The RDN (relative distinguished name) to use when loading the username. The DN for each LDAP entry is composed of two parts: the RDN and the location within the LDAP directory where the record resides. The RDN is the portion of your DN that is not related to the directory tree structure. Example:
- `cn`

### User First Name Attribute
The attribute field to use when loading the user’s first name. Example:
- `givenName`

### User Last Name Attribute
The attribute field to use when loading the user’s last name. Example:
- `sn`

### User Display Name Attribute
The attribute field to use when loading the user’s full name. Example:
- `displayName`

### User Email Attribute
The attribute field to use when loading the user’s email address. Example:
- `mail`

### User Password Attribute
The attribute field to use when loading a user’s password. Example:
- `unicodePwd`

### Group Schema Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Group Object Class</strong></td>
<td>This is the name of the class used for the LDAP group object. Examples:</td>
</tr>
<tr>
<td></td>
<td>- <code>groupOfUniqueNames</code></td>
</tr>
<tr>
<td></td>
<td>- <code>group</code></td>
</tr>
<tr>
<td><strong>Group Object Filter</strong></td>
<td>The filter to use when searching group objects. Example:</td>
</tr>
<tr>
<td></td>
<td>- <code>(objectCategory=Group)</code></td>
</tr>
<tr>
<td><strong>Group Name Attribute</strong></td>
<td>The attribute field to use when loading the group's name. Example:</td>
</tr>
<tr>
<td></td>
<td>- <code>cn</code></td>
</tr>
<tr>
<td>Setting</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Group Members Attribute</td>
<td>The attribute field to use when loading the group's members. Example:</td>
</tr>
<tr>
<td></td>
<td>• member</td>
</tr>
<tr>
<td>User Membership Attribute</td>
<td>The attribute field to use when loading the user's groups. Example:</td>
</tr>
<tr>
<td></td>
<td>• memberOf</td>
</tr>
</tbody>
</table>

**Use the User Membership Attribute, when finding the user's group membership**

Put a tick in the checkbox if your directory server supports the group membership attribute on the user. (By default, this is the 'memberOf' attribute.)

- If this checkbox is ticked, your application will use the group membership attribute on the user when retrieving the members of a given group. This will result in a more efficient retrieval.
- If this checkbox is not ticked, your application will use the members attribute on the group ('member' by default) for the search.
- If the 'Enable Nested Groups' checkbox is ticked, your application will ignore the 'Use memberOf Attribute on the User' option and will use the members attribute on the group for the search.

**Use the User Membership Attribute, when finding the members of a group**

Put a tick in the checkbox if your directory server supports the group membership attribute on the user. (By default, this is the 'memberOf' attribute.)

- If this checkbox is ticked, your application will use the group membership attribute on the user when retrieving the list of groups to which a given user belongs. This will result in a more efficient search.
- If this checkbox is not ticked, your application will use the members attribute on the group ('member' by default) for the search.

*Diagrams of Some Possible Configurations*
Diagram above: Confluence connecting to an LDAP directory.

Diagram above: Confluence connecting to an LDAP directory with permissions set to read only and local groups.

Configuring the LDAP Connection Pool

When connection pooling is enabled, the LDAP directory server maintains a pool of connections and assigns them as needed. When a connection is closed, the directory server returns the connection to the pool for future use. This can improve performance significantly.

To configure your LDAP connection pool:

1. Choose **Browse > Confluence Admin**.
2. Click 'User Directories' in the left-hand panel.
3. Click 'LDAP Connection Pool Configuration' in the 'Additional Configuration' section.

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initial Pool Size</td>
<td>The number of LDAP connections created when initially connecting to the pool.</td>
<td>1</td>
</tr>
<tr>
<td>Preferred Pool Size</td>
<td>The optimal pool size. LDAP will remove idle connections when the number of connections grows larger than this value. A value of 0 (zero) means that there is no preferred size, so the number of idle connections is unlimited.</td>
<td>1.0</td>
</tr>
</tbody>
</table>
Maximum Pool Size | The maximum number of connections. When the number of connections reaches this value, LDAP will refuse further connections. As a result, requests made by an application to the LDAP directory server will be blocked. A value of 0 (zero) means that the number of connections is unlimited. | 0

Pool Timeout (seconds) | The length of time, in seconds, that a connection may remain idle before being removed from the pool. When the application is finished with a pooled connection, the connection is marked as idle, waiting to be reused. A value of 0 (zero) means that the idle time is unlimited, so connections will never be timed out. | 30

Pool Protocol | Only these protocol types will be allowed to connect to the LDAP directory server. If you want to allow multiple protocols, enter the values separated by a space. Valid values are:
- plain
- ssl
| plain ssl
(Both plain and ssl)

Pool Authentication | Only these authentication types will be allowed to connect to the LDAP directory server. If you want to allow multiple authentication types, enter the values separated by a space. See RFC 2829 for details of LDAP authentication methods. Valid values are:
- none
- simple
- DIGEST-MD5 | simple

Notes:
- The connection pool settings are system wide and will be used to create a new connection pool for every configured LDAP directory server.
- You must restart your application server for these settings to take effect.

Configuring an SSL Connection to Active Directory

If you want to configure a read/write connection with Microsoft Active Directory, you will need to install an SSL certificate, generated by your Active Directory server, onto your Confluence server and then install the certificate into your JVM keystore.

### On this page:
- [Prerequisites](#)
- **Step 1. Install the Active Directory Certificate Services**
- **Step 2. Obtain the Server Certificate**
- **Step 3. Import the Server Certificate**

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Updating user, group, and membership details in Active Directory requires that your Atlassian application be running in a JVM that trusts the AD server. To do this, we generate a certificate on the Active Directory server, then import it into Java's keystore.

**Prerequisites**

To generate a certificate, you need the following components installed on the Windows Domain Controller to which you're connecting.

<table>
<thead>
<tr>
<th>Required Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internet Information Services (IIS)</td>
<td>This is required before you can install Windows Certificate Services.</td>
</tr>
<tr>
<td>Windows Certificate Services</td>
<td>This installs a certification authority (CA) which is used to issue certificates. Step 1, below, explains this process.</td>
</tr>
<tr>
<td>Windows 2000 Service Pack 2</td>
<td>Required if you are using Windows 2000</td>
</tr>
</tbody>
</table>

**Step 1. Install the Active Directory Certificate Services**

If Certificate Services are already installed, skip to step 2, below. The screenshots below are from Server 2008, but the process is similar for Server 2000 and 2003.

1. Log in to your Active Directory server as an administrator.
2. Click **Start**, point to **Administrative Tools**, and then click **Server Manager**.
3. In the **Roles Summary** section, click **Add Roles**.
4. On the **Select Server Roles** page, select the **Active Directory Certificate Services** check box. Click **Next** twice.

5. On the **Select Role Services** page, select the **Certification Authority** check box, and then click **Next**.
6. On the **Specify Setup Type** page, click **Enterprise**, and then click **Next**.

7. On the **Specify CA Type** page, click **Root CA**, and then click **Next**.
8. On the **Set Up Private Key** and **Configure Cryptography for CA** pages, you can configure optional configuration settings, including cryptographic service providers. However, the default values should be fine. Click **Next** twice.

9. In the **Common name for this CA** box, type the common name of the CA, and then click **Next**.
10. On the **Set Validity Period** page, accept the default values or specify other storage locations for the certificate database and the certificate database log, and then click **Next**.
11. After verifying the information on the **Confirm Installation Selections** page, click **Install**.
12. Review the information on the results screen to verify that the installation was successful.
The steps above describe how to install the certification authority (CA) on your Microsoft Active Directory server. Next, you will need to add the Microsoft Active Directory server’s SSL certificate to the list of accepted certificates used by the JDK that runs your application server.

The Active Directory certificate is automatically generated and placed in root of the C:\ drive, matching a file format similar to the tree structure of your Active Directory server. For example: c:\ad2008.ad01.atlassian.com_ad01.crt.

You can also export the certificate by executing this command on the Active Directory server:

```
certutil -ca.cert client.crt
```

### Step 3. Import the Server Certificate

For an application server to trust your directory’s certificate, the certificate must be imported into your Java runtime environment. The JDK stores trusted certificates in a file called a keystore. The default keystore file is called cacerts and it lives in the jre\lib\security sub-directory of your Java installation.

In the following examples, we use server-certificate.crt to represent the certificate file exported by your directory server. You will need to alter the instructions below to match the name actually generated.

### Windows

1. Navigate to the directory in which Java is installed. It’s probably called something like C:\Program Files\Java\jdk1.5.0_12.
2. Run the command below, where server-certificate.crt is the name of the file from your directory server:

   ```
   keytool -import -keystore .\jre\lib\security\cacerts -file server-certificate.crt
   ```

3. keytool will prompt you for a password. The default keystore password is changeit.
4. When prompted Trust this certificate? [no]: enter yes to confirm the key import:

   ```
   Enter keystore password:  changeit
   Owner: CN=ad01, C=US
   Issuer: CN=ad01, C=US
   Serial number: 15563d6677a4e9e4582d8a84be683f9
   Certificate fingerprints:
   Trust this certificate? [no]:  yes
   Certificate was added to keystore
   ```

You may now use the ‘Secure SSL’ option when connecting your application to your directory server.

### UNIX

1. Navigate to the directory in which Java is installed. cd $JAVA_HOME will usually get you there.
2. Run the command below, where server-certificate.crt is the name of the file from your directory server:

```
sudo keytool -import -keystore ./jre/lib/security/cacerts -file server-certificate.crt
```

3. `keytool` will prompt you for a password. The default keystore password is `changeit`.

4. When prompted Trust this certificate? [no]: enter yes to confirm the key import:

```
Password: 
Enter keystore password: changeit
Owner: CN=ad01, C=US
Issuer: CN=ad01, C=US
Serial number: 15563d6677a4e9e4582d8a84be683f9
Certificate fingerprints:
Trust this certificate? [no]: yes
Certificate was added to keystore
```

You may now use the ‘Secure SSL’ option when connecting your application to your directory server.

**Mac OS X**

1. Navigate to the directory in which Java is installed. This is usually `/Library/Java/Home`.

2. Run the command below, where server-certificate.crt is the name of the file from your directory server:

```
sudo keytool -import -keystore ./jre/lib/security/cacerts -file server-certificate.crt
```

3. `keytool` will prompt you for a password. The default keystore password is `changeit`.

4. When prompted Trust this certificate? [no]: enter yes to confirm the key import:

```
Password: 
Enter keystore password: changeit
Owner: CN=ad01, C=US
Issuer: CN=ad01, C=US
Serial number: 15563d6677a4e9e4582d8a84be683f9
Certificate fingerprints:
Trust this certificate? [no]: yes
Certificate was added to keystore
```
You may now use the 'Secure SSL' option when connecting your application to your directory server.

Connecting to an Internal Directory with LDAP Authentication

You can connect your Confluence application to an LDAP directory for delegated authentication. This means that Confluence will have an internal directory that uses LDAP for authentication only. There is an option to create users in the internal directory automatically when they attempt to log in, as described in the settings section.

Overview

An internal directory with LDAP authentication offers the features of an internal directory while allowing you to store and check users' passwords in LDAP only. Note that the 'internal directory with LDAP authentication' is separate from the default 'internal directory'. On LDAP, all that the application does is to check the password. The LDAP connection is read only. Every user in the internal directory with LDAP authentication must map to a user on LDAP, otherwise they cannot log in.

When to use this option: Choose this option if you want to set up a user and group configuration within your application that suits your needs, while checking your users' passwords against the corporate LDAP directory. This option also helps to avoid the performance issues that may result from downloading large numbers of groups from LDAP.

On this page:
- Overview
- Connecting Confluence to an Internal Directory with LDAP Authentication
- Server Settings
  - Copying Users on Login
- Schema Settings
- Advanced Settings
- User Schema Settings

The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Connecting Confluence to an Internal Directory with LDAP Authentication

To connect to an internal directory but check logins via LDAP:

1. Choose Browse > Confluence Admin.
2. Click 'User Directories' in the left-hand panel.
3. Add a directory and select type 'Internal with LDAP Authentication'.
4. Enter the values for the settings, as described below.
5. Save the directory settings.
6. If you want LDAP users to be used in place of existing internal users, move the 'Internal with LDAP Authentication' directory to the top of the list. You can define the directory order by clicking the blue up-
and down-arrows next to each directory on the 'User Directories' screen. Here is a summary of how the directory order affects the processing:

- The order of the directories is the order in which they will be searched for users and groups.
- Changes to users and groups will be made only in the first directory where the application has permission to make changes.

For details see Managing Multiple Directories.

7. Add your users and groups in Confluence. See Adding Users and Adding a Group.

### Server Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name that will help you to identify the directory. Examples:</td>
</tr>
<tr>
<td></td>
<td>• Internal directory with LDAP Authentication</td>
</tr>
<tr>
<td></td>
<td>• Corporate LDAP for Authentication Only</td>
</tr>
<tr>
<td>Directory Type</td>
<td>Select the type of LDAP directory that you will connect to. If you are adding a new LDAP connection, the value you select here will determine the default values for some of the options on the rest of screen. Examples:</td>
</tr>
<tr>
<td></td>
<td>• Microsoft Active Directory</td>
</tr>
<tr>
<td></td>
<td>• OpenDS</td>
</tr>
<tr>
<td></td>
<td>• And more.</td>
</tr>
<tr>
<td>Hostname</td>
<td>The host name of your directory server. Examples:</td>
</tr>
<tr>
<td></td>
<td>• ad.example.com</td>
</tr>
<tr>
<td></td>
<td>• ldap.example.com</td>
</tr>
<tr>
<td></td>
<td>• opensds.example.com</td>
</tr>
<tr>
<td>Port</td>
<td>The port on which your directory server is listening. Examples:</td>
</tr>
<tr>
<td></td>
<td>• 389</td>
</tr>
<tr>
<td></td>
<td>• 10389</td>
</tr>
<tr>
<td></td>
<td>• 636 (for example, for SSL)</td>
</tr>
<tr>
<td>Use SSL</td>
<td>Select this check box if the connection to the directory server is an SSL (Secure Sockets Layer) connection. Note that you will need to configure an SSL certificate in order to use this setting.</td>
</tr>
<tr>
<td>Username</td>
<td>The distinguished name of the user that the application will use when connecting to the directory server. Examples:</td>
</tr>
<tr>
<td></td>
<td>• cn=administrator,cn=users,dc=ad,dc=example,dc=com</td>
</tr>
<tr>
<td></td>
<td>• cn=user,dc=domain,dc=name</td>
</tr>
<tr>
<td></td>
<td>• <a href="mailto:user@domain.name">user@domain.name</a></td>
</tr>
<tr>
<td>Setting</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Copy User on Login      | This option affects what will happen when a user attempts to log in. If this check box is selected, the user will be created automatically in the internal directory that is using LDAP for authentication when the user first logs in and their details will be synchronised on each subsequent log in. If this check box is not selected, the user's login will fail. If you select this check box the following additional fields will appear on the screen, which are described in more detail below:  
  - Default Group Memberships  
  - Synchronise Group Memberships  
  - User Schema Settings (described in a separate section below) |
| Default Group Memberships | This field appears if you select the **Copy User on Login** check box. If you would like users to be automatically added to a group or groups, enter the group name(s) here. To specify more than one group, separate the group names with commas. Each time a user logs in, their group memberships will be checked. If the user does not belong to the specified group(s), their username will be added to the group(s). If a group does not yet exist, it will be added to the internal directory that is using LDAP for authentication. Please note that there is no validation of the group names. If you mis-type the group name, authorisation failures will result – users will not be able to access the applications or functionality based on the intended group name.  
  Examples:  
  - confluence-users  
  - confluence-users, jira-users, jira-developers |
Synchronise Group Memberships

This field appears if you select the **Copy User on Login** check box. If this check box is selected, group memberships specified on your LDAP server will be synchronised with Confluence each time the user logs in.

If you select this check box the following additional fields will appear on the screen, both described in more detail below:

- Group Schema Settings (described in a separate section below)
- Membership Schema Settings (described in a separate section below)

### Schema Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base DN</td>
<td>The root distinguished name (DN) to use when running queries against the directory server. Examples:</td>
</tr>
<tr>
<td></td>
<td>- o=example,c=com</td>
</tr>
<tr>
<td></td>
<td>- cn=users,dc=ad,dc=example,dc=com</td>
</tr>
<tr>
<td></td>
<td>- For Microsoft Active Directory, specify the base DN in the following format: dc=domain1,dc=local. You will need to replace the domain1 and local of your specific configuration. Microsoft Server provides a tool called ldp.exe which is useful for finding out and configuring the LDAP structure of your server.</td>
</tr>
<tr>
<td>User Name Attribute</td>
<td>The attribute field to use when loading the username. Examples:</td>
</tr>
<tr>
<td></td>
<td>- cn</td>
</tr>
<tr>
<td></td>
<td>- sAMAccountName</td>
</tr>
</tbody>
</table>

### Advanced Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use Paged Results</td>
<td>Enable or disable the use of the LDAP control extension for simple paging of search results. If paging is enabled, the search will retrieve sets of data rather than all of the search results at once. Enter the desired page size – that is, the maximum number of search results to be returned per page when paged results are enabled. The default is 1000 results.</td>
</tr>
</tbody>
</table>
Follow Referrals

Choose whether to allow the directory server to redirect requests to other servers. This option uses the node referral (JNDI lookup `java.naming.referral`) configuration setting. It is generally needed for Active Directory servers configured without proper DNS, to prevent a `javax.naming.PartialResultException: Unprocessed Continuation Reference(s)` error.

**User Schema Settings**

Note: this section is only visible when **Copy User on Login** is enabled.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional User DN</td>
<td>This value is used in addition to the base DN when searching and loading users. If no value is supplied, the subtree search will start from the base DN. Example:</td>
</tr>
<tr>
<td></td>
<td>• <code>ou=Users</code></td>
</tr>
<tr>
<td>User Object Class</td>
<td>This is the name of the class used for the LDAP user object. Example:</td>
</tr>
<tr>
<td></td>
<td>• <code>user</code></td>
</tr>
<tr>
<td>User Object Filter</td>
<td>The filter to use when searching user objects. Example:</td>
</tr>
<tr>
<td></td>
<td>• <code>(&amp;(objectCategory=Person)(sAMAccountName=*))</code></td>
</tr>
<tr>
<td>User Name RDN Attribute</td>
<td>The RDN (relative distinguished name) to use when loading the username. The DN for each LDAP entry is composed of two parts: the RDN and the location within the LDAP directory where the record resides. The RDN is the portion of your DN that is not related to the directory tree structure. Example:</td>
</tr>
<tr>
<td></td>
<td>• <code>cn</code></td>

<td>The attribute field to use when loading the user's last name. Example:</td>
</tr>
<tr>
<td></td>
<td>• <code>sn</code></td>
</tr>
<tr>
<td>User Display Name Attribute</td>
<td>The attribute field to use when loading the user's full name. Example:</td>
</tr>
<tr>
<td></td>
<td>• <code>displayName</code></td>
</tr>
</tbody>
</table>
### User Email Attribute
The attribute field to use when loading the user's email address. Example:
- `mail`

### Group Schema Settings
Note: this section is only visible when both **Copy User on Login** and **Synchronise Group Memberships** are enabled.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| Additional Group DN | This value is used in addition to the base DN when searching and loading groups. If no value is supplied, the subtree search will start from the base DN. Example:  
  - `ou=Groups` |
| Group Object Class | This is the name of the class used for the LDAP group object. Examples:  
  - `groupOfUniqueNames`  
  - `group` |
| Group Object Filter | The filter to use when searching group objects. Example:  
  - `(objectCategory=Group)` |
| Group Name Attribute | The attribute field to use when loading the group's name. Example:  
  - `cn` |
| Group Description Attribute | The attribute field to use when loading the group's description. Example:  
  - `description` |

### Membership Schema Settings
Note: this section is only visible when both **Copy User on Login** and **Synchronise Group Memberships** are enabled.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| Group Members Attribute | The attribute field to use when loading the group's members. Example:  
  - `member` |
| User Membership Attribute | The attribute field to use when loading the user's groups. Example:  
  - `memberOf` |
Use the User Membership Attribute, when finding the user's group membership

Select the check box if your directory server supports the group membership attribute on the user. (By default, this is the 'memberOf' attribute.)

- If this check box is selected, your application will use the group membership attribute on the user when retrieving the members of a given group. This will result in a more efficient retrieval.
- If this check box is not selected, your application will use the members attribute on the group ('member' by default) for the search.

## Diagrams of Possible Configurations

Connecting to Crowd or JIRA for User Management

You can connect your Confluence application to Atlassian Crowd or to JIRA (version 4.3 or later) for management of users and groups, and for authentication (verification of a user's login).

On this page:

- Connecting Confluence to Crowd for User Management
- Connecting Confluence to JIRA for User Management
- Diagrams of Some Possible Configurations
Connecting Confluence to Crowd for User Management

Atlassian Crowd is an application security framework that handles authentication and authorisation for your web-based applications. With Crowd you can integrate multiple web applications and user directories, with support for single sign-on (SSO) and centralised identity management. The Crowd Administration Console provides a web interface for managing directories, users and their permissions. See the [Crowd Administration Guide](#).

**When to use this option:** Connect to Crowd if you want to use the full Crowd functionality to manage your directories, users and groups. You can connect your Crowd server to a number of directories of all types that Crowd supports, including custom directory connectors.

**To connect Confluence to Crowd:**

1. Go to your [Crowd Administration Console](#) and define the Confluence application to Crowd. See the Crowd documentation: [Adding an Application](#).
2. Choose **Browse > Confluence Admin**.
3. Click ‘**User Directories**’ in the left-hand panel.
4. Add a directory and select type ‘**Atlassian Crowd**’. Enter the settings as described below.
5. Save the directory settings.
6. Define the **directory order** by clicking the blue up- and down-arrows next to each directory on the ‘**User Directories**’ screen. Here is a summary of how the directory order affects the processing:
   - The order of the directories is the order in which they will be searched for users and groups.
   - Changes to users and groups will be made only in the first directory where the application has permission to make changes.
   For details see [Managing Multiple Directories](#).
7. If required, configure Confluence to use Crowd for single sign-on (SSO) too. See the Crowd documentation: [Integrating Crowd with Atlassian Confluence](#).

**Crowd Settings in Confluence**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A meaningful name that will help you to identify this Crowd server amongst your list of directory servers. Examples:</td>
</tr>
<tr>
<td></td>
<td>• Crowd Server</td>
</tr>
<tr>
<td></td>
<td>• Example Company Crowd</td>
</tr>
<tr>
<td>Server URL</td>
<td>The web address of your Crowd console server. Examples:</td>
</tr>
<tr>
<td></td>
<td>• <a href="http://www.example.com:8095/crowd/">http://www.example.com:8095/crowd/</a></td>
</tr>
<tr>
<td></td>
<td>• <a href="http://crowd.example.com">http://crowd.example.com</a></td>
</tr>
<tr>
<td>Application Name</td>
<td>The name of your application, as recognised by your Crowd server. Note that you will need to define the application in Crowd too, using the Crowd administration Console. See the Crowd documentation on <a href="#">adding an application</a>.</td>
</tr>
</tbody>
</table>
Application Password

The password which the application will use when it authenticates against the Crowd framework as a client. This must be the same as the password you have registered in Crowd for this application. See the Crowd documentation on adding an application.

Crowd Permissions

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read Only</td>
<td>The users, groups and memberships in this directory are retrieved from Crowd and can only be modified via Crowd. You cannot modify Crowd users, groups or memberships via the application administration screens.</td>
</tr>
<tr>
<td>Read/Write</td>
<td>The users, groups and memberships in this directory are retrieved from Crowd. When you modify a user, group or membership via the application administration screens, the changes will be applied directly to Crowd. Please ensure that the application has modification permissions for the relevant directories in Crowd. See the Crowd documentation: Specifying an Application's Directory Permissions.</td>
</tr>
</tbody>
</table>

Advanced Crowd Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Nested Groups</td>
<td>Enable or disable support for nested groups. Before enabling nested groups, please check to see if the user directory or directories in Crowd support nested groups. When nested groups are enabled, you can define a group as a member of another group. If you are using groups to manage permissions, you can create nested groups to allow inheritance of permissions from one group to its sub-groups.</td>
</tr>
<tr>
<td>Synchronisation Interval (minutes)</td>
<td>Synchronisation is the process by which the application updates its internal store of user data to agree with the data on the directory server. The application will send a request to your directory server every (x) minutes, where (x) is the number specified here. The default value is 60 minutes.</td>
</tr>
</tbody>
</table>

Connecting Confluence to JIRA for User Management

Note that the license tiers for JIRA and Confluence do not need to match to use this feature. For example, you can manage a Confluence 50 user license with JIRA, even if JIRA only has a 25 user license.
Subject to certain limitations, you can connect a number of Atlassian web applications to a single JIRA server for centralised user management.

**When to use this option:** You can only connect to a server running JIRA 4.3 or later. Choose this option as an alternative to Atlassian Crowd, for simple configurations with a limited number of users.

*If you are running JIRA 4.2 or earlier, please see Connecting to JIRA 4.2 or Earlier for User Management.*

**To connect Confluence to JIRA 4.3 or later:**

1. Go to your JIRA administration screen and define the Confluence application to JIRA:
   - For JIRA 4.3.x, select 'Other Applications' from the 'Users, Groups & Roles' section of the Administration menu.
   - For JIRA 4.4 or later, select 'Users' > 'JIRA User Server' in Administration mode.
   - Click 'Add Application'.
   - Enter the application name and password that Confluence will use when accessing JIRA.
   - Enter the IP address or addresses of your Confluence server. Valid values are:
     - A full IP address, e.g. 192.168.10.12.
     - A wildcard IP range, using CIDR notation, e.g. 192.168.10.1/16. For more information, see the introduction to [CIDR notation on Wikipedia](https://en.wikipedia.org/wiki/Classless_interdomain_routing) and [RFC 4632](https://tools.ietf.org/rfc/rfc4632.txt).
   - Save the new application.

2. Set up the JIRA user directory in Confluence:
   - Choose Browse > Confluence Admin.
   - Click 'User Directories' in the left-hand panel.
   - Add a directory and select type 'Atlassian JIRA'.
   - Enter the settings as described below. When asked for the application name and password, enter the values that you defined for your Confluence application in the settings on JIRA.
   - Save the directory settings.
   - Define the directory order by clicking the blue up- and down-arrows next to each directory on the 'User Directories' screen. Here is a summary of how the directory order affects the processing:
     - The order of the directories is the order in which they will be searched for users and groups.
     - Changes to users and groups will be made only in the first directory where the application has permission to make changes.
   - For details see [Managing Multiple Directories](#).

3. In order to use Confluence, users must be a member of the confluence-users group or have Confluence 'can use' permission. Follow these steps to configure your Confluence groups in JIRA:
   a. Add the confluence-users and confluence-administrators groups in JIRA.
   b. Add your own username as a member of both of the above groups.
   c. Choose one of the following methods to give your existing JIRA users access to Confluence:
      - Option 1: In JIRA, find the groups that the relevant users belong to. Add the groups as members of one or both of the above Confluence groups.
      - Option 2: Log in to Confluence using your JIRA account and go to the Confluence Administration Console. Click 'Global Permissions' and assign the 'can use' permission to the relevant JIRA groups.

**JIRA Settings in Confluence**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A meaningful name that will help you to identify this JIRA server amongst your list of directory servers. Examples:</td>
</tr>
<tr>
<td></td>
<td>• JIRA Server</td>
</tr>
<tr>
<td></td>
<td>• My Company JIRA</td>
</tr>
</tbody>
</table>
| **Server URL** | The web address of your JIRA server. Examples:  
| |  
| | • http://www.example.com/8080  
| | • http://jira.example.com  
| **Application Name** | The name used by your application when accessing the JIRA server that acts as user manager. Note that you will also need to define your application to that JIRA server, via the 'Other Applications' option in the 'Users, Groups & Roles' section of the 'Administration' menu.  
| **Application Password** | The password used by your application when accessing the JIRA server that acts as user manager.  

### JIRA Permissions

<table>
<thead>
<tr>
<th><strong>Setting</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
</table>
| **Read Only** | The users, groups and memberships in this directory are retrieved from the JIRA server that is acting as user manager. They can only be modified via that JIRA server.  
| **Read/Write** | The users, groups and memberships in this directory are retrieved from the JIRA server that is acting as user manager. When you modify a user, group or membership, the changes will be applied directly to your application and to the JIRA server that is acting as user manager.  

### Advanced JIRA Settings

<table>
<thead>
<tr>
<th><strong>Setting</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
</table>
| **Enable Nested Groups** | Enable or disable support for nested groups. Before enabling nested groups, please check to see if nested groups are enabled on the JIRA server that is acting as user manager. When nested groups are enabled, you can define a group as a member of another group. If you are using groups to manage permissions, you can create nested groups to allow inheritance of permissions from one group to its sub-groups.  
| **Synchronisation Interval (minutes)** | Synchronisation is the process by which the application updates its internal store of user data to agree with the data on the directory server. The application will send a request to your directory server every x minutes, where 'x' is the number specified here. The default value is 60 minutes.

Diagram above: Confluence connecting to JIRA for user management, with JIRA in turn connecting to LDAP.

RELATED TOPICS

Configuring User Directories
Option 1 – Manually Recreate Users and Groups in Confluence

Use this option if you have only a few users and groups.

1. Log in to Confluence as a Confluence system administrator.
2. Go to the user directories administration screen and move the internal directory to the top of the list of directories, by clicking the arrows in the ‘Order’ column.
3. Make sure that you have at least one user from the internal directory in each of the confluence-users and confluence-administrators groups.
4. Make sure that you have a username in the internal directory with Confluence system administrator permissions.
   - If you do not have such a user, add a new one now, and log out of Confluence.
   - Log back in as the user you just added, and go back to the user directories administration screen.
5. Disable the ‘Atlassian Crowd’ directory.
6. Manually add the required users and groups in Confluence. They will be added to the internal directory, because you have moved it to the top of the list of directories.
   - If you have assigned Confluence permissions to a group which exists in JIRA, you must create a group in Confluence with the same name.
   - If a user who exists in JIRA has created content or has had permissions assigned to them in Confluence, you must also create that user in Confluence.
7. Add the users to the required groups.

Option 2 – Transfer Crowd/JIRA Users and Groups to the Confluence Database

If your Confluence site currently uses JIRA or Crowd for user management, you can revert to internal user management as described below. If your Confluence instance has only a few users, it is easier to recreate the users and groups in Confluence manually. If you have a large number of users and groups, it is more efficient to migrate the relevant users and groups into the Confluence Internal directory.

Both options provided below will reset the affected users’ passwords. When done, be sure to notify them to use the ‘Reset My Password’ link on the Confluence log in page before they attempt to log in.
Use this option to migrate External Application (Crowd or JIRA) users into the Confluence database. You need a knowledge of SQL to perform this task.

The SQL commands given below are tailored for MySQL. If you are using a database other than MySQL, you will need to modify the SQL to work in your database.

**Step 1. Create Backups**

Creating backups is the only way to restore your data if something goes wrong.

1. From Confluence, create a full XML site backup including attachments.
2. Stop Confluence.
3. Make a backup copy of the Confluence home and installation directories.
4. Repeat the above steps for your External Application.
5. From your MySQL administration tool, create a database backup for the Crowd/JIRA and Confluence databases.

**Step 2. Replace Confluence User Management**

Use the SQL below to move groups and users from your External Application to Confluence by transferring table content. The SQL provided is specific to MySQL and must be modified for other databases.

**Find the IDs for your Directories**

1. Run the following command and take note of the resulting number. It will be referenced throughout the following instructions as `<Confluence Internal ID>`.

```sql
select id from cwd_directory where directory_name='Confluence Internal Directory';
```

2. From the User Directories administration page, find the name of the directory who's users/groups you want to move. Run the following command and take note of the resulting number. It will be referenced throughout the following instructions as `<External Application ID>`.

```sql
select id from cwd_directory where directory_name='<External Directory Name>';
```

**Move Groups to Confluence**

1. It is possible that you have several groups in your Internal Directory that have the same name as groups in your External Application. To find these, run:

```sql
select distinct a.id, a.directory_id, a.group_name, d.directory_name
from cwd_group a join cwd_group b on a.group_name=b.group_name join cwd_directory d on d.id=a.directory_id where a.directory_id != b.directory_id;
```

a. If you have results from the previous query, for each of the group names that have duplicates, find the id for the group in the Confluence Internal Directory (internal group id) and the External Application (external group id). Run the following:
1. Move all the groups in the External Application to the Confluence Internal Directory.

```sql
update cwd_group set directory_id=<Confluence Internal ID> where directory_id=<External Application ID>;
```

### Move Users to Confluence

1. It is possible that you have several users in your Internal Directory that have the same name as users in your External Application. To find these, run:

```sql
select distinct a.id, a.directory_id, a.user_name, d.directory_name
from cwd_user a join cwd_user b on a.user_name=b.user_name join cwd_directory d on d.id=a.directory_id where a.directory_id != b.directory_id;
```

a. If you have results from the previous query, for each of the user names that have duplicates, find the id for the user in the Confluence Internal Directory (<internal user id>) and the External Application (<external user id>). Run the following:

```sql
update cwd_membership set child_user_id=<internal user id> where child_user_id=<external user id>;
update cwd_user_credential_record set user_id=<internal user id> where user_id=<external user id>;
update cwd_user_attribute set user_id=<internal user id>, directory_id=<Confluence Internal ID> where user_id=<external user id>;
delete from cwd_user where id=<external user id>;
```

```sql
update cwd_user set directory_id=<Confluence Internal ID> where directory_id=<External Application ID>;
```

### Delete the External Application directory

1. You need to change the order of your directories so that the Internal directory is at the top, and active.
a. If you have only two directories - the Internal and the External Application directory you are deleting, then do the following:

```
update cwd_app_dir_mapping set list_index = 0 where directory_id = <Confluence Internal ID>;
```

b. If you have more than two directories, you need to rearrange them so the Internal Directory is at the top (list_index 0) and the External Application directory you are deleting is at the bottom.
   - List the directories and their order using

```
select d.id, d.directory_name, m.list_index from cwd_directory d join cwd_app_dir_mapping m on d.id = m.directory_id order by m.list_index;
```

   - Change the list indexes so that they are in the order you want. Directory order can be rearranged using

```
update cwd_app_dir_mapping set list_index = <position> where directory_id = <directory id>;
```

c. Check that the internal directory is enabled.
   - List the internal directory. An enabled directory will have its 'active' column set to 'T'

```
select id, directory_name, active from cwd_directory where id = <Internal Directory id>;
```
   - If the internal directory is not active, activate it by

```
update cwd_directory set active = 'T' where id = <Internal Directory id>;
```

2. When the directories are ordered correctly, delete the External Application directory from the directory order:

```
delete from cwd_app_dir_operation where app_dir_mapping_id = (select id from cwd_app_dir_mapping where directory_id = <External Application ID>);
delete from cwd_app_dir_mapping where directory_id = <External Application ID>;
```

3. The External Application directory is referenced in several other tables in the database. You need to remove the remaining references to it:
delete from cwd_directory_attribute where directory_id=<External Application ID>;
delte from cwd_directory_operation where directory_id=<External Application ID>;

4. All references to the External Directory should now have been removed. Delete the directory using:

delete from cwd_directory where id = <External Application ID>;

Reset passwords
1. All users who were in the External Directory you deleted, including admins, will be unable to log in. Their passwords need to be reset by choosing the 'Forgot your password?' link on the login page. Alternatively, use the instructions at Restoring Passwords To Recover Admin User Rights to reset the administrator password, then set the users’ passwords for them via the Manage Users page in the administration screen.

RELATED TOPICS

Configuring User Directories

Connecting to JIRA 4.2 or Earlier for User Management
Atlassian JIRA is an issue and project tracking tool. Like Confluence, JIRA offers the ability to store its users and groups in its database. You can configure Confluence to look for its users and groups in the JIRA database. This page describes the legacy JIRA database connector, which provides a direct connection to the JIRA database.

When to use this option: Choose the legacy JIRA database connector if your JIRA server is JIRA 4.2 or earlier, for backwards compatibility with the already-existing option for Confluence to use JIRA for user management.

If you are using JIRA 4.3 or later, you cannot use the legacy JIRA database connector. Instead, choose the 'Atlassian JIRA' directory type.

On this page:
- Connecting Confluence to JIRA
- JIRA Settings in Confluence

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Connecting Confluence to JIRA

To connect Confluence to JIRA 4.2 or earlier:
1. Edit the Confluence server.xml file, to construct the datasource location, as described below.
2. Restart Confluence.
3. Choose Browse > Confluence Admin.
4. Click User Directories in the left-hand panel.
5. Add a directory and select type Legacy Atlassian JIRA (4.2 and earlier). Enter the settings as
6. Save the directory settings.
7. Define the directory order by clicking the blue up- and down-arrows next to each directory on the 'User Directories' screen. Here is a summary of how the directory order affects the processing:
   • The order of the directories is the order in which they will be searched for users and groups.
   • Changes to users and groups will be made only in the first directory where the application has permission to make changes.

For details see Managing Multiple Directories.

8. In order to use Confluence, users must be a member of the confluence-users group or have Confluence ‘can use’ permission. Follow these steps to configure your Confluence groups in JIRA:
   a. Add the confluence-users and confluence-administrators groups in JIRA.
   b. Add your own username as a member of both of the above groups.
   c. Choose one of the following methods to give your existing JIRA users access to Confluence:
      • Option 1: In JIRA, find the groups that the relevant users belong to. Add the groups as members of one or both of the above Confluence groups.
      • Option 2: Log in to Confluence using your JIRA account and go to the Confluence Administration Console. Click ‘Global Permissions’ and assign the ‘can use’ permission to the relevant JIRA groups.

**JIRA Settings in Confluence**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A meaningful name that will help you to identify this JIRA server amongst your list of directory servers. Examples:</td>
</tr>
<tr>
<td></td>
<td>• JIRA</td>
</tr>
<tr>
<td></td>
<td>• Example Company JIRA</td>
</tr>
</tbody>
</table>
Datasource Location

The JNDI name of the JIRA datasource configured in your application server. Example:
java:comp/env/jdbc/YourJiraDatasource

In JIRA standalone distributions (using the default application server, Tomcat 6) you can construct the datasource location as follows:

1. Open your `<jira_install>/conf/server.xml` file in a text editor.
2. Look for the database setup section in that file. It looks something like this:

```xml
<Resource auth="Container"
driverClassName="com.mysql.jdbc.Driver"
maxActive="20"
name="*jdbc/JiraDS*"
password="jiruser"
type="javax.sql.DataSource"
url="jdbc:mysql://localhost/jiradb?useUnicode=true&characterEncoding=UTF8"
username="jiruser"
validationQuery="select 1"/>
```

3. Copy the above lines (the 'Resource' section) and paste it to your Confluence's `server.xml` file (located at `<confluence_install>/conf/server.xml`), under the Context path. This will then expose the value of the name attribute as the JNDI resource locator.
4. Copy the JNDI name from the `name` parameter. In this example, the datasource location is: `java:comp/env/jdbc/JiraDS`

Managing Multiple Directories

This page describes what happens when you have defined more than one user directory in Confluence. For example, you may have an internal directory and you may also connect to an LDAP directory server and/or other types of user directories. When you connect to a new directory server, you also need to define the directory order.

Duplicate usernames across directories are not supported. If you are connecting to more than one user directory, please ensure that the usernames are unique to one directory. For example, if you have a user jsmit in both 'Directory1' and 'Directory2', that is an unsupported configuration.

Overview

Here is a summary of how the directory order affects the processing:

- The order of the directories is the order in which they will be searched for users and groups.
- Changes to users and groups will be made only in the first directory where the application has permission to make changes.

On this page:

- Overview
- Configuring the Directory Order
- Effect of Directory Order
  - Login
  - Permissions
  - Updating Users and groups

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Configuring the Directory Order

You can change the order of your directories as defined to Confluence. Select 'User Directories' from the Confluence Administration Console and click the blue up- and down-arrows next to each directory.

<table>
<thead>
<tr>
<th>Directory Name</th>
<th>Type</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Confluence Internal Directory</td>
<td>Internal</td>
<td>🔄</td>
</tr>
<tr>
<td>OpenLDAP</td>
<td>OpenLDAP (Read-Write)</td>
<td>🔄</td>
</tr>
</tbody>
</table>

Notes:

- Please read the rest of this page to understand what effect the directory order will have on authentication (login) and permissions in Confluence, and what happens when you update users and groups in Confluence.

Effect of Directory Order

This section summarises the effect the directory order of the directories will have on login and permissions, and on the updating of users and groups.

Login

The directory order is significant during the authentication of the user, in cases where the same user exists in multiple directories. When a user attempts to log in, the application will search the directories in the order specified, and will use the credentials (password) of the first occurrence of the user to validate the login attempt.
Permissions

The directory order is significant when granting the user permissions based on group membership. If the same username exists in more than one directory, the application will look for group membership only in the first directory where the username appears, based on the directory order.

Example:

- You have connected two directories: The Customers directory and the Partners directory.
- The Customers directory is first in the directory order.
- A username jsmith exists in both the Customers directory and the Partners directory.
- The user jsmith is a member of group G1 in the Customers directory and group G2 in the Partners directory.
- The user jsmith will have permissions based on membership of G1 only, not G2.

Updating Users and groups

If you update a user or group via the application's administration screens, the update will be made in the first directory where the application has write permissions.

Example 1:

- You have connected two directories: The Customers directory and the Partners directory.
- The application has permission to update both directories.
- The Customers directory is first in the directory order.
- A username jsmith exists in both the Customers directory and the Partners directory.
- You update the email address of user jsmith via the application's administration screens.
- The email address will be updated in the Customers directory only, not the Partners directory.

Example 2:

- You have connected two directories: A read/write LDAP directory and the internal directory.
- The LDAP directory is first in the directory order.
- All new users will be added to the LDAP directory. It is not possible to add a new user to the internal directory.

RELATED TOPICS

Configuring User Directories

- Requesting Support for External User Management

Managing Nested Groups

Some directory servers allow you to define a group as a member of another group. Groups in such a structure are called "nested groups". If you are using groups to manage permissions, you can create nested groups to allow inheritance of permissions from one group to its sub-groups.
This page describes how Confluence handles nested groups that exist in one or more of your directory servers.

**Enabling Nested Groups**

You can enable or disable support for nested groups on each directory individually. Go to the 'User Directories' section of the Confluence Administration Console, edit the directory and select 'Enable Nested Groups'. See Configuring User Directories.

Notes:

- Before enabling nested groups for a specific directory type in Confluence, please make sure that your directory server supports nested groups.
- Please read the rest of this page to understand what effect nested groups will have on authentication (login) and permissions in Confluence, and what happens when you update users and groups in Confluence.

**On this page:**

- Enabling Nested Groups
- Effect of Nested Groups
  - Login
  - Permissions
  - Viewing Lists of Group Members
  - Adding and Updating Group Memberships
- Examples
  - Example 1: User is Member of Sub-Group
  - Example 2: Sub-Groups as Members of the 'jira-developers' group
  - Example 3: Sub-Groups as Members of the 'confluence-users' group
- Notes

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

**Effect of Nested Groups**

This section summarises the effect nested groups will have on login and permissions, and on the viewing and updating of users and groups.

**Login**

When a user logs in, they will be allowed access to the application if they belong to an authorised group or any of its sub-groups.

**Permissions**

The user will be allowed access to a function if they belong to a group that has the necessary permissions, or if they belong to any of its sub-groups.

**Viewing Lists of Group Members**

If you ask to view the members of a group, you will see all users who are members of the group and all users belonging its sub-groups, consolidated into one list. We call this a 'flattened' list.

You cannot view or edit the nested groups themselves. You will not be able to see that one group is a member of another group.
Adding and Updating Group Memberships

If you add a user to a group, the user is added to the named group and not to any other groups.

If you try to remove a user from a flattened list, the following will happen:

- If the user is a member of the top group in the hierarchy (tree) of groups contained in the flattened list, the user will be removed from the group.
- Otherwise, you will see an error message stating that the user is not a direct member of the group.

Examples

Example 1: User is Member of Sub-Group

Let's assume that the following two groups exist in your directory server:

- staff
- marketing

Memberships:

- The marketing group is a member of the staff group.
- User jsmith is a member of marketing.

You will see that jsmith is a member of both marketing and staff. You will not see that the two groups are nested. If you assign permissions to the staff group, then jsmith will get those permissions.

Example 2: Sub-Groups as Members of the 'jira-developers' group

In an LDAP directory server, we have groups 'engineering-group' and 'techwriters-group'. We want to grant both groups developer-level access to our JIRA site.

- Add a group called 'jira-developers'.
- Add the 'engineering-group' as a sub-group of 'jira-developers'.
- Add the 'techwriters-group' as a sub-group of 'jira-developers'.

Group memberships are now:

- jira-developers — sub-groups: engineering-group, techwriters-group
- engineering-group — sub-groups: dev-a, dev-b; users: pblack
- dev-a — users: jsmith, sbrown
- dev-b — users: jsmith, dblue
- techwriters-group — users: rgreen

When JIRA requests a list of users in the 'jira-developers' group, it will receive the following list:

- pblack
- jsmith
- sbrown
- dblue
- rgreen

Diagram: Sub-groups as members of the 'jira-developers' group
Example 3: Sub-Groups as Members of the 'confluence-users' group

In an LDAP directory server, we have groups 'engineering-group' and 'payroll-group'. We want to grant both groups access to our Confluence site.

- Add a group called 'confluence-users'.
- Add the 'engineering-group' as a sub-group of 'confluence-users'.
- Add the 'payroll-group' as a sub-group of 'confluence-users'.

Group memberships are now:

- **confluence-users** — sub-groups: engineering-group, payroll-group
- **engineering-group** — sub-groups: dev-a, dev-b; users: pblack
- **dev-a** — users: jsmith, sbrown
- **dev-b** — users: jsmith, dblue
- **payroll-group** — users: rgreen

When Confluence requests a list of users in the 'confluence-users' group, it will receive the following list:

- pblack
- jsmith
- sbrown
- dblue
- rgreen

Diagram: Sub-groups as members of the 'confluence-users' group
Notes

- **Possible impact on performance.** Enabling nested groups may result in slower user searches.

- **Definition of nested groups in LDAP.** In an LDAP directory, a nested group is defined as a child group entry whose DN (Distinguished Name) is referenced by an attribute contained within a parent group entry. For example, a parent group 'Group One' might have an `objectClass=group` attribute and one or more `member=DN` attributes, where the DN can be that of a user or that of a group elsewhere in the LDAP tree:

  ```
  member=CN=John Smith,OU=Users,OU=OrgUnitA,DC=sub,DC=domain
  member=CN=Group Two,OU=OrgUnitBGroups,OU=OrgUnitB,DC=sub,DC=domain
  ```

- [Managing Nested Groups](#)
- [Synchronising Data from External Directories](#)
Synchronising Data from External Directories

For certain directory types, Confluence stores a cache of directory information (users and groups) in the application database, to ensure fast recurrent access to user and group data. A synchronisation task runs periodically to update the internal cache with changes from the external directory.

On this page:
- Affected Directory Types
- How it Works
- Finding the Time Taken to Synchronise
- Manually Synchronising the Cache
- Configuring the Synchronisation Interval

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Affected Directory Types

Data caching and synchronisation apply to the following user directory types:
- LDAP (Microsoft Active Directory and all supported LDAP directories) where permissions are set to read only.
- LDAP (Microsoft Active Directory and all supported LDAP directories) where permissions are set to read only, with local groups.
- LDAP (Microsoft Active Directory and all supported LDAP directories) where permissions are set to read/write.
- Atlassian Crowd.
- Atlassian JIRA.

Data caching and synchronisation do not occur for the following user directory types:
- LDAP (Microsoft Active Directory and all supported LDAP directories) where permissions are set to authenticate only, with local groups.
- Internal Directory with LDAP Authentication.
- Internal Directory.

How it Works

Here is a summary of the caching functionality:
- The caches are held in the application database.
- When you connect a new external user directory to the application, a synchronisation task will start running in the background to copy all the required users, groups and membership information from the external directory to the application database. This task may take a while to complete, depending on the size and complexity of your user base.
- Note that a user will not be able to log in until the synchronisation task has copied that user’s details into the cache.
- A periodic synchronisation task will run to update the database with any changes made to the external directory. The default synchronisation interval, or polling interval, is one hour (60 minutes). You can change the synchronisation interval on the directory configuration screen.
- You can manually synchronise the cache if necessary.
• If the external directory permissions are set to read/write: Whenever an update is made to the users, groups or membership information via the application, the update will also be applied to the cache and the external directory immediately.
• All authentication happens via calls to the external directory. When caching information from an external directory, the application database does not store user passwords.
• All other queries run against the internal cache.

Finding the Time Taken to Synchronise

The ‘User Directories’ screen shows information about the last synchronisation operation, including the length of time it took.

Manually Synchronising the Cache

You can manually synchronise the cache by clicking ‘Synchronise’ on the ‘User Directories’ screen. If a synchronisation operation is already in progress, you cannot start another until the first has finished.

Screen snippet: User directories, showing information about synchronisation

Configuring the Synchronisation Interval

Note: The option to configure the synchronisation interval for Crowd and JIRA directories is available in Confluence 3.5.3 and later. Earlier versions of Confluence allow you to configure the interval for LDAP directories only.

You can set the ‘Synchronisation Interval’ on the directory configuration screen. The synchronisation interval is the period of time to wait between requests for updates from the directory server.

The length you choose for your synchronisation interval depends on:

• The length of time you can tolerate stale data.
• The amount of load you want to put on the application and the directory server.
• The size of your user base.

If you synchronise more frequently, then your data will be more up to date. The downside of synchronising more frequently is that you may overload your server with requests.

If you are not sure what to do, we recommend that you start with an interval of 60 minutes (this is the default setting) and reduce the value incrementally. You will need to experiment with your setup.

Diagrams of Possible Configurations for User Management

The aim of these diagrams is to help people understand each directory type at a glance. We have kept the diagrams simple and conceptual, with just enough information to be correct.

Some things that we do not attempt to show:

- In most cases, we do not attempt to show that you can have multiple directory types mapped to Confluence at the same time. We illustrate that fact in just the first two LDAP diagrams.
- We have not included a diagram for Confluence's legacy connection to JIRA database.
- We do not attempt to show all of the possible configurations and layered connections that are available now that you can use JIRA as a directory manager.

On this page:

- Confluence Internal Directory
- Confluence with Read/Write Connection to LDAP
- Confluence with Read-Only Connection to LDAP, with Local Groups
- Confluence Internal Directory with LDAP Authentication
- Confluence with LDAP Authentication, Copy Users on First Login
- Confluence Connecting to JIRA
- Confluence Connecting to JIRA and JIRA Connecting to LDAP
- Confluence and JIRA Connecting to Crowd

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Confluence Internal Directory

User Management Limitations and Recommendations
This page describes the optimal configurations and limitations that apply to user management in Confluence.
On this page:

- General Recommendations
- Recommendations for Connecting to LDAP
  - Optimal Number of Users and Groups in your LDAP Directory
  - Redundant LDAP is Not Supported
  - Specific Notes for Connecting to Active Directory
- Recommendations for Connecting to JIRA for User Management
  - Single Sign-On Across Multiple Applications is Not Supported
  - Custom Application Connectors are Not Supported
  - Custom Directories are Not Supported
  - Optimal Number of Users and Applications
  - Recommendations

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

General Recommendations

- **Duplicate usernames across directories are not supported**. If you are connecting to more than one user directory, please ensure that the usernames are unique to one directory. For example, if you have a user `jsmith` in both 'Directory1' and 'Directory2', that is an unsupported configuration.

- **Be careful when deleting users in remote directories**. If you are connecting to an LDAP directory, a Crowd directory or a JIRA directory, please take care when deleting users from the remote directory. If you delete a user that is associated with data in Confluence, this will cause problems in Confluence.

Recommendations for Connecting to LDAP

Please consider the following limitations and recommendations when connecting to an LDAP user directory.

Optimal Number of Users and Groups in your LDAP Directory

The connection to your LDAP directory provides powerful and flexible support for connecting to, configuring and managing LDAP directory servers. To achieve optimal performance, a background synchronisation task loads the required users and groups from the LDAP server into the application's database, and periodically fetches updates from the LDAP server to keep the data in step. The amount of time needed to copy the users and groups rises with the number of users, groups, and group memberships. For that reason, we recommended a maximum number of users and groups as described below.

This recommendation affects connections to LDAP directories:

- Microsoft Active Directory
- All other LDAP directory servers

The following LDAP configurations are not affected:

- Internal directories with LDAP authentication
- LDAP directories configured for ‘Authentication Only, Copy User On First Login’

Please choose one of the following solutions, depending on the number of users, groups and memberships in your LDAP directory.

<table>
<thead>
<tr>
<th>Your environment</th>
<th>Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Up to 10 000 (ten thousand) users, 1000 (one thousand) groups, and 20 (twenty) groups per user

Choose the 'LDAP' or 'Microsoft Active Directory' directory type. You can make use of the full synchronisation option. Your application's database will contain all the users and groups that are in your LDAP server.

More than the above

Use LDAP filters to reduce the number of users and groups visible to the synchronisation task.

Our Test Results

We performed internal testing of synchronisation with an AD server on our local network consisting of 10 000 users, 1000 groups and 200 000 memberships.

We found that the initial synchronisation took about 5 minutes. Subsequent synchronisations with 100 modifications on the AD server took a couple of seconds to complete.

Please keep in mind that a number of factors come into play when trying to tune the performance of the synchronisation process, including:

- **Size of userbase.** Use LDAP filters to keep this to the minimum that suits your requirements.
- **Type of LDAP server.** We currently support change detection in AD, so subsequent synchronisations are much faster for AD than for other LDAP servers.
- **Network topology.** The further away your LDAP server is from your application server, the more latent LDAP queries will be.
- **Database performance.** As the synchronisation process caches data in the database, the performance of your database will affect the performance of the synchronisation.
- **JVM heap size.** If your heap size is too small for your userbase, you may experience heavy garbage collection during the synchronisation process which could in turn slow down the synchronisation.

Redundant LDAP is Not Supported

The LDAP connections do not support the configuration of two or more LDAP servers for redundancy (automated failover if one of the servers goes down).

Specific Notes for Connecting to Active Directory

When the application synchronises with Active Directory (AD), the synchronisation task requests only the changes from the LDAP server rather than the entire user base. This optimises the synchronisation process and gives much faster performance on the second and subsequent requests.

On the other hand, this synchronisation method results in a few limitations:

1. **Externally moving objects out of scope or renaming objects causes problems in AD.** If you move objects out of scope in AD, this will result in an inconsistent cache. We recommend that you do not use the external LDAP directory interface to move objects out of the scope of the sub-tree, as defined on the application's directory configuration screen. If you do need to make structural changes to your LDAP directory, manually synchronise the directory cache after you have made the changes to ensure cache consistency.

2. **Synchronising between AD servers is not supported.** Microsoft Active Directory does not replicate the uSNChanged attribute across instances. For that reason, we do not support connecting to different AD servers for synchronisation. (You can of course define multiple different directories, each pointing to its own respective AD server.)

3. **Synchronising with AD servers behind a load balancer is not supported.** As with synchronising between two different AD servers, Microsoft Active Directory does not replicate the uSNChanged attribute...
across instances. For that reason, we do not support connecting to different AD servers even when they are load balanced. You will need to select one server (preferably one that is local) to synchronise with instead of using the load balancer.

4. **You must restart the application after restoring AD from backup.** On restoring from backup of an AD server, the uSNChanged timestamps are reverted to the backup time. To avoid the resulting confusion, you will need to flush the directory cache after a Active Directory restore operation.

5. **Obtaining AD object deletions requires administrator access.** Active Directory stores deleted objects in a special container called cn=Deleted Objects. By default, to access this container you need to connect as an administrator and so, for the synchronisation task to be aware of deletions, you must use administrator credentials. Alternatively, it is possible to change the permissions on the cn=Deleted Objects container. If you wish to do so, please see [this Microsoft KB Article](#).

6. **The User DN used to connect to AD must be able to see the uSNChanged attribute.** The synchronisation task relies on the uSNChanged attribute to detect changes, and so must be in the appropriate AD security groups to see this attribute for all LDAP objects in the subtree.

### Recommendations for Connecting to JIRA for User Management

Please consider the following limitations and recommendations when connecting to a JIRA server for user management.

**Single Sign-On Across Multiple Applications is Not Supported**

When you connect to JIRA for user management, you will not have single sign-on across the applications connected in this way. JIRA, when acting as a directory manager, does not support SSO.

**Custom Application Connectors are Not Supported**

JIRA, Confluence, FishEye, Crucible and Bamboo can connect to a JIRA server for user management. Custom application connectors will need to use the new REST API.

**Custom Directories are Not Supported**

Earlier versions of JIRA supported OSUser Providers. It was therefore possible write a special provider to obtain user information from any external user directory. This is no longer the case.

**Optimal Number of Users and Applications**

Please consider the following limitations when connecting to a JIRA server for user management:

- Maximum 500 users.
- Maximum 5 connected applications.

### Recommendations

**RELATED TOPICS**

- [Connecting to an LDAP Directory](https://confluence.atlassian.com/display/DOCS/Connecting+to+an+LDAP+Directory)
- [Connecting to Crowd or JIRA for User Management](https://confluence.atlassian.com/display/DOCS/Connecting+to+Crowd+or+JIRA+for+User+Management)
- [Configuring User Directories](https://confluence.atlassian.com/display/DOCS/Configuring+User+Directories)
- [Requesting Support for External User Management](https://confluence.atlassian.com/display/DOCS/Requesting+Support+for+External+User+Management)
This page gives guidelines on how to request help from the Atlassian support team if you are having problems with external user management. External user management includes connections to Active Directory, other LDAP servers, Atlassian Crowd or Atlassian JIRA for user management. The information on this page is provided in addition to the more general page on Troubleshooting Problems and Requesting Technical Support.

The cause of such problems may be:

- The LDAP server is not responding.
- The application password is incorrectly configured, causing the LDAP server or other directory to return an authentication error.
- Other LDAP settings are incorrectly configured.

On this page:

- Troubleshooting the Connection to your External User Directory
- Problems During Initial Setup
- Complex Authentication or Performance Problems

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Troubleshooting the Connection to your External User Directory

The configuration screen for external directories in Confluence has a 'Test Settings' button. This will help you to diagnose problems with user management in Active Directory and other LDAP servers.

To test your directory connection:

1. Choose **Browse > Confluence Admin**.
2. Click 'User Directories' in the left-hand panel.
3. **Edit** the relevant directory.
4. Click 'Test Settings'.
5. The results of the test will appear at the top of the screen.

Please refer to our knowledge base articles for troubleshooting user management and login issues.

If the above resources do not help, continue below.

Problems During Initial Setup

Raise a [support request](https://confluence.atlassian.com/doc/support-requests) and include the following information.

- Download an LDAP browser to make sure you have the right settings in your LDAP directory. Atlassian recommends [LDAP Studio](https://www.atlassian.com/software/lst). Include screenshots of your user and group DNs.
- If you can start up Confluence and access the Administration Console, review your directory settings. See [Connecting to an LDAP Directory](https://confluence.atlassian.com/doc/setting-up-connecting-to-an-ldap-directory). Attach screenshots of all your settings.

Complex Authentication or Performance Problems

Raise a [support request](https://confluence.atlassian.com/doc/support-requests) and include the following information.

Confluence Server

Log in to Confluence and access the Administration Console.

- Take a screenshot of the 'System Information' screen, or save the page as HTML.
- Take a screenshot of the 'Global Permissions' screen, if people are having problems with logging in.
- Go to 'Space Admin' for the relevant space and take a screenshot of the 'Permissions' page, if you are having problems with space or page permissions.
**Confluence Configuration Files**

- If you have implemented a custom authenticator or in any way modified `seraph-config.xml` or `seraph-paths.xml`, please provide the modified file.

**User Management System**

- Include the name and version of your LDAP server.
- Does your LDAP server use dynamic or static groups?
- Review your directory settings. See [Connecting to an LDAP Directory](#). Attach screenshots of all your settings.

**Diagnostics**

- Enable profiling. See [Performance Tuning](#).
- Enable detailed user management logging, by editing `confluence/WEB-INF/classes/log4j.properties`.

Change this section:

```properties
###
# Atlassian User
###
#log4j.logger.com.atlassian.user=DEBUG
#log4j.logger.com.atlassian.confluence.user=DEBUG
#log4j.logger.bucket.user=DEBUG
#log4j.logger.com.atlassian.seraph=DEBUG
#log4j.logger.com.opensymphony.user=DEBUG
```

Remove the `#` signs at the beginning of the lines, so that it looks like this:

```properties
###
# Atlassian User
###
log4j.logger.com.atlassian.user=DEBUG
log4j.logger.com.atlassian.confluence.user=DEBUG
log4j.logger.bucket.user=DEBUG
log4j.logger.com.atlassian.seraph=DEBUG
log4j.logger.com.opensymphony.user=DEBUG
```

- After enabling both the above, please attempt a Confluence LDAP account login and attach a copy of the log files that are produced when the problem occurs. To do this, locate your install directory or exploded WAR directory, then zip the full `/logs` subdirectory into a single file for us to examine. The logs subdirectory is located in your Confluence Home directory.

Confluence User Management
This section describes how to manage users and groups in Confluence. To learn how to configure external user management in Confluence, see Configuring User Directories.

⚠ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

- Searching For and Managing Users
- Adding Users
- Adding a Group
- Adding or Removing Users in Groups
- Changing Usernames
- Editing User Details
- Global Groups Overview
- Global Permissions Overview
- Removing a Group
- Removing or Deactivating a User
- Setting up Anonymous Access
- Viewing members of a group
- Restoring Passwords To Recover Admin User Rights
- Resetting the Login Count for a User

Searching For and Managing Users
If you are a Confluence Administrator, you can add users, assign them to groups and edit their user details.

On this page:
- Accessing the User Management Screen
- Listing All Users
- Using the Simple User Search
- Using the Advanced User Search
- Notes

⚠ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Accessing the User Management Screen
To search for and manage users:

1. Go to the user management screen for the user concerned. There are two ways to do this:
   - Either,
     - Go to the user's Profile and click the 'Administer User' link on the user's profile screen. (This link is available in Confluence 2.8.2 and later.)
   - Or, Choose Browse > Confluence Admin.
Select ‘Manage Users’ in the left-hand panel.
The ‘Manage Users’ screen appears, as shown below. You can now choose to list all users or you can search for a specific user.

1. Open the ‘Manage Users’ screen as described above.
2. Click the ‘Show all users’ link. All members of the confluence-users group are listed in alphabetical order, by username. If there are more users than can fit on one page, the results will be divided into multiple pages.
3. To move to another page of results, click the numbered links, ‘Next’ or ‘Previous’ near the top or bottom of the page.
4. To specify how many results should be shown per page, click a number ‘10’, ‘20’, ‘50’ or ‘100’ near the top of the page.

To search for a specific user via the simple user search:
1. Open the 'Manage Users' screen as described above.
2. If the 'Simple' link is showing, click it. (If you see the 'Advanced' link and no 'Simple' link, then you're fine. The simple search is already active.)
3. The simple user search screen will appear, as shown below.
4. Type some information about the user into the 'Search' textbox. You can type all or part of their username, full name or email address.
5. Click the 'Search' button.
6. Confluence will display a list of matching users. Click the link on a username to see and edit the details for that user.

![Screenshot above: Simple user search]

**Using the Advanced User Search**

The advanced user search allows you to specify the field in which your search term appears, i.e. username, full name or email address. You may find this useful if you need to limit the number of users appearing in the search results.

To search via the advanced user search:

1. Open the 'Manage Users' screen as described above.
2. If the 'Advanced' link is showing, click it. (If you see the 'Simple' link and no 'Advanced' link, then you're fine. The advanced search is already active.)
3. The advanced user search screen will appear, as shown below.
4. Complete one or more of the following fields:
   - **User Name** — Enter all or part of the person's username i.e. their login id, e.g. 'joe', or 'bloggs'.
   - **Full Name** — Enter all or part of the person's name, e.g. 'joe bloggs', or 'bloggs', or 'joe'.
   - **E-Mail** — Enter all or part of the person's email address, e.g. 'acme'
5. Click the 'Search' button.
6. Confluence will display a list of matching users. Click the link on a username to see and edit the details for that user.
Multiple user directories: You may define multiple user directories in Confluence, so that Confluence looks in more than one place for its users and groups. For example, you may use the default Confluence internal directory and also connect to an LDAP directory server. In such cases, you can define the directory order to determine where Confluence looks first when processing users and groups. Here is a summary of how the directory order affects the processing:

- The order of the directories is the order in which they will be searched for users and groups.
- Changes to users and groups will be made only in the first directory where the application has permission to make changes.

See Managing Multiple Directories.

Crowd and the user search: If you are using Atlassian’s Crowd for user management, you will need Crowd 1.5.1 or later to use the ‘Simple’ option in the user search. If your version of Crowd does not support the simple user search, you will see only the ‘Advanced’ search form.

Adding Users

There are a number of ways to add users to Confluence:

- **By public signup:** If public signup is enabled on your Confluence site, people can add themselves as users of the site. See below.
- **Via an invitation URL:** Administrators with Confluence Administrator or System Administrator permissions can send people an invitation URL. See below.
- **By adding users manually:** Administrators with Confluence Administrator or System Administrator permissions can add new users. See below.
- **Via an external user directory:** See Configuring User Directories.

Choosing public or private signup

You can set your signup mode to public or private at the same time as adding or inviting new users to the site.
You need Confluence Administrator or System Administrator permissions to change the signup mode.

To choose public or private signup:

1. Click Add Users on the dashboard.
   Or take the longer route: Choose Browse > Confluence Admin. Click Users > Add User.
2. Choose the signup mode:
   a. **Private**: There will not be a 'Sign Up' link on the Confluence screens. People can sign up if an administrator sends them the Invitation URL. Administrators can add users manually too.
   b. **Public**: A 'Sign Up' link will appear on the Confluence screens. People can click the link to add their own usernames. In addition, people can sign up if an administrator sends them the Invitation URL, and administrators can add users manually.

On this page:

- Choosing public or private signup
- Inviting people to sign up via a URL
- Resetting the signup URL
- Enabling and disabling notifications about user signup
- Adding users manually
- Notes

Related pages:

- User Management
- Confluence Administrator's Guide

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

**Inviting people to sign up via a URL**

You can invite new users to the site by sending them a signup URL. This option is available in both public and private signup modes. When someone visits the URL in a browser, a Confluence signup screen will appear.

To invite people to sign up:

1. Click Add Users on the dashboard.
   Or take the longer route: Choose Browse > Confluence Admin. Click Users > Add User.
2. Copy the **Invitation URL** and paste it into an email message, or onto a page on your extranet.

**Resetting the signup URL**

If your signup mode is private, the invitation URL will include a security token, like this:

```plaintext
http://confluence.example.com/signup.action?token=d513a04456312c47
```

You can change the URL at any time, by clicking Reset. The previous URL will become unusable. People will no longer be able to use the previous URL to sign up. Instead, they will see an error message that the signup token has expired.

The reset option is available only in **private** signup mode.
Enabling and disabling notifications about user signup

By default, Confluence will send an email notification to all Confluence administrators whenever someone signs up to the Confluence site, either by clicking the ‘Sign Up’ link or by clicking the invitation URL sent by an administrator. The notification is enabled by default.

To disable this notification:

1. Click Add Users on the dashboard.
   Or take the longer route: Choose Browse > Confluence Admin. Click Users > Add User.
2. Remove the tick from Notify administrators when users sign up.

Adding users manually

To add a new user:

1. Click Add Users on the dashboard.
   Or take the longer route: Choose Browse > Confluence Admin. Click Users > Add User.
2. Enter the user’s details: username, password, name and email address.
3. Click Create.

Screenshot: Adding and inviting users

Notes

You may define multiple user directories in Confluence, so that Confluence looks in more than one place for its users and groups. For example, you may use the default Confluence internal directory and also connect to an LDAP directory server. In such cases, you can define the directory order to determine where Confluence looks first when processing users and groups. Here is a summary of how the directory order affects the processing:

- The order of the directories is the order in which they will be searched for users and groups.
- Changes to users and groups will be made only in the first directory where the application has permission to make changes.

See Managing Multiple Directories.
### Adding a Group

A group is a collection of users. Administrators create groups so that the administrator can assign permissions to a number of people at once. For example, it is quicker to give group ‘X’ access to Confluence, rather than giving every team member access individually.

> The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

#### To add a new group:

1. Choose **Browse > Confluence Admin**.
2. Click **Manage Groups** in the left-hand panel.
3. Click **Add Group**.
4. Enter a name for your group and click **Save**.

You are now ready to start adding users to the group.

### Notes

- **Multiple user directories**: You may define multiple user directories in Confluence, so that Confluence looks in more than one place for its users and groups. For example, you may use the default Confluence *internal directory* and also connect to an *LDAP* directory server. In such cases, you can define the *directory order* to determine where Confluence looks first when processing users and groups. Here is a summary of how the directory order affects the processing:
  - The order of the directories is the order in which they will be searched for users and groups.
  - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

See [Managing Multiple Directories](#).

### Related Topics

No content found for label(s) managing-groups.

### Adding or Removing Users in Groups

If you are a **Confluence Administrator**, you can add users and groups, and assign users to groups in order to determine their permissions.

This page tells you how to add a user to a group or remove a user from a group. For an overview of users and groups, please refer to [Users and Groups](#) and [Confluence User Management](#).

You can edit group membership in two places:

- From the group management screen.
- From the user management screen for a particular user.

Both methods are described below.

#### On this page:

- Adding and Removing Members via the Group Management Screen
- Editing Group Membership from the User Management Screen
- Notes

> The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.
Adding and Removing Members via the Group Management Screen

This is the recommended method, available in Confluence 2.10 and later. It allows you to manage the group membership for a number of users at the same time.

To add members to a group:

1. Choose Browse > Confluence Admin.
2. Select ‘Manage Groups’ in the left-hand panel.
3. The ‘Manage Groups’ screen appears, showing a list of groups. Select the group to which you want to add users.
4. The ‘Group Members’ screen appears, showing the users who belong to the selected group. (See screenshot below.) Click the ‘Add Members’ link.
5. The ‘Add Members’ screen appears, as shown below. Type in the usernames of the people you want to add to the group. You can also search for and select users by clicking the icon, as described in Searching for Users.
6. When you have added the required username(s), click the ‘Add’ button to add the member(s) to the group.

To remove members from a group:

1. Choose Browse > Confluence Admin.
2. Select ‘Manage Groups’ in the left-hand panel.
3. The ‘Manage Groups’ screen appears, showing a list of groups. Select the group from which you want to remove the user.
4. The ‘Group Members’ screen appears, showing the users who belong to the selected group. (See screenshot below.) Click the ‘Remove user from group’ icon next to the user whose group membership you want to remove.

Editing Group Membership from the User Management Screen
You can update a user's group membership from the user management screen. This functionality allows you to update one user at a time.

**To add a user to a group or remove a user from a group:**

1. Go to the user management screen for the user concerned. There are two ways to do this:
   - Either,
     - Go to the user's Profile and click the 'Administer User' link on the user's profile screen. (This link is available in Confluence 2.8.2 and later.)
     - Or, Choose Browse > Confluence Admin.
   - Select 'Manage Users' in the left-hand panel.
   - The 'Manage Users' screen appears, as shown below. You can now choose to 'Show all users' or you can search for a specific user by entering all or part of the person's username, full name or email address. (For more details about the user search, see Searching For and Managing Users.)
   - Click the link on the username you want to edit.

2. Now you should be able to see the user's current details, with links allowing you to edit the user's details and groups. See the screenshot showing a user's details below.

3. Click 'Edit Groups'. This will display two lists of groups, as shown in the screenshot below. Update the user's group membership as follows:
   - 'Not a member of groups' — This box shows all groups to which the user does not belong. To add the user to a group, select a group and click 'Join'. Hold the Ctrl key down and click to select more than one group.
   - 'Member of groups' — This box shows all groups to which the user belongs. Select a group and click 'Leave' to remove the user from the group.
Multiple user directories: You may define multiple user directories in Confluence, so that Confluence looks in more than one place for its users and groups. For example, you may use the default Confluence internal directory and also connect to an LDAP directory server. In such cases, you can define the directory order to determine where Confluence looks first when processing users and groups. Here is a summary of how the directory order affects the processing:

- The order of the directories is the order in which they will be searched for users and groups.
- Changes to users and groups will be made only in the first directory where the application has permission to make changes.

See Managing Multiple Directories.

**Changing Usernames**

A username is the name used to log into Confluence, eg. jsmith.

Currently, there is no straightforward method for changing a username and its associated content, to that of another user. The only practicable method currently available is to execute direct SQL queries on your database. There is a feature request to facilitate this process via a web interface and you can vote for it to improve its chances of being implemented. Be aware, however, that no matter what method you use to change usernames in Confluence, there is no support provided for this process. The instructions below provide suggested guidelines on how to change a username via SQL queries, although this may vary depending on your database.

The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

**Instructions For Changing Usernames**
This document is for use with 3.5. If using an earlier version, please see the 3.4 version of the page.

The following SQL commands are only tested for MySQL and PostgreSQL Databases. If you have any other database please contact your DBA to determine the equivalent queries.

Usernames can only be changed through direct update to the Confluence database.

1. If you have a database administrator, request that they approve the database-related steps described below
2. If you are using JIRA user management, Revert from JIRA To Internal User Management
3. Backup Confluence
4. If you are using MySQL, make sure you are not running in safe updates mode:

   ```sql
   set sql_safe_updates=0;
   ```

5. Create a `usermigration` table:

   ```sql
   create table usermigration
   (oldusername varchar(255),
    newusername varchar(255))
   ```

6. Usernames that will be changed must be placed in the `usermigration` table with their current and planned usernames:

   ```sql
   insert into usermigration (oldusername, newusername)
   values ('oldusername', 'newusername');
   ```

7. Run the following SQL commands:
   a. If you have command line access to your database, download the scripts for PostgreSQL or MySQL then run them against your database:

      **PostgreSQL**

      ```bash
      $ psql -f PostgreSQLChangeUsernames.sql your_database_name
      ```

      **MySQL**

      ```bash
      $ mysql your_database_name < MySQLChangeUsernames.sql
      ```

   b. Otherwise, run the following:

      i. If your DB administration tool does not support multiple SQL queries, these must be entered individually:

      **PostgreSQL**

      ```bash
      ```

update SPACEGROUPS a, usermigration u
set a.creator = u.newusername
where a.creator = u.oldusername;

update SPACEGROUPS a, usermigration u
set a.lastmodifier = u.newusername
where a.lastmodifier = u.oldusername;
update SPACEPERMISSIONS a, usermigration u
set a.creator = u.newusername
where a.creator = u.oldusername;

update SPACEPERMISSIONS a, usermigration u
set a.lastmodifier = u.newusername
where a.lastmodifier = u.oldusername;

update SPACEPERMISSIONS a, usermigration u
set a.permusername = u.newusername
where a.permusername = u.oldusername;

update SPACES a, usermigration u
set a.creator = u.newusername
where a.creator = u.oldusername;

update SPACES a, usermigration u
set a.lastmodifier = u.newusername
where a.lastmodifier = u.oldusername;

update TRACKBACKLINKS a, usermigration u
set a.creator = u.newusername
where a.creator = u.oldusername;
ii. Reassign user preferences in the OS_PROPERTYENTRY table. Usernames in the OS_PROPERTYENTRY table need to be prefixed with 'CWD_'.

**PostgreSQL**

```sql
update os_propertyentry
set entity_name = 'CWD_' || newusername from usermigration u
where entity_name = 'CWD_' || u.oldusername;
```

**MySQL**

```sql
update OS_PROPERTYENTRY a, usermigration u
set a.entity_name = concat('CWD_', u.newusername)
where a.entity_name = concat('CWD_', u.oldusername);
```

iii. Reassign personal spaces and settings associated with the old username to the new username. The tilda (~) is required as it is prepended to the space key of all personal spaces:

**PostgreSQL**

```sql
update spaces
set spacekey = '~' || newusername from usermigration u
where spacekey = '~' || u.oldusername;

update bandana
set bandanacontext = '~' || newusername from usermigration u
where bandanacontext = '~' || u.oldusername;
```

**MySQL**

```sql
update SPACES a, usermigration u
set a.spacekey = concat('~', u.newusername)
where a.spacekey = concat('~', u.oldusername);

update BANDANA a, usermigration u
set a.bandanacontext = concat('~', u.newusername)
where a.bandanacontext = concat('~', u.oldusername);
```

8. Each username is associated with a full name. For example, username ‘jsmith’ may have a full name of ‘John M Smith’. If this fullname needs to be changed, modify the first_name, lower_first_name, last_name and lower_last_name in the cwd_user table. Ensure the lower_columns are merely copies of their normal counterparts but with all letters in lower case. Then modify the display_name and lower_display_name columns so that they are the first_name and last_name columns or the lower_first_name and lower_last_name columns put together but separated by a space.
Rebuild the Indexes

After all the updates, it's necessary to Rebuild the Indexes from Scratch

All old usernames in Confluence should now be replaced with the new usernames from the usermigration table.

**Editing User Details**

To update a user's details:

1. First, go to the user management screen for the user concerned. There are two ways to do this:
   - Either,
     - Go to the user's Profile and click the 'Administer User' link on the user's profile screen.
   - Or, Choose Browse > Confluence Admin.
     - Select the link 'Manage Users' in the left-hand panel.
     - Locate the user by doing a search on the username or the groups to which they belong.
     - Click the user link.

2. Now you should be able to see the user's current details and links allowing you to edit them.
   - **View Profile** — View the user's profile.
   - **Edit Groups** — Add or remove this user from a group.
   - **Edit Details** — Change details such as the user's name, email address, contact details and team or department information.
     - Changing a user's username is not supported. See Changing Usernames for information.
   - **Set Password** — Edit the user's password details.
   - **Remove** — You can remove a user permanently if the user has not added or edited any content on the site.
   - **Disable** — You can disable (i.e. deactivate) access for a user who has already added or edited any content on the site.

🏠 Administrators Guide Home  🏛️ Confluence Documentation Home

**Global Groups Overview**

There are two special default groups in Confluence:

1. **confluence-administrators**: This is a group of 'super-users' who can access the 'Administration Console' and perform site-wide administration. Members of this group can also see all spaces in the Confluence instance.
   - Any user who is a member of this group has site-wide administration powers, regardless of any other setting. The settings on the [Global Permissions screen](#) do not affect the powers allowed to members of this group.

2. **confluence-users**: This is the default group for all new users. Permissions you assign to this group will be assigned to all newly signed-up users of Confluence.

⚠️ **Confluence Administrator permission and confluence-administrators group are not related**

Going by the names, you would think the 'confluence-administrators' group and the 'Confluence Administrator' permission are related – but they are not. To resolve confusion, we want to make explicit that granting a user or group 'Confluence Administrator' permission is not the same as granting them membership to the 'confluence-administrators' group. Granting the 'Confluence Administrator' permission enables access to only a subset of the administrative functions. Granting membership to the 'confluence-administrators' group, on the other hand, gives complete access.

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.
Confluence Administrator permission and confluence-administrators group are not related

Going by the names, you would think the 'confluence-administrators' group and the 'Confluence Administrator' permission are related – but they are not. To resolve confusion, we want to make explicit that granting a user or group 'Confluence Administrator' permission is not the same as granting them membership to the 'confluence-administrators' group.

Granting the 'Confluence Administrator' permission enables access to only a subset of the administrative functions. Granting membership to the 'confluence-administrators' group, on the other hand, gives complete access.

Other user groups: A Confluence administrator can also group users together into user groups for more convenient administration. Once created, groups become available at the space and page levels to allow for flexible access control. A user in one of these groups will automatically be granted all permissions granted to the group.

Anonymous users: Confluence treats all users who do not log in when they access Confluence as being 'anonymous'. You can grant anonymous 'Use Confluence' permission via the Global Permissions screen. This will allow non-registered users to access pages and spaces in Confluence. A space administrator can then further control anonymous access per space via the space permissions.

Global Permissions Overview

Permissions determine the actions which a user is allowed to perform within Confluence. Global permissions are one of the levels of permission provided by Confluence.

In order to assign these permissions, you must already have the global 'Confluence Administrator' or 'System Administrator' permission (described below). You can then assign global permissions to groups, individual users and anonymous users. Further permissions are granted from the space administration screens.

On this page:

- Overview of the global permissions
- Comparing the System Administrator with the Confluence Administrator Permission
- Comparing the Administrator Permissions with the confluence-administrators Group
- Updating Global Permissions
- Error messages you may see

Related pages:

- Searching For and Managing Users
- Enabling or Disabling Public Signup
- Global Groups Overview
- Confluence Administrator's Guide

Some functionality described on this page is restricted in Confluence OnDemand.
Global permissions control access across the whole Confluence site. Here is a list:

<table>
<thead>
<tr>
<th>Global Permission</th>
<th>Description</th>
</tr>
</thead>
</table>
| Can Use                            | This is the most basic permission that allows users to access the site.  

1. Users with this permission count towards the number of users allowed by your license. See the information on [removing/deactivating users](https://confluence.atlassian.com/cache/help/removing-deactivating-users).  

| Attach Files to User Profile       | This allows the user to upload files to be stored in their user profile.  

2. This feature was made obsolete by the introduction of personal spaces in Confluence 2.2. Hence, this permission is no longer relevant. Attachments can be accessed from a user profile view (for example, an image within the 'About Me' field of a profile view) by attaching these files to a page within that user's personal space and referencing them using appropriate wiki markup code. |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>

Refer also to the note about the 'confluence-administrators' group <a href="https://confluence.atlassian.com/cache/help/confluence-administrators">below</a>.</td>
</tr>
</tbody>
</table>
The first system administrator is defined during installation

During the initial configuration of Confluence, the Setup Wizard asks for the username of the System Administrator. This user will have the 'System Administrator' permission and will be a member of the 'confluence-administrators' group.

Comparing the System Administrator with the Confluence Administrator Permission

Confluence recognises two levels of administrator:

- **System Administrator** – Users with this permission can perform all the Confluence administrative functions, including the ones which the 'Confluence Administrator' permission does not allow.
- **Confluence Administrator** – Users with this permission can perform most, but not all, of the Confluence administrative functions.

Tip: The two-tier administration is useful when you want to delegate some administrator privileges to project managers or team leaders. You can give 'Confluence Administrator' permission to users who should be able to perform most administrative functions, but should not be able to perform functions that can compromise the security of the Confluence system.

The following functions are excluded from the 'Confluence Administrator' permission:

<table>
<thead>

</tbody>
</table>
### Comparing the Administrator Permissions with the confluence-administrators Group

The 'confluence-administrators' group defines a set of ‘super-users’ who can access the Administration Console and perform site-wide administration. Members of this group can also see the content of all pages and spaces in the Confluence instance, regardless of space permissions. They cannot immediately see the pages for which they are excluded by page restrictions without knowing the direct URL to the page (restrictions can be removed by members of the confluence-administrators group in the Space Admin screen if need be). For example, they will not see restricted pages displayed by the children macro. But they are able to access restricted pages directly using the page URL. The settings on the ‘Global Permissions’ screen do not affect the powers allowed to members of this group.

Granting the ‘System Administrator’ or ‘Confluence Administrator’ permission to a user will not automatically grant the user access to all spaces in the site. These permissions will only give access to the Administration Console.

Be aware, however, that users with ‘System Administrator’ can add themselves to the ‘confluence-administrators’ group and become a super-user.

⚠️ **Confluence Administrator permission and confluence-administrators group are not related**

Going by the names, you would think the ‘confluence-administrators’ group and the ‘Confluence Administrator’ permission are related – but they are not. To resolve confusion, we want to make explicit that granting a user or group ‘Confluence Administrator’ permission is not the same as granting them membership to the ‘confluence-administrators’ group. Granting the ‘Confluence Administrator’ permission enables access to only a subset of the administrative functions. Granting membership to the ‘confluence-administrators’ group, on the other hand, gives complete access.

Read more about [global groups](#).

### Updating Global Permissions

**To view the global permissions for a group or user:**

1. Choose Browse > Confluence Admin.
2. Select Global Permissions in the Security section of the left-hand panel. The View Global Permissions screen appears.
Add or edit group and user permissions as follows:

**To add permissions for a group:**

1. First add the group to Confluence, if you have not already done so.
2. Click **Edit Permissions**. The ‘Edit Global Permissions’ screen appears, as shown below.
3. Enter the group name in the **Grant browse permission to** box in the ‘Groups’ section. You can search for the group name.
4. Click **Add**.
5. The group will appear in the list and you can now edit its permissions.

**To add permissions for a specific user:**
(Consider adding the user to a group and then assigning the permissions to the group, as described above, instead of assigning permissions to the specific user.)

1. First add the user to Confluence, if you have not already done so.
2. Click **Edit Permissions**. The ‘Edit Global Permissions’ screen appears, as shown below.
3. Enter the username in the **Grant browse permission to** box in the ‘Individual Users’ section. You can search for the username.
4. Click **Add**.
5. The username will appear in the list and you can now edit its permissions.

**To add or edit the permissions for a user or group:**

1. Select, or clear, the check box under the relevant permission in the row for the relevant user/group. A selected check box indicates that the permission is granted.
2. To allow anonymous access to your Confluence site, select the ‘Use Confluence’ and ‘View User Profile’ options in the ‘Anonymous Access’ section.
   - For more information about these permissions, refer to Setting up Anonymous Access.
3. Click **Save All** to save your changes.

*Screenshot: Editing global permissions*
Confluence will let you know if there is a problem with some permissions. In rare situations, you may see the following error messages below a permission:

- 'User/Group not found' — This message may appear if your LDAP repository is unavailable, or if the user/group has been deleted after the permission was created.
- 'Case incorrect. Correct case is: xxxxxx' — This message may appear if the upper/lower case in the permission does not match the case of the username or group name. If you see a number of occurrences of this message, you should consider running the routine supplied to fix the problem.

Removing a Group

To remove a group:

1. Choose Browse > Confluence Admin.
2. Select ‘Manage Groups’ in the left panel. A list of all existing groups is displayed along with links to remove them.
3. Click ‘Remove’ beside the group you want to remove. You will need to confirm your action before the group is deleted.
- **Multiple user directories**: You may define multiple user directories in Confluence, so that Confluence looks in more than one place for its users and groups. For example, you may use the default Confluence internal directory and also connect to an LDAP directory server. In such cases, you can define the directory order to determine where Confluence looks first when processing users and groups. Here is a summary of how the directory order affects the processing:
  - The order of the directories is the order in which they will be searched for users and groups.
  - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

See [Managing Multiple Directories](#).

### Removing or Deactivating a User

If you are a [Confluence Administrator](#), you can remove and deactivate users.

You can **remove** a user from Confluence if they have not yet added or edited any content on the site. Such content includes pages and blog posts, and edits and comments on existing pages.

You can **deactivate**, or disable, a user, including one who has contributed content.

- Deactivated users can no longer log in to Confluence.
- Deactivating a user will not remove the content created by them from the site.
- Deactivated users do not count towards your license count. (See the notes below.)

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

#### To remove a user:

1. Go to the user's [Profile](#) and click the 'Administer User' link.
2. Click 'Remove'.

#### To deactivate a user:

1. Go to the user's [Profile](#) and click the 'Administer User' link.
2. Click 'Disable'.

**Groups:**
- atlassian-developers
- atlassian-staff
- confluence-administrators
- confluence-managers
- confluence-users
- documentation
- licensed-contributors

**View Profile | Edit Groups | Edit Details | Set Password | Remove | Disable**

*Screenshot above: Viewing user details*

**Notes**
- The 'Administer User' link is only visible if you are logged in as an administrator.
- You can also remove or disable users using the Administration Console.
- You can edit the groups that a user belongs to if you don't wish to prevent their access to Confluence completely.
- **Multiple user directories:** You may define multiple user directories in Confluence, so that Confluence looks in more than one place for its users and groups. For example, you may use the default Confluence internal directory and also connect to an LDAP directory server. In such cases, you can define the directory order to determine where Confluence looks first when processing users and groups. Here is a summary of how the directory order affects the processing:
  - The order of the directories is the order in which they will be searched for users and groups.
  - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

See Managing Multiple Directories.

- **Number of users and your license.** The Confluence 'License Details' screen tells you how many users your Confluence instance is licensed to support, and how many are currently registered. See Viewing and Editing License Details. The number of registered users includes only users who have the 'Can Use' global permission. Deactivated users, as described above, are not included.

**Setting up Anonymous Access**

You can enable anonymous access (also known as public access) to your site by granting the 'Use Confluence' permission to 'Anonymous' users.

This user category has been created for convenient administration of users who have not logged into the site.
Permissions assigned to this group apply to all anonymous users of the site.

The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

### Enabling Anonymous Access

To enable anonymous access to your site,

1. Choose Browse > Confluence Admin.
2. Click 'Global Permissions' in the left-hand panel.
3. Click 'Edit Permissions'.
4. In the 'Anonymous Access' section, select the 'can use' check box to enable anonymous access to the content on your site.
5. If you selected the 'can use' check box in the previous step and want to allow anonymous access to user profile views, select the check box in the 'View User Profiles' section.
   Note: You cannot grant the 'View User Profiles' permission independently of the 'Use Confluence' permission.
6. Click 'Save All'.
7. You can now grant further permissions from the space administration screens to control the viewing and editing privileges of anonymous users. See Space Permissions Overview

### Disabling Anonymous Access

To disable anonymous access to your site, clear the 'can use' check box and the 'View User Profiles' check box, then click 'Save All'.

Restoring Passwords To Recover Admin User Rights

Use this document if you are unable to log in to Confluence as administrator. The most common reason for using these instructions is if you have lost the administration password for your Confluence site.

Before you Start

Please note the following before you start:

- The following instructions include example SQL that should work on MySQL and PostgreSQL. You may need to customise the queries for other databases or for your installation.
- We strongly recommend testing the queries on a test database before modifying your production database.

New user management in Confluence 3.5 and later

- Confluence now uses the CWD_USER table in the database to store and refer to its users.
- When you imported your backup on upgrade from Confluence 3.4.9 or earlier, the upgrade process copied the users from the OS_USER table (for upgrades from versions older than 2.7) or the USERS table (for versions 2.7 to 3.4) into the CWD_USER table.
- The new user management framework also introduced user directories. Making modifications to users in the database will only fully work for users in Confluence's Internal Directory. The instructions below include extra steps for instances in which the user management has been delegated to external sources (via LDAP, Crowd or JIRA).

Please refer to the older documentation if you are still using OSUser or AtlassianUser.

Using Crowd for SSO

- If Confluence is configured for SSO through Crowd, you will only be able to authenticate as users from the Crowd server.
- This document covers how to recover administration rights from the local 'Confluence Internal Directory' only. However, you will not be able to authenticate as a local Confluence administrator while Crowd SSO is enabled. Please refer to Integrating Crowd with Atlassian Confluence for details on how to configure or disable Crowd SSO.

On this page:

- Before you Start
- Step 0. Get access to the database
- Step 1. Identify Administrator
- Step 2. Replace Administrator Password
- Step 3. Put the Internal Directory in First Position
- Step 4. Clean Up
- Notes

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Step 0. Get access to the database
If you are using the embedded HSQL database, you can find the files containing your database in `<confluence-home-directory>/database`. When you shut down Confluence, the SQL will be written to a '.script' or '.log' file in that directory to which you can append the SQL described below.

If you are using a proper production database, connect to the database with your normal tools. You will need to have permission to run queries and update data in the database.

**Step 1. Identify Administrator**

To find out which usernames have admin privileges, connect to your database using a database admin tool such as [DBVisualiser](#). Please download a database admin tool now if you do not have one installed already. Then connect to your database and retrieve the list of administrator usernames and IDs with:

```sql
SELECT u.id, u.user_name FROM cwd_user u 
JOIN cwd_membership m ON 
  u.id = m.child_user_id 
JOIN cwd_group g ON 
  m.parent_id = g.id 
JOINcwd_directory d ON 
  d.id = g.directory_id 
WHERE g.group_name = 'confluence-administrators' AND 
d.directory_name = 'Confluence Internal Directory';
```

If there are multiple results, choose one ID/username combination to use for the following steps. If there are no results, skip down to 'If No Local Users Exist' in Step 2.

**Step 2. Replace Administrator Password**

Confluence does not store passwords in plain text in the database, but uses hashes computed from the original password. You will need to insert a hash, rather than the plain password, over the existing password in the database. Below is the hash for the password `admin`

```
X61Ey612Kl2gpFL56FT9weDnpSo4AV8j8+qx2AuTHdRyY036xxzTTrw10Wq3+4qQyB+XURPWx1ONxp3Y3pB37A==
```

For an External Database

To change the password to `admin` for a given username:

1. Shut down Confluence.
2. Connect to your database.
3. Run the following SQL:
For the Evaluation Embedded HSQL Database

To change the password to admin for a given username:

1. Shut down Confluence.
2. Open `<confluence-home>/database/confluencedb.script`, or `confluencedb.log` if the .script file looks empty.
3. Search for:

   INSERT INTO CWD_USER VALUES(

4. Keep searching until you find the appropriate user, then replace their password with the hash value above.
5. Save the file.

If No Local Users Exist

There may be no administrators in your Internal Directory. If this is the case, you need to add one:

1. Add a new admin user by running:

   ```sql
   insert into cwd_user(id, user_name, lower_user_name, active, created_date, updated_date, first_name, lower_first_name, last_name, lower_last_name, display_name, lower_display_name, email_address, lower_email_address, directory_id, credential) values (1212121, 'admin', 'admin', 'T', '2009-11-26 17:42:08', '2009-11-26 17:42:08', 'A. D.', 'a. d.', 'Ministrator', 'ministrator', 'A. D. Ministrator', 'a. d. ministrator', 'admin@example.com', 'admin@example.com', (select id from cwd_directory where directory_name='Confluence Internal Directory'), 'x61Ey612K12gpFL56FT9weDnpSo4AV8j8+qx2AuTHdRyY036xxzTTrw10Wq3+4qQyB+XURPWx1ONxp3Y3pB37A==');
   ```

2. Add new groups by running:
Confluence 4.2 Documentation

insert into cwd_group(id, group_name, lower_group_name, active, local, created_date, updated_date, description, group_type, directory_id) values ('888888','confluence-administrators','confluence-administrators','T','F','2011-03-21 12:20:29','2011-03-21 12:20:29',NULL,'GROUP',(select id from cwd_directory where directory_name='Confluence Internal Directory'));
insert into cwd_group(id, group_name, lower_group_name, active, local, created_date, updated_date, description, group_type, directory_id) values ('999999','confluence-users','confluence-users','T','F','2011-03-21 12:20:29','2011-03-21 12:20:29',NULL,'GROUP',(select id from cwd_directory where directory_name='Confluence Internal Directory'));

3. Add group memberships into cwd_membership:

insert into cwd_membership (id, parent_id, child_user_id) values (888888, (select id from cwd_group where group_name='confluence-users' and directory_id=(select id from cwd_directory where directory_name='Confluence Internal Directory')), 1212121);
insert into cwd_membership (id, parent_id, child_user_id) values (999999, (select id from cwd_group where group_name='confluence-administrators' and directory_id=(select id from cwd_directory where directory_name='Confluence Internal Directory')), 1212121);

If using an Oracle database, use `sysdate` instead of a string for the `created_date` column.

Step 3. Put the Internal Directory in First Position

Start Confluence, and try logging in with the username of the user you updated/created and the password `admin`. If this works, skip to Step 4. Otherwise, your Internal Directory does not have high enough priority.

To put your Internal Directory in first position:

1. Find the directory names and their order:

   ```sql
   select d.id, d.directory_name, m.list_index from cwd_directory d join cwd_app_dir_mapping m on d.id=m.directory_id;
   ```

2. Take note of the ID with list_index 0, and the list_index and ID of the Confluence Internal Directory.

3. Switch the order of the directories:

   ```sql
   update cwd_app_dir_mapping set list_index = 0 where directory_id = <Internal Directory id>;
   update cwd_app_dir_mapping set list_index = <Noted Internal Directory list_index> where directory_id = <Directory id that had list_index 0>;
   ```

4. Check to see if the directory is active (the ‘active’ column should be set to ‘T’):
select id, directory_name, active from cwd_directory where id = <Internal Directory id>;

5. If necessary, activate the directory:

update cwd_directory set active = 'T' where id = <Internal Directory id>;

Step 4. Clean Up

To tidy up:

1. Start Confluence.
2. Log in with your modified/created username and use password admin.
3. Change your password. **Do not leave your password as admin, or your instance will not be secure.**
4. If you created a new user in Stage 2, create a new admin via the UI and delete the admin you created in Stage 2.
5. If you followed Stage Three, go to Confluence Administration > User Directories and rearrange your directories so they are correctly configured again.

Notes

- Learn more about the password hash algorithm Confluence is using.

Resetting the Login Count for a User

Confluence records the number of failed logins attempts made against each user account. When the login attempts exceed a preset number (see Configuring Captcha for Failed Logins), the user will be prompted to authenticate using CAPTCHA until they successfully log in.

If you are a Confluence Administrator, you can manually reset the failed login count for a user.

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

To reset the failed login count for a user,

1. Choose Browse > Confluence Admin.
2. Select 'Manage Users' in the left-hand panel. The 'Manage Users' screen appears, as shown below.
3. Search for the desired user and click the user in the search results. The 'View User' screen will be displayed.
4. Click the 'Reset Failed Login Count' for the user. The 'Current Failed Login Count' will be reset to 0.

Screenshot: Resetting failed login count for a user
Disabling the Built-In User Management

By selecting the 'External user management' option in Confluence, you can disable the group and user management screens in Confluence. You need system administrator permissions to set this option.

⚠ Setting this option currently has no effect. Please see the notes below.

You will find it useful to select external user management under the following circumstances:

- When Crowd's directory permissions are configured so that Confluence cannot update the Crowd directories, then Confluence's external user management setting must be turned on. Otherwise, a 'System Error' will occur when Confluence attempts to write data into Crowd. For more information about integrating Crowd with Confluence, see Connecting to Crowd or JIRA for User Management.
- If you are using JIRA for user management, we recommend that you turn on Confluence's external user management setting. This centralises user management in JIRA. See Connecting to Crowd or JIRA for User Management and Connecting to JIRA 4.2 or Earlier for User Management.

⚠ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

To disable management of users and groups within Confluence:

1. Choose Browse > Confluence Admin.
2. Click 'Security Configuration' in the left-hand panel.
3. The 'Edit Security Configuration' screen will appear. Click 'Edit'.
4. Tick the 'External user management' check box.
5. Click 'Save'.

Notes

- Please refer to the following bugs and improvement requests:
  - CONF-16709 – When the External User Management check box is ticked, the group and user management screens are still functional.
  - CONF-21158 – Enabling both public signup and external user management renders a blank screen during signup.
  - CONF-9830 – This is a request to rename this feature to better reflect its functionality.

Integrating Confluence with Other Applications

You can integrate Confluence with other applications using Application Links. The Application Links feature allows you to link Confluence to applications like Atlassian's JIRA. Linking two applications allows you to share
information and access one application's functions from within the other. For example, if you linked your Confluence server with a JIRA server, you could view JIRA issues in a Confluence page via the JIRA Issues Macro.

⚠️ The information on this page does not apply to Confluence OnDemand.

Getting Started

The Application Links quick start guide provides instructions on how to set up the most common application link configuration.

Administrator's Guide

The administrator's guide is for administrators who want to configure application links for their applications. The guide contains information on adding a new application link, configuring the authentication for an application link, setting up project links and more.

Developer Resources

These resources are for developers who want to develop with the Application Links plugin. Take a look at the Development Hub.

Related Topics

- Configuring Application Links
- Confluence and JIRA

Configuring Application Links

An application link is a trust relationship between two applications. Linking two applications allows you to share information and to access one application's functions from within the other.

⚠️ The information on this page does not apply to Confluence OnDemand.

![Screenshot above: Application links for a Confluence server](image)

Notes

- In the above screenshot, the column titled 'Incoming Authentication' is visible in Confluence 3.5.1 and later. The column does not appear in Confluence 3.5.

Adding an Application Link

This page describes how to add a new application link in Confluence. The process for adding an application link is different depending on whether the application that you are linking Confluence to, supports Application Links (i.e. has Application Links installed) or not.

If you are linking Confluence to an application that does not have Application Links, you will need to do additional configuration in that application. This is because Application Links in Confluence will not be able to automatically configure authentication in your remote application.

Please read the appropriate set of instructions below:

- Linking to an application that supports Application Links.
- Linking to an application that does not support Application Links.

On this page:

- Adding an Application Link to an Application That Supports Application Links
- Adding an Application Link to an Application That Does Not Support Application Links
- Notes

⚠️ The information on this page does not apply to Confluence OnDemand.

Adding an Application Link to an Application That Supports Application Links

Before you begin:

- Make sure that the base URL is set correctly in Confluence. See Configuring the Server Base URL for instructions.
- Make sure that the base URL is set correctly in the application which you intend to link to. See the appropriate instructions: JIRA instructions | FishEye/Crucible instructions | Bamboo instructions. This is required for synchronisation to work correctly.

To link to an application that supports Application Links:

1. Log in as a system administrator and go to the administration page. Click ‘Application Links’ in the administration menu. The ‘Configure Application Links’ page will appear, showing the application links that have been set up.
2. Click ‘Add Application Link’. Step 1 of the link wizard will appear.
3. Enter the server URL of the application that you want to link to (the 'remote application').
4. Click the 'Next' button. Step 2 of the link wizard will appear.
5. Enter the information required to configure authentication for your application link:
   - 'Create a link back to this server' – Tick this check box if you want to create a two-way link between the remote application and your application. If you want to do this, you will need to enter the username and password of an administrator for the remote application.
     Note: These credentials are only used to authenticate you to the remote application, so that Application Links can make the changes required for the new link. The credentials are not saved.
   - 'Reciprocal Link URL' – The URL you give here will override the base URL specified in your remote application's administration console, for the purposes of the application links connection. Application Links will use this URL to access the remote application.
6. Click the 'Next' button. Step 3 of the link wizard will appear.
7. Enter the information required to configure authentication for your application link:
   - 'The servers have the same set of users' or 'The servers have different sets of users' – Select
one of these options depending on how you manage users between the two applications.

- **These servers fully trust each other** – Tick this check box if you know that the code in both applications will behave itself at all times and are sure each application will maintain the security of its private key.

  For more information about configuring authentication, see Configuring Authentication for an Application Link.

8. Click the 'Create' button to create the application link.

Screenshots above: Adding an application link to an application that supports Application Links (click to view full-sized images)

**Adding an Application Link to an Application That Does Not Support Application Links**

Before you begin:

- Make sure that the base URL is set correctly in Confluence. See Configuring the Server Base URL for instructions.
- Make sure that the base URL is set correctly in the application which you intend to link to. See the appropriate instructions: JIRA instructions | FishEye/Crucible instructions | Bamboo instructions. This is required for synchronisation to work correctly.

**To link to an application that does not support Application Links:**

1. Log in as a system administrator and go to the administration page. Click ‘Application Links’ in the administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
2. Click ‘Add Application Link’. Step 1 of the ‘Link to another server’ dialogue will be displayed.
3. Enter the server URL of the application that you want to link to, in the ‘Server URL’ field. Click the ‘Next’ button. Step 2 of the ‘Link to another server’ dialogue will be displayed.
4. Fill out the fields, as follows:
   - ‘Application Name’ — Enter the name by which this remote application will be referred to, in your application.
   - ‘Application Type’ — Select the type of application that you are linking to: Bamboo, FishEye/Crucible, JIRA, Confluence, Subversion.
   - ‘Application URL’ — This will be set to the server URL you entered in the previous step and will not be editable.
5. Click the ‘Create’ button to create the application link. The 'Configure Application Links' page will be displayed, listing all of the application links that have currently been set up for your application including
6. Configure the desired authentication type (Trusted Applications, OAuth, basic HTTP, none) for your new application link. See Configuring Authentication for an Application Link.

7. In your application that does not support Application Links, configure the same type of authentication that you configured for your application link's outgoing authentication (in the previous step). For example, if you configured outgoing Trusted Applications authentication in your Application-Links-enabled application, you also need to log into your non-Application-Links application and manually configure Trusted Applications (see the relevant administrator's documentation for the application).

> Screenshots above: Adding an application link to an application that supports Application Links (click to view full-sized images)

### Notes

#### Related Topics
- Making an Application Link the Primary Link
- Configuring Authentication for an Application Link
- Configuring Project Links across Applications

#### Configuring Authentication for an Application Link

Configuring authentication for an application link is essentially defining the level of trust between Confluence and the application that it is linked to.

#### On this page:
- Choosing Authentication for an Application Link
- Security Implications for each Authentication Type
- About Primary Authentication Types
- About Impersonating and Non-Impersonating Authentication Types

⚠️ The information on this page does not apply to Confluence OnDemand.

### Choosing Authentication for an Application Link

The level of authentication that you should configure for your application link depends on a number of factors.
- Do the two applications you are linking trust each other? i.e. are you sure that the code in the application will behave itself at all times and that the application will maintain the security of its private key?
- Do the two applications you are linking share the same user base or not?
- Do you have administrative access to the application you are linking to?

Common scenarios include:

- If the two applications you are linking trust each other and share the same user base, configure two-way authentication using Trusted Applications for both incoming and outgoing authentication. For example, you may link your internal Confluence server to an internal JIRA server.
- If the two applications you are linking trust each other but do not share the same user base, configure two-way authentication using OAuth for both incoming and outgoing authentication. For example, you may link your internal Confluence server to an external (customer-facing) JIRA server.
- If you do not have administrative rights to the application that you are linking to (e.g. linking to a public FishEye server), configure a one-way outgoing link authenticated using basic HTTP authentication or do not configure any authentication for the link. For example, you may link your external Confluence server to a partner organisation’s Confluence server. An unauthenticated link will still allow the local application to render hyperlinks to the remote application or query anonymously-accessible APIs.

The flowchart below provides a guide to what authentication you should configure for your application link.

Read the following topics for information on how to configure authentication for an application link:

- Configuring Basic HTTP Authentication for an Application Link
- Configuring OAuth Authentication for an Application Link
- Configuring Trusted Applications Authentication for an Application Link
- Incoming and Outgoing Authentication

Flowchart above: Determining what authentication to configure for an Application Link
Security Implications for each Authentication Type

If you configure **Trusted Applications authentication** for your application (i.e. your servers have the same set of users and they fully trust each other), please be aware of the following security implications:

- **Trusted applications are a potential security risk.** When you configure Trusted Applications authentication, you are allowing one application to access another as any user. This allows all of the built-in security measures to be bypassed. Do not configure a trusted application unless you know that all code in the application you are trusting will behave itself at all times, and you are sure that the application will maintain the security of its private key.

If you configure **OAuth authentication** for your application (i.e. your servers have different sets of users and they fully trust each other), please be aware of the following security implications:

- **Adding an OAuth consumer requires the transmission of sensitive data.** To prevent *man-in-the-middle* attacks, it is recommended that you use **SSL** for your applications while configuring OAuth authentication.
- **Do not link to an application using OAuth authentication, unless you trust all code in the application to behave itself at all times.** OAuth consumers are a potential security risk to the applications that they are linked to.

Screenshot above: Configuring authentication during application link setup
About Primary Authentication Types

You can configure multiple authentication types for each application link. When a feature makes a request using an Application Link, it will use one of the configured authentication types. If more than one authentication type is configured, it will by default use the authentication type that is marked as the primary authentication type. The default authentication type is indicated by the green tick next to the authentication type on the list application link screen.

You cannot configure which authentication type is the primary authentication type. The primary authentication type is determined automatically by Application Links and depends on a weight defined by each authentication type method. However, every feature that uses Application Links can also choose to use a specific authentication type and might not use the default primary authentication type.

About Impersonating and Non-Impersonating Authentication Types

Applications Links allows you to configure 'impersonating' and 'non-impersonating' authentication types:

- Impersonating authentication types make requests on behalf of the user who is currently logged in. People will see only the information that they have permission to see. This includes OAuth and Trusted Applications authentication.
- Non-impersonating authentication types always use a pre-configured user when making a request. Everyone logged into the system will see the same information. This includes basic HTTP authentication.

Configuring Basic HTTP Authentication for an Application Link

The instructions on this page describe how to configure Basic HTTP authentication for outgoing authentication and/or incoming authentication for an application link.

Basic HTTP authentication allows Confluence to provide user credentials to a remote application and vice versa. Once authenticated, one application can access specified functions on the other application on behalf of that user. For example, if you supply the credentials of a Confluence administrator on your Confluence server to a remote application, the remote application will be able to access all functions on your Confluence server that the Confluence administrator can access.

This method of authentication relies on the connection between Confluence and the remote application being secure. We recommend that you use Trusted Applications authentication or OAuth authentication for your application link instead, if possible.

On this page:

- Before You Begin
- Configuring Basic HTTP Authentication for Outgoing Authentication
- Configuring Basic HTTP Authentication for Incoming Authentication
- Notes

⚠️ The information on this page does not apply to Confluence OnDemand.

Before You Begin

- The instructions assume that both of the applications that you are linking have the Application Links plugin installed. If the remote application that you are linking to supports Basic HTTP authentication, but does not have the Application Links plugin installed, you will need to configure Basic HTTP authentication from within the remote application (see the relevant administrator’s documentation for the application). This is in addition to configuring the outgoing/incoming authentication for the application link (as described below).
- You must be a Confluence administrator to configure Basic HTTP authentication for an application link.

Configuring Basic HTTP Authentication for Outgoing Authentication
Configuring **outgoing basic http authentication** will allow Confluence to trust a remote application (i.e. allow the remote application to access specified functions in Confluence).

**To configure basic http authentication for an outgoing application link:**

1. Log in as a system administrator and go to the administration page. Click ‘Application Links’ in the administration menu. The ‘Configure Application Links’ page will appear, showing the application links that have been set up.
2. Click the ‘Configure’ link next to the application link that you want to configure authentication for.
3. Click the ‘Outgoing Authentication’ tab. The outgoing authentication page will be displayed.
4. Click the ‘Basic Access’ tab.
5. Click the ‘Configure’ button and enter the credentials (username and password) that the remote application will use to log into your application.
6. Click the ‘Apply’ button to save your changes.

---

**Configuring Basic HTTP Authentication for Incoming Authentication**

Configuring **incoming basic http authentication** will allow the remote application that you are linking to, to trust Confluence (i.e. allow Confluence to access specified functions on the remote application it is linked to).

**To configure basic http authentication for an incoming application link:**

1. Log in as a system administrator and go to the administration page. Click ‘Application Links’ in the administration menu. The ‘Configure Application Links’ page will appear, showing the application links that have been set up.
2. Click the ‘Configure’ link next to the application link that you want to configure authentication for.
3. Click the ‘Incoming Authentication’ tab. The incoming authentication page will be displayed.
4. Click the ‘Basic Access’ tab.
5. Click the ‘Configure’ button and enter the credentials (username and password) that the your application will use to log in to the remote application.
6. Click the ‘Apply’ button to save your changes.

**Notes**

**Related Topics**

- Configuring OAuth Authentication for an Application Link
- Configuring Trusted Applications Authentication for an Application Link

**Configuring OAuth Authentication for an Application Link**

The instructions on this page describe how to configure OAuth for outgoing authentication and/or incoming authentication for an application link.

**OAuth** is a protocol that allows a web application to share data/resources with any other OAuth-compliant external application. These external applications could be another web application (such as a JIRA installation or an iGoogle home page), a desktop application or a mobile device application, provided that they are accessible from within your network or available on the Internet.

For example, you could set up an application link between Confluence and an iGoogle page using OAuth authentication. This would allow you to view data from your Confluence server in a Confluence gadget on the iGoogle page (see Configuring Confluence Gadgets for Use in Other Applications).

A typical scenario is setting up an application link between two applications which trust each other, do not share the same set of users but both applications have the Application Links plugin installed. In this case, you would configure OAuth for both outgoing authentication and incoming authentication. See Configuring Authentication for an Application Link for other configurations.
Key OAuth Terminology
- **Service provider** — An application that shares ('provides') its resources.
- **Consumer** — An application that accesses ('consumes') a service provider's resources.
- **User** — An individual who has an account with the Service Provider.

For more information about OAuth, see Configuring OAuth as well as the OAuth specification.

On this page:
- **Before You Begin**
- **Configuring OAuth for Outgoing Authentication**
- **Configuring OAuth for Incoming Authentication**

The information on this page does not apply to Confluence OnDemand.

Before You Begin

- Adding an OAuth consumer requires the transmission of sensitive data. To prevent 'man-in-the-middle' attacks, it is recommended that you use SSL for your applications while configuring OAuth authentication.
- Do not link to an application using OAuth authentication, unless you trust all code in the application to behave itself at all times. OAuth consumers are a potential security risk to the applications that they are linked to.
- The instructions assume that both of the applications that you are linking have the Application Links plugin installed. If the remote application that you are linking to supports OAuth, but does not have the Application Links plugin installed, you will need to configure OAuth from within the remote application (see the relevant administrator's documentation for the application) in addition to configuring the outgoing/incoming authentication for the application link (as described below).
- You must be a Confluence administrator to configure OAuth authentication for an application link.

Configuring OAuth for Outgoing Authentication

Configuring **outgoing OAuth authentication** will allow Confluence to access data in a remote application on behalf of a user (i.e. allow Confluence to access specified functions in the remote application).

To configure OAuth authentication for an outgoing application link:

1. Log in as a system administrator and go to the administration page. Click 'Application Links' in the administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
2. Click the 'Configure' link next to the application link that you want to configure OAuth for.
3. Click the 'Outgoing Authentication' tab. The outgoing authentication page will be displayed.
4. Click the 'OAuth' tab.
5. If you are not currently logged in to the remote application (or you logged in to the remote application under a variant of the application's hostname, such as the IP address), a login dialogue will display.
   - Enter the 'Username' and 'Password' for the remote server, not your local server, and click the 'Login' button. The remote server needs to learn the identity of your local server for the OAuth protocol to work and your admin credentials are used to store your local server's public key on the remote server. If you are already logged into your remote server, then the appropriate changes can be made without having to log in again.
6. Click the 'Enable' button to enable OAuth authentication for the outgoing link. Your application will be
automatically set up to be the 'consumer' and the remote application as a 'service provider'.

Configuring OAuth for Incoming Authentication

Configuring incoming OAuth authentication will allow the remote application that you are linking to, to access data in Confluence.

To configure OAuth authentication for an incoming application link:

1. Log in as a system administrator and go to the administration page. Click 'Application Links' in the administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
2. Click the 'Configure' link next to the application link that you want to configure OAuth for.
3. Click the 'Incoming Authentication' tab. The incoming authentication page will be displayed.
4. Click the 'OAuth' tab.
5. Click the 'Enable' button to enable OAuth authentication for the incoming link. The remote application will be automatically set up to be the 'consumer' and your local application as a 'service provider'.

Configuring Confluence Gadgets for Use in Other Applications

Configuring Trusted Applications Authentication for an Application Link
The instructions on this page describe how to configure Trusted Applications for outgoing authentication and/or incoming authentication for an application link.

Trusted Applications authentication allows one application to allow access to specified functions on another application on behalf of any user, without the user having to log into the second application. For example, if you configure a JIRA server to trust a Confluence server, every Confluence user will see exactly the same list of issues when they view the Confluence JIRA Issues’ macro as they see when they use the JIRA Issue Navigator as a logged-in JIRA user.

A typical scenario is setting up an application link between two applications which trust each other, have the same set of users and both have the application links plugin installed. In this case, you would configure Trusted Applications for both outgoing authentication and incoming authentication. See Configuring Authentication for an Application Link for other configurations.

On this page:
- Before You Begin
- Configuring Trusted Applications for Outgoing Authentication
- Configuring Trusted Applications for Incoming Authentication
- Notes

⚠️ The information on this page does not apply to Confluence OnDemand.

Before You Begin

- Trusted applications are a potential security risk. When you configure Trusted Applications authentication, you are allowing one application to access another as any user. This allows all of the built-in security measures to be bypassed. Do not configure a trusted application unless you know that all code in the application you are trusting will behave itself at all times, and you are sure that the application will maintain the security of its private key.
• The instructions below assume that both of the applications that you are linking have the Application Links plugin installed. If the remote application that you are linking to supports Trusted Applications, but does not have the Application Links plugin installed, you will need to configure Trusted Applications from within the remote application (see the relevant administrator's documentation for the application) in addition to configuring the outgoing/incoming authentication for the application link (as described below).

• You must be a Confluence administrator to configure Trusted Applications authentication for an application link.

Configuring Trusted Applications for Outgoing Authentication

Configuring outgoing Trusted Applications authentication will allow the remote application to trust Confluence (i.e. allow Confluence to access specified functions and data on the remote application).

To configure Trusted Applications authentication for an outgoing application link:

1. Log in as a system administrator and go to the administration page. Click 'Application Links' in the administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
2. Click the 'Configure' link next to the application link that you want to configure Trusted Applications authentication for.
3. Click the 'Outgoing Authentication' tab. The outgoing authentication page will show, with the 'Trusted Applications' tab displayed.
4. If you are not currently logged into the remote application (or you logged into the remote application under a variant of the application's hostname, e.g. the IP address), a login dialogue will display.
   • Enter the 'Username' and 'Password' for the remote server, (not your local server), and click the 'Login' button. You need to enter the credentials for the remote server, as the remote server needs to be instructed to trust your local server for the Trusted Applications protocol to work. If you are already logged into your remote server, then the appropriate changes can be made without having to log in again.
5. Configure the settings for the Trusted Applications authentication:
   • 'IP Patterns' — Enter the IP addresses (IPv4 only) from which the remote application will accept requests (this effectively is the IP address your local server). You can specify wildcard matches by using an asterisk (*), e.g. '192.111.*.*' (note, you cannot use netmasks to specify network ranges). If you are entering multiple IP addresses, separate them with commas or spaces. Please note, if you are setting up Trusted Applications between two applications that both have the Application Links plugin installed, you can leave this field blank (or explicitly use *.*.*.*). However, if your remote application does not have the Application Links plugin installed and you are configuring the IP Patterns in the remote application (not the Application Links plugin), you must not leave this field blank nor use *.*.*.*. Failure to configure IP address restrictions in this scenario is a security vulnerability, allowing an unknown site to log into your site under a user’s login ID.
   Consider the following scenarios, if you want to limit access by using this field:
   • If your local application is using a proxy server, you need to add the proxy server's IP address to this field.
   • If your local application is a clustered instance of Confluence, you need to configure the remote server to accept requests from each cluster node. If you do not set up each node appropriately, your Confluence users may not be able to view any information from the remote server. You can set this up by either specifying each individual IP address for each node of the cluster (e.g. 172.16.0.10, 172.16.0.11, 172.16.0.12), or specifying the IP address for the clustered Confluence instance using wildcards (e.g. 172.16.0.*).
   • 'URL Patterns' — Enter the URLs in the remote application that your local application will be allowed to access. Each URL corresponds to a particular application function. Enter one URL per line, as follows:
     • If your remote application is JIRA, enter the following URL Patterns: /plugins/servlet/streems, /sr/jira.issueviews:searchrequest, /secure/RunPortlet, /rest, /rpc/soap
If your remote application is Confluence, enter the following URL Patterns: /plugins/servlet/stream, /plugins/servlet/applinks/whoami

- 'Certificate Timeout (ms)' — Enter the certificate timeout. The default is 10 seconds. The certificate timeout is used to prevent replay attacks. For example, if a Trusted Applications request is intercepted and (maliciously) re-sent, the application will be able to check when the request was first sent. If the second request is sent more than 10 seconds (or whatever the certificate timeout is set to) after the initial request, it will be rejected. Please note, you should not have to change the default value of this field for most application links. Note that the certificate timeout relies on the clocks on both servers being synchronised.

6. Click the 'Apply' button to save your changes.

Configuring Trusted Applications for Incoming Authentication

Configuring incoming Trusted Applications authentication will allow Confluence to trust the remote application that you are linking it to (i.e. allow your 'trusted' remote application to access specified functions and data on Confluence).

To configure Trusted Applications authentication for an incoming application link:

1. Log in as a system administrator and go to the administration page. Click 'Application Links' in the administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
2. Click the 'Configure' link next to the application link that you want to configure Trusted Applications authentication for.
3. Click the 'Incoming Authentication' tab. The incoming authentication page will show, with the 'Trusted Applications' tab displayed.
4. The tab will show whether Trusted Applications is currently enabled or not. Use the 'Modify' or 'Configure' button to configure Trusted Applications. The Trusted Applications configuration settings will be displayed:

- 'IP Patterns' — Enter the IP addresses (IPv4 only) from which our application will accept requests. You can specify wildcard matches by using an asterisk (*), e.g. '192.111.*.*' (note, you cannot use netmasks to specify network ranges). If you are entering multiple IP addresses, separate them with commas or spaces.

⚠️ Please note, if you are setting up Trusted Applications between two applications that both have the Application Links plugin installed, you can leave this field blank (or explicitly use *.*.*.*). However, if your remote application does not have the Application Links plugin installed and you are configuring the IP Patterns in the remote application (not the Application Links plugin), **you must not leave this field blank nor use *.*.*.***. Failure to configure IP address restrictions in this scenario is a security vulnerability, allowing an unknown site to log into your site under a user's login ID.

Consider the following scenarios, if you want to limit access by using this field:

- If the remote application is using a proxy server, you need to add the proxy server's IP address to this field.
- If the remote application is a clustered instance of Confluence, you need to accept requests from each cluster node. If you do not specify each node's address, Confluence users may not be able to view any data from your application. You can set this up by either specifying each individual IP address for each node of the cluster (e.g. 172.16.0.10, 172.16.0.11, 172.16.0.12), or specifying the IP address for your clustered Confluence instance using wildcards (e.g. 172.16.0.*).

- 'URL Patterns' — Enter the local URLs that the remote application will be allowed to access. Each URL corresponds to a particular application function. Enter one URL per line, as follows:

  - If your local application is JIRA, enter the following URL Patterns — /plugins/servlet/stream, /sr/jira.issueviews:searchrequest, /secure/RunPortlet, /rest/rpc/soap
  - If your local application is Confluence, enter the following URL Patterns — /plugins/servlet/stream, /plugins/servlet/applinks/whoami
• **Certificate Timeout (ms)** — Enter the certificate timeout. The default is 10 seconds. The certificate timeout is used to prevent replay attacks. For example, if a Trusted Applications request is intercepted and (maliciously) re-sent, the application will be able to check when the request was first sent. If the second request is sent more than 10 seconds (or whatever the certificate timeout is set to) after the initial request, it will be rejected. Please note, you should not have to change the default value of this field for most application links. Note that the certificate timeout relies on the clocks on both servers being synchronised.

5. Click the **Apply** button to save your changes.

- Configuring Basic HTTP Authentication for an Application Link
- Configuring OAuth Authentication for an Application Link

**Incoming and Outgoing Authentication**

When you configure authentication for an application link, you are defining the level of trust between the two linked servers. When configuring a link from one application to another, you can set up:

- **Incoming authentication** (authentication of requests coming from a linked application into this application).
- **Outgoing authentication** (authentication of requests sent from this application to a linked application).

See [Configuring Authentication for an Application Link](#).

---

**The information on this page does not apply to Confluence OnDemand.**

**Editing an Application Link**

You can change the details, such as the application name and display URL, for an existing application link.

**On this page:**

- **Editing an Application Link**
- **Notes**

---

**The information on this page does not apply to Confluence OnDemand.**

**Editing an Application Link**

To edit an application link:

1. Log in as a system administrator and go to the administration page. Click 'Application Links' in the administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
2. Click the **Configure** link next to the application link that you want to edit the details for. The application details for the application link will be displayed.
3. Update the application details as desired. Please note, you cannot update the Application Type nor the Application URL.

- **Application Name** — Update this field to change the display name for the application that you are linking to.
- **Display URL** — This URL is used when displaying links to the application in the browser. When creating the application link, you may have used a URL that is not accessible to other users, such as an internal IP address. If so, you can change the display URL to an address in a domain that is
accessible to other users.

4. Click the 'Update' button to save your changes.

Configuring Authentication for an Application Link
Making an Application Link the Primary Link
Relocating an Application Link

Making an Application Link the Primary Link
If you have set up application links to more than one of the same application type, e.g. you have linked your application to two JIRA servers, then one of the servers will be marked as the 'Primary' link. This means that any outgoing requests will be directed to the primary link's application.

For example, if you have set up a Confluence server that is linked to two JIRA servers with two-way authentication for both links, you can nominate an application link to one of the JIRA servers as the primary link. Every time Confluence requests JIRA information (e.g. for a JIRA issues macro), it will request it from the primary link's JIRA server. Note, both JIRA servers can still make requests of the Confluence server (e.g. a Confluence page gadget on the dashboards of each JIRA instance).

On this page:
- Making an Application Link the Primary Link
- Notes

⚠️ The information on this page does not apply to Confluence OnDemand.
Making an Application Link the Primary Link

To make an application link the primary link:

1. Log in as a system administrator and go to the administration page. Click 'Application Links' in the administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
2. Click the 'Make Primary' link next to the application link that you want to make the primary link. A ✓ symbol will display in the 'Primary' column next to the application link.

   The 'Primary' column and 'Make Primary' link will only display if you have set up application links to more than one of the same application type, e.g. you have linked your application to two JIRA servers.

Notes

Please read Making a Project Link the Primary Link for information on how primary project links also influence the information shared between servers.

Making a Project Link the Primary Link

Relocating an Application Link

This page describes how to change the location of an application link. You will need to relocate an application link if the target application has been moved to a new address.

The information on this page does not apply to Confluence OnDemand.

To relocate an application link:

1. Log in as a system administrator and go to the administration page. Click 'Application Links' in the administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
2. If the remote application for an application link cannot be reached by your application, the 'List Application Links' page will display a warning message (see 'Relocate Link - Warning Message' screenshot below).
3. If your remote application has been moved to a different address (rather than just being offline temporarily), click the 'Relocate' link in the warning message (see 'Relocate Link - Updating URL' screenshot below).
4. Enter the new URL for the remote application of your application link and click 'Relocate'.
5. You will need to confirm the relocation, if the new URL cannot be contacted. Otherwise, the application link will be updated.

Screenshot above: Relocate link – The warning message

Making an Application Link the Primary Link

Upgrading an Application Link

The instructions on this page describe how to upgrade an existing application link. You may want to upgrade an application link in either of the two situations below:

- Your Confluence instance has been upgraded from a version that does not include Application Links to a version that does. For example, you may have configured Trusted Applications or OAuth in a Confluence 3.4 instance (does not include Application Links) and then upgraded to Confluence 3.5 (includes Application Links).
- Your remote application has been upgraded to a version that includes Application Links. For example, you had set up an application link in a Confluence 3.5 instance (includes Application Links) to JIRA 4.2 instance (does not include Application Links), and then upgrade to JIRA 4.3 (includes Application Links).

On this page:
- Upgrading an Application Link (Local App Upgraded to Include Application Links)
- Upgrading an Application Link (Remote App Upgraded to Include Application Links)
- Notes

The information on this page does not apply to Confluence OnDemand.

Upgrading an Application Link (Local App Upgraded to Include Application Links)

When you upgrade from a Confluence version that does not include Application Links to version that does, you will have the option of converting any Trusted Applications or OAuth links to Application Links. The advantage of converting your links to Application Links is that link configuration will be simplified in future.

To upgrade an application link when your local application has been upgraded to include Application Links:

1. After your application upgrade, navigate to the administration console.
2. Click ‘Application Links’. The ‘Configure Application Links’ screen will be displayed with the following message: “There are existing Trusted Applications or OAuth relationships that should be upgraded to Application Links. Click here to upgrade.”
3. Click the ‘Click here to upgrade’ link. The ‘Existing Trust Relationships’ screen will be displayed showing
all Trusted Applications and OAuth relationships that can be upgraded to Application Links.
4. Click the 'Upgrade to Application Link' link next to the desired trust relationship. The 'Upgrade to Application Link' wizard will be displayed.
5. Complete the wizard. The process will be similar to adding a new link (described on Adding an Application Link), except that most fields should be pre-filled.

Screenshots above: Upgrading an application link for local application

Upgrading an Application Link (Remote App Upgraded to Include Application Links)

When an application link is created between a version of Confluence that supports Application Links, and a remote legacy application (either a non-Atlassian product, or an older version of an Atlassian product that did not ship with Application Links), this link is configured to run in "legacy mode". While there is no distinguishable difference to a user, connection and configuration without Application Links is a little different. For example:

- Setting up OAuth requires manual configuration by the administrator. In OAuth authentication for between applications that support Application Links, exchange of the consumer keys and public keys is done automatically.
- The Trusted Applications protocol (Atlassian-specific) will not be available for authentication.

If you upgrade your remote application to a version that does include Application Links, the application link will continue to work. However, upgrading your link may simplify link configuration and make additional authentication protocols available (as mentioned above).

To upgrade an application link when your remote application has been upgraded to include Application Links:

1. After you have upgraded your remote application to a version that includes Application Links, go to the administration console of your local application. A warning will be displayed, requesting that you upgrade the link to full Application Links mode.
2. Click 'Upgrade' in the warning message to start the upgrade wizard. Note the following:
   - You will be prompted to make your application link a reciprocal link. You will need to provide administrator credentials for your remote application, if you choose to do so.
   - If you make your application link a reciprocal link, you will also be able to make reciprocal links for your project links. For example, you may be able to link your JIRA project to a FishEye repository and also make a link from your FishEye repository back to the JIRA project.
Screenshot above: Upgrading an application link wizard

Notes

Related Topics

Adding an Application Link
Configuring Authentication for an Application Link
Deleting an Application Link

Deleting an application link stops the two applications from sharing information. You will no longer be able to make requests from one application to the other. This means that certain features may not work, e.g. JIRA issues macro in Confluence, Confluence Page Gadget in JIRA, etc.

If you have set up application links to multiple servers of the same application type, e.g. you have linked your application to multiple JIRA servers, deleting the primary link will mean that another of the links will be made the primary link.

Deleting an application link will also delete all project links set up for that application link.

The information on this page does not apply to Confluence OnDemand.

To delete an application link:

1. Log in as a system administrator and go to the administration page. Click 'Application Links' in the administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
2. Click the 'Delete' link next to the application link that you want to delete. A confirmation screen will be displayed.
3. Click the 'Confirm' button to delete the application link.

Configuring Project Links across Applications

Let's assume that you are managing a project or team. You would like to connect your project's Confluence space with your JIRA project, and link up your team's source repository too. When you have connected your applications via Application Links, you can also connect the areas of those applications that contain information relating to your project or team. Using project links (also called entity links) you can associate one or more projects, spaces and repositories across the linked applications.

To connect all the information relating to the project or team that you are managing, you can link one or more of the following:

- JIRA projects.
- Confluence spaces.
- FishEye repositories.
- FishEye projects. A FishEye 'project' is the Crucible project if you have installed FishEye and Crucible, otherwise it is the paths associated via the 'FishEye Project Content' function in FishEye.
- Crucible projects.
- Bamboo projects.

Uses for Project Links

- Uses for Project Links
- Managing Project Links

The information on this page does not apply to Confluence OnDemand.
The following integration features use project links:

- Activity streams. For example, the project links determine the activity retrieved from JIRA to display in the activity stream of a FishEye repository or a Crucible project.
- The JIRA FishEye plugin. For example:
  - The link between a JIRA project and a FishEye repository determines the repository searched for a particular issue key when displaying the FishEye source tab in JIRA.
  - The link between a JIRA project and a Crucible project determines the Crucible project scanned for review activity when displaying the Crucible reviews tab in JIRA.
  - When you create a defect in Crucible, Crucible will know which JIRA project to put it in.
- Third-party plugins may make use of project links to enrich their functionality too.

Managing Project Links

The information on this page does not apply to Confluence OnDemand.

To link a Confluence space to a project in another application:

1. Choose Browse > Space Admin.
   - Space Admin is displayed only if you are a space administrator for that space or you are a Confluence system administrator.

2. Click 'Application Links' in the left-hand panel.

3. Choose the Confluence space that you want to link from.

4. The instructions for adding a project link will vary depending on whether the target application has the Application Links functionality installed:
   - If the target application has Application Links:
     a. Click 'Add Link'. A dropdown menu will appear listing the applications you have already linked to.
     b. In the dropdown menu, click the application that contains the project you want to link to. For
example, if you want to link to a specific JIRA project, click the JIRA site that contains that project. If you want to link to a Confluence space, click the Confluence site that contains that space.

- **c.** Click one of the options on the 'Authorization required' screen:
  - 'Authorize' — Click this option if you want to grant your project authorised access to the target project. The target application will open in a new window, so that you can log in and authorise access.
  - 'Skip – your access is anonymous' — Click this option if you only want to allow anonymous access to the target project.
- **d.** In the 'Name or Key' field, enter the name/key of the project in the remote application that you want to link to. For example, if you want to link to a JIRA project, enter the project key. If you want to link to a Confluence space, enter the space key.
- **e.** Click the 'Create' button to create the project link.

- If the target application does not have Application Links:
  - **a.** Click 'Add Link'. A dropdown menu will display listing the applications you have already linked to.
  - **b.** In the dropdown menu, click the application that contains the project you want to link to. For example, if you want to link to a specific JIRA project, click the JIRA site that contains that project. If you want to link to a Confluence space, click the Confluence site that contains that space.
  - **c.** In the 'Key' field, enter the name/key of the project in the remote application that you want to link to. For example, if you want to link to a JIRA project, enter the project key. If you want to link to a Confluence space, enter the space key.
  - **d.** *(optional)* Enter the alias for the project in the 'Alias' field. This is the display name for the project in your administration console.
  - **e.** Click the 'Create' button to create the project link.

Screenshots above: Linking to a JIRA project (where the target JIRA server supports Application Links)

**RELATED TOPICS**

- Making a Project Link the Primary Link
- Deleting a Project Link

- **Making a Project Link the Primary Link**
  If you have set up project links to more than one project in the same application, for example you have linked your Confluence space to two JIRA projects, then one of the project links will be marked as the primary link. All outgoing requests will be directed to the primary link.
For example, if you have a Confluence space that is linked to two JIRA projects, you can nominate the link to one of the JIRA projects as the primary link. Every time Confluence requests JIRA information (for example, in a JIRA issues macro) it will request it from the primary link's JIRA project. Note, both JIRA projects can still request information from the Confluence space (for example, a Confluence page gadget on the dashboards of each JIRA instance).

The information on this page does not apply to Confluence OnDemand.

To make a project link the primary link:

1. Choose Browse > Space Admin. Space Admin is displayed only if you are a space administrator for that space or you are a Confluence system administrator.
2. Click 'Application Links' in the left-hand panel.
3. Click the 'Make Primary' link in the 'Action' column for the project link that you want to make the primary link. A symbol will display in the 'Primary' column next to the link.

Note: The 'Primary' column and 'Make Primary' link will appear only if you have set up multiple project links to the same application, for example you have linked a Confluence space to a number of JIRA projects.

Screenshot above: Viewing the project links for a Confluence space

RELATED TOPICS

Adding Project Links between Applications
Deleting a Project Link

Deleting a Project Link
Deleting a project link stops the two projects from sharing information.

If you have set up multiple project links to the same application, for example you have linked a Confluence space to multiple JIRA projects, deleting the primary link will mean that another of the links will be made the primary link.

The information on this page does not apply to Confluence OnDemand.

To delete a project link:

1. Choose Browse > Space Admin. Space Admin is displayed only if you are a space administrator for that space or you are a Confluence system administrator.
2. Click 'Application Links' in the left-hand panel.
3. Click the 'Delete' link next to the link that you want to delete.
4. A confirmation screen will appear. Click the 'Confirm' button to delete the link.
Installing Confluence and JIRA Together

This page describes Atlassian's recommendation for installing JIRA and Confluence on the same server. Refer to Here Be Dragons for instructions on integrating all Atlassian applications.

⚠️ Do not deploy multiple Atlassian applications in a single Tomcat container —
Deploying multiple Atlassian applications in a single Tomcat container is not supported. We do not test this configuration and upgrading any of the applications (even for point releases) is likely to break it. There are also a number of known issues with this configuration (see this FAQ for more information).

We also do not support deploying multiple Atlassian applications to a single Tomcat container for a number of practical reasons. Firstly, you must shut down Tomcat to upgrade any application and secondly, if one application crashes, the other applications running in that Tomcat container will be inaccessible.

Finally, we recommend not deploying any other applications to the same Tomcat container that runs Confluence, especially if these other applications have large memory requirements or require additional libraries in Tomcat's lib subdirectory.
Recommended Setup - Separate Stand-Alone Installations

Atlassian recommends running JIRA and Confluence in separate stand-alone instances running behind an Apache Web Server. See the guides for:

- Installing Confluence
- Running Confluence behind Apache
- Installing JIRA
- Integrating JIRA with Apache

Advantages

- Each application can be restarted without affecting the other.
- If one webapp hangs for any reason (eg. running out of memory), it doesn't affect the other.
- Any problems can be debugged more easily. Logs are separate and product-specific, rather than everything going to catalina.out. Thread and heap dumps are smaller and more relevant.
- It reduces the likelihood of jar conflicts (eg. jars that must be installed in common/lib or lib for Confluence running off Apache Tomcat version 6 or above), particularly if you later want to install a third webapp not from Atlassian.
- Apache HTTP Web Server is well suited for running publicly available sites, with extensive modules for security and efficiency. It also allows for flexibility with URLs (ie http://confluence.atlassian.com, http://confluence, and so on).

Apache Web Server is recommended and reliable. It is also a third-party product, and therefore not developed nor supported by Atlassian. See Atlassian Support Offerings for details.

Integrating JIRA and Confluence

Please refer to the guide to Installing Confluence and JIRA Together.

JIRA and Confluence are designed to complement each other. Collect your team's thoughts, plans and knowledge in Confluence, track your issues in JIRA, and let the two applications work together to help you get your job done.

Below are some ways you can get JIRA and Confluence working together.

On this page:

- Setting Up Trusted Communication between JIRA and Confluence
- Inserting JIRA issues
- Combining Confluence Shortcuts and JIRA Quick Search
- Viewing Confluence Content in JIRA or JIRA Content in Confluence
- Integrating JIRA and Confluence User Management
- Useful Plugins

Setting Up Trusted Communication between JIRA and Confluence

An administrator can configure JIRA (3.12.0 or later) and Confluence to communicate in a trusted way, so that Confluence can request information from JIRA on behalf of the currently logged-in user. JIRA will not ask the user to log in again or to supply a password.
Trusted communication is used when embedding information from one application (for example, a list of JIRA issues) into another application (for example, a Confluence page).

Read more about trusted communication.

**Inserting JIRA issues**

You can insert issues from a JIRA site onto your Confluence page using the ‘Insert JIRA Issue’ dialogue box. You can also use this dialogue box to create a new issue on the JIRA site. See Inserting JIRA Issues.

**Combining Confluence Shortcuts and JIRA Quick Search**

In our Confluence site’s global configuration (Administration > Shortcut Links) we have the following shortcut defined:

```plaintext
JIRA: http://jira.atlassian.com/secure/QuickSearch.jspa?searchString=
```

Use the above option to create links using Confluence’s shortcut notation.

- Link directly to JIRA issues like this: CONF-1000
- Use JIRA’s quick-search functionality to create links to particular groups of issues. The following link will display a list of all open issues in the Confluence project of type ‘Improvement’: CONF open improvements

**Viewing Confluence Content in JIRA or JIRA Content in Confluence**

**Using Gadgets**

You can embed a Confluence activity stream or a Confluence page in JIRA’s dashboard. Likewise, JIRA gadgets can be rendered on a Confluence page. See Adding a Confluence Gadget to a JIRA Dashboard and Gadget Macro for information on how to set up gadgets.

**Using the JIRA Issues macro**
For versions earlier than Confluence 3.1 and JIRA 4.0, use the {jiraissues} and {jiraportlet} macros to embed JIRA reports and portlets into your Confluence site.

Any JIRA search result can be embedded in a Confluence page using the **JIRA Issues macro** with your choice of included fields and field ordering, and any JIRA dashboard portlet can be embedded in a Confluence page using the **JIRA Portlet macro**.

**Integrating JIRA and Confluence User Management**

To save you having to enter users into both JIRA and Confluence, you may benefit from using **Atlassian Crowd** as the user repository for both applications. Alternatively you can configure Confluence to use JIRA's user database. See [Connecting to Crowd or JIRA for User Management](#).

**Useful Plugins**

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on [plugin support](#).

- The **JIRA Linker plugin** provides a custom field that helps you find an URL, particularly a Confluence page, so you can add a page link into a JIRA issue.

**Setting Up Trusted Communication between JIRA and Confluence**

An administrator can configure JIRA and Confluence to communicate in a trusted way, so that Confluence can request information from JIRA on behalf of the currently logged-in user. JIRA will not ask the user to log in again or to supply a password.

When JIRA is configured to trust Confluence in this way, we call Confluence the 'trusted application' and JIRA the 'trusting application'.

Trusted communication is used when embedding information from one application (e.g. a list of JIRA issues) into another application (e.g. a Confluence page). Currently only JIRA can be configured to trust Confluence, and only the following two macros have been enhanced to use trusted communication:

- **JIRA Issues macro**
- **JIRA Portlet macro**

Further implementations will follow, especially as we roll out the tight integration required between Atlassian products for JIRA Studio.

⚠️ **Potential security risk**

Do not configure a trusted application unless you trust all code in that application to behave itself at all times. Trusted communication uses public/private key cryptography to establish the identity of the trusted server, so you must also be sure that the trusted application will maintain the security of its private key. Read the details of the [security risks](#) below.
Prerequisites

- JIRA 3.12.0 or later.
- Confluence 2.7.0 or later.
- In order to authenticate successfully against JIRA, the Confluence user must also be registered as a JIRA user with the same username.

**Common user base recommended**

It is **highly recommended** that your JIRA and Confluence instances share a common user base, rather than two separate user bases with duplicated usernames. You will receive an error if Confluence passes JIRA a username which JIRA cannot recognise. Also, with separate user bases you run the risk that the same username may be used by two different people. The trusted application does not supply the user's password, so the trusting application will assume the username belongs to the user registered in the trusting application's own user base.

**Tip:** Try [Atlassian Crowd](https://www.atlassian.com/software/crowd) for a tidy user management solution.

Why do we need Trusted Communication?

The [JIRA Issues](https://www.atlassian.com/software/jira) and the [JIRA Portlet](https://www.atlassian.com/software/jira) macros allow you to embed a list of JIRA issues into a Confluence page. Prior to Confluence 2.7, if you wanted to display JIRA issues that had restricted viewing, then you needed to store the JIRA user's credentials (username and password) in the macro code directly on the Confluence page. This was not very secure.

The reasons we require the user credentials are:

- Your JIRA instance might not be public, and you might not want to allow anonymous access to your issues.
- You might have security restrictions on some of your issues. So you don't want to allow someone to leak data from your JIRA project by using the JIRA Issues Macro on a Confluence page.

Overview

Here is a summary of the integration points in a trusted communications relationship. Each of the following points is described in more detail in the sections below.
A JIRA System Administrator configures JIRA to trust Confluence.

A Confluence System Administrator configures the macro plugin to use (or not use) trusted communication.

A Confluence user adds one of the macros to a Confluence page.

A Confluence user or anonymous user views the Confluence page.

### Configuring JIRA to Trust Confluence Using Trusted Applications

Trust only has to be established once between the two applications. Once trust has been established, it is entirely transparent to the Confluence users.

Application links are used to enable trust relationships between two applications. Linking two applications allows you to share information and access one application's functions from within the other.

You can configure an application link to use Trusted Applications as the authentication mechanism. For instructions, see Configuring Trusted Applications Authentication for an Application Link.

### Configuring the Macro Plugin in Confluence

By default, Confluence ships with trusted communication enabled for the following macros:

- JIRA Issues macro
- JIRA Portlet macro

A Confluence System Administrator can decide on the level of trusted communication used by the macros. The different levels are:

- Ignore trusted communications altogether. Trusted communication is turned off at the global level.
- Perform trusted communications whenever the macro is used on a Confluence page, but do not show certain warning messages.
- Perform trusted communications whenever the macro is used on a Confluence page, and show all warning messages. **This is the default configuration.**

To change the default trusted communication level for the JIRA Macros plugin,
1. Choose **Browse > Confluence Admin**.
2. Select ‘Plugins’ in the left-hand panel.
3. The ‘Plugin Manager’ screen appears, showing a list of installed plugins. Scroll down and click the 'JIRA Macros' link.
4. The 'JIRA Macros' panel appears in the top middle of the screen, as shown below. Click 'Enable' or 'Disable' next to the following options:
   - **JIRA application trust support** – With this option enabled, Confluence will attempt trusted communication with JIRA whenever a user views a page containing the JIRA Issues or Portlet macro, provided criteria are met as described below. With this option disabled, Confluence will never attempt trusted communication with JIRA for these macros.
     - **Enable** if you do not intend to configure trusted communication between JIRA and Confluence.
   - **JIRA application trust warnings** – With this option enabled, Confluence will display all error and warning messages that may arise from a problem during trusted communication (assuming that trusted communication is enabled). With this option disabled, Confluence will suppress certain warnings. See troubleshooting below.
     - **Enable** if you have a large number of existing JIRA macros already on your Confluence instance, pointing at a diverse range of JIRA servers. Some of those JIRA servers may have a trusted communication link established (requiring the functionality to be enabled) while other JIRA servers may have no trusted communication link. In this case, you may want to turn off the warning messages so they do not appear on your Confluence pages where the JIRA macros point to non-trusting JIRA servers.

**Screenshot: JIRA Macros panel in Plugin Manager**

### JIRA Macros

**Vendor:** Atlassian Software Systems  
**Plugin Version:** 2.4

Macros to retrieve information from JIRA.

- **Disable plugin**
  - jiraportlet
    - Macro to display a JIRA portlet - requires JIRA 3
  - jiraissues
    - Macro to retrieve a feed of JIRA issues and summarise them in the page
  - JIRA application trust support
    - Send user authentication via trusted application link
  - JIRA application trust warnings
    - Display warning messages when trusted user authentication is not available

**Adding the Macro to a Confluence Page**

The Confluence user can add and edit the macros as described on the following pages:

- Using the [JIRA Issues macro](#)
• Using the [JIRA Portlet macro](https://confluence.jetbrains.com/display/DOCS/Using+the+JIRA+Portlet+macro)

**Remove the username and password from your macro markup code**

Before Confluence 2.7, you needed to include a username and password in the macro markup code if you wanted to display JIRA issues which had restricted viewing. Once your administrator has set up trusted communication between Confluence and JIRA, you no longer need to include a username and password in the markup code for your JIRA macros.

The following options are available for determining the issues which will be retrieved from JIRA and displayed on the Confluence page:

<table>
<thead>
<tr>
<th>What you want to do</th>
<th>Macro parameter</th>
<th>URL parameter</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display the JIRA issues which the logged-in user is authorised to see. And if the user is not logged in, display only issues which allow unrestricted viewing.</td>
<td>Do not specify any authentication parameters. In this case, the behaviour depends on the way your administrator has set up trusted communication between JIRA and Confluence. Here is a summary of the behaviour. If trusted communication is enabled, the authorisation will work seamlessly. When a logged-in user views your page, they will see only the JIRA issues they are allowed to see. And if they are not logged in, they will see only the issues which allow unrestricted viewing. If trusted communication is disabled, the Confluence page will show only the JIRA issues which allow unrestricted viewing.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ensure that Confluence will display only the JIRA issues which allow unrestricted viewing.</td>
<td>anonymous</td>
<td>Regardless of who the user is (logged in or not), the Confluence page will show only anonymously-visible issues. Confluence will not attempt to set up a trusted communication link with JIRA in this case.</td>
<td></td>
</tr>
<tr>
<td>---</td>
<td>---</td>
<td>---</td>
<td></td>
</tr>
<tr>
<td>Use a pre-determined username and password to access the JIRA issues.</td>
<td>&amp;os_username=MYNAME&amp;os_password=MY PASSWORD</td>
<td>Not recommended. Prior to Confluence 2.7, this was the only way of displaying issues with restricted viewing. For Confluence 2.7 and later, this method will still work. Confluence will not attempt to set up a trusted communication link with JIRA in this case.</td>
<td></td>
</tr>
</tbody>
</table>

Refer to the section below for details of what happens when a user views a Confluence page containing a JIRA macro.

**Viewing the Confluence Page**

When a user views a Confluence page which contains a JIRA Issues or JIRA Portlet macro, this is what happens:

- If the macro markup contains an explicit username and password in the URL parameter, Confluence will not request trusted communication with JIRA. Confluence will retrieve the JIRA issues which the specified username is authorised to see. This behaviour is the same as Confluence versions prior to 2.7.
- If the macro markup contains the `anonymous` parameter, Confluence will retrieve only the JIRA issues which allow unrestricted viewing. Confluence will not attempt to set up a trusted communication link with JIRA in this case.
- If the user is anonymous (not logged in), Confluence will retrieve only the JIRA issues which allow unrestricted viewing. Confluence will not attempt to set up a trusted communication link with JIRA in this case.
- If trusted communication is disabled via the Plugin Manager in Confluence, then Confluence will not request trusted communication with JIRA. So if there is no explicit username and password in the markup code, Confluence will retrieve only the JIRA issues which allow unrestricted viewing. This behaviour is the same as Confluence versions prior to 2.7.
- If trusted communication is enabled via the Plugin Manager in Confluence:
  - If the user is logged in, Confluence attempts trusted communication with JIRA. Confluence sends the username to JIRA. JIRA returns a set of issues which that username is authorised to access, based on the JIRA user base and the JIRA groups and permissions. Confluence displays those issues on the page.
  - If JIRA or Confluence encounters a problem during the trusted communication process, an error message may appear on the Confluence page above the macro output – see troubleshooting below.
Security Risks

Please take the following considerations into account when setting up trusted communication:

- When you configure JIRA to trust an application, you are allowing the application to access JIRA in the name of a particular user. The trusted application passes JIRA the user's login name, but no other authentication information. JIRA does not request the user's password. By doing this, you are bypassing JIRA's authentication mechanism.
- Do not configure a trusted application unless you trust all code in that application to behave itself at all times.
- Trusted communication uses public/private key cryptography to establish the identity of the trusted server. The trusted application needs to maintain the security of its private key. Confluence stores its private key in the database. So you must be sure that the Confluence database is secure, and also any full backups of the database.
- Ensure that you specify an IP address for your Confluence site when configuring trusted applications in JIRA. Do not use the wild card *.*.*.* as the IP address. Failure to configure IP address restrictions is a security vulnerability, allowing an unknown site to log into your JIRA site under a user's login ID.
- Be aware of the risks associated with using separate user bases, as explained above. We strongly recommend a common user base between the trusted and trusting applications.
- When configuring an application to trust another application, you should use a trusted network or SSL to protect the sensitive information passed between the applications during the configuration procedure. This will help to prevent man-in-the-middle attacks.

Troubleshooting

Below are the warning messages which may appear on your Confluence page, above the output of the JIRA Issues or JIRA Portlet macro.

<table>
<thead>
<tr>
<th>Warning Message</th>
<th>Cause</th>
<th>Solution</th>
<th>Warning Message Can be Turned Off?</th>
</tr>
</thead>
<tbody>
<tr>
<td>javax.net.ssl.SSLHandshakeException: sun.security.validator.ValidatorException:</td>
<td>JIRA is running over SSL</td>
<td>Add JIRA's SSL Certificate to the Java Keystore</td>
<td>No</td>
</tr>
<tr>
<td>sun.security.validator.ValidatorException: PKIX path building failed:</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>sun.security.provider.certpath.SunCertPathBuilderException:</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>unable to find valid certification path to requested target</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>The JIRA server does not recognise your user name.</td>
<td>The logged-in Confluence user is not registered in the JIRA</td>
<td>Add the username to your JIRA user base. It is highly recommended that your JIRA and Confluence instances share a common user base.</td>
<td>No</td>
</tr>
<tr>
<td>Issues have been retrieved anonymously.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| The JIRA server does not trust this Confluence instance for user authentication. Issues have been retrieved anonymously. You can set the macro to always use an anonymous request by setting the 'anonymous' parameter to 'true'. | Your JIRA instance has not been configured to trust your Confluence instance. | One of the following solutions:  
- Configure JIRA to trust Confluence.  
- Disable trusted communications for the JIRA macros in Confluence.  
- Use the `anonymous` parameter in all your JIRA Issues and JIRA Portlet macros. | Yes |
|---|---|---|---|
| The JIRA server does not support trust requests. Issues have been retrieved anonymously. You can set the macro to always use an anonymous request by setting the 'anonymous' parameter to 'true'. | Your JIRA instance is not able to handle trusted communications (i.e. the JIRA version is earlier than 3.12.0). | One of the following solutions:

Consult [Troubleshooting the JIRA Issues Macro and Trusted Applications](#) for further troubleshooting.

**Technical Overview of the Trusted Applications Authentication (TAA) Protocol**

Read this section if you want a bit more information on the technical side of things.

Atlassian has developed its own protocol to set up trust between JIRA and Confluence. Below is a technical overview of the process.

**Configuring JIRA to trust Confluence:**

1. When the JIRA System Administrator provides the base URL of the Confluence instance, JIRA requests a
trusted application authentication certificate from Confluence. The certificate contains Confluence's trusted application ID and public key (generated specifically for use with the TAA protocol).

2. JIRA validates the certificate and asks the System Administrator for a few extra details about the trust relationship, such as a name for the Confluence instance, timeout, allowed IP addresses and allowed request URLs.

3. JIRA stores all this information in the database.

Making a trusted request from Confluence to JIRA:

1. Confluence sends a web request to JIRA, appending additional headers to the request, including:
   - Timestamp (nonce) of the request + user name of the currently logged-in Confluence user, encrypted with a symmetric key (generated on the fly).
   - The symmetric key, encrypted with Confluence's private key.
   - Confluence's application ID (as displayed when trusted communication was established).

2. JIRA attempts to decode the encrypted headers, using the stored information about the relationship. It conducts the following checks to validate the request:
   - The trusted application ID refers to a valid trusted application.
   - The given username exists in the JIRA user base.
   - The agreed timeout has not expired.
   - The request originated from a trusted IP address.
   - The resource being requested matches those specified in the URL match list.

3. If any of these checks fails, a response is sent to Confluence indicating the reason for failure. Otherwise, JIRA will authenticate the specified user for the duration of the single request, and respond with the resources (i.e. the JIRA issues).

  - Improving Database Performance
- Webserver Configuration
  - Apache and Apache Connector Tips
  - Configure Web Proxy Support for Confluence
  - Running Confluence behind Apache
- Start Confluence Automatically on System Startup
  - Start Confluence Automatically on Linux
  - Start Confluence Automatically on Windows as a Service
- Confluence Data Model
Application Server Configuration

The following pages contain information about configuring your application server for Confluence:

- Application Server URL encoding
- Managing Application Server Memory Settings
- Switching to Apache Tomcat

Application Server URL encoding

Application servers may have different settings for character encodings. We strongly suggest setting this to UTF-8 where possible.

Information on setting the character encoding is available at:

- Configuring Tomcat's URI Encoding

Configuring Tomcat's URI encoding

By default, Tomcat uses ISO-8859-1 character encoding when decoding URLs received from a browser. This can cause problems when Confluence's encoding is UTF-8, and you are using international characters in attachment or page names.

1. Edit `conf/server.xml` and find the line where the Coyote HTTP Connector is defined. It will look something like this, possibly with more parameters:

   ```xml
   <Connector port="8090"/>
   ```

2. Add a `URIEncoding="UTF-8"` property to the connector:

   ```xml
   <Connector port="8090" URIEncoding="UTF-8"/>
   ```

3. Restart Tomcat
If you are using mod_jk

You should apply the same URIEncoding parameter as above to the AJP connector if you are using mod_jk, and add the following option to your Apache mod_jk configuration:

```xml
<Connector port="8009" protocol="AJP/1.3" URIEncoding="UTF-8"/>

JkOptions +ForwardURICompatUnparsed
```

More information using Apache with Tomcat

For comprehensive examples of how to use Tomcat and Apache with Confluence, see Running Confluence behind Apache.

Managing Application Server Memory Settings

The minimum and maximum JVM heap space allocated to the application server affects performance. Confluence administrators may wish to modify this value from the defaults depending on their server load. This document only provides guidelines rather than rules, so administrators optimising for performance should use this document as a starting point only.

⚠️ For a comprehensive overview of memory management, and memory tuning in Confluence under Sun JRE, please read Garbage Collector Performance Issues

Testing For Optimum Memory Settings

In the general case, both JIRA & Confluence users will benefit from setting the minimum and maximum values identical. In larger installations, there is benefit to memory tuning, if there is a perceived performance issue. If you are experiencing Out of Memory Heap errors, try doubling the -Xmx and -Xms values for your installation to see if this resolves or helps resolve your issue. If not, please lodge a support ticket as there may be other factors contributing.

Memory usage is most likely to be maximised under peak load, and when creating a site XML backup. In many cases, the backup can be the cause of the OOM, so increase -Xmx values and verify if a backup was occurring at the time of OOM. A quick rule of thumb for gauging the success of a memory adjustment is using simple anecdotal evidence from users. Is it snappier? The same? How does it handle while a backup is occurring?

⚠️ Atlassian recommends in normal use, to disable the XML backup and use a Production Backup Strategy.

- If you normally perform manual XML site backups on your server, test your maximum memory requirements by performing a site XML backup while the server is under maximum load
- If you do not create manual XML site backups, simply monitor the server while under maximum load

Applying Memory Settings

See Fix Out of Memory Errors by Increasing Available Memory.

Related Topics
Switching to Apache Tomcat

Apache Tomcat is the only application server supported for Confluence. To move Confluence from an application server (e.g. WebSphere) to Tomcat using the same database, follow the instructions below.

Please note, you cannot simply copy the WAR file or expanded WAR directory from an old Confluence EAR/WAR version in the old application server to Tomcat. This will not work.

Follow these instructions:

1. Before You Start
2. Backing Up
3. Switching Application Servers
4. Applying Customisations
   • Confluence Server
   • Plugins
   • Look and Feel
   • Performance
   • Advanced Customisations
5. Testing Confluence

1. Before You Start

1. The following instructions will only work if you are running the same major version of Confluence on both application servers. If you are running different major versions of Confluence, you will need to upgrade Confluence before you can switch to Tomcat.
2. Note that you need current software maintenance, as the process for changing application servers involves installing Confluence or Confluence EAR-WAR.
3. If the environment (e.g. the database system, the operating system and so on) that you are running Confluence in has changed, please ensure it still complies with the Confluence System Requirements.
4. If you are using an external database, familiarise yourself with all known issues for your specific database. Also make sure the Confluence database connector principal (the database user login) has sufficient permissions to modify the database schema.
5. Note any customisations that you have made to Confluence, e.g. enabled/installed plugins, modified layouts, custom themes, etc. You will need to reapply these after you have switched to Tomcat. You can view the list of customisations in the Reapplying Customisations section below.
6. We recommend that you do not run any other applications in your Tomcat application server that is running Confluence, to prevent performance issues.

2. Backing Up

Before you switching to Tomcat, you must back up the following:

1. Back up your Confluence Home directory. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
1. **Tip:** Another term for ‘Home directory’ would be ‘data directory’. The location of the Home directory is stored in a configuration file called `confluence-init.properties`, which is located inside the `confluence/WEB-INF/classes` directory in your Confluence Installation directory.

2. **Back up your database.** Perform a manual backup of your external database before proceeding with the upgrade and check that the backup was created properly. If you are not a database expert or unfamiliar with the backup-restore facilities of your database, you should try to restore the backup to a different system to ensure that the backup worked before proceeding. This recommendation is not specific to Confluence usage, but it is good practice to ensure that your database backup is not broken.

   The ‘embedded database’ is the HSQLDB database supplied with Confluence for evaluation purposes; you don’t need to back it up since it is stored in the home directory. But you should not use this database for production systems anyway, so if you happen to accidentally still use HSQLDB in a production system, please migrate to a proper database before the upgrade.

3. **Back up your Confluence Installation directory** (if you are using Confluence) or **your Confluence webapp** (if you are using Confluence EAR-WAR edition). The ‘Confluence Installation directory’ is the directory into which the Confluence application files and libraries have been unpacked (unzipped) when Confluence was installed. Confluence does not modify or store any data in this directory. This directory is also sometimes called the ‘Confluence Install directory’.

### 3. Switching Application Servers

1. Install Confluence on your new application server. We recommend that you install Confluence (from the zip file) as it is preconfigured with Tomcat. If you want more control over the installation process, you can install Confluence EAR-WAR on Tomcat however this requires more manual configuration. Regardless of which method you choose, as part of the installation process:
   - If you are connecting to your database via a standard JDBC connection, enter the URL, username and password for your existing database.
   - If you are connecting to your database via datasource, use the settings for your existing database when you configure the JDBC datasource in your new server. Refer to the appropriate guide below:
     - Configuring a MySQL Datasource in Apache Tomcat
     - Configuring a SQL Server Datasource in Apache Tomcat
     - Configuring a PostgreSQL Datasource in Apache Tomcat

2. Copy the following files from your old Confluence installation to your new one:
   - `{CONFLUENCE_INSTALL}\confluence\WEB-INF\classes\confluence-init.properties`
   - `{CONFLUENCE_INSTALL}\confluence\WEB-INF\classes\atlassian-user.xml`
   - `{CONFLUENCE_INSTALL}\confluence\WEB-INF\classes\osuser.xml` *(copy this over if you are using JIRA user management)*
   - `{CONFLUENCE_INSTALL}\confluence\WEB-INF\classes\seraph-config.xml` *(copy this over if you using custom SSO)*
   - `{CONFLUENCE_INSTALL}\confluence\WEB-INF\web.xml` *(copy this over if you have previously modified it, e.g. to configure a datasource)*

3. Make sure you shutdown the old server before you startup the new one.

4. If you are running the new application server on a different machine to the old one, carry out the followin actions as soon as you start the new server:
   - Re-index your data.
   - Make sure that the attachments location is valid for the new server.

5. If you have applied special settings to their Confluence server and/or Confluence look and feel, you will need to reapply these customisations as described in below.

### 4. Applying Customisations

After switching to Tomcat, you need to review any customisations and other special configurations you previously used for your Confluence instance, and re-apply if necessary. This section also contains some
Tomcat-specific customisations that you may wish to considering applying, if you haven’t used Confluence with Tomcat before.

⚠️ Before you apply customisations

Please ensure that your Confluence installation works correctly on Tomcat without any customisations before you apply any of customisations listed below. This will make it easier to identify problems, if you run into trouble during the switch to Tomcat.

Confluence Server

- For long-term use, we recommend that you configure Confluence to start automatically when the operating system restarts. For Windows servers, this means configuring Confluence to run as a Window service.
- If you are using the Confluence edition and you have previously defined a CATALINA_HOME environment variable, please check that it points to the correct path for the new Confluence Tomcat server.
- If you were previously running Confluence on a non-standard port, edit your new <Installation-Directory>/conf/server.xml file as described in Change listen port for Confluence.

Plugins

- If you were previously using any plugins, install the latest compatible version and disable any plugins that are incompatible with your new instance of Confluence. The easiest way to do this is to use the Plugin Repository in the Confluence Administration Console.

Look and Feel

- If you are using any customised themes, please check that they are displaying as expected. Some further customisation may be required to ensure compatibility with your new version of Confluence.
- If you had previously customised the default site or space layouts, you will need to reapply your changes to the new defaults as described here. Please do not just copy your VM (velocity) files across. Ensure that Confluence works without your custom layouts then apply the layout via the Confluence Administration console.

Performance

- If the load on your Confluence instance is high, you may need more simultaneous connections to the database. Read more about this in the Performance Tuning guide.
- If you had previously modified the memory flags (Xms and Xmx) in either the <Installation-Directory>/bin/setenv.sh or the <Installation-Directory>/bin/setenv.bat file, you may want to make the modifications in your new installation. The parameters are specified in the JAVA_OPTS variable. See Fix Out of Memory Errors by Increasing Available Memory for more information.

Advanced Customisations

- If you were previously running Confluence over SSL, you will need to reapply your configuration as described in Running Confluence Over SSL or HTTPS.
- If you were using a custom SSO authenticator, change seraph-config.xml to the correct authenticator.
- If you had changed the Confluence interface text, you will need to copy over the ConfluenceActionSupport.properties file.
- If you had previously modified the Confluence source code, you will need to reapply your changes to the new version.

5. Testing Confluence

Make sure you test Confluence on the new server before deploying it in production.

The Working with Confluence Logs document contains the locations for the application logs, if you need to refer to them.
Database Configuration

This document provides information on configuring an external database.

The Embedded Database for Evaluation Purposes

The Confluence installation includes an embedded HSQLDB database, supplied for the purpose of evaluating Confluence.

If you are using the embedded database, the database files are stored in the database folder under your Confluence Home directory. See also Important Directories and Files.

![Embedded Database is Not Suitable for Production Instances of Confluence](image)

Production instances of Confluence should use an external database. When using the default HSQLDB database, you run the risk of unrecoverable data loss due to not being transaction safe.

- Corruption is occasionally encountered after sudden power loss and can usually be corrected using this data recovery procedure.
- HSQLDB is still suitable for evaluation purposes, but the risk can only be eliminated by switching databases. External databases may also provide superior speed and scalability.

Selecting an External Database

The XML backup built into Confluence is not well suited for database migration for large data sets (see Product Backup Strategy). Choose your database wisely. If you need to migrate later, Atlassian support will refer you to a third party database migration tool. Vote for CONF-12599 to add a more robust strategy for large implementation migrations.

Below is more information on selecting and migrating to an external database:

- Migrating to a Different Database
- List Of Supported Databases

Configuring Database Character Encoding

Configuring Database Character Encoding

The database used with Confluence should be configured to use the same character encoding as Confluence. The recommended encoding is Unicode UTF-8.

There are two places where character encoding may need to be configured:

- when creating the database
- when connecting to the database (JDBC connection URL or properties).

The configuration details for each type of database are different. Some examples are below.

On this page:

- JDBC connection settings
- Creating a UTF-8 database
- Updating existing database to UTF-8

⚠️ The information on this page does not apply to Confluence OnDemand.

JDBC connection settings

MySQL

Append "useUnicode=true to your JDBC URL:

```
jdbc:mysql://hostname:port/database?useUnicode=true&characterEncoding=utf8
```
If you are modifying `confluence.cfg.xml` directly rather than via the Confluence Installation GUI, you'll need to escape out the & in the URL string as this is a reserved XML token and will break the syntax when the XML is parsed. An effective URL could be similar to:

```xml
<property
    name="hibernate.connection.url">jdbc:mysql://hostname:port/database?useUnicode=true&amp;characterEncoding=utf8</property>
```

### Creating a UTF-8 database

**MySQL**

1. Create a UTF-8 database with binary UTF-8 collation.
   - Binary UTF-8 provides case-sensitive collation.
   ```sql
   CREATE DATABASE confluence CHARACTER SET utf8 COLLATE utf8_bin;
   ```

2. You will also need to set the `Server Character set` to utf8. This can be done by adding the following in `my.ini` for Windows or `my.cnf` for other OS. It has to be declared in the Server section, which is the section after `[mysqld]`:
   ```ini
   [mysqld]
   default-character-set=utf8
   ```

3. Use the `status` command to verify database character encoding information.
In some cases, the individual tables collation and character encoding may differ from the one that the database as a whole has been configured to use. Please use the command below to ensure all tables within your Confluence database are correctly configured to use UTF-8 character encoding and binary UTF-8 collation:

```
use confluence;
show table status;
```

Check for the value listed under the **Collation** column, to ensure it has been set to `utf8_bin` (that is, case-sensitive) collation for all tables.

If not, then this can be changed by the following command, executed for each table in the Confluence database:

```
ALTER TABLE tablename CONVERT TO CHARACTER SET utf8 COLLATE utf8_bin;
```

Please substitute the `<tablename>` above, with each table within the confluence database.

Relevant MySQL manual for more detailed explanation:

- Specifying Character Sets and Collations documentation.
- Connection Character Sets and Collations.
- SHOW TABLE STATUS Syntax.
- ALTER TABLE Syntax.
CREATE DATABASE confluence WITH ENCODING 'UNICODE';

Or from the command-line:

```
$ createdb -E UNICODE confluence
```

For more information see the [PostgreSQL documentation](https://www.postgresql.org/).

**For PostgreSQL running under Windows**

Please note that international characters sets are only fully supported and functional when using PostgreSQL 8.1 and above under Microsoft Windows.

**For PostgreSQL running under Linux**

Please make sure you check the following to ensure proper handling of international characters in your database.

When PostgreSQL creates an initial database cluster, it sets certain important configuration options based on the host environment. The command responsible for creating the PostgreSQL environment `initdb` will check environment variables such as `LC_CTYPE` and `LC_COLLATE` (or the more general `LC_ALL`) for settings to use as database defaults related to international string handling. As such it is important to make sure that your PostgreSQL environment is configured correctly before you install Confluence.

To do this, connect to your PostgreSQL instance using `pgsql` and issue the following command:

```
SHOW LC_CTYPE;
```

If `LC_CTYPE` is set to either "C" or "POSIX" then certain string functions such as converting to and from upper and lower case will not work correctly with international characters. Correct settings for this value take the form `<LOCALE>.<ENCODING>` (en_AU.UTF8 for example).

If your `LC_CTYPE` is incorrect please check the [PostgreSQL documentation](https://www.postgresql.org/) for information on configuring database localisation. It is not easy to change these settings with a database that already contains data.

**Updating existing database to UTF-8**

**MySQL database with existing data**

⚠️ For an existing database

If you're using a existing database, confirm the Character Encoding by executing the query:

```
SHOW VARIABLES LIKE 'character%';
```

and

```
SHOW VARIABLES LIKE 'collation%';
```

The results should be UTF-8.

**For PostgreSQL running under Windows**

Please note that international characters sets are only fully supported and functional when using PostgreSQL 8.1 and above under Microsoft Windows.

**For PostgreSQL running under Linux**

Please make sure you check the following to ensure proper handling of international characters in your database.

When PostgreSQL creates an initial database cluster, it sets certain important configuration options based on the host environment. The command responsible for creating the PostgreSQL environment `initdb` will check environment variables such as `LC_CTYPE` and `LC_COLLATE` (or the more general `LC_ALL`) for settings to use as database defaults related to international string handling. As such it is important to make sure that your PostgreSQL environment is configured correctly before you install Confluence.

To do this, connect to your PostgreSQL instance using `pgsql` and issue the following command:

```
SHOW LC_CTYPE;
```

If `LC_CTYPE` is set to either "C" or "POSIX" then certain string functions such as converting to and from upper and lower case will not work correctly with international characters. Correct settings for this value take the form `<LOCALE>.<ENCODING>` (en_AU.UTF8 for example).

If your `LC_CTYPE` is incorrect please check the [PostgreSQL documentation](https://www.postgresql.org/) for information on configuring database localisation. It is not easy to change these settings with a database that already contains data.

**Updating existing database to UTF-8**

**MySQL database with existing data**

⚠️ For an existing database

If you're using a existing database, confirm the Character Encoding by executing the query:

```
SHOW VARIABLES LIKE 'character%';
```

and

```
SHOW VARIABLES LIKE 'collation%';
```

The results should be UTF-8.
Before proceeding with the following changes, please **backup your database**.

This example shows how to change your database from latin1 to utf8.

1. Dump the database to a text file using `mysqldump` tool from the command-line:
   ```bash
   mysqldump -p --default-character-set=latin1 -u <username> --skip-set-charset confluence > confluence_database.sql
   ``

2. **copy** `confluence_database.sql` to `confluence_utf8.sql`

3. Open `confluence_utf8.sql` in a text editor and change all character sets from 'latin1' to 'utf8'

4. Encode all the latin1 characters as UTF-8:
   ```bash
   recode latin1..utf8 confluence_utf8.sql
   ```
   (the recode utility is described at [http://directory.fsf.org/recode.html](http://directory.fsf.org/recode.html); it can actually be downloaded from [http://recode.progiciels-bpi.ca/](http://recode.progiciels-bpi.ca/), and is available for Ubuntu via `apt-get`)

In MySQL:

1. DROP DATABASE confluence;
2. CREATE DATABASE confluence CHARACTER SET utf8 COLLATE utf8_bin;

Finally, reimport the UTF-8 text file:

1. `mysql -u <username> -p --default-character-set=utf8 --max_allowed_packet=64M confluence < /home/confluence/confluence_utf8.sql`

To support large imports, the parameter `--max_allowed_packet=64M` used above sets the maximum size of an SQL statement to be very large. In some circumstances, you may need to increase it further, especially if attachments are stored in the database.

Testing database encoding

See [Troubleshooting Character Encodings](#) for a number of tests you can run to ensure your database encoding is correct.

**RELATED TOPICS:**

- [Character encodings in Confluence](#)
- [Known Issues for MySQL](#)
- [Database Setup Guides](#)
  - [Database JDBC drivers](#)
  - [Database Setup for Oracle](#)
  - [Database Setup for SQL Server](#)
  - [Database Setup For Any External Database](#)
  - [Database Setup for PostgreSQL](#)
  - [Database Setup For MySQL](#)

**Database JDBC drivers**

The JDBC drivers for all databases currently supported for Confluence are linked below. You will need to make the driver available to your application server, as described in the appropriate setup guide.

ℹ️ Please note, we bundle a number of JDBC drivers with Confluence, as shown below. You do not have to download or install the drivers for the relevant databases, **if you are using a direct JDBC connection**. If you are connecting via a datasource, you will still need to download and install the drivers manually.

**JDBC Driver Download Links**
Database Setup for Oracle

This guide covers deploying the Confluence or Confluence WAR distributions with an Oracle database.

⚠️ This database can only be set up by an Oracle database administrator (DBA)

If you are not a DBA, you should not attempt to set up this database.

Oracle has a history of being extremely difficult to set up. If you do not have access to an experienced Oracle DBA in your organisation, you are recommended to select any free, scalable and easy-to-install alternative rather than proceeding with Oracle. Users evaluating Confluence are recommended to start with an alternative database and only consider migrating to Oracle after approval from their DBA. Atlassian's technical support for Oracle setup difficulties will also reflect the high minimum skill requirements for attempting an Oracle setup.

Database Setup Information

This setup guide must be used in conjunction with the list of Known Issues For Oracle. Please review that page before continuing.

Schema Requirements

Confluence can be deployed to a schema in any Oracle instance.

Database Compatibility

Please refer to Supported Platforms for information about supported database versions. If your version of Oracle is not supported, please upgrade to a supported version before installing Confluence.

Check your database drivers, to see if you need an update.

- For Oracle 11.1, use the 10.2.0.4 or 11.1.0.7.0 driver (Java 6 ojdbc6.jar).
- For Oracle 11.2, use the 11.2.0.1.0 driver (Java 6 ojdbc6.jar).

Tip: search for the jar filename on the download site.
Check that your version of Oracle does not have any known issues:

<table>
<thead>
<tr>
<th>Oracle Version</th>
<th>Oracle Driver</th>
<th>Issue</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Pre 10g</td>
<td>Driver incompatibilities</td>
<td>Upgrade to latest 10g drivers if compatible</td>
</tr>
</tbody>
</table>

You may be also interested in the relevant JIRA documentation to check the compatibility of your Oracle server and driver.

**Deploying Confluence with Oracle**

Complete the instructions for installing Confluence, then return to this document instead of proceeding to the Confluence Setup Guide.

**Database Preparation**

Tailor these instructions to your particular database version:

1. Perform any necessary database or driver upgrades. Download the latest compatible database drivers. See the Oracle JDBC driver FAQ.
2. Create a Confluence user and grant the following permissions to the user:

   ```
   grant connect to <user>;
   grant resource to <user>;
   ```

   Do not grant the database user the select any table permission, or it can cause problems with other schemas. See CONF-3613 for a report.

**Adding a Datasource to Tomcat**

1. Open `<INSTALL>/conf/server.xml` for editing.
2. Locate the section Host -> Context

   ```
   <Host name="localhost" debug="0" appBase="webapps" unpackWARs="true" autoDeploy="false">
     <Context path="" docBase="../confluence" debug="0" reloadable="true">
       <!-- Logger is deprecated in Tomcat 5.5. Logging configuration for Confluence is specified in confluence/WEB-INF/classes/log4j.properties -->
       <Manager pathname="/" />
     </Context>
   </Host>
   ```

3. Paste in the Resource section provided, before Manager as shown:
<Host name="localhost" debug="0" appBase="webapps" unpackWARs="true" autoDeploy="false">
    <Context path="" docBase="../confluence" debug="0" reloadable="true">
        <!-- Logger is deprecated in Tomcat 5.5. Logging configuration for Confluence is specified in confluence/WEB-INF/classes/log4j.properties -->
        <Resource name="jdbc/confluence" auth="Container" type="javax.sql.DataSource" driverClassName="oracle.jdbc.OracleDriver" url="jdbc:oracle:thin:@hostname:port:sid" username="<username>" password="<password>" connectionProperties="SetBigStringTryClob=true" maxActive="25" maxIdle="5" maxWait="10000" />
    </Context>
</Host>

4. Change the username and password to match the Oracle login.
5. Change url to match hostname, port and sid of the Oracle server. Note that sid stands for the Schema ID. For example:

    jdbc:oracle:thin:@example.atlassian.com:1521:confluencedb

For connecting to an Oracle RAC cluster, you'll need to edit the connection string using Oracle's connection syntax like this:

    jdbc:oracle:thin:@(DESCRIPTION=
        (SDU=32768)
        (enable=broken)
        (LOAD_BALANCE=yes)
        (FAILOVER=yes)
        (ADDRESS=
            (PROTOCOL=TCP)
            (HOST=dbserver1.example.com) (PORT=1525))
        (ADDRESS=
            (PROTOCOL=TCP)
            (HOST=dbserver2.example.com) (PORT=1525))
        (CONNECT_DATA=
            (SERVICE_NAME=CONFDB)))
This example has been broken up over multiple lines for clarity, but it should be compacted into a single line.

6. If required, choose different maxActive and maxIdle values. These set how many total database connections will be allowed at one time, and how many will be kept open even when there is no database activity.

Configuring Confluence Datasource Access

Configure Confluence to use this datasource:

1. Edit the file <INSTALL>/confluence/WEB-INF/web.xml
2. Go to the end of the file and just before </web-app>, insert the following:

   <resource-ref>
   <description>Connection Pool</description>
   <res-ref-name>jdbc/confluence</res-ref-name>
   <res-type>javax.sql.DataSource</res-type>
   <res-auth>Container</res-auth>
   </resource-ref>

3. Download the Oracle JDBC database drivers for your JDK version via the Database JDBC drivers page. We recommend using the thin drivers only. Copy the JAR file into <confluence install>/WEB-INF/lib. This directory path is potentially <INSTALL>/lib if Confluence is running off Apache Tomcat version 6 or above.

Running the Confluence Setup Wizard

Now Confluence is ready to attempt to connect to Oracle:

1. Startup Confluence using <INSTALL>/bin/startup.bat or <INSTALL>/bin/startup.sh
2. Insert your licence and select External Database.
3. Select Datasource Connection using your Oracle version.
4. Enter java:comp/env/jdbc/confluence for the name of the datasource.

Confluence should now deploy using the Oracle database specified. Please read this comment on Oracle database optimisation.

Oracle Configuration Tips

24-hour time format with Oracle 8i

We have received a report from a user that when an Oracle 8i database is configured to use 24-hour time as the default format, an exception like this may occur:

005-12-06 13:23:20 Loading root WebApplicationContext

2005-12-06 13:24:34 StandardContext[]: Exception sending context initialized event to listener instance
of class
com.atlassian.confluence.util.ConfluenceContextLoaderListener

org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'userAccessor' defined in class path resource [applicationContext.xml]:
Can't resolve reference to bean 'userAccessorTarget' while setting property 'target';
nested exception is
org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'userAccessorTarget' defined in class path resource [applicationContext.xml]: Can't resolve reference to bean 'spacePermissionManager' while setting property 'spacePermissionManager';
nested exception is
org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'spacePermissionManager' defined in class path resource [securityContext.xml]: Can't resolve reference to bean 'spacePermissionManagerTarget' while setting property 'target';
nested exception is
org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'spacePermissionManagerTarget' defined in
class path resource [securityContext.xml]:
Initialization of bean failed;
nested exception is
org.springframework.jdbc.UncategorizedSQLException: (Hibernate operation):
encountered SQLException [Cannot create PoolableConnectionFactory];
nested exception is
org.apache.commons.dbcp.SQLNestedException: Cannot create PoolableConnectionFactory
...
org.apache.commons.dbcp.SQLNestedException: Cannot create PoolableConnectionFactory,
cause:

java.sql.SQLException: ORA-00604: error occurred at recursive SQL level 1
ORA-12705: invalid or unknown NLS parameter value specified

One symptom of this problem is that Confluence may refuse to start after midday.

The workaround is to go to 'General Configuration' and set the default time format to "HH:mm".

**RELATED TOPICS**

- Known Issues For Oracle
- Database Setup for SQL Server

Use this guide in conjunction with the more general Database Setup Guide for Any Database. These instructions add some reference notes specific to SQL Server.

1. Review the known issues for SQL Server.
2. Identify which character encoding to use. To do this, check the encoding currently used by your application server and Confluence. All three must use compatible encoding. For example, the default SQL Server encoding of USC-2 is compatible with UTF-8.
3. Create a new database (as an SQL administrator). If you set your application server and Confluence to use an encoding incompatible with USC-2, specify that character encoding for the database.
4. Set the default collation for the database to be 'SQL_Latin1_General_CP1_CS_AS' (case sensitive). You can do this by issuing the following SQL query:

   ```sql
   ALTER DATABASE <database_name> COLLATE SQL_Latin1_General_CP1_CS_AS
   ```

5. Configure the database to use the isolation level, Read Committed with Row Versioning. You can do this by issuing the following SQL query:

   ```sql
   ALTER DATABASE <database_name>
   SET READ_COMMITTED_SNAPSHOT ON
   WITH ROLLBACK IMMEDIATE;
   ```

6. Create a new SQL user account for Confluence (as an SQL administrator). Provide full create, read and write permissions for the database tables. Please note, Confluence must be able to create its own schema.
7. Install the database drivers, if needed:

   - **SQL Server JDBC Drivers bundled with Confluence**
     The JDBC drivers for this database are bundled with Confluence. You do not have to download or install any JDBC drivers to use this database with Confluence, if you are using a direct JDBC connection. If you are connecting via a datasource, you will still need to download and install the drivers manually. See [Database JDBC drivers](#) for more information on the bundled JDBC drivers.
     - If you're not sure which connection you're using, it's most likely JDBC. A JNDI resource must be configured manually, as described in [Configuring a MySQL Datasource in Apache Tomcat](#).
   - If you are configuring a datasource to connect to your MS SQL server database, you will need to...
place the jar file in `<confluence install>/WEB-INF/lib` (for Confluence 2.10 onwards) or `<confluence install>/common/lib` (for earlier versions). Information and links to the appropriate database drivers are available on Database JDBC drivers. You may also find this page helpful: http://jtds.sourceforge.net/faq.html

8. Start Confluence and visit the home URL (e.g. http://localhost:8090) to start the Confluence Setup Wizard and select a Custom Install, insert the relevant connection information.
   - When prompted for a **driver class name** in the database setup step enter:
     
     ```
     net.sourceforge.jtds.jdbc.Driver
     ```
   - When prompted for the **jdbc url**, the format to use is:
     
     ```
     jdbc:jtds:sqlserver://<server>:<port>/<database>
     ```

### Configuring a SQL Server Datasource in Apache Tomcat

This page contains instructions on how to set up an SQL Server datasource connection for Confluence or Confluence EAR/WAR.

**On this page:**

- 1. Install the Driver
- 2. Shut down Tomcat
- 3. Configure Tomcat
- 4. Configure the Confluence web application
- 5. Configure Confluence

**1. Install the Driver**

2. After unpacking the file you have downloaded, you'll find a file called something like `jtds-1.2.5.jar` (whatever is the latest version).
3. Copy this file into the `common/lib` directory of your Tomcat installation. Be aware that this directory may be just `lib` for Tomcat version 6 and beyond (i.e. `<tomcat-install>/lib` rather than `<tomcat-install>/common/lib`).

   ✅ Alternatively you can get the driver from `/confluence/WEB-INF/lib/jtds-1.2.2.jar` and move it into the `common/lib` directory of your Tomcat installation.

**2. Shut down Tomcat**

1. Run `bin/shutdown.sh` or `bin/shutdown.bat` to bring Tomcat down while you are making these changes.

   ✅ Make a backup of your `<CONFLUENCE_HOME>/confluence.cfg.xml` file and your `<CONF LUENCE_INSTALL>/conf/server.xml` file so you can easily revert should there be a problem.

**3. Configure Tomcat**

1. Firstly, you need to edit `<confluence install>/conf/server.xml` and find the following lines:
1. Within the Context tags, directly after the opening `<Context.../>` line, insert the DataSource Resource tag:

```
<Context path="" docBase="../confluence" debug="0" reloadable="true">

<!-- Logger is deprecated in Tomcat 5.5. Logging configuration for Confluence is specified in confluence/WEB-INF/classes/log4j.properties -->

Within the Context tags, directly after the opening `<Context.../>` line, insert the DataSource Resource tag:

```
<Resource name="jdbc/confluence" auth="Container"
   type="javax.sql.DataSource"
   username="yourDatabaseUser"
   password="yourDatabasePassword"
   driverClassName="net.sourceforge.jtds.jdbc.Driver"
   url="jdbc:jtds:sqlserver://localhost:1433/yourDatabaseName"
   maxActive="20"
   maxIdle="10"
   validationQuery="select 1" />
```

- Replace the username and password parameters with the correct values for your database
- In the url parameter, replace the word 'yourDatabaseName' with the name of the database your confluence data will be stored in.

**Why is the validationQuery element needed?**

When a database server reboots, or there is a network failure, all the connections in the connection pool are broken and this normally requires a Application Server reboot.

However, the Commons DBCP (Database Connection Pool) which is used by the Tomcat application server can validate connections before issuing them by running a simple SQL query, and if a broken connection is detected, a new one is created to replace it. To do this, you will need to set the "validationQuery" option on the database connection pool.

**If switching from a direct JDBC connection to datasource, you can find the above details in your `<CONFLUENCE_HOME>/confluence.cfg.xml` file.**
The configuration properties for Tomcat's standard data source resource factory (org.apache.tomcat.dbcp.dbcp.BasicDataSourceFactory) are as follows:

- `driverClassName` — Fully qualified Java class name of the JDBC driver to be used.
- `maxActive` — The maximum number of active instances that can be allocated from this pool at the same time.
- `maxIdle` — The maximum number of connections that can sit idle in this pool at the same time.
- `maxWait` — The maximum number of milliseconds that the pool will wait (when there are no available connections) for a connection to be returned before throwing an exception.
- `password` — Database password to be passed to our JDBC driver.
- `url` — Connection URL to be passed to our JDBC driver. (For backwards compatibility, the property `driverName` is also recognized.)
- `user` — Database username to be passed to our JDBC driver.
- `validationQuery` — SQL query that can be used by the pool to validate connections before they are returned to the application. If specified, this query MUST be an SQL SELECT statement that returns at least one row.

4. Configure the Confluence web application

1. Edit `/confluence/WEB-INF/web.xml` in your confluence installation
2. Go to the end of the file and just before `</web-app>`, insert the following:

```xml
<resource-ref>
  <description>Connection Pool</description>
  <res-ref-name>jdbc/confluence</res-ref-name>
  <res-type>javax.sql.DataSource</res-type>
  <res-auth>Container</res-auth>
</resource-ref>
```

5. Configure Confluence

- **If you have not yet set up Confluence**
  1. Follow the steps in the Confluence Setup Guide
  2. In the Database Setup section, choose the "Datasource Connection" option.
  3. Set the JNDI name to `java:comp/env/jdbc/confluence`
  4. Set the Database dialect to SQL Server.

- **If you are changing an existing Confluence installation over to using a Tomcat datasource**
  1. Edit the `<confluence home>/confluence.cfg.xml` file
  2. Delete any line that contains a property that begins with hibernate.
  3. Insert the following at the start of the `<properties>` section.

```xml
<property name="hibernate.setup">true</property>
<property name="hibernate.dialect">net.sf.hibernate.dialect.SQLServerIntIdialect</property>
<property name="hibernate.connection.datasource">java:comp/env/jdbc/confluence</property>
```

4. Restart Confluence.

Configuring a MySQL Datasource in Apache Tomcat

Database Setup For Any External Database

If you are using Confluence in a production environment, data should be stored in an external database. The embedded database is bundled for evaluation purposes and does not offer full transactional integrity in the event of sudden power loss.

This document provides instructions for setting up Confluence for use with a production-ready database. It covers both migration from an evaluation installation of Confluence and installation of an empty database during initial setup. The following specific database guides have additional information:

- PostgreSQL Guide
- MySQL Guide
- Oracle Guide
- SQL Server

Preparation

Install the following on the Confluence server:

- Database administration tool, for example DBVisualizer
- JDBC database drivers
- The database server (unless accessed remotely)

The instructions refer to two particular directories:

- The `<Confluence Installation Directory>` is the directory where you unpacked the Confluence download.
- The `<Confluence Home Directory>` is the directory where Confluence stores its data, which you set by editing the `confluence-init.properties` file in `Confluence Installation Directory/confluence/WEB-INF/classes`.

Database Setup

Create the schema and setup permissions:

1. Visit the Database Configuration page to review any known issues and database setup for your database.
2. Create a new schema using the correct database encoding.
3. Create a user with full read/write access to the Confluence schema, including the ability to create tables.
4. If the database only permits users to log in from approved hosts (e.g. localhost), grant database access permission for the Confluence server.
5. If the database is hosted remotely to the Confluence server, set up any firewall permissions.
6. Test the connection by using the database administration tool installed on the Confluence server to log in to the database.

Migration From an Evaluation Instance of Confluence

Continue here if you are migrating from an evaluation instance with the built-in database. If you are installing Confluence for the first time, continue below.

Create Backups

To keep any existing Confluence content:
1. If you are already using an external database, use your database administration tool to create a full database backup.
2. Manually create an XML backup of Confluence under ‘Administration’ -> ‘Backup & Restore’. If you have less than 100MB of attachments, check ‘Backup attachments’ when creating the backup. If you have over 100MB of attachments, you should not check the ‘Backup attachments’ and instead you should manually copy the /attachments directory in your Confluence home to a backup location. This attachments directory will later be copied into the new home directory.
3. Download the backup file to a backup location.

**Database Connection Setup**

Set up Confluence's database connection:

1. Stop Confluence if it is already running.
2. The JDBC database drivers for your database must be available to the application server. You can skip this step if the drivers are already loaded.
   a. Copy the database driver JAR file into the lib directory. In Confluence this directory is /confluence/WEB-INF/lib. Other application servers will use a different path.
   b. If the application server does not support dynamic library loading, stop your application server.
3. Create a new Confluence home directory.
4. Open the WEB-INF/classes/confluence-init.properties file in your Confluence installation and change the confluence.home property to point to this new Confluence home directory.
5. Start up Confluence. Refer to the platform-specific installation instructions to learn how. You should be presented with the **Confluence setup wizard**. Enter your license information.
6. Select 'Custom install'.
7. Select a database from the drop down list.
8. Select Direct JDBC and then enter the username, password and database driver of the new database.
9. If you created a Confluence backup earlier and wish to restore it, import it into Confluence now.
10. Once the wizard is complete, if you did not check the 'Backup attachments', copy the backed up /attachments directory into the new Confluence home.

Troubleshooting External Database Connections

Database Setup for PostgreSQL

This document provides instructions for setting up Confluence for use with a PostgreSQL database. Please check the Known Issues for PostgreSQL before you start.

On this page:

- 1. Install PostgreSQL
- 2. Create a User and a Database
- 3. Configure Confluence to use the PostgreSQL Database
- Troubleshooting

1. Install PostgreSQL

To install PostgreSQL,
1. Download the database software and installer from the PostgreSQL download site and save it to your desktop. Choose the package that matches your operating system. Where available, choose the One Click Installer. These instructions assume you will use the One Click Installer. For example:
   - PostgreSQL One Click Installer for Windows.
   - PostgreSQL One Click Installer for Linux.
   - PostgreSQL One Click Installer for Mac OS X.

2. Run the installer. Please note the following information when installing PostgreSQL:
   - The password that you are prompted to provide during the installation process is for the 'postgres' account, which is the db root level account.
   - The default port for PostgreSQL is 5432. If you decide to change the default port, please ensure that your new port number does not conflict with any services running on that port. You will also need to remember to update all further mentions of db port.
   - Choose the locale that best fits your geographic location, when prompted to enter a locale.
   - Do not launch Stack Builder at the completion of the installer.

3. PostgreSQL is now installed on your machine.

2. Create a User and a Database

⚠ All screenshots below are taken from a PostgreSQL configuration on a Windows machine.

To create a PostgreSQL user and database,
1. Start the ‘pgAdmin III’ administration tool on your machine. The pgAdmin III administration console will display. The database user and database that will be used by Confluence are created via the ‘pgAdmin III’ tool.

2. Connect to the PostgreSQL server (e.g. double-click on the server name in the object browser). Enter a ‘postgres’ password when prompted.

3. Create a new user, i.e. login role (e.g. right-click ‘Login Roles’ in the object browser and select ‘New Login Role...’):
   - Enter a name and password for the new user.
   - Do not select any role privileges.

4. Create a database (e.g. right-click ‘Databases’ and select ‘New Database...’):
   - Enter a name for the new database.
   - Set the owner of the database to the user you created in the previous step.
   - Select ‘UTF8’ for ‘Encoding’.
Creating a User and Database via Linux command-line

If you are on Linux and do not have the above pgAdmin III administration tool, you can use the command line interface instead. Assuming that you are using the default installation directory of /opt/PostgreSQL/8.3/bin/, enter the following commands:

```
sudo -s -H -u postgres
# Create the Confluence user:
/opt/PostgreSQL/8.3/bin/createuser -S -d -r -P -E confuser
# Create the Confluence database:
/opt/PostgreSQL/8.3/bin/createdb -O confuser confluence
exit
```

3. Configure Confluence to use the PostgreSQL Database

Once you have installed and set up PostgreSQL, you will need to configure Confluence to use the PostgreSQL database.

To configure Confluence to use PostgreSQL,
1. **Install Confluence**, if you haven't done so already. Ensure that you download the Confluence distribution, not the evaluation installer.

2. Ensure that Confluence is stopped (for example, by ensuring that the application server or service which is running Confluence has been stopped or terminated).

3. Install the database drivers, if needed:

   **PostgreSQL JDBC Drivers bundled with Confluence**
   The JDBC drivers for this database are bundled with Confluence. You do not have to download or install any JDBC drivers to use this database with Confluence, **if you are using a direct JDBC connection**. If you are connecting via a datasource, you will still need to download and install the drivers manually. See Database JDBC drivers for more information on the bundled JDBC drivers.
   - If you’re not sure which connection you’re using, it’s most likely JDBC. A JNDI resource must be configured manually, as described in Configuring a MySQL Datasource in Apache Tomcat.

   Note: Confluence only bundles the JDBC 3 driver which will work under the 1.6 JVM. However, if you are using Java 6 and want to use the JDBC 4 driver, you can download it via Database JDBC drivers and install it as described below. You will need to remove the existing PostgreSQL JDBC 3 driver (e.g. postgresql-8.4-701.jdbc3), if you do want to use the JDBC 4 driver.

   - If you are configuring a datasource to connect to your PostgreSQL database, you will need to place the jar file in `<confluence install>/WEB-INF/lib` (for Confluence 2.10 onwards) or `<confluence install>/common/lib` (for earlier versions).
   Information and links to the appropriate database drivers are available on Database JDBC drivers.

   **Windows renames .jar extensions to .zip! Just rename it back to .jar. You’ll have to set your folder options to view hidden file extensions if you can’t rename it without changing the file type (Tools >> Folder Options >> View >> Uncheck “Hide Extensions for known file types.”**

4. Start Confluence and after entering your license code on the 'Confluence Setup Wizard' page, click 'Custom Installation'. The 'Choose a Database Configuration' page will display.
5. Select 'PostgreSQL' and click 'External Database'. The 'Configure Database' page will display.
6. Choose your desired database connection method (please note that if you choose to connect via datasource, you will need to install the appropriate database drivers as described in the previous step).
7. Enter your PostgreSQL database setup details (as defined in the previous step above):

   **Connecting to an SSL Database**
   Simply add `ssl=true` parameter in the Database URL, for example:

   ```
jdbc:postgresql://localhost:5432/confluence?ssl=true
```
If the server that is hosting the PostgreSQL database is not the same server as Confluence, then please ensure that the confluence server can contact the database server and also refer to the PostgreSQL documentation on how to set up `pg_hba.conf`. If the `pg_hba.conf` file is not set properly, remote communication to the PostgreSQL server will fail.

**Running SQL Queries**

For ongoing maintenance of your server, you can continue to use PGAdmin as your SQL browser.

**Troubleshooting**

- [Known Issues for PostgreSQL](#) contains common issues encountered when setting up your PostgreSQL database to work with Confluence.
- If you are unable to connect to the database from Confluence and they are on different machines, most likely you have a firewall in between the two machines or your `pg_hba.conf` file is misconfigured. Verify that your firewall is set to allow connections through 5432 or double check your hba configuration.
- If Confluence is complaining that it's missing a class file, you might have forgotten to place the jdbc driver in the WEB-INF/lib folder or possibly have placed it in the wrong folder.
- If none of the above describes your issue, please create a support ticket at [http://support.atlassian.com](http://support.atlassian.com) and be sure to include your logs (found in confluence-install/logs and confluence-data/logs).

**Configuring a PostgreSQL Datasource in Apache Tomcat**

This page contains instructions on how to set up an PostgreSQL datasource connection for Confluence or Confluence EAR/WAR.

**On this page:**

1. Install the Driver
2. Shut down Tomcat
3. Configure Tomcat
4. Configure the Confluence web application
5. Configure Confluence

1. Install the Driver

   2. Copy this file into the `common/lib` directory of your Tomcat installation. Be aware that this directory may be just `lib` for Tomcat version 6 and beyond (i.e. `<tomcat-install>/lib` rather than `<tomcat-install>/common/lib`).

   *If you are using Confluence 3.2.0 or later you can get the driver from `/confluence/WEB-INF/lib/postgresql-8.4-701.jdbc3.jar` and move it into the `common/lib` directory of your Tomcat installation.*

2. Shut down Tomcat
1. Run `bin/shutdown.sh` or `bin/shutdown.bat` to bring Tomcat down while you are making these changes.

   - Make a backup of your `<CONFLUENCE_HOME>/confluence.cfg.xml` file and your `<CONF
   LUENCE_INSTALL>/conf/server.xml` file so you can easily revert should there be a problem.

3. Configure Tomcat

   1. Firstly, you need to edit `<confluence install>/conf/server.xml` and find the following lines:

   ```
   <Context path="" docBase="../confluence" debug="0" reloadable="true">
   <!-- Logger is deprecated in Tomcat 5.5. Logging configuration
   for Confluence is specified in confluence/WEB-INF/classes/log4j.properties -->
   
   <Resource name="jdbc/confluence" auth="Container"
     type="javax.sql.DataSource"
     username="postgres"
     password="postgres"
     driverClassName="org.postgresql.Driver"
     url="jdbc:postgresql://localhost:5432/yourDatabaseName"
     maxActive="20"
     maxIdle="10"
     validationQuery="select 1" />
   ```

   - Replace the username and password parameters with the correct values for your database
   - In the url parameter, replace the word 'yourDatabaseName' with the name of the database your confluence data will be stored in.

   ```
   Why is the validationQuery element needed?
   When a database server reboots, or there is a network failure, all the connections in the
   connection pool are broken and this normally requires a Application Server reboot.
   However, the Commons DBCP (Database Connection Pool) which is used by the Tomcat
   application server can validate connections before issuing them by running a simple SQL
   query, and if a broken connection is detected, a new one is created to replace it. To do this,
   you will need to set the "validationQuery" option on the database connection pool.
   ```

   ```
   If switching from a direct JDBC connection to datasource, you can find the above details in
   your `<CONFLUENCE_HOME>/confluence.cfg.xml` file.
   ```
The configuration properties for Tomcat's standard data source resource factory (org.apache.tomcat.dbcp.dbcp.BasicDataSourceFactory) are as follows:

- **driverClassName** — Fully qualified Java class name of the JDBC driver to be used.
- **maxActive** — The maximum number of active instances that can be allocated from this pool at the same time.
- **maxIdle** — The maximum number of connections that can sit idle in this pool at the same time.
- **maxWait** — The maximum number of milliseconds that the pool will wait (when there are no available connections) for a connection to be returned before throwing an exception.
- **password** — Database password to be passed to our JDBC driver.
- **url** — Connection URL to be passed to our JDBC driver. (For backwards compatibility, the property driverName is also recognized.)
- **user** — Database username to be passed to our JDBC driver.
- **validationQuery** — SQL query that can be used by the pool to validate connections before they are returned to the application. If specified, this query MUST be an SQL SELECT statement that returns at least one row.

4. **Configure the Confluence web application**

   1. Edit `/confluence/WEB-INF/web.xml` in your confluence installation
   2. Go to the end of the file and just before `</web-app>`, insert the following:

   ```xml
   <resource-ref>
   <description>Connection Pool</description>
   <res-ref-name>jdbc/confluence</res-ref-name>
   <res-type>javax.sql.Datasource</res-type>
   <res-auth>Container</res-auth>
   </resource-ref>
   ```

5. **Configure Confluence**

   - **If you have not yet set up Confluence**
     1. Follow the steps in the [Confluence Setup Guide](#)
     2. In the Database Setup section, choose the "Datasource Connection" option.
     3. Set the JNDI name to `java:comp/env/jdbc/confluence`
     4. Set the Database dialect to Postgres.

   - **If you are changing an existing Confluence installation over to using a Tomcat datasource**
     1. Edit the `<confluence home>/confluence.cfg.xml` file
     2. Delete any line that contains a property that begins with hibernate.
     3. Insert the following at the start of the `<properties>` section.

   ```xml
   <property name="hibernate.setup"><![CDATA[true]]></property>
   <property name="hibernate.dialect"><![CDATA[net.sf.hibernate.dialect.PostgresSQLDialect]]></property>
   <property name="hibernate.connection.datasource"><![CDATA[java:comp/env/jdbc/confluence]]></property>
   ```

   4. Restart Confluence.

Configuring a MySQL Datasource in Apache Tomcat

Database Setup For MySQL

This page provides instructions for installing Confluence and the open-source MySQL database on Microsoft Windows, as well as how to set up and configure MySQL to work with Confluence. Additional instructions are also provided for migrating across any existing Confluence database content. Use this guide in conjunction with the more general Database Setup Guide for Any Database. These instructions add some important reference notes specific to MySQL.

**Please note the following points:**

- Throughout the instructions below, the Confluence Installation Directory refers to the directory where you extracted the Confluence zipped installer.
- The MySQL Database Setup procedure below will make modifications to your default MySQL Server settings. These modifications result in:
  1. The default collation (localisation) option being changed to `utf8_bin` (that is, case-sensitive binary UTF8), such that by default, all new database tables will be created with this type of case-sensitive collation.
  2. The default MySQL database storage engine being changed to 'InnoDB'.

On this page:

- 1. Install Confluence
- 2. Install MySQL Server
- 3. Set up your MySQL Database and User
- (Optional) 4. Back Up Confluence Data
- 5. Set Up your Database Connection
- Troubleshooting
- Related Documents

1. Install Confluence

Install Confluence if you have not done so already. Ensure that you download Confluence, not the evaluation installer.

2. Install MySQL Server

To install MySQL Server,

1. If you do not have an operational MySQL database server instance available, install 'MySQL Community Server' database server (version 5.0).
   The installation package can be downloaded from the MySQL download page or from the version 5.0 download page. Instructions for installing the MySQL 5.0 database server on Windows can found on the Installing MySQL on Windows page of the MySQL web site.
2. Run the 'MySQL Server Instance Config Wizard':

   a. At the start of the Config Wizard (or after having chosen Reconfigure Instance), choose Detailed Configuration.
   b. Choose the type of MySQL Server that best suits your hardware requirements. This will affect the MySQL Server's usage of memory, disk and CPU resources. Refer to the relevant MySQL documentation for further information.
   c. Choose 'Transactional Database Only' for the database usage step. This ensures that your MySQL database will use InnoDB as its default storage engine. It is highly recommended that you only use the InnoDB storage engine with Confluence. Avoid using the MyISAM storage engine as this can lead to data corruption.
   d. Set the InnoDB Tablespace settings to your requirements. (The default settings are acceptable).
   e. Set the approximate number of concurrent connections permitted that best suits your Confluence usage requirements. You can use one of the presets if desired or enter a number manually. Refer to the relevant MySQL documentation for further information.
   f. For the networking options, ensure the 'Enable TCP/IP Networking' and 'Enable Strict Mode' options are selected (default). Refer to the MySQL documentation on setting the networking and server SQL modes for further information.
   g. For the MySQL server instance's default character set option, choose 'Best Support For Multilingualism' (i.e. UTF-8).
   h. For the Windows configuration option, choose whether or not to install the MySQL Server as a Windows Service. If your hardware is going to be used as a dedicated MySQL Server, you may wish to choose the 'Install As Windows Service' (and Launch the MySQL Server automatically) options. Refer to the relevant MySQL documentation for further information.
   i. Finally, select the 'Modify Security Settings' option to enter and set your MySQL Server (root) access password.

3. Install the database drivers, if needed:

   MySQL JDBC Drivers bundled with Confluence
   The JDBC drivers for this database are bundled with Confluence. You do not have to download or install any JDBC drivers to use this database with Confluence, if you are using a direct JDBC connection. If you are connecting via a datasource, you will still need to download and install the drivers manually. See Database JDBC drivers for more information on the bundled JDBC drivers.
   - If you're not sure which connection you're using, it's most likely JDBC. A JNDI resource must be configured manually, as described in Configuring a MySQL Datasource in Apache Tomcat.

   • If you are configuring a datasource to connect to your MySQL database, you will need to place the jar file (i.e. mysql-connector-java-5.x.y-bin.jar where x.y depends on the driver version) in <confluence install>/WEB-INF/lib (for Confluence 2.10 onwards) or <confluence install>/common/lib (for earlier versions). Information and links to the appropriate database drivers are available on Database JDBC drivers.
4. Configure your MySQL server's settings by editing MySQL's my.cnf file (often named my.ini on Windows operating systems). Locate the [mysqld] section in the file and modify the following parameters:
   - Specify the default character set to be UTF-8:
     ```
     [mysqld]
     ...
     default-collation=utf8_bin
     character-set-server=utf8
     collation-server=utf8_bin
     default-character-set=utf8
     ...
     ```
   - Set the default storage engine to InnoDB:
     ```
     [mysqld]
     ...
     default-storage-engine=INNODB
     ...
     ```
   - Specify/increase the value of `max_allowed_packet` to be at least 32M:
     ```
     [mysqld]
     ...
     max_allowed_packet=32M
     ...
     ```

   (Refer to MySQL Option Files for detailed instructions on editing `my.cnf` and `my.ini`.)

5. Restart your MySQL server for the changes to take effect:
   - On Windows, use the Service Manager to restart the service.
   - On Linux, depending on your setup you will need to run either "/etc/init.d/mysqld stop", "/etc/init.d/mysql stop" or "service mysqld stop" followed by the same command with "stop" replaced with "start".
   - On Mac OS X, run "sudo /Library/StartupItems/MySQLCOM/MySQLCOM restart".

3. Set up your MySQL Database and User

   To create the database and user privileges,
1. Run the "mysql" command as a MySQL super user. The default is "root" with a blank password.
2. Create an empty Confluence database schema by running

   CREATE DATABASE confluence;

3. Create the Confluence database user by running

   GRANT ALL PRIVILEGES ON confluence.* TO 'confluenceuser'@'localhost' IDENTIFIED BY 'confluencepass';

Replace "confluenceuser" and "confluencepass" with a username and password of your choice. If Confluence is not running on the same server as your MySQL database server, replace "localhost" with the hostname or IP address of the Confluence server.

To support international languages in Confluence, you should verify that the newly created database is using UTF-8 encoding and re-examine the JDBC URL settings (configured in Stage 3).

For an existing database

If you're using a existing database, confirm the Character Encoding by executing the query:

   SHOW VARIABLES LIKE 'character%'; and SHOW VARIABLES LIKE 'collation%';.

The results should be UTF-8.

(Optional) 4. Back Up Confluence Data

This stage is only required if you have existing Confluence content you wish to transfer.

To back up your Confluence data,

1. Manually create an XML backup of Confluence under Administration -> Backup & Restore. If you have less than 100MB of attachments, check 'Backup attachments' when creating the backup. If you have over 100MB of attachments, you should not check the 'Backup attachments' and instead you should manually copy the /attachments directory in your Confluence home to another location. This attachments directory can then be copied into the new home directory as described later.
2. Download the backup file to a backups folder.

5. Set Up your Database Connection

To set up your Confluence MySQL database connection or to switch to using this external database,
1. Ensure that Confluence is stopped (for example, by ensuring that the application server or service which is running Confluence has been stopped or terminated).

2. If you haven't started Confluence yet, you can skip this step. If you have set up Confluence with the built-in (HSQLDB) database, edit Confluence Installation Directory_/confluence/WEB-INF/classes/confluence-init.properties and change the confluence.home property to point to a new directory. e.g. if you had

   ```
   confluence.home=c:/confluencedata
   ```

   You could change it to:

   ```
   confluence.home=c:/confluencedata_mysql
   ```

   This is your new Confluence Home Directory. (The name doesn't have to end in _mysql – that's just an example)

3. Start Confluence and set up the new configuration.
   a. Enter your license key and click the 'Custom Installation' button.
   b. Under the 'External Database' heading, select 'MySQL' from the dropdown list and click 'External Database'.
   c. On the next page, click 'Direct JDBC'.
   d. Enter confluenceuser in the User Name field, and the password you chose earlier in the Password field
   e. Click the Next button. If you get the error message Could not successfully test your database: : Server connection failure during transaction. Due to underlying exception: 'java.sql.SQLException: Access denied for user 'confluenceuser'@'localhost' (using password: YES)' verify that you have properly given the confluenceuser user all the right permissions when connecting from localhost.
   f. (optional) If you previously backed up your Confluence data, you can choose to restore it at the 'Load Content' page. Choose 'Restore From Backup', browse for the backup you created and restore it. Otherwise choose either the example or empty site as you wish.

**Troubleshooting**

- Known Issues for MySQL contains common issues encountered when setting up your MySQL database to work with Confluence.
- If Confluence is complaining that it's missing a class file, you might have forgotten to place the jdbc driver in the WEB-INF/lib folder or possibly have placed it in the wrong folder.
- If none of the above describes your issue, please create a support ticket at [http://support.atlassian.com](http://support.atlassian.com) and be sure to include your logs (found in confluence-install/logs and confluence-data/logs).

**Related Documents**

- Configuring Database Character Encoding
- Known Issues for MySQL

**Configuring a MySQL Datasource in Apache Tomcat**

This page tells you how to set up a MySQL datasource connection for Confluence or Confluence EAR/WAR.
1. Shut down Tomcat

1. Run `bin/shutdown.sh` or `bin/shutdown.bat` to bring Tomcat down while you are making these changes.
2. Make a backup of your `<CONFLUENCE_HOME>/confluence.cfg.xml` file and your `<CONFLUENCE_INSTALL>/conf/server.xml` file so that you can easily revert if you have a problem.

2. Install the Drivers

2. After unpacking the file you have downloaded, you will find a file called something like `mysql-connector-java-3.0.10-stable-bin.jar`.
3. Copy this file into the `common/lib` directory of your Tomcat installation. Be aware that this directory may be just `lib` for Tomcat version 6 and beyond (i.e. `<tomcat-install>/lib` rather than `<tomcat-install>/common/lib`).

3. Configure Tomcat

1. If you are using the Confluence distribution, edit the `conf/server.xml` file in your Tomcat installation. If you are running your own Tomcat instance, edit the XML file where you declared the Confluence Context descriptor.
2. If editing `conf/server.xml`, find the following lines:

   ```xml
   <Context path="" docBase="../confluence" debug="0" reloadable="true">
   <!-- Logger is deprecated in Tomcat 5.5. Logging configuration for Confluence is specified in confluence/WEB-INF/classes/log4j.properties -->
   <Resource name="jdbc/confluence" auth="Container" type="javax.sql.DataSource">
   <UserSelector class="org.apache.catalina.users.NoUserDirUserSelector"/>
   <JndiResource name="java:comp/env/jdbc/confluence" type="javax.sql.DataSource"/>
   <ResourceParameter name="jndiName" value="java:comp/env/jdbc/confluence" />
   <ResourceParameter name="type" value="com.mysql.jdbc.Driver" />
   <ResourceParameter name="url" value="jdbc:mysql://localhost:3306/confluence?useUnicode=true&characterEncoding=utf8" />
   <ResourceParameter name="maxActive" value="15" />
   <ResourceParameter name="maxIdle" value="7" />
   <ResourceParameter name="defaultTransactionIsolation" value="READ_COMMITTED" />
   <ResourceParameter name="validationQuery" value="Select 1" />
   <ResourceParameter name="username" value="yourusername" />
   <ResourceParameter name="password" value="yourpassword" />
   </Resource>
   </Context>
   ```

3. Within the `Context` tags, directly after the opening `<Context.../>` line, insert the `DataSource` Resource tag:

   ```xml
   <Resource name="jdbc/confluence" auth="Container" type="javax.sql.DataSource">
   <UserSelector class="org.apache.catalina.users.NoUserDirUserSelector"/>
   <JndiResource name="java:comp/env/jdbc/confluence" type="javax.sql.DataSource"/>
   <ResourceParameter name="jndiName" value="java:comp/env/jdbc/confluence" />
   <ResourceParameter name="type" value="com.mysql.jdbc.Driver" />
   <ResourceParameter name="url" value="jdbc:mysql://localhost:3306/confluence?useUnicode=true&characterEncoding=utf8" />
   <ResourceParameter name="maxActive" value="15" />
   <ResourceParameter name="maxIdle" value="7" />
   <ResourceParameter name="defaultTransactionIsolation" value="READ_COMMITTED" />
   <ResourceParameter name="validationQuery" value="Select 1" />
   <ResourceParameter name="username" value="yourusername" />
   <ResourceParameter name="password" value="yourpassword" />
   </Resource>
   ```

   - Replace the `username` and `password` parameters with the correct values for your database.
   - In the `url` parameter, replace the word 'confluence' with the name of the database your Confluence
data will be stored in.
- If you plan to use non-Latin characters, you will also need to add "&useUnicode=true&characterEncoding=utf8" on the end of the above URL. These options are not required for any database other than MySQL.

Notes
- If switching from a direct JDBC connection to datasource, you can find the above details in your <CONFLUENCE_HOME>/confluence.cfg.xml file.
- Why is the validationQuery element needed? When a database server reboots, or there is a network failure, all the connections in the connection pool are broken and this normally requires an application server reboot.

However, the Commons DBCP (Database Connection Pool) which is used by the Tomcat application server can validate connections before issuing them by running a simple SQL query, and if a broken connection is detected, a new one is created to replace it. To do this, you will need to set the "validationQuery" option on the database connection pool.

- The configuration properties for Tomcat's standard data source resource factory (org.apache.tomcat.dbcp.dbcp.BasicDataSourceFactory) are as follows:
  - driverClassName – Fully qualified Java class name of the JDBC driver to be used.
  - maxActive – The maximum number of active instances that can be allocated from this pool at the same time.
  - maxIdle – The maximum number of connections that can sit idle in this pool at the same time.
  - maxWait – The maximum number of milliseconds that the pool will wait (when there are no available connections) for a connection to be returned before throwing an exception.
  - password – Database password to be passed to our JDBC driver.
  - url – Connection URL to be passed to our JDBC driver. (For backwards compatibility, the property driverName is also recognized.)
  - user – Database username to be passed to our JDBC driver.
  - validationQuery – SQL query that can be used by the pool to validate connections before they are returned to the application. If specified, this query MUST be an SQL SELECT statement that returns at least one row.

4. Configure the Confluence Web Application
   1. Edit confluence/WEB-INF/web.xml in your Confluence installation.
   2. Go to the end of the file and insert the following element just before </web-app>:

   ```xml
   <resource-ref>
     <description>Connection Pool</description>
     <res-ref-name>jdbc/confluence</res-ref-name>
     <res-type>javax.sql.DataSource</res-type>
     <res-auth>Container</res-auth>
   </resource-ref>
   ```

5. Configure Confluence

If you have not yet set up Confluence:
   1. Follow the steps in the Confluence Setup Guide
   2. In the Database Setup section, choose the "Datasource Connection" option.
   3. Set the JNDI name to java:comp/env/jdbc/confluence
   4. Set the Database dialect to MySQL.

If you are changing an existing Confluence installation over to using a Tomcat datasource:
1. Find your ConfluenceHome directory (see: Confluence Home Directory if you don’t know where it is).
2. Edit the confluence.cfg.xml file
3. Delete any line that contains a property that begins with hibernate.
4. Insert the following at the start of the <properties> section.

   ```xml
   <property name="hibernate.setup"><![CDATA[true]]></property>
   <property name="hibernate.dialect"><![CDATA[net.sf.hibernate.dialect.MySQLDialect]]></property>
   <property name="hibernate.connection.datasource"> <![CDATA[java:comp/env/jdbc/conf
luence]]></property>
   ```

5. Restart Confluence

Run bin/startup.sh or bin/startup.bat to start Tomcat with the new settings.

RELATED TOPICS

**Database Setup For MySQL**

**Creating Database Schema Manually**

**Database Schema Creation**

This document provides information on how to find the SQL for database table creation.

Often, DBAs will require that table creation be done manually. To find the required SQL statements, you can use the script generated from our evaluation version's HSQLDB database.

- Install Confluence with no external database.
- Shut down Confluence.
- Find the file located in `<confluence-home>/database/confluencedb.script`

The `confluence-home` directory is not your installation directory, its the directory specified in `confluence-init.properties`. For more information, see Confluence Home Directory and Confluence Installation Directory.

To see some example SQL statements, click 'Tools' and select 'Attachments' on this wiki page.

To get Confluence to run against this established schema, configure the database with the normal procedure, then modify the hibernate.connection.url, username and password from `confluence-home/confluence.cfg.xml` or `server.xml`, depending on whether it's a direct jdbc or resoruce connection. This is described in Migrating Confluence Between Servers.

**RELATED TOPICS**

**Database Configuration**

**Migrate to Another Database**

**Limitations of Database Migration**

⚠️ The XML backup built into Confluence is not well suited for database migration for large data sets (see Production Backup Strategy for reference). If the procedures below do not work, use a commercial database migration tool.
Database Migration

This document outlines how to migrate your data from your existing database to another database. It is designed for migrating from an evaluation to a production database. Large data sets will require third party database migration tools. You should use this method when moving from the embedded DB to an external DB, or from one type of external DB to another (e.g. Oracle to Postgres).

If you are simply moving your DB from one server to another you can just change the JDBC URL in <confluence.home>/confluence.cfg.xml (if you are using a direct JDBC connection) or in the definition of your datasource (if you are connecting via a datasource).

There are two ways you can perform the migration:

1. Method one is the standard procedure.
2. For large installations of Confluence using version 2.2 or later: If the total size of attachments on your installation exceeds 500MB, use method two.

On this page:

- Method One - Standard Procedure
  - Step One: Backing up your data
  - Step Two: Configuring the Confluence Home Directory
  - Step Three: Setting up the new database
  - Step Four: Setting up Confluence with the new database
- Method Two - For large installations
  - Step One: Backing up your data
  - Step Two: Configuring the Confluence Home Directory
  - Step Three: Moving your attachments
  - Step Four: Setting up new database
  - Step Five: Setting up Confluence with the new database
- A Note about Case Sensitivity in your Database
- Troubleshooting

Method One - Standard Procedure

Step One: Backing up your data

1. Create a backup of your existing data. This is done from the Administration Console. Instructions on how to create a backup can be found here.
2. Shut down and backup the Confluence Home Directory.
3. If you are already using an external database, please make a backup of it using the utilities that were installed with it.

Note which plugins are currently installed/enabled, so that you can reinstate them later.

Step Two: Configuring the Confluence Home Directory

1. Create a new Confluence Home Directory. You can place this directory anywhere you like and give it a name of your choice.
2. Open WEB-INF/classes/confluence-init.properties file in your Confluence installation and change the confluence.home property to point to this new Confluence Home Directory.

Step Three: Setting up the new database

Perform the database setup instructions for your database.

Step Four: Setting up Confluence with the new database
If your databases are not already configured for Confluence, refer to Database Configuration to setup your database access.

1. Make sure that the JDBC drivers for your database are available to the application server. If you don’t already have the JDBC driver, please download one from here.
2. Make sure that your database is using a case-sensitive collation. Please refer to the section on case sensitivity below and see this issue for more details: CONF-7917.
3. If you are running the Confluence distribution, copy your JDBC database driver (a .jar file), into the <confluence-install>/lib folder.
4. Start up Confluence. You will see the Confluence Setup Wizard.
5. Select ‘Custom Install’.
6. Select your database from the drop down list.
7. Select ‘Direct JDBC’ and then enter the details of the new database you want to migrate to.
   
   - Read the documentation on the Setup Wizard for more detailed explanation.
8. When prompted, restore the contents of the backup you made in Step One into the new Confluence site.

Your old Confluence data will now be imported to your new database.

**Method Two - For large installations**

**Step One: Backing up your data**

1. Before proceeding with these instructions please check that:
   - you are upgrading from at least Confluence version 2.2 and your attachments are stored in the file system, and not in your database. (To migrate between attachment storage systems, please see Attachment Storage Configuration)
   - These instructions will not work if either of the above is not true.
2. From Confluence, go to Administration -> Backup & Restore and create a manual backup that excludes attachments.
3. Shut down and back up the Confluence Home Directory.
4. If you are already using an external database, please make a backup of it using the utilities that were installed with it.

**Step Two: Configuring the Confluence Home Directory**

1. Create a new Confluence Home Directory. You can place this directory anywhere you like and give it a name of your choice.
2. Open WEB-INF/classes/confluence-init.properties file in your Confluence installation and change the confluence.home property to point to this new Confluence Home Directory.

**Step Three: Moving your attachments**

Move the contents of your attachments directory from your old Confluence Home to your new Confluence Home.

**Step Four: Setting up new database**

Perform the database setup instructions for your database.

**Step Five: Setting up Confluence with the new database**

If your databases are not already configured for Confluence, refer to Database Configuration to setup your database access.

1. Make sure that the JDBC drivers for your database are available to the application server. If you don’t already have the JDBC driver, please download one from here.
2. Make sure that your database is using a case-sensitive collation. Please refer to the section on case sensitivity below and see this issue for more details: CONF-7917.
3. If you are running the Confluence distribution, copy your JDBC database driver (a .jar file), into the <confluence-install>/lib folder.
4. Start up Confluence. You will see the Confluence Setup Wizard.
5. Select 'Custom Install'.
6. Select your database from the drop down list.
7. Select 'Direct JDBC' and then enter the details of the new database you want to migrate to.
   Read the documentation on the Confluence Setup Wizard for more detailed explanation.
8. When prompted, restore the contents of the backup you made in Step One into the new Confluence site.

A Note about Case Sensitivity in your Database

'Collation' refers to a set of rules that determine how data is sorted and compared. Case sensitivity is one aspect of collation. Other aspects include sensitivity to kana (Japanese script) and to width (single versus double byte characters).

Case sensitive or case insensitive collation – how should you create your Confluence database? What about when you are migrating your existing Confluence instance from one database to another?

Setting up a New Confluence Instance

For new Confluence instances, we recommend using case sensitive collation for your Confluence database. This is the default collation type used by many database systems.

Note: Even if the database is configured for case sensitive collation, Confluence reduces all usernames to lower case characters before storing them in the database. For example, this means that 'joebloggs', 'joeBloggs', and 'JoeBloggs' will be treated as the same username.

Migrating an Existing Confluence Instance to a Different Database

The default Confluence configuration uses case sensitive database collation. This is typical of databases created under default conditions. If you are migrating from this type of configuration to a new database, we recommend that the new database uses case sensitive collation. If you use case insensitive collation, you may encounter data integrity problems after migration (for example, via an XML import) if data stored within your original Confluence site required case sensitive distinctions.

Troubleshooting

If you're unable to restore your XML backup, consult our Troubleshooting Guide.

RELATED TOPICS

No content found for label(s) database-configuration.

The Embedded HSQLDB Database

The Confluence installation includes an embedded HSQLDB database, supplied for the purpose of evaluating Confluence.

If you are using the embedded database, the database files are stored in the \database folder under your Confluence Home directory. See also Important Directories and Files.
Embedded Database is Not Suitable for Production Instances of Confluence

Production instances of Confluence should use an external database. When using the default HSQLDB database, you run the risk of unrecoverable data loss due to not being transaction safe.

- Corruption is occasionally encountered after sudden power loss and can usually be corrected using this data recovery procedure.
- HSQLDB is still suitable for evaluation purposes, but the risk can only be eliminated by switching databases. External databases may also provide superior speed and scalability.

RELATED TOPICS

Important Directories and Files
Database Configuration
Troubleshooting the Embedded Database (HSQL DB)

java.sql.SQLException: User not found: SA

Also see http://hsqldb.sourceforge.net/doc/guide/ch01.html#N101C2.

HSQLDB periodically must update its files to represent changes made in the database. In doing so, it must delete the current confluencedb.data file on the filesystem (beneath conf.home/database) and replace it with a new one.

If an administrator issues a shutdown on Confluence in this period, data can be lost, and is typically noticed by the error message, when starting Confluence up again, of 'User not found: SA'.

Users encountering this problem should seek to restore backups, contained in the backup directory beneath confluence.home. If daily backups have been turned off, and no other copy of data remains, the data is lost.

HSQLDB should not be used as a production database. It is included for evaluation purposes only.

Hibernate logging

It can be useful to enable detailed Hibernate logging when debugging problems with HSQL.

Connecting to the Embedded Database

Connecting to the Embedded HSQL Database can be quite difficult. You may need to connect to the database to retrieve information, or for troubleshooting purposes.

Please follow the instructions on how to connect to the embedded HSQL Database using the free Database Administration Tool DBVisualizer.

Connecting to HSQLDB using DBVisualizer

The purpose of this guide is to walk you through connecting to Confluence’s embedded Hypersonic SQL Database using the Database Administration tool DBVisualizer.

Below are step by step instructions on how to Configure DBVisualizer and connect it to HSQLDB.

Prerequisites

1. Download and install the latest copy of DBVisualizer.
2. You will also need to download a copy (preferably the latest version) of HSQLDB
3. Extract the contents of the HSQLDB archive
4. Ensure that Confluence is not running.

Connection Procedure

Please ensure that you read and follow the instructions below carefully.

⚠️ Remember to backup your `<confluence-home>/database` folder before attempting any modifications

1. Enter Connection Name

   1. Click on the icon highlighted in Red
   2. Enter an identifiable name for the connection. e.g. conf2.5.4-std

2. Select JDBC Driver

   1. From the drop down list select HSQLDB Embedded
2. Click on **Load Driver Files**
3. Browse to directory where the `HSQldb.jar` file is located. Confluence bundles this and it can be found at `<confluence-installation>/confluence/WEB-INF/lib/hsqldb-*.jar`.

3. **Select Database Path**
   1. Browse to your `<Confluence-Home>` directory
   2. Open the **Database** folder
   3. Select the `confluencedb.properties` file

4. **Enter Connection Details**

   ![Database Configuration Screenshot]

   - Press the **Finish** button to create and connect this database connection.

1. Remove the **".properties"** from the end of `confluencedb`
2. Type in `sa` for the username
3. Leave the password field blank

*refer to the example screenshot above if you are unsure*

5. **Connect to embedded Database**
1. Click on Test Connection to verify that the details are correct.
2. Click on "Finish" to complete the setup
3. Select the connection from the list on the left hand side.
4. You can now click on "Connect" to connect to the embedded database.

HSQL database manager

Alternatively, you can use HSQLDB's database manager. Just copy the value of hibernate.connection.url 1 in confluence.cfg.xml as the URL and you're good to go.

Database Tables Reference

Below is a diagram of the Table References in Confluence (2.5.4).

This may be useful for Database Administrators that need to manually create the Database tables.
Troubleshooting External Database Connections

A common administration issue when configuring Confluence is identifying database connectivity problems. This page tells you about a helper utility, in the form of a JSP page, that can help you to isolate database connectivity issues. It checks whether you can connect to a database with your application server. If your application server cannot connect to the database, Confluence will not be able to connect to the database either.

Introduction to the Atlassian Database Check Utility

You can use this utility to:

- Check that your application server can successfully query your database, either via immediate JDBC connectivity or a datasource in the context of your application server.
- Pinpoint problems in your configuration which may occur if the above is failing.

This is what the utility does:

- Check that a JDBC driver can be loaded into memory and view what is already loaded.
- Connect to a JDBC URL and do a 'select 1' from the database.
- Find a DataSource in the JNDI environment and do the above.
- View the System classpath (to ensure that the JDBC JAR file is there).

Using the Utility

If you have already set up Confluence completely

1. Download the attached testdatabase.jsp to your <confluence-install>/confluence directory.
2. Restart Confluence.
4. Check that your database driver is loaded into memory. If not, check the system classpath for the JDBC driver file, and that the driver is in the <confluence-install>/lib directory (for Confluence version 2.10 onwards) or <confluence-install>/common/lib (for earlier versions). Here are some instructions.
5. Enter the DB settings Confluence is using and test the database. If an error appears, check that the db service is running, the location matches, and that any users specified actually exist with the right login and permissions. You may be able to find a workaround by Googling the error.

If you cannot set up Confluence because of an error in ‘Configuring Database’

1. Record the DB settings you are using for your direct JDBC or datasource connection in the ‘Configure Database’ step of your setup.
2. Download the attached testdatabase.jsp to your <confluence-install>/confluence directory.
3. Rename your <confluence-install>/confluence/Web-INF/web.xml file to backup web.xml. This disables redirection.
4. Restart Confluence.
6. Check that your database driver is loaded into memory. If not, check the system classpath for the JDBC driver file, and that the driver is in the <confluence-install>/common/lib directory as described in these instructions.
7. Enter the DB settings you recorded and test the database. If an error appears, check that the db service is running, the location matches, and that any users specified actually exist with the right login and permissions. You may be able to find a workaround by Googling the error.
8. After correcting the error, rename <confluence-install>/confluence/Web-INF/backup web.xml back to web.xml.

Notes

If you use this utility, please let us know ways in which we could improve it or leave helpful hints for others here.
For a comprehensive set of database instructions that might be helpful for troubleshooting, please refer to the following links:

- PostgreSQL
- MySQL

**Requesting Technical Support**

If you are still stuck after attempting the suggestions above, [lodge a free technical support request](#) with information on your database setup.

### Configuring database query timeout

If database queries are taking too long to perform, and your application is becoming unresponsive, you can configure a timeout for database queries. There is no default timeout in Confluence.

To configure a database query timeout, do the following on your test server:

1. Shut down Confluence.

2. Extract `databaseSubsystemContext.xml` from the `confluence-x.x.x.jar` that is in `confluence/WEB-INF/lib/`, and put a copy in `confluence/WEB-INF/classes/`.

3. Edit `confluence/WEB-INF/classes/databaseSubsystemContext.xml` to add the `defaultTimeout` property to the "transactionManager" bean:

```xml
<bean id="transactionManager" class="org.springframework.orm.hibernate.HibernateTransactionManager">
  <property name="sessionFactory">
    <ref bean="sessionFactory"/>
  </property>
  <property name="defaultTimeout" value="120"/>
</bean>
```

The timeout is measured in seconds and will forcibly abort queries that take longer than this. In some cases, these errors are not handled gracefully by Confluence and will result in the user seeing the Confluence error page.

4. Start Confluence.

Once the timeout is working properly in your test environment, migration the configuration change to Confluence.

⚠️ You will need to reapply these changes when upgrading Confluence, as the original `databaseSubsystemContext.xml` file changes from version to version.

### Improving Database Performance

**Diagnosis**
Use native database tools to assess the impact of your database. If you'd like to check what Confluence is doing from its side, you can enable sql loggin. If you analyze thread dumps, as this is done in general Troubleshooting Confluence Hanging or Crashing guide, you may find the kinds of threads like this:

```
"http-8080-Processor150" daemon prio=1 tid=0x08543368 nid=0x11aa in Object.wait()
    [0x665a4000..0x665a51b0]
at  java.lang.Object.wait(Native Method)
   -  waiting on <0x83140488> (a
        com.mchange.v2.resourcepool.BasicResourcePool
    at
at
   -  locked <0x83140488> (a
        com.mchange.v2.resourcepool.BasicResourcePool
    }
```

These threads are waiting for a database connection. It could be that the database is not performing optimally, or it may just need tuning for allowing more connection threads. Both are discussed below.

**Upgrade your Database and Drivers**

SQL Server 2000, Oracle 9i, and MySQL with 3.1 drivers are among some of the issues with database performance. Ensure you are using updated versions of databases and their drivers.

**Upgrade your hardware**

Atlassian does not offer specific recommendations on hardware for database performance. Use good judgment and native OS and database tools for your assessment.

**Ensure you have the Latest Database Indices**

Confluence has improved database performance over time. You'll want to make sure you have all the latest, if you're getting hung threads waiting for db connections.

_Confluence 2.10 or Manual .ddl Indices_
With 2.10 and later, Confluence includes database indices bundled. Confluence 2.10 automatically creates the necessary database indexes when you upgrade. If you are not on 2.10, you may have run the ddl manually during the upgrade process. To check, you can look against these.

**Additional Indices not Included in 2.10**

- One import db index is the **lower case page title index**. Prior to Confluence 3.0, querying for a page by title and space key can take a long time due to table scans necessary on a lowercase where clause. On most databases it is possible to add a lowercase index on these columns that helps with performance. See [Creating a Lowercase Page Title Index](#) for instructions on how to do this. Prior to 2.10, apply lowercase title indexes (all Confluence versions).
- The compound database index for the ATTACHMENTDATA table is described in [CONF-13819](#).
- A composite index on some of the columns in SpacePermissions table is described in [CONF-14488](#).

**Tuning the Database Connection Pool**

This is described in the knowledge base article [Confluence Slows and Times out During Periods of High Load due to DB Connection Pool](#).

**Configure a Database Query Timeout**

If a database is getting overloaded, you can prevent it from crashing Confluence by [Configuring a Database Query Timeout](#).

**Related Articles**

[Troubleshooting Database Issues](#).

**Creating a Lowercase Page Title Index**

**Diagnosis**

Confluence sometimes has performance problems retrieving pages by title because the query uses the lower() function. For example, the query looks something like this:

```sql
select * from CONTENT where lower(TITLE) = :title and SPACEID = :spaceid
```

Database profiling might show a query like the following taking a long time to execute (emphasis added):

```sql
select ... from CONTENT page0_, SPACES space1_
where page0_.CONTENTTYPE='PAGE'
and ((lower(space1_.SPACEKEY)= @P0 and page0_.SPACEID=space1_.SPACEID)
and(lower(page0_.TITLE)= @P1 )
and(page0_.PREVVER is null )and(page0_.CONTENT_STATUS='current' ))
```

Typically, databases don't use indexes when you use a function in a where clause; they do a table scan instead. This makes the performance of this query not ideal ([CONF-11577](#)).

**Generic solution**

On many databases (e.g. Oracle, PostgreSQL, DB2 for z/OS), it is possible to create the index using the normal "create index" syntax, just using the function instead of the column name.
create index CONFTITLE_LOWER on CONTENT(lower(TITLE));

Sources:
- http://www.postgresql.org/docs/current/static/sql-createindex.html
- http://asktom.oracle.com/kyte/article1/

SQL Server

On SQL Server, you can add a computed column to the database table and then add an index on this column.

```sql
alter table CONTENT add TITLE_LOWER as lower(TITLE);
create index CONFTITLE_LOWER on CONTENT(TITLE_LOWER);
```

Sources:

MySQL

It is not currently possible to create a lowercase index on MySQL. Confluence 3.0 includes some caching improvements which should alleviate this performance problem on this database.

Source:

Workaround for MySQL databases, using a case-insensitive collation:

Please check whether your MySQL database has been set to use case-sensitive or case-insensitive collation. The queries to check whether your database is set to case-insensitive collation are:

```sql
show full columns from content where field = 'title';
show full columns from spaces where field = 'spacekey';
```

If the `collation_name` is returned as `<encoding>_ci`, the `ci` indicates case-insensitive collation.

If the database has been set to use case-insensitive collation, you can try removing `lower` from the following queries, in your `ContentEntityObject.hbm.xml` file residing in your `<Confluence-Install>/confluence/WEB-INF/lib/confluence-2.x.x.jar/com/atlassian/confluence/core/`:
<query name="confluence.page_findLatestBySpaceKeyTitle"><![CDATA[
    from Page page
    where lower(page.space.key) = :spaceKey

    lower(page.title) = :pageTitle and

    page.originalVersion is null and

    page.contentStatus = 'current'
]]></query>

<query name="confluence.page_findLatestBySpaceKeyTitleOptimisedForComments"><![CDATA[
    from Page page
    left join fetch page.comments as theComments

    left join fetch theComments.children

    where lower(page.space.key) = :spaceKey

    lower(page.title) = :pageTitle and

    page.originalVersion is null and

    page.contentStatus = 'current'
]]></query>

DB2 for Linux or Windows

DB2 supports indexes on generated columns which are used for queries with a matching predicate. You can implement it like this:
ALTER TABLE CONTENT ADD COLUMN TITLE_LOWER 
GENERATED ALWAYS AS (LOWER(TITLE));
CREATE INDEX CONFTITLE_LOWER ON

Apache and Apache Connector Tips

The speed of downloading attachments is extremely slow. We are experiencing the following speeds

Large file served directly through Apache: 15000 KB/sec
Large file served directly from Tomcat HTTP connector: 14500 KB/sec
Large file served from Confluence (using Apache/mod_jk/Tomcat): 84 KB/sec

You can see that the file served from Confluence is ~176 times slower!

Solution

We upgraded mod_jk from version 1.2.8 to 1.2.10 and the download speed improved significantly to ~12000 KB/sec.

Configure Web Proxy Support for Confluence

Some of Confluence's macros, such as {rss} and {jiraissues} need to make web requests to remote servers in order to retrieve data. If Confluence is deployed within a data-centre or DMZ, it may not be able to access the Internet directly to make these requests. If you find that the {rss} macro does not work, ask your network administrator if Confluence needs to access the Internet through a web proxy.

Configuring an outbound HTTP proxy in Confluence

Proxy support is configured by passing certain system properties to the Java Virtual Machine on startup. These properties follow the conventions defined by Oracle:

- http.proxyHost
- http.proxyPort (default: 80)
- http.nonProxyHosts (default: <none>)

At a minimum, you need to define http.proxyHost to configure an HTTP proxy. System property configuration is described on the Configuring System Properties page.
Properties `http.proxyHost` and `http.proxyPort` indicate the proxy server and port that the http protocol handler will use.

```
-Dhttp.proxyHost=proxy.example.org
-Dhttp.proxyPort=8080
```

Property `http.nonProxyHosts` indicates the hosts which should be connected to directly and not through the proxy server. The value can be a list of hosts, each separated by a pipe character `|`. In addition, a wildcard character (asterisk) `*` can be used for matching. For example:

```
-Dhttp.nonProxyHosts=*.foo.com|localhost
```

Note: You may need to escape the pipe character `|` in some command-line environments.

If the `http.nonProxyHosts` property is not configured, all web requests will be sent to the proxy.

Please note that any command line parameters set are visible from the process list, and thus anyone who has the appropriate access to view the process list will see the proxy information in the clear.

To avoid this, you can set these properties in the catalina.properties file, located in `confluence-install/conf/`

```
http.proxyHost=yourProxyURL
http.proxyPort=yourProxyPort
http.proxyUser=yourUserName
http.proxyPassword=yourPassword
```

**Configuring HTTP proxy authentication**

Proxy authentication is also configured by providing `system properties` to Java in your application server’s configuration file. Specifically, the following two properties:

- `http.proxyUser` – username
- `http.proxyPassword` – secret

Authentication has a few more options in Confluence 2.10 and later, as documented below.

**HTTP proxy (Microsoft ISA) NTLM authentication (2.10 and later)**

Confluence 2.10 and later supports NTLM authentication for outbound HTTP proxies when Confluence is running on a Windows server.

To clarify, this means the `{rss}` and `{jiraissues}` macro will be able to contact external websites if requests have to go through a proxy that requires Windows authentication. This support is not related to logging in Confluence users automatically with NTLM, for which there is a [user-contributed authenticator](https://confluence.atlassian.com/display/CORE/Confluence+NTLM+Authentication) available.
To configure NTLM authentication for your HTTP proxy, you need to define a domain system property, http.auth.ntlm.domain, in addition to the properties for host, port and username mentioned above:

```
-Dhttp.auth.ntlm.domain=MYDOMAIN
```

**Configuring authentication order (2.10 and later)**

Sometimes multiple authentication mechanisms are provided by an HTTP proxy. If you have proxy authentication failure messages, you should first check your username and password, then you can check for this problem by examining the HTTP headers in the proxy failure with a packet sniffer on the Confluence server. (Describing this is outside the scope of this document.)

To set the order for multiple authentication methods, you can set the system property http.proxyAuth to a comma-separated list of authentication methods. The available methods are: ntlm, digest and basic; this is also the default order for these methods.

For example, to attempt Basic authentication before NTLM authentication, and avoid Digest authentication entirely, you can set the http.proxyAuth property to this value:

```
-Dhttp.proxyAuth=basic,ntlm
```

**Troubleshooting**

1. There’s a diagnostic jsp file in CONF-9719 for assessing the connection parameters.
2. 'Status Code [407]' errors are described in APR-160.
3. Autoproxies are not supported yet. See CONF-16941.

**Running Confluence behind Apache**

The content on this page relates to platforms which are not supported for Confluence. Consequently, Atlassian can not guarantee providing any support for the steps described on this page. Please be aware that this material is provided for your information only and that you use it at your own risk.

**Introduction**

Running Confluence behind a web server should be done for performance reasons in high-load environments. In general, web server caching and thread management is far superior to that provided by your application server’s HTTP interface.

To run Confluence behind the Apache httpd web server, there are two main configuration options: mod_jk or mod_proxy.

<table>
<thead>
<tr>
<th>Connection type</th>
<th>Features</th>
</tr>
</thead>
</table>
| mod_proxy (also known as reverse proxy) | * recommended connection method  
* simple HTTP proxy to application server  
* works with all application servers  
* if application paths are consistent, there is minimal load on the web server |
| mod_jk (also known as AJP) | • uses the AJP binary protocol  
• provides failover (and load balancing, which Confluence supports only with a clustered license)  
• only works with some application servers (typically Tomcat)  
• if application paths are consistent, there is some load on the web server to translate requests to AJP |

**Features common to both mod_proxy and mod_jk**

- application paths must be consistent to avoid complex and slow URL rewriting
- works with name-based virtual hosting, both on web server and app server
- web server keeps a pool of connections to application server

**Mod_proxy documentation**

- [Using Apache with mod_proxy](https://httpd.apache.org/docs/2.4/mod/mod_proxy.html) is the main documentation for this configuration.
- If you want to set up the common configuration of JIRA and Confluence virtual hosts, you can use [Apache 's virtual hosts](https://httpd.apache.org/docs/2.4/vhosts.html) with separate application servers.

**Mod_jk documentation**

- [Using Apache with mod_jk](https://httpd.apache.org/docs/2.4/mod/mod_jk.html) is the main documentation for this configuration.
- You can follow a similar method to the mod_proxy documentation above for setting up virtual hosts in Apache and Tomcat, if required.

**Mod_jk2 not supported**

The misleadingly-named mod_jk2 is an older method of connecting to Tomcat from Apache. Since mod_jk2 is no longer supported by the Apache Foundation, we do not support this configuration, and are not updating our [mod_jk2 documentation](https://httpd.apache.org/docs/2.4/mod/mod_jk.html). Mod_jk2 also has unresolved problems with Unicode URLs; you need to use either mod_proxy or mod_jk for international characters to work correctly in Confluence.

**Other related documentation**

- [Apache and Apache Connector Tips](https://httpd.apache.org/docs/2.4/connector.html)
- [Using the (older) mod_jk2 connector](https://httpd.apache.org/docs/2.4/mod/mod_jk2.html)
- [Configuring Tomcat's URI encoding](https://tomcat.apache.org/tomcat-7.0-doc/uri-encoding-howto.html)
- [Running Confluence Over SSL or HTTPS](https://confluence.apache.org/display/COB/Running+Confluence+Over+SSL+or+HTTPS)

**General Apache Configuration Notes**

**On this page:**

- [Prefer Apache mod_deflate to Confluence's built-in gzip implementation](https://httpd.apache.org/docs/2.4/mod/mod_deflate.html)
- [Ensure keepalive is enabled](https://httpd.apache.org/docs/2.4/mod/mod_keepalive.html)
- [Enable keepalive for recent MSIE user agents](https://httpd.apache.org/docs/2.4/mod/mod_keepalive.html)

**Prefer Apache mod_deflate to Confluence's built-in gzip implementation**

1. Disable gzip in confluence. See [Compressing an HTTP Response within Confluence](https://confluence.apache.org/display/COB/Compressing+an+HTTP+Response+within+Confluence).

2. Enable gzip compression in Apache. For RedHat distributions this can be achieved by adding the following lines:
AddOutputFilterByType DEFLATE text/html text/plain text/xml text/css application/x-javascript

# ensure sensible defaults
DeflateBufferSize 8192
DeflateCompressionLevel 4
DeflateMemLevel 9
DeflateWindowSize 15

Ensure keepalive is enabled

KeepAlive On

Enable keepalive for recent MSIE user agents

The standard Apache SSL configuration is very conservative when it comes to MSIE and SSL. By default all keepalives are disabled when using HTTPS with MSIE. While MSIE will always be special, the issues with SSL and MSIE have been solved since Service Pack 2 for Windows XP, released over 4 years ago. For anyone using an XP machine SP2 or above, it is safe to allow keepalive for MSIE 6 and above.

Remove the following lines:

SetEnvIf User-Agent ".*MSIE.*" \ nokeepalive ssl-unclean-shutdown \ downgrade-1.0 force-response-1.0

Add these in their place:

BrowserMatch "MSIE [1-5]" nokeepalive
ssl-unclean-shutdown downgrade-1.0
force-response-1.0
BrowserMatch "MSIE [6-9]"
ssl-unclean-shutdown

Configuring Tomcat's URI encoding
Running Confluence Over SSL or HTTPS
Using Apache with mod_jk

The content on this page relates to platforms which are not supported for Confluence. Consequently, Atlassian can not guarantee providing any support for the steps described on this page. Please be aware that this material is provided for your information only and that you use it at your own risk.

Introduction

The Apache web server is often used in front of an application server to improve performance in high-load environments. Mod_jk allows request forwarding to an application via a protocol called AJP. Configuration of this involves enabling mod_jk in Apache, configuring a AJP connector in your application server, and directing Apache to forward certain paths to the application server via mod_jk.

Mod_jk is sometimes preferred to mod_proxy because AJP is a binary protocol, and because some site administrators are more familiar with it than with mod_proxy.

The scope of this documentation is limited to configuring the AJP connector in Tomcat 5.x. Other application servers may support AJP connectors; please consult your application server documentation for instructions on how to configure it.

The configuration below assumes your Confluence instance is accessible on the same path on the application server and the web server. For example:

<table>
<thead>
<tr>
<th>Externally accessible (web server) URL</th>
<th><a href="http://www.example.com/confluence/">http://www.example.com/confluence/</a></th>
</tr>
</thead>
<tbody>
<tr>
<td>Application server URL (HTTP)</td>
<td><a href="http://app-server.internal.example.com:8090/confluence/">http://app-server.internal.example.com:8090/confluence/</a></td>
</tr>
</tbody>
</table>

The AJP connection of the application server is set to: app-server.internal.example.com:8009.

Configuring mod_jk in Apache

The standard distribution of Apache does not include mod_jk. You need to download it from the JK homepage and put the mod_jk.so file in your Apache modules directory.

Next, add the following in httpd.conf directly or included from another file:
# Put this after the other LoadModule directives
LoadModule jk_module modules/mod_jk.so

# Put this in the main section of your configuration (or desired virtual host, if using Apache virtual hosts)
JkWorkersFile conf/workers.properties
JkLogFile logs/mod_jk.log
JkLogLevel info

JkMount /confluence worker1
JkMount /confluence/* worker1

Configuring workers.properties

Create a new file called 'workers.properties', and put it in your Apache conf directory. (The path for workers.properties was one of the configuration settings above.)

```properties
worker.list=worker1

worker.worker1.host=app-server.internal.example.com
worker.worker1.port=8009
worker.worker1.type=ajp13
```

Tomcat 5.x configuration

In Tomcat 5, the AJP connector is enabled by default on port 8009. An absolutely minimal Tomcat server.xml is below for comparison. The relevant line is the Connector with port 8009 – make sure this is uncommented in your server.xml.
<Server port="8000" shutdown="SHUTDOWN">
  <Service name="Catalina">

    <!-- Define a HTTP/1.1 Connector on port 8090 -->
    <Connector port="8090" />

    <!-- Define an AJP 1.3 Connector on port 8009 -->
    <Connector port="8009" protocol="AJP/1.3" />

    <Engine name="Catalina" defaultHost="localhost">
      <Host name="localhost" appBase="webapps">
        <Context path="/confluence" docBase="/opt/webapps/confluence-2.2/confluence"/>
        <Logger className="org.apache.catalina.logger.File Logger"/>
      </Host>
    </Engine>
  </Service>
</Server>

Points to note:

- the Connector on port 8009 has protocol of "AJP/1.3". This is critical.
- the Context path of the Confluence application is "/confluence". This must match the path used to access Confluence on the web server.
- we recommend keeping your application Contexts outside the server.xml in Tomcat 5.x. The above example includes them for demonstration only.

Improving the performance of the mod_jk connector
The most important setting in high-load environments is the number of processor threads used by the Tomcat AJP connector. By default, this is 200, but you should increase it to match Apache's maxThreads setting (256 by default):

```xml
<Connector port="8009" minSpareThreads="5" maxThreads="256" protocol="AJP/1.3" />
```

All the configuration parameters for the AJP connector are covered in the Tomcat documentation.

Ensuring UTF-8 compatibility

If you have problems downloading attachments with non-ASCII characters in the filename, add the following to your Apache configuration:

```text
JkOptions +ForwardURICompatUnparsed
```

And specify UTF-8 as the URIEncoding in the AJP connector configuration:

```xml
<Connector port="8009" protocol="AJP/1.3" URIEncoding="UTF-8" />
```

These settings are discussed further on Configuring Tomcat's URI encoding.

More information

The Tomcat JK website has complete documentation on workers.properties and Apache configuration. You can also find information there on how to use mod_jk with IIS.

Alternatives

If you're not happy with mod_jk, or find it too difficult to configure, you can:

- use mod_proxy, which works with any application server, and together with mod_proxy_html allows complex URL rewriting to deal with different application paths on the web server and the application server.

Using Apache with mod_proxy

This page describes how to integrate Confluence into an Apache website using mod_proxy.

⚠️ The content on this page relates to platforms which are not supported for Confluence. Consequently, Atlassian can not guarantee providing any support for the steps described on this page. Please be aware that this material is provided for your information only and that you use it at your own risk.
On this page:

- **Simple configuration**
  - Set the context path
  - Configure mod_proxy
  - Set the URL for redirection
  - Set the Confluence Base URL

- **Complex configuration**
- Adding SSL
- More information
- Alternatives

There are some common situations where you might do this:

- You have an existing Apache-based website, and want to add Confluence to the mix (for example, http://www.example.com/confluence).
- You have two or more Java applications, each running in their own application server on different ports, for example, http://localhost:8090/confluence and http://localhost:8080/jira. By setting up Apache with mod_proxy, you can have both available on the regular HTTP port (80) – for example, at http://www.example.com/confluence and http://www.example.com/jira. This allows each application to be restarted, managed and debugged separately.

This page describes how to configure mod_proxy. We describe two options:

- If you want a URL like http://www.example.com/confluence/, go to the simple configuration.
- If you want a URL like http://confluence.example.com/, go to the complex configuration.

**Simple configuration**

Set the context path

Set your Confluence application path (the part after hostname and port) correctly. Say you want Confluence available at http://www.example.com/confluence/, and you currently have it running at http://localhost:8090/. The first step is to get Confluence available at http://localhost:8090/confluence/.

To do this in Tomcat (bundled with Confluence), edit conf/server.xml, locate the "Context" definition:

```
  <Context path="" docBase="..//confluence"
  debug="0" reloadable="true">
```

and change it to:

```
  <Context path="/confluence"
  docBase="../confluence" debug="0"
  reloadable="true">
```

Then restart Confluence, and ensure you can access it at http://localhost:8090/confluence/

**Configure mod_proxy**
Now enable mod_proxy in Apache, and proxy requests to the application server by adding the example below to your Apache httpd.conf (note: the files may be different on your system; the [JIRA docs](#) describe the process for Ubuntu/Debian layout):

```
# Put this after the other LoadModule directives
LoadModule proxy_module
/usr/lib/apache2/modules/mod_proxy.so
LoadModule proxy_http_module
/usr/lib/apache2/modules/mod_proxy_http.so

# Put this in the main section of your configuration (or desired virtual host, if using Apache virtual hosts)
ProxyRequests Off
ProxyPreserveHost On

<Proxy */
    Order deny,allow
    Allow from all
</Proxy>

ProxyPass /confluence
http://localhost:8090/confluence
ProxyPassReverse /confluence
http://localhost:8090/confluence

<Location /confluence>
    Order allow,deny
    Allow from all
</Location>
```

**Note to Windows Users**

It is recommended that you specify the absolute path to the `mod_proxy.so` and `mod_proxy_http.so` files.

Set the URL for redirection
You will need to modify the server.xml file in your tomcat's conf directory and set the URL for redirection.

Locate this code segment

```xml
<Connector port="8090"
  maxHttpHeaderSize="8192"
  maxThreads="150"
  minSpareThreads="25" maxSpareThreads="75"
  enableLookups="false"
  redirectPort="8443" acceptCount="100"
  connectionTimeout="20000"
  disableUploadTimeout="true" />
```

And append the following segment:

```xml
<Connector port="8090"
  maxHttpHeaderSize="8192"
  maxThreads="150"
  minSpareThreads="25" maxSpareThreads="75"
  enableLookups="false"
  redirectPort="8443" acceptCount="100"
  connectionTimeout="20000"
  disableUploadTimeout="true"
  proxyName="www.example.com"
  proxyPort="80" />
```

Replace www.example.com with the URL you wish to be redirected to.

If this isn't working for you, try adding a scheme attribute to your Connector tag: `scheme="https"`.

Set the Confluence Base URL

The last stage is to set the Base URL to the address you're using within the proxy. For example, if you're using http://www.example.com then set your Base URL to this.

**Complex configuration**

Complex configuration involves using the mod_proxy_html filter to modify the proxied content en-route. This is
required if the Confluence path differs between Apache and the application server. For example:

<table>
<thead>
<tr>
<th>Externally accessible (Apache) URL</th>
<th><a href="http://confluence.example.com/">http://confluence.example.com/</a></th>
</tr>
</thead>
<tbody>
<tr>
<td>Application server URL</td>
<td><a href="http://app-server.internal.example.com:8090/confluence/">http://app-server.internal.example.com:8090/confluence/</a></td>
</tr>
</tbody>
</table>

Notice that the application path in the URL is different in each. On Apache, the path is /, and on the application server the path is /confluence.

For this configuration, you need to install the mod_proxy_html module, which is not included in the standard Apache distribution.

Alternative solutions are discussed below.

```latex
# Put this after the other LoadModule directives
LoadModule proxy_module modules/mod_proxy.so
LoadModule proxy_http_module modules/mod_proxy_http.so
LoadModule proxy_html_module modules/mod_proxy_html.so

<VirtualHost *>
    ServerName confluence.example.com

    # Put this in the main section of your configuration (or desired virtual host, if using Apache virtual hosts)
    ProxyRequests Off
    ProxyPreserveHost On

    <Proxy *>
        Order deny,allow
        Allow from all
    </Proxy>
```
ProxyPass / http://app-server.internal.example.com:8090/confluence
ProxyPassReverse / http://app-server.internal.example.com:8090/confluence

ProxyHTMLURLMap / /confluence/

<Location />
    Order allow,deny
The ProxyHTMLURLMap configuration can become more complex if you have multiple applications running under this configuration. The mapping should also be placed in a Location block if the web server URL is a subdirectory and not on a virtual host. The [Apache Week tutorial](http://www.apache week.com) has more information how to do this.

**Adding SSL**

If you're running Apache in front of Tomcat, it's a good idea to terminate your SSL configuration at Apache, then forward the requests to Tomcat over HTTP. You can set up Apache to terminate the SSL connection and use the ProxyPass and ProxyPassReverse directives to pass the connection through to Tomcat (or the appropriate application server) which is running Confluence.

1. Create a new SSL host by creating a virtual host on 443
2. The standard http connection on apache could be used to redirect to https if you want or it could just be firewalled.
3. Within the VirtualHost definition:
   a. define the SSL options (SSLEngin and SSLCertificateFile)
   b. define the ProxyPass and ProxyPassReverse directives to pass through to Tomcat.

Because of how the ProxyPass and ProxyPassReverse directives work, you should not need to modify the tomcat installation at all.

Most of the relevant Apache Config:

```
Listen 443

NameVirtualHost *:443
<VirtualHost *:443>
    SSLEngine On
    SSLCertificateFile /etc/apache2/ssl/apache.pem
    ProxyPass / http://localhost:8090/
    ProxyPassReverse / http://localhost:8090/
</VirtualHost>
```

More information

- The [mod_proxy_html site](http://mod-proxy.html) has documentation and examples on the use of this module in the complex configuration.
- [Apache Week has a tutorial](http://www.apache week.com) that deals with a complex situation involving two applications and ProxyHTMLURLMap.
• Using Apache with virtual hosts and mod_proxy shows how to configure the special case where you want JIRA and Confluence running on separate application servers on virtual host subdomains.

Alternatives

If Tomcat is your application server, you have two options:

• use mod_jk to send the requests to Tomcat
• use Tomcat’s virtual hosts to make your Confluence application directory the same on the app server and the web server, removing the need for the URL mapping.

If your application server has an AJP connector, you can:

• use mod_jk to send the requests to your application server.

Using Apache with virtual hosts and mod_proxy

⚠️ The content on this page relates to platforms which are not supported for Confluence. Consequently, Atlassian can not guarantee providing any support for the steps described on this page. Please be aware that this material is provided for your information only and that you use it at your own risk.

Introduction

The Apache web server is often used in front of an application server to improve performance in high-load environments. Mod_proxy simply redirects requests for certain URLs to another web server, so it typically requires no additional configuration on the application server.

This page documents a very common configuration request: configuring JIRA and Confluence on two Apache virtual hosts, running on different application servers. This is just a special case of mod_proxy configuration.

You can use virtual hosts in your application server if you want to run JIRA and Confluence on the same application server. There is a sample configuration for Tomcat you can use after configuring Apache.

Apache configuration

For this configuration to work properly, the application paths must be the same on both the application servers and the web server. For both JIRA and Confluence below, this is /.

<table>
<thead>
<tr>
<th>JIRA external URL</th>
<th><a href="http://jira.example.com/">http://jira.example.com/</a></th>
</tr>
</thead>
<tbody>
<tr>
<td>JIRA application server URL</td>
<td><a href="http://jira-app-server.internal.example.com:8080/">http://jira-app-server.internal.example.com:8080/</a></td>
</tr>
<tr>
<td>Confluence external URL</td>
<td><a href="http://confluence.example.com/">http://confluence.example.com/</a></td>
</tr>
<tr>
<td>Confluence application server URL</td>
<td><a href="http://confluence-app-server.internal.example.com:8090/">http://confluence-app-server.internal.example.com:8090/</a></td>
</tr>
</tbody>
</table>

Add the following to your Apache httpd.conf:

```
# Put this after the other LoadModule directives
LoadModule proxy_module
/usr/lib/apache2/modules/mod_proxy.so
```
LoadModule proxy_http_module /usr/lib/apache2/modules/mod_proxy_http.so

# Put this with your other VirtualHosts, or at the bottom of the file
NameVirtualHost *
<VirtualHost *>
  ServerName confluence.example.com

  ProxyRequests Off
  <Proxy *>
      Order deny,allow
      Allow from all
  </Proxy>

  ProxyPass / http://confluence-app-server.internal.example.com:8090/
  ProxyPassReverse / http://confluence-app-server.internal.example.com:8090/
  <Location />
      Order allow,deny
      Allow from all
  </Location>
</VirtualHost>

<VirtualHost *>
  ServerName jira.example.com

  ProxyRequests Off
  <Proxy *>
      Order deny,allow
      Allow from all
  </Proxy>
</VirtualHost>
</Proxy>

ProxyPass / http://jira-app-server.internal.example.com:8080/
ProxyPassReverse / http://jira-app-server.internal.example.com:8080/

<Location />
  Order allow,deny
Points to note:

- ProxyPass and ProxyPassReverse directives send traffic from the web server to your application server.
- The application path is the same on the application server and on the web server (both are `/`).
- Because the above configuration uses name-based virtual hosting, you must configure your DNS server to point both names (jira.example.com, confluence.example.com) to your web server.

More information

For different ways to configure mod_proxy, see Using Apache with mod_proxy.

If you use Tomcat, mod_jk provides a different way of connecting Apache via AJP. You can also use the above configuration with just one application server if you use Tomcat's virtual hosts.

Using mod_rewrite to Modify Confluence URLs

Confluence requires URL rewriting for proper functionality. If Confluence is accessible via different domain names without URL rewriting, you will experience an array of problems. See Various Issues Caused when Server Base URL Does Not Match the URL Used to Access Confluence.

In some cases, you may wish to access Confluence from different domains.

- http://wiki
  (from an internal network)
- http://wiki.domain.com
  (the externally visible domain)

To configure Confluence over multiple domains,

1. Add a DNS entry mapping http://wiki to the externally visible ip address of the Confluence server.
3. Add Apache HTTP proxy, using the instructions from Running Confluence behind Apache.
4. Add the mod_rewrite module, to change the URL.

You might be interested in the UrlRewriteFilter that is Java web filter that works in a similar way of the Apache's mod_rewrite.

Start Confluence Automatically on System Startup

Confluence can be configured to start automatically on system startup, allowing it to recover automatically after a reboot.

No content found for label(s) auto-startup.

Start Confluence Automatically on Linux

On Linux/Solaris, the best practice is to install, configure and run each service (including Confluence) as a dedicated user with only the permissions they require.
To install, configure and run Confluence automatically on Linux/Solaris:

1. Create a confluence user for instance, using the following command:

   ```
   sudo useradd --create-home -c "Confluence role account" confluence
   ```

2. Create a directory to install Confluence into:

   ```
   sudo mkdir /usr/local/confluence
   sudo chown confluence: /usr/local/confluence
   ```

3. Log in as the confluence user to install Confluence:

   ```
   sudo su - confluence
cd /usr/local/confluence/
tar zxvf /tmp/confluence-3.0.1-std.tar.gz
ln -s confluence-3.0.1-std/ current
   ```

4. Edit

   `<<CONFLUENCE_INSTALL_DIRECTORY>>/confluence/WEB-INF/classes/confluence-init.properties` file, and set `confluence.home=/usr/local/confluence/<Confluence_Data_Home>` (ensure you have removed the comment '#')

5. Then back as root, create the file `/etc/init.d/confluence` (code shown below), which will be responsible for starting up Confluence after a reboot (or when manually invoked).

   - If you are running Ubuntu Jaunty (or later) do not perform this step. Please use the instructions further down this page.
#!/bin/sh -e
# Confluence startup script
#chkconfig: 2345 80 05
#description: Confluence

# Define some variables
# Name of app (JIRA, Confluence, etc)
APP=confluence
# Name of the user to run as
USER=confluence
# Location of application's bin directory
CATALINA_HOME=/usr/local/confluence/current
# Location of Java JDK
export JAVA_HOME=/usr/lib/jvm/java-6-sun

case "$1" in
  # Start command
  start)
    echo "Starting $APP"
    /bin/su -m $USER -c "$CATALINA_HOME/bin/startup.sh &> /dev/null"
    ;;
  # Stop command
  stop)
    echo "Stopping $APP"
    /bin/su -m $USER -c "$CATALINA_HOME/bin/shutdown.sh &> /dev/null"
    echo "$APP stopped successfully"
    ;;
  # Restart command
  restart)
    $0 stop
    sleep 5
    $0 start
    ;;
  *)
    echo "Usage: /etc/init.d/$APP {start|restart|stop}"
    exit 1
    ;;
esac

exit 0

6. Make this file executable:

    sudo chmod +x /etc/init.d/confluence

7. Set this file to run at the appropriate runlevel. For example, use `sudo chkconfig --add confluence` on Redhat-based systems, `sudo update-rc.d confluence defaults` or `rcconf` on Debian-based systems.

8. You should now be able to start Confluence with the init script. A successful startup output typically looks like this:
$ sudo /etc/init.d/confluence start
Starting Confluence:
If you encounter issues starting up Confluence, please see the Installation guide at http://confluence.atlassian.com/display/DOC/Confluence+Installation+Guide
Using CATALINA_BASE: /usr/local/confluence/current
Using CATALINA_HOME: /usr/local/confluence/current
Using CATALINA_TMPDIR: /usr/local/confluence/current/temp
Using JRE_HOME: /usr/lib/jvm/java-1.5.0-sun
done.

You should then see this running at http://<server>:8090/

The port for this will be whatever is defined in your Confluence server.xml file.

Adding Confluence as a service for Ubuntu Jaunty (or later)

To continue configuring Confluence to start automatically as a service on Ubuntu Jaunty (or later):

1. After logging in as the confluence user to install Confluence, create start and stop scripts in /usr/local/confluence:

   **Example start script:**

   ```bash
   #!/bin/bash
   export JAVA_HOME=/usr/lib/jvm/java-6-sun-1.6.0.16/
   export JDK_HOME=/usr/lib/jvm/java-6-sun-1.6.0.16/
   cd /usr/local/confluence/current/bin
   ./startup.sh
   ```

   **Example stop script:**

   ```bash
   #!/bin/bash
   export JAVA_HOME=/usr/lib/jvm/java-6-sun-1.6.0.16/
   export JDK_HOME=/usr/lib/jvm/java-6-sun-1.6.0.16/
   cd /usr/local/confluence/current/bin
   ./shutdown.sh
   ```

2. Make both of these scripts executable. For example, by issuing the command: sudo chmod a+x /usr/local/confluence/start /usr/local/confluence/stop.

3. Karmic and later: Create two text files in /etc/init/ called confluence-up.conf and confluence-down.conf:

   confluence-up:

   ```bash
   #!/bin/bash
   start /usr/local/confluence/start
   ```

   confluence-down:

   ```bash
   #!/bin/bash
   stop /usr/local/confluence/stop
   ```
confluence-down:

start on runlevel [2345]

script

date >> /tmp/confluence-startup.out
exec sudo -u confluence /usr/local/confluence/start >>
/tmp/confluence-startup.out 2>&1

end script

... and make them readable to all users:
sudo chmod a+r /etc/init/confluence-up.conf /etc/init/confluence-down.conf

1. Jaunty, Intrepid: Create two text files in /etc/event.d/ called **confluence-up** and **confluence-down**:

confluence-up:

```
start on runlevel 2
start on runlevel 3
start on runlevel 4
start on runlevel 5

exec sudo -u confluence /usr/local/confluence/start >>
/tmp/confluence-startup.out 2>&1
```

confluence-down:

```
start on runlevel 1
start on runlevel 6

exec sudo -u confluence /usr/local/confluence/stop >>
/tmp/confluence-shutdown.out 2>&1
```
... and make them readable to all users:
```bash
sudo chmod a+r /etc/event.d/confluence-up /etc/event.d/confluence-down
```

- [Start Confluence Automatically on System Startup](#)
- [Start Confluence Automatically on Windows as a Service](#)

**Start Confluence Automatically on Windows as a Service**

For long-term use, we recommend that you configure Confluence to start automatically when the operating system restarts. For Windows servers, this means configuring Confluence to run as a Windows service.

There are two ways to install the Confluence distribution as a service: using the [Confluence installer](#) or manually as described below.

**On this page:**

- Reasons for Starting Confluence as a Service
- Changing the User Running the Service
- Manually Installing the Confluence Distribution as a Service
- Managing Confluence as a Service
- Upgrading Confluence
- Troubleshooting Confluence while Running as a Windows Service
- Requesting Support

**Problem with 64-bit Windows**

If you are running 64-bit Windows, please note that Apache Tomcat cannot run as a Windows service if you are using a 64-bit JDK. **Please ensure that you are using a 32-bit JDK.** Refer to our [knowledge base article](#) for more information.

**Reasons for Starting Confluence as a Service**

Installation as a Windows service offers these advantages:

- Reduced risk of shutting down Confluence by accident (If you start Confluence manually, a console window opens and there is a risk of someone accidentally shutting down Confluence by closing the window).
- Automated Confluence recovery after server restart.
- Improved troubleshooting through logging server output to file.

You can read more about Windows services in the [Microsoft Developer Network](#).

**Changing the User Running the Service**

If you wish to run the service as a non-administrator user for security, or if you are using network drives for backups, attachments or indexes, you can run the service as another user. To change users, open the Apache Tomcat Confluence properties, go to the 'Log On' tab and enter the required username and password. Go to your Windows Control Panel -> User Accounts and confirm that the user has write permissions for the `%CATALINA_HOME%` index and database directories. Note that any network drives must be specified by UNC and not letter mappings (eg. `\backupserver\confluence` not `z:\confluence`).

For more detail, see [Creating a Dedicated User Account on the Operating System to Run Confluence](#).

**Manually Installing the Confluence Distribution as a Service**
From your Windows-based server:

1. Open a command prompt in the `<CONFLUENCE-INSTALL>/bin` directory.
2. Confirm that the JAVA_HOME variable is set to the JDK base directory with the command:
   
   ```
   echo %JAVA_HOME%
   ```
   
   Note that any directory in the path with spaces (e.g. `C:\Program Files` must be converted to its eight-character equivalent (e.g. `C:\Progra~1`).

3. If you are installing Confluence on a Windows 2008 server, be sure to run the command prompt using 'run as administrator'. (Otherwise running 'service.bat', as described in the next step, will fail.)
4. Use the following command to install the service with default settings:

   ```
   service.bat install Confluence
   ```

5. Now, to have the service start automatically when the server starts, run:

   ```
   tomcat6 //US//Confluence --Startup auto
   ```

6. If you have a less than a 512 megabytes of memory, skip this step. For users with large Confluence installations, you can increase the maximum memory Confluence can use. (The default is 256MB). For example, you can set the maximum memory to 512 megs using:

   ```
   tomcat6 //US//Confluence --JvmMx 512
   ```

7. If you do not have any JVM parameters that you pass to your distribution of Confluence, you can skip this step. If you do, add them to the service using:

   ```
   tomcat6 //US//Confluence ++JvmOptions="-Djust.an.example=True"
   ```

8. For further configuration options, please refer to the [Tomcat Windows Service How-To](guide) guide.

9. Go to your Windows Control Panel -> Administrative Tools -> Services -> Apache Tomcat Confluence and right-click on Properties to verify the settings are correct.

   ✨ Confluence is now installed as a service, but will not automatically start up until the next server reboot.

10. Start the Confluence service with the command:

    ```
    net start Confluence
    ```

**Managing Confluence as a Service**

You can manage the Confluence service from the command prompt.
• Stop Confluence with:

```bash
net stop Confluence
```

• Uninstall the Confluence service with:

```bash
service.bat remove Confluence
```

### Upgrading Confluence

After upgrading Confluence, you can either uninstall and reinstall the Windows service or change the StartPath parameter to your new folder. Refer to the [Tomcat documentation](#) for help.

### Troubleshooting Confluence while Running as a Windows Service

- Check the Knowledge Base articles:
  - No content found for label(s) `windows_service`.

- If none of the above solves your problem, please refer to the complete list of known issues in our Knowledge Base.

- When investigating memory issues or bugs, it may be useful to view information from Confluence's garbage collection. To turn on the verbose garbage collection, use the command:

  ```bash
tomcat6 //US//Confluence
++JvmOptions="-Xloggc:<CONFLUENCE-INSTALL>\logs\atlassian-gc.log"
```

- The Confluence 2.9 installer does not work when installed as service, due to a missing semi-colon in `service.bat`. Please refer to reported issue [CONF-12785](#).

- You can use a [Sysinternals tool](#) called `Procmon.exe` from the The Microsoft Windows Sysinternals Team, to check that the error occurred at the specific time when the Confluence service started. You need to match the time when Tomcat failed, as captured by this tool, against the time in the Windows Event Viewer.

  **Note**
  
  We do not recommend that you run this tool for too long as it may disrupt other Atlassian applications. Once you have captured the required information you will need to press Ctrl + E to stop capturing.

### Requesting Support

If, after following the troubleshooting guide above, you still cannot make Confluence run as a Windows Service or if there is an error when setting the JVM configuration for the service, you can [create a support request](#).

Please provide the following information when creating your support request, because we will need it to assist you:

- Are you running a 32 bit or 64 bit Windows?
- Give us the result of running `java -version` from Windows command line console.
• A screen shot of your Windows Registry setting for Tomcat.
• If you have modified service.bat, please give us a copy of this file for review.
• What application server are you using? eg. Are you using the Confluence distribution?
• Your atlassian-confluence.log file.

Foreign-key constraints:
Known Issues with Enterprise or Webhosting environments

When you attempt to run Confluence, you may get the following error:
java.security.AccessControlException: access denied (java.lang.RuntimePermission accessDeclaredMembers)
   at java.security.AccessControlContext.checkPermission(AccessControlContext.java(Compiled Code))
   at java.security.AccessController.checkPermission(AccessController.java(Compiled Code))
   at java.lang.SecurityManager.checkPermission(SecurityManager.java(Compiled Code))

Some of the libraries Confluence relies on to function make use of features of the Java language that may be restricted by Java security policies. This does not normally cause any problems: the default security configuration of most application servers will happily run Confluence. However, in some shared-hosting or enterprise environments, security settings may be such that Confluence can not function.

The permissions required by Confluence to run are detailed in the sample policy file below. You may need to give this information to your systems administrator so that they can be deployed with the Confluence application.
grant codeBase
"file:${catalina.home}/webapps/confluence/
-
"
{ 
permission java.security.AllPermission;
};

grant {
permission java.lang.RuntimePermission
"accessDeclaredMembers";
permission
java.lang.reflect.ReflectPermission
"suppressAccessChecks";
permission java.lang.RuntimePermission
"defineCGLIBClassInJavaPackage";
};

Setting Up Public Access

Granting of permissions to use Confluence can be done on the basis of membership of a group, to a particular user, or to the 'Anonymous' user. There is not an actual user named 'Anonymous', it is just a name for a category of granted permissions.

In the security administration of Confluence, the 'Anonymous' user includes all logged-in users, and anonymous users who have not logged in. That is, if you allow the 'Anonymous' user to do something, you are allowing all users to do it.

To enable public access to a confluence space, you must give 'Anonymous' the following permissions:

- The global 'Use Confluence' permission. This permission determines whether a user can access the Confluence installation at all, and is set by the site administrator in Administration -> Global Permissions.
- The relevant space permissions. The 'Anonymous' user must have at least the 'View Space' permission for a space to be publicly accessible. You set these permissions via 'Browse Space' -> 'Space Admin' -> 'Permissions'.

While these two permissions are the bare minimum necessary for public access to a space, you may wish to give 'Anonymous' additional permissions if you want a space to allow anonymous comments, or anonymous editing.

We severely warn against giving the 'Anonymous' user any administrative privileges, either within a space, or especially globally over the Confluence instance. Giving administrative privileges to untrusted users may lead to a serious security compromise of your site.

Setting Up a Mail Session for the Confluence Distribution

Set up a mail session for the Confluence distribution to use Gmail as follows:

1. Stop Confluence.
2. Move (don't copy) activation-1.0.2.jar and mail-1.4.1.jar from `<confluence-install>/confluence/WEB-INF/lib` to `<confluence-install>/lib`.
3. Add the following to your server.xml file found in `<confluence-install>/conf/` (add it just before the `<Context>` tag):

   ```xml
   <Resource name="mail/GmailSMTPServer"
     auth="Container"
     type="javax.mail.Session"
     mail.smtp.host="smtp.gmail.com"
     mail.smtp.port="465"
     mail.smtp.auth="true"
     mail.smtp.user="yourEmailAddress@gmail.com"
     password="yourPassword"
     mail.smtp.starttls.enable="true"
     mail.transport.protocol="smtps"
     mail.smtp.socketFactory.class="javax.net.ssl.SSLSocketFactory"
    />
   
   For Confluence 3.5.x
   ```

4. Restart Confluence.
5. Go to Browse > Confluence Admin and click on Mail Servers. Choose either Edit an existing configuration, or Add a new SMTP mail server.
6. Edit the server settings as necessary, and set the JNDI Location as:

   ```java
   java:comp/env/mail/GmailSMTPServer
   ```

   Note that the JNDI Location is case sensitive and must match the resource name specified in server.xml.

7. Submit, and send a test email.

Troubleshooting SQL Exceptions

If you get an exception similar to those shown below, it is a good idea to increase the logging levels of your Confluence instance. If you request Atlassian support, this additional logging will help us work out the cause of the error.

Increased logging levels will enable us to diagnose errors like these:
org.springframework.dao.DataIntegrityViolationException: (HibernateTemplate): data integrity violated by SQL ''; nested exception is
java.sql.BatchUpdateException: Duplicate entry '1234' for key 1
  at
org.springframework.jdbc.support.SQLStateSQLExceptionTranslator.translate(SQLStateSQLExceptionTranslator.java:88)
caused by: java.sql.BatchUpdateException: Duplicate entry '1234' for key 1
  at

or

(HibernateTemplate): data integrity violated by SQL ''; nested exception is
java.sql.BatchUpdateException: ORA-00001: unique constraint (CONFLUENCE.SYS_C0012345) violated

This document outlines the steps to take to increasing logging on your system.

Changing the logging levels via the Administration Console

With Confluence 2.7 and later, you can adjust logging levels at runtime via the Administration Console — read the instructions. Below we tell you how to edit the log4j files directly.

1. Open confluence/WEB-INF/classes/log4j.properties and uncomment the following lines. The double ## lines are comments, leave them intact.
## log hibernate prepared statements/SQL queries (equivalent to setting 'hibernate.show_sql' to 'true')
#log4j.logger.net.sf.hibernate.SQL=DEBUG

## log hibernate prepared statement parameter values
#log4j.logger.net.sf.hibernate.type=DEBUG

If you cannot locate these lines in your log4j.properties file, please add them to the end of it.

2. Restart Confluence.
3. Redo the steps that led to the error.
4. Zip up your logs directory and attach it your support ticket.
5. If you are using Oracle and received a constraint error, please ask your database administrator which table and column the constraint (that is, CONFLUENCE.SYS_C0012345) refers to and add that information to your support ticket.
6. Open confluence/WEB-INF/classes/log4j.properties again and remove the 4 lines you added in step 1. (The additional logging will impact performance and should be disabled once you have completed this procedure.)

  - Supported Platforms FAQ

### System Requirements

Confluence works with a broad range of operating systems, database systems and application servers. Provided you have the technical knowledge, it is very likely that you will be able to run Confluence with an 8-year-old
database or even on some 8-year-old hardware. Realistically, it is not technically feasible for us to provide our legendary support service on all environments available. There can only be a finite number of platforms and release versions of those that we support.

Our rule of thumb when releasing a new version of Confluence is that we will officially support platforms that have been released within the last one to two years (or the latest version of that platform if no new version of it was released in that period). This does not necessarily mean that you will need to upgrade your database or application server every time you upgrade Confluence. However, if you do run into problems with an unsupported version of a database or application server, we may have to ask you to upgrade to something newer.

Please refer to our Supported Platforms topic for details on platforms that we currently support in this version of Confluence and our Supported Platforms FAQ topic for details on our support handling procedures.

**On this page:**

- Confluence Software Requirements
  - Operating Systems
  - Application Servers
  - Databases
  - Java
  - Please Note: Impact of Antivirus Software
- Confluence Hardware Requirements
- Atlassian Hosted Solutions

**Confluence Software Requirements**

Please read the Supported Platforms page for Confluence. That page contains a list of specific software that Confluence will work with.

**Operating Systems**

Atlassian supports the operating systems listed on the Supported Platforms page.

If you would like to run Confluence on VMware, please read our Running Confluence in a Virtualised Environment document first.

**Confluence on Virtualised Environments**

Atlassian officially supports non-clustered installations of Confluence 3.0 and later on VMware. Although possible, we do not recommend (nor support) running versions of Confluence prior to 3.0 on VMware, since Confluence 3.0 resolved many performance issues that were present in earlier versions. Be aware that we also do not support clustered installations of Confluence on VMware. Please comment or vote on the feature request at CONF-19559.

**Application Servers**

An application server is required to run Confluence. Apache Tomcat is bundled with the distribution.

Atlassian only supports the application servers listed on the Supported Platforms page, provided they are running on Windows, Linux, or Solaris. If you are using a different application server or earlier version, we may ask you to migrate to one of the supported application servers before we can provide you with further support.
Databases

A database is required to run Confluence. Atlassian supports the databases listed on the Supported Platforms page.

If you have no preference for a particular database and wish to set up Confluence for production purposes, we highly recommend using PostgreSQL. This is a scalable, robust and free database server that is also easy to set up. For database setup information, please refer to Database Setup For Any External Database.

Confluence should work with the database versions listed below. However, we do not test these versions regularly and we may ask you to migrate to one of the supported databases before we can provide you with further support.

- **PostgreSQL** — 8.2, 8.3, 8.4, 9.0
- **MySQL** — 5.1 (using the InnoDB storage engine, not MyISAM)
- **Oracle** — 11.1, 11.2
- **Microsoft SQL Server** — 2005, 2008, 2008 R2
- **DB2** — 9.7

Java

Confluence requires the Java Runtime Environment (JRE) installed.

If using the Zip or archive distribution of Confluence, you will need to install a supported JRE. The automated installer bundles Java and will install this for you.

For instructions on installing the JRE for Windows and Linux/Solaris, please refer to Installing Java for Confluence.

Please Note: Impact of Antivirus Software

The presence of antivirus software on your operating system running Confluence greatly decreases the performance of Confluence. Antivirus software that intercepts access to the hard disk is particularly detrimental and may even cause errors in Confluence.

You should configure your antivirus software to ignore the following directories:

- Confluence home directory
- Confluence's index directory
- All database-related directories

⚠️ This recommendation above is particularly important if you are running Confluence on Windows. No matter how fast your hardware is, antivirus software will almost always have a negative impact on Confluence's performance and may render Confluence impossible to use.

Confluence Hardware Requirements

Please be aware that while some of our customers run Confluence on SPARC-based hardware, Atlassian only officially supports Confluence running on x86 hardware and 64-bit derivatives of x86 hardware.

See Server Hardware Requirements Guide for details.

Refer also to the tips on reducing out of memory errors, in particular the section on Permanent Generation Size.

Atlassian Hosted Solutions

If you do not have the resources to set up and maintain a Confluence installation locally, consider Atlassian
hosted solutions. Atlassian can run and maintain your own installation of Confluence, handling all the testing, monitoring and upgrading processes for you. For more information, please refer to our Confluence Hosted and our integrated JIRA Studio solutions on our website.

Server Hardware Requirements Guide

Server administrators can use this guide in combination with the free Confluence trial period to evaluate their server hardware requirements. Because server load is difficult to predict, live testing is the best way to determine what hardware a Confluence instance will require in production.

Peak visitors are the maximum number of browsers simultaneously making requests to access or update pages in Confluence. Visitors are counted from their first page request until the connection is closed and if public access is enabled, this includes internet visitors as well as logged in users. Storage requirements will vary depending on how many pages and attachments you wish to store inside Confluence.

Minimum Hardware Requirements

On small instances, server load is primarily driven by peak visitors.

5 Concurrent Users

- 2GHz+ CPU
- 512MB RAM
- 5GB database space

25 Concurrent Users

- Quad 2GHz+ CPU
- 2GB+ RAM
- 10GB database space

Please be aware that while some of our customers run Confluence on SPARC-based hardware, Atlassian only officially supports Confluence running on x86 hardware and 64-bit derivatives of x86 hardware.

Example Hardware Specifications

These are example hardware specifications for non-clustered Confluence instances. It is not recorded whether the RAM refers to either total server memory or memory allocated to the JVM, while blank settings indicate that the information was not provided.

<table>
<thead>
<tr>
<th>Accounts</th>
<th>Spaces</th>
<th>Pages</th>
<th>CPUs</th>
<th>CPU (GHz)</th>
<th>RAM (Meg)</th>
<th>Notes</th>
</tr>
</thead>
</table>

### Server Load & Scalability

When planning server hardware requirements for your Confluence deployment, you will need to estimate the server scalability based on peak visitors, the editor to viewer ratio and total content.

- The editor to viewer ratio is how many visitors are performing updates versus those only viewing content
- Total content is best estimated by a count of total spaces

Confluence scales best with a steady flow of visitors rather than defined peak visitor times, few editors and few spaces. Users should also take into account:

- Total pages is not a major consideration for performance. For example, instances hosting 80K of pages can consume under 512 meg of memory
- Always use an external database, and check out the performance tuning guides.

As mentioned on the documentation for Operating Large or Mission-Critical Confluence Installations, some important steps are loadtesting your usecase and monitoring the system continuously to find out where your system could do better and what might need to improve in order to scale further.

### Maximum Reported Usages

These values are largest customer instances reported to Atlassian or used for performance testing. Clustering for load balancing, database tuning and other performance tuning is recommended for instances exceeding these values.

| Most Spaces | 1700 |
| Most Internal Users | 15K |
Most LDAP Users | 100K
---|---
Most Pages | 80K

**Hard Disk Requirements**

All wiki content is stored in the database, while attachments use either the database or filesystem. For example, the wiki instance you are reading now uses approximately 1 GB of database space and 9.4 GB of disk space.

Here is a breakdown of the disk usage requirements for this wiki, as at December 2008:

<table>
<thead>
<tr>
<th>Database size</th>
<th>1003 MB</th>
</tr>
</thead>
<tbody>
<tr>
<td>Home directory size</td>
<td>9.4 GB</td>
</tr>
</tbody>
</table>

**Size of selected database tables**

<table>
<thead>
<tr>
<th>Data</th>
<th>Rows</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content bodies (incl. all versions of blogs, pages and comments)</td>
<td>170462</td>
<td>145 MB</td>
</tr>
<tr>
<td>Content metadata (incl. title, author)</td>
<td>188697</td>
<td>48 MB</td>
</tr>
<tr>
<td>Content and user properties</td>
<td>193652</td>
<td>42 MB</td>
</tr>
<tr>
<td>Users</td>
<td>20679</td>
<td>5.8 MB</td>
</tr>
<tr>
<td>Attachment metadata</td>
<td>25718</td>
<td>5.0 MB</td>
</tr>
<tr>
<td>Labels</td>
<td>43235</td>
<td>4.5 MB</td>
</tr>
</tbody>
</table>

Note: not all database tables or indexes are shown, and average row size may vary between instances.

**Size of selected home directory components**

<table>
<thead>
<tr>
<th>Data</th>
<th>Files</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachments (incl. all versions)</td>
<td>27484</td>
<td>5.9 GB</td>
</tr>
<tr>
<td>Usage index (now disabled)</td>
<td>240</td>
<td>2.6 GB</td>
</tr>
<tr>
<td>Search index</td>
<td>10</td>
<td>236 MB</td>
</tr>
<tr>
<td>Office Connector cache</td>
<td>44</td>

<td>Plugin files</td>
<td>1508</td>
<td>139 MB</td>
</tr>
</tbody>
</table>
Private & Online Comparison

Private instances manage their users either internally or through a user repository such as LDAP, while online instances have public signup enabled and must handle the additional load of anonymous internet visitors. Please keep in mind that these are examples only, not recommendations:

<table>
<thead>
<tr>
<th>Use Case</th>
<th>Space</th>
<th>User Accounts</th>
<th>Editor</th>
<th>Editor To Viewer Ratio</th>
<th>Pages</th>
<th>Page Revisions</th>
<th>Attachments</th>
<th>Comments</th>
<th>Total Data Size (GB)</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Online Documentation</td>
<td>140</td>
<td>11,500</td>
<td>1,000</td>
<td>9%</td>
<td>8,800</td>
<td>65,000</td>
<td>7,300</td>
<td>11,500</td>

Confluence Installation Guide

Prerequisites

Before beginning to install Confluence, please check that:

- Your system meets the minimum system requirements to run Confluence.
- This version of the Confluence documentation matches the version of Confluence that you are installing. The Confluence documentation version you are currently viewing is indicated toward the top of the page tree on the left or in the 'breadcrumb trail' in the top banner of this page. If you need to access a different version of the Confluence documentation, use the control at the top of the page tree on the left or you can access it from the documentation home page.

Choose the Confluence Installation Type

Choose the type of Confluence installation you’d like from the table below, and follow the link(s) to the installation instructions.

<table>
<thead>
<tr>
<th>Installation Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Installing Confluence on Windows** | Install Confluence via the Atlassian installer. This is the easiest method of installing Confluence.  
This is the best option for evaluators. |
| **Installing Confluence on Linux** |  |
| **Installing from a Zip File on Windows** | This option requires you to manually carry out installing the files and configuring system properties.  
Use this option if there is no specific installer for your operating system. |
| **Installing From an Archive File on Linux** |  |
| **EAR/WAR distribution (Zip Archive)** | This distribution allows you to deploy Confluence onto your own existing application server, instead of the Apache Tomcat server bundled with the regular distribution. |
| **Confluence Clusters (Zip Archive)** | Install Confluence as a series of clusters, to improve performance or availability. Please read the Confluence Clustering Overview and the Cluster Checklist before you consider installing Confluence in a cluster. |

Please read Running Confluence in a Virtualised Environment if you are interested in running Confluence in a virtual machine.

If you wish to upgrade Confluence, see Upgrading Confluence.

</tbody>
</table>

If you have not already done so, please verify that this version of the Confluence documentation matches that of the Confluence version you are installing. The Confluence documentation version you are currently viewing is indicated toward the top of the page tree on the left or in the 'breadcrumb trail' in the top banner of this page. If you need to access a different version of the Confluence documentation, use the control at the top of the page tree on the left or you can access it from the documentation home page.

Take me back to the Confluence Installation Guide.

Installing Confluence on Windows

This guide describes how to install a new Confluence installation on Windows using the automated 'Windows Installer'. You can also install Confluence from a 'zip' archive — see Installing Confluence on Windows from Zip File for details.

If you are upgrading Confluence, please refer to the Upgrading Confluence guide.

⚠️ Please Note:

- Some anti-virus or other Internet security tools may interfere with the Confluence installation process and prevent the process from completing successfully. If you experience or anticipate experiencing such an issue with your anti-virus/Internet security tool, disable this tool first before proceeding with the Confluence installation.
- Before you begin installing Confluence, please read the System Requirements page.

On this page:

- **Using the Installation Wizard**
  - 1. Download and Run the Confluence 'Windows Installer'
  - 2. Starting Confluence
  - 3. Run the Setup Wizard
  - 4. Next Steps
- **Performing an Unattended Installation**
  - Download and Run the Confluence 'Windows Installer' in Unattended Mode

Using the Installation Wizard

Use the installation wizard if you are installing Confluence on your server for the first time or you wish to specify your installation options.
If you have previously installed Confluence using the installation wizard and wish to re-install Confluence again with the same installation options, you can re-install Confluence in 'unattended mode' without any user input required (see below for details).

1. Download and Run the Confluence 'Windows Installer'

To install Confluence as a service, the Windows Installer must be run using a Windows administrator account. While you can run the Windows Installer with a non-administrator account, your installation options will be much more limited.

1. Download the Confluence 'Windows Installer' (.exe) file from the Confluence Download page.
2. Run the installer file to start the installation wizard.
   - If a Windows 7 (or Vista) 'User Account Control' dialog box requests if you want to allow the installation wizard to make changes to your computer, click 'Yes'. If you do not, the installation wizard will have restricted access to your operating system and any subsequent installation options will be limited.
3. Choose between the 'Express Install' or 'Custom Install' options:
   a. Express Install — If you choose this option, Confluence will be installed with default settings which are shown in the next step of the installation wizard. If you want to customise any of these options, click the 'Back' button and choose the 'Custom Install' option instead.
   b. Custom Install — If you choose this option, Confluence will prompt you to specify the following options (which are presented during subsequent steps of the installation wizard and pre-populated with default values):
      - The 'Destination Directory' in which to install Confluence.
      - The Confluence Home Directory (which must be unique for each Confluence installation).
      - The Windows 'Start' menu folder options.
      - The TCP ports (i.e. an HTTP connector port and a control port) that Confluence will operate on.
      - If you are running the installer using an administrator account, you will be prompted to 'Install Confluence as a service' (recommended). You can also do this manually later, as described in Start Confluence Automatically on Windows as a Service.
      - If you installed Confluence as a service, you must start Confluence through the Windows 'Start' menu, since Confluence will not start if you run start-confluence.bat at the Windows Command Prompt.
4. The installation wizard will install Confluence onto your operating system and will start Confluence automatically when the wizard finishes. Confluence will also be launched automatically in your browser window if you chose this option.

Please Note:

- If you chose to install Confluence as a service, the Confluence service will be run as the Windows 'SYSTEM' user account. To change this user account, see Changing the Windows user that the Confluence service uses.
- If you do not install Confluence as a service, then once started, Confluence will be run as the Windows user account under which Confluence was installed.
- If you use Confluence running on a Windows Server in production, we strongly recommend creating a dedicated user account (e.g. with username 'confluence') for running Confluence.
  - For more information about creating a dedicated user account and defining which directories this account should have write access to, refer to our guidelines.
  - If you installed Confluence as a service, do not forget to change the user account that runs the Confluence service to your dedicated user account for running Confluence.

2. Starting Confluence

If Confluence is not already started, you can start Confluence using the appropriate Windows 'Start' menu.
shortcut or command prompt option.

Once Confluence is started, you can access Confluence from the appropriate Windows 'Start' menu shortcut or a browser on any computer with network access to your Confluence server.

### 2.1 Windows 'Start' Menu Shortcuts

The Installer will have created the following Windows 'Start' menu shortcuts:

- **Access Confluence** — opens a web browser window to access your Confluence application. Your Confluence server must have been started for this shortcut to work.
- **Start Confluence Service** — starts up the Apache Tomcat application server which runs your Confluence installation, so that you can access Confluence through your web browser.
- **Stop Confluence Service** — stops the Apache Tomcat application server which runs your Confluence installation. You will not be able to access Confluence through your web browser after choosing this shortcut.
- **Uninstall Confluence** — uninstalls Confluence from your Windows operating system.

### 2.2 Starting and Stopping Confluence from a Command Prompt

Enter the bin subdirectory of your Confluence installation directory and run the appropriate file:

- `start-confluence.bat` (to start Confluence)
- `stop-confluence.bat` (to stop Confluence)

If you followed our guidelines for running Confluence with a dedicated user account, then to run Confluence as this user account (e.g. 'confluence'), use the runas command to execute `start-confluence.bat`. For example:

```bash
> runas /env /user:<DOMAIN>\confluence start-confluence.bat
```

(Where `<DOMAIN>` is your Windows domain or computer name.)

### 2.3 Accessing Confluence from a Browser

You can access Confluence from any computer with network access to your Confluence server by opening a supported web browser on the computer and visiting this URL:

- `http://<computer_name_or_IP_address>:<HTTP_port_number>`

Where:

- `<computer_name_or_IP_address>` is the name or IP address of the computer on which Confluence is installed and
- `<HTTP_port_number>` is the HTTP port number specified when you installed Confluence (above).

If Confluence does not appear in your web browser, you may need to change the port that Confluence runs on.

3. **Run the Setup Wizard**

See the Confluence Setup Guide.

4. **Next Steps**

- See Confluence 101.
- If you did not install Confluence as a service, you will need to `start Confluence manually` every time you
restart your computer. To change your Confluence installation to run as a service, please see Start Confluence Automatically on Windows as a Service.

- To get the most out of Confluence, please see Performance Tuning.

Performing an Unattended Installation

If you have previously installed Confluence using the installation wizard (above), you can use a configuration file from this Confluence installation (called response.varfile) to re-install 'unattended mode' without any user input required.

Installing Confluence in unattended mode saves you time if your previous Confluence installation was used for testing purposes and you need to install Confluence on multiple server machines based on the same configuration.

⚠️ Please Note:

- The response.varfile file contains the options specified during the installation wizard steps of your previous Confluence installation. Hence, do not uninstall your previous Confluence installation just yet.
- If you intend to modify the response.varfile file, please ensure all directory paths specified are absolute, for example, sys.installationDir=C:\Program Files\Atlassian\Confluence

Unattended installations will fail if any relative directory paths have been specified in this file.

Download and Run the Confluence 'Windows Installer' in Unattended Mode

1. Download the Confluence 'Windows Installer' (.exe) file from the Confluence Download Center to a suitable location.
2. Open the Windows command prompt and perform the remaining steps in the command prompt.
3. copy the response.varfile file located in the .install4j subdirectory of your previous Confluence installation directory, to the same location as the downloaded 'Windows Installer' file.
   🔄 You can uninstall your previous Confluence installation after this step. Save your response.varfile if you need to install Confluence on multiple machines.
4. Change directory (cd) to the location of the 'Windows Installer' file and run the following command:

   ```
   atlassian-confluence-X.Y.exe -q -varfile response.varfile
   ```

   Where:

   - X.Y — refers to the version of Confluence you are about to install.
   - -q — instructs the installer to operate in unattended mode (i.e. 'quietly').
   - -varfile response.varfile — specifies the configuration file containing the configuration options used by the installer. The location and name of the configuration file should be specified after the -varfile option.
5. Confluence will start automatically when the silent installation finishes. Continue from step 2 Starting Confluence (above).

Installing Confluence on Windows from Zip File
These instructions apply to:

- Confluence distributed as an archive file. This distribution includes Apache Tomcat as the application server.
- Windows systems. For other operating systems please refer to the Confluence Installation Guide.
- Manual installation and configuration using a zipped download file. For a simpler installation process, please use the Confluence Installer instead.

Also, please check that the version of Confluence which you are installing coincides with the version that this documentation is written for.

On this page:

1. Before you Start

Please check the following points:

1. Ensure that your system meets the minimum requirements to run Confluence. For more information, please refer to our Supported Platforms topic and for further details, our System Requirements topic.
2. Have your Confluence license key ready. You can obtain a trial, free or commercial license now, or retrieve your existing license key.

2. Install a Java Development Kit (JDK)

Please refer to the Installing Java for Confluence topic for details on installing a JDK for Confluence. If you are certain that this has already been installed and that the JAVA_HOME environment variable has been correctly configured, then proceed to the next step.

3. Download the Confluence Installation File

1. If you have not downloaded Confluence already, download the zip file.
2. Please check your unzip program before extracting the downloaded zip file. You should use a third-party unzip program like 7Zip or Winzip. If you do not have one, please download and install one of these before continuing:
   - 7Zip (recommended). If in doubt, download the ‘32-bit.exe’ version.
   - Winzip.
3. Use your unzip program to unzip the installation file to a directory such as c:\confluence.
   - Do not use spaces in your directory path.

   The directory into which you unzipped the Confluence installation is called the Confluence Installation directory. Next, you will define the Confluence Home directory.

4. Define your Confluence Home Directory

Now you need to define the Confluence Home directory. This is where Confluence will store its configuration information, indexes and attachments.

Tip: Another term for 'home directory' would be 'data directory'.

We suggest using different paths for your installation and home directories. This will facilitate easier upgrades.

Examples of Installation and Home Directories

- Installation directory: c:\confluence\confluence-vX.X
- Home directory: c:\confluence\data

1. Open your Confluence Installation directory (created when you unzipped Confluence — see above).
2. Under the Installation directory, open this file: `confluence\WEB-INF\classes\confluence-init.properties` in a text editor such as Notepad.

3. Scroll to the bottom of the text and find this line:

   ```
   # confluence.home=c:/confluence/data
   ```

4. Remove the '#' and the space at the beginning of this line, so that Confluence no longer regards the line as a comment. The line should now begin with `confluence.home`

5. If you decide to change the Confluence Home directory from the default, please note the following:
   - Avoid spaces in the directory path or file name.
   - Use forward slashes '/' to define the path.

For example:

```
confluence.home=c:/data/confluence-home
```

5. Check the Ports

If you have another application running on your machine which is using the same ports that Confluence uses by default, you may need to change the port which Confluence will use. For example, if you have an installation of JIRA running on this machine, JIRA might be already using the port which Confluence requests by default.

By default, Confluence listens on port '8090'. If this port is already in use in your installation, follow these instructions to change the ports:

- To change the ports for Confluence, open the file `conf/server.xml` under your Confluence Installation directory. The first four lines of the file look like this:

  ```
  <Server port="8000" shutdown="SHUTDOWN" debug="0">
  <Service name="Tomcat-Standalone">
  <Connector className="org.apache.coyote.tomcat4.CoyoteConnector" port="8090" minProcessors="5" maxProcessors="75"
  enableLookups="true" redirectPort="8443" acceptCount="10"
  debug="0" connectionTimeout="20000" useURIValidationHack="false"/>
  ```

You need to modify both the `server` port (default is 8000) and the `connector` port (default is 8090) to ports that are free on your machine.

- **Hint:** You can use `netstat` to identify free ports on your machine. See more information on using `netstat` on Windows or on Linux.

For example, here are the first four lines of a modified `server.xml` file, using ports '8020' and '8099':

```
<Server port="8020" shutdown="SHUTDOWN" debug="0">
  <Service name="Tomcat-Standalone">
  ```
Modified conf/server.xml using ports 8020 and 8099

```
<Server debug="0" shutdown="SHUTDOWN" port="8020">
  <Service name="Tomcat-Standalone">
    <Connector className="org.apache.coyote.tomcat4.CoyoteConnector" port="8099"
               minProcessors="5" maxProcessors="75"
               enableLookups="true" redirectPort="8443" acceptCount="10"
               debug="0" connectionTimeout="20000" useURIValidationHack="false"/>
    ...
  </Service>
</Server>
```

To access Confluence in this configuration, point your web browser to [http://localhost:8099/](http://localhost:8099/).

You will find more information on [this page](http://localhost:8099/).

### 6. Select an External Database

This step is optional for users evaluating Confluence. However, if you are installing Confluence for production purposes, this step is mandatory. Please refer to the [database requirements](http://localhost:8099/) listed on our [System Requirements](http://localhost:8099/) topic for help in choosing an external database.

External databases are those listed on our [Supported Platforms](http://localhost:8099/) topic, excluding HSQLDB, which is bundled with Confluence and should not be used in production.

When you have chosen your external database, follow the [database setup guide](http://localhost:8099/) for setting up your database to work with Confluence.

You can learn more about migration from an existing installation or use of the evaluation database [here](http://localhost:8099/). You will continue to use the Database Setup Guide during the Confluence Setup Wizard. (See [step 8](http://localhost:8099/) below.)

### 7. Start Confluence

1. Go to your Confluence Installation directory (created when you unzipped Confluence — see [above](http://localhost:8099/)).
2. Under your Confluence Installation directory, open the `bin` directory and run the startup script: `startup.bat`. A command prompt window should appear.

    Please do not close this command prompt window. If you do so, Confluence will stop running.

#### Troubleshooting

If the window closes immediately when started, this means that an error is preventing Confluence from starting. To view this error:

1. Open a command prompt: Click on your 'Start' menu, then click 'Run'. In the Run box, type `cmd` and click 'OK'.
2. From the command prompt, go to your Confluence Installation directory.
3. Go into the `bin` subdirectory.
4. Run `catalina.bat run`.

    You should not run `startup.bat` at this point, because that would still produce a popup window that would close straight away.

5. Read the error message.
6. Find the solution to that error in the [Installation FAQ](http://localhost:8099/).

    ✓ If you changed the port earlier, use the port you specified in [step 5](http://localhost:8090/).

    ✓ If your web browser window shows an error, try waiting for 30 seconds or so and then refresh the browser page.
8. Next Step is the Confluence Setup Wizard

The Confluence Setup Wizard should appear in your web browser, prompting you to enter your license key. Follow the instructions on the screens, and read more guidelines on the Confluence Setup Wizard.

If the web browser shows an error instead of the Setup Wizard, check the Installation FAQ.

9. Start Confluence automatically on Windows as a Service

Confluence should be run as a service.

Uninstalling Confluence from Windows

This page describes the procedure for uninstalling an instance of Confluence which has been installed using the Windows Installer.

To uninstall Confluence from Windows:

1. Log in to Windows as the same user that was used to install Confluence with the Windows Installer.
2. Start the uninstaller by doing either of the following:
   - Click the Windows Start Menu > All Programs > Confluence > Uninstall Confluence
   - OR
   - Open the Windows Control Panel, choose Add or Remove Programs (on Windows XP) or Programs and Features on (Windows 7, Vista) and then select Confluence X.Y from the list of applications and click Uninstall/Change.
   - OR
   - Open the Windows command prompt and do the following:
     a. Change directory to your Confluence installation directory
     b. Run the uninstall.exe file
3. Follow the prompts to uninstall Confluence from your computer.

Please note:

- The uninstaller will not delete the Confluence Home Directory.
- All log files that were generated while Confluence was running will not be deleted.
- All files within the Confluence Installation Directory will be deleted (with the exception of the Tomcat log folder located in the Confluence Installation Directory).
- The uninstaller can be made to operate in unattended mode by specifying the --q option at the Windows command prompt — i.e. uninstall -q
- If you wish to re-install Confluence in 'unattended mode', do not uninstall your previous installation of Confluence just yet. See Using the Silent Installation Feature for more information.

Installing Confluence on Linux

This guide describes how to install a new Confluence installation on Linux using the automated 'Linux Installer'. You can also install from a 'zip' archive — see Installing Confluence on Linux from Archive File for details. If you are upgrading Confluence, please see Upgrading Confluence.

Please Note:

- It is possible that any anti-virus or other Internet security tools installed on your Linux operating system may interfere with the Confluence installation process and prevent the process from completing...
Successfully. If you experience or anticipate experiencing such an issue with your anti-virus/Internet security tool, disable this tool first before proceeding with the Confluence installation.

- Before you begin installing Confluence, please read the System Requirements page.

**Using the Console Wizard**

Use the console wizard if you are installing Confluence on your server for the first time or you wish to specify your installation options.

If you have previously installed Confluence using the installation wizard and wish to re-install Confluence again with the same installation options, you can re-install Confluence in 'unattended mode' without any user input required (see below for details).

1. **Download and Install the Confluence 'Linux Installer'**

   - If you execute the Linux Installer with 'root' user privileges, the installer will create and run Confluence using a dedicated user account. You can also execute the Linux Installer without 'root' user privileges, although your installation options will be much more limited and a dedicated user account (to run Confluence) will not be created. To run Confluence as a service, the Linux Installer must be executed with 'root' user privileges.

   1. Download the appropriate **Confluence 'Linux 64-bit / 32-bit Installer'** (.bin) file from the Confluence page.

      Please Note:

      - To access the 32-bit installer, you may need to click the 'Show all' link on the 'Confluence Download' page to access the other installation packages.
      - The difference between the 64-bit / 32-bit .bin installers relates to their bundled Java platforms that run Confluence. Bear in mind that a Confluence installation installed using the 64-bit installer may require additional memory (to run at a similar level of performance) to a Confluence installation installed using the 32-bit installer. This is because a 64-bit Java platform's object references are twice the size as those for a 32-bit Java platform.

   2. Open a Linux console and change directory (cd) to the '.bin' file's directory.

      Please Note:

      If the '.bin' file is not executable after downloading it, make it executable, for example:

      ```
      chmod a+x atlassian-confluence-X.Y.bin
      ```

      (where X.Y represents your version of Confluence)

   3. Execute the '.bin' file to start the console wizard.

   4. When prompted to choose between 'Express Install', 'Custom Install' or 'Upgrade an existing Confluence installation', choose either the 'Express Install' or 'Custom Install' options:

      - **Express Install** — If you choose this option, Confluence will be installed with default settings which are shown in the next step of the console wizard.

      Please Note:

      - If you are running the installer with 'root' user privileges, Confluence will be installed as a service.
      - If you want to customise any of these options:
        i. Enter 'e' to exit the console wizard.
        ii. Execute the console wizard again (step 3 above).
        iii. Choose the 'Custom Install' option instead.

      - **Custom Install** — If you choose this option, Confluence will prompt you to specify the following options (which are presented during subsequent steps of the console wizard and pre-populated with default values):

        - **The 'Destination Directory' in which to install Confluence**.
        - The **Confluence Home directory** (which must be unique for each Confluence installation).
        - The **TCP ports** (i.e. an HTTP and a Control port) that Confluence will run through.
        - If you are running the installer with 'root' user privileges, you will be prompted to 'Run Confluence as a service' (recommended). You can also do this manually later, as described in **Start Confluence Automatically on Linux**.

   5. The console wizard will install Confluence onto your operating system and will start Confluence successfully.
automatically when the wizard finishes.

**Please Note:**

If you executed the Linux Installer with 'root' user privileges, the Linux Installer creates a dedicated Linux user account with username 'confluence', which is used to run Confluence. This account has only:

- Full write access to your **Confluence Home Directory**.
- Limited write access to your **Confluence Installation Directory**.

If you executed the Linux Installer without 'root' user privileges, be aware that Confluence can still be run with 'root' privileges. However, to protect the security of your operating system, **this is not recommended**.

2. Start Confluence

If Confluence is not already started, you can start Confluence using the appropriate command at the Linux console.

Once Confluence is started, you can access Confluence from a browser on any computer with network access to your Confluence server.

2.1 Starting and Stopping Confluence manually

In the Linux console, enter the bin subdirectory of your Confluence installation directory and execute the appropriate file:

- start-confluence.sh (to start Confluence)
- stop-confluence.sh (to stop Confluence)

Confluence will be ready to access (from a browser window) when the following message appears in the application's log file:

```
******************************************
*************
... You can now access Confluence through your web browser.
*************
******************************************
```

2.2 Accessing Confluence from a Browser

You can access Confluence from any computer with network access to your Confluence server by opening a supported web browser on the computer and visiting this URL:

- http://<computer_name_or_IP_address>[:<HTTP_port_number>]

where:

- `<computer_name_or_IP_address>` is the name or IP address of the computer on which Confluence is installed and
Confluence 4.2 Documentation

1. 

2. 

3. 

4. 

5. 

<HTTP_port_number> is the HTTP port number specified when you installed Confluence (above).

If Confluence does not appear, you may need to change the port that Confluence runs on.

Note: Application server logs (i.e. for Apache Tomcat) will be written to logs/catalina.out.

3. Run the Setup Wizard

See the Confluence Setup Guide.

4. Next Steps

See Confluence 101.

If you did not install Confluence to run as a service, you will need to start Confluence manually every time you restart your computer. To change your Confluence installation to run as a service, please see Start Confluence Automatically on Linux.

To get the most out of Confluence, please see Performance Tuning.

Performing an Unattended Installation

If you have previously installed Confluence using the console wizard (above), you can use a configuration file from this Confluence installation (called response.varfile) to re-install Confluence in 'unattended mode' without any user input required.

Installing Confluence in unattended mode saves you time if your previous Confluence installation was used for testing purposes and you need to install Confluence on multiple server machines based on the same configuration.

Please Note:

- The response.varfile file contains the options specified during the installation wizard steps of your previous Confluence installation. Hence, do not uninstall your previous Confluence installation just yet.
- If you intend to modify the response.varfile file, please ensure all directory paths specified are absolute, for example, sys.installationDir=/opt/atlassian/confluence

Unattended installations will fail if any relative directory paths have been specified in this file.

Download and Run the Confluence 'Linux Installer' in Unattended Mode

1. Download the Confluence 'Linux Installer' (.bin) file from the Confluence Download Center to a suitable location.
2. Open a Linux console.
3. Copy (cp) the file .install4j/response.varfile located in your previous Confluence installation directory, to the same location as the downloaded 'Linux Installer' file.
   - You can uninstall your previous Confluence installation after this step. Save your response.varfile if you need to install Confluence on multiple machines.
4. Change directory (cd) to the location of the 'Linux Installer' file and execute the following command:

   atlassian-confluence-X.Y.bin -q -varfile response.varfile

Where:

- X.Y — refers to the version of Confluence you are about to install.
- -q — instructs the installer to operate in unattended mode (i.e. 'quietly').
- -varfile response.varfile — specifies the configuration file containing the configuration options used by the installer. The location and name of the configuration file should be specified after the -varfile option.
5. Confluence will start automatically when the silent installation finishes. Continue from the step above, Starting Confluence.

### Installing Confluence on Linux from Archive File

These instructions apply to:
- Confluence distributed as an archive file. The distribution includes Apache Tomcat as the application server.
- **Linux or Solaris** systems. If you are installing Confluence on a different system, please refer to [Installing Confluence](#).

Also, please check the version of Confluence which you are installing. Refer to the [documentation home page](#) to verify the latest Confluence version and to find documentation for older versions.

**Hint:** If you are evaluating Confluence on Solaris or you are unsure which version to install, this is the one to use.

### On this page:

- 1. Before you Start
- 2. Install the JDK (Java Development Kit)
- 3. Download and Extract the Confluence Installation File
- 4. Define your Confluence Home Directory
- 5. Check the Ports
- 6. Select an External Database
- 7. Start Confluence
- 8. Confluence Setup Wizard

#### 1. Before you Start

Please check the following points:

1. Ensure that your system meets the minimum requirements to run Confluence. For more information, please read the detailed [System Requirements](#).
2. Have your Confluence license key ready. You can [obtain a trial, free or commercial license](#) now, or retrieve your existing license key.
3. You must be able to use a command prompt and install Java to continue. If not, please contact your system administrator to assist you or consider the [Confluence Hosted evaluation option](#).
4. Make sure that you use a Gnu version of zip application - Solaris and AIX are known to have problems with zip, because they use their own (old) versions instead of the Gnu version.

#### 2. Install the JDK (Java Development Kit)

**Confluence requires Java 6 (JDK 1.6) or later**

Confluence needs JDK 1.6 or newer to be installed on your computer.

- A JRE (Java Runtime Environment) is not enough.
- Confluence will not work with JDK 1.5 or earlier.

**OpenJDK is currently not supported. A JIRA issue to request support for this JDK has been created.**

1. If you are not sure whether you have JDK installed correctly, please confirm by doing the following:
   a. Open a shell console.
   b. Type `echo $JAVA_HOME` in the shell console and then press Enter
   c. View the result:
• If a line is displayed such as /opt/jdk1.6.0_12 or /usr/lib/jvm/java-6-sun, then your JDK is installed and properly configured.
• If nothing is displayed, then you either need to install the JDK or set the $JAVA_HOME environment variable. You can set this environment variable in your user account's 'profile' file. Alternatively, you can set this after installing Confluence (in step 4 below) by defining this path in your Confluence installation's setenv.sh file, usually located in the Confluence bin directory.
• If you have installed an unsupported JDK and you want to use SSL then you need to install the Sun JSSE package.

2. If you need to install the JDK, follow these instructions:
   • Go to the Java download page.
   • Download the version entitled 'JDK 6 Update XX', where 'XX' stands for some number. (The latest version is available on that page.)
   • When the download has finished, run the Java installer. Detailed installation instructions are provided on Oracle's website.
     1 At one point, you will be asked to choose an installation directory. Make a note of this directory for use later.

3. **Download and Extract the Confluence Installation File**

1. If you have not downloaded Confluence already, [download the TAR.GZ file](#).

Use your unzip program to unzip the installation file to a directory such as /home/jsmith/confluence-2.7.0-std/.

Most Linux/Solaris users can use any unzip program (such as GNU Tar) to extract the Confluence installer. However, Solaris users should not use the Solaris Tar program due to a known issue associated with its use in extracting Confluence. Use another application such as GNU Tar instead.

For example, change directory to your home directory in Linux and enter the following commands in the shell console:

- gunzip confluence-<version>-std.tar.gz
- tar -xf confluence-<version>-std.tar

(where <version> refers to the Confluence version you downloaded.)

1 As usual on Linux/Solaris-based operating systems, avoid using spaces in your directory path. The directory into which you unzipped the Confluence installation is called the Confluence Installation directory. Next you will define the Confluence Home directory.

4. **Define your Confluence Home Directory**

Now you need to define the Confluence Home directory. This is where Confluence will store its configuration information, indexes and attachments.

Tip: Another term for 'Home directory' would be 'data directory'.

We suggest using different paths for your installation and home directories. This will facilitate upgrades.

Examples of Installation and Home Directories:

• Installation directory: /usr/local/confluence/

If you wish to install or maintain multiple versions of Confluence, you can add a version number to the Confluence installation directory name like /usr/local/confluence-3.1-std/ and optionally, create the symbolic link /usr/local/confluence/ that points to /usr/local/confluence-3.1-std/

• Home directory: /usr/local/confluence-data/

1. Open your Confluence Installation directory (created when you unzipped Confluence — see above).
2. Under the Installation directory, find this file: confluence/WEB-INF/classes/confluence-init.pr
3. Open the `confluence-init.properties` file in a text editor.
4. Scroll to the bottom and find this line:

```bash
# confluence.home=c:/confluence/data
```

5. Remove the '#' and the space at the beginning of this line, so that Confluence no longer regards the line as a comment. The line should now begin with `confluence.home`

6. If you decide to change the Confluence Home directory from the default, use an absolute path rather than a symbolic link to specify the path and file name. For example:

```bash
confluence.home=/home/jsmith/confluence-data/
```

5. **Check the Ports**

If you have another application running on your machine which is using the same ports that Confluence uses by default, you may need to change the port which Confluence will use. For example, if you have a installation of JIRA running on this machine, JIRA might be already using the port which Confluence requests by default.

By default, Confluence listens on port '8090'. If this port is already in use in your installation, follow these instructions to change the ports:

- To change the ports for Confluence, open the file `conf/server.xml` under your Confluence Installation directory. The first four lines of the file look like this:

```
<Server port="8000" shutdown="SHUTDOWN" debug="0">
  <Service name="Tomcat-Standalone">
    <Connector
```

You need to modify both the `server` port (default is 8000) and the `connector` port (default is 8090) to ports that are free on your machine.

✓ Hint: You can use netstat to identify free ports on your machine. See more information on using `netstat` on Windows or on Linux.

For example, here are the first four lines of a modified `server.xml` file, using ports '8020' and '8099':

```
<Server port="8020" shutdown="SHUTDOWN" debug="0">
  <Service name="Tomcat-Standalone">
    <Connector
```
Modified conf/server.xml using ports 8020 and 8099

```
<Server debug="0" shutdown="SHUTDOWN" port="8020">
  <Service name="Tomcat-Standalone">
    <Connector
      className="org.apache.coyote.tomcat4.CoyoteConnector" port="8099"
      minProcessors="5" maxProcessors="75"
      enableLookups="true" redirectPort="8443" acceptCount="10"
      debug="0" connectionTimeout="20000" useURIValidationHack="false"/>
...```

To access Confluence in this configuration, point your web browser to http://localhost:8099/.

You will find more information on this page.

6. Select an External Database

This step is optional for users evaluating Confluence. However, if you are installing Confluence for production purposes, this step is mandatory. Please refer to the database requirements listed on our System Requirements topic for help in choosing an external database.

External databases are those listed on our Supported Platforms topic, excluding HSQLDB, which is bundled with Confluence and should not be used in production.

When you have chosen your external database, follow the database setup guide for setting up your database to work with Confluence.

You can learn more about migration from an existing installation or use of the evaluation database here. You will continue to use the Database Setup Guide during the Confluence Setup Wizard. (See step 8 below.)

7. Start Confluence

1. Go to your Confluence Installation directory (created when you unzipped Confluence — see above).
2. Under your Confluence Installation directory, open the bin directory and run the startup script: start-confluence.sh.
3. Once Confluence is running, open a web browser and visit http://localhost:8090/.
   ✔ Hint: If you changed the port earlier, use the port you specified in step 6 above.

8. Confluence Setup Wizard

The Confluence Setup Wizard should appear in your web browser, prompting you to enter your license key. Follow the instructions on the screens, and read more guidelines on the Confluence Setup Wizard.

If the web browser shows an error instead of the Setup Wizard, check the Installation FAQ.

Documentation Home

Uninstalling Confluence from Linux

This page describes the procedure for uninstalling Confluence, which had been installed using the Linux Installer.
To uninstall Confluence from Linux:

1. Open a Linux console.
2. Change directory (`cd`) to your Confluence installation directory.
3. Execute the command `uninstall`. This command must be executed as the same user account that was used to install Confluence with the Linux Installer.
4. Follow the prompts to uninstall Confluence from your computer.

Please note:

- The uninstaller will not delete the Confluence Home Directory.
- All log files that were generated while Confluence was running will not be deleted.
- All files within the Confluence Installation Directory will be deleted (with the exception of the Tomcat log folder located in the Confluence Installation Directory).
- The uninstaller can be made to operate in unattended mode by specifying the `-q` option — i.e., `uninstall -q`.
- If you wish to re-install Confluence in 'unattended mode', do not uninstall your previous installation of Confluence just yet. See Using the Silent Installation Feature for more information.

Change listen port for Confluence

Problem

This page tells you what to do if you get errors like the following when starting Confluence, when you can't access Confluence on port 8090.

If you see this error:

```
java.net.BindException: Address already in use: JVM_Bind:8090
```

This means you are running other software on Confluence's default port of 8090. This may be another other process running on the same port. It may also be a previous instance of Confluence that hasn't been shut down cleanly.

To find out what process is listening on that port, load a command prompt and type: `netstat -an`

```
-a : Displays all active TCP connections and the TCP and UDP ports on which the computer is listening.
-n : Displays active TCP connections, however, addresses and port numbers are expressed numerically and no attempt is made to determine names.
```

There is also Process Explorer tool available to determine what is binding port 8090.
Solution: Change the Ports which Confluence Listens On

To change the ports for Confluence, open the file `conf/server.xml` under your Confluence Installation directory. The first four lines of the file look like this:

```xml
<Server port="8000" shutdown="SHUTDOWN" debug="0">
  <Service name="Tomcat-Standalone">
    <Connector className="org.apache.coyote.tomcat4.CoyoteConnector" port="8090" minProcessors="5" maxProcessors="75"
      enableLookups="true"
      redirectPort="8443" acceptCount="10"
      debug="0" connectionTimeout="20000"
      useURIVisualHack="false"/>
    ...
  </Service>
</Server>
```

You need to modify both the `server` port (default is 8000) and the `connector` port (default is 8090) to ports that are free on your machine.

✅ Hint: You can use `netstat` to identify free ports on your machine. See more information on using `netstat` on Windows or on Linux.

For example, here are the first four lines of a modified `server.xml` file, using ports ‘8020’ and ‘8099’:
To access Confluence in this configuration, point your web browser to http://localhost:8099/. NOTES

[1] For more information on netstat, see using netstat on Windows, or netstat man page (Linux).

[2] The JIRA distribution runs on port 8080 by default. If you're looking to change the port of the JIRA distribution, see Changing JIRA Standalone’s port.

Installing the Confluence EAR-WAR Edition

The Confluence EAR-WAR distribution is intended for deployment into an existing J2EE application server.

To use this method of installation, you need to know how to deploy a web application on an existing application server. If not, please use the Confluence distribution instead.

On this page:

- Step 1. Check the System Requirements and Known Issues
- Step 2. Download and Extract EAR-WAR Installation File
- Step 3. Review Application Server Memory Allocation
- Step 4. Configure confluence-init.properties
- Step 5. Edit Tomcat Context Descriptors
- Step 6. Add UTF-8 Encoding
Step 1. Check the System Requirements and Known Issues

1. Please check the Confluence system requirements.
2. In addition to the above requirements, the EAR-WAR distribution requires the Apache Tomcat application server. For more information on Confluence's supported application servers, please refer to our Supported Platforms page.
3. If deploying as an unexploded WAR, Ant 1.3 or later is required. This is bundled with the WAR download.
4. Confluence, the database and application server must use the same character encoding. UTF-8 is recommended.
5. Deploying multiple Atlassian applications in a single Tomcat container is not supported. We do not test this configuration and upgrading any of the applications (even for point releases) is likely to break it. There are also a number of known issues with this configuration (see this FAQ for more information).

Step 2. Download and Extract EAR-WAR Installation File

This section gives detailed instructions for installing Confluence EAR-WAR edition on an Apache Tomcat 5.5, or 6 server.

1. Download the Confluence EAR/WAR zip file. (You need to click the 'Show all' link to see the EAR/WAR zip file.)
2. Please check your unzip program before extracting the downloaded zip file. Some archive-extract programs cause errors when unzipping the Confluence zip file:
   - Windows users must avoid the Windows built-in unzip utility, as it doesn't extract all the files. Use a third-party unzip program like 7Zip or Winzip.
   - Solaris users will need to use GNU tar to handle the long file names.
3. Extract the downloaded zip file.
4. You have now unzipped your Confluence installation directory, which should contain the version number e.g. confluen ce-4.0.1 or confluen ce-4.0.2. This directory will be later referred to as the Confluence installation directory. Inside is a confluence subdirectory, referred to later as the Exploded Confluence WAR directory. Record the absolute path to the Confluence WAR directory.

Step 3. Review Application Server Memory Allocation

Confluence requires a maximum heap allocation (Xmx) of at least 256 MB for normal operation. Also, remember to set the maximum PermGen memory allocation (XX:MaxPermSize). See Increasing Application Server Memory.

⚠️ Do not configure a heap allocation so large that it does not allow enough remaining physical memory for your operating system and other applications on the server. The heap allocation should be large enough for Confluence, but not so large that the memory would be paged to disk during normal operation.

Step 4. Configure confluence-init.properties
1. Inside the Confluence installation directory, edit ...confluence/WEB-INF/classes/confluence-init.properties in a text editor.

2. Now define your Confluence Home directory, by setting the confluence.home property to a directory of your choosing.

   We suggest using different paths for your installation and home directories. This will facilitate upgrades.
   This is the directory that will contain all of Confluence's configuration, backup and attachment files.

   ✓ Tip: Another term for 'Home directory' would be 'data directory'.

Step 5. Edit Tomcat Context Descriptors

1. Create a file called confluence.xml and save in the conf/Catalina/localhost sub-directory of Tomcat. If these directories don't exist you can create them manually.

2. Open your new confluence.xml file and add these lines:

   ```xml
   <Context path="/confluence"
   docBase=""CONFERENCE_INSTALLATION_DIRECTORY_PATH>confluence" debug="0"
   reloadable="true">
   </Context>
   ```

   More on Context Path

   To run Confluence without a context path, change the path in the Context tag to an empty string ("""). If not using a context path, your config will need to be saved as ROOT.xml rather than confluence.xml.

   In Tomcat, a context path name follows the name of its xml file (except for ROOT.xml where no context path is used. Hence if you wish to change the context path to a different name, change both the context path and the name of the xml file. eg. "/wiki" context path should be saved in file wiki.xml.

3. For docBase, specify the value you noted down earlier.

4. Restart Tomcat, and Confluence should be accessible under /confluence/ on your Tomcat server.

5. Follow the link below to proceed with the setup wizard.

Step 6. Add UTF-8 Encoding

1. Edit conf/server.xml and find the line where the Coyote HTTP Connector is defined. It will look something like this, possibly with more parameters:

   ```xml
   <Connector port="8080"/>
   ```

2. Add a URIEncoding="UTF-8" property to the connector:

   ```xml
   <Connector port="8080" URIEncoding="UTF-8"/>
   ```

Step 7. (Optional) Configure Tomcat to Run on a Different Port

See Switching to Apache Tomcat.

Step 8. (Optional) Configure Confluence to Run as a Windows Service
Confluence can be run as a service.

Step 8. Run the Confluence Setup Wizard

Once Confluence is running, open a web browser and visit http://localhost:8080/ (Tomcat default port).

If you changed the port earlier, use the port you specified. Note that the Confluence installer normally uses port 8090 as the default, to avoid conflicts with JIRA (using port 8080).

The Confluence Setup Wizard should appear in your web browser, prompting you to enter your license key. Follow the instructions on screen, and read more guidelines on the Confluence Setup Wizard.

Notes

- Tomcat users, take care not to unzip the Confluence installation into your Tomcat webapps folder, as this may cause Confluence to be deployed more than once. It may cause a Cluster Panic error.
- If you deploy Confluence on an unsupported server, server-related issues cannot be covered by Atlassian technical support. You can try Atlassian Answers for assistance instead.

Installing Java for Confluence

This page contains instructions for installing a Java Runtime Environment (JRE). This is a manual step that is only required for Confluence installations where you are installing from a zip or archive file.

If you are using the automated installer, the required Java files are bundled and will be automatically put in place, hence you will not need to follow the instructions on this page.

Please refer to our Supported Platforms topic for details of the Java versions that are supported for Confluence.

Installing the JRE

A JRE (Java Runtime Environment) needs to be installed on the same server machine that will have Confluence installed.

For Windows: (click to expand)

Installing the JRE on Windows
1. If you are not sure whether you have a JRE installed, please confirm by doing the following:
   - Check Control Panel > Programs and Features in Windows 7 (just Programs on older version of Windows).
   - Java should appear as a line item in the list. If not, you do not have Java installed.

2. To install the JRE, follow these instructions:
   - Go to the Java download page.
   - Download the version entitled 'Java SE Update XX (JRE)', where 'XX' stands for some number.
     (The latest version will be available on that page.)
   - When the download has finished, run the Java installer. At one point, you will be asked to choose a directory to install to. Copy or write this directory down for use later.

3. Check that the JAVA_HOME environment variable has been set correctly.
   - Open the Start menu, choose Run, type cmd in the Run dialog box and click OK.
   - In the command prompt window, type echo %JAVA_HOME% and then press Enter.
   - View the result:
     - If a directory path is displayed that looks similar to one of the following examples, with the letters 'jre' immediately preceding a series of version numbers, and this path matches the location where you installed the JRE in step 2, then your JRE has been successfully installed and your JAVA_HOME environment variable has been set correctly.
     - Examples of typical JAVA_HOME environment variable values:
       - C:\Program Files\Java\jre6
       - C:\Programs\Java\jre6
       - C:\Java\jre6
       - C:\jre6
     - If nothing is displayed or you do not see 'jre' immediately followed by a series of version numbers (like one of the examples above), then you need to set the JAVA_HOME environment variable. Please follow these instructions to set your JAVA_HOME environment variable to the directory you where you have just installed the Jre. By default, this directory is under C:\Program Files\Java.

For Linux: (click to expand)

Installing the JRE on Linux

1. If you are not sure whether you have JRE installed correctly, please confirm by doing the following:
   a. Open a shell console.
   b. Type echo $JAVA_HOME in the shell console and then press Enter
   c. View the result:
     - If a line is displayed such as /opt/jre6 or /usr/lib/jvm/java-6, then your JRE is installed and properly configured.
     - If nothing is displayed, then you either need to install the JRE or set the $JAVA_HOME environment variable. You can set this environment variable in your user account’s ‘profile’ file. Alternatively, you can set this after installing Confluence (in step 4 below) by defining this path in your Confluence installation’s setenv.sh file, usually located in the Confluence bin directory.
     - If you have installed an unsupported JRE and you want to use SSL then you need to install the Sun JSSE package.

2. If you need to install the JRE, follow these instructions:
   - Go to the Java download page.
   - Download the version entitled ‘Java SE Update XX (JRE)’, where ‘XX’ stands for some number.
     (The latest version is available on that page.)
   - When the download has finished, run the Java installer. Detailed installation instructions are provided on Oracle’s website.

Setting the JAVA_HOME Variable in Windows

This information is only relevant if you are installing Confluence on a Windows server.

After you have installed the Java Runtime Environment (JRE) in Windows, you must set the JAVA_HOME environment
ment variable to point to the JRE installation directory.

Stage 1. Locate the JRE Installation Directory

If you already know the installation path for the Java Runtime Environment, go to Stage 2 below. Otherwise, find the installation path by following these instructions:

1. If you didn’t change the installation path for the Java Runtime Environment during installation, it will be in a directory under C:\Program Files\Java. Using Explorer, open the directory C:\Program Files\Java.
2. Inside that path will be one or more subdirectories such as C:\Program Files\Java\jre6.

Stage 2. Set the JAVA_HOME Variable

Once you have identified the JRE installation path:

1. Right-click the My Computer icon on your desktop and select Properties.
2. Click the Advanced tab.
3. Click the Environment Variables button.
5. Enter the variable name as JAVA_HOME.
6. Enter the variable value as the installation path for the Java Development Kit.
   - If your Java installation directory has a space in its path name, you should use the shortened path name (e.g. C:\Progra~1\Java\jre6) in the environment variable instead.

   Note for Windows users on 64-bit systems

   Progra~1 = 'Program Files'
   Progra~2 = 'Program Files(x86)'

7. Click OK.
8. Click Apply Changes.
9. Restart Windows. (This is not always necessary, but it often prevents problems.)
10. If you are running the Confluence EAR/WAR distribution, rather than the regular Confluence distribution, you may need to restart your application server.

Confluence Cluster Installation

Overview

There are two methods of installing Confluence in a cluster, depending on whether you have existing data. This page describes a fresh installation with no existing data.

See also Confluence Cluster Installation with Existing Data.
Oracle Coherence Licensing Change:

- Due to a license agreement change, Confluence is now available in two editions:
  - **Standard Edition** — Confluence with Ehcache’s caching technology (available to customers with non-clustered Confluence licenses).
  - **Clustered Edition** — Confluence with Oracle's Coherence clustering and distributed caching technology (available to customers with Confluence clustered licenses only).

  **Caution:** If you are currently running a clustered installation of Confluence, please do not upgrade it with a standard edition of Confluence.

For more information about these changes, please refer to the [Coherence License Changes](#) document.

Changes

If you have a Confluence clustered license, are running a clustered installation of Confluence and wish to upgrade to Confluence version 2.6 or later, please ensure that you download only a clustered edition of Confluence and please refer to the [Confluence 3.0.1 Upgrade Notes](#) for additional upgrade information.

---

**Installation with no existing data**

To get Confluence running in a two-node cluster, you must do the following:

1. Ensure you meet the clustering **requirements**, including obtaining a clustered license key from Atlassian for each node.
2. Install Confluence on a single node, configuring an external database and a cluster name.
3. Load test the single node installation, see whether clustering is required.
4. Shut down the first node, copy the Confluence application and Confluence home directory to the second node.
5. Start the first node, wait until it is running, then bring up the second node and it will automatically join the cluster.
6. Test the cluster is working correctly.
7. Configure a load balancer in front of the two clustered nodes.

Each of these steps will be described in detail below.

**1. Clustering requirements**

Your Confluence cluster installation must meet all the following criteria for clustering:

- You must have a clustered license.
- You must use an external database.
- You must use a load balancer with session affinity in front of the cluster.

Clustered commercial licenses may be purchased through the [Confluence website](https://confluence.com). Clustered evaluation licenses may be obtained by emailing sales@atlassian.com.

A cluster can run using two copies of Confluence. However, cluster administrators must understand how to configure an application server and web server with load balancing, so we recommend you are comfortable installing Confluence as a EAR/WAR in your application server before proceeding with a clustered installation.

**2. Installation on first node**

Cluster administrators should already be comfortable with the normal installation method, so it won't be repeated here. There are two differences in the Confluence Setup Wizard from a normal installation:

- You must use an external database.
- You must enter a cluster name.
Enter a cluster name to create a new cluster

**Technical note**

The cluster name will be converted into a unique multicast IP address and port for your Confluence cluster. UDP multicast traffic is used for Confluence to automatically discover other nodes in the cluster when they start up.

3. **Load test the single node**

Most Confluence installations do not need to be clustered. Ensure you have tested your single node installation with the number of users you expect to host before going ahead with the additional complexity of clustering.

Check out our [performance tuning tips](#) for ways to improve the performance of a single instance of Confluence.

You can upgrade your single node to a multi-node cluster at any time by resuming this guide from step 4 below.

4. **Copy Confluence to second node**

Confluence clusters must use the same JDK, application server and application. The easiest way to ensure this is to shut down Confluence on the first node, then copy its web application and home directory to the second node:

1. Shut down Confluence on node #1.
2. Shut down your application server on node #2, or stop it automatically loading web applications.
3. Copy the Confluence web application from node #1 to node #2.
4. Copy the Confluence home directory from node #1 to node #2.

Copying the web application ensures any modifications you have made to the application itself, custom LDAP settings (`atlassian-user.xml`), and any other advanced configuration are copied to node #2.

Copying the home directory ensures the Confluence search index (the `index/` directory), the database and cluster configuration (`confluence.cfg.xml`), and any other home directory settings are copied to node #2.

5. **Start Confluence on the first node, wait, then start Confluence on second node**

For the most stable start-up process, it is important to start Confluence one server at a time.

1. Start Confluence on node #1.
2. Wait for Confluence to become available on node #1.
3. Start Confluence on node #2.
4. Wait for Confluence to become available on node #2.

6. **Test cluster connectivity**

The [Cluster Administration page](#) (Administration, Cluster Configuration) includes information about the active cluster. When the cluster is running properly, this page displays:

- a correct count of the nodes in the cluster
- a status display for each node in the cluster
- an uptime for each node that is accurate.
1. Create a new document on node #1.
2. Ensure the new document is visible by accessing it directly on node #2.
3. Wait one minute (Confluence does batch indexing once per minute).
4. Search for the new document on node #1, ensure it appears.
5. Search for the new document on node #2, ensure it appears.

### Technical note

If Confluence detects more than one instance accessing the database but not in a working cluster, it will shut itself down in a cluster panic. This can be fixed by troubleshooting the network connectivity of the cluster.

### 7. Configure load balancer

For the moment, configuring the load balancer is outside the scope of this document.

However, a simple [Apache and Tomcat load-balancing configuration](#) is available, which includes sample configuration for the Apache Tomcat and the Apache web server, using its load-balancing JK connector.

### Troubleshooting

If you have problems with the above procedure, please see our [Cluster Troubleshooting guide](#).

### Upgrading a cluster

It is important that upgrades follow the procedure for [Upgrading a Confluence Cluster](#).

### Related documentation

### Confluence Cluster Installation with Existing Data

#### Overview

There are two methods of installing Confluence in a cluster, depending on whether you have existing data. This page describes how to upgrade an existing Confluence instance into a cluster.

See also [Cluster installation without existing data](#).
Oracle Coherence Licensing Change:

- Due to a license agreement change, Confluence is now available in two editions:
  - **Standard Edition** — Confluence with Ehcache's caching technology (available to customers with non-clustered Confluence licenses).
  - **Clustered Edition** — Confluence with Oracle's Coherence clustering and distributed caching technology (available to customers with Confluence clustered licenses only).

- For more information about these changes, please refer to the [Coherence License Changes](#) document.
- If you have a Confluence clustered license, are running a clustered installation of Confluence and wish to upgrade to Confluence version 2.6 or later, please ensure that you download only a [clustered edition of Confluence](#) and please refer to the [Confluence 3.0.1 Upgrade Notes](#) for additional upgrade information.

Cluster installation from an existing copy of Confluence

BEFORE ATTEMPTING THIS, PLEASE MAKE A BACKUP. To upgrade an existing copy of Confluence to run in a two-node cluster, you must do the following:

1. Ensure that your version of the Confluence distribution has been upgraded to the version you want to run the Cluster on. **Do not upgrade your version of Confluence and switch to the clustered version at the same time.** First upgrade your system (e.g. from Confluence 2.5.8 to 2.7.1) and make sure everything works fine (e.g. for a week) before switching (e.g. from Confluence 2.7.1 to 2.7.1 Clustered).
2. Ensure you meet the clustering requirements, including obtaining a clustered license key from Atlassian for each node.
3. Due to [CONF-8959](#), you need to perform [attachment migration](#) to the database before you change your license to a clustered license.
4. Upgrade the existing Confluence instance to a clustered license. Do this by going to Admin > Licence Details. Confluence should warn you that this version of Confluence is not capable of clustering.
5. Shutdown Confluence. Deploy a clustered version of Confluence (Do not attempt to install any version of Confluence that is not the Clustered equivalent to your current release). Edit confluence-init.properties (confluence-ver-clustered/confluence/WEB-INF/classes/confluence-init.properties) to set confluence.home to the same path as the old home. Start the first node, and verify that things are working correctly.
6. Shut down the first node, copy the Confluence application and Confluence home directory to the second node.
7. Start the first node, wait until it is running, then bring up the second node and it will automatically join the cluster.
8. Test the cluster is working correctly.
9. Configure a load balancer in front of the two clustered nodes.

Each of these steps will be described in detail below.

1. Clustering requirements

Your Confluence cluster installation must meet all the following criteria for clustering:

- you must be running Confluence 2.3 or later
- you must have a clustered license
- you must use an external database
- you must use a load balancer with session affinity in front of the cluster.

Clustered commercial licenses may be purchased through the [Confluence website](#). Clustered evaluation licenses may be obtained by emailing [sales@atlassian.com](mailto:sales@atlassian.com).
A cluster can run using two copies of the Confluence distribution. However, cluster administrators must understand how to configure an application server and web server with load balancing, so we recommend you are comfortable installing Confluence as a EAR/WAR in your application server before proceeding with a clustered installation.

You can follow the instructions to [Migrate Confluence to an external database](#).

2. Upgrade existing instance to clustered license

Once you’ve obtained your clustered license from Atlassian, you can simply update the license in your running Confluence instance:

1. Go to 'Administration'.
2. Go to 'License Details', and paste in the new license.
3. Click 'Save'.

When you enter a clustered license, you will see a new line appear on this page: *Licensed Clustered Nodes*. This tells you how many nodes your Confluence license will allow.

<table>
<thead>
<tr>
<th>Organisation</th>
<th>Atlassian</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date Purchased</td>
<td>Aug 15, 2006</td>
</tr>
<tr>
<td>License Type</td>
<td>Confluence: Commercial Server</td>
</tr>
<tr>
<td>Licensed Users</td>
<td>Unlimited</td>
</tr>
<tr>
<td>Licensed Nodes</td>
<td>8 nodes (2 nodes currently clustered).</td>
</tr>
</tbody>
</table>

*License Details page shows the number of cluster nodes permitted*

3. Migrate your attachments to the Database

You can do this by navigating to Admin > Attachment Storage > Edit, and changing it to “Database”.

4. Copy Confluence to second node

For the remaining steps in setting up a cluster with existing data, please continue from [step 4 in the normal Confluence cluster installation guide](#).

5. Start Confluence on the first node, wait, then start Confluence on second node

See comment in step 4.

6. Test cluster connectivity

See comment in step 4.

7. Configure load balancer

See comment in step 4.

Troubleshooting

If you have problems with the above procedure, please see our [Cluster Troubleshooting guide](#).

Upgrading a cluster

It is important that upgrades follow the procedure for [Upgrading a Confluence Cluster](#).

Confluence User Guide

Upgrading a Confluence Cluster

This page contains instructions for upgrading an existing Confluence cluster to a new version of Confluence. If you are not running a clustered instance of Confluence and wish to, see Confluence Cluster Installation with Existing Data.

Oracle Coherence Licensing Change:

- Due to a license agreement change, Confluence is now available in two editions:
  - **Standard Edition** — Confluence with Ehcache's caching technology (available to customers with non-clustered Confluence licenses).
  - **Clustered Edition** — Confluence with Oracle's Coherence clustering and distributed caching technology (available to customers with Confluence clustered licenses only).
  
  **Alert** If you are currently running a clustered installation of Confluence, please do not upgrade it with a standard edition of Confluence.

- For more information about these changes, please refer to the Coherence License Changes document.

- If you have a Confluence clustered license, are running a clustered installation of Confluence and wish to upgrade to Confluence version 2.6 or later, please ensure that you download only a clustered edition of Confluence and please refer to the Confluence 3.0.1 Upgrade Notes for additional upgrade information.

You can download the latest version of Confluence from here.

Overview

The steps involved in upgrading a multi-node Confluence cluster are:

1. Backup your Confluence instance.
2. Read the Release Notes for this version and check you have the required expertise to perform the upgrade.
3. Stop each node in the cluster.
4. Install the new version into the application server on the first node.
5. Install the new version into the application server onto the remaining nodes.

**Step One: Backing up**

⚠️ We highly recommend that you backup your Confluence home and install directories and your database before proceeding.

For specific files to backup see Upgrading Confluence.

**Step Two: Things you need to check ...**

- Always check the release-notes for the version of Confluence you are installing for upgrade instructions specific to that version.
- To perform this upgrade you must be familiar with the usage of the application server running your Confluence Cluster, and the web server load balancing it.
- Check the Confluence Configuration Guide for your application server and database, to make sure there isn't anything extra you need to do to get Confluence running.
- Check that you know what configurations or customisations have been made to your Confluence instance. These may include specialised user management configurations and changes to Confluence's Java classes and Velocity templates.
Step Three: Stopping the cluster

It is vital that all nodes in the cluster are running the same version of Confluence. That's why the first step is to stop all the nodes.

Stop the Confluence application on each node using your application server.

Step Four: Upgrading the first node

We advise configuring your load balancing web server to redirect traffic away from Confluence until the upgrade is complete on multiple nodes.

Upgrading a cluster node uses the same process as Upgrading Confluence.

1. Unzip the new version.
2. Edit its confluence-init.properties to point to the existing home directory.
3. Port any immediately required customisations from the old version to the new one. Eg atlassian-user.xml.
4. Install the new version into the application server. Eg for Tomcat edit confluence.xml or server.xml to point to the new location, and restart Tomcat.
5. Wait for the Node to finish upgrading and confirm that you can log in and view pages before continuing to Step Five.
6. Port any additional customisations from the old version to the new version. Eg modifications to Java classes or Velocity templates.

Step Five: Upgrading other nodes

Copy the confluence installation, complete with customisations, to the next node.

1. Edit its confluence-init.properties to point to the existing home directory.
2. Install the new version into the application server. Eg for Tomcat 5 edit confluence.xml to point to the new location, and restart Tomcat.
3. Wait for the Node to finish upgrading and confirm that you can log in and view pages before continuing with the next node.

Troubleshooting

For suggested troubleshooting techniques, see our Cluster Troubleshooting page.

Apache and Tomcat load balancing

Overview

The following is a description of how to set up a Confluence Cluster on a Windows machine using Apache and mod_jk to handle the loadbalancing.

The characteristics of this cluster are:

- Session affinity: sessions are associated with single servers.
- Failover: if a server dies, a connection will be directed to the nearest available server. (NOTE: sessions are not replicated)
• Failback: when a server comes back online, it will rejoin the cluster.
• Weighted load balancing: the load balancing can be controlled to take into account machine differences. (See the mod_jk documentation for details on this.)

What do you need?

1. Download and install one copy of Apache httpd. Do not install Apache as a service, but set it to listen on port 8080. (Tested with Apache httpd 2.0.55.)
2. Download the latest version of mod_jk. Copy this file into the Apache modules/ directory and rename it to mod_jk.so. (Tested with JK-1.2.19.)
3. Download and extract one copy of the ZIP distribution of Apache Tomcat. (Tested with Tomcat 5.5.)

Apache configuration

Edit the main Apache config file, conf/http.conf:

• add the following immediately after the other LoadModule directives:

```conf
LoadModule jk_module modules/mod_jk.so
```

• add the following just before the end of the file:

```conf
JkWorkersFile conf/workers.properties
JkLogFile logs/mod_jk.log
JkLogLevel info

JkMount /confluence loadbalancer
JkMount /confluence/* loadbalancer
```

Create a workers.properties file in the Apache conf/ directory. This version of the workers.properties file is configured to use 2 Tomcat instances: `tomcat1` and `tomcat2`. 
worker.list=loadbalancer

worker.tomcat1.port=18081
worker.tomcat1.host=localhost
worker.tomcat1.type=ajp13
worker.tomcat1.lbfactor=1

worker.tomcat2.port=28081
worker.tomcat2.host=localhost
worker.tomcat2.type=ajp13
worker.tomcat2.lbfactor=1

worker.loadbalancer.type=lb
worker.loadbalancer.balanced_workers=tomcat1, tomcat2
worker.loadbalancer.method=Busyness

Tomcat configuration

The Tomcat configuration below will run multiple instances from the same binaries in the main Tomcat directory. For complete documentation of this configuration, see the RUNNING.txt file in the Tomcat distribution.

Create instance home directories

Create a directory for each instance of Tomcat, somewhere outside where you installed Tomcat. For example, if you extracted Tomcat to /opt/apache/tomcat-5.5, your instances could be in /var/tomcat-instances/tomcat1, /var/tomcat-instances/tomcat2. These folders will be referred to as the instance home directories.

Copy the following folders from the Tomcat installation directory into each instance home directory. Some of the folders may be empty, but copy them anyway.

- conf
- logs
- shared
- webapps

Configure server.xml in each instance

Edit conf/server.xml in the instance home directories to include the Confluence application and have distinct listen ports for Server, HTTP Connector and AJP13 Connector. All nodes can use the same Confluence webapp as long as you set confluence.home via a system property (see startup scripts below).
Attached are two sample configurations:

- **tomcat1/conf/server.xml** - listens on port 18080 (http) and 18081 (ajp13)
- **tomcat2/conf/server.xml** - listens on port 28080 (http) and 28081 (ajp13)

To use these sample config files, you will need to edit them to set the Confluence web-app location and the data source configuration.

If editing the configuration files yourself, the points to note are:

- 'Server' port must be distinct
- 'Connector' for HTTP must be uncommented and use a distinct port. Use this port for testing the node individually.
- 'Connector' for AJP13 must be uncommented and use a distinct port. This port must match the port of the worker in the Apache workers.properties.
- 'Engine' for localhost must have jvmRoute matching the name of the worker in Apache's workers.properties.
- 'Context' for Confluence must be added inside the 'Host' tag, and include a 'Resource' for the datasource, as per normal Confluence installation under Tomcat.

**Create a startup script for each instance**

The startup scripts for each instance must set the CATALINA_BASE environment variable and confluence.home system property. The variables in the sample scripts below should reference:

- CATALINA_HOME - Tomcat installation directory
- CATALINA_BASE - Tomcat instance home directory (distinct for each node)
- JRE_HOME - Java runtime directory
- JAVA_OPTS - include a confluence-home system property (distinct for each node)

**tomcat1/startup.bat:**

```bat
set CATALINA_HOME=C:\home\mryall\opt\apache\apache-tomcat-5.5.16
set CATALINA_BASE=C:\home\mryall\var\tomcat-instances\tomcat1
set JRE_HOME=C:\Java\jre1.5.0_06
set JAVA_OPTS=-Dconfluence.home=C:\home\mryall\data\confluence\cluster\tomcat1 -Xmx512m %CATALINA_HOME%\bin\startup.bat
```

**tomcat2/startup.bat:**
set CATALINA_HOME=C:\home\mryall\opt\apache\apache-tomcat-5.5.16
set CATALINA_BASE=C:\home\mryall\var\tomcat-instances\tomcat2
set JRE_HOME=C:\Java\jre1.5.0_06
set JAVA_OPTS=-Dconfluence.home=C:\home\mryall\data\confluence\cluster\tomcat2 -Xmx512m %CATALINA_HOME%\bin\startup.bat

Continue setting up Confluence

Follow the Confluence Cluster Installation procedure with the steps following the app server setup.

Troubleshooting

General advice

The above tomcat configurations enable HTTP connectors on each Tomcat instance so that you can connect to the nodes individually. To check whether the load balancer (Apache & mod_jk) is causing the problem, try connecting to the individual Tomcat instances. Please note that you should not allow users to directly access individual nodes in production mode: You don't want people to bookmark nodes since the node details might change, or single nodes may be taken out of the cluster for maintenance while the cluster itself is still available.

Session-affinity doesn’t seem to be working?

Ensure the name you use for your worker in workers.properties (e.g. tomcat1) matches the jvmRoute attribute of the engine tag in your Tomcat server.xml. For an example, search for 'Engine' in the attached sample config.

For troubleshooting your Confluence cluster, see Cluster Troubleshooting.

Clustering and Load Balancing in Tomcat 5, Part 1
Clustering and Load Balancing in Tomcat 5, Part 2

Creating a Dedicated User Account on the Operating System to Run Confluence

This step is optional if you are evaluating Confluence, but should be mandatory for Confluence installations.
used in production. If you have used the Confluence installer on Linux, this user will be created automatically.

A dedicated user should be created to run Confluence, because Confluence runs as the user it is invoked under and therefore can potentially be abused. For example:

- If your operating system is *nix-based (for example, Linux or Solaris), type the following in a console:
  
  ```bash
  $ sudo /usr/sbin/useradd --create-home --comment "Account for running Confluence" --shell /bin/bash confluence
  ```

- If your operating system is Windows:
  
  1. Create the dedicated user account by either:
     
     - Typing the following at the Windows command line:
       
       ```cmd
       > net user confluence mypassword /add /comment:"Account for running Confluence"
       ```
     
     (This creates a user account with user name ‘confluence’ and password ‘mypassword’. You should choose your own password.)
     
     - Opening the Windows 'Computer Management' console to add your 'confluence' user with its own password.
  
  2. (Optional) Use the Windows 'Computer Management' console to remove the 'confluence' user's membership of all unnecessary Windows groups, such as the default 'Users' group.

  ✅ If Windows is operating under Microsoft Active Directory, ask your Active Directory administrator to create your 'confluence' account (with no prior privileges).

Ensure that only the following directories can be written to by this dedicated user account (e.g. 'confluence'):

- The following subdirectories of your Confluence Installation Directory:
  
  - logs
  - temp
  - work
- Your Confluence Home Directory.

⚠️ Do not make the Confluence Installation Directory itself writeable by the dedicated user account.

ℹ️ See also Best Practices for Configuring Confluence Security.

### Getting a Confluence License

Need a Confluence license or license key?

- If you do not yet have a license, you can get a free multi-user evaluation license or a 10-user starter license immediately.
- If you already have a Confluence license, you can retrieve your key or generate a new key from the license viewer.
- For enterprise, non-profit, open source and educational licenses, see Confluence licensing and pricing.
- If you cannot find your key or are having problems, contact sales@atlassian.com.

### Running Confluence in a Virtualised Environment

This page provides some performance data and observations on running Confluence with VMware. The information on this page is intended to help you decide whether or not to run Confluence using a VMware product. It does not contain detailed instructions on how to set this up (please refer to the appropriate VMware product documentation instead).

On this page:

- Summary
- Recommendations
  - General
  - VMware ESX 3.5
  - VMware ESX 4i
Performance Testing Setup

- Server Configuration
- Installed Software
- Testing Tool

Test Results

- Result Descriptions
- Low-to-Medium-load Confluence
- Medium-to-High-load Confluence

Summary

Confluence on Virtualised Environments

Atlassian officially supports non-clustered installations of Confluence 3.0 and later on VMware. Although possible, we do not recommend (nor support) running versions of Confluence prior to 3.0 on VMware, since Confluence 3.0 resolved many performance issues that were present in earlier versions. Be aware that we also do not support clustered installations of Confluence on VMware. Please comment or vote on the feature request at CONF-19559.

Confluence is generally slower in a virtualised environment. As can be seen in the test results below, the amount by which Confluence slows down varies based on the workload.

Under low load there are several operations which are in fact faster under VMware. This is probably due to the 4CPU VM instance running on 8 real CPUs as opposed to there being only 4 real CPUs on the baseline machine.

Please note, no performance tuning was applied to VMware for these tests. It may be possible to improve Confluence's performance by tuning VMware. However, this may cause other applications to run more slowly in the virtual environment. We recommend that you consult the VMware documentation before deciding whether to do this.

Recommendations

General

- If you are running a medium-to-high-load instance, your biggest performance gain will be to run the application and database on a real machine and not on virtual infrastructure.
- Under medium-to-high-load, moving the database onto another machine will help.
- Always ensure that there are enough virtual CPUs and memory allocated to the virtual instance. This may not be possible under VMware ESX 3.5 due to limitations of 4 vCPUs per VM.
- Always ensure that there is enough CPU time and memory available on the physical host to service all VMs. Applications should not go into swap.
- Use modern CPUs with VT extensions — there is still a noticeable performance penalty for using a VM with these CPUs, but it will likely be much higher when using old CPUs.
- Carefully monitor your VMware hosts to ensure that there is no resource starvation.

VMware ESX 3.5

- If possible, upgrade to VMware ESX 4i.
- Under low-to-medium-load, using a non-virtualised database will generally result in better response times.

VMware ESX 4i

- Under low-to-medium-load, keep the database inside the virtual machine if there is enough CPU time for both the database and application.
- Using VMware EX 4i and virtual machine version 7, you will be able to allocate up to 8 vCPUs to an instance.
## Performance Testing Setup

### Server Configuration

All testing was performed on the following hardware. In the case of virtual machines, one VM per machine was configured.

<table>
<thead>
<tr>
<th>Platform</th>
<th>CPU</th>
<th>Real Ram</th>
<th>Disk</th>
<th>Virtualisation Software</th>
<th>Virtual machine version</th>
<th>Virtual CPU’s</th>
<th>Virtual Ram</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dell R610</td>
<td>2 x Intel 'Nehalem' Xeon E5520 (Quad Core)</td>
<td>32Gb (8x 4Gb DDR3)</td>
<td>2 x 15K 146Gb SAS, Raid 1 4,5</td>
<td>VMware ESX 3.5</td>
<td>4</td>
<td>4</td>
<td>32Gb</td>
</tr>
<tr>
<td>Dell R610</td>
<td>2 x Intel 'Nehalem' Xeon E5520 (Quad Core)</td>
<td>32Gb (8x 4Gb DDR3)</td>
<td>2 x 15K 146Gb SAS, Raid 1 4,5</td>
<td>VMware ESXi 4</td>
<td>7</td>
<td>4</td>
<td>32Gb</td>
</tr>
<tr>
<td>Dell R610</td>
<td>2 x Intel 'Nehalem' Xeon E5520 (Quad Core)</td>
<td>32Gb (8x 4Gb DDR3)</td>
<td>2 x 15K 146Gb SAS, Raid 1 5</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Notes:**

1. VT extensions were enabled in the BIOS on the machines running VMWare.
2. VT extensions were disabled in the BIOS on the machines not running VMWare, as per Dell best practices.
3. In order to limit the CPUs in the baseline test to match the number in VMWare, the kernel boot parameter `maxcpus=4` was added to the startup.
4. The full disk was allocated to VMWare.
5. The filesystem used in all machines was EXT3.

### Installed Software

Each server was set up with identical software, as follows:

<table>
<thead>
<tr>
<th>Atlassian Product</th>
<th>Confluence 3.0.1-rc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database</td>
<td>PostgreSQL 8.2.6</td>
</tr>
<tr>
<td>Application Server</td>
<td>Tomcat 6.0.14</td>
</tr>
<tr>
<td>Java</td>
<td>Java(TM) SE (build 1.6.0_07-b06), Java HotSpot(TM) 64-Bit Server VM (build 10.0-b23, mixed mode)</td>
</tr>
</tbody>
</table>
## Operating System

Redhat Enterprise Linux 5.3 (Tikanga) 64bit (Kernel 2.6.18-128.2.1.el5). The file system used for all tests was EXT3 with the default options.

The following tuning was applied to the operating system, in order to allow for more memory usage by the database server and better network throughput:

```bash
net.ipv4.ip_forward = 0
net.ipv4.conf.default.rp_filter = 1
net.ipv4.conf.default.accept_source_route = 0
kernel.sysrq = 0
kernel.core_uses_pid = 1
net.ipv4.tcp_syncookies = 1
kernel.msgmnb = 65536
kernel.msgmax = 65536
kernel.shmmax = 1310720000
kernel.shmall = 4294967296
net.core.rmem_max = 16777216
net.core.wmem_max = 16777216
net.ipv4.tcp_rmem = 4096 87380 16777216
net.ipv4.tcp_wmem = 4096 65536 16777216
net.ipv4.tcp_no_metrics_save = 1
net.ipv4.tcp_moderate_rcvbuf = 1
net.core.netdev_max_backlog = 2500
```

## Testing Tool

Performance tests were conducted with **Apache Jakarta JMeter 2.3.4** using the standard Confluence performance tests.

## Test Results

The following tests were performed for each application. In each case, the test was performed with a database local to the host instance (i.e. in the same operating system image) and also with the database residing on a separate, non-virtualised physical server of the same specifications as above.

### Result Descriptions

The following descriptions relate to the result graphs below.

- **Average time Comparison** — The average response time of the requests in the scenario - the lower the better.
- **95 percent Comparison** — The time (in milliseconds) by which 95% of all requests in the scenario have completed. This is not an average value – rather, you can think of it as a 'how long the slowest requests (except the very worst 5% cases) take to complete' scenario.
- **Scenarios:**
  - **Dashboard** — Simulates visiting the Confluence dashboard.
  - **Edit Page** — Simulates saving a page back to Confluence and notifying all people who are watching this page.
• **View Page** — Simulates loading one out of hundreds of different Confluence pages. Some are short, others are long. Some have many images, others have many comments. Some have many macros, others do not. The pages are accessed through their full URL, as if someone had clicked link within the application or a bookmark.

• **Search Site** — Simulates a search across the whole system.

• **Browse User Personal Space** — Simulates regular browsing of pages in a user’s personal space.

• **Ext-DB** (In the legend of each graph) — Indicates scenarios in which the database resides on a separate non-virtualised physical server.

**Low-to-Medium-load Confluence**

This test performs around **18 requests/second** on the Confluence instance. This is not enough to saturate the host CPU time and during the test there is around **50-75% idle time**. You could expect to see similar results if your Confluence instance has enough resources available to it.

**Medium-to-High-load Confluence**

This test tries to perform double the requests/second of the lower load test (i.e. approximately **36 requests/second**) on the Confluence instance. This is enough load to saturate the available CPU time on a 4 CPU machine. This test is designed to simulate an instance which does not have enough resources to serve the number of requests being made to it.
Confluence Setup Guide

Before running the Confluence Setup Wizard, as described below, you should have already completed installing Confluence.

When you access Confluence in your web browser for the first time, you will see the Confluence Setup Wizard. This is a series of screens which will prompt you to supply some default values for your Confluence site. It will also offer some more advanced options for setting up data connections and restoring data from a previous installation.

1. Start the Setup Wizard
   1. If Confluence is not already running, start it now:
      - If you are running the Confluence distribution on Windows, click Start > Programs > Confluence > Start Confluence Server.
      - Or, run the start-up script found in the bin folder of your installation directory:
        - start-confluence.bat for Windows.
        - start-confluence.sh for Linux-based systems.
   2. Go to the following web address in your web browser: http://localhost:8090
      The above web address uses port '8090'. If you chose a different port during installation, change '8090' to the number you chose.
      - You should see the licensing screen described below.
      - If an error message appears, first check that you are using the port which you specified during installation. Then check the Installation FAQ.
2. Enter your License Key

Confluence Setup Wizard

Confluence needs some information before it is fully installed. If at any stage of the installation you need more information, check out the online setup guide. If you get stuck, you can lodge a support request with us and we will assist you further with your licensing query.

Enter License
Please enter your Confluence license key below - either commercial or evaluation. You can generate an evaluation license online and then return to this page.

Choose Installation Type
There are two ways to install Confluence:

Evaluation Installation
Install Confluence with default settings and an embedded database. This is recommended for anyone evaluating or demonstrating Confluence, as it will get you up and running as quickly as possible. This option is not advised for running a production instance of Confluence.

Production Installation
Perform a custom setup. Select this option if you want to configure Confluence with an external database, or initialise the server with your own data. This is strongly recommended for running a production instance, as the use of an external database is essential for data integrity.

Screenshot above: Licensing and installation type

Hint: The above image and all the images on this page are screenshots. Clicking an image will not configure Confluence.

Find your Confluence license key and paste it into the License Key field, shown on the screenshot above.

If you already have a license key, you can retrieve it from the Atlassian website.
If you do not already have a Confluence license, you can obtain one now:

- To get a free evaluation license:
  1. Click **generate an evaluation license online** on the setup wizard, shown on the screenshot above.
  2. Follow the prompts to generate your license key and insert it into the setup wizard's licensing screen automatically.
- To get a commercial, academic, non-profit or open source license:
  1. Copy your **Server ID** from the setup wizard's licensing screen, shown on the screenshot above.
  2. Choose the license type you need from the list on the **Atlassian website**.
  3. Complete the **online order form**.

### 3. Choose your Installation Type

Refer to the screenshot [above](#). In this step, you will choose whether you want an evaluation or a production installation.

**Option 1: Evaluation Installation** — Set up Confluence with the embedded **HSQLDB database** and default settings. This option will also install a Demonstration space with some example content to get you working with Confluence as quickly and easily as possible. You may upgrade to another type of database later on.

Who should choose this option?

- Choose the evaluation installation if you are evaluating Confluence or if you are new to Confluence.
- This option is not recommended for production instances of Confluence.

⚠️ **For production use, we strongly recommend that you connect to an external database rather than using the embedded database. The evaluation installation is therefore not suitable for production environments.**

Next, you will be asked for details of your system administrator. Go to **step 10 below**. Yes, you really can skip all the steps between.

**Option 2: Production Installation** — Customise your Confluence instance to use your own database and your own data.

The production installation offers the following options:

- Connect Confluence to an external database. **Recommended for Confluence used in production environments.**
- Restore data from an existing Confluence database.
- Install Confluence without the demonstration content.

### 4. Production Installation: Database Configuration
The above screen appears if you have chosen a production installation of Confluence. You can choose to use the embedded database supplied with your Confluence installation, or to connect to an external database.

- **Option 1: Embedded Database** — If you select this option, Confluence will use an embedded HSQLDB database. You should only select this option for the purposes of evaluating or demonstrating the use of Confluence. You can migrate to an external database later on if you wish.

- **Option 2: External Database** — If you wish Confluence to use an external database, select your database type from the database dropdown list and then click the 'External Database' button.
  - For production purposes, you **should use an external database** to ensure your data is kept safe and consistent.
  - If you choose PostgreSQL, please make sure that the version you install is supported by Atlassian. It is possible that we do not yet support the latest version of PostgreSQL.
  - Read the page about **supported platforms** for more information about which databases are supported. For details about choosing an external database, refer to the page on **system requirements**.

5. **Production Installation: External Database**

### Before you Start
- **Character encoding:**
  - We strongly recommend that character encoding is consistent across your database, application server and web application, and that you use **UTF-8** encoding.
  - Before setting up your database, please read about configuring character encoding.
- **Database name:** When creating a new external database, give it the name 'confluence'.

You can choose to configure your database via a standard JDBC connection or via a server-managed
datasource connection. Choose one of the two options below.

**Option 1: Standard Database Connection** — This uses a standard JDBC database connection. Connection pooling is handled within Confluence.

Supply the following information:

- **Driver Class Name** — The Java class name for the appropriate database driver. This will depend on the JDBC driver, and will be found in the documentation for your database. You will also need to put the appropriate database driver 'jar' file in the server's classpath. For the Confluence distribution, this means copying the jar file into the `<confluence-install>/lib` directory.

- **Database URL** — The JDBC URL for the database you will be connecting to. This will depend on the JDBC driver, and will be found in the documentation for your database.

- **User Name** — A valid username which Confluence will use to access your database.

- **Password** — The password corresponding to the above username.

You will also need to know:

- The size of the connection pool Confluence should maintain. If in doubt, just go with the default provided.

- What kind of database you're connecting to, so you can tell Confluence which dialect it needs to use.

**Option 2: Datasource Connection** — This asks the Java application server for a database connection. You will need to have configured a datasource into your application server.

Supply the following information:

- **Datasource Name** — The JNDI name of the datasource, as configured in the application server. Note: Some servers will have JNDI names like `jdbc/datasourcename`; others will be of the form `java:comp/env/jdbc/`. Consult your application-server documentation.
• What kind of database you're connecting to, so you can tell Confluence which dialect it needs to use.

6. Production Installation: Load Content

![Load Content](image)

If you are evaluating or demonstrating Confluence, or are introducing Confluence to users who are new to the idea of a Wiki, we recommend the example site as the best way to become acquainted with what Confluence can do for you. More experienced users will want to start with an empty site, or restore a backup of their own.

- **Example Site**
  
  Recommended: Load the 'Demonstration Space' to begin working with Confluence immediately.

- **Empty Site**
  
  Start with an empty site. After finishing the setup you will need to create at least one space before you can add any content of your own.

- **Restore From Backup**
  
  Use data from a previous installation of Confluence. If you are upgrading or replicating Confluence you will probably want to select this option.

Screenshot above: Load content

Select one of the following options:

- **Example Site** — This option will load Confluence's 'Demonstration Space'. Select this if you are using Confluence for the first time, or if you want the Demonstration Space for your other Confluence users. The Demonstration Space helps to familiarise you with Confluence and what it can do for you. You can then continue using your Confluence deployment as normal — there's no need to reinstall later.

- **Empty Site** — Select this option if you are already familiar with Confluence. You will need to create at least one space before you can start adding content to the site.

- **Restore from Backup** — Select this option if you want to use Confluence data from a previous installation.

7. Production Installation: Restore Data from Backup

This option allows you to reload your data from an existing Confluence installation into your new Confluence site during the initial setup procedure. You can choose to upload data from a zipped backup file, or to restore from a backup file on your file system.

**Option 1: Upload a zipped backup to Confluence** — This option will load the data from a zipped backup file.

To create a backup file from your existing version of Confluence, go to the 'Backup & Restore' section of your Administration Console.

To restore from a zipped backup:

1. Browse for the relevant daily backup file or a file you have created via a [manual backup](#).
2. Check 'Build Index' to build the data index, used for the search.
3. Click the 'Upload and Restore' button.

**Option 2: Restore a backup from the filesystem** — This option is recommended if you have a very large daily backup file (greater than 100MB), or a daily backup file that is already on the server and doesn't require
uploading.

1. Copy the XML backup file into the restore directory inside your confluence Home directory and then refresh the page. You should now see your backup file appear on the 'Restore Data' screen (pictured above), in the box beneath the heading 'Restore a backup from the filesystem'.
2. Check 'Build Index' to build the data index, used for the search.
3. Click the 'Restore' button.

When the restore process has finished, you are ready to log in to Confluence. The system administrator account and all other information has been transferred from your previous Confluence installation.

8. Production Installation: Set Up User Management

![User Management Setup]

Choose how Confluence should manage its users.

Manage Users and Groups within Confluence

Confluence will maintain its own database of users and groups. If you are unsure, choose this option. You can always change the user management configuration after Confluence has been set up.

If you are planning to connect to an LDAP or Crowd server, you should choose this option, and complete your user management configuration after Confluence is set up. Learn more about configuring LDAP integration.

Manage Users and Groups with JIRA

If you have JIRA 4.3 or later, Confluence can use JIRA for user management. This is not recommended for more than 500 users. Learn more about configuring JIRA integration.

Screenshot above: User management

You can choose to manage Confluence's users and groups inside Confluence or in JIRA.

- If you do not have Atlassian JIRA installed, or if you would prefer to set up external user management later, choose Manage users and groups within Confluence.
- If you have JIRA installed, the setup wizard gives you the opportunity to configure the JIRA connection automatically. This is a quick way of setting up your JIRA integration with the most common options. It will configure a JIRA user directory for Confluence, and set up application links between JIRA and Confluence for easy sharing of data. Choose Connect to JIRA.

9. Production Installation: Connect to JIRA
Enter the following information:

- **JIRA Base URL** – The web address of your JIRA server. Examples:
  
  http://www.example.com:8080/jira/
  http://jira.example.com

- **JIRA Administrator Login: Username** – Enter the username of a user with the ‘JIRA System Administrators’ global permission in JIRA.

- **JIRA Administrator Login: Password** – Enter the password that the above user uses to sign in to JIRA.

- **Confluence Base URL** – JIRA will use this URL to access your Confluence server. The URL you give here will override the base URL specified in your Confluence administration console, for the purposes of the JIRA connection.

- **User Groups** – Specify one or more JIRA groups whose members should be able to use Confluence. The default group is `jira-users`. (These groups will receive the ‘can use’ permission in Confluence.)

- **Admin Groups** – Specify one or more JIRA groups whose members should have administrative access to Confluence. The default group is `jira-administrators`. (These groups will receive the ‘Confluence system administrator' and 'Confluence administrator' permissions in Confluence.)

For full details and a troubleshooting guide, see [Configuring JIRA Integration in the Setup Wizard](#).

### 10. Set Up System Administrator
Setup System Administrator

Please configure the system administrator account for this Confluence installation.

Configure Account

- Username: admin
- Password:
- Confirm:
- Name:
- Email:

Next >>

Screenshot above: System administrator

The system administrator has full administrative power over your Confluence instance. This person will be able to add more users, create spaces, and set further Confluence options. Please refer to the overview of global permissions for more information.

Hint: If you are evaluating Confluence, set yourself up as the administrator.

1. Enter the following information to set up your system administrator's user account:
   - Username — The username under which the system administrator will log in to Confluence, e.g. 'jsmith'.
   - Password — The password which the system administrator will use to log in.
   - Confirm — Enter the same password again.
   - Name — The system administrator's full name, e.g. 'John Smith'.
   - Email — The system administrator's email address, e.g. 'jsmith@example.com'.

2. Click 'Next'.

11. Setup is Complete

Screenshot above: Setup is complete

Congratulations! You have installed and set up Confluence. Click the Start using Confluence now link to open the Demonstration space in your Confluence wiki. This space contains some sample content and ideas, to help you get started quickly.

If you wish, you can click the link to learn how to import data from another wiki. This link leads to an overview page on your own Confluence server, containing information about the Universal Wiki Converter, an application that you can use to import data from other wiki types such as MediaWiki, DokuWiki and others.

RELATED TOPICS

Confluence 101
Before you Start

- **Character encoding:**
  - We strongly recommend that character encoding is consistent across your database, application server and web application, and that you use UTF-8 encoding.
  - Before setting up your database, please read about configuring character encoding.
  - **Database name:** When creating a new external database, give it the name ‘confluence’.

You can choose to configure your database via a standard JDBC connection or via a server-managed datasource connection. Choose one of the two options below.

**Option 1: Standard Database Connection** — This uses a standard JDBC database connection. Connection pooling is handled within Confluence.

**Setup Standard Database**

<table>
<thead>
<tr>
<th><strong>Driver Class Name</strong></th>
<th>com.mysql.jdbc.Driver</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Database URL</strong></td>
<td>jdbc:mysql://localhost/confluence</td>
</tr>
<tr>
<td><strong>User Name</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Password</strong></td>
<td></td>
</tr>
</tbody>
</table>

Supply the following information:

- **Driver Class Name** — The Java class name for the appropriate database driver. This will depend on the JDBC driver, and will be found in the documentation for your database. You will also need to put the appropriate database driver 'jar' file in the server's classpath. For the Confluence distribution, this means copying the jar file into the `<confluence-install>/lib` directory.

- **Database URL** — The JDBC URL for the database you will be connecting to. This will depend on the JDBC driver, and will be found in the documentation for your database.

- **User Name** — A valid username which Confluence will use to access your database.

- **Password** — The password corresponding to the above username.

You will also need to know:

- The size of the connection pool Confluence should maintain. If in doubt, just go with the default provided.
- What kind of database you're connecting to, so you can tell Confluence which dialect it needs to use.

**Option 2: Datasource Connection** — This asks the Java application server for a database connection. You will need to have configured a datasource into your application server.
Setup Datasource Connection

If "java:comp/env/jdbc/DatasourceName" doesn't work, try "jdbc/DatasourceName" (or vice versa)

Datasource Name: java:comp/env/jdbc/

Next >>

Screenshot above: Datasource connection

Supply the following information:

- **Datasource Name** — The JNDI name of the datasource, as configured in the application server. Note: Some servers will have JNDI names like jdbc/datasourcename; others will be of the form java:comp/env/jdbc/datasourcename. Consult your application-server documentation.

You will also need to know:

- What kind of database you're connecting to, so you can tell Confluence which dialect it needs to use.

Restoring from Backup During Setup

This page is part of the Confluence Setup Guide.

This option allows you to reload your data from an existing Confluence installation into your new Confluence site during the initial setup procedure. You can choose to upload data from a zipped backup file, or to restore from a backup file on your file system.

Option 1: Upload a zipped backup to Confluence — This option will load the data from a zipped backup file. To create a backup file from your existing version of Confluence, go to the 'Backup & Restore' section of your Administration Console.

To restore from a zipped backup:

1. Browse for the relevant daily backup file or a file you have created via a manual backup.
2. Check 'Build Index' to build the data index, used for the search.
3. Click the 'Upload and Restore' button.

Option 2: Restore a backup from the filesystem — This option is recommended if you have a very large daily backup file (greater than 100MB), or a daily backup file that is already on the server and doesn't require uploading.

1. Copy the XML backup file into the restore directory inside your confluence Home directory and then refresh the page. You should now see your backup file appear on the 'Restore Data' screen (pictured above), in the box beneath the heading 'Restore a backup from the filesystem'.
2. Check 'Build Index' to build the data index, used for the search.
3. Click the 'Restore' button.

When the restore process has finished, you are ready to log in to Confluence. The system administrator account and all other information has been transferred from your previous Confluence installation.
Configuring JIRA Integration in the Setup Wizard

This page describes the **Connect to JIRA** step in the Confluence setup wizard.

**Overview**

You can connect your application to a JIRA server, to manage your users via JIRA and share information with JIRA. When you are installing the application, the setup wizard gives you the opportunity to configure the JIRA connection automatically. This is a quick way of setting up your JIRA integration with the most common options.

You can also configure the JIRA connections via the application administration screens. In that case, you will need to set up connections individually. There are two parts to the integration process:

- A peer-to-peer link between JIRA and the application for sharing information and facilitating integration features. This link is set up via Application Links.
- A client-server link between the application and JIRA for delegating user and group management to your JIRA server.

**Requirements**: You need JIRA 4.3 or later.

---

**Connecting to JIRA in the Setup Wizard**
**Connect to JIRA**

Fill in the details of the JIRA server you wish to retrieve user and group information from. You will need a valid administrator account on that JIRA server. Learn more about configuring JIRA integration.

### JIRA Server Location

**JIRA Base URL**

For example: http://jira.mycompany.com or http://mycompany.com/jira

### JIRA Administrator Login

Confluence will need to log in to JIRA with administrative privileges to retrieve user information.

**Username**

This username must have system administrator rights on your JIRA server.

**Password**

### Advanced Options

**Confluence Base URL**

http://localhost:8090

JIRA will use this URL to access your Confluence server. If Confluence is behind a proxy, you may need to change the URL given here.

**User Groups**

jira-users
Users in these groups will have access to Confluence. Comma-separated.

**Admin Groups**

jira-administrators
Users in these groups will have administrative access to Confluence. Comma-separated.

Troubleshooting

This section describes the possible problems that may occur when integrating your application with JIRA via the setup wizard, and the solutions for each problem.

---

**Screenshot above: Connecting to JIRA in the Confluence setup wizard**

Enter the following information:

- **JIRA Base URL** – The web address of your JIRA server. Examples:
  
  - http://www.example.com:8080/jira/
  - http://jira.example.com

- **JIRA Administrator Login: Username** – Enter the username of a user with the ‘JIRA System Administrators’ global permission in JIRA.
- **JIRA Administrator Login: Password** – Enter the password that the above user uses to sign in to JIRA.
- **Confluence Base URL** – JIRA will use this URL to access your Confluence server. The URL you give here will override the base URL specified in your Confluence administration console, for the purposes of the JIRA connection.
- **User Groups** – Specify one or more JIRA groups whose members should be able to use Confluence. The default group is jira-users. (These groups will receive the ‘can use’ permission in Confluence.)
- **Admin Groups** – Specify one or more JIRA groups whose members should have administrative access to Confluence. The default group is jira-administrators. (These groups will receive the ‘Confluence system administrator’ and ‘Confluence administrator’ permissions in Confluence.)

</tbody>
</table>
The setup wizard displays the following error message:

- An error occurred: java.lang.IllegalStateException: Could not create the application in JIRA/Crowd (code: 500). Please refer to the logs for details.

The setup wizard has not completed the integration of your application with JIRA. The links are only partially configured. The problem occurred because there is already a user management configuration in JIRA for this <application> URL.

Remove the partial configuration if it exists, try the ‘Connect to JIRA’ step again, and then continue with the setup. Detailed instructions are below.

No users can log in after you have set up the application with JIRA integration.

Possible causes:

- There are no users in the group that you specified on the ‘Connect to JIRA’ screen.
- For FishEye: There are no groups specified in the ‘groups to synchronize’ section of your administration console.

Solution 1: Removing a Partial Configuration – The Easiest Way

If the application’s setup wizard fails part-way through setting up the JIRA integration, you may need to remove the partial configuration from JIRA before continuing with your application setup. Please follow the steps below.

Remove the partial configuration if it exists, try the ‘Connect to JIRA’ step again, and then continue with the setup wizard:

1. Log in to JIRA as a user with the ‘JIRA System Administrators’ global permission.
2. Click the ‘Administration’ link on the JIRA top navigation bar.
3. Remove the application link from JIRA, if it exists:
   a. Click ‘Application Links’ in the JIRA administration menu. The ‘Configure Application Links’ page will appear, showing the application links that have been set up.
   b. Look for a link to your application. It will have a base URL of the application linked to JIRA. For example:
      - If you want to remove a link between JIRA and FishEye, look for the one where the ‘Application URL’ matches the base URL of your FishEye server.
      - If you want to remove a link between JIRA and Confluence, look for the one where the ‘Application URL’ matches the base URL of your Confluence server.
   c. Click the ‘Delete’ link next to the application link that you want to delete.
   d. A confirmation screen will appear. Click the ‘Confirm’ button to delete the application link.
4. Remove the user management configuration from JIRA, if it exists:
   a. Go to the JIRA administration screen for configuring the applications that have been set up to use JIRA for user management:
      - In JIRA 4.3: Click ‘Other Applications’ in the ‘Users, Groups & Roles’ section of the JIRA administration screen.
      - In JIRA 4.4: Select ‘Administration’ > ‘Users’ > ‘JIRA User Server’.
   b. Look for a link to your application. It will have a name matching this format:

   `<Type> - <HostName> - <Application ID>`

   For example:
If you have multiple servers of the same type running on the same host, you will need to match the application ID of your application with the one shown in JIRA. To find the application ID:

- Go to the following URL in your browser:

  `<baseUrl>/rest/applinks/1.0/manifest`

Replace `<baseUrl>` with the base URL of your application. For example:

  `http://localhost:8060/rest/applinks/1.0/manifest`

- The application links manifest will appear. Check the application ID in the `<id>` element.
  - In JIRA, click 'Delete' next to the application that you want to remove.

5. Go back to the setup wizard and try the 'Connect to JIRA' step again.

**Solution 2: Removing a Partial Configuration – The Longer Way**

If solution 1 above does not work, you may need to remove the partial configuration and then add the full integration manually. Please follow these steps:

1. Skip the 'Connect to JIRA' step and continue with the setup wizard, to complete the initial configuration of the application.
2. Log in to JIRA as a user with the 'JIRA System Administrators' global permission.
3. Click the 'Administration' link on the JIRA top navigation bar.
4. Remove the application link from JIRA, if it exists:
   - Click 'Application Links' in the JIRA administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
   - Look for a link to your application. It will have a base URL of the application linked to JIRA. For example:
     - If you want to remove a link between JIRA and FishEye, look for the one where the 'Application URL' matches the base URL of your FishEye server.
     - If you want to remove a link between JIRA and Confluence, look for the one where the 'Application URL' matches the base URL of your Confluence server.
   - Click the 'Delete' link next to the application link that you want to delete.
   - A confirmation screen will appear. Click the 'Confirm' button to delete the application link.
5. Remove the user management configuration from JIRA, if it exists:
   - Go to the JIRA administration screen for configuring the applications that have been set up to use JIRA for user management:
     - In JIRA 4.3: Click 'Other Applications' in the 'Users, Groups & Roles' section of the JIRA administration screen.
     - In JIRA 4.4: Select 'Administration' > 'Users' > 'JIRA User Server'.
   - Look for a link to your application. It will have a name matching this format:
For example:

```
FishEye / Crucible - localhost -
92004b08-5657-3048-b5dc-f886e662ba15
```

Or:

```
Confluence - localhost - 92004b08-5657-3048-b5dc-f886e662ba15
```

If you have multiple servers of the same type running on the same host, you will need to match the application ID of your application with the one shown in JIRA. To find the application ID:

- Go to the following URL in your browser:

  `<baseUrl>/rest/applinks/1.0/manifest`

  Replace `<baseUrl>` with the base URL of your application.

  For example:

  `http://localhost:8060/rest/applinks/1.0/manifest`

- The application links manifest will appear. Check the application ID in the `<id>` element.
- In JIRA, click 'Delete' next to the application that you want to remove.
- Add the application link in JIRA again, so that you now have a two-way trusted link between JIRA and your application:
  - Click 'Add Application Link'. Step 1 of the link wizard will appear.
  - Enter the server URL of the application that you want to link to (the 'remote application').
  - Click the 'Next' button.
  - Enter the following information:
    - 'Create a link back to this server' – Tick this check box to add a two-way link between the two applications.
    - 'Username' and 'Password' – Enter the credentials for a username that has administrator access to the remote application.
      Note: These credentials are only used to authenticate you to the remote application, so that Application Links can make the changes required for the new link. The credentials are not saved.
    - 'Reciprocal Link URL' – The URL you give here will override the base URL specified in your remote application’s administration console, for the purposes of the application links connection. Application Links will use this URL to access the remote application.
  - Click the 'Next' button.
  - Enter the information required to configure authentication for your application link:
    - 'The servers have the same set of users' – Tick this check box, because the users are the same in both applications.
    - 'These servers fully trust each other' – Tick this check box, because you trust the code in both applications and are sure both applications will maintain the security of their private keys.
For more information about configuring authentication, see Configuring Authentication for an Application Link.

7. Configure a new connection for user management in JIRA:
   a. Go to the JIRA administration screen for configuring the applications that have been set up to use JIRA for user management:
      • In JIRA 4.3: Click 'Other Applications' in the 'Users, Groups & Roles' section of the JIRA administration screen.
      • In JIRA 4.4: Select 'Administration' > 'Users' > 'JIRA User Server'.
   b. Add an application.
   c. Enter the application name and password that your application will use when accessing JIRA.
   d. Enter the IP address or addresses of your application. Valid values are:
      • A full IP address, e.g. 192.168.10.12.
      • A wildcard IP range, using CIDR notation, e.g. 192.168.10.1/16. For more information, see the introduction to CIDR notation on Wikipedia and RFC 4632.
   e. Save the new application.

8. Set up the JIRA user directory in the application.
   a. For Confluence:
      • Go to the Confluence Administration Console.
      • Click 'User Directories' in the left-hand panel.
      • Add a directory and select type 'Atlassian JIRA'.
      • Enter the following information:
         • Name – Enter the name of your JIRA server.
         • Server URL – Enter web address of your JIRA server. Examples:
           http://www.example.com:8080/jira/
           http://jira.example.com

         • Application name and Application password – Enter the values that you defined for Confluence in the settings on JIRA.
   b. For FishEye/Crucible:
      • Click 'Authentication' on the FishEye/Crucible 'Admin Menu'.
      • Click 'Edit' in the section titled 'JIRA or Crowd Authentication'.
      • Enter the following information:
         • Application name and Application password – Enter the values that you defined for your application in the settings on JIRA.
         • JIRA/Crowd URL – The web address of your JIRA server. Examples:
           http://www.example.com:8080/jira/
           http://jira.example.com

      • Auto-add – Select 'Create a FishEye/Crucible user on successful login' (default) to ensure that your JIRA users will be automatically enrolled into FishEye/Crucible when they first log in via JIRA.
      • Synchronize users with JIRA/Crowd – Select 'Yes' (default) to ensure that JIRA will synchronize all changes in the user information on a regular basis. The synchronization interval is set to 60 minutes (1 hour) by default.
      • Single sign on (SSO) – Select 'Disabled'. This option is not available when using JIRA for user management and if enabled will make the integration fail.
Groups of users to synchronize – Select at least one group to synchronize. The default is 'jira-users'.

d. Click ‘Apply changes’.

Notes

- When you connect to JIRA in the setup wizard, the setup procedure will configure Trusted Applications authentication for your application. Please be aware of the following security implications:
  - Trusted applications are a potential security risk. When you configure Trusted Applications authentication, you are allowing one application to access another as any user. This allows all of the built-in security measures to be bypassed. Do not configure a trusted application unless you know that all code in the application you are trusting will behave itself at all times, and you are sure that the application will maintain the security of its private key.
  - In the next step, you will specify the username and password of your Confluence system administrator. If you have connected to JIRA, the setup wizard will add the Confluence administrator’s username and password to both JIRA and Confluence. This is done so that you can still access Confluence even if JIRA is down. Please note that the password in Confluence is not linked to the password in JIRA. If you subsequently change the administrator’s password, only the password in JIRA will change. This is because the JIRA user directory is placed first in the list of user directories. See Managing Multiple Directories.

Upgrading Confluence

This document describes the standard, recommended procedure for upgrading to Confluence 4.2. Use this procedure when upgrading from Confluence version 3.5 or later on Windows or Linux.

If you are changing the operating system that will run Confluence, the database it is using, the location of its files, or are upgrading from a version pre-3.5, please see Upgrading Confluence Manually.

Upgrading to Confluence 4.2?

If so, please review the Confluence 4.2 Release Notes for important information about this version of Confluence. Ensure that you have read the Confluence Knowledge Base.

Also, we strongly recommend that you check the upgrade notes for every major version of Confluence that you are skipping, since there might be specific changes between Confluence versions that could affect your Confluence installation. The upgrade notes for recent major versions of Confluence are accessible from the Upgrade Notes Overview page.

Finally, please check the Supported Platforms page to ensure that your Java version, operating system, application server, database and browser are supported for this release of Confluence. The End of Support Announcements for Confluence page has important information regarding supported platforms.

On this page:

- Before you Start
- Backing Up
- Testing the Upgrade in a Test Environment
  - Upgrade Overview
  - Performing the Upgrade
    - Upgrading Confluence on Windows

  • Back Up Your External Database
  • Check Plugin Compatibility

Before you Start

<i>Changing your Database?</i>

If you are planning to change to a different database, we recommend that you complete the Confluence upgrade first. Then follow the instructions on [migrating to a different database](#).

1. Note that you need current software maintenance to perform the upgrade.
2. Confirm that your license support period is still valid before you try to upgrade.
3. If your current license has expired but you have a new license with you, please update your license in Confluence before performing the upgrade. If you forget to do this and your license has expired, you will receive errors during the upgrade process. Refer to the instructions on [upgrading beyond current license period](#).
4. Check the release notes for the new version of Confluence you are installing, plus the upgrade notes for any major versions you are skipping. It is important to read these upgrade notes as there might be specific changes between Confluence versions that could affect your Confluence instance. The upgrade notes pages for recent major versions of Confluence are accessible from the [Upgrade Notes Overview](#) page. (Each upgrade notes page is a 'child' of its respective release notes page.)
5. Make sure that your environment (e.g. the database system, the operating system, the application server and so on) still complies with the Confluence System Requirements. A newer version of Confluence may have different requirements than the previous version.
6. If you are using Confluence EAR-WAR edition, check [Installing the Confluence EAR-WAR Edition](#) to see if there is anything extra you will need to do to get Confluence running.
7. If you are using an external database, familiarise yourself with all known issues for your specific database. Also make sure the Confluence database connector principal (the database user account) has sufficient permissions to modify the database schema.
8. Note which plugins are installed and enabled on your current Confluence instance. Please verify whether a compatible version of the plugin is available in the version of Confluence you are upgrading to. This information is available via the 'Plugins' menu in your Administration screens, and selecting Confluence Upgrade Check. This will tell you which plugins have an updated version which is compatible with your target upgrade version. You can also check the respective home pages for these plugins on the Atlassian Plugin Exchange. Once you have confirmed the availability of compatible versions, you should upgrade your plugins after successfully upgrading Confluence. Please test these first by applying them to the latest Confluence version in a test environment.
9. If you have made any customisations to Confluence, please verify their compatibility in the latest version. For example, if you have modified any layouts or are using your own custom theme, please test these first by applying them to the latest Confluence version in a test environment. You can [see the customisations applied to your Confluence installation](#).
10. Some anti-virus or other Internet security tools may interfere with the Confluence upgrade process and prevent the process from completing successfully. If you experience or anticipate experiencing such an issue with your anti-virus/Internet security tool, disable this tool first before proceeding with the Confluence upgrade.

Back up

Before you begin the Confluence upgrade, you must back up the following:

1. **Back up your Confluence Home directory.** The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in
Tip: Another term for 'Home directory' would be 'data directory'. The location of the Home directory is stored in a configuration file called confluence-init.properties, which is located inside the confluence/WEB-INF/classes directory in your Confluence Installation directory. The Confluence installer will automatically prompt you to run a backup, storing the files in a .zip archive at the same level as your Confluence Home directory.

2. **Back up your database.** Perform a manual backup of your external database before proceeding with the upgrade, and double check that the backup was actually created properly. If you are not a database expert, or unfamiliar with the backup-restore facilities of your database, simply restore the backup to a different system to ensure the backup worked before proceeding. This recommendation is generally a good best practice. Surprisingly, many companies get in trouble for broken database backups because they skip this basic but vital "smoke test" of the operation. The 'embedded database' is the HSQLDB database supplied with Confluence for evaluation purposes. You don't need to back it up since it is stored in the Confluence home directory. You should not be using this database for production systems at all, so if you happen to be using HSQLDB in a production system, please migrate to a proper database **before** the upgrade. Read about the various shortcomings of HSQLDB.

3. **Back up your Confluence Installation directory or your Confluence webapp** (if you are using Confluence EAR-WAR edition). The Confluence installer will automatically back up these files, storing the files in a .zip archive at the same level as your Confluence installation directory. The 'Confluence Installation directory' is the directory into which the Confluence application files and libraries have been unpacked (unzipped) when Confluence was installed. Confluence does not modify or store any data in this directory. This directory is also sometimes called the 'Confluence Install directory'.

### Testing the Upgrade in a Test Environment

Be sure to test the upgrade in a test environment before proceeding on your production server.

1. Create a snapshot of your current production Confluence environment on a test server, as described in the page on Moving Confluence Between Servers.

   **XML imports**

   Importing an old XML backup file to a new major version (i.e Confluence 3.5 to Confluence 4.0) **is not recommended**. Please recreate your production instance in a test environment first.

2. Perform the upgrade on your cloned environment.

3. Test all your unsupported plugins and any customisations with the new version before proceeding on your production server. You can read more about supported and unsupported plugins.

### Upgrade Overview

The upgrade feature of the **Linux** and **Windows** Installers automates the following tasks for you:

1. Backs up the Installation and Home Directories of the existing Confluence installation to be upgraded.
2. Installs **Confluence 4.2** whilst migrating the following from your existing Confluence installation to the new Confluence 4.2 installation:
   - TCP port values in your existing Confluence installation's server.xml file. Be aware that other
configurations or customisations in this file are not migrated during upgrade, and will need to be re-applied.

- Custom values in your existing Confluence installation's `confluence-init.properties` (confluence.home property) and `setenv.sh` / `setenv.bat` files (JAVA_OPTS parameters)

The upgrade feature detects and notifies you of any files in the `confluence` subdirectory of your existing Confluence Installation Directory which have been deleted, added or modified from a ‘default’ Confluence installation. This informs you of any customisations you will need to migrate manually over to your upgraded Confluence installation directory. Note that modifications to files in directories other than `confluence` will not be detected when you upgrade to Confluence 4.0, for example any modifications to start-up scripts under the `bin` directory will not be detected. The next time you upgrade (e.g. to version 4.0.1) the the upgrade feature will cover modifications across the whole Confluence Installation Directory.

**Please Note:**

- The upgrade process requests that you conduct a backup of your database using your database's backup utilities. If your database does not support online backups, you can stop the upgrade process, shut down Confluence, perform your database backup and then restart the upgrade process to continue on.
- If you have made customisations to your `server.xml` file or any other files in your Confluence installation directory which are not handled by the upgrade wizard, these must be re-applied manually.
- If your attachments and index files are located outside your Confluence Home Directory, then backups of these directories must be performed manually.

### Performing the Upgrade

Refer to the appropriate upgrade instructions below for your operating system:

#### Upgrading Confluence on Windows

1. Download the Confluence 'Windows Installer' (.exe) file (for the new version of Confluence) from the Confluence Download Center.
2. Run the `.exe` file to start the upgrade wizard.
   - If a Windows 7 (or Vista) 'User Account Control' dialog box requests if you want to allow the upgrade wizard to make changes to your computer, specify 'Yes'. If you do not, the installation wizard will have restricted access to your operating system and any subsequent installation options will be limited.
3. At the 'Upgrading Confluence?' step, choose the 'Upgrade an existing Confluence installation' option.
4. In the 'Existing Confluence installation directory' field, specify the Confluence Installation Directory of your Confluence installation to be upgraded.
   - The upgrade wizard will attempt to find an existing Confluence installation and use its location to pre-populate this field. However, always verify this location, particularly if you have multiple Confluence installations running on the same machine.
5. During subsequent steps of the upgrade wizard, you will be prompted to specify or do the following options:
   a. At the 'Back up Confluence directories' step, ensure the 'Back up Confluence home' option is selected. This creates 'zip' archive file backups of your existing Confluence Installation and Confluence Home Directories in their respective parent directory locations.
      - **Please Note:** Choosing this option is strongly recommended!
   b. At this point, the upgrade wizard notes any customisations in your existing Confluence Installation Directory which it cannot automatically migrate to your upgraded Confluence installation. If you are notified by the installer about any files containing such customisations, please make a note of the locations of these files as you will need to manually migrate their customisations (which are not mentioned in the overview above) to your upgraded Confluence installation. One relatively common customisation that the upgrade wizard cannot automatically migrate is an SSL configuration defined in the `conf/server.xml` file of the Confluence Installation Directory. **Please Note:** when upgrading from the version that was not installed by the installer the customisations can only be detected in the `confluence` subdirectory of your existing Confluence Installation Directory.
Confluence 4.2 Documentation

Upgrading Confluence on Linux

1. Download the appropriate Confluence 'Linux 64-bit / 32-bit Installer' (.bin) file that suits your operating system (for the new version of Confluence) from the Confluence Download Center.

2. Open a Linux console and change directory (cd) to the '.bin' file's directory.

   chmod a+x atlassian-confluence-X.Y.bin
   (where X.Y represents your version of Confluence)

3. Execute the '.bin' file to start the upgrade wizard.

4. When prompted to choose between creating a new Confluence installation or upgrading an existing installation, choose the 'Upgrade an existing Confluence installation' option.

5. Specify the Confluence Installation Directory of your Confluence installation to be upgraded.

   The upgrade wizard will attempt to find an existing Confluence installation and will provide its location as a choice. However, always verify this location, particularly if you have multiple Confluence installations running on the same machine.

6. During subsequent steps of the upgrade wizard, you will be prompted to specify or do the following options:

   a. Choose the option to back up Confluence's directories. This creates 'zip' archive file backups of your existing Confluence Installation and Confluence Home directories in their respective parent directory locations.

   Please Note:

   • Choosing this option is strongly recommended!
   • At this point, the upgrade wizard notes any customisations in your existing Confluence Installation Directory which it cannot automatically migrate to your upgraded Confluence installation. If you are notified of any files containing such customisations, please make a note of the locations of these files as you will need to manually migrate their customisations (which are not mentioned in the overview above) to your upgraded Confluence installation. One relatively common customisation that the upgrade wizard cannot automatically migrate is an SSL configuration defined in the conf/server.xml file of the Confluence Installation Directory. 

Congratulations, you have completed upgrading your Confluence installation on Windows!
Confluence 4.2 Documentation

Will not be detected when you upgrade, for example, modifications to conf/serv er.xml. However the next time you upgrade (e.g. to version 4.1.1) the upgrade feature will cover modifications across the whole Confluence Installation Directory.

b. At the Upgrade Check List step, back up your external database and check that any non-bundled plugins will be compatible with your upgraded Confluence version. You may have already conducted the latter (in step 5 of the Before You Start section above).

c. Upon proceeding, your existing Confluence installation will be shut down if it is still running. The upgrade wizard will then:
   i. Back up your existing Confluence installation.
   ii. Delete the contents of the existing Confluence installation directory.
   iii. Install the new version of Confluence to the existing Confluence installation directory.
   iv. Starts your new (upgraded) Confluence installation.
   If you noted any files that contain customisations which must be migrated manually to your upgraded Confluence installation (above), then:
      1. Stop the upgraded Confluence installation.
      2. Migrate the customisations from these files into the upgraded Confluence Installation Directory.
      3. Restart the upgraded Confluence installation.

7. The last step of the upgrade wizard provides you with a link to launch the upgraded Confluence installation in a browser, so you can check the upgrade.

Congratulations, you have completed upgrading your Confluence installation on Linux!

Upgrade Check List

The upgrade wizard requests that you perform the following tasks before it actually commences the upgrade of your existing Confluence installation.

Back Up Your External Database

Perform a backup of your external database (using your database's native backup tools) and verify that the backup was created correctly.

- If your database's native backup tools support 'online backups' (i.e. which would typically create a 'snapshot' of your Confluence database while the database is still in use), you can leave the upgrade wizard running while you perform the database backup and then continue on with the wizard after verifying that the database backup was created correctly.
- If your database's native backup tools do not allow you to perform an 'online backup' of your Confluence database, you should:
   1. Quit the upgrade wizard now.
   2. Use your database's native backup tools to perform an 'offline backup' of your Confluence database and verify that this backup was created correctly.
   3. Re-run the Linux / Windows Installer to start the upgrade wizard again and continue from where you left off.

- If you are using HSQLDB as the Confluence internal database, please note that this should be used for evaluating Confluence only. If you happen to accidentally use the HSQLDB database for a production system, quit the upgrade wizard now and use the Migrating Confluence Between Servers procedure to upgrade Confluence.

Inconsistent database backups may not restore correctly! If you are unfamiliar with your database's native backup/restore facilities, then test your database backup's integrity by doing the following:

1. Restoring the database backup to a different (test) system,
2. Connecting a test instance of your current Confluence version to this restored database.

Alternatively, use the Migrating Confluence Between Servers procedure to upgrade Confluence instead.
Check Plugin Compatibility

If you have installed any 3rd-party Confluence plugins (i.e. not included in Confluence), please verify that they will be compatible with the version of Confluence you are upgrading to. You can find a plugin's compatibility information from the plugin's home page on the Atlassian Plugin Exchange. Once you have confirmed the availability of compatible versions, you should upgrade your plugins after successfully upgrading Confluence. This can be done by navigating to Browse > Confluence Admin > Configuration > Plugins.

Upgrading Beyond Current Licensed Period

This page explains the recovery process should you mistakenly try to upgrade your Confluence installation to a version beyond your current license entitlement.

ℹ️ The information on this page applies to Confluence 2.7.2 and later.

License Warnings

During an upgrade an obvious indication that your license has expired can be found in your log file. You will see a ‘WARN’ level entry similar to this:

```
[confluence.upgrade.impl.DefaultUpgradeManager] isUpgradeAllowed
Your license is now outside of it's support period. You need to renew the license before you can upgrade to this version of Confluence.
```

When you try to connect to the Confluence instance, you will see the following warning screen:

<table>
<thead>
<tr>
<th>Time</th>
<th>Level</th>
<th>Type</th>
<th>Description</th>
<th>Exception</th>
</tr>
</thead>
<tbody>
<tr>
<td>2008-02-04 10:51:04</td>
<td>null</td>
<td>(EventType: upgrade)</td>
<td>Cannot proceed with upgrade. Your current license does not entitle you to upgrade to this version of Confluence. Please check that the support period of your license has not expired or that you have the correct partner license. If you wish to renew your license, please contact <a href="mailto:sales@atlassian.com">sales@atlassian.com</a>. If you have a new license, please enter it on this page and restart.</td>
<td>fatal</td>
</tr>
</tbody>
</table>

Updating the Confluence License

1. Contact Atlassian Sales to arrange for a new license to be issued, as instructed on the warning screen illustrated above.
2. Once you have received a suitable license, supply the license key to Confluence:
   - Click the link given on the license warning screen, illustrated above.
   - You will first be asked to log in as a Confluence administrator.
   - Then you will be presented with a simplified license administration screen. Enter the credentials of a Confluence system administrator.
   - Copy the license key into the 'License' field and click 'Save':
3. Restart Confluence to continue the upgrade.

Upgrading Confluence

Confluence Post-Upgrade Checks

This article provides a list of items for Confluence Administrators to check after a Confluence upgrade to ensure that it has completed successfully. This list is not exhaustive, but it does cover common upgrade mistakes.

On this page:

- **Before You Begin**
- **Upgrade Checklist**
  - 1. Layout and Menu
  - 2. Search
  - 3. Permissions
  - 4. Attachments
  - 5. Plugins

**Before You Begin**

After you have completed an upgrade, you should see the following message in the atlassian-confluence log file:

```
2010-03-08 08:03:58,899 INFO [main] [atlassian.confluence.upgrade.AbstractUpgradeManager] upgradeFinished
Upgrade completed successfully
```

If you do not see the line in your log similar to the one above, this means that your upgrade has not completed successfully. Please check our Troubleshooting Upgrades documentation to check for a suitable recommendation or fix. If there are no errors logged or if none of the errors are referenced in the the Troubleshooting Upgrades documentation, please contact Atlassian Support using the Support Utilities in your administration console.

**Upgrade Checklist**
Below is a recommended list of items to check after completing an upgrade.

1. Layout and Menu

Visit the Confluence dashboard and check that it is accessible and displays as expected. Test the different Internet browsers that you have in use in your environment. In addition, confirm that the layout appears as expected and that the menus are clickable and functioning.

2. Search

Try searching for content, for example pages, attachments or user names. Check that the expected results are returned.

3. Permissions

Confirm that you can visit a page that has viewing restrictions, but you have permission to view. Confirm that you can edit a page that has edit restrictions but you have permission to edit. Make sure that the permissions of child pages are functioning as well. Involve as many space administrators as possible to confirm they are working. Confirm that anonymous or forbidden users cannot access or modify restricted pages.

4. Attachments

Confirm that attachments are accessible and searchable.

5. Plugins

Outdated third-party plugins can cause upgrade failure. Quite often, they will just be incompatible and simply do not work anymore. If you discover that your plugin is no longer working, please check for the latest version for your plugin in the Atlassian Plugin Exchange.
Upgrading to Confluence 4.2?

If so, please review the Confluence 4.2 Release Notes for important information about this version of Confluence. Ensure that you have read the Confluence Knowledge Base.

Also, we strongly recommend that you check the upgrade notes for every major version of Confluence that you are skipping, since there might be specific changes between Confluence versions that could affect your Confluence installation. The upgrade notes for recent major versions of Confluence are accessible from the Upgrade Notes Overview page.

Finally, please check the Supported Platforms page to ensure that your Java version, operating system, application server, database and browser are supported for this release of Confluence. The End of Support Announcements for Confluence page has important information regarding supported platforms.

On this page:

- Before you Start
- Backing Up
- Testing the Upgrade in a Test Environment
- Performing the Upgrade
- Reapplying Customisations to your New Confluence
- Checking for Known Issues and Troubleshooting the Confluence Upgrade

Before you Start

Changing your Database?

If you are planning to change to a different database, we recommend that you complete the Confluence upgrade first. Then follow the instructions on migrating to a different database.

1. Note that you need current software maintenance to perform the upgrade.
2. Confirm that your license support period is still valid before you try to upgrade.
3. If your current license has expired but you have a new license with you, please update your license in Confluence before performing the upgrade.
   - If you forget to do this and your license has expired, you will receive errors during the upgrade process. Refer to the instructions on upgrading beyond current license period.
4. Check the release notes for the new version of Confluence you are installing, plus the upgrade notes for any major versions you are skipping. It is important to read these upgrade notes as there might be specific changes between Confluence versions that could affect your Confluence instance. The upgrade notes pages for recent major versions of Confluence are accessible from the Upgrade Notes Overview page. (Each upgrade notes page is a ‘child’ of its respective release notes page.)
5. Make sure that your environment (e.g. the database system, the operating system, the application server and so on) still complies with the Confluence System Requirements. A newer version of Confluence may have different requirements than the previous version.
6. If you are using Confluence EAR-WAR edition, check Installing the Confluence EAR-WAR Edition to see if there is anything extra you will need to do to get Confluence running.
7. If you are using an external database, familiarise yourself with all known issues for your specific database. Also make sure the Confluence database connector principal (the database user account) has sufficient permissions to modify the database schema.
8. Note which plugins are installed and enabled on your current Confluence instance. Please verify whether a compatible version of the plugin is available in the version of Confluence you are upgrading to. This information is available via the ‘Plugins’ menu in your Administration screens, and selecting Confluence Upgrade Check. This will tell you which plugins have an updated version which is compatible with your target upgrade version. You can also check the respective home pages for these plugins on the Atlassian.
Plugin Exchange. Once you have confirmed the availability of compatible versions, you should upgrade your plugins after successfully upgrading Confluence. Please test these first by applying them to the latest Confluence version in a test environment.

9. If you have made any customisations to Confluence, please verify their compatibility in the latest version. For example, if you have modified any layouts or are using your own custom theme, please test these first by applying them to the latest Confluence version in a test environment. You can see the customisations applied to your Confluence installation.

10. Some anti-virus or other Internet security tools may interfere with the Confluence upgrade process and prevent the process from completing successfully. If you experience or anticipate experiencing such an issue with your anti-virus/Internet security tool, disable this tool first before proceeding with the Confluence upgrade.

Backing Up

Before you begin the Confluence upgrade, you must back up the following:

1. **Back up your Confluence Home directory.** The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

   ✔ Tip: Another term for ‘Home directory’ would be ‘data directory’. The location of the Home directory is stored in a configuration file called `confluence-init.properties`, which is located inside the `confluence/WEB-INF/classes` directory in your Confluence Installation directory. The Confluence installer will automatically prompt you to run a backup, storing the files in a .zip archive at the same level as your Confluence Home directory.

2. **Back up your database.** Perform a manual backup of your external database before proceeding with the upgrade, and double check that the backup was actually created properly. If you are not a database expert, or unfamiliar with the backup-restore facilities of your database, simply restore the backup to a different system to ensure the backup worked before proceeding. This recommendation is generally a good best practice. Surprisingly, many companies get in trouble for broken database backups because they skip this basic but vital "smoke test" of the operation.

   ❗ The ‘embedded database’ is the HSQLDB database supplied with Confluence for evaluation purposes. You don't need to back it up since it is stored in the Confluence home directory. You should not be using this database for production systems at all, so if you happen to be using HSQLDB in a production system, please migrate to a proper database before the upgrade. Read about the various shortcomings of HSQLDB.

3. **Back up your Confluence Installation directory or your Confluence webapp** (if you are using Confluence EAR-WAR edition). The Confluence installer will automatically back up these files, storing the files in a .zip archive at the same level as your Confluence installation directory. The 'Confluence Installation directory' is the directory into which the Confluence application files and libraries have been unpacked (unzipped) when Confluence was installed. Confluence does not modify or store any data in this directory. This directory is also sometimes called the ‘Confluence Install directory’.

Testing the Upgrade in a Test Environment

Be sure to test the upgrade in a test environment before proceeding on your production server.

1. Create a snapshot of your current production Confluence environment on a test server, as described in the page on Moving Confluence Between Servers.
XML imports

⚠ Importing an old XML backup file to a new major version (i.e Confluence 3.5 to Confluence 4.0) is not recommended. Please recreate your production instance in a test environment first.

2. Perform the upgrade on your cloned environment.

3. Test all your unsupported plugins and any customisations with the new version before proceeding on your production server. You can read more about supported and unsupported plugins.

Performing the Upgrade

If you are migrating servers or migrating databases, perform those operations in separate steps.

The upgrade process allows you to unzip the new Confluence installation into a directory of your choice and then edit the configuration files to point your new installation to your existing data files. Follow these instructions:

1. Shut down your existing Confluence instance.
2. Download the Confluence EAR-WAR zip file: Go to the Download Center, and click 'Show all' to find the EAR-WAR zip file.
3. If you are on Windows, please check your unzip program before extracting the downloaded zip file. Some archive-extract programs cause errors when unzipping the Confluence zip file. You should use a third-party unzip program like 7Zip or Winzip. If you do not have one, please download and install one before continuing:
   - 7Zip — Recommended. If in doubt, download the '32-bit.exe' version
   - Winzip
4. Use your unzip program to unzip the installation file. You should now have a new directory called confluence-<version>. In the rest of this document, we will refer to this as the <Installation-Directory>.
   - Do not use spaces in your directory path.
   - You can read more about the Confluence Installation directory.
5. Edit the confluence-init.properties file found at: <Installation-Directory>\confluence \WEB-INF\classes\confluence-init.properties and update 'confluence.home' to point to your existing Confluence Home directory.
   - Make sure you have first backed up your Home directory.
   - Open the confluence-init.properties file in a text editor such as Notepad.
   - Scroll to the bottom and find this line:

```
# confluence.home=c:/confluence/data
```
   - Remove the '#' and the space at the beginning of this line, so that Confluence no longer regards the line as a comment. The line should now begin with confluence.home.
   - Update the directory name after the = sign, to point to your existing Confluence Home directory.
6. If you are using Tomcat, you need to update either your confluence.xml or server.xml (depending on where you have defined the Confluence context descriptor) to point to the location of the new Confluence installation (also remember to copy over any customisations such as a tomcat datasource if you have one).
7. If you have delegated your user management to JIRA, LDAP or any other external user management system, copy the following files from your old Confluence installation to your new Confluence installation:
   - <Installation-Directory>/confluence/WEB-INF/classes/osuser.xml.
   - <Installation-Directory>/confluence/WEB-INF/classes/atlassian-user.xml(if
you are upgrading from Confluence 2.2 or later).

### Upgrading to Confluence 3.5+ and using JIRA user management?

Please review our KB article first: [Upgrade to Confluence 3.5 with JIRA User Management Fails](#).

### If you are upgrading from an earlier version of Confluence (2.5.5 and earlier)

and are copying your existing `atlassian-user.xml` file from your previous instance, please ensure that the hibernate cache parameter in this file has been enabled, to avoid performance related issues. (NOTE: If you use Crowd for your user management, you do not need to do this.):

```xml
<hibernate name="Hibernate Repository" key="hibernateRepository" description="Hibernate Repository" cache="true" />
```

8. If you have delegated your user management to Crowd, you will also need to copy the Crowd client library and configuration files from your old Confluence installation to your new Confluence installation: `<Installation-Directory>/confluence/WEB-INF/lib/crowd-integration-client-X.X.X.jar` and `<Installation-Directory>/confluence/WEB-INF/classes/crowd.properties`. If you need more information, please refer to the [Crowd documentation](#).

9. Restart your application server and start Confluence.

**Please note** that Confluence will need to re-index attachments and this can take 5-10 minutes. Please wait until Confluence has finished indexing the attachments before trying to access Confluence via your web browser. (There is no easy and quick way to determine if the indexing process is completed. Please wait for approximately 10 minutes after the server start up before accessing Confluence via a web browser.)

10. During the startup process Confluence will create any missing database indexes. If you created any database indexes on your own, please check those afterwards and remove those that duplicate the indexes added by Confluence. Just in case you run into any errors which prevent Confluence from starting up, you can set the system property `hibernate.hbm2ddl.skip_creating_missing_indexes` to `true` to skip automatic index creation.

11. Visit Confluence in your web browser and log in using a username from your previous Confluence installation. You should be able to log in immediately, without seeing the Setup Wizard.

12. Take a quick look around your Confluence site to confirm that all your spaces and pages are present and everything looks normal. You should see the new Confluence version number in the page footer.

13. Consider any adjustments you need to make to customisations and special configurations, as described below.

---

### Reapplying Customisations to your New Confluence

**Hint:** The steps below are for advanced Confluence users, who have applied special settings to their Confluence server and/or Confluence look and feel

After upgrading your Confluence installation to a later version of Confluence, you need to consider any customisations you have applied to your system and other special configurations:

- If you had previously installed **Confluence/Tomcat as a Windows service**, uninstall the service (to ensure that the old Confluence cannot start automatically when the server restarts) and reinstall the new one. For details please see [Start Confluence Automatically on Windows as a Service](#).
- If you are using the Confluence distribution and you have previously defined a **CATALINA_HOME**...
environment variable, please check that it points to the correct path for the new Confluence Tomcat server.

- If you had previously connected your Confluence installation to an external database via a JNDI datasource or you implemented SSL, edit your new web.xml file and and copy over any relevant modifications from your old web.xml file, which relate to these customisations.

- If you were previously running Confluence on a non-standard port, edit your new <Installation-Directory>/conf/server.xml file as described in Change listen port for Confluence.

- If you had previously defined a Tomcat datasource, edit your new <Installation-Directory>/conf/server.xml and copy over the datasource definition from your old server.xml.

- If you were previously using any plugins, install the latest compatible version and disable any plugins that are incompatible with your new version of Confluence. The easiest way to do this is to use the Plugin Repository in the Confluence Administration Console.

- If you are using any customised themes, please check that they are displaying as expected. Some further customisation may be required to ensure compatibility with your new version of Confluence.

- If you had previously customised the default site or space layouts, you will need to reapply your changes to the new defaults as described here.

- If you had previously modified the Confluence source code, you will need to reapply your changes to the new version.

- If you were previously running Confluence over SSL, you will need to reapply your configuration as described in Running Confluence Over SSL or HTTPS.

- If you had previously modified the memory flags (Xms and Xmx) in either the <Installation-Directory>/bin/setenv.sh or the <Installation-Directory>/bin/setenv.bat file, you may want to make the modifications in your new installation. The parameters are specified in the JAVA_OPTS variable.

- If you had changed the Confluence interface text, you will need to pull over the ConfluenceActionSupport.properties file.

- If you were using a custom SSO authenticator, change seraph-config.xml to the correct authenticator.

**Checking for Known Issues and Troubleshooting the Confluence Upgrade**

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

**Upgrading Confluence Manually**

This document tells you how to upgrade from one version of Confluence to a later version. This document refers to the Confluence distribution, which includes Apache Tomcat as the bundled application server.

If you want to upgrade an EAR/WAR distribution deployed on your own existing application server, please refer to Upgrading Confluence EAR-WAR Distribution instead.
Please also check the following before you start using this guide:

- **The version of Confluence** that you will be upgrading to. Refer to the [documentation home page](#) to verify the latest Confluence version and to find documentation for older versions.
- **The supported platforms** for the version that you will be upgrading to. Please see the [Supported Platforms](#) page for the version of Confluence that you will be upgrading to, as well as the [End of Support Announcements for Confluence](#).
- If you are running **Confluence on a cluster**, please see [Upgrading a Confluence Cluster](#) instead of this document.

### Upgrading to Confluence 4.2?

If so, please review the [Confluence 4.2 Release Notes](#) for important information about this version of Confluence. Ensure that you have read the [Confluence Knowledge Base](#).

Also, we strongly recommend that you check the upgrade notes for every major version of Confluence that you are skipping, since there might be specific changes between Confluence versions that could affect your Confluence installation. The upgrade notes for recent major versions of Confluence are accessible from the [Upgrade Notes Overview](#) page.

Finally, please check the [Supported Platforms](#) page to ensure that your Java version, operating system, application server, database and browser are supported for this release of Confluence. The [End of Support Announcements for Confluence](#) page has important information regarding supported platforms.

**On this page:**

- **Before you Start**
- **Backing Up**

- **Useful Plugins**

### Before you Start

**Changing your Database?**

If you are planning to change to a different database, we recommend that you complete the Confluence upgrade first. Then follow the instructions on [migrating to a different database](#).

1. Note that you need current [software maintenance](#) to perform the upgrade.
2. Confirm that your [license support period](#) is still valid before you try to upgrade.
3. If your current license has expired but you have a new license with you, please [update your license](#) in Confluence before performing the upgrade.
   - If you forget to do this and your license has expired, you will receive errors during the upgrade process. Refer to the instructions on [upgrading beyond current license period](#).
4. Check the [release notes](#) for the new version of Confluence you are installing, plus the upgrade notes for any major versions you are skipping. It is important to read these upgrade notes as there might be specific changes between Confluence versions that could affect your Confluence instance. The upgrade notes pages for recent major versions of Confluence are accessible from the [Upgrade Notes Overview](#) page. (Each upgrade notes page is a 'child' of its respective release notes page.)
5. Make sure that your environment (e.g. the database system, the operating system, the application server and so on) still complies with the Confluence [System Requirements](#). A newer version of Confluence may have different requirements than the previous version.
6. If you are using Confluence EAR-WAR edition, check [Installing the Confluence EAR-WAR Edition](#) to see...
if there is anything extra you will need to do to get Confluence running.

7. If you are using an external database, familiarise yourself with all known issues for your specific database. Also make sure the Confluence database connector principal (the database user account) has sufficient permissions to modify the database schema.

8. Note which plugins are installed and enabled on your current Confluence instance. Please verify whether a compatible version of the plugin is available in the version of Confluence you are upgrading to. This information is available via the 'Plugins' menu in your Administration screens, and selecting Confluence Upgrade Check. This will tell you which plugins have an updated version which is compatible with your target upgrade version. You can also check the respective home pages for these plugins on the Atlassian Plugin Exchange. Once you have confirmed the availability of compatible versions, you should upgrade your plugins after successfully upgrading Confluence. Please test these first by applying them to the latest Confluence version in a test environment.

9. If you have made any customisations to Confluence, please verify their compatibility in the latest version. For example, if you have modified any layouts or are using your own custom theme, please test these first by applying them to the latest Confluence version in a test environment. You can see the customisations applied to your Confluence installation.

10. Some anti-virus or other Internet security tools may interfere with the Confluence upgrade process and prevent the process from completing successfully. If you experience or anticipate experiencing such an issue with your anti-virus/Internet security tool, disable this tool first before proceeding with the Confluence upgrade.

Back up

Before you begin the Confluence upgrade, you must back up the following:

1. **Back up your Confluence Home directory.** The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   
   Tip: Another term for 'Home directory' would be 'data directory'. The location of the Home directory is stored in a configuration file called confluence-init.properties, which is located inside the confluence/WEB-INF/classes directory in your Confluence Installation directory. The Confluence installer will automatically prompt you to run a backup, storing the files in a .zip archive at the same level as your Confluence Home directory.

2. **Back up your database.** Perform a manual backup of your external database before proceeding with the upgrade, and double check that the backup was actually created properly. If you are not a database expert, or unfamiliar with the backup-restore facilities of your database, simply restore the backup to a different system to ensure the backup worked before proceeding. This recommendation is generally a good best practice. Surprisingly, many companies get in trouble for broken database backups because they skip this basic but vital "smoke test" of the operation.
   
   Tip: The "embedded database" is the HSQLDB database supplied with Confluence for evaluation purposes. You don't need to back it up since it is stored in the Confluence home directory. You should not be using this database for production systems at all, so if you happen to be using HSQldb in a production system, please migrate to a proper database before the upgrade. Read about the various shortcomings of HSQLDB.

3. **Back up your Confluence Installation directory or your Confluence webapp** (if you are using Confluence EAR-WAR edition). The Confluence installer will automatically back up these files, storing the files in a .zip archive at the same level as your Confluence installation directory. The 'Confluence Installation directory' is the directory into which the Confluence application files and libraries have been unpacked (unzipped) when Confluence was installed. Confluence does not modify or store any data in this directory. This directory is also sometimes called the 'Confluence Install directory'.

Testing the Upgrade in a Test Environment

Be sure to test the upgrade in a test environment before proceeding on your production server.
1. Create a snapshot of your current production Confluence environment on a test server, as described in the page on Moving Confluence Between Servers.

**XML imports**

⚠ Importing an old XML backup file to a new major version (i.e Confluence 3.5 to Confluence 4.0) **is not recommended**. Please recreate your production instance in a test environment first.

2. Perform the upgrade on your cloned environment.

3. Test all your unsupported plugins and any customisations with the new version before proceeding on your production server. You can read more about supported and unsupported plugins.

**Performing the Upgrade**

- If you are migrating servers or migrating databases, perform those operations in separate steps.

To install Confluence, unzip the new Confluence installation zip file into a directory of your choice and then edit the configuration files to point your new installation to your existing data files. Follow these instructions:

1. Shut down your existing Confluence instance.
2. Download the Confluence zip file.
3. **If you are on Windows**, please check your unzip program before extracting the downloaded zip file. Some archive-extract programs cause errors when unzipping the Confluence zip file. You should use a third-party unzip program like 7Zip or Winzip. If you do not have one, please download and install one before continuing:
   - 7Zip — Recommended. If in doubt, download the ‘32-bit.exe’ version
   - Winzip
4. Use your unzip program to unzip the installation file. You should now have a new directory called confluence-<version>, e.g. confluence-4.0.0-std.
   - In the rest of this document, we will refer to this as the `<Installation-Directory>`.
   - If you decide to change the location from the default, make sure that you choose a different location from your existing Confluence installation, because legacy files may cause problems if you install the new Confluence version into an existing directory.
   - Do not use spaces in your directory path.
   - You can read more about the Confluence Installation directory.
5. Edit the `confluence-init.properties` file found at: `<Installation-Directory>\confluence\WEB-INF\classes\confluence-init.properties` and update 'confluence.home' to point to your existing Confluence Home directory.
   - You can read more about the Confluence Home directory.
   - Make sure you have first backed up this directory, as instructed above.
   - Open the `confluence-init.properties` file in a text editor such as Notepad.
   - Scroll to the bottom and find this line: 
     ```
     # confluence.home=c:/confluence/data
     ```
   - Remove the '#' and the space at the beginning of this line, so that Confluence no longer regards the line as a comment. The line should now begin with `confluence.home`.
   - Update the directory name after the '=' sign, to point to your existing Confluence Home directory.
6. **If you are running Confluence as a Windows service**, use the command prompt and type `<Installation-Directory>\bin\service.bat remove Confluence`.
It is vital that you stop and remove the existing service prior to uninstalling the old instance of Confluence! For more information on running Confluence as Windows service, please refer to the Start Confluence Automatically on Windows as a Service topic.

To remove the service installed by the Confluence installer, you need to run the `<confluence auto installer installation folder>\UninstallService.bat.`

7. If you are using an external database (i.e. not the embedded HSQLDB database supplied for evaluation purposes), copy the jdbc driver jar file from your old Confluence installation to the new Confluence installation. The jdbc driver jar file in the old Confluence installation should be located in either the `<Installation-Directory>/common/lib` or `<Installation-Directory>/confluence/WEB-INF/lib` directories. Once you have identified this file, copy it to either the `<Installation-Directory>/lib` or `<Installation-Directory>/confluence/WEB-INF/lib` directories of your Confluence installation.

8. If you have delegated your user management to JIRA, LDAP, Crowd, or any other external user management system, copy the following files from your old Confluence installation to your new Confluence installation:
   - `<Installation-Directory>/confluence/WEB-INF/classes/osuser.xml.`
   - `<Installation-Directory>/confluence/WEB-INF/classes/atlassian-user.xml` (if you are upgrading from Confluence 2.2 or later).

9. If you are upgrading from an earlier version of Confluence (2.5.5 and earlier) and are copying your existing `atlassian-user.xml` file from your previous instance, please ensure that the hibernate cache parameter in this file has been enabled, to avoid performance related issues. (NOTE: If you use Crowd for your user management, you do not need to do this.):

   ```xml
   <hibernate name="Hibernate Repository" key="hibernateRepository" description="Hibernate Repository" cache="true" />
   ```

10. Consider any adjustments you need to make to customisations and special configurations, as described below.

11. Your new version of Confluence may not function correctly or could encounter problems or errors if these are not implemented.

12. Start your new version of Confluence.

   Please note that Confluence will need to re-index attachments and this can take 5-10 minutes. Please wait until Confluence has finished indexing the attachments before trying to access Confluence via your web browser.

13. During the startup process Confluence will create any missing database indexes. If you created any database indexes on your own, please check those afterwards and remove those that duplicate the indexes added by Confluence. Just in case you run into any errors which prevent Confluence from starting up, you can set the system property `hibernate.hbm2ddl.skip_creating_missing_index` to `true` to skip automatic index creation.

14. Visit Confluence in your web browser and log in using a username from your previous Confluence installation. You should be able to log in immediately, without seeing the Setup Wizard.

15. Take a quick look around your Confluence site to confirm that all your spaces and pages are present and
everything looks normal. You should see the new Confluence version number in the page footer.

Reapplying Customisations to your New Confluence

**Hint:** The steps below are for advanced Confluence users, who have applied special settings to their Confluence server and/or Confluence look and feel

After upgrading your Confluence installation to a later version of Confluence, you need to consider any customisations you have applied to your system and other special configurations:

- If you had previously installed **Confluence/Tomcat as a Windows service**, uninstall the service (to ensure that the old Confluence cannot start automatically when the server restarts) and reinstall the new one. For details please see [Start Confluence Automatically on Windows as a Service](#).
- If you are using the Confluence distribution and you have previously defined a **CATALINA_HOME environment variable**, please check that it points to the correct path for the new Confluence Tomcat server.
- If you had previously connected your Confluence installation to an **external database** via a JNDI datasource or you implemented **SSL**, edit your new `web.xml` file and and copy over any relevant modifications from your old `web.xml` file, which relate to these customisations.
- If you were previously running **Confluence on a non-standard port**, edit your new `<Installation-Di rectory>/conf/server.xml` file as described in [Change listen port for Confluence](#).
- If you had previously defined a **Tomcat datasource**, edit your new `<Installation-Directory>/conf/server.xml` and copy over the datasource definition from your old `server.xml`.
- If you were previously using any **plugins**, install the latest compatible version and disable any plugins that are incompatible with your new version of Confluence. The easiest way to do this is to use the [Plugin Repository](#) in the Confluence Administration Console.
- If you are using any **customised themes**, please check that they are displaying as expected. Some further customisation may be required to ensure compatibility with your new version of Confluence.
- If you had previously customised the **default site or space layouts**, you will need to reapply your changes to the new defaults as described here.
- If you had previously modified the Confluence **source code**, you will need to reapply your changes to the new version.
- If you were previously running **Confluence over SSL**, you will need to reapply your configuration as described in [Running Confluence Over SSL or HTTPS](#).
- If you had previously modified the **memory flags** (`Xms` and `Xmx`) in either the `<Installation-Direct ory>/bin/setenv.sh` or the `<Installation-Directory>/bin/setenv.bat` file, you may want to make the modifications in your new installation. The parameters are specified in the `JAVA_OPTS` variable.
- If you had changed the **Confluence interface text**, you will need to pull over the `ConfluenceActionSupport.properties` file.
- If you were using a custom SSO authenticator, change **seraph-config.xml** to the correct authenticator.

Checking for Known Issues and Troubleshooting the Confluence Upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the **Confluence post-upgrade checklist** to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.
Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Appfire’s Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Supported Platforms

This page describes the supported platforms for Confluence. Please review them before installing Confluence. The information on this page applies to Confluence 4.2.

Further information:

- Please read End of Support Announcements for Confluence for important information regarding the end of support for various platforms and browsers when used with Confluence.
- Please read System Requirements for any further information about these supported platforms and hardware requirements.

Key: ✔ = Supported. ❌ = Not Supported

<table>
<thead>
<tr>
<th>Java Version</th>
<th>✔ 1.6.0_4+ (Note: Java 6 update 18+ have known issues.) Recommend to use Java 6 Update 26+. ✔ 1.7</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>Safari (Windows and Mac) (8)</td>
<td>✔ Latest stable version supported ✔ Tested with 5 ([8])</td>
</tr>
</tbody>
</table>

1. Confluence is a pure Java application and should run on this platform provided the JDK requirement is satisfied.
2. While some of our customers run Confluence on SPARC-based hardware, Atlassian only officially supports Confluence running on x86 hardware and 64-bit derivatives of x86 hardware.
3. Ensure that you configure your Confluence MySQL database to use the InnoDB storage engine as the MyISAM storage engine could lead to data corruption.
4. HSQLDB: Confluence ships with a built-in HSQL database. While this database is fine for evaluation purposes, it is somewhat susceptible to data loss during system crashes. Hence, for production environments, we recommend that you configure Confluence to use an external database.
5. Internet Explorer 8 and 9 do not support the drag-and-drop functionality of HTML5. As Confluence relies on this functionality, the drag-and-drop experience in Internet Explorer 8 and 9 is not complete.
6. The latest stable version of Firefox is also supported.
7. The latest stable version of Chrome is also supported. Chrome does not have WEBDAV / plugin support for features such as Edit in Word for attachments will not work. Please refer to CONF-23322 for information on the progress of the issue.
8. The latest stable version of Safari is also supported. Confluence does not support editing in Mobile Safari on iOS devices (such as iPhone and iPad). Please refer to CONF-19524 for information on the progress of this issue.
9. Confluence is tested with these versions of Internet Explorer in standards-compliant rendering mode, not compatibility mode. Enabling compatibility mode may cause problems because it emulates older, unsupported rendering modes.

End of Support Announcements for Confluence

This page contains announcements of the end of support for various platforms and browsers when used with Confluence. This is summarised in the table below. Please see the sections following for the full announcements.

End of Support Matrix for Confluence

The table below summarises information regarding the end of support announcements for upcoming Confluence releases. If a platform (version) has already reached its end of support date, it is not listed in the table.

<table>
<thead>
<tr>
<th>Platform</th>
<th>Confluence End of Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2 database</td>
<td>Confluence 4.3 (announcement)</td>
</tr>
</tbody>
</table>

Why is Atlassian ending support for these platforms?

Atlassian is committed to delivering improvements and bug fixes as fast as possible. We are also committed to providing world class support for all the platforms our customers run our software on. However, as the complexity of our applications grows, the cost of supporting multiple platforms increases exponentially. Each new feature has to be tested on several combinations of application servers, databases, web browsers, etc, with setup and ongoing maintenance of automated tests. Moving forward, we want to reduce the time spent there to increase Confluence development speed significantly.

On this page (most recent announcements first):

- Deprecated Databases for Confluence (13 March 2012)
- Deprecated Operating Systems for Confluence (21 July 2011)
- Deprecated Databases for Confluence (7 January 2011)
- Deprecated Web Browsers for Confluence (7 January 2011)
- Deprecated Databases for Confluence (12 October 2010)
- Deprecated Web Browsers for Confluence (12 October 2010)
- Deprecated Databases for Confluence (6 July 2010)
- Deprecated Databases for Confluence (24 March 2010)
- Deprecated Databases for Confluence (27 January 2010)
- Deprecated Java Platforms for Confluence (27 January 2010)
- Deprecated Web Browsers for Confluence (14 December 2009)

Deprecated Databases for Confluence (13 March 2012)

This section announces the end of Atlassian support for certain databases for Confluence. End of support means that Atlassian will not fix bugs related to the specified database past the support end date for your version of Confluence.

The details are below. Please refer to the list of supported platforms for details of platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

End of Life Announcement for Database Support
**Database**

<table>
<thead>
<tr>
<th>Database</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2</td>
<td>When Confluence 4.3 is released, due in mid 2012</td>
</tr>
</tbody>
</table>

**DB2 notes:**
- Confluence 4.2 is the last version that will support DB2.
- From Confluence 4.3, no versions of DB2 will be supported.
- Confluence 4.2 and previously-released versions will continue to work with DB2. However, we will not fix bugs affecting DB2 after the [end-of-life date](#) for your version of Confluence.
- Confluence 4.3 will not be tested with DB2.

**Deprecated Operating Systems for Confluence (21 July 2011)**

This section announces the end of Atlassian support for certain operating systems for Confluence. End of support means that Atlassian will not fix bugs related to running Confluence server on that operating system past the support end date.

We will stop supporting the following operating systems from Confluence 4.0, due in late 2011:

- Mac OS X (as a Confluence server platform).

The details are below. Please refer to the list of [supported platforms](#) for details of platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

**End of Life Announcement for Operating System Support**

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mac OS X (as a Confluence server platform)</td>
<td>When Confluence 4.0 releases, due in late 2011</td>
</tr>
</tbody>
</table>

**Mac OS X Notes:**
- Atlassian intends to end support for Mac OS X (as a server platform) in Confluence 4.0 (due for release in late 2011). Confluence 3.5 is the last version that will support Mac OS X.
- The Sun/Oracle JDK/JRE 1.6 is the only JDK platform officially supported by Atlassian. This means that Apple Mac OS X is not a supported operating system for the Confluence server, as the Sun/Oracle JDK does not run on Mac OS X.
- Accessing Confluence as a user from Mac OS X via a compatible web browser will still be supported for the foreseeable future.

**Deprecated Databases for Confluence (7 January 2011)**

This section announces the end of Atlassian support for certain database versions for Confluence. End of support means that Atlassian will not fix bugs related to certain database versions past the support end date.

We will **stop supporting the following database versions** from Confluence 4.0, due in late 2011:

- MySQL 5.0.

The details are below. Please refer to the list of [supported platforms](#) for details of platform support for
End of Life Announcement for Database Support

<table>
<thead>
<tr>
<th>Database</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>MySQL (version 5.0 only)</td>
<td>When Confluence 4.0 releases, due in late 2011</td>
</tr>
</tbody>
</table>

**MySQL Notes:**
- Atlassian intends to end support for MySQL 5.0 in Confluence 4.0 (due for release in the middle of 2011). Confluence 3.5 is the last version that will support MySQL 5.0.
- MySQL 5.1 will still be supported.
- ‘Support End Date’ means that Confluence 3.5 and previously released versions will continue to work with MySQL 5.0. However, we will not fix bugs affecting MySQL 5.0 past the support end date.
- Confluence 4.0 will not be tested with MySQL 5.0.

End of Life Announcement for Web Browser Support

<table>
<thead>
<tr>
<th>Web Browser</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft Internet Explorer (version 7 only)</td>
<td>When Confluence 4.0 releases, late the middle of 2011</td>
</tr>
<tr>
<td>Safari (version 4 only)</td>
<td>When Confluence 4.0 releases, due in late of 2011</td>
</tr>
<tr>
<td>Firefox (version 3.5 only)</td>
<td>When Confluence 4.0 releases, due in late of 2011</td>
</tr>
</tbody>
</table>

**Internet Explorer Notes:**
- Atlassian intends to end support for IE7 in Confluence 4.0 (due for release in the middle of 2011). Confluence 3.5 is the last version that will support IE7.
- IE8 will still be supported.
- ‘Support End Date’ means that Confluence 3.5 and previously released versions will continue to work with IE7. However, we will not fix bugs affecting IE7 past the support end date.
- Confluence 4.0 will not be tested with IE7.

**Safari Notes:**
- Atlassian will introduce support for Safari 5 in Confluence 3.5.
- We intend to end support for Safari 4 in Confluence 4.0 (due for release in the middle of 2011).
Confluence 3.5 is the last version that will support Safari 4.

- 'Support End Date' means that Confluence 3.5 and previously released versions will continue to work with Safari 4. However, we will not fix bugs affecting Safari 4 past the support end date.
- Confluence 4.0 will not be tested with Safari 4.

• **Firefox Notes:**
  - Atlassian will end support for Firefox 3.0 in Confluence 3.5, as [previously announced](#).
  - We intend to end support for Firefox 3.5 in Confluence 4.0 (due for release in the middle of 2011)
  - Confluence 3.5 is the last version that will support Firefox 3.5.
  - Firefox 3.6 will still be supported.
  - 'Support End Date' means that Confluence 3.5 and previously released versions will continue to work with Firefox 3.5. However, we will not fix bugs affecting Firefox 3.5 past the support end date.
  - Confluence 4.0 will not be tested with Firefox 3.5.

### Deprecated Databases for Confluence (12 October 2010)

This section announces the end of Atlassian support for certain database versions for Confluence. End of support means that Atlassian will not fix bugs related to certain database versions past the support end date.

We will **stop supporting the following database versions:**

- From Confluence 3.5, due in the first half of 2011, Confluence will no longer support PostgreSQL 8.1.
  - *Note, PostgreSQL 8.2 and PostgreSQL 8.4 will still be supported.*

The details are below. Please refer to the [Supported Platforms](#) for more details regarding platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

<table>
<thead>
<tr>
<th>Database</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>PostgreSQL (version 8.1 only)</td>
<td>When Confluence 3.5 releases, due in the first half of 2011</td>
</tr>
</tbody>
</table>

- **PostgreSQL (version 8.1 only) End of Support Notes:**
  - Atlassian intends to end support for PostgreSQL 8.1 in Confluence 3.5 (due to release in the first half of 2011), with the final support for these platforms in Confluence 3.4. PostgreSQL 8.2 and PostgreSQL 8.4 will still be supported.
  - 'Support End Date' means that Confluence 3.4 and previous released versions will continue to work with the PostgreSQL 8.1 However, we will not fix bugs affecting PostgreSQL 8.1 past the support end date.
  - Confluence 3.5 (due to release in the first half of 2011) will not be tested with PostgreSQL 8.1.

### Deprecated Web Browsers for Confluence (12 October 2010)

This section announces the end of Atlassian support for certain web browser versions for Confluence. End of support means that Atlassian will not fix bugs related to certain web browser versions past the support end date.

We will **stop supporting the following web browser versions:**

- From Confluence 3.5, due in the first half of 2011, Confluence will no longer support Firefox 3.0.
  - *Note, Firefox 3.5 and Firefox 3.6 will still be supported.*

The details are below. Please refer to the [Supported Platforms](#) for more details regarding platform support for Confluence.
End of Life Announcement for Web Browser Support

<table>
<thead>
<tr>
<th>Web Browser</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firefox (version 3.0 only)</td>
<td>When Confluence 3.5 releases, due in the first half of 2011</td>
</tr>
</tbody>
</table>

- Firefox (version 3.0 only) End of Support Notes:
  - Atlassian intends to end support for Firefox 3.0 in Confluence 3.5 (due to release in the first half of 2011), with the final support for these platforms in Confluence 3.4. Firefox 3.5 and Firefox 3.6 will still be supported.
  - ‘Support End Date’ means that Confluence 3.4 and previous released versions will continue to work with Firefox 3.0. However, we will not fix bugs affecting Firefox 3.0 past the support end date.
  - Confluence 3.5 (due to release in the first half of 2011) will not be tested with Firefox 3.0.

 Deprecated Databases for Confluence (6 July 2010)

This section announces the end of Atlassian support for certain database versions for Confluence. End of support means that Atlassian will not fix bugs related to certain database versions past the support end date.

We will stop supporting the following database versions:

- From Confluence 3.4, due in the second half of 2010, Confluence will no longer support Oracle 10g (i.e. Oracle 10.1 and Oracle 10.2).
  
  Note, Oracle 11g (i.e. Oracle 11.1 and Oracle 11.2) will still be supported.

We have made these decisions in line with Oracle's decision to stop support for Oracle 10g, as per the "Oracle Database (RDBMS) Releases Support Status Summary [ID 161818.1]" article on the Oracle Support site (note, you will need an Oracle Support account to find and view the article). This also will reduce the testing time required for each release and help us speed up our ability to deliver market-driven features. We are committed to helping our customers understand this decision and assist them in upgrading to Oracle 11g if needed.

The details are below. Please refer to the Supported Platforms for more details regarding platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

End of Life Announcement for Database Support

<table>
<thead>
<tr>
<th>Database</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle (version 10.1 and 10.2 only)</td>
<td>When Confluence 3.4 releases, due in the second half of 2010</td>
</tr>
</tbody>
</table>

- Oracle (version 10.1 and 10.2 only) End of Support Notes:
  - Atlassian intends to end support for Oracle 10.1 and Oracle 10.2 in Confluence 3.4 (due to release in the second half of 2010), with the final support for these platforms in Confluence 3.3. Oracle 11.1 and Oracle 11.2 will still be supported.
  - ‘Support End Date’ means that Confluence 3.3 and previous released versions will continue to work with the Oracle 10.1 and Oracle 10.2. However, we will not fix bugs affecting Oracle 10.1 or Oracle 10.2 past the support end date.
  - Confluence 3.4 (due to release in the second half of 2010) will not be tested with Oracle 10.1 and Oracle 10.2.
### Deprecated Web Browsers for Confluence (6 July 2010)

This section announces the end of Atlassian support for certain web browser versions for Confluence. End of support means that Atlassian will not fix bugs related to certain web browser versions past the support end date.

We will **stop supporting the following web browser versions**:

- From Confluence 3.4, due in the second half of 2010, Confluence will no longer support Safari 3 or Safari 3.1.
  
  *Note, Safari 4 will still be supported.*

The details are below. Please refer to the [Supported Platforms](#) for more details regarding platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

**End of Life Announcement for Web Browser Support**

<table>
<thead>
<tr>
<th>Web Browser</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Safari (version 3 and 3.1 only)</td>
<td>When Confluence 3.4 releases, due in the second half of 2010</td>
</tr>
</tbody>
</table>

**Safari (version 3 and 3.1 only) End of Support Notes:**

- Atlassian intends to end support for Safari 3 and Safari 3.1 in Confluence 3.4 (due to release in the second half of 2010), with the final support for these platforms in Confluence 3.3. Safari 4 will still be supported.
- ‘Support End Date’ means that Confluence 3.3 and previous released versions will continue to work with the Safari 3 and Safari 3.1. However, we will not fix bugs affecting Safari 3 and Safari 3 past the support end date.
- Confluence 3.4 (due to release in the second half of 2010) will not be tested with Safari 3 and Safari 3.1.

### Deprecated Databases for Confluence (24 March 2010)

This section announces the end of Atlassian support for certain database versions for Confluence. End of support means that Atlassian will not fix bugs related to certain database versions past the support end date.

We will **stop supporting the following database versions**:

- From Confluence 3.3, due in Q3 2010, Confluence will no longer support DB2 8.2.
  
  *Note, DB2 9.7 will still be supported.*

We are reducing our database support to reduce the amount of testing time and help us speed up our ability to deliver market-driven features. We are committed to helping our customers understand this decision and assist them in upgrading to DB2 9.7 if needed.

The details are below. Please refer to the [Supported Platforms](#) for more details regarding platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

**End of Life Announcement for Database Support**

<table>
<thead>
<tr>
<th>Database</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
DB2 (version 8.2 only) | When Confluence 3.3 releases, due Q3 2010

- DB2 (version 8.2 only) End of Support Notes:
  - Atlassian intends to end support for DB2 8.2 in Q3 2010, with the final support for these platforms in Confluence 3.2. DB2 9.7 will still be supported.
  - 'Support End Date' means that Confluence 3.2 and previous released versions will continue to work with the DB2 8.2. However, we will not fix bugs affecting DB2 8.2 past the support end date.
  - Confluence 3.3 (due to release in Q3 2010) will not be tested with DB2 8.2.

 Deprecated Application Servers for Confluence (27 January 2010)

This section announces the end of Atlassian support for certain application servers for Confluence. End of support means that Atlassian will not fix bugs related to certain application servers past the support end date.

We will stop supporting the following application servers:

- From Confluence 3.2, due late Q1 2010, Confluence will no longer support JBoss application servers.
- From Confluence 3.3, due in Q3 2010, Confluence will no longer support Oracle WebLogic, IBM WebSphere or Caucho Resin.

We are reducing our application server platform support to reduce the amount of testing time and help us spee up our ability to deliver market-driven features. We are committed to helping our customers understand this decision and assist them in migrating to Tomcat, our supported application server.

The details are below. Please refer to the Supported Platforms for more details regarding platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcements at atlassian dot com.

End of Life Announcement for Application Server Support

<table>
<thead>
<tr>
<th>Application Servers</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>JBoss 4.2.2</td>
<td>When Confluence 3.2 releases, due late Q1 2010</td>
</tr>
<tr>
<td>Oracle WebLogic 9.2</td>
<td>When Confluence 3.3 releases, due Q3 2010</td>
</tr>
<tr>
<td>IBM WebSphere 6.1</td>
<td>When Confluence 3.3 releases, due Q3 2010</td>
</tr>
<tr>
<td>Caucho Resin 3.0, 3.1.6, 3.1.7</td>
<td>When Confluence 3.3 releases, due Q3 2010</td>
</tr>
</tbody>
</table>

- JBoss End of Support Notes:
  - 'Support End Date' means that Confluence 3.1 and previous released versions will continue to work with stated application servers. However, we will not fix bugs affecting JBoss application servers.
  - Confluence 3.2 will not support JBoss application servers.

- WebLogic, WebSphere and Resin End of Support Notes:
  - Atlassian intends to end support for Oracle WebLogic, IBM WebSphere, and Caucho Resin in Q3 2010, with the final support for these platforms in Confluence 3.2.
  - 'Support End Date' means that Confluence 3.2 and previous released versions will continue to work with the stated application servers. However, we will not fix bugs affecting Oracle WebLogic IBM WebSphere, and Caucho Resin application servers past the support end date.
  - Confluence 3.3 (due to release in Q3 2010) will only be tested with and support Tomcat 5.5.20+ and 6.0.
Why is Atlassian doing this?

We have chosen to standardise on Tomcat, because it is the most widely used application server in our user population. It is fast, robust, secure, well-documented, easy to operate, open source, and has a huge community driving improvements. It is the de facto industry standard, with several companies available that specialise in providing enterprise grade support contracts for it, ranging from customisations to 24/7 support.

Deprecated Java Platforms for Confluence (27 January 2010)

This section announces the end of Atlassian support for certain Java Platforms for Confluence.

We will stop supporting the following Java Platforms:

- From Confluence 3.3, due Q3 2010, support for Java Platform 5 (JDK/JRE 1.5) will end.

We are ending support for Java Platform 5, in line with the Java SE Support Roadmap (i.e. “End of Service Life for Java Platform 5 dated October 30, 2009). We are committed to helping our customers understand this decision and assist them in updating to Java Platform 6, our supported Java Platform.

The details are below. Please refer to the Supported Platforms for more details regarding platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

End of Life Announcement for Java Platform Support

<table>
<thead>
<tr>
<th>Java Platform</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java Platform 5 (JDK/JRE 1.5)</td>
<td>When Confluence 3.3 releases, due Q3 2010</td>
</tr>
</tbody>
</table>

- **Java Platform 5 End of Support Notes:**
  - Atlassian intends to end support for Java Platform 5 in Q3 2010.
  - ‘Support End Date’ means that Confluence 3.2.x and previous released versions will continue to work with Java Platform 5 (JDK/JRE 1.5), however we will not fix bugs related to Java Platform 5 past the support end date.
  - Confluence 3.3 will only be tested with and support Java Platform 6 (JDK/JRE 1.6).
  - If you have concerns with this end of support announcement, please email eol-announcement at atlassian dot com.

Deprecated Web Browsers for Confluence (14 December 2009)

This section announces the end of Atlassian support for certain web browsers for Confluence.

We will stop supporting older versions of web browsers as follows:

- From Confluence 3.2, due late Q1 2010, support for Firefox 2 and Safari 2 will end.
- From 13 July 2010, in line with Microsoft's Support Lifecycle policy, support for IE6 will end.

The details are below. Please refer to the Supported Platforms for more details regarding platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

</tr>
<tr>
<td>Internet Explorer 6</td>
<td>When Confluence 3.3 releases (target Q3 2010) or 13 July 2010, whichever is sooner</td>
</tr>
</tbody>
</table>

- **Firefox 2 and Safari 2 Notes:**
  - Confluence 3.1 is the last version to officially support Firefox 2 and Safari 2.
  - You may be able to use these older browsers for the most common use cases like viewing and editing content, but official support for these browsers will end once you upgrade to Confluence 3.2.
  - Confluence 3.2 is currently targeted to release late Q1 2010 and will not be tested with Firefox 2 and Safari 2. After the Confluence 3.2 release, Atlassian will not provide fixes in older versions of Confluence for bugs affecting Firefox 2 and Safari 2.

- **Internet Explorer 6 Notes:**
  - Confluence 3.2 (due late Q1 2010) will be the last version to officially support Internet Explorer 6.
  - Confluence 3.3 is currently targeted to release Q3 2010 and will **not** support IE6.
  - Atlassian will support IE6 in Confluence until the 13th of July 2010, in line with Microsoft's [Support Lifecycle policy](#). Beyond that date, released versions of Confluence will continue working with IE6 just as they did before, but we will not fix bugs affecting Internet Explorer 6.
  - You may be able to use Internet Explorer 6 for the most common use cases like viewing and editing content, but official support for this browser will end once you upgrade to Confluence 3.3.

**Supported Platforms FAQ**

**Q: How does Atlassian choose which JRE versions, application servers and databases to support?**

For application servers and databases, we try to pick a good cross-section of open source options and popular commercial platforms. We then choose which JRE versions to support based on the recommended environments for these servers.

**Q: What is a supported platform?**

A supported platform is one that:

- Confluence is regularly tested on during the development cycle
- One that is available within Atlassian for support technicians and developers to reproduce problems
- Bugs raised against it will be given a high priority

Supporting a platform means we know how to get Confluence running in that environment and can troubleshoot Confluence issues within it. It does not mean we have any particular expertise beyond that. As such, we may not be able to provide assistance with customising or tuning that application server or database. (Atlassian support is not a substitute for a good database administrator.)

**Q: Can I get assistance with running Confluence on a platform that is not supported?**

If you are running Confluence on an unsupported platform, then we can not guarantee providing any support for it. Furthermore, we will recommend that you switch to a platform which is supported.

**Q: If you write your application to standards like J2EE, JDBC and SQL, doesn’t that mean it should run on any compliant server?**

Confluence is a complicated application and we commonly encounter interesting edge-cases where different
servers have interpreted the specifications differently. Then again, each server has its own different collection of bugs.

**Q: How can I get Atlassian to support Confluence on a new platform?**

Supporting a new platform involves a significant investment of time by Atlassian, both up-front costs to set up new testing environments and fix any issues we might encounter and the ongoing costs involved in maintaining the application against this new environment in the future. As such, supporting a new platform is not something we will do unless we know there is significant demand for it.

Please be aware that your interest alone will not be enough for us to add support for your application server or database. We would need to see a significant number of votes on the issue raised in our public JIRA site or a significant level of interest in our forums, before considering supporting that platform.

**Q: My organisation has standardised on an operating environment that Confluence does not support. What can I do?**

In this situation, you have the following two options:

1. Run Confluence in the unsupported environment, with the caveats mentioned above.
2. Make an exception to your standardised operating environment and set up Confluence based on its supported platforms.

**Release Notes**

**Latest Major Release: Confluence 4.2**

With great pleasure, Atlassian presents Confluence 4.2. Create content that pops, see what's trending, and be a trendsetter.

Hint: Finding a list of known issues

To find a list of known issues in a particular Confluence version, you can create a filter in the Atlassian issue tracker and use the permlink located at the top right of the issue tracker’s page to access the filtered report. The following example filter is the list of bugs reported for Confluence 2.7:

Read the JIRA documentation on creating filters.

Confluence Release Cycle

New versions of Confluence are released frequently. Our goals are to:

- Make bug-fixes available to customers sooner
- Give interested customers early access to new features and API changes
- Make Confluence major releases predictable

Feature Releases

We aim to release new versions of Confluence every three to four months. These releases will contain the bulk of new functionality.

Feature releases are numbered by incrementing Confluence’s minor version number, so the move from Confluence 2.0 to 2.1 and 2.1 to 2.2 both introduced significant new features to the product. Occasionally we may change to a whole new major version number (Confluence 2.0 was originally slated to be released as 1.5), but that is mostly done for marketing purposes, and shouldn’t be considered to have any practical meaning.

Feature releases may not be API-compatible with the previous release. This means that you should test RPC clients, macros and plugins before running them on a newer version of Confluence.

You can find the timeline history of our major releases at the downloads archive.

Bug-Fix Releases

Confluence bug-fix releases are scheduled every three to four weeks, depending on the number and urgency of the bugs that have been fixed during that particular development cycle. We aim to minimise the time between a bug being reported and a fix being available, without either us or our customers having to manage clumsy sets of manual patches.

Bug-fix releases will contain mostly bug-fixes, plus the occasional minor new feature or enhancement. Enhancements will be limited, however, as the main aim of these point releases is to improve stability, and make no significant API changes.

Bug-fix releases are numbered by incrementing the patch-level. So the first bug-fix release after Confluence 2.2 is 2.2.1, followed by 2.2.2. Occasionally, we will re-issue a bug-fix release because something was faulty with the original download. In that case we will create a "re-issue" release number, for example 2.1.5a or 2.2.1a.

Obviously, we don’t expect anyone to upgrade Confluence every two weeks, administrators should keep their own schedule, based on how much of an inconvenience is being caused by any bugs that may have been fixed since. Sometimes, however, a security issue or serious application bug will arise that we feel it is in everyone’s
best interests to fix as soon as possible. In such cases, we will recommend in the Release Notes that all customers upgrade to the latest version.

**Milestone Releases**

Occasionally, when possible, we will release preview "milestone releases" of the next major Confluence version. How often and when we do so depends on the particulars of the current development cycle. In situations where we are working on a number of disparate features we may be able to do a number of progressive development releases, whereas in iterations where we are making significant changes to the Confluence internals, we may not have anything suitable for public consumption until quite late in the release cycle.

Milestone releases will be announced in the developer release notes. Milestone releases are published for testing plugins and early feedback about our work, please don't use them on production systems.

The version number of a milestone release will be the version number of the next major release, suffixed with -m. So Confluence 2.3-m1 will be followed by 2.3-m2, and so on until the ultimate release of the finished Confluence 2.3.

**Upgrade Notes Overview**

Typically, each major release of Confluence comes with upgrade notes, which are specific recommendations for upgrading from the previous major version. If you plan to upgrade and skip a few Confluence versions, you must read the upgrade notes for all major versions between your current version and the version to which you are upgrading, to make sure you do not miss something important.

Please read our general information about upgrading Confluence.

For example:

When upgrading from Confluence 3.4 to Confluence 4.0, read the upgrade notes for Confluence 3.5, as well as those for Confluence 4.0.

Also, we strongly recommend that you read the upgrade notes for any minor releases in-between, since they contain important information that will affect your Confluence upgrade.

**Below is a list of upgrade notes for previous major releases of Confluence, as well as the upgrade notes for important minor releases:**

- [Confluence 4.2 Upgrade Notes](#)
- [Confluence 4.1 Upgrade Notes](#)
- [Confluence 4.0 Upgrade Notes](#)
- [Confluence 3.5 Upgrade Notes](#)
- [Confluence 3.4 Upgrade Notes](#)
- [Confluence 3.3 Upgrade Notes](#)
- [Confluence 3.2 Upgrade Notes](#)
- [Confluence 3.1 Upgrade Notes](#)
- [Confluence 3.0.1 Upgrade Notes](#)
- [Confluence 3.0 Upgrade Notes](#)
- [Confluence 2.10 Upgrade Notes](#)
- [Confluence 2.9 Upgrade Notes](#)
- [Confluence 2.8 Upgrade Notes](#)
- [Confluence 2.7 Upgrade Notes](#)
- [Confluence 2.6 Upgrade Notes](#)

You will find the upgrade notes attached to the release notes for the relevant version.
Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

Release Notes

Coherence license changes SEPT 2009 - new Standard and Clustered Confluence Editions

Summary

Oracle Coherence (formerly known as Tangosol Coherence) is the technology that provides clustering and distributed caching in Confluence. It has also been used for caching purposes in non-clustered Confluence deployments.

The Oracle Coherence technology was first incorporated into Confluence version 2.3. Since then, Atlassian has been able to distribute the Coherence technology library files via the following means:

- Included with all versions and distributions of Confluence downloadable from our website since version 2.3, regardless of whether these were intended for clustered or single-server installations.
- From the Atlassian Maven repositories.

However, Atlassian is about to enter a new license agreement with Oracle over the Coherence technology. This means that from late September 2009, Atlassian will only be permitted to distribute the Coherence library files to customers who have purchased a license for it (that is, a Confluence clustered license).

As a result, the following changes will occur:

- The next version of Confluence (3.0.1) will be released in two editions:
  - **Standard** — Editions of Confluence without the Coherence library files. Ehcache will replace the local caching functionality previously provided by the Coherence technology.
  - **Clustered** — Editions of Confluence containing the Coherence library files.
- Customers who have purchased a non-clustered Confluence license will only be able to download standard editions of Confluence from the Atlassian website, whereas customers who have purchased a Confluence clustered license will be able to download clustered editions of Confluence.
- From late September 2009:
  - **Standard editions of Confluence** will be made available for each previous major releases of Confluence back to version 2.6. These will be available as Confluence versions 2.10.4, 2.9.3, 2.8.3, 2.7.4 and 2.6.3 and will be available to customers with non-clustered licenses.
  - **All other previous versions of Confluence currently available from our download page** (from 2.6 to 3.0 inclusively), will be re-released as clustered editions and will only be available to customers with Confluence clustered licenses.
  - The Coherence library files will no longer be available in any form from the Atlassian Maven repositories.
  - The installation files for all versions of Confluence prior to 2.6 (which are no longer supported) will be removed from the Atlassian website and will no longer be available for download and installation.

⚠️ If you are currently running a clustered installation of Confluence, please do not upgrade it with a standard edition of Confluence.

What are the implications?

I am a Confluence customer with a non-clustered Confluence license, running Confluence 2.3 or later.
The Confluence distribution you are running will continue to function and if it is Confluence version 2.6 or later, be supported by Atlassian in accordance with our standard support policy.

However, if you upgrade to Confluence version 3.0.1 or later or obtain any Confluence version released after late September 2009, you will only be able to download and upgrade to standard editions of Confluence.

I run a customised installation of Confluence 2.3 or later and must build Confluence from source.

Confluence source code downloaded before late September 2009 requires that the Coherence library files are present in either your local or the Atlassian Maven repositories for automated Maven builds to complete successfully.

If you have Confluence source code downloaded before late September 2009 (excluding version 3.0.1) but conduct an automated Maven build of Confluence using this source code after this date, your build will fail if the Coherence library files are not available in your local Maven repository. This is because the Coherence library files will also not be available in the Atlassian Maven repository.

Hence, to build a customised installation of Confluence using this source code, we recommend that you locate the tangosol-3.3.jar and coherence-3.3.jar from the WEB-INF/lib directory of your own existing Confluence installation and install them into your local Maven repository using the following commands:

```
mvn install:install-file
-Dfile=tangosol-3.3.jar
-DgroupId=tangosol-coherence \ 
-DartifactId=tangosol -Dversion=3.3 
-Dpackaging=jar
mvn install:install-file
-Dfile=tangosol-3.3.jar
-DgroupId=tangosol-coherence \ 
-DartifactId=coherence -Dversion=3.3 
-Dpackaging=jar
```

⚠️ These commands will install the Coherence library files into your local Maven repository, which should be available to you only. Please do not upload these files to any public Maven repository nor make them publicly available by any other means. Atlassian's End User License Agreement does not grant permission to redistribute any part of Confluence, which includes these Coherence library files.

Alternatively, you can download the sources for one of the new standard or clustered editions of Confluence and reapply your customisations. These will compile without any additional problems.

I am a plugin developer and wish to compile plugins against old or existing versions of Confluence

This will affect plugin developers in two ways:

1. When building a plugin, Maven will complain about the absence of the Coherence library files in the Atlassian Maven repository.
2. When using the Atlassian Plugin Toolkit to test a plugin, Maven will be unable to download the
appropriate Confluence EAR-WAR distribution file (from the Atlassian Maven repository), against which to perform integration tests.

Therefore, we recommend that as soon as possible, plugin developers start compiling their plugins based on the new standard editions of Confluence (without the Coherence library files). Standard editions of Confluence will be binary-compatible with clustered editions and existing clustered instances of Confluence. Hence, plugins developed against standard editions of Confluence will also run on any clustered editions and existing clustered instances of Confluence.

I am a plugin developer concerned about API changes and multiple Confluence editions resulting from these changes

As long as you are using only Confluence APIs to develop plugins, your plugins will be binary compatible with both standard and clustered editions of Confluence. The interfaces of the Confluence CacheManager, Cache and ClusterManager will be the same in both editions of Confluence, although there will be only one important change from previous versions of Confluence.

In existing versions of Confluence, the ClusterManager exposes the Coherence InvocationService to allow clients to execute code or perform queries across all nodes of the cluster. This API will be unavailable in all standard edition versions of Confluence from version 3.0.1 back to 2.6. If your plugin uses this service (and Atlassian is not aware of any that do) you should instead use Confluence’s RemoteEvent API to send messages to other cluster nodes and direct them to perform the work.

Also, if for some reason your plugin references some other Coherence classes directly (or imports the Coherence-specific implementations of the CacheManager, Cache or ClusterManager), you will need to rewrite your plugin to use the generic interfaces only.

I am a plugin developer and want to test my plugin against Confluence in a cluster

For testing purposes, you must own a Confluence clustered license and have access to a clustered Confluence installation (either an existing one or one based on the new Confluence clustered edition).

**Confluence Release Summary**

This page shows the highlights of the major Confluence releases.

**Current Release**

For information about the latest release, please go to the Release Notes.

**Confluence 4.2 — 10 April 2012**

- Page layouts
- Likes
- Quick comments
- Popular content on the dashboard
- Recommended content by email
- Labels on attachments
- Signup invitations via URL
- Easy upgrade, try and buy for plugins
- More in the **Confluence 4.2 Release Notes**

**Confluence 4.1 — 13 December 2011**

- Autoconvert for Pasted Links
- Image effects
- Quick find and replace
- Follow Your Network On the Dashboard
- Space attachments macro
- Global PDF stylesheets
- Use any character in page titles
• New translation feature
• More in the release notes

Confluence 4.0 — 19 September 2011
• Brand New Editor
• Simplified Editing Experience
• New Macros
• Faster Editing Experience
• Introducing @mentions
• Improved Page Comparison Functionality
• Email Notification Improvements
• New Confluence Installer and Guided Upgrades
• New Editor Plugin Points for Developers
• More in the release notes

Confluence 3.5 — 16 March 2011
• Easy, Powerful Connections to Active Directory, LDAP and Crowd
• Improved JIRA Integration
• Drag-and-Drop for HTML5 Browsers
• Autowatch and Improved Notification Settings
• Sharing Pages and Blog Posts
• Enhanced Code Macro
• More Administrative Improvements
• “What’s New” Feature Tour
• Categories, a New Way of Organising Spaces
• Embedding Audio and Video with the Multimedia Macro
• Infrastructure Changes
• More in the release notes

Confluence 3.4 — 12 October 2010
• New Keyboard Shortcuts, Mac-Friendly Too
• Keyboard Shortcut Dialog
• User Macros in Macro Browser and Autocomplete
• New Plugin Manager
• Improved Performance
• Infrastructure Changes
• More in the release notes

Confluence 3.3 — 7 July 2010
• Confluence Page Gadget
• Autocomplete for Inserting Macros
• Property Panels for Links
• Property Panels for Images
• Manage Watchers
• Email Notifications for Network Activity and Blogs
• Blog Improvements
• Context-Sensitive Help Links
• Security Features
• Infrastructure Changes
• More in the release notes

Confluence 3.2 — 24 March 2010
• Autocomplete for Inserting Links
• Autocomplete for Embedding Images and Documents
• A Link Browser that's Smarter, Smoother, Faster
• New Documentation Theme
- New Easy Reader Theme
- Template Bundles
- Reordering while Moving a Page
- New Keyboard Shortcuts and Editor Hints
- User Interface Enhancements
- More in the release notes

Confluence 3.1 — 8 December 2009
- Introducing Gadgets
- Drag-and-Drop
- Office 2007 Support
- New 'Move Page' Feature
- Enhanced Image Browser
- Draft Comparisons
- Page Restrictions Dialog Box
- Other Editor Enhancements
- New Web Browser Versions Supported
- More in the release notes

Confluence 3.0 — 1 June 2009
- Introducing the Macro Browser
- Enhanced User Profiles
- Introducing Your Network
- New User Status
- New Hover Profile Feature
- Customisable Enhanced PDF Exports
- Improved Rich Text Editor
- Performance Improvements
- Engine Room and Developer Community
- Administration Improvements
- More in the release notes

Confluence 2.10 — 3 December 2008
- Introducing the Widget Connector
- Improved Office Connector Now Bundled
- Introducing Quick Navigation
- 'Did You Mean', OpenSearch and More
- Custom Stylesheets for Confluence Spaces
- Updated JIRA Issues Macro with Custom Fields and Dynamic Display
- Enhanced User and Group Management
- Upgraded Rich Text Editor
- Universal Wiki Converter now with SharePoint Import and More
- Improved Activity Macros
- Plugin Framework 2
- More in the release notes

Confluence 2.9 — 7 August 2008
- Streamlined Search
- Auto Save
- Charts
- Page Tree
- Gallery
- New Tutorial
- More in the Menus
- Alphabetical Page Ordering
- Better Spam Prevention
• Plugin Repository
• Engine Room and Developers’ Community
• More in the release notes

**Confluence 2.8 — 10 April 2008**
• Dynamic menus and simplified screen design
• Page ordering
• Collapsible comments
• Multiple-label filter
• Confluence installer
• Task list
• Performance enhancements
• Administration, management and monitoring
• More in the release notes

**Confluence 2.7 — 12 December 2007**
• JIRA Issues and Portlet macros use new trusted authentication
• Two-tier administrator permissions
• Inserting images and attaching files during page creation
• Sorting of images in Gallery macro
• Simplified and improved logging
• Performance, maintainability and administration
• More in the release notes

**Confluence 2.6 — 27 September 2007**
• Fresh look for the Default theme
• Personalised comments and Dashboard
• Space description on Dashboard
• Labels on templates
• Default content for space home pages
• Social Bookmarking plugin now bundled with Confluence
• Back-dating and renaming news items
• More in the release notes

**Confluence 2.5 — 29 April 2007**
• Introducing flexible page restrictions
• Dynamic task list JRE incompatibilities
• contentbylabel macro supports AND condition
• More in the release notes

**Confluence 2.4 — 14 March 2007**
• Editable comments
• Page mailing
• More in the release notes

**Confluence 2.3 — 5 January 2007**
• Confluence Massive — cluster support
• People directory
• Activity plugin — usage statistics
• Blogging RPC plugin — manage news in Confluence using blogger-compatible desktop clients
• WebDAV client support via WebDAV plugin — create, edit, move pages, attachments, etc via WebDAV
• More in the release notes

**Confluence 2.2 — 27 April 2006**
• Personal spaces
• Localisation/internationalisation — drop-in language packs (similar to JIRA)
Confluence 4.2 Release Notes

10 April 2012

With great pleasure, Atlassian presents Confluence 4.2. Create content that pops, see what's trending, and be a trendsetter.

Highlights of Confluence 4.2

- CAPTCHA support — spam protection
- Improved searching
- Improved LDAP performance
- Confluence ships with Tomcat 5.5
- More in the release notes

Confluence 2.1 — 20 December 2005
- Autosave
- Concurrent edit warnings
- LDAP integration with Atlassian User/POLIS
- More in the release notes

Confluence 2.0 — 17 November 2005
- Rich Text Editing — WYSIWYG editor
- Labels
- Dashboard tabs — All, My, Team, New
- RSS builder
- Export pages as Word documents
- Copy pages
- More in the release notes

Confluence 1.4 — 23 May 2005
- New user interface
- Enhanced editing — doing more in the edit interface
- Page permissions
- New plugin types
- Configurable themes
- Completely rewritten Wiki to HTML conversion engine
- More in the release notes

Confluence 1.3 — 30 November 2004
- Mail archiving
- Themes
- Trash can
- More granular space permissions
- More in the release notes

Confluence 1.2 — 23 August 2004
- Page list views — alphabetical, directory view and search view of all pages in a space
- Image thumbnails and thumbnail galleries
- Threaded comments
- Enhanced Search - indexing attachment comments and file names and contextual searching
- New permissions interface
- More in the release notes

Confluence 4.2 Documentation

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Page layouts

Page layouts offer a quick and easy way to add sections and columns to a page. Choose a predefined layout, add the content to each section, and you're done. It's a great way of creating a common page structure, so that readers know where to find the information on each page. Don't worry, the Section and Column macros are still available too. See the video.
A two-column page layout in edit mode. (It's all laid out in the documentation.)

Likes
Has someone written a mind-bogglingly clever post on Confluence? Did you laugh out loud at someone's comment? Click **Like** to let them know. Confluence has like buttons on every page, blog post and comment. If enough people like the post, it will show up on the dashboard's new 'Popular' tab and in the 'Recommended Updates' summary sent by email. **See the video.**
Quick comments

Showing people a picture of themselves is a great way to encourage them to say something! We have added an enticingly empty comment at the bottom of every page, with the user's profile picture. This replaces the rather uninviting Add Comment button in earlier versions of Confluence. And here's what we are really proud of: When you click the box to write a comment, the full editor loads instantly. No page refresh required. See the video. POW!
**All about chocolate**

5 Added by Sarah Maddox, last edited by Sarah Maddox on Mar 05, 2012

Chocolate is inevitable.

**So let's talk about chocolate**

Two penguins find themselves together on an ice floe, drifting helplessly into warmer waters. The penguins are very fond of each other. Suddenly, **crack**, the ice floe splits in half. Right between the penguins. As they drift apart, one penguin sadly waves a flipper and calls out, "Chocolate milk!"

---

**Invitation to add a comment**

---

**Popular content on the dashboard**

Want to see what's trending? The new 'Popular' tab on the dashboard shows the pages, blog posts and comments that are attracting most attention, based on the number of comments and likes they have received. The items are listed in order of popularity, with the most popular at the top. Activity that involves people in your network ranks higher than activity not involving your network, and the most recent activity ranks higher than earlier activity. See the video.
Confluence sends out a daily or weekly email message summarising the top news that is relevant to you. This is a great way of drawing people into the wiki discussions even if they are infrequent users of Confluence. The report shows the most popular content in the wiki, based on the number of likes and comments, and recently-created pages or blog posts. Confluence gives a higher ranking to activity by people in your network or in your favourite spaces. A link in the email message allows you to choose daily or weekly notifications, or to turn the notification off. See the video.

Note: All Confluence users will receive this email message by default. For instructions on turning it off, see the Confluence 4.2 Upgrade Notes.
Labels on attachments

You can now label attachments, just as you can label pages and blog posts.

- Using the Gallery macro, you can display a selection of images on your page filtered by label.
- The Attachments macro and the Space Attachments macro can show documents or other attachments with a specific label.
- The Content by Label macro also displays attachments (alongside pages, blog posts and spaces) with a given label, and you can filter by content type to show only attachments.

All about chocolate

<table>
<thead>
<tr>
<th>Attached Files</th>

</tr>
</tbody>
</table>

Labels on attachments. (Become attached to our documentation.)
Signup invitations via URL

It's what you have been dreaming of: a quick and easy way of inviting people to sign up to Confluence. Just send them a URL. You can also choose between public and private signup modes, and decide whether you want a notification each time someone signs up.

Inviting users and setting the signup mode. (You're invited to see the documentation too.)

Easy upgrade, try and buy for plugins

Now you can view, manage and upgrade your existing plugins from just one tab, called Manage my plugins. Simple, logical, clean. You will also notice some shiny Try, Buy, and Renew buttons appearing, for plugins that support the new functionality in the Universal Plugin Manager. Clicking one of those buttons takes you straight to MyAtlassian.com, where you can get an evaluation or full license on the spot. The license is automatically added to Confluence, and you are returned to the plugin manager. And the plugin manager looks much prettier too.
Other improvements

- **Author lozenge on blog post comments:**
  
  You will see an ‘author’ lozenge on blog comments, making it easy to scan a post for comments from the author. The author lozenge appears only on blog posts, and only for the original creator of the post.

  ![John Masson](image)
  
  John Masson **AUTHOR** Mar 01, 2012
  
  I think since 100% is out we need to keep it narrower. I didn’t think it was that bad before, but right now it looks odd because it's "almost" 100% but not quite… Perhaps 50% looks better? Seems more intentional?
  
  Edit · Remove · Reply · Like

- **Share notifications showing all people notified:**
  
  When someone shares a page with you, the email message shows the other people they shared it with too.
Mouse-free macros, links and images:
This is one for wiki markup fans! Now you can add macros, links and images by wiki markup alone. Type the macro, including its parameters and the closing curly bracket. Add a link, such as an anchor link, and end it with a square bracket. Insert an image or other embedded object, enclosed between exclamation marks. As soon as you close the macro, link, or embedded image, Confluence will convert it to rich text format and add it to the page. See the video.

Fixed images in Word exports:
We have fixed this bug: CONF-6246 - Authenticate to see issue details

Personal spaces more open:
The permissions for personal spaces are now more in line with Confluence’s philosophy of encouraging collaboration. When you create your personal space, the option that allows registered users to update content is selected by default. You will also be assigned as a watcher of your new personal space. (Existing settings will not be changed on upgrade.)

Gadget subscriptions:
An administrator can quickly add all the gadgets from a JIRA, Bamboo, FishEye or Crucible site – or from another Confluence site – to your Confluence gadget directory. People can then pick and choose the gadgets to add to their Confluence pages. Before this release, the administrator had to register the gadgets one by one. To subscribe to another site’s gadgets, go to Confluence Admin > External Gadgets and open the new Gadget Feeds tab.

Infrastructure changes

- PostgreSQL 9.0: From this release of Confluence, we support PostgreSQL 9.0 as well as 8.2, 8.3 and 8.4. See Supported Platforms.
- Java 7: We now support Oracle JRE / JDK 1.7 as well as 1.6. See Supported Platforms.
- Confluence 4.2 includes version 2.0.5 of the Universal Plugin Manager (UPM).
- Confluence 4.2 includes Atlassian Gadgets 3.2
- The implementation of quick comments required some significant changes to the editor’s initialisation code. This will have consequences for some Confluence plugins. Details are in this blog post: JavaScript Changes Required for Confluence 4.2 Compatibility.

Confluence 4.2 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.2. For details of the new features and improvements in this release, please read the Confluence 4.2 Release Notes.

On this page:

- Upgrade Notes
  - Checking for compatible plugins before upgrading
  - Disabling notification of signups
  - Configuring the Recommended Updates notification
  - Disabling the new 'Popular' tab on the dashboard
  - Advance notice: End of support for DB2 in Confluence 4.3
  - Advance notice: Removal of JIRA Portlet macro in Confluence 4.3

- Upgrade Procedure
- Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

Upgrade Notes

Checking for compatible plugins before upgrading

Before upgrading to Confluence 4.2, please consider the plugins that are essential for your installation, and use the [plugin upgrade check](https://confluence.atlassian.com/pages/entry/plugin_upgrade_check/500504696) to see whether there is a compatible version of those plugins available for Confluence 4.2.

In particular, the implementation of quick comments required some significant changes to the editor’s initialisation code. This will have consequences for some Confluence plugins. Details are in this blog post: [JavaScript Changes Required for Confluence 4.2 Compatibility](https://confluence.atlassian.com/pages/entry/JavaScript-Changes-Required-for-Confluence-4.2-Compatibility/607496806).

Disabling notification of signups

This release includes an automatic notification, sent by email to all administrators, each time someone signs up to the Confluence site. This notification is part of the feature that allows you to invite people to sign up via a URL, and to set your signup mode to public or private. See the [documentation](https://confluence.atlassian.com/pages/entry/Documentation/500505056).

The notification is enabled by default on the first upgrade to Confluence 4.1.9 or later. If you are upgrading to Confluence 4.2 from Confluence 4.1.7 or earlier, you may want to disable the notification after upgrading, especially if you allow public signup and are expecting a large number of signups.

To disable the notification:

The email notification includes a link to change notification settings. Alternatively, follow these steps:

1. Click **Add Users** on the dashboard.
   Or take the longer route: Choose **Browse > Confluence Admin**. Click **Users > Add User**.
2. Remove the tick from **Notify administrators when users sign up**.

Configuring the Recommended Updates notification

Confluence now sends a regular email report to subscribers, containing the top content that is relevant to the person receiving the message. By default Confluence will send a weekly update to **all** users, except under these conditions:

- If you have public signup enabled, the Recommended Updates email notification is turned off by default.
- If you are connected to LDAP and a user has never logged in to Confluence, that user will not receive the Recommended Updates notification.
You can turn off the Recommended Updates notification, or change its settings for the site. See Configuring the Recommended Updates Email Notification. Confluence users can choose their personal settings, which will override the defaults. See Subscribing to Email Notifications of Updates to Confluence Content.

**Disabling the new ‘Popular’ tab on the dashboard**

In some environments, you may prefer not to display the new ‘Popular’ tab on the dashboard. For example, if your wiki allows only a small group of people to log in and contribute content or comments. Then the tab may not be relevant to you.

To prevent the tab from appearing, you can disable the relevant plugin module. You need System Administrator permissions to do this. Go to the Dashboard Macros plugin (See Configuring a Plugin), click Manage plugin modules and disable the Popular Tab module.

**Advance notice: End of support for DB2 in Confluence 4.3**

We are planning to end support for DB2 in Confluence 4.3. See End of Support Announcements for Confluence.

**Advance notice: Removal of JIRA Portlet macro in Confluence 4.3**

The JIRA Portlet macro, for JIRA 3.x and earlier, allows you to display a JIRA dashboard portlet on a Confluence page. Gadgets replaced portlets in JIRA 4.0 and Confluence 3.1.

In Confluence 4.1 and 4.2, it is no longer possible to add a JIRA Portlet macro via the Confluence macro browser. It is still possible to add the macro using wiki markup or by copying an existing JIRA Portlet macro. The macro still displays information correctly.

In Confluence 4.3, we will remove the JIRA Portlet macro from Confluence. Pages that contain the macro will no longer display information drawn from JIRA. Instead, they will show an error reporting that the macro does not exist. To prevent this behaviour, please upgrade to a version of JIRA that supports gadgets, and follow the instructions in Migrating from JIRA Issues and JIRA Portlets to Gadgets.

### Upgrade Procedure

⚠️ Upgrade a test environment first

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home Directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.
2. If your version of Confluence is earlier than 3.5, then you must upgrade to Confluence 3.5.x before upgrading to Confluence 4.x. There are several reasons for this:
   - There were major changes to user management and LDAP in Confluence 3.5.
   - From version 3.5, you will be able to use our new automated installer / upgrader to move to 4.0. The Confluence 4.0 installer does not support upgrading from Confluence versions earlier than 3.5.
   - We recommend that you fix any issues arising from the upgrade to version 3.5.x, separately from those that may arise from upgrading to version 4.x. Please contact Atlassian Support for assistance.
   - Please read the Upgrade Notes Overview and the upgrade notes for each version of Confluence.
listed on that page. (There are hyperlinks to each one.) If you are upgrading from 2.1 or earlier, please read the 2.2 Release Notes. If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade from version 2.7.x to version 3.5.x, then upgrade to the latest version. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

Issues Resolved in Confluence 4.2

Below are the issues resolved in Confluence 4.2, ordered by number of votes. For the full details of the fixes, improvements and new features, please take a look at our issue tracker. Please also take a look at the Confluence 4.2 Release Notes for the new features in this release.

Confluence 4.1.9 Release Notes

27 March 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.1.9. This release includes the new invitation URL, providing a quick and easy way of inviting people to sign up to Confluence. We have also fixed some bugs.

Note: Confluence 4.1.8 was an internal release, not available publicly.

Don’t have Confluence 4.1 yet?

Take a look at the new features and other highlights in the Confluence 4.1 Release Notes.

Inviting people to sign up via a URL

It's what you have been dreaming of: a quick and easy way of inviting people to sign up to Confluence. Just send them a URL. You can also choose between public and private signup modes, and decide whether you want a notification each time someone signs up. See the documentation.
Inviting users and setting the signup mode.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.1.9 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.

**Confluence 4.1.9 Upgrade Notes**

Below are some important notes on upgrading to **Confluence 4.1.9**. For details of the fixes in this release, please read the release notes.

**Upgrade Notes**
Disabling notification of signups

This release includes an automatic notification, sent by email to all administrators, each time someone signs up to the Confluence site. This notification is part of the feature that allows you to invite people to sign up via a URL, and to set your signup mode to public or private. See the documentation.

The notification is enabled by default on the first upgrade to Confluence 4.1.9 or later. You may want to disable the notification after upgrading to Confluence 4.1.9, especially if you allow public signup and are expecting a large number of signups.

To disable the notification:

The email notification includes a link to change notification settings. Alternatively, follow these steps:

1. Click **Add Users** on the dashboard.
   Or take the longer route: Choose **Browse > Confluence Admin.** Click **Users > Add User.**
2. Remove the tick from **Notify administrators when users sign up.**

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database.** The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   Tip: Another term for 'Home directory' would be 'data directory'. Read more about **finding your Home directory.**
2. If your version of Confluence is earlier than 3.5.x, then you **should** upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.
3. If your version of Confluence is earlier than 4.1, read the **release notes and upgrade guides** for all releases between your version and the latest version.
   In particular:
   - Please read the **Confluence 4.1 Upgrade Notes.**
   - Please read the **Confluence 3.5 Upgrade Notes.**
   - If you are upgrading from 2.1 or earlier, please also read the **2.2 release notes.**
4. **Download** the latest version of Confluence.
5. Follow the instructions in the **Upgrade Guide.**

Confluence 4.1.7 Release Notes

12 March 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.1.7, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

Don't have Confluence 4.1 yet?

Take a look at the new features and other highlights in the **Confluence 4.1 Release Notes.**

Release Notices
Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.1.7 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.

Confluence 4.1.7 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.1.7. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
    ▶ Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.
3. If your version of Confluence is earlier than 4.1, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 4.1 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.1.6 Release Notes

27 February 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.1.6, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

Don't have Confluence 4.1 yet?

Take a look at the new features and other highlights in the Confluence 4.1 Release Notes.

Confluence 4.1.6 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.1.6. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory. 
   Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.
3. If your version of Confluence is earlier than 4.1, read the release notes and upgrade guides for all releases between your version and the latest version.
   In particular:
   - Please read the Confluence 4.1 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.1.5 Release Notes

13 February 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.1.5, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.
Don't have Confluence 4.1 yet?
Take a look at the new features and other highlights in the Confluence 4.1 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.1.5 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.

### Confluence 4.1.5 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.1.5. For details of the fixes in this release, please read the release notes.

### Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.

3. If your version of Confluence is earlier than 4.1, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 4.1 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.1.4 Release Notes

31 January 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.1.4, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

Don’t have Confluence 4.1 yet?

Take a look at the new features and other highlights in the Confluence 4.1 Release Notes.

Download Latest Version

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.1.4 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.

**Confluence 4.1.3 Upgrade Notes**

Below are some important notes on upgrading to Confluence 4.1.3. For details of the fixes in this release, please read the release notes.

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.  
   ![Checkmark] Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5.x, then you **should** upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.
3. If your version of Confluence is earlier than 4.1, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 4.1 Upgrade Notes.
Confluence 4.1.2 Release Notes

03 January 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.1.2, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

Don't have Confluence 4.1 yet?

Take a look at the new features and other highlights in the Confluence 4.1 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.1.2 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.

Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.

3. If your version of Confluence is earlier than 4.1, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 4.1 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

4. Download the latest version of Confluence.

5. Follow the instructions in the Upgrade Guide.

Confluence 4.1 Release Notes

13 December 2011

With great pleasure, Atlassian presents Confluence 4.1. With numerous improvements for content presentation it delivers the extraordinary new Autoconvert feature, along with attractive new image effects, find and replace, new icons, improved translation features and global PDF stylesheets.

Highlights of Confluence 4.1:

- Autoconvert for Pasted Links
- Image effects
- Quick find and replace
- Follow Your Network On the Dashboard
- Space attachments macro
- Global PDF stylesheets
- Use any character in page titles
- New translation feature
- Other improvements
- Helping you transition to the Confluence 4.x generation
- Confluence Quick Reference Guide
- Release notices

Thank you for your feedback:

🌟 More than 35 requests implemented
🌟 Over 185 votes fulfilled

More:

- Read the Upgrade Notes for important information about this release.
- See the full list of issues resolved in this release.
OnDemand Customers

Confluence OnDemand customers will be automatically upgraded to Confluence 4.1 in the next scheduled maintenance window.

Highlights of Confluence 4.1

Autoconvert for Pasted Links

When you paste URLs into Confluence, Autoconvert will now analyse what you are pasting and automatically convert it into something that will display well in Confluence. Examples include YouTube videos, JIRA issue queries and Google Maps; many other content types are supported.

YouTube URLs

Create the widget below with Autoconvert, simply by pasting the YouTube URL onto the page.

Paste this:
http://www.youtube.com/watch?feature=player_embedded&v=2XQlQG!0lnk

To get this:

JIRA Issues URLs

Create the JIRA list below with Autoconvert, simply by pasting the JIRA query URL onto the page.

Paste this:
https://jira.atlassian.com/sr/jira.issueviews:searchrequest-xml/temp/SearchRequest.xml?qqlQuery=project...

To get this:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
### Google Maps URLs

Create the **Google Maps Widget** below with Autoconvert, simply by pasting the Google Maps URL onto the page.

**Paste this:**

```
http://maps.google.com/maps?f=q&source=s_q&hl=en&geocode=&q=san+francisco+golden+gate+bridge...
```

**To get this:**

### Other supported content types:

- Confluence page, blog, comment, status, user links,
- Shared screenshot links from Skitch,
- Google search results links,
- Confluence shortcut links: when pasting these, just the name of the link content (minus the URL prefix) will be used as the link display name.

2

Image effects

Enhance the presentation of your images and screenshots with slick new border effects.

Click Effects to apply taped style, instant camera style, drop shadow style, captions and more.
Quick find and replace

Updating your wiki content is now easier with the new find and replace feature. Using familiar conventions, automatically find and replace specific text strings within your Confluence page or blog. It's also accessible with a keyboard shortcut Ctrl-F (Windows) or Cmd-F (Mac OS).

See the documentation for more details.
Follow Your Network On the Dashboard

See recent updates from just the people you follow in Confluence, with the new network tab on the Confluence dashboard. With this, following a few people in different parts of your company to make a quick filter of the main events happening outside your immediate team.

Space attachments macro

The new Space Attachments macro allows you to show all the attachments in the current space on your page. You can even filter them by file extension. Previously, you've only been able to show the attachments on the current page, using the Attachments macro.
Simply type `{space-attachments}` into a page to use it.

6

Global PDF stylesheets

Set your custom PDF stylesheets at the global level, as with custom layouts. When there is no specific individual space stylesheet defined, PDF space exports will fall back to this global stylesheet. This means that users won’t have to re-apply the same stylesheet to all their individual spaces. This is an efficient way of achieving one look and feel.

See the documentation for more details.

7

Use any character in page titles

Confluence now allows “special” characters in your page titles, such as semicolons and exclamation marks. This allows more descriptive page names and generally removes restrictions when creating page titles and naming your content.
New translation feature

For those customers working on creating translations of the Confluence user interface, the 4.1 release has a new feature that will help. After opening the Confluence dashboard, you can simply add this text to the end of your Confluence URL, like so:

```
?i18ntranslate=on
```

Then press Enter.

This will then cause each element of the user interface to display its special key name while Confluence is still an interactive mode. This makes it easier to find the essential context for each key, which can then be searched on http://translations.atlassian.com where you can enter an appropriate translation for your custom language pack.

The key names are displayed with a "lightning bolt" graphic between elements of the names. For example, the buttons will show up with elements shown like so:

![Confluence dashboard with "lightning bolt" graphic](attachment:image)

For the Browse menu, you can find its associated `system.space.menu` key on [http://translations.atlassian.com](http://translations.atlassian.com). When you use this new translation feature, you can see the full context of the user interface elements. By understanding where a feature appears on the interface, for example the Browse menu, you can write a more meaningful translation for your users.

To turn off the translation view, use this:

```
?i18ntranslate=off
```
Other improvements

As always, we have made various small improvements to Confluence.

**General improvements**

- **Favourites have been refined**
  You’ll now see a newly named and cleaner Favourites tab in your personal space. Additionally, the list of favourites is now paginated and you can click the stars to remove favourites.

- **Global plugin & macro timeout setting**
  There is now a globally configurable timeout setting. This will stop pages going into a permanent loading state. In the past, this could lead to instability issues.

- **New JSON RPC**
  Confluence now has a JSON RPC library. This offers a way for Javascript developers to more easily access the Confluence API. For more details, see the documentation.

**Editor improvements**

- **Copy and paste table improvements**
  You can now copy and paste multiple table rows and entire tables. There are also new keyboard shortcuts. You can now use **Alt+Up Arrow** or **Alt+Down Arrow** to add a row above or below the current row.

- **Copy and paste list improvements**
  If you copy and paste list items from one list to another, the list content will now be joined together as expected.

**New icons**

- Based on customer feedback, this version of Confluence has a number of redesigned interface and installer icons. These new designs add more of a contemporary look and feel and are aimed at improving icon consistency and ease of use in Confluence.

General Confluence Icon

Helping you transition to the Confluence 4.x generation

We've created a set of resources to help you manage the transition to Confluence 4.x. The change management resources are listed under the current documentation.

⚠️ Note: The Wiki Markup editor has been removed in Confluence 4.x and replaced with a new XHTML-based editor. Please see Why We Removed the Wiki Markup Editor in Confluence 4.0 for full details

Confluence Quick Reference Guide

Release notices

Upgrading from a previous version of Confluence

We strongly recommend that you back up your Confluence Home directory and your database before upgrading. Follow the normal upgrade instructions to upgrade your test instance to this release.

When upgrading from a previous version of Confluence, if you have customised your cache settings (as documented in Cache Performance Tuning) then you may run into memory problems during the wiki to XHTML
migration. We are working to fix this in a later release, but in the meantime you can revert your ehcache.xml to the default version.

**Removed functionality**

Features removed from Confluence

- **Personal labels**
  
The ability to create personal labels is being removed in Confluence 4.1. You will still be able to access any personal labels you have created previously by going directly to http://<confluence_url>/users/viewmylabels.action

- **Mail archiving**
  
  This feature is being disabled by default in Confluence 4.1. However, it is still bundled as the Confluence Mail Archiving plugin, and easy to restore. Current users of the feature will not suffer any interruption, as the feature will be automatically kept in an operational state if you are using it. [See details](#).

- **The SVG graphics library **Batik**
  
  Any plugins that previously relied on the
  Batik package being provided by Confluence will now have to bundle their own version of Batik into their plugin. [See details](#).

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better!

Confluence 4.1 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.1. For details of the new features and improvements in this release, please read the Confluence 4.1 Release Notes.

On this page:

- Upgrade Notes
  - Confluence Clustered reactivated
  - Personal labels deprecated
  - Legacy Crowd SSO Authenticator removed
  - Reduced functionality for JIRA Portlets macro

- Upgrade Procedure
- Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

Upgrade Notes

Confluence Clustered reactivated
Please be aware that Confluence Clustering is now available again, following a brief hiatus after the release of Confluence 4.0.

**Personal labels deprecated**

The tab that displays personal labels in the user profile has been hidden in Confluence 4.1. We are planning to remove personal labels altogether from Confluence in a future release. The functionality for creating personal labels is still in Confluence, but we recommend that you stop using them. People can still see their existing personal labels by visiting the following URL:

```
CONFLUENCE-URL/users/viewmylabels.action
```

Where CONFLUENCE-URL is the URL of your Confluence site.

For example:  
[https://confluence.atlassian.com/users/viewmylabels.action](https://confluence.atlassian.com/users/viewmylabels.action)

**Legacy Crowd SSO Authenticator removed**

For customers with Crowd SSO authentication who ever used Confluence 3.4.9 or earlier: Customers who were using the `com.atlassian.crowd.integration.seraph.v22.CrowdAuthenticator` in their `seraph-config.xml` must replace this with `com.atlassian.confluence.user.ConfluenceCrowdSSOAuthenticator`. This has been the default Crowd SSO authenticator since Confluence 3.5, so users who installed from scratch with Confluence 3.5 or higher are not affected.

**Reduced functionality for JIRA Portlets macro**

*Upgrade notes updated in March 2012:* In Confluence 4.1, it is no longer possible to add a JIRA Portlet macro via the Confluence macro browser. It is still possible to add the macro using wiki markup or by copying an existing JIRA Portlet macro. The macro still displays information correctly.

**Upgrade Procedure**

⚠️ Upgrade a test environment first

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home Directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.
2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1. There are several reasons for this:
   - There were major changes to user management and LDAP in Confluence 3.5.
   - From version 3.5, you'll be able to use our new automated Installer / Upgrader to move to 4.1. The
Confluence 4.1 Installer does not support upgrading from earlier versions of Confluence than 3.5.x.

- We recommend that any issues arising from the upgrade to version 3.5.x be fixed separately to those that may arise from upgrading to version 4.1. Please contact Atlassian Support for assistance.
- Please read the Upgrade Notes Overview and the Upgrade Notes for each version of Confluence listed on that page. (There are hyperlinks to each one.)

If you are upgrading from 2.1 or earlier, please read the 2.2 Release Notes.
If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade from version 2.7.x to version 3.5.x, before upgrading to the latest version. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

Confluence 4.0.5 Release Notes

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
25 November 2011

The Atlassian Confluence team is pleased to announce the release of Confluence 4.0.5, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

Don’t have Confluence 4.0 yet?

Take a look at the new features and other highlights in the Confluence 4.0 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.0.5 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.0.x.

## Confluence 4.0.5 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.0.5. For details of the fixes in this release, please read the release notes.

### Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   
   Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.0.x.

3. If your version of Confluence is earlier than 4.0, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 4.0 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

4. Download the latest version of Confluence.

5. Follow the instructions in the Upgrade Guide.

## Confluence 4.0.4 Release Notes
08 November 2011

The Atlassian Confluence team is pleased to announce the release of Confluence 4.0.4, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

Don't have Confluence 4.0 yet?

Take a look at the new features and other highlights in the Confluence 4.0 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.0.4 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.0.x.

**Confluence 4.0.4 Upgrade Notes**

Below are some important notes on upgrading to **Confluence 4.0.4**. For details of the fixes in this release,
Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

TIP: Another term for 'Home directory' would be 'data directory'. Read more about [finding your Home directory](https://confluence.atlassian.com/x/fEwA).

2. If your version of Confluence is earlier than 3.5.x, then you *should* upgrade to Confluence 3.5.x before upgrading to Confluence 4.0.x.

3. If your version of Confluence is earlier than 4.0, read the release notes and upgrade guides for all releases between your version and the latest version.

   In particular:
   * Please read the [Confluence 4.0 Upgrade Notes](https://confluence.atlassian.com/x/etpR).
   * Please read the [Confluence 3.5 Upgrade Notes](https://confluence.atlassian.com/x/etpR).
   * If you are upgrading from 2.1 or earlier, please also read the [2.2 release notes](https://confluence.atlassian.com/x/etpR).

4. Download the latest version of Confluence.

5. Follow the instructions in the [Upgrade Guide](https://confluence.atlassian.com/x/etpR).

Confluence 4.0.3 Release Notes

---

**Note:** The Wiki Markup editor has been removed in Confluence 4.x and replaced with a new XHTML-based editor. Please see [Why We Removed the Wiki Markup Editor in Confluence 4.0](https://confluence.atlassian.com/x/etpR) for full details.

---

19 October 2011

The Atlassian Confluence team is pleased to announce the release of Confluence 4.0.3, which is a bug-fix release. 4.0.1 and 4.0.2 were internal releases only.

The complete list of fixes is at the bottom of this page.

**Don't have Confluence 4.0 yet?**

Take a look at the new features and other highlights in the [Confluence 4.0 Release Notes](https://confluence.atlassian.com/x/etpR).

---

**Release Notices**

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the [Confluence 4.0.3 Upgrade Notes](https://confluence.atlassian.com/x/etpR). We *strongly recommend* that you back up your `confluence.home` directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you *should* upgrade to Confluence 3.5.x before upgrading to Confluence 4.0.x.

Confluence 4.0.3 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.0.3. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.0.x.
3. If your version of Confluence is earlier than 4.0, read the release notes and upgrade guides for all releases between your version and the latest version.
   In particular:
   • Please read the Confluence 4.0 Upgrade Notes.
   • Please read the Confluence 3.5 Upgrade Notes.
   • If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.0 Release Notes

Confluence 4.2 has now been released – see the Confluence 4.2 Release Notes.

19 September 2011

With great pleasure, Atlassian presents Confluence 4.0. This is one of the most significant updates to Confluence since its initial release in 2004. With a brand new
WYSIWYG editor and wide-ranging user interface improvements, we're confident that Confluence 4.0 is the most productive and user-friendly version to date.

**Highlights of Confluence 4.0:**

- [Brand New Editor](#)
- [Simplified Editing Experience](#)
- [New Macros](#)
- [Faster Editing Experience](#)
- [Introducing @mentions](#)
- [Improved Page Comparison Functionality](#)
- [Email Notification Improvements](#)
- [New Confluence Installer and Guided Upgrades](#)
- [New Editor Plugin Points for Developers](#)
- [Other Improvements](#)
- [Helping You Transition to Confluence 4.0](#)
- [Release Notices](#)

**More:**

- Read the [Upgrade Notes](#) for important information about this release.
- See the full list of [issues resolved in this release](#).

![Learn more about Confluence 4.0](image)

**Video of What's New:**

**Thank you for your feedback:**

🌟 More than 215 requests implemented
🌟 Over 1050 votes fulfilled

⚠️ **Note:** The Wiki Markup editor has been removed in Confluence 4.x and replaced with a new XHTML-based editor. Please see [Why We Removed the Wiki Markup Editor in Confluence 4.0](#) for full details

**Highlights of Confluence 4.0**

1

**Brand New Editor**

We've rebuilt the Confluence editor from the ground up, bringing you an editing experience that's simpler, faster and richer.
The new Confluence editor delivers many advantages:

- Just one editor!
- New, streamlined user interface.
- Redesigned toolbar with enhanced text formatting (indent paragraphs) and alignment controls.

Simplified Editing Experience

Editing in Confluence 4.0 is more visual and more contextual, putting more power at your fingertips.

Table Editing

We've made table operations better in Confluence 4.0 with the following features:

- **Drag to Insert Tables**
  Inserting tables is now easier and truly "WYSIWYG" with this new feature. Just click on the new Table dropdown and drag your mouse to choose the number of rows and columns you'd like in your new table. Oh, and don't worry if you like inserting tables with your keyboard, you can still use autoformatting or CTRL+SHIFT+I to insert a table.

- **New In-Context Table Toolbar**
  The new table toolbar removes the need for a context menu and only appears when you add a table to the page.

- **Merge and Split Table Cells.**
- **Highlight cells, rows or columns.**
• Cut, copy and paste table rows.

**Improved Image Handling**

• **Paste Images From Clipboard (Firefox and Chrome only)**
  Just copy any image to your clipboard and hit CTRL+V in the editor. The image will get attached and embedded directly into your page. There’s nothing to install on your desktop, it just works!

• **Turn Images Into Links**
  Now you can turn images into links. This is especially handy for turning images into a button.

• **Custom Image Sizes**
  If you don’t like the preset image sizes, you can now specify an exact image width.

• **Search Images**
  You can now embed images from other pages using the new Search tab in the image browser.
**Simplified Macro Editing**

Confluence 4.0 introduces macro placeholders, a visual representation of your macros while editing. Create rich content with new and existing macros, without the tools getting in the way. Makes macros easier to manage while editing.

- **A More Visual Experience**
  Making it easier to visualise what the page will look like when you save it.

- **Macro Properties Panel**
  Every macro has a properties panel. The property panels for particular macros, such as the Status and View PowerPoint macros have additional functionality, as shown in the screenshot below.

- **Quick Access to Macro Editing**
  Double-click the macro to open the Macro Browser for parameter editing. The contents of some macros can be modified directly from the editor.
New Macros

We've bundled more macros with Confluence, and made some of the existing macros better, to help you easily include and present relevant content:

- **Status Macro**
  The Status macro is an easy way to show your status in reports (i.e. red, yellow or green) as a coloured lozenge. You can use the properties panel to quickly change the status.

- **Expand Macro**
  The Expand macro allows you to add a dynamically expandable section of text to your page.
Profile Picture Macro
The Profile Picture macro displays a user's profile picture on a page. Useful for creating Team Pages.

Faster Editing Experience

*Write Wiki Markup ... Fast!*

Many of Confluence’s biggest fans are avid wiki markup users. For you aficionados, we wanted to give you the fastest editing experience possible, while preserving the speed and efficiency of your existing wiki markup skills. So, we present you with Autoformatting!

*Video of Autoformatting in Action:*

What is Autoformatting?

Autoformatting lets you type wiki markup into the editor. This new feature will "auto-format" your text on the fly. To learn more, click on the help button in the editor and select the Editor Autoformatting tab.

Try these and see what you think:

- **Font Formatting**
  Bold, underline, strikethrough, italic, superscript, subscript – just type the markup, such as *Bold*, and watch it convert to **Bold** on the fly!

- **Basic Tables**
  Try typing |||||, or || **Heading 1** || **Heading 2** ||, then hit enter to instantly see this:
Emoticons
All of our emoticons convert on the fly. Try typing :-) into the editor to instantly see this: 😊. It even works for (()), showing this: ☛.

Lists
For numbered lists, type # and a space at the start of each line.
For bulleted lists, type * and a space at the start of each line.

Headings
Type h4. then some heading text to see a level 4 heading.

New Page Links
Quickly insert a link to create a page with Autocomplete for links. Simply type '[' in the editor and as you type, Confluence will display a Create Page link if a page with that title does not already exist in your current space.

Introduced in a previous release of Confluence (see details in this blog post), adding links, media and macros can still be quickly added by typing [, ! or { in the editor to add various kinds of content to your page.

Introducing @mentions
Confluence 4.0 includes the new @mentions feature. This allows you to easily bring collaborators into a conversation: if you are mentioned in any Confluence content (a page, blog post or comment) you will be notified by email.

To mention someone, type @ and their name, when editing. Mentions will instantly suggest people you are following in your network, so you can quickly find and involve your friends.
Improved Page Comparison Functionality

We've got a better way to view changed content in Confluence.

Improved Page Diffs

We've simplified page diffs to make them easier to read. Now, page differences appear exactly as they do in Confluence. Images, text and tables are displayed as rendered. Additionally, page diffs now show changes to both formatting and macros.
Where possible, email notifications are now rendered in your email view with the correct diff colour coding.

Email Notification Improvements

New Email Design

All email notifications in Confluence now have a new design. This works in major email clients as well as on the iPhone.
Follow Notifications

Confluence now sends email when someone follows you.

New Confluence Installer and Guided Upgrades

Much to the delight of any sysadmins that are looking after Confluence, the Windows and Linux guided installer are now available.

Guided Upgrades

The new Linux and Windows Installers include an option that allows you to upgrade an existing Confluence 3.5 (or later) installation. This upgrade automates the following tasks for you:

1. Backs up the Installation and Home Directories of the existing Confluence installation.
2. Installs **Confluence 4.0.x** whilst migrating the following from your existing Confluence installation:
   - TCP port values in your existing Confluence installation's server.xml file,
   - The upgrade feature detects and notifies you of any other files in the Confluence subdirectory of your existing Confluence Installation Directory, which have been deleted, added or modified from the default. This informs you of any customisations you will need to manually migrate across to your upgraded Confluence installation directory.

**Simplified Installation Process**

- **Guided installer:** The guided install wizard has been implemented for Confluence 4.0 on both Windows and Linux operating systems. Installing a new instance is a breeze.
- **Easy JIRA Integration:** Hook Confluence up with JIRA, right within the Confluence setup wizard.

**New Editor Plugin Points for Developers**

We've added more editor plugin points for developers. Notable improvements include:

**Editor Plugin Points**

- **Extend the Macro Property Panel**
  Plugin developers can add buttons to the Macro Property Panel in the editor. For example, insert a Gliffy diagram or see the tutorial on how to do this.

- **Render an Image in the Macro Placeholder**
  A plugin developer can now render an image instead of a placeholder for bodyless macros. For more information, check out the tutorial on how to do this.

- **Custom Parameter Rendering in Placeholders**
  You can choose to display any parameter in the macro placeholder in the editor, instead of having the placeholder automatically show the first few parameters.

- **New Pluggable More Menu**
  Plugin developers can add items to the editor's More menu. See this tutorial for details.

**Developer Resources**

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
• **View Storage Format**  
  To assist with plugin developers and help with developer issues, developers running in Dev mode and Confluence administrators can view the page storage format from the Tools menu in Confluence.

• **New API Changes**  
  We have disabled the `getPage()` and `getBlogEntry()` read methods in the XML-RPC/SOAP API. If you have a script that primarily reads or appends to existing pages, it will break. Creating pages and overwriting existing pages will still work.

• **Plugin Developer Documentation**  
  We have created a landing page for Confluence 4.0 planning. This includes resources for plugin developers to help you create new plugins, and make use of the new plugin points, as well as upgrade your existing plugins.

**Infrastructure Changes**

This release includes a number of improvements in the APIs and under the covers as well.

• **Anti-XSS Mode**  
  This is now enabled by default for plugins.

• **Alignment and Border Parameters**  
  The `alignment` and `border` properties in the macro definition template have been removed.

• **Thumbnail Settings**  
  The `Thumbnail maximum height` and `Thumbnail maximum width` settings have been removed from the General Configuration page.

• **Link Browser**  
  The Link browser is no longer built in GWT and is now built in core JavaScript.

• **Integration Platform 2.12.0**

• **Upgrade to AUI 3.5.0**

10

**Other Improvements**

As always, we have made various small improvements to Confluence screens, functionality and supported platforms.

• **Chrome and Internet Explorer 9 Support**  
  See the [upgrade notes](#) for more information about browser support.

• **Administrator's task list in the Admin Console**  
  This new task list in the Admin Console helps administrators get started after a new install.

• **New keyboard shortcut:**  
  `CTRL+SHIFT+E` to preview when you are in the editor; hit 'E' to get back to the editor.

• **Administration UI**  
  Help tips have been added to the field descriptions.

• **Quicknav Improvements**  
  Quicknav now indicates the space the page is coming from. This helps you find a page that might have the same title across multiple spaces, as well as selecting the first search result by default, making it quicker to open the link.

• **Advanced Linking**  
  We've updated the Link dialog to cater for these link types: shortcut links, anchor Links, and undefined links (which you can do using Autocomplete).
Helping You Transition to Confluence 4.0

We've created a set of resources to help you manage the transition away from wiki markup. We know your people have become experts with using wiki markup in Confluence, but we think you'll really appreciate the new editor, and we want to make it as easy as possible for you to make the change. The change management resources are listed under the current documentation.

Release Notices

Upgrading from a previous version of Confluence

⚠️ You can only upgrade to Confluence 4.0 from Confluence 3.5. From version 3.5, you'll be able to use our new automated upgrader to move to 4.0. See the Confluence 4.0 Upgrade Notes.

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.

When upgrading from a previous version of Confluence, if you have customised your cache settings (as documented in Cache Performance Tuning) then you may run into memory problems during the wiki to XHTML migration. We are working to fix this in a later release, but in the meantime you can revert your ehcache.xml to the default version.

- If you still experience problems, try reducing the 'maxElementsInMemory' attribute on each cache to a very small value such as 50.
- Note that any cache changes you make to work around migration problems should only be considered temporary. You should restore caching to its original settings again after migration has been successful.

Removed Functionality

Features removed from Confluence

- The Edit Page in Word functionality
  This is being removed in Confluence 4.0. Note: This is a different feature to "Edit attachment in Word".

- Mail Page Plugin
  The Mail Page plugin is no longer bundled in Confluence. With the introduction of the “Share Page” feature in 3.5 this is no longer needed.

- Social Bookmarking Plugin
  The Social Bookmarking plugin is no longer bundled in Confluence but is still supported.

- The SnipSnap importer has been removed from the admin console.
- Please be aware that Confluence Clustered is not available for version 4.0 yet. It will be forthcoming in a minor release, following the launch of version 4.0.

Settings removed from Confluence

These settings were removed due to low recorded usage and the ongoing goal of simplifying Confluence.

- The CamelCase Links setting, from general configuration.
- The Number of Ancestors to Show in Breadcrumbs setting.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better!

Confluence 4.0 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.0. For details of the new features and improvements in this release, please read the Confluence 4.0 Release Notes.

On this page:

- Upgrade Notes
  - Content updates after upgrade
  - User macros migration
  - Email notifications
  - Plugins may not be compatible with Confluence 4.0
  - Functionality removed: converting a Global Space to a Personal Space
  - Functionality removed: editing a Confluence page in an Office application
  - Functionality removed: linking to comments using commentid
  - Functionality removed: Mail Page plugin
  - Functionality removed: Social Bookmarking plugin
  - Drag-and-drop in Internet Explorer 9
  - Various admin settings removed
  - Confluence Clustered delayed

- Upgrade Procedure
- Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

Upgrade Notes

Content updates after upgrade

You will notice once you upgrade to Confluence 4.0, every page will have been edited during the migration process. This manifests itself in the appearance of changes to every page's content by various different users. When migrating pages, Confluence will show the same username that last contributed to your content as the author of the change. This is the upgrade task of migrating your wiki page storage format to XHTML from Wiki Markup. Do not be alarmed by this. This will only happen once for all current versions of content. This will not
In Confluence 4.0, rarely used admin settings have been taken out. These are as follows:

- The **Set Site Support Address** setting,
- The **CamelCase Links** general configuration setting,
- The **Functionality removed: converting a Global Space to a Personal Space**

Confluence 4.0 does not offer the ability to convert a global space to a personal space. Our research has shown that this feature is not used much. We have decided to remove it as part of our ongoing mission to simplify Confluence where possible. We deprecated this functionality in the Confluence 3.5 Upgrade Notes.

- The **Functionality removed: editing a Confluence page in an Office application**

After extensive usability testing, we are confident the new Confluence 4.0 editor will be easier to learn and more reliable to use than the previous editor. Therefore this feature is no longer required. Other functions of the Office Connector (e.g. “Edit Attachments in Office”) remain.

- The **Functionality removed: linking to comments using commentid**

Confluence 4.0 does not allow linking to comments by comment ID. Users will now have to use the permalink URL to link to comments. This will primarily affect plugin developers.

- The **Functionality removed: Mail Page plugin**

The Mail Page plugin is no longer bundled in Confluence. With the introduction of the “Share Page” feature, this is no longer needed.

- The **Functionality removed: Social Bookmarking plugin**

The Social Bookmarking plugin is no longer bundled with Confluence as of the 4.0 release. Our research has shown that this feature is not used much. If you are currently using this plugin, you will need to reinstall it from plugins.atlassian.com. Atlassian continues to fully support this plugin.

- The **Drag-and-drop in Internet Explorer 9**

Internet Explorer 9 does not support the drag-and-drop functionality of HTML5. This means that when using IE9, you will not be able to use the attachments drag-and-drop feature in Confluence 4.0.

- Various admin settings removed

In Confluence 4.0, rarely used admin settings have been taken out. These are as follows:

- The **Set Site Support Address** setting,
- The **CamelCase Links** general configuration setting,
1. The **Number of Ancestors to Show in Breadcrumbs** setting.
2. The **SnipSnap Importer** settings.

**Confluence Clustered delayed**

Please be aware that **Confluence Clustered** is not available for version 4.0 yet. It will be forthcoming in a minor release, following the launch of version 4.0.

**Upgrade Procedure**

⚠️ **Upgrade a test environment first**

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your **Confluence Home Directory** and database. See the documentation on [backing up your Confluence site](https://confluence.atlassian.com/administering-backing-up-your-site-18168). If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 3.5.x, then you **should** upgrade to Confluence 3.5.x before upgrading to Confluence 4.0. There are several reasons for this:
   - There were major changes to user management and LDAP in Confluence 3.5.
   - From version 3.5, you’ll be able to use our new automated Installer / Upgrader to move to 4.0. The Confluence 4.0 Installer does not support upgrading from earlier versions of Confluence than 3.5.x.
   - We recommend that any issues arising from the upgrade to version 3.5.x be fixed separately to those that may arise from upgrading to version 4.0. Please contact [Atlassian Support](https://support.atlassian.com) for assistance.
   - Please read the [Upgrade Notes Overview](https://confluence.atlassian.com/upgrade-notes-overview-18170) and the Upgrade Notes for each version of Confluence listed on that page. (There are hyperlinks to each one.)

   If you are upgrading from 2.1 or earlier, please read the [2.2 Release Notes](https://confluence.atlassian.com/2.2-release-notes-22725).  
   If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade from version 2.7.x to version 3.5.x, before upgrading to the latest version. For more details, please refer to [CONF-11767](https://issues.atlassian.com/browse/CONF-11767).

3. [Download](https://confluence.atlassian.com/download) the latest version of Confluence.
4. Follow the instructions in the [Upgrade Guide](https://confluence.atlassian.com/).  

**Checking for Other Known Issues and Troubleshooting the Confluence Upgrade**

After you have completed the steps required to upgrade your Confluence installation, check all the items on the [Confluence post-upgrade checklist](https://confluence.atlassian.com/post-upgrade-checklist-18169) to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the [Knowledge Base](https://confluence.atlassian.com/knowledge-base-18171) and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to [troubleshooting upgrades](https://confluence.atlassian.com/troubleshooting-upgrades-18172) in the Confluence Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a [support ticket](https://support.atlassian.com/) and one of our support engineers will help you.

Confluence 3.5.13 Release Notes

6 September 2011

The Atlassian Confluence team is pleased to announce the release of Confluence 3.5.13, which is a bug-fix release.

Internal directories with LDAP authentication (“delegated LDAP authentication”) can now update a user’s membership information when they log in, in addition to the user’s information. This is now our recommended configuration for connecting Confluence to LDAP servers with very large numbers of users, groups or memberships.

Note that Confluence 3.5.12 was not publicly released. Issues marked in JIRA as fixed in 3.5.12 are available for the first time in this release.

The complete list of fixes is at the bottom of this page.

Don’t have Confluence 3.5 yet?

Take a look at the new features and other highlights in the Confluence 3.5 Release Notes.

If you are upgrading from Confluence 3.5.2 and using Microsoft SQL server, please refer to this workaround to prevent errors in the upgrade progress.

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.5.13 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.5.13 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.5.13. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   
   Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Older Releases
Confluence 3.x.x Releases

Confluence 3.0.1 Release Notes

20 August 2009

Confluence 3.0.1 is a recommended upgrade which fixes some security flaws and other issues.

Please refer to the security advisory for details of the security vulnerabilities, risk assessments and mitigation strategies.

⚠️ Critical issue affecting non-clustered implementations of Confluence 3.0.1

Non-clustered (i.e. you do not have a clustered license) implementations of Confluence 3.0.1 are affected by an issue that can cause Confluence to crash. Please read the Confluence 3.0.1 Upgrade Notes for details on the issue and instructions on how to address it.
Attachment Handling Fixes

When a hierarchy of pages was moved from one space to another, the attachments on child or descendent pages of the parent page were not correctly moved. Instead, users would have to move one page at a time between spaces in order to maintain page attachment integrity. This issue has now been resolved.

Sporadic issues associated with attachment migration occurred when upgrading from either Confluence 2.9.x or 2.10.x, to 3.0. These have now been fixed.

Macro Fixes

A bug was identified in which excerpted content would not be rendered in a blog post macro until the source page containing that content had first been viewed. This phenomenon could occur when excerpt include macros were used in a blog post. It could also occur when excerpt macros were used in a blog post in conjunction with the content=excerpts blog post macro parameter. This problem has now been fixed.

An issue was found with the tasklist macro whereby special characters used in its title were not correctly escaped. This has now been resolved.

Rich Text Editor Fixes

An issue was found in which the Rich Text Editor's link removal feature (available from the right-click context menu) did not work with external links. This has now been resolved.

In the Firefox web browser, the spell checker is now automatically enabled by default in the Rich Text Editor. Users no longer have to first disable the right-click context menu and then enable and select 'Check Spelling' from the Firefox's own right-click context menu.

An issue was identified, which prevented the ability to escape from the quote text effect once it had been selected. This has now been addressed, such that a paragraph is automatically added after selecting this text effect.

Other Enhancements and Fixes

When a Confluence administrator first installs Confluence, runs through the Confluence Setup Wizard and then reaches the database configuration step, the database password is now hidden and is no longer shown in clear text.

It is now possible to filter network RSS feeds by different content types. This is achieved by implementing parameter modifications to the RSS feed link in your RSS newsreader. For more information, please refer to Subscribing to a Network RSS Feed.

Some customers experienced problems importing their site backup from a previous version of Confluence into version 3.0. This has now been resolved in Confluence 3.0.1.

An issue was identified in which multiple blog posts posted on a single day would be listed out of chronological order. This has now been fixed and multiple blog posts posted on a single day are now ordered according to their time of creation.

A problem was identified when accessing Confluence content in Internet Explorer that caused file downloads to fail over an SSL connection. This problem has now been fixed in this release of Confluence.

An issue was found in the page tree views on instances of Confluence running on Weblogic 10.x. This has now been resolved.

There's a complete list of fixes below. Click a specific issue to see details of the fix.

Don't have Confluence 3.0 yet?
Take a look at the new features and other highlights in the Confluence 3.0 Release Notes.

**Upgrading from a Previous Version of Confluence**

Upgrading Confluence should be fairly straightforward. Please read the Confluence 3.0.1 Upgrade Notes. We strongly recommend that you back up your `confluence.home` directory and database before upgrading.

## Upgrade Notes

### ClusterManager for Non-Clustered Licenses causes Critical Errors

If you have customised the cache settings in your installation of Confluence (e.g. for performance reasons), then please read ALL information on this page before upgrading to Confluence 3.0.1 or to a 'standard edition' of Confluence. This page also contains important information for customers who are upgrading their installation of Confluence to version 2.6 or later from September 2009.

### Confluence 3.0.1 Upgrade Notes

Below are some important notes on upgrading to **Confluence 3.0.1**. Confluence 3.0.1 is a recommended upgrade which fixes some security flaws as well as other bugs. For more details, please read the [Confluence 3.0.1 Release Notes](http://jira.atlassian.com/).

### On this page:

- Upgrade Notes
  - ClusterManager for Non-Clustered Licenses causes Critical Errors

</tbody>
</table>

Click [here](http://jira.atlassian.com) to open a report on [http://jira.atlassian.com](http://jira.atlassian.com) for Resolved or Closed issues in Confluence 3.0.1.
The ClusterManager in the non-clustered (i.e. you do not have a clustered license) implementations of Confluence 3.0.1 and Confluence 3.0.2 does not perform any locking (e.g. for job synchronisation). As a result, your Confluence instance may crash due to certain jobs being executed concurrently when they shouldn't be.

We strongly recommend that you upgrade to Confluence 3.1 or later to avoid this issue, if possible. If you wish to install or upgrade to a non-clustered implementation of Confluence 3.0.1 or 3.0.2, you must apply the patch attached to CONF-17136 after upgrading.

**Introduction of 'Standard' and 'Clustered' editions**

- **Oracle Coherence Licensing Change:**
  - Due to a license agreement change between Atlassian and Oracle over the Coherence technology, from September 2009, Confluence will be made available in two editions:
    - **Standard Edition** — Confluence with Ehcache's caching technology (available to customers with non-clustered Confluence licenses).
    - **Clustered Edition** — Confluence with Oracle’s Coherence clustering and distributed caching technology (available to customers with Confluence clustered licenses only).
  - If you are currently running a clustered installation of Confluence, please do not upgrade it with a standard edition of Confluence.
  - For more information, please refer to the Coherence License Changes document.
  - In standard editions of Confluence, Ehcache replaces the local caching functionality previously provided by the Coherence technology.

Confluence 3.0.1 is the first Confluence version to be released in two editions 'standard' and 'clustered'.

Also, from September 2009:

- Standard editions will be released for each previous major version of Confluence back to 2.6. These will be:
  - Available as Confluence versions 2.10.4, 2.9.3, 2.8.3, 2.7.4 and 2.6.3.
  - Available to customers with non-clustered Confluence licenses.
  - The remaining previous versions of Confluence currently available from our download page (from 2.6 to 3.0 inclusively), will be re-released as clustered editions and will only be available to customers with Confluence clustered licenses.
  - The installation files for all versions of Confluence prior to 2.6 (which are no longer supported) will be removed from the Atlassian web site and will no longer be available for download and installation.

**Confluence Caching Layer Changes**

Due to the caching layer changes in the 'standard editions' of Confluence, you will need to reapply any cache customisations made to your cache sizes and/or cache configuration file, if all three of the following points are applicable:

- You have implemented cache customisations to your Confluence installation's cache sizes (either via the Administration Console or cache configuration file).
- You have an existing installation of Confluence 3.0 or earlier (excluding the 'standard edition' versions) and will be upgrading to Confluence 3.0.1 or later (or one of the earlier standard editions).
- Your Confluence installation is using a non-clustered Confluence license.

If you customised your Confluence instance's cache settings via the Administration Console, please
refer to the [Reapplying Cache Size Modifications via the Administration Console](#) section below.

If you customised your Confluence instance’s cache settings by modifying the cache configuration file, please refer to the [Reapplying Cache Configuration File Modifications](#) section below.

## Reapplying Cache Size Modifications via the Administration Console

To reapply your cache size modifications via the administration console:

1. Before you upgrade, use the procedure described on the [Cache Statistics](#) page to open the 'Cache Statistics' section of the Administration Console in the 'Advanced' view.

2. Print out this view or save a copy of the web page for later reference. (This contains your existing individual cache settings.)

3. After upgrading Confluence, view the 'Cache Statistics' section of your upgraded Confluence installation in the 'Advanced' view.

4. Use the same procedure describe on the [Cache Statistics](#) page to re-adjust the size of each cache based on the previous settings that you had printed out (or saved).

## Reapplying Cache Configuration File Modifications

To maintain your existing cache configuration file settings, you will need to transfer any cache customisations you have implemented in the Coherence cache configuration file (`confluence-coherence-cache-config.xml`) to the relevant entries in the Ehcache cache configuration file (`ehcache.xml`).

Each cache has a cache-mapping element in the Coherence file (of which there is an equivalent cache element in the `ehcache.xml` file). Unfortunately, copying across your customisations is not quite a straightforward process because the Coherence file defines several 'caching schemes' to store the actual cache values, which in turn are referenced by the cache-mapping elements. In contrast, the `ehcache.xml` file does not support caching schemes and a cache's values are expressed explicitly in separate parameters of a cache element.

To convert your Coherence cache configuration file customisations across to the equivalent Ehcache file:

1. Open both the `confluence-coherence-cache-config.xml` and `ehcache.xml` files in a text editor. These files are located in the `<confluence-home>/config` directory.

   - **Tip** If you implemented your customisations in a version of Confluence prior to 3.0, you will most likely find the `confluence-coherence-cache-config.xml` file in the `<confluence-install>/WEB-INF/classes` directory.

2. In the customised `confluence-coherence-cache-config.xml` file:

   a. Identify the caching schemes that were customised in this file and make a note of the values of all its child elements.

   - **Tip** Typically, each caching scheme is located inside a `local-scheme` element and all of these are enclosed within the `cache-schemes` element, which appears towards the end of this file.

   b. Note each customised caching scheme by the content of its `scheme-name` element.

   c. For each cache-mapping element (which typically appears towards the top of this file), identify if...
it has a `scheme-name` element whose content matches one noted in the previous step and if so, make a note of its associated `cache-name` element.

3. In the `ehcache.xml` file:

   a. Identify each `cache` element whose `name` parameter matches the `cache-name` elements noted in step '2c'.
   b. Using the mappings table below, apply the values noted in step '2a' to the appropriate parameters of the `cache` elements identified in the previous step ('3a').

Mappings table showing how elements of the Coherence cache configuration file map to parameters of the equivalent Ehcache file.

<table>

</tr>
</tbody>
</table>

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your confluence.home directory and database**.

2. If your version of Confluence is earlier than 3.0.1, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 3.0.1 release notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. **Download** the latest version of Confluence.

4. Follow the instructions in the **Upgrade Guide**.

Useful Plugins

**Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.**

- Appfire's **Upgrade Assistant for Confluence (UAC)** is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

**Confluence 3.0.2 Release Notes**

6 October 2009

Confluence 3.0.2 is a recommended upgrade which fixes some security flaws and other issues.
Please refer to the [security advisory](#) for details of the security vulnerabilities, risk assessments and mitigation strategies.

**Critical issue affecting non-clustered implementations of Confluence 3.0.2**

Non-clustered (i.e. you do not have a clustered license) implementations of Confluence 3.0.2 are affected by an issue that can cause Confluence to crash. Please read the [Confluence 3.0.2 Upgrade Notes](#) for details on the issue and instructions on how to address it.

**Editing and Visual Improvements**

A bug in the Rich Text Editor lead to the generation of line break and other character formatting problems after saving a page. This bug has been fixed.

The sizes of some headings were considered too similar to be visually distinguishable on a page, especially when the headings were separated by intervening text content. This was particularly the case for heading sizes 2 and 3. Hence, the sizes of headings were modified to make them visually more distinct.

The format of colours used in Confluence's user profile areas has been modified slightly to make headings more prominent and form labels clearer.

The blog posts macro was missing the 'Restrict to These Authors' (author) parameter from the macro browser. However, this parameter is now available in the macro browser.

**Other Enhancements and Fixes**

Some customers' users experienced long delays while logging into Confluence, especially when their user accounts belonged to groups containing a large number of other user accounts. This issue was fixed.

Customers were able to generate Confluence page PDF exports directly from external web sites by adding the 'Export to PDF' link (accessible via a Confluence page's 'Tools' menu) to their external web pages. Unfortunately, this function was broken by the introduction of the form token handling security enhancement feature introduced in Confluence 3.0. In Confluence 3.0.2, however, this issue was resolved.

Some customers experienced an issue in which automatic content indexing would stop. This problem has been resolved.

When browsing Active Directory groups in Confluence, it was not possible to view group members if the LDAP Distinguished Names (DN) did not include the username. This bug was fixed.

There's a complete list of fixes below. Click a specific issue to see details of the fix.

**Don’t have Confluence 3.0 yet?**

Take a look at the new features and other highlights in the [Confluence 3.0 Release Notes](#).

**Upgrading from a Previous Version of Confluence**

Upgrading Confluence should be fairly straightforward. Please read the [Confluence 3.0.2 Upgrade Notes](#). We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.0.2 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.0.2. Confluence 3.0.2 is a recommended upgrade which fixes some security flaws as well as other bugs. For more details, please read the Confluence 3.0.2 Release Notes.

On this page:

- Upgrade Notes
  - ClusterManager for Non-Clustered Licenses causes Critical Errors
  - New License Key Requirements for Confluence 3.1
  - Upgrading an Existing Confluence License for Confluence 3.1 Compatibility

- Upgrade Procedure
- Useful Plugins

Upgrade Notes

ClusterManager for Non-Clustered Licenses causes Critical Errors

The ClusterManager in the non-clustered (i.e. you do not have a clustered license) implementations of Confluence 3.0.1 and Confluence 3.0.2 does not perform any locking (e.g. for job synchronisation). As a result, your Confluence instance may crash due to certain jobs being executed concurrently when they shouldn’t be.

We strongly recommend that you upgrade to Confluence 3.1 or later to avoid this issue, if possible. If you wish to install or upgrade to a non-clustered implementation of Confluence 3.0.1 or 3.0.2, you must apply the patch attached to CONF-17136 after upgrading.

New License Key Requirements for Confluence 3.1

The next major release of Confluence (version 3.1) will require Confluence administrators to upgrade (or have upgraded) their Confluence license to Atlassian's new license key format. We are undertaking this change to enhance and improve the support we provide our customers. Bear in mind that this license upgrade will not incur any additional costs and does not change Confluence's functionality in any way.

Confluence 3.0.2 will still operate as usual under your existing Confluence license. However, any customers running Confluence 3.0.0 or later will be able to upgrade their Confluence license to the new license key format before Confluence 3.1 is released. Customers whose licenses expire before Confluence 3.1 is released will be required to upgrade their license to the new license key format.

As a consequence of these imminent licensing changes, relevant pages of the Administration Console area in Confluence 3.0.2 contain warnings about Atlassian's new license key requirement, which will be mandatory in Confluence 3.1. Links to upgrade old licenses to the new license key format are provided in these warnings.

Upgrading an Existing Confluence License for Confluence
3.1 Compatibility

If you have just upgraded to Confluence 3.1:

Please refer to the License Upgrade procedure for Confluence 3.1 in the Confluence 3.1 Upgrade Notes instead.

The following procedure can only be performed by Confluence Administrators, on Confluence versions 3.0.0 or later.

To upgrade your existing license to the new license key format, which will be required for continued use of Confluence 3.1:

1. Visit the license upgrade area in your account at my.atlassian.com.

   If you are using Confluence 3.0.2, you can also access this site by visiting the opening page of the Administration Console (by selecting 'Browse' -> 'Confluence Admin' menu item) or the License Details page of your Confluence installation and clicking on the 'Upgrade this license key now' link.

   If you are already using an upgraded Confluence license, this link will not appear on these pages.

2. Enter your Atlassian account details (email address and password) to access and manage your Atlassian product licenses.

3. Select the appropriate Confluence license to expand its details.

4. In the 'info' note below your license on the right-hand side of the page, click the 'update your license key' link (as shown in screenshot 1 below). Once this is done, the note changes to that shown in screenshot 2 below.

   If the 'info' note looks like the one in screenshot 2, then your license key has been upgraded and you should not need to take any further action.

   

   Screenshot 1: License Key Update Function

   If you are using Confluence 3 or above, you will need to update your license key.

   Screenshot 2: Updated License Key Note

   This license key is compatible with Confluence 3 or above. If you are using an older version of Confluence, you can downgrade your license key.

5. Copy the new license from the text box above this message to your clipboard.

6. Visit the License Details page in your Confluence installation and paste the new license from your clipboard into the 'License' field.

7. Click the 'Save' button. You will notice two changes:

   - If you are using Confluence version 3.0.2, the links to upgrade your license on the License Details and Administration Console opening pages will vanish.
A ‘Support Entitlement Number’ (SEN) will be assigned to your license on the License Details page.

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your confluence.home directory and database**.

2. If your version of Confluence is earlier than 3.0.2, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 3.0.2 release notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. **Download** the latest version of Confluence.

4. Follow the instructions in the **Upgrade Guide**.

**Useful Plugins**

**Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.**

- Appfire's **Upgrade Assistant for Confluence (UAC)** is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

**Confluence 3.0 Release Notes**

⚠️ Confluence 3.0 fixes some security flaws. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

**1 June 2009**

**With great pleasure, Atlassian presents Confluence 3.0.**

Confluence 3.0 is a major release which presents a number of new features and enhancements. With Confluence 3.0, we introduce the new **Macro Browser** feature, which provides a simple, point-and-click interface for discovering and inserting any of Confluence’s 80+ bundled macros into a page. **Macros** greatly enhance the functionality of Confluence pages by allowing users to add tools like task lists, RSS feeds and multi-media content. The macro browser makes it easy to select the macro you need and preview its output with your chosen settings before finally adding it to your page. It also makes it easy to edit and modify the parameters of existing macros on a page.

Confluence 3.0 also provides a range of social features that allow you to discover and connect with other users in your Confluence site. **User Profiles** have been redesigned with a more intuitive layout and provide additional fields for users to share information about themselves like their IM handle or personal website. The new **Network** feature lets you follow other users inside your Confluence site and view an aggregated stream of all the activity such as page edits, blogs posts and status updates they undertake. The new **Hover Profile** feature displays a user's summary profile information whenever you hover your mouse pointer over their name anywhere in Confluence. Hover profiles provide easy access to the user's email address and profile details and allow you to add them to your network. Finally, you can let others know what you are working on, share a link or simply...
broadcast a short message to your team by setting your **User Status**. Once your current status message has been updated, it will appear in various activity streams, your profile views and your profile sidebar.

The new **PDF Export** feature addresses one of the most highly voted requests for Confluence. You have full control over your PDF exports using Cascading Style Sheet (CSS) modifications. You also have the ability to customise page and margin sizes, add a title page or table of contents list to your exported document, add customisable headers and footers and easily select a subsection of documentation for export.

The **Rich Text Editor** now includes a **right-click context menu** that makes it easier to insert links, images, macros and tables into your Confluence page. It is now also possible to copy/cut and paste rows within tables.

Confluence’s **performance** has been substantially improved, with dramatic improvements in response times. Furthermore, **scalability** has been enhanced, with significantly improved CPU utilisation compared to previous Confluence versions.

**Highlights of this Release:**

- Introducing the Macro Browser
- Enhanced User Profiles
- Introducing Your Network
- New User Status
- New Hover Profile Feature
- Customisable Enhanced PDF Exports
- Improved Rich Text Editor
- Performance Improvements
- Engine Room and Developer Community
- Administration Improvements
- More than 240 Fixes and Improvements

**Responding to your Feedback:**

🌟 680+ votes satisfied

**Upgrading from a previous version of Confluence**

- Upgrading Confluence should be fairly straightforward. **We strongly recommend that you back up your Confluence Home directory and your database before upgrading.**
- Please refer to the **Confluence 3.0 Upgrade Notes** for further essential information about plug-ins and other factors affecting your upgrade.

**Highlights of Confluence 3.0**

1

**Introducing the Macro Browser**

Now you can choose from Confluence's plugin-based macros and implement them with ease, from a single point.

- Using the macro browser’s fast filtering capabilities, you can quickly find any bundled **macro**, including...
additional plugin-based macros installed on your Confluence system.

- Select your macro and modify and preview its parameters before adding it to your Confluence page or blog post.
- Take a look at our documentation for more details on the new macro browser feature.

Enhanced User Profiles

Confluence’s enhanced user profiles area has been augmented to incorporate Confluence 3.0’s new community-based features and to improve the overall user experience.

- User profiles now allow users to enter ‘structured’ information about themselves, which can be used by Confluence’s community-based features.
- Each user’s profile view shows a list of their own recent activities, such as page or blog post updates, changes to their profile information and status updates (described below).
- A summary of each user's profile information is displayed in a ‘profile sidebar’ on the right-hand side of pages within their personal space and their blog posts too. The profile sidebar appears on pages based on the default Confluence theme.
- Take a look at our documentation for more details on the enhanced user profiles feature.

The new user profile view
The new profile sidebar which appears on your blog posts or pages within your personal space.
Introducing Your Network

The new network feature helps you keep track of what other users are doing throughout your Confluence site, by allowing you to ‘follow’ their recent activities.

- The activities tracked by the network feature include:
  

Additions or edits to pages or blog posts, including comments of users you are following.
Updates to statuses or profile details of users you are following.
From the network view, you can set up an RSS feed which provides notifications on the activities of users you are following.
Take a look at our documentation for more details on the network feature.

New User Status

User status allows you to broadcast a short message of up to 140 characters rapidly for others to see.

- Your messages could include anything from what you are currently working on to a message or a hyperlink you want to share immediately with other users.
- Other users can see your status messages on various activity streams throughout Confluence and on your profile views and personal space pages.
- Take a look at our documentation for more details on the new user status feature and your status updates page.

What are you working on?

Touching up the Community-based features.

Update  Cancel
New Hover Profile Feature

Hover profile is a convenient tool that provides quick access to key information about other Confluence users, their user profile features and their network functions. Whenever you hover your mouse pointer over a Confluence user's name, key details about them appears in a popup balloon, such as their name, profile picture, email address and their current status.

- From a user's hover profile popup balloon, you can access the following functions:
  - Follow the user to track their recent activities via your network (or stop following them).
  - Directly send the user an email message via your email client.
- You can also access the following features of their user profile via their hover profile popup:
  - The user's personal space.
  - The user's profile, network or status updates views.

Customisable Enhanced PDF Exports

The enhanced PDF export feature in Confluence 3.0 has been rebuilt from the ground up and provides full customisation of your PDF exports with CSS modifications, to suit your particular requirements.

- Key enhancements to PDF export customisations include the ability to:
  - Customise page and margin sizes.
  - Add a table of contents or add headers and footers with customisable content.
  - Add a title page to your document.
  - Select a subsection of a space (for example, a chapter or section) to export more easily.
- PDF exports are now up to four times faster on large spaces.
- This feature addresses some of the most highly voted Confluence issues. Important bugs in the old PDF export feature have been fixed in this new version, including:
  - Fixed width columns — Table columns were consistently presented with fixed widths using the old PDF export function. However, the new PDF export function presents table columns with variable widths, as they appear on screen.
  - Ability to handle landscape page exports.
- Take a look at our documentation for more details on the enhanced PDF export and PDF stylesheet features.
The old PDF export function only generated fixed-width table columns

The Livesearch macro allows the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>no</td>
<td>none</td>
<td>Uniquely identifies the Livesearch when there are multiple livesearch macros in one page.</td>
</tr>
<tr>
<td>spaceKey</td>
<td>no</td>
<td>all spaces</td>
<td>Specify a space key to limit the search to the given space.</td>
</tr>
</tbody>
</table>

The new PDF export feature now generates variable-width table columns

The Livesearch macro allows the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>no</td>
<td>none</td>
<td>Uniquely identifies the Livesearch when there are multiple livesearch macros in one page.</td>
</tr>
<tr>
<td>spaceKey</td>
<td>no</td>
<td>all spaces</td>
<td>Specify a space key to limit the search to the given space.</td>
</tr>
</tbody>
</table>

Easily add a title page when you export a space as a PDF

A table of contents is generated in the PDF by default when you export a space
It's easy to add custom headers and footers

**Improved Rich Text Editor**

The rich text editor contains several interface enhancements and bug fixes that improve its overall user experience.

- The rich text editor includes a right-click context menu, making it easier to insert links, images, macros and tables into your Confluence page or blog post.
- It is now possible to cut/copy and paste rows.
- Take a look at our documentation for more details on the rich text editor overview to see more information about its enhancements and redesigned interface.

**Right-click context menu**
Performance Improvements

A number of performance improvements have been implemented.

- Confluence is now able to use more available resources under high load conditions.
- For Confluence installations, actions are up to 2 times faster.
- For Confluence Clustered installations:
  - Viewing pages is up to 2.5 times faster under medium, high and peak load.
  - Other actions are up to 5 times faster under medium load and 10 times faster under high and peak load.
- For more information, please refer to the Confluence 3.0 performance improvements documentation.

Confluence installations - Medium Load

Average time Comparison

- Dashboard
- Edit Page
- View Page
- Search Site
- Reader RSS

2.10  3.0
Engine Room and Developer Community

- Confluence 3.0 now implements the Atlassian Plugin Framework 2.2 and the new Shared Access Layer (SAL).
- For more information, please refer to the Plugin Framework Documentation.

Administration Improvements

Confluence contains a number of improvements to its administrative features, many of which are easily accessible from the Administration Console.

- Security improvements:
  - A new form token authentication mechanism provides Confluence with the means to validate the origin and intent of requested actions, thus adding an additional level of security against phenomena such as cross-site request forgery. This feature also provides a mechanism for Confluence plugin developers to protect their plugins. For more information, please refer to the form token handling documentation.
  - Anti-XSS mode is now enabled by default and the remaining encoding bugs have been fixed.
- You can now generate a thread dump from the Administration Console. See our documentation on generating a thread dump.
- It is now possible to adjust the size of Confluence's internal caches, allowing administrators to fine tune Confluence's cache handling and performance at runtime without the need to restart Confluence. For more information on using this feature, refer to our page on cache statistics.
- The Office connector contains additional configuration options and provides simplified handling of the {viewfile} macro for the new Macro Browser.

More than 240 Fixes and Improvements

Page comparisons have been improved such that deletions or additions of single words (and short phrases) within a single line are highlighted red or green, respectively. Furthermore, large sections of unchanged text are compacted to reduce page length, but their content and context can easily be revealed at a click.

- Page comparisons now appear in email notifications, whenever a user edits a page or blog post.
- As well as the enhanced PDF export feature, you can now choose a subsection of a space (such as a document chapter) more easily, to export to XML or HTML.
- Using the new network, profile and user status list macros, you can incorporate components of Confluence 3.0's new community-based features directly into your page or blog post.
- Atlassian now provides support for recently added features to the widget macro, which include Widgetbox, Yahoo Video, Dailymotion, Wufoo HTML Form Builder, DabbleDB, Google Calendar and BackType micro-blogging.
- The Activity Macros now incorporate improved handling of the 'author' parameter.
- Take a look at the complete list of issues resolved in Confluence 3.0.

Known Issues in this Release

We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Confluence release, and report any problems so that we can fix them quickly.

We would like to highlight a known issue affecting the rich text editor, in which text cannot be added to the end of line that already ends with a link. Refer to [CONF-15053](#) for more information about this issue. For more information on other known issues associated with the release of Confluence 3.0, please refer to [Confluence 3.0 Known Issues](#).

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

Confluence 3.0 Known Issues

We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Confluence release, and report any problems so that we can fix them quickly. Below is a list of known issues. We’re working on them, and will have a point release out as soon as possible.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

While you’re waiting, take a look at the great new features in Confluence 3.0 Release Notes.

You can also browse the Confluence project in our issue tracker to see what's fixed and what's not, for each release.

Issues to be Fixed

<table>
<thead>
<tr>
<th>Issue</th>
<th>Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>In the rich text editor, text cannot be added to the end of line that already ends with a link.</td>
<td>CONF-15053</td>
</tr>
</tbody>
</table>

Other Issues

⚠️ Early 3.0 Build Issue

Note that an early build of 3.0 (Build number 1626) had a problem when moving a page from one space to another. If the default filesystem attachment storage was configured then any attachments on the page would fail to be moved if the page was moved to a new space. The attachment would only be accessible again if the page was moved back to its original space.

The current 3.0 release (3.0.0_01) does not have this problem. See CONF-15986 for more details.

Confluence on MySQL databases

Some customers who run Confluence on a MySQL database may find that when they upgrade to Confluence 3.0 or later, their Confluence 3.0 upgrade fails, with the Confluence logs revealing a "Specified key was too long" error. This issue is known to occur when MySQL’s MyISAM storage engine and UTF-8 character set is used with Confluence.

If this is the case, please refer to the Upgrade to Confluence 3.0 with MySQL database fails with messages like "specified key was too long" knowledge base article on how to resolve this upgrade issue.

Confluence 3.0 Upgrade Notes

Below are some essential notes on upgrading to Confluence 3.0. For details of the new features and improvements in this release, please read the Confluence 3.0 Release Notes.

On this page:

- Upgrade Notes
Anonymous Access to User Profiles

Confluence 3.0 introduces a new Anonymous Access Global Permission, View User Profiles, which prevents individuals who have not logged in to Confluence from viewing other users' profiles. This permission, which is accessible from the Administration Console was introduced to protect the identity and security of Confluence user accounts and details associated with the Confluence 3.0 Community-based features.

In all new installations of Confluence 3.0, this permission is disabled for Anonymous users by default, such that an individual will not be able to view another user's profile details until they have logged in to Confluence.

Plugins

If you are having trouble with any screens in Confluence 3.0, which could be related to potentially incompatible or unsupported third-party plugins, try using the plugin safe mode to disable all unsupported plugins.

The Usage Tracking Plugin is disabled by default

Due to performance issues in high load environments, the Confluence Usage Tracking Plugin is disabled by default in Confluence 3.0. While upgrading to Confluence 3, the plugin will be turned off even if it was active before. We do still deliver the plugin as part of Confluence (and have even improved its performance since 2.10), so if you don't have a high load environment and are happy with the performance of the plugin, you can easily reactivate this plugin through the Administration Console.

Upgrade Procedure

⚠️ Upgrade a test environment first

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence home directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 2.10.x, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.10 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade again from version 2.7.x to the latest. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

5. If you encounter a problem during the upgrade, please create a support ticket and one of our support
Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

RELATED TOPICS

Confluence 3.0 Release Notes

Confluence 3 Performance improvements

Confluence 3.0 has significant performance improvements over Confluence 2.10 and earlier versions. This page explains the performance characteristics of Confluence 3.0 and shows the improvements that were made when compared to its predecessor Confluence 2.10. In brief, compared to version 2.10, Confluence 3.0 response times are down by 30% to 40%, and response times in a cluster are down by 50%. In other words, the clustered version of Confluence 3.0 is now twice as fast as before. Confluence also scales a lot better than before: More or faster CPU's are better utilised with Confluence 3.0 than they were with 2.10 and earlier versions.

1 Specific performance improvements

We have fixed a few bottlenecks that were so specific that you might have encountered them while analysing logfiles and thread dumps. Even if you did not see them, they might have been slowing your system down, depending on your use-case.

- Rebuilding the search index is significantly faster, up to factor 2. In our performance testing, a sample set of 20,000 pages that took 30 minutes using Confluence 2.10 now just takes 16 minutes in Confluence 3.0.

- Improved Database Queries
  - CONF-14488: Added composite database index to SpacePermissions table. This will speed up installations with many page or space restrictions
  - CONF-14422: Now, only the most recent version of an attachment is loaded when retrieving it for the first time. This had slowed down pages (and the dashboard) when an attachment had hundreds or thousands of revisions
  - CONF-14273: Reduced overall DB load when rendering pages, which can help overall performance in case the database server was under high load already

- Caching Enhancements
  - CONF-12894: Improved resource caching to improve HTTPS/SSL speed. This will make the screen render faster when you are using HTTPS.
  - CONF-8034: Now serving caching headers for attachments to improve user interface responsiveness: Attachments (this includes user avatars) will not be downloaded again by the browser, leading to faster page loads

- Others:
  - Viewing PDF files through the office connector will use less memory and therefore significantly reduce garbage collection, which has caused some systems to perform a lot slower than needed
  - USGTRK-37: A bug was fixed in the usage statistics plugin that enables it to work smarter. It is still a plugin that is not made for high load so we suggest you disable it on high load scenarios

2 General performance improvements

We have been improving Confluence response time and scalability by implementing small improvements across the board. They are too many and too small to be presented individually, so we will use the results of our general
performance-test to demonstrate the effect.

In our general Confluence performance tests, we execute a standardised set of commonly-used functions that simulates the activity of concurrent users. We base this profile on the actual usage patterns of our public Confluence installation, a rather large and active instance. To cater for irregular usage spike, we increase the load by factor 10. On average, this load test performs 10 to 15 Confluence requests per second. Most customer installations do not even get close to these numbers during normal operation. Under normal (low) load, the response times are actually a lot better than what we present here. But we prefer to use this medium load scenario because it simulates cases which may occur infrequently, and in which Confluence still needs to perform reasonably well. In addition to this scenario, we defined two additional, more extreme scenarios that perform the same requests, but at 20 to 35 requests per second to simulate an even higher load.

⚠️ How to read and understand the statistics

Please note that we use the term "request" for anything that requests or posts data to Confluence. So viewing a Confluence page is a request, performing a search is a request, posting a comment is a request, and also using the quick navigation drop-down performs requests.

The data table

Each row in the table represents one use case. All use cases are run in parallel for 30 minutes, with a 5 minute ramp-up period.

- **Samplers**: The first column is the name of the requests performed in this scenario, like reading pages, commenting pages, or performing searches.
- **95% Percentile**: This is the time (in milliseconds) by which 95% of all requests of this scenario have completed. This is not an average value, you rather can think of it as a "how long the slowest requests (except the very worst 5% cases) take" - scenario.
- **Average**: the third column shows the average response time of the requests in this scenario - the lower the better.

The most important use-cases are the following:

- **View Page**: This loads one out of hundreds of different Confluence pages. Some are short, others are long. Some have many images, others have many comments. Some have many macros, others do not. The pages are accessed through their full URL, as if someone had clicked a link within the application or a bookmark.
- **Search Site**: A search across the whole system.
- **Quick Nav**: This simulates typing a character into the search field and getting back suggestions in real time. This is one of the most popular and time-critical operations. Therefore, this operation needs to be very fast.
- **Dashboard**: Simulates visiting the Confluence dashboard.
- **Edit Page**: This saves a page back to Confluence, and notifies all people who are watching this page.

The graph

The chart shows how many concurrent requests per second are being processed. The blue line indicates the moving average per second, and they green lines indicate variation. The blue line is not constant, since the pages and operations requested are extremely different in their CPU usage: A short page with no comments will render faster than a long page with many macros and comments, which in turn, will render faster than a page-edit that triggers many notifications. These differences in requests result in different CPU loads over time.

The more stable the blue average line is, the more consistent the user experience. The higher the line is, the more users can access and use Confluence simultaneously.
Applying the numbers to your company’s usage patterns

The notes on this page geared at showing the performance differences between 2.10 and 3.0, using the same tests we used to test Confluence 2.10.

Hardware specification

All tests were conducted on two to four servers, each of which had the following specifications:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server model</td>
<td>Dell 2950</td>
</tr>
<tr>
<td>CPU type</td>
<td>Intel(R) Xeon(R) CPU E5405 @ 2.00GHz (4 Cores)</td>
</tr>
<tr>
<td>CPUs per server</td>
<td>1 or 2, depending on test. See test details</td>
</tr>
<tr>
<td>RAM</td>
<td>32Gb (but just 2Gb are used for the JVMs, and the database uses 3Gb)</td>
</tr>
<tr>
<td>Disks</td>
<td>2 x 15K, 72Gb SAS</td>
</tr>
<tr>
<td>Network</td>
<td>1Gbps</td>
</tr>
<tr>
<td>Webserver</td>
<td>Tomcat 6, Java 6</td>
</tr>
<tr>
<td>Database</td>
<td>Postgres 8.2.4</td>
</tr>
</tbody>
</table>

When testing the Confluence distribution, one server acts as the application server and one as the database server, which is the setup we recommend to customers to enable high performance. A third server is used to generate the load, using JMeter. In the cluster, we use two application servers and one database server. In the cluster configuration we use the Pound load balancer, which runs on the same (fourth) server as the load generator JMeter. We do not use any webserver or caching proxy for our tests, and we cannot make any recommendations about which one to use. We want to measure the raw performance of the application server and suggest that you use the web servers/proxies with which you are most familiar.

Software and Settings

The JVM settings we used were -XX:MaxPermSize=192m -Xmx2000m -XX:+PrintGCTimeStamps -verbosegc -XX:+PrintGCDetails -XX:+PrintTenuringDistribution -XX:NewSize=384m -XX:SurvivorRatio=2 -XX:+UseParallelGC -XX:+UseParallelOldGC.

The usage tracking plugin was disabled during these tests because it is known to have performance issues and we recommend that it be turned off in high load deployments.

Confluence

Confluence is most frequently installed on one physical machine. Unless you know you are using (or are planning to use) a cluster, then this section is for you.

Confluence 3.0 has significantly better performance characteristics than Confluence 2.10. We compare three load scenarios and give the details below.

Medium Load scenario, 1 CPU
We define Medium Load as requesting roughly 15 requests per second from the loadtest. Most customers with smaller user bases never get even close to this usage, so they will experience a lot faster response times than what you can see below. But occasionally even customers with less than 1000 active users might experience spikes in usage, so we chose 15 requests per second as our medium load scenario.

We are using modest hardware (see above) with just one Xeon CPU with 4 cores, since we assume this is what a medium sized company would be using.

**Average time Comparison**

![Graph showing average time comparison]
Confluence 2.10 throughput

Confluence 3.0 throughput

Medium Load comparison between 2.10 and 3.0

The most important scenario ("View Page") used to take about 900ms in Confluence 2.10, but in 3.0 it is down to 600ms, which is a performance improvement of about 50%. Almost all other scenarios have improved as well, some even by more than 100% (e.g. more than twice as fast). The throughput in this scenario has only changed from approximately 13/s to 14/s. However, this is because the test itself is not making more requests. The main improvement here is that the throughput has less variations (ups/downs) for example when rendering very complicated or large pages. You can improve the smoothness of the line even further by using a different garbage collector, as explained on our tuning page.

High Load Scenario, 2 CPUs

We define a High Load Scenario as one in which the load generation equates to approximately 25 requests per second. In this test, we are using the same hardware as above, but with 2 CPUs. We assume that any company which expects 20 or more requests per second, even if this occurs during a short time frame, will have greater hardware resources (of equivalent cost) than to what is used in this test.

### Average time Comparison

![Average time Comparison Chart]

### 95 percent Comparison

![95 percent Comparison Chart]
Confluence 2.10 throughput

Confluence 3.0 throughput

High Load comparison between 2.10 and 3.0

This scenario shows the performance improvements between Confluence 2.10 and 3.0 best. Confluence 2.10 managed about 22 requests per second, Confluence 3.0 about 27 requests per second. Although this is a significant improvement, those in response times are even more impressive. If you have times when there are 20 requests per second, Confluence will respond a lot better and end users will notice the difference.

Peak Load Scenario, 2 CPUs

We define a Peak Load Scenario as one in which approximately 35 requests per second from the load generator. Very few of our customers ever reach these high levels of requests per second, but if you do have 100,000 users and many of them view pages at the same time, then the peak load scenario may occasionally be reached. Again, these tests are run on a 2CPU hardware.

</tbody>
</table>
Confluence 2.10 throughput
Confluence 3.0 is able to deliver about 22 requests per second, but response times are not so good. Rendering a page takes 3s and rendering the dashboard takes 2s on average. Confluence 3.0 delivers improved throughput of about 28 requests per second and response times are significantly better than 2.10 (rendering a page is down to 2s, and rendering the dashboard is down to 1.4s). However, response times under Peak Load in 3.0 are still not ideal. Even with 2 CPUs Confluence 3.0 starts reaching its limits here. While Confluence 3.0 is able to deliver results, what we really recommend for this peak load scenario is a clustered solution. Read on for more details.

**Confluence Clustered**

When rolling out Confluence to a larger amount of users, Clustering becomes important to balance spikes in load. The most commonly used deployment is a 2-node cluster, running on three physical machines (two application servers connected to one database server).

Clustering does not make a single request faster in low load scenarios, but it helps the system dealing with a larger number of requests in parallel, without degrading in performance.

**Medium Load Scenario, Clustered, 2 nodes, 1 CPU per node**

As above, we define the Medium Load scenario as making 15 requests per second. This test uses just 1 CPU per machine.

Confluence 3.0 throughput

Medium Load comparison between 2.10 and 3.0 in clustered mode

As you can see, the response time of each request is a lot better in Confluence 3.0. On average the performance has doubled, leading to response times that are just 50% of what they used to be. This means that a clustered Confluence installation provides the same responsiveness as a Confluence installation, while still being much better at scaling, which will be shown below. In this example the load was so low that throughput did not increase very much.

High Load Scenario, Clustered, 2 nodes, 2 CPUs per node

As above, we define the High Load scenario as making 25 requests per second. Few customers will reach these levels of requests per second, but if you have several ten thousand users these levels can be reached during peak business hours. This test is run on servers with 2 CPUs per machine.

High Load comparison between 2.10 and 3.0 in clustered mode

In this test we show how using a Cluster for high load instances can increase throughput and reduce response time. Confluence 3.0 has many improvements which benefit the clustered version. In the case of the test above, we can see that as the load is increased, Confluence is able to use more of the available CPU power on the 8 core machines to scale up and handle the higher load with an very good response time. This is where clustering makes a lot of sense now.

Peak Load Scenario, Clustered, 2 nodes, 2 CPUs per node

As above, we define peak load as the load generator making around 35 requests per second. During this test we used 2 CPUs per machine.

Confluence 2.10 throughput

Confluence 3.0 throughput

Peak Load comparison between 2.10 and 3.0 in clustered mode
This test highlights how well Confluence 3.0 can now scale. Response times remain low as the load is increased. Confluence 3.0 is able to make far better use of more powerful hardware than Confluence 2.10 which is shown by the improved response times for key scenarios like Page view and Dashboard.

### Average Time Comparison

The chart below compares the average time for various features in Confluence 4.2. The bars represent the time taken for each feature, with the blue bars indicating the time for Confluence 2.0 and the red bars for Confluence 3.0. The % increase is calculated based on the time taken by Confluence 3.0 compared to Confluence 2.0.

Above are the issues resolved in Confluence 3.0, ordered by number of votes. For the full details of the fixes, improvements and new features, please take a look at our issue tracker.

**Confluence 3.1.1 Release Notes**

**27 January 2010**

**Confluence 3.1.1** is a recommended upgrade which fixes a number of issues.

**Performance Enhancements and Fixes**

This release fixes two bugs that affected configuration of Confluence's internal caches. The first bug caused an error to be thrown when a Confluence internal cache was either increased to over 5000 elements (from under 5000) or resized when it was already over 5000 elements, via the Administration Console. The second bug caused changes made to Confluence's internal caches via the Administration Console to be lost after a Confluence restart. This meant that caches could only be resized by manually editing the cache configuration files (XML).

We identified an issue where Hibernate was not cleaning up its session correctly when closed, causing memory leaks. We have changed the way that Hibernate SessionImpl objects are stored which should fix this problem and reduce memory consumption.

A **system property** (atlassian.user.experimentalMapping) was introduced in Confluence 2.10 to fix performance problems noted when adding a local user to a local user group. We have fixed an bug with this system property that prevented users from being removed from user groups via the Administration Console, when the system property is set.

**Other Fixes**

We have found a bug that periodically caused an error to display when trying to view the 'Confluence Gadgets' window. This has now been fixed.

There's a complete list of fixes below. Click a specific issue to see details of the fix.
Don't have Confluence 3.1 yet?

Take a look at the new features and other highlights in the [Confluence 3.1 Release Notes](#).

[Download Latest Version]

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the [Confluence 3.1.1 Upgrade Notes](#). We *strongly recommend* that you back up your `confluence.home` directory and database before upgrading.

Confluence 3.1.1 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.1.1. Confluence 3.1.1 is a recommended upgrade which fixes a number of issues. For more details, please read the Confluence 3.1.1 Release Notes.

On this page:
- Upgrade Procedure
- Useful Plugins

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.
2. If your version of Confluence is earlier than 3.1.0, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.1.1 Release Notes.
   - If you are upgrading from 2.1 or earlier, please pay careful attention to the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.1.2 Release Notes

3 March 2010

Confluence 3.1.2 is a recommended upgrade which fixes a number of bugs. Please see the Updates and Fixes in this Release section below for details.

We identified a bug (see CONF-18437) that caused errors to be thrown whenever the macro browser was used in a theme other than the default theme. This bug also caused the preview mode to hang when the preview tab was clicked (i.e. the loading icon would spin forever without the preview mode loading). This has been fixed for all themes bundles with Confluence. If you are using a custom theme, you will need to implement a custom workaround, as described in the related JIRA issue.

Don't have Confluence 3.1 yet?

Take a look at the new features and other highlights in the Confluence 3.1 Release Notes.

Confluence 3.1.2 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.1.2. Confluence 3.1.2 is a recommended upgrade which fixes a number of bugs. For more details, please read the Confluence 3.1.2 Release Notes.

On this page:

- Upgrade Notes
- Upgrade Procedure
- Useful Plugins

Upgrade Notes

There are no upgrade tasks specific to Confluence 3.1.2. Please refer to the 'Upgrade Procedure' section below.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your confluence.home directory and database**.
2. If your version of Confluence is earlier than 3.1.2, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.1.2 Release Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. **Download** the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on **plugin support**.

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.1 Release Notes

⚠️ Confluence 3.1 fixes some security flaws. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

8 December 2009
With great pleasure, Atlassian presents Confluence 3.1.

Confluence 3.1 is a major release which presents a number of new features and enhancements. With Confluence 3.1, we introduce OpenSocial Gadgets, which allow you to add functionality from other web applications or websites, such as JIRA 4.0+, iGoogle or Gmail, directly into a Confluence page or blog post. Confluence also provides its own Gadgets that can be embedded into other web applications.

The new Drag-and-Drop feature is a major step forward in Confluence file attachment. With Drag-and-Drop, you can attach one or more files to a page or blog post simply by dragging them from your desktop onto the Confluence page. You can also embed images, Office documents and PDF files into a page or blog post while in edit mode simply by dragging and dropping them into the rich text editor.

Office 2007 documents are now fully supported in Confluence so features like document import, edit in Word and embedding documents in a page now work with Office 2007 files. With the new Move Page feature, you can more quickly and reliably move the page you are editing or viewing to a new parent page, even to one within a new space. An enhanced Image Browser lets you preview images before embedding them into a page. You can also attach image files to a page by dragging and dropping them into the Image Browser window itself. A new Page Restrictions dialog allows you to view changes made to a page or blog post before they are actually saved.

Other editor enhancements include Exit Notifications to prevent the loss of unsaved content in a page, blog post or comment, a new Insert Menu for the rich text editor, fields that auto-complete in the macro browser and improved rich text editor speed.

Confluence 3.1 now fully supports Internet Explorer 8, Safari 4 and Firefox 3.5. Other smaller improvements include the ability to add pages or blog posts directly from the Confluence dashboard, a facility to link to Confluence pages more easily and the ability to expand activity streams at the click of a button.

Finally, we have also introduced a simplified installation process for evaluators to help get Confluence up and running quickly. Simplified Confluence evaluation installers have been created for MacOS X and Windows operating systems.

Highlights of this Release:

- Introducing Gadgets
- Drag-and-Drop
- Office 2007 Support
- New 'Move Page' Feature
- Enhanced Image Browser
- Draft Comparisons
- Page Restrictions Dialog Box
- Other Editor Enhancements
  - Edit Mode Exit Notification
  - New Rich Text Editor Insert Menu
  - Macro Browser Smart Fields
  - Rich Text Editor Speed
- New Web Browser Versions Supported
- Other Improvements
  - Add Pages or Blog Posts from the Dashboard
  - New 'Link to this page' feature
  - Get 'More' from your Activity Streams
  - User Interface Performance Improvements
  - Other Small Enhancements and Improvements to Confluence

Responding to your Feedback:

⭐ 300+ votes satisfied
Thank you for all your issues and votes. Keep logging, to help us keep improving!
Below is a list of the highlights in this release.
Attached is the full list of issues resolved in this release.

Upgrading from a previous version of Confluence

- Upgrading Confluence should be fairly straightforward. **We strongly recommend that you back up your Confluence Home directory and your database before upgrading.**
- Please refer to the Confluence 3.1 Upgrade Notes for further essential information about plugins and other factors affecting your upgrade.

Highlights of Confluence 3.1

1

**Introducing Gadgets**

Gadgets are small objects that offer dynamic content and functionality which may be served by any OpenSocial-compliant web application, such as JIRA 4.0+, Confluence or non-Atlassian applications such as iGoogle and Gmail. Confluence can interact with any gadgets that support the OpenSocial specification.

- Confluence supports the use of gadgets in pages and blog posts, which are accessible through the macro browser.
- Confluence can also serve its own gadgets, for use in any other OpenSocial-compliant web application. Gadgets bundled with Confluence include:
  - **Activity Stream** — This gadget shows a list of recent activities that have occurred on the Confluence server, such as the addition of new pages, blog posts or comments, content edits, status updates and so on.
  - **Quick Navigation Aid** — This gadget provides heading and content search capabilities on a Confluence server.
    - Your Confluence installation can also serve these gadgets in any of its own pages or blog posts.

For more information on using these gadgets, refer to Confluence Gadgets.

**Inserting a JIRA Gadget onto a Confluence Page**
Drag-and-Drop

The new 'drag-and-drop' feature allows you to drag one or more file(s) which are accessible from your computer and drop them directly into a Confluence page or blog post.

- Files can be attached to a page or blog post by dropping them directly onto the page view or the 'Attachments' list associated with the page.
- Image files can be attached to a page or blog post by dragging them from your computer directly onto the Image Browser.
- Image and Office files can be added directly into your Confluence page or blog post content by dropping them into the rich text editor's editor window.

For more information about this feature and on how to set it up, refer to the Drag-and-Drop documentation.

Screenshots: Attaching an Image to the Image Browser

Screenshot: Attaching Multiple Files to an 'Attachments' list
Office 2007 Support

Confluence now provides full support for the new Office 2007 file formats, allowing you to view and edit content from Microsoft Word 2007 (.docx and .dotx), PowerPoint 2007 (.pptx and .potx) and Excel 2007 (.xlsx) files.

- Along with existing Microsoft Office versions, Confluence now fully indexes Microsoft Office 2007 files and their content can be searched by Confluence.
- Using Confluence’s [Office connector macros](#), you can insert Word, PowerPoint or Excel 2007 files directly into your Confluence page or blog post.
- Office files can be edited directly from any page or blog post or their list of attachments.
  
  If you use the Firefox browser to work with Confluence, don’t forget to [reconfigure the Firefox add-on](#) (WebDAV Launcher options) to handle the new Office 2007 file extensions. Otherwise, you will not be able to edit these new Office 2007 file formats from Confluence.

**Screenshot: Embedding an Office 2007 Document**

This feature uses technology licensed from Aspose.
**New 'Move Page' Feature**

Confluence introduces a new page moving feature, that easily allows you to move the page you are currently viewing, adding or editing, to another page in the same or another space within your Confluence site. This feature is available through a new 'Move Page' dialog box, which provides the following flexible methods for moving pages:

- **Known Location** – Allows you to type the name of a space and within that space, the 'parent' page under which to move your page.
- **Search** – Allows you to search for a 'parent' page (within a selected space or set of spaces) under which to move your page.
- **Recently Viewed** – Allows you to select one of your recently viewed pages to be the 'parent' of your page to be moved.
- **Browse** – Allows you to select a space and page that will be the 'parent' of your page to be moved. Pages are browsed via a tree view.

For more information, refer to [Moving a Page](#).

**Screenshot: Moving a Page to a Known Parent Page**

---

**Enhanced Image Browser**

A new 'Image Browser' has been introduced to replace the old 'Insert Image' window. The image browser provides a less-cluttered and enhanced interface that allows you to:

- Preview an image in detail before inserting it into a page. This is done by hovering over any image in the browser and clicking the 'magnifying glass' icon in the lower-right corner.
- Preview an image elsewhere on the web via its URL before inserting it into a page.

**Screenshot: Previewing an Image in the Image Browser**
Draft Comparisons

Confluence's drafts feature has been enhanced, such that you can now view unsaved changes in your drafts as a 'diff' before you decide to resume editing them. This nifty 'draft comparison' feature comes in handy, particularly when other people have made subsequent changes to a page or blog post in your drafts list and you need to merge changes or resolve a conflict.

Page Restrictions Dialog Box

Confluence's page restrictions feature has been incorporated into a convenient and accessible dialog box, which is now easier to use than before.

- The page restrictions dialog box can be accessed from the padlock icon or the 'Tools' -> 'Restrictions' menu item whilst viewing any Confluence page. From this dialog box, you can see all viewing and editing restrictions associated with the current page. You no longer need to view the page's associated 'Info' page to see the page's restrictions.
- You no longer have to edit a page to modify its page restrictions. You can edit all page restrictions from this easily accessible dialog box.
- The page restrictions dialog box is still accessible when a page is in edit mode.
- In addition to user and group names, the name field also accepts a user's full name. Full names are 'auto-completed' to help you find the relevant person more rapidly.

Screenshot: The Page Restrictions Dialog Box

Other Editor Enhancements

Edit Mode Exit Notification

Whenever you add or edit a page, comment or blog post and then click onto another Confluence feature that
navigates away from your unsaved content, a message box appears, warning that your content will be saved as a draft (if it is a page) or lost (if a comment). This allows you to cancel out of this action if it was accidental.

New Rich Text Editor Insert Menu

Confluence’s rich text editor now combines a number of its commonly used editing features into a new convenient 'Insert' menu.

- The Horizontal line, Insert Symbol and Insert Emoticon Toolbar icons have been moved into the new insert menu.
- The functionality to insert images, links or attachments into a page can now also be accessed from this menu.
- The macro browser, as well as a number of commonly-used macros are conveniently accessible from this menu too.

Macro Browser Smart Fields

When using the Macro Browser, an ‘auto-complete’ feature is now provided on any parameters that require the entry of a single item, such as a page title, username or space key. This greatly facilitates the customisation of macros and minimises the need to know the exact item names in advance.
Rich Text Editor Speed

Thanks to many individual technical improvements, the rich text editor opens up a lot faster than in previous Confluence releases. In a local network environment, the rich text editor is accessible almost instantly. When accessing a Confluence server on a different continent, the rich text editor still opens up rapidly. In our Sydney office for instance, accessing the rich text editor from our Confluence server in the US takes less than 3 seconds.

New Web Browser Versions Supported

Confluence 3.1 now fully supports the following recent web browser versions:

- Internet Explorer 8
- Safari 4
- Firefox 3.5

Confluence now provides full usability with these recent browser versions as many bugs associated with these browsers have been fixed.

Other Improvements

Add Pages or Blog Posts from the Dashboard

You can now add pages or blog posts directly from the Dashboard without having to browse to a specific space first. To do this, click on either the ‘Add Page’ or ‘Add Blog Post’ buttons to open the pop-up balloon, which allows you to choose the space in which to add the new page or blog post and in the case of pages, a template on which to base the page content.
New 'Link to this page' feature

If you wish to link to a Confluence page from any other location on the web, use the convenient 'Link to this Page' feature (available from any page's or blog post's 'Tools' menu). Upon selecting this feature, the 'Link to this Page' dialog box opens, from which you can copy three versions of the link to embed elsewhere:

- **Link** – Standard URL which should work from any other accessible location on the web.
- **Tiny Link** – A reduced-length version of the 'Link', which can be used in text fields of limited length, such as tweets or Confluence Status Updates.
- **Wiki Markup** – A wiki markup version of the link, which can be used in any other location within your Confluence site.

Get 'More' from your Activity Streams

A 'More' feature has been added to various activity streams throughout the Confluence interface, including the user profile sidebar, user profile page and recently updated macro. Clicking 'More' expands the list of results, providing a convenient means of accessing progressively more distant user activities.
User Interface Performance Improvements

Most JavaScript and Cascading Style Sheet (CSS) files are now downloaded in one batch, greatly improving the performance of Confluence's editing features and general page rendering.

Other Small Enhancements and Improvements to Confluence

- Support for OAuth — With the introduction of gadgets (above) in this release, Confluence 3.1 now allows you to establish OAuth relationships with other web applications such as JIRA 4.0+, iGoogle, Gmail etc., thereby allowing them to share resources via gadgets.
- New Log In and Log Out screens.
- In an aim to minimise confusion, 'News Items' are now consistently called 'Blog Posts' throughout the Confluence interface and a list of blog posts is collectively referred to as a 'Blog'.
- Macro developers are now able to specify whether the macro body should or should not be displayed in Rich Text editor. For more information, please refer to CONF-12149.
- Other minor interface improvements.

Known Issues in this Release

We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Confluence release and report any problems so that we can fix them quickly.

We value this feedback, which means that we can tell you about some minor known issues in Confluence 3.1. Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the important technical advisories on the front page of the Knowledge Base.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

Confluence 3.1 Known Issues

Below are some known issues associated with Confluence 3.1.

On this page:

- JIRA/Crowd and Confluence deployment
- JIRA Gadgets in Confluence
- Bamboo integration
- PDF exports only render gadgets as links
- Problematic Confluence Gadgets window when running Confluence on Java 6
- Other issues

**JIRA/Crowd and Confluence deployment**

Confluence will not start up or will display strange behaviour (drop down menus not working) if JIRA 4.0/4.0.1 or Crowd 2.0.x is running on the same application server installation, for example, by attempting to run Confluence and JIRA 4.0 in the same Apache Tomcat server installation. This problem results from a bug in JIRA (tracked as JRA-19894) that is scheduled to be fixed in JIRA 4.0.2. Crowd will be fixed in the 2.1 release. In the meantime, please read our [KB article](#) on how to resolve this issue.

In the meantime, you can run JIRA or Crowd and Confluence in different 'instances' of the same application server, for example two separate Apache Tomcat server installations. If you already do so, or have installed both the Confluence distribution and JIRA 4.0 distribution, or Crowd 2.0.x, you can ignore this known issue.

**JIRA Gadgets in Confluence**

As of Confluence 3.1, users can embed gadgets into Confluence pages. When integrating JIRA gadgets into
Confluence pages, you may encounter UI problems like a missing "Login"-button which is required to make the gadget authenticate with the JIRA server. This problem can be circumvented by setting up JIRA and Confluence to use Trusted Apps communication (since it removes the need for manual authentication). See KB article for details.

**Bamboo integration**

Our continuous integration product Bamboo exposes gadgets which can be embedded into Confluence pages. However, some of these exhibit problems once embedded onto a Confluence page:

- **BAM-4900**: Unable to edit Bamboo gadgets in Confluence
- **BAM-4890**: Bamboo gadget added in JIRA dashboard is not saving the preferences

These bugs are being fixed in Bamboo 2.5, which will ship in January 2010.

**PDF exports only render gadgets as links**

If you place any gadget on a Confluence page and export the page to PDF, the gadget output will not be rendered in the PDF output. Instead, each gadget is rendered on a page as a box containing the name of the gadget, the latter of which is hyperlinked. Clicking this hyperlink, opens the gadget contents itself in a new browser window or tab.

**Problematic Confluence Gadgets window when running Confluence on Java 6**

The [Confluence Gadgets](#) window may indicate that ‘**An error has occurred while trying to load the Gadget Directory**’ and prevent you from accessing the URLs of your Confluence gadgets. This problem can occur if you are running Confluence on Java 6. After you install Confluence 3.1 or upgrade an existing Confluence installation to this version, please check the Confluence Gadgets window immediately after starting the Confluence server.

If you see this error message and cannot access your Confluence gadgets, it can be resolved by restarting Confluence. (You may need to do this more than once.)

For more information about this issue, please refer to [CONF-17417](#).

**Other issues**

Refer to our JIRA site for a list of **Confluence 3.1-specific bugs**.

**Confluence 3.1 Upgrade Notes**

Below are some important notes on upgrading to **Confluence 3.1**. For details of the new features and improvements in this release, please read the [Confluence 3.1 Release Notes](#).

**On this page:**

- Upgrade Notes
  - New License Key Requirements for Confluence 3.1
  - Upgrading an Existing Confluence License for Confluence 3.1 Compatibility
  - Custom layouts must be re-implemented after upgrading Confluence
  - Customers running Confluence on Weblogic are required to specify the `prefer-web-inf-class`es element in the `weblogic.xml` file prior to upgrading Confluence
  - The Drag-and-Drop feature disables the ability to drag and drop links or text in Firefox 3.0
  - Clarification of supported user management configurations in Confluence
- Upgrade Procedure
- Checking for Known Issues and Troubleshooting the Confluence Upgrade
New License Key Requirements for Confluence 3.1

In order to continue using Confluence, you must upgrade your Confluence license to Atlassian's new license key format.

We have undertaken this change to enhance and improve the support we provide our customers. Bear in mind that this license upgrade will not incur any additional costs and does not change Confluence's functionality in any way.

Upgrading an Existing Confluence License for Confluence 3.1 Compatibility

This procedure can only be performed by Confluence Administrators.

To upgrade your existing license to the new license key format, which will be required for continued use of Confluence 3.1:

1. Visit the license upgrade area in your account at my.atlassian.com.
2. Enter your Atlassian account details (email address and password) to access and manage your Atlassian product licenses.
3. If your Confluence license is already associated with a Confluence Server ID (that is, most customers running recent versions of Confluence), follow procedure b below. If my.atlassian.com prompts you to enter a Server ID before upgrading your license, follow procedure a:

   a. Procedure for associating a Confluence license with your Confluence Server ID:
      i. If you have not already upgraded your Confluence installation to version 3.1, go to your Confluence installation's License Details page to access the Server ID associated with your Confluence license. Make a note of this Server ID.
      ii. If you have already upgraded your Confluence installation to version 3.1 and cannot access your Confluence installation's License Details page, open the confluence.cfg.xml file (located inside the Confluence Data Directory) in a text editor and make a note of your Confluence installation's Server ID from the confluence.setup.server.id property in this file.
      iii. If you cannot access the Server ID in your Confluence installation using either of the two methods above, then please contact our customer support team for further assistance. This issue may occur when upgrading from a very old version of Confluence.
      iv. Follow the remaining prompts on my.atlassian.com to enter your Server ID and then upgrade your Confluence license.

   b. Procedure for upgrading a Confluence license associated with a Server ID:
      i. Select the appropriate Confluence license to expand its details.
      ii. In the 'info' note below your license on the right-hand side of the page, click the 'update your license key' link (as shown in screenshot 1 below). Once this is done, the note changes to that shown in screenshot 2 below.
3. ii. Copy the new license from the text box above this message to your clipboard.

4. Ensure your upgraded Confluence installation has been started, enter your Confluence site's URL into a web browser and on the Confluence license upgrade screen, click the 'page' link in the 'Description' field to begin updating Confluence with your upgraded Confluence license to open the 'Update Confluence License' page.

5. On the 'Update Confluence License' page, paste your new license details into the 'License' field.

6. Enter the Confluence administrator account's username and password details and click the 'Save' button.
7. If your license update was successful, you will be prompted to restart Confluence.

Screenshot: Successful Confluence License Update Screen

Custom layouts must be re-implemented after upgrading Confluence

If you have customised your Main Layout on either the space or the global level, or if you have a custom theme plugin, the new Link to this Page, Page Restrictions and 'Move Page' dialog box features in Confluence 3.1 will not immediately work for you.

To resolve these issues, you will need to re-implement your custom layouts or reset these custom layouts back to the Confluence default settings.

Other Issues:

The following other issues may occur prior to resolving these issues:

- The Atlassian Confluence footer may appear fixed on the page and obscure content that extends below the length of the web page.
- Some pages may not render at all.

Depending on the version of Confluence you upgraded from and the customisations that had been implemented, other user interface problems or problems with Confluence's functionality may be found.

Re-implementing custom layouts:
To re-implement your custom layouts, please refer to [Upgrading Customised Site and Space Layouts](#) for details on retrieving the customisations made to your layouts and re-implementing them into your upgraded version of Confluence.

**Customers running Confluence on Weblogic are required to specify the `prefer-web-inf-classes` element in the `weblogic.xml` file prior to upgrading Confluence**

If you are a customer running Confluence on Weblogic, then before upgrading to Confluence 3.1, you must ensure that the `prefer-web-inf-classes` element in the `weblogic.xml` file has been specified with the content value of `true`. For more information, please refer to [Installing Confluence EAR-WAR on Weblogic](#).

To do this:

1. Ensure that Confluence and Weblogic have been stopped.
2. Open the `weblogic.xml` file in a text editor. (This file is located in the `<confluence install directory>` directory.)
3. Ensure that `<prefer-web-inf-classes>true</prefer-web-inf-classes>` has been added as a child element of the `<container-descriptor>` element, such that your `<container-descriptor>` element looks something like:

   ```xml
   <container-descriptor>
   <prefer-web-inf-classes>true</prefer-web-inf-classes>
   </container-descriptor>
   ```

   ! Your particular `weblogic.xml` may have other child elements of the `<container-descriptor>` element, so leave these intact.
4. Save any changes made to the `weblogic.xml` file.
5. Follow the upgrade procedure.

**The Drag-and-Drop feature disables the ability to drag and drop links or text in Firefox 3.0**

Some browsers like Firefox and Safari allow Confluence users to create links easily by dragging and dropping hyperlinks from other web pages directly into the rich text editor window. This browser-specific feature also allows the rearrangement of text when editing Confluence wiki page content, by highlighting text and dragging and dropping it elsewhere.

However, the Confluence 3.1 Drag-and-Drop feature is not compatible with these link creation and text rearrangement features of Firefox 3.0 and setting up Confluence’s Drag-and-drop feature will disable these Firefox 3.0 features.

To allow the Confluence 3.1 Drag-and-Drop feature to work together with these link creation and text rearrangement features of Firefox, upgrade your Firefox browser to version 3.5.

**Clarification of supported user management configurations in Confluence**

In Confluence 3.1, Atlassian is clarifying our support for user management configurations and code-level customisations. This is being done so that we can deliver significant improvements in our user management performance and configuration in a future release.
Confluence is fully supported with the following configurations provided and documented by Atlassian:

- Built-in user management with Atlassian-User Hibernate managers ("default user management")
- Built-in user management, with OSUser LDAP authentication (deprecated since 2.7, moving to Atlassian-User LDAP is recommended)
- External user management with read-only JIRA JDBC providers ("JIRA delegated user management")
- External user management with Atlassian-User LDAP providers ("standard LDAP user management")
- External user management with Atlassian Crowd.

Unfortunately, we cannot offer complete support for code-level customisations in our user management system. The following caveats apply to customers who are using extensions to our user management systems:

- Custom implementations of Atlassian-User managers are supported for problems which are not related to user management.
- Custom Seraph authenticators are supported for problems which are not related to user management or authentication.
- Custom implementations of OSUser providers are not supported with Confluence. The OSUser APIs required for implementing custom providers were deprecated in Confluence 2.7, so customers with custom OSUser implementations will need to migrate their code to the Atlassian-User API to have support for their Confluence instance.

Advance warning: In Confluence 3.2, Atlassian will be removing functionality required for custom OSUser providers. From this point, custom OSUser providers will not work correctly with Confluence 3.2, so we recommend porting any custom OSUser providers to the Atlassian-User interfaces as part of your Confluence upgrade process.

Upgrade Procedure

⚠️ Upgrade a test environment first

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence home directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 3.0.x, then please read the Upgrade Notes Overview and the Upgrade Notes for each version of Confluence listed on that page. (There are hyperlinks to each one.) Furthermore:
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade again from version 2.7.x to the latest. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Checking for Known Issues and Troubleshooting the Confluence Upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:
• **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

• **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to **troubleshooting upgrades** in the Confluence Knowledge Base.

• If you encounter a problem during the upgrade and cannot solve it, please create a **support ticket** and one of our support engineers will assist you through the process.

**Useful Plugins**

**Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.**

- Appfire's **Upgrade Assistant for Confluence (UAC)** is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.2.1 Release Notes

⚠️ This release fixes some security flaws. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

4 May 2010

Confluence 3.2.1 is a recommended upgrade which fixes some security flaws and other bugs.

As part of the security update we have made changes to Confluence functionality, including some parts of the Administration Console. Please refer to the security advisory for a summary of changed behaviour. We have updated the documentation where relevant.

We have also fixed a bug that caused an out of memory error when attempting to display an Excel spreadsheet on a Confluence page. Before this fix, the error might occur if the spreadsheet has a large number of empty cells. Confluence now limits the number of spreadsheet cells it will display. By default, the maximum is 10000 cells. The Confluence administrator can adjust this value in the Office Connector configuration screen, as described in the documentation.

Purging items from a space's trash can was very slow and blocked all other database updates. This is now fixed.
A bug introduced in Confluence 3.2 prevented people from adding a page when using the Left Navigation theme. We have fixed this too.

In Confluence 3.2, we mistakenly introduced the words ‘Needs to be updated’ into the French and German translations of the UI text in the left navigation theme. We have now removed the extra text. The UI wording is still in English, not translated into French or German, but at least it no longer calls attention to this fact.

**Don’t have Confluence 3.2 yet?**

Take a look at the new features and other highlights in the [Confluence 3.2 Release Notes](#).

![Download Latest Version](#)

### Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the [Confluence 3.2.1 Upgrade Notes](#). We strongly recommend that you back up your `confluence.home` directory and database before upgrading.

3.2.1 Release Notes.

On this page:
- Upgrade Notes
- Upgrade Procedure
- Useful Plugins

Upgrade Notes

As part of the security update we have made changes to Confluence functionality, including some parts of the Administration Console. Please refer to the security advisory for a summary of changed behaviour. We have updated the documentation where relevant.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database.
   - The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   - Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.2, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.2 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.
- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.2 Release Notes

24 March 2010

With great pleasure, Atlassian presents the seemingly omniscient, drop dead gorgeous Confluence 3.2.

Highlights of this Release:
- Autocomplete for Inserting Links
- Autocomplete for Embedding Images and Documents
- A Link Browser that's Smarter, Smoother, Faster
- New Documentation Theme
- New Easy Reader Theme
- Template Bundles
- Reordering while Moving a Page
• New Keyboard Shortcuts and Editor Hints
• User Interface Enhancements
• And Even More Improvements

Responding to your Feedback:
⭐ 100+ votes satisfied

• Thank you for all your issues and votes. Keep logging issues to help us keep improving!
• Below is a list of the highlights in this release.
• Attached is the full list of issues resolved in this release.

Upgrading from a previous version of Confluence
• Upgrading Confluence should be fairly straightforward. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.
• Please refer to the Confluence 3.2 upgrade notes for further essential information about plugins and other factors affecting your upgrade.

Highlights of Confluence 3.2

1

Autocomplete for Inserting Links

Wouldn't it be awesome to have the WYSIWYG ease of a rich text editor combined with the speed of a wiki markup editor? We're working towards that sweetness. In the rich text editor you can now enter a trigger character to call up a list of suggested links to add to your page. A keyboard shortcut does it too.

Quick guide:
• Enter '[' and start typing to see the suggested links that match your text.
• Or press Ctrl+Shift+K to convert text to a link.
The new autocomplete also offers a quick way of adding images and documents to your page.

In the rich text editor:

- Enter '!' and start typing, to see a matching list of images and documents.
- Or press Ctrl+Shift+M immediately after a word or highlighted phrase.
A Link Browser that’s Smarter, Smoother, Faster

Do you think the autocomplete is sweet? Good, because it's in the new link browser too. We've also made it easier and faster to link to images, attachments and recently-viewed pages. The link browser pops up when you click the 'Insert Link' icon in the editor toolbar.
New Documentation Theme

Want an inbuilt table of contents for your wiki space? Lusting after a configurable header and footer? Hankering for sophisticated styling? You got it!

Features in a nutshell:

- Configurable left-hand panel. By default, the panel contains a search box and a table of contents (page tree).
- Resizable panels. People viewing the page can drag the thick bar between the left-hand panel and the content. They can also remove the panel altogether, by clicking the sidebar icon at top right.
- Customisable page header and footer.
- Text styles designed to enhance the content typically found in a documentation space.
- The **Space Jump macro** for linking from a page in one wiki space to a page with the same name in another space.
- Easy upgrade path from now on. Because the left-hand panel is part of the theme, it will be upgraded whenever Confluence is upgraded. There is no need to remove and then re-apply your customisations on each upgrade, as you would do if you added your own left-hand navigation bar.
New Easy Reader Theme

With today's huge monitors, it can become hard to read text that spans the width of the screen. Confluence 3.2 introduces the Easy Reader theme that uses only a portion of the screen, to make reading easier. Many websites are formatted this way. The Easy Reader theme is a fixed-width variation of the default Confluence theme. Its larger fonts, smooth gradient background and comfortable line length make it ideal for displaying and reading longer documents.
Template Bundles

Confluence page templates make it easy for people to collaborate, yet maintain a consistent document format. We’ve extended the template functionality in this release so that you can import templates from template bundles via the Confluence Administration Console. Confluence administrators will be able to preview templates before importing them to a specific space or as global templates.

Template bundles are built as plugins, so developers should find it easy to whip up a new template bundle. Confluence 3.2 also ships with a default template bundle. Just import the templates from the default template bundle and your users will have access to a number of handy page templates.
Reordering while Moving a Page

You can now move a page and position it sequentially amongst its siblings at the same time. In earlier versions of Confluence this was only possible on the space’s page tree view, accessed via the browse pages menu. The page tree is problematic in big spaces, so some people could not reorder pages at all. Now you can select the new ‘Reorder’ option when moving a page, and then drag a horizontal bar to put your page in the right spot amongst the other child pages.
New Keyboard Shortcuts and Editor Hints

We're on a mission to improve your editing experience. We've added a number of new keyboard shortcuts for the rich text editor in this release. Format text into bulleted/numbered lists, manipulate tables, open the macro browser and more, with a few simple key presses. Check out the new keyboard shortcuts below:

<table>
<thead>
<tr>
<th>Keystroke</th>
<th>Action (Rich Text Editor)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+Shift+A</td>
<td>Opens the macro browser</td>
</tr>
<tr>
<td>Ctrl+Shift+B</td>
<td>Formats text as a bullet list</td>
</tr>
<tr>
<td>Ctrl+Shift+K</td>
<td>Autocomplete for links. Calls up a list of suggested pages or other locations to link to from your page. More...</td>
</tr>
<tr>
<td>Ctrl+Shift+M</td>
<td>Autocomplete for embedding images and files. Calls up a list of suggested images, documents and other files to embed in your page. More...</td>
</tr>
<tr>
<td>Ctrl+Shift+N</td>
<td>Formats text as a numbered list</td>
</tr>
<tr>
<td>Ctrl+Shift+S</td>
<td>Formats text with a strike through</td>
</tr>
<tr>
<td>Ctrl+Shift+C</td>
<td>Copies a table row</td>
</tr>
<tr>
<td>Ctrl+Shift+X</td>
<td>Cuts a table row</td>
</tr>
<tr>
<td>Ctrl+Shift+V</td>
<td>Pastes a table row</td>
</tr>
<tr>
<td>Ctrl+Shift+I</td>
<td>Inserts a table</td>
</tr>
</tbody>
</table>

The rich text editor will also display handy hints along the bottom of the screen, including common keyboard shortcuts and autocomplete tips.

User Interface Enhancements

- **Image Previews in Search Results.** Confluence 3.2 helps you search more efficiently by displaying thumbnail image previews in your search results. You can also opt to display images attached to pages/blog posts in your search results. We’ve also made the rendering of search results in Confluence pluggable. If you are a developer, you may wish to write your own search result renderer to change how
the search results are displayed.

Improved page history. We've redesigned the header for the page history to make it easier to use. Check it out!

Handling of oversized content. Taking advantage of modern browsers, the new Easy Reader theme includes CSS to handle common types of oversized content. Specific sections of a page will now have a localised scroll bar instead of making the whole page scroll. You will see this in action in the code macro, for example.

Better RSS feeds. We have improved and simplified the RSS feed builder. As before, you can choose to include either pages or blog posts or both in your feed. Now you can also choose to include comments from pages and/or comments from blog posts independently. Similarly, you can choose attachments from pages and/or blog posts. In addition, if you filter by label you can now track updates to labelled pages and
comments on those pages.

RSS Feed Builder

- **Fixed colour scheme issue.** We have removed the hard-coded colours that prevented colour schemes from applying correctly.
- **Fixed editor issue.** We've also fixed an issue that caused white space to overlap the right-hand side of the editor. This has now gone, making more space available to the editor.

And Even More Improvements

- **Hot installation of language packs.** You can now install language packs without restarting the server.
- **Purging the trash is now incremental and logged.** Purging the deleted items from the Confluence trash has caused problems for people with a large number of items in the trash. The operation is slow and prevents other database updates while in progress. Confluence now breaks the operation into separate transactions and tracks progress in the logs.
- **More REST resources.** If you are a plugin developer or use our APIs in some other way, you'll find the REST API improvements in this release useful. The previous release of Confluence introduced a prototype REST API. With Confluence 3.2, we have added the following REST resources: attachments, recently viewed pages, search and user history. There are other small improvements too.
- **Important Bug Fixes:**
  - **Custom PDF stylesheets are unique to spaces.** We've addressed an issue that caused changes made in one space's custom stylesheet to be reflected in the stylesheets for all other spaces. For more information, please see CONF-18843.
  - **Full index rebuilds now work correctly.** A Confluence bug caused a database exception to be thrown during full index rebuilds, which prevented further indexing jobs from being run correctly. This has now been fixed. For more information, please see CONF-18452.
  - **Confluence now upgrades correctly when using Crowd integration.** If you have integrated your Confluence instance with Atlassian's Crowd, you can now upgrade to this version of Confluence without the manual workaround required for Confluence 3.1. For more information, please see CONF-18150.
  - **Circular references are no longer possible with the (excerpt-include) macro.** The (excerpt-include) macro could previously be used to create circular references that would crash Confluence. This has been fixed. For more information, please see CONF-15247.
  - **Confluence upgrades do not disable enabled plugins.** Plugins that are disabled by default would previously be disabled during a Confluence upgrade, even if they had been enabled prior to
the upgrade. This has been fixed. For more information, please see CONF-18417.

Known Issues in this Release

We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Confluence release and report any problems so that we can fix them quickly.

We value this feedback, which means that we can tell you about some minor known issues in Confluence 3.2. Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the important technical advisories on the front page of the Knowledge Base.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

Confluence 3.2 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.2. For details of the new features and improvements in this release, please read the Confluence 3.2 release notes.
Upgrade Notes

**Clickr Theme and Left Navigation Theme are now Deprecated**

Confluence 3.2 introduces two new themes, the Documentation theme and the Easy Reader theme. At the same time, we are announcing the deprecation of the following two themes:

<table>
<thead>
<tr>
<th>Deprecated Theme</th>
<th>Description</th>
<th>Suggested Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clickr theme</td>
<td>This theme was inspired by the Flickr user interface, with Confluence content centred on the page. Please note that some features of Confluence 3.x are not fully supported by this theme.</td>
<td>Easy Reader theme</td>
</tr>
<tr>
<td>Left Navigation theme</td>
<td>This theme provides a navigation bar on the left hand side of the screen. Please note that some features of Confluence 3.x are not fully supported by this theme.</td>
<td>Documentation theme</td>
</tr>
</tbody>
</table>

We recommend that you move to a different theme as soon as possible. In the table above, we have suggested new themes that will give you similar and better-supported functionality.

⚠️ Advance Notice --- Clickr Theme and Left Navigation Theme will not be bundled with Confluence 3.3

Please note, the Clickr Theme and Left Navigation Theme will not be bundled with Confluence 3.3. We will not support these themes from Confluence 3.3 onwards.

### End of Support for JBoss, Firefox 2 and Safari 2

As previously announced, we are no longer providing support for:

- JBoss (all versions) from this release onwards.
- Firefox 2 and Safari 2 from this release onwards.

Please see [End of Support Announcements for Confluence](#) for further details.

### Advance Notice of End of Support for Oracle Weblogic,

...
IBM Websphere, Caucho Resin, DB2 8.2, Java Platform 5 (JDK/JRE 1.5) and Internet Explorer 6

As previously announced, we are planning on ending support for:

- Oracle Weblogic, IBM Websphere and Caucho Resin **in Confluence 3.3**.
- DB2 version 8.2 **in Confluence 3.3**. DB2 9.7 will still be supported.
- Java Platform 5 (JDK/JRE 1.5) **in Confluence 3.3**.
- Internet Explorer 6 **in Confluence 3.3 or 13 July 2010, whichever is sooner**.

Please see [End of Support Announcements for Confluence](#) for further details.

**Link Browser will Remove Tooltips**

In Confluence 3.2 and later, the link browser no longer offers the option to include a tooltip for your link. If you have existing links with tooltips, the tooltip will disappear if you edit the link with the link browser. The tooltip will remain if you edit the link using wiki markup. See issue [CONF-18668](#).

**Upgrade Procedure**

> **Upgrade a test environment first**

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your [Confluence home directory](#) and database. See the documentation on [backing up your Confluence site](#). If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 3.1.x, then please read the [Upgrade Notes Overview](#) and the Upgrade Notes for each version of Confluence listed on that page. (There are hyperlinks to each one.) Also:
   - If you are upgrading from 2.1 or earlier, please read the [2.2 release notes](#).
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade again from version 2.7.x to the latest. For more details, please refer to [CONF-11767](#).

3. [Download](#) the latest version of Confluence.

4. Follow the instructions in the [upgrade guide](#).

**Troubleshooting the Upgrade**

This section lists some specific issues that may occur during or as a result of the upgrade process, and guidelines on fixing the problem if it does happen to you.

- **Left-hand navigation bar in Documentation theme is empty.** If your existing Confluence installation already has the Documentation theme plugin installed, you may find that after upgrading to Confluence 3.2 the left-hand navigation bar is empty in the spaces that use the theme. The fix is to enable all modules of the Documentation theme plugin. See the [knowledge base article](#).

**Checking for Other Known Issues and Troubleshooting the Confluence Upgrade**

After you have completed the steps required to upgrade your Confluence installation, check all the items on the [Confluence post-upgrade checklist](#) to ensure that everything works as expected. If something is not working...
correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

**Useful Plugins**

**Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.**

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Above are the issues resolved in Confluence 3.2, ordered by number of votes. For the full details of the fixes, improvements and new features, please take a look at our issue tracker.

**Confluence 3.3.1 Release Notes**

**17 August 2010**

Confluence 3.3.1 is a recommended upgrade which fixes some security flaws and other bugs.

We have fixed a security flaw in this release that compromised the Secure Administrator Sessions (WebSudo) feature that was introduced in Confluence 3.3. Read the security advisory for more details.

**Don't have Confluence 3.3 yet?**

Take a look at the new features and other highlights in the Confluence 3.3 Release Notes.

[Download Latest Version](#)

**Release Notices**

**Security Advisory**

This release fixes a security flaw. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

**Upgrading from a Previous Version of Confluence**

Upgrading Confluence should be fairly straightforward. Please read the Confluence 3.3.1 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.3.1 Upgrade Notes

Below are some important notes on upgrading to **Confluence 3.3.1**. Confluence 3.3.1 is a recommended upgrade which fixes some security flaws as well as other bugs. For more details, please read the **Confluence 3.3.1 Release Notes**.

On this page:
- Upgrade Notes
- Upgrade Procedure
- Useful Plugins

Upgrade Notes

- We have fixed a security flaw in this release that compromised the Secure Administrator Sessions (WebSudo) feature that was introduced in Confluence 3.3. Read the [security advisory](#) for more details.

- There is known issue in this release where you will not be able to add permissions to a page when copying it. We are addressing this issue. In the meantime, you can work around this by creating a new page, copying the wiki markup from the page that you want to copy and applying permissions to the new page. See [CONF-20584](#) for more information.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**.
   - The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   - Tip: Another term for 'Home directory' would be 'data directory'. Read more about [finding your Home directory](#).

2. If your version of Confluence is earlier than 3.3, read the **release notes and upgrade guides** for all releases between your version and the latest version. In particular:
   - Please read the **Confluence 3.3 Upgrade Notes**.
   - If you are upgrading from 2.1 or earlier, please also read the **2.2 release notes**.

3. **Download** the latest version of Confluence.

4. Follow the instructions in the **Upgrade Guide**.

Useful Plugins

**Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on [plugin support](#).**

- Appfire's [Upgrade Assistant for Confluence (UAC)](#) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.3.3 Release Notes

21 September 2010
Confluence 3.3.3 is a recommended upgrade which fixes some security flaws and other bugs. Note that Confluence 3.3.2 was an internal release only.

- **Security fixes in Confluence 3.3.3.** Please refer to the [security advisory](#) for details of the security vulnerabilities, risk assessment and mitigation strategies.

- **Office Connector temporary storage location.** When configuring the temporary storage location for the Office Connector’s `View File` macro, you can no longer enter a specific file location via the Confluence Administration Console. Instead, the Administration Console offers three options, as described below. If you have previously entered a specific file location, the location will still be valid. However, if you want to change the location you will need to choose one of the three options described below, to hold the temporary file:
  - In memory.
  - In your Confluence Home directory.
  - In a file location that you can specify in the `directories.properties` file, located in the Office Connector JAR. Instructions are in the [documentation](#).

- **Preview pane now shows full content.** When previewing a wiki page in Firefox, the preview pane will now show the entire content of the page. This fixes a problem experienced with Firefox 3.6.7 and later, caused by a change in Firefox.

- **Other noteworthy fixes.** The complete list of bug fixes is at the bottom of this page. Highlights:
  - You can now set page restrictions when copying a page.
  - Confluence will retain your setting when you turn on the 'Did You Mean' feature in the search.
  - When you edit a wiki page in Word, your changes are now saved.

**Don’t have Confluence 3.3 yet?**

Take a look at the new features and other highlights in the [Confluence 3.3 Release Notes](#).

**Release Notices**

- **Security advisory**: This release fixes some security flaws. Please refer to the [security advisory](#) for details of the security vulnerabilities, risk assessment and mitigation strategies.

- **Upgrading from a previous version of Confluence**: Upgrading Confluence should be fairly straightforward. Please read the [Confluence 3.3.3 Upgrade Notes](#). We strongly recommend that you back up your `confluence.home` directory and database before upgrading.

Confluence 3.3.3 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.3.3. Confluence 3.3.3 is a recommended upgrade which fixes some security flaws as well as other bugs. For more details, please read the Confluence 3.3.3 Release Notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   
   Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.3, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.3 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin’s information page to see
whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.3 Release Notes

7 July 2010

With great pleasure, Atlassian presents Confluence 3.3 now with more ways to integrate with JIRA and an even faster and simpler editor.

Highlights of this Release:

- Confluence Page Gadget
- Autocomplete for Inserting Macros
- Property Panels for Links
- Property Panels for Images
- Manage Watchers
- Email Notifications for Network Activity and Blogs
- Blog Improvements
- Context-Sensitive Help Links
- Security Features
- Infrastructure Changes
- Even More Improvements

More:

- Thank you for all your issues and votes. Keep logging issues to help us keep improving!
- Read the release notices for important information about this release.
- Attached is the full list of issues resolved in this release.

Highlights of Confluence 3.3

Confluence Page Gadget

You wanted to display Confluence content in other applications and we’ve delivered. The Confluence Page Gadget is the newest addition to our suite of gadgets. You can specify a Confluence page or blog post to be
shown in the gadget, which you can then add to your JIRA dashboard or even another Confluence site. The gadget also renders macros from your Confluence page or blog post, allowing you to embed rich content like tasklists, spreadsheets, videos and more, in your applications via the gadget.

More...

2

Autocomplete for Inserting Macros

Confluence 3.3 builds on the autocomplete for links and autocomplete for attachments features introduced in Confluence 3.2. You can now take advantage of the speed and convenience of autocomplete to insert macros via the rich text editor. Just enter '{' and start typing to see the suggested macros that match your text.
Property Panels for Links

Keep common link functions at your fingertips with property panels for links. You no longer need to leave the rich text editor to see where a link is pointing to, or to remove the link. Click a link and a properties panel will appear. Simply click the appropriate button to view/go to the link location, edit the link or unlink it.

Property Panels for Images

Property panels have also been added for images. You no longer need to leave the rich text editor to resize an image or add a border. You can easily perform these functions via the property panel.
Manage Watchers

Confluence 3.3 now allows you to manage the watchers for all pages and blog posts in a space, if you are a space administrator for that space. You can view, add and remove watchers of a page or blog post, as well as view all watchers of the space on a single screen.
Email Notifications for Network Activity and Blogs

We've extended the email notifications functionality in Confluence. You can now subscribe to email notifications for all blog activity in your Confluence site and all activity by people that you follow.

More...

Blog Improvements

A number of improvements have been made to Confluence blogs in this release.

- **Change Comments in Blog Posts** — We've implemented change comments on blog posts, so you can comment on the updates you make to blog posts, in the same way as you can for pages.
- **Blog Navigation Improvements** — The blog view has also been redesigned to present more informative content with less clutter. The old calendar has been replaced with a new sidebar listing blog posts for the month and you can now see the profile pictures of the bloggers in posts.
Context-Sensitive Help Links

Context-sensitive help links are now available in Confluence. These links will redirect you to the appropriate online documentation for the version of Confluence that you are using. You can also use this feature to configure your own local Confluence documentation, e.g. if your deployment is in an environment without an Internet connection.

Security Features

- **Confluence secure administrator sessions.** Confluence has another line of defence against hijackers of administrator sessions. All features in the Administration section of Confluence (and some in the Space Administration section) will require the user to validate their credentials before proceeding. After validating, a message at the top of each page reminds you of your temporary administrator session. The temporary session will expire after 10 minutes of administrator inactivity and can also be terminated manually.

- **Login CAPTCHA.** Confluence now requires the user to answer a CAPTCHA question after a given number of failed login attempts. This security mechanism protects not only the login page but the
RPC-interface as well. After a configurable number of failed login attempts via the RPC interface, the user is required to log in using the web interface which then presents the CAPTCHA image.

More...

- **XSRF protection on comment creation.** An XSRF token is now required to be present when adding a comment. Don’t worry though, a system is in place so that your session will not expire and you can take your time to write the perfect comment! All the bundled themes have been updated to use this feature, but you can disable it if you are using a custom theme.

More...

- **Login information.** Confluence now captures metadata about login attempts, including the dates of the last failed and successful login and the number of failed logins. A Confluence administrator can also reset the number of failed logins for a particular user.

More...

10

**Infrastructure Changes**

We’ve made a number of infrastructure changes to aid plugin development:

- DWR deprecated. See the [Confluence 3.3 Upgrade Notes](#) for more details.
- Upgraded to Atlassian User Interface (AUI) 3.0.5. See the features in [AUI 3.0](#).
- Upgraded to [Shared Access Layer (SAL) 2.1](#).
- Upgraded to Atlassian Events 2.0.1
- Upgraded to Atlassian REST Module 2.0.0
- Upgraded to Atlassian Plugin Framework 2.5.1. See the features in [Atlassian Plugin Framework 2.5](#), including:
  - New [web panel](#) and [web panel renderer](#) plugin modules, allowing you to add sections of HTML to Confluence page.
  - Trigger control for your servlet filters, allowing you to specify the conditions under which your [servlet filter](#) plugin module is triggered.
  - Additional contexts in [web resources](#), so that Confluence now supports the standard contexts provided by the plugin framework as well as the existing Confluence contexts.
- Upgraded to Bandana 2.0. See our documentation on [persistence in Confluence](#), including:
  - Custom context objects.
  - Key enumeration.
  - Item removal.
  - Custom serialisation.

11

**Even More Improvements**

- **Streamlined 'Import Word Document' wizard.** The screens in the 'Import Word Document' wizard have been redesigned to make this feature much more intuitive.
- **Redesigned default dashboard.** We’ve made a number of minor improvements to the default dashboard, including new buttons and a new welcome message.
- **Improved ‘General Configuration’ user interface.** The General Configuration screen in the Administration Console has been given a face lift.
Accessibility Improvements. We've added labels, legends and skip links so that Confluence now complies with more of the Section 508 Web Accessibility Standards. We still have a long way to go, but these pages should now be more screen-reader friendly:

- Dashboard
- General pages
- Profiles
- Set your Password
- Attachments
- People Directory
- User Status

Release Notices

Security advisory

This release fixes some security flaws. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

Upgrading from a previous version of Confluence

- Upgrading Confluence should be fairly straightforward. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.
- Please refer to the Confluence 3.3 upgrade notes for further essential information about plugins and other factors affecting your upgrade.

Known Issues

We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Confluence release and report any problems so that we can fix them quickly.

We value this feedback, which means that we can tell you about some minor known issues in Confluence 3.3. Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the important technical advisories on the front page of the Knowledge Base.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

End of Support for WebSphere, WebLogic, Resin, Internet Explorer 6 and Java Platform 5 (JDK/JRE 1.5)

As previously announced, we are no longer providing support for:

- IBM WebSphere (all versions) from this release onwards.
- Oracle WebLogic (all versions) from this release onwards.
- Caucho Resin (all versions) from this release onwards.
- Internet Explorer 6 from this release onwards.
- Java Platform 5 (JDK/JRE 1.5) from this release onwards.

Please see End of Support Announcements for Confluence for further details.
DWR Deprecation Notice

We have replaced DWR with XWork actions (returning JSON, implementing the Beanable interface). The DWR servlet still works, however the client-side JavaScript files are not embedded into pages anymore. Support for the client side Javascript proxies has been moved into the Confluence Legacy Web Resources plugin. This plugin is disabled by default.

If you need any of the following web resources you will need to enable the Confluence Legacy Web Resources plugin:

- DWR framework
- DWR Javascript proxies for label (add, remove, suggest) or editor operations (heartbeat, draft saving, editor preferences)

You will also need to make the following resource a required resource in your view template: `legacy.confluence.web.resources:dwr-confluence`

This will embed the DWR client-side JavaScript files in your plugin's view output.

Upgrade Procedure

⚠️ Upgrade a test environment first

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence home directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.
2. If your version of Confluence is earlier than 3.2.x, then please read the Upgrade Notes Overview and the Upgrade Notes for each version of Confluence listed on that page. (There are hyperlinks to each one.) Also:
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade again from version 2.7.x to the latest. For more details, please refer to CONF-11767.
3. Download the latest version of Confluence.
4. Follow the instructions in the upgrade guide.

Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

Useful Plugins
Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Above are the issues resolved in Confluence 3.3, ordered by number of votes. For the full details of the fixes, improvements and new features, please take a look at our [issue tracker](#).

**Confluence 3.4.1 Release Notes**

1 November 2010
Confluence 3.4.1 is a bug-fix release. The full list of fixes is at the bottom of this page. Here are the highlights:

- **Edit in Word on Windows 7.** This release fixes a problem where the 'Edit in Word' functionality did not work on Windows 7. Before this fix, opening a Confluence page as a Word document would cause the document to be loaded in read-only mode for users running Windows 7.

- **Word wrap for long words in PDF exports.** A bug caused long words, or text without spaces, to be cut off in PDF exports. This is now fixed, so that long words are wrapped onto the next line. This is particularly relevant for languages where text does not contain spaces, such as Chinese and Japanese.

Don’t have Confluence 3.4 yet?

Take a look at the new features and other highlights in the Confluence 3.4 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.4.1 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.4.1 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.4.1. For details of the fixes in this release, please read the Confluence 3.4.1 Release Notes.
If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

   Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.4, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the [Confluence 3.4 Upgrade Notes](#).
   - If you are upgrading from 2.1 or earlier, please also read the [2.2 release notes](#).

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

**Useful Plugins**

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Appfire's [Upgrade Assistant for Confluence (UAC)](#) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

### Confluence 3.4.2 Release Notes

15 November 2010

**Confluence 3.4.2** is a bug-fix release. The full list of fixes is provided at the bottom of this page.

**Don't have Confluence 3.4 yet?**

Take a look at the new features and other highlights in the [Confluence 3.4 Release Notes](#).

[Download Latest Version](#)

**Release Notices**

- **Security advisory**: This release fixes some security flaws. Please refer to the [security advisory](#) for details of the security vulnerabilities, risk assessment and mitigation strategies.

  Upgrading from a previous version of Confluence should be fairly straightforward. Please read the [Confluence 3.4.2 Upgrade Notes](#). We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.4.2 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.4.2. Confluence 3.4.2 is a recommended upgrade which fixes some security flaws as well as other bugs. For more details, please read the Confluence 3.4.2 Release Notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.4, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   • Please read the Confluence 3.4 Upgrade Notes.
   • If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin’s information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

• Appfire’s Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.4.3 Release Notes

29 November 2010

Confluence 3.4.3 is a bug-fix release. The list of fixes is at the bottom of this page.

In addition to releasing Confluence 3.4.3, we have also updated the code for the Expand user macro so that the body of the macro now visible in PDF exports. To take advantage of this improvement, please copy the macro ‘template’ from this documentation page: Writing the Expand User Macro. Note that you do not need to upgrade to Confluence 3.4.3 in order to use the updated macro. Simply updating your macro template is enough.

Don't have Confluence 3.4 yet?
Take a look at the new features and other highlights in the Confluence 3.4 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.4.3 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

**Confluence 3.4.5 Upgrade Notes**

Below are some important notes on upgrading to Confluence 3.4.5. For details of the fixes in this release, please read the Confluence 3.4.5 Release Notes.

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   - Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.4, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.4 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. **Download** the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.4.6 Release Notes

4 January 2011

Confluence 3.4.6 is a bug-fix release. Please see the list of updates and fixes below.

Don't have Confluence 3.4 yet?

Take a look at the new features and other highlights in the Confluence 3.4 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.4.6 upgrade notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

**Confluence 3.4.6 Upgrade Notes**

Below are some important notes on upgrading to **Confluence 3.4.6**. For details of the fixes in this release, please read the [Confluence 3.4.6 Release Notes](#).

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   - Tip: Another term for 'Home directory' would be 'data directory'. Read more about [finding your Home directory](#).
2. If your version of Confluence is earlier than 3.4, read the [release notes and upgrade guides](#) for all **releases** between your version and the latest version. In particular:
   - Please read the [Confluence 3.4 Upgrade Notes](#).
   - If you are upgrading from 2.1 or earlier, please also read the [2.2 release notes](#).
3. Download the latest version of Confluence.
4. Follow the instructions in the [Upgrade Guide](#).

**Useful Plugins**

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on [plugin support](#).
- Appfire's **Upgrade Assistant for Confluence (UAC)** is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

**Confluence 3.4.7 Release Notes**

**27 January 2011**

**Confluence 3.4.7** is a bug-fix release.

This release solves a problem that caused the Confluence index build to fail without reporting any errors. Symptoms of the problem included missing blog posts, and missing pages in the list returned by the Content by Label macro. This is now fixed.

We have also fixed some issues experienced when editing a page or document in Word.

- When using Firefox, editing pages in Word failed if the page title contained special characters.
- Editing pages in Word failed for long path names. This problem could occur when the combination of Confluence space name and page title exceeded a certain number of characters. (The exact number depended on your environment.) Editing attachments with long path names in Office also failed.

**Don't have Confluence 3.4 yet?**

Take a look at the new features and other highlights in the **Confluence 3.4 Release Notes**.

[Download Latest Version](#)

**Release Notices**

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the **Confluence 3.4.7 upgrade notes**. We *strongly recommend* that you back up your `confluence.home` directory and database before upgrading.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.4, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   • Please read the Confluence 3.4 Upgrade Notes.
   • If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

• Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.4.8 Release Notes

7 February 2011

Confluence 3.4.8 is a bug-fix release.

This release adds OpenOffice MIME type handling capabilities to Confluence file uploads. Hence, if you now upload any OpenOffice file to Confluence and then download it, the file will be downloaded with the correct file extension instead of .zip.

We also fixed a bug in the spaces list macro, which caused this macro to fail on Confluence instances with large numbers of spaces.

Finally, if your Confluence site was started with the password.confirmation.disabled system property set to false, a bug in Confluence prevented site administrators from saving configuration changes made to any of the fields on the Edit Security Configuration page. This bug, which has now been resolved, will most likely only affect Confluence sites configured with a custom authenticator.

Don't have Confluence 3.4 yet?

Take a look at the new features and other highlights in the Confluence 3.4 Release Notes.

Confluence 3.4.8 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.4.8. For details of the fixes in this release, please read the [release notes](release_notes).

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   - Tip: Another term for 'Home directory' would be 'data directory'. Read more about [finding your Home directory](finding_your_data_directory).
2. If your version of Confluence is earlier than 3.4, read the **release notes and upgrade guides** for all releases between your version and the latest version. In particular:
   - Please read the [Confluence 3.4 Upgrade Notes](Confluence_3.4_Upgrade_Notes).
   - If you are upgrading from 2.1 or earlier, please also read the [2.2 release notes](2.2_release_notes).
3. **Download** the latest version of Confluence.
4. Follow the instructions in the [Upgrade Guide](Upgrade_Guide).

Confluence 3.4.9 Release Notes
21 February 2011

Confluence 3.4.9 is a bug-fix release.

Don't have Confluence 3.4 yet?

Take a look at the new features and other highlights in the Confluence 3.4 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.4.9 upgrade notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.4.9 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.4.9. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   - Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.4, read the **release notes and upgrade guides** for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.4 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Confluence 3.4 Release Notes

12 October 2010

With great pleasure, Atlassian presents Confluence 3.4, with more ways to **extend your wiki**, **manage your plugins** and **go places quickly**.

Highlights of this Release:

- New Keyboard Shortcuts, Mac-Friendly Too
- Keyboard Shortcut Dialog
- User Macros in Macro Browser and Autocomplete
- New Plugin Manager
- Improved Performance
- Other Improvements
- Infrastructure Changes

More:

- Read the **release notices** for important information about this release.
- See the full list of **issues resolved in this release**.

Responding to your Feedback:

- Over **180** votes satisfied.
- Thank you for all your issues and votes. **Keep logging issues** to help us keep improving!

Video of What's New:

Highlights of Confluence 3.4
New Keyboard Shortcuts, Mac-Friendly Too

Confluence has a number of new keyboard shortcuts to aid both navigation and editing. If you are already using JIRA 4.1, you will notice that we have made an effort to be as consistent as possible. Confluence shortcuts now support the standard Mac 'Cmd' key.

Some examples of shortcuts to use when viewing a page or blog post:

<table>
<thead>
<tr>
<th>c</th>
<th>Create a child page.</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>Create a blog post.</td>
</tr>
<tr>
<td>m</td>
<td>Comment on a page or a blog post.</td>
</tr>
<tr>
<td>e</td>
<td>Open the editor.</td>
</tr>
</tbody>
</table>

Try these from within the Rich Text Editor:

<table>
<thead>
<tr>
<th>Ctrl+s or Cmd+s</th>
<th>Save the page.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+Alt+7 or Cmd+Alt+7</td>
<td>Apply the default paragraph style.</td>
</tr>
</tbody>
</table>

Read more about keyboard shortcuts.

Keyboard Shortcut Dialog

Confluence has many useful keyboard shortcuts. Now it's easy to discover them. Select 'Keyboard Shortcuts' from the 'Browse' menu or just press '?' on your keyboard. The new keyboard shortcut dialog shows shortcut keys for the editor as well as for general use.
User Macros in Macro Browser and Autocomplete

Looking for a macro to add to your page?

- **User macros easy to find.** User macros are short pieces of code that perform an often-used function or add some custom formatting to a page. You can now choose which of your user macros are visible to everyone in the macro browser and autocomplete.

- **New options for writing user macros.** It’s easy to create a user macro. Just go to the Confluence Administration Console and enter the details. Confluence 3.4 offers new options for making your macro look good in the macro browser. Read all about [writing user macros](#). You can specify the macro category, link to an icon, define the parameters that the macro browser will use to prompt the user for information, and more.

- **Working examples of user macros.** To help you get started, we have documented the Expand and Stats user macros. These are working examples that you can add to your Confluence site.

Here is an example of a user macro, the Expand macro, appearing in the autocomplete dropdown:

```
{expa

Macro suggestions
| Expand
| Open Macro Browser
```

It looks like this in the macro browser:
New Plugin Manager

Managing plugins and performing Confluence upgrades is now much easier with the brand new plugin manager. The Universal Plugin Manager (UPM) is now bundled with Confluence and will soon make its way into our other tools, including JIRA. With the UPM you can:

- Perform a plugin compatibility check before upgrading Confluence.
- Install new plugins from the Atlassian Plugin Exchange.
- Manage existing plugins.
- With just one click, upgrade all plugins that have updates available.
- View and track updates via the audit log.

See the documentation on [managing plugins](#). Discover, download and install new plugins from the [Atlassian Plugin Exchange](#) without leaving Confluence.
Improved Performance

Confluence is faster in a couple of ways.

- **Loading of the dashboard.** If your Confluence site has a large number of spaces, you may notice that the dashboard now loads much faster. For details, see issue CONF-5446.

- **Daily email updates.** The performance of the job that sends the daily email updates has been improved significantly. The job may run up to 100 times faster depending on your configuration. For details, see issue CONF-13875.

Other Improvements

We have made a number of small improvements to Confluence screens and other functionality described below.

- **Space permissions.** A new dropdown menu on the space permissions screen enables you to select or deselect all the permission types at once.

- **Dashboard 'Recently Updated' section.** The list of recent updates on the dashboard now tells you what action the user performed (for example, created, updated or commented) and has a timestamp for each activity.

- **Permissions for PDF stylesheets.** Space administrators can now edit the PDF stylesheets and layouts. Previously, you had to be a system administrator to have access to these options in the space administration screen.

- **Space details and space exports.** The space details screen has a new, fresh look. Similarly, we have redesigned the screen for PDF, HTML and XML exports.

- **Database Support.** We have added support for the following database servers:
  - Microsoft SQL Server 2008.
  - PostgreSQL 8.4.
  See the page about supported platforms.

- **Improved security for users.** This release brings an improved workflow for resetting your password. Confluence now requires an additional confirmation check before allowing a password change. We have also tightened the security of the 'remember me' functionality. As an additional security measure, Confluence will prompt you for your password when you change your email address.
Infrastructure Changes

Plugin developers will find some improvements in this release too.

- **Atlassian User Interface (AUI).** We have upgraded to AUI 3.2, bringing jQuery live events and redesigned drop shadows. See [AUI 3.1 Release Notes](#) and [AUI 3.2 Release Notes](#).

- **Plugin Framework.** Now with the Atlassian Plugin Framework 2.6, you have easy access to plugin objects, the plugin module tracker, ChainingClassLoader and more. See [Plugin Framework 2.6 Release Notes](#). Confluence now also bundles the Web Resource Transformer plugin module.

- **Shared Access Layer.** SAL 2.2 includes support for secure administrator sessions ('WebSudo') and a cross-application API for accessing user profiles. See [Shared Access Layer 2.2 Release Notes](#).

- **REST plugin module.** We have upgraded from version 2.0 to version 2.2 of the Atlassian REST Plugin. Now you have more reliable detection of automatic logout, the ability to include JSON examples in your documentation, and support for secure administrator sessions ('WebSudo'). See [REST Plugin 2.1 Release Notes](#) and [REST Plugin 2.2 Release Notes](#).

- **Atlassian Plugin Development Platform.** With Confluence 3.4 comes the first public announcement of the Atlassian Plugin Development Platform. Using Atlassian's plugin development tools, developers can create plugins that extend the functionality of Atlassian applications such as JIRA, Confluence and others. The Atlassian Plugin Development Platform defines the set of tools a plugin developer can use. See [Plugin Development Platform 2.8 Release Notes](#).

Release Notices

- **Security advisory.** This release fixes some security flaws. Please refer to the [security advisory](#) for details of the security vulnerabilities, risk assessment and mitigation strategies.

- **Upgrading from a previous version of Confluence.** Upgrading Confluence should be fairly straightforward. We strongly recommend that you back up your Confluence Home directory and your database before upgrading. Please refer to the [Confluence 3.4 upgrade notes](#) for further essential information about plugins and other factors affecting your upgrade.

- **Known Issues.** We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Confluence release and report any problems so that we can fix them quickly. We value this feedback, which means that we can tell you about any minor known issues in Confluence 3.4. Please check the [important technical advisories](#) on the front page of the Knowledge Base.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

Confluence 3.4 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.4. For details of the new features and improvements in this release, please read the Confluence 3.4 release notes.

On this page:

- Upgrade Notes
  - Visibility of User Macros in the Macro Browser
  - Crowd 2.0.7 Upgrade Required if your Confluence is Integrated with Crowd
  - Configuration Option for Disabling Password Confirmation (Useful if Using a Custom Authenticator)
  - Existing 'Remember Me' Cookies No Longer Valid
  - End of Support for Oracle 10g and Safari 3 and 3.1
  - Advance Notice of End of Support for PostgreSQL 8.1 and Firefox 3.0
  - Clickr Theme and Left Navigation Theme No Longer Bundled with Confluence
  - Plugin Repository Macros No Longer Work
  - Wiki Markup in Space Description No Longer Rendered
Upgrade Procedure

- Checking for Other Known Issues and Troubleshooting the Confluence Upgrade
- Useful Plugins

Upgrade Notes

Visibility of User Macros in the Macro Browser

As stated in the release notes, the Confluence Macro Browser and autocomplete can now show user macros as well as other macros. If your Confluence site already has some user macros, when you upgrade to Confluence 3.4 the upgrade task will set all existing user macros to be **visible only to system administrators**.

After upgrading, you will need to set each macro individually to be **visible to all users**, depending on your requirements. See the documentation on **writing user macros**.

Crowd 2.0.7 Upgrade Required if your Confluence is Integrated with Crowd

If your Confluence installation is integrated with Atlassian Crowd for user management and single sign-on, you will need to upgrade to **Crowd 2.0.7** when upgrading to Confluence 3.4. Note also that for Confluence 3.4, there is a new Seraph authenticator to be specified in the `CONFLUENCE-INSTALLATION/confluence/WEB-INF/classes/seraph-config.xml` file.

```
<authenticator
class="com.atlassian.crowd.integration.seraph.v22.ConfluenceAuthenticator"/>
```

Please follow the [Crowd integration guide](#) for complete instructions, including the update to the Seraph authenticator configuration. See our [knowledge base article](#) for symptoms of the problem that occurs if Crowd is not upgraded. And here are the [Crowd 2.0.7 release notes](#).

Configuration Option for Disabling Password Confirmation (Useful if Using a Custom Authenticator)

This section is relevant to Confluence installations that use a custom authentication mechanism. You may run into problems with the Confluence security measure that requires password confirmation for administrative actions, change of email address and actions.

If necessary, you can set the `password.confirmation.disabled` system property to disable the password confirmation functionality. See [Recognised System Properties](#). We provide this configuration option as a workaround for issue [CONF-20958](#).

Existing 'Remember Me' Cookies No Longer Valid

We have tightened the security of Confluence’s ‘remember me’ functionality. As a result of this change, any existing ‘remember me’ cookies will be invalid after you upgrade your Confluence installation. When accessing Confluence for the first time after the upgrade, users will be prompted to log in as usual.

End of Support for Oracle 10g and Safari 3 and 3.1

As previously announced, we no longer offer support for:

- Oracle 10g **from this release onwards**.
- Safari 3 and 3.1 **from this release onwards**.

Please see [End of Support Announcements for Confluence](#).

Advance Notice of End of Support for PostgreSQL 8.1 and Firefox 3.0
We are planning on ending support for:

- PostgreSQL 8.1 in Confluence 3.5.
- Firefox 3.0 in Confluence 3.5.

Please see End of Support Announcements for Confluence.

Clickr Theme and Left Navigation Theme No Longer Bundled with Confluence

Confluence 3.2 introduced two new themes, the Documentation theme and the Easy Reader theme. At the same time, we announced the deprecation of the following two themes:

<table>
<thead>
<tr>
<th>Deprecated Theme</th>
<th>Description</th>
<th>Suggested Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clickr theme</td>
<td>This theme was inspired by the Flickr user interface, with Confluence content centred on the page.</td>
<td>Easy Reader theme</td>
</tr>
<tr>
<td>Left Navigation theme</td>
<td>This theme provided a navigation bar on the left hand side of the screen.</td>
<td>Documentation theme</td>
</tr>
</tbody>
</table>

Please note the following:

- The Clickr theme and Left Navigation theme are no longer bundled with Confluence and are not supported from Confluence 3.4 onwards.
- When you upgrade your Confluence installation to Confluence 3.4, the upgrade process will automatically migrate your spaces to the following themes:
  - Spaces using the Left Navigation theme will be converted to the Documentation theme.
  - Spaces using the Clickr theme will be converted to the Easy Reader theme.
- If you do not wish your spaces to be migrated, you can start Confluence with the following JVM parameter to prevent the conversion of the space themes:

  -Dconfluence.theme.skip.migration=true

During the upgrade, the Left Navigation and Clickr themes will be removed from your Confluence site but, if you specify the above parameter, your spaces will still expect to use those themes. After the upgrade, you will need to download and install the Left Navigation and Clickr themes from the Atlassian Plugin Exchange so that your spaces can continue to use them. If you do not reinstall those themes, the affected spaces will use the default theme.

- If the upgrade process converts your spaces to the new themes and you later decide to revert to the old themes, you can get some help from the Confluence logs written during the upgrade process. The logs contain a SQL query that you can run to revert the theme migration. The relevant part of the log file looks like this:
2010-08-05 15:13:22,572 INFO [main] [confluence.upgrade.upgradetask.ClickLeftNavMigrationUpgradeTask] doInTransaction To rollback the migration of spaces with Left Navigation Theme theme execute the following SQL:
update BANDANA set BANDANAVALUE = '<map><entry><string>theme.key</string><string>com.atlassian.confluence.themes.leftnavigation:leftnavigation</string></entry></map>' where BANDANACONTEXT in ('~SPACE-KEY1', 'SPACE-KEY2', 'SPACE-KEY3') and BANDANAKEY = 'atlassian.confluence.theme.settings'

2010-08-05 15:13:22,573 INFO [main] [confluence.upgrade.upgradetask.ClickLeftNavMigrationUpgradeTask] doInTransaction To rollback the migration of spaces with Clickr theme execute the following SQL:
update BANDANA set BANDANAVALUE = '<map><entry><string>theme.key</string><string>com.atlassian.confluence.themes.clickr:clickr</string></entry></map>' where BANDANACONTEXT in ('SPACE-KEY4', 'SPACE-KEY5', 'SPACE-KEY6') and BANDANAKEY = 'atlassian.confluence.theme.settings'

The words '~SPACE-KEY1', 'SPACE-KEY2', etc represent the keys of the spaces that were converted. If you run the SQL statements and install the Left Navigation and Clickr themes (see below), your spaces will be in the same state as before the upgrade task ran.

- If you restore a space from an XML backup at some time after upgrading to Confluence 3.4, the space will not be migrated to a new theme. You will need to apply a different theme manually. See Applying a Theme to a Space. Alternatively, you can download and install the Left Navigation and Clickr themes from the Atlassian Plugin Exchange if you wish to continue to use them.

Plugin Repository Macros No Longer Work

Some macros were never intended for external use, and we have always recommended that you do not add them to a wiki page. Nevertheless, it is possible that some Confluence sites have these macros on some pages. Please note that these macros no longer work in Confluence 3.4 onwards. They were part of the Plugin Repository, which we have now replaced with a new plugin manager.

These macros no longer work:

- {repository-plugin}
- {recentlyupdated-plugins}
- {popular-plugins}
- {download-stat}
- {confluence-status}
- {plugin-status}
- {plugin-repository}
- {plugins-supported}

Wiki Markup in Space Description No Longer Rendered

Please note that the space description no longer renders wiki markup. If your space descriptions include wiki markup, the markup will display as plain text.

Upgrade Procedure
Upgrade a test environment first

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence home directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 3.3.x, then please read the Upgrade Notes Overview and the Upgrade Notes for each version of Confluence listed on that page. (There are hyperlinks to each one.) Also:
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade again from version 2.7.x to the latest. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.

4. Follow the instructions in the upgrade guide.

Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

Useful Plugins

**Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.**

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.5 Release Notes

16 March 2011

With great pleasure, Atlassian presents Confluence 3.5. Discover what's happening to your content and share with your colleagues. Let people see for themselves what's new after a Confluence upgrade. Get cosy with LDAP and intimate with JIRA. Love that HTML5 drag-and-drop and more!

Highlights of this Release:

- Easy, Powerful Connections to Active Directory, LDAP and Crowd
- Improved JIRA Integration
- Drag-and-Drop for HTML5 Browsers
- Autowatch and Improved Notification Settings
- Sharing Pages and Blog Posts
- Enhanced Code Macro
- More Administrative Improvements
- "What's New" Feature Tour
- Categories, a New Way of Organising Spaces
- Embedding Audio and Video with the Multimedia Macro
- Other Improvements
- Infrastructure Changes

More:

- Read the release notices for important information about this release.
- See the full list of issues resolved in this release.

Responding to your Feedback:

- More than 1,000 votes satisfied.
- Thank you for all your issues and votes. Keep logging issues to help us keep improving!

Highlights of Confluence 3.5
Easy, Powerful Connections to Active Directory, LDAP and Crowd

Connecting Confluence to an external user directory used to be painful, whether it was Active Directory, other LDAP servers or Atlassian Crowd. You had to edit XML files, and the configuration options were limited. Confluence 3.5 brings a simple, powerful and flexible directory management interface:

- Choose from a list of supported directory types, including Microsoft Active Directory and ten other popular LDAP schemas.
- Add as many directory servers as you need. Connect directory servers of different types, including the internal directory (default), LDAP, Crowd and/or JIRA.
- Configure all your LDAP settings via the Confluence Administration Console: Permissions, server and schema settings. We pre-populate the fields with default values depending on your choice of directory type. Choose the LDAP permissions to suit your needs: Read/write, read only, local groups or authentication only. Make use of the caching and copy-as-required configurations to optimise the performance of your LDAP searches. More...
- Turn on support for nested groups.
- For larger and more complex installations, you may need to install Atlassian Crowd. If so, you will now enjoy the simple, quick setup via the Confluence and Crowd administration consoles. Clever synchronisation and caching ensure the best response times. More...
- Are your users already in JIRA? Confluence 3.5 offers a much improved integration with JIRA for user management. See below.

![Directory Management Console](image)

Improved JIRA Integration

Integrating Confluence and JIRA has just become much easier. Watch a short overview video.

- Connect JIRA and Confluence via application links. It’s now so much easier to set up a trust relationship between JIRA and Confluence, then share information across your applications. More...
• **Create, find and insert JIRA issues.** The new ‘Insert JIRA issue’ option in the editor toolbar offers a number of methods for displaying JIRA issues on a Confluence page or blog post. Insert individual issue within the text. Generate a list of issues using JIRA Query Language (**JQL**) or by specifying each issue individually on the page or blog post. You can also use this option to create an issue in JIRA and insert it within the text. [More...]

• **Connect to JIRA for user management.** **JIRA 4.3** offers a powerful user management capability. JIRA now able to act as your directory manager, interacting with one or more user directories and ensuring that you have the same set of users and groups across both applications. Confluence 3.5 can connect direct to JIRA’s new directory management feature. Clever synchronisation and caching ensure the best response times for your directory searches. [More...]

---

**Drag-and-Drop for HTML5 Browsers**

Confluence’s [drag-and-drop](#) feature now supports HTML5 in preference to Google Gears. If your browser fully supports HTML5 and you no longer need the Google Gears browser add-on for anything else, you can uninstall this add-on without any loss of functionality in Confluence. The following browsers support HTML5-based drag-and-drop:

- Firefox 3.6
- Safari 5
- You can try it with Chrome too. (Official Chrome support coming soon!)
**Autowatch and Improved Notification Settings**

Confluence’s new autowatch makes it easier than ever to keep track of pages and blog posts that interest you. Other improvements help you optimise your notifications. [Watch a short overview video.]

- **Watch your own content automatically.** With autowatch turned on, you will receive an email notification each time someone edits or comments on a page that you added or updated. You can turn autowatch on or off by editing the email settings in your user profile.
- **Adjust your settings directly from the email notification.** The notification email message has useful links to help you manage your notifications and watches.
- **Watch for new blog posts only.** If you have subscribed to all blog posts on the Confluence site, you will now receive notification for new blog posts only. Earlier versions of Confluence sent a notification for every change to existing blog posts, and for all comments on blog posts too. [More...]
- **Watch blog posts in a space.** Would you like to know when someone adds a blog post in a space, without having to see all other updates too? Now you can! [More...]
- **Configure the from address in email notifications.** Your Confluence administrator can configure the Confluence mail server so that the ‘From’ field of the email notification contains the full name or email address of the Confluence user who made the change. [More...]

**Email Settings**

- **Autowatch**
  - Pages and blog posts that you create, edit or comment on will automatically be watched for future changes.

**Personalised Email**

- Emails appear from the user that performed the action.

**Watch blogs**

- Subscribe to only blog posts for a space

**[confluence] Plugin Development > Plugin Development**

- Joseph Clark (Confluence) to me

**Plugin Development Dashboard**

- Page edited by Joseph Clark

**Sharing Pages and Blog Posts**

Want to email a Confluence page or blog post quickly? Simply visit that page or blog post, click the new ‘Share’ button and specify the people you want to share the page with. Add an optional note then click ‘Share’. [More...]
Enhanced Code Macro

The code macro offers several new options.

- More language and environment support for syntax highlighting.
- Expandable code blocks.
- Wrap long lines of code into a new line.
- Sequential line numbering.
- Themed colour schemes.
- More...
More Administrative Improvements

- **Scheduled jobs.** Gone are the days of having to shut down your Confluence site to change a job's schedule! From the administration console you can execute jobs, configure job schedules, disable or re-enable jobs and view the execution history. More...

- **Log scanner and improved support request form.** The Support Tools plugin is now bundled with Confluence. It includes Hercules the Atlassian support bot, a superhero with extraordinary powers dedicated to protecting the public against known bugs. Hercules will scan your logs for error messages, matching them to existing bug reports and knowledge base articles. With the power of Hercules, you can find solutions in seconds. The plugin also provides a new, simple support request form with clear information about the details that will be sent to Atlassian when you submit a support request. More...
"What's New" Feature Tour

Managing change when rolling out a new software release can be a challenge. We've automated some of the work for you with the "What's New" feature tour in Confluence 3.5. The first time a user logs in after a major Confluence upgrade, the "What's New" window pops up showing screenshots, videos and links to documentation. We've designed this feature as a plugin, so you can change where the popup gets its information from or disable it altogether. More...

Categories, a New Way of Organising Spaces

Categorise your spaces then view and manage them in the new space directory. As an alternative to the dashboard, the space directory displays a list of all the global and personal spaces in the Confluence site that you have permission to see. You can choose to see all spaces, the spaces you have marked as favourite, or the spaces in a specific space category. (Space categories were previously known as 'team labels'.) You can further restrict the list to spaces containing a given word or words in the space name or description. More...
Embedding Audio and Video with the Multimedia Macro

Use the new Multimedia macro to display movies, videos and animations and embed audio files in a Confluence page. Before now, the only way to display multimedia content was using Wiki Markup. Now it's simple – just drag and drop the multimedia file into the Rich Text Editor. Confluence will attach the file and add the Multimedia macro for you. Alternatively, add the Multimedia macro via autocomplete or the macro browser, and tell it which file to display. [Watch a short overview video. More...]
Other Improvements

As always, we have made a number of small improvements to Confluence screens and functionality.

- **Keyboard shortcut and restricted search in the Documentation theme.** The Documentation theme offers a few new goodies for our technical documentation fans.
  - Press '[' on your keyboard to show/hide the left-hand navigation bar.
  - Configure the Documentation theme to show quick search results from all spaces (default) or from the current space only. People can override this restriction when entering their search term.

- **Colour in panel titles.** The Panel macro has a new parameter, allowing you to choose the colour of the text in the title as well as the background colour.
- **Embedding blog posts into pages.** The Include Page macro now accepts blog posts as well as pages for embedding into other pages or blog posts.

- **Cool new avatars.** Take a look at the fresh design of the profile pictures that come standard with Confluence. Below are just a few of them. Of course, you can still upload your own picture too.

- **Improved filtering on the Confluence dashboard.** The list of recent updates on the right of the dashboard now offers separate tabs, allowing you to view recent content updates from all spaces you have permission to see, your favourite spaces only, or spaces belonging to specific space categories. The list of spaces on the left is no longer tied to your list of recent content updates on the right. You can now use these dashboard features independently of one another.

- **Automatic language detection.** Flummoxed by a Confluence site in a foreign language? Confluence will now detect your language preference from your browser and offer you UI text and messages in that language. Alternatively, you can click the handy new option on the Confluence login screen to set your personal default language. Once you have logged in, Confluence will look at the language preference in your user profile too.
Infrastructure Changes

This release includes a number of improvements in the APIs and under the covers too.

- **Support for Safari 5.** We now offer support for Safari 5 in Confluence 3.5. See the upgrade notes for more information about browser support.

- **HTML5, character encoding and IE rendering.** Confluence's DOCTYPE declaration has been switched from 'HTML 4.01 Strict' to 'HTML5', which is automatically strict. In addition, 'X-UA-Compatible' is now explicitly set to 'EDGE'; to ensure that Internet Explorer attempts to render the page in the latest standards mode. (If the browser is set to 'Compatibility View', that will override the 'X-UA-Compatible' setting.) Character encoding is now set at the document level, based on the encoding setting in the General Configuration section of the Confluence Administration Console.

- **Additions to the remote API.**
  - Trash management. Confluence's RPC API offers new space management methods (getTrashContents, purgeFromTrash, emptyTrash) and data objects (ContentSummaries, ContentSummary). These make purging trash across a large number of spaces much easier. You can list trash items for a given space, purge a given page, and purge all pages from a space's trash.
  - Watching and managing watchers. New notification methods in the remote API mimic the watch functionality exposed through the UI: watchPage, watchSpace, watchPageForUser, getWatchersForPage, getWatchersForSpace. You can watch a page, blog post or space, or add a watch on behalf of another user. You can check whether a user is watching a page or space, and return the watchers for a page or space.
  - Blog post retrieval. The new method getBlogEntryByDateAndTitle allows you to look up an blog post by specifying its date and title.

- **New WebDAV Resource plugin module.** Plugin developers can use the WebDAV Resource module to define new kinds of content that can be accessed remotely via the Confluence WebDAV plugin. Expose your own custom entities over WebDAV, or expose existing Confluence content that is not currently accessible via WebDAV. This plugin module is available in Confluence 3.4 too, but we forgot to let you know about it until now.

- **Search engine upgraded.** We have upgraded from Lucene 2.2.0 to 2.9.3.

- **New version of the Atlassian User Interface.** Confluence 3.5 ships with AUI 3.3.1. See the AUI 3.3 release notes.

Release Notices

- **Upgrading from a previous version of Confluence.** Upgrading Confluence should be fairly straightforward. We strongly recommend that you back up your Confluence Home directory and your database before upgrading. Please refer to the Confluence 3.5 upgrade notes for further essential information about plugins and other factors affecting your upgrade.

- **Known issues.** We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Confluence release and report any problems so that we can fix them quickly. We value this feedback, which means that we can tell you about any minor known issues in Confluence 3.5. Please check the important technical advisories on the front page of the Knowledge Base.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

Confluence 3.5 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.5. For details of the new features and improvements in this release, please read the Confluence 3.5 release notes.

On this page:

- **Upgrade Notes**
  - Autowatch Turned On by Default
  - New Profile Pictures
  - Team Labels (Now Called 'Space Categories') May Need Tidying Up
  - New Support Tools Plugin
  - Changes to User Management in Confluence
    - For Customers with Internally Managed Users
    - For Customers using LDAP for User Management
    - For Customers Using JIRA for User Management
    - For Customers Using Crowd for User Management and SSO
    - For Customers Using Custom Authenticators
    - For Customers Using Custom Directory Connectors
  - Trusted Apps and OAuth Superseded by Unified Application Links
  - Upgrade Task Will Reindex Confluence Automatically
  - Changes to Recognised System Properties
  - Connections to MySQL Databases
  - Deprecation of Functionality
    - Converting a Global Space to a Personal Space
    - The 'Mail Page' Feature
  - Notes about Supported Platforms and Libraries
    - End of Support for PostgreSQL 8.1, Firefox 3.0
    - Advance Notice of End of Support for MySQL 5.0, Firefox 3.5, Safari 4, Internet Explorer 7
    - Added Support for Safari 5
    - Lucene Upgraded – Some Methods Now Deprecated
    - Scriptaculous and Prototype JavaScript Libraries Removed
    - X11 Dependencies/Libraries No Longer Required
  - Upgrade Procedure
  - Checking for Other Known Issues and Troubleshooting the Confluence Upgrade
  - Useful Plugins

Upgrade Notes
Autowatch Turned On by Default

This release includes the new 'autowatch' feature, as described in the release notes. With autowatch turned on, you will receive an email notification each time someone edits or comments on a page that you added or updated.

Note that autowatch is enabled by default for all new and existing users on upgrade. We recommend that you let all Confluence users know that autowatch will be turned on for their usernames when you upgrade to Confluence 3.5. People can turn autowatch off by editing the email settings in their user profile.

New Profile Pictures

This release brings a fresh set of profile pictures. After you have upgraded to Confluence 3.5, the old set will no longer be available for selection. Users who have already chosen one of the old pictures will keep that picture. If they later choose a new picture or upload their own picture, they will not be able to go back to the old picture again.

Team Labels (Now Called 'Space Categories') May Need Tidying Up

In Confluence 3.5, we have changed the term 'team labels' to the more descriptive term 'space categories'. These are keywords that you can apply to spaces, in order to group logically-related spaces.

Confluence 3.5 also introduces a new space directory that displays a list of spaces and offers them grouped by space category.

If your Confluence site has a number of team labels (now called space categories) already applied to the spaces, you may want to tidy up the categories to optimise your space directory.

More information:

- The Confluence 3.5 release notes describe the new space directory.
- The documentation explains how to use space categories.

New Support Tools Plugin

As mentioned in the release notes, the Atlassian Support Tools plugin is now shipped with Confluence. If you installed the earlier version of the plugin, you will need to uninstall it before upgrading Confluence.

Changes to User Management in Confluence

The way Confluence stores, accesses and manages users and groups is completely different in Confluence 3.5. You will notice many improvements, as described in the release notes. When you upgrade to Confluence 3.5, the upgrade process will automatically migrate your data by doing the following:

- Copying the configuration data from the existing OSUser or Atlassian User XML files into the Confluence database.
- Migrating your user and group data into the new database tables. It will not destroy the old data. The old tables remain in the database.
- Migrating internal and external user preferences. So if an LDAP user has logged in to Confluence before, all the same preferences will be there on next login after upgrade.

The sections below describe the upgrade considerations for each supported configuration type.

For Customers with Internally Managed Users

If your Confluence installation currently manages its users and groups in the Confluence database then there are no actions required on upgrade. This applies to Confluence sites that are not connected to Crowd, JIRA, LDAP or a custom directory for user management.

For Customers using LDAP for User Management
If your Confluence currently uses the standard method of connecting to an LDAP server for authentication and user management then the upgrade process will migrate the configuration.

To ensure that the upgrade process can migrate your configuration, please follow the Confluence upgrade guide. In particular, make sure that you:

- Copy the following files from your old Confluence installation to your new Confluence installation:

  ```
  <Installation-Directory>/confluence/WEB-INF/classes/atlassian-user.xml
  <Installation-Directory>/confluence/WEB-INF/classes/osuser.xml
  ```

Please follow these steps after the upgrade is complete:

- Ensure that the LDAP connection is correctly configured. See Connecting to an LDAP Directory and Connecting to an Internal Directory with LDAP Authentication.
- Ensure that the directory order is set to match your environment and requirements. See Managing Multiple Directories.
- Enable nested groups, if required in your organisation. To understand the performance ramifications of this, see Managing Nested Groups.
- Note that people will need to wait until the automatic synchronisation task has copied their user and group information from the LDAP directory to the internal cache before they can log in. The synchronisation task will start automatically in the background when the directory is configured. If someone tries to log in to Confluence before the synchronisation task has finished, the user authentication will fail. See Synchronising Data from External Directories.

If you are using a legacy LDAP configuration (such as OSUser with LDAP authentication only), you'll need to reconfigure your LDAP support as covered on Connecting to an LDAP Directory and Connecting to an Internal Directory with LDAP Authentication. In case you encounter an issue, please refer to Upgrade to Confluence 3.5 with OSUser LDAP Authentication Fails for more details.

**For Customers Using JIRA for User Management**

If you are already using JIRA to manage your Confluence users, via the JDBC connection to the JIRA database, you must upgrade Confluence to version 3.5 before upgrading JIRA to version 4.3.

JIRA 4.3 has a significantly different database schema and exposes a new REST interface, which Confluence will depend on for continued JIRA user management. If you upgrade to JIRA 4.3 before upgrading to Confluence 3.5, your Confluence users will no longer be able to log in once you upgrade to Confluence 3.5.

Confluence 3.5 does not ship with an OSUser migrator, and it will not recognise the OSUser definition in your atlassian-user.xml file. When upgrading Confluence:

1. Do not copy the modified atlassian-user.xml and osuser.xml to your Confluence 3.5 installation directory.
2. Ensure that previous Confluence's server.xml file is copied to your Confluence 3.5 installation directory, in order to retain the JIRA datasource.
3. Upgrade to Confluence 3.5.

Please follow these steps after the upgrade is complete:

- Log in to Confluence 3.5.x using the administration username and password you used prior to configuring JIRA user management in Confluence. (Confluence is not yet configured to point to JIRA, so your JIRA credentials will not work.)
  - If you cannot remember or do not have a password which allows you to log in, reset the administrator's password in the database and restart Confluence to log in.
- Ensure that the JIRA connection is correctly configured:
• If you plan to connect to JIRA 4.2 or earlier, set up the 'Legacy JIRA Database Connector'. See Connecting to JIRA 4.2 or Earlier for User Management.
• When you upgrade to JIRA 4.3 or later, set up the new JIRA server connection. See Connecting to Crowd or JIRA for User Management.
• Ensure that the directory order is set to match your environment and requirements. See Managing Multiple Directories.

For Customers Using Crowd for User Management and SSO

If you are using Confluence with Atlassian Crowd for user management and SSO:

• You will need to upgrade to Crowd 2.1 or later, before upgrading to Confluence 3.5. Earlier versions of Crowd are not compatible with Confluence 3.5. Confluence 3.4 and earlier will work with Crowd 2.1.
• Copy the following files from your old Confluence installation to your new Confluence installation:

<Installation-Directory>/confluence/WEB-INF/classes/atlassian-user.xml

• You no longer need to copy the Crowd integration JAR files into Confluence's WEB-INF/lib/ directory.
• If you are using com.atlassian.crowd.integration.seraph.v22.ConfluenceAuthenticator for SSO (defined in $CONFLUENCE$/WEB-INF/classes/seraph-config.xml), please use the newer version instead: com.atlassian.confluence.user.ConfluenceCrowdSSOAuthenticator. Specifically, change this:

<authenticator class="com.atlassian.crowd.integration.seraph.v22.ConfluenceAuthenticator"/>

to this

<authenticator class="com.atlassian.confluence.user.ConfluenceCrowdSSOAuthenticator"/>

• After the upgrade, you may notice a difference when first connecting Confluence to Crowd: People will need to wait until a synchronisation task has copied their user and group information from Crowd to the internal cache before they can log in. If someone tries to log in to Confluence before the synchronisation task has finished, the user authentication will fail.
• Ensure that the directory order is set to match your environment and requirements. See Managing Multiple Directories.

See Connecting to Crowd or JIRA for User Management.

For Customers Using Custom Authenticators

Custom authenticators, as defined in seraph-config.xml, are not affected and should work in the same way as in earlier versions of Confluence.

For Customers Using Custom Directory Connectors

Custom directory types are not possible and not supported in Confluence 3.5 and later. If you have custom
providers defined in OSUser or in Atlassian-User, thus defining your own storage for users and groups, the upgrade procedure will prevent you from starting Confluence.

Please see if one of the following solutions will work for you:

- If you have written a custom provider to support an LDAP schema not natively supported by Confluence 3.4 or earlier, you may no longer need your custom directory connector. Please check the supported LDAP schemas to see if you can use the new LDAP connectors supplied with Confluence 3.5.
- If you have written a custom provider to support nested groups, you can now use the new directory connectors supplied with Confluence 3.5. See Managing Nested Groups.
- If you have written a custom provider to connect to your own database, please consider loading the data into Confluence via the database instead. You will then need to flush the relevant caches in the application.

If you need to keep the custom directory connection, please consider whether Atlassian Crowd meets your requirements. See the documentation on developing a custom directory connector for Crowd.

**Trusted Apps and OAuth Superseded by Unified Application Links**

Confluence 3.5 includes the Unified Applications Link (UAL) plugin which manages trust relationships. Authentication for trust relationships, such as Trusted Apps and OAuth, is now configured via Application Links in your administration console. When you first navigate to the Application Links screen, you will be prompted to upgrade your existing Trusted Apps and OAuth trust relationships to application links.

For instructions on how to upgrade your links, see Upgrading an Application Link.

Please note, there is a known issue with the upgrade dialog. This will affect you if you have set up two different types of authentication (e.g. Trusted Apps and OAuth) to the same remote server. The upgrade message displayed on your Application Links screen will prompt you to upgrade two application links. However, you actually only need to have one application link with two authentication types configured, i.e. upgrade one application link and then configure the missing authentication type on that upgraded link.

**Upgrade Task Will Reindex Confluence Automatically**

We have upgraded the Confluence search engine from Lucene 2.2.0 to 2.9.3. As a result, a reindex is highly recommended when you upgrade. The search will continue to work after upgrade even without a reindex, but you will see exceptions in the logs and reduced capabilities.

When you upgrade to Confluence 3.5, an upgrade task will run automatically to rebuild the index. During the rebuild task, the upgrade process will require three times the size of the index on disk in order to perform the upgrade task. This space will be freed up when the upgrade process has finished.

If you would prefer to rebuild your index later, you can pass the following argument to Confluence when starting up after the upgrade:

```
-Dconfluence.skip.reindex=true
```

The initial startup will show an error message from ConfluenceSearcherInitialisation in the logs, because the warming query is run before the upgrade task. This is not a problem.

**Changes to Recognised System Properties**

We have removed the following system property: confluence.import.use-legacy-importer. Specifying this property will no longer have any effect in Confluence. See Recognised System Properties. (See the Confluence 3.3 documentation for the behaviour in earlier versions of Confluence.)

**Connections to MySQL Databases**
If your Confluence installation is connected to a MySQL database, please ensure that this database uses the 'READ-COMMITTED' transaction isolation level. MySQL's default transaction isolation mode:

- will cause issues with missing LDAP and other remote directory user permissions.
- is no longer supported in Confluence 3.5.

See the last step of the MySQL server installation procedure for details.

**Deprecation of Functionality**

This section provides advanced warnings of features in Confluence 3.5 that will be deprecated in Confluence 4.0 (a future release of Confluence).

### Converting a Global Space to a Personal Space

Confluence 4.0 will no longer support the ability to convert a global space to a personal space. Our research has shown that this feature is used very little. Hence, we have decided to remove this feature as part of our ongoing mission to simplify Confluence where possible.

### The 'Mail Page' Feature

In Confluence 4.0, the 'Mail Page' plugin will no longer be bundled with Confluence. This means that the 'Mail Page' feature for e-mailing a page will not be available in Confluence (out of the box) and the Share button will be the recommended method for e-mailing pages to others.

**Notes about Supported Platforms and Libraries**

### End of Support for PostgreSQL 8.1, Firefox 3.0

As previously announced, from this release onwards we no longer offer support for:

- PostgreSQL 8.1.
- Firefox 3.0.

Please see End of Support Announcements for Confluence.

### Advance Notice of End of Support for MySQL 5.0, Firefox 3.5, Safari 4, Internet Explorer 7

We are planning to end support for the following database and browsers in Confluence 4.0:

- MySQL 5.0.
- Firefox 3.5.
- Safari 4.
- Internet Explorer 7 (IE7).

Please see End of Support Announcements for Confluence.

### Added Support for Safari 5

We now offer support for:

- Safari 5 in Confluence 3.5.

### Lucene Upgraded – Some Methods Now Deprecated

This section is of interest to plugin developers. As stated above, we have upgraded the Confluence search engine from Lucene 2.2.0 to 2.9.3. A number of Lucene methods are now deprecated. These methods will be
listed when you compile your plugin. We recommend that you consult the Lucene documentation and replace these methods as soon as possible. They will no longer be available when Confluence upgrades to Lucene 3. This further upgrade is not yet scheduled, but we plan to do it sometime.

**Scriptaculous and Prototype JavaScript Libraries Removed**

jQuery is the supported JavaScript library for plugin developers.

We first announced the deprecation of other JavaScript libraries with Confluence 2.8. Please note that we have now removed the following libraries from Confluence:

- Prototype
- Scriptaculous

**X11 Dependencies/Libraries No Longer Required**

X11 dependencies/libraries on Unix-/Linux-based operating systems are no longer required by Confluence 3.5 or later. Hence, these libraries do not need to be installed for your Confluence 3.5 upgrade or when installing a new instance of Confluence 3.5 or later.

**Upgrade Procedure**

*Upgrade a test environment first*

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home Directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.
2. If your version of Confluence is earlier than 3.4.x, then please read the Upgrade Notes Overview and the Upgrade Notes for each version of Confluence listed on that page. (There are hyperlinks to each one.)
   - Also:
     - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
     - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade again from version 2.7.x to the latest. For more details, please refer to CONF-11767.
3. Download the latest version of Confluence.
4. Follow the instructions in the upgrade guide.

**Checking for Other Known Issues and Troubleshooting the Confluence Upgrade**

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.
If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Appfire’s Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.5.1 Release Notes

1 April 2011

Confluence 3.5.1 is a bug-fix release. It includes fixes for LDAP and user management, with several improvements for customers upgrading from versions earlier than Confluence 3.5.

Don’t have Confluence 3.5 yet?

Take a look at the new features and other highlights in the Confluence 3.5 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.5.1 upgrade notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.5.1 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.5.1. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

   Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 3.5.2 Release Notes

18 April 2011

Confluence 3.5.2 is a bug-fix release.

Don’t have Confluence 3.5 yet?

Take a look at the new features and other highlights in the Confluence 3.5 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.5.2 upgrade notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.5.2 Upgrade Notes

Below are some important notes on upgrading to **Confluence 3.5.2**. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

   Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:

   - Please read the Confluence 3.5 Upgrade Notes.
If you are upgrading from 2.1 or earlier, please also read the [2.2 release notes](#).
3. Download the latest version of Confluence.
4. Follow the instructions in the [Upgrade Guide](#).

**Confluence 3.5.3 Release Notes**

5 May 2011

The Atlassian Confluence team is pleased to announce the release of **Confluence 3.5.3**.

This release introduces the option to configure the synchronisation interval for Crowd and JIRA user directory types. The synchronisation interval is set to an hour by default. In previous releases of Confluence, you could change the default setting for LDAP directories only. Now you can set the interval for directories managed in Crowd and JIRA too. Details are in the [documentation](#).

We have also fixed a number of bugs. The complete list of fixes is at the bottom of this page.

**Don't have Confluence 3.5 yet?**

Take a look at the new features and other highlights in the [Confluence 3.5 Release Notes](#).

**Release Notices**

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the [Confluence 3.5.3 upgrade notes](#). We **strongly recommend** that you back up your confluence.home directory and database before upgrading.

Confluence 3.5.9 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.5.9. For details of the fixes in this release, please read the release notes.

As of Confluence 3.5.9, the queue that backs the re-indexing workers has been improved to remove contention. This means two important changes.

1. Re-indexing is now more CPU-bound. This means that if you had previously adjusted the indexing thread count you may want to revisit that number as it can put significant load on your server if this number is too high.
2. Each thread will make use of a connection to the database. If the number of threads are configured to a high number this means that there will be a significantly bigger load on the database.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Confluence 3.5.11 Release Notes

25 August 2011

The Atlassian Confluence team is pleased to announce the release of Confluence 3.5.11, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

Note that Confluence 3.5.10 was not publicly released. Issues marked in JIRA as fixed in 3.5.10 are available for the first time in this release.

Don't have Confluence 3.5 yet?

Take a look at the new features and other highlights in the Confluence 3.5 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.5.11 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

### Confluence 3.5.11 Upgrade Notes

Below are some important notes on upgrading to **Confluence 3.5.11**. For details of the fixes in this release, please read the [release notes](#).

#### Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:
1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

   Tip: Another term for 'Home directory' would be 'data directory'. Read more about [finding your Home directory](#).

2. If your version of Confluence is earlier than 3.5, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the [Confluence 3.5 Upgrade Notes](#).
   - If you are upgrading from 2.1 or earlier, please also read the [2.2 release notes](#).

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

### Confluence 2.x.x Releases

#### Confluence 2.6.1 Release Notes

**9 November 2007**

Atlassian is proud to announce the release of Confluence 2.6.1. This is a **highly recommended** upgrade from 2.6, because it fixes some security flaws which may affect Confluence instances in a public environment. We will release more details of the security fixes within a few days, giving our customers a chance to upgrade before the details are made public. This point release also includes more than 40 other fixes and improvements.

We’re especially glad that anonymous comments will no longer show the profile picture of the previous commenter, and newly-created spaces no longer seem to have been created by an anonymous user. The {excerpt} and {excerpt-include} macros now behave better. And we’ve fixed some issues with internationalisation.

There’s a complete list of fixes below.

You can download Confluence 2.6.1 from the download centre.

---

**Security Advisory 19 November 2007**

We have now published the details of the security vulnerabilities, which are fixed in Confluence 2.6.1. Please refer to the [security advisory](#) for more information.

---

**Upgrading from a previous version of Confluence**

Upgrading Confluence should be fairly straightforward. Please read the [upgrade instructions](#). **We strongly recommend that you back up your confluence.home directory and database before upgrading!**

**Updates and fixes in this release**

Errors were reported by the JIRA trusted connection.

Confluence 4.2 Documentation

Confluence 2.6.1 Upgrade Guide

9 November 2007

Atlassian is proud to announce the release of Confluence 2.6.1. This is a highly recommended upgrade from 2.6, because it fixes some security flaws which may affect Confluence instances in a public environment. We will release more details of the security fixes within a few days, giving our customers a chance to upgrade before the details are made public. This point release also includes more than 40 other fixes and improvements.

We’re especially glad that anonymous comments will no longer show the profile picture of the previous commenter, and newly-created spaces no longer seem to have been created by an anonymous user. The {excerpt} and {excerpt-include} macros now behave better. And we’ve fixed some issues with internationalisation.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.

2. If your version of Confluence is earlier than 2.6.0, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from a version earlier than 2.6.0, please read the 2.6 upgrade notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 2.6.2 Release Notes
Atlassian is proud to announce the release of Confluence 2.6.2. This is a highly recommended upgrade, because it fixes some security flaws which may affect Confluence instances in a public environment. These flaws are XSS (cross-site scripting) vulnerabilities in some of Confluence's macros and Wiki Markup, which potentially allowed a user to insert malicious HTML tags or script into a Confluence page. Please refer to the Security Advisory for details.

This point release also includes more than 20 other fixes and improvements.

As part of our drive to tighten up the security in Confluence, we have removed support for the 'style' attribute in the Wiki Markup for images. This was an undocumented feature, which is now no longer available. To help those who may have used the 'style' tag to add coloured borders, we have added a new 'bordercolor' attribute to the image markup.

The PDF and HTML space exports are now more reliable than in Confluence 2.6.0 and 2.6.1. We've fixed the failure to send daily digest email notifications. (This problem occurred when the Confluence instance contained draft pages.) This release also contains some improvements in the wiki's support of internationalisation. And you'll be delighted to see that the plus and minus buttons are back, next to the 'Recently Updated' section of the Dashboard – so you can now increase or decrease the number of items you see in that section.

There's a complete list of fixes below. You can download Confluence 2.6.2 from the download centre.

Upgrading from a previous version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the upgrade instructions. We strongly recommend that you back up your confluence.home directory and database before upgrading!

Updates and fixes in this release

Error rendering macro 'jiraissues' : JIRA project does not exist or you do not have permission to view it.

Confluence 2.6.2 Upgrade Guide

Atlassian is proud to announce the release of Confluence 2.6.2. This is a highly recommended upgrade, because it fixes some security flaws which may affect Confluence instances in a public environment. These flaws are XSS (cross-site scripting) vulnerabilities in some of Confluence's macros and Wiki Markup, which potentially allowed a user to insert malicious HTML tags or script into a Confluence page. Please refer to the Security Advisory for details.

This point release also includes more than 20 other fixes and improvements.

As part of our drive to tighten up the security in Confluence, we have removed support for the 'style' attribute in the Wiki Markup for images. This was an undocumented feature, which is now no longer available. To help those who may have used the 'style' tag to add coloured borders, we have added a new 'bordercolor' attribute to the image markup.

The PDF and HTML space exports are now more reliable than in Confluence 2.6.0 and 2.6.1. We've fixed the failure to send daily digest email notifications. (This problem occurred when the Confluence instance contained draft pages.) This release also contains some improvements in the wiki's support of internationalisation. And you'll be delighted to see that the plus and minus buttons are back, next to the 'Recently Updated' section of the Dashboard – so you can now increase or decrease the number of items you see in that section.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:
1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.

2. If your version of Confluence is earlier than 2.6.1, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from a version earlier than 2.6.0, please read the 2.6 upgrade notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 2.6.3 Release Notes

Confluence 2.6.3 is the standard edition version of Confluence 2.6.x. This version of Confluence is equivalent to Confluence version 2.6.2, but it does not include Oracle's Coherence technology. Due to licensing changes with Oracle over the Coherence clustering and distributed caching technology, Atlassian is no longer able to distribute this technology to customers without a Confluence clustered license.

Therefore, Atlassian has released 'standard editions' for each previous major version of Confluence back to 2.6, which includes Confluence versions 2.10.4, 2.9.3, 2.8.3, 2.7.4 and 2.6.3. Confluence 2.6.3 will be the only Confluence 2.6.x version available to customers with a non-clustered Confluence license.

For its caching functionality, Confluence 2.6.3 utilises Ehcache. This functionality was provided by the Coherence technology in previous Confluence 2.6.x versions.

For more information about the features, updates and fixes in Confluence 2.6.2, please refer to the Confluence 2.6.2 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.6.2 Upgrade Notes. However, if you have customised the cache settings in your installation of Confluence (e.g. for performance reasons), then please read the Confluence 3.0.1 Upgrade Notes for important information about transferring your caching layer customisations from Coherence to Ehcache.

We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 2.6 Release Notes

The Atlassian Confluence team is delighted to present Confluence 2.6.

Confluence 2.6 brings many popular features which save you time and improve the your wiki's usability. Upgrading to Confluence 2.6 is free for all customers with active Confluence software maintenance as at 27th September 2007.

A new theme brings a fresh, clean look and feel. This is for our customers who have asked for a friendlier interface and improved readability. We've included more social networking features, to enhance the sense of community in your wiki. For example, author photos are now shown in comments and in the 'Recent Updates' on the Dashboard. And the Social Bookmarking plugin is now shipped with Confluence, allowing you to share bookmarks with your team.

Other popular new features include default content for spaces, labels on templates, the ability to backdate or rename news items (blog posts), official MySQL 5.0 support and PDF export of images.

- Many thanks for your issues and votes. They help us keep improving our products.
- We've highlighted the main features of this release below.
- Attached is a full list of issues resolved in 2.6.
### Upgrading to Confluence 2.6

- Upgrading Confluence should be fairly straightforward. Please refer to the upgrade instructions and notes. **We strongly recommend that you back up your confluence home directory and database before upgrading!**
- All draft pages will be destroyed during the upgrade process. Confluence administrators should warn users of the Confluence site that drafts will not survive the upgrade.
- If you are using any third-party plugins, please test them thoroughly before rolling 2.6 into production.

### Responding to your feedback:

🌟 5 new feature requests implemented
🌟 275 votes satisfied

### Highlights of this release:

- Fresh look for the Default theme
- Personalised comments and Dashboard
- Space description on Dashboard
- Labels on templates
- Default content for space home pages
- Social Bookmarking plugin now bundled with Confluence
- Back-dating and renaming news items
- Plus over 90 other fixes and improvements

### Highlights of Confluence 2.6

**Fresh look for the Default theme**

- Default font now Arial instead of Verdana.
- Fresh, clean look and feel - these release notes are an example of the new style.
- If you prefer the original Confluence look and feel, select the Confluence Classic Theme when creating a space.
- Improved layouts for email and RSS feeds, helping you to skim-read and classify information quickly.
2

**Personalised comments and Dashboard**

- In the new themes (Confluence Default and Clickr), comments now include the user’s profile picture. (See screenshot above.)
- 'Recently Updated' section on Dashboard includes profile picture and a summary of the change.

3

**Space description on Dashboard**

- List of spaces on the Dashboard now includes a short description of the space.
Labels on templates

- You can include labels when adding a page template.
- New pages based on the template will automatically include the labels.
- Read the documentation.

Default content for space home pages

- Confluence site administrators can define default content for a space.
- Home page for newly-added spaces will include the default content.
- Read the documentation.
Social Bookmarking plugin now bundled with Confluence

- Use Confluence to share bookmarks with your team.
- Plugin will be enabled by default.
- You can create a bookmark for any space in which you have 'create page' permission.
- To view your bookmarks, go to the 'Bookmarks' tab under 'Browse Space'.
- Drag the bookmarklet from the 'Bookmarks' tab onto your browser toolbar to create bookmarks any time.
- Use the bookmarks macro to display a list of bookmarks anywhere in Confluence.
- Subscribe to an RSS feed for your bookmarks.
- Read the documentation.
Back-dating and renaming news items

- Rename a news item at any time.
- When creating a news item, you can now set the posting date to earlier than today.
- Backdating is also supported by the [RPC interface](https://confluence.org) - useful for migrating blog posts from other systems.

![Image of backdating a news item](image)

Click ‘EDIT’ and then choose the date from the calendar.

Plus over 90 other fixes and improvements

- [MySQL 5.0](https://confluence.org) is officially supported, when used with Confluence 2.5 and above.
- Images generated by macro plugins will now [export to PDF](https://confluence.org), .doc and .html formats.
- For plugin developers, the [Joda-time library has been upgraded](https://confluence.org) from 0.98 to 1.4 in Confluence 2.6. Plugins that use the date formatting or parsing functionality of Joda-time will need to be recompiled to work with Confluence 2.6.
- Administrators can configure a non-standard port for the Confluence [outgoing mail server](https://confluence.org). The host address can now be specified as hostname:port.

Created in 2012 by Atlassian. Licensed under a [Creative Commons Attribution 2.5 Australia License](https://confluence.org).
• Improved **user migration** when integrating with LDAP: If you have existing Confluence users with the same usernames as LDAP users, you can now avoid duplicate users by configuring the LDAP repository before running the migration. The migration will then ignore users who have the same username as an LDAP user. Read the [documentation](#).
• And [more](#).

**Special thanks**

We'd like to thank some of our valued community members whose contributions to the open source plugin library have made this version of Confluence even stronger:

• Shannon Krebs, for the [BloggingRPC plugin](#), the [Contributors plugin](#) and the [Social Bookmarking plugin](#).
• David Peterson and Bob Swift for the [Chart Plugin](#).
• David Peterson for the [IM Presence Plugin](#), and the [Table of Contents plugin](#).
• Dan Hardiker & [Adaptavist](#) for the [Plugin Repository Client](#).

**Confluence 2.6 Upgrade Guide**

**Confluence 2.6** brings many popular features which save you time and improve the your wiki's usability. Upgrading to Confluence 2.6 is free for all customers with [active](#) Confluence software maintenance as at 27th September 2007.

A new theme brings a fresh, clean look and feel. This is for our customers who have asked for a friendlier interface and improved readability. We've included more social networking features, to enhance the sense of community in your wiki. For example, author photos are now shown in comments and in the 'Recent Updates' on the Dashboard. And the Social Bookmarking plugin is now shipped with Confluence, allowing you to share bookmarks with your team.

Other popular new features include default content for spaces, labels on templates, the ability to backdate or rename news items (blog posts), official MySQL 5.0 support and PDF export of images.
Draft Pages

All draft pages will be discarded during the upgrade process. Confluence administrators should warn users of the Confluence site that drafts will not survive the upgrade.

Plugins

If you are using any third-party plugins, please test them thoroughly before rolling 2.6 into production.

For plugin developers: the Joda-time library has been upgraded from 0.98 to 1.4 in Confluence 2.6. Plugins that use the date formatting or parsing functionality of Joda-time will need to be recompiled to work with Confluence 2.6.

Custom Themes

Custom Confluence 2.5.x themes are expected to be compatible with 2.6 without authors needing to make any change to their existing themes. This is because Confluence will, by default, include all Confluence 2.5.x specific styles automatically. But if you would like to upgrade your theme to use the latest Confluence 2.6 style and typography, you will need to update the way you include stylesheets in your theme. You can read full instructions here.

Custom Page Layout

1. If a space uses a custom decorator page layout, the new Confluence 2.6 decorator is not applied. This may causes GUI oddities, such as:
   - On a page, the View, Edit, Info and Attachments tabs are shown as a vertical bulleted list instead of tabs.
   - Comments do not show properly.
   Fix: Apply the Default Page Layout, then re-insert the custom code.
2. In addition, if you are using pagetree navigation to form a table of contents on the left, you may find that your wiki text becomes italic after upgrading to Confluence 2.6.
   - Cause: To create the left-hand panel, you have probably inserted a chunk of HTML/CSS in the space's page layout. The chunk of code may use a <blockquote> element to align the body of the page and draw a blue line on its left. Confluence 2.6 stylesheets apply the italic style to blockquotes.
   - Fix: Use a new format for your left-hand panel. One possible example is given here.

Steps in detail:

1. Go to the Space Admin screen and click 'Edit' to view your customised Page Layout.
2. Copy the customised code.
3. Cancel the edit.
4. Click 'Reset Default' to apply the new Confluence 2.6 default page layout.
5. If you are using the pagetree navigation panel, edit your customised code as described above.
6. On the Space Admin screen, click 'Create Custom' to create a custom page layout.
7. Reinsert your customised code and click 'Save'.

Upgrade Procedure

Upgrading Confluence should be pretty easy. We strongly recommend that you backup your confluence.home directory and database before upgrading!

You can get the latest version of Confluence here.

If you are upgrading from Confluence 2.2.x or a later version, you can find instructions here.

If you are upgrading directly from 2.1 or earlier, you should also read the 2.2 Release Notes for warnings about...
the 2.1 -> 2.2 upgrade.

Issues resolved in Confluence 2.6

Confluence 2.7.1 Release Notes

24 January 2008

Presented with pleasure by the Atlassian Confluence team: Confluence 2.7.1 is a recommended upgrade which fixes a security flaw and other bugs, and brings a couple of improvements.

We have identified and fixed an XSS (cross-site scripting) security flaw which may affect Confluence instances in a public environment. For details, please refer to the security advisory.

Recording of authorship and history for page attachments is improved, so that attachment history is now retained after operations such as editing the attachment or moving it to a new page.

A new option on the Export Space screen allows administrators to export all pages to XML even when page-restrictions deny the administrator access to some of the pages.

This release also fixes problems in the following areas:

- The SOAP API, which was broken in Confluence 2.7.0.
- Logging.
- Internationalisation (support for different languages).
- Case-sensitivity for usernames and group names when using LDAP integration, and problems with upper-case letters in usernames when applying space permissions.

There's a complete list of fixes below. Click a specific issue to see details of the fix, and to download any patches where relevant.

Confluence 2.7.1 is available from the download centre.

Upgrading from a previous version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the upgrade instructions. We strongly recommend that you back up your confluence.home directory and database before upgrading!

Updates and fixes in this release

Error rendering macro 'jiraissues': JIRA project does not exist or you do not have permission to view it.

Confluence 2.7.1 Upgrade Guide

Confluence 2.7.1 is a recommended upgrade which fixes a security flaw and other bugs, and brings a couple of improvements. You'll find details of the fixes in the release notes.
Upgrade Notes

As part of the fix for case-sensitivity in usernames and group names when using LDAP integration (CONF-9469), an upgrade task will consolidate permissions for the same user or groups where they differ only by case.

Depending on the size of your Confluence installation (number of spaces and the permissions applied to them) the upgrade task could result in a longer-than-usual delay when starting Confluence for the first time after the upgrade. Please be patient while this happens — it could take a few minutes.

During this process there will be regular progress reports in the log, something like this:

```
[atlassian.confluence.upgrade.ConsolidatePermissionsUpgradeTask] doUpgrade
Consolidating SpacePermissions for Space Monkeys in a Barrel (key=MONBAR)
```

⚠ Backup essential, because permissions will be modified

The upgrade task will modify permissions in your Confluence database. So that our usual 'strong recommendation' to back up the database becomes even stronger.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.

2. If your version of Confluence is earlier than 2.7.0, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.7 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 2.7.2 Release Notes

6 March 2008

Confluence 2.7.2 is a recommended upgrade which fixes a security flaw and other bugs.

We have fixed a security flaw which allowed users who have ‘View’ permission (or higher) on a space to purge any page in that space. For details, please refer to the security advisory and related JIRA issue.

Other good fixes in this point release:

- The Rich Text editor no longer breaks links to pages in other spaces.
- Some customers have reported problems with permissions after upgrading to Confluence 2.7.1, where some space permissions or global permissions were lost if using a case-sensitive database. From Confluence 2.7.2, the space permissions and global permissions screens will display a message
highlighting any case-sensitivity problems. We have also provided a routine to fix existing permissions affected by this issue — read the detailed instructions on running the routine.

- The JIRA Portlet macro now displays correctly when using trusted communication between JIRA and Confluence.
- Confluence 2.7.2 also clarifies the procedures around renewing your license before upgrading.

There's a complete list of fixes below. Click a specific issue to see details of the fix, and to download patches where relevant.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.7.3 Upgrade Guide. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Updates and Fixes in this Release

Error rendering macro 'jiraissues' : JIRA project does not exist or you do not have permission to view it.

Confluence 2.7.3 Upgrade Guide

Confluence 2.7.3 is a recommended upgrade which focuses on fixing a number of security flaws. You'll find details of the fixes in the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.

2. If your version of Confluence is earlier than 2.7.2, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.7 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 2.7.4 Release Notes

Confluence 2.7.4 is the standard edition version of Confluence 2.7.x. This version of Confluence is equivalent to Confluence version 2.7.3, but it does not include Oracle's Coherence technology. Due to licensing changes with Oracle over the Coherence clustering and distributed caching technology, Atlassian is no longer able to distribute this technology to customers without a Confluence clustered license.

Therefore, Atlassian has released 'standard editions' for each previous major version of Confluence back to 2.6, which includes Confluence versions 2.10.4, 2.9.3, 2.8.3, 2.7.4 and 2.6.3. Confluence 2.7.4 will be the only Confluence 2.7.x version available to customers with a non-clustered Confluence license.

For its caching functionality, Confluence 2.7.4 utilises Ehcache. This functionality was provided by the Coherence technology in previous Confluence 2.7.x versions.

For more information about the features, updates and fixes in Confluence 2.7.3, please refer to the Confluence 2.7.3 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.7.3 Upgrade Notes. However, if you have customised the cache settings in your installation of Confluence (e.g. for performance reasons), then please read the Confluence 3.0.1 Upgrade Notes for important information about transferring...
your caching layer customisations from Coherence to Ehcache.

We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 2.7 Release Notes

12 December 2007: With great pleasure, the Atlassian Confluence team presents Confluence 2.7.

Confluence 2.7 has improvements for administrators and end-users alike. Administrators can set up trusted communication between Confluence and JIRA. The result? The JIRA Issues and JIRA Portlet macros will show only the issues which the Confluence user is authorised to see. You no longer need to include a username and password in the markup code.

The two-tier administrator permissions allow system administrators to delegate some functions to team leaders or managers. Logging is simplified, and administrators can change logging levels at runtime. The improved user management framework speeds up your user searches.

Sorting of images is now possible in the Gallery macro. And when creating a page or news item, you can attach images or files immediately, without waiting until you have saved the page.

- Upgrading to Confluence 2.7 is free for all customers with active Confluence software maintenance as at 12 December 2007.
- Thank you for all your issues and votes. Keep on logging!
- We've highlighted our favourite bits of this new release below.
- And there's more.

### Upgrading to Confluence 2.7

Upgrading Confluence should be fairly straightforward. We strongly recommend that you back up your confluence.home directory and database before upgrading!

Please refer to the upgrade instructions. There you will find instructions on upgrading, and details of the following:

- If you are using any third-party plugins, please test them thoroughly before rolling 2.7 into production.
- If you are using the Resin application server, you will need to configure Resin to use an XML parser that is XSD-aware.
- When upgrading, you should consider turning off the new JIRA/Confluence trusted communication feature and/or warnings.
- Your users will be automatically migrated to AtlassianUser during the Confluence upgrade process.
- All users and groups with the old ‘Administer Confluence’ permission will be converted to the new ‘System Administrator’ permission.
- By default, all installations of Confluence will now write log messages to the Confluence home directory instead of the application server's log file.
- Java 1.4 will be deprecated after Confluence 2.8.
- Read more information.

Responding to your feedback:

- 4 new feature requests implemented
- 380 votes satisfied

![Download latest version](download.png)

Highlights of this release:

- JIRA Issues and Portlet macros use new trusted authentication
- Two-tier administrator permissions
Inserting images and attaching files during page creation  
Sorting of images in Gallery macro  
Simplified and improved logging  
Performance, maintainability and administration  
Plus over 90 fixes and improvements

Highlights of Confluence 2.7

1

**JIRA Issues and Portlet macros use new trusted authentication**

- The [JIRA Issues macro](https://confluence.atlassian.com/oxygen/jiraiissues-macro-407500.html) and the [JIRA Portlet macro](https://confluence.atlassian.com/oxygen/jiraportalletelement-macro-395044.html) allow you to display a list of JIRA issues on your Confluence page.
- Prior to Confluence 2.7, you had to include a username and password in the markup code if you needed to display issues with restricted viewing. This release and [JIRA 3.12](https://confluence.atlassian.com/issue/JIRA-3335) solve the problem.
- Read more about [trusted communication](https://confluence.howto.atlassian.com/display/ATL/Trusted+Communication+in+Atlassian+Products).

Example markup—User will see the issues they are authorised to see (provided trusted communication is enabled):

```
{jiraissues:url=CONTENT|columns=type;key;summary}
```

Example markup—User will see only the issues authorised for anonymous viewing:

```
{jiraissues:url=CONTENT|columns=type;key;summary|anonymous=true}
```
Two-tier administrator permissions

- The original 'Administer Confluence' permission is now called ‘System Administrator’.
- A new permission level, called ‘Confluence Administrator’, is similar to ‘System Administrator’ but excludes the functions which may compromise the security of the Confluence system.
- You can delegate administrator privileges to project managers or team leaders while preserving the security of your Confluence site, by granting the managers the new ‘Confluence Administrator’ permission.
- Read the documentation.

Inserting images and attaching files during page creation

- You can now attach an image or other file during creation of new page – before you have saved the page.
- This applies to pages and news items.
- We have standardised the options for Wiki Markup mode and the Rich Text editor:
  - The 'Insert Image' popup allows you to select thumbnails and alignment.
  - The 'Insert Link' popup allows aliases and tooltips.
- Read more about inserting an image and attaching a file to a page.
Sorting of images in Gallery macro

- The new 'sort' argument allows you to order the images by file name, comment or date last modified.
- Read the documentation.

Example: Sorting the images by file name

```
{gallery:title=Some office photos, and a waterfall|sort=name}
```

Example: Sorting the images by date and showing the most-recently-modified first
**Simplified and improved logging**

- Confluence now writes its logs to the Confluence home directory. Both the Confluence and Confluence EAR/WAR distributions behave in the same way. For more information, see the logging documentation.
- We have rationalised the reporting to the different levels (ERROR, INFO, WARN, etc) and removed many unnecessary exceptions and stacktraces from the logs.
- You can change the logging levels while Confluence is running. Read more information.

**Performance, maintainability and administration**

- If you are currently using the standard configuration for user management, your users will be automatically migrated to the AtlassianUser framework on upgrade to Confluence 2.7. See the upgrade notes. This will result in a dramatic increase in the speed of user searches.
- Confluence now supports Java 6, allowing you to take advantage of its performance improvements.
- A further set of improvements to the stability of your Confluence system.

**Plus over 90 fixes and improvements**

- You'll no longer see those annoying browser messages when you click the browser's 'Back' button, for example after viewing search results.
- We've fixed some problems with the image and file attachment popups, and made them behave in the same way for both the Rich Text Editor and Wiki Markup.
- See the list of features, improvements and bug fixes.

  - User migration
  - System Administrator and Confluence Administrator permissions
  - Location of Confluence logs
  - Java versions

- Upgrade procedure

Upgrade notes

Plugins

If you are using any third-party plugins, please test them thoroughly before rolling 2.7 into production.

Configuring Resin

This note applies if you are using the Resin application server. Due to an upgrade to one of the core components of Confluence (namely Spring), it will no longer work against an out-of-box configuration of Resin. To resolve this, you will need to configure Resin to use an XML parser that is XSD-aware. More information:

- Troubleshooting a Resin configuration
- Spring Framework documentation

Trusted communication between JIRA and Confluence

Confluence 2.7 provides a new trusted communication protocol, to allow secure authentication for the JIRA Issues and JIRA Portlet macros.

When upgrading, consider whether to disable warning messages or turn off trusted communication altogether. You may like to do this if you have a number of existing JIRA issues or JIRA Portlet macros in your Confluence pages, and you do not intend to set up trusted communications soon. Read more about configuring trusted communications.

By default, trusted communication will be enabled when you upgrade to Confluence 2.7. This will affect your existing macros as follows:

- If the macro markup contains a username and password, the functionality is unchanged.
- If you have already set up trusted communication with a JIRA instance, the macro output will be as described in the guide on trusted communication.
- If the macro markup does not contain a username and password and you have not set up trusted communication with a JIRA instance, your Confluence pages will show a warning message above the macro output. See more information on troubleshooting.

WebDAV attachment manager deprecated

The option to store Confluence attachments on a WebDAV server has never worked in a useful fashion, and
has not been maintained for many versions.

The WebDAV attachment manager is deprecated from Confluence 2.7, and will be removed from a future version of Confluence. If you store attachments on external WebDAV servers, we recommend that you migrate to file-system or database-backed attachment storage immediately. Refer to CONF-9313 and CONF-2887.

ℹ️ This DOES NOT affect the operation of the WebDAV plugin.

### User migration

Confluence 2.7 replaces OSUser with AtlassianUser as the underlying user management framework, greatly improving performance. Read more information about user management in Confluence.

When you upgrade from an earlier version of Confluence to release 2.7.0 or later, your users will be automatically migrated to AtlassianUser (but see the exceptions in the next paragraph). You may notice that your upgrade takes longer than usual, due to this migration process.

ℹ️ Automatic migration will not occur if any of the following is true:

- You have delegated user management to either JIRA or LDAP, or you have changed your user management from the standard configuration. If this is the case, you should upgrade as usual, ensuring that you retain your existing atlassian-user.xml or osuser.xml file.
- You have already migrated to AtlassianUser.

The progress of the migration will be shown in your log files. For example, a successful migration will show:

```
2007-10-08 21:33:07,979 INFO [main] [atlassian.confluence.upgrade.OSUserToAtlassianUserMigrationUpgradeTask] userMigrationStarted Starting user migration. 12288 users to migrate.

System Administrator and Confluence Administrator permissions

Confluence 2.7 brings two administrator-level permissions in place of one. The new permissions are 'System Administrator' and 'Confluence Administrator'. Refer to the documentation for details.

When you upgrade to version 2.7, all users and groups with the old 'Administer Confluence' permission will be converted to the new 'System Administrator' permission. The powers of the 'confluence-administrators' group remain unchanged.

Location of Confluence logs

Confluence’s default logging behaviour has changed with Confluence 2.7. Both the Confluence and Confluence EAR/WAR distributions follow the same default behaviour:

- When you start Confluence, log entries will be sent to the application server logs until Confluence has completed its initial bootstrap. Any log entries will be repeated into the `<confluence-home>` log described below.
- Once the initial startup sequence is complete, all logging will be to `<confluence-home>/logs/atlassian-confluence.log`. For example: c:/confluence/data/logs/atlassian-confluence.log.

Note that the default location is now the Confluence home directory instead of the application server’s log file.

Java versions

Confluence 2.7 supports Java 1.4, Java 5 and Java 6. We recommend Java 6 because of its increased performance and easier troubleshooting, due to enhanced memory dump and profiling capabilities.

Advance notice: Java 1.4 will be deprecated in a future release. Confluence 2.8 will be the last version that supports Java 1.4.

Upgrade procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.
2. If your version of Confluence is earlier than 2.6.x, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from a version earlier than 2.6.0, please read the 2.6 upgrade notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Confluence 2.8.1 Release Notes
21 May 2008
Confluence 2.8.1 is a recommended upgrade which fixes some security flaws as well as other bugs in Confluence 2.8. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

Two of the bug fixes resolve problems with rendering a wiki page in Internet Explorer 6. Additionally, these fixes will significantly improve performance in some configurations of Confluence 2.8.

We have created some performance testing scripts, which will be particularly useful for large or mission-critical Confluence installations.

Using a custom space logo caused some problems, particularly with Resin application server, where the page would sometimes hang and then display incorrectly. This is now fixed.

There’s a complete list of fixes below. Click a specific issue to see details of the fix.

Don’t have Confluence 2.8 yet?
Take a look at the new features and other highlights in the Confluence 2.8 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.8.1 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Updates and Fixes in this Release

Error rendering macro 'jiraissues': JIRA project does not exist or you do not have permission to view it.

Confluence 2.8.1 Upgrade Notes

Confluence 2.8.1 is a recommended upgrade which fixes some security flaws as well as other bugs. You’ll find details of the fixes in the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.

2. If your version of Confluence is earlier than 2.8.0, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.8 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 2.8.2 Release Notes

3 July 2008

Confluence 2.8.2 is a recommended upgrade which fixes some security flaws and other bugs. Please refer to the see

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
curity advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

This release fixes the 'remember me' problem encountered when using Confluence with Tomcat 5.5.26 or Tomcat 6, where logins are not remembered.

Confluence administrators will see a new link on the user profile screen, allowing them to move directly to the user management screen for that user.

This release also addresses some performance bugs:

- Label links, as well as the label summary pages, now include the 'nofollow' attribute to prevent search engines like Google from indexing them.
- We have increased the size of the UI templates cache, which should reduce the number of times Confluence needs to load resources.
- CSS caching has been improved. (Refer to CONF-11755 if you'd like to know the details.)
- When generating a URL for the multiple label filter, Confluence now sorts the labels in the URL alphabetically, ensuring that there is just one URL for each filter instead of possible multiple URLs. This should reduce the load on the server when search engine crawlers visit the Confluence site, because the crawlers no longer need to index multiple URLs.

The JIRA Issues macro now has improved caching. When trusted communication was first introduced, Confluence did not cache results for anonymous users or results retrieved using trusted communications. With Confluence 2.8.2, caching is implemented for both those cases. This fix should improve the performance of your JIRA site, because Confluence no longer needs to access the JIRA site as often.

There's a complete list of fixes below. Click a specific issue to see details of the fix.

Don't have Confluence 2.8 yet?

Take a look at the new features and other highlights in the Confluence 2.8 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.8.2 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Updates and Fixes in this Release

Error rendering macro 'jiraissues' : JIRA project does not exist or you do not have permission to view it.

Confluence 2.8.2 Upgrade Notes

Confluence 2.8.2 is a recommended upgrade which fixes some security flaws as well as other bugs. You'll find details of the fixes in the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and
1. See the documentation on [backing up your Confluence site](#).

2. If your version of Confluence is earlier than 2.8.0, read the [release notes and upgrade guides](#) for all releases between your version and the latest version. In particular:
   - Please read the [2.8 upgrade notes](#).
   - If you are upgrading from 2.1 or earlier, please read the [2.2 release notes](#).
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.0 first, confirm the upgrade was successful, then upgrade again from version 2.7.0 to version 2.8.2. For more details, please refer to [CONF-11767](#).

3. [Download](#) the latest version of Confluence.

4. Follow the instructions in the [Upgrade Guide](#).

Confluence 2.8.3 Release Notes

Confluence 2.8.3 is the standard edition version of Confluence 2.8.x. This version of Confluence is equivalent to Confluence version 2.8.2, but it does not include Oracle's Coherence technology. Due to [licensing changes](#) with Oracle over the Coherence clustering and distributed caching technology, Atlassian is no longer able to distribute this technology to customers without a Confluence clustered license.

Therefore, Atlassian has released 'standard editions' for each previous major version of Confluence back to 2.6, which includes Confluence versions 2.10.4, 2.9.3, 2.8.3, 2.7.4 and 2.6.3. Confluence 2.8.3 will be the only Confluence 2.8.x version available to customers with a non-clustered Confluence license.

For its caching functionality, Confluence 2.8.3 utilises Ehcache. This functionality was provided by the Coherence technology in previous Confluence 2.8.x versions.

For more information about the features, updates and fixes in Confluence 2.8.2, please refer to the [Confluence 2.8.2 Release Notes](#).

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the [Confluence 2.8.2 Upgrade Notes](#). However, if you have customised the cache settings in your installation of Confluence (e.g. for performance reasons), then please read the [Confluence 3.0.1 Upgrade Notes](#) for important information about transferring your caching layer customisations from Coherence to Ehcache.

We strongly recommend that you back up your `confluence.home` directory and database before upgrading.

Confluence 2.8 Beta Release Notes

28 March 2008

Confluence 2.8 will be launched in a few weeks' time. These release notes apply to Confluence 2.8 Beta, which is currently undergoing internal testing. These release notes show the highlights of the upcoming release, although we have not included all the enhancements and bug fixes. We'll publish the final and complete release notes with the release of Confluence 2.8.0.

If you are interested in trying out a developer's release, please take a look at the information and warnings in [Development Releases](#).
What's Coming in Confluence 2.8

1 Page Ordering

- One of the most popular feature requests is now reality — Confluence allows manual page ordering.
- You can choose the order in which wiki pages are displayed.
- Use a dynamic tree view to drag and drop your pages into the right position.
- Page order is reflected in all tree views for a space or a page family, including the PageTree macro and exports to PDF, HTML and XML.
- Read the documentation.

2 Dynamic Menus and Simplified Editing

- Drop-down menus replace tabs and links.
- Grouping of functions is more intuitive.
- Features are more visible than before — you may even come across things you didn't know Confluence had!
- Simplified screen design allows you to focus on editing the page content.
- There is more space for entering text.
- See an overview of the new menu structure and what's changed.

3 Collapsible Comments

- We've beautified the display of comments on pages and news items.
- You can collapse comments to a single line — just click the subject line of a single comment, or 'Collapse All'.
- It's easier to keep track of multi-level comment threads.
- When collapsed, a comment shows a single-line excerpt.
- The time stamp is relative for recent comments — for example, it might say 'less than a minute ago'.
- The new 'permanent link' icon makes it easier to link directly to a comment from another page.

4 Multiple Label Filter

- Combine more than one label in your label searches.
- Use '+' and '-' links to add or subtract labels from your search.
- Browse labels simply by typing in a URL, such as:

  http://CONFLUENCE_HOSTNAME/label/fedex+ideas

- Read the documentation.

5 And Lots More

- Enhanced Dynamic Tasklist.
- An installation wizard for the Confluence distribution on Windows and Mac.
- Significant performance improvements.
- More administration, management and monitoring tools.
- Plenty of bug fixes to keep everyone happy.

Confluence 2.8 Release Notes

10 April 2008

The Atlassian Confluence team is delighted to present Confluence 2.8.
We have simplified the screen design to focus on content. There's a totally new menu structure for editing or adding content and many other actions. We've also grouped the menu functions so that they are easier to use and understand. This will help new users start using Confluence quickly. For our faithful customers, you may find existing features you didn't know Confluence had!

The much voted for page-ordering feature allows you to define the order of your wiki pages yourself — just drag and drop your pages into the right position.

We've beautified the display of comments on pages and news items. With the multiple-label filter, you can combine more than one label in your label searches and surf labels directly via a sensible URL. Getting Confluence up and running is easier than ever with our new installer. An enhanced task list is bundled with Confluence, bringing faster response times and a simple yet powerful user interface.

There are some great performance enhancements and a lot for administrators and developers too.

- Thank you for all your issues and votes. Keep on logging, to help us keep improving!
- Below is a list of the highlights in this release.
- Attached is the full list of issues resolved in this release.

### Upgrading to Confluence 2.8?

- Upgrading Confluence should be fairly straightforward. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.
- If you are using any third-party plugins, please test them thoroughly before rolling 2.8 into production.
- Please refer to the Confluence 2.8 Upgrade Notes for further essential information about upgrading.

### Highlights of this release:

- Dynamic menus and simplified screen design
- Page ordering
- Collapsible comments
- Multiple-label filter
- Confluence installer
- Task list
- Performance enhancements
- Administration, management and monitoring
- Highlights for developers
- Over 100 fixes and improvements
- Special thanks

### Highlights of Confluence 2.8

#### Dynamic menus and simplified screen design

- Drop-down menus replace tabs and links.
- Grouping of functions is more intuitive.
• Features are more visible than before — you may even come across things you didn’t know Confluence had!
• A cleaner screen design lets you focus on the page’s content.
• It’s simpler than ever to edit a page.
• There is more space for entering text.
• See an overview of the new menu structure and what’s changed.

Page ordering
• One of the most popular feature requests is now a reality — Confluence allows manual page ordering.
• You can choose the order in which wiki pages are displayed.
• Use a dynamic tree view to drag and drop your pages into the right position.
• Page order is reflected in all tree views for a space or a page family, including the PageTree macro and exports to PDF, HTML and XML.
• Take a look at the documentation to learn more.
Collapsible comments

- We've beautified the display of comments on pages and news items.
- You can collapse comments to a single line.
- It's easier to keep track of multi-level comment threads.
- When collapsed, a comment shows a single-line excerpt.
- The time stamp is relative for recent comments — for example, it might say 'less than a minute ago'.
- The 'permanent link' icon is back, after a temporary absence in Confluence 2.6. Instead of lurking behind the date, it's now a link icon at the bottom right of each comment.

Multiple-label filter

- Combine more than one label in your label searches.
- Use the '-' link next to the label name to subtract a label from your multiple-label search.
- Browse labels simply by typing in a URL, such as:

  http://CONFLUENCE_HOSTNAME/label/fedex+ideas

- Take a look at the documentation to learn more.
Confluence installer

- The installation wizard lets you install the Confluence distribution without fuss or bother.
- Your Java environment is automatically configured.
- Confluence starts up in your browser after installation and leads you straight into the Setup Wizard.
- You can choose to install Confluence as a Windows service.
- Confluence appears in your Windows Start Menu.
- Read the documentation.

Task list

- The enhanced task list plugin is now bundled with Confluence.
- Permissions in the task list match the permissions of the page containing it.
- New user and group pickers help you to choose the right person or group.
- The sophisticated visual design suits the Confluence look and feel — take a look at the borders, icons,
Performance enhancements

- You will notice significant performance improvements in this release.
- A new gzip compression filter speeds up the transfer of data from Confluence and uses far less memory than the earlier implementation.
- The PDF space export uses less server memory.
- And more for the technically-minded:
  - The commonly-accessed resources use permanent client-side caching.
  - We have optimised some operations that were performed on every request, decreasing the average time taken to load a page.
  - We have optimised the database access for labels and attachments.
  - Where users belong to many groups, the retrieval of groups from LDAP is faster.
  - Access to Confluence’s data storage mechanism (Bandana) has been made more granular, so that we don’t load the entire context when retrieving individual keys from large contexts.

Administration, management and monitoring

- Confluence now supplies statistics and other information via a Java Management Extensions (JMX) interface. A number of third-party consoles will allow you to view the information and monitor your Confluence instance. There's more information in the documentation.
- The Plugin Repository client shows you which plugins are officially supported.
- You can raise a support request via the Administration Console.
- Troubleshoot your LDAP user management directly from the Administration Console.
- A new field on the System Information page displays the current access latency to the Confluence database — useful for diagnosing database network problems.
**Highlights for developers**

- Install custom path-mapping as part of your plugin, using the new Path Converter plugin modules — prettify your URLs.
- Include your JavaScript and CSS resources neatly, using the Web Resource plugin type.
- The Velocity template engine has been upgraded to version 1.5.
- We have begun a cleanup of the HTML and CSS for viewing and editing a page, moving towards semantic markup and web standards.
- We are moving towards standardisation on a single JavaScript library, based on jQuery. This is the supported JavaScript library for plugin developers. The benefits? No more conflicts between libraries. jQuery is fast. And there's less to learn!

**Over 100 fixes and improvements**

- The People Directory uses the hCard microformat for simple integration with a variety of microformat-enabled tools.
- And more.

**Special thanks**

We'd like to thank Shannon Krebs, David Peterson and David Chui in particular for their continuing contributions to the open-source Confluence plugin library.

Confluence 2.8 Screen and Menu Changes

Can't find a menu item in Confluence 2.8? That's understandable, because the user interface (layout of the screens and menus) in Confluence 2.8 has changed dramatically. This page contains a quick summary of the changes. Please read on for a quick and easy introduction.

Refer to Using the Confluence Screens for an overview of the new Confluence menu structure.

On this page:

- What's on this page?
- Confluence 2.8 User Interface in Detail
- New Menu Structure in Confluence 2.8
- Changes to Menu Items in Confluence 2.8
- RELATED TOPICS

Some of the Confluence documentation will not immediately reflect the new user interface in Confluence 2.8. We are working to rectify the situation as quickly as possible. In the interim, please use this page as a guide.

What's on this page?

The image below shows a Confluence 2.8 screen, with numbers added to the image. The numbers relate to a table of menu commands below the image, showing the new menu structure. Finally, there is a comprehensive table of menu commands, their new locations and how to get there.

Confluence 2.8 User Interface in Detail

The following screenshot and numbered list show the new menu layout in Confluence 2.8.

Screenshot: Confluence 2.8 Annotated User Interface Changes
### New Menu Structure in Confluence 2.8

The numbers in this list relate to the numbers added onto the image above.

<table>
<thead>
<tr>
<th>Number</th>
<th>Menu Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>'Space Menu'</td>
<td>containing Pages, News, Labels, Attachments, Bookmarks, Mail, Advanced and Space Admin.</td>

<td>'Edit Button'</td>
<td>which opens the current page for editing.</td>
</tr>
<tr>
<td>4</td>
<td>'Add Menu'</td>
<td>containing Page, News, Comment, Attachment, Add Bookmark. There may also be other items in this menu, depending upon the plugins you have installed on your Confluence site. For example, Add Diagram (Gliffy plugin) and Add Spreadsheet (E ditGrid plugin).</td>
</tr>
<tr>
<td>5</td>
<td>'Tools Menu'</td>
<td>containing Attachments, History, E-mail, Favourite, Watch, Info, View Wiki Markup, Export to PDF, Export to Word, Copy, Move and Remove.</td>
</tr>
<tr>
<td>6</td>
<td>'Labels'</td>
<td>This line shows tags attached to the current page.</td>
</tr>
</tbody>
</table>

### Changes to Menu Items in Confluence 2.8
This table lists every change to the menu structure that has occurred in Confluence 2.8. Names for some commands have changed, so the old menu option names are listed, next to the new names, with instructions for finding them. (You can search the text on this page for the name of a menu item you used to use in an earlier version of Confluence – you'll find instructions next to it.)

<table>

#### Confluence 2.8 Upgrade Notes

Below are some essential notes on upgrading to **Confluence 2.8**. For details of the new features and improvements in this release, please read the [Confluence 2.8 Release Notes](#).

On this page:

- **Upgrade Notes**
  - Crowd Integration
  - Default Order of Pages Changed from Alphabetical to Natural
  - Plugins
  - Velocity Template Engine
  - Dynamic Tasklist 2
  - Customised Page Layouts
  - JavaScript Libraries
  - Java Versions

- **Upgrade Procedure**

### Crowd Integration

If you are using [Atlassian Crowd](https://confluence.atlassian.com) as your Confluence user management and single sign-on solution, please upgrade to **Crowd 1.3.2** or later. With Confluence 2.8 the atlassian-user interface has changed, and Crowd 1.3.2 provides the required update to Crowd's atlassian-user integration module.
Default Order of Pages Changed from Alphabetical to Natural

Confluence 2.8 introduces the ability to move pages into any order you choose.

As part of the above feature, we have changed the default page order in Confluence, from simple alphabetical ordering to a 'natural' ordering. The natural ordering handles numeric values correctly when doing string comparisons.

Impact:

- The new natural ordering is the same as the ordering already used by the PageTree plugin, which some customers use to create a left-hand navigation panel.
- The change to natural ordering should have little effect on most users because, under most situations, natural ordering and alphabetical ordering will produce the same results.
- For customers who have inserted chapter or page numbers to force the correct order, the new natural ordering will show the existing pages in the correct order.

If you do find that the order of your pages is adversely affected, you can use the new page-ordering function to move the pages.

Plugins

Please check the following if you have added any plugins to Confluence:

- If you are using any third-party plugins, please test them thoroughly before rolling 2.8 into production.
- The PageTree plugin has been updated. If you are using this plugin, please download the latest version to ensure compatibility with Confluence 2.8.

Velocity Template Engine

Confluence’s Velocity template engine has been upgraded from 1.3 to 1.5. Please test carefully for compatibility problems with existing third-party themes and plugins. For developers, there’s more information about Migrating to Velocity 1.5.

Dynamic Tasklist 2

The Dynamic Tasklist 2 plugin is now bundled with Confluence. The new tasklist macro replaces the older tasklist and dynamictasklist macros. What happens to existing tasklists?

- By default, the new macro will be enabled and the older macros disabled in your Plugin Repository.
- When someone views a page containing an older version of the task list, the display will show the new format but the page will not be updated.
- When someone first adds a task or changes anything in the task list, the data will be converted to the new format.

Customised Page Layouts

The Confluence Upgrade Guide includes instructions on re-applying your customisations after the upgrade. We’re repeating some of that information here, because it’s particularly important due to the UI changes in this release.

If a space uses a customised page layout, the new Confluence 2.8 layout will not be applied. This means that you will not see the new menu structure within that space. For example, this will happen if you are using pagetree navigation to form a table of contents on the left.

Fix: Apply the Default Page Layout, then re-insert your custom code.
Steps in detail:

1. Go to the Space Admin screen and click 'Edit' to view your customised Page Layout.
2. Copy the customised code.
3. Cancel the edit.
4. Click 'Reset Default' to apply the new Confluence 2.8 default page layout.
5. On the Space Admin screen, click 'Create Custom' to create a custom page layout.
6. Reinsert your customised code and click 'Save'.

JavaScript Libraries

jQuery is the supported JavaScript library for plugin developers.

Advance notice — deprecated libraries: We have decided to standardise on jQuery as the JavaScript library for Confluence. This library will eventually replace all others. For this reason, use of the following JavaScript libraries in Confluence is deprecated:

- The Yahoo! User Interface Library (YUI)
- Prototype
- Scriptaculous

Because there is a lot of legacy plugin code using Prototype and Scriptaculous, these will continue to be available for at least one more major release of Confluence.

Java Versions

Confluence 2.8 supports Java 1.4, Java 5 and Java 6. We recommend Java 6 because of its increased performance and easier troubleshooting, due to enhanced memory dump and profiling capabilities.

Advance notice — Java 1.4 will be deprecated in a future release. Confluence 2.8 will be the last version that supports Java 1.4. Please refer to the Java 1.4 Support Timeline for more information.

Upgrade Procedure

⚠️ As always please test your upgrades in your TEST environment before rolling into PRODUCTION.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence installation directory and your Confluence home directory, as directed in the Upgrade Guide. If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 2.7.x, read the release notes and upgrade guides for all releases between your version and the latest version.
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.0 first, confirm the upgrade was successful, then upgrade again from version 2.7.0 to version 2.8. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

5. If you encounter a problem during the upgrade, please create a support ticket and one of our support engineers will assist you through the process.
Confluence 2.9.1 is a recommended upgrade which fixes some security flaws and other issues.

Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

This release also addresses an issue relating to contributed filtering with LDAP. In the previous version, the search function was not able to filter results by authors from an LDAP directory. This fix requires an upgrade action; see the Confluence 2.9.1 Upgrade Notes for more information.

There's a complete list of fixes below. Click a specific issue to see details of the fix.

Don't have Confluence 2.9 yet?

Take a look at the new features and other highlights in the Confluence 2.9 Release Notes.

Download the latest version of Confluence.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.9.1 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Updates and Fixes in this Release

Error rendering macro 'jiraissues' : JIRA project does not exist or you do not have permission to view it.

Confluence 2.9.1 Upgrade Notes

Confluence 2.9.1 is a recommended upgrade which fixes some security flaws as well as other bugs. You'll find details of the fixes in the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.

2. If your version of Confluence is earlier than 2.8.0, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.9 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

**Fix for Contributor Filtering LDAP Users**

An issue was fixed in this release relating to search functionality and filtering by contributor. Authors from LDAP directories are now taken into account, however you will need to carry out the instructions to make sure all users are included in this feature.

**Enabling Contributor Filtering for Search**

**Confluence 2.9** includes an enhancement to the search functionality which allows the filtering of search results by author or contributor. Unfortunately an existing bug in Confluence prevented this functionality from being used on sites that use LDAP for their user management.

**Monitoring the Upgrade Task in Confluence 2.9.1**

**Confluence 2.9.1** fixes this defect and also includes an upgrade task that should ensure any existing content contributors are properly indexed and therefore available in the contributor filter auto-complete box.

Enabling this functionality is simply a case of installing Confluence 2.9.1 and watching your log file during startup for specific messages, such as the following.

```
Beginning PersonalInformation repair.
Found <n> usernames that need to be retrieved.
Finished Personal Information repair.
```

On a large external directory of users, it is possible that this task may take many minutes to run. However, the processing of this task will not delay the startup of Confluence.

**Enabling Detailed Progress Reporting during Upgrade**

If you wish to see more detailed progress reporting during the upgrade, you will need to carry out the following steps.

**To enable detailed progress reporting,**

2. During startup of Confluence, you should also see additional progress reporting messages similar to the following:

```
Created 10 from <n> missing Personal Information objects.
Created 20 from <n> missing Personal Information objects.
Created 30 from <n> missing Personal Information objects.
```

**Manually Instigating the Fix**

Should you discover any problems during the repair task (as reported in the logs), then a Confluence Administrator can manually rerun the task by visiting the following page.
That page presents a single button that will re-run the repair task. In addition to the logging noted previously, the same messages will be returned to the administrator's browser.

**Actions Taken when Running the Fix**

There is no functional cost to running this fix. Should you accidentally run it too frequently, there is no functional implication. It is worth being aware of what is happening in the back-end so you can schedule a relevant time to perform it. While the fix is running, the following occurs:

- Two database queries are run to find the missing contributors, each involving an inner join against the same table.
- Each missing user is requested from the LDAP server by username.
- Each missing user will lead to a row insert in the database (these arebatched).

**Restoring Inherited Page Permissions After 2.9 Upgrade**

Confluence instances that were upgraded to Confluence 2.9 are affected by a vulnerability. Child pages under a page protected by permissions are not protected by inherited permissions, as they should be. Please note that new installs of Confluence 2.9 which were not an upgrade from an old version are **not** affected.

Carry out the steps below to rectify the situation.

**To Restore Inherited Page Permissions After Upgrading to Confluence 2.9,**

1. Log into Confluence as ‘Administrator’.
2. Access this specific page in Confluence:

   CONFLUENCE_HOME/admin/permissions/pagepermsadmin.action

   (replace ‘CONFLUENCE_HOME’ with the domain name of your own Confluence instance).
3. On that page, a single button is visible, entitled ‘Rebuild Ancestor Table’. Click that button. It will report its success.
5. Find ‘Inherited Content Permissions’ in the list. Now, click the ‘Flush’ button to the right of ‘Inherited Content Permissions’.
6. Inherited permissions will now be applied.

Read more about this vulnerability in the [Security Advisory](#).

**Confluence 2.9.2 Release Notes**

**14 October 2008**

**Confluence 2.9.2** is a recommended upgrade which fixes some security flaws and other issues.

Please refer to the [security advisory](#) for details of the security vulnerabilities, risk assessment and mitigation strategies.
You can now view the Wiki Markup code for previous versions of a page as well as the current version. Open a previous version from the page history, then select ‘View Wiki Markup’ from the ‘Tools’ menu. Previously, a bug caused Confluence to show the Wiki Markup only for the current version of the page.

Another bug caused an error to occur when you copied a page and tried to add an attachment before saving the page. This is now fixed, along with a number of other issues.

**Don't have Confluence 2.9 yet?**

Take a look at the new features and other highlights in the Confluence 2.9 Release Notes.

[Download Latest Version]

**Upgrading from a Previous Version of Confluence**

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.9.2 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

**Updates and Fixes in this Release**

**Error rendering macro 'jiraissues' : JIRA project does not exist or you do not have permission to view it.**

**Confluence 2.9.2 Upgrade Notes**

Confluence 2.9.2 is a recommended upgrade which fixes some security flaws as well as other bugs. You'll find details of the fixes in the release notes.

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.

2. If your version of Confluence is earlier than 2.9.0, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.9 upgrade notes and the 2.9.1 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

**Confluence 2.9.3 Release Notes**

**Confluence 2.9.3** is the standard edition version of Confluence 2.9.x. This version of Confluence is equivalent to Confluence version 2.9.2, but it does not include Oracle’s Coherence technology. Due to licensing changes with Oracle over the Coherence clustering and distributed caching technology, Atlassian is no longer able to distribute this technology to customers without a Confluence clustered license.

Therefore, Atlassian has released ‘standard editions’ for each previous major version of Confluence back to 2.6, which includes Confluence versions 2.10.4, 2.9.3, 2.8.3, 2.7.4 and 2.6.3. Confluence 2.9.3 will be the only Confluence 2.9.x version available to customers with a non-clustered Confluence license.

For its caching functionality, Confluence 2.9.3 utilises Ehcache. This functionality was provided by the Coherence technology in previous Confluence 2.9.x versions.
For more information about the features, updates and fixes in Confluence 2.9.2, please refer to the Confluence 2.9.2 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.9.2 Upgrade Notes. However, if you have customised the cache settings in your installation of Confluence (e.g. for performance reasons), then please read the Confluence 3.0.1 Upgrade Notes for important information about transferring your caching layer customisations from Coherence to Ehcache.

We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 2.9 Release Notes

7 August 2008

With great pleasure, Atlassian presents Confluence 2.9.

First up is the Search. The new screen design focuses the eye on your search term and results. To help you find information more quickly, Confluence now searches all content types by default and puts the most relevant results at the top of the list. Because a wiki is all about people, Confluence treats personal information as the most relevant. With author filtering, you can now find content written by a specific person.

The macros bundled with Confluence have been treated to a major overhaul. The Chart and Gallery macros offer sophisticated new displays and more interactivity. The revised Pagetree macro is now included in the Confluence download. Try using the Pagetree to add a navigation panel to your pages. We have added some popular new features and fixed a number of much-voted-for bugs in other macros too.

When you are editing a page, Confluence now automatically saves your work and displays the time of the last auto-save. If something goes wrong, you can quickly retrieve your work by selecting 'Drafts' from the user menu.

Other features include resetting page order to alphabetical and some much-needed help in the ongoing battle against spam.

Highlights of this Release:

- Streamlined Search
- Auto Save
- Charts
- Page Tree
- Gallery
- New Tutorial
- More in the Menus
- Alphabetic Page Ordering
- Better Spam Prevention
- Plugin Repository
- Engine Room and Developers' Community
- More than 140 Fixes and Improvements
- Special Thanks

Responding to your Feedback:

210 votes satisfied

Thank you for all your issues and votes. Keep logging, to help us keep improving!

Below is a list of the highlights in this release.
Attacked is the full list of issues resolved in this release.

## Upgrading from a previous version of Confluence

- **Confluence 2.9 requires Java 5 at a minimum**, and will no longer work with Java 1.4. Before upgrading to Confluence 2.9, please refer to the [Confluence 2.9 Upgrade Notes](#) for more details on this change.
- Upgrading Confluence should be fairly straightforward. **We strongly recommend that you back up your Confluence Home directory and your database before upgrading.**
- Please refer to the [Confluence 2.9 Upgrade Notes](#) for further essential information about plugins and other factors affecting your upgrade.

### Highlights of Confluence 2.9

1. **Streamlined Search**
   - The redesigned Search screen helps you to focus on the search term and results, by simplifying the filter box and other parts of the screen.
   - By default, the search now includes all spaces and all content types: pages, news items, comments and so on.
   - You can filter the search results by space, content type and date modified.
   - If your Confluence site uses the standard out-of-the-box configuration for user management, you can also filter the search results by contributor.
   - The search results are weighted to give personal information the highest relevance, followed by pages, news items and the other content types.
   - When using the Search macro or the Search API, you can now also filter by contributor.
   - Take a look at our documentation for more details on the search and the ranking of search results.
Auto Save

- Confluence automatically saves your work to a draft while you are adding or editing a page.
- Now with release 2.9, a message near the 'Save' button shows the time of the latest auto-save.
- If something goes wrong, retrieve the saved draft easily from the dropdown menu under your name.
- You can read more about drafts in the documentation.
Charts

- The Chart macro presents a sophisticated new look.
- Below are some example charts displayed on a Confluence page.
- The documentation shows you how to add the macro to your page and choose different formats and types.

Page Tree

- The Pagetree macro is now bundled as part of your Confluence installation.
- It displays a dynamic, hierarchical list of pages which you can use as a table of contents or a navigation
panel.
- You can choose to include a search box above the tree of pages or on its own.
- New links allow viewers to collapse or expand all branches in the tree at once.
- There are a number of options for specifying the root of the page tree. For example, you can show children of the current page, or children of the current page's parent, or all pages in the space.
- Take a look at the documentation to see the complete list of options.

**Gallery**

- Use the Gallery macro to display a set of pictures on a page.
- Now you can include or exclude individual pictures, or simply display all the images at once.
- Choose pictures from the current page or another Confluence page.
- Take a look at the documentation for help on these and other options.

**Atlassian T-shirts**

- Viewers can click an image to zoom in and view the gallery as a slide show.
New Tutorial

- When you download Confluence and choose to include the sample content, you will receive a new Demonstration Space.
- There's a tutorial for those are new to Confluence or new to wikis.
- Other users will enjoy the advanced topics and links to more information.
- You can use the tutorial as a quick-start guide for new starters in your organisation.
More in the Menus

- The Space menu which appeared in Confluence 2.8 has now been renamed to ‘Browse’. Faithful Confluence users will recognise and welcome this old friend.
- The Browse menu now includes the People Directory, Space administration and Confluence administration for authorised users.
- You can now reach your personal labels, watches and drafts directly from the dropdown menu under your name on any Confluence page.

Alphabetical Page Ordering

- By default Confluence orders your pages alphabetically, but you can drag and drop them into any order you like.
- Now Confluence 2.9 allows you to reset the page order to alphabetical, just by clicking the A icon next to the parent page.
- The documentation tells you more.
Better Spam Prevention

- A new link on the user profile screen allows administrators to jump directly to the user management screen — handy for dealing with those pesky spammers of the human variety.
- We have enhanced Confluence’s Captcha functionality to strengthen the barrier against non-human spammers such as bots or web spiders.
- Captcha is now active on user profile pages as well as other pages.
- The image which Captcha displays is now even more difficult for non-humans to read. Take a look at the word ‘brihter’ in the screenshot below.
- You can read the instructions on configuring Captcha behaviour.
**Plugin Repository**

- The [Plugin Repository](https://confluencelassian.com/) shows more consistent information about the plugins on your Confluence site, including the system and bundled plugins which are shipped with Confluence.

**Engine Room and Developers' Community**

- Confluence's request throughput has been improved, thanks to better class- and resource-loading strategies.
- Startup time has also been reduced. This is particularly good for developers and anyone who needs to restart Confluence often.
- The [Search API](https://confluencelassian.com/) now allows you to filter search results by contributor.
- As part of the ongoing work to make it easier for internal developers and plugin developers to work on Confluence, this release includes re-factorings of some web action classes.
- To improve Confluence's resistance to cross site scripting security vulnerabilities, we have added an experimental automatic HTML entity encoding feature. This is the first step to providing a more secure product by default.

**More than 140 Fixes and Improvements**

- Take a look at the [complete list of issues resolved in Confluence 2.9](https://confluencelassian.com/).

**Special Thanks**

We'd like to say thank you to Zohar Melamed and Shannon Krebs, who wrote the original Pagetree and Pagetree Search plugins.

Confluence 2.9 Upgrade Notes

Below are some essential notes on upgrading to Confluence 2.9. For details of the new features and improvements in this release, please read the Confluence 2.9 Release Notes.
On this page:

- Upgrade Notes
- Plugins
- Java Versions
- Supported Databases and Application Servers
- JavaScript Libraries
- Confluence Themes

Upgrade Notes

Plugins

Please check the following if you have added any plugins to Confluence:

- If you are using any third-party plugins, please test them thoroughly before rolling 2.9 into production.
- If you have installed the Gallery plugin onto your Confluence site, please remove it (or do not reinstall it after upgrading Confluence) in order to get the benefit of the new Gallery macro. The Gallery macro has been significantly improved in this release. It now incorporates features which were previously available only in the separate Gallery plugin.
- If you have installed the PageTree plugin or the Pagetree Search plugin onto your Confluence site, please remove them (or do not reinstall them after upgrading Confluence) in order to get the benefit of the new Pagetree macro. The Pagetree macro has been significantly improved in this release. It replaces the previous PageTree plugin, and incorporates the pagetree search option.
- If you are using the Blog Posts macro, be aware that invalid space keys will now be detected and cause the macro to fail. Previously they were ignored and blog posts from all spaces were returned.

Java Versions

Java 1.4 is not supported in Confluence 2.9 and later. Please refer to the Java 1.4 Support Timeline for more information.

Before upgrading to Confluence 2.9, you will need to ensure your environment is running at least Java 5. Confluence 2.9 supports Java 5 and Java 6. We recommend Java 6 because of its increased performance and easier troubleshooting, due to enhanced memory dump and profiling capabilities.

You can check your current Java version in Confluence:

1. Choose Browse > Confluence Admin.
2. Select 'System Information' from the 'Administration' section in the left-hand panel.
3. Refer to 'Java Version'.
   - If the version is 1.5 or higher, you do not need to do anything.
   - If the version is 1.4, you need to upgrade your JDK before you can upgrade to Confluence 2.9.

If you are running the Confluence EAR-WAR edition against your own application server, you will need to check with your application server vendor about which JDK versions are supported.

Supported Databases and Application Servers Additions to Application Server Support

We have added the following versions to the list of officially supported application servers:

- Resin 3.0 and 3.1
- Tomcat 6 (see known issue with authenticated datasources)

Platforms No Longer Supported
The following platforms were on the ‘unsupported but working’ list for Confluence 2.8. They are not on that list as of Confluence 2.9. They probably still work, but we have not tested them. Please upgrade soon.

- MySQL 4.0 — please upgrade to MySQL 5
- SQLServer 2000 — please upgrade to SQLServer 2005
- Websphere 6.0 — please upgrade to Websphere 6.1
- Weblogic 8.1 — please upgrade to Weblogic 9.2

Please refer to the list of supported application servers and databases on our Supported Platforms topic for the updated matrix.

Advance Notice — Changes to Supported Platforms in the Next Release

The next major release of Confluence after 2.9 will not support the following platforms/versions any more. We will still test those platforms infrequently, and Confluence will probably still work fine with them for a while, but they will be not officially supported.

- MySQL 4.1 — please upgrade to MySQL 5
- Tomcat 5.0 — please upgrade to Tomcat 5.5 or 6
- Resin 2 — please upgrade to Resin 3
- JBoss 4.0.x — please upgrade to JBoss 4.2.x

JavaScript Libraries

jQuery is the supported JavaScript library for plugin developers.

Advance notice — deprecated libraries: We have decided to standardise on jQuery as the JavaScript library for Confluence. This library will eventually replace all others. For this reason, use of the following JavaScript libraries in Confluence is deprecated:

- Prototype
- Scriptaculous

Because there is a lot of legacy plugin code using Prototype and Scriptaculous, these will continue to be available for this release of Confluence.

The Yahoo! User Interface Library (YUI) has been removed from this release, following its deprecation in Confluence 2.8.

Confluence Themes

Advance notice — The Confluence Classic Theme will be deprecated in a future release. Confluence 2.9 will be the last version that supports the Confluence Classic Theme. This theme uses outdated typography and formatting, which was replaced by the new-look Default Theme in Confluence 2.6. At that time, we introduced the Classic Theme to minimise the impact on customers who relied on the older typography. After Confluence 2.9, the Classic Theme will no longer be supported.

Upgrade Procedure

⚠️ Upgrade a test environment first
As always please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:
1. Before you upgrade, we strongly recommend that you back up your Confluence home directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 2.8.x, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.8 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.0 first, confirm the upgrade was successful, then upgrade again from version 2.7.0 to version 2.8.2. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

5. If you encounter a problem during the upgrade, please create a support ticket and one of our support engineers will assist you through the process.

### Confluence 2.10.1 Release Notes

**7 January 2009**

Confluence 2.10.1 is a recommended upgrade which fixes some security flaws and other issues.
Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

A bug was identified in Confluence version 2.10.0 that made the label parameter of the Content by Label Macro case-sensitive. This resulted in link breakages where differences existed in case usage between {contentbylabel} label parameter values and the page labels they referenced. However, this issue has now been fixed.

Another issue was identified in Confluence version 2.10.0 that prevented specific Confluence components (for example, those of the Rich Text Editor) from loading correctly when running Confluence behind certain proxy server configurations. For example, this may have become apparent when running Confluence behind an Apache HTTP Server using the mod_proxy connection module. This issue has also been fixed in Confluence version 2.10.1, along with a number of other issues.

There's a complete list of fixes below. Click a specific issue to see details of the fix.

**Don't have Confluence 2.10 yet?**

Take a look at the new features and other highlights in the Confluence 2.10 Release Notes.

![Download Latest Version]

**Upgrading from a Previous Version of Confluence**

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.10.1 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 2.10.1 Upgrade Notes

Confluence 2.10.1 is a recommended upgrade which fixes some security flaws as well as other bugs. You’ll find details of the fixes in the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and
database.

2. If your version of Confluence is earlier than 2.10, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.10 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 2.10.2 Release Notes

18 February 2009

Confluence 2.10.2 is a recommended upgrade which fixes a security flaw and other issues.

Please refer to the security advisory for details of the security vulnerability, risk assessment and mitigation strategies.

Rich Text Editor fixes

A bug was identified in Confluence version 2.10, which affected the Rich Text Editor in Internet Explorer browsers. This bug prevented new content that was entered into a single line break between existing chunks of text from being saved. For instance, if a user placed their cursor on a single blank line (or line break) between two existing sections of text, entered new text (consisting of any number of paragraphs) and saved it, the new text would not be saved. This issue has now been fixed.

Another issue was identified in the Rich Text Editor which made text appearing immediately under an image concatenate with the image's Wiki Markup when the page content was saved. This prevented the image from being displayed. While inserting an additional line break between the image and text provided a workaround, this issue has now been fixed and this workaround is no longer required.

Content by Label Macro fixes

A bug was identified in the Content by Label Macro that prevented its sort parameter from functioning correctly. However, this has now been fixed. Furthermore, the performance of the Content by Label Macro has been improved.

With the release of Confluence 2.10, the default behaviour of the Content by Label Macro's space parameter was modified to @self. Due to customer feedback and popular demand, however, we reverted this parameter's default behaviour back to @all.

Other fixes

A stability issue was identified in Confluence version 2.10 which has now been fixed. However, a minor side effect has been identified which can result in some superfluous non-breaking spaces not being removed from the end of lines, when either saving a page or switching from the Rich Text Editor to Wiki Markup modes.

A bug was identified in Confluence version 2.10 that prevented Confluence from playing SWF files with Flash Player 10 in Internet Explorer. This has now been fixed.

Some issues were identified with the Code Block Macro in Confluence 2.10, which resulted in the removal of white space within a code block when switching from Wiki Markup to Rich Text Editor modes. However, a fix was introduced to mitigate these issues.

An issue was identified when Viewing Pages Alphabetically, which prevented Confluence from listing pages by specific letters of the alphabet when 1,000 or more pages started with any one letter of the alphabet. This issue has now been fixed.
When writing content in Wiki Markup, URLs containing accented characters now render correctly into links. Additionally, Confluence's French and German product interface translations have been improved.

There’s a complete list of fixes below. Click a specific issue to see details of the fix.

Don’t have Confluence 2.10 yet?

Take a look at the new features and other highlights in the Confluence 2.10 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.10.2 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

**Confluence 2.10.2 Upgrade Notes**

Confluence 2.10.2 is a recommended upgrade which fixes some security flaws as well as other bugs. You’ll find details of the fixes in the release notes.

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your `confluence.home` directory and database**.

2. If your version of Confluence is earlier than 2.10, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the [2.10 upgrade notes](#).
   - If you are upgrading from 2.1 or earlier, please also read the [2.2 release notes](#).

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

**Confluence 2.10.3 Release Notes**

**15 April 2009**

Confluence 2.10.3 is a recommended upgrade which fixes some security flaws and other issues.

Please refer to the security advisory for details of the security vulnerabilities, risk assessments and mitigation strategies.

**General Fixes**

A bug was identified, whereby viewing or editing restrictions could not be assigned to a page, whose parent page contained an apostrophe in its title and also possessed existing page restrictions. This bug has now been fixed.

When a user is restricted from viewing a page, Confluence presents them with a more informative **Access Denied** error rather than a general **Page Not Found** error.

When the `{gallery}` macro is used on a page with no parameters or image attachments, it would render into an error in HTML or PDF exports. This issue has now been fixed.

An issue was identified whereby under certain circumstances, clicking on a page's or blog's thumbnail image to expand it would result in a Runtime Error in Internet Explorer versions 6 and 7. This issue has now been fixed.

**Widget Connector Plugin**

Several new features have been added to the Widget Connector Plugin packaged with Confluence 2.10.3, including support for new widget, video and micro-blogging sites. Other supported features include Google Calendar and the Wufoo HTML Form Builder. For more information on how to add these features to your Confluence page or blog, refer to Widget Connector Macro.

Episodic made changes to the format of IDs they designate for all new videos, allowing them to be alphanumeric rather than solely numeric. The Widget Connector plugin has been updated to support this new URL format.

**Engine Room Fixes**
An issue was identified in Confluence's PDF Export feature that could result in memory leaks. These in turn may have affected the performance and stability of Confluence instances. This issue has now been fixed.

A few other issues were identified which under certain or specific circumstances, could affect the stability of Confluence. However, these have now been fixed.

There's a complete list of fixes below. Click a specific issue to see details of the fix.

Don't have Confluence 2.10 yet?

Take a look at the new features and other highlights in the Confluence 2.10 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.10.3 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

### Confluence 2.10.3 Upgrade Notes

Confluence 2.10.3 is a recommended upgrade which fixes some security flaws as well as other bugs. You'll find details of the fixes in the [release notes](#).

#### Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your confluence.home directory and database**.

2. If your version of Confluence is earlier than 2.10, read the [release notes and upgrade guides](#) for all releases between your version and the latest version. In particular:
   - Please read the [2.10 upgrade notes](#).
   - If you are upgrading from 2.1 or earlier, please also read the [2.2 release notes](#).
3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 2.10.4 Release Notes

⚠️ Please skip this version and upgrade to Confluence 3.0 or later

Please be advised that there is a known bug in Confluence 2.10.4, whereby the ehcache.xml file is completely missing and there is no 'Cache Statistics' link on the Administration console. If the link http://.../admin/cachestatistics.action is directly accessed, a blank page is returned with no cache statistics details. Please upgrade to the latest version of Confluence 3.x, as indicated in the release notes. If you cannot upgrade to Confluence 3.x, please contact our support team.

Confluence 2.10.4 is the standard edition version of Confluence 2.10.x. This version of Confluence is equivalent to Confluence version 2.10.3, but it does not include Oracle's Coherence technology. Due to licensing changes with Oracle over the Coherence clustering and distributed caching technology, Atlassian is no longer able to distribute this technology to customers without a Confluence clustered license.

Therefore, Atlassian has released 'standard editions' for each previous major version of Confluence back to 2.6, which includes Confluence versions 2.10.4, 2.9.3, 2.8.3, 2.7.4 and 2.6.3. Confluence 2.10.4 will be the only Confluence 2.10.x version available to customers with a non-clustered Confluence license.

For its caching functionality, Confluence 2.10.4 utilises Ehcache. This functionality was provided by the Coherence technology in previous Confluence 2.10.x versions.

For more information about the features, updates and fixes in Confluence 2.10.3, please refer to the Confluence 2.10.3 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.10.3 Upgrade Notes. However, if you have customised the cache settings in your installation of Confluence (e.g. for performance reasons), then please read the Confluence 3.0.1 Upgrade Notes for important information about transferring your caching layer customisations from Coherence to Ehcache.

We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 2.10 Release Notes

⚠️ Confluence 2.10 fixes some security flaws. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

3 December 2008

With great pleasure, Atlassian presents Confluence 2.10.

Confluence 2.10 is a major release which presents a number of new features and enhancements. With Confluence 2.10 we introduce the new Widget Connector, an easy way to embed multi-media content from all over the web directly into your Confluence page. Add Youtube videos, Flickr slide shows and Google Gadgets just to name a few. Now that the improved Office Connector is bundled with Confluence 2.10, you can also display the contents of attached documents, spreadsheets, presentations, and PDFs directly on any page. Also, with the new Office Connector, you can now view the contents of attachments using the new 'View' feature from the attachments page, or from a search.

In Confluence 2.10, finding all your content in Confluence is a lot easier. With Quick Navigation just start typing
in the search box and immediately see suggested results. With OpenSearch autodiscovery, you can add Confluence search to your Firefox or IE7 search box with just one click. And with ‘Did You Mean’, you no longer have to worry about mistyping search terms since Confluence now suggests corrections to misspelled words. Take a look at the new search results page, you'll find the right page, attachment or person far more easily.

You can better control your avatar with new profile picture cropping and spruce up your personal space with custom stylesheets. Page editing has become more reliable through an upgrade to our rich text editor which now supports Safari and has a new styles dropdown. JIRA users will be delighted to use our new JIRA Issues Macro with drag and drop column sorting, paging and support for custom fields.

Confluence administrators will benefit from improved user management, a broader range of supported wikis for the Universal Wiki Converter and some good performance improvements.

Please see our overview video to see a demonstration of the new features in Confluence 2.10.

Highlights of this Release:

- Introducing the Widget Connector
- Improved Office Connector Now Bundled
- Introducing Quick Navigation
- ‘Did You Mean’, OpenSearch and More
- Custom Stylesheets for Confluence Spaces
- Updated JIRA Issues Macro with Custom Fields and Dynamic Display
- Enhanced User and Group Management
- Upgraded Rich Text Editor
- Universal Wiki Converter now with SharePoint Import and More
- Improved Activity Macros
- Plugin Framework 2
- More than 250 Fixes and Improvements

Responding to your Feedback:

- ★ 720+ votes satisfied
- ★ 11 new feature requests implemented

Upgrading from a previous version of Confluence

- Upgrading Confluence should be fairly straightforward. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.
- Please refer to the Confluence 2.10 Upgrade Notes for further essential information about plugins and other factors affecting your upgrade.

Highlights of Confluence 2.10

1. Introducing the Widget Connector
Now you can embed multi-media content from other web sites into a Confluence page. Bring your wiki page to life with Google Gadgets, videos, slide shows, Twitter messages and more. Simply type the word '{widget}' and give it the web address of the content you want to embed.

- Gadgets: [Google Gadgets](#).
- Videos: [YouTube](#), [MySpace Video](#), [Google Video](#), [Episodic](#), [Vimeo](#), [Metacafe](#), [blip.tv](#), [Viddler](#).
- Photos and images: [Flickr](#), [Skitch.com](#).
- Micro-blogging: [Twitter](#), [FriendFeed](#).
- Documents and presentations: [SlideShare](#), [SlideRocket](#), [Scribd](#), presentations on [Google Docs](#).
- Our [documentation](#) shows you what to do.

---

**Improved Office Connector Now Bundled**

The Office Connector is shipped as part of Confluence 2.10. There is no need to install it separately. Use the Office Connector to create and edit rich content for Confluence using [Microsoft Office](#) or [OpenOffice](#).

- The new 'View' feature lets you view Office documents from the Search results, from the Attachments.
Introducing Quick Navigation

Confluence’s search box now offers a quick navigation feature, the fastest way to find content in Confluence.

- Start typing your search term. Confluence matches titles as you type, showing a quickly-adjusting list of pages, news items, personal profiles, attachments and so on.
- The matching items are grouped by content type so that you can quickly find the type you want.
- When the matching item is a person’s name, their profile picture appears next to their name in the list.
- Still not found what you are looking for? Click the ‘Search’ option at the bottom of the list to do a full search.
'Did You Mean', OpenSearch and More

Confluence 2.10 includes a number of improvements to the Search functionality.

- Find what you're looking for even if you mistype your search term. Confluence’s new ‘Did you mean’ feature analyses your search term and suggests an alternative spelling to give you more relevant search results.
- You can now search Confluence from the convenience of your browser's search box, if you are using Firefox or IE7. Just add your Confluence site as a search provider, via the dropdown menu next to the browser's search box. This is because Confluence now supports the autodiscovery part of the OpenSearch standard.
- We have also improved the layout of the Search screen so that it is easier to read. The titles now stand out more and a longer extract is shown.
- If the matching item is a person, the profile picture and other profile information appear in the search results.
- If the matching item is an attached Office document, a new 'View' link allows you to view the document online.
- There is a search box at the bottom as well as the top of the screen, so you do not need to scroll up to enter a new search term.
- The 'Clear Filter' link replaces the old 'Clear Search', and now just clears the filter criteria instead of the entire search.
- When ranking the search results, Confluence now gives slightly higher priority to pages created recently.
- Take a look at our documentation for full details of the new features.
Custom Stylesheets for Confluence Spaces

Change the look of your Confluence space by specifying your own CSS styles. Cascading Style Sheets (CSS) are the standard way of styling web pages.

- For example, you might choose to change the background for the header at the top of each Confluence page. See our tutorial.
- Or you might change the look of the tabs in your Space Admin screens, as described in this example.
- To get started, take a look at our documentation.
Updated JIRA Issues Macro with Custom Fields and Dynamic Display

The JIRA Issues macro now gives you more control both when viewing the output and when coding the macro.

- Specify any JIRA field as a column for display, including custom fields.
- Click the column headers to sort the output.
- Drag and drop the columns into a different order.
- Temporarily remove a column from the display.
- Click the triangle at top right of the issue table to collapse the table.
- Retrieve a page of issues at a time, rather than a huge list all at once.
- Take advantage of the improved performance of your JIRA site. The JIRA Issues macro now caches the results for anonymous users and for results retrieved using trusted communication. This should improve the performance of your JIRA site if you have set it up for trusted communication, because Confluence no longer needs to access the JIRA site as often.
- Our documentation tells you how to use the macro.
Enhanced User and Group Management

Searching for users and adding users to groups is now much easier.

- You can add and remove users directly from the group management screen. This allows you to manage the group membership for a number of users at the same time.
- The new user search offers a simple and an advanced option. With the simple option, just type all or part of the person's name, username or email address. If you want to restrict your search, use the advanced option to specify the field you want searched. Or you can search for users in a specific group.
- A new user picker lets you select the people you need from the list of matching users. This makes things much easier when adding members to a group, or when assigning page permissions and space permissions.
**Upgraded Rich Text Editor**

Confluence 2.10 brings many improvements to the Rich Text Editor and is a big step along the way to a great WYSIWYG experience.

- You can now use Safari to create and edit Confluence pages.
- The styles dropdown list now illustrates the format of each style, such as ‘Heading 1’, ‘Heading 2’ and so on.
- Tables are easier to insert and edit.
Universal Wiki Converter now with SharePoint Import and More

The Universal Wiki Converter (UWC) allows you to import content from other wikis into Confluence. Coinciding with the release of Confluence 2.10, there are some great improvements to this useful tool.

- You can now import pages from SharePoint wiki libraries, as well as other wikis, into Confluence.
- The UWC's enhanced user interface allows you to drag and drop wiki pages onto the UWC screen for conversion to Confluence.
- A new link on the Confluence Administration Console gives easy access the Universal Wiki Converter documentation and download pages.
- There is a new command-line interface to the UWC.
- The UWC also offers a new converter for Vqwiki, improvements to the Swiki converter, and more.
Improved Activity Macros

The Blog Posts macro, Recently Updated macro and Content by Label macro now support a common set of parameters, making it easier to code the macros and display the content you need.

- Filter content by author, label, space or content type.
- Use a minus sign (-) to exclude specific values. For example, using the ‘author’ parameter you can specify `author=-hpotter,hgranger,adumbledore`. You will get content which has been created/updated by either 'hgranger' or 'adumbledore’ (or both) but ‘hpotter' has not touched.
- Sort the resulting list of items by title, date created or date modified, in ascending or descending order.

For the HTML Include macro and the RSS macro, you can now specify a ‘whitelist’ of allowed URLs. This will improve the security of your Confluence site, because it can be dangerous to include content from untrusted external sites. Our documentation shows you how to specify the whitelist.

Plugin Framework 2
Confluence 2.10 comes with Atlassian's new Plugin Framework 2.1, based on [Spring Dynamic Modules](https://www.springframework.org/) using an embedded [OSGi](https://osgi.org) container. The new framework lays the groundwork for the following improvements:

- More robust Spring component plugins.
- The ability for plugins to depend on each other.
- Control over plugin load order.
- The ability for plugins to define their own extension points.
- More consistent plugin APIs between products.
- More consistent plugin behaviour across different versions of Confluence.

Take a look at our [developer documentation](https://docs.atlassian.com/confluence/2.10.x). The new [plugin framework](https://docs.atlassian.com/confluence/2.10.x) is under development. Here are some [guidelines](https://docs.atlassian.com/confluence/2.10.x) on converting your existing plugins to the new framework. We'd be delighted to have your feedback via our [JIRA project](https://jira.atlassian.com/).

### More than 250 Fixes and Improvements

- A new attachments icon 📃 on the first line under the title of a page tells you that there are files attached to the page, as well as how many attachments.
- A new lock icon 🏷️ marks pages which have view or edit restrictions.
- The Demonstration Space included in the Confluence download now has more sample content. We have adapted pages from our own development, human resources and sales teams, to give some ideas on how your organisation might use Confluence.
- The default home page for a space now includes a list of recently updated content, a search input box and a tree view of the pages in the space. The default home page is created when you add a space. You can edit the home page to include or remove any content as required.
- You can now crop and tailor your profile picture and delete any profile pictures that you no longer want.
- There is no longer any need to re-create the database indexes manually during the upgrade procedure. From Confluence 2.10, the upgrade process will automatically re-create the indexes.
- Trusted authentication and other Seraph-based authentication methods are now available for calls to the Confluence RPC methods. This makes it practical to write front-end AJAX functionality which uses the remote API to retrieve or modify Confluence data.
- Take a look at the [complete list of issues resolved in Confluence 2.10](https://jira.atlassian.com/).

Confluence 2.10 Upgrade Notes

Below are some essential notes on upgrading to Confluence 2.10. For details of the new features and improvements in this release, please read the Confluence 2.10 Release Notes.

On this page:

- Upgrade Notes
  - Enabling the New Quick Navigation Feature on Customised Confluence Sites
  - Crowd and the User Search
  - RSS and HTML macro whitelists
  - Plugins
  - Java Versions
  - Platforms No Longer Supported
  - JavaScript Libraries
  - Confluence Themes
  - End of Life of SnipSnap Import
  - No Need to Re-Create Database Indexes Manually

- Upgrade Procedure

Upgrade Notes

Enabling the New Quick Navigation Feature on Customised Confluence Sites

If you have customised your Main Layout on either the space or the global level, or if you have a custom theme plugin, the new quick navigation feature will not work immediately for you.

To enable quick navigation, you need to add the following statement to your Main Layout anywhere before the `#standardHeader()` statement:

```
#requireResourcesForContext("main")
```

Crowd and the User Search

Confluence 2.10 includes a much-enhanced user search. (See the release notes.) If you are using Atlassian's Crowd for user management, you will need Crowd 1.5.1 or later to use the 'Simple' option in the user search. If your version of Crowd does not support the simple user search, you will see only the 'Advanced' search form. Please consider upgrading your Crowd version, to take advantage of the advanced user search.

RSS and HTML macro whitelists

To improve the security of a default installation of Confluence, macros which display HTML from external sources now use a whitelist of URLs configured by the Confluence administrator. This affects the RSS and
HTML include macros.

See Configuring a URL Whitelist for Macros for instructions on how to configure a list of allowed URL patterns for the RSS and HTML macros in Confluence 2.10.

Plugins

If you are using any third-party plugins on your Confluence instance, please test them thoroughly before rolling 2.10 into production.

Java Versions

Java 1.4 is not supported in Confluence 2.9 and later. Please refer to the Java 1.4 Support Timeline for more information.

Before upgrading to Confluence 2.10, you will need to ensure your environment is running at least Java 5. Confluence 2.10 supports Java 5 and Java 6. We recommend Java 6 because of its increased performance and easier troubleshooting, due to enhanced memory dump and profiling capabilities.

You can check your current Java version in Confluence:

1. Choose Browse > Confluence Admin.
2. Select ‘System Information’ from the ‘Administration’ section in the left-hand panel.
3. Refer to ‘Java Version’:
   - If the version is 1.5 or higher, you do not need to do anything.
   - If the version is 1.4, you need to upgrade your JDK before you can upgrade to Confluence 2.10.

If you are running the Confluence EAR-WAR edition against your own application server, you will need to check with your application server vendor about which JDK versions are supported.

Platforms No Longer Supported

The following platforms were on the ‘unsupported but working’ list for Confluence 2.9. They are not on that list as of Confluence 2.10. We will still test those platforms infrequently, and Confluence will probably still work fine with them for a while, but they will not be officially supported.

- MySQL 4.1 — please upgrade to MySQL 5
- Tomcat 5.0 — please upgrade to Tomcat 5.5 or 6
- Resin 2 — please upgrade to Resin 3
- JBoss 4.0.x — please upgrade to JBoss 4.2.x

Please refer to the list of supported application servers and databases on our Supported Platforms topic for the updated matrix.

There is a workaround to enable MySQL 4.1.x.

JavaScript Libraries

jQuery is the supported JavaScript library for plugin developers.

Advance notice — deprecated libraries: We have decided to standardise on jQuery as the JavaScript library for Confluence. This library will eventually replace all others. For this reason, use of the following JavaScript libraries in Confluence is deprecated:

- Prototype
- Scriptaculous

Because there is a lot of legacy plugin code using Prototype and Scriptaculous, these will continue to be
available for this release of Confluence.

The Yahoo! User Interface Library (YUI) is no longer supported, following its removal in Confluence 2.9.

Confluence Themes

The Confluence Classic Theme is no longer supported, following its deprecation in Confluence 2.9. This theme uses outdated typography and formatting, which was replaced by the new-look Default Theme in Confluence 2.6. At that time, we introduced the Classic Theme to minimise the impact on customers who relied on the older typography.

When you upgrade to Confluence 2.10, an upgrade task runs to do the following:

- Any space with the Classic Theme configured will be migrated to use the Default Theme.
- If your Global Theme is set to use the Classic Theme, the Global Theme is also migrated to the Default Theme.
- The Classic Theme plugin is uninstalled. (The Classic Theme entry in the database is removed.)

End of Life of SnipSnap Import

Advance notice — EOL SnipSnap import: Confluence 2.10 is the last release which will include the SnipSnap Import option in the Confluence Administration Console. From the next release after Confluence 2.10, the SnipSnap import will no longer be available.

No Need to Re-CREATE Database Indexes Manually

In previous releases of Confluence, you needed to manually re-create the database indexes during the upgrade procedure. For this purpose, we provided a set of SQL statements as an attachment to the Upgrade Guide. From Confluence 2.10, the upgrade process will automatically re-create the indexes. Please refer to the Upgrade Guide.

Upgrade Procedure

⚠️ Upgrade a test environment first

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home Directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.
2. If your version of Confluence is earlier than 2.9.x, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.9 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.5.8 first, confirm the upgrade was successful, then upgrade again from version 2.5.8 to the latest. For more details, please refer to CONF-11767.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.
5. If you encounter a problem during the upgrade, please create a support ticket and one of our support engineers will assist you through the process.

### Workaround For Enabling MySQL 4.1.x with Confluence 2.10

With the release of Confluence 2.10, MySQL 4.1.x is no longer supported and will not work by default. See the [Supported Platforms](http://www.atlassian.com/software/confluence) topic for further details.

However, there is a workaround to enable MySQL 4.1.x with Confluence 2.10.

#### To enable MySQL 4.1.x with Confluence 2.10:

1. When launching Confluence from the command line, add the following parameter:

   ```
   -Dmysql4Compatibility=true
   ```

2. This will enable MySQL 4.1.x to work with Confluence 2.10. Please note however, that use of this database will not be supported by Atlassian.

### Release Notes 2.0

[Atlassian Software](http://www.atlassian.com/software/confluence) is proud to present Confluence 2.0 (otherwise known as Yarra). Yarra is the result of five months of solid work by the Confluence team, and we're really glad to be able, finally, to share it with the world. Existing customers who wish to upgrade, or new users who wish to try out Confluence for 30 days, can download Confluence from the Atlassian website: [http://www.atlassian.com/software/confluence](http://www.atlassian.com/software/confluence)

Yarra is the fifth major update to Confluence. Among the improvements in Confluence 2.0 are an easy-to-use WYSIWYG editor for writing pages, labels for categorising them, and a powerful RSS builder for keeping track of what's new.
Confluence 2.0 is a free upgrade for any customer who purchased their Confluence license after November 16th, 2004. If the maintenance period of your license has expired, or is about to expire, why not contact our friendly sales staff and get it renewed? It's the only way to keep up with all the great new features we're adding.

A big thanks to everyone who reported bugs and offered suggestions over the last few months, especially everyone who helped by trying out our Development Releases. Also, congratulations to the Socceroos for getting Australia into the World Cup for the first time in 32 years. It almost makes up for losing the Ashes.

Contents

- Upgrading
- Migration
- New Features
- Notable Bug Fixes
- Outstanding Bugs

Upgrading From a Previous Version of Confluence

Upgrading Confluence should be pretty easy. We strongly recommend that you backup your confluence.home directory and database before upgrading!

⚠️ Upgrades from 1.4.2 and earlier

If you are upgrading from Confluence 1.4.2 or earlier, you may experience problems with some space-related functionality (see CONF-4765), such as adding a space as a favourite. To work around this, please restart the Confluence instance after the upgrade. This will be fixed in Confluence 2.0.2.

Important Migration Notes

⚠️ Macro/Plugin Compatibility

Necessary changes were made to the Confluence rendering subsystem during the development of Confluence 2.0 that may render some third-party plugins (especially macros) inoperable. If you upgrade Confluence and find that macros or plugins are not operating correctly, try removing all files from [confluence-home]/plugins and restarting Confluence.

⚠️ HSQL 1.8 Upgrade

If you are using the embedded HSQL database, it is possible that Confluence will not be able to automatically upgrade your data. If this happens, Confluence 2.0 will refuse to start, and you will be directed to the following Confluence page which contains instructions on how to upgrade the database manually: Upgrading From HSQL 1.7.1 to 1.8
SSO update

If you are using some third-party Seraph authenticator with Confluence, or have written your own, you should read CONF-4581 before upgrading. Confluence now uses the Seraph defined login.link.url property to define its login link urls, which may cause issues with authenticators that relied on Confluence’s previous, incorrect behaviour.

Weblogic Performance

Confluence 2.0 may perform very badly under Weblogic. There is a workaround for this problem described in CONF-4634, and a full fix IS included in 2.0.1.

JDK 1.5

If you are running Confluence 2.0 on the JDK 1.5, you will need to download some additional dependencies as described in CONF-4643. A full fix is included in a 2.0.1.

MySQL 5

If you are running Confluence 2.0 on the MySQL 5 database, you may encounter some problems. One fix is described here.

Upgrading from 1.4.4

After upgrading to 2.0, administrators will need to rebuild the site's search-index to ensure all the new search features are enabled. Do this from the Content Indexing section of the global administration menu.

Upgrading from 1.3.5 or Earlier

Users upgrading from an earlier version of Confluence should check the release-notes of the other major Confluence releases:

- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

New Features

The four major new features in Confluence 2.0 are:

- Rich Text Editing
- Labels for content
- New Dashboard Features for managing sites with large numbers of spaces.
- A dynamic RSS Builder

...but there's a lot more on top of that.

Rich Text Editing
Browser Compatibility

The Confluence Rich Text editor is currently only compatible with Internet Explorer 6 on Windows, plus Mozilla and Firefox across platforms. Javascript must be enabled in the browser for the editor to function. Support for Safari under Mac OS X is currently not available. To track Safari compatibility, please follow this JIRA issue: CONF-3864

It almost goes without saying that the most highly requested feature in Confluence has been the ability to create pages without having to learn wiki markup. We're glad we can finally offer a powerful "what you see is (pretty much) what you get" rich text editor built into Confluence, making it easier for anyone to contribute to the site.

The WYSIWYG editor is enabled when you install or upgrade to Confluence 2.0. Global Administrators can disable the editor if they want to stick with pure wiki markup, and can also choose which editor users should be presented with by default. (The setting is under "General Configuration" in the administrative console). Users can also choose which editor they prefer simply by clicking on the "Make this my default editor" link that appears on the edit screen.

For the "feature mad" amongst us, here are some neat things you can do with the WYSIWYG editor:

- Full screen view - really useful for editing large pages. Click in the menu bar.
- Quickly switch between WYSIWYG and Wiki markup without a page refresh
- Change the size of your editing window to suit your browser. Your size preference is remembered across sessions. To change it, drag the handle in the bottom right hand corner of the editor.
- Undo and redo!

Labels

Another highly requested feature was the ability to categorise content within Confluence beyond the rigid heirarchy allowed by spaces and parent-child relationships between pages. To this end we have introduced labels: simple one-word 'tags' that can be added to any page or blog-post the user has permission to edit. Labels can be used to categorise content, bookmark it, flag it for attention, or anything else you can think of.

A Tag By Any Other Name

Picking a name for labels wasn't easy. Google's GMail service calls them labels, while other collaborative categorisation systems such as del.icio.us and Flickr call them tags. We decided that 'label' was a more natural description. For more information about our choice, see Labels vs Keywords on our new Developer Blog and for more on the overall philosophy behind labels and tags, check out the Folksonomy page on Wikipedia.

Labels can be added to any page from the edit screen, or through a dynamic interface right when you're viewing a page.
Once a page is labeled, then clicking on the label's name allows you to browse other pages with the same label, or view related labels that commonly occur on the same pages. You can also view the space's most popular labels from the space browser, to get an idea of the most popular topics within the space.

Personal Labels
If you prepend my: to a label (for example, my:todo or my:favourite), then the label is a personal label - only visible to you. Personal labels allow you to tag content for your own purposes: for example to keep track of pages you feel need your attention, or that contain information you refer to frequently. You can browse your personal labels from your user profile. Any user can add their personal labels to any page, even when they don't have editing permission.

Favourites
Favourites are a special personal label: my:favourite or my:favorite. Whenever you see the ⭐ icon, it means you can label this content as being your favourite, and whenever you see the ⭐ icon, it means that the content is currently in your list of favourites. You can view your favourites from the Labels tab of your user profile, or keep track of them on your dashboard.

Label-Aware Macros
Many existing macros have been improved to allow you to filter content based on labels: including the {recent-pages}, {recently-updated} and {blog-posts} macros. We've also added macros that provide more information about labels and labelled content:

- {related-labels} gives a list of labels that might be related to a page
- {listlabels} lists all the labels in a space
- {contentbylabel} lists content that has a particular label
- {recently-used-labels} lists labels that have been recently added or applied
- {navmap} draws a nice-looking table of links to pages with a particular label

Dashboard Features
The Confluence dashboard has been improved to make it easier for you to keep track of only those spaces you are interested in: a big improvement for Confluence sites with large numbers of spaces. The list of spaces is now divided into four tabs (although all four may not be visible):

- **All** shows you all spaces
- **My** shows you all spaces you have marked as your favourites (you can mark a space as your favourite from the **All** tab by clicking on the ☮ icon)
- **Team** shows you all the available 'teams', and the spaces that have been assigned to them
- **New** shows you any space that has been added in the last week

The recently updated content list on the dashboard will reflect the spaces in your chosen tab. So if you're looking at the **My** tab, the dashboard will only be showing you the recent updates in your favourite spaces.

**Teams**

Teams are a simple, and very wiki-like way to group spaces together. Space administrators can add "team labels" to a space, which are then used to group those spaces under the team tab on the dashboard. So if your wiki has 100 spaces, but only five of them are of any interest to your sales team, just add a "sales" team label to those five spaces. That will group those spaces together on the dashboard under the 'team' tab, and your sales team need never look at the other 95 spaces.

**RSS Builder**

Confluence has always provided a brace of useful RSS feeds, but the problem is that for every feed we provided, users asked for half a dozen more. The obvious answer is to let users build RSS feeds based on their own chosen criteria. You can access the RSS builder from the Confluence dashboard.

Once in the builder, you can choose:

- Which spaces to include in the feed
- Which types of content should be tracked
- Which labels, if any, you are interested in
- How many items to include in the feed
- Whether you want a single RSS entry per page or one for each time the page is edited
- Whether you want an RSS 2.0 or Atom 0.3 feed
- Whether Confluence should require authentication to view the feed

Once you have decided what you want, Confluence will give you a URL to paste into your RSS reader. These URLs can be shared with other Confluence users, although they will only ever be allowed to see
content that they have permission to view. If you have asked to authenticate, Confluence will require HTTP Basic Authentication, which is supported by most RSS readers.

We've also taken the opportunity to improve the presentation of our RSS feeds - including a lot more information in each feed so you can follow your Confluence site entirely from your newsreader.

⚠️ The Atom Working Group has blessed the final Atom 1.0 standard, and are recommending that all applications remove support for Atom 0.3. However, as of the release of Confluence 2.0, there is no stable Atom 1.0 library from which we could generate feeds. In some future release of Confluence, Atom 0.3 support will be removed in favour of Atom 1.0.

Other New Features

Record "Change Comments" When Editing a Page

There is now a field on the edit screen for recording a "change comment" when you edit a page. These comments are stored in the page history, and can be used to keep a more complete history of why a page has been edited.

Embed Flash and Movies

You can now embed Flash content or movies (Quicktime or Windows Media) into a page as easily as you can an image: just attach the Flash or movie file to the page, then include it as you would include an image (!filename.mov!).

Export Pages as Word Documents

You can now export pages straight into Word from the Info tab. This is extremely useful for emailing around content to non-Confluence users, printing a document or just creating a backup in Word.

Copy Pages

Also on the Info tab is a "Copy" link that allows you to clone a page in a single click - including making copies of any attachments.

Improved Search Interface

Results returned from Confluence's search engine now have:

- Improved contextual results, showing the most important text around where your query was matched in the page
- Contextual results for any attachment: see where a search was matched even inside PDF, Word, PowerPoint or Excel documents!
- Search results for attachments give you more (and clearer) information about what the attachment is, and where it's from!

Chart Plugin
The **Chart Macro** is now shipped with Confluence, allowing you to dynamically generate neat looking charts like this:

***Fish Sold***

---

**Wiki Source**

```
{chart:title=Fish Sold|type=bar|width=400|height=350|legend=true}
|| Fish Type || 2004 || 2005 ||
|| Herring | 9,500 | 8,300 |
|| Salmon | 2,900 | 4,200 |
|| Tuna | 1,500 | 1,500 |
{chart}
```

**Improved Gallery Macro**

The gallery macro has been spruced up, and now has a slideshow view:
Improved search showing fragments from attachments, file sizes and types.

Screenshot of the new 2.0 rich text editor

A very basic (quite boring - sorry, it's late) example

The new Dashboard space tabs, here showing the "jira" team tab and one favourite space.

Some release notes exported to Word (even on a Mac!) - great for printing too.

Popular labels for a given space.

Additions to the Remote API

Additions to the Confluence Remote API include:

- Comment manipulation
- Label manipulation
- Attachment uploading and editing
- Improved user- and permissions management
Confluence now uses version 2.0 of the Apache XML-RPC library. Java XML-RPC clients using earlier versions of the Apache XML-RPC libraries (i.e. 1.3 or earlier) may experience problems with responses containing non-ASCII data.

Also...
- You can download all the attachments on a page in a single zip-file
- Import and restore now have progress indicators
- Backup and restore use significantly less memory
- The embedded database has been upgraded to HSQL 1.8, which should be significantly more reliable
-Collapsed breadcrumbs now expand with a single mouse click

Notable Bug Fixes

We resolved a lot of issues between Confluence 1.4.4 and Confluence 2.0. The best way to see what we've fixed is to ask JIRA, the world's best issue-tracker: Issues Resolved for 2.0

Outstanding Bugs

Some bugs were introduced during the Confluence 2.0 development cycle that we could not fix in time for the final release. Of note are:
- Some pernicious Javascript errors when changing styles in the rich text editor under Internet Explorer
- The rich text editor may not perfectly handle complex pages with structural macros
- Attachments containing high-bit characters in their filenames may not be correctly retrieved by Confluence

Once again, if you find any bugs in Confluence, or have any feature suggestions, you can report them online in JIRA.

Release Notes 2.0.1

Confluence 2.0.1 is a maintenance release that resolves some issues users may have encountered using Confluence 2.0. In particular, this includes issues relating to failures to upgrade and javascript problems.

2.0.1 is a free upgrade for all customers who purchased their Confluence license after November 28th, 2004.

Who should upgrade?

Confluence 2.0.1 is a recommended upgrade for all users who have not yet upgraded to 2.x and for those users of 2.0 that are encountering issues fixed in this release.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.4.4 or earlier of Confluence, please check the release-notes of the other major Confluence releases:

- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Changes in 2.0.1

See also: Issues resolved for 2.0.1

- Javascript failing with a class not found. (CONF-4643)
- Confluence 2.0 hangs on weblogic. (CONF-4634)
- Disabling WYSIWYG editor causes AJAX error in Preview mode. (CONF-4745)
- Ancestors table hangs on to foreign key relationships if it can't be deleted. (CONF-4700)

Issues resolved for 2.0.1

| JIRA Issues |
| --- | --- | --- | --- | --- |
| Type | Key | Summary | Status | Resolution |
| Authenticate to retrieve your issues |

Release Notes 2.0.2
Confluence 2.0.2 is a maintenance release that resolves a security issue, along with various issues users may have encountered using Confluence 2.0.1.

⚠️ A security flaw as described by the Confluence Security Advisory 2005-12-05 has been identified to exist in Confluence 1.4.x and 2.0.x. This has been fixed in 2.0.2. We recommend to all customers that they either upgrade to 2.0.2 or follow the instructions provided on the Confluence Security Advisory 2005-12-05 to patch there installation.

⚠️ The release of Firefox 1.5 resulted in new bugs and issues with the Rich Text editor. Therefore every version of Confluence up to 2.0.2 isn't very compatible with this browser in terms of Rich Text editing.

Confluence 2.0.3 will feature an updated version of the editor which will solve most of the problems with Firefox 1.5 (CONF-4809).

2.0.2 is a free upgrade for all customers who purchased their Confluence license after December 5th, 2004.

Who should upgrade?

Confluence 2.0.2 is a recommended upgrade for all users as it contains a security patch for the Confluence Security Advisory 2005-12-05. If you are unable to upgrade to 2.0.2, then please see Confluence Security Advisory 2005-12-05 for details on how to patch your installation.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.0, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.4.4 or earlier of Confluence, please check the release-notes of the other major Confluence releases:

- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3

Changes in 2.0.2

See also: Issues resolved for 2.0.2

- Search results page needs to XML encode the query string provided by the user (CONF-4825).
- Recently updated does not list any items (CONF-4770).
- CamelCase linking interferes with rendering of attachment link (CONF-3447).
- Umlaute in links are causing encoding problems with the Rich Text editor (CONF-4775).
- Disabled accounts still receive (blank) daily reports (CONF-4802).

Release Notes 2.0.3

Confluence 2.0.3 is a maintenance release. It contains an upgrade of the WYSIWYG editor and numerous bug fixes.

2.0.3 is a free upgrade for all customers who purchased their Confluence license after December 12th, 2004.

Who should upgrade?

Confluence 2.0.3 is a recommended upgrade for all users who are having problems with the WYSIWYG editor. This release contains an upgrade to the WYSIWYG module that contains numerous bug fixes.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.0, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.4.4 or earlier of Confluence, please check the release-notes of the other major Confluence releases:

- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3

Changes in 2.0.3

See also: Issues resolved for 2.0.3

- Upgrade to TinyMCE 2.0.1 (CONF-4808)
- Backup restore progress monitor does not refresh during restore, making it look like the backup is hanging (CONF-4895)
- Information leak when accessing url directly (CONF-4794)
- Personal labels showing up on the {contentbylabel} macro (CONF-4894)

Release Notes 2.1

Atlassian is happy to offer our customers an early Christmas present: Confluence 2.1 (otherwise known as Bogan). Existing customers who wish to upgrade, or new users who wish to try out Confluence for 30 days, can download Confluence from the Atlassian website: http://www.atlassian.com/software/confluence

Bogan is the Sixth major update to Confluence, offering vastly improved LDAP integration through our new atlassian-user library, as well as introducing the much-requested autosave feature to protect you from losing your precious edits.

Upgrading from 2.0
Upgrading Confluence should be pretty easy: you can find instructions here. We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

### Plugin Compatibility

Any plugin written for Confluence 2.0 and earlier that interfaces with the User system will need to be updated for Confluence 2.1. Plugin developers can find more information on the Atlassian developer blog.

### LDAP Integration Configuration Changes

Customers who have already integrated Confluence with LDAP through the OSUser LDAP providers will need to make changes to their `osuser.xml` file before upgrading. You can find full details in step 3 of LDAP Authentication with OSUser.

### OSUSer or Seraph Customisations

Customers who have performed their own customisations on OSUser or Seraph within Confluence must be sure to test their changes with Confluence 2.1 before upgrading any production system. While we have tried to maintain backwards compatibility, the integration of atlassian-user may adversely affect existing customisations.

Upgrading from 1.4 and earlier

Users upgrading directly from 1.4 or earlier should also read the 2.0 Release Notes for caveats regarding the 1.4 -> 2.0 upgrade.

Contents

1. New Features
2. Improvements
3. Notable Bug-fixes

See also: Issues Resolved for 2.1

**New Features**

**Autosave**

If you've used wikis for long enough, you know the pain of losing a long, involved editing session to a browser crash, session timeout, or just not thinking and clicking on a link to another page. As of Confluence 2.1, this is no longer a problem: the most you'll lose is half a minute of your work.

Every thirty seconds (this interval is configurable by the global administrator), the browser will save your unfinished edit to the server. This autosave will hang around until you either hit the "Save" or "Cancel" button yourself, even if the server is restarted. So if you lose your changes, all you have to do is navigate back to the edit page, and will be given the chance to begin editing again where you left off.

You can view your outstanding autosaved documents from your profile under the "Drafts" tab.
Concurrent Edit Warnings

A useful side-effect of autosave is that now Confluence has an accurate way of measuring who is editing which page. If two people start editing the same page at the same time, Confluence will display a warning message telling you who else is editing the page. You can then negotiate between yourselves who gets to save first.

Even better, Confluence will let you know how long it was since the other editor made any changes to the page, so if somebody has just left their browser open on the edit page for a couple of hours, you'll know you can sneak your changes in while they're asleep.

User Management

Confluence 2.1 sees the landing of our new atlassian-user user management library. Most Confluence customers will not see any significant change from this move, but for anyone looking to integrate Confluence with an external user-base (especially LDAP), atlassian-user is a big step forward.

Confluence can now integrate fully with an LDAP directory server, without the previously annoying practice of having to mirror the users and groups locally on Confluence: Confluence LDAP Documentation Index

Improvements

Performance

A lot of work was done improving the performance of the Confluence dashboard and edit pages, especially for customers who may have thousands of spaces and hundreds of thousands of pages in their Confluence installation. Both of these pages should now respond significantly faster.

Other

- You can now manually set the MIME type under which embedded objects should be served – CONF-4906
- The system info and error pages include more information about your database configuration – CONF-4957
- Email attachments no longer show up on the recently updated list (this seems to have regressed in the final release) – CONF-4684
- Added an icon mapping for sub-tasks in the jiraissues macro – CONF-4921
- Allow attached Windows Bitmap files to be displayed as embedded resources – CONF-4922

Notable Bug-fixes

Confluence 2.1 includes all bug-fixes that were made up to Confluence 2.0.3, and also includes fixes for the following issues:

- Preview now works correctly when rich text editor is disabled – CONF-4935
- Info tab no longer shows incoming links from pages in the trash – CONF-4815
Trying to set a page as its own parent now presents a validation error instead of a system error – CONF-4941
Confluence no longer removes every second character from the filenames of email attachments – CONF-4938
JiraJdbcProfileProvider problems reliably accessing profile information from JIRA resolved – CONF-4933
Unresolved images now replaced with placeholders in WYSIWYG editor – CONF-4929
Removing the {excerpt} macro from a page now deletes the excerpt – CONF-4918

Release Notes 2.1.1

Confluence 2.1.1 is a maintenance release that resolves some issues users may have encountered using Confluence 2.1, including issues related to user management, the editing UI and email notifications.

2.1.1 is a free upgrade for all customers who purchased their Confluence license after December 24th, 2004.

Who should upgrade?

Due to the severity of the issues that it resolves, Confluence 2.1.1 is a recommended upgrade for all Confluence customers.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.1, you can find instructions here. We strongly recommend that you **backup your confluence.home directory and database before upgrading**!

If you are upgrading from Confluence 2.0.3 or earlier, please check the release-notes of the other major
Confluence releases:

**Release Notes 2.1.2**

Confluence 2.1.2 is a maintenance release that resolves some issues users may have encountered using Confluence 2.1.1 or earlier, including issues related to page editing, Javascript errors in Firefox and Safari and PDF exports.

2.1.2 is a free upgrade for all customers who purchased their Confluence license after January 12th, 2005.

*Who should upgrade?*

Confluence 2.1.2 fixes a number of bugs found in Confluence 2.1.1 and earlier. Customers are recommended to upgrade if they are experiencing any of the issues fixed in this release.

*Upgrade Procedure*

⚠️ If you are using MySQL, please apply the patch detailed in this bug report [http://jira.atlassian.com/browse/CONF-5153](http://jira.atlassian.com/browse/CONF-5153). That is, please download 2.1.2, extract it, and copy the above mentioned patch into the unpacked 2.1.2 distribution *and then* go about your upgrade. We will be releasing a version with this patch bundled soon.

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.1 or 2.1.1, you can find instructions here. **We strongly recommend that you backup your `confluence.home` directory and database before upgrading!**

If you are upgrading from Confluence 2.0.3 or earlier, please check the release-notes of the other major Confluence releases:
Changes in 2.1.2

See also: Issues resolved for 2.1.2

Improvements

- JiraPortlet macro now has an optional "baseurl" parameter for when Confluence accesses JIRA from a different URL to regular users – CONF-4897
- Children listed at the bottom of pages are now sorted alphabetically – CONF-4878
- Confluence warns space administrators when they permit anonymous access to a space, but global anonymous access is disabled – CONF-4898

Bugs Fixed

- NS_ERROR_NOT_AVAILABLE popup no longer appears when editing certain pages in Firefox – CONF-5038
- "Error converting parameters" popup no longer appears when editing certain pages in Safari – CONF-4976
- Edit page no longer returns NoSuchElementException error under some circumstances – CONF-5007
- "Last week" and "Last month" searches no longer fail when time period spans the new year – CONF-5056
- News items marked as favourites are now listed on the dashboard – CONF-4998
- Mail attachments no longer show up in recent changes on dashboard – CONF-4684
- PDF Export no longer fails with error parsing background-color attributes – CONF-5026
- Anonymous users do not cause a crash when exporting a space – CONF-5129
- Disabling a servlet plugin no longer causes a NullPointerException – CONF-5021
- Notification emails no longer prepend the site's context path twice to certain URLs – CONF-5024
- It is now possible to move a page between spaces and change its parent in the same operation – CONF-5103
- Dashboard favourite selection now works in Opera 8.5 – CONF-5012
- Username links no longer cause a NullPointerException in certain configurations – CONF-5028

Release Notes 2.1.3

Confluence 2.1.3 is a maintenance release that resolves some issues users may have encountered using Confluence 2.1.2 or earlier, including issues related to Rich Text editing, LDAP user management, restoring to MySQL, and Unicode on MS SQL Server

2.1.3 is a free upgrade for all customers who purchased their Confluence license after January 23rd, 2005.
Who should upgrade?

Confluence 2.1.3 fixes a number of bugs found in Confluence 2.1.2 and earlier. Customers are recommended to upgrade if they are experiencing any of the issues fixed in this release.

Confluence is a **recommended upgrade** for all customers using Confluence's new atlassian-user LDAP user management with dynamic group mappings. For more information see [USER-95](#).

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.1 to 2.1.2, you can find instructions here. We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

If you are upgrading from Confluence 2.0.3 or earlier, please check the release-notes of the other major Confluence releases:

- [Release Notes 2.1](#)
- [Release Notes 2.0](#)
- [Release Notes 1.4](#)
- [Release Notes 1.3](#)
- [Release Notes 1.2](#)
- [Release Notes 1.1](#)

Changes in 2.1.3

See also: [Issues resolved for 2.1.3](#)

**Improvements**

- You can now suppress camel-case linking with `{nl:CamelCaseWord}` – [CONF-3700](#)
- Confluence RSS macro is now compatible with Google News RSS – [CONF-4892](#)
- The `{contentbylabel}` macro supports a wider range of options – [CONF-5137](#)

**Bugs Fixed**

- Many fixes related to Rich Text editing, and switching between Rich Text and Wiki Markup editing.
- Further PDF export fixes – [CONF-4930](#)
- The upload option in the attachments macro works – [CONF-5127](#)
- Fixed a bug where Word exports would open in the wrong application – [CONF-5163](#)
- Handling of situation where site exceeds its licensed user limit and then removes users is improved – [CONF-5208](#)
- Restoring a site to MySQL now properly removes and re-creates database tables – [CONF-5153](#)
- Confluence now uses correct NVARCHAR type for multibyte text in MS SQL Server – [CONF-5204](#)

**Issues resolved for 2.1.3**

Release Notes 2.1.4
Confluence 2.1.4 is a maintenance release that resolves some issues users may have encountered using Confluence 2.1.3 or earlier. Confluence 2.1.4 fixes more than 55 issues, including bugs related to space import/export, the WYSIWYG editor, page breadcrumbs, and many more.

2.1.4 is a free upgrade for all customers who purchased their Confluence license after February 16th, 2005.

**Who should upgrade?**

Confluence 2.1.4 fixes a number of bugs found in Confluence 2.1.3 and earlier. Customers are recommended to upgrade if they are experiencing any of the issues fixed in this release.

Confluence is a recommended upgrade for all customers using Confluence’s new atlassian-user LDAP user management, as it fixes important issues related to user login validation.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from an earlier Confluence 2.1 release, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

- If you are running a Sybase or Microsoft SQL Server database, please replace confluence/WEB-INF/classes/com/atlassian/confluence/upgrade/UpgradeUtils.class with this version before upgrading.
  
  You should also install this if your upgrade fails with the message: Session is currently disconnected

If you are upgrading from Confluence 2.0.3 or earlier, please check the release-notes of the other major Confluence releases:

- Release Notes 2.1
- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

**Changes in 2.1.4**

More than 55 issues were resolved between 2.1.3 and 2.1.4. For the complete list, see: Issues resolved for 2.1.4

**Note about markup for embedded content**

A bug was fixed in 2.1.4 that previously allowed spaces as attribute separators in embedded content wiki markup (CONF-5406). This means !image.jpg|alt=Great pic! now works correctly, but !image.jpg|border=1,alt=test! doesn’t. The correct and documented way to write the latter continues to be !image.jpg|border=1,alt=test!.

**Improvements**

- {livesearch} macro results can now be limited to a particular space – CONF-3432
- A setting was added to General Configuration to control the maximum number of attachments that can be uploaded at once – CONF-5447
- A setting was added to General Configuration to enable or disable GZip content encoding – CONF-5257
- “Insert Link” and “Insert Image” now work correctly on Safari in OS X 10.4.4 and later – CONF-5435
- A draft is automatically saved when moving from ‘Edit’ to ‘Preview’ – CONF-5366
- A getPermissionsForUser method was added to the remote API to allow administrators to retrieve the permissions of particular users – CONF-5439
Notable Bugs Fixed

- Many fixes related to the maintenance of the ancestors table while moving or renaming pages, which may have resulted in the misplacing of page breadcrumbs or inherited page-level permissions – CONF-5104, CONF-5243, CONF-5244
- Many fixes related to Rich Text editing, including the handling of tables and whitespace – CONF-5299, CONF-5231, CONF-5492, CONF-5294, CONF-5324, CONF-5247, CONF-5362, CONF-5265
- Space import no longer overwrites part of global configuration – CONF-5370
- Confluence no longer tries to create indexes with names bigger than DB2 can handle – CONF-5316
- “Insert Link” and “Insert Image” no longer erase contents of edit field in Safari on OS X 10.4.4 and later – CONF-5329
- Links from the {labels} macro are now space-relative – CONF-5346
- 😱 emoticons no longer mistaken for embedded image markup – CONF-3369
- “Profile:” no longer mistaken as the start of a file: URL

Release Notes 2.1.5

Confluence 2.1.5 is a maintenance release that resolves some issues users may have encountered using Confluence 2.1.4 or earlier.
Confluence 2.1.5 fixes around 50 issues, including a number of fixes for LDAP support, the WYSIWYG editor, and other areas.
2.1.5 is a free upgrade for all customers who purchased their Confluence license after March 16th, 2005.

⚠️ Confluence 2.1.5 has a problem which disables the rich text editor link dialog. Please replace the file WEB-INF/classes/com/atlassian/confluence/user/actions/PagePickerAction.properties with this file: PagePickerAction.properties

This is fixed in 2.1.5a.

**Known Issues in 2.1.5a**

Anonymous users may get a Javascript error under some circumstances. See CONF-5765 for details and a patch.

When using LDAP user management, changing passwords for local users won't work. See CONF-5775 for details and a patch.

Who should upgrade?

Confluence 2.1.5 fixes a number of bugs found in Confluence 2.1.4 and earlier. Customers are recommended to upgrade if they are experiencing any of the issues fixed in this release.

Confluence is a **recommended upgrade** for all customers using Confluence's new atlassian-user LDAP user management, as it fixes important issues related to LDAP integration.
Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from an earlier Confluence 2.1 release, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.0.3 or earlier, please check the release-notes of the other major Confluence releases:

- Release Notes 2.1
- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Changes in 2.1.5

More than 48 issues were resolved between 2.1.4 and 2.1.5. For the complete list, see: Issues resolved for 2.1.5

Improvements

- LDAP queries are cached to improve performance - CONF-5288
- Administrators can insert custom HTML on every Confluence page, see Administration, Custom HTML - CONF-5350
- Tables created in the rich text editor don't have non-breaking spaces added to each cell - CONF-5044
- News improvements - Info tab available including list of version, News can be exported as PDF - CONF-1 989, CONF-5582, CONF-5594

Notable Bugs Fixed

- Anchor, user profile and attachment links now round-trip properly in the rich text editor - CONF-5678
- Paging of LDAP users works properly - CONF-5438
- Servlet plugins can be disabled - CONF-5598
- Forgotten username emails work again - CONF-5530
- User profiles fixes with LDAP - CONF-5225, CONF-5549

Release Notes 2.2

Atlassian is proud to announce the release of Confluence 2.2, otherwise known as Shoalhaven. Existing customers who wish to upgrade, or new users who wish to try out Confluence for 30 days, can download Confluence from the Atlassian website: http://www.atlassian.com/software/confluence

Shoalhaven is the seventh major update to Confluence (in two years!). It introduces 'personal spaces', support for localisation/internationalisation, CAPTCHA spam protection, a multitude of new extension points for plugin developers, a simpler LDAP configuration syntax, and more.
Upgrading from 2.1

Upgrading Confluence should be pretty easy: you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

- **MySQL Driver Support**
  For users using MySQL with Confluence 2.2 (or higher), please ensure that you are using the latest (3.1.12) MySQL Java Connector. Earlier versions of the MySQL connector have a bug which may prevent Confluence from upgrading successfully. (more information below)

- **LDAP Authentication**
  If you are currently using LDAP authentication through OSUser (that is, you adjusted your o suser.xml file), please do not upgrade to 2.2. This feature is currently unavailable and an issue has been filed for it here. This issue has been resolved in Confluence 2.2.1.

- **User Management Bug**
  You must apply the patch attached on this bug report to be able to create users in this version. This issue has been resolved in Confluence 2.2.1.

- **Index Rebuilding**
  Upgrading to 2.2 will trigger a rebuild of Confluence's search index. This will cause certain features such as search, the dashboard and RSS feeds to behave unpredictably for up to a few minutes after upgrading.

- **LDAP Integration Configuration Changes**
  The configuration file syntax for atlassian-user has changed. Customers who configured Confluence 2.1 to use AtlassianUser LDAP integration must follow the instructions on this page.

- **Anonymous Permission Changes**
  The way that anonymous permissions are applied to users who have logged in has changed. Administrators should understand how they have changed below before upgrading.

- **Plugin Loading Changes**
  Prior to Confluence 2.2, it was possible for an outdated plugin, or a plugin with unsatisfied dependencies, to break the entire plugin subsystem. Confluence 2.2 is much more careful about loading plugins, and isolating them if they break. This may, however, cause Confluence to refuse to load an entire plugin, simply because one of its contained plugin modules will not load.

Upgrading from 2.0 and earlier

Users upgrading directly from 2.0 or earlier should also read the 2.1 Release Notes for caveats regarding the 2.0 -> 2.1 upgrade.
1. New Features
2. Improvements
3. Notable Bug-fixes
4. Important note for MySQL users

New Features

Personal Spaces

Two of the most frequent questions we get from Confluence customers have been: "How do I give my users their own wiki?" and "How do I give my users their own blog?" It seems everybody needs a little Personal Space.

Personal spaces belong to particular users, and rather than being listed on the dashboard, are available from the user's profile. (Future versions of Confluence will feature a 'people browser' to make it easier to discover the interesting personal spaces on your server). They can contain pages and news items like any other space, be searched and browsed. They can be kept private, or opened up so the whole world can view and edit them, just like global spaces.
Your personal space is your own private workspace within Confluence.
You can optionally let other people view or contribute to it.

Who can contribute to your personal space?
You can customize these permissions once the space is created.

Choose who can view content:
- Me
- Registered users - anyone logged into Confluence
- Anonymous - anyone, logged in or not

Choose who can contribute (create and edit) content:
- Me
- Registered users - anyone logged into Confluence
- Anonymous - anyone, logged in or not

Choose Theme
To change the theme of this space, select one below.

- Default Theme
  Use the globally configured look and feel. You can customise colour schemes and layouts manually.

- Left Navigation Theme
  Provides a navigation bar on the left hand side of the screen.

Confluence's search and RSS builder interfaces have been updated to make it easy to choose whether you're interested in personal spaces or not.

Oh, and if you create a personal space, don't forget to upload (or choose) your own profile picture, so people can see who you are.
Confluence now supports drop-in language packs to change the language of the user interface. The global administrator can select a default language for the entire site, while individual users can set their preferred language in their preferences.

No language packs are currently available, but we are currently working with our global partners so we can begin to provide translations. If you are interested in translating Confluence into another language, you can find instructions on building a language pack here: Language Module.

CAPTCHA Support

Many of the more public Confluence wikis have been suffering at the hands of spammers. CAPTCHA support adds the familiar 'type in this word' question to signup, edit and comment forms, to defeat automated spamming bots. You can turn on CAPTCHA from the global administrative console, and also choose which users will, or will not be subject to the spam check.
Exclusions
By default, captchas are shown to only anonymous users. This streamlines the editing process for trusted, signed-in users.

Exclude from captchas:
- No one (everyone will see captchas)
- Signed in users
- Members of the following groups

Plugin Improvements
Each version of Confluence is more customisable than the last. One of the most exciting things to come from our recent plugin competition was learning just how creative our plugin developers are, and discovering more ways we can help them add features to Confluence.

- **Job Module** and **Trigger Module** allow you to schedule periodic tasks to run within Confluence
- **Web UI Modules** allow plugin developers to add new links, buttons and tabs to the Confluence interface, and make it easier for theme developers to stay up to date with changes to the Confluence UI.
- **Code Formatting Module** allow you to plug support for new languages into the {code} macro (or override the existing language support with something better).

We've also made a number of improvements to the plugin system, including:

- Making sure that a single 'rogue' plugin can't bring down the whole plugin subsystem.
- Enabling 'conditional get' for plugin resources, so browsers don't download them again and again.
- Fixing problems that may occur when a servlet or component plugin is reloaded or upgraded. (With many thanks to Dan Hardiker of Adaptavist.)

New atlassian-user Configuration Syntax
As promised, we have cleaned up the configuration file syntax for our atlassian-user user management library. This should make it much easier to configure Confluence to use external user repositories such as LDAP. You can find details of the new configuration file format here: Connecting to an LDAP Directory

Improvements

Permissions Changes
In Confluence 2.1 and earlier, permissions that were assigned to Anonymous users were not automatically assigned to logged-in users, leading to the confusing situation where you could view a page when not logged in, but not view it when you were logged in.

In Confluence 2.2 and later, permissions that are assigned to the Anonymous user are also assigned to all logged in users. The sole exception to this rule is the global Use Confluence permission, which must still be explicitly granted to any user who wishes to log in. (This exception is necessary due to licensing restrictions).

Search
With help from Kelvin Tan, we've overhauled much of the underlying infrastructure of Confluence's search engine. Search in Confluence should now be more efficient, and some searches that were problematic before (such as wildcard* searches) now work as you would expect them to.

LDAP Performance
Confluence’s performance against external LDAP user repositories should now be significantly faster.

**Other**

- The General Configuration screen is much better organised
- You can choose a space's initial permissions and theme when you create it
- The left-navigation theme has improved
- Themes may now be packaged with icons that will be displayed in the theme selector (see the screenshot of the "create personal space" screen above for an example)
- Confluence Standalone is now packaged with Tomcat 5.5
- Atom feeds are now generated to the Atom 1.0 standard
- The back-end storage of attachment files has been changed to resolve a number of problems that were caused when the underlying filesystem did not support the character-set of the attachment filename

**Important note for MySQL users**

For users using MySQL with Confluence 2.2 (or higher), please ensure that you are using the latest (3.1.12) MySQL Java Connector. Earlier versions of the MySQL connector have a bug which is triggered by improvements in Confluence 2.2. These earlier connector versions will result in an error being recorded in your logs on upgrade (and will result in unstable operation of Confluence)

```
ERROR
[hibernate.tool.hbm2ddl.SchemaUpdate]
execute could not complete schema update
```

You can download the latest MySQL connector from the [MySQL Java Connector 3.1 download page](https://dev.mysql.com/downloads/connector/). Please be sure that you remove any older versions of the connector from your application server.

Release Notes 2.2.1

Confluence 2.2.1 is a maintenance release that resolves some issues users may have encountered using Confluence 2.2, including issues related to LDAP user management, i18n, personal spaces and drafts.

2.2.1 is a free upgrade for all customers who purchased their Confluence license after May 18th, 2004.

Who should upgrade?

Confluence is a recommended upgrade for all customers using Confluence with external LDAP user management. All other customers should consult the list of issues resolved, and determine if this release is necessary for their own deployments.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

⚠️ Draft Table Upgrade

Upgrading Confluence to 2.2.1 will cause all autosaved 'drafts' to be deleted from the database. Be sure everyone has saved their work before upgrading!

⚠️ Confluence 2.2.1 and 2.2.1a

The current version available for download is 2.2.1a. 2.2.1 was originally released with an old version of the atlassian-plugins library, which caused the plugin fixes listed below not to be included in the release. Confluence 2.2.1a resolves that problem.

⚠️ PageChildrenMacro IndexOutOfBoundsException error

Customers who downloaded 2.2.1 or 2.2.1a before the official announcement may encounter an error when using the {children} macro to view the children of other pages in the same space. There is a patch for this issue attached to CONF-6197

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

- Release Notes 2.2
- Release Notes 2.1
- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Changes in 2.2.1

For a complete list, see: Issues resolved for 2.2.1

External User Management

- Creating a new user will no longer cause a primary key violation on some Confluence installations. CONF-6092
- Fixed a regression where authentication against an external LDAP server via the old OSUser integration layer did not function. CONF-6052
Fixed a possible ClassCastException on viewing a user's profile. CONF-6021

Plugins

Note: Due to a scheduling error, these fixes were not included in Confluence 2.2.1, but are in the supplementary 2.2.1a release.

- Component plugins are now correctly unregistered when they are removed. CONF-4041
- Plugins may now contain and reference dependent jar files. Thanks to Dan Hardiker of Adaptavist for the patch. PLUG-8
- Installing an older version of an already-installed plugin no longer causes an error. PLUG-12
- Removing an uploaded plugin no longer causes it to be deactivated the next time it is installed. PLUG-13

General Stability

- Confluence can now store drafts for spaces with long (>20 character) keys. CONF-6010
- Attachments stored in MySQL databases will no longer be silently truncated to 64KB. CONF-6120
- Global language setting is now saved correctly. CONF-6027
- Missing attachment data no longer causes PDF export to crash. CONF-6063
- Misleading "attachment missing" errors are no longer logged after a space import. CONF-6026

Improvements

- A Javascript alert warns users if they have left the CAPTCHA field blank. CONF-5984
- A link to the logged-in user's personal space is included on every page (from their full name). CONF-6056
- The {children} macro can now show the children of pages in another space. CONF-5986

Release Notes 2.2.2

Confluence 2.2.2 is a maintenance release that resolves some issues users may have encountered using Confluence 2.2, including issues related to PDF generation, internationalisation, backup/restore and more.

2.2.2 is a free upgrade for all customers who purchased their Confluence license after May 31st, 2005.

**Who should upgrade?**

Confluence 2.2.2 resolves CONF-6237, a bug related to the backup and restore of personal spaces. As such it is a recommended upgrade for customers wishing to restore or import data containing personal spaces. Other users should consult the list of resolved issues, and determine if the upgrade is necessary for their installation.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2 or 2.2.1, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major
Confluence releases:

- Release Notes 2.2
- Release Notes 2.1
- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Changes in 2.2.2

Over 25 issues were resolved between Confluence 2.2.1 and 2.2.2. For a complete list, see: Issues resolved for 2.2.2

Backup/Restore

- An issue was resolved that could cause personal spaces to be imported incorrectly from backups. Existing backup files are still valid, the error was only during the re-importing process – CONF-6237

PDF Export

- PDF exports can now be generated for pages containing non-latin characters. To enable these exports you will need to provide Confluence with the correct font – CONF-1457
- PDF exports created in Confluence are now properly searchable, both in Confluence (CONF-1360) and in Adobe Acrobat (CONF-4529)

Other

- (UI) Fixed a Javascript error when saving a page with CAPTCHA disabled – CONF-6221
- (User management) Resolved an error when deleting a non-empty group – CONF-6082
- (i18n) Resolved issues with hard-coded English text in various places – CONF-6202
- (i18n) Resolved issues with internationalisation keys showing up in the permissions guide – CONF-6053

Release Notes 2.2.3

Confluence 2.2.3 is a maintenance release that resolves some issues users may have encountered using Confluence 2.2, including issues related to LDAP user management, installation, backup/restore and more. This release also includes a patch for a serious security issue regarding global permissions.

2.2.3 is a free upgrade for all customers who purchased their Confluence license after June 8th, 2005.

Who should upgrade?

Confluence 2.2.3 resolves a security bug related to unauthorised modification of global permissions. As such this release is a recommended upgrade for all customers.
For users of older versions of Confluence who do not wish to upgrade, a patch for this issue will be available shortly.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2, 2.2.1 or 2.2.2, you can find instructions here. *We strongly recommend that you backup your* confluence.home *directory and database before upgrading!*

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

- [Release Notes 2.2](#)
- [Release Notes 2.1](#)
- [Release Notes 2.0](#)
- [Release Notes 1.4](#)
- [Release Notes 1.3](#)
- [Release Notes 1.2](#)
- [Release Notes 1.1](#)

**Changes in 2.2.3**

As part of a new process for pushing out bug fix releases more quickly, this release follows just a week after the release of 2.2.2. Six issues were resolved between Confluence 2.2.2 and 2.2.3. For a complete list, see: [Issues resolved for 2.2.3](#)

**Global Permissions**

- A security problem was identified where unauthorised users could modify global permissions. For more information, including details on how to patch previous Confluence versions, please see [the security advisory](#)

**Backup/Restore**

- An issue was resolved where attachments were not imported from space exports. Existing backup files are still valid, the error was only during the re-importing process – [CONF-6286](#)

**External user management**

- Queries to LDAP repositories are now correctly escaped, so user and group names may contain commas – [USER-106](#)

**Other**

- (UI) Fixed parent link in preview of new page – [CONF-6275](#)
- (authentication) Fixed incorrect redirect from login when base URL contained an extra slash – [CONF-626](#)
- (installation) Improved error handling during Confluence setup – [CONF-6276](#)

**Issues resolved for 2.2.3**

Release Notes 2.2.4

Confluence 2.2.4 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.2.

2.2.4 is a free upgrade for all customers who purchased their Confluence license after June 22nd, 2005.

Who should upgrade?

Confluence 2.2.4 is a minor bugfix release. Customers should consult the list of issues resolved in this release to determine if it is worth their while upgrading.

Customers still running Confluence 2.2.2 or earlier are recommended to upgrade, as a significant security vulnerability was resolved in Confluence 2.2.3

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2 - 2.2.3, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

- Release Notes 2.2
- Release Notes 2.1
- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Changes in 2.2.4

We are currently trialling a process of more frequent bugfix releases, to make fixes available as soon as possible to those people who want them. 2.2.4 resolves six issues:

See also: Issues Resolved for 2.2.4

User Interface

- The "Space Admin" tab is no longer displayed to non-administrators. (Even though the tab was visible, non-administrators could still not access any of the administrative functions) CONF-6385
- Personal spaces are no longer listed in the space picker in the feed builder CONF-6830
- Attempts to create news items with invalid characters now fail with the correct error message CONF-6358

Performance

- The velocity manager is no longer loaded twice, saving memory. CONF-6355
- The velocity cache now expires templates that have not been recently used, potentially saving memory. CONF-6339

Developer API

- Putting pages into, and removing them from the trash now trigger the correct events within Confluence CONF-6353

2.2.5 Security Patch

This patch fixes a minor security vulnerability regarding the administration of space mail accounts. It affects only Confluence 2.2.5.

To install this patch please download the three files attached to this page, stop Confluence and copy them to your WEB-INF/classes/com/atlassian/confluence/mail/actions directory, where they will replace the existing files. Then start Confluence.

Release Notes 2.2.6a

Confluence 2.2.6a is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.2.

2.2.6a is a free upgrade for all customers who purchased their Confluence license after June 22nd, 2005.

Who should upgrade?

Confluence 2.2.6a is a minor bugfix release. Customers should consult the list of issues resolved in this release to determine if it is worth their while upgrading. Customers running Confluence 2.2.5 should upgrade, as 2.2.6a fixes a security problem which could allow an unauthorised user to modify space mail box configuration. Only version 2.2.5 is affected by this vulnerability. Customers running 2.2.5 who don't wish to upgrade can follow these instructions to patch the vulnerability.

Customers still running Confluence 2.2.2 or earlier are recommended to upgrade, as a significant security vulnerability was resolved in Confluence 2.2.3

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2 - 2.2.3, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!
If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

- Release Notes 2.2
- Release Notes 2.1
- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Changes in 2.2.6a

We are currently trialling a process of more frequent bugfix releases, to make fixes available as soon as possible to those people who want them. 2.2.6a resolves 20 issues.

A few of the issues are noted below, see Issues Resolved for 2.2.6a for a complete list.

User Interface

- The rich text editor allows underlining to be removed, and lists in tables are better behaved. CONF-6450, CONF-6508
- Users with capital letters in their names can watch pages and spaces. CONF-6489

LDAP

- LDAP users can be removed from local Confluence groups. CONF-6131
- The 'Change Password' link is no longer shown when LDAP is enabled. CONF-6360

Performance

- Indexing performance has been improved. CONF-6465

Issues Resolved for 2.2.6a

Release Notes 2.2.7

Confluence 2.2.7 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.2.

2.2.7 is a free upgrade for all customers who purchased their Confluence license after July 28th, 2005.

Who should upgrade?

Confluence 2.2.7 is a minor bugfix release. Customers should consult the list of issues resolved in this release to determine if it is worth their while upgrading.

Customers still running Confluence 2.2.2 or earlier are recommended to upgrade, as a significant security vulnerability was resolved in Confluence 2.2.3
Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2 - 2.2.3, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

- [Release Notes 2.2](#)
- [Release Notes 2.1](#)
- [Release Notes 2.0](#)
- [Release Notes 1.4](#)
- [Release Notes 1.3](#)
- [Release Notes 1.2](#)
- [Release Notes 1.1](#)

Changes in 2.2.7

We are currently trialling a process of more frequent bugfix releases, to make fixes available as soon as possible to those people who want them. 2.2.7 resolves 23 issues.

A few of the issues are noted below, see Issues Resolved for 2.2.7 for a complete list.

Task List Macro

- Tasks with the same name in different lists are now distinguished. [CONF-5809](#)

User Management

- The manage groups page can now display an unlimited number of groups. [CONF-6458](#)
- Users that belong to more than 100 groups are now always able to login. [CONF-6292](#)

PDF Export

- Exporting pages to PDF which include other pages will now have correct links and not lose images. [CONF-1155](#)

Internationalisation

- Tree view of page hierarchy will not be truncated when using multi-byte character sets. [CONF-5872](#)

Issues Resolved for 2.2.7

Release Notes 2.2.8

Confluence 2.2.8 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.2.
Confluence 2.2.8 has slower indexing than previous versions. There is a fix for that regression here: [CONF-6908](#).

2.2.8 is a free upgrade for all customers who purchased their Confluence license after August 8th, 2005.

**Who should upgrade?**

Confluence 2.2.8 is a minor bugfix release. Customers should consult the list of issues resolved in this release to determine if it is worth their while upgrading.

Customers still running Confluence 2.2.2 or earlier are recommended to upgrade, as a significant security vulnerability was resolved in Confluence 2.2.3

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2 - 2.2.3, you can find instructions here. We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

- [Release Notes 2.2](#)
- [Release Notes 2.1](#)
- [Release Notes 2.0](#)
- [Release Notes 1.4](#)
- [Release Notes 1.3](#)
- [Release Notes 1.2](#)
- [Release Notes 1.1](#)

**Changes in 2.2.8**

We are currently trialling a process of more frequent bugfix releases, to make fixes available as soon as possible to those people who want them. 2.2.8 resolves 22 issues.

A few of the issues are noted below, see Issues Resolved for 2.2.8 for a complete list.

- Exporting a space as HTML now creates an index page which includes all the pages in the export. [CONF-6670](#)
- Timeouts can be set for HTTP requests made from Confluence to RSS feeds and JIRA instances. [CONF-6697](#)
- RSS Autodiscovery works in Safari. [CONF-4607](#)
- When a group is deleted, space permissions for the group are now correctly removed. [CONF-6733](#)
- Change default background colour from grey to white. [CONF-6733](#)
- Non-breaking spaces are handled correctly when indexing. [CONF-6685](#)
- Rich text editor respects leading spaces in noformat macro. [CONF-6527](#)

Release Notes 2.2.9

Confluence 2.2.9 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.2. 2.2.9 resolves an indexing performance regression introduced in 2.2.8, and includes fixes for external user management, and MaxDB and Sybase compatibility.

2.2.8 is a free upgrade for all customers who purchased their Confluence license after September 9th, 2005.

Who should upgrade?

Confluence 2.2.9 is a minor bugfix release. Customers should consult the list of issues resolved in this release to determine if it is worth their while upgrading.

If you are running Confluence 2.2.8, but do not wish to upgrade to 2.2.9, we strongly recommend installing the patch attached to CONF-6908 instead to resolve an issue related to re-indexing performance.

Customers still running Confluence 2.2.2 or earlier are recommended to upgrade, as a significant security vulnerability was resolved in Confluence 2.2.3

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2 - 2.2.3, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

- Release Notes 2.2
- Release Notes 2.1
- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Changes in 2.2.9

2.2.8 resolves approximately 25 issues. See Issues Resolved for 2.2.9 for a complete list. A few of the issues are noted below.

External user management:

- LDAP users are no longer given the option to change their passwords in Confluence – CONF-6144
- External users belonging to more than 100 groups can log in successfully – CONF-6292
- External users can be removed from local groups – CONF-6832

Database Compatibility

- 'Review restricted pages' report now succeeds on MaxDB – CONF-6849
- Fixed Sybase error when removing a space – CONF-6715

Indexing

- A re-indexing performance regression introduced in 2.2.8 has been resolved – CONF-6908
- Advanced search queries for specific index fields now work as expected – CONF-6714
- Errors in text extractors no longer cause index queue flushing to fail – CONF-6857

Issues Resolved for 2.2.9
**Release Notes 2.2.10**

Confluence 2.2.10 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.2. 2.2.10 resolves an assortment of issues that were reported by customers.

2.2.10 is a free upgrade for all customers who purchased their Confluence license after November 30th, 2005.

**Who should upgrade?**

Confluence 2.2.10 is a minor bugfix release. Customers should consult the list of issues resolved in this release to determine if it is worth their while upgrading.

If you are running Confluence 2.2.8, but do not wish to upgrade to 2.2.10, we strongly recommend installing the patch attached to [CONF-6908](#) to resolve an issue related to re-indexing performance.

Customers still running Confluence 2.2.2 or earlier are recommended to upgrade, as a significant security vulnerability was resolved in Confluence 2.2.3

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x version, you can find instructions here. We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

- [Release Notes 2.2](#)
- [Release Notes 2.1](#)
- [Release Notes 2.0](#)
- [Release Notes 1.4](#)
- [Release Notes 1.3](#)
- [Release Notes 1.2](#)
- [Release Notes 1.1](#)

**Changes in 2.2.10**

2.2.10 resolves over 40 issues. All these issues are listed below:

<table>
<thead>
<tr>
<th>JIRA Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>

Release Notes 2.3

After much hard toil from the Confluence developers we are happy, nay ecstatic, to announce the availability of Confluence 2.3 (known affectionately as Snowy). Snowy is the eighth major update to Confluence. It supports clustered deployment as 'Confluence Massive', and introduces a people directory, activity statistics plugin, personal timezone preferences, and the ability to access Confluence via the Metaweblog and WebDAV APIs. Confluence 2.3 is a free upgrade for any customer who purchased Confluence after January 4th, 2006.

Upgrading from Confluence 2.2.x

Upgrading Confluence should be fairly straightforward; you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Installation Notes

Known Issues and Patches

Please read the Release Notes 2.3 section of the release-notes before installing Confluence 2.3. These issues were resolved with a new maintenance release of Confluence 2.3.1

Contents

1. New Features
2. Improvements

See also: Issues Resolved for 2.3

New Features

Confluence Massive

Confluence is now a clusterable application. This means that it is possible to run multiple Confluence servers behind a load-balancer, to provide high availability, and to scale Confluence beyond the capacity of a single server.

Confluence Massive uses Tangosol Coherence to share data between nodes (and many other things besides).

If you are thinking of running Confluence in a cluster, and need to know what is required and how it works, you can read Technical Overview of Clustering in Confluence.

You can find instructions for installing a Confluence cluster here: Confluence cluster installation.

Cluster Licensing

Confluence Massive clustering is only enabled if you have a clustered licence. For information on purchasing clustered Confluence licences, please check our pricing page, or contact our friendly sales team.

The People Directory

In version 2.2 (Shoalhaven), we added personal spaces to Confluence. Because of the potential for the
The proliferation of personal spaces we kept them off the Dashboard and search results by default, but this made it quite hard to find people in a Confluence site.

The People Directory, which you can find linked from the bottom of the Dashboard, gives you a way to browse through the other people who use a Confluence instance, their profiles and personal spaces.

If you find people whose personal spaces you want to follow, you can mark them as favourites from the people directory. This will add their personal spaces to your ‘My’ tab on the Dashboard, and will also make sure they’re included when you search or make RSS feeds from your favourite spaces.

Activity Tracking

The activity plugin lets you know what’s happening in Confluence: how many pages are being visited or edited in each space or across the whole site, which spaces or pages are the busiest, who are the most prolific editors.
You can view activity statistics for a space in Browse Space, or globally from the administration console.

The plugin also provides macros that allow you to embed usage data into a Confluence page: `{usage}`, `{popular}` and `{topusers}`.

### Most popular content (Views)

8. ![Administrators Guide](#) (353)
9. ![Dynamic Tasklist Macro](#) (335)
10. ![Frequently Asked Questions](#) (320)

⚠ Activity tracking does not work in a cluster, and will be disabled for clustered deployments. We're working on making the activity tracker clusterable in a future release. You can follow this issue in JIRA: CONF-7520

**Blogger and MetaWeblog API Support**

Confluence 2.3 bundles the Blogging RPC Plugin. This allows users to manage their News in Confluence using one of the many available blogger-compatible desktop clients.
You can read more about this plugin, including instructions for setting up various blogging clients for use with Confluence, on the plugin information page.

WebDAV Client Support

The Confluence WebDAV plugin allows users to mount Confluence as a shared drive, using the WebDAV protocol.

This provides a familiar interface for anyone who uses Confluence as a repository for files: you can browse your wiki straight from Windows Explorer or the Mac Finder; view Word or PDF versions of pages; upload attachments and edit attachments in place; create, edit and move pages.
For more information on the WebDAV plugin, check out: WebDAV Plugin

WebDAV is supported natively in Windows XP (as "Web Folders") and Mac OS X, although there are third-party clients that may provide different functionality or compatibility. We have a compatibility matrix if you're interested.

⚠️ Experimental

WebDAV client support is currently experimental, and is disabled by default. You can turn it on from the Plugin management page in the global administration console.

Improvements

Plugins

- Adaptivist's fantastic Plugin Repository Client is bundled with Confluence.
- User Macro Module allow you to share user macros more easily.
- Lifecycle Module allow you to hook into Confluence startup and shutdown.
- Events are now produced when themes are applied, or colour-schemes modified.
- Confluence now ships with 'bundled' plugins that are installed when Confluence is installed, but are not hard-coded into the application (so they can be upgraded without upgrading Confluence).
- Plugin resources now set Last-Modified and ETag headers properly, so they can be conditionally retrieved by browsers.
- Confluence is now built entirely using Maven 2. More on this soon.

Other Changes

- Users can now choose to have dates and times displayed in their own timezone instead of the server’s - CONF-1026.
- Most Confluence configuration data has been moved from the filesystem into the database.
- The Clickr Theme is bundled with Confluence.
- HTML exports are more reliable for sites with non-ASCII page titles - CONF-4862.
- You can now get users from multiple LDAP repositories at the same time (or different search paths in the same LDAP repository) - CONF-6034.
- Shortcut links can now have the substitution string in the middle of the URL (CONF-3246), and have
custom display text and titles (CONF-514).

- User macros are more flexible: you can configure how macro bodies are pre-rendered (CONF-2293), and you can also specify that a user macro generates wiki markup instead of HTML (CONF-3780).
- Pages with large numbers of attached images no longer eat up too many database connections - CONF-6393.
- When creating an RSS feed with the feed builder, you can choose whether to see full content, diffs, or both - CONF-6321.
- Searches now default to AND rather than OR for combining search terms - CONF-5874.
- The login page no longer prompts you to log in when you're already logged in. - CONF-6843.
- Support for the Nintendo Wii.
- Various improvements to performance that should result in a faster display of pages, and fewer problems for servers with large numbers of space permissions.
- Many static resources in Confluence are cached more effectively, so browsers have to retrieve CSS and Javascript files significantly less often - CONF-7212.

**Known Issues and Patches**

- Confluence 2.3 was originally accidentally shipped with three testing-only language packs. Since Sunday January 14th, the language packs have been removed from the distribution, but if you downloaded Confluence before that date they will be present. These language packs are machine translations, and are not intended for use on production systems (unless you're a native German speaker and really want a good laugh). If you downloaded an affected copy of Confluence and want to remove these packs, delete de_DE-1.0.jar, ja_JP-1.0.jar and ru_RU-1.0.jar from confluence/WEB-INF/lib.
- You need to apply this patch to enable LDAP user integration : CONF-7585
- If you have problems restoring backups please apply the patch included in this issue: CONF-7584
- Due to class name changes, if you're upgrading from an existing system running:
  2. DB2 - you need to edit confluence.home/confluence.cfg.xml and replace bucket.dialect with com.atlassian.hibernate.dialect.DB2Dialect. More information in this issue: CONF-7690
- Log file atlassian-confluence.log is not presently generated. Please see these instructions for enabling it.

| And one was there, a stripling on a small and weedy beast, |
FileAppender log4j.properties

The 2.3 log4j.properties file doesn’t specify a file for the FileAppender (because the necessary lines haven’t been uncommented). Hence the log files normally generated via the file appender, logs/atlassian-confluence.log, is presently missing?

If you experience this situation and see errors in the logs such as:

```
log4j:WARN File option not set for appender [confluencelog].
log4j:WARN Are you using FileAppender instead of ConsoleAppender?
log4j:ERROR No output stream or file set for the appender named [confluencelog].
```

- Please uncomment the following lines in the log4j.properties file located under confluence/WEB-INF/classes and restart Confluence
  (ie remove the #’s)

Release Notes 2.3.1

Confluence 2.3.1 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.3.

2.3.1 is a free upgrade for all customers who purchased their Confluence license after January 23rd, 2006.

Who should upgrade?

Confluence 2.3.1 is a bugfix release which resolves some significant issues in Confluence 2.3. Customers running Confluence 2.3 should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.3 and wishing to upgrade should use this version also.

Significant issues for customers upgrading to Confluence 2.3

- **LDAP integration**: Confluence 2.3 shipped with a broken user migration script for customers wishing to integrate LDAP servers with their Confluence installation. 2.3.1 ships with a fixed version of this script which can also be obtained from CONF-7585
- **Upgrading with MySQL**: Customers using Confluence with MySQL may have had difficulty upgrading their instances to Confluence 2.3. This issue has been resolved in 2.3.1.

Significant issues for existing Confluence 2.3 users

- **Backup import**: Confluence 2.3 users wishing to import backups into their Confluence instance should upgrade to 2.3.1 or apply the patch listed against CONF-7584

Upgrade Procedure
Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or Confluence 2.3 version, you can find instructions here. **We strongly recommend that you backup your** `confluence.home` directory and database before upgrading!

### Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the [2.2 Release Notes](#) for caveats regarding the 2.1 -> 2.2 upgrade.

### Changes in 2.3.1

2.3.1 resolves 20 issues. All these issues are listed below:

<table>
<thead>
<tr>
<th>JIRA Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td><img src="Authenticate" alt="Authenticate to retrieve your issues" /></td>

### Release Notes 2.3.2

Confluence 2.3.2 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.3.1

⚠️ **Warning for LDAP users**

Confluence 2.3.2 has a serious bug that prevents it from working with LDAP servers. Please use [Confluence 2.3.3](#) instead.

2.3.2 is a free upgrade for all customers who purchased their Confluence license after February 12th, 2006.

**Who should upgrade?**

Confluence 2.3.2 is a bugfix release which resolves some significant issues in Confluence 2.3.1 Customers running Confluence 2.3.1 and 2.3 should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.3 and wishing to upgrade should use this version also.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or Confluence 2.3 version, you can find instructions here. **We strongly recommend that you backup your** `confluence.home` directory and database before upgrading!

### Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the [2.2 Release Notes](#) for caveats regarding the 2.1 -> 2.2 upgrade.

### Changes in 2.3.2

2.3.2 resolves 22 issues. All these issues are listed below:
Release Notes 2.3.3

Confluence 2.3.3 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.3.2

Release Notes 2.4

The Atlassian Confluence team is proud to present to you Confluence 2.4.2! What happened to 2.4 and 2.4.1? Let's
just say we gave them a good workout. Confluence 2.4 is the ninth release of Confluence. It introduces much awaited support for editable comments, the ability to mail a page to groups of users and includes the usual slew of fixes since the last stable release.

Confluence 2.4 is the first in a series of frequent, small releases planned for the first half of 2007, that will help us get the functionality you want from Confluence, faster. For more information on our new release schedule, you might want to read this blog post.

Confluence 2.4.2 is a free upgrade for any customer who purchased Confluence after March 13th, 2006.

Upgrading from Confluence 2.2.x and 2.3.x

Upgrading Confluence should be fairly straightforward: you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Contents
1. New Features
2. Improvements

See also: Issues Resolved for 2.4.2

New Features

Editable Comments

Say so long! to those annoying typos and ill-structured sentences as comments in Confluence are now editable. Comments may be edited by the original author or the administrator for the space in which the comment was posted.

Confluence has a ten minute grace period after the comment is posted in which updates will not be flagged in the user interface. This is in acknowledgment of the fact that most edits within this period are for correcting minor typos and formatting which will not impact the flow of conversation.
Page Mailing

Confluence 2.4 ships with the Mail Page plugin allowing users to conveniently send the contents of a Confluence page to other interested parties. You can easily specify who you want the page mailed to by using a combination of:

- Email addresses
- Confluence user names
- Confluence group names

For security reasons, the Mail Page plugin is disabled by default. If you want to use this feature, an administrator will have to enable it. There must also be a mail server configured in the Confluence instance for this operation to be available.

This operation is reached via a page's Info tab.

For more information, see the Confluence user guide: E-mailing a Page

Improvements

- The People Directory no longer shows inactive users (CONF-7771)
- Log messages now have more context such as the URL of the page being displayed and the name of the logged in user (CONF-7878)

Changes to the Page Permission API in Confluence 2.4

Confluence 2.4 contains changes to the Confluence API that will affect any plugins that modify Page Permissions (aka ContentPermissions). Some methods have been deprecated, some new methods have been created, and one method now behaves differently from before.

⚠️ Confluence 2.4 does not support having multiple view and edit permissions on a page. The Content Permission API allows such a state, but it should be avoided. For example, if a Page has multiple permissions set on it, these permissions will not be displayed properly via the user interface, and the pages may not be returned appropriately in a search.
## Summary of Changes

### Deprecated methods

- `ContentPermissionManager.getInheritedViewContentPermissions(Page)`
- `ContentPermissionManager.getInheritedContentPermissions(ContentEntityObject contentEntityObject)`
- `ContentEntityObject.getPermissions()`
- `ContentEntityObject.getContentPermission(String permissionType)`

### Changed methods

- `ContentPermissionManager.addContentPermission(ContentPermission permission, ContentEntityObject content)`

### Added methods

- `ContentPermissionManager.setContentPermissions(List contentPermissions, ContentEntityObject content, String type)`
- `ContentPermissionManager.getInheritedContentPermissionSets(ContentEntityObject contentEntityObject)`
- `ContentEntityObject.getContentPermissionSet(String type)`
- `ContentEntityObject.hasPermissions(String type)`
- `ContentEntityObject.removeContentPermissionSet(ContentPermissionSet set)`

### Removed methods

- `ContentPermissionManager.saveContentPermission(ContentPermission permission)`
- `ContentPermissionManager.getContentUserPermission(ContentEntityObject contentEntityObject)`
- `ContentPermissionManager.onContentContextChanged(ContentEntityObject content)`
- `ContentEntityObject.setPermissions(List permissions)`
- `ContentEntityObject.clearPermissions(ContentPermissionManager permissionManager)`

The change most likely to cause problems is:

- `ContentPermissionManager.addContentPermission(ContentPermission permission, ContentEntityObject content)`

This method now adds a ContentPermission to the ContentEntityObject as one would expect. Previously if a ContentPermission already existed on the ContentEntityObject, then any existing ContentPermission would be removed. That is, the method really behaved as one would expect "setContentPermission" to behave. As a result, any code that used addContentPermission in Confluence 2.3 or earlier, should now use setContentPermissions with a single entry list.
Example conversion of old addContentPermission usage

replace

ContentPermissionManager.addContentPermission(p, c)
with

ContentPermissionManager.setContentPermissions(java.util.Collections.singletonList(p), c, p.getType())

Most methods that used to return a ContentPermission have been replaced with methods that return a ContentPermissionSet. In some places we have used deprecation to point to the new method and reimplemented the old method to extract the first ContentPermission from the ContentPermissionSet.

As usual, the methods on the ContentPermissionManager should be used rather than those on the ContentEntityObject. The only ContentEntityObject method that should be used is getContentPermissionSet. Even that method should be used only to display the existing Permissions. All writes to the ContentPermissionSets should be performed via the ContentPermissionManager.

The onContentContextChanged method of the ContentPermissionManager was previously used to notify a ContentPermissionManager that cached permissions on a ContentEntityObject may be invalid. This is now accomplished by publishing a ContentPermissionEvent. That event is published automatically when changing ContentPermissions via the ContentPermissionManager.

No changes have been made yet to the the XML RPC API. It does not currently allow modification of ContentPermissions.

Release Notes 2.4.1

The Atlassian Confluence team is proud to present to you Confluence 2.4.2! What happened to 2.4 and 2.4.1? Let's just say we gave them a good workout. Confluence 2.4 is the ninth release of Confluence. It introduces much awaited support for editable comments, the ability to mail a page to groups of users and includes the usual slew of fixes since the last stable release.

**Release Notes 2.4.2**

The Atlassian Confluence team is proud to present to you Confluence 2.4.2! What happened to 2.4 and 2.4.1? Let's just say we gave them a good workout.

**Confluence 2.4 is the ninth release of Confluence. It introduces much awaited support for editable comments, the ability to mail a page to groups of users and includes**
the usual slew of fixes since the last stable release.

Confluence 2.4 is the first in a series of frequent, small releases planned for the first half or 2007, that will help us get the functionality you want from Confluence, faster. For more information on our new release schedule, you might want to read this blog post.

Confluence 2.4.2 is a free upgrade for any customer who purchased Confluence after March 13th, 2006.

Upgrading from Confluence 2.2.x and 2.3.x

Upgrading Confluence should be fairly straightforward: you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

New Features

Editable Comments

Say so long! to those annoying typos and ill-structured sentences as comments in Confluence are now editable. Comments may be edited by the original author or the administrator for the space in which the comment was posted.

Confluence has a ten minute grace period after the comment is posted in which updates will not be flagged in the user interface. This is in acknowledgment of the fact that most edits within this period are for correcting minor typos and formatting which will not impact the flow of conversation.

For more information, see the Confluence user guide: Editing a Comment

Page Mailing

Confluence 2.4 ships with the Mail Page plugin allowing users to conveniently send the contents of a Confluence page to other interested parties. You can easily specify who you want the page mailed to by using a combination
of:

- Email addresses
- Confluence user names
- Confluence group names

For security reasons, the Mail Page plugin is disabled by default. If you want to use this feature, an administrator will have to enable it. There must also be a mail server configured in the Confluence instance for this operation to be available.

This operation is reached via a page's Info tab.

For more information, see the Confluence user guide: [E-mailing a Page](#)

**Improvements**

- The People Directory no longer shows inactive users ([CONF-7771](#))
- Log messages now have more context such as the URL of the page being displayed and the name of the logged in user ([CONF-7878](#))

Release Notes 2.4.3

Confluence 2.4.3 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.4.2

2.4.3 is a free upgrade for all customers who purchased their Confluence license after March 22nd 2006.

Who should upgrade?

Confluence 2.4.3 is a recommended upgrade release which resolves some significant issues in Confluence 2.4.2. Customers running older versions of Confluence should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.4 and wishing to upgrade should use this version also.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or Confluence 2.3 version, you can find [instructions here](#).

*We strongly recommend that you backup your confluence.home directory and database before upgrading!*

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the [2.2 Release Notes](#) for caveats regarding the 2.1 -> 2.2 upgrade.

Changes in 2.4.3

2.4.3 resolves 15 issues. All these issues are listed below:

JIRA Issues

Release Notes 2.4.4

Confluence 2.4.4 is a recommended upgrade release that resolves issues users may have encountered using
Confluence 2.4.3 or earlier.

2.4.4 is a free upgrade for all customers who purchased their Confluence license after March 30th 2006.

Who should upgrade?

Confluence 2.4.4 is a recommended upgrade release that resolves issues users may have encountered using Confluence 2.4.3 or earlier. Customers running older versions of Confluence should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.4 and wishing to upgrade should upgrade directly to 2.4.4.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or Confluence 2.3 version, you can find instructions here.

We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Source Release

Please note that the source release for 2.4.4 is currently unavailable. We have scheduled a fix for this which should be included in 2.4.5. Please see CONF-8007 for more details.

Changes in 2.4.4

2.4.4 resolves 17 issues. All these issues are listed below:

<table>

Release Notes 2.4.5

Confluence 2.4.5 is a maintenance release that resolves issues users may have encountered using Confluence 2.4.4 or earlier.

2.4.5 is a free upgrade for all customers who purchased their Confluence license after April 12th 2006.

Who should upgrade?

Confluence 2.4.5 is a recommended upgrade release which resolves some significant issues in Confluence 2.4.4. Customers running older versions of Confluence should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.4 and wishing to upgrade should upgrade directly to 2.4.5.

Upgrade Procedure
Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or Confluence 2.3 version, you can find instructions here.

*We strongly recommend that you backup your confluence.home directory and database before upgrading!*

**Upgrading from Confluence 2.1 and earlier**

Users upgrading directly from 2.1 or earlier should also read the [2.2 Release Notes](#) for caveats regarding the 2.1 -> 2.2 upgrade.

**Changes in 2.4.5**

2.4.5 resolves these issues:

**Release Notes 2.5**

The Atlassian Confluence team is proud to present Confluence 2.5. Confluence 2.5 is the tenth release of Confluence. It introduces more flexible page restrictions, and also includes a number of minor fixes.

Confluence 2.5 is a free upgrade for any customer who purchased Confluence after April 27th, 2006.

**Upgrading from Confluence 2.2 and later**

Upgrading Confluence should be fairly straightforward: you can find instructions here. *We strongly recommend that you backup your confluence.home directory and database before upgrading!*

**Upgrading from Confluence 2.1 and earlier**

Users upgrading directly from 2.1 or earlier should also read the [2.2 Release Notes](#) for caveats regarding the 2.1 -> 2.2 upgrade.

**Introducing flexible page restrictions**

Page restrictions give you the ability to choose who may read and/or edit any given page.

By popular request, page restrictions have been enhanced and can now be assigned to multiple people and/or groups:
Other significant issues resolved

**Dynamic task list JRE incompatibilities**

Many customers have been prevented from upgrading the Java runtime hosting their Confluence instance due to CONF-4082, an issue which would prevent existing dynamic task lists from working with the new JRE. This issue has been resolved in Confluence 2.5 allowing dynamic task list users to upgrade and downgrade between Java versions without experiencing conversion exceptions.

**contentbylabel macro supports AND condition**

You may now use the `operator=AND` parameter with the `contentbylabel` macro to select pages that have all of the supplied labels. ([CONF-4969](CONF-4969))

**Release Notes 2.5.1**
Confluence 2.5.1 is a maintenance release that resolves issues users may have encountered using Confluence 2.5 or earlier.

2.5.1 is a free upgrade for all customers who purchased their Confluence license after May 7th 2006.

Who should upgrade?

Confluence 2.5.1 is a bugfix release which resolves some significant issues in Confluence 2.5. Customers running older versions of Confluence should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.5 and wishing to upgrade should upgrade directly to 2.5.1.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or a later version, you can find instructions here.

We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Changes in 2.5.1

2.5.1 resolves these issues:

Release Notes 2.5.2

Confluence 2.5.2 is a maintenance release that resolves issues users may have encountered using Confluence 2.5 or earlier.

2.5.2 is a free upgrade for all customers who purchased their Confluence license after May 22nd 2006.

Who should upgrade?

Confluence 2.5.2 is a bugfix release which resolves some significant issues in Confluence 2.5. Customers running older versions of Confluence should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.5 and wishing to upgrade should upgrade directly to 2.5.2.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or a later version, you can find instructions here.
We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Changes in 2.5.2

2.5.2 resolves these issues:

```
<table>
<thead>
<tr>
<th>JIRA Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>

</table>
```

Release Notes 2.5.3

Confluence 2.5.3 is a maintenance release that resolves issues users may have encountered using Confluence 2.5 or earlier.

2.5.3 is a free upgrade for all customers who purchased their Confluence license after May 30th 2006.

Who should upgrade?

Confluence 2.5.3 is a bugfix release which resolves some significant issues in Confluence 2.5. Customers running older versions of Confluence should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

In particular, 2.5.3 fixes a problem which could cause indexing to fail when extracting text from unprintable encrypted PDF files.

Customers running releases older than 2.5 and wishing to upgrade should upgrade directly to 2.5.3.

Shared Mode Removed

This release removes the 'Shared Mode' setting from General Configuration. If you have shared mode enabled you should disable it before upgrading.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or a later version, you can find instructions here.

We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Changes in 2.5.3

2.5.3 resolves these issues:
Release Notes 2.5.4

Confluence 2.5.4 is a maintenance release that resolves issues users may have encountered using Confluence 2.5 or earlier.

2.5.4 is a free upgrade for all customers who purchased their Confluence license after June 13th 2006.

Who should upgrade?

Confluence 2.5.4 is a bugfix release which resolves some significant issues in Confluence 2.5. Customers running older versions of Confluence should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.5 and wishing to upgrade should upgrade directly to 2.5.4.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or a later version, you can find instructions here.

*We strongly recommend that you backup your `confluence.home` directory and database before upgrading!*

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the [2.2 Release Notes](#) for caveats regarding the 2.1 -> 2.2 upgrade.

Changes in 2.5.4

2.5.4 resolves these issues:

<table>
<thead>
<tr>
<th>Type</th>
<th>Key</th>
<th>Summary</th>
<th>Status</th>
<th>Resolution</th>
</tr>
</thead>
<tbody>
<tr>
<td>JIRA</td>

Release Notes 2.5.5

Confluence 2.5.5 is a recommended upgrade that resolves issues you may have encountered in Confluence 2.5.4 or earlier. Confluence 2.5.5 resolves two security bugs, related to space permissions and invalid
characters in space names and keys.

As such this release is a recommended upgrade for all customers.

Confluence 2.5.5 is a free upgrade for all customers who purchased their Confluence license or maintenance renewal after July 26th 2006.

Upgrading to Confluence 2.5.5

Upgrading Confluence should be fairly straightforward. You can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Changes in 2.5.5

Patch for security issues

Confluence 2.5.5 resolves two security bugs, related to:

- space permissions
- invalid characters in space names and keys.

For more information, please see the security advisory.

Server ID

Starting with release 2.5.5, Confluence will generate a server ID for you. Server ID has replaced License ID on the License Details page. You will find the server ID useful when contacting Atlassian support.

Server ID:

- is generated when you install Confluence for the first time
- exists for the life of the Confluence instance
- survives an upgrade
- is held in the database
- is not bound to a specific licence
- is the same for all servers in a cluster.

Translations for rich text editor now compatible with Confluence language pack plugins

Thank you to everyone who voted for this popular fix.

The rich text editor in Confluence shows text in tooltips, warnings and other messages. If you are using Confluence in a language other than English, you will want to translate these messages as well as the standard Confluence text.

With Confluence 2.5.5:

- The translations for the rich text editor can be part of a Confluence language pack plugin.
- If your language pack does not contain translations for the rich text editor, the text will show in English. (Before 2.5.5, it showed the 'key' value rather than English.)
- Partial translations of rich text editor messages are already included in the professional French and German language packs. Full translation is under construction.

This makes things much simpler!

You will find more information here:

- Overview of language pack translations
- Technical overview of language pack plugins
### Other fixes in 2.5.5

2.5.5 resolves these issues:

- Errors were reported by the JIRA trusted connection.

Upgrade Guide 2.5.5

Who should upgrade?

Confluence 2.5.5 is a recommended upgrade that resolves issues you may have encountered in Confluence 2.5.4 or earlier. Confluence 2.5.5 resolves two security bugs, related to space permissions and invalid characters in space names and keys.

As such this release is a recommended upgrade for all customers.

Confluence 2.5.5 is a free upgrade for all customers who purchased their Confluence license or maintenance renewal after July 26th 2006.

If you are running a release older than 2.5 and you want to upgrade, you should upgrade directly to 2.5.5. Refer to the upgrade procedure below.

Upgrade Procedure

Upgrading Confluence should be pretty easy. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.2.x or a later version, you can find instructions here.

If you are upgrading directly from 2.1 or earlier, you should also read the 2.2 Release Notes for warnings about the 2.1 -> 2.2 upgrade.

Release Notes 2.5.6

Confluence 2.5.6 is a recommended upgrade that resolves a number of security bugs and other issues you may have encountered in Confluence 2.5.5 or earlier.

As such this release is a recommended upgrade for all customers.

Confluence 2.5.6 can be downloaded from http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa, and is a free upgrade for all customers who purchased their Confluence license or maintenance renewal after August 8th 2006.

Upgrading to Confluence 2.5.6

Upgrading Confluence should be fairly straightforward. You can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!
Changes in 2.5.6

- For details about the security fixes, please see the [security advisory](#).
- [CONF-8944](#) resolves a Crowd integration issue for Confluence 2.5.6 and later.
- The Crowd integration fix will be ported to previous Confluence versions in the near future - please see [CONF-9122](#).

Here's a complete list of the bug fixes in Confluence 2.5.6:

Errors were reported by the JIRA trusted connection.

**Upgrade Guide 2.5.6**

*Who should upgrade?*

Confluence 2.5.6 is a recommended upgrade that resolves a number of security bugs and other issues you may have encountered in Confluence 2.5.5 or earlier.

As such this release is a recommended upgrade for all customers.
Confluence 2.5.6 can be downloaded from http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa, and is a free upgrade for all customers who purchased their Confluence license or maintenance renewal after August 8th 2006.

If you are running a release older than 2.5 and you want to upgrade, you should upgrade directly to 2.5.6. Refer to the upgrade procedure below.

**Upgrade Procedure**

Upgrading Confluence should be fairly straightforward. **We strongly recommend that you backup your confluence.home directory and database before upgrading!**

If you are upgrading from Confluence 2.2.x or a later version, please see the Confluence Upgrade Instructions.

If you are upgrading directly from 2.1 or earlier, you should also read the 2.2 Release Notes for warnings about the 2.1 -> 2.2 upgrade.

**Release Notes 2.5.7**

Confluence 2.5.7 is a recommended upgrade that resolves two issues you may have encountered in Confluence 2.5.6:

- Indexing errors claiming 'too many open files', caused by duplicate libraries in the Confluence web application.
- Caching should be enabled by default for the LDAP configuration in atlassian-user.xml.

Confluence 2.5.7 can be downloaded from http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa, and is a free upgrade for all customers who purchased their Confluence license or maintenance renewal after 30 August 2006.

If you don’t wish to upgrade to 2.5.7, but do want a fix for issue CONF-9251 ("Too many open files" error during index operations), you can manually remove the duplicate libraries shipped in the Confluence web application. Please follow the instructions on the JIRA issue.

**Upgrading to Confluence 2.5.7**

Upgrading Confluence should be fairly straightforward. You can find instructions here. **We strongly recommend that you backup your confluence.home directory and database before upgrading!**

**Changes in 2.5.7**

Here’s a complete list of the bug fixes in Confluence 2.5.7:

Errors were reported by the JIRA trusted connection.

Upgrade Guide 2.5.7

Who should upgrade?

Confluence 2.5.7 is a recommended upgrade that resolves two issues you may have encountered in Confluence 2.5.6:

- Indexing errors claiming ‘too many open files’, caused by duplicate libraries in the Confluence web application.
- Caching should be enabled by default for the LDAP configuration in atlassian-user.xml.

Confluence 2.5.7 can be downloaded from http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa, and is a free upgrade for all customers who purchased their Confluence license or maintenance renewal after 30 August 2006.

If you are running a release older than 2.5 and you want to upgrade, you should upgrade directly to 2.5.7. Refer to the upgrade procedure below.

Upgrade Procedure

Upgrading Confluence should be fairly straightforward. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.2.x or a later version, please use the Confluence Upgrade Instructions.

If you are upgrading directly from 2.1 or earlier, you should also read the 2.2 Release Notes for warnings about the 2.1 -> 2.2 upgrade.

Release Notes 2.5.8

Confluence 2.5.8 is a highly recommended upgrade that resolves some issues in the user management framework and a memory leak in Confluence 2.5.x.

You can download Confluence 2.5.8 from http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa. This upgrade is free for all customers with active Confluence software maintenance as at 3 October 2007.

This release has been made available after the Confluence 2.6 release date. This 2.5.8 version is for customers who want to fix the issues listed below, but do not want all the new functionality and theme changes in Confluence 2.6 yet.

Upgrading to Confluence 2.5.8

Upgrading Confluence should be fairly straightforward. You can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Changes in 2.5.8

Here’s a complete list of the bug fixes in Confluence 2.5.8:

Errors were reported by the JIRA trusted connection.

Upgrade Guide 2.5.8

Who should upgrade?

Confluence 2.5.8 is a highly recommended upgrade that resolves some issues in the user management framework and a memory leak in Confluence 2.5.x.

You can download Confluence 2.5.8 from http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa. This upgrade is free for all customers with active Confluence software maintenance as at 3 October 2007.

If you are running a release older than 2.5 and you want to upgrade, you should upgrade directly to 2.5.8, referring to the upgrade procedure below.

Upgrade procedure

Upgrading Confluence should be fairly straightforward. We strongly recommend that you back up your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.2.x or a later version, please use the Confluence Upgrade Instructions.

If you are upgrading directly from 2.1 or earlier, you should also read the 2.2 Release Notes for warnings about the 2.1 -> 2.2 upgrade.
Confluence 1.x.x Releases
Release Notes 1.0

Confluence 1.0

Ring the bells. Break out the champagne. Paint the town red. Dance naked in the streets. Or at least that's what we'll be up to tonight, because we're finally releasing Confluence 1.0!

Confluence 1.0 represents the hard work and dedication of quite a few people. Obviously there's the development team: Ara, Armond, Charles, Dave, Mike and Ross, but there's also the JIRA team and the rest of the guys at Atlassian who have offered support, advice, and loud music. A huge thanks also goes out to everyone involved in the beta-testing program. Your real-world use of Confluence gave us invaluable suggestions and bug-reports, and we apologise for the times we've messed up your databases on the way.

We're pretty proud of all the cool stuff we've managed to fit into Confluence already, and we're looking forward to making it even better in forthcoming versions (Remember, a license entitles you to a year of upgrades).

The only sad moment for the day is that for the 1.0 release, we had to lose emoticons. The regular expression responsible for turning 😊 into a smiley-face was causing pages to take ten seconds to render. Commenting out the filter lowers the rendering time of even highly complex pages to a few hundred milliseconds. We promise, the smileys will return in a future version, faster and stronger than ever! Or if you don't mind the cost, you can re-enable them by uncommenting the emoticonFilter line in wikiSubsystemContext.xml

Users of late Release Candidate builds will notice a substantial improvement in performance as a result.

Contents
1. New Features
2. Notable Bug-fixes since RC6
3. Outstanding Issues
4. Upgrading from RC6
5. Notable Features from Previous Releases

See also: Issues Resolved for 1.0

New Features

For once, we managed to resist the urge to add any new features this week, since we were busy cleaning everything up for today's release.

Notable Bug-fixes

- We have verified that you can now use Confluence's internal datasources with MySQL (for users of RC5 or earlier, see the upgrade section below for information on how to change to the production-ready datasources)
- Fixed the database transaction problems that were causing problems with user/group management, page renaming and commenting
- [~user] links no longer place the context path in the link twice
- Fixed a rendering regression that caused text to be spaced incorrectly within panels
- The 404 error page no longer causes a NullPointerException
- The recent comments RSS feed returns a valid RSS version number
- The 'diff' link now works in HTML edit notification emails when Confluence is installed in a non-root context.

Outstanding Issues

- The Emoticon filter is currently shipped disabled, because it was causing page-load times to go through the roof CONF-963
- You can not complete the Confluence setup process if you have external user-management enabled. Set up Confluence before setting up external user-management. CONF-950
- It is possible to make a "create page" link to a page with invalid characters in its title (which will thus fail to
Upgrading from RC6

We haven’t made any changes to the database schema, so you should just be able to install the new version of Confluence, point it at your existing confluenceHome directory, and carry on as before. I would, however, recommend making a backup before you upgrade, just in case.

If you:

1. have not gone through the Confluence database setup steps since Confluence 1.0RC5
2. are running the embedded HSQL database, or are connecting to a database directly (not through an Application Server Datasource)

Then you will need to add a few connection pooling properties to confluence.cfg.xml file in your confluenceHome directory. Edit the file, and insert the following somewhere in the <Properties> section:

If you do not fall into the category described above, or if you find these lines are already in the file, you do not need to do this!

```
<property
name="hibernate.c3p0.max_statements"><![CDATA[0]]></property>
<property
name="hibernate.c3p0.min_size"><![CDATA[0]]></property>
<property
name="hibernate.c3p0.timeout"><![CDATA[30]]></property>
<property
name="hibernate.c3p0.max_size"><![CDATA[4]]></property>
```

This will enable c3p0 connection-pooling, which is far more reliable than the default pooling that we were using previously.

Notable Features from Previous Releases

Here’s a quick retrospective of some of the cool things we have added to Confluence during the beta- and RC-releases. It is by no means comprehensive, but you can follow the links to the original release notes for an idea of just how busy we’ve been in recent months.

Confluence 1.0a2 (November 6, 2003)
• Shortcut links allow you to create special URL Shortcuts to point to existing web services: i.e. CONF-195
• Undefined and Orphaned Pages reports
• Revert page to previous version

Confluence 1.0a3 (December 5, 2003)

• Comments for pages
• Links in exported PDFs are internal links if the destination page has also been exported, external links otherwise
• Personal History popup keeps track of the pages you have visited
• Page Information screen lists all the incoming and outgoing links on a page
• Printable version of every page

Confluence 1.0b1 (December 19, 2003)

• Pages that have changed since your last login are highlighted in the 'recent changes' list
• Pages can be organised in parent-child hierarchies, allowing for clearer organisation of pages within a space
• Page renaming refactors links to the page, wherever they may appear in the site
• Search works across all content in the site, including comments, space descriptions and user information
• A new permission was added for creating comments
• {color} macro for coloured text
• Parameters allowed on image links

Confluence 1.0b3 (January 19, 2004)

• Beta2 was released a few days earlier, but we'd prefer not to talk about it.
• Searching works across PDF, HTML, XML and Word attachments
• The colour-scheme and page decorators can be configured across the site
• The site homepage is configurable
• Emoticons 😊
• New macros: {include}, {include-html}, {rss}, {search}, {jiraissues}, {junitreport}
• User profiles can be longer than 255 characters
• Much better handling of anonymous contributions

Confluence 1.0b4 (January 26, 2004)

• FatCow, our acceptance-testing framework was introduced to the world
• Confluence now supports chronologically organised content: blog posts
• You can now move pages between spaces, and have their links updated accordingly
• en — and em — dashes are supported
• You can link directly to attachments
• New macros: {blog-posts}, {anchor}, and an improved {rss} macro

Confluence 1.0rc1 (February 6, 2004)

• XML-RPC and SOAP APIs allow you to programatically interact with Confluence
• Trackback allows Confluence to notify other sites of links, and be notified by them
• User notifications on page and space editing were overhauled
• Look and Feel configuration was enabled individually for each space
• Linking to space descriptions and user profile pages directly is now possible: Confluence User Community, Mike Cannon-Brookes
• History popup tracks more than just pages

Confluence 1.0rc2 (February 13, 2004)

• Improvements to the remote API
• RSS and HTML macros now use HTTP proxies if configured to

Confluence 1.0rc5 (February 20, 2004)
• RC3, RC4 and RC5 were released within days of each other, in a flurry of mad bug-fixing
• Page templates can now be filled in in-line
• If a page is moved or renamed and you go to the URL it used to inhabit, Confluence will try to direct you to its new location
• Exported PDFs now incorporate the site's stylesheet

**Confluence 1.0rc6 (March 5, 2004)**

• You can prevent people signing up, for private Confluence installations
• You can configure Confluence to mask user email addresses
• User management can now be shared with JIRA
• Page templates can now contain drop-down menus and text areas
• New macro: `{html}`

**Release Notes 1.0rc5**

**Confluence 1.0rc5**

It's time to release Confluence 1.0rc5 into the wild: it's the fourth Release Candidate since last Friday, and we're definitely getting close here. The last two release-candidates did not have their own release-notes, so these notes will also include things that were fixed for those versions.

**Contents**

1. **New Features**
2. **New Macros**
3. **Improvements**
4. **Notable Bug-fixes**
5. **Outstanding Issues**

See also: [Issues Resolved for 1.0rc5](#)

**New Features**

In keeping with our promise to not add any features during the Release Candidate process, we have been very restrained, and only added two new features 😊

**Template Preview**

Page templates have been given an overhaul: when filling in your template variables, you are presented with a template of the rendered page, with input fields where the variables will be inserted. If you have the same variable used in several places, the form will take care of keeping them all in synch.
Step 2: Fill in template variables

Choose values for the variables in this template. These values will be automatically inserted into the template for you in the correct locations.

New template (btle)

By David Loeng (author)

February (month) 20th (day), 200 (year)

After a week of frantic bug-fixing, we have released Confluence 1.0 Release Candidate 2. Thanks everyone for reporting all the bugs they found in RC1. While we really hope you'll keep reporting anything you find that doesn't work, we're also hoping that there's a lot less to report now.

(from) - (to)
(from) - (to)
(from) - (to)

We have released RC2 because it's a lot more stable than RC1. We know a lot of you are already using Confluence in some kind of production capacity, and we don't want to keep you waiting for the important fixes that we put in this week.

Since we're in the middle of a feature freeze, there obviously aren't any new major features in this release, but there are a number of incremental improvements, and a lot of fixes.

Regards,

David Loeng (author)

Page Redirection

When you rename or move a page, the page's old URL will attempt to give users some clue as to where they should be looking: checking which pages have had this name in the past, or redirecting users to pages in another space with the same name.

In This Space

The page you were looking for may have been renamed to one of the following:

- Ridiculous (Fish Space)
  And yet another page to add to the confusion
- Before (Fish Space)
  Lorem ipsum dolor sit amet, consectetur adipiscing elit. Integer euismod tellus et sem. Aliquam ullamcorper hendrerit arcu. Sed lacinio odio, mattis ut, sollicitudin at, tincidunt vitae, magna. Integer aliquam nibh sed libero...

In Other Spaces

The page you were looking for may have moved to another space:

- Cows (Bouncy Space)
  This is the page before it was renamed.

New Macros

- (weblogs) is a synonym for (blog-posts)

Improvements
• The user signup screen has a more friendly UI
• Exported PDFs now incorporate the site's stylesheet, and thus look a lot better.
• Confluence now has a useful "404" error page that gives the user some suggestions of how to find what they were looking for.
• An Administrators page, linked from the footer of each page, lists those users in the "confluence-admin" group. (If you don't want your address to be made public on this page, create an administrative group with some other name)
• The error you receive when you exceed your licensed user limit is more informative, and no longer directs users to email Atlassian. 😊
• The SnipSnap importer converts SnipSnap blog posts to Confluence blog posts.
• Several methods added to the XML-RPC and SOAP APIs for managing users and spaces. (See Conf Remote API Additions)
• The Daily Report email is more informative and more readable
• Page comments and Parent/child relationships are maintained during HTML and PDF exports
• news: and nntp: URL schemes are now recognised in bracketed links

Notable Bug-fixes

Since RC2

• Links between pages now work when you have a context path other than / (oops!)
• The daily report email is no longer sent every minute (oops!)
• You can no longer download attachments without being logged in (OOPS!)
• Search results no longer highlight words that were terms in previous searches

Since RC3

• Page redirects now work properly under Orion 2.0.2

Since RC4

• Removing a user no longer causes their notifications to hang around and crash things
• Removing a blog post works, too
• Many fixes to PDF rendering and exporting
• Many fixes to handling of Latin character set (See outstanding issues below)
• Invalid macros now give a more informative error than "no group 3"
• The 404 error page no longer requires you to log in to view it
• Macros that generate HTML (page include, HTML include, JIRA, RSS, FatCow) bypass the remainder of the page processing, and so should have far fewer formatting errors now.
• User browser filter remembers your search across pages

Plus, of course, innumerable fixed to annoying crashing bugs across all three releases.

Outstanding Issues

Latin Characters under Resin

We've tested creating pages with non-ASCII titles and content across several different browsers and several different operating systems, and they seem to be working reliably now... except on Resin. This will be quite noticeable since confluence.atlassian.com itself is running under Resin, but we have so far been unable to come up with a solution that works on this application server.

For users who need this functionality, we suggest running under Tomcat.

• On MySQL, the "orphaned pages" report may include the space's homepage CONF-766
• Combining block macros with lists is dangerous CONF-756
• Under some circumstances, paragraph tags will not be closed CONF-746

Release Notes 1.0b1

**Confluence 1.0b1**

Confluence 1.0b1 was released 19th December 2003.

That's right - we finally got it out the door! *cheers from around the room erupt as developers across in the Atlassian offices crack open a beer.*

**New Features**

- It's soooo much faster as we've implemented caching at multiple levels - trust me, it now *flies* in development. Here's hoping it flies for you too. (For those with a development bent, turn on profiling via the URL to see a beautiful profiling stack trace on stdout)
- The last login date is now tracked, pages and spaces changed since your last login are highlighted in green (as these are presumably pages you want to view), you can see a diff of the currently viewed page against the date you last logged in and there are various related reports of spaces/pages changed since your last login.
- Parent/child page hierarchies have been implemented. You can specify the parent for any pages and the ancestry is reflected in the breadcrumbs list. The full hierarchy is shown (including the current page's position) on the Page Information screen, and there is a related macro to show the children in various different types of trees (see the Notation Guide for details)
- Search has been completely overhauled - search now works across pages, comments and space descriptions and the results now display descriptions with highlighted search terms (this is really cool!)
- Page renaming and link refactoring now works across comments, space descriptions and pages - neat!
- The Notation Guide has been significantly improved with more useful examples, a list of the available macros and a tabbed interface. Also the edit/create pages now have a 'quick notation guide' to the most commonly used operations
- There is a new 'Create Comment' permission - so that you can make spaces which are publicly viewable/commentable, but not editable.
- The UI of the 'create link' and 'external link' links within a rendered page have been improved with subtle icons
- Page comments now have a sexy icon of their own, and can be shown/hidden at will. You can also permalink to any given comment and comments are fully indexed.
- Undefined and orphaned pages reports have been tightened significantly so that they now report truly undefined/orphaned pages
- You can create a list of URLs ignored from external referrers - this is useful where your server is known by multiple IP / domain name combinations, or you want to ignore all internal referrers (Admin / General configuration)
- `{color}` macro to colour blocks of text
- Logging in to Confluence now takes you to your intended destination, not the Dashboard
- There is an option to choose whether the default link for a space goes to the space homepage or the space summary (people internally and externally seem to be divided about which it should go to - so you can choose for yourselves)
- You can now edit and add SMTP servers through the web interface
- The administration interface has been completely overhauled and tightened
• Added a Mail Queue administration page
• Added a View System Information page
• Added a pretty error page, and the ability to submit but reports (including exports) directly to us
• The permissions viewing and editing pages have been greatly simplified and improved across the application
• Confluence now has a licensing system, so you will need a license key to evaluate (these can be generated online as with JIRA).
• Image embedding can now include parameters (such as height, width, alignment etc) - see the Notation Guide for details.
• https:// links are now treated just like ftp:// and http:// external links
• Various rendering bugs have been fixed.
• Many other minor fixes, improvements and performance tweaks

Release Notes 1.0b4

Confluence 1.0b4

To belatedly ring in the Year of the Code-Monkey, it's time for Confluence 1.0 beta 4. We've had some great feedback on the last few betas, thanks to everyone for submitting bugs, and contributing to Atlassian Answers and the discussion space.

Contents

1. FatCow
2. New Features
3. New Macros
4. Improvements
5. Notable Bug-fixes
6. Outstanding Issues

See also: Issues Resolved for 1.0b4

Atlassian FatCow

Along with 1.0b4, we're also releasing FatCow: Functional Acceptance Testing for the Confluence Wiki. Styled after Ward Cunningham's FIT and Bob Martin's Fitnesse, FatCow allows you to define web-based acceptance tests in wiki notation, and then run them from inside Confluence. Here's a tutorial showing how to write a quick FatCow test suite that makes sure Confluence shows up on Google. 😊

FatCow is Open Source, and also serves as example code for anyone who wants to extend Confluence by writing their own macros (something that we'll be looking to make easier in future releases).
New Features

Blog Posts
Each space can now host a "blog" of pages that are organised by date, rather than just by title. This is pretty useful if you want to attach some kind of updating news to a space. The "create blog post" button can be found on the right-hand toolbar.

Blogging support is pretty basic right now: you can create posts, and you can include the most recent posts in a page using the {blog-posts} macro. Rest assured, we'll be piling on the features in the next few releases.

Move Pages Between Spaces
A much requested feature, our newest refactoring lets you move pages cleanly from one space to another. We're using this already to maintain a private space where we stage documentation waiting to be transferred to the main documentation space.

Configurable Site Description
You can now change the text in the site description that appears on the user's dashboard: somewhere to put welcome messages or MOTDs. And, of course, it understands Confluence markup.

#{includePage("Page")} Velocimacro
For the decorator-editors, you can use this render the contents of a page anywhere inside a decorator. The page has to be in the space that the user is looking at, and if the page does not exist, nothing will be rendered.

New Macros
- {blog-posts} displays the most recent blog posts for a space.
- {rss} macro now has maxEntries and titleBar parameters.
- {anchor} macro allows you to create named anchors in a page (link to them with [SPACE:page#anchor])

Improvements
- You can now draw en – and em — dashes.
- mailto: links are now drawn as just the email address, like so user@example.com
- the {search} macro now excludes the page it was included in from the search results
- you can also link to attachments using #-anchors [SPACE:page#attachment.pdf]
- you are given the opportunity to pick a template when creating a page from a link, and any entered page title survives picking a page template

Notable Bug-fixes
- Spurious error message about editing a stale version of a page have been squashed.
- No longer crashes when you add a user to certain groups.
- Some database queries have been rewritten to work around the fact that MySQL doesn't understand sub-selects.
- Diffs more reliably highlight changed words
- Several minor rendering problems to do with deeply nested lists have been fixed.
- and many more...

Outstanding Issues
- You should restart Confluence immediately after finishing the initial setup steps, to avoid data loss CONF-493
- New-lines may not be drawn if the next line starts with whitespace CONF-475

Release Notes 1.0rc2

Confluence 1.0rc2

After a week of frantic bug-fixing, we have released Confluence 1.0 Release Candidate 2. Thanks everyone for reporting all the bugs they found in RC1. While we really hope you'll keep reporting anything you find that doesn't work, we're also hoping that there's a lot less to report now.

We have released RC2 because it's a lot more stable than RC1. We know a lot of you are already using Confluence in some kind of production capacity, and we don't want to keep you waiting for the important fixes that we put in this week.

Since we're in the middle of a feature freeze, there obviously aren't any new major features in this release, but there are a number of incremental improvements, and a lot of fixes.

But first, a...

**WARNING**

If you are upgrading from Confluence 1.0rc1, do not perform a backup of your data from within Confluence. There was a serious bug with RC1 that caused user permissions to be corrupted during data exports.

There have been no database changes between RC1 and RC2, so you should simply be able to run RC2 against your existing data without performing a backup/restore.

If you wish to back your data up safely before the upgrade, you will need to do so manually: shut down Confluence, make a copy of your Confluence home directory (as defined in confluence-init.properties, and if you are storing your data in something other than HSQL, use your database's native backup procedure.

h4. Contents

1. Improvements
2. Other Bug Fixes
3. Other Outstanding Issues

See also: Issues Resolved for 1.0rc2

**Improvements**

* Remote XML-RPC and SOAP APIs now have a `{{getPermissions()}}` method
* `{noformat}` macro accepts a title parameter
* Page view and create links are no longer displayed if the user does not have permission to view or create the destination page.
* When you create a page from viewing a previous page, you are given another chance to make that page the new page's parent.
* RSS and HTML include macros use HTML proxies if they are defined using the standard Java {{http.proxyHost}} and {{http.proxyPort}} system properties.
* Default session timeout is now 60 minutes
* Improvements to user browser and user profile page UI
* Shortcut link definitions are now backed up and restored

**Notable Bug-fixes**

**Stability**

We've done a lot of work tracking down the source of any exception and page error that has been reported to us, and fixing their causes. We've also made one or two improvements to the error reporting page, but we're hoping you won't see it nearly as often (if at all) any more.

**Page Templates**

The creation, editing and deletion of page templates should now be a lot more reliable and provide a smoother user experience.

**Also**

* You no longer have to restart Confluence after its initial setup [http://jira.atlassian.com/browse/CONF-493](http://jira.atlassian.com/browse/CONF-493).
* Performing a full data export no longer corrupts users' group membership data: [http://jira.atlassian.com/browse/CONF-645](http://jira.atlassian.com/browse/CONF-645).
* You can now link to profiles of users with an @ symbol in their usernames: [http://jira.atlassian.com/browse/CONF-639](http://jira.atlassian.com/browse/CONF-639).
* Trying to create a page with illegal characters in its name no longer loses your page content on some browsers: [http://jira.atlassian.com/browse/CONF-713](http://jira.atlassian.com/browse/CONF-713).
* Trackback pings are now sent for URLs that are not surrounded by square brackets: [http://jira.atlassian.com/browse/CONF-708](http://jira.atlassian.com/browse/CONF-708).
* And, of course, [many more](http://jira.atlassian.com/).  

**Outstanding Issues**

The two major areas we still need to work on are the PDF export and the use of non-ASCII characters in pages (especially page titles). Handling of both are much better than they were a week ago, but there's still some work to do before they're completely reliable.

**Release Notes 1.0rc6**
Confluence 1.0rc6

Confluence 1.0rc6 fixes more bugs. Lots of them. There aren't many new and interesting features to report, although we have implemented the much-requested ability to mask email addresses and prevent public signup. Mostly, we've been toiling away fixing the lots of little problems that are getting in the way of us calling Confluence truly worthy of the 1.0 label.

Contents

1. New Features
2. New Macros
3. Improvements
4. Notable Bug-fixes
5. Outstanding Issues

New Features

Private Confluence Configuration

In private mode, the only way to add users to Confluence is through the administrative interface: users can not sign up on their own. This way, you can prevent random passers-by from signing on to your Confluence installation. The site administrator can configure this in the general administration settings.

Email Address Privacy

Another much-requested feature, the site administrator has three options for email-address privacy:

- Public: just like pre-rc6, users email addresses are displayed publicly.
- Masked: email addresses are still displayed publicly, but masked in such a way to make it harder for spam-bots to harvest them.
- Private: only site administrators can see users' email addresses.

Administrators should be aware that even in private mode, anyone in the confluence-admin group will still be listed (with their email address) on the administrators page, although their addresses will be masked.

Share User Management with JIRA

For sites with both a Confluence and a JIRA installation, Confluence can be set up to delegate its user-management to JIRA.

Template Field Types

Templates now support drop-down menus and text-input areas.

@{}\textarea{5,10}@ will give you a 5 x 10 text-area called 'variablename'.
@{}\list{one, two, three, four}@ will give you a drop-down list called 'variablename', with options one, two, three and four.
New Macros

- The `{html}` will allow you to insert arbitrary HTML code into a page. This macro is turned off by default, as it is a security-risk on public systems. We only recommend you enable it on private or intranet-based Confluence installations where you trust your users not to write malicious HTML code. Here's a trivial example of its use:

```html
<p>This HTML is <b>inserted</b> into the page</p>
```

- The `{junitreport}` macro has an option: "reportdetails=failuresonly" that will cause it to only show details of tests that have failed. For example: `{junitreport:directory=file:///var/tests|reportdetail=failuresonly}`

Improvements

- Users are now taken to their preferred homepage rather than the dashboard after logging in
- Text-fields in a template are disabled during preview and viewing
- Orphaned and Undefined page reports are now paginated
- Macros such as `{code}` or `{noformat}` are now made part of a list if they are placed adjacent to them

Notable Bug-fixes

- User->Group relationships should no longer disappear during manual or scheduled backups
- Search results no longer allow people to see content they might not be allowed to see
- Comments should no longer appear out of order on a page
- Moving a page between spaces no longer breaks #anchor links
- Many rendering fixes, some subtle, some not so
- Many stability fixes, especially regarding import and export

Outstanding Issues

Random MySQL Disconnections
If you are running Confluence against MySQL using Confluence's built-in datasource, the connection with the database server may be lost after long periods of inactivity. We are pretty sure we have a fix for this, but since the bug takes several hours to manifest, we were not able to test the fix before the release of rc6.

The good news is that if we are right, it will only require a quick edit of your configuration file to implement the fix. Further announcements will be made both on confluence.atlassian.com, and the confluence-user mailing-list.

In the meantime, the workaround is to not use Confluence's built-in datasource, but to configure Confluence to use your application-server's JNDI datasources instead. Instructions for doing this with Tomcat can be found here, and if you need more help, don't hesitate to contact us at confluence-support@atlassian.com.

Latin Characters under Resin

We've tested creating pages with non-ASCII titles and content across several different browsers and several different operating systems, and they seem to be working reliably now... except on Resin. This will be quite noticeable since confluence.atlassian.com itself is running under Resin, but we have so far been unable to come up with a solution that works on this application server.

For users who need this functionality, we suggest running under Tomcat.

Also..

- On MySQL, the "orphaned pages" report may include the space's homepage CONF-766
- You can create a link to a page with an illegal title: prompting the user to create a page that can not exist CONF-810
- Trackbacks are not sent for shortcut links CONF-888

Release Notes 1.0a3

Confluence 1.0a3

Confluence 1.0a3 was released December 5 2003

New Features

- Completely rearchitected around the spring framework
- Page comments (CONF-235) - users can now attach comments to a page.
- Email notification for new comments.
- Supports non-ASCII characters in page names (CONF-297)
- Improved handling of internal and external links in exported PDFs
- Editing popup to help with inserting links (internal and external) into pages (CONF-129)
- Personal history (CONF-196) - a popup window containing your recently visited pages.
- Page information screen (CONF-270) lists all the incoming and outgoing links for a page, and all attachments
- User profile UI has been enhanced (CONF-172)
- Dashboard and Space summary pages have had a big UI overhaul
Confluence 4.2 Documentation

- Brief help on Wiki notation now available on create and edit pages. (CONF-295)
- Improved available help on various pages.
- Enhanced mail-server administration.
- All pages have a printable version accessible from the icon at the top-right of the page (CONF-338)
- HTML and text email notifications have been greatly improved and are now much more useful. Links in HTML emails work seamlessly with online Confluence version.
- Many other minor fixes, improvements and performance tweaks

Release Notes 1.0b2

I see dead pages!

Confluence 1.0b2 was released on Friday January 16, 2004 with a major bug in its search indexing that caused it to index pages that no longer existed. It was replaced by 1.0b3 the next Monday.

See also: Release Notes 1.0b3 and Issues Resolved for 1.0b3

Feature List

The features listed on this page refer to Confluence version 1.0 beta1.

Content Management
- Content is organised into discrete spaces in which users can create and edit pages.
- Easy-to-learn, easy-to-read but powerful notation for designing pages and linking between them, based on the popular textile markup.
- Arbitrary files can be attached to pages.
- Comments can be left on pages.
- Page templating allows rapid creation of boiler-plate pages.
- Pages can be organised into hierarchies.

Update Tracking
- Each page has a full change history, accessible as coloured diffs highlighting each change made.
- Simple Reports which pages have been updated since you last logged in.
- Email subscription informs you of pages that have been added or updated, or comments left.
- RSS feeds available for new and updated pages across the site, or in individual spaces.

Searching
- Full-text searching of all content, including pages, comments and space descriptions

Site Management
- Smart page-renaming updates links across the entire site, even in comments or space descriptions.
- Pages or spaces can be imported from plain text files, or exported to PDF or HTML.
- Simple backup and restore to XML files.
- Automatic daily backup feature.
- Reports of "orphaned" pages that exist but are not linked to, and of links that point to pages that do not yet exist.

User Management and Security
- Flexible security, from a public site, to a personal space.
- User- and group-based permissions.
- Separate viewing, commenting, editing and administration permissions for each space.

Deployment and Compatibility
- Available on a wide variety of platforms, either as a stand-alone server, or as a web-archive deployable into a compatible Java application server.
- Compatible with a large number of databases
Support

- Confluence is under full-time development, with licensees entitled to a year of free updates.
- Atlassian's Legendary Service.

Release Notes 1.0rc1

Confluence 1.0rc1

It's Friday again, and that means it's time for us to release Murray; Confluence 1.0 Release Candidate 1.

RC1 marks the start of the feature-freeze as we plunge headfirst towards a stable 1.0 release. From now until 1.0-final we will be concentrating on fixing up the remaining bugs and polishing the interface. We are hoping that we won't need to send out a second release candidate, but we can't really make any promises until we've had a chance to go through the inevitable deluge of new issues that will follow this release.

Of course, this means that there are features you want to see in Confluence that won't make it into 1.0-final. [Keep those ideas and suggestions coming|DISC:]. Confluence isn't going to stop at 1.0 -- we just had to draw a line _somewhere_ or we'd end up perpetually in beta. We have no plans to slow down development after the first major release. Your Confluence licence includes a year of upgrades, and if you think Confluence is way cool now, it's just going to get better.

As always, before upgrading an existing Confluence installation, be sure to back up your data.

As you can see below, we've been busy the last two weeks. A hard-earned thirst needs a good cold beer.

Contents

1. New Features
2. New Macros
3. Improvements
4. Notable Bug Fixes
5. Outstanding Issues
6. Database Changes from Beta

See also: Issues Resolved for 1.0rc1

New Features

Remote API

Confluence can now be browsed and edited remotely via SOAP or XML-RPC. [There are more details of the XML-RPC API here](http://developer.atlassian.com/display/CONFDEV/Confluence+XML-RPC+and+SOAP+APIs), while the SOAP WSDL can be downloaded from 

```{Your_confluence_root}/rpc/soap/confluenceservice-v1.wsdl
```

Throwing together a GUI client for Confluence is now [pretty](http://blogs.atlassian.com/rebelutionary/archives/000385.html) [easy](http://fishbowl.pastiche.org/2004/02/05/a_confluence_gui_client_in_200_lines_of_code), so feel free to embed Confluence support into your favourite editor, web browser or IDE.

Blogging Enhancements

The sketchy blogging support from Beta4 has been upgraded and overhauled. Enhancements include:

- The look and feel of blog pages has been greatly improved.
- A "recent blog posts" list available from the Space Summary page.
- Daily and monthly views for blog posts.
- Blog posts can now be edited and deleted.
- You can now link to blog posts using the internal link syntax. Blog posts are addressed by their
posting-date and title, like so: \{SPACEKEY:/2004/01/03/Blog Post Title\}.
- You can link to the daily views, too: \{SPACEKEY:/2004/01/03/\}.
- RSS feeds are available for new blog posts, both globally (from the dashboard), and for each space (from the space summary page).

Also, anonymous users are no longer allowed to post blog entries. We couldn’t really think of a use-case where anonymous blog-posts would be wanted, but if you can, let us know!

**Configurable User Notification**

With any knowledge-sharing application, it's important to keep informed as to what has changed. One way to do this is by subscribing to any of the RSS feeds offered by Confluence. Another is to have Confluence email you directly whenever there has been a change. Up 'til now, users have had to make do with the ad-hoc regular-expression based notifications that were put in for developers. With RC1, we now have a more fine-grained and user-friendly way to choose how you find out about changes to the site.

# Each day, Confluence can email you a summary of any changes that have been made to the site in the past 24 hours. You can activate this feature in your user preferences.
# You can subscribe to "watch" a page from the option in the right-hand operations menu. Whenever the page is modified, commented on, or a new attachment is added, you will receive an email. When you no longer want to watch the page, you can click the icon again to unsubscribe.
# You can subscribe to watch an entire space from the option on the space summary page. This subscribes you to all pages in that space, and also notifies you when new pages are created.

Each user can now also choose whether or not they will be notified of changes they make themselves.

**Trackbacks**

While Confluence has always tracked links between pages within the Confluence site, it now has a way to track links to and from external sites: the Trackback API. In this way, a Confluence page can be informed when another site has mentioned it, and inform other sites that it has linked to them.

We have implemented the [Trackback](http://www.movabletype.org/docs/mttrackback.html) and [Trackback auto-discovery](http://www.movabletype.org/docs/mttrackback.html#autodiscovery%20of%20trackback%20ping%20urls) APIs across pages and blog-posts. Trackback is a widely implemented API that allows web pages to notify each other of links. You can enable (or disable) trackbacks from the Confluence general administration page.

When Trackbacks are enabled, each Page and Blog Post within Confluence is set up to receive trackback pings, and contains the auto-discovery code to allow clients to automatically find out how to send those pings. Trackbacks that are received are listed in the right-hand sidebar of the page.

Also when Trackbacks are enabled, Confluence will perform auto-discovery on each outgoing link from a page to see if the destination is equipped to receive trackbacks, and send its own trackback ping.

Look forward to future versions of Confluence making _very_ interesting use of this feature. ;)

**Per-Space Look and Feel**

The template-- and colour-scheme editing features that were available on a global basis in previous versions of Confluence can now be configured separately for each space, allowing you to apply a different look and feel to the various spaces within your Confluence site.

**New Macros**

- **Panel Macro** allows you to draw a shaded box containing some content.
Improvements

- Import and Export should now be much faster, and use significantly less memory.
- The user browser now has a search function, to make it possible to manage large numbers of users effectively.
- Incoming links are no longer displayed on a page if the user is unable to view the page being linked from.
- The \{anchor\}, \{blog-posts\}, \{index\} and \{quote\} macros are now documented properly.
- You can escape smileys by putting a backslash before their last character, to cause them not to be rendered as images :).
- You can now link to peoples’ user profile pages with \[~username\] (e.g. \[~cmiller\]).
- You can now link to space homepages with \[SPACEKEY:\] (e.g. \[TEST:\]).
- mailto: links have a nifty icon: mailto:user@example.com.
- The History popup now tracks your visits to blog posts, space summaries and user profile pages.
- Recent changes listings on the dashboard, user profile and space summary pages now includes changes to all content, not just pages.
- New Emoticons! (well, icons really)

| (\y) | (\i) | (\x) | (\!) |
| (\y) | (\i) | (\x) | (\!) |

Notable Bug-fixes

- Added HTML headers to detect and prevent RSS, HTML-Include and FatCow macros from being made to loop in on themselves. [CONF-525@JIRA]
- The \{anchor\} macro, and \[DOCPRIV:null\] links now work as advertised. [CONF-616@JIRA], [CONF-605@JIRA]
- Fixed a divide-by-zero error in page diffs. [CONF-584@JIRA]
- Included {{javax.transaction}} libraries with release, to allow the WAR to run under Tomcat 5 [CONF-613@JIRA].
- And many more rendering and stability fixes...

Outstanding Issues

- Still some problems with character encoding in page titles. [CONF-569@JIRA]
- HTML include macro interacts badly with other Radeox filters. [CONF-549@JIRA]

Database Changes from Beta4

New Tables

TRACKBACK and NOTIFICATION tables were introduced. These tables should be generated automatically when you first start RC1.

New column in the EXTRNLINKS table

- alter table EXTRNLINKS add column CONTENTTYPE varchar(255);
- Constraint Change on LINKS Table*

The "not null" constraint was removed from the DESTPAGETITLE column of the LINKS table. Consult your database documentation on how to alter your database for this change. For example:

- _MySQL 3.23:_ alter table LINKS modify DESTPAGETITLE VARCHAR(255);
- _PostgreSQL 7.3.2_ alter table LINKS alter DESTPAGETITLE drop not null;

Issues Resolved for 1.0rc1

JIRA Issues
Release Notes 1.0b3

Confluence 1.0b3

1.0b3 was released on January 19th, 2004. It replaces the short-lived 1.0b2 release, after 1.0b2 managed to escape into the wild with a bug in the search index that made it see pages that weren’t there any more. Since 1.0b2 only existed for one weekend, the release-notes for both versions have been folded into a single document.

This is a massive release. Over 90 issues (new features, improvements and bug-fixes) were resolved between beta-1 and beta-3, with even more improvements made below the issue-tracking radar.

Contents

1. New Features
2. New Macros
3. Improvements
4. Notable Bug-fixes
5. Outstanding Issues

See also: Issues Resolved for 1.0b3

New Features

Search Attachments

Attachments are now indexed for searching just like any other content in the Confluence space. Alongside text, HTML and XML attachments, Confluence will also index Word, RTF and PDF documents.

Configurable Look and Feel

The site administrators can now customise the colour-scheme of the Confluence installation. More advanced configuration can be done by [editing the site’s templates|Custom Decorator Templates] through a web interface, changing the appearance of the whole site.

Site Homepage

The site administrator can now set the site homepage for users who have not logged in: choosing from either the dashboard (the default behaviour in beta1 and before), or any of the Space homepages within the site.

Users who have logged in can choose their own site homepage in their user profile.

RSS Feed for New Comments

You can subscribe to all new comments added to a space using an RSS newsreader. (The link to the RSS feed can be found on the Space Summary page)

Emoticons
New Macros

- Include Page Macro: include the contents of one Confluence page within another.
- HTML Include Macro: include the contents of an HTML document within a Confluence page (turned off by default. See Enabling the html-include Macro for more information).
- RSS Feed Macro: include an external RSS feed
- Search Results Macro: include the results of a Confluence search
- JIRA Issues Macro: integrate Jira issue reports with your Confluence site
- JUnit Report Macro: include JUnit test result data

Improvements

- Users' login names and full names are indexed for searching.
- Users' profiles may now be longer than 255 characters, and are also indexed for searching.
- Usernames are no longer case-sensitive.
- Anonymous contributions are clearly labeled.
- Users are warned if they are editing or commenting without having logged in.
- Notification emails now link to the appropriate "diff" page, so you can quickly see what has changed.
- Page diffs now highlight precisely what changed within each line: very useful when just one or two words change in a long paragraph.
- Lists of child pages and links are sorted alphabetically.
- Long lists of pages or search results are paginated.
- Shortcut links can be given different link text in the same way as other links.
- Incoming links and "hot referrers" are listed in the sidebar of the page view.
- Child pages are listed below the page contents in the page view.

Notable Bug-fixes

- You no longer get the old page (or don't see the comment) immediately after editing or commenting on a page [http://jira.atlassian.com/browse/CONF-453](http://jira.atlassian.com/browse/CONF-453).
- Persistent login cookies no longer conflict with a JIRA installation on the same server [http://jira.atlassian.com/browse/CONF-440](http://jira.atlassian.com/browse/CONF-440).
- Persistent login cookies no longer fail for users with certain characters in their username [http://jira.atlassian.com/browse/CONF-387](http://jira.atlassian.com/browse/CONF-387).
- Users who are not logged in no longer see strange table titles [http://jira.atlassian.com/browse/CONF-422](http://jira.atlassian.com/browse/CONF-422).
- And many more.

Outstanding Issues

- You should restart Confluence immediately after finishing the initial setup steps, to avoid data loss [http://jira.atlassian.com/browse/CONF-493](http://jira.atlassian.com/browse/CONF-493).
- New-lines may not be drawn if the next line starts with whitespace: [http://jira.atlassian.com/browse/CONF-475](http://jira.atlassian.com/browse/CONF-475).
- Emoticons are rendered inside `{noformat}` blocks: [http://jira.atlassian.com/browse/CONF-502](http://jira.atlassian.com/browse/CONF-502).
- If you put a `{children}` macro after an `{include}` macro, it will list the children of the included page: [http://jira.atlassian.com/browse/CONF-504](http://jira.atlassian.com/browse/CONF-504).

</tr>
<tr>
<td>AUTHENTICATE to retrieve your issues</td>
</tr>
</tbody>
</table>

Release Notes 1.0a2

Confluence 1.0a2 was released November 6, 2003.

New Features

- Shortcut links (CONF-195 & CONF-247) - shortcut links enable you to easily make links to any 'web service' from within the syntax of a Confluence page. Simply specify your shortcut and the URL to link to (eg "google", "http://www.google.com/search?q=$1") to add your own links. You could use this to link directly to JIRA installations, Google, intranets, searches or anything that has a 'URI' based interface.
- Revert page to a previous version (CONF-32) - revert to a previous version of any given page from the list of previous versions.
- Forgot password function (CONF-88) - retrieve your password if you happen to have forgotten it
- Report: undefined pages (CONF-197) - list of all pages which are linked to from other pages, but not defined.
- Report: orphaned pages (CONF-198) - shows all the pages which are never linked to (ie have content but no way to get to them).
- Interstitial help page after creating a space (CONF-251)
- 'Notify me', and HTML/text email preferences, with HTML email content
- Links to non-exported pages are now maintained in exported PDFs (the links point back to the online Confluence installation)
- Custom Radeox macros can now be used within Confluence - this enables you to write your own macros to produce custom content
- XML import/export of a single space (CONF-199) - useful for porting spaces between installations
- XML import/export of a single page (CONF-200) - useful for creating pages automatically, or sync'ing pages between installations.
- Many other minor fixes, improvements and performance tweaks

Release Notes 1.0.1

Confluence 1.0.1

Over the course of the last month of supporting Confluence 1.0, there are a number of patches that we have
been distributing to fix specific problems our users have encountered. Confluence 1.0.1 is a maintenance release into which all these patches have been integrated.

Who Should Upgrade?

All the issues that were resolved for this release are listed below. We have not snuck in any other changes: what you see here in the release notes is precisely what you will get. If you find something on the list that directly affects you, or that you feel justifies the effort of an upgrade, then do so. Otherwise, feel free to stick with 1.0.

Upgrade Procedure

If You Have Customised osuser.xml

If you have customised Confluence's user-management, for example to integrate it with LDAP or JIRA, you will have to integrate your changes to account for the caching OSUser providers we introduced in Confluence 1.0.1. See this document for more details: Confluence Caching OSUser Provider. Updated instructions for integrating with JIRA user management are here: Delegate user management to use JIRA logins

Otherwise

To avoid the possibility of data-loss, you should back up your ConfluenceHome directory and your database before upgrading, and perform a full backup from within the application.

Changes in 1.0.1

See also Issues Resolved for 1.0.1

Direct Attachment Links

In response to a loud demand from users, links to attachments using the [^attachment.jpg] syntax will download the attachment file directly, instead of linking to an anchor in the destination page.

Sybase ASE Support

Confluence 1.0.1 resolves the following problems that were causing Confluence not to work with Sybase ASE 12.5.1:

- ORDER-BY mappings failing on Sybase (CONF-1021)
- Can't add users under Sybase (CONF-1022)
- Weird datatype error under Sybase (CONF-1024)
- Sybase doesn't like complicated distinct selects (404 page fails) (CONF-1025)
- Backup import fails under Sybase (CONF-1063)

These bug-fixes may also improve Confluence's compatibility with other untested databases. They will not, however, have any effect on Confluence's operation against PostgreSQL, MySQL or HSQL.

Microsoft SQL Server Dialect in Setup Page

The Microsoft SQL Server database dialect was missing from the database setup page. It has now been added to the list. Confluence has not yet been tested on Microsoft SQL Server, and the usefulness of this option is not yet guaranteed. However, since the Sybase issues above are now resolved and SQL Server belongs to the same family as Sybase, it would be well worth a try.

JIRA User Provider Caching

Users who were linking their user management to JIRA's using the supplied provider were experiencing significant performance problems as a result. 1.0.1 introduces caching to the user provider, which should speed up these installations significantly.

Global Reports Visibility
Under Confluence 1.0, the global "undefined pages" and "orphaned pages" reports did not properly filter out pages that the user could not see. The user could not see the content of any page they did not have access to, but they could learn of the existence of (and names of) pages and spaces they were not permitted to see. This bug is fixed in 1.0.1

**Locale-Independent Dates in Backup/Restore**

In Confluence 1.0, dates were written into backup files using a localised representation of the month. As such, if you exported Confluence data from a server in one locale it might not import successfully into a server with a different Locale setting. Confluence 1.0.1 still recognises the 1.0 export format, but its own exports will write out dates in a locale-independent format.

As noted above, this means that data exported from Confluence 1.0.1 *can not* be imported successfully into Confluence 1.0.

**Fix Browser Crash on Viewing Some Templates**

Previously, if you created a template containing no variables, then anyone attempting to preview or use that template would have their browser hang in an infinite Javascript loop. Confluence 1.0.1 fixes this bug.

**Typo Fixed on User Group Editing Page**

A single-character change from "privilage" to "privilege".

**Issues Resolved for 1.0.1**

<table>
<thead>
<tr>
<th>JIRA Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>

**Release Notes_1.0.1**

*Confluence 1.0.1*

Over the course of the last month of supporting Confluence 1.0, there are a number of patches that we have been distributing to fix specific problems our users have encountered. Confluence 1.0.1 is a maintenance release into which all these patches have been integrated.

**Who Should Upgrade?**

All the issues that were resolved for this release are listed below. We have not snuck in any other changes: what you see here in the release notes is precisely what you will get. If you find something on the list that directly affects you, or that you feel justifies the effort of an upgrade, then do so. Otherwise, feel free to stick with 1.0.

**Upgrade Procedure**

**If You Have Customised osuser.xml**

If you have customised Confluence's user-management, for example to integrate it with LDAP or JIRA, you will have to integrate your changes to account for the caching OSUser providers we introduced in Confluence 1.0.1. See this document for more details: Confluence Caching OSUser Provider. Updated instructions for integrating...
with JIRA user management are here: Delegate user management to use JIRA logins

Otherwise

To avoid the possibility of data-loss, you should back up your ConfluenceHome directory and your database before upgrading, and perform a full backup from within the application.

**Changes in 1.0.1**

See also [Issues Resolved for 1.0.1](#)

**Direct Attachment Links**

In response to a loud demand from users, links to attachments using the `[^attachment.jpg]` syntax will download the attachment file directly, instead of linking to an anchor in the destination page.

**Sybase ASE Support**

Confluence 1.0.1 resolves the following problems that were causing Confluence not to work with Sybase ASE 12.5.1:

- ORDER-BY mappings failing on Sybase (CONF-1021)
- Can't add users under Sybase (CONF-1022)
- Weird datatype error under Sybase (CONF-1024)
- Sybase doesn't like complicated distinct selects (404 page fails) (CONF-1025)
- Backup import fails under Sybase (CONF-1063)

These bug-fixes may also improve Confluence's compatibility with other untested databases. They will not, however, have any effect on Confluence's operation against PostgreSQL, MySQL or HSQL.

**Microsoft SQL Server Dialect in Setup Page**

The Microsoft SQL Server database dialect was missing from the database setup page. It has now been added to the list. Confluence has not yet been tested on Microsoft SQL Server, and the usefulness of this option is not yet guaranteed. However, since the Sybase issues above are now resolved and SQL Server belongs to the same family as Sybase, it would be well worth a try.

**JIRA User Provider Caching**

Users who were linking their user management to JIRA's using the supplied provider were experiencing significant performance problems as a result. 1.0.1 introduces caching to the user provider, which should speed up these installations significantly.

**Global Reports Visibility**

Under Confluence 1.0, the global "undefined pages" and "orphaned pages" reports did not properly filter out pages that the user could not see. The user could not see the content of any page they did not have access to, but they could learn of the existence of (and names of) pages and spaces they were not permitted to see. This bug is fixed in 1.0.1

**Locale-Independent Dates in Backup/Restore**

In Confluence 1.0, dates were written into backup files using a localised representation of the month. As such, if you exported Confluence data from a server in one locale it might not import successfully into a server with a different Locale setting. Confluence 1.0.1 still recognises the 1.0 export format, but its own exports will write out dates in a locale-independent format.

As noted above, this means that data exported from Confluence 1.0.1 can not be imported successfully into Confluence 1.0.
Fix Browser Crash on Viewing Some Templates

Previously, if you created a template containing no variables, then anyone attempting to preview or use that template would have their browser hang in an infinite Javascript loop. Confluence 1.0.1 fixes this bug.

Typo Fixed on User Group Editing Page

A single-character change from "privilage" to "privilege".

Release Notes 1.0.3

Confluence 1.0.3

Confluence 1.0.3 is another maintenance release, hopefully the last maintenance release we will need on the 1.0 branch before moving full steam ahead towards version 1.1. It fixes some bugs regarding the remote SOAP/XML-RPC API, the display of the 404 error page under Postgresql, and the display of the site's stylesheet under certain versions of Internet Explorer.

The Confluence development team are now working hard on 1.1, which will contain significant improvements and new features. Remember, a Confluence license entitles you to a year of upgrades, so if you buy 1.0.3 today, you'll be able to upgrade to 1.1 for no extra charge when the time comes.

See also: Issues Resolved for 1.0.3

Who should upgrade?

Confluence users should be running at least Confluence 1.0.2. Versions prior to 1.0.2 contain a bug that will cause their licenses to expire a month after the build date listed in the page footer, regardless of the true expiry date of the license. Versions 1.0.2 and later do not contain this bug. (Note: In the absence of this bug, only trial licenses ever expire. Purchased licenses for Confluence do not expire.)

All the issues that were resolved for this release are listed below. We have not snuck in any other changes: what you see here in the release notes is precisely what you will get. If you find something on the list that directly affects you, or that you feel justifies the effort of an upgrade, then do so. Otherwise, feel free to stick with 1.0.2

Upgrade Procedure

Confluence 1.0.3 contains no database or configuration file changes, so you should just be able to unpack it on top of your existing Confluence installation:

1. Shut down the Confluence server
2. Back up confluence/WEB-INF/classes/confluence-init.properties, and if you have customised it, confluence/WEB-INF/classes/osuser.xml
3. Unpack Confluence 1.0.3 in the same location as your existing Confluence installation
4. Restore the two files you backed up in step 1 to the 1.0.3 installation.
5. Start Confluence

To avoid the possibility of data-loss, you should back up your ConfluenceHome directory and your database before upgrading, and perform a full backup from within the application.

Changes in 1.0.3

Global RSS Feed Fixes

The global RSS feeds found on the Dashboard page were not being generated correctly: an extra ')' was being added to the end of links. This has been fixed in 1.0.3

Page Not Found Fix for Postgresql

Users running Confluence against a Postgresql database were encountering a system error whenever someone attempted to visit a page that did not exist. This has been fixed.
Remote API Fixes

Several outstanding issues with the remote API that were holding back the TimTam client have been fixed. In addition a getVersion method has been added to allow client authors to determine which version of Confluence a server is running, and adjust their features to match. The full description of Confluence's remote API is here: Confluence XML-RPC and SOAP APIs

- The WSDL file now respects the server's configured base URL, so SOAP can be used on servers that are behind a proxy.
- getVersion now recognises when a user is in the confluence-administrators super-user group.
- storePage handles re-parenting a page correctly
- storePage will now allow a page to be renamed (all links to the page are automatically redirected)

Other Fixes

- You can now comment on a blog post when the title contains non-US-ASCII characters
- The bug that was causing some versions of Internet Explorer 6 to not display the site's stylesheet has been fixed

Issues Resolved for 1.0.3

Release Notes 1.1

Nymboida, Nym to his friends, is Confluence 1.1. He wants to be your friend.

Confluence 1.1 is the first major update to Confluence. It's faster, more reliable, and packed with new features. Thanks to our policy of a year's free upgrades, any current Confluence customer will be able to upgrade to 1.1 at no cost.

Current customers, or new users who wish to try out Confluence for 30 days can download either the standalone or WAR distributions from the Atlassian website: http://www.atlassian.com/software/confluence

Upgrading from 1.0.3a

Upgrading Confluence should be pretty easy: you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

- Users who have enabled external user-management by customising their osuser.xml file will need to read this document also.
- Users who have used MySQL or Postgresql with Confluence 1.0 should read this document which explains how to get rid of any extraneous triggers or indexes that might have been created.

Contents

1. New Features
2. New Macros
3. Improvements
4. **Notable Bug-fixes**
5. **Outstanding Issues**

See also: [Issues Resolved for 1.1](#)

**New Features**

**Macro Management**

The biggest Nymboida new feature from an end user point of view is going to be the rewritten macro support.

**Management** - You can now enable and disable macros from this convenient (and very attractive) console. Macros are now grouped into libraries to make the management and creation of related macros simpler. Libraries can be installed, activated or deactivated as a single entity.

**Macro Libraries**

Use this page to enable and disable macros and libraries below.

<table>
<thead>
<tr>
<th>Libraries</th>
<th>Basic Macros</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Basic Macros</strong></td>
<td>This library includes basic macros for linking and formatting content.</td>
</tr>
<tr>
<td>6 of 7 macros</td>
<td>□ Disable library</td>
</tr>
<tr>
<td>enabled</td>
<td></td>
</tr>
<tr>
<td><strong>Compatibility</strong></td>
<td></td>
</tr>
<tr>
<td>Macros</td>
<td>□ All macros enabled.</td>
</tr>
<tr>
<td><strong>Advanced Macros</strong></td>
<td></td>
</tr>
<tr>
<td><strong>HTML Macros</strong></td>
<td></td>
</tr>
<tr>
<td>Library disabled.</td>
<td></td>
</tr>
</tbody>
</table>

**User Macros** - We’ve also had a lot of requests from users for simple formatting macros: people who wanted their code snippets or notes to be formatted in a certain way. Confluence 1.1 contains a simple way for administrators to create new macros from within the application without a restart: defining a template that the macro will apply to its arguments or content. User macros are very handy for providing consistent formatting and layouts across your pages.
Custom Macros - Installation of new macro libraries is a breeze: simply drop the library .jar file inside the web application, restart Confluence, and your new macros will appear in the management console. Confluence 1.1 also includes a custom macro toolkit (with Task List example shown below) to help users build their own complex macros easily using Java.

![Tasks: Shopping List](image)

- Buy apples
- Buy bananas
- Purchase shopping bag
- Collect laundry
- Deposit money

More information:
- [Guide to Confluence Macros](#) - a guide to the Macro Management console
- [Writing User Macros](#) - how to write User Macros
- [Custom Java Macros - obsolete](#) - a guide (and worked example) for writing and distributing your own Java macros for Confluence

Attachments: versioning, comments and WebDAV support

**Versioning** - The number one feature request for Confluence 1.0 was versioned attachments. You ask, we deliver! 😊 Confluence can now have multiple versions of the same file attached to a page. It will keep a history of different versions of attachments, expandable dynamically.

**Comments** - Each attachment can now be accompanied with a comment describing why it is there, what it's about or the reason for it being attached. This is useful for tracking the differences between attachment versions, as well as for informing users as to why they should be interested in a particular file.

![Attachments](image)

**WebDAV** - You can configure Confluence to store attachments in an external WebDAV server. This allows companies with an existing WebDAV infrastructure to give users alternative ways of accessing attachments and attaching files to Confluence pages.

**Improvements to Page and Space Exports**

- Exporting pages and spaces to PDF should be a great deal more reliable now. Whereas in Confluence 1.0, the export was likely to fail if the pages contained questionable markup, we now dynamically clean up each page before we export it.
- You can choose whether or not page comments are exported. Often you want to exclude comments if you want to send out a PDF of a page or publish a space as a website.
- The templates used to publish pages and spaces to HTML can be customised on a global and per-space basis. This makes it easy to publish a static website from the contents of a Confluence space: customise your templates, choose which pages to export, and voila.

Customise Display of Blog Posts
The templates used to display blog posts (both individually and in lists) can be edited either globally, or on a per-space basis, in the same way as the site's main decorators are editable. Also, the interface for editing templates has improved and will continue to do so in future releases.

**Page Locking**

If you want to prevent another user from editing, deleting or renaming a page, you can now lock it. You may want to do this because certain pages in an otherwise public space (for example, front pages, disclaimers or copyright notices) must remain un-edited, or just because you're working on the page and don't want anyone else to interfere just yet.

Locking a page restricts editing to a single user (yourself), or members of a particular group. Anyone with the space administrative permission can override or delete a lock.

**Oracle and Weblogic Support**

We have made a concerted attack on the various issues that were making Confluence unreliable on Oracle and Weblogic, and we're pleased to report that both have been running just fine in testing. Most importantly, the bug that was preventing pages being saved to Oracle when they were over 4Kb in length has been fixed.

For details of what precisely was fixed, see:

- [The Weblogic support super-issue in JIRA](#)
- [The Oracle support super-issue in JIRA](#)

**Search Powerpoint and Excel Attachments**

Confluence already searches across attached Word, PDF and RTF documents, XML, HTML and any plain text file. This search support has now been expanded in Nymboida to include searching and indexing of all text within Microsoft Powerpoint presentations and Excel spreadsheets.

In addition, the new attachment comments are also searchable.

**TinyURL**

Every page has a unique, short URL displayed at the top of its Page Information page. This makes it easier to send colleague's the URLs for pages with long titles via email, instant message or IRC.

**New and Improved Macros**

**New**

- `{excerpt}` allows you to mark a portion of the page as its "excerpt". This has no effect on the page itself, but other macros (such as `{blog-posts}` and `{children}`) can use the excerpt as a short summary of the content of the page.
- `{excerpt-include}` includes one page's excerpt in another page.

**Improved**

- `{code}` macro supports coloured highlighting for several more languages: JavaScript, ActionScript, XML and SQL.
- `{code}` macro can have its title and border customised in the same way as the `{panel}` macro
- `{blog-posts}` takes an optional `time` parameter to indicate how far back it should look for blog posts. For example, `{blog-posts:time=7d}` will show all blog-posts within the last seven days
- `{blog-posts}` takes an optional `content` parameter to change the way the blog-posts are displayed. `content=excerpts` displays excerpts instead of the full content of the blog entry (using the `{excerpt}` macro if available, otherwise extracting the first few hundred characters of the post). `content=titles` displays the entries as a list of titles.
- `{children}` takes an optional `excerpts=true` parameter: if any of the children have an excerpt available, the first line will be displayed in the list.

**Improvements**
Improvements to the Markup Engine

Many improvements have been made to the Confluence markup parser, fixing niggling inconsistencies, and allowing many more combinations of effects. If you want to produce something like the following, you can:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Some code</td>
<td>public static void main(String[] args)</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>System.out.println(&quot;Hello World&quot;);</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

| A list | Item 1       |
|        | Item 2       |
|        | Item 3       |
|        | Item 4       |

| A panel | I like cheese |
|         | Brie          |
|         | Camembert     |
|         | Gruyere       |
|         | Cheddar       |

You can also center an image using ![image.gif|align=center!]

**Improvements to Linking**

- You can specify a link title (which appears in the mouse-over tooltip) by adding another section to the link: [Link Body Text|Page Name|Link Title]
- ` [/foo/bar/baz.html]` will create a relative URL link to `/foo/bar/baz.html` on the same server as Confluence is running
- file: URL links work
- UNC-style links: `\\SERVER\share\directory\file.doc` will create a file:// link to the file on an external share

**Note:** Some web browsers (specifically Mozilla) consider file: URLs to be a security hazard, and do not follow them.

**And a whole lot more...**

Here’s the quick fire version of some of the other improvements we’ve made in this release:

- You can resize the recent changes lists on the dashboard and space summary pages. This change is persisted in your user preferences.
- UI state (whether comments or attachments are open, size of recent changes lists) persists between sessions for registered users.
- The maximum attachment size can be configured from the General Configuration administration page.
- Going to `http://yoursite.example.com/display` now brings up a list of spaces instead of an error page.
- The display of the space summary page is significantly faster.
- Newly created users don’t show up on the dashboard recent changes list unless they edit their profiles.
- The word “Confluence” has been moved to the end of page titles instead of the beginning, making them
easier to distinguish in tabs and bookmarks.

- There are more ways to navigate to the "recent blog posts" page for a space.
- Removing a user is significantly faster.
- Headings in pages are automatically turned into anchors with the same name.
- Creating a space now creates an index page as well as a home-page.

Notable Bug-fixes

It's hard to know where to start. We've fixed a lot of bugs across the whole application. If you want to know what's been fixed, you're probably best off looking for yourself.

Two areas, however, have been improved enough to deserve special mention.

- **PDF Export** - as mentioned above, we've made the PDF export much, much more reliable than it once was. Where before a page or space may have confused the PDF converter into not working, it should now be able to handle any markup you throw up at it.
- **International characters** - Many issues related to the use of non-ASCII characters in page titles, links, page contents and RSS feeds have been resolved since Confluence 1.0. Our users in non-English-speaking countries should find Confluence a much more pleasant and seamless experience now than they may have before.

Issues Resolved for 1.1

</tr>
</tbody>
</table>

Release Notes 1.1.1

Confluence 1.1.1 is a maintenance release that fixes some bugs regarding attachments, page links and notifications. Remember, a Confluence license entitles you to a year of upgrades, and this upgrade along with future updates will be free of charge.

**Who should upgrade?**

This release mainly fixes the bugs discovered in our recent 1.1 release. The major issues resolved are listed below, or you can see the full list here. As some of the issues resolved have a significant impact on the user experience of Confluence, we recommend that anyone currently running 1.1 upgrade to 1.1.1.

**Upgrade Procedure**

1. Shut down the Confluence server
2. Back up `confluence/WEB-INF/classes/confluence-init.properties` and if you have customised it, `confluence/WEB-INF/classes/osuser.xml`
3. Unpack Confluence 1.1.1 in the same location as your existing Confluence installation
4. Restore the two files you backed up in step 1 to the 1.1.1 installation.
5. Start Confluence

To avoid the possibility of data-loss, you should back up your ConfluenceHome directory and your database before upgrading, and perform a full backup from within the application.

**Changes in 1.1.1**
Attachment fixes

- Attachment versioning introduced a new table in Confluence that had a column whose name conflicted with some databases like Sybase
- Links to older version of attachments could not be accessed if the webapp was deployed with a context path
- Attaching files that contained '+' and '&' symbols caused certain pages in Confluence to break

These have been fixed in 1.1.1.

Notification fixes

Users opting to receive html formatted email received emails with the correct subject but no content. In addition, the "View Changes" link in the daily change email was broken. These are now fixed.

Email Server fixes

An upgrade to an email component used in Confluence in 1.1, caused an error to be displayed when users attempted to modify their email server settings. An upgrade has been added in 1.1.1 that will fix this problem to save users from having to perform the fix manually.

Export to PDF fix

Spaces labelled with names containing an ' &' symbol could not be exported to PDF. This has been fixed.

Wiki Notation fix

The notation for a horizontal ruler was changed to five dashes (up from 4) in 1.1. This stopped the ruler from showing. This has been changed back in 1.1.1.

Issues Resolved for 1.1.1

Errors were reported by the JIRA trusted connection.

### Release Notes 1.1.2

This fixes an upgrade problem in 1.1.1 where users attempting to upgrade from 1.0.x directly to 1.1.1 encountered an "Upgrade Failed" error. Therefore, if you are still using a version older than 1.1, and are planning to upgrade, please upgrade to 1.1.2 to avoid this problem.

If you have already upgraded to 1.1.1 from 1.0.3a and cannot start Confluence due to the upgrade error, simply download 1.1.2 and upgrade to it. This should fix the problem.

If you have already upgraded successfully to 1.1.1 from 1.1 then you may safely ignore this upgrade.

#### Useful tips when upgrading from 1.0.3a

Upgrading Confluence should be pretty easy; you can find instructions here. We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

- Users who have enabled external user-management by customising their `osuser.xml` file will need to read this document also.
- Users who have used MySQL or Postgresql with Confluence 1.0 should read this document which explains how to get rid of any extraneous triggers or indexes that might have been created.

### Release Notes 1.2

Atlassian is proud to present Confluence 1.2, otherwise known as Swan, to the world. Existing customers who wish to upgrade, or new users who wish to try out Confluence for 30 days can download either the standalone or WAR distributions from the Atlassian website: [http://www.atlassian.com/software/confluence](http://www.atlassian.com/software/confluence)

Swan is the second major update to Confluence, and once again all existing customers can upgrade for free, thanks to the provision for one year of free upgrades in your license. You will find that Swan contains significant new features in the areas of user management, search and space browsing, as well as the usual raft of enhancements, bug fixes and things we just couldn't resist throwing in at the last minute.

In all, 109 issues were resolved between 1.1.2 and 1.2. You can see the full list here: [Issues Resolved for 1.2](http://example.com/issue/resolved)

Looking towards the future, we are going to attempt to increase the frequency of releases. While having one release every three months makes for impressively long release notes, it also means that customers are often left waiting longer than might be necessary for important enhancements or bug-fixes.

#### Upgrading from 1.1.2

Upgrading Confluence should be pretty easy; you can find instructions here. We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

You will need to reindex your site after upgrading to enable some of the new site search features. You can do this from the "Rebuild Search Index" link on the Administration Console.
Site administrators upgrading from 1.1.2 or earlier should take particular note of the changes to global and space permissions. Confluence should automatically upgrade old permissions to the new scheme when upgrading from or importing data from earlier versions, but it is a good idea to check that your spaces are still secure and accessible after the upgrade, just in case.

Upgrading from 1.0.3a

Users upgrading directly from 1.0.3a should also read the Nymboida Release Notes for caveats regarding the 1.0 -> 1.1 upgrade.

Contents

1. New Features
2. Improvements
3. Notable Bug-fixes

See also: Issues Resolved for 1.1

New Features

Page List Views

The old "list pages" screen has been enhanced, almost to the point of being unrecognisable. In its place, we now offer three ways to browse the contents of a space.

The Alphabetical View looks like the "list pages" screen from 1.1 and earlier, but it has been enhanced to allow you to find pages quickly by the first letter of their title.

The Directory View presents the contents of a space as a tree, allowing you to drill down the hierarchy of parent and child pages (You will need Javascript turned on to use this view).

The Search View presents Swan’s enhanced search interface, already focused on the space you are looking at.

Image Thumbnails and Thumbnail Galleries

You can now display a thumbnail of any image attached to a page. Clicking on the thumbnail will pop up a window containing the full-sized image. For example, the nice picture of the waterfall from my holiday in California was generated by the following wiki-markup.

!waterfall.jpg|align=right thumbnail!
In addition, the `{gallery}` macro will create a thumbnail gallery of all the images that are attached to the page the macro is included in. You can see an example of this macro in action here: Thumbnaill and Gallery Example.

The maximum sizes for thumbnails are configured in the General Configuration section of the Administrative Console.

**Threaded Comments**

Bowing to public demand, we have added the ability to arrange comments by thread: users may respond to a particular comment, and the comments will be arranged in accordance with who responded to what.

The default is still for comments to be presented as a flat list, but you can enable comment-threading in the General Configuration section of the Administrative Console.

**Improvements**

**Enhanced Search**

The site-search functionality of Confluence has been enhanced, both subtly behind the scenes, and quite obviously in front of them.

Behind the scenes, we now index more information such as attachment comments and filenames. We have improved the indexing of Powerpoint presentations so that more text is extracted from the Powerpoint file. We have also tweaked the ranking algorithms behind the search so that you are more likely to find the page (space, comment, blog post, attachment, user...) you are looking for.
More obviously, we have given the user a lot more control over searching with an intuitive user interface that allows you to limit searches by space, type of content, or date last modified, and to group search results by type and space.

The `{search}` macro has also been updated to take advantage of the new search features (the options are described more fully in the notation guide linked from Confluence's edit page):

```
{search:query=Confluence|maxLimit=5|spacekey=DISC|type=page}
```

**New Permissions Interface**

**Groups**

These are the permissions currently assigned to groups for this space.

<table>
<thead>
<tr>
<th>Group</th>
<th>Make comments</th>
<th>Create &amp; edit pages</th>
<th>Administrate space</th>
</tr>
</thead>
<tbody>
<tr>
<td>atlassian-staff</td>
<td>✔️</td>
<td>✔️</td>
<td>🕒</td>
</tr>
<tr>
<td>conffluence-administrators</td>
<td>✔️</td>
<td>✔️</td>
<td>🕒</td>
</tr>
<tr>
<td>conffluence-users</td>
<td>✔️</td>
<td>🕒</td>
<td>🕒</td>
</tr>
</tbody>
</table>

Grant browse permission to [atlassian-developers](#) OK

Two of the biggest issues users have been having with permissions in Confluence were:

- The interface for setting permissions was confusing.
- It was hard to keep sites that allowed anonymous access below the workgroup license 25-user limit, especially if they used external user management.

Both of these issues have been fixed in Swan, but it has involved a slight change in the way permissions are checked. This should not be a problem for new Confluence users: the new system is easier to use than the old. However, if you are upgrading from 1.1.2 or earlier, you should read [this document](#) to see what's different.

**And a whole lot more...**

Here’s the quick fire version of some of the other improvements we’ve made in this release:

- The "double-click to edit" feature has been removed.
- Blog views now come with a monthly calendar showing nearby posts
- Macro libraries can now include images, or any other content the macro needs to serve over the web: look out for new example code in the [macro documentation](#) soon.
- Users can set their profile page to be their site homepage
- You can delete all referrer links that match your exclusion list (in General Configuration), to rid the site of referrer spam
- The site’s administrative, search and editing pages are served with robots exclusion meta tags so that only the site’s main content will be indexed by well-behaved search engines
- Restoring backups should be significantly faster for installations with many users
- Administrators can choose to restore backups from the filesystem instead of uploading them (important if your backup is quite large)
- Confluence now serves files with a proper Content-Length header, so browsers can display the download accurately
- CSS stylesheets are hidden in emails so they don't mess up Lotus Notes
- Export and backup filenames use a neater yyyyMMdd date format
Notable Bug-fixes

- Exports created on Windows can now be imported on Unix-like operating systems without having to fix the path separators.
- Hyphens in page headings or anchors will no longer render strangely.
- Restoring a backup during setup now properly generates the search indexes.
- Page "short links" now respect the configured site URL, regardless of which URL the user is accessing the site from.
- Strange Powerpoint files no longer choke the indexer.
- Users with Admin privileges can now see the link to the Administration Console without being in the 'confluence-administrators' superuser group.
- Space administrators can modify space templates without having global administrator privileges.
- User macros are now lower-cased by default.
- It is now possible to change the case of a page title by renaming the page.

Issues Resolved for 1.2

Permissions Changes in 1.2

For Swan, changes were made to the way Confluence manages and checks permissions. This document is a guide for anyone migrating from Confluence 1.1.2 or earlier describing why the changes were made, and what this means to existing Confluence installations.

Why Change?

There were two goals behind changing permissions in Confluence:

1. Fix a significant problem whereby users with external user management enabled could not also enable Confluence anonymous access without blowing out their 25-user workgroup license.
2. Make the user interface for assigning and viewing permissions easier to use and understand.

What Changed?

"Anyone" User Removed

In Confluence 1.1.3, there was an "Anyone" user, who represented anyone using the system, whether logged in or not.

This user was the source of the licensing problem, and no longer exists in Confluence 1.2.

Anonymous Permissions Added

Confluence 1.2 has explicit permissions for anonymous users. These permissions are only granted to users who are not logged in.

There is nothing stopping an administrator granting some permission to anonymous users, but not granting it to logged-in users. This results in the slightly bizarre possibility that a user might be able to do more before logging in than they can after. Luckily, this is a pretty easy situation for administrators to avoid.
Enabling anonymous access has no effect on Confluence's user count for licensing purposes.

**Guard Permissions Added**

The roles of the "Use Confluence" and "View Space" permissions have been expanded so that now they are required permissions before a user or group can be granted any more rights.

Before a user has access to anything in the Confluence server, they must first have "Use Confluence" permission, and likewise before a user has access of any kind to a space, they must first have the "View Space" permission.

For licensing purposes, your number of users is equivalent to the number of non-anonymous users with the "Use Confluence" guard permission.

*Migrating from 1.1 to 1.2*

**Migrating Automatically**

When you upgrade from Confluence 1.1, or when you restore a backup created in 1.1 into Confluence 1.2, an upgrade task will run to automatically migrate your permissions to the new scheme, while keeping them consistent with your 1.1 security settings. The task will make the following changes:

- All "Anyone" permissions will be converted into two separate permissions: one for Anonymous access, and one for the confluence-users group. (If the confluence-users group does not exist, this step will be skipped)
- Any user or group with some global or space permission will also be granted the equivalent guard permission.

After starting up with the new version of Confluence, we suggest that you check that the permissions have migrated successfully. While we have tested the migration code, maintaining your site's security is important enough to warrant a double-check, just in case.

**Migrating Manually**

If the automatic migration does not complete successfully, which would most likely happen if you have removed the "confluence-users" group, you will need to perform the above steps manually, through the user administration interface.

**Release Notes 1.2.1**

Confluence 1.2.1 is a maintenance release that fixes some bugs that users may have encountered using Confluence 1.2. It incorporates improvements to performance for large Confluence installations, and fixes bugs related to the remote API, over-use of disk space, and a few annoying errors users were experiencing when setting up a new Confluence instance.

1.2.1 is a free upgrade for all existing Confluence customers.

**Who should upgrade?**

The issues resolved below are all either fixes to problems that have effected small numbers of users, or improve areas of Confluence that may not be used in your installation. As such, we recommend you read through the release notes and decide whether this upgrade is necessary.

If 1.2 is working fine, and none of the issues below are bothering you, there is no need to upgrade.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2, you can find instructions here. **We strongly recommend that you backup your confluence.home directory and database before upgrading!**
If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the Confluence 1.2 release notes.

Changes in 1.2.1

See also: Issues Resolved for 1.2.1

Remote API Fixes

- `getBlogEntries()` will no longer erroneously return SQL Timestamps instead of date objects — CONF-1756
- `getPage()` will now successfully retrieve a previous page version — CONF-1721
- `renderContent()` can now successfully render a page containing the `{blog-posts}` macro — CONF-1717

Setup Fixes

- Some users were encountering the following error during setup: "Unable to store Trigger with name: 'backupTrigger' and group: 'DEFAULT', because one already exists with this identification." This should no longer occur — CONF-1760
- Some users were encountering a NullPointerException in org.apache.lucene.store.FSDirectory.create() during setup when connecting to an external datasource. This should no longer occur — CONF-1767

Performance and Efficiency Fixes

- Installations with large search indexes will no longer experience a performance degradation when saving content — CONF-1759
- Backups will no longer leave a redundant exploded copy of the files being backed up in the temp directory — CONF-1752
- Deleting a space was not deleting its attachments from the confluence home directory. This is now fixed — CONF-1765
- Thumbnails are now stored in their own directory, so they won't be included unnecessarily in backups — CONF-1785

Other Issues Resolved

- Confluence now generates significantly higher-quality image thumbnails (Thanks to Mike Aizatsky for the tip) — CONF-1725

Note

Unless you are running JDK 5.0 (which we do not recommend as it is still in pre-release), this improvement will only be visible if you are running Confluence on Mac OS X

- URLs longer than 255 characters will no longer cause an exception when saving a page — CONF-1743
- Pages with titles containing quotes no longer break PDF exports — CONF-1719
- Internet Explorer 6 SP2 will no longer corrupt zip-files downloaded from Confluence — CONF-1669

Release Notes 1.2.2

Confluence 1.2.2 is a maintenance release that fixes some bugs that users may have encountered using Confluence 1.2 and 1.2.1. It fixes problems with attachment downloading, text file imports and text-only emails.

1.2.2 is a free upgrade for all existing Confluence customers.

Who should upgrade?

Confluence 1.2.2 includes a fix for CONF-1810. This bug will cause serious problems for anyone who attaches multiple versions of the same file to a Confluence page, corrupting subsequent downloads.

As such, Confluence 1.2.2 is a recommended upgrade for anyone running 1.2 or 1.2.1.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2 or 1.2.1, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the Confluence 1.2 release notes.

Changes in 1.2.2

See also: Issues Resolved for 1.2.2

- The correct file size will now be stored for multiple versions of the same attachment, fixing a serious download corruption bug – CONF-1810
- Long (excerpt) blocks no longer overrun their database field – CONF-1705
- The (code) macro will no longer garble XML – CONF-1829
- Page diffs now escape HTML tags correctly – CONF-1830
- Fixed Postgresql error when you try to import text files that contain the nul (\0) character – CONF-1739
- "New Blog Post" icon in Page Operations URL now goes to the correct URL – CONF-1848
- "Next" link at the bottom of the alphabetical page listing now works – CONF-1797
- Text-formatted Confluence daily emails are now sent as text – CONF-1724
- The search input box on the "404 Not Found" page has been fixed – CONF-1800

Release Notes 1.2.3

Confluence 1.2.3 is a maintenance release that fixes some bugs that users may have encountered using the 1.2 series of Confluence. It fixes problems with Oracle support on Weblogic, thumbnail display, errors moving pages between spaces.

1.2.2 is a free upgrade for all existing Confluence customers.
**Who should upgrade?**

The issues resolved below are all either fixes to problems that have effected small numbers of users, or improve areas of Confluence that may not be used in your installation. As such, we recommend you read through the release notes and decide whether this upgrade is necessary.

Of particular note should be CONF-1911 which might effect customers trying to use Confluence with Oracle under Weblogic, and CONF-1914, a security issue where users may determine the names of attachments that they can not access.

If Confluence 1.2.2 is working fine for you, feel free to stick with it.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2 or higher, you can find instructions here. **We strongly recommend that you backup your confluence.home directory and database before upgrading!**

If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the Confluence 1.2 release notes.

**Changes in 1.2.3**

See also: Issues Resolved for 1.2.3

- Oracle LOB handler now works correctly under Weblogic – CONF-1911
- Attachments are no longer listed in search results if the user is not permitted to download them – CONF-1914
- Tomcat no longer hijacks Confluence's logging – CONF-1934
- Incoming page links no longer listed multiple times – CONF-1928
- Comments in daily update report are now linked properly – CONF-1904
- Thumbnails and the gallery macro no longer draw images with width and height of 0 – CONF-1861
- Fixed a system error moving pages between spaces when they are linked to from a comment – CONF-1851
- Fixed a system error when removing an attachment – CONF-1861

**Release Notes 1.3**

Attlassian Software is proud to present Confluence 1.3 (otherwise known as Murrumbidgee). Existing customers who wish to upgrade, or new users who wish to try out Confluence for 30 days can download either the standalone or WAR distributions from the Atlassian website: [http://www.atlassian.com/software/confluence](http://www.atlassian.com/software/confluence)

Murrumbidgee is the third major update to Confluence (in less than nine months!), and once again we’ve raised the bar of what you should expect from a professional wiki. Confluence 1.3 looks better, performs better, installs more easily and does far more than it ever has before.
A big thanks to everyone who reported bugs, and offered suggestions over the last few months, especially everyone who helped by trying out our Development Releases.

Upgrading from 1.2.3

Upgrading Confluence should be pretty easy. We strongly recommend that you backup your confluence.home directory and database before upgrading!

You will need to reindex your site after upgrading to enable some of the new site search features. You can do this from the "Rebuild Search Index" link on the Administration Console.

Also, we've added a bunch of space-level permissions since 1.2. While our upgrade process should make sure everyone has the same permissions after the upgrade as they did before, it's a good idea to check to make sure nothing has been missed.

Upgrading from 1.1.2 or Earlier

Users upgrading from an earlier version of Confluence should check the release-notes of the other major Confluence releases:

- Release Notes 1.2
- Release Notes 1.1

Contents

- New Features
- New Macros
- Improvements
- Notable Bug-fixes

See also: Issues Resolved for 1.3

New Features

Many of the features added to Confluence 1.3 are of interest only to site administrators. To get an idea of what's changed from the perspective of a user, you should read What's New in 1.3

Mail Archiving

Confluence is a collaboration tool. When communication happens through Confluence, it gets archived, indexed and interlinked so the whole team can benefit from the information. But what happens to communication that happens via email? At best it gets hidden away in the corner of one team member’s inbox, at worst it just falls into nowhere.

Now, you can put that mail into Confluence as well.
Each Confluence space has a mail archive. You can import mail directly by uploading an mbox file, or you can have Confluence regularly poll a POP mailbox for new mail. Once mail is imported into Confluence it can be browsed chronologically or by thread, and searched using Confluence's powerful full-text search functionality.

The threading and searching functionalities within Confluence are more powerful, and more useable than most dedicated mail archives that you will find online! For more information about Confluence's mail support, read the Mail Archiving FAQ.

Themes

It is now possible to package a particular Confluence look and feel into a theme. Themes can be dropped into a Confluence installation, after which they will be available for global or space administrators to customise the look and feel of the site.

Themes are built using the new plugin architecture that has been built into Confluence: for more details on how to create your own theme, see Theme Module.

The Trash Can
One of the most popular feature-requests, it is now possible to undelete pages, mail and blog-posts. When content is deleted from a space it is moved to that space's trash can. Space administrators can restore deleted pages, or consign them to oblivion.

More Granular Space Permissions

Another of our most popular feature-requests, we've divided up the space permissions so administrators have more control over what users can and can not do.

New Emoticons

Because you can never have enough neat-looking graphics.

Macros

- `{note}`, `{information}`, `{warning}` and `{tip}` macros let you add coloured notes to your page.
- The `{section}` and `{column}` macros give you an alternative to wiki-markup tables
- The `{jiraportlet}` macro allows you to embed a JIRA 3 portlet into a Confluence page
- The `{excerpt}` macro has an optional `hidden=true` parameter to hide the contents of the excerpt within the page
- The `{excerpt-include}` macro has an optional `nopanel=true` parameter to display the excerpt without any decoration
• The `{jiraissues}` macro has an optional `count=true` parameter to display only the number of issues found, not the details of those issues. It also has an optional `cache=off` parameter to ensure that a list of Jira issues will refresh on each request.
• The `{blog-posts}` macro consistently displays blog-posts in reverse chronological order
• The `{search}` macro can be limited to particular types of content
• The notation guide has been reorganised to be more friendly to users who don’t know what a macro is

**Improvements**

**Referrer Management**

![Manage Referrers](image)

For public sites, referrer management has been vastly improved in Confluence 1.3, with a new management screen, the ability to block unwanted referrers right from where they are displayed, and the ability to turn off referrer tracking with a single click.

**Setup Wizard**

The Confluence setup wizard has been rewritten from the ground up. We’ve made it task-oriented, and stripped it back to just the stuff you need to get Confluence running. The result is a much smoother, much faster installation.

**User Interface**

We’ve made a lot of improvements to Confluence’s user interface. You’ll notice some improvements on the Dashboard, making it easier to see exactly what’s changed recently. You’ll notice some huge changes to the space summary/space administration section of the site.

**Backups**

• You can now exclude attached files from your backups. Of course, this means you have to back up your attachment directory separately, but if you already have a good backup regime for your filesystem (and can thus restore attachments separately), it means your Confluence data backups will take a lot less space
• We now include important system configuration in your backups, so that when you restore a site from backup, it will work the same way as it did when you backed it up.

**Indexing**

We have improved the way we index content within Confluence, which means your searches are even more likely to find the right result.

If the primary language of your Confluence site is not English, you should change the "Indexing Language" preference in Confluence's General Configuration.

**Site Performance**
We’ve identified a number of places that were slowing down the performance of Confluence sites, from the dashboard to the spaces list page, to the search indexer, to the storing of referrers. Confluence should now perform faster than ever.

Also...

- Pages in an export are now in alphabetical, not creation order.
- The remote API can be accessed by anonymous users (this must be turned on in General Configuration)
- When previewing a page, you can continue editing without having to go back to the edit page
- You can link to anything in Confluence if you know its ID in the database (currently this is how you must link directly to mail) using the following link format: [$1234]
- You can link to anything relative to the root of the Confluence installation (useful for pointing to parts of the site that can't otherwise be linked) using three leading slashes: [////pages/editpage.action?pageId=1234]
- A whole lot more that we've forgotten...

Notable Bug Fixes

We resolved a lot of issues between Confluence 1.2.3 and Confluence 1.3. The best way to see what we've fixed is to ask JIRA, the world's best issue-tracker: Issues Resolved for 1.3

Confluence Presentation

This presentation was relevant to Confluence 1.3, so it was rather outdated.

We have removed it from this documentation space. You can find a copy of it here.

What’s New in 1.3

Many of the changes between Confluence 1.2 and 1.3 are really of interest only to Confluence administrators. Here we detail the changes that will be important to all Confluence users.

The Trash

Previously, when you deleted a page or blog post, it was unrecoverable. In 1.3, deleting a page moves it to the Trash. Space administrators can retrieve pages from the trash, or purge them forever. If a page has been deleted (or you have deleted a page by mistake), contact a space administrator to get it back.

Note Macros

There are new macros for inserting coloured notes into a page:

{note}:
Mail Archiving

Confluence now includes the capability to store email. This allows you to store mailing-list archives, or records of conversations amongst your team inside Confluence. Mail archiving must be set up by a space administrator.

All mail is indexed, but by default we exclude it from search results because the volume of email can often overwhelm the content of the Confluence site. When you do a search, you might see a reminder that there could be an answer to your question in the email archives.

To link to an email from a Confluence page, you must find the numeric ID of that mail from the end of its URL, and put that in your link like so: [$12572], which Confluence will draw like this:

Improved JIRA Macros

The {jiraissues} macro has two new optional parameters:

- `count=true` makes the macro only return the number of issues matched by your filter, not the whole list of issues
- `cache=off` makes the macro retrieve the filter results from JIRA every time the page is loaded, ensuring the results are accurate. (Be careful if the filter returns a lot of results, though, you don't want to overload your servers)

There is a new {jiraportlet} macro that allows you to retrieve any portlet from a server running JIRA 3, and display it in a Confluence page, like so:

Error rendering macro 'jiraportlet' : Bad Gateway
Easy Column Layout

You can use the \{section\} and \{column\} macros to organise your page into columns. This is especially useful when you combine it with the \{jiraportlet\} macro: you can arrange a Confluence page just like a JIRA dashboard!

Here's a simple two-column layout:

For more information, check the notation guide

Other Things

- Take a look at how the space summary page has been reorganised
- If you hit alt-E on any wiki page or blog post (ctrl-E if you're using a Mac), you'll be taken to the edit page.
- If you start a link with three slashes, you can link to something relative to the root of the Confluence installation. This is useful for creating links to pages that are part of Confluence, such as the dashboard ([/]/), or the space list ([////spaces/listspaces.action]).
- The \{excerpt\} macro can take a hidden=true parameter to hide the contents of the excerpt within the page
- The \{excerpt-include\} macro can take a nopanel=true parameter to display the excerpt without any decoration or tables

Release Notes 1.3.1

Confluence 1.3.1 is a maintenance release that fixes some bugs that users may have encountered using Confluence 1.3.

1.3.1 is a free upgrade for all existing Confluence customers.

Who should upgrade?

Confluence 1.3.1 fixes a number of bugs that were found in Confluence 1.3. However, none of the bugs that were fixed were considered critical or likely to cause data-loss. Administrators should only upgrade Confluence if they are affected by (or feel they would be affected by) one of the issues resolved by this release.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.
Changes in 1.3.1

See also: Issues Resolved for 1.3.1

- Preferences for hiding or masking email addresses are no longer ignored on some screens – CONF-2352
- The plugin manager will no longer fail with an error when trying to return a plugin to its default state after activating or deactivating it – CONF-2396
- Disabling hot referrers in the referrer manager screen now works as expected – CONF-2397
- The save option has been restored to the comment preview screen – CONF-2321
- Deleting a blog post or a page no longer leaves possible orphaned comments in recent changes lists – CONF-2323
- Also, some edge cases in the setup wizard were fixed, the demonstration content was tidied up, and a few minor UI issues were resolved.

Release Notes 1.3.2

Confluence 1.3.2 is a maintenance release which includes 30 bug fixes and improvements that users may have requested using Confluence 1.3.

1.3.2 is a free upgrade for all existing Confluence customers.

Who should upgrade?

We recommend that all 1.3.x users upgrade to Confluence 1.3.2. It includes, among other things, the fix of a memory leak which had been occuring in our error monitoring (see below or CONF-2540); if you have been encountering performance issues within Confluence, this could be of benefit.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or 1.3.1, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence [1.3 release notes](https://confluence.atlassian.com/). For 1.3.2

Changes in 1.3.2

See also: Issues Resolved for 1.3.2

We’ve closed 30 issues, so we will not name them all. Among the most prominent in the list are:

- A memory leak in our collection of logging events as a threadlocal, see CONF-2540
- Consistent UI handling for editing and previewing blogs and comments, see CONF-2479 and CONF-2470
- Improved IO handling when building exports, see CONF-2510
- Better cleaning up attachments when pages are removed, see CONF-2567
Release Notes 1.3.4

Confluence 1.3.4 is a maintenance release which includes a few important bug fixes for anyone running Confluence. These release-notes include information about the (briefly available) 1.3.3 version of Confluence, which 1.3.4 has superseded.

1.3.4 is a free upgrade for all existing Confluence customers.

Who should upgrade?

We recommend that all 1.3.x users upgrade to Confluence 1.3.4. For customers running 1.3.2 and earlier, it includes a fix to the security issue described in Confluence Security Advisory 2005-02-09, and it thus an important upgrade for anyone who is still running an un-patched system.

For customers running 1.3.3, the upgrade is also recommended as this version fixes CONF-2740, a regression in 1.3.3 which could cause referrer and trackback data to disappear.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or 1.3.1, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

Changes in 1.3.4

See also: Issues Resolved for 1.3.4

Since only five bug-fixes were made for this release, here is a quick run-down.

- The patch for the security issue described in Confluence Security Advisory 2005-02-09 has been applied to 1.3.4
- A regression in 1.3.3 that caused trackback and referrer data to be lost has been fixed – CONF-2731
- An intermittent ClassCastException when viewing blog-posts has been fixed – CONF-1671
- The image cache for Apache FOP is now cleared between exports, preventing a case where the wrong version of an attachment may end up in a PDF export – CONF-2647
- A spurious "Connection already closed" log message in the JIRA user management bridge no longer occurs CONF-2656

Issues Resolved for 1.3.4

Issues resolved for 1.3.3
Release Notes 1.3.5

Confluence 1.3.5 is a maintenance release which fixes a number of bugs found in earlier 1.3.x Confluence releases. Some areas improved in this release are space export/import, search and LDAP user management. 1.3.5 is also the first Confluence version to be successfully tested against Resin 3.0: see below for the special steps you need to take to get it running.

1.3.5 is a free upgrade for all existing Confluence customers.

Who should upgrade?

We recommend that all 1.3.x users upgrade to Confluence 1.3.5. For customers running 1.3.2 and earlier, it includes a fix to the security issue described in Confluence Security Advisory 2005-02-09, and it thus an important upgrade for anyone who is still running an un-patched system.

For customers running 1.3.4, the upgrade is also recommended as this version fixes CONF-2750, a regression in 1.3.4 that made it impossible to page through search results.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 – 1.3.4, you can find instructions here. **We strongly recommend that you backup your confluence.home directory and database before upgrading!**

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

Changes in 1.3.5

Resin 3.0 Compatibility

Confluence 1.3.5 is the first Confluence version to be successfully tested against Resin 3.0.12. Customers wishing to run Confluence under Resin 3 should read the special instructions at Known Issues for Resin 3.x
**Issues Resolved**

- Paging through search results no longer results in an error. [CONF-2750](#)
- Space export and import now performs much more reliably. [CONF-2678](#)
- Setup wizard no longer complains about an incomplete setup if you restore a backup from disk. [CONF-2637](#)
- Special characters in search no longer cause parser to explode. [CONF-2527](#), [CONF-2532](#), [CONF-2728](#), [CONF-2735](#)
- Attachment filenames containing spaces are no longer truncated when downloading using Firefox. [CONF-2739](#)
- For the full list of fixes, see [Issues Resolved for 1.3.5](#)

**Issues Resolved for 1.3.5**

<table>
<thead>
<tr>
<th>JIRA Issues</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

**Release Notes 1.3.6**

Confluence 1.3.6 is a special maintenance release for customers who are using Confluence with an Oracle database. It contains a number of fixes, originally developed for Confluence 1.4, to Confluence’s behaviour against Oracle databases.

1.3.6 is available as a free upgrade for all existing Confluence customers from the [archive download page](#).

**Who should upgrade?**

We recommend that customers skip Confluence 1.3.6 and upgrade to Confluence 1.4. Confluence 1.4 includes a great many new features and bug-fixes that are not included in 1.3.6. We do, however, recognise that 1.4 is a significant upgrade and some customers wish to continue with Confluence 1.3 for the time being.

Confluence 1.3.6 is recommended only for Confluence customers who:

- are not yet ready to upgrade to Confluence 1.4, and
- are running Confluence with an Oracle database

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 – 1.3.4, you can find [instructions here](#). We strongly recommend that you backup your confluence.home directory and database before upgrading!

**Changes in 1.3.6**

Confluence 1.3.6 addresses a number of situations in which Confluence could lock up, consume additional resources, or fail to perform backup or restore operations against an Oracle database.

**Release Notes 1.4**

Atlassian Software is proud to present Confluence 1.4 (otherwise known as Hunter). Existing customers who wish to upgrade, or new users who wish to try out Confluence for 30 days can download either the standalone or WAR distributions from the Atlassian website: [http://www.atlassian.com/software/confluence](http://www.atlassian.com/software/confluence)
Hunter is the fourth major update to Confluence, and the biggest yet in terms of new features and improvements both visible to the user or hidden "under the hood". Between 1.3.5 and 1.4, we resolved a massive 480 issues.

A big thanks to everyone who reported bugs, and offered suggestions over the last few months, especially everyone who helped by trying out our Development Releases.

Contents

- Upgrading
- Migration
- New Features
- Notable Bug Fixes
- Outstanding Bugs

Upgrading From a Previous Version of Confluence

Upgrading Confluence should be pretty easy: you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from 1.3.5

Because of the significant UI changes between 1.3 and 1.4 (see below), we highly recommend disabling any themes or UI customisations before upgrading Confluence.

After upgrading to 1.4, administrators will need to rebuild the site's search-index to ensure all the new search features are enabled. Do this from the Content Indexing section of the global administration menu.

⚠️ Upgrade Migration

The database migration tasks that must be run to upgrade Confluence from 1.3 to 1.4 may take several minutes to run. During this time, Confluence will be unavailable.

🚨 Confluence License Expiration

A commercial Confluence license entitles you to a year of free upgrades. As such, Confluence 1.4 is the first release of Confluence to which some customers may not be able to upgrade.

If you were issued your Confluence license before May 24th 2004, you will not be able to upgrade to Confluence 1.4. Confluence 1.4 will refuse to run with any license issued before this date, and you will be required to downgrade to a previous Confluence version.

Upgrading from 1.2.3 or Earlier

Users upgrading from an earlier version of Confluence should check the release-notes of the other major Confluence releases:

- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Migration

The best place to find out about the new features available in Confluence 1.4 is by checking out our What's New in Confluence 1.4 pages. However, there are a few features of specific interest to Confluence administrators that will be mentioned here:
v2Renderer

The engine by which Confluence converts wiki-text to HTML has been rewritten from scratch for Confluence 1.4. This was necessary, as the complexity of Confluence's markup was overwhelming the capabilities of the previous engine and leading to an increasing number of bugs, some of which had the potential to bring down the entire server.

v2Renderer is in every way more powerful (and better, more predictable) than the previous engine, and has undergone a lot of testing to make sure that it renders wiki pages the same way as its predecessor. However, pages that made use of bugs or undocumented features in the original engine may no longer render the same in 1.4 as they did in 1.3. If you come across something that is a bug or a missing feature in the new renderer, please file an issue in JIRA.

One side-effect of the new renderer is that custom Java macros written for Confluence 1.3 and earlier may not be compatible with Confluence 1.4 (although most should continue to function). For more information, macro authors should read this document.

New User Interface

In response to a lot of feedback from customers and users of Confluence, the User Interface has undergone a major overhaul between Confluence 1.3 and 1.4. While the changes are mostly self-explanatory, and we believe the new interface is significantly easier for everyone to use and understand than its predecessor, it may be a good idea to make the following resource available to your users as part of the transition: 1.4 Interface - Where Did Everything Go?

Because of the substantial changes to the interface, themes and UI customisations made for Confluence 1.3 and earlier are not compatible with Confluence 1.4, and should be disabled before you upgrade.

Blogs have become News

Also in response to a lot of feedback, blogs in Confluence have now been renamed to news. We feel this makes it a lot easier to explain them to new and non-technical Confluence users. None of the functionality of blogs has been changed, just the name. 😊

New Features

Confluence 1.4 has a lot of cool new stuff. Over the next week we'll be releasing a new section of the Confluence website that will examine the new features in detail. Stay tuned.

Notable Bug Fixes

We resolved a lot of issues between Confluence 1.3.5 and Confluence 1.4. The best way to see what we've fixed is to ask JIRA, the world's best issue-tracker: Issues Resolved for 1.4

Outstanding Bugs

Some bugs were introduced during the Confluence 1.4 development cycle that we could not fix in time for the final release. Of note are:

- Index rebuilding may fail on multi-processor systems (for a workaround, see CONF-3168)
- You can not install an XWork plugin by uploading through the web interface, it must be copied into WEB-INF/lib (CONF-3184)
- Uploading a malformed plugin through the web interface may make other plugins cease to function (CONF-F-3183)
- Under certain circumstances, the mbox mail import may fail against Oracle databases (CONF-3284)
- The Insert Image and Insert Link popups jump the cursor to the top of the text input area on browsers other than Internet Explorer (CONF-3232)

Once again, if you find any bugs in Confluence, or have any feature suggestions, you can report them online in JIRA.

Release Notes 1.4.1

Confluence 1.4.1 is a maintenance release that resolves some issues users may have encountered using Confluence 1.4. Issues include an occasional failure to display Confluence pages, Oracle and MySQL database issues, and a slow memory-leak.

1.4.1 is a free upgrade for all customers who purchased their Confluence license after June 2nd, 2004.

**Who should upgrade?**

Confluence 1.4.1 is a recommended upgrade for all users of Confluence 1.4, as it addresses a memory-leak which, while slow, would progressively degrade Confluence's performance and ultimately cause the server to exhaust available memory.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.3.6 or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.

**Changes in 1.4.1**

See also: Issues Resolved for 1.4.1

- A slow memory leak has been fixed. (CONF-3347)
- An issue where Confluence pages would intermittently only display their header when loading has been resolved. (CONF-3295)
- Confluence will now deploy reliably on MySQL 4.1 with UTF-8 encoding. (CONF-3306)
- Several issues regarding Confluence's use of the Oracle database have been resolved.
- A recurring bug preventing PNG images from being exported to PDF on some application servers has been fixed. (CONF-731)
- Inconsistencies with custom colour-schemes have been resolved (CONF-3314)

Release Notes 1.4.2

Confluence 1.4.2 is a maintenance release that resolves some issues users may have encountered using previous Confluence 1.4 releases. 1.4.2 introduces Websphere and DB2 compatibility, and fixes issues related to content indexing and the mail queue.

1.4.2 is a free upgrade for all customers who purchased their Confluence license after June 30th, 2004.

Who should upgrade?

Confluence 1.4.2 is a bugfix release. Customers should consult the list of issues resolved for this release to decide whether it is worth their while upgrading. Since this release includes a number of important performance and reliability fixes for content indexing, anyone who relies on Confluence's search functionality should consider upgrading.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4 or 1.4.1, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.3.6 or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.

Database Connection Pool Changes

Dependent on the size of your Confluence installation, the new re-indexing task may use up to 10 database connections simultaneously. As such, you may need to increase the size of your database connection pool in order to allow Confluence to continue to operate during and after rebuilding the search index.

If Confluence has been set up to use direct JDBC connections, then you will find the setting for Confluence's connection pool size in confluence.cfg.xml in your confluence home directory. Confluence should update this value automatically when you upgrade, so after starting up Confluence 1.4.2 for the first time, you should check to make sure it has been updated to 15 connections, as seen below:

```xml
<property
name="hibernate.c3p0.max_size">15</property>
```

If Confluence has been configured to use a datasource supplied by the application server, you should ensure the application server is configured to supply Confluence with sufficient connections to run.

Changes in 1.4.2

See also: Issues Resolved for 1.4.2

- Confluence has now been tested on Websphere 5.1.1.3 (see Known Issues for Websphere)
- Confluence has now been tested against DB2 8.1 (Linux and Windows)
- The mechanism by which Confluence rebuilds its full-text search index has been rewritten to be significantly less memory-intensive (but may be 10-15% slower). CONF-3340
- An issue that could cause comments or attachments to be removed from the search index when a page was edited has been resolved. CONF-3489
An issue that could cause index rebuilding to fail (especially on multi-processor systems) has been resolved. CONF-3168

Issues related to the size and reliability of the mail queue were resolved. CONF-3334 CONF-3474

An exception when creating global templates was fixed. CONF-3386

Some Javascript errors that were being flagged on Internet Explorer no longer occur. CONF-3422 CONF-3482

Exporting a space to HTML via XML-RPC now succeeds. CONF-3401

Creating a blog post via XML-RPC now succeeds. CONF-3412

ALL CAPS WORDS are no longer linked when CamelCase linking is activated. CONF-3361

The display of user attachments does not break when the user has not yet set a profile. CONF-3420

Issues Resolved for 1.4.2

Release Notes 1.4.3

Confluence 1.4.3 is a maintenance release that resolves some issues users may have encountered using previous Confluence 1.4 releases. 1.4.3 introduces a new SOAP service provider, and fixes issues related to incoming link tracking, notifications management, serving resources from dynamically loaded plugins, and much more.

1.4.3 is a free upgrade for all customers who purchased their Confluence license after August 17th, 2004.

**Who should upgrade?**

Confluence 1.4.3 is a bugfix release. While Atlassian recommends customers always run the most recently available stable Confluence release, customers should consult the list of issues resolved to decide whether it is worth their while upgrading.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4 to 1.4.2, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.3.6 or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.

**Changes in 1.4.3**

See also: Issues Resolved for 1.4.3

**Remote API Changes**

Confluence now ships with an second SOAP provider running Apache Axis, alongside the existing Glue SOAP provider. This is the first step towards migrating entirely to Axis as our sole SOAP provider over the next few major Confluence releases. If you use Confluence's SOAP API, you should read this document for information about the migration process and timeframe.
Other changes made to the remote API:

- A condition under which SOAP faults could be masked by HTML error pages on some application servers was resolved. (CONF-3043)
- Deleting a page via the remote API now places that page in the trash. (CONF-3403)
- Adding space level permissions to a user through the remote API now works as expected. (CONF-3596)

Other Changes and Fixes

- A bug that would cause a page's most recent editor to change when the page was previewed has been fixed (CONF-3424)
- A bug that could cause a page's incoming links not to be displayed has been fixed (CONF-3509)
- A bug that could cause "Watch this space" not to function has been fixed (CONF-3510)
- A bug that could cause Confluence to run out of available file descriptors when exporting a space has been fixed (CONF-3517)
- A bug that could cause an email notification to be sent regarding a page that was restricted by page-level permissions has been fixed (CONF-3573)
- The attachment upload form in the "Insert Image" is more robust against error (CONF-3677, CONF-3676)
- Searching for a page in the Parent Page Picker Popup now functions as expected (CONF-3364)
- Deleting a user now correctly deletes their email notifications (CONF-3619)
- Restoring a page from the trash now re-adds that page's comments to the search index (CONF-3564)
- Attachment links are now not rendered if the user can not view the attachment due to page level permissions (CONF-3553)
- The list of recently edited pages in a user's profile is now more accurate (CONF-2430)
- Plugins uploaded through the web interface can now correctly serve downloadable resources (CONF-3387)
- The \{recently-updated\} macro and recent blogs pages now work under JDK 1.5 (CONF-3528, CONF-3601)
- The \{section\} macro's "border" property now works correctly (CONF-3736, CONF-3433)
- The \{noformat\} macro now has a "nopanel" parameter that will suppress drawing a background or border (CONF-3656)
- Several issues regarding the \{tasklist\} macro were fixed (CONF-3622, CONF-3633, CONF-3632)
- The \{dynamictasklist\} macro no longer breaks PDF exports (CONF-3513)
- The informational macros no longer center their text when viewed in Internet Explorer (CONF-3537)
- Links are now parsed in the title of a \{panel\} macro (CONF-3560)
- The string ?!?! is no longer interpreted by the Wiki/HTML renderer as a broken image

Confluence SOAP Provider Migration

Starting with the release of Confluence 1.4.3, and stretching through the next three major releases, Confluence will be transitioning from using the Glue library to provide a SOAP remote API, to using Apache Axis. Unfortunately, while the SOAP services will stay the same, the WSDL that these libraries generate to interact with the same services will change, so SOAP applications that interact with Confluence will need to migrate with us.

The migration should be relatively painless. Since the underlying objects represented by the WSDL are still the same, the process should involve regenerating your SOAP stubs, and a few cosmetic code changes.

The XML-RPC API is unaffected by this change.
1.4.3 and 1.5/2.0

- Deploy Axis SOAP service alongside Glue
  - Completed

(unscheduled)

- Allow configuration of default SOAP provider, the default at installation being Axis
  - Incomplete

(unscheduled)

- Remove Glue SOAP provider
  - Incomplete

Progress on these issues can also be tracked via [CONF-3141](http://example.com/CONF-3141)

**The Plan**

As of version 1.4.3, Confluence ships with three SOAP endpoints:

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>WSDL URL</th>
<th>Provider</th>
</tr>
</thead>
<tbody>
<tr>
<td>/rpc/soap/confluenceservice-v1</td>
<td>/rpc/soap/confluenceservice-v1.wsdl</td>
<td>Glue</td>
</tr>
<tr>
<td>/rpc/soap-glue/confluence-service-v1</td>
<td>/rpc/soap-glue/confluence-service-v1.wsdl</td>
<td>Glue</td>
</tr>
<tr>
<td>/rpc/soap-axis/confluence-service-v1</td>
<td>/rpc/soap-axis/confluence-service-v1?wsdl</td>
<td>Axis</td>
</tr>
</tbody>
</table>

⚠️ The Axis and Glue providers produce slightly different WSDL URLs

ℹ️ Third-party SOAP [RPC Plugins](http://example.com/RPC-Plugins) deployed in Confluence will be similarly deployed in three locations

Over the next three major Confluence releases we will:

1. Make the provider of /rpc/soap/confluenceservice-v1 configurable, then
2. Change the default provider to Axis (but leave it configurable), then finally
3. Remove the Glue provider entirely

**What This Means for SOAP Clients**

Confluence major releases occur every three or four months. Thus, authors of SOAP clients should keep in mind this timeline, starting with the release of Confluence 2.0 (November 2005)

<table>
<thead>
<tr>
<th>0-3 months</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• All existing SOAP clients written against the Glue provider will continue to function normally.</td>
<td></td>
</tr>
<tr>
<td>• New clients should be written to the Axis provider in /rpc/soap-axis</td>
<td></td>
</tr>
<tr>
<td>• Existing clients should change their SOAP endpoints to point to /rpc/soap-glue (or, better still, move directly to Axis)</td>
<td></td>
</tr>
</tbody>
</table>
### Issues Resolved for 1.4.3

<table>

### Release Notes 1.4.4

Confluence 1.4.4 is a maintenance release that resolves some issues users may have encountered using previous Confluence 1.4 releases. 1.4.4 fixes a number of issues, including many related to the reliability of uploaded plugins

1.4.4 is a free upgrade for all customers who purchased their Confluence license after September 23rd, 2004.

**Who should upgrade?**

Confluence 1.4.4 is a bugfix release. While Atlassian recommends customers always run the most recently available stable Confluence release, customers should consult the list of issues resolved to decide whether it is worth their while upgrading.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence versions between 1.4 and 1.4.3, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.3.6 or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.

**Changes in 1.4.4**

**Uploaded Plugin Fixes**

Prior to Confluence 1.4.4, plugins containing Spring components, XWork actions or velocity templates could not be uploaded through the web interface, and needed to be installed manually in WEB-INF/lib. Confluence 1.4.4 fixes these issues.
Database Indexes

Confluence 1.4.4 now correctly creates database indexes on a clean installation. If you are upgrading an existing Confluence instance, you should consult Performance Tuning for information on indexes that can improve Confluence's performance significantly.

Development Releases

Development Releases are interim builds of Confluence that we make available so that interested customers can try out new features, especially those features that you may have been waiting for, and don't want to wait another month for the next official release.

⚠️ Please note the following

- Development releases are not safe—Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path—Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Current Development Release Cycle

The links below show the improvements made approximately every two weeks.

- Confluence 4.2-Beta3 Release Notes – 27 March 2012
- Confluence 4.2-Beta2 Release Notes – 16 March 2012
- Confluence 4.2-Beta1 Release Notes – 13 March 2012

Previous Development Release Cycles

4.1 Development

Confluence 4.2-Beta3 Release Notes

27 March 2012
With great pleasure, Atlassian presents Confluence 4.2 Beta 3.

This beta release is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance. This also provides Atlassian with useful feedback. Beta releases also give plugin developers an opportunity to test and fix their plugins in advance of an official release.

In this release

This release contains minor fixes only. In particular, we have fixed the LabelManager API, so that is is now backwards compatible. (We broke backwards compatibility in beta 1.) Details are in this issue: [CONF-24902 - Authenticate](https://confluence.atlassian.com/display/CONF24902/Authenticate) to see issue details.

Please see the new features of Confluence 4.2 described in the [Confluence 4.2-Beta1 Release Notes](#).

Upgrade notes

Upgrading from a previous version of Confluence

Follow the [usual upgrade instructions](#) to upgrade your test instance to this release. *We strongly recommend that you back up your Confluence Home directory and your database before upgrading.*

A big *thank you* to everyone who helps us ensure that Confluence keeps getting better and better!

**Tips**

**Downloading Confluence 4.2 Beta 3**

The Confluence 4.2 Beta 3 release is available at the [download centre](#). When upgrading, please follow the [upgrade notes](#) below.
Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Confluence 4.2-Beta2 Release Notes

16 March 2012

Confluence 4.0 Beta 2 is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance. This also provides Atlassian with useful feedback. Beta releases also give plugin developers an opportunity to test and fix their plugins in advance of an official release.

This release contains minor fixes only. Please see the fixes and improvements reported in the Confluence 4.2-Beta1 Release Notes.

### Downloading Confluence 4.2 Beta 2

The Confluence 4.2 Beta 2 release is available at the download centre. When upgrading, please follow the upgrade notes below.

Upgrade Notes

Upgrading from a previous version of Confluence
Follow the usual upgrade instructions to upgrade your test instance to this release. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better!

Confluence 4.2-Beta1 Release Notes

12 March 2012

With great pleasure, Atlassian presents Confluence 4.2 Beta 1.

Confluence 4.0 Beta 1 is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance. This also provides Atlassian with useful feedback. Beta releases also give plugin developers an opportunity to test and fix their plugins in advance of an official release.

Highlights of Confluence 4.2 Beta 1:

- Page Layouts
- Likes
- Quick Comments
- Popular Content on the Dashboard
- Personalised Summary Email
- Attachment Labels
- Share Notifications Showing All People Notified
- Gadget Subscriptions
- Other Improvements
- Infrastructure Changes
- Upgrade Notes

Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Highlights of Confluence 4.2 Beta 1
**Page Layouts**

Page layouts offer a quick and easy way to add sections and columns to a page. Choose a predefined layout, add the content to each section, and you're done. It's a great way of creating a common page structure, so that readers know where to find the information on each page. Don't worry, the Section and Column macros are still available too.

**A two-column page layout in edit mode**

**Likes**

Has someone written a mind-blowingly cool post on Confluence? Click the **Like** button to them know. It's quick and easy to make their day! Confluence has like buttons on every page, blog post and comment. If enough people like your post, it will show on the dashboard's new popular tab. The information in your personalised summary email is based on the number of people in your network who have liked the content.
Quick Comments

Showing people a picture of themselves is a great way to encourage them to say something! We want to encourage people to comment on Confluence pages and blog posts, so we have added an inviting empty comment, showing the user's avatar, at the bottom of the page. This replaces the rather uninviting Add Comment button in earlier versions. And here's what we are really proud of: When you click the box to write a comment, the full editor loads instantly. Boom! No page refresh required.
Invitation to add a comment

Two penguins find themselves together on an ice floe, drifting helplessly into warmer waters. The penguins are very fond of each other. Suddenly, crack, the ice floe splits in half. Right between the penguins. As they drift apart, one penguin sadly waves a flipper and calls out, "Chocolate milk!"

Popular Content on the Dashboard

Want to see what's trending? The new Popular tab on the dashboard shows the pages and blog posts that attracting most attention, based on the number of comments and likes.
Personalised Summary Email

Confluence sends out a weekly summary of the news that interests you. Each email message is tailored according to the spaces you follow and your network. This is a great way of drawing people into the wiki discussions even if they are infrequent users of Confluence. You can opt in or out of the recommended updates summary via an option on the email settings page of your user profile.
Attachment Labels

You can now label attachments, just as you can label pages and blog posts. Using the Attachments macro, you can filter to show documents or other attachments with a specific label. The Content by Label macro also displays attachments (alongside pages, blog posts and spaces) with a given label.

Share Notifications Showing All People Notified

If someone shared a page with you, it's nice to know who else they shared it with. We introduced sharing of pages and blog posts in Confluence 3.5. Just click Share and follow the prompts. Confluence sends an email message to the people that you have specified. In this release, when someone shares a page with you, the email message shows the other people they shared it with too.
Gadget Subscriptions

Confluence 4.2 includes Atlassian Gadgets 3.2, with gadget subscriptions. This means that you can quickly access all the gadgets from your JIRA, Bamboo, FishEye, or Crucible site – or from another Confluence site – to your Confluence gadget directory, for easy addition to your Confluence pages. To subscribe to another site's gadgets, go to Confluence Admin > External Gadgets and click the new Gadget Feeds tab.

External Gadgets

Subscribing to another application's gadgets
Other Improvements

- We have fixed the following bug: CONF-6246 - Authenticate to see issue details
- The permissions for personal spaces are now more in line with Confluence's philosophy of encouraging collaboration. When you create a personal space, the option that allows registered users to update content is selected by default. You will also be assigned as a watcher of your new personal space.
- Blog comments now include an 'author' lozenge to allow you to quickly scan a page for comments from the author.

John Masson  AUTHOR  Mar 01, 2012
I think since 100% is out we need to keep it narrower. I didn't think it was that bad before, but right now it looks odd because it's "almost" 100% but not quite... Perhaps 50% looks better? Seems more intentional?

Infrastructure Changes

- Confluence now uses version 2.0 of the Universal Plugin Manager (UPM).
- Confluence 4.2 includes Atlassian Gadgets 3.2
- From this release of Confluence, we support PostgreSQL 9.0 as well as 8.2, 8.3 and 8.4.
- The implementation of quick comments required some pretty significant changes to the editor’s initialisation code. This will have consequences for some Confluence plugins. Details are in this blog post: JavaScript Changes Required for Confluence 4.2 Compatibility.

Upgrade Notes

Upgrading from a previous version of Confluence

Follow the usual upgrade instructions to upgrade your test instance to this release. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better!

Confluence 4.1-rc1 Release Notes

Confluence versions marked "Milestone", "Beta" or “Release Candidate” (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in
subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

⚠️ **Do not use in production**

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

**Who should try this out?**

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.

⚠️ **Please note the following**

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.

Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.

**Upgrade Procedure**

If you wish to upgrade your existing Confluence installation with this version, ensure you have created a separate copy of your current Confluence production installation first and using that copy, follow the normal upgrade instructions to upgrade it to this development release. If you have also implemented customised site- or space-specific layouts, you will need to re-implement them after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

**Downloads**

All development releases are available from Development Releases on the Atlassian website.
Important information for plugin developers

If you are a plugin developer testing for compatibility against Confluence 4.1, it is very important that you read the information at the bottom of these release notes about Velocity templates and deprecation.

Highlights of this Release

1. Image Effects

After inserting an image, you can now apply one of five effects to the image by clicking the new Effects button and choosing from one of the following:

- Taped,
- Instant Camera,
- Curl Shadow,
- Snapshot,
- Drop Shadow.
2. Autoconvert Pasted Links

Linking to things in Confluence is much too hard. Sometimes you already have the URL from some other tab and just want to paste it in. If it's a link to a system Confluence knows about, why should you have to mess around with doing it "properly" by looking it up in the link dialog or the issue dialog just because you want it to get refactored later?

For example, if you paste in https://jira.atlassian.com/browse/CONF-23567 then some people will give you grief for not using the insert JIRA issue link to make it CONF-23567 - Authenticate to see issue details. The new Autoconvert feature will automatically convert pasted links into a useful macro. You have to see it to believe it. It works for:

- Pasting Links to JIRA issues
- Pasting JIRA JQL links
- Pasting Youtube URLs
- Most widget connector URLs (like Skitch links)
- Any shortcut link

3. Editor Find & Replace

This will be a welcomed feature to users who used to copy wiki markup out into another text editor to do a find replace then paste it back in. Now everyone will be able to do it right from the editor.

4. Dashboard Network Tab

Having a difficult time finding relevant content in the dashboard activity stream? This allows you to see recent updates from just the people you follow in Confluence. As part of this work there were some changes made in the background to the way the Dashboard works meaning

- a lot less DB queries
- the dashboard recent updates macro now accepts a 'users' parameter (which drives the Network tab)
- adding any new tabs will be a lot easier for the developers
5. Editor Copy / Paste Improvements

Copy / Paste Multiple Rows or Whole Tables

We've spent time focusing on a number of editor efficiency issues, most recently being the ability to easily copy and paste multiple table rows or whole tables within a page, across pages, across Confluence installs or even from other sources (eg: HTML tables on the web). Additionally (which didn't happen in Wiki Markup where users could previously copy/paste rows fairly simply) you can now overwrite existing cells by pasting into them and where the clipboard contents are bigger than the existing table, it will automatically be adjusted with additional columns to fit. This is a big usability improvement.

Oh and one more thing, you can now use Alt+Up Arrow or Alt+Down Arrow to add a new row above or below your current one, which works beautifully with the new easy to copy/paste rows.

CONF-23408

CONF-23929

Copy / Paste list items

Fixing another similar pain point, we also spent some time working on the pasting of list items into existing lists, making this more consistent with what you'd expect. If you copy a couple of list items from one part of a list, or another one, and paste them into the middle of a list, they are added at the same level, not indented. This is the first of a number of tweaks to the way lists work which will be a big usability improvement.

CONF-23842

6. Favourites Page

The concept of a personal label has been removed and you'll now see a newly named and cleaner Favourites tab in your personal space. Additionally the list of favourites is now paginated and uses AJAX to un-favourite pages on the page.
7. Global Stylesheets

Now a custom PDF stylesheet can be set at the global level, just like custom layouts, so where there is no specific individual space stylesheet defined when a PDF space export is done it will fall back to this global stylesheet, meaning users won't have to apply the same stylesheet to all their individual spaces if they want the same behaviour.

8. (No More) Page Title Character Restrictions

You can now use "special" characters such as : or @ or % in your page titles, as in the screenshot below. Various new features like this are now possible, thanks to the move to the new Confluence editor.
9. Global plugin & macro timeout setting

**CONF-9344, CONFDEV-27**

There is now a globally configurable timeout setting which will stop pages going into a permanent loading state leaving users no easy way to edit them to sort out the offending macros or plugins. In the worst case scenario this had the potential to bring down Confluence itself before.
10. New Logo and Icons

As you may know, Atlassian introduced a new logo in October. Now, Charlie 2.0 has made it to Confluence.

You’ll also notice a bunch of new icons to give some of your favourite features in Confluence a fresh look. Here are some examples of the new page and blog post icons.
**Important note for plugin developers**

As of Confluence 4.1, Confluence will now log a warning every time a Velocity template makes a call to a deprecated Java class or method. Under Confluence's deprecation policy, deprecated code is likely to be removed in future releases of the product, and plugin developers are strongly advised to stop using it as early as possible.

When you run Confluence in Developer Mode, these warnings will instead cause an exception to be thrown and the processing of the template to be aborted. This is to give plugin developers much more immediate (and harder to ignore) feedback about potentially dangerous code. Developer Mode is turned on by the Atlassian SDK, so if you use the SDK to build or test your plugin you should know right away if there's something dangerous going on in your Velocity files.

If you want to switch this behaviour back to just logging a warning, you should start Confluence with the `-Dconfluence.velocity.deprecation.strictmode=false` system property set.

**Confluence 4.1-rc1 Upgrade Notes**

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory. Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.0.x.
3. If your version of Confluence is earlier than 4.0, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 4.0 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.1-m5 EAP Release Notes

Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

Do not use in production

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

Who should try this out?

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.

Please note the following

- Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.

Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.

Upgrade Procedure
If you wish to upgrade your existing Confluence installation with this version, ensure you have created a separate copy of your current Confluence production installation \textit{first} and using that copy, follow the \url{normal upgrade instructions} to upgrade it to this development release. If you have also implemented customised site- or space-specific layouts, you will need to \url{re-implement them} after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

\section*{Downloads}

All development releases are available from \url{Development Releases} on the Atlassian website.

\section*{Highlights of this Milestone}

\subsection*{Image Effects}

After inserting an image, you can now apply one of five effects to the image by clicking the new \textit{Effects} button and choosing from one of the following:

- Taped,
- Instant Camera,
- Curl Shadow,
- Snapshot,
- Drop Shadow.
(No More) Page Title Character Restrictions

You can now use "special" characters such as : or @ or % in your page titles, as in the screenshot below. Various new features like this are now possible, thanks to the move to the new Confluence editor.
Confluence 4.0-beta2 ("Beta 2") Release Notes

18 August 2011

With great pleasure, Atlassian presents Confluence 4.0, Beta 2.

Confluence 4.0 Beta 1 was an internal release. This beta release is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance. This also provides Atlassian with useful feedback. Beta releases also give plugin developers an opportunity to test and fix their plugins in advance of an official release.

Highlights of Confluence 4.0 Beta 2:

- **Brand New Editor**
- **Simplified Editing Experience**
- **New Macros**
- **Faster Editing Experience**
- **Introducing @mentions**
- **Improved Page Comparison Functionality**
- **Email Notification Improvements**
- **New Confluence Installer and Guided Upgrades**
- **New Editor Plugin Points for Developers**
- **Other Improvements**
- **Helping You Transition to Confluence 4.0**
- **We Welcome Your Feedback**
• Upgrade Notes

More:

• Read the Upgrade Notes for important information about this release.
• See the full list of issues resolved in this release.

Downloading the Confluence 4.0 Beta

The Confluence 4.0 Beta release is available here. When upgrading, please follow the Upgrade Notes below.

Got Questions? Want to learn more?
We have a lot of resources available for Administrators, Plugin Developers and End Users to help you transition to Confluence 4.0. Checkout our Planning for Confluence 4.0 page for resources.

Do not use in production

• EAP releases are not safe — EAP releases are snapshots of the ongoing Confluence development process. As such:
  • While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  • Features in development releases may be incomplete, or may change or be removed before the next full release.
• No upgrade path — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a Confluence EAP release may not be able to be migrated to a future Confluence release.

Highlights of Confluence 4.0

1

Brand New Editor

We've rebuilt the Confluence editor from the ground up, bringing you an editing experience that's simpler, faster and more intuitive.
The new Confluence editor delivers many advantages:

- Just one editor!
- Align left, centre or right, without using macros.
- Indent paragraph blocks and lists from the toolbar.
- A new colour picker.
- A new, streamlined user interface.

Simplified Editing Experience

Confluence 4.0 introduces macro placeholders, a visual representation of your macros while editing. Create rich content with new and existing macros, without the tools getting in the way.

Simplified Macro Editing

Makes macros easier to manage when editing.

- **A more visual experience**
  Making it easier to visualise what the page will look like when you publish it.

- **Macro properties panel**
  Every macro has a properties panel. The property panels for particular macros, such as the Status and View File macros have additional functionality, described below.

- **Quick access to macro editing**
  Double-click the macro to open the Macro Browser for parameter editing. Contents of some macros can be modified directly from the editor.
Improved Image Handling

- **Paste Images From Clipboard (Firefox and Chrome only)**
  Just copy any image to your clipboard and hit CTRL-V in the editor. The image will get attached and embedded directly into your page. There's nothing to install on your desktop, it just works!

- **Turn Images into Links**
  Now you can turn images into links. This is especially handy for turning images into a button like the Atlassian Documentation team is known to do. Previously, this was only available in wiki markup but can now be done in the shiny new Confluence 4.0 editor via the properties panel. We're still working on the link icon.

- **New Default Image Sizes**
  We've received a lot of feedback indicating that there isn't much difference between the preset image sizes. So, we've tweaked the sizes so that you can choose from a wider range of options. The small option remains the same at 100 pixels, medium has increased slightly to 300 pixels and large has changed to 500 pixels.

- **Custom image sizes**
  If you don't like the preset image sizes, you can now specify an exact image width.

- **Search Images**
  You can now embed and search images through a new "Search" tab in the image browser. Previously, this could only be done through Autocomplete (!).
Advanced Table Editing

We’ve made table operations better in Confluence 4.0 with the following features:

- **Drag to Insert Tables**
  Inserting tables is now easier and truly "WYSIWYG" with this new feature. Just click on the New Table dropdown and drag your mouse to choose the number of rows and columns you’d like in your new table. Oh, and don't worry if you like inserting tables with your keyboard, you can still use autoformatting or CTRL+SHIFT+I to insert a table.

- **New In-Context Table Toolbar**
  The new table toolbar removes the need for a context menu and only appears when you add a table to the page.

- **Merge and Split Table Cells.**
- **Highlight cells, rows or columns.**
- **Cut, copy and paste table rows.**
New Macros

We've bundled more macros with Confluence, and made some of the existing macros better, to help you easily include and present relevant content:

- **Status Macro**
  The Status macro displays a coloured lozenge in the editor, so you can see the status directly. You can use the properties panel to change the status while editing, without having to use the Macro Browser.

- **Expand Macro**
  The Expand macro allows you to add a dynamically expandable section of text to your page.

- **Profile Picture Macro**
  The Profile Picture macro displays a users profile picture on a page. Useful for creating Team Pages.
Faster Editing Experience

Write Wiki Markup ... Fast!

Many of Confluence's biggest fans are avid wiki markup users. For you aficionados, we wanted to give you the fastest editing experience possible, while preserving the speed and efficiency of your existing wiki markup skills. So, we present you with Autoformatting!

Autoformatting lets you type wiki markup into the editor this new feature will "auto-format" your text on the fly. To learn more, click on the "?" help button in the editor and select the Wiki Markup tab.

Try these and see what you think:

- **Font Formatting**
  Bold, underline, strikethrough, italic, superscript, subscript – just type the markup, such as *Bold*, and watch it convert to Bold on the fly!

- **Basic Tables**
  Try typing |||||, or || Heading 1 || Heading 2 ||, then hit enter to to instantly see this:

<table>
<thead>
<tr>
<th>Heading 1</th>
<th>Heading 2</th>
</tr>
</thead>
</table>

- **Emoticons**
  All of our emoticons convert on the fly. Try typing (:) in the editor to instantly see this: 😊.

- **Lists**
  For numbered lists, type # and a space at the start of each line.
  For bulleted lists, type * and a space at the start of each line.

- **Headings**
  Type h4, then some heading text to see a level 4 heading.

**Instant Links, Media and Macros**

Introduced in a previous release of Confluence (see details in this blog post), adding links, media and macros
can be quickly added by typing [, ! or { in the editor to add various kinds of content to your page. There's also
some small improvements added onto previous autocomplete functionality:

- The first item in the list is pre-selected to make editing faster,
- The macro autocomplete list now loads much faster,
- The macro autocomplete list now inserts most macros directly, without launching the Macro Browser,
  unless the macro requires a parameter.

**New Page Links**
Quickly insert a link to create a page with Autocomplete for links. Simply type '[' in the editor and as you
type, Confluence will display a Create Page link if a page with that title does not already exist in your
current space.

<table>
<thead>
<tr>
<th>Task</th>
<th>Person</th>
<th>Status</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Produce Release Notes</td>
<td>Erwin Dawson</td>
<td>WIP</td>
<td>Release Notes</td>
</tr>
<tr>
<td>Performance Report</td>
<td>Matt Ryal</td>
<td>TBA</td>
<td>Release Performance Report</td>
</tr>
</tbody>
</table>

**Introducing @mentions**

Confluence 4.0 includes the new @mentions feature. This allows you to easily bring collaborators into a
conversation: if you are mentioned in any Confluence content (a page, blog, comment or status update), you w
be notified by email.

To mention someone, type @ and their name, when editing. Mentions will instantly suggest people you are
following in your network, so you can quickly find and involve your friends.
Improved Page Comparison Functionality

We've got a better way to view changed content in Confluence.

Improved Page Diffs

We've simplified page diffs to make them easier to read. Additionally, page diffs now show changes to both formatting and macros.
Diffs in Email

Where possible, email notifications now show page differences exactly as they appear in Confluence. These are now rendered in your email view with the correct diff colour coding.
Email Notification Improvements

New Email Design

All email notifications in Confluence now have a new design. This works in major email clients as well as on the iPhone.

Follow Notifications

Confluence now sends email when someone follows you.
New Confluence Installer and Guided Upgrades

Much to the delight of any sysadmins that are installing any new instances of Confluence, the Windows (.exe) and Linux (.bin) guided installers are now available.

Simplified Installation Process

- **Guided installer**: The guided install wizard has been implemented for Confluence 4.0 on both Windows and Linux operating systems. Installing a new instance is a breeze.

- **Windows UAC support**: You will be prompted for elevated privileges in order to permit the full array of install options.

- **New instance vs Upgrade selection**: You can choose to install a new instance or upgrade an existing instance.

- **Install & Home directory selection**: Default folders are provided depending on the user being an admin/root or standard user (based on respective OS write permissions).

- **Port selection**: Choose your ports during the guided install process. Also, the ports in Confluence have changed! Take note: The default running port is now 8090 with the control port at 8009.

- **Install as a service**: Assuming you have elevated privileges, you have the option on both Windows and Linux to install Confluence as a service. This is practical for production instances.

- **Evaluation license generation**: As a recap, we added a simplified workflow in Confluence 3.5 to assist in generating licenses for evaluators.

Easy JIRA Integration

- **Setup wizard process improvements**: Hook Confluence up with JIRA, right within the in-application setup wizard.

New Guided Upgrades

The new Linux and Windows Installers from our EAP release now include an option that allows you to upgrade an existing Confluence 3.5.x or later installation. This upgrade automates the following tasks for you:

1. Backs up the Installation and Home Directories of the existing Confluence installation to be upgraded,
2. Installs Confluence 4.0.x whilst migrating the following from your existing Confluence installation to the new installation:
   - TCP port values in your existing Confluence installation's server.xml file,
   - The upgrade feature detects and notifies you of any other files in the confluence subdirectory of your existing Confluence Installation Directory, which had been deleted, added or modified from a 'default' Confluence installation. This informs you of any customisations you will need to migrate manually over to your upgraded Confluence installation directory.

New Editor Plugin Points for Developers
We've added more editor plugin points for developers. Notable improvements include:

**Extend the Macro Property Panel**

Plugin developers can add buttons to the Macro Property Panel in the editor. For example, insert a Gliffy diagram or see the tutorial on how to do this.

**Render an Image in the Macro Placeholder**

A plugin developer can now render an image instead of a placeholder for bodyless macros. For more information, check out the tutorial on how to do this.

**Custom Parameter Rendering in Placeholders**

You can choose to display any parameter in the macro placeholder in the editor, instead of having the placeholder automatically show the first few parameters.

**New Pluggable Format Menu**

Plugin developers can add items to the editor's Format menu. See this tutorial for details.

**View Storage Format**

To assist with plugin developers and help with developer issues, developers running in Dev mode and Confluence administrators can view the page storage format from the "Tools" menu in Confluence.

**New API Changes**

We have disabled the getPage() and getBlogEntry() read methods in the XML-RPC/SOAP API. If you have a script that primarily reads or appends to existing pages, it will break. Creating pages and overwriting existing pages will still work.

**Plugin Developer Resources**

We have created a landing page for Confluence 4.0 planning. This includes resources for plugin developers to help you create new plugins and make use of the new plugin points available as well as upgrade your existing plugins.

**Infrastructure Changes**

This release includes a number of improvements in the APIs and under the covers as well.

- **Anti-XSS Mode**
  Anti-XXS mode is now enabled by default for plugins.

- **Alignment and Border Parameters**
  The alignment and border properties in the macro definition template have been removed.

- **Thumbnail Settings**
  The 'Thumbnail maximum height' and 'Thumbnail maximum width' settings have been removed from the General Configuration page.

- **Link Browser**
  The Link browser is no longer built in GWT and is now built in core JavaScript.

- **Integration Platform 2.12.0**

- **Upgrade to AUI 3.5.0**

**Other Improvements**

As always, we have made various small improvements to Confluence screens, functionality and supported
Platforms:

- **Microsoft Office 2010 support**
  The Office Connector now supports Microsoft Office 2010.

- **Chrome and Internet Explorer 9 support**
  See the [upgrade notes](#) for more information about browser support.

- **Administrator’s task list in the Admin Console**
  This new task list in the Admin Console helps administrators get started after a new install.

- **New keyboard shortcuts:**
  - CMD+S to save a page from the change comment field.
  - CMD+SHIFT+e to preview when you are in the editor; hit 'e' to get back to the editor.
  - CMD+SHIFT+d to display the Wiki Markup dialog.

- **Option to disable the "secure" cookie**
  When using HTTPS, you can disable the "secure" cookie, just for the login page.

- **Help tips in the administration screens**
  The help tips have been moved into the field descriptions.

- **Backup and Restore page**
  The Backup and Restore page has been redesigned.

- **404 page**
  The 404 page now has a dashboard breadcrumb.

- **Quicknav Improvements**
  Quicknav now indicates the space the page is coming from. This helps you find a page that might have the same title across multiple spaces, as well as selecting the first search result by default, making it quicker to open the link.

- **New Emoticons**
  Confluence 4.0 comes with a shiny new set of emoticons.

- **Remember Last Tab**
  Some of the feedback you gave us:

  "...I find it frustrating that "add a web link" is an extra click away after I open the link dialog. I use that at least as often as I link to another Confluence page..."

  We've taken some of the pain out of this process, by having the link browser remember the last tab you clicked. So if always use web links, it will always open to the web links tab for you. We’re investigating taking this a step further, by allowing users to insert a web link from the "search tab as well."

- **Advanced Linking**
  We've updated the Link dialog to cater for these link types: shortcut links, anchor Links, and undefined links (which you can do via Autocomplete).
  To round out this improvement, we've implemented an "Advanced" tab in the Links Dialog. This basically covers the "remaining link types" that were available in Wiki Markup.

- **Improved Conflict Merging**
  Make this one sentence: Now if you're editing a page at the same time as someone else, Confluence will intelligently merge your changes with the other person's change when you save. This means you'll be seeing the "another user has made changes to this page since you started editing" warning a lot less often. In the cases where Confluence cannot merge the changes, it will show the diffs and prompt you to either overwrite or discard your changes. We've also made merging table conflicts much more reliable.

---

**Helping You Transition to Confluence 4.0**

We've created a set of resources to help you manage the transition away from wiki markup. We know your people have become experts with using wiki markup in Confluence, but we think you'll really appreciate the new editor, and we want to make it as easy as possible for you to make the change. The [change management resources](#) are listed under the current documentation.
Support for Macros that are not yet Confluence 4.0 Compatible
You can upgrade to Confluence 4.0 with macros that are not yet 4.0 compatible. If you upgrade and a macro is not yet 4.0 compatible, wiki markup will be maintained for that macro. Once these plugins are 4.0 compatible, an administrator will receive a new task in the administration console to run an update. We will have some more information on this shortly.

Copy and Paste Wiki Markup
Many people tell us they like to take notes in wiki markup, then paste them into Confluence. We've also spoken to customers who have lots of scripts that produce wiki markup and are manually inserted into pages. For these folks, we present the Insert Wiki Markup dialog. Simply select 'Wiki Markup' from the 'Insert' menu to launch the Wiki Markup dialog. From there you can insert any wiki markup, even macros.

"View Source" for the new editor
Some of you might be thinking, "what about the view wiki markup?". A lot of people used the View Wiki Markup option to see how pages were made and to copy the underlying markup. We've implemented "view source" (accessible from the Tools menu) so that you can see what macros were used to create the selected page and copy them to your own page.

We Welcome Your Feedback
To make it easy for you to provide EAP feedback we've created a simple "Got Feedback" button in the Confluence navigation bar:
Let the Confluence team know what you think of the EAP by providing feedback!

Upgrade Notes
Upgrading from a previous version of Confluence
Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.

When upgrading from a previous version of Confluence, if you have customised your cache settings (as documented in Cache Performance Tuning) then you may run into memory problems during the wiki to XHTML migration. We are working to fix this in a later release, but in the meantime you can revert your ehcache.xml to the default version.

- If you still experience problems, try reducing the 'maxElementsInMemory' attribute on each cache to a very small value such as 50.
- Note that any cache changes you make to work around migration problems should only be considered temporary. You should restore caching to it's original settings again after migration has been successful.

Removed Functionality
Features removed from Confluence
• The **Edit Page in Word** functionality
  This is being removed in Confluence 4.0. **Note:** This is a different feature to "Edit attachment in Word".

• **Mail Page Plugin**
  The Mail Page plugin is no longer bundled in Confluence. With the introduction of the "Share Page" feature in 3.5 this is no longer needed.

• **Social Bookmarking Plugin**
  The Social Bookmarking plugin is no longer bundled in Confluence but is still supported.

• The **SnipSnap importer** has been removed from the admin console.

**Settings removed from Confluence**

• The **CamelCase Links** setting, from general configuration.

• The **Number of Ancestors to Show in Breadcrumbs** setting.

A big **thank you** to everyone who helps us ensure that Confluence keeps getting better and better!

**Confluence 4.0-m36 EAP Release Notes**

1 August 2011

Today we are happy to announce our third public EAP build for Confluence 4.0. An Early Access Preview (EAP) release is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release.

Please see previous 4.0 EAP release notes for the complete list of 4.0 changes:

• [Confluence 4.0-m27](#)
• [Confluence 4.0-m29](#)

**Highlights of Confluence 4.0 EAP:**

• [New Confluence Installer](#)
• [Improved Image Handling](#)
• [Links Dialog: Remember My Tab](#)
• [Improved Conflict Merging](#)
• [Set Page Location On Save](#)
• [Infrastructure changes](#)
• [We Welcome Your Feedback](#)

**More:**

• Read the [upgrade notes](#) for important information about this release.
• See the full list of [issues resolved in this release](#).

---

**Downloading the Confluence 4.0 EAP**

The Confluence 4.0-m36 EAP Release is available [here](#). When upgrading, please follow the [upgrade notes](#) below.
Do not use in production

- **EAP releases are not safe** — EAP releases are snapshots of the ongoing Confluence development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because EAP releases represent work in progress, we **can not** provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a Confluence EAP release may not be able to be migrated to a future Confluence release.

**Highlights of this Milestone**

1

**New Confluence Installer**

Much to the delight of any sysadmins that are installing any new instances of Confluence, the Windows (.exe) and Linux (.bin) guided installers are now available.

**Simplified Installation Process**

- **Guided installer:** The guided install wizard has been implemented for Confluence 4.0 on both Windows and Linux operating systems. Installing a new instance is a breeze.
- **Windows UAC support:** You will be prompted for elevated privileges in order to permit the full array of install options.
- **New instance vs Upgrade selection:** You can choose to install a new instance or upgrade an existing instance (the upgrade capability will be available in a subsequent release)
- **Install & Home directory selection:** Default folders are provided depending on the user being an admin/root or standard user (based on respective OS write permissions)
- **Port selection:** The ports in Confluence have changed! Take note: The default running port is now **8090** with the control port at **8009**
- **Install as a service:** Assuming you have elevated privileges, you have the option on both Windows and Linux to install Confluence as a service. This is practical for production instances.
- **Evaluation license generation:** As a recap we added a simplified workflow in Confluence 3.5 to assist generating licenses for evaluators.

Sample screenshots below:
Easy JIRA Integration

- **Setup wizard process improvements**: Hook up Confluence with JIRA right within the in-app setup wizard (huge thanks to the Integration team for taking this work on)

Improved Image Handling

**Turn Images Into Links**

Now you can turn images into links. This is especially handy for turning images into a button like the Docs team is known to do. (Previously this was only available in wiki markup but can now be done in the shiny new Confluence 4.0 editor via the properties panel.) - We're still working on the link icon.
New Default Image Sizes
We've gotten a lot of feedback that there isn't much difference between the pre-set image sizes. So we've
tweaked the sizes so you can choose from a wider range of options. Small remains the same at 100px, medium
has increased slightly to 300px and large is now 500px.

Custom image sizes
If you don't like the pre-set image sizes you can now specify an exact image width:

Links Dialog: Remember My Tab
Some of the feedback you gave us:
...I find it frustrating that "add a web link" is an extra click away after I open the link dialog. I use that at least as often as I link to another confluence page...

We've taken some of the pain out of this by having the link browser remember the last tab you clicked. So if always use web links, it will always open to the web links tab for you. We're investigating taking this a step further by allowing users to insert a web link from the "search tab as well."

![Image of link browser with sticky tabs]

### 4

**Improved Conflict Merging**

This feature is back into Confluence 4.0. Now if you're editing a page at the same time as someone else, Confluence will intelligently merge your changes with the other person's change when you save. This means you'll be seeing the "another user has made changes to this page since you started editing" warning a lot less often. We've also made merging table conflicts much more reliable.

### 5

**Set Page Location On Save**

We've heard a lot of feedback from new users that understanding where their page fits in the Confluence page hierarchy is not very intuitive. To help solve this problem when you create a new page and save it, users will be prompted and asked where they would like to save the page.

### 6

**Infrastructure changes**

- Remove 'Thumbnail maximum height' and 'Thumbnail maximum width' settings from the General Configuration page
- Update upgrade task to blow away thumbnails directory
- Link browser is no longer build in GWT and is in core JavaScript
- Upgrade Plugins to 2.8.0
- Integration Platform 2.12
- Update personal sidebar preference to use browser local storage instead of cookies
We Welcome Your Feedback

To make it easy for you to provide EAP feedback we've created a simple "Got Feedback" button in the
Confluence navigation bar:

Let the Confluence team know what you think of the EAP by providing feedback!

Important Note - Comments Editor

You will notice in this milestone we have a new, simplified comments design. Please note - this design was experimental for internal dogfooding and will not be shipping in Confluence 4.0. It will be removed in the next EAP release.

Upgrade Notes

- **Upgrading from a previous version of Confluence.** Follow the normal upgrade instructions to upgrade your test instance to this release. *We strongly recommend that you back up your Confluence Home directory and your database before upgrading.*

- When upgrading from a previous version of Confluence, if you have customised your cache settings (as documented in Cache Performance Tuning) then you may run into memory problems during the wiki to XHTML migration. We are working to fix this in a later milestone release but in the meantime you can revert your ehcache.xml to the default version.
  - If you still experience problems you should try reducing the 'maxElementsInMemory' attribute on each cache to a very small value such as 50.
  - **Note** that any cache changes you make to work around migration problems should only be considered temporary. You should restore caching to it's original settings again after migration has been successful.

- Note that the 'Edit Page in Word' functionality of Confluence is being removed in Confluence 4.0.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

**Confluence 4.0-m29 EAP Release Notes**

**27 June 2011**

Following our first public EAP milestone of Confluence 4.0 earlier this month, we present you with our 2nd public EAP build. An Early Access Preview (EAP) release is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release.

**Highlights of Confluence 4.0 EAP:**

- **Paste images into the editor (Firefox and Chrome)**
- **Drag to Insert Tables**
- **New "View Source" for pages and blogs**
- **Other Features and Improvements**
- **We Welcome Your Feedback**

More:
• Read the upgrade notes for important information about this release.
• See the full list of issues resolved in this release.

**Downloading the Confluence 4.0 EAP**

The Confluence 4.0-m29 EAP Release is available here. When upgrading, please follow the upgrade notes below.

**Default Port Number Change**

The default port for the Confluence installer has changed from 8080 (http) and 8005 (shutdown) to 8880 and 8805 respectively. If you are upgrading from the previous EAP you may have to update your deployment configuration to reflect this change.

**Do not use in production**

- **EAP releases are not safe** — EAP releases are snapshots of the ongoing Confluence development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a Confluence EAP release may not be able to be migrated to a future Confluence release.

**Highlights of this Milestone**

**Paste images into the editor (Firefox and Chrome)**

Just copy any image to your clipboard and hit CTRL-V in the editor. The image will get attached and embedded directly into your page. There's nothing to install on your desktop...it just works!

This is turned off by default at the moment. You'll need to turn it on from the Universal Plugin Manager.
Drag to Insert Tables

Inserting tables got even more "WYSIWYG" and easier with this feature. Just click on the new Table dropdown and drag your mouse to choose the number of rows and columns you want in your new table. Oh, and don't worry if you like inserting tables with your keyboard, you can still use autoformatting or CTRL+SHIFT+I to insert a table.

New "View Source" for pages and blogs
A lot of people used the "view wiki markup" option to see how pages were made and to copy the underlying markup. Now that wiki markup is gone, we've implemented "view source" (accessible from the Tools menu) so that you can see what macros were used to create the selected page and copy them to your own page.

Other Features and Improvements

- HTML Diffs can display a macro's icon
- Allow administrators to specify the number of reindexing threads at reindex time
- Render tables inside a wrapping DIV to make them easier to style in themes
- Implement end of link markers as a dark feature
- Expose image uploader in drag and drop plugin so it can be used by paste plugin

We Welcome Your Feedback
To make it easy for you to provide EAP feedback we've created a simple "Got Feedback" button in the
Confluence navigation bar:
Let the Confluence team know what you think of the EAP by providing feedback!

Upgrade Notes

- **Upgrading from a previous version of Confluence.** Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.

- When upgrading from a previous version of Confluence, if you have customised your cache settings (as documented in Cache Performance Tuning) then you may run into memory problems during the wiki to XHTML migration. We are working to fix this in a later milestone release but in the meantime you can revert your ehcache.xml to the default version.
  - If you still experience problems you should try reducing the 'maxElementsInMemory' attribute on each cache to a very small value such as 50.
  - **Note** that any cache changes you make to work around migration problems should only be considered temporary. You should restore caching to it's original settings again after migration has been successful.

- Note that the 'Edit Page in Word' functionality of Confluence is being removed in Confluence 4.0.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

Confluence 4.0-m27 EAP Release Notes

3 June 2011

With great pleasure, Atlassian presents our first public milestone of Confluence 4.0.

An Early Access Preview (EAP) release is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release.

Highlights of Confluence 4.0 EAP:

- Simplified Editing Experience
- Introducing Macro Placeholders and New Macros
- Autoformatting – Write Wiki Markup In the Editor
- New Wiki Markup Dialog
- Autocomplete Improvements
- Introducing Confluence Mentions
- Improved Table Operations
- Improved Page Comparison Functionality
- New Email Design
- New Editor Plugin Points for Developers
- Other Improvements
Infrastructure Changes
Helping You Transition to Confluence 4.0
We Welcome Your Feedback

More:

• Read the upgrade notes for important information about this release.
• See the full list of issues resolved in this release.

Downloading the Confluence 4.0 EAP

The Confluence 4.0-m27 EAP Release is available here. When upgrading, please follow the upgrade notes below.

Do not use in production

• EAP releases are not safe — EAP releases are snapshots of the ongoing Confluence development process. As such:
  • While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  • Features in development releases may be incomplete, or may change or be removed before the next full release.

• No upgrade path — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a Confluence EAP release may not be able to be migrated to a future Confluence release.

Highlights of Confluence 4.0

1

Simplified Editing Experience

We've rebuilt the Confluence editor from the ground up, to bring you an editing experience that's simpler, faster and more intuitive.

Below is some of the artwork proposed for the Angry Nerds website:

![Angry Nerds](image)

Location | Labels | Unrestricted
---|---|---
What did you change? | Notify watchers | Preview >
Save | Cancel

Hirc Confluence saves drafts automatically. If you ever lose a window, re-open your work from the "Username -> Drafts" menu.
• Just one editor!
• Left, Centre, Right align, without any macros.
• Indent paragraph blocks and lists from the toolbar.
• New Colour Picker.
• The user interface has been streamlined.

Introducing Macro Placeholders and New Macros

Confluence 4.0 introduces macro placeholders, a visual representation of your macros while editing. Create rich content with existing and new macros, but without them getting in the way.

Easy Macro Management

To make macros easier to manage when editing, the editor now uses macro placeholders. Placeholders offer the following advantages:

• **Quick access to macro editing**
  Edit the content of a macro directly in the editor, or double-click the placeholder to open the Macro Browser for parameter editing.

• **Macro placeholder properties panel**
  Every macro placeholder has a properties panel. The properties panels for particular macros, such as the Status and View File macros, have additional functionality, as described below.

New and Improved Macros

We've bundled more macros with Confluence, and made some of the existing macros better, to help you easily include and present relevant content:

• **New: Status Macro**
  The Status macro displays a coloured lozenge in the editor, so you can see the status directly. You can use the properties panel to change the status while editing, without having to use the Macro Browser.

  ![Green placeholder](Image)

  ![Edit Remove](Image)

• **New: Expand Macro**
  The Expand macro allows you to add a dynamically expandable section of text to your page.

  ![Expand placeholder](Image)

  ![Edit Remove](Image)

• **Improved: Include Page Macro**
  The properties panel for the Include Page macro has a ‘Go to included page’ button that allows you to quickly check the page you have included, while still in the editor.
• **Improved: JIRA Issues Macro**
  You can quickly open up the JIRA issue or filter, right from the editor, using the new 'View in JIRA' button in the properties panel.

• **Improved: View File Macro**
  The placeholder for the View File macro displays an image according to the file type (for example PDF or Word file). And you can easily download the file while you are editing the page, using the new 'Download file' button in the properties panel.

---

**Autoformatting – Write Wiki Markup In the Editor**

Many of Confluence’s biggest fans are avid wiki markup users. For you aficionados, we wanted to give you the fastest editing experience possible, while preserving the speed and efficiency of your existing wiki markup skills. So, we present you with Autoformatting!
Autoformatting lets you type wiki markup into the editor and "auto-formats" your text on the fly. To learn more, click on the "?” help button in the editor and select the "Wiki Markup" tab.

Try these and see what you think:

- **Font Formatting**
  Bold, underline, strikethrough, italic, superscript, subscript – just type the markup, such as *Bold*, and watch it convert to Bold on the fly!

- **Basic Tables**
  Try typing ||||, or || Heading 1 || Heading 2 ||, then hit enter to get a table header like this:

<table>
<thead>
<tr>
<th>Heading 1</th>
<th>Heading 2</th>
</tr>
</thead>
</table>

- **Emoticons**
  All of our emoticons convert on the fly. Try typing (:) in the editor to instantly see this: 😄.

- **Lists**
  For numbered lists, type # and a space at the start of each line.
  For bulleted lists, type * and a space at the start of each line.

- **Headings**
  Type h4. then some heading text to see a level 4 heading.

---

**New Wiki Markup Dialog**

Many people tell us they like to take notes in wiki markup, then paste them into Confluence. We've also spoken to customers who have lots of scripts that produce wiki markup and are manually inserted into pages. For these folks, we present the Wiki Markup dialog. Simply select 'Wiki Markup' from the 'Insert' menu to launch the Wiki Markup dialog. From there you can insert any wiki markup, even macros.
Autocomplete Improvements

Autocomplete uses wiki markup syntax to quickly link to content, embed images and other media and insert macros into the page. If you haven't experienced autocomplete, you should see this blog post. Be sure to try the following:

New Page Links

Quickly insert a link to create a page with Autocomplete for links. Simply type '[' in the editor and as you type, Confluence will display a Create Page link if a page with that title does not already exist in your current space.

Instant Link, Media and Macro Creation

Type ['!, ! or { in the editor to add various kinds of content to your page:

- The first item in the list is pre-selected to make editing even faster.
- The macro autocomplete list now loads much faster.
- The macro autocomplete list now inserts most macros directly, without launching the Macro Browser, unless the macro requires a parameter.

Introducing Confluence Mentions

Confluence 4.0 includes the new Mentions feature. This allows you to easily bring in collaborators to a conversation: if you are mentioned in any Confluence content (a page, blog, comment or status update), you will be notified by email.

To mention someone, type @ and their name, when editing. Mentions will first suggest people you are following in your network, so you can quickly find and involve your friends.
Improved Table Operations

We've made table operations better in Confluence 4.0 with the following features:

New In-Context Table Toolbar

The new table toolbar removes the need for a context menu and only appears when you add a table to the page.

New Table Operations

New table manipulation buttons are available for highlighting discrete cells, rows or columns and for copying or pasting rows.

Merge and Split Table Cells

You can now merge and split cells in a table. This feature satisfies the single most popular issue on our issue tracker!
Improved Page Comparison Functionality

We've got a better way to view changed content in Confluence.

Improved Page Diffs

We've simplified page diffs to make them easier to read. Additionally, page diffs now show changes to both formatting and macros.

 diffs in Email

Where possible, email notifications now show page differences as they appear in Confluence. These come through with the diff colour coding.

New Email Design

All email notifications in Confluence now have a new design. This works in major email clients as well as on the iPhone.
New Editor Plugin Points for Developers

We've added more editor plugin points for developers. Notable improvements include:

**Extend the Macro Property Panel**

Plugin developers can add buttons to the Macro Property Panel in the editor. For example, insert a Gliffy diagram or see the tutorial on how to do this.

**Render an Image in the Macro Placeholder**

A plugin developer can render an image instead of a placeholder for bodyless macros. Here is an example, showing a Gliffy image rendered inside the editor:

![Rendered Gliffy Diagram](image)

For more information, check out the tutorial on how to do this.
Custom Parameter Rendering in Placeholders

You can choose to display any parameter in the macro placeholder in the editor, instead of having the placeholder automatically show the first few parameters.

New Pluggable Format Menu

Plugin developers can add items to the editor's Format menu. See this tutorial for details.

Other Improvements

As always, we have made various small improvements to Confluence screens and functionality.

- **Administrator's task list in the Admin Console**
  This new task list in the Admin Console helps administrators get started after a new install.

- **New keyboard shortcuts:**
  - CMD+S to save a page from the change comment field.
  - CMD+SHIFT+e to preview when you are in the editor; hit 'e' to get back to the editor.
  - CMD+SHIFT+d to display the Wiki Markup dialog.

- **Better Image Handling**
  In the Insert Image dialog, we've introduced the Search tab so you can insert images from other pages. And all images now embed as clickable thumbnails.

- **Option to disable the "secure" cookie**
  When using HTTPS, you can disable the "secure" cookie, just for the login page.

- **Help tips in the administration screens**
  The help tips have been moved into the field descriptions.

- **Backup and Restore page**
  The Backup and Restore page has been redesigned.

- **404 page**
  The 404 page now has a dashboard breadcrumb.

Infrastructure Changes

This release includes a number of improvements in the APIs and under the covers as well.

- **Support for Chrome**
  We now offer support for Chrome in Confluence 4.0. See the upgrade notes for more information about browser support.

- **API Changes**
  We have disabled the getPage() and getBlogEntry() read methods in the XML-RPC/SOAP API. If you have a script that primarily reads or appends to existing pages, it will break. Creating pages and overwriting existing pages will still work.

- **Upgrade to AUI 3.4**
  Confluence 4.0 uses AUI 3.4.

- **Anti-XSS Mode**
  Anti-XSS mode is now enabled by default for plugins.

- **Mail Page Plugin**

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
The Mail Page plugin is no longer bundled in Confluence.

- **Alignment and Border Parameters**
  The alignment and border properties in the macro definition template have been removed.

### Helping You Transition to Confluence 4.0

We've created a set of resources to help you manage the transition away from wiki markup. We know your people have become experts with using wiki markup in Confluence, but we think you'll really appreciate the new editor, and we want to make it as easy as possible for you to make the change. The change management resources are listed under the current documentation.

### We Welcome Your Feedback

To make it easy for you to provide EAP feedback we've created a simple "Got Feedback" button in the Confluence navigation bar:

Let the Confluence team know what you think of the EAP by providing feedback!

### Upgrade Notes

- **Upgrading from a previous version of Confluence.** Follow the normal upgrade instructions to upgrade your test instance to this release. *We strongly recommend that you back up your Confluence Home directory and your database before upgrading.*

- When upgrading from a previous version of Confluence, if you have customised your cache settings (as documented in Cache Performance Tuning) then you may run into memory problems during the wiki to XHTML migration. We are working to fix this in a later milestone release but in the meantime you can revert your ehcache.xml to the default version.
  - If you still experience problems you should try reducing the 'maxElementsInMemory' attribute on each cache to a very small value such as 50.
  - **Note** that any cache changes you make to work around migration problems should only be considered temporary. You should restore caching to it's original settings again after migration has been successful.

- Note that the 'Edit Page in Word' functionality of Confluence is being removed in Confluence 4.0.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

**Confluence 3.5-rc1 ("Release Candidate 1") Release Notes**

Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official
release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

**Do not use in production**

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

Who should try this out?

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.

**Please note the following**

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.

Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.

**Upgrade Procedure**

If you wish to upgrade your existing Confluence installation with this version, ensure you have created a
separate copy of your current Confluence production installation first and using that copy, follow the normal upgrade instructions to upgrade it to this development release. If you have also implemented customised site- or space-specific layouts, you will need to re-implement them after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

Downloads

All development releases are available from Development Releases on the Atlassian website.

Previous Betas and Milestones

- Confluence 3.5-beta3 ("Beta 3") Release Notes – 4 March 2011
- Confluence 3.5-beta2 ("Beta 2") Release Notes – 4 March 2011
- Confluence 3.5-beta1 ("Beta 1") Release Notes – 10 February 2011
- Confluence 3.5-m4 ("Milestone 4") Release Notes – 22 December 2010
- Confluence 3.5-m3 ("Milestone 3") Release Notes – 17 December 2010
- Confluence 3.5-m2 ("Milestone 2") Release Notes – 7 December 2010
- Confluence 3.5-m1 ("Milestone 1") Release Notes – 22 November 2010

Bugs fixed

- Scheduled jobs administration bug fixes
- Editor bug fixes
- Dashboard bug fixes
- User management bug fixes
- Other bug fixes

Scheduled jobs administration bug fixes

- Fixed an unhandled exception in the scheduled jobs administration screen when Gliffy is installed.
- Removed the daily backup job from the scheduled jobs administration screen. It can still be controlled via the backups screen.
- Made wording changes in the scheduled jobs administration screen.

Editor bug fixes

- Fixed drag and drop not working properly in the editor in Internet Explorer.
- Fixed position of the comment editor, which was showing below the notation guide when using the Easy Reader theme.
- Fixed JavaScript error thrown by drag and drop in IE8 when native XMLHttp support is disabled.

Dashboard bug fixes

- Added backwards compatibility with 3.4 for dashboard-recently-updated macro parameters.
- Fixed problem: Unable to select certain category labels with special characters on the dashboard spaces and updates lists.

User management bug fixes

- Improved incremental license counting, so the licensed user count is now accurate immediately after adding or removing users.
- The old-style seraph group joining authenticators will now work with the new user management system, so users don't have to edit their seraph-config.xml to get Confluence 3.5 working. We still recommend customers use the standard Confluence (or Crowd SSO) authenticators, and configure whether users from their directories should join groups when they log in through the User Directories administration console.
- Fixed migration of local groups with LDAP users.

Other bug fixes

- The "what's new" dialog will no longer show for milestone and beta development releases.
- Comments are back to being correctly imported during a site or space restore.
- Better handling of failure to create unique constraint in DB2.
- Fixed: Mail servers configured before Confluence 2.8 trigger ClassCastException when extracting email from name.
- French and German translations have been updated for 3.5.
- Space directory filter no longer removes search results on every keystroke.
- Space Directories will now show in two-column layout on screens with a resolution as low as 1024x768.
- Upgraded to Social Bookmarks plugin 1.3.8, to resolve sort ordering issues.
- Reduced memory footprint when loading bundled plugins and the demo site.

Known Issues

- The bundled Support Tools plugin does not start up and outputs a stack trace to the server logs at startup. This will be fixed in the final release.

Confluence 3.5-beta3 ("Beta 3") Release Notes

Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

⚠️ Do not use in production

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

Who should try this out?

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.
Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.

Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.

### Upgrade Procedure

If you wish to upgrade your existing Confluence installation with this version, ensure you have created a separate copy of your current Confluence production installation first and using that copy, follow the normal upgrade instructions to upgrade it to this development release. If you have also implemented customised site- or space-specific layouts, you will need to re-implement them after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

### Downloads

All development releases are available from Development Releases on the Atlassian website.

### Previous Betas and Milestones

- **Confluence 3.5-beta2 (“Beta 2”) Release Notes** – 4 March 2011
- **Confluence 3.5-beta1 (“Beta 1”) Release Notes** – 10 February 2011
- **Confluence 3.5-m4 (“Milestone 4”) Release Notes** – 22 December 2010
- **Confluence 3.5-m3 (“Milestone 3”) Release Notes** – 17 December 2010
- **Confluence 3.5-m2 (“Milestone 2”) Release Notes** – 7 December 2010
- **Confluence 3.5-m1 (“Milestone 1”) Release Notes** – 22 November 2010

### New Features and Improvements

#### Highlights of this release:

- Improved Crowd SSO configuration
- Bugs fixed

### Improved Crowd SSO configuration

Confluence 3.5 now ships with everything you need to configure SSO when using a Crowd server for centralised user authentication. To enable this, administrators just need to:

1. Ensure the Crowd directory is configured in the User Directories administration console
2. Configure crowd.properties with the details for the Crowd server (including the application name and
password)

3. Configure seraph-config.xml with the new SSO authenticator:

```xml
<authenticator
class="com.atlassian.confluence.user.ConfluenceCrowdSSOAuthenticator"/>
```

Customers with an existing Confluence 3.4 SSO configuration should not need to change anything for this to work, but we recommend all customers using SSO switch to use this new authenticator.

**Bugs fixed**

- JIRA Issues macro can now show on a single line when it shows a single issue.
- Resolved issues migrating user configurations with multiple LDAP directories configured.
- Crowd System Password Encoders is now properly listed in the System Plugins section of the plugins administration console.
- Upgraded to Share plugin 1.5, to resolve javascript errors in IE7.
- Upgraded to Drag and Drop plugin 1.0.16, to resolve more corner cases.
- Fixed font sizes and colours in the Macro Browser and Preview dialogs.
- Fixed square buttons on dialogs on Mac OSX
- Insert image dialog shows previews once again
- Added migration for mail server configurations so customers with mail settings unchanged since Confluence 2.7 will still be able to send emails.
- Fixed invalid HTML markup for dashboard updates with profile pictures disabled

**Confluence 3.5-beta2 ("Beta 2") Release Notes**

Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

↓ Do not use in production

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

**Who should try this out?**

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.

**New Features and Improvements**

**Highlights of this release:**

- [Support Tools Plugin](https://confluence.atlassian.com/support-tools-plugin)
- [Improved Share Button](https://confluence.atlassian.com/improved-share-button)
- [Improved Delegated LDAP User Directory Configuration](https://confluence.atlassian.com/improved-delegated-ldap-user-directory-configuration)
- Bugs fixed
  - [Space Directory bug fixes](https://confluence.atlassian.com/space-directory-bug-fixes)
  - [Other bug fixes](https://confluence.atlassian.com/other-bug-fixes)
- Improvements for developers
- Known issues

**Support Tools Plugin**
Support's Support Tools Plugin is now bundled into Confluence. It provides a log analyser to help sysadmins identify known issues with their instance, and a new improved support request feature.

**Improved Share Button**

We've improved the new "Share" button introduced in Confluence 3.5. Notable changes:

- **Share with email**
  
  You can now easily share a page with someone by entering just their email address.

- **Share for blog posts**
  
  The Share button now works for blog posts as well as pages.

- **New email style and short link in email**
  
  We've been using the Share button as an opportunity to explore some new email notification designs.

We hope to follow this format for all the other email notifications in the near future. Additionally, to make sure your link doesn't break we now email users the "short link" for a Confluence page instead of the full page URL.

**Improved Delegated LDAP User Directory Configuration**

We have added an option to copy users automatically from the LDAP server to Confluence when they authenticate for the first time. Copied users can also be assigned automatically to default groups.
Users in directories marked as "Read Only, with Local Groups" can also automatically be added to default groups.

**Bugs fixed**

**Space Directory bug fixes**
- Search filters now fire more reliably, and results are now sorted by the DB, reducing result rendering time
- Only team categories are shown for each space, rather than personal labels or favourites.
- We now show personal space icons rather than the generic space icon.
- Pagination fixes

**Other bug fixes**
- Performance results are much improved across the board.
- Probably the last ever WYSIWYG round-trip bug fix: the HTML macro now safely round-trips its content (CONF-8441).
- The demonstration space (example site) has been updated with content for Confluence 3.5
- Reshuffled administration console entries, so that security is no longer the top of the list.
- Fixed a bug with watch all blog posts for space receiving notifications for any change, not just blog posts. Also fixed who is listed as watching the space, rather than watching just the blog posts on that space.
- Fixed notification emails showing the wrong unsubscribe links for space blog watches.
- The username for anonymous users can now be translated for email notifications.
- Notifications are now sent using the right locale.
- Global logo descriptions will now be autogenerated, if none was found.
• Errors from the old lucene index format should now be much less verbose or worrying.
• Child page lists are now loaded via AJAX, rather than on initial page render. Users no longer have to wait for a page refresh to expand this list.
• Fixed a bug where malformed label names were always reported as being too long.
• Upgraded to Tomcat 6.0.32 in the Confluence distribution.
• Upgraded to Social Bookmarks Plugin 1.3.7.
• Upgraded to Drag and Drop Plugin 1.0.15.
• Upgraded to Plugin Framework 2.7.1, to reduce the amount of logging for some minor issues.

Improvements for developers
• Added support for EventPublisher @EventListener style listeners to the listener plugin module descriptor. Developers can now configure their listeners in their atlassian-plugin.xml using the standard:

```xml
<listener name="Something Happened Listener" key="SomethingHappenedListener" class="com.example.SomethingHappenedListener">
  <description>Listener for something happened events</description>
</listener>
```

Known issues

**Local users cannot log in when using Crowd or Delegated LDAP**

Whatever directories appear after a Crowd or Delegated LDAP directory in the User Directories admin UI will not be consulted, as these two directories currently throw an authentication-failed error, rather than a user-not-found error for users they do not contain. This is being fixed in Crowd now, and will be included in the next build.

**Migration error when importing from backup (CONFDEV-3172)**

The performance fix for caching crowd Application objects introduced this issue. It's fixed in Crowd now, and will be included in the next build.

**What's New showing for beta software**

The What's New dialog should not be enabled on a beta install of Confluence, but it is. We're investigating why, and will have a fix before we build another beta/milestone.

**Local groups are not imported when doing in place upgrades or restoring from backup**

Users currently have to be manually reassociated with their old groups. We're working on fixing it!

Note about CONFDEV issues
The Confluence team is using an internal JIRA project for tracking development with GreenHopper. The CONFDEV issues refer to our internal tracking numbers for user stories or bugs discovered and fixed within the scope of a release.

Confluence 3.5-beta1 ("Beta 1") Release Notes

Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

⚠️ Do not use in production

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

Who should try this out?

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.

⚠️ Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we **cannot** provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.
Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.

Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.

**Upgrade Procedure**

If you wish to upgrade your existing Confluence installation with this version, ensure you have created a separate copy of your current Confluence production installation *first* and using that copy, follow the normal upgrade instructions to upgrade it to this development release. If you have also implemented customised site- or space-specific layouts, you will need to re-implement them after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**Previous Milestone(s)**

- **Confluence 3.5-m4 ("Milestone 4") Release Notes** – 22 December 2010
- **Confluence 3.5-m3 ("Milestone 3") Release Notes** – 17 December 2010
- **Confluence 3.5-m2 ("Milestone 2") Release Notes** – 7 December 2010
- **Confluence 3.5-m1 ("Milestone 1") Release Notes** – 22 November 2010

**New Features and Improvements**

**Highlights of this release:**

- "What's New"
- Revised Dashboard Layout
- New Insert JIRA Issue dialog
- Improved JIRA issues macro
- Share a Page
- More Notification Improvements
  - One-click 'stop watch' links
  - Even more improvements
  - Space Blog Watches
- Drag-and-Drop Improvements
- New (code) macro
- Space Directory Improvements
- Scheduled Job Administration
- Applinks
- Performance / Stability
- Security
- Other improvements
- Small Improvements Gallery

"What's New"

When a user first logs in to Confluence 3.5, they’ll be presented with an AUI dialog box promoting new product features. (We aim to eventually work this feature into all our products.)

The content on this dialog is retrieved from Atlassian's web servers - the following screenshot is a mockup of what the final dialog box might look like.
Like other products that encourage you to actually read their release notes before continuing, the What's New dialog will keep annoying appearing on login until the user clicks "Don't show again". However, you can always access this dialog box again from the Browse Menu:

Revised Dashboard Layout

Previously in Confluence, you could filter the "Recently Updated" section on your dashboard by selecting a tab in the spaces list. For example, clicking on the Favourite tab in the spaces list on the left would limit recent updates on the right to your favourite spaces only).

This was a source of confusion for many users not expecting a tab change on the bottom left to update the recent updates on the top right.

To address the issue, the recent updates section has been given its own set of tabs (which now function independently of the spaces list). In the process, the tabs were also given a face lift and the recent updates section now takes up the entire right hand side of the dashboard.

New Insert JIRA Issue dialog

If you have configured one or more application links (aka 'applinks') to a JIRA server, you can insert a JIRA Issue link into your Confluence page while you're editing the page. You can access this feature via a new JIRA
button on the editor toolbar.

When you click it or press Ctrl + Shift + J, you get:

From here you can:
- Embed recently viewed issues
- Create a new issue
- Search for issues

**Improved JIRA issues macro**

Completely overhauled to support applinks, the JIRA issues macro now supports a single issue key, multiple comma separated issue keys or a JQL query. We've also changed the macro to use the name "jira" (although "jiraissues" will still work).

Finally, the macro now supports OAuth-based authentication from Confluence to JIRA. Note that all new features of the JIRA issues macro require a JIRA application link to be configured.

Here are some examples of using the improved JIRA issues macro:

<table>
<thead>
<tr>
<th>What you type</th>
<th>What you get</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>{jira:JRA-9}</code></td>
<td></td>
</tr>
<tr>
<td><code>{jira:assignee=currentUser()}</code></td>
<td>a table with all issues assigned to you</td>
</tr>
<tr>
<td><code>{jira:JRA-9,JRA-10,JRA-12}</code></td>
<td>a table containing the individual issue keys listed</td>
</tr>
</tbody>
</table>

**Share a Page**

How many times have you copied a page link, pasted it into an email and sent it off to someone with a little note? The new "Share a page" feature makes this common activity super quick.
More Notification Improvements

One-click ‘stop watch’ links

- **Ask and you shall receive** - Clicking the ‘Stop watching this page’ link in email notifications now automatically removes the watch for you without requiring a confirmation. You can still undo this if you clicked the link by accident.

Even more improvements

- **Straight to edit mode** - Clicking the ‘Change notification preferences’ link now takes you directly to edit mode for your email preferences.
- **More information** - We’ve added more information at the bottom of email notifications for when you’re watching all blogs.
- **Links in Plain text** - The stop watch links have been made available for those of you receiving emails in plain text.

Space Blog Watches

**CONF-6478** is a highly voted for issue, with over 100 votes. The idea is that blog posts are newsworthy updates so you might want to get email notifications for new blog posts without getting emailed for all other activity in the space.
Drag-and-Drop Improvements

Powered by HTML 5 - Drag-and-drop is now powered by HTML5. That means:

- Drag-and-drop works in all browsers, including Chrome!
- If you use a browser that fully supports HTML 5, you'll never get that annoying prompt to install Gears again. It just works.

Drag-and-drop multimedia files - Confluence 3.5-m4 introduced the Multimedia Macro. In this release we added drag and drop - Dragging a multimedia file onto a page will automatically insert the multimedia macro for you.

New {code} macro

The newcode macro project has now been bundled into Confluence, replacing the original code macro in atlassian-renderer. The new code macro has a number of improvements over the original macro (wider syntax support, copy/paste without getting line numbers in the clipboard).

Space Directory Improvements

We've improved the Space Directory since last milestone. Notable additions since then are:

- Clicking on the space category now switches tabs to that category
- Partial name search in space directory

Scheduled Job Administration

A new Confluence administration screen to monitor, and manage scheduled jobs. This is available through the "Scheduled Job Administration" link in the Confluence admin console. Here are some screenshots:
Applinks

The first cut of applinks has been integrated into Confluence. We will use this as the basis for delivering deeper JIRA integration later in this release.

Performance / Stability

A cache has been added to store page diffs. This should prevent the situation where RSS feeds with diffs can slow down Confluence.

Security

The underlying user management code has been updated so that it now enforces permissions on directories at a low level. This means remote API calls that create or modify users or groups on read only directories will fail and no longer write to the directory as they did in previous 3.5 milestones.

Other improvements

- Fix CSS vendor prefix antipattern
- Multimedia macro UX/UI improvements
- Media items in the image/media autocomplete now display an appropriate icon
- Change Team Labels to Space Categories
- Change blue collapsing arrows to grey
- Display the default welcome message on the General Configuration Admin page
- Display default contact administrator message on General Configuration admin page
- Fix for broken fonts on Windows
- Upgrade to AUI 3.3
- Fix and improve printing DOC theme in IE7
- Log in and Sign up links misaligned
- Capitalise the first letter of category labels in the spaces list and recently updated dashboard macros

Small Improvements Gallery

Bugs fixed
MySQL Configuration Change Required

The default transaction isolation mode of MySQL will cause issues with missing LDAP and other remote directory user permissions, and is no longer supported. Users must reconfigure their MySQL instances to use READ_COMMITTED instead. See MySQL Crowd configuration for instructions.

User management bug fixes

- CONFDEV-2404 - Fix migration of crowd user directories
- CONFDEV-2068 - Infinite redirect during login for users with confluence admin but not system admin permission
- CONFDEV-1638 - Fix duplicate initialisation of application object
- CONFDEV-1414 - User Directories menu option should only appear for system administrators

Drag and drop bug fixes

- CONFDEV-2711 - Drag and Drop should indicate multiple file uploads
- CONFDEV-2155 - Drag and drop produces incorrect file size if the file already exists

Other bug fixes

- CONFDEV-2678 - Blog comment links contain {0}
- Improved Thumbnail Rendering
  - Thumbnails for transparent images (PNG & GIF) now render properly.
  - Thumbnail rendering does not cause OOM errors even if the image is very large by delegating to a stream based renderer (this should solve the problem mentioned in Studio Multi-Tenant Reliability Proposal)

Improvements for developers

- CONFDEV-2730 - Bump AUI version from 3.3.0 to 3.3.1
- CONFDEV-2359 - Crowd upgraded to 2.2.0-m4. Embedded Crowd upgraded to 1.0-alpha26

Known Issues

- Insert JIRA issue dialog does not work if you are running confluence on the root context path. For example, http://servername, instead of http://servername/confluence. You can download a new version here that fixes it
- Imports from XML site backups may not work under certain circumstances if running an Oracle database.
- Installers for Mac and Windows have not been released for this version. They will be released for beta 2.

Note about CONFDEV issues

The Confluence team is using an internal JIRA project for tracking development with GreenHopper. The CONFDEV issues refer to our internal tracking numbers for user stories or bugs discovered and fixed within the scope of a release.

Confluence 3.5-m4 ("Milestone 4") Release Notes

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.
Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the [normal upgrade instructions](#) to upgrade your test instance to this release. *We strongly recommend that you backup your Confluence home directory and database before upgrading!*

Downloads

All development releases are available from the [development releases page](#) on the Atlassian website.

Previous Milestone(s)

- [Confluence 3.5-m3 ("Milestone 3") Release Notes](#)

Features

**Notification Improvements**

We have continued work further notification improvements in this milestone. Notifications about changes are now sent with From address of the email including the name of the user who made the change. This behaves the same as in JIRA and should make it a lot easier to decipher Confluence notifications in your inbox.
The format of the From address used in emails can be customised by Confluence administrators under the Mail Servers configuration, using the same formats as in JIRA. The default format is "<user’s full name> (Confluence)".

**Automatic Language Detection**

This milestone includes the ability to select a user’s preferred language automatically, by respecting the Accept-Language header which the user’s browser sends. Unless a language preference has been made in the profile settings, the closest matching language to the one suggested by the browser will be used.

**New Space Directory**

One of the biggest problems facing customers with large installations of Confluence is the scalability of the dashboard. It’s a well-known problem that the list of spaces on the dashboard doesn’t scale for sites with more than a few dozen spaces. We’ve added a new screen called the Space Directory where you can browse every space without having to use the Dashboard.

The Space Directory will eventually make the ‘All’ list of spaces on the dashboard obsolete, and make the performance of the dashboard much better for our large customers.

**Multimedia Autocomplete**

We have also continued work on editor improvements for Confluence 3.5. In this milestone, you can now embed multimedia files into your page via autocomplete. Try it out by hitting “!” in the editor and entering the name of a movie file attached in Confluence.

**Remote API for Watching and Managing Watchers**

We’ve added a bunch of new methods into the Confluence SOAP and XML-RPC APIs for watching and
managing watchers. The new methods in the remote API mimic the watch functionality exposed through the UI:

- `boolean watchPage(String token, long pageId)` – watch a page or blog post, returns false if a space, page or blog is already being watched
- `boolean watchSpace(String token, String spaceKey)` – watch a space, returns false if the space is already watched
- `boolean watchPageForUser(String token, long pageId, String username)` – add a watch on behalf of another user (space administrators only)
- `boolean isWatchingPage(String token, long pageId, String username)` – check whether a user is watching a page (space administrators only, if the username isn't the current user)
- `boolean isWatchingSpace(String token, String spaceKey, String username)` – check whether a user is watching a space (space administrators only, if the username isn't the current user)
- `RemoteUser[] getWatchersForPage(String token, long pageId)` – return the watchers for the page (space administrators only)
- `RemoteUser[] getWatchersForSpace(String token, String spaceKey)` – return the watchers for the space (space administrators only).

There's also a very obscure old method called `getBlogEntryByDayAndTitle` which only allowed you to look up a blog post in the current month. We've added a new method to look up any blog post by date and title:

- `RemoteBlogEntry getBlogEntryByDateAndTitle(String token, String spaceKey, int year, int month, int dayOfMonth, String postTitle)` – retrieve a blog post by specifying the date it was published and its title.

**Small improvements**

- CONFDEV-1792 - Change edit-page "comment" to "what did you change?" (user testing showed that "comment" was confusing)
- CONFDEV-1614 - Change link styling in Confluence
- CONFDEV-1409 - New set of avatars
- CONFDEV-977 - Add tips at the bottom of all dialogs for which there's a keyboard shortcut

**Bug fixes**

**Multimedia Macro bug fixes**

- CONFDEV-1955 - Fixed the help link in the multimedia macro

**User management bug fixes**

- CONFDEV-1682 - Attempting to remove an LDAP group in Confluence UI throws an unhandled exception
- CONFDEV-1499 - Update the message shown to users when there are more users than the license allows

**Other bug fixes**
Confluence 4.2 Documentation

- CONFDEV-1936 - Removed the BundleUserMacrosUpgradeTask upgrade task as it wasn't needed
- CONFDEV-1924 - Fixed broken personal sidebar layout in documentation theme
- CONFDEV-1855 - (attachments) macro ordering reversed
- CONFDEV-1840 - Support zip should no longer be created when atlassian-user.xml doesn't exist
- CONFDEV-1805 - External gadget urls don't work for https
- CONFDEV-1742 - LuceneUtils has very verbose warnings when index is using old format

**Improvements for developers**

- CONFDEV-1896 - Updated AUI to 3.2.1
- CONF-21462 - Plugin authors can now sign their plugins
- CONFDEV-1877 - Fix Confluence in IDEA 10: webapp has compile dependency on confluence core

**Known issues**

- CONFDEV-2112 - Spaces with custom decorators built after 3.5-m3 fail with an error
- CONFDEV-2120 - Logos don't work in the Space Directory

**Note about CONFDEV issues**

The Confluence team is using an internal JIRA project for tracking development with GreenHopper. The CONFDEV issues refer to our internal tracking numbers for user stories or bugs discovered and fixed within the scope of a release.

**Confluence 3.5-m3 ("Milestone 3") Release Notes**

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.

**Who should upgrade?**

⚠️ Please note the following

- Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.
However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.

Previous Milestone(s)

- Confluence 3.5 Milestone 2

Features

**HTML5, character encoding and IE rendering mode**

A bundle of small markup improvements have been made for Confluence 3.5-m3:

- Confluence's DOCTYPE declaration has been switched from HTML 4.01 Strict to HTML5, which is automatically strict as well.
- X-UA-Compatible is now explicitly set to EDGE, to ensure IE always renders in latest standards mode
- Character encoding is now set at the document level according to the encoding setting in General Configuration

**Multimedia Macro**

The new multimedia macro has been expanded to support many more file types. You can now embed MP3, MOV, AVI files and many more. Try it out by searching for 'multimedia' in the macro browser.

![Multimedia Macro Example](image)

**User management improvements and bug fixing**

- CONFDEV-1642 - Membership caching handles nested groups correctly
- CONFDEV-1636 - Build against Crowd 2.1.0 release version
- CONFDEV-1441 - Test migration of user preferences when upgrading
- CONFDEV-1318 - Handle exception when removing a directory that is synchronising

**Notifications bug fixing**

- CONFDEV-1819 - Unwatching a page via email no longer says "Stopped watching 'null'"

**Administrative improvements**
- **CONF-3987** - Confluence now respects `atlassian.mail.senddisabled` and `atlassian.mail.fetchdisabled`, as in JIRA
- **CONF-21323** - Improved RSS feed contextual logging information (also in 3.4.5)

### Small improvements
- **CONFDEV-977** - Tips displayed for dialogs with keyboard shortcuts
- **CONFDEV-1023** - Title colour attribute added to panel macro
- **CONFDEV-1013** - Include page macro is now able to render blog posts
- **CONFDEV-1409** - New set of standard profile pictures

### Small improvement screenshots

![Small improvement screenshots](image)

### Bug fixes
- **CONF-21144** - Copy and paste of emoticons is working again (also in 3.4.5)

### Performance Fixes
- **CONF-21376** - Improve performance of attachments in RSS feeds (also in 3.4.5)

### Known issues
- **CONFDEV-1924** - Personal sidebar looks broken in documentation theme

### Note about CONFDEV issues
The Confluence team is using an internal JIRA project for tracking development with GreenHopper. The CONFDEV issues refer to our internal tracking numbers for user stories or bugs discovered and fixed within the scope of a release.

### Confluence 3.5-m2 ("Milestone 2") Release Notes

⚠️ **For testing use only**

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.

### Who should upgrade?
Please note the following

- Development releases are not safe — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Previous Milestone(s)

- Confluence 3.5 Milestone 1

Features

Improved Notifications

Autowatch your content

How many times have you created a page or blog post and then forgot to watch it? Confluence now lets you automatically watch any pages you add, edit or comment on. This is turned on by default for all new users and upgraded users (yes, that means you!), and you can turn off autowatch via your Email Settings page.
Enabling this setting will improve your ability to keep track of your contributions on the wiki:

- Automatically watch any page/blog post that you add
- Automatically watch any page/blog post that you edit
- By default, have the the 'watch this page' checkbox ticked when you write a new comment.

**Easier to stop watching content**

Getting too many emails from Confluence? In this milestone, we've made it much easier to stop watching pages, spaces and users. When you get a notification email now, (most of the time) there’s a handy link at the bottom allowing you to quickly unsubscribe from your existing watches. The link will change depending on why you got the email in the first place (e.g. whether you were watching the space, page or network).

The link takes you straight to your Manage Watches page (for space and page watches) or to your network page (for users you follow) and gives you a prompt to easily remove the appropriate watch:

These notification improvements are the result of a 20% project by Anna Katrina Dominguez, who joined our team earlier this year. The project is still a work-in-progress, so please let us know what you think as per the Feedback section below.

**Multimedia Macro**

Previously, the only way to embed multimedia items (videos and audio) in Confluence was through Wiki Markup. This milestone introduces a new multimedia macro so you can embed multimedia using the macro browser, eliminating the dependency on wiki markup. The first cut of this macro only supports SWF files but we will be adding support to more formats and advanced settings in later milestones. This macro is available via Autocomplete for Macros and the Macro Browser.
Small Improvements

- Previously, it was not possible to differentiate between two gadgets with the same name and description. We’ve now updated the macro browser to show a gadget’s URL so users can more easily distinguish between gadgets with the same name and description (CONF-17991):

Note: This still style will change slightly in a later milestone.
- Minor UI tweaks:
  - Black headings on the dashboard for consistency with other Atlassian applications
  - All dialog close and cancel buttons have now been changed to links

- When adding a new user macro, the template field is shown pre-populated with a simple example
• Prototype and Scriptaculous libraries have been removed. This can lead to a minor improvement in page load time.
• The number of images requested on the dashboard have been reduced leading to a small improvement in dashboard load time.

Performance Fixes
• Re-enabled caching of PropertySet results. This will allow high performance lookups of UserPreferences once again.
• Added caching for plugin module descriptors inside the plugin framework. All callers of the PluginAccessor methods that return these objects should see a noticeable improvement in lookup time.

With these fixes, page rendering is now much faster than m1 – more than 100ms in our own testing – and roughly on par with 3.4.x. Work continues to make performance even better.

Bugfixes
• CGP-153: Gadget security token is "malformed" when page is open for a long time
• CGP-155: Gadget dialog close button should be a link

Known issues
• CONFDEV-1742: Lots of error messages generated until reindex is completed
• CONFDEV-1752: Card and deck macros no longer work properly
• CONFDEV-1686: Unless you've come from an email link, the Watches page always shows 'You have already stopped watching "null".'

Feedback
We'd love to hear any feedback you have from testing this milestone of Confluence. Please raise any issues you discover in our issue tracker against the Confluence project with affects-version "3.5 (EAP)", or comment on this page.

Confluence 3.5-m1 ("Milestone 1") Release Notes

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ("milestone") leading up to the next Confluence major release.
Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following
- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. **We strongly recommend that you backup your Confluence home directory and database before upgrading!**

**Downloads**

All development releases are available from the development releases page on the Atlassian website.

**Previous Milestone(s)**

This is the first milestone in Confluence 3.5 development.

**Features**

*Improved user management – better LDAP support and more*

This milestone includes the first release of the new improved user management in Confluence trunk bringing a number of significant user management improvements to Confluence:

- Support for nested groups in LDAP, the most highly-voted issue for Confluence (CONF-17150)
- Much improved support for LDAP integration, with configuration UI for administrators and many bug fixes
- Predefined configuration settings for all LDAP servers supported by Confluence and Crowd
- Improved performance and consistent behaviour across all remote directory types – LDAP, Crowd and
Confluence 4.2 Documentation

JIRA – through a new database-backed storage and periodic synchronisation system

- New, faster database schema for user management with improved foreign keys, constraints and indexes
- Integrated support for JIRA as a user management system, supporting JIRA 4.2 and earlier via read-only JDBC access, and JIRA 4.3 and later via read-write REST API
- Integrated support for Crowd as a user management system, offering a new faster REST API with Crowd 2.1 and later
- Improved permission checking performance (CONF-20475)
- Improved user management caching, with fewer bugs and better performance
- Read-write LDAP support for most LDAP servers
- In-application testing of LDAP configuration before saving
- Consistent UI for user management configuration in JIRA 4.3+ and Confluence
- Automatic migration from atlassian-user.xml and crowd.properties configuration into the new administration UI for all supported configurations (not yet complete)
- Data migration for users, groups, memberships and user preferences into the new database schema (not yet complete).

That said, there is still a bit of work to get this ready for release. Outstanding work on user management for Confluence 3.5 includes:

- Further work on performance improvement
- Completion of work on testing and documenting the upgrade process for all the supported existing user management configurations
- Improving a few areas of our user management with the new search and management APIs
- Writing automated tests to verify several of the new features are actually fixed and working correctly. (All are automatically tested in isolation, but not in Confluence.)

Feedback welcome. If you can test an upgrade of Confluence in your test environment and Confluence does not correctly upgrade your user management configuration or data, we would love to hear from you. Please raise an issue as covered in the Feedback section below.

Screenshots

Documentation theme improvements

We have added a neat improvement to the Documentation theme where you can configure the search box to limit searches to the current space by default. We think this will be really useful for knowledge base or documentation spaces, where searching in the current space is the most common use case.

- You configure the search setting in the theme configuration screen:
To override the space-specific search when entering your search terms, you can prefix the search with ‘all’ or just change the filter setting when you arrive at the search page.

**Keyboard shortcut improvements**

Building on top of the Confluence 3.4 keyboard shortcut improvements:

- 'T' – New keyboard shortcut added to show/hide the Documentation theme's sidebar. This shortcut is the same as the one used in the Issue Navigator in JIRA 4.2, and is handy for getting a quick glimpse of the full content of a page.
• ‘k’ – When you open the ‘Link to this page’ dialog, the ‘Tiny Link URL’ is now automatically selected in Chrome and Safari. Previously, it only worked this way in Firefox and Internet Explorer.

Other improvements

The dashboard icons now use CSS sprites, which should make for faster initial and subsequent load times when viewing the Confluence dashboard.

API changes

The user management changes have results in significant API changes in this area of the application. Specifically, the following change has broken some of our plugin test code:

• To modify an existing user, you need to create a new `com.atlassian.user.impl.DefaultUser` instance to call `setFullName()` or `setEmail()` because these methods are no longer on the `com.atlassian.user.User` interface.

We aim to preserve complete backwards-compatibility for plugins where possible, so please raise an issue if your plugin is broken in a way that cannot be backwards-compatible.

Feedback

We'd love to hear any feedback you have from testing this milestone of Confluence. Please raise any issues you discover in our issue tracker against the Confluence project with affects-version 3.5.

Release Notes 3.4-beta1 ("Beta 1")
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

**Downloads**

All development releases are available from the development releases page on the Atlassian website.
Previous milestones in the 3.4 release:
- Release Notes 3.4-m4 ("Milestone 4")
- Note: 3.4-m3 was not released due to some critical bugs.
- Release Notes 3.4-m2 ("Milestone 2")
- Release Notes 3.4-m1 ("Milestone 1")

Features

There are no new features in this release, it's mostly improvements and bug fixes to prior releases.

Other Improvements

- Universal Plugin Manager has been upgraded and minor issues addressed
- Browse > Advanced > PDF/HTML/XML Export page layouts updated for spaces.
- Dropdown menu containing 'select all' and 'deselect all' options added to Edit Space Permissions form. (CONF-7817)

Known issues

- AUI drop shadows disabled in IE while a Confluence bug is resolved (this means no shadows on dropdowns and dialogs in IE for beta1)
- IE renders some JavaScript errors for the new keyboard shortcuts

Previous milestones in the 3.4 release:

- Note: 3.4-m3 was not released due to some critical bugs.
- Release Notes 3.4-m2 ("Milestone 2")
- Release Notes 3.4-m1 ("Milestone 1")

Features

**Keyboard shortcuts dialog**

Confluence now has a keyboard shortcuts dialog. This dialog is accessible by pressing '?' on your keyboard or going to Browse > Keyboard Shortcuts.

### New Keyboard shortcuts

- 'e' to edit
- 'm' to comment
- 'l' to label
- '/' to quick search
- 'g' then 'd' to go to the dashboard
- ... and lots more. Go to Browse > Confluence Keyboard Shortcuts to discover more of them...

**Note:** There are some known issues with Safari for Mac, but we are ironing them out and they should be fixed next release. Some of these keyboard shortcuts are likely to change.

### Notable Bug Fixes

- Preview in FireFox now works
- Move page dialog now works

### Other Improvements

- Recently updated on dashboard now tells you what the user did (eg updated, commented) and has a timestamp for each activity.
  **Note:** The space description no longer renders wiki markup
- UPM has been upgraded to the latest milestone
- Browse > Advanced > Space details form has been converted to AUI style forms

Milestone release advisory
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.

Who should upgrade?

Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

**New Features**

**Universal Plugin Manager**

Confluence is now bundled with Universal Plugin Manager (UPM). The UPM allows you to see and manage the plugins that you have installed in Confluence, and it allows you to discover, download and install new plugins from the Atlassian Plugin Exchange. You can read more about the UPM here.

![Universal Plugin Manager screenshot]

**User Macros in the Macro Browser**

User macros are now available in the Macro Browser and can have the same amount of metadata as existing plugin macros. The current default is to hide user macros from browse/search in the Macro Browser until the admin updates them. Below is a screenshot of what the user macro form looks like (Note: This will slightly change in a later milestone)

![User Macro Form Screenshot]

Confluence administrators and user macro developers can enter macro and parameter meta-data via the admin console. This meta-data will reflected in the macro browser. Below is an example snippet of the new syntax that is available in a user macro:
## @param
author:title=Author(s)|type=string|required=false|desc=Include pages created or modified by these authors. Separate each author with a comma.
## @param showLabels:title=Show Labels for Each Page|type=boolean|required=false|default=true
## @param showSpace:title=Show Space Name for Each Page|type=boolean|required=false|default=true
## @param excerpt:title=Display Excerpts|type=boolean|required=false|default=false|desc=Displays the first line of excerpts for each page.
## @param maxResults:title=Maximum number of results|type=int|required=false|default=15
## @param title:title=List Title|type=string|required=false
## @param spaces:title=Spaces|desc=These are case-sensitive. Separate each item with a comma or single space.|type=string|required=false
## @param sort:title=Sort By|type=enum|required=false|enumValues=title,creation,modified|default=modified
##
## .... (rest of the macro content)
More detailed User Macro API docs will be provided later, explaining how to enable user macros in the macro browser and how to develop user macros for the macro browser.

### Improvements

**Improvements in 3.4-m2 (4 issues)**

Release Notes 3.4-m1 ("Milestone 1")

**Milestone release advisory**

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. *We strongly recommend that you backup your Confluence home directory and database before upgrading!*

**Downloads**

All development releases are available from the development releases page on the Atlassian website.

---

**Improvements**
Faster

Confluence 3.4-m1 contains some performance boosts (CONF-20264). The green bar below highlights current performance.

![Average Response Times (ms)](image)

Supportability

Database Support

Confluence 3.4 now has support for:

- SQL Server 2008 (CONF-12879)
- Postgres 8.4 Support (CONFDEV-28)

Lots of bug fixes

**Release Notes 3.3-beta3 ("Beta3")**

---

**Beta release advisory**

---

*Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.*
Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

⚠️ Do not use in production

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

Who should try this out?

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.
Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.

Upgrade Procedure

If you wish to upgrade your existing Confluence installation with this version, ensure you have created a separate copy of your current Confluence production installation first and using that copy, follow the normal upgrade instructions to upgrade it to this development release. If you have also implemented customised site- or space-specific layouts, you will need to re-implement them after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

Downloads

All development releases are available from Development Releases on the Atlassian website.

Welcome to the Confluence 3.3 Beta program

The Confluence team is really excited to share with you the Confluence 3.3 Beta 3 release. We still have a few bugs to fix, but overall we feel that most of the features below will be ready to ship by the final 3.3 release later this month.

New Features

Highlights of this release:

- Confluence Page Gadget
- Editing Features
  - Image Properties Panel
  - Link Properties Panel
  - Macro Autocomplete
- Notification Features
  - Email Notification for Network and Blogs
  - Manage Page Watchers
  - Change Comments on Blog Posts
- Engine Room
  - Secure Administrator Sessions (‘Web Sudo’)
  - Login Captcha
  - XSRF Protection on Comment Creation
  - Login Information
  - Infrastructure Changes
  - Deprecation Notice
- General Improvements
  - General Configuration UI
  - Accessibility Improvements
  - Improvements to Importing Word Documents
  - Version-Specific Help Links
  - Library Upgrades
  - New Dashboard Actions
  - New Welcome Message
  - Slimmer Blog View

Confluence Page Gadget
Confluence now provides a gadget many have been requesting: the Page Gadget. This allows the display of any Confluence page within a gadget, with optional 'View' and 'Edit' links. You can embed this gadget into your JIRA dashboard or another Confluence instance.

**Page gadget configuration**

With autocomplete for space names and page titles:

![Page Gadget Configuration](image)

**Rendering macros in the gadget**

The gadget renders macros that occur in the page. Most major macros work within the Confluence Page gadget, such as the Content by Label and the Recently Updated macros:

![Confluence 3.3 Specs & News](image)

Additionally, you can embed rich content with the View File macro within a Page gadget:

![Confluence 3.2 Webinar](image)
There are still a few minor issues with the Confluence Page gadget. At present the gadget supports most bundled macros within Confluence, but not all. We will publish the full details of the supported macros in the next release. Additionally, iGoogle/Gmail integration requires further testing.

**Editing Features**

**Image Properties Panel**

Introducing a new image properties panel! Manipulating images is now possible in the Rich Text Editor. Simply click (or select via keyboard with shift and arrow keys) an existing image and the image property panel will be available. You can resize an image into small, medium and large preset sizes as well as add a border to an image without having to leave the Rich Text Editor.

**Link Properties Panel**

Editing links in the Rich Text Editor is now easier with the new properties panel. You can easily see the link and edit or unlink existing links on the page. Just place your cursor somewhere inside the link.

**Macro Autocomplete**

We have extended the autocomplete feature introduced in Confluence 3.2 to include macros. You can now type `|` in the Rich Text Editor to trigger macro autocomplete. Just continue typing to search for a particular macro and open it in the macro browser.
Notification Features

Email Notification for Network and Blogs

For their Atlassian Fedex 14 project, Don Willis and David Taylor enhanced email notifications for blogs and networks. The 'Subscribe to all Blog Posts' option gives you notifications for all the blogs in the system, subject to permissions. If you select 'Subscribe to Network', you will get notifications when anyone you are following edits content or changes their status, also subject to permissions. You can configure these options in your email settings:

Manage Page Watchers

An implementation of Matt Ryall's FedEx 14 project is available in this version of Confluence: a dialogue to view and manage watchers on pages and blog posts, as well as view all watchers of a space. This option is only currently available to space administrators. It addresses CONF-5032 and most of CONF-3703 for approximately 150 votes. Screenshots below:

New menu option
A few minor issues with icons, keyboard navigation, displaying usernames and wrapping of long names will be fixed in the next release.

**Change Comments on Blog Posts**

You can now comment on the updates you make to blog posts, in the same way as you can for pages.
Engine Room

**Secure Administrator Sessions ("Web Sudo")**

Confluence has another line of defence against hijackers of administrator sessions. All features in the Administration section of Confluence (and some in the Space Administration section) will require the user to validate their credentials before proceeding.

After validating, a message at the top of each page reminds you of your temporary administrator session. The temporary session will expire after 10 minutes of administrator inactivity and can also be terminated manually.

The secure administrator settings are configurable via the Confluence Administration Console.

**Login Captcha**

As another important security improvement Confluence now requires the user to answer a Captcha question after a given number of failed login attempts.

This security mechanism protects not only the login page but the RPC-interface as well. After a configurable number of failed login attempts via the RPC interface, the user is required to log in using the web interface which then presents the Captcha image.

This feature is enabled by default but can be disabled in the Confluence Administration Console. The configuration options include the number of failed login attempts. The default threshold for login attempts is three.

**XSRF Protection on Comment Creation**

This security mechanism requires an XSRF token to be present when adding a comment. Don’t worry though, a system is in place so that your session will not expire and you can take your time to write the perfect comment!

All the bundled themes have been updated to use this feature. There is also an option in the new Security Configuration screen to disable this feature if you need to keep using a theme that does not yet support the feature.

**Login Information**
Confluence now captures metadata about login attempts, including the dates of the last failed and successful login and the number of failed logins.

In addition, a Confluence administrator can now reset the number of failed logins for a particular user.

### Infrastructure Changes

Various changes to aid plugin development:

- All ContentEntityObjects can now be commented on
- UserStatus now optionally belongs to a space
- Custom space types are available
- Upgrade to Bandana 2.0
  - Custom context objects
  - Key enumeration
  - Item removal
  - Custom serialisation

### Deprecation Notice

DWR has been deprecated as of 3.3-m1. Support for the client side JavaScript proxies has been moved into the Confluence Legacy Web Resources plugin which is going to be disabled by default. If you need any of the following web resources you will need to enable this plugin:

- DWR framework
- DWR JavaScript proxies for label operations (add, remove, suggest) or editor operations (heartbeat, draft saving, editor preferences)

You will also need to make the following resource a required resource in your view template: `legacy.confluence.web.resources:dwr-confluence`

This will embed the DWR client-side JavaScript files in your plugin's view output.

### General Improvements

#### General Configuration UI

The General Configuration screen in the Administration Console has finally been given a face lift. It now uses an AUI form style.

#### Accessibility Improvements

We've added labels, legends and skip links so that Confluence is now more 508-compliant. We still have a long way to go, but these pages should now be more screen-reader friendly:

- Dashboard
- General pages
- Profiles
- Set your Password
- Attachments
- People Directory
- User Status

### Improvements to Importing Word Documents
The structure of the 'Tools' > 'Import Word Document' feature has been improved to make it more intuitive.

Version-Specific Help Links

Confluence now follows the Atlassian Help Link specification. All help links will now redirect to the version of the Confluence documentation that matches the version of the Confluence application that you are using.

If you wish, you can configure the redirecting of the help links by editing the `help-paths.properties` file. You could do this if you need to point Confluence help links to an internal documentation site.

Library Upgrades

- AUI 3.0-m3
- Atlassian Plugins 2.5

New Dashboard Actions

The dashboard actions are now buttons. On mouse-over, the text turns blue. When clicked, the button is indented. They have also been moved – they appear above ‘Spaces’.

New Welcome Message

The dashboard welcome message has been updated.

Slimmer Blog View

The blog view has been modified as shown in the screenshot below.

Changes shown in the screenshot:

- The old calendar has gone. It has been replaced by a sidebar that simply lists the month and all the blog posts for that month. You can scroll through the months that have blog posts in them.
- The view has been streamlined. We have removed some unnecessary information on the page.
- In a global space, the view you see via 'Browse' > 'Blogs' has the blogger's picture attached to the blog for easier identification.
Other changes not visible:

- The dates have been internationalised. Until now they were restricted to English.
- The 'Browse' > 'Blogs' view allows you to see older and newer posts, no longer restricted to the most recent 15.

| Milestone release advisory |
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we **can not** provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. **We strongly recommend that you backup your Confluence home directory and database before upgrading!**

**Downloads**

All development releases are available from the development releases page on the Atlassian website.

---

Back after a month of silence...
Hello everyone! As you might have noticed, we went dark for a whole month, skipping Milestone 2. Why is that, you wonder? To be quite honest with you, M2 was considered too rude. What was supposed to be an easter-egg went berserk, telling its unassuming user to … well, we can’t print that here. So we decided to not publish M2, and waited until M3 was complete. We have since then washed Connie’s mouth with soap, and Confluence 3.3 Milestone 3 presents itself shiny, friendly and non-abusive as ever. :-)

We’re currently planning to go Beta in about 2 weeks, just in time for Atlassian Summit, and to ship in mid to late June.

**New Features**

**Macro Autocomplete**

You can now type ‘{’ in the Rich Text Editor to trigger macro autocompletion! Just continue typing to search for a particular macro and open it in the macro browser.

Known issue: The searching/ordering is not ideal yet, and you get quite unspecific search results at time (as seen above). Sometimes it's good to be fuzzy, sometimes not. We'll probably disable searching by description (and just do that in the macro browser). Watch (and provide feedback on) [CONF-19598](http://jira.atlassian.com/browse/CONF-19598)
Link Properties Panel

Editing links in the RTE is now easier with the new properties panel. You can now easily see the link, edit and unlink existing links on the page. Simply place your cursor somewhere inside the link!

There's a known issue ([CONF-19608](https://confluence/x/6ded)) in IE where the "Unlink" button is deleting the link text as well; this will be fixed for the next milestone.

The next two weeks we'll be applying property panels to images as well. If you have any feedback on this panel already, please tell us so we can fix it up before the Beta.

BTW, we're planning to make the UI between Autocomplete and Property Panel a bit more consistent in the next milestone, and we will display the URL that the link points too as well. It's just a beta, after all.

General Improvements

General Configuration UI

The Admin General Configuration screen has finally been given a face lift! It has been converted over to use an AUI form style.

Accessibility Improvements

We've added labels, legends and skiplinks so that Confluence is now more 508-compliant. We still have a long way to go but these pages should now be more screen-reader friendly:

- Dashboard
- General pages
- Profiles
- Set your Password
- Attachments
- People Directory
- User Status
**Import Word Improvements**

The ‘Tools’ > ‘Import Word Document’ feature structure has been improved to make it more intuitive.

```
Root page title: Atlassian Confluence Notes
Where to import:  
   ○ Import as a new page in the current space
   ○ Replace Personal Notepad
   □ Delete existing children of Personal Notepad
Title conflicts:  
   ○ Rename imported pages if page name already exists
   ○ Replace existing pages with imported pages of the same title
   ○ Remove existing pages with the same title as imported pages
Split by heading: [Don't split]
Document Outline: 
   ![2010_03 Episode Atlassian-CUT]
[Import]
```

**Login CAPTCHA**

As another important security improvement Confluence now requires a CAPTCHA after 3 failed login attempts.

![Login CAPTCHA](image)

This security mechanism not only protects the login page but the RPC-interface as well. After 3 failed login attempts via the RPC interface, the user is required to log in using the web interface which then presents the CAPTCHA image.

This feature is enabled by default but can be disabled in the admin panel. The configuration options include the
number of failed login attempts. The default threshold is 3.

**Login information**

Confluence now captures login meta information. This includes the dates of the last failed and successful login and the number of failed logins. The administrator is now able to reset the number of failed logins for a particular user.

<table>
<thead>
<tr>
<th>Login: CAPTCHA required at next login</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last Login: May 18, 2010 16:29</td>
</tr>
<tr>
<td>Last Failed Login: May 18, 2010 16:30</td>
</tr>
<tr>
<td>Total Failed Login Count: 6</td>
</tr>
<tr>
<td>Current Failed Login Count: 6</td>
</tr>
<tr>
<td>(Reset Failed Login Count)</td>
</tr>
</tbody>
</table>

**Version-Specific Doc Links**

Confluence now follows the Atlassian Help Link spec and all help links will now redirect to the version of the Confluence Documentation that matches the version that you are using.

Users can edit where the links are directed by editing `help-paths.properties`.

**Library Upgrades**

- AUI 3.0-m3
- Atlassian Plugins 2.5

**New dashboard actions**

The dashboard actions are now buttons, which on mouse over the text turns blue and when clicked is indented. They have also been moved to be above ‘Spaces’.

Old:

New:

**New welcome message**

The dashboard welcome message has been updated.

Old:
New:

Welcome to Confluence

Confluence combines powerful online authoring capabilities, deep Office integration and an extensive plugin catalog to help people work better together and share information effortlessly.

Get started by creating a new space and adding users to join you.

You can change this message to whatever you like.

Change comments on blog posts.

Don W changed 1 line of vm and wrote some tests so that change comments are enabled on blog posts.

All Implemented Issues

XSRF Protection on Comment Creation

This security mechanism requires an XSRF token to be present when adding a comment. Don’t worry though, a system is in place so your session will not expire and you can take your time to write the perfect comment!

All the bundled themes have been updated to use this feature, and an option in the new Security Configuration screen to disable it if you still can’t live without an old theme.

Release Notes 3.3-m1 ("Milestone 1")
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

**Downloads**

All development releases are available from the development releases page on the Atlassian website.
Milestone 1 is a fairly minor step from a user perspective, but since there are a number of changes that could potentially impact plugin development we wanted to get it to you as soon as we could. Read on for the changes as described directly by the developers.

**Infrastructure Changes**

Various changes to aid plugin development

- All ContentEntityObjects can now be commented on
- UserStatus now optionally belongs to a space
- Custom space types
- Bandana 2.0
  - Custom context objects
  - Key enumeration
  - Item removal
  - Custom serialisation

**Deprecation notice**

DWR has been deprecated as of 3.3-m1. Support for the client side Javascript proxies has been moved into the Confluence Legacy Web Resources plugin which is going to be disabled by default (it currently isn't - automatically disabling the DWR web resources when updating Confluence will be in Milestone 2). If you need any of the following web resources you have to enable this plugin:

- DWR framework
- DWR Javascript proxies for label (add, remove, suggest) or editor operations (heartbeat, draft saving, editor preferences)

**Slimmer Blog View**

The blogs view has been modified as shown in the screen shot below.

Changes shown in the screenshot:

- The old calendar has gone. It's been replaced by a sidebar that simply lists the month and all the blogposts for that month, and allows you to scroll between the months that have blogposts in them.
- The view's been streamlined - we've gotten rid of some of the unnecessary information on the page.
- In a global space, the view you get in Browse > Blogs has the user's picture attached to the blog for easier identification.

And the additional changes not visible:

- The dates have been internationalised - until now they were stuck in English.
- The Browse > Blogs view allows you to see older/newer posts, not just the most recent 15.

Confluence 3.2 Beta Release Notes

⚠️ These are not the release notes you are looking for! The final Confluence 3.2 Release Notes are over here.

Milestone release advisory
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- Development releases are not safe — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.

Welcome to the Confluence 3.2 Beta program
With great pride we bring to you the Confluence 3.2 Beta release. We still have a few bugs to fix, but overall, this is how 3.2 will get rolled out to customers in mid March. And we want your feedback.

Note to partners and translators: The preliminary translation diff files can be found as a subpage of this overview page: Translations for Confluence Releases

⚠️ Advance warning

This release is the last one to officially support Internet Explorer 6. Read the upgrade notes and the original announcement over here.

This release is the last one to officially support application servers other than Tomcat. From the next release on, Websphere and Weblogic and JBoss will not be supported anymore. For further information on this, please see the end of support announcements page

1

Autocomplete in the editor

We are adding a new feature called Autocomplete to the Rich Text Editor. In this beta it only works in Firefox and Safari, but the goal is to make it work on Internet Explorer as well by the time the 3.2 release ships.
You can type "T" at the start of a line to display your browsing history and link to those pages, and if you keep typing you'll get recommendation for pages that match what you types:

![Autocomplete in the editor](image)

If you type "T" you'll see the attached images to the current page, and if you keep typing you'll be able to link to any image in your deployment.
This feature’s goal is to make the RTE even faster than using wiki markup. Try it out and tell us what you think!

**Note:** May require a re-index of your system to show attachments

**Known issues**

- [CONF-18281](#) - doesn’t work in IE yet

**New Links Dialog**

We have rewritten the way you add links in Confluence. The new links dialog is faster, better looking, and more powerful.
New "Documentation Theme"

Confluence now comes bundled with our hugely successful "Documentation Theme". See https://plugins.atlassian.com/plugin/details/16393 for details about the theme.

This theme replaces the old "Left Navigation Theme". We are still shipping the Left Nav theme, but it is deprecated and will stop shipping in a later release.

New "Easy Reader" Theme

With today's huge monitors, it can become hard to read large amounts of text that spans the whole screen. We are introducing a new theme which, like most websites, only uses a portion of the screen, to facilitate readability.
This theme replaces the old "Clickr Theme". We are still shipping the Clickr theme, but it is deprecated and will stop shipping in a later release.

5

Bundled templates and new template marketplace

The Bundled Templates 20% project is actually a framework to allow customers and Atlassian to deploy bundles of templates to a Confluence instance.

3.2 includes the framework plugin and a bundle of default templates[1]; these are available to the administrator to import into their instance as either space templates or global templates.

The templates import framework allows the administrator to preview a template before importing it as well as view the associated wiki-markup.

[1] Current default template bundle will be changed, pending list from Matt and Bill.

Documentation on how to write your own template plugin can be found here: Creating A Template Bundle.

Please visit PAC for the new category. TODO: add link
Better Move Page Dialog

We introduced a new page move dialog in Confluence 3.1 but the ability to change the order of pages fell out of scope. This has now been implemented and is accessed as shown -

And looks like -
REST APIs

New REST Resources

- Attachment Resource

Useful Improvements and Enhancements
Page History

What used to look like this...

You are viewing an old version (v. 7) of this page.
The latest version is v.8, last edited on Feb 15, 2010 (view differences | restore this version)
<< View previous version | view page history | view next version >>

.. now is a bit more understandable:

You are viewing an old version of this page. View the current version.

RTE Shortcuts Added

The following RTE shortcuts have been added, please try them out!

- Ctrl+Shift+C Copy table row
- Ctrl+Shift+X Cut table row
- Ctrl+Shift+V Paste table row
- Ctrl+Shift+B Bullet lists
- Ctrl+Shift+N Numbered lists
- Ctrl+Shift+F Full screen mode
- Ctrl+Shift+S Strikethrough
- Ctrl+Shift+T Insert Table
- Ctrl+Shift+A Macro Browser

RTE Hints

At the bottom of the RTE, useful editor hints get displayed. This will help promote the new keyboard shortcuts and the autocomplete feature.

Images in search results

If an image is found, it will be displayed in the search results. The main point here is that we've made it possible
to write plugins to spice up search results. You could write custom display for any kind of attachment types, or even change what the regular pages look like.

A tutorial for how to write your own renderer is located over at the Confluence Dev space.

Bundled JDBC drivers

To improve the Evaluator experience, we're now bundling a few of the most common JDBC drivers.

Improved RSS feed builder screen

The RSS feed builder looks a bit more polished and less scary.

Bug fixes and stability improvements

A host of old bugs have been fixed. Most notable:

- it is now possible to install language packs without restarting the server.
- When adding new pages or posts, there used to be a white-space overlapping the right part of the editor. This is now fixed.
- Removed many instances of hard-coded colours (mostly blue) that prevented colour schemes applying correctly.
- Enhancement for modern browsers: added CSS to handle common forms of over-sized content, so it gets a localised scrollbar instead of making the whole page scroll
- Properly set backgrounds for email and editor popups, so they don't (incorrectly) pick up backgrounds from the main wiki window.

Release Notes 3.2-m3 ("Milestone 3")
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following
- Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.

Welcome back
it's been a while since we shipped Confluence 3.1 in December. Since then, we've been having heaps of fun at our second Lab Week, during which we experimented with all sorts of new technology and crazy ideas, mainly around the editor. We've been busy coding up new features over the last weeks, but also various back-end changes. Milestones 1 and 2 were internal only and didn't show much visual anyway, but now we're getting there.

The Confluence 3.2 development cycle is going to be a short one. We are currently aiming at shipping in Mid March. There will probably be one a M4 milestone in two weeks, but then we're in Beta mode already.

The features

New Links Browser

The new link browser is now available in the editor toolbar (the old one is still there as a backup).

![New Links Browser](image)

Note: this funky icon is temporary

This new browser now has all the functionality present in the current link popup, except for the recently modified tab. You can now add links to attachments and recently viewed pages, which weren't available in m2. Please raise any bugs found against the linking component in Confluence.

Know issues

- quick search only returns pages
- error messages from the server aren't displayed yet
- usability work still to come (like cursor placement and keyboard navigation)

Documentation theme

We are going to bundle the new Documentation Theme,

Fixed Width Theme

We are introducing a theme that by default has sidebars. The main work here is behind the scenes, fixing up our HTML and CSS so that 3rd-party theme developers will benefit and be able to write such themes more easily.
If you're wondering where the 'sudden green' has come from, it has originated from Confluence's product colour on our website.

Naturally the colour scheme is customisable:

Known issues

- Space Admin screens still need work (site admin screens don't get themes applied, but space admin does)
- There's more polish to go into this theme - mostly small spacing and font size adjustments
- Our minimum resolution is 1024x768; content that doesn't fit at that size won't fit in the fixed width theme either.
- There is a certain discussion around the colours, and whether we should be a bit more conservative in terms of the background. We will keep discussing.
- The main point here is that many bugs have been fixed, and that 3rd-party theme developers will benefit from many under-the-hood bugfixes to our html and css.

Anatoli's 20% project: RSS improvements

- [CONF-18372](#) : changed the feed builder UI so that now you can choose comments/attachments for either pages, blogs, both or none. The new UI will generate slightly different parameters so that they don't interfere with old RSS query format.
There are plans to further improve the UI.

- **CONF-9312**: changed the behavior of rss feed when filtering by label. Now when you ask for comments and pages with a particular label you will get the labeled pages and comments on those pages.

### Backend changes

The Engine Room has upgraded plenty of libraries:

- Many common modules were upgraded.
- Migrated our [Sal Plugin](#) into Confluence
- REST Service for retrieving Recently Viewed pages
- Start of REST service for Confluence searches

More documentation about REST will soon follow.

### Next steps

There are still heaps of improvements that will make it into 3.2, so stay tuned for M4 and Beta1, both due this month.

Cheers,
The Confluence Development Team

**Release Notes 3.2-m4 ("Milestone 4")**
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following
- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.

With great pride we bring to you the best milestone of this release cycle. We are now more or less feature-complete. There are a few usability issues which we still want to fix, and yes, there are still plenty of
bugs. We didn’t manage to bundle a few of our new great plugins yet, and have large chunks of code to review. That’s why we didn’t call this Beta yet, but named it M4.

But overall, this is how 3.2 will get rolled out to customers. We want your feedback: Speak now or forever hold your peace. 😊

Note to partners and translators: The preliminary translation diff files can be found as a subpage of this overview page: Translations for Confluence Releases

Other News

- Integrate auto-complete and Link Browser to use REST search and attachment resources
- Bug Fixes

2

Autocomplete

We are adding a new feature called Autocomplete to the Rich Text Editor, which currently only works in Firefox and (try your luck!) Safari. You can type "I" at the start of a line to display your browsing history and link to those pages, and if you keep typing you’ll get recommendation for pages that match what you types. If you type "I!" you’ll see the attached images to the current page, and if you keep typing you’ll be able to link to any image in your deployment.
This feature's goal is to make the RTE even faster than using wiki markup. Try it out and tell us what you think!

**Note:** May require a re-index of your system to show attachments

**Known issues**

- [CONF-18281](#) - doesn't work in IE yet
- [CONF-18584](#) - when both the RTE and outer frames are scrolled the dropdown location is incorrect
- Plenty of small niggly bugs.

### New Links Browser

The Links Browser is now feature complete and has been enabled as the default insert link button in the editor.

The breadcrumbs in the search panel of the dialog is new in this milestone. This is particularly helpful when editing existing links.
Know issues

- [CONF-18589](#) IE 6 caches responses for recently viewed and attachments tabs
- [CONF-18575](#) Pressing enter on the search field leaves the page in IE7
- [CONF-18455](#) After viewing a user profile, the recently viewed tab displays no pages

New Theme

Our new Fixed Width Theme (proper name still tba) now has

- new fancy gradient
- soothing blue colour scheme
- personal sidebar folds away neatly
  - we tried floating it over content, but people weren't so keen on that.
- tidier grid than last milestone
- comment threading now far more robust, comments RTE toolbar collapses or scrolls instead of truncating (this solution will be migrated to core code after trial use in fixed width - the problem can also happen in default)
- key bugfixes: space admin screens and RTE spacing

Dashboard

Known issues

- The header nav dropdowns don't line up with the bottom of the header yet
- Personal info sidebar has some bugs to resolve after final design change (mainly: IE6 breaks, sidebar overlaps "navigate space" in some browsers)
- Attachments page is getting truncated in some circumstances
- Some RTE messages wrap poorly

Note for bug tracking: bugs that also occur in the default Confluence at 1024x768 are not theme bugs per se, even if they're being investigated at the same time.

Daniel's 20% project: Images in search results

If an image is found, it will be displayed in the search results. The main point here is that we've made it possible to write plugins to spice up search results. You could write custom display for any kind of attachment types, or even change what the regular pages look like.

A tutorial for how to write your own renderer is located over at the Confluence Dev space
Paul's 20% project: Finishing the page move dialog

We introduced a new page move dialog in Confluence 3.0 but the ability to change the order of pages fell out of scope. This has now been implemented and is accessed as shown -

![Page Move Dialog](image)

And looks like -

![Page Move Dialog](image)
Small (yet awesome) Improvements

Page History

⚠️ You are viewing an old version (v. 7) of this page.
The latest version is v. 8, last edited on Feb 15, 2010 (view differences | restore this version)
<< View previous version | view page history | view next version >>

Say Hi to the new and (largely) improved Page History navigation.

RTE Shortcuts Added

The following RTE shortcuts have been added, please try them out!

- Ctrl+Shift+C Copy table row
- Ctrl+Shift+X Cut table row
- Ctrl+Shift+V Paste table row
- Ctrl+Shift+B Bullet lists
- Ctrl+Shift+N Numbered lists
- Ctrl+Shift+F Full screen mode
- Ctrl+Shift+S Strikethrough
- Ctrl+Shift+T Insert Table
- Ctrl+Shift+A Macro Browser

RTE Hints

At the bottom of the RTE, useful editor hints get displayed. This will help promote the new keyboard shortcuts and the autocomplete feature.

Hint: press Ctrl+Shift+X to cut a row and Ctrl+Shift+V to paste a row in a table.
| Milestone release advisory |
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.

While you were away...
You can see all the feature details in the beta 2 announcement. This update about the Release Candidate is just for developers and evaluators who want to know what changed between the Beta 2 and the Release Candidate. Not much! 😊

**Changes in RC1**

It's should come as no surprise that we have mainly been bugfixing since the Beta 2.

**Faster Editor**

But, in order to make our Selenium builds pass more reliably, Agnes had to spend some time on making the editor faster. And she did! 😊

**UI tweaks**

Matt came up with a better widget connector icon, we've added the table-of-content which had been forgotten, and Stephen came up with a great fullscreen icon that really grabs your attention and means something.

Office file preview has a more prominent edit button

A common complaint at Atlassian Summit was that people didn't realize that you could launch your editor directly from the file preview so we've made it more obvious.

Road ahead

We aim at turning the RC into the Final Release and ship it on Thursday the 3rd December.

**Confluence 3.1 Beta 2 Release Notes**
Confluence 3.1 Beta 2 is a public development release ("Beta") leading up to the official release of Confluence 3.1, which we aim to ship in Q4, 2009.

Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

Do not use in production

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

Who should try this out?

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.

Please note the following

- Development releases are not safe — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.

Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.

Upgrade Procedure

If you wish to upgrade your existing Confluence installation with this version, ensure you have created a separate copy of your current Confluence production installation first and using that copy, follow the normal upgrade instructions to upgrade it to this development release. If you have also implemented customised site-
space-specific layouts, you will need to re-implement them after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

Downloads

All development releases are available from Development Releases on the Atlassian website.

Known Issues

Below are some known issues associated with Confluence 3.1.

On this page:

- JIRA/Crowd and Confluence deployment
- JIRA Gadgets in Confluence
- Bamboo integration
- PDF exports only render gadgets as links
- Problematic Confluence Gadgets window when running Confluence on Java 6
- Other issues

JIRA/Crowd and Confluence deployment

Confluence will not start up or will display strange behaviour (drop down menus not working) if JIRA 4.0/4.0.1 or Crowd 2.0.x is running on the same application server installation, for example, by attempting to run Confluence and JIRA 4.0 in the same Apache Tomcat server installation. This problem results from a bug in JIRA (tracked as JRA-19894) that is scheduled to be fixed in JIRA 4.0.2. Crowd will be fixed in the 2.1 release. In the meantime, please read our KB article on how to resolve this issue.

In the meantime, you can run JIRA or Crowd and Confluence in different 'instances' of the same application server, for example two separate Apache Tomcat server installations. If you already do so, or have installed both the Confluence distribution and JIRA 4.0 distribution, or Crowd 2.0.x, you can ignore this known issue.

JIRA Gadgets in Confluence

As of Confluence 3.1, users can embed gadgets into Confluence pages. When integrating JIRA gadgets into Confluence pages, you may encounter UI problems like a missing "Login"-button which is required to make the gadget authenticate with the JIRA server. This problem can be circumvented by setting up JIRA and Confluence to use Trusted Apps communication (since it removes the need for manual authentication). See KB article for details.

Bamboo integration

Our continuous integration product Bamboo exposes gadgets which can be embedded into Confluence pages. However, some of these exhibit problems once embedded onto a Confluence page:

- BAM-4900: Unable to edit Bamboo gadgets in Confluence
- BAM-4890: Bamboo gadget added in JIRA dashboard is not saving the preferences

These bugs are being fixed in Bamboo 2.5, which will ship in January 2010.

PDF exports only render gadgets as links

If you place any gadget on a Confluence page and export the page to PDF, the gadget output will not be rendered in the PDF output. Instead, each gadget is rendered on a page as a box containing the name of the gadget, the latter of which is hyperlinked. Clicking this hyperlink, opens the gadget contents itself in a new browser window or tab.

Problematic Confluence Gadgets window when running Confluence on Java 6

The Confluence Gadgets window may indicate that 'An error has occurred while trying to load the Gadget
Directory and prevent you from accessing the URLs of your Confluence gadgets. This problem can occur if you are running Confluence on Java 6. After you install Confluence 3.1 or upgrade an existing Confluence installation to this version, please check the Confluence Gadgets window immediately after starting the Confluence server.

If you see this error message and cannot access your Confluence gadgets, it can be resolved by restarting Confluence. (You may need to do this more than once.)

For more information about this issue, please refer to CONF-17417.

Other issues

Refer to our JIRA site for a list of Confluence 3.1-specific bugs.

Highlights of Confluence 3.1

Highlights of this Release:

- JIRA/Crowd and Confluence deployment
- JIRA Gadgets in Confluence
- Bamboo integration
- PDF exports only render gadgets as links
- Problematic Confluence Gadgets window when running Confluence on Java 6
- Other issues

Introducing Gadgets

Drag & Drop
Office 2007 Support
New ‘Move Page’ Feature
Enhanced Image Browser
Draft Comparisons
Page Restrictions Dialog Box
Web Browser Version Support
Other Editor Enhancements

- Edit Mode Exit Notification
- New Rich Text Editor Insert Menu
- Macro Browser Smart Fields
- Editor speed

Other Improvements

- Add Pages or Blog Posts from the Dashboard
- New ‘Link to this page’ feature
- ‘More’ option on Activity Streams
- User Interface Performance Improvements
- Other Small Enhancements and Improvements to Confluence

Introducing Gadgets

Gadgets are small objects that offer dynamic content and functionality which may be served by any OpenSocial-compliant web application, such as JIRA 4.0+, Confluence or non-Atlassian applications such as iGoogle and Gmail.

- Confluence supports the use of gadgets in pages and blog posts, which are accessible through the macro browser.
- Confluence can also serve its own gadgets, for use in any other OpenSocial-compliant web application.
Two such gadgets are bundled with Confluence:

- **Activity Stream** — This gadget shows a list of recent activities that have occurred on the Confluence server, such as the addition of new pages, blog posts or comments, content edits, status updates and so on.
- **Quick Navigation Aid** — This gadget provides heading and content search capabilities on a Confluence server.

Your Confluence installation can also serve these gadgets in any of its own pages or blog posts.

### Inserting a JIRA Gadget onto a Confluence Page

![Insert 'Created vs Resolved Chart' Macro](image)

**Drag & Drop**

The new 'drag and drop' feature allows you to drag one or more file(s) which are accessible from your computer and drop them directly into a Confluence page or blog post.

- Files can be attached to a page or blog post by dropping them directly onto the page view or the 'Attachments' list associated with the page.
- Image files can be attached to a page or blog post by dragging them from your computer directly onto the Image Browser.
- Image and Office files can be added directly into your Confluence page or blog post content by dropping them into the rich text editor's editor window.

### Download Video

For more information about this feature and on how to set it up, refer to the [Using Drag-and-Drop in Confluence](#) documentation.

### Screenshots: Attaching an Image to the Image Browser
**Office 2007 Support**

Confluence now provides full support for the new Office 2007 file formats, allowing you to view and edit content from Microsoft Word 2007 (.docx and .dotx), PowerPoint 2007 (.pptx and .potx) and Excel 2007 (.xlsx) files.

- Along with existing Microsoft Office versions, Confluence now fully indexes Microsoft Office 2007 files and their content can be searched by Confluence.
- Using Confluence’s **Office connector macros**, you can insert Word, PowerPoint or Excel 2007 files directly into your Confluence page or blog post.
- Office files can be edited directly from any page or blog post or their list of attachments.

⚠️ If you use the Firefox browser to work with Confluence, don’t forget to **reconfigure the Firefox add-on** (WebDAV Launcher options) to handle the new Office 2007 file extensions. Otherwise, you will not be able
Confluence 4.2 Documentation

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.

New ‘Move Page’ Feature

Confluence introduces a new page moving feature, that easily allows you to move the page you are currently viewing, adding or editing to another page elsewhere in the same or another space of your Confluence site. This feature is available through a new ‘Move Page’ dialog box, which provides the following flexible methods for moving pages:

- **Known Location** – Allows you to type the name of a space and within that space, the ‘parent’ page under which to move your page.
- **Search** – Allows you to search for a ‘parent’ page (within a selected space or set of spaces) under which to move your page.
- **Recently Viewed** – Allows you to select one of your recently viewed pages to be the ‘parent’ of your page to be moved.
- **Browse** – Allows you to select a space and page (within the tree of pages in the space) that will be the ‘parent’ of your page to be moved.

For more information, refer to [Moving a Page](#).
A new 'Image Browser' has been introduced to replace the old 'Insert Image' window. The image browser provides a less-cluttered and enhanced interface that allows you to:

- Preview an image in detail before inserting it into a page. This is done by hovering over any image in the browser and clicking the 'magnifying glass' icon in the lower-right corner.
- Preview an image elsewhere on the web via its URL before inserting it into a page.

---

**Draft Comparisons**

Confluence's drafts features have been enhanced, such that you can now view any of your unsaved draft changes before deciding to resume editing them. This nifty feature comes in handy, particularly when other people have made subsequent changes to a page or blog post in your drafts list and you need to merge changes or resolve a conflict.
Page Restrictions Dialog Box

Confluence’s page restrictions feature has been incorporated into a convenient and accessible dialog box that is now easier to use than before.

- The page restrictions dialog box can be accessed from the padlock icon or the ‘Tools’ -> ‘Restrictions’ menu item whilst viewing any Confluence page. From this dialog box, you can see all viewing and editing restrictions associated with the current page. You no longer need to view the page’s associated ‘Info’ page to see the page’s restrictions.
- You no longer have to edit a page to modify its page restrictions. You can edit all page restrictions from this easily accessible dialog box.
  🔄 The page restrictions dialog box is still accessible when when a page is in edit mode.
- In addition to user and group names, the name field also accepts a user's full name. Full names are 'auto-completed' to help you find the relevant person more rapidly.

Web Browser Version Support

Confluence 3.1 now fully supports the following recent web browser versions:

- Internet Explorer 8
- Safari 4
- Firefox 3.5
Other Editor Enhancements

Edit Mode Exit Notification

Whenever you add or edit a page, comment or blog post and then click onto another Confluence feature that navigates away from your unsaved content, a message box appears, warning that your content will be saved as a draft (if it is a page) or lost (if a comment). This allows you to cancel out of this action if it was accidental.

New Rich Text Editor Insert Menu

Confluence’s rich text editor now combines a number of its commonly used editing features into a new convenient 'Insert' menu.

- The Horizontal line, Insert Symbol and Insert Emoticon Toolbar icons have been moved into the new insert menu.
- The functionality to insert images, links or attachments into a page can now also be accessed from this menu.
- The macro browser, as well as a number of commonly-used macros are conveniently accessible from this menu too.

Macro Browser Smart Fields

When using the Macro Browser, an 'auto-complete' feature is now provided on any parameters that require the
entry of a single item, such as a page title, username or space key. This greatly facilitates the customisation of macros and minimises the need to know the exact item names in advance.

Editor speed

Thanks to many individual technical improvements, the Rich Text Editor opens up a lot faster than in previous Confluence releases. On a local network it appears almost instantly, and even when accessing a Confluence server on a different continent (in our case, accessing a Confluence server in the US from Australia) it takes less than 3 seconds to start editing a page.

Other Improvements

Add Pages or Blog Posts from the Dashboard

You can now add pages or blog posts directly from the Dashboard without having to browse to a specific space first. To do this, click on either the ‘Add Page’ or ‘Add Blog Post’ buttons to open the pop-up balloon, which allows you to choose the space in which to add the new page or blog post and in the case of pages, a template on which to base the page content.

New ‘Link to this page’ feature
If you wish to link to a Confluence page from any other location on the web, use the convenient 'Link to this Page' feature (available from any page's or blog post's 'Tools' menu). Upon selecting this feature, the 'Link to this Page' dialog box opens, from which you can copy three versions of the link to embed elsewhere:

- **Link** – Standard URL which should work from any other accessible location on the web.
- **Tiny Link** – A reduced-length version of the 'Link', which can be used in text fields of limited length, such as tweets or Confluence Status Updates.
- **Wiki Markup** – A wiki markup version of the link, which can be used in any other location within your Confluence site.

![Link to this Page](image)

*More* option on Activity Streams

A 'More' option has been added to various activity streams throughout the Confluence interface, including the profile sidebar, a user's profile page and via the recently updated macro. Clicking 'More' expands the list of results, providing a convenient means of accessing progressively more distant user activities.
User Interface Performance Improvements

Most JavaScript and Cascading Style Sheet (CSS) files are now downloaded in one batch, greatly improving the performance of Confluence's editing features and general page rendering.

Other Small Enhancements and Improvements to Confluence

- Support for OAuth — With the introduction of gadgets (above) in this release, Confluence 3.1 now allows you to establish OAuth relationships with other web applications such as JIRA 4.0+, iGoogle, Gmail etc., thereby allowing them to share resources via gadgets.
- New Log In and Log Out screens.
- In an aim to minimise confusion, 'News Items' are now consistently called 'Blog Posts' throughout the Confluence interface and a list of blog posts is collectively referred to as a 'Blog'.
- Macro developers are now able to specify whether the macro body should or should not be displayed in Rich Text editor. For more information, please refer to CONF-12149.
- Other minor interface improvements.

Confluence 3.1 Beta 1 Release Notes

⚠️ Confluence 3.1 Beta 2 has been released!

Please refer to the Confluence 3.1 Beta 2 Release Notes for updated information on the enhancements available in this version.

Confluence 3.1 Beta 1 is a public development release ("Beta") leading up to the official release of Confluence
3.1, which we aim to ship in Q4/2009.

Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

Do not use in production

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

Who should try this out?

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code. Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.

Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.

Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.

Upgrade Procedure

If you wish to upgrade your existing Confluence installation with this version, ensure you have created a separate copy of your current Confluence production installation *first* and using that copy, follow the normal
upgrade instructions to upgrade it to this development release. If you have also implemented customised site- or space-specific layouts, you will need to re-implement them after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

Downloads

All development releases are available from Development Releases on the Atlassian website.

Known Issues

There are several bugs outstanding which will be resolved before the official release. Some bugs you are most likely to come across are:

- **Page Preview** — When editing a page or blog post and you click the 'Preview' tab, only the first section of content is shown. You will not be able to scroll down to view the remaining content on a page.
- **Widget Connector Icon** — The current icon has not yet been finalised and will change before the official release of Confluence 3.1.
- **Quick Navigation Aid** — The Quick Navigation Aid does not work in Internet Explorer 6.0.

Refer to our JIRA site for a list of Confluence 3.1-specific bugs.

Highlights of Confluence 3.1

Highlights of this Release:

- Introducing Gadgets
- Office 2007 Support
- New 'Move Page' Feature
- New Image Browser
- Draft Comparisons
- New Page Restrictions Dialog Box
- New Rich Text Editor Insert Menu
- Other Editor Enhancements
  - Macro Browser Smart Fields
  - Edit Mode Exit Notification
- Other Improvements

1

Introducing Gadgets

Gadgets are small objects that offer dynamic content and functionality which may be served by any OpenSocial-compliant web application, such as JIRA 4.0+, the same or another Confluence installation, or non-Atlassian applications such as iGoogle and Gmail.

- Confluence supports the use of gadgets in pages and blog posts, which are accessible through the macro browser.
- Confluence can also serve its own gadgets, for use in any other OpenSocial-compliant web application including the same or another Confluence installation. Two such gadgets are bundled with Confluence:
  - Activity Stream — This gadget shows a list of recent activities that have occurred on the Confluence server, such as the addition of new pages, blog posts or comments, content edits, status updates and so on.
  - Quick Navigation Aid — This gadget provides heading and content search capabilities on a Confluence server.

Inserting a JIRA Gadget onto a Confluence Page
Office 2007 Support

Confluence now provides full support for Office 2007 files, allowing you to view and edit content from Microsoft Word 2007 (.docx and .dotx), PowerPoint 2007 (.pptx and .potx) and Excel 2007 (.xlsx) files.

- Along with existing Microsoft Office versions, Confluence now fully indexes Microsoft Office 2007 files and their content can be searched by Confluence.
- Office files can be edited directly from any page's or blog post's list of attachments.
- Using Confluence's Office connector macros, you can insert Word, PowerPoint or Excel 2007 files directly into your Confluence page.

New 'Move Page' Feature

Confluence introduces a new page moving feature, that easily allows you to move the page you are currently viewing, adding or editing to another page elsewhere in the same or another space of your Confluence site. This feature is available through a new 'page move' dialog box, which provides the following flexible methods for moving pages:
- **Known Location** – Allows you to type the name of a space and within that space, the 'parent' page under which to move your page.
- **Search** – Allows you to search for a 'parent' page (within a selected space or set of spaces) under which to move your page.
- **Recently Viewed** – Allows you to select one of your recently viewed pages to be the 'parent' of your page to be moved.
- **Browse** – Allows you to select a space and page (within the tree of pages in the space) that will be the 'parent' of your page to be moved.

For more information, refer to [Moving a Page](#).

---

**New Image Browser**

A new 'Image Browser' has been introduced to replace the old 'Insert Image' dialog box. The image browser provides a less-cluttered and enhanced interface that allows you to:

- Hover over any image in the browser and expand the image (to preview it in detail) by clicking its 'magnifying glass' icon in the lower-right corner, before inserting it onto a page.
- Add a link to an image elsewhere on the web via the image's URL.
Draft Comparisons

Confluence’s drafts features have been improved, such that you can now view any of your unsaved draft changes before deciding to resume editing them. This nifty feature comes in handy, particularly when other people have made subsequent changes to a page or blog post in your drafts list and you need to merge changes or resolve a conflict.

<table>
<thead>
<tr>
<th>Title</th>
<th>Last Saved Date</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page with Partial Content</td>
<td>less than a minute ago</td>
<td>Resume Editing</td>
</tr>
<tr>
<td>Page with Content to Merge</td>
<td>2 minutes ago</td>
<td>View Changes</td>
</tr>
<tr>
<td>Page with a Conflict</td>
<td>12 minutes ago</td>
<td>View Changes</td>
</tr>
</tbody>
</table>

Unpublished Changes for ‘Working with Drafts Overview’

At regular intervals, Confluence will automatically save the page you are editing and maintain a copy of it as a draft. If some system failure or error prevents you from saving your changes, you can retrieve the draft and continue working on it.

A draft is a snapshot version of a page which Confluence saves automatically at regular intervals while you are editing the page. Confluence saves these interim versions even if you do not save the page yourself. This is a useful feature that minimises loss of work if your Confluence site experiences a problem.

At regular intervals, Confluence will automatically save the page you are editing and maintain a copy of it as a draft. If some system failure or error prevents you from saving your changes, you can retrieve the draft and continue working on it.

* Drafts are created while you are adding and editing a page or blog post.
**New Page Restrictions Dialog Box**

Confluence's page restrictions feature has been incorporated into a convenient and accessible dialog box that is now easier to use than before.

- The page restrictions dialog box can be accessed from the padlock icon or the 'Tools' -> 'Restrictions' menu item on any Confluence page. From this dialog box, you can view all viewing and editing restrictions associated with the page you are viewing. You no longer need to view the page's associated 'Info' page in order to view these restrictions.
- It is no longer necessary for a page to be in edit mode in order to modify its page restrictions. You can edit all page restrictions from this dialog box.
- The page restrictions dialog box is still accessible when when a page is in edit mode.

![Page Restrictions Dialog Box](image)

**New Rich Text Editor Insert Menu**

Confluence's rich text editor now combines a number of its commonly used editing features into a new convenient 'Insert' menu.

- The Horizontal line, Insert Symbol and Insert Emoticon Toolbar icons have been moved into the new insert menu.
- The functionality to insert images, links or attachments into a page can now also be accessed from this menu.
- The macro browser, as well as a number of commonly-used macros are conveniently accessible from this menu too.
Other Editor Enhancements

Macro Browser Smart Fields

When using the Macro Browser, an 'auto-complete' feature is now provided on any parameters that require the entry of a single item, such as a page title, username or space key. This greatly facilitates the customisation of macros and minimises the need to know the exact item names in advance.

Edit Mode Exit Notification

Whenever you add or edit a page, comment or blog post and then click onto another Confluence feature that navigates away from your unsaved content, a message box appears, warning that your content will be saved as a draft (if it is a page) or lost (if a comment). This allows you to cancel out of this action if it was accidental.
Other Improvements

Other small enhancements and improvements to Confluence include:

- Support for Internet Explorer 8 — Confluence 3.1 now fully supports Internet Explorer 8, released around mid-2009.
- Support for OAuth — With the introduction of gadgets (above) in this release, Confluence 3.1 now allows you to establish OAuth relationships with other web applications such as JIRA 4.0+, iGoogle, Gmail etc., thereby allowing them to share resources via gadgets.
- New 'Link to this page' feature — If you wish to link to a Confluence page from any other location on the web, use the convenient 'Link to this Page' feature (available from any page's or blog post's 'Tools' menu). Upon selecting this feature, the 'Link to this Page' dialog box opens, from which you can copy three versions of the link to embed elsewhere:
  - Link — Standard URL which should work from any other accessible location on the web.
  - Tiny Link — A reduced-length version of the 'Link', which can be used in text fields of limited length, such as tweets or Confluence Status Updates.
  - Wiki Markup — A wiki markup version of the link, which can be used in any other location within your Confluence site.
- 'More' links on activity streams — 'More' links have been added to various activity streams throughout the Confluence interface, including the profile sidebar, a user's profile page and via the recently updated macro. Clicking on a 'More' link expands the list of results, providing a convenient means of accessing progressively more distant user activities.
- New Log In and Log Out screens.
- In an aim to minimise confusion, 'News Items' are now consistently called 'Blog Posts' throughout the Confluence interface and a list of blog posts is collectively referred to as a 'Blog'.
- Other minor interface improvements.

Confluence 3.1 Newly Deprecated Code

This page should show all the code that was deprecated (not deleted!) during the Confluence 3.1 release cycle.

This is work in progress, and may not be a complete summary. As always, the truth is in the code. This page is more for explaining and discussing our decisions.

Release Notes 3.1-m7 ("Milestone 7")

Milestone release advisory
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us. Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.

Not quite a beta yet!
While this release is almost feature complete there are still one major technical improvement (superbatching) and one feature (the dashboard-widget) outstanding, so we can't call it beta just yet. Apart from that though, M7 is feature complete. Anything that you don't see here, you won't see in the final product. We will keep fixing bugs (yes, there are still quite a few unfortunately), but if something else in the functionality really annoys you, please raise it with us now! You can add a comment, or you can send us a mail, or of course raise JIRA issues.

⚠️ The files are not available for download at the moment, they will be added on Thursday. This page is a teaser, and for use by our translators. 😊

Gadgets & Office Team

**Indexing and Searching of Office 2007 files**

The contents of Confluence attachments created by PowerPoint 2007, Excel 2007, and Word 2007 are now fully searchable inside Confluence. This includes files with pptx, xlsx, and docx extensions as well as other extensions like potx (PowerPoint template) and dotx (Word template).

**PowerPoint 2007 previews**

You can now preview PowerPoint 2007 files directly in Confluence. We're proud to say that this completes the goal of supporting the new 2007 file formats for the three main Microsoft Office products (Word, Excel, and PowerPoint) in Confluence 3.1. This is in addition to already supporting the legacy binary format.

**Keyboard navigation of full-screen PowerPoint and PDF slideshows**

If you are using Flash player 10 or higher, you will no longer see any controls when previewing Powerpoint or PDF files in full screen mode. Instead, you must use the spacebar or the arrow keys to move between the slides. Press escape to exit full screen mode.
Launch Microsoft Office from the Attachments screen.

Previously, you had to preview a file to get the option to edit it. We've added a new 'Edit' option to each attachment that will launch the appropriate desktop editor for that attachment. The old 'Edit' option has been renamed to 'Properties'.

Editing user preferences of OpenSocial gadgets in the Macro Browser

As promised in the last release notes we moved the editing of non hidden user preferences to the usual location for macro parameters on the right hand side:

Activity Stream Gadget

We've added an activity stream gadget for Confluence. This means you can now have your Confluence Activity on your JIRA dashboard or on a Confluence page! You can also directly comment from the activity stream.
Dialogs Team

Page move dialog

We've added new tabs and improved the design of the new Move Page dialog based on feedback from earlier iterations. Some key improvements:

- A quick way of specifying a known location in the wiki using space and page title autocomplete (quick-nav style)
- Search and Recently Viewed tabs for locating a parent page in different ways
- An improved tree component which gives better loading feedback
- Fixed description panels so helpful text doesn't disappear when you scroll the tree
- A new location panel in the dialog so you know where you're moving a page from and to
- Immediately highlight problems with the new location, such as attempting to move a page beneath itself or its children.

The move dialog is feature-complete for this release, but we still have a few remaining improvements to make. In particular, scrolling the tree to the correct location when it opens and making the tree completely undraggable will be fixed for the next release.

Image browser

The new image browser dialog now supports uploading files. The upload proceeds faster than before (because the entire window doesn't need reloading), and you'll get a thumbnail of your image preselected, ready to insert.

We've fixed the bugs with image borders that prevented them working properly in the rich text editor, and enabled borders by default for newly inserted images. The dialog also includes some simple keyboard navigation that should make it more intuitive to interact with. All features of the image dialog have been tested with all our supported browsers.
We also spent some time on improved validation of uploaded attachments and thumbnail generation. The old insert image window is now disabled, so please let us know if you have any problems with the new functionality.

The image dialog is feature-complete for this release, but also has a few issues which will be fixed before the final release. Better handling of server outages and not being able to attach due to permissions is coming in the next release.

**Page “Permissions” dialog**

We have reverted to the two row layout to avoid permission-restriction-inconsistencies, and fixed a few bugs along the way. Most notably, inherited restrictions are now displayed separately from the current level’s restrictions, and hidden by default. This avoids cluttering the page with stuff you usually know about already (when working in restricted page hierarchies).

**Engine Room**

Nothing big went into M7, the super-batching work is ongoing and will mean faster page loads from 3.0-beta1 onwards.

**Small Improvements**

The footer is now always at the bottom at the viewport, rather than the bottom of the content. This makes the layout a lot cleaner on short pages:
Open bugs

Plenty.

What's next?

Beta 1 is due next week

Release Notes 3.1-m6 ("Milestone 6")
For testing use only
Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- Development releases are not safe — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.
We are pretty close to Beta now, so if you are a plugin author and haven’t checked out the latest milestones of 3.1, you should do it now. The API won’t change much anymore, from now on it’s mainly bugfixing.

**Gadgets & Office Team**

*Editing user preferences of OpenSocial gadgets in the Macro Browser*

You can now edit user preferences of OpenSocial gadgets directly in the Macro Browser. Let’s take our all time favourite Hamster gadget as an example:

![Edit Hamster Macro](image1)

![Change body color to red](image2)

⚠️ The UI will be slightly different in the next milestone, as we are going to move the form fields in the center of to the right hand side and make them part of the normal macro parameters.

**Gadget Directory**

You can now discover which gadgets are exposed by Confluence and can be used in other OpenSocial containers like JIRA 4 or iGoogle. There is a new “Gadget Directory” menu item in the browse menu which allows you to browse through the list of available gadgets.

![Gadget Directory](image3)

**Dialogs Team**

There’s a new “Insert” menu in the editor that helps you insert links, attachments, images and some default
macros without having to already know which little button you’re meant to press. (On IE the macro icons look odd, that’s a bug and will be addressed soon)

Help us choose the right macros!

We picked a few macros that we thought users should know about, which are simple enough to use right away, and which represent a decent spread across a range of macros to stimulate your interest in the “add more” button. Our constraint is 5 macros max, since the menus gets too long on stupid good old IE6 on a 1024x768 screen.

Apart from the edit menu, some bug fixes of note: Problems with links in the RTE have been fixed; pressing escape in the new image dialog doesn’t prevent it working next time; and move page works in IE8.

A lot of work has gone into the new page move dialog but it’s not quite ready, so we didn’t put it into M6.

Engine Room

A setting (under General Config) to serve the Javascripts back in the header has been introduced. This has been disabled by default for this milestone but will eventually be turned on as the default for 3.1. Reasoning behind this is that quite a few plugins have been broken and unusable by moving the scripts to the bottom of the page.

Work has been continued on the REST API however these were purely back end changes and the API itself has not changed since m5.

Bugfix Team

CONF-17171 - made selecting a page version on a page history view easier
General bug fixing.

Small Improvements

New Login Screen design, which looks more consistent with other products like JIRA. Another step forward in terms of making Confluence look better
Known Issues

Errors were reported by the JIRA trusted connection.

Release Notes 3.1-m5 ("Milestone 5")

Milestone release advisory
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. *We strongly recommend that you backup your Confluence home directory and database before upgrading!*

**Downloads**

All development releases are available from the development releases page on the Atlassian website.

---

Gadgets & Office Team
Gadgets in the Macro Browser

Want to embed one of those fancy new JIRA gadgets into your page? This has become really easy with the new Macro Browser integration. Just have a look in the "External Content" category to find available gadgets. Confluence comes with the Confluence QuickNav gadget by default, but the administrator can add as many gadgets as you like.

![Gadgets in the Macro Browser](image)

Configure your JIRA gadgets in the Macro Browser

You can now configure your JIRA gadgets using the macro browser. Just pick a JIRA gadget from the Macro Browser, configure it and add it to your Confluence page or blog post.

![Configure your JIRA gadgets in the Macro Browser](image)

Office 2007 support

We've fixed a couple of minor issues with the Word 2007 integration. But the really good news is that we've started working on PowerPoint 2007 support! Nothing to see yet, but stay tuned.

Dialogs Team

The new image browsing dialog has been restyled and as a bonus now works in new pages and blogs.

Engine Room

The Confluence REST plugin (prototype API) has now been enabled for this milestone. In addition to spaces (in previous milestone) we now have an API for viewing Confluence content (pages, blogs, comments) with page children expansion supported.

Some very basic documentation can be found here: [Prototype REST API](#)

Bugfix Team

Fixed [multiple bugs](#).

Misc
Faster editor load

With a few improvements we have made to the way we load TinyMCE, it should appear faster across all the browsers.

This is an Agnes Ro 20% production

Prototype REST API

⚠️ This page is obsolete

Please refer to the REST API documentation in the Confluence developer documentation.

This page documents the Prototype REST API supported for Confluence 3.1.

**Space**

**Getting a List of Spaces**

**Resource:** /space

**Description:** List all spaces (maximum page size of 50) visible to the current user

**Parameters:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start-index</td>
<td>start offset of the list</td>
</tr>
<tr>
<td>max-results</td>
<td>maximum number of results to return</td>
</tr>
<tr>
<td>type</td>
<td>space type e.g. personal, all</td>
</tr>
<tr>
<td>expand</td>
<td>use ‘space’ to expand the spaces details of each space listed</td>
</tr>
</tbody>
</table>

**Result:**
Looking up Details of a space

Resource: /space/{key}
Description: Displays the details of the space identified by {key}
Parameters:

<table>
<thead>
<tr>
<th>expand</th>
<th>use 'rootpages' to list all the root level pages of the space</th>
</tr>
</thead>
</table>

Result:
Content

Getting Content

Resource: /content/{id}
Description: Gets confluence content by id
Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expand</td>
<td>use 'children' to list all the child pages of the page</td>
</tr>
</tbody>
</table>

Result:
Release Notes 3.1-m4 ("Milestone 4")

Milestone release advisory
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

**Downloads**

All development releases are available from the development releases page on the Atlassian website.

**Features!**
As you may know, we have started a major hiring campaign, and this has slowed us down a little in the past few weeks. M4 however is back with a vengeance, boasting quite a few improvements. See for yourself

*Editor Team*

**Move Page**

We are reworking the way you can move pages around. It is now possible to move pages without editing the page, and you don't drag&drop anymore, you simply pick your parent in the tree. The next Milestones will allow you to search for a parent, and to use your recently viewed pages to move. At the moment, you can not re-order while moving the page (is this a problem though? What do you think?)

*Macro Browser*

David Taylor's "Smart Fields" 20% project has been included in the Macro Browser although only for macro parameters that take single entries. i.e. if a macro takes a single username, space, or page then a suggestion drop down will be presented (See the screenshot). If a macro takes multiple usernames or spaces or pages then there will be no assistance.

Displays the excerpted contents from another page within the same space. [Documentation]

![Page Containing the Excerpt *](image)

David's "Smart Fields" work also included some custom fields for the Office Connector viewfile macros to provide assistance with referencing the MS Office document you are trying to view. Instead of separate fields for
space and page name these have been combined into a single field with a suggest drop down. The file name field has been converted to a select box showing the appropriate attachments for the selected page.

Embeds an Office Excel document (.xls) into your Confluence page. Documentation

**Page Name**

**Monkey Trousers**

Confluence page containing the attached .xls file. If not specified, the current page is assumed.

**File Name**

Name of the attached .xls file to view in the page.

**Show Grid?**

Shows or hides grid lines.

**Worksheet Name**

Name of worksheet to show. If not specified, the first worksheet is shown.

**Last Row**

Number of last row to show, where the first row starts at 0. Example: to show the first 2 rows, use 1. If not specified, all rows are shown.

### Image Browser

Some further progress has been made on the second "insert image" button on the RTE and wiki editor toolbars. You can now view and insert images that are already attached to the page.

This dialog is still missing some obvious functionality such as image configuration options and image upload hence the reason the original dialog is still present for now.

**Known Issue:** You should also note that in the current milestone this new dialog is only working correctly when editing pages, not when creating new pages.

### Engine Room

**JS/CSS rearrangements**

As you saw on our previous milestone notes, we have rearranged CSS to the top and JS to the bottom of the page, making the rendering experience better. This might have consequences for your macros/plugins, so DO have a look, and tell us what you think.

### REST

The Confluence REST plugin (prototype API) has been added, however it will be disabled for this release. Hopefully we will be able to enable this in next milestone when the plugin is a bit more stable.

Some space level resources have been implemented.

### Getting a List of Spaces

**Resource:** /space
Description: List all spaces (maximum page size of 50) visible to the current user

Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start-index</td>
<td>start offset of the list</td>
</tr>
<tr>
<td>max-results</td>
<td>maximum number of results to return</td>
</tr>
<tr>
<td>type</td>
<td>space type</td>
</tr>
</tbody>
</table>

Result:

```
<spaces>
  <space name="Demonstration Space" key="ds">
    <link rel="self" href="http://localhost:8080/rest/prototype/1/space/ds"/>
  </space>
</spaces>
```

Looking up Details of a space

Resource: /space/{key}

Description: Displays the details of the space identified by {key}

Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expand</td>
<td>set expansion options for children elements</td>
</tr>
</tbody>
</table>

Result:
Some of the names of the elements in the space details example are subject to change. The `children` element for example will likely be changed to something more appropriate (it refers to the top level pages of a space).

Small Improvements Team

Driving on the left shouldn't be so hard, so we've updated the left hand navigation panel.
Bugfix Team

Fixed multiple bugs. Most notably:
CONF-12864 - improved performance of PageNotFound action
CONF-9575 - fixed concurrency issue that was breaking reindexing job

Gadgets & Office 2007 Team

Word 2007 & Excel 2007

We added Word 2007 support for document import and the view-file macro, as well as Excel 2007 support for the view-file macro. We don't support PowerPoint 2007 for the view-file macro yet and can't index any Office 2007 documents yet. Work in progress.
Support for importing other document formats

You can now import RTF and ODT files in addition to DOC and DOCX.

Gadget Macro

We are happy to introduce the new gadget macro! It's currently not very usable as we don't have any UI yet to change the user preferences for a gadget, which means you have to enter them manually.

Example Markup:

```plaintext
{gadget:url=[baseurl]/rest/gadgets/1.0/g/com.atlassian.confluence.plugins.gadgets:gadget-search/gadgets/gadget-search.xml}{gadget}
```

Jira chart gadget and Confluence QuickNav gadget on a Confluence page:

QuickNav gadget

We are also stoked to show off our first Confluence gadget which can be embedded in other gadget containers. The gadget URL is:
Unfortunately you can’t embed that gadget into iGoogle or GMail yet, because we have to upgrade to a newer version of the OAuth plugin first. This will work starting in 3.1-m5.

Gadget Directory

For every gadget you want to embed on a page, it needs to be added to the gadget directory first. This is to make sure you can’t just embed any third party gadgets because those might contain malicious JavaScript which will then be executed as coming from the same security domain as Confluence.

OAuth Integration

We have also integrated the OAuth admin plugin which allows you to configure your consumer information as well as adding OAuth consumers and service providers. Detailed documentation will be available on CAC in the future.

20% and miscellaneous

Thumbnail Dialogs

Thumbnail images previously opened the full image in a new popup window, when clicked. Now clicking on a thumbnail opens the image in a fancy dialog (same as the image gallery).

Sprite Image for Macro Browser

On the edit page, the macro browser is built up in the background with its pretty macro icons. Although the macro icons are cached, there are quite a number of requests made on a cold browser cache (we have 52 macro icons, so 52 requests are made just for the macro browser). This has been reduced to one request by generating a sprite image for all the icons and using it with css and background-image positioning.

hod has been added for macros to more clearly define their desire to be kicked out of paragraphs, and code macros do that. This change is still awaiting review, so it may be temporary.

AUI upgraded to 1.2.1!

Release Notes 3.1-m3 ("Milestone 3")
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.

Maintenance mainly
Milestones 2 and 3 don't have many feature-changes, because a lot of the development happens on branches and under the hood. We have been doing some UI polish, but nothing large is to be seen yet.

We did however split up resource-loading, so CSS is now at the top of the page, and JS is at the bottom, resulting in faster page views. If you are a plugin author using resource bundles and JS/CSS (which you should, obviously), then definitely check out this milestone to see if your plugin works as expected.

Stay tuned for M4 in about two weeks, which will show off some nice new feature improvements.

Cheers,
Per and the Confluence development team

**Confluence 3.1 Deprecated Code Cleanup**

This document contains information for Confluence plugin developers regarding changes to the Confluence codebase in the upcoming 3.1 release.

**Confluence 3.1 Deprecation Cleanup**

Every major Confluence release, we clean up the codebase by removing classes and methods that have been deprecated in previous releases. These changes were included in the Milestone 2 release of Confluence 3.1. We strongly encourage plugin developers to test their plugins against our milestone releases.

If the removal of these classes or methods causes you significant problems maintaining your plugins, please let us know. We will work with you to find a workaround, or possibly reinstate the code before the final release. (Note that the longer the code in question has been deprecated, the less inclined we will be to replace it. Some of the stuff we've removed here will have been giving you compiler warnings for years.)

More information on our guidelines for removing deprecated code: [Deprecation Guidelines](#)

**Changes in Confluence 3.1 Milestone 2**

For the sake of brevity, the com.atlassian.confluence part of package names has been omitted.

**Removed Classes**

<table>
<thead>
<tr>
<th>Class</th>
<th>Deprecated Since</th>
</tr>
</thead>
<tbody>
<tr>
<td>.pages.BreadcrumbsManager .pages.DefaultBreadcrumbsManager</td>
<td>2.7</td>
</tr>
<tr>
<td>.plugin.descriptor.web.conditions.user.UserHasHistoryCondition</td>
<td>2.8</td>
</tr>
<tr>
<td>.util.VelocityUtils</td>
<td>2.0</td>
</tr>
<tr>
<td>.util.PageComparator</td>
<td>2.3</td>
</tr>
<tr>
<td>.util.ResourceManager com.atlassian.confluence.util.DefaultResourceManager</td>
<td>2.8</td>
</tr>
<tr>
<td>.event.EventListener com.atlassian.confluence.event.DeprecatedEventListenerWrapper</td>
<td>2.3</td>
</tr>
</tbody>
</table>
While the ResourceDownload class was only deprecated in 2.10, it could only ever be used in the context of the ResourceManager which was deprecated earlier. It is very unlikely that code exists that relies on one but not the other.

These Radeox macros were superseded by the equivalent V2Renderer macros in Confluence 1.4, but only marked as deprecated in the 2.7 release.

### Removed Constants

<table>
<thead>
<tr>
<th>Class</th>
<th>Constant</th>
<th>Deprecated Since</th>
</tr>
</thead>
<tbody>
<tr>

Release Notes 3.1-m1 ("Milestone 1")

ℹ️ Outdated page

These are not the release notes you are looking for

This page is outdated, but has high Google ranking 😊

Please refer to the official Confluence 3.1 release notes over here.
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public **development release** (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.

Yay, we are back!
After 3.0 came out, we spent some time in bugfix-mode, then we had a 20% week, 2 devspeed weeks, and the last week was mainly spent planning the next release. So that's why there has not been much visible progress recently lately. Development on core 3.1 features has started, but in this milestone we mainly ship all the bugfixes we did for 3.0.1, some small improvements, and three 20% projects.

**New Webstart Installer**

We are trying something new. While we will provide the downloadable files too, we encourage you to try our webstart based evaluation installer. Visit [http://webstart.atlassian.com/confluence-3.1-m1-r2/confluence.jnlp](http://webstart.atlassian.com/confluence-3.1-m1-r2/confluence.jnlp) for a snappy installation experience.

**New Native Mac Installer**

When you go to the download section, you will notice a new DMG file. This contains our new native experimental Mac installer. Give it a try and tell us what you think. Instructions coming soon!

And here are all the cool features in M1 you will get.

1. **Interactive “Get more”**

Recently updated macros are now interactive. You will get a little "More" link to load new updates dynamically within the page. This small but awesome feature can also be found on your network page, and in the space’s recent update tab. It doesn’t screenshot too well, so try it out for yourself. Anyway here is what the macro looks like:

<table>
<thead>
<tr>
<th>Recently Updated</th>
<th>Updated by</th>
<th>About 3 hours ago</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://atlassian.com/confluence-3.1.1-m1">Rename News to Blogs Progress Page</a></td>
<td>Brian Nguyen</td>
<td></td>
</tr>
<tr>
<td><a href="http://atlassian.com/confluence-3.1.1-m1">Confluence Server</a></td>
<td>David Longa</td>
<td></td>
</tr>
<tr>
<td><a href="http://atlassian.com/confluence-3.1.1-m1">Confluence News to Blog Post</a></td>
<td>Brian Nguyen</td>
<td></td>
</tr>
<tr>
<td><a href="http://atlassian.com/confluence-3.1.1-m1">Confluence Without Coherence - Chapter One</a></td>
<td>Man Hyatt</td>
<td></td>
</tr>
<tr>
<td><a href="http://atlassian.com/confluence-3.1.1-m1">Confluence Without Coherence - Chapter One</a></td>
<td>Ronald Wallace</td>
<td></td>
</tr>
</tbody>
</table>

And here is what the network tab looks like:
Caveats:

- We feel that the link is a bit small and can be mistaken for a normal link. Especially on the static pages (network, updates in space) it makes sense to make the button much larger and more prominent. We will work with Design to find a solution
- The link also needs to go into the profile page (so you can see more updates on everyone’s stream), and into the status tab. Dave will add that soon

This is a Dave Loeng 20% production

Draft diffs and visibility

Always wondered what your old drafts were about? Or when a draft is being saved, what part of that huge document you’re editing has actually changed? Well, now you can, thanks to DraftDiffs.

Which takes you to this screen:
**Known issues:** Annoying Javascript alert when there are no changes at all. This feature unfortunately also highlights our roundtripping bugs... ahem...

This is a Brian Nguyen 20% production

3

**Small Improvements**

**Edit loss warning**

Whenever you are in edit mode and decide to leave the page or close it, you will now get a warning popup. This is especially useful when writing comments (no drafts...) and for technically challenged people who don't understand drafts in the first place. As raised in the JIRA issue, we may have to provide a setting to disable these warnings (it can be a bit annoying if you like to change your mind often), so watch CONF-16075 for updates. The idea has been raised that we may only want this feature for comments when no drafts are being saved. We will dogfood this over the next few weeks, and see how we like it or not.
This is just an experiment, probably not shipping as a default for 3.1, but worth a look. Do you like it?

More options to search for by time

We added two more options to filter by time: Last 6 months, Last year, Last 2 years, and fixed the calculation for today/yesterday by making it work by 24h instead of what the server thinks is midnight. 48h obviously encompasses the last 24 hours two, which was akward in the old system, where yesterday would really just mean yesterday, but not today.

Plugin points in the editor

We were approached by a developer who wants to write a spellchecker plugin for Confluence, so Agnes volunteered to pluginpointinize the editor. You won't see anything right now, but it will make many plugin authors
happy. Read the documentation for how to write plugins for the editor.

This is an Agnes Ro 20% production

"Link to this page" Dialog

In order to make Tiny Links more accessible, we added a new Menu option which opens a new dialog, which shows the three ways to link to a page. Full URL, TinyURL, and Wiki Link. Probably the Full URL is not as important, but the dialog looked a bit unbalanced, and it makes it clearer that both URL's are equivalent.

Selecting the menu opens up this dialog, with the Tiny Link conveniently selected.

Link to this Page

Link: https://extranet.atlassian.com/display/CONFDEV/Confluence+3.1-m1+Milestone

Tiny Link: https://extranet.atlassian.com/x/Elipa

Wiki Markup: [CONFDEV:Confluence 3.1-m1 Milestone Notes]
We didn't rename Tiny Links to Permalinks, as has been suggested. What do you think, should we?

This is the final Chris Broadfoot 20% production.

**Release Notes 3.0-rc1 ("Release Candidate 1")**

Hi everyone,

we are approaching the 3.0 release date. We have built our first release candidate, and we hope to turn this into the final release unchanged soon.

There have been a few changes since the last two betas: The translations are now up to date, more icons have been added to the macro browser, and we have tweaked a few screens, like the profile page. And of course we have fixed dozens of bugs (see JIRA URLs below). We are very pleased with the quality of the release and we are currently not aware of any showstoppers or critical issues. Chances are that the final release will be just a rebranded RC, however you should still not use the RC on production systems, since we still have some final testing planned. We encourage you to use it for staff training purposes and for your upgrade testing though, since no more UI changes or changes to the upgrade process are scheduled.
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

Please note the following

- Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.

Issues resolved between Beta2 and Beta3: http://jira.atlassian.com/secure/IssueNavigator.jspa?reset=true&pid=10470&fixfor=14602
Issues resolved between Beta3 and RC1: http://jira.atlassian.com/secure/IssueNavigator.jspa?reset=true&pid=10470&fixfor=14625

Thanks for your feedback so far, it has helped us track down a few bugs, which will result in a smoother upgrade for everyone!

Cheers,
The Confluence Team

**Release Notes 3.0-beta2 ("Beta 2")**

**Welcome to our Beta Phase**

The Confluence team is proud to present the first public beta release of our upcoming Confluence 3 release. It contains all the features we intend to ship. We will be publishing Beta 3 next week, and then a rapid succession of Release Candidates in two weeks. We aim at shipping Confluence 3.0 in (very) early June.

So, calling all plugin developers: If you want to make sure your plugin plays nicely with 3.0 on the launch date, and if you maybe even want to use our new features from within your plugin, this is really the last chance to get started. Download the Beta right now

Note: This is still not a stable release, it is not meant for production use. So our normal Milestone disclaimer still applies:

**Milestone release advisory**
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.

Downloads

All development releases are available from the development releases page on the Atlassian website.

What is in it?
All the features we intend to ship are available in this beta. Unfortunately, the official documentation is not ready yet, so until we get a more official summary of the new features, please refer to our recent Milestone release notes, and try the beta out yourself.

Improvements

Since publishing Milestone 9, we have focussed on polishing our existing features. Here is a rundown on the changes since then:

**Community features**

Some important bug fixes:

Some IE issues: CONF-15497, CONF-15137, CONF-15474, CONF-15421, CONF-14593

Improvements to User Follow: CONF-15335, CONF-15279, CONF-15427, CONF-15286, CONF-15016

Removed the annoying page reload when following a user, CONF-15290

**Macro Browser**

Preview button removed and replaced by a refresh icon:

Some important bug fixes:

CONF-14720 Inserting a macro via the macro browser would always scroll to the top, which is very annoying if you are editing the end of the page.

CONF-15487 It is now possible to insert more than one macro in Safari via the macro browser!

**Office Connector**

CONF-14798 Performance improvements on the backend for the viewfile macro.

Also, the initial loading of the Flash front end should be a little snappier. There was a default "pre-load" screen that added 1-2 seconds to the load time. We also changed the background color to white so it also adds the impression of not appearing until it's loaded.
Engine Room

Confluence has been upgraded to the latest releases of Plugins 2 and SAL.

We did a small performance improvement by caching PersonallInformation objects by user name (CONF-15484), which will in particular speed up the rendering of profile pictures.

As part of this release cycle we fixed a lot of smaller bugs, but the most notable ones were related to content indexing:

CONF-15352 Fixed a race condition during content indexing which would result in leaked file handles, which had been introduced in M9
CONF-15483 Fixed a problem with a reindex being started before the plugin system was loaded. This would result in empty documents in the index.

Random

CONF-14322 was fixed, so change comments containing ampersands and angle brackets will no longer affect the system.

Known Issues

The Flash preview is broken in Office Connector that is bundled with beta 2. See CONF-15612. It's already fixed and it will be bundled in Beta 3 next week.

Release Notes 3.0-m9 ("Milestone 9")
For testing use only
Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

Summary
We are one week away from feature freeze, so this is the last major milestone before we enter beta next week. We are still working on some wording, on some plugin upgrades, and a few UI tweaks, but M9 is pretty much how Confluence 3 will look like. From now on, it's mainly about fixing up non-critical bugs and doing code reviews. Many Code reviews! 😊

Enjoy:

**Community**

*Followed Users and Favourite Spaces*

The terminology has been cleaned up and made consistent across the application. If you want to see what a user is doing you **follow** them, if you want to see what happens in a space, you mark that space as **favourite**. You can mark a personal space as **favourite**, and this is independent of **following** the user who owns the space.

One area we still want to improve is the 'User Follow' menu item and profile tab, which needs a better name.

*Follow Tab RSS and Design Improvements*

You can now get an RSS feed on any user's 'User Follow' tab. This feed will include all activity of the users followed by that person. This is a great new way of monitoring content on the Extranet.

We've redesigned the follow tab to highlight the activity information more and handle large lists of followers. We also added some clarifying text to this tab to better describe the different sections of this page.

There is now a maximum number of followers shown on this page, and separate pages to show the complete list. This addresses the performance and usability problems discovered in the previous milestone when you had a large number of followers or people following you.

*Profile Page Updates*

The layout of the profile page has been changed to try to improve the visibility of the activity. This puts the user's personal information over on the right hand side of the page.

On the left hand side, we now have new links to follow a user and favourite their space.

- 🌟 Remove Space from Favourites
Update User Status Permission

A new global permission was introduced to give system administrators control over who can use the user status feature.

If the permission is turned off for a user (or their group) then they will not have the ability to set their user status, nor will they have an 'Status Updates' tab in their profile.

Macro Browser

Macro Browser in the RTE

The Macro Browser is now finally available in the Confluence rich text editor (RTE)! It will assist you in inserting and editing macros, without having to understand the wiki markup.

Editing a macro can be done by placing the cursor in the start or end tags of the macro wiki markup. If you have context menus enabled, you will also see a new option for insert/editing macros.

Upgraded Macro Icons

Thanks to Stephen, we have even better icons for the macros in the macro browser. Check 'em out!

AUI 1.0

Confluence is now using the first release of AUI, 1.0.
**PDF Export**

Many bug fixes have been done for the new PDF export:

- **CONF-15220** - PDF Export converts a bulleted sublist into a numbered sublist
- **CONF-15148** - Follow macro should not include the 'Add' action when exported to PDF
- **CONF-15042** - PDF Space Export text uses US spelling instead of Australian
- **CONF-15038** - PDF Export from a page with non-default theme is trying to use the old method, and so it fails with an error
- **CONF-14909** - column and section macros render differently in PDF export when they have borders
- **CONF-14904** - IM presence macro shows a roque nbsp when exporting to PDF
- **CONF-14901** - The PDF export doesn't recognize all literal colors when used in the color macro
- **CONF-14889** - PDF Export from the Info pages is trying to use the old method, and so it fails with an error

**Engine Room**

Confluence has been upgraded to the latest releases of Plugins 2 and SAL.

**Release Notes 3.0-m8 ("Milestone 8")**

---

**Milestone release advisory**
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following
- Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

All development releases are available from the development releases page on the Atlassian website.

Summary
The Confluence team is excited to bring you our latest milestone release: Confluence 3.0-m8, "Milestone 8". This release includes a huge amount of improvements to the community features, additional performance improvements and many bug fixes.

**Community**

Be sure to check out the great improvements in Confluence's new community features:

- **Improved Activity list on Profile Page** - The user status list has been moved to its own tab and the new Recently Updated Macro has been put in its place. It's also been given a face lift and fits nicely into the profile page. Facebook eat your heart out.
- **Status list moved to separate tab with pagination** - The user status list now has a proper location, its own tab. This tab is the central place where you manage and view your historical status updates. Links to delete old status updates will be found on this tab.
- **Each status item has its own page so you can link to a status** - You can now create links to old status objects allowing for historical references as each status can be displayed on its own page.
- **Personal space sidebar has been updated to include an activity list and your follower information** - The personal space sidebar is coming along nicely and looks great with the new recently updated macro and the follow information.
- **Adding a follower on your Favourite People tab (or using the hover) will refresh the page and update the list immediately** - We changed how the follower information was looked up as to not use the lucene index and hooked into the hover so most changes on this page will trigger a refresh and the updates will be seen immediately! No more wondering if your new follower actually worked
- **Those extra fields on your User Profile page are now run through the wiki renderer allowing links and simple formatting**

![Improvements in Confluence's community features](image)

**Macro Browser**
The macro browser team spent the past two weeks working behind the scenes on placeholders for the rich text editor. Unfortunately, this change is too complex and risky to get into 3.0, so we have just a few small improvements in the macro browser this milestone:

- More parameters and documentation are available for macros in the macro browser. We now have 100% of the bundled macros with documented parameters, and will be just fine-tuning the documentation for the remainder of the release.
- The Office Connector (viewfile) macro shows up in the macro browser as separate macros for Word, Excel, PDF and Powerpoint documents.

**PDF Export**

Balsamiq Mockups and several other complex macros now export to PDF correctly (CONF-14792).

⭐ Why don't you try out the new PDF export right now? On any page, go to Tools, Export as PDF.

**Engine Room**

The Engine Room team implemented several important performance improvements for this milestone. Specifically:

- Searching should be faster and not blocked by index updates every minute. This should also make the dashboard and macros that use the search index slightly faster. CONF-7749, CONF-14803
- Image attachments embedded in a page are now cached by your web browser. This should make pages with lots of images faster to load and reduce the load on the server. CONF-8034
- Upgraded the WebDAV plugin to 2.0-beta2. This plugin has been released to the community for a while now, to very positive response. It should be more compatible with more clients now, though there is still some special configuration needed for Windows Clients. Read the documentation about client-configuration in order to test it.

**20% Projects**

Administrators can now customise the size of Confluence's caches from the web interface. Previously, you needed to edit an XML file and restart Confluence whenever you wanted to adjust the caches. This addresses one of the most popular supportability feature requests in the Confluence JIRA project, with 34 votes: CONF-12836.

**Bugs Fixed**

Several macros which were broken in M7 are now fixed: {flowchart}, {rsvp} and {pagetree}. CONF-14615, CONF-14829, CONF-14581

The Gliffy plugin and Beanshell macros now work with Confluence 3.0; previously customisation was required to get them to work properly with our latest development versions.

Below is a complete list of issues resolved in Confluence 3.0-m8.

Errors were reported by the JIRA trusted connection.

- APP_UNKNOWN; Unknown Application: {0}; ["confluence:4557196"]

Release Notes 3.0-m7 ("Milestone 7")

Milestone release advisory

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following

- Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.

Summary
The Confluence team is proud to present another incremental milestone, called M7. We are currently aiming at shipping M8 in two weeks and M9 in four weeks. M9 will be almost feature-complete and therefore similar to a beta release. After a couple of betas and release candidates we intend to ship Confluence 3 in late May. As always, things can still change a little, so there is no fixed date. But if you are a plugin developer, you want to have your plugin tested well before the big marketing buzz kicks in. We try to remain as backward-compatible as we can for Confluence 3, but if something slipped through the cracks we need your feedback, and we need it now. So do have a look at this milestone release and tell us what you think.

**Macro Browser and Rich Text Editor**

You can now choose the kind of right-click context menu you want in the Rich Text Editor. A new button on the toolbar, handily called “Toggle context menu”, toggles between the browser's default context menu and our TinyMCE one.

You can also tell the TinyMCE context menu that it isn't wanted via the "Disable context menu" option.

Macro Browser search has been improved and now accepts multiple words (order not important) and camel-casing (matches either case in consecutive words). The filtering logic has been added to AUI as a new *commented* method of AJS, "filterBySearch" - feel free to use it.

**Community Improvements**

This milestone shows a number of improvements from the Community Team.

**Profile Layout**

In the spirit of making the profile page actually page you want to visit, it's been given a facelift and has now
come closer in line with our standard UI.

It also includes your current status is clearly visible at the top of the profile page.

For now you have a Status Updates section on the right hand side of the profile page, the next milestone will see this will be replaced with the new Recently Updated Macro (see below) so it will include other kinds of activity as well. It's here now because otherwise you wouldn't have anywhere to delete or clear your status, eventually will be moved to another tab and/or page.

User Status Updates

- Delete And Clear Status
  You can delete status entries from the list on the right. Someone hacks in your status, you can now always delete it. You can also clear your current status, so any location showing your current status will show nothing. This won't remove it from your history but your current status will now be considered cleared.

  ![Status Updates](image)

- Status Icon
  A new status Icon was introduced by the Design team. The lightbulb has been replaced with some sexy quotes (").

- Immediate Updates
  Updating your status will use Javascript-Magic to update your status on the current page, giving you immediate feedback, with no need to refresh the page.
Recently Updated Macro

This is the first milestone that shows the hard work that David Loeng and Chris Broadfoot have been doing with our Recently Updated Macro.

To build up activity in the old recently updated macro the process would simply query the lastModified date of all the relevant content, then sort it accordingly. The side effect of this was, if two people edited the same page, you would only see the one edit in your list. Not only that, if you wanted to follow a certain user’s activity and someone edited a page after them, you wouldn’t see any update!

We’ve worked very hard on this and changed the way Confluence stores changes to documents and now tracks all changes every time a document, page, profile, status, anything, is updated.

This screen shot shows two edits from two different people on the same document, something that wasn’t previously possible. These changes were critical for implementing a proper follow feature for 3.0.

Bug Fixes

A number of bugs have been fixed by the community team, here are a list of some of the main ones:

- **CONF-14773** Expanding and collapsing the personal sidebar will no longer affect the comments on that page/blogpost.
- **CONF-14870** Delete links for user status items are now properly integrated with the new XSRF protection and actually work.
- **CONF-14778** Printing pages from a personal space no longer includes the sidebar

Other bug fixes:
- **CONF-14689** Comment edits now send notifications

Plus a number of other fixes.

PDF export team

Removed the PDF Export++ option. The new PDF export is what you get when you select just PDF Export. The old PDF export was removed.
Added javascript to the space export tree that will select/deselect all descendants of the clicked node. This change applies to all export formats not just PDF. This should save hours for the Atlassian Techwriting team.

Bugs fixed

CONF-14906 - Fonts are too large in the page index macro when exported to PDF
CONF-14905 - Note macro missing colored background in PDF export
CONF-14902 - content by label macro looks ugly when exported to PDF
CONF-14900 - Bookmarks macro is producing really large font when exported to PDF
CONF-14899 - Attachments macro is showing velocity junk when exported to PDF
CONF-14898 - Panel macros (warning, note, info) could use some extra padding in PDF export
CONF-14897 - Spaces macro renders as a single bullet item list when exported to PDF
CONF-14895 - Recently-used-labels macro with a table style doesn't look like a table at all
CONF-14894 - Blockquote text too large in pdf export

Release Notes 3.0-m6 (“Milestone 6”)
For testing use only
Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

Please note the following

- Development releases are not safe—Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path—Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.

Summary
This milestone is mainly about polishing features that were introduced previously, and a bit of back-end work for security and performance. We have fixed plenty of bugs of M5 too, and will keep fixing for M7.

**Known issues**

Given the recent work that has been done to improve "recent updates" (CONF-14434), updates shown on the dashboard will be affected shortly after the upgrade. You may notice that only changes made _after_ the upgrade will show. This will be rectified as soon as the index is rebuilt.

**Improvements and new Features**

**New PDF Export**

- This milestone contains the first cut of the Improved PDF export, which also give you more control over the conversion process by allowing you to use CSS. Please find the detailed documentation on CAC. CO NF-2079

There are still plenty of known bugs with the new PDF, we included it a bit early to be able to get feedback on the CSS-styling process, not for beta-testing purposes...

**Engine Room**

The ER team has implemented several more important fixes and improvements in this milestone:

- **supportability** - integrated thread-dump tool in the administration screen (CONF-12395)
- **security** - editing comments in wiki markup is no longer double-HTML-escaped in anti-XSS mode (CONF-14601)
- **cluster performance** - avoid unnecessary updates to distributed cache to improve cluster performance (CONF-14657)
- **general performance** - improve performance of retrieving many attachments, like on the attachments page (CONF-14422)
- **front-end performance** - add caching headers to attachments rendered with a "?version=x" parameter (CONF-8034)

**Office Connector**

- When launching an external editor from Confluence, you don't have to login again. CONF-14705
- You can now monitor what is in the conversion queue and what is actually being converted CONF-14707

**Macro Browser**

The following bugs have been fixed:

Errors were reported by the JIRA trusted connection.

- APP_UNKNOWN; Unknown Application: {0}; ["confluence:4557196"]

**Release Notes 3.0-m5 ("Milestone 5")**

---

**Milestone release advisory**
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.

Issues resolved or improved in this milestone since Milestone 3
Macro Browser (in Markup Editor)

The Macro Browser is now available in the wiki markup editor! Features are listed below.

Browse Macros

You can now browse through a list of categorised macros and select a macro to insert. Macros that do not have categories define can be found in the 'All' categories tab. To insert a macro, you can either double click on the macro or click it once and then click the 'Next' button.

Insert Macro

For macros that have parameter metadata defined, you will see parameter labels and descriptions with the appropriate input fields. So far we are handling boolean and select-one-from-list type parameters. Everything else is considered a string. Please note that there is no field validation.

For macros that don't have the parameter metadata defined, you will see a single input field for the macro parameters and its notation guide help (if any) below.

Preview Macro

A default preview will be loaded only if the macro doesn't have required parameters. The preview can be updated by clicking on the 'Preview' button. This button location will change in the future.

Edit Macro

You can also edit a macro by placing your cursor in the start tag of a macro and then clicking the Macro Browser icon. It should display the 'Insert X Macro' page with it's parameters populated.

Known Issues

- Macro summary and parameter descriptions are currently under review by the tech writing team, so please ignore grammar/spelling/crappy English for this milestone.
- The macro icons (displayed in browse macros) are temporary. Hopefully we will be able to get much sexier icons.
- Some macros falsely declare they have bodies (e.g. gallery) so you may see some unnecessary body text areas

Community

Several major community features have their debut in this milestone.

Status

This milestone, we are releasing the first version of the Status feature. There is still a lot of work to be done, it's not particularly polished but we want your feedback.
First of all, set your status from the user menu, where you'll get a dialog box allowing you to enter your new status.

You can see your status and others’ statuses from user hover, under the "Status List" option in user profiles, the "Favourite People" tab (see below), personal space sidebar (see below).

**Follow**

Marking another user as "favourite" is now meaningful. In milestone 5, you’ll be able to get a list of statuses from the people you follow.

Check out the “Favourite People” tab in your user profile – you can get there via your user menu.

It will show you who you’re following, and who’s following you. You can also quickly follow someone with the user search, and see a list of status updates from the people you follow.

**Personal Space Sidebar**

With this release, we now have some structured form of a user profile for every user. On the right of any personal space*, there’ll be a sidebar with various details of the person's space you're viewing. Don't worry, you can easily collapse the sidebar and it'll shift out of sight. Once you collapse the sidebar, it will stay collapsed for all personal spaces for the duration of your login session.

Here's what it looks like:
We plan to put more information on the sidebar, at the moment it looks a little silly if the user doesn't have a status set and hasn't filled out any of the extra profile fields we added last milestone.

This only works in the Default Theme.

**Known Issues**

- There are a few known issues with the Community work, the biggest thing is what you see at the moment is a first cut of the functionality, we plan to "sexy" it up a bit and make the status and profile pages look a lot nicer.
- You will also notice that when you favourite another user you will need to wait for the index to be flushed for your changes to be applied. This will be improved in a future milestone.

**Bugfixes**

There are two relevant bug fixes in this milestone:

- Configuration to prevent anonymous users accessing user profile information ([CONF-13276](#)).
- Cannot insert links with Unicode characters in the URL ([CONF-12707](#)).

**Engine Room**

The Engine Room team has delivered one more performance improvement and a significant security improvement this milestone:

- Attachment retrieval should cache attachment IDs ([CONF-14422](#)).
- Anti-XSS mode is now enabled by default ([CONF-12573](#)).

We also fixed the regression in the previous milestone (M4) where pages with thousands of attachment versions brought all attachment retrievals to a grinding halt.

**Release Notes 3.0-m4 ("Milestone 4")**
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. *We strongly recommend that you backup your Confluence home directory and database before upgrading!*

**Downloads**

All development releases are available from the development releases page on the Atlassian website.

---

**Issues resolved or improved in this milestone since Confluence 3.0 Milestone 3**
**Experimental Macro Browser**

The Macro Browser is now available in the wiki markup editor, however it is currently **not in a state for proper use.** It is quite buggy and has been included for QA and the dev team, so please do not raise any issues against it yet.

**Community**

**User Hover Fixes**

A lot of outstanding issues with User Hover were fixed for m4.

**First Cut of User Profiles**

The profile tabs have been rearranged into a more intuitive order, with general and email preferences moved to a separate "Settings" tab:

![Profile tab navigation](image)

Additional fields have now been added to your user profile.

**Performance Improvements**

We did the following small performance improvements:

- Caching/Queries optimized for page lookups ([CONF-14273])
- Adjusted cache sizes ([CONF-14294])
- Optimized access to attachments ([CONF-14342])
- Less cache replication in a cluster ([CONF-14339])

Although the performance improvement hasn't been as dramatically as in M2, but we still see a solid trend towards shorter and less varying response times. The overall performance improvement is around 10%-15% with more to come in the next milestones.

**Known issues**

- Performance issues with frequently updated attachments. One of the performance tweaks in M4 can cause issues if you have attachments with thousands of versions. ([CONF-14422])
- The Macro Browser is very fresh and contains many bugs.

Check out [JIRA](https://issues.atlassian.com) for the full list of known bugs

**Release Notes 3.0-m3 (“Milestone 3”)**
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. All development releases are available from the development releases page on the Atlassian website.

Issues resolved or improved in this milestone since Confluence 2.10
**User Hover**

The first cut of User Hover has made it into m3. This mainly provides Confluence with the stepping block for features like Status. At present, it's only really useful to e-mail someone, or visit their user profile (both are notoriously difficult pre-m3).

Just hover over any user's name or profile picture, you should see the following information:

![User Hover Image]

**Performance**

The Engine Room Team has started attacking general performance and also cluster performance. Our loadtests already show a significant improvement for high loads, and we hope it will show on EAC too.

In particular we made the following changes:

- Remove blocking in OGNL ([CONF-14121](#))
- Rely on Coherence to do locking instead of using synchronized methods ([CONF-14093](#))
- Remove unnecessary synchronization on Hibernate's UpdateTimestampsCache ([CONF-14098](#))

More backend improvements related to caching and retrieval of macros have been done, which should make rendering long pages faster.

Overall we have seen a significant performance improvement under light to mid-level load, even more so on the clustered version of Confluence. This is mostly due to [CONF-14093](#).

**Rich Text Editor**

Context menus are now available in the RTE (Agnes' Fedex 9 project). Just right click in the editor! They are especially useful for table editing.

![Rich Text Editor Image]

**Notifications which show just relevant changes**
When watching a page in Confluence, you normally get all the content whenever something changes. This isn't so useful, so we've added the option to get just the changes to the content emailed to you.

Just check the "Show changed content" box in Email Preferences. If enough people find this useful we are considering enabling it by default.

Viewing changes for content has also been similarly improved. By default, unchanged content is hidden and you can click the ellipsis to expand it.

Both improvements rely on 20% work done by David Taylor to dramatically improve the diffing algorithm used for Confluence content.

20% projects

Batching web resources

Confluence is now using Atlassian Plugins 2.2. beta4, which supports batching of web resources. This should result in a performance improvement, with fewer requests to the server for jss/css files.

See here for more details.

Roundtrip bugs

Yes, it’s lame, but DonW fixed a couple of particularly annoying round-trip RTE bugs in his 20% time:

- Images no longer get attached to the previous paragraph
- Emoticons can all be escaped in wiki markup, and will automatically be escaped when going from Rich Text to wiki markup.

Known issues

Plenty of known bugs. Check out JIRA.

Release Notes 2.10-rc1 ("Release Candidate 1")

Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

This release is a milestone development release for 2.10. This is a public development release (DR) leading up to Confluence 2.10. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

Who should upgrade?
Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

**Upgrade Procedure**

Follow the [normal upgrade instructions](#) to upgrade from Confluence 2.9.x to this release. **We strongly recommend that you backup your confluence-home directory and database before upgrading!**

**Downloads**

All development releases are available from [Development Releases](#) on the Atlassian website.

**Issues resolved or improved in this release**

We are now reaching the end of the 2.10 release cycle.

We have released our first release candidate RC1 today, you can see it on our public Confluence installation at [http://confluence.atlassian.com](http://confluence.atlassian.com). There should be no more code changes made to Confluence from this point on unless any important issues are found in this release candidate.

While this is not the final release, and the official release notes will be unveiled next week, you should definitely have a look now to confirm everything still works fine with your plugins.

The RC1 is functionally almost equivalent to M8 which was announced in early November, but has a number of additional bugfixes. Check out our roadmap in the [JIRA project](#)

**Known problems**

The Edit Grid plugin doesn't work with this version of Confluence. See the [Jira issue](#) for more details.

**Release Notes 2.10-m8 ("Milestone 8")**

*Do not use this release to upgrade your production systems.*

For all production use and testing of Confluence, please use the [latest official release](#).

This release is a milestone development release for 2.10 ("Two Ten"). This is a public development release (D R) leading up to Confluence 2.10. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we're up to.

**Who should upgrade?**
Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, our performance-testing and compatibility testing for databases and application servers is not done to the full extent. So, for example, a milestone release might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the [normal upgrade instructions](#) to upgrade from Confluence 2.9.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

**Downloads**

All development releases are available from [Development Releases](#) on the Atlassian website.

**Issues resolved or improved in this release**

**Writer**

Bug fixes:

- CONF-13670 : fixed bug when Html Export used to fail on recently updated macro displaying an attachment.

**Office Connector**

- CONF-13613 : fixed several bugs in the pdf preview
- CONF-13643 : fixed previewing viewfile macro gives error on a new page with attachments
- Numerous other bugs. See the [Office Connector release notes](#)

**Discovery**

- Added recentness boosting to QuickNav.
- Added the space name to the tooltips for QuickNav results.
- Fixed bug preventing Did-You-Mean feature being enabled via the admin console.
Plugins

- Upgraded to Jira Macros Plugin v2.8.7, which contains several bugfixes (m7 contained v2.8.6)

Bug Fixing

Significant bug fixes since M7 include:

- CONF-13580: a blocker bug when editing pages with certain types of macros.
- CONF-13543: a blocker bug causing drafts to not be saved in certain situations
- CONF-13521: a serious issue with the RTE forcing the use of the base url.
- Several bugs (CONF-13338) fixed relating to the escaping of attachment filenames.
- Fixed the HTML around the quick search box that was causing a large right hand margin on some browsers.

Release Notes 2.10-m7 ("Milestone 7")

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

This release is a milestone development release for 2.10 ("Two Ten"). This is a public development release (DR) leading up to Confluence 2.10. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we **can not** provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases have been load- and performance-tested for a while.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, our performance-testing and compatibility testing for databases and application servers is not done to the full extent. So, for example, a milestone release might behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure
Follow the [normal upgrade instructions](#) to upgrade from Confluence 2.9.x to this release. **We strongly recommend that you backup your confluence-home directory and database before upgrading!**

**Downloads**

All development releases are available from [Development Releases](#) on the Atlassian website.

**Issues resolved or improved in this release**

**Office Connector**

- Changed the preview link to just "View". Previously it was "View Online" or "View as HTML". It will always be on the right of the actions links. This makes the alignment of the other links nicer.
- The slide viewer will always be downloading a few slides ahead of the current slide. This should make it appear to be loading slides faster when you advance the slides.
- Other minor refinements of the slide viewer UI.

**RTE**

- Keyboard shortcuts added for insert link/image (ctrl+k and ctrl+m)
- Keyboard shortcuts fixed for headings (ctrl+1 for heading one and so on)
- Links pasted into the rich text editor will work (for most browsers and to some extent for all browsers)
- Initial indent within a code macro is now displayed properly.
- Extra newlines are no longer added to bodies of most macros Eg {note}inline body{note} will be left alone by round-trip.
- Less extra whitespace will be added to wiki markup by going to rich text.
- Draft saving should now work in all browsers again.
- Editor tabs are now rounded in safari and firefox.

**QuickNav**

- A faulty optimisation that was causing problems with multi-word searches has been fixed.

**Search**

- Increased range of data boosting to cover a full year (instead of one month)

**Did-you-mean**

The administration screens for the did-you-mean configuration have been substantially improved.

**Default Space Content**

The default content used for the home page in a newly created space or personal space has been improved to show recently updated content, and a pagetree of the space.

**Plugins**

Included most recent bug-fix versions of:

- LeftNav Theme
- Userlister plugin
- ToC Plugin
- Social Bookmarking Plugin
- Email Page Plugin
- Live Search Plugin
- IM Presence Plugin
- Dashboard Macros Plugin
- Contributors Plugin
- Attachments Plugin
- JIRA Plugin
- Advanced Macros
Engine Room

Multiple bug fixes.

Release Notes 2.10-m5 ("Milestone 5")

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.10 ("Two Ten"). This is a public development release (DR) leading up to Confluence 2.10. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following

• Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  • While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  • Features in development releases may be incomplete, or may change or be removed before the next full release.

• No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, our performance-testing and compatibility testing for databases and application servers is not done to the full extent. So, for example, a milestone release might behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade from Confluence 2.9.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

Downloads

All development releases are available from Development Releases on the Atlassian website.

Issues resolved or improved in this release

Office Connector

• View Online" or "View as HTML" link for supported file types on the Attachments screen, Attachments
macro, and Search Results. This makes it easy to quickly preview Office files without having to leave Confluence.

- New look for the PPT and PDF flash viewer with a download button, and an improved fullscreen.
• Conversion Queue for managing performance when you may have a lot of users using the Office Connector.

Rich Text Editor
• Tab & Shift+Tab in lists are now shortcuts for indent/outdent
• Lots of bug fixes (especially around table editing)
• Round tripping bugs around links were fixed (shortcut links, using colors & images in links)
• The format dropdown is now styled properly
Quick nav improvements

- Is now at least twice as fast since we have reduced the pause by half.
- More page results! 6 in fact.
- See more of each search result. You can see the whole title (just hover!), and more letters with better truncation.
- People should not be getting weird timeout messages anymore
- New administrative feature to limit the number of simultaneous quick nav searches, or to turn it off.

Open Search

- You can now search Confluence from the convenience of the search box in your browser (for FF and IE7). Just add the search provider from the search provider menu dropdown on the top right of your browser.

Site Search improvements

- Normal search is at least 5 times faster than it use to be.
• Better relevancy algorithm relevant

Miscellaneous Small Improvements
• Cleaner, sweeter breadcrumbs and 10 more rounded corners.

Plugins
• New version of Dynamic Task List (3.1.1)
  • Fixes TASK-108
• New version of Chart Plugin (1.12)
  • Fixes CONF-12792
• SNAPSHOT version of JIRA Issues Macro
  • Fixes lots of stuff
• 1.5-SNAPSHOT version of Advanced Macros
  • removed RSS macro
  • upgrade content-by-label
  • upgraded blogposts
  • upgraded recently-updated
  • Fixed Gallery Macro: ADVMACROS-39, ADVMACROS-48, ADVMACROS-49
• 1.5-SNAPSHOT version of Dashboard Macros
  • renamed recently-updated to recently-updated-dashboard to make way for new code in Advanced Macros
• New version of HTML Macros (1.5)
  • Includes RSS Macros now to take advantage of shared whitelist

atlassian-plugins upgrade to v 2.1.0.rc1
• added filter plugin type
• added standard decorators that are available to plugins
• added support for xml plugin artifacts

Release Notes 2.10-m4 ("Milestone 4")

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.
This release is a milestone development release for 2.10 ("Two Ten"). This is a public development release (DR) leading up to Confluence 2.10. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we're up to.

Who should upgrade?
Please note the following

- Development releases are not safe—Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path—Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, our performance-testing and compatibility testing for databases and application servers is not done to the full extent. So, for example, a milestone release might behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade from Confluence 2.9.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

Downloads

All development releases are available from Development Releases on the Atlassian website.

Issues resolved or improved in this release

TinyMCE upgrade complete
- Colour Text, Insert Emoticons and Custom Character are now back in the editor!
- Fullscreen mode is also back and even better. It no longer pops up in a new window, but enlarges the editor in the current page you are editing.

Quick Navigation polish and performance improvements
- performance significantly better than m3
- can handle concurrent requests up to 30 users without breaking a sweat (on medium datasets) - this should address the timeout issues people have been having

Plugins
- New build of JIRA Issues macros. Bug-fixes, but new feature: all RSS and Email version of the macro will be static, and not require javascript or Ajax.
- Content Filtering Macros: contentbylabel and blogposts have a new, SearchAPI v2 backend.
  - All existing parameters should continue to work
• **New, standard set of parameters** for various kinds of filtering

• Content Filtering macros: new `{recently-changed}` macro, which is a reimplementation of `{recently-updated}`. All existing recently-updated params should work, with the addition of the new standard params listed above. Will eventually replace `{recently-updated}`.

• Added an optional whitelist for the RSS macro and the HTML-include macro.

**Release Notes 2.10-m3 ("Milestone 3")**

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.10 ("Two Ten"). This is a public development release (DR) leading up to Confluence 2.10. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

**Who should upgrade?**

**Issues resolved or improved in this release**
TinyMCE 3 is in

This milestone contains the long-awaited TinyMCE 3 upgrade. It comes at a cost (we had to disable the emoticons, special characters, colour-pickers and fullscreen mode) to make it into M3, but they will be back in M4, and this gives us a much more stable Rich Text Editor two weeks earlier than expected. Please note: we have not yet started working on roundtripping bugs (e.g. stuff that breaks when switching from RTE to WikiMarkup and back). We will start attacking bugs those towards the end of the release cycle and during the 3.0 cycle. But the improvements in the RTE itself are extremely valuable already, including support for safari. If you encounter problems please don't hesitate to ask or raise issues. We want to make this a really solid experience.

Oh, and the new RTE starts up much faster too! Kudos to the relentless work of the Writer-Team (especially David T and Agnes), who have been working for many hours over the past months to get us here.

Quick Navigation

- Matches titles as you type
- Shows 3 pages, 3 news items, 2 attachments, 3 people, 2 spaces. If no titles are matched the category isn't shown.
- People's profile photos are shown
- Use your keyboard to navigate
- Now with % more rounded corners
Clear Search

- Improved search result page and results
  - Lighter 'Showing ...' line
  - Better fit with a grid, softening of filter panel corners and better spacing
  - Emphasis of the titles
  - Clearer, simpler result format
  - Real profile pictures of real people
- Clear filter instead of clear search
- Search field at the bottom of the page
Small improvements

Per’s first 20% project displays a lock-icon next to documents that have restricted access.

Enjoy!

Notes on deploying to your test-instance

With the TinyMCE upgrade, we have renamed the TinyMCE plugin key to match the Confluence version. Hence, you may find that there are two TinyMCE plugins installed which can cause errors when editing (e.g. the pop-ups not working). If so, you will need to disable both and then re-enable the 2.10-m3 version of TinyMCE. This will be fixed for the final 2.10 release with an upgrade task to uninstall the old plugin.

Release Notes 2.10-m2 ("Milestone 2")
Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.10 (“Two Ten”). This is a public development release (D R) leading up to Confluence 2.10. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

Who should upgrade?

⚠ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Issues resolved or improved in this release

“Did you mean?”

Dave Loeng’s auto-suggest feature is the first major 20%-project to make it into Confluence. Try it out by mistyping a search, and you will find a link suggesting more relevant searches. **This is an actual example of me typing way too fast:** 😊
User management

Confluence Hosted developer Jens Schumacher has been very busy hacking on Confluence again, this time he improved the user-management a lot - so much more convenient than before.

- Improved Search
- Adding and removing users when viewing a group
- New table styles
- Improved User Picker

Try misspelling someone's difficult surname, like say, 'fraggemnan'.
Avatar cropping and deletion

Another, smaller 20%-project also made it into this release: Charles Miller and Dmitry baranovskiy enabled Confluence to allow cropping of uploaded avatar-images, and while they were at it the highly desired "delete images you never intended to upload in the first place" issue got solved too in order to make another 23 voters happy.
Backend changes

The Engine Room team has implemented several important backend changes in this milestone:

- Integrated the first version of Plugins 2.0, including an initial migration the Confluence plugin repository to Plugins 2. An updated version of this plugin and a converted dynamictasklist are planned for the next milestone.
- Trusted authentication and other Seraph-based authentication methods are now available for calls to the Confluence RPC methods (CONF-8680). This makes it practical to write Confluence gadgets which use the remote API to retrieve data. Tom Davies is using this to implement his Crucible Confluence review plugin.

Release Notes 2.10-m1 ("Milestone 1")

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.10 ("Two Ten"). This is a public development release (D R) leading up to Confluence 2.10. **Downloads**

All development releases are available from [Development Releases](#) on the Atlassian website.

**Issues resolved or improved in this release**

It's all about small improvements this time.

During the last weeks we have fixed a whole bunch of bugs, worked on major functionality, and done a lot of planning. Therefore the M1 is a rather small release - it contains the bugfixes, but no major work yet. We have developed a new feature and two great smaller improvements which are almost done, but didn't make it into this Milestone, so expect a lot more in M2 in two weeks.

But wait, there is one small new feature that might have a big impact on EAC. Jens Schumacher, developer on [Confluence Hosted](#), has been working on a top secret mission, and his new feature means you now can store CSS per space and for the whole installation.

Inside Atlassian we now have a small competition going with developers competing for the nicest/coolest/weirdest CSS-based design to be delivered within the next two weeks.

The competition only started yesterday, but there are some funky screenshots available already 😊. Obviously Confluence still has areas that are completely hardwired and not stylable yet, but we are working on this as we go.
Release Notes 2.9-rc1 ("Release Candidate 1")

Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.9. This is a public development release (DR) leading up to Confluence 2.9. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

Who should upgrade?

Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

Additionally, our performance-testing and compatibility testing for databases and application servers is not done to the full extent. So, for example, a milestone release might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade from Confluence 2.8.x to this release. We strongly
**Recommendation**: recommend that you backup your confluence-home directory and database before upgrading!

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**Issues resolved or improved in this release**

We are now at the end of the 2.9 release cycle.

We have released our first release candidate RC1 today, you can see it on our public Confluence installation at http://confluence.atlassian.com. We are aware of one remaining major bug that we want to fix (JIRA-issues macro not working in preview mode), but apart from that and some minor fixes we will not change the code anymore.

While this is not the final release, and the official release notes will be unveiled next week, you should definitely have a look now if everything still works fine with your plugins, if you haven't done so yet. We made some changes to the plugin subsystem and to the action class hierarchy (please refer to the other milestone release notes), and we are aware of some plugins (such as the Gliffy plugin) which had to get changed a bit to be compatible with 2.9.

The RC1 is functionally almost equivalent to M5/M6 which was announced in early July, but has a big amount of additional bugfixes, check out our roadmap in the JIRA project at http://jira.atlassian.com/browse/CONF?report=com.atlassian.jira.plugin.system.project:roadmap-panel for more details.

**Known problems**

Jira-issues macro does not work in preview mode.

**Release Notes 2.9-m5 ("Milestone 5")**

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.9. This is a public development release (DR) leading up to Confluence 2.9. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we're up to.

**Who should upgrade?**

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.
Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, our performance-testing and compatibility testing for databases and application servers is not done to the full extent. So, for example, a milestone release might behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure
Follow the normal upgrade instructions to upgrade from Confluence 2.8.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

Downloads
All development releases are available from Development Releases on the Atlassian website.

Issues resolved or improved in this release
We are rapidly approaching the end of the 2.9 release cycle. There will be a really small M6 later this week, and then that’s it, we are going into bugfix and compatibility-testing mode, so we can release on the 29th of July.

Plugins
We have done a significant amount of work in the area of plugin loading (and the plugin classloaders) to improve performance. There are no API changes, but it is very possible that these changes may expose bugs. While we tried to remain backwards compatible, it is crucial that you test for compatibility of your plugins.

Editor
The preview in the editor is now capable of rendering content exactly as it appears on the page. However, to do this, we have had to disable interaction with the preview. You will no longer be able to follow links or interact with the preview in any other way.

When drafts are saved automatically to the server, this will be shown to you at the top of the editor.

Engine room
Whisper the words "Action class hierarchy" anywhere close to a Confluence developer and he or she will cringe. Not anymore as of this Milestone. Plenty of inheritance trees have been cut, and miraculously Confluence still works. This will enable us to work faster and more efficiently in the future.

Page tree and UI
We had a few nasty UI bugs recently where plugin JavaScript code would interfere with our menus and other JavaScript code, and we had a few Pagetree bugs. The most important ones have been fixed in this release.

Discovery Team
Author auto-complete field added to the search result screen to allow filtering searches by contributor (author or editor).

The 'new search' (or reset search) link on the search screen filter left the building somewhere around milestone 3. This has now been re-instated.

A couple of 2.9 specific bug fixes are also included.
Known problems

Several small bugs, specifically around the new author-search.

Release Notes 2.9-m3 ("Milestone 3")

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

This release is a milestone development release for 2.9. This is a public development release (DR) leading up to Confluence 2.9. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following
  - **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
    - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
    - Features in development releases may be incomplete, or may change or be removed before the next full release.
  - **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

Issues resolved or improved in this release

Milestone 3 is all about the UI: It features major parts of the new search UI, and we have added two more menu
items to the "Browse" menu.

Some effort was spent on making the page tree more stable, and we have spent more time on internal code improvements (which did however not ship in this milestone)

**Known problems**

Several small bugs. And a slowdown of search performance by 50%, which will be addressed in a later milestone release.

**Release Notes 2.9-m2 ("Milestone 2")**

Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.9. This is a public development release (DR) leading up to Confluence 2.9. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we're up to.

**Who should upgrade?**
Please note the following

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, our performance-testing and compatibility testing for databases and application servers is not done to the full extent. So, for example, a milestone release might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the [normal upgrade instructions](#) to upgrade from Confluence 2.8.x to this release. *We strongly recommend that you backup your confluence-home directory and database before upgrading!*

**Downloads**

All development releases are available from [Development Releases](#) on the Atlassian website.

**Issues resolved or improved in this release**

Page Ordering: We have been improving the page-tree a bit, fitting in some work that was intended for Confluence 2.8 but didn't make it. The tree now has a “revert to alphabetical mode” button which will revert manually ordered nodes back to the original alphanumeric ordering. Additionally we added one small improvement which will help to battle spam: administrators will see two additional buttons on the page tree that enable easy deletion and preview of pages. We are not entirely sure yet whether (and how) these two buttons will ship, so don't raise improvement issues for those two buttons yet. (IF they ship with 2.9, then we will put in some more polish of course)

Unfortunately there are a few known (uncritical) bugs related to the revert-to-alphabetic-mode in edge-cases, which will be addressed by M3.

Search: The Search has improved internally (the ranking should be a bit more relevant than before), and also what is being searched has changed: mail and personal spaces are searched by default, and using the space key in the search boosts hits within that space.

**Known problems**
Some small issues, mainly with the UI, but nothing serious.

Release Notes 2.8-m9 ("Milestone 9")

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

Confluence 2.8-m9 is a milestone development release for 2.8. This is a public development release (DR) leading up to Confluence 2.8. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Milestone releases may not have not been load- or stress-tested, or maybe they have but some performance problems still persist. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade from Confluence 2.7.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

Downloads

All development releases are available from Development Releases on the Atlassian website.

Issues resolved or improved in this release

All functional changes are now complete. We are only fixing some remaining bugs now.

Known problems

- We found a major performance problem during our loadtests. Confluence works exactly like before under
low load, but once you go above a request per second you will notice a much load than acceptable. We will fix that for the final release.

- a few glitches when viewing with IE6&7, and when using the new page tree. Will be fixed for the final version

Outlook

We are in bugfix-mode now. While a few icons and CSS-styles will still change, the main priority is now to iron out all our bugs during the next one or two weeks.

Release Notes 2.8-m7 (“Milestone 7”)

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

Confluence 2.8-m7 is a milestone development release for 2.8. This is a public development release (DR) leading up to Confluence 2.8. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following

- Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Milestone releases may not have not been load- or stress-tested, or maybe they have but some performance problems still persist. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade from Confluence 2.7.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

Downloads
Issues resolved or improved in this release

This page describes the changes you can expect from Confluence 2.8 Milestone 7. M7 is a "small" milestone that delivers some features that just didn't make it into M6, but which can't wait for M8 nor RCs either because we need your feedback as soon as possible!

End-user improvements

User Interface improvements:

- Matt Ryall's Fedex project: improved comment threading, with dynamic collapsing

  • Matt Ryall says:
  Not to be too picky but why is "View Source" listed under the actions list.
  That list seems like very valuable real estate and could not the same results be gotten by using the browser.
  Edit | Remove | Reply

  • Zachary Davis says:
  The "View source" action actually pops up a window with the wiki-markup of the current page, as I think this is a brilliant idea, but perhaps a term other than "View source" would be less confusing.
  Edit | Remove | Reply

  • Cheryl Jerzal says:
  agree: useful function, but confusing name

  • Kate Ellington says:
  "View Wiki Source" ?
  Edit | Remove | Reply

  • Eric Delphish says:
  I like "View Wiki Source". It's cleaner and won't take up extra

  • Matt Ryall says:
  Thanks for the suggestion, guys.
  Fortunately enough, this feature has existed since Confluence 1.0, and always be
  noticed.
  We'll definitely have a look at the naming based on this discussion. Putting it
  Edit | Remove | Reply

- Edit page title change

  The title is not duplicated anymore, you simply edit the title directly

- Put PDF, Watch and Favourite icons on Tools menu

  just didn't make it into M6, but which can't wait for RC1 either

- Replace printable view with an improved print stylesheet for better printing directly from the page
- Improved editor caching
- Fixed editor layout bug in Safari
- Menus appear on hover
- Move command in Tools menu
Page Ordering:

- Included the page ordering tree into the edit-page, ironed out some bugs

Misc:

- Our student developer Chris Broadfoot added a few missing links into our user-management section, and incorporated a pretty slick way to change the size of the pagination window. Well done!

API changes

For plugins which configure Confluence's web interface, Condition implementations which depend on GlobalHelper are now deprecated, and should be converted to use the new WebInterfaceContext interface. The easiest way for most plugins to do this is to extend BaseConfluenceCondition rather than the now-deprecated AbstractConfluenceCondition. (Javadoc links to come once this is published.)

Known problems

- We found a severe performance problem during our loadtests. Confluence works exactly like before under low load, but once you go above a request per second you will notice a much higher load than
acceptable. We will fix that for the final release.
- Upgrade issue for clustered deployments. Don't use this Milestone on a Cluster.
- a few glitches when viewing with IE6&7, and when using the new page tree in a browser without FireBug installed.

Outlook

We are in bugfix-mode now. While a few icons and CSS-styles will still change, the main priority is now to iron out all our bugs during the next two weeks.

Release Notes 2.8-m6 (“Milestone 6”)

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

Confluence 2.8-m6 is a milestone development release for 2.8. This is a public development release (DR) leading up to Confluence 2.8. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following
- Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Milestone releases have not been load- or stress-tested. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade from Confluence 2.7.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

All development releases are available from Development Releases on the Atlassian website.
Issues resolved or improved in this release

Milestone 6 incorporates Milestone 5 changes (which were released but never publicly documented, sorry)

Milestone 5 (the missed one)

The user interface improvements include the most drastic changes to be done for Confluence 2.8. After adding a new Actions menu to the page, we have removed the unnecessary tab navigation. This completes our migration to a menu-based user interface. The content of the page is now the most important aspect of the page, as all the editing and modification features are now out of the way when reading a page. The UI has also been improved in other small ways in this milestone, and we have fixed many bugs with the printable view and the default themes.

Plugin components that expect to be injected with the old, deprecated CacheManager interface will now work again. This means plugins such as the JIRA issues macro will be useable once more. Plugins that use the ContainerManager.getComponent method of obtaining the cache manager will continue to malfunction; there is no plan to support this usage. More commentary about this at CONF-10602.

The Page Ordering feature mostly contains bug fixes. The majority of changes are done in the back end as we prepare to remove extJS library and substitute the page tree widget with a custom component.

Milestone 6 (the current one)

User Interface improvements:

- performance improvements through better clientside-caching on the edit-page
- user menu has been included. The only thing missing to wrap up the UI changes is to move the remaining icon-buttons (PDF, watch pages, etc) to menu items as well. This will be delivered in two weeks.
- New and improved Tree component, that lets you drag more comfortably than before
- Added the ability to cancel a page move by pressing 'esc' after the user starts dragging a page
- Added automatic scrolling functionality. If a user drags a page to the top/bottom of the screen in an attempt to reach a page that is currently outside of the screen, it will automatically scroll up/down.
- Known problem: No indication of subnodes being loaded
- bugfixes

Technical improvements and API changes

- JMX has been added to the list of Confluence capabilities for improved monitoring
- Raising a support case is now possible directly from the admin console. This will attach logs and other relevent system information automatically.
- JQuery now default JS library. We have removed ExtJS as a Javascript-dependency, and will standardize on JQuery in all of Confluence
- Coherence cache lease duration has been set at 10 minutes to support system recovery when threads do not release their leases properly. A warning message will be logged detailing that a lease has timed out to help with tracking down errant lease management.

Known problems

- We found a severe performance problem during our loadtests. Confluence works exactly like before under low load, but once you go above a request per second you will notice a much higher load than acceptable. We will fix that for the final release.
- Upgrade issue for clustered deployments. Don't use this Milestone on a Cluster.
- a few glitches when viewing with IE6&7

Release Notes 2.8-m4 (“Milestone 4”)

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.
Confluence 2.8-m4 is a milestone development release for 2.8. This is a public development release (DR) leading up to Confluence 2.8. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we're up to.

**Who should upgrade?**

⚠️ **Please note the following**

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Milestone releases have not been load- or stress-tested. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade from Confluence 2.7.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**Issues resolved or improved in this release**

This release mainly fixes bugs and glitches of the previous milestone, and extends the functionality slightly. You will notice that a new dropdown-menu has been added which allows you to access the browse-space actions easier, and that most macros now honor the new page ordering that can be set in recently added page-reorder-component.

We had forgotten to release the source code of the previous milestones, this has been taken care of now, thanks Alain from Adaptavist for pointing this out! 😊

The coolest improvement however is that we are able to deliver the first Fedex 7 project in this milestone - less than two weeks since the actual event! (see [http://blogs.atlassian.com/developer/2007/09/atlassian_fedex_day_vi.html](http://blogs.atlassian.com/developer/2007/09/atlassian_fedex_day_vi.html) for an overview of Fedex 6 last year). Use the new drop-down menu to "Browse Labels", select one of the most popular ones, and you will now be able to filter by multiple labels - just increase or decrease the
number of labels by using the plus- and minus-signs next to the related labels. Admittedly the UI still needs some finishing touches, but it works fine already and it will make 21 voters happy once released officially (http://jira.atlassian.com/browse/CONF-4577). More Fedex-projects can be expected to make it into M5 and M6.

You can view the complete list of fixes and newly implemented features in JIRA. They contain all the issues resolved during development of 2.8, not just the ones fixed since the previous milestone.

**Known problems**

There are still a few known bugs in this release, most noticeably the broken printable view (CONF-10583) which will be fixed soon. Please continue reporting problems through JIRA, your feedback has been very helpful and a lot of it has been incorporated already.

The CacheManager API has changed in milestone 4, and all plugins that use the old CacheManager interface will be broken (CONF-10602). In milestone 5, Confluence has a workaround for plugins that get the cacheManager injected. That is, the following code will work correctly in 2.8-m5 (but is currently broken in 2.8-m4):

```java
import com.atlassian.user.impl.cache.CacheManager;

public class MyClass {
    private CacheManager cacheManager;

    public void setCacheManager(CacheManager cacheManager) {
        this.cacheManager = cacheManager;
    }
}
```

Plugins that access the CacheManager not via dependency injection, but statically through the ContainerManager will fail at runtime with a ClassCastException. These plugins should be rewritten to use dependency injection, or use the new com.atlassian.cache.CacheManager interface. The following code is broken in 2.8-m4, and will continue to be broken for the final release of 2.8:

```java
CacheManager cacheManager = (CacheManager) ContainerManager.getComponent("cacheManager");
```
Plugins that wish to avoid using the deprecated CacheManager interface should change to use `com.atlassian.cache.CacheManager`.

**Release Notes 2.8-m3 ("Milestone 3")**

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

Confluence 2.8-m3 is a milestone development release for 2.8. This is a public development release (DR) leading up to Confluence 2.8. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

**Who should upgrade?**

⚠️ Please note the following
- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

All development releases are available from Development Releases on the Atlassian website.

**Issues resolved or improved in this release**

- First draft of UI improvements: We are working hard on moving the HTML and CSS delivered by Confluence towards standards-compliance and accessibility. We are at the same time reworking our UI structure. We feel that the UI has been growing a bit too organically over the past years, resulting in somewhat confusing navigation like the "remove page"-button only available when you are editing a page, for example. We have implemented an initial dropdown-menu for adding content, thus already cleaning up the UI a bit. All the navigation-changes we make are targetted at the default theme, however some
HTML&CSS changes may also affect the other themes. In the future our changes will enable plugin-developers to hook into Confluence easier than before, and skinning Confluence will be considerably easier. However, plugin-developers should be aware of the changes we are making, and check (by examining this Milestone release) whether they have to schedule some maintenance work for their plugins. More changes will be made, so don't rush it - but plan for it.

- First draft of Page Reordering. We are working on implementing a highly anticipated feature that will dramatically improve the quality of content generated from a Confluence space. So far the PDF files you generate from Confluence have been alphabetically ordered - which for example makes even the Confluence User Manual quite awkward to read. With the new page ordering feature it will be able to structure your Wiki exactly as you like - or of course leave it in alphabetic mode if you prefer that. Our goal is to deliver a really useful solution, and this Milestone only shows you the first 50% of the feature. We are currently busy implementing all the feedback and bug-reports we get from Sarah (our documentation queen) and the next Milestone releases will deliver further improvements and bugfixes.

You can view the complete list of fixes and newly implemented features in JIRA. They contain all the issues resolved during development of 2.8, not just the ones fixed since the previous milestone.

**Known problems**

No major known problems, but plenty of smaller to medium sized bugs, mainly related to page reordering. They will get tackled in M4.

**Release Notes 2.8-m2 ("Milestone 2")**

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. Confluence 2.8-m2 is a milestone development release for 2.8. This is a public development release (DR) leading up to Confluence 2.8. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we're up to.

**Who should upgrade?**

⚠️ Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.
Milestone releases have not been load- or stress-tested. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the [normal upgrade instructions](#) to upgrade from Confluence 2.7.x to this release. **We strongly recommend that you backup your confluence-home directory and database before upgrading!**

**Downloads**

All development releases are available from [Development Releases](#) on the Atlassian website.

**Issues resolved in this release**

- Velocity template engine upgrade

Confluence's velocity template engine has been upgrade from 1.3 to 1.5. This shouldn't mean too much to end users however there could be some compatibility problems with existing themes and plugins. Check this upgrade guide that we use internally as well: [http://confluence.atlassian.com/display/DOC/Migrating+to+Velocity+1.5](http://confluence.atlassian.com/display/DOC/Migrating+to+Velocity+1.5)

- File upload component upgrade

Pell multipart has been replaced with the Jakarta Commons Fileupload component to handle web browser file uploads. Again this won't have much impact on the Confluence experience but could cause some odd problems when attaching files to Confluence.

- PDF space export

There has been some optimizations made the space PDF export which should result in less server memory usage during export

- New GZIP compression filter

Confluence team have integrated a new GZIP compression filter to achieve more efficient downloads and page views. This is not currently enabled by default, so to test this with your plugin you need to turn it on in the management console. We are using it internally at Atlassian, and the performance improvement while browsing pages is quite substantial.

You can view the complete list of fixes and newly implemented features [in JIRA](#). They contain all the issues resolved during development of 2.8, not just the ones fixed since the previous milestone.

**Known problems**

There are a few cosmetic UI problems related to space logos and to the login screen, none of them impact productivity. Notification mails are empty because of a Velocity macro bug.

**Release Notes 2.7-rc1 (“Release Candidate 1”)**

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use [the latest official release](#).

Confluence 2.7-rc1 is a release candidate for 2.7. This is a public development release (DR) leading up to Confluence 2.7. Development releases are a snapshot of our work in progress, allowing our customers to see what we're up to.

**Who should upgrade?**
Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestones and release candidates aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone/release candidate has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones and release candidates re timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Milestone releases and release candidates have not been load- or stress-tested. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade from Confluence 2.6.x to this release. *We strongly recommend that you backup your confluence-home directory and database before upgrading!*

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**Issues resolved in this release**

View the list of fixes and newly implemented features in JIRA. They contain all the issues resolved during development of this release, not just the ones fixed since the previous milestone.

**Known problems**

None.

You should really download this Release Candidate and check if your plugin works with it. If not, use the last few days before the official 2.7.0 release to fix it 😊

**Release Notes 2.7-m5 (“Milestone 5”)**

Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

Confluence 2.7-m5 is a milestone development release for 2.7. This is a public development release (DR) leading up to Confluence 2.7. Development releases are a snapshot of our work in progress, allowing our
customers to see what we're up to.

**Who should upgrade?**

⚠️ **Please note the following**
- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path**— Because development releases represent work in progress, we **cannot** provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Milestone releases have not been load- or stress-tested. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the [normal upgrade instructions](http://jira.atlassian.com/browse/CONF-10001/) to upgrade from Confluence 2.6.x to this release. *We strongly recommend that you backup your confluence-home directory and database before upgrading!*

**Downloads**

All development releases are available from [Development Releases](http://jira.atlassian.com/browse/CONF-10001/) on the Atlassian website.

**Issues resolved in this release**

View the list of fixes and newly implemented features in [JIRA](http://jira.atlassian.com). They contain **all** the issues resolved during development of 2.7, not just the ones fixed since the previous milestone.

**Known problems**

For some reason, an outdated version of the new Dynamic Tasklist 2 was included in this milestone. Since Milestones are not real customer releases, we do ship them with bugs like this. If you want to see the latest and greatest Dynamic Tasklist 2 in action, please simply upgrade to the latest version using the plugin repository from the administration console.

Also, there is an annoying (2.7-specific) bug in this release that causes warnings for all colours used by the colour-macro: [http://jira.atlassian.com/browse/CONF-10001/](http://jira.atlassian.com/browse/CONF-10001/). It will be resolved by the time the next milestone gets released.

Apart from that, M5 is a nice Milestone release and definitely worth a look for all plugin developers - especially now that we are getting closer and closer to the end of the release cycle, and fewer and fewer major architectural changes will be made.
Release Notes 2.7-m4 ("Milestone 4")

Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

Confluence 2.7-m4 is the second milestone development release for 2.7. (Milestone 3 has been skipped because of stability concerns.) This is a public development release (DR) leading up to Confluence 2.7. Development releases are a snapshot of our work in progress, allowing our customers to see what we're up to.

Who should upgrade?

Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Milestone releases have not been load- or stress-tested. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade from Confluence 2.6.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

Milestone releases have not been load- or stress-tested. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade from Confluence 2.6.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**Bugs fixed in this release**

View the list of fixes in JIRA.

**Release Notes 2.6-dr1**

Confluence 2.6-dr1 is a public development release leading up to Confluence 2.6. Development releases are a snapshot of our work in progress, allowing our customers to see what we're up to.

Who should upgrade?
Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

This development release is being made available specifically for Confluence plugin developers to test their existing plugins against the significant style changes that have been made.

For all production use and testing of Confluence, please use the latest official release.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade from Confluence 2.5.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**Note about themes**

Confluence 2.5.x themes are expected to be compatible with 2.6 without authors needing to make any change to their existing themes. This is possible because Confluence will, by default, include all Confluence 2.5.x specific styles automatically.

However, if you would like to upgrade your theme to use the latest style and typography changes in Confluence 2.6, you will need to update the way you include stylesheets in your theme. Full instructions on how to do so can be found here.

**Including Cascading Stylesheets in Themes for Confluence 2.6**

Firstly, you will need to disable the inclusion of Confluence 2.5.x styles. These were included by default to allow 2.5.x themes to remain compatible in Confluence version 2.6 and after.

To disable 2.5.x styles, add the following to your theme's `atlassian-plugin.xml`: 

```xml
<!-- Disable Confluence 2.5.x styles -->
```
...<theme key="aqua"
    i18n-name-key="com.atlassian.confluence.themes.aqua.name" name="Aqua Theme"
class="com.atlassian.confluence.themes.BasicTheme">
      <description key="com.atlassian.confluence.themes.aqua.desc"/>
      ...
      <param name="includeClassicStyles" value="false"/>
      ...
</theme>
...

Note the flag `includeClassicStyles` is set to false. You will have to set this explicitly as the default is true.

Secondly, you will need to declare your custom theme style sheet in `atlassian-plugin.xml` like this:
Differences from Confluence 2.5.x

- You no longer have to include your theme stylesheet in the main decorator using `#pluginStylesheet` anymore. Confluence will load your theme's stylesheet automatically provided that its the active theme.
- The resource is declared in the `theme` module instead of the `layout` module.
- You need to start your custom style sheet (say `my-css.vm`), by copying over the latest styles from `http://yourhost/contextPath/styles/main-action.css`. This step is necessary as Confluence now includes either your theme stylesheet or the default stylesheet, **not both**. This implies:
  - you can no longer rely on the default styles being there to style parts of the Confluence you are not directly theming
  - you are no longer overriding styles with your plugin style sheet. It is now the primary stylesheet
  - you will need to merge any new styles in later versions of Confluence into your theme's style sheet

Multiple style sheets

It is possible to configure your theme to use multiple style sheets. This feature may useful if you want to break up your main style sheet into a few smaller style sheets with more defined purposes. You can declare these like so:

```xml
<theme key="aqua"
i18n-name-key="com.atlassian.confluence.themes.aqua.name" name="Aqua Theme"
class="com.atlassian.confluence.themes.BasicTheme">
  <description key="com.atlassian.confluence.themes.aqua.desc"/>
  ...
  <resource type="stylesheet"
  name="my.css"
  location="styles/my-css.vm"/>
  ...
</theme>
...
```
These style sheets will be included in the order in which they are declared.

Release Notes 2.3-DR2

Confluence 2.3-DR2 is the second public development release leading up to Confluence 2.3. Development releases are a snapshot of our work in progress, allowing our customers to see what we're up to.

Who should upgrade?
Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

This development release is being made available specifically for Confluence plugin developers. The changes to the Confluence API discussed below mean that many plugins will need to be updated to work with Confluence 2.3.

For all production use and testing of Confluence, please use the latest official release.

This release should not be used for testing a clustered deployment; the clustering user interface is not yet complete.

*Upgrade Procedure*

Follow the normal upgrade instructions to upgrade from Confluence 2.2.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

If you are upgrading from Confluence 2.1.x or earlier, be sure to read the upgrade instructions in the Confluence 2.2 release notes.

*Downloads*

All development releases are available from Development Releases on the Atlassian website.

*Things to look out for*

- The Tangosol Coherence jars included in this DR are now fully licensed.
- The API for retrieving historical versions of content has changed.

*Architecture changes between Confluence 2.3-DR1 and 2.3-DR2*

**Content history API changed**

The getPreviousVersions method of ContentEntityObject has been removed, because it was insanely inefficient as soon as a piece of content started having lots of versions. It has been replaced with the following methods on the ContentEntityManager:
ContentEntityObject
getPreviousVersion(ContentEntityObject ceo);

ContentEntityObject
getNextVersion(ContentEntityObject ceo);

ContentEntityObject
getOtherVersion(ContentEntityObject ceo, int version);

/**
 * Get a VersionHistorySummary for all previous versions of a ContentEntityObject, starting with the current
 * content.
 *
 * @param ceo the entity object to return the version history of
 * @return the full version history of that object, as VersionHistorySummary objects.
 */
List
getVersionHistorySummaries(ContentEntityObject ceo);

The VersionHistorySummary class defines a limited set of Content data that is relevant to viewing version histories.

Release Notes 2.3-DR1

Confluence 2.3-DR1 is the first public development release leading up to Confluence 2.3. Development releases are a snapshot of our work in progress, allowing our customers to see what we’re up to.
Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path**— Because development releases represent work in progress, we **cannot** provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Who should upgrade?

This development release is being made available specifically for Confluence plugin developers. The changes to the Confluence API discussed below mean that many plugins will need to be updated to work with Confluence 2.3.

For all production use and testing of Confluence, please use the latest official release.

The bundled Tangosol library with this development release has a license which expires on August 31, 2006. This release will not operate after that date.

This release should not be used for testing a clustered deployment; the clustering user interface is not yet complete.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade from Confluence 2.2.x to this release. *We strongly recommend that you backup your confluence-home directory and database before upgrading!*

If you are upgrading from Confluence 2.1.x or earlier, be sure to read the upgrade instructions in the Confluence 2.2 release notes.

Downloads

All development releases are available from Development Releases on the Atlassian website.

New features in Confluence 2.3

In short, the new features of Confluence 2.3 are:

- Clustering support (not available in 2.3-DR1)
- People directory
- Bundled Plugin Repository Client

Architecture changes between Confluence 2.2 and 2.3-DR1

Summarised below are architectural changes that might be relevant to plugin developers. Please add a comment below if there is anything else that should be listed here.

*We've kicked the Bucket!*

Most of the functionality of Confluence's biggest internal library, bucket, has been split into three new components: atlassian-config, atlassian-spring and atlassian-event.
Where practical, the old interface is still available as deprecated classes and methods. **However, some plugins will not compile unless modified to use the new package names.**

Please refer to the source code or [Javadoc](#) for details on the new interface.

**Tangosol Coherence replaces EhCache**

Tangosol Coherence is now the caching library used by Confluence, both in clustered and non-clustered mode. To facilitate this, some of the caching APIs have been updated.

As mentioned above, the Tangosol license included with this release is specifically for testing purposes and will expire on August 31, 2006.

**Bandana configuration stored in database**

The Bandana Confluence configuration files previously stored in confluence-home are now stored in the database. An upgrade from a previous version will automatically move existing configuration settings to the database.

**Release Notes 2.0-RC2**

Confluence 2.0-RC2 is the second release candidate for Confluence 2.0 (previously known as Confluence 1.5). It resolves almost 80 issues since the 1.5-RC1 release.

**Who should upgrade?**

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features. Developer releases are not suitable for running on production systems.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4 or higher, you can find [instructions here](#). We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.3.x or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.

**Important Notice**

If, after you have upgraded Confluence, the "Recent Changes" list on the dashboard is empty, this may be because you need to re-build your site's search index. You can do this under Administration  Content Indexing  Rebuild Search Index

**Important Notice 2**

If, after you have upgraded Confluence and you find the page breadcrumbs do not show the page's parents correctly, log into your site as administrator, then visit [http://yoursite.example.com/admin/permissions/rebuild_ancestor_table.action](http://yoursite.example.com/admin/permissions/rebuild_ancestor_table.action) (substituting your own site's URL, obviously) to rebuild the ancestor table (this will be fixed for the final release).

**Downloads**

All development releases are available from [Development Releases](#) on the Atlassian website.
New Features in Confluence 2.0-RC2

The 2.0-RC2 has largely concentrated on fixing bugs and polishing existing features. If you are upgrading from Confluence 1.4 or earlier, you should read the 1.5-DR2 Release Notes for a description of the major new features in Confluence 2.0.

Consult JIRA for the full list of issues resolved for 2.0-RC2.

Error rendering macro 'jiraissues' : JIRA project does not exist or you do not have permission to view it.

Release Notes 2.0-RC1

Confluence 2.0-RC1 is the first release candidate for Confluence 2.0 (previously known as Confluence 1.5). It resolves almost 150 issues since the 1.5-RC2 release.

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features. Developer releases are not suitable for running on production systems.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.3.x or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.

Important Notice

If, after you have upgraded Confluence, the "Recent Changes" list on the dashboard is empty, this may be because you need to re-build your site's search index. You can do this under Administration  Content Indexing  Rebuild Search Index

New Features in Confluence 2.0-RC1

The 2.0-RC1 has largely concentrated on fixing bugs and polishing existing features. If you are upgrading from Confluence 1.4 or earlier, you should read the 1.5-DR2 Release Notes for a description of the major new features in Confluence 2.0.

Consult JIRA for the full list of issues resolved for 2.0-RC1.

Notable Features and Improvements

- You can now place markup such as bold or italics within a word if you are using the WYSIWYG editor
- The following characters are now permitted in page titles: ! & ( ) * ~ $ _ Pages can not, however, start with ~ or $.
- The most recent change comment for a page is now included in the page's searchable text
- rel="nofollow" added to links to printable versions of pages, to prevent them from being indexed by
search engines

- The Recent Changes list on the dashboard now correctly reflects whether you are viewing all spaces, a team, or your favourite spaces
- Further improvements to the edit page UI including:
  - Improved label editing
  - Inline page previewing
  - Hiding of lesser-used functions such as moving a page or editing page permissions
- Attachment downloads now support HTTP conditional get
- Space exports now include that space's labels and page-level properties
- Support for labels in the SOAP and XML-RPC remote APIs has been completed
- Determining if a user exists via the remote API is now supported

Release Notes 1.5-DR2

Confluence 1.5-DR2 is the first public development release leading up to Confluence 1.5. (Confluence 1.5-DR1 was an internal release only). Developer releases are a snapshot of our work in progress, allowing our customers to see what we’re up to, and provide feedback

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features. Developer releases are not suitable for running on production systems.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

⚠️ Macro Compatibility

Incompatibilities exist that may cause Confluence not to start if custom macros are deployed. When upgrading to Confluence 1.5-DR2, be sure to remove any custom Macro plugins from your $confluencehome/plugins and WEB-INF/lib directories. These incompatibilities should be resolved before the final, stable release.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.3.x or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.

Downloads

All development releases are available from Development Releases on the Atlassian website.

New Features in Confluence 1.5-DR2

We've been pretty busy, but the four major new features you can find in 1.5-DR2 are:

- [WYSIWYG Editing](#)
- [Labels](#) for content
- A dynamic [RSS Builder](#)
- Change summaries

Consult JIRA for the [full list of issues resolved for 1.5-DR2](#). 1.5-DR2 also incorporates all the bug-fixes that were made between [TestTest](#).
WYSIWYG Editing

⚠️ Browser Compatibility

The Confluence WYSIWYG editor is currently only compatible with Internet Explorer 6 on Windows, plus Mozilla and Firefox across platforms. Javascript must be enabled in the browser for the editor to function. Support for Safari under Mac OS X is currently not available. To track Safari compatibility, please follow this JIRA issue: CONF-3864

The WYSIWYG editor allows for Confluence pages to be edited directly through an editing GUI embedded in the web browser, without having to remember Confluence's wiki markup. It almost goes without saying that this has been our number one most requested features, and we're glad we can finally offer it!

Global administrators can enable WYSIWYG editing in the General Configuration screen of the site’s preferences. They can also choose whether users are presented with the WYSIWYG editor by default, or whether users default to the old wiki markup text-field.

If WYSIWYG markup is enabled, but an individual user does not like the default set by the administrator, they are free to override it via a “make this my default” link that will appear on whichever editor is currently not your default.

For the "feature mad" amongst us, here are some neat things you can do with the WYSIWYG editor:

- Full screen view - really useful for editing large pages. Click in the menu bar.
- Quickly switch between WYSIWYG and Wiki markup without a page refresh
- Change the size of your editing window to suit your browser. Your size preference is remembered across sessions. To change it, drag the handle in the bottom right hand corner of the editor.
- Undo and redo!

Labels for content

Another highly requested feature was the ability to categorise content within Confluence beyond the rigid heirarchy allowed by spaces and parent-child relationships between pages. To this end we have introduced labels.

Labels are simple one-word 'tags' that can be added to any page or blog-post the user has permission to edit.
Labels can be used to categorise content, bookmark it, flag it for attention, or anything else you can think of.

**A Tag By Any Other Name**

Picking a name for labels wasn't easy. Google's GMail service calls them labels, while other collaborative categorisation systems such as del.icio.us and Flickr call them tags. We decided that 'label' was a more natural description. For more information about the philosophy behind labels and tags, check out the Folksonomy page on Wikipedia.

Labels can be added to any page from the edit screen, as a space-separated list of words. If you are browsing the site with a modern, Javascript-enabled browser, you'll also be able to use the dynamic web UI to add labels while viewing the page through an interactive interface.

Once a page is labeled, then clicking on the label's name allows you to browse other pages with the same label, or view related labels that commonly occur on the same pages.

You can also view the space's most popular labels from the space browser, to get an idea of the most popular topics within the space.

Many other Confluence features interact with labels: they can be searched for through the search interface, the new RSS builder can filter pages by their label, and we're looking forward to building label support into Confluence's packaged macros, and even the dashboard.

**Personal Labels**

If you prepend *my:* to a label (for example, *my:todo* or *my:favourite*), then the label is a personal label – only visible to you. Personal labels allow you to tag content for your own purposes. You can browse your personal labels from your user profile. Any user can add their personal labels to any page, even when they don't have editing permission.
Personal Label Privacy

It is possible in Confluence 1.5-DR2 to see other people's personal labels in various views through the system. This is a known issue and in the final release, personal labels will be private to the user. (sharing personal labels at the user's discretion is also planned for the future)

Favourites

Favourites are a special personal label: my:favourite or my:favorite. Whenever you see the 🌟 icon, it means you can label this content as being your favourite, and whenever you see the 🌟 icon, it means that the content is currently in your list of favourites. You can view your favourites from the Labels tab of your user profile, but they come in handy for...

Labels and the Dashboard

Labels can be used on the Dashboard to create different views of the Confluence site. The list of spaces now offers the following tabs:

- **My** shows you spaces that you have labelled as a Favourite. You can label any space you see on the dashboard by clicking its 🌟 icon.
- **Team** allows space admins to dynamically create lists of spaces on particular topics (see below. This tab only appears if there are teams that the user can see)
- **New** shows any spaces that have been created in the last week (This tab only appears if there are new spaces)
- **All** shows all the spaces in the Confluence site

A "team" is a group of spaces that share a common team label. Spaces can be labeled from the Advanced tab of Browse Space.

As of Confluence 1.5-DR2, anyone can add space-level labels. This will be fixed in the final release.

The Recent Changes list on the dashboard will show only content that has been changed in the spaces that are currently listed in the space view. So if you are currently viewing the 'My' tab, only updates in your favourite spaces will be shown on the dashboard.

If you are logged in, Confluence will remember your most recently selected tab and team on the dashboard.

Dynamic RSS Builder

A third highly-requested feature. Confluence has always provided a brace of useful RSS feeds, but the problem is that for every feed we provided, users wanted half a dozen more. The obvious answer is to let users build RSS feeds based on their own chosen criteria. You can access the RSS builder from the Confluence dashboard...
Once in the builder, you can choose

- Which spaces to include in the feed
- Which types of content should be tracked
- Which labels, if any, you are interested in
- How many items to include in the feed
- Whether you want a single RSS entry per page or one for each time the page is edited
- Whether you want an RSS 2.0 or Atom 0.3 feed
- Whether Confluence should require authentication to view the feed

Once you have decided what you want, Confluence will give you a URL to paste into your RSS reader. These URLs can be shared with other Confluence users, although they will only ever be allowed to see content that they have permission to view. If you have asked to authenticate, Confluence will require HTTP Basic Authentication, which is supported by most RSS readers.

We've also taken the opportunity to improve the presentation of our RSS feeds - including a lot more information in each feed so you can follow your Confluence site entirely from your newsreader.

The Atom 1.0 draft has just been accepted as an IETF standard. Future versions of Confluence will be phasing out use of Atom 0.3 in favour of Atom 1.0

Change summaries

In a very late addition (added during our recent Fedex Day 2), Confluence now has change summaries. These allow you to add a comment to each edit that will appear in change histories, allowing you to keep a more complete record of how and why a particular page has been modified.

There is also a \{change-history\} macro to enable you to display a page's history within its body if you so desire.

Other Things to Check Out

Embed Flash and Movies

You can now embed Flash content or movies (Quicktime or Windows Media) into a page as easily as you can an image: just attach the Flash or movie file to the page, then include it as you would include an image (!filename.mov!).

Export Pages as Word Documents

You can now export pages straight into Word from the Info tab. This is extremely useful for emailing around
content to non-Confluence users, printing a document or just creating a backup in Word.

**Improved Search Interface**

Results returned from Confluence's search engine now have:

- Improved contextual results, showing the most important text around where your query was matched in the page
- Contextual results for any attachment: see where a search was matched even inside PDF, Word, PowerPoint or Excel documents!
- Search results for attachments give you more (and clearer) information about what the attachment is, and where it's from!

**Improved Gallery Macro**

The gallery macro has been spruced up, and now has a slideshow view:
A very basic (quite boring - sorry, it's late) example of change summaries.
The new RSS builder lets you construct RSS feeds of exactly the content you want.
The new Dashboard space tabs, here showing the

These release notes exported to Word (even on a Mac!) - great for printing too.
Improved search showing fragments from attachments, file sizes and types.

Screenshot of the new 1.5 WYSIWYG editor.

Also:

- Additions to the Confluence Remote API including:
  - Comment manipulation
  - Label manipulation
  - Attachment uploading and editing
  - Improved user- and permissions management
- Import and restore now have progress indicators
- Backup and restore use significantly less memory
- The embedded database has been upgraded to HSQL 1.8, which should be significantly more reliable
- Collapsed breadcrumbs now expand with a single mouse click

Known Bugs

Confluence 1.5-DR2 is a preview, not a full Confluence release, and as such there are a number of known bugs included in the release (at no extra cost!). Important bugs include:

- The left-navigation theme is currently broken
- The "make this my default editor" link does not always appear (try switching back and forth between views)
- The Info page may cause a Hibernate exception when its parent has page level permissions
- The space export may be unreliable, and does not properly back up labels.
- Incoming Trackback pings are not recognised
- Various WYSIWYG round-trip inconsistencies

Release Notes 1.5-DR1

Confluence 1.5-DR1 is the first development release leading up to Confluence 1.5. Developer releases are a snapshot of our work in progress, allowing our customers to see what we're up to, and provide feedback
Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features. Developer releases are not suitable for running on production systems.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

**DB2 Compatibility**

At the time of release, there were a number of issues performing database queries for labels or RSS feeds against DB2 databases. These issues will be fixed for the next release. For now, though, we do not recommend testing this release on DB2.

**Macro Compatibility**

Incompatibilities exist that may cause Confluence not to start if custom macros are deployed. When upgrading to Confluence 1.5-DR1, be sure to remove any custom Macro plugins from your `$confluencehome/plugins` and `WEB-INF/lib` directories. These incompatibilities will be resolved before the final, stable release.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4 or higher, you can find instructions here. We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

If you are upgrading from Confluence 1.4.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**New Features in Confluence 1.5-DR1**

The three major features we've been working on are:

- WYSIWYG Editing
- Labels for content
- A dynamic RSS Builder

Consult JIRA for the full list of issues resolved for 1.5-DR1

1.5-DR1 also incorporates all the bug-fixes that were made between Confluence 1.4 and Confluence 1.4.3.

**WYSIWYG Editing**

**Browser Compatibility**

The Confluence WYSIWYG editor is currently only compatible with Internet Explorer 6 on Windows, plus Mozilla and Firefox across platforms. Javascript must be enabled in the browser for the editor to function. Support for Safari under Mac OS X is currently not available. To track Safari compatibility, please follow this JIRA issue: CONF-3864.
The WYSIWYG editor allows for Confluence pages to be edited directly through an editing GUI embedded in the web browser, without having to remember Confluence's wiki markup. It almost goes without saying that this has been our number one most requested features, and we're glad we can finally offer it!

Global administrators can enable WYSIWYG editing in the General Configuration screen of the site's preferences. They can also choose whether users are presented with the WYSIWYG editor by default, or whether users default to the old wiki markup text-field. If WYSIWYG markup is enabled, but an individual user does not like the default set by the administrator, they are free to override it in their preferences.

Labels for content

Another highly requested feature was the ability to categorise content within Confluence, beyond the rigid heirarchy allowed by spaces and parent-child relationships between pages. To this end we have introduced labels. Labels are simple one-word 'tags' that can be added to any page or blog-post that the user has permission to edit. Labels can be used to categorise content, bookmark it, flag it for attention, or anything else you can think of.

Picking a name for labels wasn't easy. Google's GMail service calls them labels, while other collaborative categorisation systems such as del.icio.us and Flickr call them tags. We decided that 'label' was a more natural description. For more information about the philosophy behind labels and tags, check out the Folksonomy page on Wikipedia

Labels can be added to any page from the edit screen, as a space-separated list of words. If you are browsing the site with a modern, Javascript-enabled browser, you'll also be able to use the dynamic web UI to add labels directly from the page itself. Once a page is labeled, then clicking on the label will enable you to browse other pages that have been similarly tagged, or browse other labels that commonly occur on the same page. You can also view the space's 200 most popular labels from the space browser, to get an idea of the most popular concerns within the space. Many other Confluence features interact with labels: they can be searched for through the search interface, the new RSS builder can filter pages by their label, and we're looking forward to building label support into Confluence's packaged macros, and even the dashboard.

Personal Labels

If you prepend my: to a label (for example, my:todo or my:favourite, then the label is a personal label – only visible to you. Personal labels allow you to discreetly tag content for your own purposes. You can browse
your personal labels from your user profile. Any user can add their personal labels to a page, even if they don't have permission to edit it.

Dynamic RSS Builder

A third highly-requested feature. Confluence has always provided a brace of useful RSS feeds, but the problem is that for every feed we provided, users wanted half a dozen more. The obvious answer is to let users build RSS feeds based on their own chosen criteria. You can access the RSS builder from the Confluence dashboard

Once in the builder, you can choose

- Which spaces to include in the feed
- Which types of content should be tracked
- Which labels, if any, you are interested in
- How many items to include in the feed
- Whether you want a single RSS entry per page or one for each time the page is edited
- Whether you want an RSS 2.0 or Atom 0.3 feed
- Whether Confluence should require authentication to view the feed

Once you have decided what you want, Confluence will give you a URL to paste into your RSS reader. These URLs can be shared with other Confluence users, although they will only ever be allowed to see content that they have permission to view. If you have asked to authenticate, Confluence will require HTTP Basic Authentication, which is supported by most RSS readers.

We've also taken the opportunity to improve the presentation of our RSS feeds - including a lot more information in each feed so you can follow your Confluence site entirely from your newsreader.

The Atom 1.0 draft has just been accepted as an IETF standard. Future versions of Confluence will be phasing out use of Atom 0.3 in favour of Atom 1.0

Known Bugs

Confluence 1.5-DR1 is a preview, not a full Confluence release, and as such there are a number of known bugs included in the release (at no extra cost!). Important bugs include:

- Label and RSS database queries do not work on DB2
- WYSIWYG editor adds extra information to browser history on Firefox
- Going to a page when not logged in will present you with a 404 error page, instead of giving you the chance to log in
- Various WYSIWYG round-trip bugs

Release Notes 1.4-RC2

Confluence 1.4 Release Candidate 2

1.4-RC2 is now available for download [here](https://www.example.com).

Confluence 1.4-RC2 is (barring some absolute disaster) the final public developer build for Confluence 1.4. It incorporates all the changes that were deployed in the [private DR7 build](https://www.example.com), as well as around 60 new bug fixes and improvements.

Confluence 1.4-RC2 is being released to give Confluence customers the opportunity to test the upgrade path for their existing Confluence installation. By testing your migration with this pre-release, you can ensure that any problems you may experience will be fixed before the final 1.4 release, rather than having to rely on ad-hoc patches or wait for 1.4.1.

Who should upgrade?
While 1.4-RC2 is still pre-release software, and we do not recommend upgrading production Confluence sites until the release of 1.4-final, we would recommend any existing Confluence customer install this release on a test server, and try to import their existing Confluence data into it.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or higher, you can find in instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

⚠️ When you first start Confluence 1.4-RC2 after upgrading, the server may take a few minutes to become fully functional. This is because Confluence is rearranging information in the database so that it can be looked up more efficiently. This will only be done the first time Confluence is started after upgrading.

New Features in Confluence 1.4-RC2

The changes made between DR7 and RC2 are mostly correctness and polish issues - major feature development on Confluence 1.4 has been completed. A few notable changes however are:

- You can upload attachments while editing a page – from the "Insert Link" popup
- The dynamic content-tree degrades gracefully on unsupported browsers
- Many bugs related to PDF export (and images included in PDF exports) have been fixed
- Ü characters in page titles no longer confuse the database
- Text properties set via the contentPropertyManager can now be longer than 255 characters, fixing related bugs in the {tasklist} and {excerpt} macros
- The {attachments} macro can display the list of attachments inline within a page
- New XML-RPC and SOAP plugin types allow you to deploy web services dynamically into Confluence
- A potential connection leak that has been causing problems for Oracle users has been fixed.

And much much more.

Release Notes 1.4-DR7

Confluence 1.4-DR7

Confluence 1.4-DR7 is the first release-candidate build of Confluence 1.4. In 1.4-DR7 we have resolved over 120 issues: mostly related to fixing bugs and polishing up the application for a stable release. We anticipate that DR7 will be the last major build before the stable 1.4 release.

DR7 is not a public release. It has been built and deployed onto http://confluence.atlassian.com as part of our internal quality-control process, but we have decided that the developer time required to make this a public beta release would be better directed towards continuing the push towards a final, stable 1.4 build.

Who should upgrade?

Since Confluence 1.4-DR7 is not publicly available, nobody should upgrade. The upgrade note below is just for completeness, so when we come to gather all these release notes together into a single note for 1.4, we don’t miss the warning.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or higher, you can find in instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!
If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

When you first start Confluence 1.4-DR7 after upgrading, the server may take a few minutes to become fully functional. This is because Confluence is rearranging information in the database so that it can be looked up more efficiently. This will only be done the first time Confluence is started after upgrading.

New Features in Confluence 1.4-DR7

The changes made between DR6 and DR7 are mostly correctness and polish issues - major feature development on Confluence 1.4 has been completed. A few notable changes however are:

- The space content tree is now updated dynamically, leading to much faster page-load times and much less load on the server (for large spaces, this page was turning into a reliable way to DOS Confluence). However, you must have a modern web browser with Javascript enabled for the tree to work. (A non-Javascript fallback will be included in 1.4-final - CONF-3098)
- You can now customise the site's name alongside the logo
- The display and navigation of page history diffs has been improved significantly
- Webdav configuration has been reinstated to the same functionality as 1.3.5
- An "insert image" popup has been added to the page editing screen, that can select images from the page's attachments. There is also an Attachments tab in the "insert link" popup. Allowing file upload from these popups has not yet been implemented (CONF-3099)
- Many improvements and fixes to email notifications
- Marking your change as a "minor edit" will prevent email notifications being sent
- The new Component plugin module adds new beans to the Spring context
- You can now uninstall plugins via the web interface
- The default theme has various keyboard shortcuts (see the tabs on this page)
- The Include Page Macro can now include pages from other spaces
- For developers, macros can now decide whether or not they have a body
- Report showing all attachments to pages in a space (check it out!)
- Generally improved notifications including a much more usable "File Attached" notification
- "View wiki source" link, for all those source junkies...

And much much more.

Release Notes 1.4-DR6

Confluence 1.4-DR6

Confluence 1.4-DR6 is the next development release in the cycle leading up to Confluence 1.4. In 1.4-DR6 we:

- introduce page-level view permissions,
- make Confluence radically more themeable,
- further improved the overall user interface and usability,
- add several interesting new plugin types,
- add file attachments to blog posts and user profile pages,
- let you customize Confluence logos at a space and global level, and
- help you keep track of all the email watches you might have set up in Confluence.

Phew! Got all that?

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.
Note for Oracle Users

Confluence 1.4-DR6 is currently not recommended for Oracle users, as it has not passed our test-suite against the Oracle database. This will (obviously) be fixed before we release Confluence 1.4.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or higher, you can find instructions here. We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

If you upgrade to Confluence 1.4-DR6 you will need to rebuild your search indexes before search will function correctly. Look for "Rebuild Search Index" on the global Administration page.

Downloads

All development releases are available from Development Releases on the Atlassian website.

New Features in Confluence 1.4-DR6

See also: Issues Resolved for 1.4-DR6

Page Level Permissioning

A highly-requested feature, and the reason this DR took so long to get out, you can now hide pages from other users. The option for hiding pages can be found at the bottom of the page's "Edit" screen.

- You can hide a page so it is only visible to yourself, or only visible to members of groups you belong to.
- Once a page is hidden, all its child pages (and their children, and so on) are also hidden.
- A new space-level permission has been introduced to determine which users are permitted to hide pages.

Please note that it may be possible for users to learn the names of hidden pages, even if they can't see their content. So don't make a page called "We Hate Bob Smith" if Bob Smith has access to your wiki. Just make a page called "We hate..." and put Bob's name in the body.

Improved Themes

While the overwhelming reaction to the User Interface changes we have made in the 1.4-DR series has been positive, it has sparked continuing discussions on the user mailing list about various aspects of the presentation of a Confluence site. From these discussions we have determined:

- Everyone wants something slightly different.
- Some people want something completely different.

In response, we've moved to vastly improve the level of themeability that Confluence offers. Almost all of the user interface elements have been pushed into customisable decorators, so if you don't like the tabs, you will be able to install a theme that removes them entirely! We're hoping to bring out some example themes with the 1.4 release that do just this, but for now you can read the documentation for the new decorators in the Theme Module documentation.

Plugin Improvements

To make Confluence more flexible, we're introducing more ways for advanced users to extend the system:
Uploadable Plugins

Confluence administrators can now upload new plugins through the administrative interface, and have them installed without restarting the server.

Search Extractor Plugins

Extractor plugins allow you to add custom information to Confluence's full-text index when Confluence content is saved or updated. The most obvious application for this plugin type is to allow you to index attachment formats that Confluence does not yet support, but more creative plugin authors might make use of this as a sneaky way to store and retrieve metadata about any content in the Confluence system. Documentation for Extractor plugins is coming soon.

XWork Plugins

XWork plugins allow you to add new XWork (Webwork 2) actions to Confluence. Advanced programmers can add entirely new behaviours to the application: take a look at the examples in XWork-WebWork Module, in which we've implemented a rudimentary "Google Suggest"-like live search entry box for Confluence:

Servlet Plugins

Servlet plugins allow you to deploy servlets into Confluence dynamically – perfect for integrating Confluence with some legacy application that is only available as a servlet. See Servlet Module for an example.

Attachments for Blog Posts and User Profiles

You can now upload attachments to blog posts and user profiles, both frequently requested features. Users have the option to nominate one picture attached to their profile as their "profile picture", but we haven't quite decided what to do with this information yet. 😃

There is a new global permission to determine if users can attach files to their profile. This permission is not assigned by default, so you will need to explicitly give it to users if you want to enable this feature.

Customizing Logos at a Space and Global Level

Space and global administrators may now easily configure the image displayed as the Confluence logo. This can be done for each space, or at a global level, without having to actually edit a single file.

Keeping track of your Email Watches

A Notifications link on your profile displays a list of all currently configured email watches you might have set up on various spaces or pages. You can now delete them in one, central, place or simply visit them.

Bug fixes

All bugs fixes made between Confluence 1.3.2 and Confluence 1.3.5 have been merged into the developer release branch, fixing many annoying bugs including the crash on selecting "Next" in search results. See also: Issues Resolved for 1.3.4, Issues Resolved for 1.3.5.

Release Notes 1.4-DR4

Confluence 1.4-DR4

Confluence 1.4-DR4 is the fourth development release in the cycle leading up to Confluence 1.4. In 1.4-DR4 the user interface continues to improve, and our new wiki->HTML renderer lands, fixing a large number of bugs (but probably introducing a few more)

1.4-DR4a

One of the bugs that was introduced in 1.4-DR4 caused the edit option to disappear completely from the Confluence interface for anyone who was not a global administrator. Because that issue rendered Confluence mostly unusable, 1.4-DR4a has been released including a fix to that problem. 1.4-DR4a also includes the patch for Confluence Security Advisory 2005-02-09.

We would like to remind everyone who downloads the developer releases that they are not fully stable.

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

**New Features in Confluence 1.4-DR4**

**User Interface Enhancements**

The user interface of Confluence continues to improve. A big thank you to all the users who contributed feedback on DR3. While the changes between DR3 and DR4 aren’t as radical as the last release, we’ve been able to polish up a lot of the edges, and make Confluence even easier and more pleasant to use.

We’re still gathering feedback on the UI changes, add your input here: [1.4 UI Discussion](#)

**Mail Archives**

- You can now bulk-delete all mail within a space (mail deleted this way does not go to the trash, and **cannot** be recovered later!)
- Pagination on the mail archives is a bit more sane: it doesn’t try to tell you about every single page of mail in the archives.
- The mbox importer detects if you’re trying to import something that isn’t an mbox file, making you much less likely to break anything if you upload the wrong file.

**Nofollow Support**

As part of the effort to combat spam on wikis and blogs (Confluence being both), Google [came up with some markup](#) that will cause search-engines not to follow links. By removing the main benefit of wiki-spamming (increased search-engine PageRank), it’s hoped that the noxious practice will stop being cost-effective, and eventually die out.

By default, all URLs inserted in a page (or in comments) will be given the `nofollow` tag. Inter-page links or shortcut links (i.e. [CONF-2622](#)) will not be tagged. If your wiki doesn’t support public editing or commenting, or you just [disapprove of nofollow on principle](#), the site administrator can turn the feature off in General Configuration.

**V2Renderer**

Over the last few releases of Confluence, it has become apparent that the engine we were using to convert wiki text to HTML was starting to cause us problems. There were a growing number of bugs that we **simply couldn’t fix**, because the nature of the engine meant that fixing one bug would cause ten worse bugs to spring up in its place. After a few false starts, we can now introduce ‘v2Renderer’, which fixes quite a few of these problems already, and promises to make fixing the rest of them much easier:

**Error rendering macro 'jiraissues' : JIRA project does not exist or you do not have permission to view it.**

Because this is the first public release of v2Renderer, it’s likely that there are some situations in which the markup of pages may change. We’ve been pretty careful, but users who have been making heavy use of undocumented (or accidental) features of the old markup may encounter situations in which the page displays differently to before. Please, **please report these problems to us**, so that we can fix the renderer for the final release, or perhaps provide you with a script to painlessly convert your pages to a markup that works.

**Renderer Bugs**

If you file a bug about the v2Renderer, **PLEASE** make sure you put it in the Wiki/XHTML component: this makes finding all the relevant bugs so much easier for me. – [Charles Miller](#)

**Macros**

There is a new macro API that we will be rolling out for 1.4. However, there’s a compatibility layer in place to
make sure that most 1.3 macros will continue to function properly. Most macros written for Confluence 1.3 will continue to work in 1.4-DR4. Most of our macros are running without any changes at all, and many of the ones we did migrate were changed over in order to use the capabilities of the new engine to fix bugs.

We suggest that macro authors who are worried about compatibility test their macros with 1.4-DR4 and contact us as soon as possible to discuss how we can improve the compatibility layer before the final release, or help you migrate to the new API.

Known Bugs

The renaming of links when a page is moved or renamed is currently unreliable. This is a side-effect of the change in renderers, and will be fixed before the final version of 1.4 is released.

Release Notes 1.4-DR3

Confluence 1.4-DR3 is the third development release in the cycle leading up to Confluence 1.4. It is the first step in a process of making the Confluence User Interface simpler, and easier to navigate.

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

New Features in Confluence 1.4-DR3

User Interface Enhancements
Some of the most frequent feedback we get about Confluence is that while users like the wealth of features on offer, the interface is often overwhelmed by too much information and too many options, making Confluence difficult to navigate, and difficult to introduce to non-technical users. Confluence 1.4-DR3 is the first step in an attempt to present a cleaner, more useable design for Confluence, while still providing a powerful interface for experienced users.

1.4-DR3 is a developer release. As such, some of the changes to the interface are incomplete, and some may not make it into the final version. Please offer your feedback on 1.4 UI Discussion.

While the obvious way to get a look at the new interface is just to explore this site, here are a few screenshots that might help:

New attachment management interface

New-look recently updated list for spaces
I'm also compiling a page to help people who are used to Confluence Classic, and might be a little lost in the new interface: **1.4 Interface - Where Did Everything Go?**

**Known Bugs**

A page has been created in the Discussion space to gather comments, suggestions, compliments and complaints about the new interface: **1.4 UI Discussion**

**1.4 Interface - Where Did Everything Go?**

If you're used to the Confluence Classic interface, the new 1.4 interface might be a little hard to navigate at first. We think that the new design is a vast improvement, but it's inevitable that people who have used the application since its release will be wondering where some of the buttons they were used to have gone...

**Where Did They Go...**

- **Blogs**?
- **Rename Page**?
- **Move Page**?
- **Create Child Page**?
- **Page Locks**?
- **Page History? Short URL? Watch Page? Remove Page**?

Like it? Don't? Join the discussion.

**Blogs?**

By incredibly popular demand, blogs have been renamed to "News" across the site. While blogs are all the rage at the moment (or, as my brother would say, very zeitgeisty), it's still far easier to explain "News" to someone familiar with blogs, than it is to explain blogs to someone who is familiar with news.

**Rename Page?**

Rename page is no longer a separate function. Just edit the page and change the page title, and Confluence will rename all the links to the page for you.
### Move Page?

Move page is no longer a separate function. Just edit the page and change its space, and Confluence will move the page to the new space for you, renaming any links to the page. If the page has children, you will be given the option to move all the children as well.

### Create Child Page?

Whenever you select the "Add Page" link from the top of the page, your current page will be automatically inserted into the Parent Page box. We've found that this is the way most people use Confluence anyway.

### Page Locks?

Page locks have been renamed "Permissions" and moved to the bottom of the edit page. We found that most people didn't understand (or couldn't find) locks, and thus didn't understand that Confluence has page-level edit security.
Release Notes 1.4-DR2

Confluence 1.4-DR2 is the second development release in the cycle leading up to Confluence 1.4. Seeing as the DR2 development fortnight straddled Christmas it's not quite as feature-laden as some previous releases, but we thought we'd give you a few new toys to play with for the New Year.

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

Downloads

All development releases are available from Development Releases on the Atlassian website.

New Features in Confluence 1.4-DR2

Consult JIRA for the full list of issues resolved for 1.4-DR2.

Export Page Hierarchy

When you export a page to PDF or HTML, you have the option to include its children in the export.
Popup Page Picker

We now have a popup that can be used to select pages for inserting links, or choosing a page's parent. The picker lets you choose from your recently visited pages, the list of pages that link to the current page, or you can perform a search within the picker itself.

New Macros

As part of the process of making Confluence more flexible, we have implemented the various functions of the Confluence dashboard and space summary pages as macros. These macros are currently disabled by default, but if you're interested in using them within regular pages, you can enable them from your global plugin configuration.

This currently has no effect on the dashboard itself - but will become useful in the future when the dashboard becomes customisable. For example, the {spaces-list} macro will reproduce the list of spaces that appears on the dashboard:

Spaces: All Favourite Category New (1)

Known Bugs

There is a known bug that occurs whenever you enable or disable a plugin in Confluence 1.4-DR2. The error will appear to be 'null', but the following will appear in the logfiles:
This is issue [CONF-2513](#) and will be fixed in the next DR.

**Release Notes 1.4-DR1**

Confluence 1.4-DR1 is the first development release in the cycle leading up to Confluence 1.4. On the surface, we have implemented one of Confluence’s most requested features. Under the hood, there's a whole new event system to play with.

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or higher, you can find [upgrade instructions here](#). **We strongly recommend that you backup your `confluence.home` directory and database before upgrading!**

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the [Confluence 1.3 release notes](#).

**Downloads**

All development releases are available from [Development Releases](#) on the Atlassian website.

**New Features in Confluence 1.4-DR1**

Consult JIRA for the [full list of issues resolved for 1.4-DR1](#) (Note, this list doesn't include all the 1.3.1 fixes that were also merged into the development release)

**Move Page Hierarchy**

When you move a page between spaces, you now have the option to include all children of that page in the move. With 13 votes, this was one of Confluence's most requested features.

(Note, as of DR1, you can not both move a hierarchy of pages and rename the root page at the same time. This bug is filed as [CONF-2452](#))

**Attach Multiple Files**

Another commonly requested feature, you can now attach multiple files to a page at once. By default, you can
attach a maximum of five at a time, but this maximum is configurable.

GZip Content Encoding

Pages are served with GZip content encoding, which means less bandwidth consumption and faster page downloads.

Events and Listeners

We have implemented the beginnings of a pervasive system of events within Confluence.

By the final release of 1.4, all major actions within Confluence will trigger an event. These events can be listened for, and reacted to by a new plugin module type: "listener". This will allow Confluence to be further customised, as extensions can react to anything that happens within the system.

Creating an event listener plugin is insanely easy. Step one, implement this interface:

```java
package com.atlassian.confluence.event;

import com.atlassian.confluence.event.events.ConfluenceEvent;

/**
 * Defines a listener for Confluence events.
 */
public interface EventListener
{
    /**
     * Perform some action as a response to a Confluence event. The EventManager will
     * ensure that this is only called if the class of the event matches one of the
     * classes returned by getHandledEventClasses
     *
     * @param event some event triggered within Confluence
     */
}
/**
 * Determine which event classes this listener is interested in.
 *
 * The EventManager performs rudimentary filtering of events by their class. If
 * you want to receive only a subset of events passing through the system, return
 * an array of the Classes you wish to listen for from this method.
 *
 * For the sake of efficiency, only exact class matches are performed.
 * Sub/superclassing
 * is not taken into account.
 *
 * Returning an empty array will allow you to receive every event.
 *
 * @return An array of the event classes that this event listener is interested in,
 * or an empty array if the listener should receive all events. Must not
 * return null.
Step two: Package it as a plugin module with a descriptor like this:

```xml
<listener name="My Listener"
  key="mylistener"
  class="com.example.listeners.MyListener">
  <description>Listens for stuff.</description>
</listener>
```

And that's about it. We'll be adding information about the events that are being produced in Confluence over the next couple of days (We would have had them documented today, but Nick, who wrote most of them, was sick).

Bugs Fixed

All bugs that were fixed in [Confluence 1.3.1](release-notes-1.3-final.html) are also fixed in Confluence 1.4-DR1.

**Release Notes 1.3-final**

Confluence 1.3-final is the stable release of Confluence 1.3. Woohoo! We made it! The [full release-notes for Confluence 1.3 are located here](release-notes-1.3-final.html), this page documents only the changes made since the 1.3-DR4 development release.

1.3-final contains over 100 improvements over 1.3-DR4, mostly focused around fixing bugs, polishing the interface, and making Confluence ready for a stable release.

Who should upgrade?

Confluence 1.3 is the new stable release of Confluence. It contains a huge raft of enhancements and fixes made since 1.2.3. If you are running Confluence (and not using Oracle, see below), you should upgrade to Confluence 1.3. If you are not running Confluence, you should install 1.3 immediately, regardless of your database.

Current users of Confluence on [Oracle databases](https://confluence.atlassian.com/blog/oracle-databases-in-confluence-1.3-1529.html) users may wish to delay upgrading.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2 or higher, you can find in instructions here. We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the [Confluence 1.2 release notes](release-notes-1.2.html).

**Note:** You will need to rebuild the search index after you upgrade for certain features (including mail threading)
to work properly.

New Features in Confluence 1.3-final

New Demonstration Content

As part of the DR4 setup improvements, users were given the option to install an example space, but the demonstration content that was loaded was pretty uninspiring. For the final release, the demonstration space now contains a suite of demonstration pages, examples of what Confluence can do, and a few pictures of the Sydney Opera House. This should make it much easier to get Confluence up and running quickly.

Referrer Performance Improvement

We discovered (from monitoring the http://confluence.atlassian.com site) that our recording of HTTP referrers was causing some serious performance problems for public Confluence sites. Upgrading to Confluence 1.3-final should make Confluence a lot more responsive, especially under heavy load.

Improved Notation Guide

The notation guide has been reorganised to be more user-focused, making it easier to find the markup or macro you are looking for.

It is also now possible for macro plugins to insert themselves into the notation guide. Just write your macro description as a two-column HTML table row, put it in a vm file, and include the following in your atlassian-plugin.xml file:

```
<resource type="velocity" name="help" location="/path/to/your/helpfile.vm">
  <param name="help-section" value="tables"/>
</resource>
```

The help section can be one of: texteffects, headings, breaks, links, lists, images, tables, advanced, confluence, external or miscellaneous. If you don't include a help section, it will be put in the 'macros' section.

Improved Search Indexing

We've updated the way we index content within Confluence. A lot of searches that came up empty before will now find something. In addition, you can now set your primary language for indexing under General Configuration, so that the indexer can better optimise itself for non-English content.

Also

- By popular demand (it was our most highly voted-for bug), pages are now exported in alphabetical order, not in order of creation.
- The Remote API can be accessed anonymously, if you wish (anonymous remote access must be turned on in the general configuration).
- When previewing a page, you can continue to edit on that screen, instead of having to go back to the edit page.
- The thread view on a mail page has been improved, and the full-thread view is no longer a pop-up.
- You no longer need to be in the confluence-admin group to access the administration pages, you just need global administrative privileges
- You can link to anything in Confluence if you know its ID in the database (currently this is how you must
Issues Resolved for 1.3-final

In all, over 130 issues were resolved between DR4 and 1.3-final. Unfortunately, merging all the versions together in JIRA means the list of precisely what went into those 130 has been lost, but if you sort this list by last-modification date, you'll get some idea... Issues Resolved for 1.3

Release Notes 1.3-DR4

Confluence 1.3-DR4 is the fourth development release in the cycle leading up to Confluence 1.3. We’re on the home stretch! The final, stable 1.3 isn’t far away.

Confluence 1.3-DR4 includes a raft of improvements to mail archiving, a redesigned setup wizard, significant improvements to the way we back up and restore your system configuration, and a truck-load of bug fixes.

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2 or higher, you can find in the Confluence 1.2 release notes. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the Confluence 1.2 release notes.

Note: You will need to rebuild the search index after you upgrade for certain features (including mail threading) to work properly.

New Features in Confluence 1.3-DR4

Setup Improvements

Confluence’s setup wizard was badly in need of an overhaul, so that’s exactly what we’ve done. Among the improvements, we have:

- Improved the ordering of steps. For example, if you are importing straight from a backup, you no longer need a redundant administrative user.
- Added a quick, two-step setup process to get Confluence running straight away
- Made the database setup much more robust, and much better at reporting errors
- Removed those steps that weren’t really necessary to get Confluence running

Hopefully this will make it a lot easier to get Confluence up and running, or show off Confluence to your friends and family.

Mail Archive Improvements

(CONF-2050)

We’ve been working hard to build on the basic mail-archiving features included in 1.3-DR3. Included in the new
version are:

- Improved indexing of mail senders, message-ids and subjects
- Improved integration of mail with search
- The ability to delete mail (if you have been assigned the delete mail permission)
- Direct access to mail archives from the dashboard
- Display of mail attachments in the "view mail" page
- The ability to link to a single message by its internal Confluence ID ([$1234] will link to message 1234)
- The ability to navigate forward and back through mails chronologically
- Email addresses are displayed or masked in accordance with your global preferences

We still have a few things to do (date based views, a calendar), but the mail archive is now very useable. Especially when you take into account...

**Mail Threading**

*(CONF-2059)*

Of course, it’s important for your mail archive to be able to represent conversation threads. How you present threads, though, is just as important.

Here’s how most mail-based web archives present your thread at the bottom of each message:

- **Follow-Ups:**
  - RE: PaceDateModified
    - From: Bob Wyman

- **References:**
  - RE: PaceDateModified
    - From: Tim Bray

Not very helpful, is it. Here’s how that same bottom-of-the-message view looks in Confluence:

![Entire Thread](image)

*Re: PaceDateModified* Dare Obasanjo <kpako@yahoo.com>

The real question is why you'd be looking for "last modified" information from an entry in the first place when atom:updated exists.

*Re: PaceDateModified* Eric Scheid <eric.scheid@ironclad.net.au>

Why? When you two versions of the same entry, and they both have the same atom:updated value, yet they are different in content. How do you determine which is the most recently modified?

*Re: PaceDateModified* Robert Sayre <mint@franklinmint.fm>

The definition of atom:updated holds the answer to that question--it doesn't matter.

Robert Sayre

*Re: PaceDateModified* Dare Obasanjo <kpako@yahoo.com>

The one you fetched most recently from the feed. Is this a trick question?

*Re: PaceDateModified* Eric Scheid <eric.scheid@ironclad.net.au>

That's not a good assumption to make as to which is most recently modified. Lots of things can go wrong to break that assumption. e.

At a glance, you can see exactly where the message sits in a conversation.

**Backup Improvements**

*(CONF-1090 and CONF-2046)*
Confluence 1.3-DR4 contains two significant improvements to backing up and restoring the system.

- You can now exclude attached files from your backups. Of course, this means you have to back up your attachment directory separately, but if you already have a good backup regime for your filesystem (and can thus restore the attached files separately), it means that your Confluence data backups will take up far less room.
- We now include important parts system configuration in your backups. this means that colour-schemes and plugin preferences are now saved, and fixes a large number of issues that users have filed due to the restore process not bringing the system back up in the same state as when they saved it.

Library Upgrades

We have continued the process of upgrading to the most recent stable versions of those libraries Confluence is built on, which should result in improved stability and performance.

Bugs fixed for 1.3-DR4

We've also fixed a lot of bugs, as we ramp up for the stable 1.3 release. Take a look in JIRA for the full list.

Release Notes 1.3-DR3

Confluence 1.3-DR3 is the third development release in the cycle leading up to Confluence 1.3 - and a momentous day in the history of Confluence.

We've finally made it to that special point in every applications life.

Confluence has evolved.

1.3-DR3 is best summed up by Jamie Zawinski's Law of Software Envelopment:

```
Every program attempts to expand until it can read mail. Those programs which cannot so expand are replaced by ones which can.
```

That's right - Confluence now has more content than ever before. It reads, stores and indexes email. Oh, and as a nifty little bonus - it also indexes Word documents, PDF documents, RTF documents, Excel spreadsheets, PowerPoint files, text files, source files etc... attached to your mail!

Have we got your interest? How does all this magic happen you ask? Read on to pull back the curtain.

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the Confluence 1.2 release notes.

Note: Because we have made significant changes to permissions in 1.3-DR2, you should check that your user permissions have been correctly migrated. The upgrade manager should ensure permissions remain consistent between versions, but as with anything related to security, it's best to double-check.
New Features in Confluence 1.3-DR2

Mail Archiving

(CONF-1965)

Confluence is a collaboration tool. When communication happens through email instead of through Confluence, information will get lost in the depths of someone's mail folders, instead of shared with the team, archived, interlinked and indexed.

While we would love to see all collaboration within a group to happen through Confluence, it's often not possible to change the way people work. So instead of finding new ways to force people to use Confluence instead of email, why not route all the relevant email into Confluence?

It is now possible to archive email within a Confluence space. The support for mail is only just getting started in DR3, but we believe this is an incredibly useful direction for Confluence to go, and will be expanding and improving the mail integration in future releases.

Confluence spaces can retrieve mail periodically from a POP mailbox (this will delete all mail from that POP account, so don't try it on an account you want to keep mail on), or space administrators can import mail directly from a standard mbox-format mail file.

Once mail is imported into Confluence, it can be browsed chronologically from the Content pane of the Space Summary page, and can be searched through Confluence's search interface.

In the future, we will be adding new ways to link to and between email (bringing the email closer to the other content of the wiki), proper representation of email threads, more flexible search, and much, much more.

Read the Mail Archiving FAQ for more information

Want to play with it now?

We love to play with features right now, so here's how you can:

- Testing mail search is a snap.
- Testing mailing content into Confluence is also easy. It will also be indexed.

Improved Indexing Performance

We now make much more efficient use of resources by batching updates to full-text search index. This should lead to improved performance for many tasks within Confluence, but will mean that it may take up to a minute for a change in the site to be reflected in the site's index. (CONF-2029)

In addition, we have made a number of improvements to the indexing of large PDFs, including fixing some cases where a PDF might cause indexing to freeze indefinitely. (CONF-1953, CONF=1954)
Library Upgrades

Many of the libraries Confluence is dependent on have been upgraded for this release, which should result in improved stability and performance.

Bugs fixed for 1.3-DR3

We've fixed a handful of issues specifically for 1.3-DR3, take a look in JIRA for the full list.

Release Notes 1.3-DR2

Confluence 1.3-DR2 is the second development release in the cycle leading up to Confluence 1.3. For DR2, we have made space-level permissions a lot more fine-grained, and added a new plugin manager which should open the way to making it easier for people to write extensions to Confluence:

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the Confluence 1.2 release notes.

Note: Because we have made significant changes to permissions in 1.3-DR2, you should check that your user permissions have been correctly migrated. The upgrade manager should ensure permissions remain consistent between versions, but as with anything related to security, it's best to double-check.

New Features in Confluence 1.3-DR2

New Space-Level Permissions

(CONF-1375, CONF-1764 and their linked issues)

We've been getting a lot of requests for more fine-grained control over who can do what in a space, so as a result, we've added a whole raft of new permissions at the space level:

<table>
<thead>
<tr>
<th>Object</th>
<th>Permissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page</td>
<td>create/edit, remove, export</td>
</tr>
</tbody>
</table>
Create space permission is still managed at the global level.

The permissions editing screens have been changed a little, too, taking into consideration the feedback we received from the last DR. All editing functions are now firmly on the edit screen, and we have introduced a user-picker to avoid having to find users in a massive drop-down list.

**New Plugin Architecture**

*(CONF-1877)*

Confluence now incorporates the plugin architecture that was written for JIRA 3.0 (which in turn was adapted from Confluence's macro management. Who said code reuse was dead?). Right now, there's not much you can do with it, but plugins pave the way to making Confluence a great deal more flexible and extensible.

See: [Writing Confluence Plugins](#)

**New Macro Descriptor Format**

*(CONF-1878)*

Macro libraries are now implemented as plugins, which means that if you have written a macro library, you will need to convert your `macro-library.xml` files to `atlassian-plugin.xml` files.

**Themes**

*(CONF-1856)*

It is now possible to package a colour-scheme and a set of customised decorators into a portable Confluence plugin. Just drop the theme jar into your server's classpath, restart the server and space administrators will be able to select the theme from the space administration console.

<table>
<thead>
<tr>
<th>Blog Post</th>
<th>create/edit, remove</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comment</td>
<td>create, remove</td>
</tr>
<tr>
<td>Attachment</td>
<td>create, remove</td>
</tr>
<tr>
<td>Space</td>
<td>export, administer</td>
</tr>
</tbody>
</table>

DR-2 comes with two very simple themes (look under themes/ in your Confluence directory), but we will have more (and more useful) themes available by the time 1.3.0 is released. In addition, we're hoping that users will continue to share their Confluence modifications in the [Confluence Extensions Space](#), and that themes will help
you continue to share neat things you’ve done with Confluence.

Bugs fixed for 1.3-DR2

All the bug-fixes that were part of the Confluence 1.2.3 release have also been incorporated into 1.3-DR2. In addition, we’ve fixed a handful of issues specifically for 1.3-DR2, take a look in JIRA for the full list.

Release Notes 1.3-DR1

Confluence 1.3-DR1 is the first development release in the cycle leading up to Confluence 1.3. In it, we have rewritten the Space Summary/Space Administration pages to be more useable, adn implemented a much-requested feature: the ability to undelete pages.

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the Confluence 1.2 release notes.

New Features in Confluence 1.3-DR1

Space Summary

The Space Summary page has been the dumping-ground for every space-related operation and report since Confluence’s early alpha releases. As such, it had become confusing to navigate and hard to find anything on.

For 1.3-DR1, we have rewritten the space summary to be a suite of tabbed pages, making that whole area of Confluence easier to navigate, more self-explanatory, and much better-looking.

The Trash Can

When a page or blog post is deleted, it is no longer removed completely, but is placed in a space-wide trash can.

The trash can be found in the Administration tab of the newly rearranged Space Summary pages. Space Administrators can choose to restore pages from the trash, or purge them so they are unrecoverable.

New Emoticons

Just because.

Bug Fixes

All the bug-fixes that were part of the Confluence 1.2.2 release have also been incorporated into 1.3-DR1. In addition, we’ve fixed one or two issues specifically for 1.3-DR1, take a look in JIRA for the full list.

Add Spell Checking To Confluence

Confluence has no inbuilt support for spell checking. You may wish to vote for Confluence to add its own spell checking or add spell checking to your browser instead:

• Add spell checking to Internet Explorer
• Install the Firefox browser with inbuilt spell checking

Can I run multiple instances of Confluence & connect them to a central database?

Confluence can be clustered.

If running as a single node, you may only have one instance of Confluence connecting to a single database.

There are a couple of reasons for this, but it all comes down to the fact that the Confluence application maintains a lot of state (caches, search indexes) separate to the database, and multiple front-ends will quickly see that state get out of sync, with disastrous effect.

Because of this, Confluence periodically checks to make sure it's the only application accessing the database, and if it finds a conflict it will shut down rather than risk corrupting your data.

Capturing HTTP traffic using Wireshark or Fiddler

This is a quick guide to help you start capturing HTTP traffic when requested by support. This can be helpful either for network traffic issues or for understanding issues with page content loading.

When submitting the captured result to support...

Don't forget to mention the IP Address of the servers involved so Support can go through the TCP dump. Also please mention the time when you performed the operation requested by support.

Wireshark

Wireshark is a network protocol analyzer that can be installed on Windows, Linux and Mac. It provides a comprehensive capture and is more informative than Fiddler. This is the preferred tool to use when troubleshooting Sharepoint connectivity issues.

To use:

1. Install Wireshark. (Mirror here)
2. Open your Internet browser.
3. Clear your browser cache.
4. Open Wireshark
5. Click on "Capture > Interfaces". A pop up window will show up.
6. You probably want to capture traffic that goes through your Ethernet Driver. Click on the Start button to start capturing traffic via this interface.
7. Visit the URL that you wanted to capture the traffic from.
8. Go back to your Wireshark screen and press Ctrl + E to stop capturing.
9. After the traffic capture is stopped, please save the captured traffic into a *.pcap format file and attach it to your support ticket.
## Wireshark limitation

- If you are using HTTPS, please disable it in your test environment so Wireshark can be used.
- Wireshark cannot sniff traffic within the same machine (localhost) on Windows. If you need to sniff local traffic on Windows, try Fiddler.

### Fiddler

Fiddler is a web debugging proxy tool that can capture HTTP(S) traffic. It can only run on Windows.

To use:

1. Download [Fiddler](https://www.fiddler2.com/).
2. Open it.
3. Clear your browser cache.
4. Browse to your site. Visit the pages that are problematic and a contrasting non-problematic page if appropriate, for contrast.

   ![Warning] Fiddler can capture local traffic by using the machine's name as the host name rather than 'localhost'.

5. Click File > Save > All Sessions....
6. Attach the resulting file in .saz format for Support.

### Using HTTPS?

Fiddler has a functionality to capture traffic using its decrypt HTTPS functionality. Make sure you enable this before you start capturing.

## Changing Server ID for Test Installations

This page tells you how to obtain a new server ID to use in a test installation of Confluence. Please note this is not essential. If your test server has the same server ID as production it will not affect your production installation. The separate server ID is however useful for the support team, to help us distinguish between your servers.

If you would like to change the server ID on your test installation, you will need to acquire a new server ID for your test environment:

1. Install a new, temporary instance of Confluence. See [Installing Confluence](https://confluence.atlassian.com/display/CDOC/Installing+Confluence).
   - Choose the the zip file. Do not use the automatic installer.
   - Make sure the installation points to a new empty home directory.
2. Start the new, temporary Confluence instance. This will create a confluence.cfg.xml in the home directory you specified. Look in this file for the line:

   ```xml
   <property name="confluence.setup.server.id">BIBE-YA0Z-8EK6-SS9C</property>
   ```

   The above line in your own file will contain a server ID that you can use.
3. On your test server, go to the `<<Confluence-Home>>/confluence.cfg.xml` file and replace the existing server ID with the one you have just obtained in the new temporary installation of Confluence.
4. Start up the test server, go to Administration --> License Details and update the license to your developer license that you generate from [https://my.atlassian.com](https://my.atlassian.com).
Copy Or Rename A Space

Currently Confluence does not support renaming or copying spaces through the user interface. You may wish to vote towards these feature requests:

- Feature request to clone an entire space - this will enable duplication of every page, news item and comment plus space themes and colour schemes.
- Feature request to copy a page hierarchy between existing spaces.

Use The Copy Space Plugin

The best option is to install the Copy Space Plugin.

⚠ Note that this plugin is still in beta release, and is not officially supported by Atlassian.
⚠ Note that copying a space can take a long time and may appear to time out when using this plugin (even when the copied space is created correctly). If this occurs, please ensure that your space has not been created before attempting to copy the space again.

Read the developer's notes in the Atlassian blogs.

Manually Clone Or Rename A Space

Alternatively, it is possible to manually clone or rename a space by modifying an XML backup of the target space.

Notes

- May require manually updating external links to that space.
- The instructions have been confirmed for Confluence 2.2 onwards. Users running older versions are recommended to upgrade Confluence before continuing.
- Where examples are given, they involve changing `oldkey:Old Space Name` into `newkey:New Space Name`. You need to substitute your own keys for `oldkey` and `newkey`, and your own space names for `Old Space Name` and `New Space Name`.
- When importing a space export for a space that already exists, the previous space content will be overwritten.
- Read the process in full before beginning.

Stage 1: Rename Space

1. Select a new, unique space key and name for the second space. Space keys may only consist of ASCII letters or numbers (A-Z, a-z, 0-9) and no empty spaces are allowed in the key.

2. Clone your production Confluence instance to a test server on another computer now. (For instructions, see Migrating Confluence Between Servers.) You should now have a production server and test server both containing the same data and can avoid the risk of corrupting your production Confluence instance.

3. On the test server, login as an administrator.

4. Go to Browse Space -> Advanced -> Export Space and export the target space as XML including attachments.
5. Save the space backup.

6. Open the space backup file with a zip file editor and find the file `entities.xml`.

7. Edit `entities.xml` in a text editor.

8. Do a 'Search & Replace' on the old space name as shown below. Swap out `Old Space Name` and `New Space Name` for the actual names.

<table>
<thead>
<tr>
<th>Search For</th>
<th>Replace With</th>
</tr>
</thead>
<tbody>
<tr>
<td>[CDATA[Old Space Name]]</td>
<td>[CDATA[New Space Name]]</td>
</tr>
</tbody>
</table>

9. Do a 'Search' for any occurrences of the old space name that occur in user content. You may wish to replace some or all of these references with the new space name. Replace `Old Space Name` and `New Space Name` with the actual names.

<table>
<thead>
<tr>
<th>Search For</th>
</tr>
</thead>
<tbody>
<tr>
<td>Old Space Name</td>
</tr>
</tbody>
</table>

10. Do four 'Search & Replaces' on each of the references to the old space key as shown below. Swap out `oldkey` and `newkey` for your actual keys.

    | Search For                  | Replace With                  |
    |-----------------------------|--------------------------------|
    | [oldkey]                    | [newkey]                      |
    | spaceKey=oldkey             | spaceKey=newkey               |
    | [oldkey:]                   | [newkey:]                     |
For example:

<table>
<thead>
<tr>
<th>Space name</th>
<th>Test Space</th>
</tr>
</thead>
<tbody>
<tr>
<td>New space name</td>
<td>Test Space 2</td>
</tr>
<tr>
<td>Old Space Name</td>
<td>Test Space</td>
</tr>
<tr>
<td>New Space Key</td>
<td>test2</td>
</tr>
</tbody>
</table>

The above search and replace ensures that you will change the test oldkey to test2, and change the "Test Space" Old Space Name to Test Space 2.

11. Save the modified entities.xml.

12. Overwrite the original entities.xml in the space backup with the modified version.

13. Login to the test instance as a Confluence administrator.

14. Go to Administration -> Backup & Restore. Under 'Upload a zipped backup to Confluence', browse to select to the modified space backup. Check the 'Build index' option and select 'Upload & Restore'.

15. Once the restore process has completed, access the new space and test that you can access pages, embedded links and attachments. Any error in this step indicates that your search and replace was performed incorrectly and you should to retry from step 2.

Stage 2: Restore On Production

1. Backup your production instance now.

2. Login to the production instance as a Confluence administrator.

3. Go to Administration -> Backup & Restore. Under 'Upload a zipped backup to Confluence', browse to select to the modified space backup. Check the 'Build index' option and select 'Upload & Restore'. If any data loss occurs as a result of using this workaround, immediately revert to the backup.

4. Once the restore process has completed, access the new space and test that you can access pages, embedded links and attachments. If any error occurs during this step, revert to the site backup.

5. If renaming a space, you can delete the old space by going to Browse Space -> Space Admin -> Remove Space. Click OK to remove the old space.

Stage 3: Rename Space References

Links in other spaces to the old space will remain unchanged. If you are renaming a space, you will need to change these links to point to the new space. Users who are copying a space can leave the links pointing to the original space by skipping this stage.

Changing these links depends on if you want to change every link, or only some. If not all links must be changed or you are unwilling to stop your production instance, this must be done by editing each page individually. If all links must be changed, follow the instructions below.
1. Create a site XML backup including attachments from Administration -> Backup & Restore.

2. Save the site XML backup file.

3. Stop the production instance.

4. Create two copies of the site backup. Keep one copy as the original, unmodified backup, the other will be modified. Rename the backups so that it is clear which is being modified.

5. Open the copy for modification and edit entities.xml.

6. Do four 'Search & Replaces' on each of the references to the old space key as shown below. Swap out oldkey and newkey for the actual keys.

<table>
<thead>
<tr>
<th>Search For</th>
<th>Replace With</th>
</tr>
</thead>
<tbody>
<tr>
<td>[oldkey]</td>
<td>[newkey]</td>
</tr>
<tr>
<td>spaceKey=oldkey</td>
<td>spaceKey=newkey</td>
</tr>
<tr>
<td>[oldkey:</td>
<td>[newkey:</td>
</tr>
<tr>
<td>key=oldkey]</td>
<td>key=newkey]</td>
</tr>
</tbody>
</table>

7. Save the updated entities.xml back into the modified site XML backup file.

8. Start the production instance.

9. Import the modified site XML backup from Administration -> Backup & Restore. If you have any problems, revert to the original unmodified backup and redo the links manually instead.

Done.

Customising Confluence Icons

Icons are intended to be added/customised from time to time by users to adopt a new look. The file locations are hard to locate.

These steps are under the presumption that users have access to the source code:

- Search for the atlassian-renderer library.
- Extract the library and search for the file com/atlassian/renderer/DefaultIconManager.java where the icons are being mapped.
- Check out how the referencing are being done there and add your own icons within

The Confluence 2.10 version of CONFKB:DefaultIconManager is attached to this article.

Disabling Drag-and-Drop

Your Confluence system administrator may wish to disable the drag-and-drop feature for various reasons.

If you are a Confluence system administrator and wish to disable the drag-and-drop feature, you need to access
the **Plugin Manager** in your Confluence installation's 'Administration' section and disable the entire 'Confluence Drag and Drop Plugin'. Refer to [Installing a Plugin](#) for details on accessing the **Plugin Manager** and disabling entire plugins or plugin modules.

You can also disable the 'drop zone' that appears on the 'Attachments' view or the image dialog box by disabling the respective 'View Attachments Drop Zone' or 'Image Dialog Drop Zone' modules of this plugin. Doing this removes these drop zones while retaining Confluence's drag-and-drop functionality.

**Disabling Password management from User**

This page describes a way of preventing your user from changing their passwords. In this way, you can ensure that all passwords are only set from Confluence Admin.

- **Customisations are not supported**
  
  Note that Atlassian support does not cover customisations to Velocity files, such as those described on this page.

- **LDAP Passwords are not set by Confluence**
  
  Note that Confluence does not manage LDAP Users.

- **All files should be located under** `<confluence-home>\confluence\users`.

**Removing the User Password Option.**

To remove the option that allows people to select a new password, you will need to edit the Velocity template (.vm file) as described below.

1. **Locate your changemypassword.vm file under**

   `<confluence_home>\confluence\users\changemypassword.vm`

2. **Edit this file with your favorite editor, such as Wordpad, Notepad or Notepad++ (recommended).** The file looks something like this:

   ```html
   <html>
   <head>
   <title>$generalUtil.htmlEncode($pageTitle)</title>
   #requireResource("confluence.web.resources:aui-forms")
   </head>

   #applyDecorator("root")
   #decoratorParam("context" "profile")
   #decoratorParam("mode" "edit-profile")
   #decoratorParam("helper" $action.helper)

   <body>
   ```
1. Add a comment, as shown below, replacing the block that starts with "<fieldset..." and ends with "</fieldset>". After the edit, you should have something like this:

```html
<html>
<head>
<title>$generalUtil.htmlEncode($pageTitle)</title>
#requireResource("confluence.web.resources:aui-forms")
</head>

#applyDecorator("root")
#decoratorParam("context" "profile")
#decoratorParam("mode" "edit-profile")
#decoratorParam("helper" $action.helper)

<body>

#div class="padded">
#if ($settingsManager.getGlobalSettings().isExternalUserManagement())
$action.getText("cannot.change.password.users.outside")
#elseif(!$userAccessor.isReadOnly($remoteUser))
#applyDecorator("form-aui")
#decoratorParam("formName" "changepassword")
#decoratorParam("submitAction" "dochangemypassword.action")
#decoratorParam("editAction" "changemypassword.action")
#decoratorParam("editMode" "$editMode")
#decoratorParam("saveValue" "Save")
#form_xsrfToken()

<fieldset>
#tag("Password" "label='cur.pass.name'" "name='currentPassword'" "theme='aui'")
#tag("Password" "label='new.pass.name'" "name='newPassword'" "theme='aui'")
#tag("Password" "label='new.pass.confirm.name'" "name='newPasswordConfirmation'" "theme='aui'")
#tag("Submit" "theme='aui'" "name='Test'")
</fieldset>
@end
</div>
</body>
</html>
```
Dear User,

You cannot change your password, this is disabled. Please continue to use your actual password. If you have any complaints contact the Admin.

Regards your Admin.

After following the above steps, you will have something like this:

Congratulations, that’s it

Have a candy!

Disabling Profile Edit from User

This page describes a way of preventing your user from changing their Profile. In this way, you can ensure that all Profiles are only set from Confluence Admin.

Customisations are not supported

Note that Atlassian support does not cover customisations to Velocity files, such as those described on this page.

All files should be located under `<confluence-home>/confluence/users`. 
Removing the User Password Option.

To remove the option that allows people to select a new password, you will need to edit the Velocity template (.vm file) as described below.

1. Locate your editmyprofile.vm file under

   `<confluence_home>`\confluence\users\editmyprofile.vm

2. Edit this file with your favorite editor, such as Wordpad, Notepad or Notepad++ (recommended). The file looks something like this:

   ```
   #macro (renderIfEdit $markup)
   #trim()
   #if ($editMode == true)
   $!generalUtil.htmlEncode($markup)
   #else
   $!statusTextRenderer.render($markup)
   #end
   #end
   #end
   #set($viewingMyProfile = $personalInformationEntity.belongsTo($remoteUser))
   <html>
   <head>
   <title>$generalUtil.htmlEncode($pageTitle)</title>
   #requireResource("confluence.web.resources:aui-forms")
   #requireResource("confluence.userstatus:userstatus-resources")
   </head>
   #if ($editMode)
   #set($mode = "edit-profile-single")
   #else
   #set($mode = "edit-profile-three")
   #end
   #applyDecorator("root")
   #decoratorParam("context" "profile")
   #decoratorParam("mode" $mode)
   #decoratorParam("helper" $action.helper)
   #decoratorParam("infopanel-width" "200px")
   <body>
   <div class="profile-info #if(!$editMode)section-3#end">
   #applyDecorator("form-aui")
   #decoratorParam("formName" "editmyprofileform")
   #decoratorParam("submitAction" "$req.contextPath/users/doeditmyprofile.action")
   #decoratorParam("editAction" "$req.contextPath/users/editmyprofile.action")
   #decoratorParam("editMode" "$editMode")
   #if(!$editMode & & $viewingMyProfile)<a href="$req.contextPath/users/editmyprofile.action" class="edit-link">$action.getText("edit.name")</a>#end
   <h2 class="subheading first">$action.getText("profile.group.personal")</h2>
   #form_xsrfToken()
   ```
<fieldset>
#if (!$settingsManager.getGlobalSettings().isExternalUserManagement() && !userAccessor.isReadOnly($user))
#tag( "TextField" "label='fullname.name''name='fullName''size='50''theme='aui''"
#tag( "TextField" "label='email.name''name='email''size='50''theme='aui''"
#else
#if($editMode)
</fieldset>

<br/>
#bodytag( "Submit" "theme='aui''"
#param ("submitValue" "$action.getText('save.name')"
#end
#end
</fieldset>

<h2 class="subheading">$action.getText("profile.group.business")</h2>

</div>
This red line above is just the Save and Cancel Button, you cannot remove other tags, or it will disappear from Profile Details.

1. Let's comment what is shown in Green with <!-- and -->. And let's add a comment saying that the user cannot edit his profile. After the edit, you should have something like this:
#macro (renderIfEdit $markup)
#trim()
#if ($editMode == true)
$!generalUtil.htmlEncode($markup)
#else
$!statusTextRenderer.render($markup)
#end
#end

#set($viewingMyProfile = $personalInformationEntity.belongsTo($remoteUser))
<html>
<head>
<title>$generalUtil.htmlEncode($pageTitle)</title>
#requireResource("confluence.web.resources:aui-forms")
#requireResource("confluence.userstatus:userstatus-resources")
</head>

#if ($editMode)
#set($mode = "edit-profile-single")
#else
#set($mode = "edit-profile-three")
#end

#applyDecorator("root")
#decoratorParam("context" "profile")
#decoratorParam("mode" $mode)
#decoratorParam("helper" $action.helper)
#decoratorParam("infopanel-width" "200px")

<body>
<div class="profile-info #if(!$editMode)section-3#end">
#applyDecorator("form-aui")
#decoratorParam("formName" "editmyprofileform")
#decoratorParam("submitAction" "$req.contextPath/users/doeditmyprofile.action")
#decoratorParam("editAction" "$req.contextPath/users/editmyprofile.action")
#decoratorParam("editMode" "$editMode")
#if(!$editMode & $viewingMyProfile)<a href="$req.contextPath/users/editmyprofile.action" class="edit-link">$action.getText("edit.name")</a>#end
<h2 class="subheading first">$action.getText("profile.group.personal")</h2>
#form_xsrfToken()
<fieldset>
#if (!$settingsManager.getGlobalSettings().isExternalUserManagement() &
!$userAccessor.isReadOnly($user))
#tag( "TextField" "label='fullname.name'" "name='fullName'" "size='50'" "theme='aui'"
     "readonly=true")
#tag( "TextField" "label='email.name'" "name='email'" "size='50'" "theme='aui'"
     "readonly=true")
#else
#if($editMode)
   #tag("TextField" "label='fullname.name'" "name='fullName'" "size='50'" "theme='aui'"
       "readonly=true")
   #tag("TextField" "label='email.name'" "name='email'" "size='50'" "theme='aui'"
       "readonly=true")
#else
   #if($editMode)
   #bodytag("Component" "name='personalInformation'" "template='textarea.vm'" "theme='aui'"
      "label="$action.getText('personal.info')"
      "rows" 8)
   #param ("cols" 70)
   #param ("renderWiki" $blockWikiStyleRenderer)
   #end
   #end
</fieldset>

<h2 class="subheading">$action.getText("profile.group.business")</h2>

<fieldset>
#foreach ($key in $action.getUserDetailsKeys("personal"))
   #bodytag("TextField" "label='confluence.user.profile.$key'" "name='userparam-$key'
     "value=getUserProperty('$key')" "size='50'" "theme='aui'"
     "renderWiki" $statusTextRenderer)
#end
#end
</fieldset>

<p><font size="3" color="red">You cannot change your Profile, this is disabled.<br>
If you need to change anything contact the Admin.<br></font></p>
Save the file. You can reload your page and see the changes. There is no need to restart Confluence.

After following the above steps, you will have something like this:
And Something like this too:

Disabling Theme Selection

This page describes a way of preventing your space administrators from changing the theme in a space. In this way, you can ensure that all spaces follow the global look and feel.

Customisations are not supported

Note that Atlassian support does not cover customisations to Velocity files, such as those described on this page.
Removing the Theme Selection Option

To remove the option that allows people to select a theme for a space, you will need to edit the Velocity template (.vm file) as described below.

1. Locate your choosetheme.vm file under

   `<confluence_home>\confluence\spaces\choosetheme.vm`

2. Edit this file with your favorite editor, such as Wordpad, Notepad or Notepad++ (recommended). The file looks something like this:

   ```html
   <html>
   <head>
   <title>$action.getActionName($action.getClass().getName())</title>
   </head>
   #applyDecorator("root")
   #decoratorParam("helper" $action.helper)
   #decoratorParam("context" "space-administration")
   #decoratorParam("mode" "view-space-administration")
   #decoratorParam("help-path" "/spaces/help/choosetheme.vm")
   </body>
   #applyDecorator("root")
   #decoratorParam("context" "spaceadminpanel")
   #decoratorParam("selection" "choosetheme")
   #decoratorParam("title" $action.getActionName($action.getClass().getName()))
   #decoratorParam("selectedTab" "admin")
   #decoratorParam("helper" $action.helper)
   </body>
   <html>
   <form method="POST" action="dochoosetheme.action" name="choosethemeform">
   #form_xsrfToken()
   #parse "/includes/common-choosetheme.vm"
   <input type="hidden" name="changesSaved" value="true">
   #tag ("Submit" "value='confirm.name'" "align='center'" "theme='notable'" "template='submit.vm'")
   </form>
   </form>
   </body>
   </html>
```
3. Add a comment, as shown below, replacing the block that starts with "<form method..." and ends with "</form>". After the edit, you should have something like this:

```html
<html>
<head>
<title>$action.getActionName($action.getClass().getName())</title>
</head>

#applyDecorator("root")
#decoratorParam("helper" $action.helper)
#decoratorParam("context" "space-administration")
#decoratorParam("mode" "view-space-administration")
#decoratorParam("help-path" "/spaces/help/choosetheme.vm")

<body>
#applyDecorator ("root")
#decoratorParam ("context" "spaceadminpanel")
#decoratorParam ("selection" "choosetheme")
#decoratorParam ("title" $action.getActionName($action.getClass().getName()))
#decoratorParam ("selectedTab" "admin")
#decoratorParam("helper" $action.helper)

<h1>Dear Space Administrator,</h1>
<p><font size="3" color="red">You cannot change this Theme, we took so much effort building our Theme.<br>Please continue to use the Global Look and Feel<br>If you have any complains contact the Admin.<br>Regards your Admin.<br></font></p>

#end
</body>

#end
</html>
```

4. Save the file. You can reload your page and see the changes. There is no need to restart Confluence.

After following the above steps, you will have something like this:
Congratulations, that's it

Have a chocolate!

Editing your database password

To reset the password for the database user that Confluence uses to connect to the database, follow the guide below.

If your Confluence instance connects directly via JDBC, then your password will be in your `<CONFLUENCE_HOME>/confluence.cfg.xml` file.

E.g.
Change the "hibernate.connection.password" property to the correct value (in the above example replace "confluencepass" with the new password).

If you're connecting via datasource then you will see in the confluence.cfg.xml file something like:
I.e. the property "hibernate.connection.datasource" is defined. If so your password is defined within your datasource. Each application server stores its information differently, but if you are using tomcat, then check your server.xml file.

Enable public anonymous access

How do I configure Confluence for public-anonymous access?

There are two different permissions that need to be set to allow anonymous access to a Confluence site. First, the 'Anonymous' user needs the global "Use Confluence" permission, secondly you need to give 'Anonymous' permissions in each space you want to make public. Full instructions can be found here.

Confluence FAQ

Find out what is generating files in the Confluence temporary directory.

The Confluence applications stores temporary files in the Confluence temporary directory. The location of the directory is located in: <confluence_home>/temp.

There are a few methods that can help you determine which component of Confluence generated the file:

- **Open the file**: allows you to view the contents of the file
- **Examine the file name and extension**: Usually, the file name has a string prefix
  - eg backupxxxxx.zip - generated from the attachments plugin where users choose to 'download all attachments'
  - chartxxxxxxx.png - generated from the Charts macro plugin which generates the chart images to be displayed on the page.
  - jiraissuesxxxxx.html - generated from the JIRA Issues Macro when the plugin gets issues content from JIRA.
- **Examine the creation time (timestamp) of similarly named files**: This allows you to determine if the file is generated periodically, in which case this infers the file was created by a scheduled task. If the timestamps for the files are random, then the files are most likely generated at runtime (that is, during page rendering or by user actions).

Hint:
Please refer to this article for the procedure change the schedule of the cleanup of the temporary directory.

To remove files manually from the command line one could issue a command (applicable to *nix) similar to:

```
find <confluence_home>/temp -name 'download*' -mmin +60 -print0 | xargs -0 rm -rf
```

as well as place the command in a cron job.

### Fix Out of Memory Errors by Increasing Available Memory

Java applications like JIRA and Confluence run in a "Java virtual machine" (JVM), instead of directly within an operating system. When started, the Java virtual machine is allocated a certain amount of memory, which it makes available to applications like JIRA. By default, Java virtual machines are allocated 64Mb of memory, no matter how many gigabytes of memory your server may actually have available. 64Mb is inadequate for medium to large JIRA installations, and so this needs to be increased.

On this page:

- **Step 1: Diagnosis**
  - Determine type of error message
  - Determine Confluence’s usage patterns
  - Determine available system memory
  - Guidance

- **Step 2: Increase Available Memory**
  - Linux
  - Windows (starting from .bat file)
  - Windows Service
  - Setting Properties for Windows Services via Command Line
  - Setting Properties for Windows Services via the Windows Registry

- **Step 3: Verify Your Settings**

### Step 1: Diagnosis

#### Expand to see diagnosis section

**Determine type of error message**

Look in the `atlassian-confluence.log` to see which type of OutOfMemory Error you’re receiving. There are three common messages:

1. Heap Space
2. Perm Gen Space
3. GC Overhead

- ✔ This document discusses increasing memory to address PermGen and Heap space errors. Follow the links above to assess root causes for each issue. For GC Overhead, refer to [Confluence Crashes Due to java.lang.OutOfMemoryError GC overhead limit exceeded](https://confluence.atlassian.com/display/DOCS/Confluence+Crashes+Due+to+java.lang.OutOfMemoryError+GC+overhead+limit+exceeded).

**Determine Confluence’s usage patterns**
In JIRA, go to Administration » System » System Info, and look at the memory graph during times of peak usage:

![Java VM Memory Statistics](image)

This server has been allocated a maximum of 650Mb and a minimum of 256m. You can see the minimum displayed here; if you're trying to see whether your settings are being picked up, this is where to look.

**Determine available system memory**

### On Windows

From the Close Programs Dialogue (Press ctrl-alt-delete), select the Performance tab:

![Windows Task Manager](image)

> The amount marked **Available** is the amount in kilobytes you have free to allocate to Confluence. On this server we should allocate at most 214Mb.

### On Linux

Run `cat /proc/meminfo` to view the memory usage.

Setting the `-Xmx` above the available amount on the server runs the risk of OutOfMemoryErrors due to lack of physical memory. If that occurs the system will use swap space, which greatly decreases performance.

**Guidance**

The default values supplied with Confluence stand-alone are sufficient for most installations. Please refer to [Managing Application Server Memory Settings](#) and [Server Hardware Requirements Guide](#) for a discussion.

**Step 2: Increase Available Memory**

**Linux**

- Expand to see Linux instructions
To increase heap or perm gen space memory in Linux installations,

1. From `<confluence-install>/bin` (Stand-alone) or `<Tomcat-home>/bin` (EAR-WAR installation), open `setenv.sh` (you can create this file in the EAR/WAR version).
2. Find the section `JAVA_OPTS=-Xms256m -Xmx512m -XX:MaxPermSize=256m ...`
3. See `Diagnosis` above and enter the appropriate values. Xmx is maximum, Xms is minimum, and MaxPermSize is PermGen.

---

Windows (starting from .bat file)

Expand to see Windows .bat file instructions

To Configure System Properties in Windows Installations When Starting from the .bat File,

1. From `<confluence-install>/bin` (Stand-alone) or `<Tomcat-home>/bin` (EAR-WAR installation), open `setenv.bat`.
2. Find the section `set JAVA_OPTS=%JAVA_OPTS% -Xms256m -Xmx512m -XX:MaxPermSize=256m`.
3. See `Diagnosis` above and enter the appropriate values. Xmx is maximum, Xms is minimum, and MaxPermSize is PermGen.

---

Windows Service

Expand to see Windows Service instructions

There are two ways to configure system properties if you Start Confluence Automatically on Windows as a Service - either via command line or in the Windows Registry.

Setting Properties for Windows Services via Command Line

---
Setting Properties for Windows Services via Command Line

1. Identify the name of the service that Confluence is installed as in Windows (Control Panel > Administrative Tools > Services):

   ![Control Panel Services](image)

   In the above example, the SERVICENAME is: JIRA030908110721

2. Open the command window from Start >> Run >> type in 'cmd' >> Enter
3. cd to the bin directory of your Confluence instance, or the bin directory of your Tomcat installation if you are running Confluence EAR/WAR.
4. Run:

   `tomcat6w //ES//%SERVICENAME%`

   In the above example, it would be `tomcat6w //ES//JIRA030908110721` (this is a JIRA screenshot, but the same applies to Confluence)

5. Click on the Java tab to see the list of current start-up options:

   ![Java Options](image)

6. Set the maximum memory allocation here

7. Also add `-XX:MaxPermSize=256m` to the java options section.

---

*Setting Properties for Windows Services via the Windows Registry*
In some versions of Windows, there is no option to add Java variables to the service. In these cases, you must add the properties by viewing the option list in the registry.

To Set Properties for Windows Services via the Windows Registry,

1. Go to \{Start >> Run, and run "regedit32.exe". 

![Image of regedit32.exe](image)

2. Find the Services entry:
   - 32-bit: HKEY_LOCAL_MACHINE >> SOFTWARE >> Apache Software Foundation >> Procrun 2.0 >> Confluence
   - 64-bit: HKEY_LOCAL_MACHINE >> SOFTWARE >> Wow6432Node >> Apache Software Foundation >> Procrun 2.0 >> Confluence

![Image of registry view](image)

3. To change existing properties, especially increasing Xmx memory, double-click the appropriate value.

![Image of registry view](image)

4. To change additional properties, double-click options. Note: Make sure to add only one argument per line.

![Image of registry view](image)

5. Modify the memory allocations here (i.e. -XX:MaxPermSize=256m).

Step 3: Verify Your Settings

Expand to see verification instructions

To verify what settings are in place, check Viewing System Information. You should see a section called "Java Runtime Arguments". 

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Look for Xmx (maximum) and Xms (minimum) settings.
Alternatively, on Linux, run `ps -aux | grep java` to see the environment parameters.

Getting a License for a Staging Environment

If you already have a developer license, you can [add it under the Administration > License Details page]. You can also create a new key as described below.

Getting a Developer License

Only a [technical contact] for your commercial/academic license is able to create a Developer license.

Atlassian supplies ‘developer’ licenses which can be used by existing commercial license holders who wish to deploy non-production installations of our software to use in QA/staging environments. Developer licenses are free of charge to commercial license holders and, like our commercial offerings, they include 12 months of updates starting from the date of purchase of the commercial license.

If you hold a commercial license, you can obtain a free developer license by following these steps:

1. Log in to your [Atlassian account].
2. Under the "Licenses" heading, all of your licenses will be displayed. Click the plus sign next to a license to view its details.
3. Click the 'View Developer License' link in the bottom right corner of the license detail panel, below your commercial license key.

Your new developer license will be generated and displayed in a popup window. Repeat this process as many times as necessary for multiple developer licenses. If you are unable to create the license, [contact our sales department] for help.

*A [Atlassian Starter Licenses] do not include free Developer Licenses. If you need a development environment for your Starter License please [purchase] an additional Starter License.

Note about Version Compatibility

Earlier versions of our products do not support developer licenses. The table below indicates which versions of each product support developer licenses.

<table>
<thead>
<tr>
<th>JIRA</th>
<th>Confluence</th>
<th>Bamboo</th>
<th>Clover for Ant</th>
<th>Clover for Eclipse 3</th>
<th>Clover for IDEA 6</th>
<th>Crowd</th>
<th>Crucible</th>
<th>FishEye</th>
<th>JIRA Performance Plugin</th>
<th>JIRA VSS Plugin</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.7+</td>
<td>2.3+</td>
<td>All</td>
<td>1.3.14+</td>
<td>1.2.12+</td>
<td>1.0.2+</td>
<td>All</td>
<td>1.0.3+</td>
<td>1.3.3+</td>
<td>JIRA 3.11+ (Disabled)</td>
<td>JIRA 3.11+</td>
</tr>
</tbody>
</table>

If you are working with an older version that does not recognise developer licenses, you can use your existing commercial license in your test environment.

How can I retrieve a recently deleted space or page?

To restore a page, you may find the wanted information in the [Restoring a Deleted Page] documentation.
Unfortunately there is no easy way to restore a space - tell your Confluence Administrator to restore the site's daily backup and retrieve the deleted space from there.

To setup Confluence in a staging environment you may need to use a Developer License.

**How do I adjust the session timeout**

To change the default session timeout (which is 60 minutes) you must edit the file web.xml. For a Confluence EAR/WAR installation, this file can be found in `<YOUR DEPLOYMENT>/confluence/WEB-INF/web.xml`. For a Confluence instance, the file is located in `<YOUR CONFLUENCE INSTALLATION DIRECTORY>/conf/web.xml`.

The element you want to edit in the `web.xml` file is:

```xml
  <session-config>
    <session-timeout>60</session-timeout>
  </session-config>
```

The value within the `session-timeout` tag defines the amount of time the session will exist, in minutes.

Note that after editing the `web.xml` file you will need to restart confluence for your change to take effect.

On a related note, to configure Confluence's internal connection pool timeout period, please tweak the `c3p0.timeout` property in your `<Confluence-Home>/confluence.cfg.xml` file:

```xml
  <property name="hibernate.c3p0.timeout">30</property>
```

This value is an indication of the number of seconds a connection can remain pooled but unused before being discarded. Zero means idle connections never expire. More details can be found [here](#).

**How do I change the space key?**

See [Copy Or Rename A Space](#).

**How do I check which spaces have email accounts**

If you have numerous spaces in Confluence and would like to check for spaces which have a mail setting, you can run a database query like the one below:
select spaces.spacename, spaces.spacekey, bandana.bandanakey 
from spaces, bandana 
where spaces.spacekey = bandana.bandanacontext AND bandana.bandanakey="atlassian.confluence.space.mailaccounts";

**RELATED TOPICS**

- How do I Disable Automatic Mail Polling?
- How do I configure the Plugin Repository to update its plugins information offline?

With the launch of plugins.atlassian.com, the Confluence Plugin Repository SVN metadata has been deactivated. For existing clients, requests to confluence.atlassian.com for repository metadata are now transparently redirected to plugins.atlassian.com, which provides up-to-date plugin information in the same XML format as that served from the old repository proxy.

While Confluence installations with access to confluence.atlassian.com see no impact from this change, those installations which cannot access confluence.atlassian.com need special instructions.

**Download the latest plugins.atlassian.com XML for your version of Confluence**

PAC makes the plugin repository client data available at the URL

https://plugins.atlassian.com/server/legacy/confluence/xml/<bn>

where <bn> is the build number of the Confluence installation. The build number is visible at Admin -> System Information (near the bottom of the page). Build numbers for all released Confluence builds are also available [here](#).

Save the resulting file and place it on a Web server accessible from Confluence. This can be the same server as Confluence itself; for example, if you're running Confluence at [http://localhost:8090](http://localhost:8090), place the saved XML in the confluence directory inside your installation directory.

**Keeping the XML up to date**

When a change is made on plugins.atlassian.com to a plugin's data, the generated XML will update at most one day after the change is made. Consider writing a **cron** job or similar to fetch the XML on a weekly basis and store it in your chosen location to ensure you are always up to date on plugin information.

**Configure the Plugin Repository Client**

Now go to Admin -> Plugins -> Confluence Atlassian Plugin Repository and click on the Configure link.

There are four plugin repository data source options:
1. **HTTP Data Source Generator** - Plain text XML file served over HTTP. Never used, except for debugging.

2. **Subversion Generator (Deprecated)** - Check out the metadata from SVN and generate the XML internally. As this uses the deprecated SVN metadata, it can be ignored.

3. **Local Generator (Deprecated)** - Read the metadata off your local filesystem and generate the XML internally. As this uses the deprecated SVN metadata, it can be ignored.

4. **Proxy Client** - Pull XML data from another Confluence Plugin Repository Client that has been configured to act as a server.

In this case you would need to choose the **Proxy Client** option, as it is able to fetch XML from any server, not just plugins.atlassian.com.

Paste the URL to the XML data in the **Data Source** field and uncheck the **Data Source Proxying** option if it is checked. Then click **Save** and select **Admin -> Plugin Repository**, and the client should load the repository info as before.

**RELATED TOPICS**

**Confluence Repository Client**

**How do I disable indexing of attachments**

Sometimes a user can experience problems indexing large MSExcel or MSPowerPoint documents and the reindexing may cause potential warning messages that are harmless. There is already a request to suppress these warnings from the re-indexing of unreadable documents by the POI library.

The error is usually not serious yet can sometimes cause problems when large attachments are used. So you may like to disable indexing of a particular type of document.

To do this, you can use one of the methods described below.

**Method 1: Using the Administration Console**

You can disable the relevant modules from the **Attachment Extractors** or Office Connector plugins, by going to **Browse -> Confluence Admin -> Plugins -> Manage Existing** and disabling the relevant plugin modules:

- To disable the indexing of PDF attachments, go to the **Attachment Extractors -> Manage plugin modules** and disable the following module:
  - PDF Content Extractor — For PDF attachments

- To disable the indexing of Office attachments, go to the **Office Connector plugin -> Manage plugin modules** and disable the following modules as required:
  - Word Content Extractor — For Word 97/2007 (.doc and .docx) attachments
  - PowerPoint 97 Content Extractor — For PowerPoint 97 (.ppt) attachments
  - PowerPoint 2007 Content Extractor — For PowerPoint 2007 (.pptx) attachments
  - Excel 97 Content Extractor — For Excel 97 (.xls) attachments
  - Excel 2007 Content Extractor — For Excel 2007 (.xlsx) attachments

The search query will ignore all attachments of the type corresponding to the disabled module.

**Method 2: Editing the atlassian-plugin.xml files of plugins**

You need to modify the content of the atlassian-plugin.xml file in the following JAR files and comment out the relevant file type extractor:
- confluence-attachment-extractors-x.x.jar (for PDF) or
- OfficeConnector-x.x.jar (for Office files)

Both of these JAR files are located in the confluence\WEB-INF\classes\classes\com\atlassian\confluence\setup\atlassian-bundled-plugins.zip file.

If you are unfamiliar with modifying JAR files, please refer to the Editing Files within JAR Archives document for further information.

You can identify file type extractors in atlassian-plugin.xml files by the occurrence of ContentExtractor in their key attribute.

⚠️ Once the ContentExtractor for a file type is disabled, all files of that type become unsearchable.

The example below shows a pdfContentExtractor disabled which would prevent PDF attachments from being indexed.
The following table shows the file type extractors in the atlassian-plugin.xml of the OfficeConnector-x.x.jar file, which require commenting out to prevent indexing:

<table>
<thead>
<tr>
<th>Type of attachment</th>
<th>File Type Extractor</th>
</tr>
</thead>
</table>

The <atlassian-plugin> tag with the following content:

```xml
<atlassian-plugin
key="com.atlassian.confluence.plugins.attachmentExtractors" name="Attachment Extractors">
    <plugin-info>
        <description>This plugin extracts searchable text from various attachment types.</description>
        <version>1.1</version>
        <vendor name="Atlassian Pty Ltd" url="http://www.atlassian.com/"/>
    </plugin-info>

    <!--
    <extractor name="PDF Content Extractor" key="pdfContentExtractor" class="com.atlassian.bonnie.search.extractor.PdfContentExtractor" priority="1100">
        <description>Indexes contents of PDF files</description>
    </extractor>
    -->

</atlassian-plugin>

## How Do I Find My License from the File System?

If you're not sure where your license is in [my.atlassian.com](http://my.atlassian.com), you can look in `<confluence-home>/confluence.cfg.xml`.

## How Do I Get More Statistics From Confluence?

Confluence has several plugins that you can use for generating statistics, such as:

- Use the [SQL](http://confluence.atlassian.com/display/CW/Confluence+SQL) and [Chart](http://confluence.atlassian.com/display/CW/Confluence+Chart) plugins together. Read the [Confluence Reporting HOWTO](http://confluence.atlassian.com/display/CW/Confluence+Reporting+HOWTO) for information about the reporting capabilities of Confluence, including the `{sql}` macro, charting and security.
  - Refer to [Obtaining Confluence Instance Metrics](http://confluence.atlassian.com/display/CW/Obtaining+Confluence+Instance+Metrics) for some useful SQL queries.
  - Our [user community](http://confluence.atlassian.com/display/CW/User+Community) have contributed some great SQL queries.
- The [Reporting Plugin](http://confluence.atlassian.com/display/CW/Reporting+Plugin) contains macros which allow powerful and flexible reporting on Confluence content and content from other locations.
- Customware's [Tracking Plugin](http://confluence.atlassian.com/display/CW/Tracking+Plugin) contains macros for anonymously tracking content access. Otherwise known as `hit counting`, this macro provides the ability to count the number of times a given piece of content has been viewed. It does not count views by the most recent editor of the page.
  - Make use of the `tracking-info` macro to track the number of times an attachment is downloaded
- Make user macros like `countpages`, which counts the number of pages in a space.
- Use the [Contributors](http://confluence.atlassian.com/display/CW/Contributors) and [Contributors Summary](http://confluence.atlassian.com/display/CW/Contributors+Summary) macros to get more details regarding the contributors for required pages.
- [Statistical Analysis Plugin](http://confluence.atlassian.com/display/CW/Statistical+Analysis+Plugin) from Adaptavist, is another cluster-ready, enterprise scalable third-party plugin.
- The [Google Analytics plugin](http://confluence.atlassian.com/display/CW/Google+Analytics+plugin) offers trends from Google Analytics. For more information on using Google Analytics and Confluence you may wish to refer to this [blog post](http://confluence.atlassian.com/display/CW/Google+Analytics+plugin) by David Simpson.
- Use the simple [viewtracker Plugin](http://confluence.atlassian.com/display/CW/Viewtracker+Plugin) to track page or blog views and viewers.

In addition, Confluence has a [built-in access logging mechanism](http://confluence.atlassian.com/display/CW/Built+in+Access+Logging+Mechanism), which shows who has logged in and the URL.
invoked. To enable it, you need to modify a couple of configuration files and restart Confluence. The *traditionally* generated access log can then be analysed by one of the available access log analyser tools such as [Webalizer](https://webalizer.sourceforge.net/), [Google Analytics](https://www.google.com/analytics/) or [AwStats](http://www.awstats.org) which can generate useful statistics.

![See our documentation on Obtaining Confluence Instance Metrics](image)

If none of the above tools satisfy your requirements, you can [create a feature request in jira](https://jira.atlassian.com). Please note that there are already several feature requests and improvements created by our customers all being collated under one [umbrella issue](https://jira.atlassian.com/issuetypes/2).

Please cast your vote, add your comments to the discussion and don't forget to add yourself as a watcher to be notified on progress. All our improvements and new features are implemented according to [this guide](https://confluence.atlassian.com/).

**RELATED TOPICS**

**How Do I Identify Inactive Users in Confluence**

If you want to disable inactive users and prevent them from being counted by Confluence license count it is possible to find out by running queries against your database.

This is particularly useful if you have numerous users.

Note: the queries are the same regardless of which user management system you're using in Confluence 3.5 or later. See the [old version of this document](#) for the various queries needed with legacy user management systems.

**List users who are inactive**

```sql
select * from cwd_user
where active = 'F';
```

**List users by last login date**

```sql
select username, successdate from
logininfo
order by successdate;
```

**List users by previous login date**

The "previous" login date is the one before the user's last login.
Active users who have not created any content since 2007

```sql
SELECT username, prevsuccessdate FROM logininfo
ORDER BY prevsuccessdate;
```

How do I know what Confluence version I am running?

At the bottom of a Confluence page you will see a line like this:

```
Powered by Atlassian Confluence 2.10.1, the Enterprise Wiki. Bug/feature request - Atlassian news - Contact administrators
```

In the above it means that you are running Confluence version 2.10.1.

If you do not see that line, you can visit `http://<Your Confluence URL>/admin/systeminfo.action` and find out the version from there.

How do I prevent personal spaces from being shown on the dashboard

To disable personal pages from being shown in the dashboard one will need to customise the recently updated `content` macro by giving it a different parameter.

Here's how:

1. Login as an admin and go to your Confluence administration console
2. Under the "Look and Feel" menu, click on "Layouts" (or type this in your browser: `http://yourConfluenceURL/admin/listdecorators.action`)
3. Under "Site Layouts" look for "Global Layouts" and choose "Create Custom"
4. In the layout editor, look for this line:
$helper.renderConfluenceMacro("{recently-updated:dashboard|showProfilePic=true}")

5. Enter the list of space that is allowed to shows up by inserting the SpaceKey in the line:

$helper.renderConfluenceMacro("{recently-updated:spaces=SpaceKey1,SpaceKey2|showProfilePic=true}")

⚠️ If you have numerous global spaces, it would be more convenient to use @global instead of listing each space separately. See RecentlyUpdatedMacro-Parameters for the list of parameters available for the function.

6. Save

⚠️ Personal spaces will still show up in daily email update. If you don't want this to show in the email update, you need to make the space accessible only to selected groups or people.

How do I Remove a User who has Content Created

Confluence doesn't allow the removal of user who has created any content. The standard method for removal is described in Removing a User. If you want to delete the content as well, the SQL is described below. Locate the content created by the user using the queries:

SELECT * FROM CONTENT WHERE contenttype = 'COMMENT' and creator = '<Username that you wish to remove>'

and

SELECT * FROM CONTENT WHERE contentid IN (SELECT DISTINCT pageid FROM CONTENT WHERE contenttype = 'COMMENT' and creator = '<Username that you wish to remove>')

Run the same DELETE commands after verifying the content is indeed content you wish to delete.

How do I Remove the Last Updated and Created By Text?

Open the file <confluence-install>/confluence/decorators/includes/page-metadata.vm in a text editor and remove the following text:
How do I suppress cluster warning message in Confluence?

You might find that under Logging and Profiling in Confluence Admin, either (or both)
are set to DEBUG.

Please change them to INFO and the warning messages in logs should disappear.

**How to Disable Emoticons**

The text markup (i) is rendered as ☺, a principle which applies to many more Inserting Emoticons and Icons. There is a feature request at CONF-4884 for enabling or disabling emoticon rendering in this manner via Confluence’s Administrative features. However, to disable emoticon rendering in Confluence:

**For Confluence 2.8.x and earlier:**

1. Open up the wikiFiltersSubsystemContext.xml:
   - For Confluence 2.5.x and earlier, this file is located in \WEB-INF\classes directory
   - For Confluence 2.6.x to Confluence 2.8.x, this file is located in \WEB-INF\lib\confluence-2.x.y.jar\plugins. Please follow the steps as suggested here to edit files in a .jar file.
2. Determine the following line and remove/comment out the content:

   ```xml
   <ref local="emoticonRendererComponent"/>
   ```

**For Confluence 2.9.x and later:**

1. Open up the wiki-renderer-components.xml, located in \WEB-INF\lib\confluence-2.x.y.jar\plugins. Please follow the steps as suggested here to edit files in a .jar file.
2. Determine the following line and remove/comment out the content:

   ```xml
   <renderer-component key="emoticon" name="Emoticon Renderer" class="com.atlassian.confluence.renderer.plugin.SpringRendererComponent Factory" weight="10000">
   <param name="componentName">emoticonRendererComponent</param>
   </renderer-component>
   ```

Alternatively, manually escape the character with a "backslash", \\
. For example:

```
\(i)
```

**Code** Macro and **Noformat** Macro is also an option as any emoticons wrapped within the macro will be disabled automatically.

**How to display a banner like the Confluence Documentation space**

The documentation spaces on this wiki show a banner at the top of every page. Here are instructions on how to add a banner to your own Confluence site.

**Using the Documentation theme**
The simplest way to add a header or footer to a page is to apply the Documentation theme to your space, and then add the header and/or footer in the theme configuration. See Configuring the Documentation Theme.

Using the default Confluence theme

Edit the main layout for the space. After the Content div header:

```
## CONTENT DIV BEGINS
<div id="header">
    #quickSearch()
    <ul id="header-menu-bar"
        class="ajs-menu-bar">
        #if($sitemeshPage.getProperty("page.browse-menu"))
            $sitemeshPage.getProperty("page.browse-menu")
        #else
            #menuMacros_renderGlobalBrowseMenu()
            #end
            #menuMacros_renderUserMenu()
        </ul>
        $!sitemeshPage.getProperty("page.breadcrumbs")
</div>
```

Add the following:
To invoke a macro, use text like:

```java
$helper.renderConfluenceMacro("{recently-updated-dashboard:dashboard|showProfilePic=true}")
```

How to Force Links to Open in a New Window

By default, links are opened in the same window. To force them to be opened in a new window, follow these steps:

1. Visit Administration >> Custom HTML
2. Click Edit
3. In the At end of the HEAD field, insert this code:
   - For external links only, like [http://www.google.com]:
     ```html
     <script>
     jQuery(document).ready(function() {
         jQuery(".external-link").attr("target", "_blank");
     });
     </script>
     ```
   - For all type of links (internal and external):
4. Hit Save

⚠️ This customisation will only work for Confluence 3.0.1 and above

### How to get a Java Heap Dump

**Getting the heap dump**

If you hit the `java.lang.OutOfMemoryError: Java Heap Space` and you have eliminated the usual causes you may need to get a Java heap dump, to determine the cause.

To get a heap dump add the `-XX:+HeapDumpOnOutOfMemoryError` parameter to your `JAVA_OPTS`

For example:

```
JAVA_OPTS="-Xms128m -Xmx1024m -XX:MaxPermSize=192m -XX:+HeapDumpOnOutOfMemoryError $JAVA_OPTS -Djava.awt.headless=true "
```

Next reproduce the out of memory error.

The next time you have an out of memory error, a `.hprof` file will be created that is approximately the size of your java heap, i.e. 1024m (according to the above example).

Please wait till its completely written out (before restarting confluence) and attach a zip of this dump to your support case.

⚠️ Please note that your `-Xmx` should not be bigger than 1536m otherwise it is near impossible to open the heap dump.

### Setting the Memory Settings

How to set the heap or permanent generation memory depends on your distribution, platform, and how you start Confluence. Refer to [Configuring System Properties](#).

- If you're starting Confluence from a Windows Service, make sure you add the properties through the registry settings.
- To verify if your settings have been picked up, check [Displaying System Properties](#).

### How to Hide the Referrer

Run [Confluence over SSL](#). Major browsers do not send the HTTP_REFERER when you are linking from an https:// site to an http:// site.

To run confluence on SSL please refer to [Adding SSL for Secure Logins and Page Security](#).

### Additional Information
How to run a SQL script on your database

This document contains some basic instructions on how to run a SQL script on your database. This document is not intended to be exhaustive of the databases we support. We still recommend that you ask your DBA to perform this task if possible.

The following examples assume a database name of yourdb and a script file called myscript.sql. Of course, the extension of the SQL script file does not have to be .sql. Any file can be used so long as it contains SQL statements.

MySQL

```bash
mysql yourdb < myscript.sql
```

PostgreSQL

```bash
psql yourdb < myscript.sql
```

How to Search Confluence for Uses of a Macro

See [tech doc writer Sarah Maddox's blog](https://techdoc.atlassian.com/) for how to do this in Confluence 3.5 or later.

Expand to see pre-Confluence 3.5 SQL

Illegal Search Terms

Several terms are illegal to use when searching Confluence, like : or {}. If you search for just the macro term, you're likely not to get the right search results. For example, searching for 'usage', which is the name of a macro but also a common English word, will not yield an accurate count.

Query the Database

If, for example you want to search for the uses of the usage macro, you can search the database:

⚠️ For large instances of Confluence, searches across the entire bodycontent table of the database might be expensive. You can try this on a [test server](https://confluence.example.com).
You might want to use the SQL Plugin to automate this, or better yet the Macro usage stats plugin. Note that these are third party (unsupported) plugins.

```
SELECT * FROM BODYCONTENT WHERE BODY LIKE '%{usage}%'  
```

If you want to get the last users or the creators of the pages where the noformat macro is used, you might run:

```
SELECT CREATOR FROM CONTENT WHERE CONTENTID IN (SELECT CONTENTID FROM BODYCONTENT WHERE BODY LIKE '%{noformat}%' ) GROUP BY CREATOR
SELECT LASTMODIFIER FROM CONTENT WHERE CONTENTID IN (SELECT CONTENTID FROM BODYCONTENT WHERE BODY LIKE '%{noformat}%' ) GROUP BY LASTMODIFIER  
```

Listing the occurrences of the excerpt include macro (MYSQL only)

```
select c.contentid, c.title, c.lastmoddate, c.lastmodifier, s.spacename
from bodycontent bc join content c on bc.contentid=c.contentid join spaces s on s.spaceid = c.spaceid where c.contenttype='PAGE' and prevver is null
and bc.body regexp '.*\{(excerpt-)?include*\}.*'  
```

Logging Uses of a Macro

This information won't tell you how often a macro is invoked - rather how often it appears on pages. For counting how often it's invoked (and measuring the time it takes to invoke it), check Identifying Slow Performing Macros.

Counting the Incidents of Invoked Logs

You can then grep the logs like:
How to turn on Debugging for indexing

There may be circumstances where you need to turn on debug logging for indexing (e.g. when automatic indexing is not occurring or you are getting errors related to indexing).

Enabling debugging for indexing temporarily

From Administration >> Logging and Profiling, add the following package, and set to DEBUG:

`com.atlassian.confluence.search.lucene`

Enabling debugging for indexing permanently

1. Edit `<CONFLUENCE_INSTALL>/confluence/WEB-INF/classes/log4j.properties` file and add

   `log4j.logger.com.atlassian.confluence.search.lucene=DEBUG`

2. Restart Confluence

Logging should appear in the `<CONFLUENCE_HOME>/logs/atlassian-confluence.log` file, like the following:

```
grep -c "\{usage\}" atlassian-confluence.log
```
2009-10-01 08:50:07,633 DEBUG [http-8080-6] [search.lucene.queue.DatabaseIndexTaskQueue] enqueue Enqueuing task: IndexQueueEntry{id=0, handle='com.atlassian.confluence.pages.Page-91258884', type=Unknown, creationDate=Thu Oct 01 08:50:07 EDT 2009}

2009-10-01 08:50:07,635 DEBUG [http-8080-6] [search.lucene.queue.DatabaseIndexTaskQueue] enqueue Enqueuing task: IndexQueueEntry{id=0, handle='com.atlassian.confluence.pages.Page-91258884', type=Unknown, creationDate=Thu Oct 01 08:50:07 EDT 2009}

2009-10-01 08:50:08,023 DEBUG [DefaultQuartzScheduler_Worker-7] [search.lucene.queue.DatabaseIndexTaskQueue] getUnflushedEntries Fetching index entries added since: Thu Oct 01 08:50:06 EDT 2009

2009-10-01 08:50:08,027 DEBUG [DefaultQuartzScheduler_Worker-7] [search.lucene.queue.DatabaseIndexTaskQueue] getUnflushedEntries Fetched 2 entries from database.

2009-10-01 08:50:08,027 DEBUG [DefaultQuartzScheduler_Worker-7] [search.lucene.queue.DatabaseIndexTaskQueue] getUnflushedEntries Having excluded entries that have previously been flushed, 2 entries remain.
List page- and space-related details for an attachment using the attachment’s name

Occasionally, the indexing task will report some attachments that failed to be indexed correctly. If you wish to list the page- and space-related information for these problematic attachments (of which you only know their title from the logs) please query your database with the following SQL statement:

```
select s.spacekey, s.spacename, a.title, a.pageid, a.attachmentid, '(confluence-home)/attachments/' + a.pageid + '/' + a.attachmentid + '/'+ a.attversion as filepath
from attachments a
join content c
  on a.pageid = c.contentid
join spaces s
  on c.spaceid = s.spaceid
where a.title like '<Name of Attachment>'
```

Please substitute the attachment name in the above query depending upon your requirement.
The `filepath` column will list all attachments in the directory structure format similar to the way that they are stored in Confluence, such as `<Confluence-Home>/attachments/pageid/attachmentid/attachment version`

**Related Linux Commands**

`file <Filename>`

If you wish to check the filetype for attachments in your `<Confluence-Home>/attachments/` folder, run the above Linux command.
For example:

```
file ../data/attachments/32775/98305/1
```

The result is:

```
../data/attachments/32775/98305/1: PNG image data, 1200 x 1000, 8-bit/color RGB, non-interlaced
```
open <Filename>

This command will open files from a shell. By default, opens each file using the default application for that file. Eg:

```
open ../data/attachments/32775/98305/1 -a /Applications/Preview.app/
```

The result is:
The file is opened in Preview.

**Migrate Confluence from one database to another**

**How do I migrate Confluence from one database to another?**

First perform an XML backup of your Confluence site. You can do this from the Administration > Backup and Restore page.

Once you’ve made the backup file, you can set up a new Confluence instance from scratch against your new database and restore the backup that you just created. Detailed instructions can be found [here](#).

**RELATED TOPICS**

No content found for label(s) database-configuration.

**FAQ Home**

**Migrating from JIRA Issues and JIRA Portlets to Gadgets**

If JIRA Portlets are a significant component to your Confluence installation, it’s a good idea to consider upgrading both JIRA and Confluence together. With Confluence 3.1 and JIRA 4.0, Atlassian has introduced gadgets to replace portlets and the JIRA Portlet macro. It is a good idea to migrate to gadgets. Because of the wide variety of differences in invocations, this is a manual process. You will need to remove the JIRA Portlet macro and add the corresponding gadget.

**Adding the JIRA gadgets to Confluence**

1. Register the JIRA Saved Filter and JIRA Portlet gadgets as external gadgets on your Confluence site. See [Registering External Gadgets](#). (See [All Atlassian Gadgets](#) for a list of available gadgets.)
2. Add either trusted communication or OAuth between your JIRA and Confluence sites.
3. Update all your Confluence pages that contain JIRA Portlet macros, replacing the macros with gadgets.

**Page Restrictions Performance Considerations**

This has been markedly improved in Confluence 3.3. See [CONF-16866](#).

**Page Permissions and the Confluence Search Index**

Modifying the page permissions requires reindexing all child pages, as well as comments and attachments on all those pages.

The reasons for this:

- Page permissions are stored on every item in the index
- When you search, a filter is applied to all items in the index which prevents you seeing content you don’t
have permission to see

- If the permission information on attachments wasn't updated when a page permission was changed, users who didn't have permission to view the attachment in Confluence would still see that attachment in the search results as well as some of its content
- To update any record in the index, you need to delete it from the index and re-add it (this is a limitation of Lucene)

Therefore, to update an attachment record in the index, even just to change the permissions, the attachment's content must be reindexed.

**Performance Considerations**

In the large majority of situations, this design should not be a problem. In large spaces with deep page hierarchies, it might be. Use performance logging for the index flush operation to assess the impact of changing a page restriction - try it on the space's home page, or a page with a lot of children, to see the performance impact of changing a page restriction.

**Space Design Considerations**

For some space designs, deep page hierarchies may be desirable. If possible, it's recommended to split spaces where it makes sense to do so, according to how your information is organized. One workaround – CONF-7089 – involves opening up access to just a few pages in a mostly-restricted space so as to "open" the space where space permissions close it. This may be a performance concern if the space, and attachments in the space, are large.

**Workarounds**

There are a few workarounds to consider:

1. Avoid page restrictions on large page hierarchies. If you have a large hierarchy you have to protect differently to other content in the space, consider moving the hierarchy to a new space. (Space permissions are applied in a manner that doesn't have this problem, but having a large number of spaces also causes scaling issues.)
2. Disable page permissions completely. You can do this on a space-by-space basis by not granting the "Restrict" permission in the space permissions screen.
3. Turn off attachment content indexing. See How do I disable indexing of attachments or Configuring Attachment Size for information on how to do attachment types or size limits.

**Which Pages Have Restrictions?**

A database query to show which pages in your instance have page restrictions:
For page permissions:

```
SELECT DISTINCT content.contentid,
content.TITLE as page_title,
CONTENT_PERM.USERNAME as
page_restriction_username,
CONTENT_PERM.CP_TYPE as
page_restriction_type FROM CONTENT_PERM,
content WHERE CONTENTID IN (SELECT
CONTENT_ID FROM CONTENT_PERM_SET WHERE ID
IN (SELECT CPS_ID from CONTENT_PERM))
```

For space permissions:

```
select distinct S.SPACEID,
S.SPACENAME,PERMGROUPNAME from
SPACEPERMISSIONS SP inner join SPACES S on
S.SPACEID = SP.SPACEID where PERMGROUPNAME
is not null and PERMGROUPNAME <>
'confluence-users' ;
```

**Preventing and Cleaning Up Spam**

If you have a public-facing Confluence site, your site may be affected by spammers.

**Stopping Spammers**

To prevent spammers:
2. Run Confluence behind an Apache webserver and create rules to block the spammer's IP address.

### Blocking Spam at Apache or System Level

If a spam bot is attacking your Confluence site, they are probably coming from one IP address or a small range of IP addresses. To find the attacker's IP address, follow the Apache access logs in real time and filter for a page that they are attacking.

For example, if the spammers are creating users, you can look for `signup.action`:

```bash
$ tail -f confluence.atlassian.com.log | grep signup.action
1.2.3.4 -- [13/Jan/2010:00:14:51 -0600] "GET /signup.action HTTP/1.1" 200 9956 "" "Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1; SV1)" 37750
```

Compare the actual spam users being created with the log entries to make sure you do not block legitimate users. By default, Apache logs the client's IP address in the first field of the log line.

Once you have the offender's IP address or IP range, you can add it to your firewall's blacklist. For example, using the popular Shorewall firewall for Linux you can simply do this:

```bash
# echo "1.2.3.4" >> /etc/shorewall/blacklist
# /etc/init.d/shorewall reload
```

To block an IP address at the Apache level, add this line to your Apache vhost config:

```apache
Deny from 1.2.3.4
```

You can restart Apache with a "graceful" command which will apply the changes without dropping any current sessions.

If this still does not stop the spam, then consider turning off public signup.

### Deleting Spam

#### Profile Spam

By 'profile spam', we mean spammers who create accounts on Confluence and post links to their profile page.

If you have had many such spam profiles created, it is easier to delete them via SQL, as described below.
To delete a spam profile:

1. Shut down Confluence and back up your database. **Note:** This step is essential before you run any SQL commands on your Confluence database.
2. Find the last real profile:

   ```sql
   SELECT bodycontentid, body FROM bodycontent WHERE contentid IN
   (SELECT contentid FROM content WHERE contenttype='USERINFO')
   ORDER BY bodycontentid DESC;
   ```

3. Look through the bodies of the profile pages until you find where the spammer starts. You may have to identify an number of ranges.
4. Find the killset:

   ```sql
   CREATE TEMP TABLE killset AS SELECT
   bc.bodycontentid, c.contentid, c.username FROM
   bodycontent bc JOIN content c ON bc.contentid=c.contentid WHERE
   bodycontentid >= BOTTOM_OF_SPAM_RANGE AND bodycontentID <=
   TOP_OF_SPAM_RANGE
   AND c.contenttype='USERINFO';
   
   DELETE FROM bodycontent WHERE bodycontentid IN (SELECT bodycontentid
   FROM killset);
   
   DELETE FROM links WHERE contentid IN (SELECT contentid FROM killset);
   
   DELETE FROM content WHERE prevver IN (SELECT contentid FROM killset);
   
   DELETE FROM attachments WHERE pageid IN (SELECT contentid FROM
   killset);
   
   DELETE FROM content WHERE contentid IN (SELECT contentid FROM killset);
   
   DELETE FROM os_user_group WHERE user_id IN (SELECT id FROM killset k
   JOIN os_user o ON o.username=k.username);
   
   DELETE FROM os_user WHERE username IN (SELECT username FROM killset);
   ```

5. Once the spam has been deleted, restart Confluence and rebuild the index. This will remove any references to the spam from the search index.

**Notes**

- See **CONF-1469**. Your comments that issue are very much appreciated.

**Rebuild the Content Indices from scratch**

*Why are the Content Indices failing?*

See [Searching and Indexing Troubleshooting](#).

**Flushing the Index Queue**

You may be able to address the issue without a complete rebuild of the index. When you experience search problems within your Confluence instance, or cannot find things after performing an upgrade, one simple solution that can help you locate your content is to manually rebuild the index, as described in [Content Index](#).
**Administration**. You can try either a complete rebuild, or flush the queue contents.

**Rebuilding the Failed Content Indices**

If you are still experiencing problems after performing the above rebuild, the next step may be to remove the index and rebuild it from scratch, as described below. For example, the rebuild procedure described above may not restore a corrupted index file. You may want to ensure that all index files are re-created.

The **Space Activity** feature uses the index to store data. To preserve the activity data, keep the Plugins directory and delete the rest of the index.

To remove the index and rebuild it from scratch:

1. Shut down your Confluence server.
2. Make a backup of your `<confluence-home>/index/plugin` directory if it exists. This is where the Usage Tracking plugin stores its index for the usage statistics and it cannot be rebuilt.
3. Remove the `<confluence-home>/index` directory.
4. If in step 2, you have the `<confluence-home>/index/plugin` directory, create the `<confluence-home>/index` directory and copy in the backup of `<confluence-home>/index/plugin` directory made in step 2.
5. Restart server.
   - A new index directory will be created upon restart of your application.
6. Now perform the manual re-indexing of your site to build a brand new index from scratch.

If you still cannot find your content, please contact Confluence Support.

**Redirect users to a page on login**

**Can I set Confluence to redirect users to a space homepage immediately after login?**

Yes. You can direct users to any of the space homepages when they login to the site. This is configured by a site administrator from the **Administration Console**. Instructions on how to do this can be found here.

You can also modify the login page’s content or establish single sign-on integration.

**RELATED TOPICS**

Administration Guide  
Customising Space Homepage

**Redirect users to a site-wide home page after a successful login**

As an administrator, you can set a site-wide home page within any space, to which users are sent after logging in.

To set the site-wide home page as an administrator:

1. Go to Administration > General Configuration
2. Click Edit
3. Set **Site Homepage** to your desired home page

Setting home pages within spaces depends on the access permissions to both the space and your site.

- If your site allows anonymous access, the site homepage must also be accessible anonymously.
- If your site does not allow anonymous access, the site homepage must be accessible to the "confluence-users" group.

In Confluence 1.2 and earlier, the site homepage must be accessible anonymously, regardless of site permissions.
Note: please ensure that the View Space Goes to Space Summary setting is set to OFF if you want users to be sent to space homepage instead of the summary page.

For instructions on configuring this feature at the user level, see Redirect to a specific page (home page) within the site after logging in.

RELATED TOPICS

Redirect to a specific page (home page) within the site after logging in

Restrict Attachments Based On File Type

If a user has permission to upload attachments, you can restrict them to certain filetypes only by installing the Attachment Filter. Note that this is an unsupported plugin and has only been tested to work on Confluence 2.2 - 2.3.x. There is an open new feature request to have this updated and supported here.

You can also restrict the maximum size of any one attachment that a user can upload, or disable the indexing of attachments, which may help performance.

Search for User Properties in the Database

So long as you have not changed the user authentication from the default (i.e. you are NOT using external user management such as LDAP or JIRA) the users of confluence are stored in OS_USER table.

The user's properties such as fullname, email and when they previously logged in, are stored in the OS_PROPERT ENTRY table.

If you know the user's username (which can be found in OS_USER table), you can find their details using the following query:

```
select * from os_propertyentry p, os_user u where p.entity_id = u.id and u.username='user_name_goes_here';
```

Using Firebug Lite in Internet Explorer when browsing a Confluence page

1. Open a Confluence page in IE.
2. Copy and paste the following into your IE browser URL bar and press enter:

   ```javascript
   javascript:var%20firebug=document.createElement('script');firebug.setAttribute('src','http://getfirebug.com/releases/lite/1.2/firebug-lite-compressed.js');document.body.appendChild(firebug);(function(){if(window.firebug.version){firebug.init();}else{setTimeout(arguments.callee);}})();
   ```

3. You should see a Firebug console at the bottom of the browser now.

For more information, please refer to Firebug Lite's documentation

What are the IP Address Ranges for Atlassian's Servers?

Various functions like the automatic support request and plugin repository require access to Atlassian Servers. The IP address range to configure for your firewall are as follows:
Where are the files that used to be in my Confluence installation directory?

With the release of Confluence 2.6.0, many files have been moved inside `WEB-INF/lib/confluence-x.x.x.jar` file, which means they can no longer be edited by simply opening and saving a file.

For example, you may find that some files previously were in `<confluence install directory>/confluence/WEB-INF/classes` are no longer there.

If you want to edit them for customisation, you will need to extract the relevant files from the `confluence-x.x.x.jar`, and place them in the directory where they are used to reside.

You can either use a zip application or use the `jar` tool from your JDK installation to extract the file.

### Example

You want to modify `xwork.xml` in Confluence 2.10.2. The steps to follow are:

1. Shutdown Confluence
2. Locate `WEB-INF/lib/confluence-2.10.2.jar`.
3. Open the jar file using your favourite zip application and search for `WEB-INF/lib/confluence-2.10.2.jar/xwork.xml`. You can also use JAVA's `jar` tool if you like.
4. Extract `xwork.xml` and place it in `WEB-INF/classes/`, and modify as necessary.
5. Restart Confluence

The problem with customization is that they might break in the new version of Confluence. Some codes in your customized file might have changed in the new version. Hence, it is best that you do not copy your customized file directly to the new installation directory. Instead, you need to apply the same customization in the new version of the file.

Where are user macros stored?

User macros are stored in the bandana table:

```sql
select * from bandana as b where b.bandanakey = 'atlassian.confluence.user.macros';
```

Backup FAQ

This section contains solutions for common issues or queries associated with backing up the content within your Confluence site or installation.
The XML backup is known to be inefficient and prone to errors with larger instances. You can **switch to an external backup process** for a reliable and efficient solution.

View one of the following issues or queries for more information:

- Are there any scripts for backup creation and restore?
- Backup will not import
- Can Confluence be restored from a backup minus attachments?
- Can XML backups be deleted automatically?
- Does running a regular XML backup slow performance?
- How can I reduce the space taken up by automatic backups?
- How to Change the Version of a Space Backup
- How to Find Attachments in Attachments Folder
- Is it Possible to Store the Confluence Home Directory on a Network Share?
- Providing Database Dump with Content Anonymised

**RELATED TOPICS**

**Site Backup and Restore**

**Are there any scripts for backup creation and restore?**

Check out [User Submitted Backup & Restore Scripts](#).

**Backup will not import**

See [Troubleshooting failed XML site backups](#).

**Can Confluence be restored from a backup minus attachments?**

Yes. First, ensure you have created a site backup that includes the attachments. Then, restore this site backup. Refer to [Site Backup and Restore](#) for more information.

**Can XML backups be deleted automatically?**

Windows users must manually delete any backup files. Linux users can insert a nightly or weekly automation script or cron similar to the following:

```
ls -t <path to your backup dir>/* | tail +6 | xargs -i rm {}
```

**Does running a regular XML backup slow performance?**

The XML backup is known to be inefficient and prone to errors with larger instances. You can **switch to an external backup process** for large instances.

**How can I reduce the space taken up by automatic backups?**

Switch to a manual backup process according to the 'Backups For Large Instances' section of [Site Backup and Restore](#), which will give you more control over disk usage.

**How to Change the Version of a Space Backup**

Confluence prevents the import of space backups which aren't from the same major version. The reason for this is that any schema change between the export and imported version of Confluence will cause the import to fail, leaving you with an incomplete import. Even worse, the failure can be database-dependent, so it may work fine on one particular database but your backup will fail to import later.

**Do not import a modified space backup on a production server. Import the modified space backup on a test server, then export from the test server to create a pristine space backup for the new version.**
To change the version of a space backup, do the following:

- extract the space backup ZIP file
- edit `exportDescriptor.properties` in a text editor
- change the buildNumber to the buildNumber of the Confluence version you wish to import into
- zip up the modified contents of the backup into a ZIP file again.

This will allow you to import a backup into a test instance of Confluence. After checking the imported space for errors, export it cleanly from the test server and import the fresh backup into your production server.

If your import fails on the test server due to Hibernate errors, this indicates a schema incompatibility and cannot be worked around. You will need to restore your entire site on an old version of Confluence, and export the space from there. See the last section of Restoring a space for details.

### How to Find Attachments in Attachments Folder

#### Symptoms

Attachments are stored on filesystem but there isn't any attachment in the attachments folder.

#### Diagnosis

You can determine the missing attachments by using the [Missing Attachments Report](#).

#### Cause

The attachment naming scheme is numerical so as to avoid encoding problems with operating systems.

#### Resolution

You can look for the attachment detail (e.g file type, attachment name) from ATTACHMENTS table.

```
Select * from ATTACHMENTS where pageID='<PageID>'
```

As attachment is stored as this structure:

Confluence 2.x:

```
<attachments>/pageID/attachment/attachment
```

Version, you may want to run the following query to retrieve attachments of a page:

Confluence 3.x:

See [Hierarchical File System Attachment Storage](#).

### Is it Possible to Store the Confluence Home Directory on a Network Share?

**Is it possible to house Confluence Home/Confluence on a NAS device instead of local drives?**

It is possible to set up this configuration. To do so, specify the network location from `<confluence-install>/confluence/WEB-INF/classes/confluence-init.properties`. Atlassian does not suggest
installing Confluence or hosting Confluence Home directory on NAS device because when a NAS or connection
to NAS is down, Confluence cannot function correctly and you risk potential data corruption.

**Providing Database Dump with Content Anonymised**

Particularly for indexing issues, it is useful to provide a database backup to Support so that they can reproduce
the issue.

However, some of your content may be private, so to anonymise it you can use the guide below:

<table>
<thead>
<tr>
<th><strong>Postgres</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Take the Postgres dump of your Confluence database:</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td><code>pg_dump -U username confluenceDB &gt; outfile.dump</code></td>
</tr>
<tr>
<td>2) Create a test database:</td>
</tr>
<tr>
<td><code>createdb -U username tempDB</code></td>
</tr>
<tr>
<td>3) Load it into a test database:</td>
</tr>
<tr>
<td><code>psql -U username tempDB &lt; outfile.dump</code></td>
</tr>
<tr>
<td>4) Run the following query against your test database:</td>
</tr>
</tbody>
</table>
| `update BODYCONTENT set BODY='a';`  
`update CWD_USER set CREDENTIAL='{PKCS5S2}ymGp6ZB7V+CS6xORA4DEDNDnv+RHyLlZ143Rc25gJ+Vw7ZTUGpzxuDhJv7hAgruT';` |
MySQL

1) Take the mysql dump of your confluence database:

```bash
mysqldump -u username -ppassword
database_name > FILE.sql
```

2) Load it into a test database

```bash
mysql -u username -ppassword
test_database < FILE.sql
```

3) Run the following query against your test database:

```sql
update BODYCONTENT set BODY='a';
update CWD_USER set
CREDENTIAL='{PKCS5S2}ymGp6ZB7V+CS6xORA4
DEDNDnv+RHyL1Zl43Rc25gJ+Vw7ZTUGpzxuDhJv
7hAgruT';
```

- The queries will update all content on pages to "a" and reset the password to 'admin'.
- This only anonymizes the data on pages, comments and blog posts and user passwords. It does not anonymise the titles of pages, usernames or labels.

Other Databases

Please consult your database documentation on how to take database dump and restore. Once a copy database has been created, you can execute the update queries above.

Configuration FAQ

Remove Version from Footer
See Editing the Footer.
How do I configure Confluence to use GMail as the mail server
To configure Confluence to use Gmail to send emails, you will need to create a JNDI mail session and then have Confluence use it, as described below.

To do this for the Confluence distribution, please see Setting Up a Mail Session for the Confluence Distribution.

1. Stop Confluence.
2. Move (don't copy) activation-1.0.2.jar and mail-1.4.1.jar from /confluence/WEB-INF/lib to <Confluence Standalone install>/lib. Or if you are using Confluence WAR release, move to <Tomcat 5 install>/common/lib or <Tomcat 6 install>/lib.
3. Paste the following code in confluence.xml or server.xml located at <confluence-install>/conf, inside the <Context>node (substitute username and password):
Tomcat 5.5 or Tomcat 6

```xml
<Resource name="mail/Session"
  auth="Container"
  type="javax.mail.Session"
  mail.smtp.host="smtp.gmail.com"
  mail.smtp.port="465"
  mail.smtp.auth="true"
  mail.smtp.user="nobody@gmail.com"
  password="foobar"
  mail.smtp.starttls.enable="true"
  mail.smtp.socketFactory.class="javax.net.ssl.SSLSocketFactory"
/>
```

4. Restart your Confluence instance.
5. Add `java:comp/env/mail/Session` to your JNDI mail configuration from Administration > Mail Servers.

**Note:** You may optionally add `mail.debug="true"` into the `<Resource>` to see logs generated by JavaMail.

How do I Configure an Automatic Refresh of the Recently Updated List

To have the dashboard refresh automatically:

1. Modify the Main Layout at Administration->Layouts->Main Layout.
2. Add in the `<META HTTP-EQUIV="REFRESH" CONTENT="5">` tag in the html header tag
3. This example will refresh the browser in every 5 seconds

```html
<html>
  <head>
    <META HTTP-EQUIV="REFRESH" CONTENT="5">
  </head>
  ...................

  ...................

  ...................
```

How do i completely remove the "Space Details" page from Confluence exports?

1. Export to html file extension, and customize the layout from Administration->Layouts->Export Layouts->Space Export Layout
2. Export to PDF file extension, take a look at WEB-INF/classes/com/atlassian/confluence/spaces/Space.pdfexport.vm

Disabling Profile Pictures on the Recently Updated Dashboard

To prevent Profile Pictures from being displayed in the Recently Updated Dashboard:

1. Open your confluence/decorators/global.vmd file.
2. Edit the following line (change true to false)
There is no need to stop or restart confluence. The change should work on the next refresh of the page.

How to dump Active Directory data to a file

You can extract all the data present in your Active Directory onto a file using the following command (please ensure you are logged in with sufficient rights to do this)

```bash
csvde -f test.csv
```

This command will perform a CSV dump of every entry in your Active Directory server. You should be able to see the full DN's of users and groups.

How to Revert from Clustering to Single Node

Disabling a Cluster

If reverting from a Clustered configuration, one solution is to back up the data, install a new stand-alone, and restore the data. This is the recommended approach. An alternative is:

1. Download the standard (non-clustered) distribution from the Confluence Downloads
2. Point confluence-init.properties to the existing confluence-home directory.
3. Set in confluence.cfg.xml:

   ```xml
   <property
   name="confluence.cluster">false</property>
   ```

To check to see if clustering has been disabled, look in the logs after the xml during startup. In your catalina.out, you have:

```
INFO [KB:main]
[KB:confluence.cluster.tangosol.TangosolClusterManager] startCluster Bringing up cluster service
```

This line won't exist if you start it up with the config we gave above. That's how to test it.

Adding a Site-Wide Banner

Confluence administrators can add a site-wide banner, i.e. a message or alert that will appear at the top of every page on your Confluence site.

Screenshot: Example of a Site-Wide Banner
To add a site-wide banner,

1. Choose Browse > Confluence Admin.
2. Click 'Custom HTML' in the 'Look and Feel' section of the left-hand panel.
3. Click 'Edit'.
4. Add the following code to the 'At beginning of the BODY' textbox.

   <!-- Message Banner -->
   <div style="background-color: yellow; border: 2px solid red; margin: 4px; padding: 2px; font-weight: bold; text-align: center;">
     Your important message...
   </div>

5. Click 'Save'.

If you want the banner across the bottom of the page, you should add the code to the 'At end of the BODY' textbox instead.

If your banner significantly increases the height of your Confluence site footer, you may need to add HTML to allow for the extra height of a custom footer.

**RELATED TOPICS**

Customising Look and Feel Overview

**Editing the Footer**

⚠️ 'Powered by Atlassian Confluence'

Atlassian requires that the text 'Powered by Atlassian' be displayed in the footer on every page, as specified in the license agreement. Other than that, you can customise the footer text.

To change the footer text, follow the instructions in Modify Confluence Interface Text. You can specify additional configurations in /confluence/decorators/includes/footer.vmd.

If the height of your footer is significantly greater than the default, you may need to add HTML to allow for the extra height of a custom footer.

If you need to revert to a former version, for example to restore the 'Powered By Atlassian Confluence' text, you can refer to the attached footer file.

**Editing the version information in the footer**

Please note that editing the version information displayed by Confluence is not recommended. If you alter the information it is harder for our support team to help you with any enquiries. Also note that there are other ways to
Confluence 4.2 Documentation

1. Choose Browse > Confluence Admin.
2. Click ‘Custom HTML’ in the ‘Look and Feel’ section of the left-hand panel.
3. Click ‘Edit’.
4. Add the following code to the ‘At end of the HEAD’ textbox.

```html
<style type="text/css">
#com-atlassian-confluence #main {
  padding-bottom: 200px;
}
</style>
```

5. Click ‘Save’.

You may need to adjust the code supplied in these instructions depending on the height of your custom footer

> If your footer still overlaps site content, increase the ‘padding-bottom’ amount by the height of the overlap in pixels. Conversely, if there is an excessive gap between your footer and site content, decrease the ‘padding-bottom’ amount.

Where does Confluence store all its data?

Attachments, extensions and configuration files are stored in the Confluence Home Directory that is configured when Confluence is first installed. All remaining data resides in the configured database.

See Important directories and files for more information.

FAQ Home

Running Confluence Behind a Caching Proxy Server

> One major concern is Confluence’s ability to withstand a Slashdot, and someone told us that Atlassian had basically said that Confluence could not handle the load of such an event/attack.
Ideally I would want to put a Squid cache directly infront of Confluence, set the default policy to cache content of normal pages for ~5 minutes (at least) and then pass-through more of the dynamic pages (like the editor & such).

This is, in fact, the case. We don't have any deployed Confluence sites that have the requirement of being Slashdot-proof, but this is probably one of those chicken-and-egg things.

The problem is not one of simple scaleability. We're currently working on "Confluence Massive", a clusterable Confluence that will scale to handle whatever load you feel like throwing at it. But if your aim is to protect the server against sudden, transient loads, throwing a cluster at the problem that will then spend 99% of its time not being utilised is probably a waste. Thus, the best solution is to have some kind of caching reverse-proxy that will divert load away from Confluence itself.

The main problem with the reverse-proxy solution is that every Confluence page is built dynamically for whichever user is currently accessing it. This affects obvious stuff like the "You are logged in as username" notice, less obvious stuff like the "edit" and "attachments" links that appear or disappear based on whether the user has permission to perform the action on the other end of the link, and even less obvious stuff like wiki-links to spaces the user can't see, or in-page macros that output their content based on the user's identity.

To run Confluence behind a caching reverse-proxy, you'd need one of:

1. A proxy that understood the user's identity, or
2. A Confluence site that removed all the personalised content for cacheable pages.

If you had (1), you could tell the proxy to cache content only for anonymous users (since all anon content is the same, and to survive a slashdotting you only really have to worry about the sudden influx of non-logged-in users). That said, (1) is quite tricky, as it relies on the existence of some SSO mechanism that both Confluence and Squid can be hooked into. If such a mechanism existed, though, it'd be a really neat solution.

In the absence of SSO, you've got (2), which involves.

- Theme Confluence so that the 'view page' 'view blog post' and 'view mail' pages contain no personalised content: no profile link or user identity, and all links to other functions available whether the user has permission to access them or not.
- Ensure that all wiki pages on the server are meant to be visible to anonymous users
- Disable (or avoid the use of) macros that deliver different content based on user identity
- Introduce an interceptor into Confluence that would provide If-Modified-Since/Last-Modified conditional get support for wiki pages
- Configure Confluence so the site root URL points to a page, rather than the dashboard.
- Configure Squid to cache the 'view page' URLs (/display/* /pages/viewpage.action /pages/viewblogpost.action)

This is assuming that only the site root or a regular wiki page would ever be the victim of a direct slashdotting, but I figure this is a reasonable enough assumption to make.

With conditional get supported, you could have Squid configured to query the server to see if a page has changed, and just put in some kind of sensible defaults for the maximum time to cache any page (5 minutes or so would be fine, since pages could contain dynamic content), and the minimum gap between if-modified queries (15 seconds would easily prevent the server from being overloaded, while making sure that in regular use you wouldn't get many situations where you edited a page, but couldn't see your own changes).

**How do I pull down RSS Feeds or use the Repository plugin through a web proxy**

You will need to make Confluence aware of your proxy.

**How do I Modify the Frequency of Content Indexing**

Confluence Content Indexing frequency is handled using a cron job set in schedulingSubsystemContext.xml.
Time is derived from the Confluence server

The time zone is taken from the server on which Confluence is running. To check the time according to the server, do the following:

1. Choose Browse > Confluence Admin.
2. Click 'System Information' in the left-hand panel and look at the 'System Time'.

Confluence uses Quartz for scheduling periodic jobs. To change the time of your content indexing, you will need to edit the Quartz configuration.

To change the time of your content indexing

1. Open the Quartz configuration file `schedulingSubsystemContext.xml` located under `confluence/WEB-INF/lib/confluence-x.x.x.jar`. Where x.x.x is your Confluence version number.
2. For Confluence earlier than 2.6, the index cron job is located in `<install dir>\confluence\WEB-INF\classes\schedulingSubsystemContext.xml`. Find the following section of the file:

   ```xml
   <bean id="indexQueueFlushTrigger" class="org.springframework.scheduling.quartz.CronTriggerBean">
     <property name="jobDetail">
       <ref bean="indexQueueFlushJob"/>
     </property>
     <property name="cronExpression">
       <value>0 0/5 * * * ?</value>
     </property>
   </bean>
   ``

   The string '0 0/5 * * ?' sets up a Cron Trigger for the job to run every 5 minutes.

3. Place the modified file as `<install dir>\confluence\WEB-INF\classes\schedulingSubsystemContext.xml`. It will take precedence over the jarred version.

4. You can set a new time by editing this string. Note that the date and time format in this configuration file is in this order:
   - Second minute hour day

5. Restart Confluence.

For example, to set the new time to twenty past ten PM, change the string to '0 20 22 * * ?'.

For complete details on the formatting of the cron string, please see [http://www.opensymphony.com/quartz/api/org/quartz/CronTrigger.html](http://www.opensymphony.com/quartz/api/org/quartz/CronTrigger.html).

Customise Confluence Page Exports

Modify the style or content of the following page exports:
Available Velocity Context Objects in Exporters

Since the export functionality is not implemented as a WebWork action, it does not inherit the default Velocity context used by Confluence actions. It creates its own context and populates it with a separate list of components.

All exporters have at least the items listed below. Some exporters may extend this with other objects.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Class Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>$generalUtil</td>
<td>A GeneralUtil object with several useful methods, including URL encoding.</td>
<td>GeneralUtil</td>
</tr>
<tr>
<td>$textUtil</td>
<td>Common utilities for string manipulation.</td>
<td>TextUtils</td>
</tr>
<tr>
<td>$rendererBean</td>
<td>Mostly for internal use, but can also be used for manipulating page or space exports.</td>
<td>WikiExporter</td>
</tr>
<tr>
<td>$exportDate</td>
<td>A java.util.Date created when the export is actually performed.</td>
<td>Date</td>
</tr>
<tr>
<td>$exportContent</td>
<td>An ExportContext object which holds the context in which the export is performed, such as the user performing the export.</td>
<td>ExportContext</td>
</tr>
<tr>
<td>$dateFormatter</td>
<td>Provides a date and time formatter suitable for the exporting user's locale and environment.</td>
<td>DateFormatter</td>
</tr>
<tr>
<td>$baseUrl</td>
<td>The base URL of the Confluence installation (http://&lt;server&gt;:&lt;port&gt;/contextPath).</td>
<td>String</td>
</tr>
</tbody>
</table>

- Confluence Objects Accessible From Velocity

Customise MS Word Exports

Overview

Confluence exports a Confluence page as a Microsoft Word document by:

1. Generating the HTML rendering of a page from Confluence wiki markup
2. Overriding some Confluence page styles with MS Word styles using a CSS wrapper

The wrapper is generated using a Velocity macro to provide CSS style information specific to MS Word exports.
Modifying Content

Please do not attempt to modify the output without some experience in CSS and HTML markup. You may also need to review Velocity template language.

- W3Schools CSS Tutorial
- W3Schools HTML Tutorial
- Velocity Template Overview

Before modifying any styles, you should always take a backup of both any files you are modifying and your entire Confluence install directory. If you require assistance with your customisation attempt, you should post your modified files along with a technical description to Atlassian Answers.

Important Files

The formatting is defined using the CSS styles in main Confluence stylesheet and overridden by any styles in the Word export wrapper.

Main Stylesheet

This file formats the default appearance of all Confluence content. Changes to this document will be shown when viewing a page from within Confluence, as well as in HTML or MS Word exports. You should avoid changing this document unless you wish a style to be changed throughout Confluence. The file is located under the Confluence install directory:

```bash
...\confluence\WEB-INF\classes\styles\site\-css.vm
```

Export Wrapper

This file overrides the main Confluence stylesheet, so styles outlined in this file will be specific to MS Word exports. It set the font and style for body text, some macro and grids, and a default background colour. The file is located under the Confluence install directory:

```bash
...\confluence\pages\exportword.vm
```

How To Modify Styles

If the CSS tag already exists in the Word export wrapper, you can modify it directly. If the CSS tag is defined by the main stylesheet, copy it into the export wrapper as a new entry in the `<style>` element and update it there:

1. Identify its CSS tag in the main stylesheet. You may need to use trial and error to identify which cascading property is relevant
2. Transfer the tag into the Word export wrapper so that it overrides the main stylesheet
3. Modify the tag style in the wrapper

Common Modifications

You can easily set the body font or background colour in the export wrapper.

Modify Body Font

The wrapper sets the body font:
Modify Background Colour

The wrapper sets the background colour:

```html
<body style="background-color: white; padding: 10px;">
  <h1>$page.title</h1>
  $renderedPageContent
</body>
```

Customise PDF Exports

To customise Confluence's PDF output, you can edit the CSS stylesheets used by the PDF exporter. See Customising Exports to PDF.

I am trying to install Confluence but the demo-site.zip file is missing

The demo-site.zip is normally located in the WEB-INF/classes/com/atlassian/confluence/setup directory.

There are some cases where the extraction utility used to extract the Confluence installation file will recursively extract the contents of all zip files contained within the installation file. If the demo-site.zip file has been extracted, you will see an entities.xml file in this directory instead.

Confluence FAQ

How do I Disable Automatic Mail Polling?

Disabling mail polling in Confluence will prevent Confluence from checking for new mail automatically, but mail retrieval will still work if a user triggers "Check for new mail" manually.

To disable automatic mail polling you would need to restart Confluence with the following parameter in your JVM's JAVA_OPTS:
-Dconfluence.disable.mailpolling=true

RELATED TOPICS

How do I check which spaces have email accounts

Recognised System Properties

How do I change the default polling time for email in Confluence?

Modify the cronExpression property of the mailPollTrigger bean in schedulingSubsystemContext.xml file.

In Confluence installation directory, this file is jarred in $confluence installation directory$/confluence/WEB-INF/lib/confluence-x.x.jar. Unzipping the file and placing it WEB-INF/classes folder will over ride the configuration from the jarred version.

For example, the expression below will fire at 12pm (noon) every day:

```
<property name="cronExpression">
  <value>0 0 12 * * ?</value>
</property>
```

Cron expression

You may also like to view an information on how to create Cron expressions to provide the ability to specify complex time combination. [http://quartz.sourceforge.net/javadoc/org/quartz/CronTrigger.html](http://quartz.sourceforge.net/javadoc/org/quartz/CronTrigger.html)

Change default font, color, or spacing in Confluence

Beginning in Confluence 2.10, you can customise your space or instance using CSS from the User Interface. See [Styling Confluence with CSS](http://confluence.atlassian.com/display/CDOC/styling+confluence+with+css) for details. For earlier versions, check the instructions [here](http://confluence.atlassian.com/display/CDOC/styling+confluence+with+css).

Share users and groups between Confluence and JIRA

How do I share users and groups between Confluence and JIRA?

To save your having to enter users into both JIRA and Confluence, you can configure Confluence to use JIRA’s user database.

Instructions on how to do this can be found [here](http://confluence.atlassian.com/display/CDOC/styling+confluence+with+css).

Disabling Attachment Downloads

⚠️ Code Changes Required

This configuration requires changing the Confluence code in your installation. You will need to reapply these changes whenever you upgrade Confluence. Proceed with caution.

At the moment, permissions for downloading attachments can't be set. To disable attachment downloading you need to edit your velocity files. Attachments can currently be downloaded in two separate ways: by viewing the attachments for a page, and by viewing all the attachments for a Space (Browse > Attachments).

These customisations will disable attachment downloads for all users, including administrators.

Attachments for a whole Space

To disable downloading attachments from a Space, you need to edit the listattachmentsforspace.vm file. Delete or comment out the following line:

```html
<td><a name="!generalUtil.urlEncode($!attachment.content.displayTitle)-attachment-$!generalUtil.urlEncode($!attachment.fileName)">#parse("/pages/includes/attachment_icon.vm")</a><a href="$req.contextPath$!attachment.downloadPathWithoutVersion">$generalUtil.shortenString($attachment.fileName, 50)</a></td>
```

and replace it with either of the following two code blocks:

Disabling downloading for all attachments
Disabling downloading for specific file types

#set($disabledDownloads = ['ext1', 'ext2'])
#set($disabled = false)
#set($attachmentExtension = $attachment.fileExtension)
<tr id="attachment_$!attachment.id">
  #foreach($doNotDownload in $disabledDownloads)
    #if($attachmentExtension == $doNotDownload)
      #set($disabled = true)
      #break
    #end
  #end
  #if(!$disabled)
    <td><a
      name="$!generalUtil.urlEncode($!attachment .content.displayTitle)-attachment-$!generalUtil.urlEncode($!attachment.fileName)">
      #parse="/pages/includes/attachment_icon.vm"
    </a>
    $generalUtil.shortenString($attachment.fileName, 50)
  </td>
</tr>
<a href="$req.contextPath$!attachment.downloadPathWithoutVersion">$generalUtil.shortenString($attachment.fileName, 50)</a></td>
# else
  <td><a name="$!generalUtil.urlEncode($!attachment.content.displayTitle)-attachment-$!generalUtil.urlEncode($!attachment.fileName)="#parse
="/pages/includes/attachment_icon.vm"</a></td>
To specify which files you want disabled, change the

'ext1', 'ext2'

in the first line to the extensions for which you want to disable downloading. You can specify as many extensions as you want, as long as they are in quotes, are comma separated and do not include the '.' at the start. For example, if I did not want users to download .jpg and .doc and .png files, the line would read

```java
#set($disabledDownloads = ['jpg', 'doc', 'png'])
```

References:

- **Attachments for a specific page**
  - If you take the steps in this section but not in the section above, the files you disable can still be downloaded by browsing all attachments for a Space.

Disabling downloading for all attachments
Disabling downloading for specific file types

```java
#set($disabledDownloads = ['ext1', 'ext2'])
#set($disabled = false)
#set($attachmentExtension = $attachment.fileExtension)
#foreach($doNotDownload in $disabledDownloads)
  #if($attachmentExtension == $doNotDownload)
    #set($disabled = true)
    #break
  #end
#end
#if(!$disabled) <a class="filename" href="${req.getContextPath()}/${attachment.downloadPathWithoutVersion}"
title="${generalUtil.htmlEncodeAndReplaceSpaces($attachment.fileName)}">
  ${generalUtil.htmlEncode($generalUtil.shortenString($attachment.fileName, 35))}
</a>
#else
  ${generalUtil.htmlEncode($generalUtil.shortenString($attachment.fileName, 35))}
#end
```

Again, to specify which files you want disabled, change the
in the first line to the extensions for which you want to disable downloading. You can specify as many extensions as you want, as long as they are in quotes, are comma separated and do not include the '.' at the start. For example, if I did not want users to download .jpg and .doc and .png files, the line would read

```plaintext
#set($disabledDownloads = ['jpg', 'doc', 'png'])
```

### Removing the 'Download All' button

⚠️ If you do not take the steps in this section, users will still be able to download all attachments for a page regardless of whether they have been disabled or not.

Delete or comment the following lines in `viewattachments.vm`

```plaintext
#if ($action.latestVersionsOfAttachments.size() > 1)
<a id="download-all-link"
class="dashboard-action
dashboard-action-text
dashboard-action-spacing"
href="$req.contextPath/pages/downloadallattachments.action?pageId=$pageId"
title="$action.getText('download.all.desc')">$action.getText('download.all')</a>
#end
```

### Disabling the 'Remember Me' feature

⚠️ Code Changes Required

This configuration requires changing the Confluence code in your installation. You will need to reapply these changes whenever you upgrade Confluence. Proceed with caution.

The Confluence Administration Console does not provide an option for disabling the 'Remember Me' feature. If you like, you can vote for and comment on the request to provide this ability: [CONF-10383](https://confluence.atlassian.com/browse/CONF-10383).
As a workaround, you can modify the Velocity file login.vm as described below. This modification simply removes the 'Remember Me' checkbox from the web page.

The steps required are as follows:

1. Stop Confluence.
2. Go to your Confluence installation directory.
3. Locate the `<CONFLUENCE-INSTALLATION>/confluence/login.vm` file and make a backup copy.
4. Edit the file.
5. Locate the following line of code:

```velocity
#bodytag( "Component" "label='remember.accesskey'" "name='os_cookie'" 
"value='false'" "theme='aui'" "template='onofflist.vm'" "tabindex='4'")
#end
```

Comment out the line so that it looks like this (note the extra '#' character in front):

```velocity
##bodytag( "Component" "label='remember.accesskey'" "name='os_cookie'" 
"value='false'" "theme='aui'" "template='onofflist.vm'" "tabindex='4'")
#end
```

6. Locate another, similar line of code:

```velocity
#bodytag( "Component" "label='remember.accesskey'" "name='os_cookie'" 
"value='false'" "theme='aui'" "template='onofflist.vm'")
#end
```

Comment out the line so that it looks like this:

```velocity
##bodytag( "Component" "label='remember.accesskey'" "name='os_cookie'" 
"value='false'" "theme='aui'" "template='onofflist.vm'")
#end
```

7. Save the file and restart Confluence.
8. Repeat the above steps each time you install a new version of Confluence.

**How do I disable RSS Feeds?**

⚠️ **Code Changes Required**

This configuration requires changing the Confluence code in your installation. You will need to reapply these changes whenever you upgrade Confluence. Proceed with caution.

Confluence does not have an option to disable RSS feeds from the Administration Console and there is a discussion regarding this in [CONF-10755](https://confluence.atlassian.com/display/CONF/CONF-10755). However there is a workaround on how to disable RSS via some simple modifications that this guide will show.

To disable RSS feeds in Confluence, you would need to disable `createrssfeed.action` and `configurerssfeed.action` properties. They are defined in `xwork.xml`, a configuration file that is zipped in one of the Confluence dependencies library files.

In this guide, we will be modifying `global.vmd` and `configurerssfeed.vm` and place a modified `xwork.xml`
Within your Confluence installation directory. A modified version of each of the file is accessible from the links below. As ruled at the steps below, you can place them in the corresponding directories where they belong. However, before applying the patch remember to backup your original files.

- **CONFDEV:configurerssfeed.vm**
- **CONFDEV:global.vmd**
- **CONFDEV:xwork.xml**

And then follow these steps:

- Place **CONFDEV:global.vmd** in ":<confluence-install>/confluence/decorators/global.vmd. This newer velocity file will remove the RSS functionalities from Confluence dashboard.
- Place the customized **CONFDEV:xwork.xml** in "<confluence-install>/confluence/WEB-INF/classes/xwork.xml". This file has removed the xwork action so an rss feed can’t connect (you'll notice it's commented out):

```xml
<action name="createrssfeed" class="com.atlassian.confluence.spaces.actions.CreateRssFeedAction">
    <interceptor-ref name="defaultStack"/>
</action>
```

- The attached **CONFDEV:configurerssfeed.vm** file contains an explanation why RSS is disabled. Place it in "<confluence-install>/confluence/dashboard/configurerssfeed.vm. You can modify the message to suit your need.

In this patch, the changes in xwork.xml above will cause entering createrssfeed.action or configurerssfeed.action into URL leading to the error page defined in configurerssfeed.vm.

To disable the RSS Feeds link in the Advanced section of spaces, you have to unjar the confluence-x.y.z.jar (where x.y.z is the version of Confluence that you are using) which is located in confluence-install/confluence/WEB-INF/lib/confluence-x.y.z.jar. If none of this makes any sense to you, please refer to this page: Editing Files within JAR Archives

The file you are looking for is plugins/space-advanced-sections.xml.

Remove the following block from this file:
Re Jar this file and replace the current confluence-x.y.z.jar file. You will have to restart confluence to see the effects.

How to audit Confluence - enabling user access logging

Often, for auditing purposes, administrators need to know who did what on their Confluence site. Notifications are not ideally suited for this purpose. Application servers are able to log the requested URL, but they cannot determine the currently logged in user. This log is not currently formatted to be accessible to web log analysis tools such as AwStats as it lacks a host and get method, so must be viewed manually.

Instead, you can generate a basic log indicating which users are accessing which pages in Confluence. Confluence has a built-in access logging mechanism that shows the user and URL invoked. To enable it, you need to modify a couple of configuration files and restart Confluence.

Configuring the AccessLogFilter

There is a simple AccessLogFilter in Confluence than can be enabled via confluence/WEB-INF/classes/log4j.properties and confluence/WEB-INF/web.xml.

Note: Please do not modify the application-wide web descriptor, $server/conf/web.xml. This will be ineffective and potentially may break Confluence.

To enable user access logging:

1. Uncomment these line in confluence/WEB-INF/classes/log4j.properties:
2. Enable the filter in `confluence/WEB-INF/web.xml` by removing the comments around these lines:

```xml
<filter-mapping>
  <filter-name>AccessLogFilter</filter-name>
  <url-pattern>/display/*</url-pattern>
  <url-pattern>*.action</url-pattern>
</filter-mapping>
```

Notice that the `*.action` pattern is added optionally to log the actions of Confluence in addition to the page views, such as user logins by specifying `login.action`. This combination of URL patterns will work for all URLs. You can further modify the pattern by adjusting the `url-pattern` field.

An alternative filter: For troubleshooting purposes, often it is useful to capture all accesses to Confluence. To do this use the following filter mapping in `confluence/WEB-INF/web.xml` instead of the above:

```xml
<filter-mapping>
  <filter-name>AccessLogFilter</filter-name>
  <url-pattern>/*</url-pattern>
</filter-mapping>
```

3. Restart Confluence.

Logging information being stored in the `atlassian-confluence.log` file in the Confluence Home directory.

**Advanced configuration**

You can choose to redirect the access log to a different file by adding a new RollingFileAppender at the top of `log4j.properties`:
log4j.appender.accesslog=org.apache.log4j.RollingFileAppender
log4j.appender.accesslog.Threshold=DEBUG
log4j.appender.accesslog.File=${catalina.home}/logs/atlassian-confluence-access.log
log4j.appender.accesslog.MaxFileSize=20480 KB
log4j.appender.accesslog.MaxBackupIndex=5
log4j.appender.accesslog.layout=com.atlassian.confluence.util.PatternLayoutWithStackTrace
log4j.appender.accesslog.layout.ConversionPattern=%d %p [%t] [%c{4}] %M %m%n

Find this line:

`\#log4j.category.com.atlassian.confluence.util.AccessLogFilter=INFO`

Change it to this:

`log4j.category.com.atlassian.confluence.util.AccessLogFilter=INFO, accesslog
log4j.additivity.com.atlassian.confluence.util.AccessLogFilter=false`

The web.xml url-pattern given above only matches page views (/display/*). You could change the url-pattern, or duplicate the entire filter-mapping to log access for different kinds of access (/admin/* for admin functions, /pages/* for edits and creates, etc. Note that /pages/editpage.action* doesn't work).

**What is Logged**

The log file will contain the following values separated by spaces:

- Username or '-' if no user
- URL
• VM free memory at start of request (in KB)
• Change in free memory after request is finished (in KB)
• Time taken for request (in ms).
• Remote address
• Thread name

Example:

```
2008-08-08 10:33:05,359 INFO [atlassian.confluence.util.AccessLogFilter ] init AccessLogFilter initialized. Format is: <user> <url> <starting memory free (kb)> +- <difference in free mem (kb)> <query time (ms)> <remote address>
```

The above may be preceded by additional log4j-generated text, depending on the log4j pattern which is configured.

Other Options

Google Analytics

Google Analytics can be easily integrated with Confluence for access tracking.

After signing up, copy the Javascript and paste it into the 'Before end of <body>' section of Administration, Custom HTML. This will put the Javascript on every page generated by Confluence.

This might not work correctly if your users are behind a firewall or authenticated proxy.

For more information on using Google Analytics with Confluence you may wish to refer to this blog post by David Simpson.

Tomcat Valve Component access log

Refer to How to Audit Confluence Using Tomcat Valve Component.

Notes

- Path must contain forward slashes '/', not backward slashes. This note is particularaly relevant for Windows Users. When configuring the log4j logging options, each backslash in your path must be written as a forward slash. For example, this path:

  ```
  c:\confluence\data
  ```

  must be written as:

  ```
  c:/confluence/data
  ```

RELATED TOPICS

Working with Confluence Logs
How to Audit Confluence Using Tomcat Valve Component

How to Audit Confluence Using Tomcat Valve Component

Apart from using user access logging built in Confluence to audit accesses, an admin can use Tomcat's Valve Component to do similar things.

Below are the steps on how to do this in a Confluence instance:

1. Edit `<confluence install>/conf/server.xml`
2. Add the following line within the `<Context>` tags declaration:
<Valve className="org.apache.catalina.valves.AccessLogValve" directory="logs" prefix="localhost_access_log." suffix=".log" pattern="%t %{Authorization}i %{User-Agent}i %h %m %r %b %s" />

This will log the time, user account and password in base 64 encoding, client used, IP Address, Request method, First line of the request (method and request URI), Bytes sent, excluding HTTP headers, or '-' if zero, and HTTP status code of the response. The log file will be saved in <confluence install>/logs/localhost_access_log.log.

Below is the sample output:

```
[28/Apr/2010:13:06:23 +1000] null
Microsoft Data Access Internet Publishing Provider Protocol Discovery 127.0.0.1 OPTIONS OPTIONS /plugins/servlet/confluence/default HTTP/1.1 - 401
[28/Apr/2010:13:06:25 +1000] Basic YWRtaW46YWRtaW4= Microsoft Data Access Internet Publishing Provider DAV 127.0.0.1 PROPFIND PROPFIND /plugins/servlet/confluence/default HTTP/1.1 2252 207
Microsoft Data Access Internet Publishing Provider Protocol Discovery 127.0.0.1 OPTIONS OPTIONS / HTTP/1.1 - 200
```

RELATED TOPICS
Editing Files within JAR Archives

⚠️ The content on this page relates to platforms which are not supported for Confluence. Consequently, Atlassian **cannot guarantee providing any support for the steps described on this page.** Please be aware that this material is provided for your information only and that you use it at your own risk.

In Confluence, many files are contained inside a JAR file. This page tells you how to customise such a file:

- Extract the contents of the JAR file into a working directory.
- Edit one of the files extracted from the JAR.
- Place the updated file in a location which Confluence will recognise. Files in this location will override the version of the file in the JAR.

Note that, using the instructions below, you do not need to bundle the updated file back into the JAR.

### On this page:
- **About JAR Files**
- **Customising a File Contained within a Confluence JAR File**
- **Notes**

### About JAR Files

A JAR file is a Java ARchive file. It is similar to a UNIX tar file (or a Windows zip file). To manage a JAR file, you can use the `jar` command-line tool which is included with the JDK. The `jar` tool takes several files, or an entire directory structure, and compresses them together into a single file. This saves a little space, and makes it much easier to manage that group of files as a single unit. The terms ‘file’ and ‘archive’ can be used interchangeably in this context, as they refer to the same collection of bytes.

### Customising a File Contained within a Confluence JAR File

These instructions assume that you already know which JAR file contains the file you need to edit.

**To customise a file contained with a JAR:**

1. Shut down Confluence.
2. Create a new working directory, for example `/tmp/confluence-working`.
3. Change directory (cd) to your working directory.
4. Extract the contents of the JAR:
   ```
   jar xf </path/to/file.jar>
   ```
   For example, to edit the main Confluence JAR file for Confluence 3.5:
   ```
   jar xf $CONFLUENCE/confluence/WEB-INF/lib/confluence-3.5.jar
   ```
5. You now have a directory structure, or at least a set of files, which is the contents of the JAR archive.
6. Find the file that you need to update, edit the file and save it.
7. Examine the structure of files and folders in your working directory, created when you extracted the content of the JAR.
   - Files in the root level of your structure can be recognised by Confluence if you put them in the `/WEB-INF/classes/` folder. For example, if you modify the `schedulingSubsystemContext.xml`
file, you can place it in `<confluence install>/confluence/WEB-INF/classes/schedulingSubsystemContext.xml`.

- Files in a subdirectory of your structure need to be placed in a similar subdirectory under `<confluence install>/confluence/WEB-INF/classes/`. For example, if you modify the `fonts/verdanaz.xml` file, you must put it in `<confluence install>/confluence/WEB-INF/classes/fonts/verdanaz.xml`.

8. Restart Confluence.

Notes

As an alternative to the `jar` utility, you can extract the JAR file using an unzipping utility like Winzip, 7-zip, Stuffit or the OS X Archive Extractor.

**RELATED TOPICS**

- Installing Patched Class Files
- Where are the files that used to be in my Confluence installation directory?
- Changing Space Layouts in Custom Themes

Many custom themes do not support custom layout configuration via user interface.

The guide below is an example to change the layout in the Documentation theme. The aim is to remove the children displayed at the bottom of the page:

1. Unzip the `<confluence-install>/confluence/WEB-INF/classes/com/atlassian/confluence/setup/atlassian-bundled-plugins.zip`
2. Unjar the `doctheme-X.X.X.X.jar` in the unzipped `atlassian-bundled-plugins.zip`
3. Once unjarred, edit the `/doctheme/decorators/page.vmd`
4. Comment the following line in the file:

   ```
   ##renderChildren()
   ```

5. Save the file.
6. Jar the file back to `doctheme-X.X.X.X.jar`.
7. Zip the `atlassian-bundled-plugins.zip` back.
8. Restart your Confluence. Your changes would be reflected after this.

If you need a guide to help with the editing files within JAR archives, you can refer to this [documentation](#). However, please keep in mind that the Documentation Theme plugin is part of bundled plugins. Hence, it is stored in a special place, which is located at `<confluence-install>/confluence/WEB-INF/classes/com/atlassian/confluence/setup/atlassian-bundled-plugins.zip`. Therefore, if you are following the guide, please make sure the paths are correct.

**How to Convert a datasource to a direct JDBC connection in oracle**

1) Shutdown confluence
2) Edit `CONFLUENCE_HOME/confluence.cfg.xml` file
3) Delete
<property
name="hibernate.connection.datasource">java:comp/env/jdbc/confluence</property>

<property
name="hibernate.dialect">net.sf.hibernate.dialect.Oracle9Dialect</property>

<property
name="hibernate.setup">true</property>

and replace with

<property
name="hibernate.c3p0.acquire_increment">1</property>

<property
name="hibernate.c3p0.idle_test_period">100</property>

<property
name="hibernate.c3p0.max_size">250</property>

<property
name="hibernate.c3p0.max_statements">0</property>

<property
name="hibernate.c3p0.min_size">5</property>

<property
name="hibernate.c3p0.numHelperThreads">9</property>

<property
name="hibernate.c3p0.timeout">30</property>
<property name="hibernate.connection.SetBigStringTryClob">true</property>
<property name="hibernate.connection.driver_class">oracle.jdbc.driver.OracleDriver</property>
<property name="hibernate.connection.password">PASSWORD</property>
<property name="hibernate.connection.url">jdbc:oracle:thin:@HOST:1522:DATABASENAME</property>
<property name="hibernate.connection.username">USERNAME</property>
<property name="hibernate.database.lower_non_ascii_supported">true</property>
4) restart confluence

**Bulk Fix Spaces with Deprecated Themes using SQL Query**

Later versions of Confluence may deprecate older themes. Spaces that are configured with this theme will be migrated automatically to a new theme, during the upgrade process. In some scenarios, this may not happen, hence you can fix this by following this guide.

In this guide, we are using Left Navigation Theme as an example of deprecated theme (if you are trying to find another theme, please replace the LIKE section to the respective theme). The following SQL query will list all spaces with the:

```sql
SELECT s.spacename, s.spacekey FROM spaces s
WHERE s.spacekey in (SELECT bandanacontext FROM BANDANA
WHERE bandanavalue LIKE '
%<string>com.atlassian.confluence.themes.
leftnavigation:leftnavigation</string>%'
AND bandanakey = 'atlassian.confluence.theme.settings'
)
```

In order to change all spaces that uses Left Navigation Theme to the Default Theme, use the following query:
UPDATE BANDANA SET bandanavalue = '<map>
    <entry>
        <string>theme.key</string>
        <string></string>
    </entry>
</map>' WHERE bandanavalue LIKE '%<string>com.atlassian.confluence.themes.leftnavigation:leftnavigation</string>%' AND bandanakey = 'atlassian.confluence.theme.settings';

Flush Confluence/browser cache after executing the query.

Changing Editor's Keyboard Shortcuts

Some users may experience some problem with keyboard shortcuts which might be clashing with other operating system/application's keyboard shortcuts.

The guide below is a workaround to change the keyboard shortcut for a particular function. The aim here is to change the quote shortcut in the editor from ctrl+alt+q to ctrl+alt+y:

2. Unjar the confluence-tinymce-plugin-X.X.X.X.jar in the unzipped atlassian-bundled-plugins.zip.
3. Once unjarred, edit the /tinymce3/plugins/keyboardshortcuts/editor_plugins_src.js unzipped.
4. Change the following line in the file:

   ed.addShortcut('ctrl+alt+q', '', ['FormatBlock', false, 'macro_quote']);

   to for example:

   ed.addShortcut('ctrl+alt+y', '', ['FormatBlock', false, 'macro_quote']);

5. Save the file.
7. Zip the atlassian-bundled-plugins.zip back.
8. Restart your Confluence instance. Your changes would be reflected after this. You may need to force refresh your browser.

If you need a guide to help with the editing files within JAR archives, you can refer to this Editing Files within JAR Archives. However, please keep in mind that the Tinymce plugin is part of bundled plugins. Hence, it is...
stored in a special place, which is located at `<confluence-install>/confluence/WEB-INF/classes/com/atlassian/confluence/setup/atlassian-bundled-plugins.zip`. Therefore, if you are following the guide, please make sure the paths are correct.

### Installation FAQ

This section contains solutions for common issues encountered when **installing and starting Confluence**, including solutions to common queries about this process.

If necessary, review your logs by opening the Confluence install directory and checking the `/logs/catalina.out` and `/logs/catalina.out` files for errors you may encounter.

View one of the following issues or queries for more information:

- [Separate the Home and Install directories in Confluence 3.2](#)
- [I receive a BUILD FAILED message when trying to create an EAR file in Confluence 2.6 or 2.7](#)
- [The Confluence window closes immediately when started](#)
- [How do I re-trigger the setup wizard](#)
- [Confluence starts but a problem prevents me from accessing the dashboard](#)
- [How much disk space does Confluence need?](#)
- [How Do I Make Confluence Accessible from the Root Context with a Tomcat EAR WAR configuration](#)
- [How To Bind Confluence to a Particular Network Interface](#)
- [Deploying Multiple Atlassian Applications in a Single Tomcat Container](#)

### Separate the Home and Install directories in Confluence 3.2

It's recommended to create the 'Home' directory separately from the 'Install' directory, however if you've already combined the two directories this will help you untangle them...

1. Stop Confluence
2. Backup your current home/installation directory
3. Create a new blank home directory (parent only, no sub-directories)
4. Move the following files/directories to the new home directory
   - attachments
   - backups
   - bundled-plugins
   - bundled-plugins_language
   - config
   - confluence.cfg.xml
   - index
   - plugin-cache
   - plugins-osgi-cache
   - plugins-temp
   - viewfile
5. There are two sub-directories which will need to be created in the home directory:
   - logs
     It's fine to leave this empty, however if you want to keep your existing confluence log move the `atlassian-confluence.log` file from the existing 'logs' directory to the newly created one
   - temp
     This is also fine to leave empty
6. Edit the `confluence/WEB-INF/classes/confluence-init.properties` file to reflect the new home directory path (the one created in Step 3)
7. Start Confluence

Did it work?

If you've followed the steps correctly, your new installation and home directories should look like this:

Home

```
- attachments
- backups
- bundled-plugins
- bundled-pl...s_language
- config
  - confluence.cfg.xml
  - index
  - logs
- plugin-cache
- plugins osgi-cache
- plugins-temp
- temp
- viewfile
```

Install

```
- bin
- conf
- confluence
- lib
  - LICENSE
  - licenses
  - logs
  - NOTICE
  - README.html
  - README.txt
  - RELEASE-NOTES
  - RUNNING.txt
- temp
- webapps
- work
```

You should have no problems starting Confluence, and the log files should be updated as normal.

If Confluence tries to load a new site (such as in a new installation) you'll need to confirm that the home
directory path is specified correctly in `confluence-init.properties`.

If you find you’re unable to search or the recently updated menu isn’t showing any content try rebuilding your search index via Confluence Admin > Content Indexing

I receive a BUILD FAILED message when trying to create an EAR file in Confluence 2.6 or 2.7

When trying to create a EAR file, you may encounter with the following error:

```
BUILD FAILED
file:/users/a237185/confluence/confluence-2.7/build.xml:67: Warning: Could not find file
/users/a237185/confluence/confluence-2.7/etc/ear-application.xml to copy.
```

This is due to the `build.xml` file being incorrect for Confluence 2.6.x and 2.7.0. This problem will be fixed for future releases. However for these releases, please open the `build.xml` file and change the following two lines:

From:

```
<copy preservelastmodified="true"
file="${ant.confluence.etc}/ear-applicatio
n.xml"
tofile="${ant.confluence.build.ear}/META-INF/application.xml" overwrite="yes"/>
<copy preservelastmodified="true"
file="${ant.confluence.dist}/${ant.conflue
nce.name}-${ant.confluence.version}.war"
tofile="ant.confluence.nameild.ear}/Conflu
ence War Distribution.war"
overwrite="yes="/>
```

To:
Confluence 4.2 Documentation

The Confluence window closes immediately when started

An error is preventing Confluence from starting.

1. Open a command prompt. On Windows, do this by clicking on your Start menu, then click Run. In the Run box, type cmd and press OK
2. From the command prompt, go to your Confluence install directory
3. Go into the bin subdirectory
4. Run startup.bat and read the error message
5. Find a solution to the error below:
   - java.lang.NoClassDefFoundError IntraHibernateAttachmentCopier
   - Exception in thread "main" java.lang.NoClassDefFoundError: ...
   - Error creating Confluence Home directory
   - JAVA_HOME environment variable is not defined correctly
   - Port 8090 is in use
   - Error creating bean with name 'scheduler'
   - Error registering bean with name 'fileSystemAttachmentDataDao'

java.lang.NoClassDefFoundError IntraHibernateAttachmentCopier

If you are seeing "java.lang.NoClassDefFoundError: com/atlassian/confluence/pages/persistence/dao/hibernate/AbstractHibernateAttachmentDao$IntraHibernateAttachmentCopier", you have unzipped Confluence using a program that cannot handle long filenames. You must delete your install directory and go back to the point in the instructions that covers unzipping Confluence using a third-party unzip program.

Exception in thread "main" java.lang.NoClassDefFoundError: ...

If http://localhost:8090 goes to an error page when you run Confluence, go to the install directory and find the /logs/catalina.out. If this file contains a single line error starting with "Exception in thread "main" java.lang.NoClassDefFoundError", your install path may contain spaces. The solution is to rename your install directory path so that there are no spaces, then restart Confluence.

Error creating Confluence Home directory
The confluence.home variable specified in confluence-init.properties cannot be created. To fix this, edit /confluence/WEB-INF/classes/confluence-init.properties and check the path specified exists. Make sure all the directory slashes use / and that the # has been removed. If you're stuck, try using confluence.home=c:/confluence/data

JAVA_HOME environment variable is not defined correctly

You have not installed the Java Development Kit, or not set the %JAVA_HOME% to the directory of the JDK. You should re-check your steps in Stage 2.

Port 8090 is in use

If you have another Confluence instance running on the same machine, you must edit <INSTALL>/conf/server.xml and change both 8090 and 8000 to ports that do not conflict with your other Confluence instances according to these instructions.

Error creating bean with name ‘scheduler’

You will need to adjust your system time.

Error registering bean with name ‘FileSystemAttachmentDataDao’

If you did not use one of the recommended unzipping tools, and happened to use for instance the default Windows XP extractor, one of the classes required for starting up Confluence may not be located due to the lengthy file path. This is due to the reason that the default Windows tool silently fails to extract files with long names. We suggest you to use other tools such as WinZIP and 7zip and redo the deployment process.

Cause:
at java.lang.Class.forName0(Native Method)

How do I re-trigger the setup wizard

To re-trigger the setup wizard:

1. Ensure the application server (for example, Apache Tomcat) running Confluence has been stopped.
2. Delete <confluence-home>/confluence.cfg.xml.
3. Re-start Confluence's application server and then Confluence.

Confluence starts but a problem prevents me from accessing the dashboard

Find a solution to one of these problems below:

- localhost:8090 times out
- localhost:8090 goes to the Tomcat start homepage
- Logins fail at the login screen
localhost:8090 times out

Check the server logs for errors. If you are running the Confluence distribution on Windows, error messages will be printed to the console window that opened when you ran startup.bat. On Linux/Solaris systems, Confluence will log messages to logs/catalina.out.

localhost:8090 goes to the Tomcat start homepage

The CATALINA_HOME environment variable is set to another instance of Tomcat. You should run shutdown.sh, remove the CATALINA_HOME reference to the other Tomcat version, and run startup.sh again.

Logins fail at the login screen

If you try to login with the correct username and password but are always returned to the login screen without any error messages, and you are running a software firewall, please check that it is not blocking the Confluence server.

How much disk space does Confluence need?

For the recommended minimum amount of disk space, please see the 'Requirements' section in the Installation Guide.

Note that the actual disk space needed will depend significantly on the number of attachments (i.e. files which users attach to Confluence pages), and on the sizes of the attachments. You can calculate the hard drive requirements as you would with any standard file server.

FAQ Home

How Do I Make Confluence Accessible from the Root Context with a Tomcat EAR WAR configuration

Tomcat uses the ROOT.xml file to describe the root context. To make Confluence run at the Root, name the file that contains the context descriptor for Confluence ROOT.xml in the conf/Catalina/localhost/ directory. This is described in Installing the Confluence EAR-WAR Edition.

How To Bind Confluence to a Particular Network Interface

In situations where a computer has more than one network interface, you can use the same port number on each of these network interfaces. For example, if you are running a JIRA instance on port 8080, you might also want to run Confluence on port 8080. In this case, you have to specify the IP address of the network interface.

Change the server.xml file by adding the element:

```xml
<Connector className="org.apache.coyote.tomcat4.CoyoteConnector"
    address="192.168.1.1"
    port="8080" minProcessors="5" maxProcessors="75"
    enableLookups="true" redirectPort="8443"
    acceptCount="100" debug="0" connectionTimeout="20000"
    useURIValidationHack="false" disableUploadTimeout="true" />
```

Also change the hostname from localhost to the relevant host name, in the file above, on the same IP.

Deploying Multiple Atlassian Applications in a Single Tomcat Container

Deploying multiple Atlassian applications in a single Tomcat container is not supported. We do not test this
configuration and upgrading any of the applications (even for point releases) is likely to break it. There are also a number of known issues with this configuration:

- You may not be able to start up all of the applications in the container, due to class conflicts (in 3rd party libraries bundled with our application) that result from the Atlassian applications sharing a single JVM in the Tomcat container.
- You will not be able to determine the startup order of the applications. Hence, you may experience problems such as JIRA starting before Crowd, rather than vice versa.
- Memory problems are also common as one application may allocate all of the memory in the Tomcat JVM to itself, starving the other applications.

We also do not support deploying multiple Atlassian applications to a single Tomcat container for a number of practical reasons. Firstly, you must shut down Tomcat to upgrade any application and secondly, if one application crashes, the other applications running in that Tomcat container will be inaccessible.

Finally, we recommend not deploying any other applications to the same Tomcat container that runs the Atlassian application, especially if these other applications have large memory requirements or require additional libraries in Tomcat's lib subdirectory.

### Mail Archiving FAQ

This section contains solutions for common issues or queries associated with Confluence’s Mail Archiving feature that was introduced in Confluence 1.3.

View one of the following issues or queries for more information:

- Can Confluence replace my regular mail client?
- How do I use the mail archive?
- Okay, I've imported the mail, but where is it?
- How do I get mail into Confluence?

The emphasis on the DR3 release was to:

- Import email into Confluence.
- Have Confluence monitor POP mailboxes.
- View email.
- Search email.

### Mail Archiving Features are Now Optional

Confluence Mail Archiving is an optional feature from Confluence 4.1 onwards. This means that the Mail elements in the Confluence interface as mentioned on this page will not appear in the user interface by default.

Mail archiving features are now contained in a bundled plugin. To activate mail archiving features in Confluence, activate the plugin from Confluence Admin > Configuration > Plugins > Show System Plugins > Confluence Mail Archiving Plugin.

The user interface and functionality of the feature have not changed.
Mail Archiving Features are Now Optional

Confluence Mail Archiving is an optional feature from Confluence 4.1 onwards. This means that the Mail elements in the Confluence interface as mentioned on this page will not appear in the user interface by default.

Mail archiving features are now contained in a bundled plugin. To activate mail archiving features in Confluence, activate the plugin from Confluence Admin > Configuration > Plugins > Show System Plugins > Confluence Mail Archiving Plugin.

The user interface and functionality of the feature have not changed.

No, Confluence cannot replace your regular mail client.

Confluence's mail archive is designed to supplement the way you currently handle email, not to replace it. This is why Confluence deliberately does not come with features common in email clients. For example, you cannot mark emails as read or unread, you cannot reply to emails from within Confluence, and so on.

How do I use the mail archive?

Some suggested scenarios include:

Project-related conversations

Say you are using a Confluence space to organise a project. The project lead and the customer have a long conversation (via email) clarifying the project's goals and requirements. Rather than have that conversation lost in their individual mailboxes, if they CC’ed their mail to a POP box being monitored by Confluence, all that information will be archived alongside the rest of the project's documentation.

Customer Support Tracking

All incoming and outgoing sales and support email is diverted (at the mail-server) to be read by Confluence. Staff can then use Confluence's features to find all previous communications with particular customers.

And?

Of course, the real fun will come from seeing how this feature can be put to other uses.

Okay, I've imported the mail, but where is it?
Mail Archiving Features are Now Optional

Confluence Mail Archiving is an optional feature from Confluence 4.1 onwards. This means that the Mail elements in the Confluence interface as mentioned on this page will not appear in the user interface by default.

Mail archiving features are now contained in a bundled plugin. To activate mail archiving features in Confluence, activate the plugin from Confluence Admin > Configuration > Plugins > Show System Plugins > Confluence Mail Archiving Plugin.

The user interface and functionality of the feature have not changed.

Because of the typically overwhelming volume of email, especially compared to the more sedate pace of wiki updates, we do not notify you of recently arrived mail in the same places we notify you of changed Confluence content.

Mail will not appear in the recent changes list on the dashboard or space summary pages. Similarly, mail will not appear by default in search results.

You can view mail...

1. In order of arrival from the Mail Archive section, found under the Content tab of the Space Summary screen.
   - 'Browse' Dropdown menu > Mail
2. You can also explicitly select Mail (or All Content) in the search page to include mail in your search results.

How do I get mail into Confluence?

All mail messages belong to a particular space.

From the space administration screen, space administrators can:

- Configure Confluence to poll a POP mailbox for incoming mail
  1. Go to Space Admin
  2. Choose "Mail Accounts"
  3. Add Pop Account
- Import mail from an mbox-format mail file

Confluence will delete mail from a POP box as it reads it. Do not point Confluence to an account unless you are happy with it removing all the mail you have stored there.

New User FAQ
This section contains solutions for common issues or queries encountered by new Confluence users.

View one of the following issues or queries for more information:

- [Can I use CamelCaseLinks like they do on WardsWiki?](#)
- [Can Users Edit Individual Sections Within a Page?](#)
- [How does Confluence differ from a wiki?](#)

### Can I use CamelCaseLinks like they do on WardsWiki?

Yes you can. Camelcasing is not enabled by default but a site administrator can easily enable it from the administration screens.

See [Enabling CamelCase linking](#).

#### RELATED TOPICS

No content found for label(s) camelcasing.

### Can Users Edit Individual Sections Within a Page?

Some wiki software allows the editing of sections within a page (sectional editing). This functionality is currently not available in Confluence, but we are looking to include it in a future release. This issue is being tracked on the Confluence JIRA project: [CONF-5913](#).

In the meantime, for pages that are getting long enough to be hard to edit in a single block, you can get an approximation of sectional editing by using the `{include}` macro. For example:

```markdown
h3. [Section One]
   ([edit]///pages/editpage.action?spaceKey=SPACE&pageTitle=Section One])

{include:Section One}

h3. [Section Two] ([edit]///pages/editpage.action?spaceKey=SPACE&pageTitle=Section Two])

{include:Section Two}
```

The links to the edit pages can be simplified by using the `{link-to:page edit}` macro available in David Peterson's [Linking Plugin](#).

#### Technical Stuff

The problem lies in the complexity of Confluence’s wiki markup. We made a couple of proof-of-concept implementations of sectional editing as part of our "Fedex Day" program, and while it’s quite easy to come up with a solution that works with 90% of pages, there are a lot of edge-cases where it’s actually quite hard to
determine precisely where a given section starts and finishes.

Next time we perform a significant overhaul of our wiki markup processing engine, we'll be looking specifically to add functionality that will make sectional editing work properly.

**How does Confluence differ from a wiki?**

Essentially, Confluence is a [wiki](https://confluence.org). Our aim was to build an application that was built to the requirements of an enterprise knowledge management system, without losing the essential, powerful simplicity of the wiki in the process.

From the wiki, we took the following lessons:

- It should be easy for anyone to create and edit pages
- It should be easy for anyone to link pages together
- It should be easy to see what has changed recently
- The site should be searchable
- Users should have the tools to organise and group pages without having any particular structure imposed upon them

On top of that, we added professional features, such as the partitioning of content into separately managed spaces, user- and group-based access control, automated refactoring, PDF exporting, searchable attachments, a comprehensive remote API, easy installation and a professional and easy-to-use presentation; all wrapped up in Atlassian's "Legendary Service".

**RELATED TOPICS**

**RSS Feeds FAQ**

This section contains solutions for common issues or queries associated with [RSS Feeds](https://confluence.org) and the [RSS Feed Macro](https://confluence.org).

View one of the following issues or queries for more information:

- [Create an RSS feed for mail from only specified mail accounts](https://confluence.org)
- [How do I fix a "Could not download (Feed URL) - Connection timed out (errno238)" error?](https://confluence.org)
- [How do I fix a "Could not retrieve (Feed URL) - Not Permitted" error?](https://confluence.org)
- [How do I fix an "Error formatting 'macro rss java.lang.NullPointerException" error?](https://confluence.org)
- [How do I fix an "Unable to retrieve (Feed URL) - Connection refused - connect" error?](https://confluence.org)
- [How do I force authentication for public feeds?](https://confluence.org)
- [Is it possible to delete a feed?](https://confluence.org)
- [I want to remove RSS Feeds completely](https://confluence.org)

**Create an RSS feed for mail from only specified mail accounts**

This is not possible, but you can vote towards [tagging incoming mail with labels on arrival](https://confluence.org). Once tagged, feeds could monitor all new mail with that label.

**How do I fix a "Could not download (Feed URL) - Connection timed out (errno238)" error?**

The feed source may be offline, or the firewall may be blocking access either between the Confluence server any your computer. Confirm that you can access the feed URL from your browser. If it cannot, your firewall settings may be blocking access to Confluence. For example, your server may be configured to block outgoing requests.
How do I fix a "Could not retrieve (Feed URL) - Not Permitted" error?

You must append a valid login to Private Feeds as described in the Usage section of the RSS Feed Macro.

How do I fix an "Error formatting 'macro rss java.lang.NullPointerException" error?

The link is not a valid feed, so check your URL. If stuck, you can recreate internal Confluence feeds Using the RSS Feed Builder.

How do I fix an "Unable to retrieve (Feed URL) - Connection refused - connect" error?

The URL is invalid. If the link appears correct, confirm that you can access Confluence. Paste the feed into a third-party RSS feed reader and confirm that it can access it. If it cannot, your firewall settings may be blocking access to Confluence. For example, your server may be configured to block outgoing requests.

How do I force authentication for public feeds?

With anonymous access enabled, you can force user authentication when creating the feed by checking 'Authorised'. If anonymous access is disabled, all feeds will require user authentication.

Is it possible to delete a feed?

No, because RSS feeds are based on the view permissions for pages and spaces. RSS is an extension of normal page viewing functionality, so if you can view a page, you can receive an RSS feed for it. The only way to remove an RSS feed is to prevent all access to a page for that user, so that no content will be delivered.

I want to remove RSS Feeds completely

While Confluence does not have this functionality, there is a work around to remove RSS feeds completely. Refer to How do I Disable RSS Feeds?

Upgrade FAQ

This section contains solutions for common issues and queries encountered when upgrading Confluence. View one of the following pages for more information.

FAQ

- I cannot find the "Rich Text" editor. Is the editor part of Confluence 1.4.3?
- Server ID FAQ
- Upgrade My Trial To A Commercial Version

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

I cannot find the "Rich Text" editor. Is the editor part of Confluence 1.4.3?

The Rich Text Editor (aka WYSIWYG editor) is available in Confluence 2.0 and upwards. Rich Text editing is enabled by default.

If you wish to upgrade your Confluence installation, instructions can be found here.

FAQ Home

Server ID FAQ

What causes this Server ID to be generated? Is it tied to the hardware, OS, or Confluence instance?

The Server ID:

- is generated when you install Confluence for the first time
- exists for the life of the Confluence instance
- survives an upgrade
- is held in the database
- is not bound to a specific licence
- is the same for all servers in a cluster.

What’s the policy on re-associating licenses with server IDs?

There’s no need to do this. Once you have a Server ID associated to a license, you can leave it as is.

What happens when I need to reinstall (quickly) on a different system?

Because the server ID is held in the database, it travels with the instance when the database or XML backup is restored on the new system. You need not generate a new Server ID for your new system.

What do I do when the license screen from my.atlassian.com is asking for my Server ID?

The Server ID is located on the license screen. If you have only a License ID, you may bypass the requirement to enter a Server ID - just look for the link from my.atlassian.com on my.atlassian.com after choosing "associate server ID." Check Unable to Find Server ID for Confluence 2.5.4 or Before for further info.

Searching Confluence Knowledge Base

Upgrade My Trial To A Commercial Version

First, you will need to purchase Confluence to receive your commercial license key. If you already have a free 30 day evaluation then you can easily convert this to the commercial version, or setup your commercial instance on another system and transfer your trial data across.

Upgrade A Trial To The Commercial Version

If you wish to change your trial into a commercial version while keeping the same hardware, login in as a Confluence administrator and paste in your commercial license key under the Administrator > License Details screen. The conversion to a commercial version is instantaneous and can be done regardless of whether your evaluation period has expired or is still ongoing.
Migrate Your Trial Data To A Server

If you installed your Confluence trial on a PC but wish to host your commercial version on another system, such as a server managed by your IT department, you can transfer the trial data across. Begin by creating an XML backup on the trial PC, then install Confluence on the commercial server. During installation, you will be presented with the Confluence Setup Wizard. The wizard gives you the opportunity to insert your commercial license key and also to import an XML backup. If you import the XML backup from your trial, your commercial instance will be setup already containing all your trial wiki content and any internal users.

Usage FAQ

This section contains solutions for common issues or queries about the everyday use of Confluence.

View one of the following issues or queries for more information:

- Add many files to a page at once
- Create a page by passing parameters to a template
- Editing or Deleting a Page That Won't Render
- How do I obtain content that hasn't been modified in a certain period of time
- How to Add a Quick Search for Firefox
- How to Make Confluence Open a New Tab when Clicking on the Attachments Link
- Printing Confluence Pages
- Redirect to a specific page (home page) within the site after logging in

Add many files to a page at once

Confluence offers several ways to add many files to a page at once:

- Confluence pages and attachments can also be mounted as a network drive, and files can be dragged and dropped into Confluence using the WebDAV Plugin.
- Alternatively, users who do not wish to use WebDAV can write a custom script to attach all PDF files in a directory to a Confluence page using the addAttachment function in the Remote API. This script can be adapted from one of the Remote API script examples.

Create a page by passing parameters to a template

Confluence supports populating wiki content through templates. Check out Page Templates if you would like to create a new page by filling in a graphical, form-based template. If you have an existing page and would like to pass text as parameters to a macro that fills in the blanks in a template, create the template as a User Macro and call it from inside your Confluence page.

Editing or Deleting a Page That Won't Render

⚠️ You may be able to access the edit page URL by hitting ctrl+e

If you have a page that you can't access (for example, due to an incompatible plugin that won't render a macro), you can delete or edit the page by manually entering the appropriate URL. The URL looks like this:
Substitute your page ID for the one you wish to delete. To determine the page ID, you may be able to access it from the edit page URL by hitting ctrl+e. If not, you can obtain this information from the database using an SQL query like this:

```
SELECT CONTENTID FROM content WHERE TITLE = '<pagename>' AND VERSION = '1';
```

This may return multiple results if there are pages with the same name in different spaces, so you may have to further determine the correct one.

Alternatively, if you don't know the page ID, you can access the page for editing using an URL like:

```
http://<baseurl>/pages/editpage.action?spaceKey=<spaceKey>&title=pageName
```

To delete an attachment manually, you can use a URL like:

```
http://<baseurl>/pages/removeattachment.action?pageId=32787&fileName=harbour.jpg&version=1
```

To view the attachments on a page:

```
http://<baseurl>/pages/viewpageattachments.action?pageId=<pageId>
```

Get the page ID similarly.
To get the wiki markup from the database directly, try:

```
SELECT BODY FROM BODYCONTENT WHERE CONTENTID IN (SELECT CONTENTID FROM content WHERE TITLE = '<insert name of page or blog post>');
```

How do I obtain content that hasn't been modified in a certain period of time

**Via the Archiving Plugin**

The [Archiving Plugin](https://confluence-plugins.atlassian.com/archiving-plugin) is a great tool for managing outdated content.

**Via SQL**

This can be achieved by running the following SQL query on your Confluence database.

```
SELECT * from content as c, spaces as s 
where c.spaceid = s.spaceid and 
s.spacename='INSERT SPACE NAME HERE' and 
c.LASTMODDATE < 'INSERT DATE HERE';
```

How to Add a Quick Search for Firefox

**Description**

To add a quick search term into Firefox's address bar, add the following link to your bookmarks:

```
http://confluence.atlassian.com/dosearchsite.action?quickSearch=true&searchQuery.queryString=%s
```

Make a keyword for it, and you can search a confluence instance using the keyword, a space and then the search term. For example, if you use the keyword cac with the above link, you can search confluence using:

```
cac searchterm
```

How to Make Confluence Open a New Tab when Clicking on the Attachments Link

Modifying the template file in confluence-attachments-plugin-x.x.jar (in this case, I try on
confluence-attachments-plugin-2.10.jar). Please edit attachmentsmacro.vm file. This file is located in confluence-attachments-plugin-2.10.jar file. Extract this file by using the Editing files within .jar archives guide guide.

If you are able to extract it successfully, you can locate to attachmentsmacro.vm file and find the following lines:

```html
<td><a name="$generalUtil.urlEncode($page.title)-attachment-$generalUtil.urlEncode($attachment.fileName)" #parse ("/pages/includes/attachment_icon.vm")</a>
<a href="$req.contextPath$attachment.downloadPathWithoutVersion">$attachment.fileName</a></td>
```

and change the above code to be:

```html
<td><a name="$generalUtil.urlEncode($page.title)-attachment-$generalUtil.urlEncode($attachment.fileName)" #parse ("/pages/includes/attachment_icon.vm")</a>
<a target="_blank" href="$req.contextPath$attachment.downloadPathWithoutVersion">$attachment.fileName</a></td>
```

After making changes, please repack the file by following the steps here.

For newer Confluence versions:

- For List Attachments page under Space (via Space >> Browse >> Attachments), the file to be edited can be found at:
  `<confluence-install>/confluence/pages/listattachmentsforspace.vm`. Find for the following lines of code:
and change it to

```html
<a target="_blank"
    href="$req.contextPath!attachment.downloadPathWithoutVersion">$general
Util.shortenString($attachment.fileName, 50)</a>
```

- For Attachments page under Page (via Page >> Tools >> Attachments), the file to be edited can be found at:
  `<confluence-install>/confluence/pages/includes/attachments-table.vm`. Find for the following lines of code:

```html
<a class="filename"
    href="$generalUtil.htmlEncode("${req.contextPath}${attachment.downloadP
athWithoutVersion}")"
    title="$generalUtil.htmlEncodeAndReplaceSpaces($attachment.fileName)"
    data-filename="$generalUtil.htmlEncode($attachment.fileName)">
  $generalUtil.htmlEncode($generalUtil.shortenString($attachment.fileName
, 35))
</a>
```

and change it to

```html
<a class="filename" target="_blank"
    href="$generalUtil.htmlEncode("${req.contextPath}${attachment.downloadP
athWithoutVersion}")"
    title="$generalUtil.htmlEncodeAndReplaceSpaces($attachment.fileName)"
    data-filename="$generalUtil.htmlEncode($attachment.fileName)">
  $generalUtil.htmlEncode($generalUtil.shortenString($attachment.fileName
, 35))
</a>
```

Printing Confluence Pages

You can print one or more Confluence pages:

- To print a single page, use your browser's 'Print' option.
- Confluence allows you to export a single page, a part of a space, or an entire space into a single PDF file. See Exporting Confluence Pages and Spaces to PDF.

Redirect to a specific page (home page) within the site after logging in

As a user, you can set the home page to which you are sent after logging in.

To set your home page as a user:

1. View your profile via the profile link on the top right
2. Click the Edit My Profile on the right
3. Set Site Homepage to your desired home page

For instructions on configuring this feature at the administrator level, see Redirect users to a site-wide home page after a successful login.

Information relating to Unsupported Platforms

The content on this page relates to platforms which are not supported for Confluence. Consequently, Atlassian can not guarantee providing any support for the steps described on this page. Please be aware that this material is provided for your information only and that you use it at your own risk.

For details of supported platforms for Confluence, please refer to the topic on supported platforms.

View one of the following topics for more details:

- Setting up Confluence with IIS
  - Connecting Confluence with IIS 5.1 or 6
  - Connecting Confluence with IIS 7
- Using the IBM 64bit J9 JDK

Setting up Confluence with IIS

The content on this page relates to platforms which are not supported for Confluence. Consequently, Atlassian can not guarantee providing any support for the steps described on this page. Please be aware that this material is provided for your information only and that you use it at your own risk.

This page describes how to install Confluence with IIS using the Apache jk connector.

If you are using JIRA as well as Confluence, please refer to this page in the JIRA documentation instead.
On this page:

- Step 1. Install IIS
  - IIS 6
  - IIS 7
- Step 2. Install Confluence
- Step 3. Configure Tomcat
- Step 4. Configure the Tomcat Connector
- Step 5. Connect Confluence with IIS

Step 1. Install IIS

If you are running Windows Server 2003, you will only be able to use IIS 5.1 or 6. If you are using Windows Server 2008, you might like to install IIS 7.

IIS 6

If you are using Windows Server 2003 or XP professional, follow these instructions for installing IIS 6.

After installation is complete you should be able to go to http://localhost/iishelp/iis/misc/default.asp in your browser and see the IIS Getting Started page.

IIS 7

Similar to the previous Windows versions, IIS is not installed by default in Windows Server 2008 so you need to install it manually.

1. Start your Server Manager.
2. Click 'Roles'.
3. In the right hand panel, click "Add Roles".
4. A new window will pop up. Select the 'Web Server (IIS)' option.
5. Click 'Next' until you see another set of checkbox options to install the required 'Roles Services' for the web server (IIS).
6. Scroll down to 'Application Development' and tick the following:
   - CGI
   - ISAPI Extensions
   - ISAPI Filters
7. Click 'Next'.
8. And lastly, click 'Install'.

To check that IIS has been installed successfully, you can direct your browser to http://localhost/ and see the IIS 7 logo.

You can learn more about IIS 7 from this website.

Step 2. Install Confluence

Do a normal Confluence installation, after which you should be able to use confluence as usual through the URL http://localhost:8090.

Step 3. Configure Tomcat

Add another connector to your server.xml file, directly after the existing <Connector ... /> tag:
Step 4. Configure the Tomcat Connector

These instructions are based on the Tomcat Connector, IIS Configuration documentation.

1. Download the isapi_redirect.dll from the apache tomcat download page - click 'browse download area' to search for the file.
   - For example, you will find the win32 binaries here: http://apache.wildit.net.au/tomcat/tomcat-connectors/jk/binaries/win32/ and if the current version is 1.2.27, you will download this file: http://apache.wildit.net.au/tomcat/tomcat-connectors/jk/binaries/win32/jk-1.2.27/isapi_redirect-1.2.27.dll.
   - Make sure you rename the file to isapi_redirect.dll before using it otherwise it will not work.

2. Place the isapi_redirect.dll file in a directory c:\ajp_iis (the name of the directory isn't important, but if you use a different one make sure to take account of this in the instructions which follow)

3. Create a isapi_redirect.properties file in the same directory as you put the DLL. You can use this sample isapi_redirect.properties file if you have used ajp_iis as the directory name.
   - Note that this sample properties file assumes that the dll is named isapi_redirect.dll. If you want to name your DLL something else, you must edit this file.

4. Create workers.properties and uriworkermap.properties files. You can use the sample workers.properties file and the sample uriworkermap.properties file.

5. Create an empty file named rewrites.properties in c:\ajp_iis.

Step 5. Connect Confluence with IIS

Connect Confluence with IIS, depending on your version of IIS:

<Connector port="8009"
enableLookups="false" redirectPort="8443"
protocol="AJP/1.3" URIEncoding="UTF-8" />

Restart Confluence.
In the logs/catalina.YYYY-MM-DD.log file you should see the Jk is running:

INFO: Starting Coyote HTTP/1.1 on http-8090
7/09/2006 14:40:04
org.apache.jk.common.ChannelSocket init
INFO: JK: ajp13 listening on /0.0.0.0:8009
7/09/2006 14:40:04
org.apache.jk.server.JkMain start
INFO: Jk running ID=0 time=0/31&nbsp;config=null
• To connect Confluence with IIS 5.1 or 6 please refer to Connecting Confluence with IIS 5.1 or 6.
• For IIS 7 please refer to Connecting Confluence with IIS 7.

Connecting Confluence with IIS 5.1 or 6

⚠️ The content on this page relates to platforms which are not supported for Confluence. Consequently, Atlassian can not guarantee providing any support for the steps described on this page. Please be aware that this material is provided for your information only and that you use it at your own risk.

This documentation is part of the Setting up Confluence with IIS documentation.

On this page:
• Connecting Confluence with IIS
• Other Configuration
• IIS 6.0
• Troubleshooting

Connecting Confluence with IIS

1. Using the IIS management console (Internet Information Services in Administrative Tools), add a new Virtual Directory to your IIS web site. The name of the virtual directory must be jakarta, as it must correspond with the first part of the extension_uri setting specified in the isapi_redirect.properties file. Its physical path should be the directory where you placed isapi_redirect.dll (in the example it is C:\ajp_iis). When creating this new virtual directory, give it execute access as well.
2. Using the IIS management console, add isapi_redirect.dll as a filter to your IIS web site. To do this, right click on the Web Sites icon from the left hand pane of the Internet Services Manager (or IIS management console), select Properties and then the ISAPI Filters tab. The name of the filter should reflect its task, for example confluence, and its executable must be the full path to the ajp isapi redirector DLL, that is c:\is\isapi_redirect.dll

3. Restart IIS (stop and start the IIS service -- not just the web server -- do this by right-clicking on 'Local Computer' in the IIS Manager and choosing All Tasks, Restart IIS...). Ensure that the confluence filter is marked with a green up arrow verifying that it is loaded and initialized correctly. If the ajp redirector did not initialize properly, check the log file for errors messages (C:\ajp_iis\ajp_plugin.log).

You can now go to http://localhost and see the Confluence Dashboard.

Other Configuration
If you want to run Confluence on a named context, rather than the root context (i.e. access it via http://host/confluence/ instead of just http://host), you need to:

1. Change the path attribute of the Context tag in server.xml from "" to "/confluence".
2. Change the line /*=ajp13w in urierworkermap.properties to /confluence/*=ajp13w.
3. Note that 'http://host/confluence' gives a 404 error, but 'http://host/confluence/' works. You need to create a virtual directory so that requests without the trailing slash still work. If you are using Confluence you would want to name the alias as confluence (if you are using JIRA, name it as jira). The physical directory can be anywhere and does not need to contain anything.

**IIS 6.0**

1. If using IIS 6.0 you will also need to add the Jakarta Isapi Redirector to the Web Service Extension’s.
2. Right-click on Web Service Extensions and choose Add a new Web Service Extension...
3. Enter tomcat for the Extension Name and then add the isapi_redirect.dll file to the required files.
4. Check the Set extension status to Allowed and then click on OK.
5. Also add the Jakarta Isapi Redirector to the ISAPI Filters for the website

**Troubleshooting**

If you have problems, look in the System Event Log, the c:\iis_ajp\ajp_plugin.log and your confluence logs.

When requesting support for IIS configuration problems, please include:

1. A zip of your logs directory
2. A zip of your c:\iis_ajp directory
3. Your conf/server.xml file
5. A screen shot of the ISAPI Filters tab of the Properties window of your 'Web Sites' icon.

**Connecting Confluence with IIS 7**

The content on this page relates to platforms which are not supported for Confluence. Consequently, Atlassian **can not guarantee providing any support for the steps described on this page**. Please be aware that this material is provided for your information only and that you use it at your own risk.

This documentation is part of the [Setting up Confluence with IIS](#) documentation.

On this page:

- [Setting up Confluence with IIS 7](#)
- [Known Issues](#)
  - 64 bit IIS
  - Double Escaped Character
- [Troubleshooting](#)

[Setting up Confluence with IIS 7](#)
After you have installed IIS 7, you need to configure the Tomcat Connector. Then follow these steps:

1. Open IIS 7 Manager
2. Navigate to your host. In the picture below, your host would be the one highlighted in blue just below “Start Page”.

![Internet Information Services (IIS) Manager](image)

3. Double click on the ISAPI and CGI Restrictions icon
4. On the right hand panel, click on Add.... Click here for picture
5. Point the path to your isapi_redirect.dll file and give it a description eg. tomcat. Give it an execute permission by clicking on the Allow extension path to execute tick box.
6. Now, click on the Default Website and double click ISAPI Filter.
7. On the right hand panel, click on Add... and point to your isapi_redirect.dll file, give the filter a name (eg. tomcat)
8. Navigate to your Default Website again.
9. Right click on Default Website to create a virtual directory and name it jakarta, point this to your c:\ajp_iis directory.
10. Click on the newly created virtual directory jakarta and double click Handler Mappings.
11. Click on Edit Feature Permissions and tick the execute permission.

![Edit Feature Permissions](image)

12. Add another virtual directory and name it confluence. Point the physical path to c:\confluence.
13. Set a context path in Confluence's xml configuration. For example, if you are using Confluence distribution you need to edit <confluence install directory>/conf/server.xml and edit your context path to this:

```xml
<Context path="/confluence" docBase="../confluence" debug="0" reloadable="false"/>
```
The reason for creating this virtual directory is so that requests without the trailing slash still work. For example, if you are deploying Confluence under http://www.example.com/confluence/ without the virtual directory, then requests to http://www.example.com/confluence will fail.

14. Finally, navigate to your host context again and do a restart. Confluence should now be accessible via http://localhost/confluence

**Known Issues**

**64 bit IIS**

If you are running a 64 bit OS, please use a [64 bit version of the Tomcat IIS connector](https://docs.confluence.org/display/12955/64+bit+IIS).

**Customer submitted solution:**

If you must use a 32 bit IIS connector, you can do so by clicking Application Pools > Advanced Settings > Allow 32bit applications.

**Double Escaped Character**

IIS 7 blocks double escaped character sequences by default. This will cause problems with Confluence pages with spaces. To fix this, please see [http://support.microsoft.com/kb/942076](http://support.microsoft.com/kb/942076).

**Troubleshooting**

The information in the Windows System Event Log can be useful for troubleshooting, followed by the c:\ajp_iis\ajp_plugin.log and your confluence logs.

When requesting support for IIS configuration problems, please include:

1. A zip of your logs directory
2. A zip of your c:\ajp_iis directory
3. Your conf/server.xml file

Support Policies

Welcome to the support policies index page. Here, you'll find information about how Atlassian Support can help you and how to get in touch with our helpful support engineers. Please choose the relevant page below to find out more.

- Bug Fixing Policy
- How to Report a Security Issue
- New Features Policy
- Patch Policy
- Security Advisory Publishing Policy
- Security Patch Policy
- Severity Levels for Security Issues

To request support from Atlassian, please raise a support issue in our online support system. To do this, visit support.atlassian.com, log in (creating an account if need be) and create an issue under Confluence. Our friendly support engineers will get right back to you with an answer.

Bug Fixing Policy

Summary

- Atlassian Support will help with workarounds and bug reporting.
- Critical bugs will generally be fixed in the next maintenance release.
- Non critical bugs will be scheduled according to a variety of considerations.
Raising a Bug Report

Atlassian Support is eager and happy to help verify bugs — we take pride in it! Please open a support request in our support system providing as much information as possible about how to replicate the problem you are experiencing. We will replicate the bug to verify, then lodge the report for you. We'll also try to construct workarounds if they’re possible.

Customers and plugin developers are also welcome to open bug reports on our issue tracking systems directly. Use http://jira.atlassian.com for the stand-alone products and http://studio.atlassian.com for JIRA Studio and Atlassian OnDemand.

When raising a new bug, you should rate the priority of a bug according to our JIRA usage guidelines. Customers should watch a filed bug in order to receive e-mail notification when a “Fix Version” is scheduled for release.

How Atlassian Approaches Bug Fixing

Maintenance (bug fix) releases come out more frequently than major releases and attempt to target the most critical bugs affecting our customers. The notation for a maintenance release is the final number in the version (i.e. the 1 in 3.0.1).

If a bug is critical (production application down or major malfunction causing business revenue loss or high numbers of staff unable to perform their normal functions) then it will be fixed in the next maintenance release provided that:

- The fix is technically feasible (i.e. it doesn’t require a major architectural change).
- It does not impact the quality or integrity of a product.

For non-critical bugs, the developer assigned to fixing bugs prioritises the non-critical bug according to these factors:

- How many of our supported configurations are affected by the problem.
- Whether there is an effective workaround or patch.
- How difficult the issue is to fix.
- Whether many bugs in one area can be fixed at one time.

The developers responsible for bug fixing also monitor comments on existing bugs and new bugs submitted in JIRA, so you can provide feedback in this way. We give high priority consideration to security issues.

When considering the priority of a non-critical bug we try to determine a ‘value’ score for a bug which takes into account the severity of the bug from the customer’s perspective, how prevalent the bug is and whether roadmap features may render the bug obsolete. We combine this with a complexity score (i.e. how difficult the bug is). These two dimensions are used when developers self serve from the bug pile.

Further reading

See Atlassian Support Offerings for more support-related information.

How to Report a Security Issue

Finding and Reporting a Security Vulnerability

If you find a security bug in the product, please open an issue on http://jira.atlassian.com in the relevant project.

- Set the priority of the bug to 'Blocker'.
- Provide as much information on reproducing the bug as possible.
- Set the security level of the bug to 'Developer and Reporters only'.

All communication about the vulnerability should be performed through JIRA, so that Atlassian can keep track of the issue and get a patch out as soon as possible.
Further reading

See Atlassian Support Offerings for more support-related information.

New Features Policy

Summary

- We do not publish roadmaps.
- Product Managers review our most popular voted issues on a regular basis.
- We schedule features based on a variety of factors.
- Our Atlassian Bug Fixing Policy is distinct from our Feature Request process.
- Atlassian provides consistent updates on the top 20 feature/improvement requests (in our issue tracker systems).

How to Track what Features are Being Implemented

When a new feature or improvement is scheduled, the ‘fix-for’ version will be indicated in the JIRA issue. This happens for the upcoming release only. We maintain roadmaps for more distant releases internally, but because these roadmaps are often pre-empted by changing customer demands, we do not publish them.

How Atlassian Chooses What to Implement

In every major release we aim to implement highly requested features, but it is not the only determining factor. Other factors include:

- Direct feedback from face to face meetings with customers, and through our support and sales channels.
- Availability of staff to implement features.
- Impact of the proposed changes on the application and its underlying architecture.
- How well defined the requested feature is (some issues gain in popularity rapidly, allowing little time to plan their implementation).
- Our long-term strategic vision for the product.

How to Contribute to Feature Development

Influencing Atlassian's release cycle

We encourage our customers to vote on feature requests in JIRA. The current tally of votes is available online in our issue tracking systems, http://jira.atlassian.com and http://studio.atlassian.com. Find out if your improvement request already exists. If it does, please vote for it. If you do not find it, create a new feature or improvement request online.

Extending Atlassian Products

Atlassian products have powerful and flexible extension APIs. If you would like to see a particular feature implemented, it may be possible to develop the feature as a plugin. Documentation regarding the plugin APIs is available. Advice on extending either product may be available on the user mailing-lists, or at Atlassian Answers.

If you require significant customisations, you may wish to get in touch with our partners. They specialise in extending Atlassian products and can do this work for you. If you are interested, please contact us.
See Atlassian Support Offerings for more support-related information.

Patch Policy

Patch Policy

Atlassian will only provide software patches in extremely unusual circumstances. If a problem has been fixed in a newer release of the product, Atlassian will request that you upgrade your instance to fix the issue. If it is deemed necessary to provide a patch, a patch will be provided for the current release and the last maintenance release of the last major version (e.g. JIRA 4.2.4) only.

Patches are issued under the following conditions:

- The bug is critical (production application down or major malfunction causing business revenue loss or high numbers of staff unable to perform their normal functions).
- A patch is technically feasible (i.e., it doesn't require a major architectural change) OR
- The issue is a security issue, and falls under our Security Patch Policy.

Atlassian does not provide patches for non-critical bugs.

Provided that a patch does not impact the quality or integrity of a product, Atlassian will ensure that patches supplied to customers are added to the next maintenance release. Customers should watch a filed bug in order to receive e-mail notification when a "Fix Version" is scheduled for release.

Patches are generally attached to the relevant http://jira.atlassian.com issue.

Further reading

See Atlassian Support Offerings for more support-related information.

Security Advisory Publishing Policy

Publication of Security Advisories

When a security vulnerability in an Atlassian product is discovered and resolved, Atlassian will inform customers through the following mechanisms:

- We will post a security advisory in the latest documentation of the affected product at the same time as releasing a fix for the vulnerability. This applies to all security advisories, including severity levels of critical, high, medium and low.
- We will send a copy of all security advisories to the 'Technical Alerts' mailing list for the product concerned.
  
  Note: To manage your email subscriptions and ensure you are on this list, please go to my.atlassian.com and click 'Email Prefs' near the top right of the page.

- If the person who reported the vulnerability wants to publish an advisory through some other agency, such as CERT, we will assist in the production of that advisory and link to it from our own.

Early warning of critical security vulnerabilities:

- If the vulnerability is rated critical (see our criteria for setting severity levels) we may send an early warning to the 'Technical Alerts' mailing list approximately one week before releasing the fix. This early warning is in addition to the security advisory itself, described above.
- However, if the vulnerability is publicly known or being exploited, we will release the security advisory and patches as soon as possible, potentially without early warning.

Further reading

See Atlassian Support Offerings for more support-related information.
Security Patch Policy

Product Security Patch Policy

Atlassian makes it a priority to ensure that customers' systems cannot be compromised by exploiting vulnerabilities in Atlassian products.

Scope

This page describes when and how we release security patches and security upgrades for our products. It does not describe the whole of disclosure process that we follow. It also excludes JIRA Studio, since JIRA Studio will always be patched by Atlassian without additional notifications.

Critical vulnerabilities

When a Critical security vulnerability is discovered by Atlassian or reported by a third party, Atlassian will do all of the following:

- Issue a new, fixed release for the current version of the affected product as soon as possible, usually in a few days.
- Issue a binary patch for the current release.
- Issue a binary patch for the latest maintenance release of the previous version of the product.
- Patches for older versions or releases normally will not be issued.

Patches will be attached to the relevant JIRA issue. You can use these patches as a "stop-gap" measure until you upgrade your installation in order to fully fix the vulnerability.

Non-critical vulnerabilities

When a security issue of a High, Medium or Low severity is discovered, Atlassian will do all of the following:

- Include the fix into the next scheduled release, both for the current and previous maintenance versions.
- Where practical, provide new versions of plugins or other components of the product that can be upgraded independently.

You should upgrade your installation in order to fix the vulnerability.

Other information

Severity level of vulnerabilities is calculated based on Severity Levels for Security Issues.

Visit our general Atlassian Patch Policy as well.

Examples

Example 1: A critical severity vulnerability is found in a (hypothetical current release) JIRA 5.3.2. The last bugfix release in 5.2.x branch was 5.2.3. In this case, a patch will be created for 5.3.2 and 5.2.3. In addition, new bugfix releases, 5.3.3 and 5.2.4, which are free from this vulnerability, will be created in a few days.

Example 2: A high or medium severity vulnerability is found in the same release as in the previous example. The fix will be included into the currently scheduled releases 5.3.3 and 5.2.4. Release schedule will not be brought forward and no patches will be issued. If the vulnerability is in a plugin module, then a plugin upgrade package may still be supplied.

Further reading

See Atlassian Support Offerings for more support-related information.

Severity Levels for Security Issues
**Severity Levels**

Atlassian security advisories include a severity level. This severity level is based on our self-calculated CVSS score for each specific vulnerability. CVSS is an industry standard vulnerability metric. You can learn more about CVSS at [FIRST.org](http://FIRST.org) web site.

CVSS scores are mapped into the following severity ratings:

- Critical
- High
- Medium
- Low

An approximate mapping guideline is as follows:

<table>
<thead>
<tr>
<th>CVSS score range</th>
<th>Severity in advisory</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 2.9</td>
<td>Low</td>
</tr>
<tr>
<td>3 – 5.9</td>
<td>Medium</td>
</tr>
<tr>
<td>6.0 – 7.9</td>
<td>High</td>
</tr>
<tr>
<td>8.0 – 10.0</td>
<td>Critical</td>
</tr>
</tbody>
</table>

Below is a summary of the factors which illustrate types of vulnerabilities usually resulting in a specific severity level. Please keep in mind that this rating does not take into account details of your installation.

**Severity Level: Critical**

Vulnerabilities that score in the critical range usually have the following characteristics:

- Exploitation of the vulnerability results in root-level compromise of servers or infrastructure devices.
- The information required in order to exploit the vulnerability, such as example code, is widely available to attackers.
- Exploitation is usually straightforward, in the sense that the attacker does not need any special authentication credentials or knowledge about individual victims, and does not need to persuade a target user, for example via social engineering, into performing any special functions.

For critical vulnerabilities, is advised that you patch or upgrade as soon as possible, unless you have other mitigating measures in place. For example, if your installation is not accessible from the Internet, this may be a mitigating factor.

**Severity Level: High**

Vulnerabilities that score in the high range usually have the following characteristics:

- The vulnerability is difficult to exploit.
- Exploitation does not result in elevated privileges.
- Exploitation does not result in a significant data loss.

**Severity Level: Medium**

Vulnerabilities that score in the medium range usually have the following characteristics:

- Denial of service vulnerabilities that are difficult to set up.
- Exploits that require an attacker to reside on the same local network as the victim.
- Vulnerabilities that affect only nonstandard configurations or obscure applications.
- Vulnerabilities that require the attacker to manipulate individual victims via social engineering tactics.
Vulnerabilities where exploitation provides only very limited access.

**Severity Level: Low**

Vulnerabilities in the low range typically have very little impact on an organisation's business. Exploitation of such vulnerabilities usually requires local or physical system access.

See Atlassian Support Offerings for more support-related information.

## Troubleshooting Problems and Requesting Technical Support

This document tells you how to troubleshoot problems in Confluence and how to obtain technical support from Atlassian.

### Troubleshooting a Problem

If you have a problem with Confluence, please follow the steps below.

**To diagnose a problem and search for a solution:**

1. If you are not a Confluence administrator, report your problem to the person in charge of your Confluence site and ask them to follow up on the issue.
2. Use the inbuilt log scanner (see below) to check your Confluence logs for errors and attempt to match them against known issues in our knowledge base and bug tracker.
3. Check our [knowledge base](#) for solutions to known issues.
4. Check our [issue tracker](#) for known bugs.
5. If your problem may be related to a plugin, you can enter [plugin safe mode](#) by temporarily disabling any third party plugins.
6. If you are having problems configuring a feature, please take a look at the appropriate guides:
   - Confluence Installation Guide
   - Confluence Setup Guide
   - Confluence Administrator's Guide
   - Confluence Configuration Guide
   - Database Configuration
7. Check the following guides for troubleshooting specific problems:
   - Issues related to your database server: [Known Issues For Supported Databases](#)
   - Issues related to your application server: [Installing the Confluence EAR-WAR Edition](#)
   - Issues related to user management: [Requesting Support for External User Management](#)
   - Issues related to performance: [Requesting Performance Support](#)
8. If the above tools and documentation do not solve your problem, please create a support request and attach your support zip file. If you believe you have found a bug, you may wish to create a bug report instead. Instructions for both are given below.

### On this page:

- Troubleshooting a Problem
- Scanning your Confluence Logs to Match Known Issues
- Raising a Support Request with a Plugin Author
- Raising a Support Request with Atlassian
  - Method 1: Using the Support Request Form via the Confluence Administration Console
  - Method 2: Raising a Support Request via the Internet
- Creating a Support Zip File via the Confluence Administration Console
- Logging a Bug Report

### Scanning your Confluence Logs to Match Known Issues
Confluence provides an inbuilt log scanner that will check your Confluence logs for errors and attempt to match them against known issues in our knowledge base and bug tracker.

The log scanner is known as Hercules, or the Atlassian support bot. It uses a set of patterns that we have discovered in our knowledge base and issue tracker.

To use the Confluence log scanner:

1. Log in as a user with Confluence Administrator or System Administrator permissions.
2. Choose Browse > Confluence Admin.
3. Click 'Atlassian Support Tools' under 'Administration' in the left-hand panel.
4. Click the 'Log Scanner' tab.
5. Click 'Scan' to scan the Confluence log file in its default location, or change the location if necessary then click 'Scan'.
6. The log scanner will return a list of links, pointing to articles in our knowledge base and/or bug reports in our issue tracker.
   - The latest-reported problems are displayed first. By default only the most recent 10 matches are displayed. If you have more than 10 matches and want to display all results, click the 'Show All' link that appears on the top of the results page.
   - Click a link to read the reported problem and possible solutions or workarounds.

Screenshot above: The log scanner

Raising a Support Request with a Plugin Author

If you have a plugin-related issue, please check whether the plugin is supported by Atlassian or by the plugin developer.

- Visit the plugin's home page in the Atlassian Plugin Exchange.
- Check the 'Supported By' entry under 'Plugin Details' on the right-hand side.
- If the plugin is not supported by Atlassian, you will need to contact the plugin author directly.

You can read more about Atlassian support for plugins.

Raising a Support Request with Atlassian

There are two ways to raise a support request with Atlassian:

- **Method 1:** (Recommended) Complete the support request form via your Confluence Administration Console, as described [below](#). A possible problem with this method is that your mail may not be forwarded correctly, due to restrictions imposed by your mail server. For example, the zip of your log files might be too large for your mail server to forward.
- **Method 2:** Raise a support request via our support site on the Internet, as described [below](#). Create a support zip file via your Confluence Administration Console, as described [below](#), and attach the zip file to
Method 1: Using the Support Request Form via the Confluence Administration Console

The advantage of this method is that it is convenient. The disadvantage is that your mail may not be forwarded correctly due to a problem (for example, the zip file is too large) or due to a security restriction on your mail server.

You can also use this method to append system information to an existing support request.

To submit a support request via the Confluence Administration Console:

1. Log in as a user with Confluence Administrator or System Administrator permissions.
2. Choose Browse > Confluence Admin.
3. Make sure that SMTP email is set up on your Confluence site and your mail server allows zip files.
4. Click 'Atlassian Support Tools' under 'Administration' in the left-hand panel.
5. Click the 'Support Request' tab.
6. Provide as much information as possible, following these guidelines:
   - 'Contact Email' – This will default to the email address of the logged-in user.
     Note: This email address will be used to find your support account on the Atlassian Support System. If no matching account is found, a new account will be created. Confluence will also send all further notifications and updates to this address.
   - 'Summary' – Enter a short and meaningful description of the problem.
   - 'Description' – Enter as much information as possible, including any error messages that are appearing and any steps the support team can take to reproduce the problem.
7. In the section titled 'Support Data to Attach', select the types of additional information you would like to be included in a zip file that will be attached to your support request.
8. Click the 'Send' button.
9. Confluence will submit your request via email to the Atlassian support site. If you do not already have a support account, Confluence will automatically request one for you. The submitted request will include all the system and environment information which you see on the support request form. It will also include a zipped copy of your Confluence log file. Refer to Working with Confluence Logs for information about the log files.
   Log files can be very big. It is possible that your email server may bounce the message if it is too large. With the default log4j configuration, the log file could be up to 20Mb in size. If you have customised the log settings, the maximum size could be even larger. Please check whether the email message has been successfully sent, and consult your email administrator if you need special provisions for this email message.
10. Once you have submitted your support request, you will receive email updates about its progress. These emails will give you the support request number.

You can view the status of your support request and add any additional information required by visiting the Atlassian Support System at any time.
Method 2 Raising a Support Request via the Internet

If your Confluence instance is not configured with SMTP mail or your Confluence instance is not running, you can raise a support request via the Internet.

To raise a support request via the Internet:

1. If you do not already have a free Atlassian support account, create one here.
2. Log in to https://support.atlassian.com and select ‘Create New Issue’.
3. Lodge a detailed description of your problem in the new support request.
4. Fill in all applicable information about your system, such as application server, database, etc.
5. If Confluence is running, go to the 'System Information' screen in your Administration Console and copy the text of your system information into the request.
6. Create a support zip file, as described below to attach to the request. If your instance does not start up, refer to Working with Confluence Logs for information about the log files.
7. If your problem concerns user management or performance, please take a look at the additional requirements in Requesting Support for External User Management or Requesting Performance Support.
8. Once your request is lodged, wait to be notified by email of updates.

Creating a Support Zip File via the Confluence Administration Console

We recommend that you attach a support zip file to every interaction with the Atlassian support team. You can use this method to append system information to an existing support request. The tool described below will also dump your system information to the logs before zipping them.

To create a support zip file via the Confluence Administration Console:
1. Log in as a user with System Administrator or Confluence Administrator permissions.
2. Go to the Administration Console and click ‘Atlassian Support Tools’ under ‘Administration’ in the left-hand panel. Click ‘Support Zip’. Ensure that everything is checked, then click the ‘Create’ button.
3. Confluence will create the support zip file and display its location on the screen. Log in to the Confluence server to retrieve the file.
4. Attach the zip file to the support case you raised on our support system, as described above.

Screenshot above: Creating a support zip file

Logging a Bug Report

If you have found a bug, the easiest way to report it is to:

- Create numbered instructions on how to reproduce the bug.
- Log it as a support request, as described above.
- The Atlassian support team will confirm your bug and lodge a bug report.

Alternatively, you can check to see if anyone else has reported the bug, then log a bug report yourself.

To log a bug report:

1. Go to the Confluence issue tracker.
2. Type keywords for your problem into the search box on the left under ‘Query’.
3. Click ‘Search’ to find any existing bug reports that match your problem.
4. Read through the summaries of the bugs shown. If any summary describes your problem, you may wish to set a watch to be notified of updates.
5. If there are no existing bug reports that match your problem, log the new bug in the issue tracker. Include information on how to duplicate the problem.
6. Sometimes it may be useful to include the result of the 500 error page, which you will find at this location:

   https://<domain><host>:<port>/500page.jsp

7. Once your issue is lodged, wait to be notified by email of updates.

### Content Anonymiser for Data Backups

Atlassian may request a copy of the entities.xml file from a customer's exported zip file (backup file), in order to diagnose database corruption or to find a bug in Confluence.

If your data is confidential, you can run an anonymiser program over your entities.xml file to remove all your data and leaving only the structure of the export.

**Usage**

To run the Content Anonymiser on your backup file:

1. Download the [anonymiser JAR](attached to this page).
2. Extract the entities.xml file from your zipped backup file to the same directory as the JAR.
3. Use the command prompt to go to the directory where all three files are located.
4. To create cleaned.xml, run the command

   ```
   java -jar confluence-export-cleaner-1.1-jar-with-dependencies.jar entities.xml cleaned.xml
   ```

5. Re-ZIP cleaned.xml with its exportDescriptor.properties to ensure we (eg. Atlassian Support) knows exactly which version of Confluence does the XML backup exported from.

**How it works**

The Content Anonymiser program replaces all the text content in file entities.xml with ‘x’ characters. For example, the word "Atlassian" will be transformed to "xxxxxxxxxx". The resulting cleaned.xml file is expected to have the same size as the original file.

This release of the Content Anonymiser uses STX, a fast and efficient XML transformation technology. It should not require a lot of memory to run, even for a large backup.

**Development**

For Atlassian developers:

- [Source code](#).
- [Maven repository](#).

### Enabling Detailed SQL Logging

Confluence uses the open source persistence framework [Hibernate](#). This page tells you how to configure Confluence’s logging to report individual SQL requests that are sent to the database by Hibernate. It is useful for troubleshooting the following events:

- [XML site backups](#) that fail to import.
- Exceptions caused by an illegal database operation.

### Enable SQL logging via the Administration Console

Since the 2.7 release, you can also enable SQL logging at runtime via the Administration Console — read the [instructions](#). This runtime option does not allow you to enable logging of SQL parameter values.

To enable detailed SQL logging in Confluence, you need to modify `log4j.properties`, located in `confluence/WEB-INF/classes`.

After you have enabled hibernate logging, please replicate the action that is causing the error in the first place. This is the best way to ensure that the Confluence log file contains relevant SQL logging.

If you require support assistance with a database related problem, it is advisable to enable detailed SQL logging before sending us the log files. This will assist us in determining what SQL queries were running during the reported problem.

If the entries mentioned below are not defined in the `log4j.properties` file, you can manually add the entries to the file in the 'Hibernate Logging' section.

### To Log SQL Queries

Stop Confluence, then change the following lines in `log4j.properties` from `ERROR` to `DEBUG`:

```text
## log hibernate prepared statements/SQL queries (equivalent to setting 'hibernate.show_sql' to 'true')
## DEBUG, TRACE or ALL is required to see query strings
log4j.logger.net.sf.hibernate.SQL=DEBUG
```

### To Log SQL Queries with Parameters

1. Stop Confluence
2. Uncomment the following lines in `log4j.properties`:

```text
## log hibernate prepared statement parameter values. Note: due to caching in net.sf.hibernate.type.NullableType, requires restart to take effect
## TRACE or ALL is required to see parameter values
## Note that log4j.appender.confluencelog.Threshold (or other appenders) also must be TRACE or ALL to see any trace messages in the logs
log4j.logger.net.sf.hibernate.type=TRACE
```

3. Change the following lines in `log4j.properties` from `DEBUG` to `TRACE`:
4. Restart Confluence

This needs to be done along with the changes to log SQL queries above (whether by the UI or by modifying the properties file).

To Disable Batched Updates for Simpler Debugging

Stop Confluence, then edit databaseSubsystemContext.xml:

- In Confluence 2.5.x and earlier, the databaseSubsystemContext.xml file is at confluence/WEB-INF/classes/databaseSubsystemContext.xml
- From Confluence 2.6.x, the databaseSubsystemContext.xml file is available in the confluence-2.6.0.jar file located in the <confluence-install>/WEB-INF/lib directory.

Uncomment the <prop> line in the following location:

```xml
<!-- it can be useful to disable batching during debugging, as HSQLDB doesn't report the exact statement which fails in batch mode -->
<prop key="hibernate.jdbc.batch_size">0</prop>
```

Generating a Heap Dump

Sometimes you may see that Confluence is holding onto a chunk of memory over a period of time (for example, tenured space is increasing close to Xmx). In such a situation, it is useful to find out what is stacking up in the memory by analysing the heap dump.

On this page:

- Automatically Generating a Heap Dump when Confluence Hits OutOfMemory Error
- Manually Generating a Heap Dump when Confluence Stops Responding
- Submitting a Heap Dump to Atlassian Support

Tips when getting a heap dump

If you have a large Xmx size, please limit your Xmx size to 1024m. This will help to keep Confluence heap dump smaller while still containing sufficient information to analyse it.

Automatically Generating a Heap Dump when Confluence Hits OutOfMemory Error
Typically, we would like to analyse the heap dump produced when Confluence died from an OutOfMemory Error. For this, you can add additional JVM parameters like below:

-XX:+HeapDumpOnOutOfMemoryError
-XX:HeapDumpPath=<path to this heap dump file>

If you do not set the HeapDumpPath parameter, by default the heap dump will be saved in the folder where Tomcat is run from.

Manually Generating a Heap Dump when Confluence Stops Responding

It is also possible to get a heap dump manually using a JDK bundled tool called `jmap`, although we recommend that you use the automatic method above for best result.

For Linux/Solaris-based Operating Systems:
Please execute the following command on Linux OS:

$JAVA_HOME/bin/jmap
-dump:format=b,file=heap.bin <pid>

For Windows:
Please find your Confluence process ID (see below) and then execute the command below on a Windows command line:

%JAVA_HOME%/bin/jmap
-dump:format=b,file=heap.bin <pid>

To find out the process ID for your Java process in Windows, you can use Process Explorer from Microsoft. This is what it looks like:

Using Process Explorer to find your Tomcat process ID
Confluence 4.2 Documentation

Tomcat run from startup.bat script  Tomcat run as Windows Service

Submitting a Heap Dump to Atlassian Support

Please zip the file and then send it to Atlassian Support.

RELATED TOPICS

- [Getting Java Crash Log File](#)

- Generating a Thread Dump
- Fix Out of Memory Errors by Increasing Available Memory

Generating a Thread Dump

- [Stack Traces and Security](#)
- Method 1: Generating a Thread Dump Externally
- Method 2: Generating a Thread Dump via the Administration Console

If Confluence is performing poorly, behaving unexpectedly or stops responding and you can generate a thread dump to help diagnose the cause of the problem. Furthermore, if you wish to contact Atlassian Support for assistance about it, you should include a thread dump in your support enquiry to help the Support team determine the cause of the problem.

A thread dump will show the state of each thread in the JVM, including a stack trace. Thread dumps are only useful if they are taken at the appropriate time. They normally need to be taken at or close to the time when the application is experiencing problems.

Information about what locks are being held and waited upon by a thread are not produced by Confluence's Thread Dump tool. If you require this information, then generate a thread dump externally.

Stack Traces and Security

To help debug support cases and provide legendary support, Confluence provides stack traces through the web interface when an error occurs. These stack traces include information about what Confluence was doing at the time, and some information about your deployment server.

Only non-personal information is supplied such as operating system and version and Java version. With proper network security, this is not enough information to be considered dangerous. No usernames or passwords are included.

Method 1: Generating a Thread Dump Externally

If Confluence stops responding or you require information on locks being held and waited upon by threads, then use one of methods described in Generating a Thread Dump Externally.

Atlassian support may ask you to use this method if a thread dump generated using method 2 does not include enough information to diagnose the problem.

Method 2: Generating a Thread Dump via the Administration Console

⚠️ For Confluence 2.10.3 or below

This feature was introduced in Confluence 3.0. If you are using a prior version then please consult this documentation on Generating a Thread Dump Externally.

To generate a Thread Dump from the Administration Console,

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
1. Choose **Browse > Confluence Admin**.
2. Select 'Thread Dump' in the left-hand panel.
3. Click the 'Generate Now' button in the centre of the page. The output is displayed in a new text box that appears just below the button.
4. Copy the contents of the thread dump in the text box and save it to a text file.

**Screenshot: Example of a generated thread dump from the Confluence administration console**

### Scheduling Thread Dumps via the Administration Console

If you were asked by Atlassian Technical Support to generate regular thread dumps, please set the Thread Dump Scheduler to take 2 to 3 thread dumps with a 30 seconds time interval in between so the Support team can observe any important patterns that may assist with the diagnosis of the problem. Attach the log file to the support ticket.

**Example: Scheduling thread dumps from the Confluence administration console**

### Generating a Thread Dump Externally

If Confluence stops responding and you cannot access its integrated Generate Thread Dump feature, it is possible to create thread dumps outside the application. External thread dumps are also useful if you require information on locks being held or waited upon by threads.
Take Multiple Thread Dumps

Typically you'll want to take several dumps about 10 seconds apart, in which case you can generate several dumps and output the stack traces to a single file as follows:

**Generating a Thread Dump on Linux, including Solaris and other Unixes**

1. Identify the `java` process that Confluence is running in. This can be achieved by running a command similar to:
   
   ```bash
   ps -ef | grep java.
   ```

2. Find the process ID of the JVM and use the `ps` command to get list of all processes:
   
   ```bash
   kill -3 <pid>
   ```
   
   This will not kill your server (so long as you included the "-3" option, no space in between).

   The thread dump will be printed to Confluence’s standard output (catalina.out).

**Generating Thread Dumps on Windows**

From the console

If you are running Confluence through a console, rather than as a service, you can click on the console and press `CTRL+BREAK` or use `jstack`:

Using `jstack`

The JDK ships with a tool named `jstack` for generating thread dumps.

1. Identify the process. Launch the task manager by pressing `Ctrl + Shift + Esc` and find the Process ID of the Java (Confluence) process. You may need to add the PID column using `View -> Select Columns` ...

2. Run `jstack <pid>` to Capture a Single Thread Dump. This command will take one thread dump of the process id `<pid>`, in this case the pid is 22668:

   ```bash
   adam@track:~$ jstack -l 22668 > threaddump.txt
   ```

   This will output a file called `threaddump.txt` to your current directory.

**Common issues with jstack:**

- You must run jstack as the same user that is running Confluence
- If the jstack executable is not in your $PATH, then please look for it in your <JDK_HOME>/bin directory
- If you receive `java.lang.NoClassDefFoundError: sun/tools/jstack/JStack` check that `tools.jar` is present in your JDK’s `lib` directory. If it is not, download a full version of the JDK.
Output

Standard logging for Confluence Stand-alone is sent to the `atlassian-confluence.log`, in the confluence-home directory, not in the confluence-install directory. Thread dumps are an exception since they dump the threads of the entire application server - they'll appear in the catalina.out file in the application directory's logs folder. You can search for the term "thread dump" in the log file for the beginning of the dump. Submit this along with the atlassian-confluence.log in your support ticket.

Thread Dump Analysis Tools

- **Samurai**
- **Thread Dump Analyzer TDA** TDA 1.0 Final can be obtained from the java.net

Getting Java Crash Log File

If you discovered that Confluence died without manual intervention, there may be something goes wrong during a local Java session. Java will produce a log file that looks like the following: `hs_err_pid20929.log`.

The location of this log file is usually in the directory where Tomcat is run eg. `/bin` folder. For Windows Services, it should be located in where Windows Services are run, eg. `c:\Windows\System32` if you are on 32 bit.

Useful VM Option

If using Java 6, it’s possible to define the path to the `hs_err_pid` file.

Add the following JVM Parameter to your existing ones:

```
-XX:ErrorFile=./hs_err_pid<pid>.log
```

RELEVANT TOPICS

- Generating a Heap Dump
- Java Crashes
- Profiling using the YourKit Plugin

There is a plugin for Confluence 2.2 and later which allows easy profiling using the [YourKit profiler](https://www.yourkit.com). No license is required to generate a memory or CPU snapshot, but you will need at least an evaluation license to analyse the results.

On this page:

- **Configuring YourKit in your JVM**
  - Windows Configuration
  - Linux/Mac OS X Configuration
- **Performance Impact**
- **Installing the YourKit Plugin**
- **Why would I do this?**
- **Plugin Source Code**

Configuring YourKit in your JVM

Download [YourKit 6.0](https://www.yourkit.com) for your platform and follow the installation instructions to install it.

⚠️ Note: YourKit version 7 is not compatible with the Confluence yourkit plugin.
The following instructions apply to Confluence and Tomcat installations with the Oracle (previously Sun) JDK. They should be easily applicable to other application servers and JVMs, however. The YourKit documentation covers this in more detail.

**Windows Configuration**

On Windows, add to your PATH environment variable the bin/win32/ directory underneath the YourKit installation directory. For example, you might add "C:\Program Files\YourKit Java Profiler 6.0.12\bin\win32" to your PATH, via Control Panel, System, Advanced, Environment Variables.

To configure Confluence's JVM to use the YourKit agent, you need to add a parameter to JAVA_OPTS in the bin/setenv.bat file in your Confluence application directory. This file controls the startup parameters for Tomcat, so you'll need to restart it after making the changes.

Add the 'agentlib' parameter to the end like this:

```
set JAVA_OPTS=%JAVA_OPTS% -Xms128m -Xmx256m -agentlib:yjpagent
```

**Linux/Mac OS X Configuration**

On Unix-based systems, include the installation directory in the library path environment variable, as shown below:

- For the Mac: `export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:/path/to/yourKitAgent`
- For other Unix-based systems:`export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/path/to/yourKitAgent`

In general, to configure the JDK, you add the `agentlib` parameter:

```
java -agentlib:yjpagent ...
```

You can add this to Tomcat's bin/setenv.sh like this:

```
JAVA_OPTS="-Xms128m -Xmx256m $JAVA_OPTS -Djava.awt.headless=true -agentlib:yjpagent "
```

**Performance Impact**

Running YourKit can have detrimental effects on performance.

To minimize performance problems use the following modifications to the agentlib parameter:
See also [Profiling overhead: how to reduce or avoid](https://yourkit.com/docs/profiling.html) in the YourKit documentation.

### Installing the YourKit Plugin

Download the plugin and upload it into Confluence through the Administration, Plugins page.

A new menu option will appear under the 'Administration' heading. Click it and you should see the options to take a memory or CPU snapshot.

This profiler dump will be saved to a local temp directory, and the path shown once it is complete. For the CPU snapshot, this will take at least 30 seconds. For the memory snapshot, 10-15 seconds.

### Why would I do this?

Analysing a profiler dump enables Atlassian Support (or you, if you are interested) to see exactly what is happening in your application: what classes are using the memory, what is using CPU and so on. This can help us debug tricky performance problems which would otherwise be impossible to analyse remotely.

Take a CPU snapshot if:

- Confluence is sometimes unresponsive
- Pages take a long time to load
- Confluence's CPU usage is peaking.
Take a memory snapshot if:

- Confluence's memory usage is higher than you expect
- You are getting OutOfMemoryError's in your logs.

If you run into situations where Confluence is unresponsive and you are not able to trigger a memory snapshot, please ensure that you start Confluence with the `onexit=memory` parameter in the JVM options (as in the example below) and simply shut down Confluence. Before shutting down a memory snapshot will be created.

```
-agentlib:yjpagent=onexit=memory
```

Plugin Source Code

The source code for this Confluence plugin is available from Subversion and browseable in Fisheye. The JAR produced by 'mvn package' includes a copy of the YJP redistributable bundled in META-INF/lib/.

**Trying Confluence in a Demonstration Site or Demo Space**

Atlassian have set up a demonstration Confluence site called the [Confluence Sandbox](#) so that you can try out Confluence for yourself.

The Confluence Sandbox has been configured so that anyone can create or edit pages within it. When using it, you should keep the following in mind:

• This server may not be running exactly the same version of Confluence as is available for purchase. While we try to keep the two in sync, there may be differences between the Confluence Sandbox and the downloadable version of Confluence. The version that the Confluence Sandbox is running can be found at the bottom of each page.

• Because the Confluence Sandbox is open for anyone to edit, Atlassian cannot be responsible for the content on it. Do not rely on anything you read in the sandbox.

• The contents of the Confluence Sandbox may be edited or deleted at any time. Atlassian will restore the Confluence Sandbox from backup periodically (usually every night), deleting everything that visitors have been added to it.

• The Confluence Sandbox contains a [demonstration space](#) with a tutorial and some sample content.

For a full demonstration of Confluence, including its administrative features, you should download and install an evaluation version of Confluence instead.

• Get an evaluation version from our [download site](#).

• Once you have set up your evaluation installation, you will see a [demonstration space](#) (with a space key of ‘DS’) in your Confluence site. This is your own version of the demo space, including a tutorial and some sample content.

• If you have any questions, [contact us](#) and we will be happy to answer them.

---

Local Confluence Documentation

This page tells you how to set up a copy of the Confluence documentation on your own local Confluence site.

On this page:

- Reasons for Setting up your own Local Documentation
- Setting up your Local Online Documentation
  - Additional Documentation Spaces Required
- Redirecting Confluence's Help Links to your Local Documentation
  - Changing the Base URL for your Help Links
  - Changing the Links for Individual Help Pages
  - Example of the Help Property File
  - Example of a Help Link
  - More Notes about Help Links

Reasons for Setting up your own Local Documentation

You may wish to run the documentation locally. In addition, you may want to point Confluence's links at your local documentation.

- If you are working in an environment without an internet connection, you will need a local copy of the documentation.
- If you have customised Confluence, you may wish to update the documentation to reflect your changes.
- You may want to change the look and feel of the documentation to integrate into your company's intranet.
- Confluence's interface contains links to help pages in the online documentation on confluence.atlassian.com. You may wish to point these help links to a different destination. Possible reasons include:
  - You want to point the help links to a destination behind your firewall.
  - You may want to link to a translated version of the documentation.

Setting up your Local Online Documentation

To set up your own Confluence site with a copy of our Confluence documentation:

1. Install [Atlassian Confluence](https://confluence.atlassian.com), if you have not already installed it. (If you do not already have Confluence, ask for a free [evaluation license](https://confluence.atlassian.com/doc/evaluation-license) or a [starter license](https://confluence.atlassian.com/doc/starter-license). You can use ‘Anonymous’ access to allow your users to view the documentation.)

2. Download the [XML source code for the Confluence documentation](https://confluence.atlassian.com/doc/XML-source-code-for-The-Atlassian-Confluence-Documentation). Note that the Confluence version of the XML source needs to be the same major Confluence version as your local Confluence site. For example, if the Confluence version in the XML is 3.0, you can import it into a Confluence site running version 3.0, 3.0.1 or 3.0.2. But you cannot import it into Confluence 2.9 nor into Confluence 3.1.

3. Import the XML file into your Confluence site. This will create a new space with key 'DOC'. **Note:** If there is already a 'DOC' space in your Confluence site, it will be overwritten. For detailed instructions, see the Confluence documentation on [Restoring a Space](https://confluence.atlassian.com/doc/restoring-a-space).

4. Remove or adjust the customised header, footer and left-hand navigation bar in your new space. **Explanation:** When you create your new space from our XML source code, the space will inherit the Confluence 'Documentation' theme. The XML source code also includes the customisations we have made to the header, footer and left-hand navigation bar. These customisations include references to our [Atlassian Documentation](https://confluence.atlassian.com) space. Since your Confluence site does not have that space, you will see errors like this in the left-hand navigation bar, header and footer in your new space:

   ```
   Unable to render {include} Couldn't find a space with key: ALLDOC
   ```

   To fix these errors, take one of the following steps:
   - Customise the navigation, header and footer sections to suit your Confluence site or environment. See our documentation on [configuring the Documentation theme](https://confluence.atlassian.com/doc/configuring-the-documentation-theme).
   - Or restore the default left-hand navigation bar, by removing all content from the navigation, header and footer sections and selecting the ‘Page Tree’ check box. See our documentation on [configuring the Document](https://confluence.atlassian.com/doc/configuring-the-documentation-theme).
   - Or change the theme of your space to the Confluence default theme or another theme of your choice.

5. Download the XML source code for the additional documentation spaces listed below and import them into your Confluence site too.

6. *(Optional)* Follow the steps in the next section if you want to redirect Confluence's help links to point to your local documentation.

Additional Documentation Spaces Required

**Why You Need the Additional Documentation Spaces**

The Confluence documentation shares some content with other Atlassian products, such as JIRA. For the sake of efficiency, we reuse the same content across documentation spaces. You will notice that some of our pages contain an {include} macro that draws in content from another space.

For example, the following macro includes content from the Application Links (APPLINKS) space into the Confluence documentation space:

```
{include:APPLINKS:_securityTrustedApps}
```

You will need to import those documentation spaces into your Confluence site, to ensure that the reused content is accessible in your Confluence documentation.

**Determining the Version Required**
We supply different versions of the documentation, for each version of the software or plugin concerned. To see which version you need, take a look at the space key in the (include) macro concerned.

- If the space key has a number at the end, that number indicates the version. For example, 012 means version 1.2, and 011 means version 1.1.
- If the space key does not include a number, you need the latest version of the documentation.

Here is an example of an include macro that requires version 1.2 of the Application Links documentation:

```
{include:APPLINKS012:_securityTrustedApps}
```

This example requires the latest version of the Application Links documentation:

```
{include:APPLINKS:_securityTrustedApps}
```

**List of Spaces Required**

Retrieve the relevant version of the XML backups from these pages:

- Application Links
- Universal Plugin Manager
- User Management

**Redirecting Confluence's Help Links to your Local Documentation**

In some parts of the Confluence user interface, you will see hyperlinks that point to the documentation for detailed information. These hyperlinks are Confluence's help links. You can redirect Confluence's help links to point to your local documentation.

There are two types of configuration changes you can make to the help property file:

- Change the base URL that determines the destination website of all your help links.
- Change the page name for each individual help link.

**Changing the Base URL for your Help Links**

You can set the base URL via the Confluence Administration Console.

**To change the base URL for your help links:**

1. Choose **Browse > Confluence Admin**.
2. Click 'General Configuration' in the left-hand navigation bar.
3. Click 'Edit'.
4. Change the 'Documentation Url Pattern' to determine the destination website for all your help links. This value forms the first part of the destination URL. For example, if you want to point your help links the 'DOC' space in your local Confluence site, your URL prefix will look like this:

   ```
   help.prefix=http://confluence.mycompany.com/display/DOC/
   ```

   In addition, you can use the following special characters in the URL:
• {0} – Optional. This value will be replaced with the version of Confluence running on your site.
• {1} – Optional. This value will be replaced with the page name from the configuration file.

Changing the Links for Individual Help Pages

If necessary, you can also change the individual page names to point to specific pages in your local documentation. You may want to do this if you are using a translated version of the documentation, for example, or your own custom guide rather than a copy of the Atlassian documentation.

The help links are contained in a property file. In summary, you will need to do the following:

• Make a copy of the property file that Confluence uses to control the help links.
• Place the copy in a given directory where it will override the default property file.
• Update the copy with your own values.

To change the destination of your Confluence help links:

1. Copy the confluence-x.x.x.jar file from your \{CONFLUENCE-INSTALLATION}\confluence\WEB-INF\lib directory and place it in a temporary location.  
   Note: Do not remove the JAR, just make a copy of it.
2. Unzip the confluence-x.x.x.jar file into your temporary location and copy the help-paths.properties file.
3. Put the copy of the help-paths.properties file into your \{CONFLUENCE-INSTALLATION}\confluence\WEB-INF\classes directory.  
   Note: The property file will override the file in the JAR.
5. Change the individual page names to point to specific pages in your local documentation. In our example file below, the first key-value pair looks like this:

   help.restore.site=Restoring+a+site

You could change it to something like this:

   help.restore.site=My+page+about+Restoring+Confluence

Example of the Help Property File

Below is an example of part of the Confluence help-paths.properties file.
help.prefix=http://docs.atlassian.com/confluence/docs-{0}/{1}

## Page Names
help.restore.site=Restoring+a+site
help.manually.backup.site=Manually+Backing+Up+The+Site
help.configure.server.URL=Configuring+the+Server+Base+URL
help.configure.time.date.format=Configuring+Time+and+Date+Formats
help.edit.user.details=Editing+User+Details

The first line (help.prefix) shows the destination website of the help links. This value forms the first part of the destination URL.

- {0} – Optional. This value will be replaced with the version of Confluence running on your site.
- {1} – Optional. This value will be replaced with the page name from the configuration file.

Below the description '## Page Names' there are a number of key-value pairs.

- The key (such as help.restore.site) is an identifier used by Confluence to find the help link for a specific screen or dialogue.
- The page name (such as Restoring+a+site) is the URL-encoded page name that forms the last part of the destination URL.

### Example of a Help Link

Here is an example of a Confluence screen with two help links, one on the words 'our online documentation' and another on 'More about daily backups':

Screenshot: Example of help links in Confluence
More Notes about Help Links

- The ability to configure the destination of the help links is available only in Confluence 3.3.x and later.
- Make sure that you keep all the key-value pairs for the page names in the help-paths.properties file. If you want to point them all to the same location, you should retain all the keys and replace all the page names with the same name. For example:

```
help.prefix=http://myguide.mycompany.com

## Page Names
help.restore.site=My+guide
help.manually.backup.site=My+guide
help.configure.server.URL=My+guide
help.configure.time.date.format=My+guide
help.edit.user.details=My+guide
```

- In the above instructions on configuring help links, we assume that you want to host your local documentation on your own Confluence site. Instead, you could choose to point the Confluence help links to an entirely different set of documentation, on a website or intranet. After reading through the instructions above, you will have an idea of how to adapt them for your own purposes.
- The help-paths.properties file is currently in the confluence-x.x.x.jar in the WEB-INF/lib directory. Instead, it should be a config file in the WEB-INF/classes directory. This will make it easy for people to change the values in the file and repoint their help links. It will also standardize the help design with that of JIRA and other Atlassian applications. This issue is tracked at CONF-20105.

Confluence SharePoint Connector

- Latest version of the Confluence SharePoint Connector

Confluence SharePoint Connector 1.5.2 has now been released. See the SharePoint Connector 1.5.2 Release Notes.

With the Confluence SharePoint Connector you can combine Confluence's free-form, easy to edit wiki with the document management and workflow strengths of SharePoint.

- Display SharePoint document libraries, calendars, links, discussions and more on your Confluence wiki
pages. Edit SharePoint's Office documents directly from Confluence and save them back to SharePoint.
- Embed Confluence pages and Confluence page trees into a SharePoint page. Click through from SharePoint to Confluence.
- Enjoy automatic login (single sign-on) between Confluence and SharePoint.
- Search Confluence and SharePoint content together, retrieving a unified set of results.

Please refer to the SharePoint Connector documentation for more information.

Contributing to the Confluence Documentation

Would you like to share your Confluence hints, tips and techniques with us and with other Confluence users? We welcome your contributions.

On this page:
- Tweeting your Hints and Tips – Tips via Twitter

Tweeting your Hints and Tips – Tips via Twitter

Do you have hints and tips about Confluence wiki to share with the world? Even more, would you like to see your tips appear on a page in the Atlassian documentation? Just tweet with the hash tag "#ConfluenceTips" and see your hint appear in our documentation. Then grab a badge for your blog! More...

Blogging your Technical Tips and Guides – Tips of the Trade

Have you written a blog post describing a specific configuration of Confluence or a neat trick that you have discovered? Let us know, and we will link to your blog from our documentation. More...

Contributing Documentation in Other Languages

Have you written a guide to Confluence in a language other than English, or translated one of our guides? Let us know, and we will link to your guide from our documentation. More...

Updating the Documentation Itself

Have you found a mistake in the documentation, or do you have a small addition that would be so easy to add yourself rather than asking us to do it? You can update the documentation page directly.

Getting Permission to Update the Documentation

Please submit the Atlassian Contributor License Agreement.

Our Style Guide

Please read our short guidelines for authors.

How we Manage Community Updates

Here is a quick guide to how we manage community contributions to our documentation and the copyright that applies to the documentation:
• **Monitoring by technical writers.** The Atlassian technical writers monitor the updates to the documentation spaces, using RSS feeds and watching the spaces. If someone makes an update that needs some attention from us, we will make the necessary changes.

• **Wiki permissions.** We use wiki permissions to determine who can edit the documentation spaces. We ask people to sign the [Atlassian Contributor License Agreement](https://confluence.license) (ACLA) and submit it to us. That allows us to verify that the applicant is a real person. Then we give them permission to update the documentation.

• **Copyright.** The Atlassian documentation is published under a Creative Commons CC BY license. Specifically, we use a [Creative Commons Attribution 2.5 Australia License](https://creativecommons.org/licenses/by/2.5/au/). This means that anyone can copy, distribute and adapt our documentation provided they acknowledge the source of the documentation. The CC BY license is shown in the footer of every page, so that anyone who contributes to our documentation knows that their contribution falls under the same copyright.

**Tips of the Trade**

Below are some links to external blog posts, videos and articles containing technical tips and instructions on setting up and using Confluence. This page presents an opportunity for customers and community authors to share information and experiences.

The references here are specific to Confluence wiki and are technical 'how to' guides written by bloggers who use Confluence. For general information on wiki comparisons, wiki adoption, best practices and business cases, please refer to the [Atlassian website](https://confluence.license) and to our [evaluator resources](https://confluence.license).

⚠️ **Please be aware that these are external blogs and articles.**

Most of the links point to external sites, and some of the information is relevant to a specific release of Confluence. Atlassian provides these links because the information is useful and relevant at the time it was written. Please check carefully whether the information is still relevant when you read it, and whether it is relevant to your version of Confluence. **Unless explicitly stated,** Atlassian does not offer support for third-party extensions or plugins. The information in the linked blog posts has not been tested or reviewed by Atlassian. We recommend that you test all solutions on a **test** server before trying them on your production site.

Tips via Twitter

This page displays a continuously-updated list of tweets from Atlassians and others, giving hints and tips about Confluence wiki. Anyone can write a tip and have it show on this page. The live Twitter stream shows recent tweets containing the word 'ConfluenceTips'or the tag '#ConfluenceTips'. We also include tweets from or to '@ConfluenceTips'.

Want to join in? Just tweet with the word '#ConfluenceTips' somewhere in the text. Then grab a badge for your blog. 😊

- Viewing the Tweets in Twitter
- Adding a Confluence Tweets Badge to your Blog
• Adding your own Tip

⚠️ Please be aware that anyone can tweet anything.

Atlassian does not monitor the tips in this Twitter stream. Anyone can tweet anything they like. We display these tips because we believe most people will do the right thing and tweet good tweets. Please check that a tweet is relevant to you before following its advice.

Viewing the Tweets in Twitter

If you prefer, you can view the search in Twitter itself.

Adding a Confluence Tweets Badge to your Blog

Would you like to let other people know that you tweet your Confluence tips? Use the code samples below to add a badge to your blog or another social site.

Choose one of these options to add the badge:

• Badge only
  Copy the code below and paste it into your blog to include just the badge with a link to this documentation page:

```html
```

This is what you will get:

![I tweet my Confluence tips. Do you?](http://confluence.atlassian.com/download/attachments/222200745/Twitter-Tips-Confluence.png)

• Badge and words
  Copy the code below and paste it into your blog to include the badge and some words encouraging other people to tweet too:
Got a Confluence tip? Tweet it now then see it in the Confluence docs.

Adding your own Tip

Quick guide to tweeting a tip

Just tweet with the word '#ConfluenceTips' somewhere in the text. Your tweet will appear in the Twitter stream on this page.

Would you like to share your information and experiences via Twitter and have your tweet appear on this page? Awesome! Here are the full instructions.

To tweet a Confluence tip,

1. Go to Twitter.com in your browser.
2. If you already have a Twitter username, sign in to Twitter now. If you do not have a Twitter username, sign up for one and follow the Twitter instructions to confirm your account details.
3. Enter your tip into the Twitter text box labelled 'What's happening'. Note that your tip can contain a maximum of 140 characters:
   - Type the words for your tip.
   - If you want people to click through to a web page to see more details about your tip, enter a web address. If the web address is long, you can convert it to a shortened address at bit.ly or one of the other web services that offer URL shortening.
   - Include the key word #ConfluenceTips somewhere in your tweet. This will ensure that your tip appears in the Twitter stream on this documentation page.
4. Click 'Tweet' to send your tweet.
5. Refresh this documentation page to see your tweet appear. It may take a few minutes, depending on the volume of tweets that Twitter is handling.
Confluence Documentation in Other Languages

Below are some links to Confluence documentation written in other languages. In some cases, the documentation may be a translation of the English documentation. In other cases, the documentation is an alternative guide written from scratch in another language. This page presents an opportunity for customers and community authors to share documentation that they have written in other languages.

Please be aware that these are external guides.

Most of the links point to external sites, and some of the information is relevant to a specific release of Confluence. Atlassian provides these links because the information is useful and relevant at the time it was written. Please check carefully whether the information is still relevant when you read it, and whether it is relevant to your version of Confluence. The information in the linked guides has not been tested or reviewed by Atlassian.

- **Topic:** //SEIBERT/MEDIA hat ein deutsches Handbuch für Confluence ab 3.3 aufwärts erstellt, das kostenfrei online mit vielen Anleitungen mit Screenshots und Videos versehen ist. 
  
  **//SEIBERT/MEDIA has created a German Handbook for Confluence 3.3 and later versions. It is publicly available for free and includes step-by-step inscriptions with screenshots and videos.**

Das Handbuch kann für die Nutzung offline im eigenen Confluence-Wiki auch gekauft werden. Das kann sinnvoll sein, wenn nicht alle Mitarbeiter Zugriff auf's Internet haben. Hier findet sich eine Preisliste für den Kauf aller Inhalte im eigenen Wiki. The documentation is also available for offline use in environments where employees do not have web access, for a fee. See the price list for offline use.

Darüber hinaus gibt es zahlreiche deutsche Confluence-Video-Tutorials. In addition, there are numerous German Confluence video tutorials.

- **Confluence version:** Confluence 3.3 and later
- **Date added:** 13 December 2010
- **Latest related English documentation:** Confluence User's Guide and Confluence Administrator's Guide
