What's the difference between load balancing and failover?

Load balancing means that all servers are active, and new requests are distributed among them. Several
strategies are available, but the most common are:

- **round-robin** — the first request goes to the first server, the second request goes to the second server, and so on. When you run out of servers, the next request goes to the first server, and around it goes again.
- **percentage-based** — if (for example) you have two servers, and one can handle twice the load of the other, you can tell the load balancer to send two requests to the stronger server for every request that goes to the weaker one.
- **availability** — the load balancer sends a test query to each of the servers every second or so, and directs each new request to the server that’s currently responding the fastest.

Failover means that only one server is active at any given time, and normally involves two servers (any number of servers may be involved, depending on the system). If the active one stops responding, requests are directed to the other server — the system ‘fails over’ to the second one.

‘Cold failover’ means that the second server is only started up after the first one has been shut down. This is the case for non-clustered Confluence.

‘Hot failover’ or ‘hot standby’ means that all servers are running at all times, and that the load is directed entirely toward one server at any one time.

A load balancer can be used in both scenarios, especially if it's smart enough to keep track of which servers are currently running.

Failover can also be managed via DNS, in a sufficiently well-controlled environment.

**What do you mean by ‘session affinity’?**

Sessions consist of several transmissions in each direction between the client (browser) and the server. Session affinity means that the load balancer keeps track of which server received the initial transmission from a given browser, and that it will then send any subsequent requests from that browser to the same server.

This is necessary with Confluence clustering, in particular, because sessions are not shared across cluster nodes. If you log into one node and then send a request to another, the other node will send you the login screen because it doesn't recognise your session cookie.

**RELATED TOPICS**

*Confluence Clustering Overview*

**Recommended network topology**

Atlassian recommends a network topology similar to the one shown below, to get the best results from a Confluence Clustered deployment.

The number of Confluence nodes in the deployment is adjustable — select the number which suits your own requirements.

The most important aspect is that cluster, database and HTTP (client) traffic are all carried on separate subnets. It is possible, on a sufficiently fast network, to carry cluster and database traffic on the same subnet but we do strongly recommend that HTTP traffic be always confined to a separate subnet on production deployments.

Confluence Clustered does not support clustered communication over WAN, VLAN or VPN. All Confluence Clustered nodes must be on the same local subnet, ideally networked via an ethernet hub or simple switch. The cluster communication network must also support multicast IP networking.

⚠️ The information on this page does not apply to Confluence OnDemand.
Use this example as a basis for your own network diagram

When you are considering a Confluence Clustered deployment, you should prepare a network diagram like the one on this page. This will facilitate discussion with Atlassian Support and help with your own planning. Please refer to the cluster checklist for more guidance on planning your clustered deployment.

Cluster Administration page

Overview
Any instance of Confluence which uses a clustered license has a Cluster Configuration page which includes information about the active cluster.

To open the Cluster Administration page,

1. Choose **Browse > Confluence Admin**.
2. Click 'Cluster Configuration' in the left-hand menu, in the section called 'Clustering'.

⚠️ **The information on this page does not apply to Confluence OnDemand.**

### Availability

To access this functionality, you must:

- Be a System Administrator (i.e. have global System Administrator permissions), and
- be using Confluence 2.3 or later, and
- be using a clustered Confluence license.

This page shows your cluster configuration, and allows you to start a new Confluence cluster using data from this instance.

**Cluster Status** indicates whether your cluster is currently running.
**Licensed nodes** is the maximum number of instances of Confluence your license allows in a cluster.

**Active nodes** lists the instances of Confluence currently participating in the cluster.

**Starting a new cluster** will perform the following changes:

- enable a clustered cache
- migrate attachments from file system to the database
- publish database connection information so other nodes can join the cluster.

ℹ️ All access to Confluence will be locked while this takes place, and you will be forced to restart Confluence afterwards.

**Cluster name** is a short name for identifying your cluster. Other Confluence instances can join the cluster using this name.

ℹ️ To join an existing cluster, start a clean copy of Confluence on this node and select ‘Join Cluster’ during the setup wizard.

**Related documents**

- [Overview of Confluence Clusters](#)
- [Confluence Cluster Installation](#)
- [Cluster Troubleshooting](#)

**Cluster Checklist**

It is possible to run Confluence in a **clustered** environment instead of on a single server. This means that you can run multiple copies of Confluence in a cluster, so that clients (such as a browser) can connect to any copy and see the same information.

ℹ️ Refer to the [clustering overview](#) for more information and a list of related pages about clustering Confluence.

⚠️ **Consider your options carefully before deciding on a clustered installation**

While we have tried to make clustering Confluence as easy and administrator-friendly as possible, it is a major architectural change and requires extra planning for deployment and upgrades. Please consider the information below and then consult [Atlassian Sales](#) before making your final decision.

---

**On this page:**

- [Purpose of this Document](#)
- [Assumed Knowledge](#)
- [General Considerations](#)
- [Server Setup](#)
- [Database Setup](#)
- [Network Setup](#)
- [Staging Environment](#)

⚠️ **The information on this page does not apply** to Confluence OnDemand.

**Purpose of this Document**

The purpose of this cluster checklist is to help you:
- Decide whether Confluence Clustered is the right solution for you.
- Create a plan for your clustered deployment.

If you need to raise a support request with Atlassian during or after cluster deployment, we will need to ask you questions about your configuration. It will save crucial time if you can provide us with your deployment plan.

For more information about clustering Confluence, refer to the clustering overview.

Assumed Knowledge

In writing this document, we have assumed that our readers have an in-depth knowledge of the following technical areas:

- Database
- Networking
- Application servers
- Load balancers

Before starting a clustered deployment please read the information on this page carefully, as well as the linked documentation, to assess if you have the assumed knowledge.

General Considerations

Confluence Clustered is designed to scale the number of simultaneously connected users at a much better performance than what a single node can achieve.

Confluence Clustered will not improve performance in systems with few users.

Clustering Confluence means that user requests can be served by independent machines. The performance gains are substantial, and have improved a lot further since Confluence 3.0. Clustering is especially great in dealing with spikes to the load, e.g. during certain hours of business. Just note that if rendering a complicated page (e.g. containing many macros or rendering many graphs) takes five seconds on an otherwise idle server, will not be faster in a clustered environment. Also, the first step when you encounter performance issues is to tune your existing system, make sure you are using the right hardware and have looked at your database.

Confluence Clustered is not a high availability solution.

General availability is higher in a Confluence cluster than on a single installation, you can for example take one node down for minor maintenance tasks e.g. when adding a new CPU or adding RAM. But you still have to bring down all nodes at the same time for software upgrades. Also there are certain conditions, like loss of network connectivity between nodes (‘split brain’), that will result in the cluster shutting itself down. Confluence Clustered offers higher reliability, but not high availability.

Confluence Clustered is not for disaster recovery nor for transparent failover.

If one node crashes, there is no transparent failover for the connected client. Also, our network requirements (see below) make Confluence unsuitable for deployment to different cities or even to different buildings.

Server Setup

The number of supported cluster nodes is limited to four.

⚠️ Not supported. In theory, you can connect more than four nodes — but that is not covered by Atlassian Support.
All cluster nodes must have the same version of OS, application server, etc.

Confluence requires a homogeneous environment. All Confluence cluster nodes must have the same version of the following:

- Operating system
- CPU
- Installed memory
- Java
- Application server

Note that 'same version' means 'same to the last digit'. For example, Java v1.4.2_16 is not the same as v1.4.2_15.

We strongly recommend users to have the same memory configuration (both the JVM and the physical memory) because a cluster uses a replicated cache. A replicated cache requires the same amount of memory on each node in the operating cluster. The memory allocations must be equal.

Use good and up-to-date hardware.

While the details are up to you, we strongly suggest that your servers have at least 4GB of physical RAM. A high number of concurrent users means that a lot of RAM will be consumed. You usually don't need to assign more than 4GB per JVM process, and most of the time even just 1GB or 2GB will be fine, you should just be prepared to fine-tune the settings.

Confluence Clustered is not supported when run in VMware or other virtualisations.

**Not supported.** We strongly discourage you to deploy a production environment of Confluence to virtual servers, and we will not be able to support you when problems arise.

When running a Confluence cluster your goal is high capacity and performance, so you should not risk lower performance by virtualising it and sharing a computer with other processes.

Many customers who are running Confluence on VMware, or similar virtualisation solutions, experience major performance problems that are extremely hard to pinpoint. Since the problems are not related to Confluence itself, we will not be able to help you.

Confluence should be the only application on the cluster servers.

No additional applications (other than core operating system services) should be running on the same servers as Confluence.

Since your goal should be increased capacity and performance, you should not risk this by running any other process on the machine with a Confluence Clustered node. While it may be fine to run JIRA, Confluence and Bamboo on a dedicated Atlassian software server for small installations, it is strongly discouraged for clustering Confluence.

Do not upgrade and switch to Confluence Clustered at the same time

If you plan to migrate to a clustered solution, make sure you are migrating within the same version of Confluence. If you plan to upgrade to a higher version of Confluence, do this **before** the migration to the clustered version.

For example, if you are currently running Confluence 2.9.2, and want to roll out the clustered version of Confluence 3.0, you must first upgrade to Confluence 3.0 and check that everything works fine (e.g. by running and monitoring your production system for a week). Then you are in a good position to migrate to the clustered version.

**Database Setup**

Run the database on its own physical server.

You are optimising for performance, so you don't want the database to slow down your application servers, or vice versa. In high load scenarios, the database may need to have better hardware than the application servers to be able to handle all requests. You should find out by performing load testing.

Attachments must be stored in a database and not the local file system

Storing attachments in the database is the only supported **attachment storage configuration** for clustering Confluence.
Make sure that you use a supported version of a database server to store Confluence's data.
Please check that your intended database is officially supported by Atlassian Confluence. The load on an average cluster solution is higher than on a single box installation, and it is therefore even more crucial to use the right database vendor and version.

Your database must be provisioned to store a large volume of binary data.
Note that Confluence clustered stores file attachments in the database, and you need an experienced DBA who can monitor and manage the data growth.

You need an experienced DBA available to troubleshoot database performance issues.
Not having an experienced full-time DBA at hand at short notice when entering the realm of high load is dangerous. While small installations of Confluence basically work 'out of the box', anything that involves high load and a lot of database space requires continual monitoring, optimising and fine tuning of the Confluence database. When we ramp up the load on our loadtesting environment, we see that database usage goes up as well. Having powerful hardware in place helps, but if there are queries that become inefficient with you particular load pattern, you need an expert to tune it. As an example, we have seen PostgreSQL switch its internal caching mechanism when a particular table reached a certain size, which resulted in a drop of performance by about 200ms per request. This happened from one second to the other. Being able to troubleshoot and then fix issues like these is important in any enterprise system, but it is even more in a high load scenario.

Network Setup
We recommend hardware load balancers or putting a software loadbalancer onto its own server.
If you use a software load balancer (which is fine except for really extreme installations), it must be deployed on a machine of its own. Running a software load balancer on a cluster node is not supported. If a node unexpectedly got overwhelmed by a spike in load, a load balancer on that node would turn unresponsive. As a result, your whole cluster would be inaccessible even though the other nodes would be available. So using a different server is common practice and common sense.

Use separate network adapters for communication between servers. The Confluence cluster nodes should have a separate physical network (i.e. separate NICs) for inter-server communication.

This is the best way of getting the cluster to run fast and reliably. Performance problems are likely to occur if your cluster nodes connect via a network that has lots of other data streaming through it.

The switch connecting the Confluence cluster nodes must not be a 'smart switch'.
⚠️ Not supported. Smart switches are not covered by Atlassian Support for Confluence Clustered.

Do not use smart switches between cluster nodes. Many problems have been reported and attributed to smart switches. They have a tendency to interrupt broadcast or multicast traffic, thus reliably killing a cluster after a certain amount of time has passed. This makes troubleshooting especially complex and tedious.

Cisco switches need additional configuration.
If the switch connecting the Confluence cluster nodes is a Cisco switch then it might need additional configuration to support Confluence clustering.

Please make sure you find out all the details about your switches before you start the deployment.

It is recommended that the database is on a different physical network from the Confluence server nodes. Since you want to increase your capacity and performance for high loads, it is recommended to have your database on a different network. Please refer to the recommended topology diagram for more information.

Minimize the latency between the Confluence cluster nodes and the database.
Even though having the nodes and the database on the same physical network usually suffices, you should take the time to explicitly measure network latency, and make sure it is as close to zero as possible.

Prepare a network diagram.
To facilitate discussion and to ease planning, you should prepare a network diagram like this example of recommended network topology.
If you request support with Confluence Clustered, we may ask for your network diagram. We recommend that you create one similar to our example before you proceed with the installation.

You need network support staff available to troubleshoot cluster communication issues.

Setting up a cluster is not trivial. Even small problems in network design will be expanded in a clustered installation. (This is true of any kind of software.)

It is absolutely vital that you have dedicated network staff available to track down problems when they arise. A cluster will usually be used by thousands of users, and you don't want to keep them waiting because a network card breaks, or because someone made an undocumented change to the network and you don't have an expert around who can figure it out.

**Staging Environment**

You need a staging environment that is exactly the same as your production system.

You must be able to test drive any change to the cluster (installing upgrades, installing plugins) and to perform other tests (checking connectivity, debugging problems) on a staging cluster.

The staging environment must be:

- On the same OS, database, and Java version as your production environment.
- Clustered.

If you require support, we may for example ask you to turn off certain third-party plugins. If you can't do this in your production environment and you don't have a staging environment for troubleshooting, we may not be able to help you.

### Confluence Security

This document is for system administrators looking to evaluate the security of the Confluence web application. The page addresses overall application security and lists the security advisories issued for Confluence. As a public-facing web application, Confluence's application-level security is important. This document answers a number of questions that commonly arise when customers ask us about the security of our product.

Other topics:

- For information about user management, groups and permissions, please refer to the [internal security overview](#).
- For guidelines on configuring the security of your Confluence site, see the [administrator's guide to configuring Confluence security](#).

---

### On this page:

- Finding and Reporting a Security Vulnerability
- Publication of Confluence Security Advisories
- Severity Levels
- Our Patch Policy
- Published Security Advisories
- Other Security Resources
Application Security Overview

Password Storage

When Confluence's internal user management is used, passwords are hashed through SHA1 before being stored in the database. There is no mechanism within Confluence to retrieve a user's password – when password recovery is performed, a reset password link is generated and mailed to the user's registered address.

When external user management is enabled, password storage is delegated to the external system.

Buffer Overflows

Confluence is a 100% pure Java application with no native components. As such it is highly resistant to buffer overflow vulnerabilities – possible buffer overruns are limited to those that are bugs in the Java Runtime Environment itself.

SQL Injection

Confluence interacts with the database through the Hibernate Object-Relational mapper. Database queries are generated using standard APIs for parameter replacement rather than string concatenation. As such, Confluence is highly resistant to SQL injection attacks.

Script Injection

Confluence is a self-contained Java application and does not launch external processes. As such, it is highly resistant to script injection attacks.

Cross-Site Scripting

As a content-management system that allows user-generated content to be posted on the web, precautions have been taken within the application to prevent cross-site scripting attacks:

- The wiki markup language in Confluence does not support dangerous HTML markup
- Macros allowing the insertion of raw HTML are disabled by default
- HTML uploaded as a file attachment is served with a content-type requesting the file be downloaded, rather than being displayed inline
- Only system administrators can make HTML-level customisations of the application

When cross-site scripting vulnerabilities are found in the Confluence web application, we endeavour to fix them as quickly as possible.

Transport Layer Security

Confluence does not directly support SSL/TLS. Administrators who are concerned about transport-layer security should set up SSL/TLS at the level of the Java web application server, or the HTTP proxy in front of the Confluence application.

For more information on configuring Confluence for SSL, see: Running Confluence Over SSL or HTTPS

Session Management

Confluence delegates session management to the Java application server in which it is deployed. We are not aware of any viable session-hijacking attacks against the Tomcat application server shipped with Confluence. If you are deploying Confluence in some other application server, you should ensure that it is not vulnerable to session hijacking.
**Plugin Security**

Administrators install third party plugins at their own risk. Plugins run in the same virtual machine as the Confluence server, and have access to the Java runtime environment, and the Confluence server API.

Administrators should always be aware of the source of the plugins they are installing, and whether they trust those plugins.

**Administrator Trust Model**

Confluence is written under the assumption that anyone given System Administrator privileges is trusted. System administrators are able, either directly or by installing plugins, to perform any operation that the Confluence application is capable of.

As with any application, you should not run Confluence as the root/Administrator user. If you want Confluence to listen on a privileged network port, you should set up port forwarding or proxying rather than run Confluence with additional privileges. The extra-careful may consider running Confluence inside a chroot jail.

**Stack Traces**

To help debug support cases and provide legendary support, Confluence provides stack traces through the web interface when an error occurs. These stack traces include information about what Confluence was doing at the time, and some information about your deployment server.

Only non-personal information is supplied such as operating system and version and Java version. With proper network security, this is not enough information to be considered dangerous. No usernames or passwords are included.

**Finding and Reporting a Security Vulnerability**

Atlassian’s approach to reporting security vulnerabilities is detailed in [How to Report a Security Issue](#).

Confluence Security Advisory 2006-01-19

⚠️ This security advisory is not endorsed by Atlassian - this is a public service advisory from a member of the confluence community. Please remember to backup any modified files, and use these instructions at your own risk. While this information is based on Confluence v2.1.2, it may have uses with older affected versions of Confluence.

The official security advisory is located at Confluence Security Advisory 2006-01-20

Problem

There is a possibility of XSS exploitation of the Full Name user profile field when displayed.

Solution

The problem was unescaped outputting of the fullname - wrapping the output in $generalUtil.htmlEncode() resolve it. The vast majority of the problem can be resolved by changing /confluence/template/includes/macros.vm in the distribution on the following lines:

- 180
- 186
I have attached the modified macros.vm file here which you can copy into your distribution.

Scope

There are other places which are still affected which Atlassian have been made aware of, a complete resolution should be provided by Atlassian in their own official advisory.

I hope this helps some of you!

Confluence Security Advisory 2005-02-09

A flaw has been found in Confluence by which attackers can bypass Confluence security and change content on the site. Atlassian STRONGLY recommends that all Confluence customers apply the fix described below immediately, or upgrade to Confluence 1.3.3

Vulnerability

By crafting custom URLs, any person with the ability to browse Confluence can modify content on the site, bypassing security settings. This vulnerability does not allow users to view content they would not normally be able to view, or escalate their privileges in other ways.

This flaw affects all versions of Confluence prior to 1.3.3, including the 1.4-DR development releases.

Fix

This vulnerability is fixed in Confluence 1.3.3 and later. Customers who do not wish to migrate to 1.3.3 can fix this bug using the procedure below:

1. Edit the file confluence/WEB-INF/classes/xwork.xml
2. Find the following section near the top of the file (around line 34):

   <interceptor-stack name="defaultStack">
     <interceptor-ref name="profiling">
       <param name="location">Before defaultStack</param>
     </interceptor-ref>
     <interceptor-ref name="transaction"/>
     <interceptor-ref name="authentication"/>
     <interceptor-ref name="requestParameterHack"/>
     <interceptor-ref name="eventnotifier"/>
     <interceptor-ref name="autowire"/>
     <interceptor-ref name="params"/>
     <interceptor-ref name="servlet"/>
     <interceptor-ref name="pageAware"/>
     <interceptor-ref name="permissions"/>
     <interceptor-ref name="profiling">
       <param name="location">After defaultStack</param>
     </interceptor-ref>
   </interceptor-stack>

3. Locate the "autowire" and "params" entries:
4. Swap the two lines around. The whole stack should now look like this:

```xml
<interceptor-stack name="defaultStack">
  <interceptor-ref name="profiling">
    <param name="location">Before defaultStack</param>
  </interceptor-ref>
  <interceptor-ref name="transaction"/>
  <interceptor-ref name="authentication"/>
  <interceptor-ref name="requestParameterHack"/>
  <interceptor-ref name="eventnotifier"/>
  <interceptor-ref name="params"/>
  <interceptor-ref name="autowire"/>
  <interceptor-ref name="servlet"/>
  <interceptor-ref name="pageAware"/>
  <interceptor-ref name="permissions"/>
  <interceptor-ref name="profiling">
    <param name="location">After defaultStack</param>
  </interceptor-ref>
</interceptor-stack>
```

5. Restart Confluence.

**Confluence Security Advisory 2005-12-05**

A flaw has been found in Confluence by which attackers can inject malicious HTML code into Confluence. Atlassian STRONGLY recommends that all Confluence customers apply the fix described below immediately, or upgrade to Confluence 2.0.2.

**Vulnerability**

By entering HTML code into the Confluence search input fields, attackers can cause arbitrary scripting code to be executed by the user's browser in the security context of the Confluence instance.

This flaw affects all versions of Confluence between 1.4-DR releases and 2.0.1.

(Atlassian was not informed of the problem before it was published by third-party security researchers. You can read the third-party security advisory here: [http://secunia.com/advisories/17833/](http://secunia.com/advisories/17833/). The vulnerability was originally reported [here](http://secunia.com/advisories/17833/).)

**Fix**

This vulnerability is fixed in Confluence 2.0.2 and later. Customers who do not wish to migrate to 2.0.2 can fix this bug using the procedure below:

1. Edit the confluence/decorators/components/searchresults.vmd
2. Replace the following reference (around line 48):

```vmd
$action.getText("search.result", [$start, $end, $total, $queryString])
```
3. Edit the confluence/search/searchsite-results.vm.
4. Replace the following reference (around line 11):

```
$action.getText("search.result", [$start, $end, $total, $generalUtil.escapeXml($queryString)])
```

with

```
Searched for <b>$action.searchQuery.queryString</b>
```

with

```
Searched for <b>$generalUtil.escapeXml($action.searchQuery.queryString)</b>
```

5. Restart Confluence.

Alternatively, you can download the patched source files from [CONF-4825](http://conf.atlassian.com/bugzilla/show_bug.cgi?id=CONF-4825). If you are patching a 2.0.x installation, then use the files with the .2.0 suffix. If you are patching a 1.4.x installation, then use the files with the .1.4 suffix.

**Confluence Security Advisory 2006-01-20**

A flaw has been found in Confluence by which attackers to inject malicious HTML code into Confluence. Atlassian STRONGLY recommends that all Confluence customers apply the fix described below immediately, or upgrade to Confluence 2.1.3.

**Vulnerability**

By entering HTML/JavaScript code into the full name of a user's profile, attackers can cause arbitrary scripting code to be executed by the user's browser in the security context of the Confluence instance.

This flaw affects all versions of Confluence between 1.4-DR releases and 2.1.2.

This issue was initally reported by Ricardo Sueiras and a fix was quickly documented by Dan Hardiker at the [Confluence Community Security Advisory 2006-01-19](http://confluence.atlassian.com/display/CONFLUENCE/Confluence+Community+Security+Advisory+2006-01-19) page. Our thanks to them for bringing this to our attention.

There is an issue in JIRA at [CONF-5233](http://conf.atlassian.com/bugzilla/show_bug.cgi?id=CONF-5233).

**Fix**

This vulnerability is fixed in Confluence 2.1.3 and later. Customers who do not wish to migrate to 2.1.3 can fix this bug using the procedure below:

Steps to fix:

1. Copy `macros.vm` to your confluence/template/includes folder
2. Restart Confluence

**Note:** If you are using version 1.4.4, please download and copy this file instead. You will need to rename it back
If you are not using any of the above versions, you will need to replace wrap calls to display full names of users in $generalUtil.htmlEncode(). Alternatively, send us an email. We do however encourage you to use the latest stable point release regardless of the version you are using.

**Confluence Security Advisory 2006-01-23**

A flaw has been found in Confluence by which the unrestricted content of a space can be revealed in search results.

**Vulnerability**

By entering in a space key and blank query string into the Search macro, pages from the specified space will be displayed, without filtering on page and space permissions. This can allow unpermitted users to view the excerpts of pages they don't have access to.

This flaw is confirmed to affect all releases from 1.4 to 2.1.2.

More information is available at [CONF-5189](http://example.com/CONF-5189).

**Fix**

This vulnerability is fixed in Confluence 2.1.3 and later. We strongly suggest that customers upgrade to this release to fix the vulnerability.

Customers who are using 1.4.x and do not wish to upgrade can download a patched class from [CONF-5198](http://example.com/CONF-5198).

**Confluence Security Advisory 2006-06-14**

**Vulnerability**

By crafting a custom HTTP request, an attacker can delete or modify global permissions settings on a Confluence site.

This flaw affects all Confluence versions between 1.4 and 2.2.2. 2.2.3 and later are not vulnerable.

**Fix**

This issue has been fixed in Confluence 2.2.3. Patches are also available for all versions of Confluence between 1.4 and 2.2.2. For more information, please see [this issue report](http://example.com/this-issue-report).

Atlassian STRONGLY recommends that all customers either upgrade to Confluence 2.2.3, or apply the patch.

**Confluence Security Advisory 2007-07-26**

In this advisory:

- **Users with view permission in a space can copy and save a page**
  - **Vulnerability**
  - **Fix**

- **Space name and key are not validated nor escaped**
  - **Vulnerability**
  - **Fix**

**Users with view permission in a space can copy and save a page**

**Vulnerability**

A user who has only view permissions in a space can copy a page and then save it in the space. In this way,
users can create a page in a space where they have only view permission.

This flaw affects only Confluence version 2.5.4.

Fix

This issue has been fixed in Confluence 2.5.5. A patch is also available for Confluence 2.5.4. For more information, including instructions on applying the patch, please see this issue report.

If you are using Confluence 2.5.4, Atlassian **strongly** recommends that you upgrade to Confluence 2.5.5 or apply the patch.

**Space name and key are not validated nor escaped**

Vulnerability

The input for space name and key is not validated properly - any characters are allowed. This makes a Confluence instance vulnerable to an XSS attack.

Fix

This issue has been fixed in Confluence 2.5.5. For more information, please see this issue report.

Atlassian recommends that you upgrade to Confluence 2.5.5.

**Confluence Security Advisory 2007-08-08**

In this advisory:

- **Input in the RSS Feed Builder is not validated**
  - Vulnerability
  - Fix
- **Input when editing Space Permissions is not validated**
  - Vulnerability
  - Fix
- **Number of labels that can be added to a page is not restricted**
  - Vulnerability
  - Fix
- **Input when editing navigation themes is not validated**
  - Vulnerability
  - Fix
- **Viewing of space content alphabetically is not validated**
  - Vulnerability
  - Fix
- **Input when editing Space Name is not validated**
  - Vulnerability
  - Fix
- **Input when viewing attachments by file-type is not validated**
  - Vulnerability
  - Fix

**Input in the RSS Feed Builder is not validated**

Vulnerability

The input for the RSS Feed Builder is not required to be escaped. This can make a Confluence instance
vulnerable to an XSS attack.

Fix

This issue has been fixed in Confluence 2.5.6. For more information, please see CONF-8993.

Atlassian recommends that you upgrade to Confluence 2.5.6.

Input when editing Space Permissions is not validated

Vulnerability

The 'Grant permission to' field on the 'Edit Space Permissions' screen is not validated. This can make a Confluence instance vulnerable to an XSS or DoS attack.

Fix

This issue has been fixed in Confluence 2.5.6. For more information, please see CONF-8980 and CONF-8979.

Atlassian recommends that you upgrade to Confluence 2.5.6.

Number of labels that can be added to a page is not restricted

Vulnerability

There is no restriction on the number of labels that can be added to a page at a time. This can make a Confluence instance vulnerable to a DoS attack.

Fix

This issue has been fixed in Confluence 2.5.6. For more information, please see CONF-8978.

Atlassian recommends that you upgrade to Confluence 2.5.6.

Input when editing navigation themes is not validated

Vulnerability

The 'Navigation Page' specified in the 'Left Navigation Theme' configuration is not validated. This can make a Confluence instance vulnerable to a XSS attack.

Fix

This issue has been fixed in Confluence 2.5.6. For more information, please see CONF-8956.

Atlassian recommends that you upgrade to Confluence 2.5.6.

Viewing of space content alphabetically is not validated

Vulnerability

When viewing space content by alphabetic character, the input is not validated as being alphabetic. This can make a Confluence instance vulnerable to an XSS attack.

Fix

This issue has been fixed in Confluence 2.5.6. For more information, please see CONF-8952.

Atlassian recommends that you upgrade to Confluence 2.5.6.

Input when editing Space Name is not validated
Vulnerability

The 'Name' field on the 'Edit Space Details' screen is not validated. This can make a Confluence instance vulnerable to an XSS attack.

Fix

This issue has been fixed in Confluence 2.5.6. For more information, please see CONF-8951.

Atlassian recommends that you upgrade to Confluence 2.5.6.

Input when viewing attachments by file-type is not validated

Vulnerability

The 'Filter By Extension' field on the 'List Space Attachments' screen is not validated. This can make a Confluence instance vulnerable to an XSS attack.

Fix

This issue has been fixed in Confluence 2.5.6. For more information, please see CONF-8950.

Atlassian recommends that you upgrade to Confluence 2.5.6.

Confluence Security Advisory 2007-11-19

In this advisory:

- DWR debug mode enabled
  - Vulnerability
  - Fix

- XSS vulnerability in exception error page
  - Vulnerability
  - Fix

- XSS vulnerability in the URL destination for the print icon
  - Vulnerability
  - Fix

- XSS vulnerability in wiki markup for images
  - Vulnerability
  - Fix

Atlassian recommends that you upgrade to Confluence 2.6.1 to fix the vulnerabilities described below.

DWR debug mode enabled

Vulnerability

Debug mode was enabled by default on Direct Web Remoting (DWR). This made it easy for a potential attacker to find information about available AJAX request handlers in Confluence.

Fix

This issue has been fixed in Confluence 2.6.1. If you do not wish to upgrade at this time, you can fix the problem by editing your $confluence install$/confluence/WEB-INF/web.xml file. For more information, please see CONF-9718.

XSS vulnerability in exception error page
Vulnerability

The attributes and parameters were not escaped on the Confluence exception error page. This is a potential vulnerability to a cross-site scripting attack.

Fix

This issue has been fixed in Confluence 2.6.1. For more information, please see CONF-9704 and CONF-9560.

XSS vulnerability in the URL destination for the print icon

Vulnerability

The print icon on the HTTP 404 error page uses the path of the requested URL, which potentially contains malicious JavaScript. The 404 page did not correctly escape it. This is a potential vulnerability to a cross-site scripting attack.

Fix

This issue has been fixed in Confluence 2.6.1. A patch is supplied for customers with Confluence version 2.6 who do not wish to upgrade at this time. For more information, please see CONF-9456.

XSS vulnerability in wiki markup for images

Vulnerability

When using image URLs in wiki markup, quotes were not correctly escaped. This is a potential vulnerability to a cross-site scripting attack.

Fix

This issue has been fixed in Confluence 2.6.1. For customers with Confluence 2.6 who do not wish to upgrade at this time, the new atlassian-renderer JAR should resolve this issue. For more information, please see CONF-9209.

Confluence Security Advisory 2007-11-27

In this advisory:

- XSS Type 2 Vulnerabilities in Macros and Wiki Markup
  - Severity
  - Risk Assessment
  - Risk Mitigation
  - Vulnerability
  - Fix

XSS Type 2 Vulnerabilities in Macros and Wiki Markup

Severity

Atlassian rates this vulnerability as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed some security flaws which may affect Confluence instances in a public environment. These flaws are XSS (cross-site scripting) vulnerabilities in some of Confluence's macros and Wiki Markup, which potentially allow a malicious user (hacker) to insert their own HTML tags or script into a Confluence page.

- The hacker might take advantage of this flaw to steal other users' session cookies or other credentials, by
sending the credentials back to the hacker’s own web server.

- The hacker’s text and script might be displayed to other people viewing the Confluence page. This is potentially damaging to your company’s reputation.

Atlassian recommends that you upgrade to Confluence 2.6.2 to fix the vulnerabilities described below.

You can read more about XSS attacks at cgisecurity, CERT and other places on the web.

**Risk Mitigation**

If you judge it necessary, you can disable public access (e.g. anonymous access and public signon) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups only.

**Vulnerability**

The following macros are affected:

- `{color}`
- `{panel}`
- `{section}`
- `{column}`
- `{code}`

The Wiki Markup for inserting images (e.g. ![myImage.png!]) is also vulnerable to XSS exploitation.

**Fix**

The fix is to escape all user input, so that no user input is interpreted as HTML or CSS. In some cases we also perform stricter validation on the range of values a user can supply in an attribute.

These issues have been fixed in Confluence 2.6.2. For more information, please see [CONF-9350](#).

Our thanks to Igor Minar, who reported this issue to Atlassian. We fully support the reporting of vulnerabilities and we appreciate his working with us towards identifying and solving the problem.

Please let us know what you think of the format of this security advisory and the information we have provided.

**Confluence Security Advisory 2007-12-14**

**In this advisory:**

- [XSS Vulnerability in Configure RSS Feed Action](#)

**XSS Vulnerability in Configure RSS Feed Action**

**Severity**

Atlassian rates this vulnerability as **high**, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

**Risk Assessment**

We have identified and fixed a security flaw which may affect Confluence instances in a public environment. This flaw is an XSS (cross-site scripting) vulnerability in a Confluence action, which potentially allows a malicious
user (hacker) to embed their own JavaScript into a Confluence page.

- The hacker might take advantage of this flaw to steal other users' session cookies or other credentials, by sending the credentials back to the hacker's own web server.
- The hacker's text and script might be displayed to other people viewing the Confluence page. This is potentially damaging to your company's reputation.

To fix the vulnerabilities described below, Atlassian recommends that you take one of the following steps:

- Upgrade to Confluence 2.7, or
- Download and install the patch for Confluence 2.5.8 or Confluence 2.6.2 from our JIRA site – see issue CONF-10164.

You can read more about XSS attacks at cgisecurity, CERT and other places on the web.

Risk Mitigation

If you judge it necessary, you can disable public access (e.g. anonymous access and public signon) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups only.

Vulnerability

A hacker can inject their own JavaScript into the following Confluence action:

```
http://www.anyhost.com/confluence/dashboard/configurerssfeed.action
```

The above Confluence action is used to build an RSS feed based on your Confluence pages and news items. The action is invoked when a selects 'Feed Builder' from your Confluence Dashboard. It can also be invoked by simply entering the URL into the browser address bar.

Fix

These issues have been fixed in Confluence 2.7, which you can download from the download centre.

A patch is available for Confluence 2.5.8 and Confluence 2.6.2. For more information, please see CONF-10164.

Our thanks to jeff peichel, who reported this issue to Atlassian. We fully support the reporting of vulnerabilities and we appreciate his working with us towards identifying and solving the problem.

Please let us know what you think of the format of this security advisory and the information we have provided.

Confluence Security Advisory 2008-01-24

In this advisory:

- XSS Vulnerability in Dashboard Action
  - Severity
  - Risk Assessment
  - Risk Mitigation
  - Vulnerability
  - Fix

XSS Vulnerability in Dashboard Action

Severity
Atlassian rates this vulnerability as **high**, according to the scale published in [Confluence Security](https://confluence.atlassian.com/display/CONFSEC/Confluence+Security). The scale allows us to rank a vulnerability as critical, high, moderate or low.

**Risk Assessment**

We have identified and fixed a security flaw which may affect Confluence instances in a public environment. This flaw is an XSS (cross-site scripting) vulnerability in a Confluence action, which potentially allows a malicious user (hacker) to embed their own JavaScript into a Confluence page.

- The hacker might take advantage of this flaw to steal other users' session cookies or other credentials, by sending the credentials back to the hacker's own web server.
- The hacker's text and script might be displayed to other people viewing the Confluence page. This is potentially damaging to your company's reputation.

To fix the vulnerabilities described below, Atlassian recommends that you take one of the following steps:

- Upgrade to [Confluence 2.7.1](https://confluence.atlassian.com/display/CONFSEC/Confluence+2.7.1), or
- Download and install the patch for Confluence 2.6.2 or Confluence 2.7.0 from our JIRA site – see issue [CONF-10289](https://jira.atlassian.com/browse/CONF-10289).

You can read more about XSS attacks at [cgisecurity](https://www.cgisecurity.com/) and [CERT](https://www.cert.org) and other places on the web.

**Risk Mitigation**

If you judge it necessary, you can disable public access (e.g. anonymous access and public signon) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups only.

**Vulnerability**

A hacker can inject their own JavaScript into the following Confluence action:

```
http://confluence-location/dashboard.action?spacesSelectedTab
```

The above Confluence action is used to determine which spaces are listed on a user's Dashboard. For example, the following URL requests a list of team spaces only:

```
http://confluence-location/dashboard.action?spacesSelectedTab=team
```

The action is invoked when a user selects one of the 'Spaces' tabs on the Dashboard, such as the 'Team' tab. It can also be invoked by simply entering the URL into the browser address bar.

**Fix**

These issues have been fixed in [Confluence 2.7.1](https://confluence.atlassian.com/display/CONFSEC/Confluence+2.7.1) (see the release notes), which you can download from the download centre.

A patch is available for [Confluence 2.6.2](https://confluence.atlassian.com/display/CONFSEC/Confluence+2.6.2) and [Confluence 2.7.0](https://confluence.atlassian.com/display/CONFSEC/Confluence+2.7.0). For more information, please see [CONF-10289](https://jira.atlassian.com/browse/CONF-10289).

Our thanks to Mary Johnson, who reported this issue to Atlassian. We fully support the reporting of vulnerabilities and we appreciate her working with us towards identifying and solving the problem.

*Please let us know what you think of the format of this security advisory and the information we have provided.*
Confluence Security Advisory 2008-03-06

In this advisory:

- Users with View-Only Permission can Delete (Purge) Pages
  - Severity
  - Risk Assessment
  - Risk Mitigation
  - Vulnerability
  - Fix

Users with View-Only Permission can Delete (Purge) Pages

Severity

Atlassian rates this vulnerability as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

More explanation of the ranking we chose:

- You might rank this vulnerability as critical, because in most installations the vulnerability will allow anonymous users to delete information.
- We have chosen a ranking of high, because the vulnerability does not allow privilege escalation i.e. it doesn't allow users to gain administration privileges.

Risk Assessment

We have identified and fixed a security flaw which allowed users who have 'View' permission (or higher) on a space to purge (delete) any page in that space.

The following Confluence versions are vulnerable: All versions from 1.3 to 2.7.1 inclusive.

To fix the vulnerabilities described below, Atlassian recommends that you take one of the following steps:

- Upgrade to Confluence 2.7.2, or
- Download and install the patch for Confluence 2.6.x or Confluence 2.7.x from our JIRA site – see issue ONF-10807.

Risk Mitigation

If you judge it necessary, you can disable public access (e.g. anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups only.

If it is not immediately feasible to upgrade to Confluence 2.7.2 or apply a patch, we recommend an alternative strategy:

- As a temporary measure, you can block the URL which allows someone to purge (delete) a page. Please ask your website administrator to block the URL described below.
- The impact is that Space Administrators will not be able to purge individual pages or news items. However, Space Administrators can still use the 'Purge All' link to clear the entire contents of Trash.

Vulnerability

Description:
A user can use the following Confluence action to permanently delete (purge) any Confluence page, provided that the user has 'View' permission (or higher) in the space to which the page belongs:
The above action is invoked when a space administrator clicks the 'Purge' link on the space's 'Trash' page next to a wiki page which has already been deleted.

The action can also be invoked by simply entering the URL into the browser address bar. In this way, it is possible for a user with 'View' permission (or higher) to remove a page via the 'Purge' action, even if the page has not been deleted.

Fix

These issues have been fixed in Confluence 2.7.2 (see the release notes), which you can download from the download centre.

A patch is available for Confluence 2.6.x, Confluence 2.7.0 and Confluence 2.7.1. For more information, please see CONF-10807.

Out thanks to Neeraj Jhanji, who reported this issue to Atlassian. We fully support the reporting of vulnerabilities and we appreciate his working with us towards identifying and solving the problem.

Confluence Security Advisory 2008-03-19

In this advisory:

- XSS Vulnerabilities in Various Confluence Actions
  - Severity
  - Risk Assessment
  - Risk Mitigation
  - Vulnerability
  - Fix

### XSS Vulnerabilities in Various Confluence Actions

**Severity**

Atlassian rates these vulnerabilities as **high**, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

**Risk Assessment**

We have identified and fixed a number of security flaws which may affect Confluence instances in a public environment. The flaws are all XSS (cross-site scripting) vulnerabilities in various Confluence actions. Each vulnerability potentially allows a malicious user (hacker) to embed their own JavaScript into a Confluence page.

- The hacker might take advantage of the flaw to steal other users' session cookies or other credentials, by sending the credentials back to the hacker's own web server.
- The hacker's text and script might be displayed to other people viewing the Confluence page. This is potentially damaging to your company's reputation.

To fix the vulnerabilities described below, Atlassian recommends that you take one of the following steps:

- Upgrade to Confluence 2.7.3, or
- Download and install the patches for Confluence 2.6.x from our JIRA site — refer to the list of issues below.

You can read more about XSS attacks at cgisecurity, CERT and other places on the web.
Risk Mitigation

If you judge it necessary, you can disable public access (e.g. anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups only.

Vulnerability

A hacker can inject their own JavaScript into the Confluence actions listed in the table below. Each of the actions is invoked when a user performs a specific function in Confluence, such as clicking a link or a button. The actions can also be invoked by simply entering the URL into the browser address bar.

For more details please refer to the related JIRA issue, also shown in the table below.

Users can Move Attachments to Any Page Regardless of Permissions

Severity

Atlassian rates this vulnerability as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security flaw which allows users who have 'Create Page' permission in a space to move an attachment from a page in that space to any other page in the Confluence site, regardless of the user's permissions in the destination space.
The following Confluence versions are vulnerable: All versions from 1.0 to 2.8.0.

Risk Mitigation

This security flaw grants extra powers only to users who already have 'Create Page' permissions in one of the spaces on the Confluence site. In most installations, this will be a trusted group of users.

If your Confluence instance allows a less trusted group of users to create and edit pages in one space, while restricting access to other spaces, you may judge it necessary to disable public access (e.g. anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups only.

Vulnerability

Any user who has 'Create Page' permission in a Confluence space can move an attachment from a page in that space to any other page in the Confluence site, regardless of the user's permissions in the destination space.

Note: If a user has permission to create a space, they will also have 'Create Page' permission in any space they create, including a personal space. Such users could upload an attachment onto the space they have created and then move the attachment to any page in the Confluence site.

Fix

This issue has been fixed in Confluence 2.8.1 (see the release notes), which you can download from the download centre.

Alternatively, you can download and install the patch for Confluence 2.7.x or Confluence 2.8.0 from our JIRA site – see issue CONF-11452.

Our thanks to Stafford Vaughan from CustomWare, who reported this issue to Atlassian. We fully support the reporting of vulnerabilities and we appreciate it when people work with us towards identifying and solving a problem.

XSS Vulnerability in Page Information View

Severity

Atlassian rates this vulnerability as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security flaw which may affect Confluence instances in a public environment. This flaw is an XSS (cross-site scripting) vulnerability in a Confluence action, which potentially allows a malicious user (hacker) to embed their own JavaScript into a Confluence page.

- The hacker might take advantage of this flaw to steal other users' session cookies or other credentials, by sending the credentials back to the hacker's own web server.
- The hacker's text and script might be displayed to other people viewing the Confluence page. This is potentially damaging to your company's reputation.

You can read more about XSS attacks at coisecurity, CERT and other places on the web.

The following Confluence versions are vulnerable: All versions from 1.3 to 2.8.0 inclusive.

Risk Mitigation

If you judge it necessary, you can hide referrers on page information views by disabling this functionality.

Vulnerability
A hacker can inject their own JavaScript into the referrer URLs which are displayed on the 'Info' view of a wiki page. The rogue JavaScript will be executed when a user opens the 'Info' view.

Fix

This issue has been fixed in Confluence 2.8.1 (see the release notes), which you can download from the download centre.

Alternatively, you can download and install the patch for Confluence 2.7.x or Confluence 2.8.0 from our JIRA site – see issue CONF-11524.

XSS Bug: Usernames Not HTML-Encoded in All Places

Severity

Atlassian rates this vulnerability as **HIGH**, according to the scale published in [Confluence Security](https://confluence.atlassian.com/display/SECURITY/SecLevel). The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security flaw which allowed certain users to circumvent Confluence’s security measures, by including HTML markup in their own username. This could allow a malicious user to execute Javascript on another user's authenticated session.

The following Confluence versions are vulnerable: All versions from **1.0 to 2.9**.

Risk Mitigation

If the user specified a username that included HTML markup (which could include Javascript), in some places Confluence would not correctly escape this source before displaying it. This could result in Javascript being executed in another user's authenticated session. To address the issue, you should update your Confluence instance as soon as possible (or follow the [patch instructions](https://confluence.atlassian.com/display/SECURITY/Confluence+Patch+Instructions) on the issue).

Vulnerability

This is a classic [Cross-Site Scripting](https://en.wikipedia.org/wiki/Cross-site_scripting) issue where usernames could include malicious Javascript.

Fix

This issue has been fixed in Confluence 2.9.1 (see the [release notes](https://confluence.atlassian.com/display/SECURITY/Confluence+Release+Notes), which you can download from the [download centre](https://confluence.atlassian.com/download-center).

For more information, see issue **CONF-7615** which has instructions on how to patch the affected velocity template.

Inherited Page Restrictions Are Not Applied After 2.9 Upgrade

Severity

Atlassian rates this vulnerability as **HIGH**, according to the scale published in [Confluence Security](https://confluence.atlassian.com/display/SECURITY/SecLevel). The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security flaw that caused any content permission inherited by a page to be lost during the upgrade process to Confluence 2.9.

The following Confluence versions are vulnerable: Version **2.9**; specifically instances of Confluence that were **upgraded to version 2.9** (from an earlier version) only.

Risk Mitigation

This issue can be resolved by following the steps under **Fix**, or upgrading to Confluence 2.9.1. If this cannot be done immediately, it may be prudent to manually apply restrictions to each page that is normally protected by inherited restrictions (that is, all child pages residing under a restricted page). Enacting the fix is trivial and should take around ten minutes for a typical Confluence instance.

Vulnerability
If you had given a parent page restrictions prior to the 2.9 upgrade, then any child pages that should be inheriting these restrictions are no longer restricted. This potentially renders these child pages viewable and editable by Confluence users who should not have these rights. However you should note that any space level restrictions are still respected so these affected pages are only opened as far as the space level security allows for your site. Note for individual pages where you have manually set the permissions, those pages are not at risk — just the pages underneath them using inherited permissions.

Fix

This issue has been fixed in Confluence 2.9.1 (see the release notes), which you can download from the download centre.

Alternatively, you can apply the manual fix, which involves a simple series of actions in the Confluence administration screens.

For more information see issue CONF-12911.

Access Vulnerability in View Wiki Markup Function

Severity

Atlassian rates this vulnerability as HIGH, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security flaw which allows users who don't have the correct 'View Page' permission in a space to view the Wiki Markup source of the page content.

The following Confluence versions are vulnerable: Version 2.9 only.

Risk Mitigation

If a user knows the URL to view the source of a page they will be able to bypass Confluence's security checks. This will allow the user to view the contents of a page they aren't meant to see.

To prevent unauthorised access, you may want to use your web server to reject all requests to URLs containing this string: /pages/viewpagesrc.action. You may judge it necessary to disable public access.

Vulnerability

If a user knows the ID of a page that they do not have 'View Page' permission for they can use the view source URL to view the Wiki Markup of a page. This will allow them to copy and paste the contents of the page to another location, or simply read the markup and deduce its final content.

Note: the user will need to know the page ID of a page. Confluence will not provide any links to the restricted page through a search or other navigation.

Fix

This issue has been fixed in Confluence 2.9.1 (see the release notes), which you can download from the download centre.

For more information see issue CONF-12845.

Access Vulnerability in Copy Page Function

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Severity

Atlassian rates this vulnerability as **HIGH**, according to the scale published in [Confluence Security](https://confluence.atlassian.com/display/SECURITY/Atlassian+Vulnerability+Severity+Definitions). The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security flaw which allows users who don’t have the correct ‘View Page’ permission in a space to copy a page and therefore see its content.

The following Confluence versions are vulnerable: All versions from **1.0 to 2.9**.

Risk Mitigation

If a user knows the URL to copy a page they will be able to bypass Confluence’s security checks. This will allow the user to view the contents of a page they aren’t meant to see.

To prevent unauthorised access, you may want to use your web server to reject all requests to URLs containing this string: `/pages/copypage.action`. You may judge it necessary to disable public access.

Vulnerability

If a user knows the ID of a page they do not have permissions for, they can use the copy page URL to copy the page to a space where they do have permission. This will allow them to create a new page based on the content of a page they aren’t meant to see.

Fix

This issue has been fixed in Confluence 2.9.1 (see the [release notes](https://confluence.atlassian.com/display/SECURITY/Atlassian+Vulnerability+Severity+Definitions)), which you can download from the [download centre](https://confluence.atlassian.com/download-center).

Alternatively, you can download and install the patch for Confluence **2.7.3** or **2.8.2** from our JIRA site – see issue [CONF-12859](https://confluence.atlassian.com/download-center).

Instruction on installing the patch can be found [here](https://confluence.atlassian.com/download-center).

---

**Access Vulnerability in Diff Page Function**

Severity

Atlassian rates this vulnerability as **HIGH**, according to the scale published in [Confluence Security](https://confluence.atlassian.com/display/SECURITY/Atlassian+Vulnerability+Severity+Definitions). The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security flaw which allows users who don’t have the correct ‘View Page’ permission in a space to create a diff of a page (a comparison of its contents with another page) and therefore see its content.

The following Confluence versions are vulnerable: All versions from **1.0 to 2.9**.

Risk Mitigation

If a user knows the URL to perform a diff of a page they will be able to bypass Confluence’s security checks. This will allow the user to view the contents of a page they aren’t meant to see.

To prevent unauthorised access, you may want to use your web server to reject all requests to URLs containing this string: `/pages/diffpages.action`. You may judge it necessary to disable public access.

Vulnerability
If a user knows the ID of a page they do not have permissions for, they can use the 'Diff Page' URL to compare the contents of that page with one where they do. This will allow them to deduce the contents of a page they don’t have access to.

Fix

This issue has been fixed in Confluence 2.9.1 (see the release notes), which you can download from the download centre.

Alternatively, you can download and install the patch for Confluence 2.7.3 or 2.8.2 from our JIRA site – see issue CONF-12860.

Instruction on installing the patch can be found here.

Our thanks to Neeraj Jhanji from Atlassian Partner ImaHima, who reported the copy and diff page issues to Atlassian. We fully support the reporting of vulnerabilities and we appreciate it when people work with us towards identifying and solving a problem.

Parameter Injection Vulnerability in Confluence

Severity

Atlassian rates this vulnerability as critical, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a flaw which would allow a malicious user (hacker) to inject their own values into a
Confluence request by adding parameters to the URL string. This would allow a hacker to bypass Confluence's security checks and perform actions that they are not authorised to perform.

Risk Mitigation

To address the issue, you should upgrade Confluence as soon as possible or follow the patch instructions below. If you judge it necessary, you can block all untrusted IP addresses from accessing Confluence.

Vulnerability

A hacker can design a URL string containing parameters which perform specific actions on the Confluence server, bypassing Confluence’s security checks. This is because Confluence does not adequately sanitise user input before applying it as an action on the server.

Exploiting this issue could allow an attacker to access or modify data and compromise the Confluence application.

The following Confluence versions are vulnerable: All versions from 1.3 to 2.9.1.

Fix

This issue has been fixed in Confluence 2.9.2 (see the release notes), which you can download from the download centre.

If you do not wish to upgrade to Confluence 2.9.2, a patch is available that will work with any affected version of Confluence. You can download and install the patch from our JIRA site. For more information, please refer to CONF-13092.

XSS Vulnerability in Various Confluence Actions and Plugins

Severity

Atlassian rates these vulnerabilities as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a number of security flaws which may affect Confluence instances in a public environment. The flaws are all XSS (cross-site scripting) vulnerabilities in various Confluence actions. Each vulnerability potentially allows a malicious user (hacker) to embed their own JavaScript into a Confluence page.

- The hacker might take advantage of the flaw to steal other users' session cookies or other credentials, by sending the credentials back to the hacker's own web server.
- The hacker's text and script might be displayed to other people viewing the Confluence page. This is potentially damaging to your company's reputation.

You can read more about XSS attacks at cisisecurity, CERT and other places on the web.

Risk Mitigation

If you judge it necessary, you can disable public access (e.g. anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.

Vulnerability

A hacker can inject their own JavaScript into the Confluence actions listed in the table below. Each of the actions is invoked when a user performs a specific function in Confluence, such as clicking a link or a button. The actions can also be invoked by simply entering the URL into the browser address bar. The rogue JavaScript will be executed when a user invokes the URL.
For more details please refer to the related JIRA issue, also shown in the table below.

</tr>
</tbody>
</table>

Fix

These issues have been fixed in Confluence 2.9.2 (see the release notes), which you can download from the download centre.

If you do not wish to upgrade to Confluence 2.9.2, you can download and install the patches provided on our JIRA site. For more information, please refer to the specific JIRA issues shown in the table of vulnerabilities above.

Our thanks to Thomas Jaehnel of OPTIMAbit, who reported most of the XSS vulnerabilities listed above. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

Privilege Escalation Vulnerability in Confluence Watches

Severity

Atlassian rates this vulnerability as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a flaw which would allow an unauthorised user to add a Confluence page to the list of pages they are watching, even if the user does not have permission to view that page. Under some circumstances, the unauthorised user may thus have access to information they are not authorised to see.

Risk Mitigation

This flaw does not allow the unauthorised user to update the page, but it may give the user access to information that they do not have permission to see.

Vulnerability

An unauthorised user can manipulate the HTTP request, so that it adds a watch to a page which the user does
not have permission to view. The page then appears in the user's list of watched pages, displaying the page title and the corresponding space name. In this way, the user can bypass Confluence's permission checks and gain access to information they are not authorised to see.

The following Confluence versions are vulnerable: All versions from 1.0 to 2.9.1.

Fix

This issue has been fixed in Confluence 2.9.2 (see the release notes), which you can download from the download centre.

If you do not wish to upgrade to Confluence 2.9.2, you can download and install the patches provided on our JIRA site. For more information, please refer to CONF-13039.

Our thanks to Thomas Jaehnel of OPTIMAbit, who reported the vulnerability listed above. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

Privilege Escalation Vulnerability in Confluence Favourites

Severity

Atlassian rates this vulnerability as moderate, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a flaw which would allow an unauthorised user to add a Confluence page to their list of favourites, even if the user does not have permission to view that page. Under some circumstances, the unauthorised user may thus have access to information they are not authorised to see.

Risk Mitigation

This flaw does not allow the unauthorised user to update the page, and it gives the user only very limited access to the information they do not have permission to see.

Vulnerability

An unauthorised user can manipulate the HTTP request, so that it marks as 'favourite' a page which the user does not have permission to view. The page is then added to the number of favourites for the user. The user cannot see the page title or content, but can see that the favourite count has been incremented.

The following Confluence versions are vulnerable: All versions from 1.0 to 2.9.1.

Fix

This issue has been fixed in Confluence 2.9.2 (see the release notes), which you can download from the download centre.

If you do not wish to upgrade to Confluence 2.9.2, you can download and install the patches provided on our JIRA site. For more information, please refer to CONF-13044.

Our thanks to Thomas Jaehnel of OPTIMAbit, who reported the vulnerability listed above. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

Confluence Security Advisory 2008-12-03

In this advisory:
XSS Vulnerability in Various Confluence Actions

Severity

Atlassian rates these vulnerabilities as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a number of security flaws which may affect Confluence instances in a public environment. The flaws are all XSS (cross-site scripting) vulnerabilities in various Confluence actions. Each vulnerability potentially allows a malicious user (hacker) to embed their own JavaScript into a Confluence page.

- The hacker might take advantage of the flaw to steal other users' session cookies or other credentials, by sending the credentials back to the hacker's own web server.
- The hacker's text and script might be displayed to other people viewing the Confluence page. This is potentially damaging to your company's reputation.

You can read more about XSS attacks at cgisecurity, CERT and other places on the web.

Risk Mitigation

If you judge it necessary, you can disable public access (e.g. anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.

Vulnerability

A hacker can inject their own JavaScript into various Confluence URLs — see the table below for the affected functional areas. A URL may be invoked when a user performs a specific function in Confluence, such as clicking a link or a button. The URL can also be invoked by simply entering it into the browser address bar. If rogue JavaScript is injected into such a URL, the JavaScript will be executed when a user invokes the URL.

For more details please refer to the related JIRA issue, also shown in the table below.

* The patch for CONF-13713 also addresses the bug in CONF-13736.

** To fix this issue, please upgrade your Attachments plugin to the latest version. This plugin is available for Confluence 2.8.2, 2.9.2 and 2.10, via the Confluence Plugin Repository.

### Fix

These issues have been fixed in Confluence 2.10 (see the release notes), which you can download from the download centre.

If you do not wish to upgrade to Confluence 2.10, you can download and install the patches provided on our JIRA site. You will need to upgrade to the latest point release for the major version of Confluence that you are running (e.g. if you are running Confluence 2.8, you will need to upgrade to version 2.8.2) and then apply the patches. For more information, please refer to the specific JIRA issues shown in the table of vulnerabilities above.

Please note that one of the issues can only be fixed by upgrading to Confluence 2.10. Please see the table above for details.

---

Our thanks to **Bjoern Froebe**, who reported one of the XSS vulnerabilities listed above. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

---

### Users can View a List of All Attachments by Supplying an Edited URL

#### Severity

Atlassian rates this vulnerability as medium, according to the scale published in [Confluence Security](https://confluence.atlassian.com/display/SECURITY/Confluence+Security). The scale allows us to rank a vulnerability as critical, high, moderate or low.

#### Risk Assessment

We have identified and fixed a security flaw which allows a user to view the list of all attachments for all pages in a Confluence instance, regardless of space-level or page-level permissions.
While the user cannot open the files, a range of metadata is available for viewing, including file name, the page that the file is attached to, the creator, and the creation and last-modified date of the attachment.

Risk Mitigation

If you judge it necessary, you can disable anonymous access to your wiki until you have applied the necessary patch or upgrade.

Vulnerability

If a user removes the space key from the URL while viewing attachments for a space, Confluence will display the full list of all attachments for all spaces. For more details, please refer to CONF-13874.

Fix

These issues have been fixed in Confluence 2.10 (see the release notes), which you can download from the download centre.

If you do not wish to upgrade to Confluence 2.10, you can download and install the patches provided in the JIRA issue, CONF-13874. You will need to upgrade to the latest point release for the major version of Confluence that you are running (e.g. if you are running Confluence 2.8, you will need to upgrade to version 2.8.2) and then apply the patch.

Our thanks to Matthew Goonan, who reported this vulnerability. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

Confluence Security Advisory 2009-01-07

In this advisory:

  - Fix

Content Overwrite Vulnerability in the Office Connector Plugin

Severity

Atlassian rates this vulnerability as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified a risk that makes it possible for users with read-only access to a Confluence wiki space to modify its contents via the document import feature of the Office Connector plugin. This issue, however, does not expose restricted content on a Confluence wiki space to unauthorised users.

Risk Mitigation

Please see the ‘Fix’ section below. If you cannot apply the fix immediately, you can consider taking one or more of the following steps:

- Disable the whole Office Connector plugin, as explained here.
- If you judge it necessary, you can disable public access (e.g. anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade.
- For even tighter control, you could restrict access to trusted groups.
Vulnerability

The Office Connector plugin was first bundled in Confluence version 2.10.0. Hence, this vulnerability affects Confluence 2.10.0 where the Office Connector Plugin is enabled. Additionally, this plugin is compatible with all versions of Confluence from 2.3.0 onwards. Hence, if you have installed the plugin, this vulnerability will affect your Confluence instance.

Fix

Please download and install the latest version of the Office Connector plugin via the Confluence Plugin Repository (instructions here). If you wish to install this plugin manually, you can download it from here.

Alternatively, install or upgrade to Confluence version 2.10.1. (See the release notes.) The Confluence 2.10.1 installation files can be downloaded from the download centre.

For more information, please refer to CONF-14014.

Our thanks to Justin Wong, who reported this vulnerability. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

Confluence Security Advisory 2009-02-18

In this advisory:

- HTTP Header Injection Flaw
  - Severity
  - Risk Assessment
  - Risk Mitigation
  - Vulnerability
  - Fix

HTTP Header Injection Flaw

Severity

Atlassian rates this vulnerability as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

An Advanced Warning of this Security Advisory published last week stated the severity of this vulnerability as critical. After further assessing the likelihood of attack, however, we have amended this to high.

Risk Assessment

We have identified and fixed a security flaw which may affect Confluence instances in a public environment. This flaw is an HTTP header injection vulnerability in the Seraph web framework that is used by Confluence. This potentially allows a malicious user (attacker) to modify the HTTP response to insert malicious code. An attacker could present a modified URL to users (e.g. disguised in an email message). If any user clicks the URL, the malicious code would be executed in the user's session.

- The attacker may take advantage of this flaw to steal other users' session cookies or other credentials, by sending the credentials back to the attacker's own web server.
- The attacker could also gain control over the underlying system, based on the privileges of the user whose session cookie has been stolen.
- The attacker could redirect the user to undesirable web sites. This is potentially damaging to your company's reputation.

Atlassian recommends that you upgrade to Confluence 2.10.2 to fix the vulnerabilities described below.

Risk Mitigation
We strongly recommend either patching or upgrading your Confluence installation to fix this vulnerability. Please see the 'Fix' section below.

Alternatively, you may consider taking the following step, although the time required to fix this vulnerability and the extent of its effectiveness will depend on your application server running Confluence and its configuration:

- Consult the vendor of your application server to see whether your application server is immune to header injection vulnerabilities or has configuration options to prevent such attacks. For example, the Coyote (HTTP) connector in Tomcat version 5.5 and later is immune to header injection attacks, as acknowledged in this reference.

  Technical note: In your application server, header injection vulnerabilities can be mitigated if the setHeader(), addHeader(), and sendRedirect() methods in the HttpServletResponse class have their parameters properly checked for header termination characters.

    You may wish to forward this technical note to the vendor of your application server to help them assess the vulnerability of your application server to header injection attacks.

Vulnerability

All versions of Confluence prior to 2.10.2 are vulnerable to this security flaw.

Fix

The fix updates the Seraph framework to a version which correctly encodes and validates redirect URLs before sending them back to the user.

To patch your existing installation of Confluence, please refer to CONF-14275. This JIRA issue contains the downloadable patch file and instructions on how to patch your existing Confluence installation.

Alternatively, install or upgrade to Confluence version 2.10.2. (See the release notes.) The Confluence 2.10.2 installation files can be downloaded from the download centre.

For more information, please refer to CONF-14275.

Confluence Security Advisory 2009-04-15

In this advisory:

- XSS Vulnerability in Various Confluence Macros
  - Severity
  - Risk Assessment
  - Risk Mitigation
  - Vulnerability
  - Fix

- HTTP Header Injection Flaw with Attachment Filenames
  - Severity
  - Risk Assessment
  - Risk Mitigation
  - Vulnerability
  - Fix

XSS Vulnerability in Various Confluence Macros

Severity

Atlassian rates this vulnerability as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment
We have identified and fixed two security flaws which may affect Confluence instances in a public environment. These flaws are all cross-site scripting (XSS) vulnerabilities in Confluence's Index and Widget Macros. Each vulnerability potentially allows a malicious user (attacker) to embed their own JavaScript into a Confluence page, which will be executed when the page is rendered.

- The hacker might take advantage of the flaw to steal other users' session cookies or other credentials, by sending the credentials back to the hacker's own web server.
- The hacker's text and script might be displayed to other people viewing the Confluence page. This is potentially damaging to your company's reputation.

You can read more about XSS attacks at cgisecurity, CERT and other places on the web.

Risk Mitigation

We recommend either patching or upgrading your Confluence installation to fix this vulnerability. Please see the 'Fix' section below.

Alternatively if you are not in a position to undertake this immediately and you judge it necessary, you can disable public access (e.g. anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.

You could also temporarily disable the Widget Connector plugin and the Index Macro module of the Confluence Advanced Macros plugin until you have applied the necessary patch or upgrade. Be aware, however, that this will cause any occurrence of these macros on existing pages or blogs in your Confluence site to render with 'Unknown Macro' indications.

Vulnerability

All versions of Confluence prior to 2.10.3 are vulnerable to this security flaw.

Fix

The fixes include an update to the Index Macro, such that it correctly renders content on the page and an update to the Widget Macro, such that it correctly encodes all parameters passed to it.

To patch your existing installation of Confluence, please refer to CONF-14753 for the Index Macro and CONF-14337 for the Widget Macro. These JIRA issues contain the downloadable patch files and instructions on how to patch your existing Confluence installation.

Alternatively, install or upgrade to Confluence version 2.10.3. (See the release notes.) The Confluence 2.10.3 installation files can be downloaded from the download centre.

For more information, please refer to CONF-14753 and CONF-14337.

Our thanks to Igor Minar, who reported one of the XSS vulnerabilities listed above. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

HTTP Header Injection Flaw with Attachment Filenames

Severity

Atlassian rates this vulnerability as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security flaw with attachment filenames. This vulnerability could lead to an HTTP Header Injection attack through the upload of attachments with modified filenames designed to exploit this flaw. An attacker could insert malicious code into the HTTP response, which would be executed in the user's session.
The attacker may take advantage of this flaw to steal other users' session cookies or other credentials, by sending the credentials back to the attacker's own web server.

The attacker could also gain control over the underlying system, based on the privileges of the user whose session cookie has been stolen.

The attacker could redirect the user to undesirable web sites. This is potentially damaging to your company's reputation.

Risk Mitigation

We strongly recommend either patching or upgrading your Confluence installation to fix this vulnerability. Please see the 'Fix' section below.

If you judge it necessary, you can disable public access (e.g. anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.

Alternatively, you may consider taking the following step, although the time required to fix this vulnerability and the extent of its effectiveness will depend on your application server running Confluence and its configuration:

- Consult the vendor of your application server to see whether your application server is immune to header injection vulnerabilities or has configuration options to prevent such attacks. For example, the Coyote (HTTP) connector in Tomcat version 5.5 and later is immune to header injection attacks, as acknowledged in this reference.

  Technical note: In your application server, header injection vulnerabilities can be mitigated if the setHeader(), addHeader(), and sendRedirect() methods in the HttpServletResponse class have their parameters properly checked for header termination characters.

You may wish to forward this technical note to the vendor of your application server to help them assess the vulnerability of your application server to header injection attacks.

Vulnerability

All versions of Confluence prior to 2.10.3 are vulnerable to this security flaw.

Fix

The fix includes a new header-injection prevention filter in Confluence, which ensures attachment filenames or any other user-provided data is correctly encoded before being included in HTTP headers.

To patch your existing installation of Confluence, please refer to CONF-14704. This JIRA issue contains the downloadable patch files and instructions on how to patch your existing Confluence installation.

Alternatively, install or upgrade to Confluence version 2.10.3. (See the release notes.) The Confluence 2.10.3 installation files can be downloaded from the download centre.

For more information, please refer to CONF-14704.

Confluence Security Advisory 2009-06-01

In this advisory:

- XSS Vulnerability in Various Confluence Actions and Macros
  - Severity
  - Risk Assessment
  - Risk Mitigation
  - Vulnerability
  - Fix

XSS Vulnerability in Various Confluence Actions and Macros

Severity
Atlassian rates these vulnerabilities as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a number of security flaws which may affect Confluence instances in a public environment. These are cross-site scripting (XSS) that affect various Confluence page/blog features and functions.

- The hacker might take advantage of the flaw to steal other users' session cookies or other credentials, by sending the credentials back to the hacker's own web server.
- The hacker's text and script might be displayed to other people viewing the Confluence page. This is potentially damaging to your company's reputation.

You can read more about XSS attacks at cgisecurity, CERT and other places on the web.

Risk Mitigation

We recommend either patching or upgrading your Confluence installation to fix these vulnerabilities. Please see the 'Fix' section below.

Alternatively, if you are not in a position to undertake this immediately and you judge it necessary, you can disable public access (e.g. anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.

Vulnerability

A hacker can inject their own JavaScript into various Confluence URLs — see the table below for the affected functional areas. A URL may be invoked when a user performs a specific function in Confluence, such as clicking a link or a button. The URL can also be invoked by simply entering it into the browser address bar. If rogue JavaScript is injected into such a URL, the JavaScript will be executed when a user invokes the URL.

For more details please refer to the related JIRA issue, also shown in the table below.

<td>2.10.3</td>
<td>CONF-15754</td>
</tr>
</tbody>
</table>
* This vulnerability may be present in earlier Confluence versions with the Office Connector plugin installed.

**Fix**

These issues have been fixed in Confluence 3.0 (see the release notes), which you can download from the download centre.

If you do not wish to upgrade to Confluence 3.0, you can download and install the patches provided on our JIRA site. You will need to upgrade to the latest point release for the major version of Confluence that you are running (e.g. if you are running Confluence 2.9, you will need to upgrade to version 2.9.2) and then apply the patches. For more information, please refer to the specific JIRA issues shown in the table of vulnerabilities above.

**Confluence Security Advisory 2009-06-16**

In this advisory:

- **Page Content Vulnerabilities**
  - **Severity**
  - **Risk Assessment**
  - **Risk Mitigation**
  - **Vulnerability**
  - **Fix**

---

**Page Content Vulnerabilities**

If you have already upgraded to Confluence 3.0, then you are not affected by the vulnerabilities described on this page and there is no need to take any further action.

**Severity**

Atlassian rates these vulnerabilities as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

**Risk Assessment**

We have identified and fixed two security vulnerabilities which may affect Confluence instances in a public environment. Both of these fixes are associated with a tightening of user access restrictions when either viewing specific page content or adding new page content.

The first of these vulnerabilities allows a user without permission to view a given page, to view the contents of any files attached to that page using the view file macro. This assumes that the user has permission to edit or create another page within the Confluence site and knows the name of the file attached to the page they cannot view. For more information, please refer to the JIRA issue CONF-15809.

The second of these vulnerabilities allows users with space administrator permissions to import pages to a Confluence space. The security level of this function has been tightened to permit only users with the system administration permission to access it. For more information, please refer to CONF-15267.

**Risk Mitigation**

If you have not already upgraded to Confluence 3.0, then we recommend either patching or upgrading your Confluence installation to fix these vulnerabilities. Please see the ‘Fix’ section below.

Alternatively, if you are not in a position to undertake this immediately and you judge it necessary, you can disable public access (e.g. anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.
All versions of Confluence up to and including version 2.10.3 with the Office Connector plugin installed are affected by the first view file macro vulnerability.

All versions of Confluence 2.10.x are affected by the second page imports vulnerability.

Fix

These issues have been fixed in Confluence 3.0 (see the release notes), which you can download from the download centre.

If you do not wish to upgrade to Confluence 3.0, you can download and install the patches provided on our JIRA site. You will need to upgrade to the latest point release for the major version of Confluence that you are running (e.g. if you are running Confluence 2.10.0, you will need to upgrade to version 2.10.3) and then apply the patches. For more information, please refer to the specific JIRA issues shown below.

To download the patch to fix the first view file macro vulnerability, please refer to CONF-15809.

To download the patch to fix the second page import vulnerability, please refer to CONF-15267.

Confluence Security Advisory 2009-08-20

In this advisory:

- Privilege Escalation Vulnerability in Profile Picture Handling
  - Severity
  - Risk Assessment
  - Risk Mitigation
  - Vulnerability
  - Fix

- XSS Vulnerability in Various Page and Blog Post Features and Functions
  - Severity

  - Fix

Privilege Escalation Vulnerability in Profile Picture Handling

Severity

Atlassian rates this vulnerability as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified a privilege escalation vulnerability, which could provide an attacker with access to administrative areas and functions of Confluence when specifying a profile picture. Under some circumstances, the attacker could gain access to Confluence administrative functions that they are not authorised to use.

Risk Mitigation

To address the issue, you should upgrade to Confluence 3.0.1 as soon as possible or follow the patch instructions in the Fix section below. If you judge it necessary, you can disable public signup to your wiki until you have applied the necessary patch or have performed the upgrade. For even tighter control, you could also restrict access to trusted groups or additionally, disable anonymous access until your system is patched or upgraded.

Vulnerability
The profile picture handling feature in all versions of Confluence up to 3.0.0 are affected by this issue. However, the Form Token Handling mechanism available in Confluence 3.0.0 and later means that the administrative areas in these versions of Confluence cannot be compromised by this vulnerability.

Fix

This issue has been fixed in Confluence 3.0.1 (see the release notes), which you can download from the download center.

If you do not wish to upgrade to Confluence 3.0.1 and you are running Confluence 2.10.x, you can download and install the patches provided on our JIRA site. We strongly recommend that you upgrade to the latest point release (2.10.3) before applying the patch. For more information, please refer to CONF-16141.

Our thanks to Elliot Kendall of Emory University, who reported this vulnerability. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

XSS Vulnerability in Various Page and Blog Post Features and Functions

Severity

Atlassian rates these vulnerabilities as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a number of XSS vulnerabilities in various Confluence page/blog features and functions, which may affect Confluence instances in a public environment.

XSS vulnerabilities potentially allow a malicious user (attacker) to embed their own JavaScript into a Confluence page.

- The attacker might take advantage of the vulnerability to steal other users' session cookies or other credentials, by sending the credentials back to the attacker's own web server.
- The attacker's text and script might be displayed to other people viewing the Confluence page. This is potentially damaging to your company's reputation.

You can read more about XSS attacks at cgisecurity, CERT and other places on the web.

Risk Mitigation

We recommend either patching or upgrading your Confluence installation to fix these vulnerabilities. Please see the 'Fix' section below.

Alternatively, if you are not in a position to undertake this immediately and you judge it necessary, you can disable public access (e.g. anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.

Vulnerability

An attacker can inject their own JavaScript into the Confluence actions listed in the table below. Each of the actions is invoked when a user performs a specific function in Confluence, such as clicking a link or a button. The actions can also be invoked by simply entering the URL into the browser address bar. The rogue JavaScript will be executed when a user invokes the URL.

For more details please refer to the related JIRA issue, also shown in the table below.
<table>

<td>3.0.0</td>
<td>3.0.0 and 3.0.1</td>
<td>CONF-16209</td>
</tr>
</tbody>
</table>

* Applying the patch for one of these issues fixes the other.

Fix

These issues have been fixed in Confluence 3.0.1 (see the release notes), which you can download from the download centre.

If you do not wish to upgrade to Confluence 3.0.1, you can patch your existing installation by downloading and installing the patched files provided on our JIRA site. For the WebDAV plugin vulnerability, this would involve upgrading the version of the plugin. We strongly recommend that you upgrade to the latest point release of the major version of Confluence that you are running before applying the patches. For example, if you are running Confluence 2.10.1, you should upgrade to version 2.10.3 and then apply the patches. For more information, please refer to the specific JIRA issues shown in the table of vulnerabilities above.

Confluence Security Advisory 2009-10-06

In this advisory:

- Session Fixation Vulnerability
  - Severity
  - Risk Assessment
  - Risk Mitigation
  - Vulnerability
  - Fix

- XSS Vulnerability in Various Confluence Macros
  - Severity
  - Risk Assessment
  - Risk Mitigation
  - Vulnerability
  - Fix

Session Fixation Vulnerability

Severity

Atlassian rates these vulnerabilities as **high**, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security vulnerability which may affect Confluence instances in a public
environment. This vulnerability could lead to a session fixation attack, in which the malicious user (attacker) can gain access to a victim’s Confluence resources whilst the victim is logged in to their Confluence user account.

The attacker does this by fixating (or setting) their session ID onto the victim's computer. While the victim is logged in, all the victim's privileges are associated with the attacker's session ID, effectively granting the attacker access to all of the Confluence data and resources accessible to the victim.

For more information about session fixation attacks, please refer to the following sources:

- Chris Shiflett's Security Corner article
- The Web Application Security Consortium’s overview

Risk Mitigation

We recommend either patching or upgrading your Confluence installation to fix these vulnerabilities. Please see the ‘Fix’ section below.

Alternatively, if you are not in a position to undertake this immediately and you judge it necessary, you can disable public access (e.g. anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.

Vulnerability

All versions of Confluence prior to 3.0.2 are vulnerable to this security issue.

Fix

These issues have been fixed in Confluence 3.0.2 (see the release notes), which you can download from the download centre.

If you do not wish to upgrade to Confluence 3.0.2 and you are currently running Confluence version 2.10.x or 3.0.x, you can patch your existing installation by downloading the appropriate patch file attached to JIRA issue CONF-15108 and installing the patch file using the instructions provided in this JIRA issue.

Our thanks to Ben L Broussard who reported this vulnerability. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

XSS Vulnerability in Various Confluence Macros

Severity

Atlassian rates these vulnerabilities as high, according to the scale published in Confluence Security. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a number of security vulnerabilities which may affect Confluence instances in a public environment. These flaws are cross-site scripting (XSS) vulnerabilities in Confluence’s pagetree, userlister and content by label macros. These XSS vulnerabilities potentially allow an attacker to embed their own JavaScript into a Confluence page.

- The attacker might take advantage of the vulnerability to steal other users’ session cookies or other credentials, by sending the credentials back to the attacker's own web server.
- The attacker's text and script might be displayed to other people viewing the Confluence page. This is potentially damaging to your company’s reputation.

You can read more about XSS attacks at cgisecurity, CERT and other places on the web.

Risk Mitigation
We recommend either patching or upgrading your Confluence installation to fix these vulnerabilities. Please see the 'Fix' section below.

Alternatively, if you are not in a position to undertake this immediately and you judge it necessary, you can disable public access (e.g. anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.

Vulnerability

An attacker can inject their own JavaScript into the Confluence actions listed in the table below. Each of the actions is invoked when a user performs a specific function in Confluence, such as clicking a link or a button. The actions can also be invoked by simply entering the URL into the browser address bar. The rogue JavaScript will be executed when a user invokes the URL.

For more details please refer to the related JIRA issue, also shown in the table below.

<table>
<thead>
<tr>
<th>Confluence action</th>
<th>Affected Confluence Versions</th>
<th>Fix Availability</th>
<th>More Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pagetree Macro</td>
<td>2.8.0 – 3.0.1</td>
<td>2.10.0 – 3.0.2 inclusive</td>
<td>CONF-16651</td>
</tr>
<tr>
<td>Userlister Macro</td>
<td>2.6.0 – 3.0.1</td>
<td>2.10.0 – 3.0.2 inclusive</td>
<td>CONF-16644</td>
</tr>
<tr>
<td>Content by Label Macro</td>
<td>2.10.0 – 3.0.1</td>
<td>2.10.0 – 3.0.2 inclusive</td>
<td>CONF-15440</td>
</tr>
</tbody>
</table>

Fix

These issues have been fixed in Confluence 3.0.2 (see the release notes), which you can download from the download centre.

If you do not wish to upgrade to Confluence 3.0.2, you can patch your existing installation by upgrading the plugins for these macros via the Confluence Plugin Repository to the version indicated in the JIRA issues listed in the vulnerability section (above).

Confluence Security Advisory 2009-12-08

In this advisory:

- XSS Vulnerability in Various Confluence Actions and Macros
  - Severity
  - Risk Assessment
  - Risk Mitigation
  - Vulnerability
  - Fix

XSS Vulnerability in Various Confluence Actions and Macros

Severity

Atlassian rates these vulnerabilities as high, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a number of security vulnerabilities which may affect Confluence instances in a public environment. These flaws are cross-site scripting (XSS) vulnerabilities that could occur when creating a
page or blog post in a personal space, using the `indexbrowser.jsp` form and when using the `gallery macro`.

- The attacker might take advantage of the vulnerability to steal other users’ session cookies or other credentials, by sending the credentials back to the attacker’s own web server.
- The attacker’s text and script might be displayed to other people viewing the Confluence page. This is potentially damaging to your company’s reputation.

You can read more about XSS attacks at [cquisecurity](https://cquisecurity.com), [CERT](https://www.cert.org) and other places on the web.

**Risk Mitigation**

We recommend either patching or upgrading your Confluence installation to fix these vulnerabilities. Please see the ‘Fix’ section below.

Alternatively, if you are not in a position to undertake this immediately and you judge it necessary, you can disable public access (e.g. anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.

**Vulnerability**

An attacker can inject their own JavaScript into the Confluence actions listed in the table below. Each of the actions is invoked when a user performs a specific function in Confluence, such as clicking a link or a button. The actions can also be invoked by simply entering the URL into the browser address bar. The rogue JavaScript will be executed when a user invokes the URL.

For more details please refer to the related JIRA issue, also shown in the table below.

<table>
<thead>
<tr>
<th>Confluence action</th>
<th>Affected Confluence Versions</th>
<th>Fix Availability</th>
<th>More Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page or blog post creation in a personal space</td>
<td>2.10 – 3.0.2</td>
<td>3.0.0 – 3.1 inclusive</td>
<td>CONF-17031</td>
</tr>
<tr>
<td>Using the <code>indexbrowser.jsp</code> form</td>
<td>All versions prior to and including 3.0.2</td>
<td>3.0.0 – 3.1 inclusive</td>
<td>CONF-17165</td>
</tr>
<tr>
<td>Gallery macro</td>
<td>2.9 – 3.0.2</td>
<td>3.0.0 – 3.1 inclusive</td>
<td>CONF-17361</td>
</tr>
<tr>
<td>Page tree and page tree search macros</td>
<td>2.9 – 3.0.2</td>
<td>2.8 – 3.1 inclusive</td>
<td>CONF-17967</td>
</tr>
<tr>
<td>Status updates tab of the user profile area</td>
<td>3.0.0 – 3.0.2</td>
<td>3.0.0 – 3.1 inclusive</td>
<td>CONF-17933</td>
</tr>
</tbody>
</table>

**Fix**

These issues have been fixed in Confluence 3.1 (see the release notes), which you can download from the download centre.

If you do not wish to upgrade to Confluence 3.1, you can patch your existing installation by upgrading the plugins for these macros via the Confluence Plugin Repository to the version indicated in the JIRA issues listed in the vulnerability section (above).

**Confluence Security Advisory 2010-05-04**
This advisory announces a number of security vulnerabilities in earlier versions of Confluence that we have found and fixed in Confluence 3.2.1. In addition to releasing Confluence 3.2.1, we also provide patches for the most important vulnerabilities mentioned. You will be able to apply these patches to older versions of Confluence. There will, however, be a number of security improvements in Confluence 3.2.1 that cannot be patched or backported. We recommend upgrading to Confluence 3.2.1 rather than applying the patches.

In this advisory:

- **XSS Vulnerabilities**
  - **Severity**
  - **Risk Assessment**

    - Applying the patch
  - **Step 2 of the Patch Procedure: Upgrade your Plugins**
  - **Step 3 of the Patch Procedure: Remove the Database Check Utility if Previously Installed**

**XSS Vulnerabilities**

**Severity**

Atlassian rates these vulnerabilities as **high**, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank a vulnerability as critical, high, moderate or low.

**Risk Assessment**

We have identified and fixed a number of security vulnerabilities which may affect Confluence instances in a public environment. These flaws are cross-site scripting (XSS) vulnerabilities exposed in the Confluence functions described in the table below.

- An attacker might take advantage of the vulnerability to steal other users' session cookies or other...
credentials, by sending the credentials back to such an attacker's own web server.

- An attacker’s text and script might be displayed to other people viewing the Confluence page. This is potentially damaging to your company’s reputation.

You can read more about XSS attacks at cisisecurity, CERT and other places on the web.

**Vulnerability**

We identified and fixed vulnerabilities in the Confluence features described in the table below.

<table>
<thead>
<tr>
<th>Confluence Feature</th>
<th>Affected Confluence Versions</th>

<td>3.0.0 – 3.2.0</td>
<td>3.2.1 and plugin upgrade</td>
<td>CONF-19381</td>
<td>High</td>
</tr>
</tbody>
</table>

**Risk Mitigation**
We recommend either patching or upgrading your Confluence installation to fix these vulnerabilities. Please see the 'fix' section below.

Alternatively, if you are not in a position to upgrade or patch immediately and you judge it necessary, you can disable public access (such as anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.

**Fix**

Confluence 3.2.1 fixes all of these issues. See the release notes. You can download Confluence 3.2.1 from the download centre.

If you cannot upgrade to Confluence 3.2.1, you can patch your existing installation using the patches and plugin upgrades listed below. We strongly recommend upgrading to 3.2.1 however, since it adds even more security features than the patches.

**Changed behaviour in Confluence**

We have removed the indexbrowser.jsp and the viewdocument.jsp pages that used to provide access to the Confluence index browser. Instead, if you need to see more details of the indexed pages in your Confluence site, you can download and run Luke. Luke is a development and diagnostic tool that accesses existing Lucene indexes and allows you to display and modify their content in several ways. See our document on content index administration.

Our thanks to Brett Porter of The Apache Software Foundation and to David Belcher of Research in Motion, who reported some of the vulnerabilities mentioned above. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

**XSS Vulnerability in Database Check Utility (Not Bundled with Confluence)**

**Severity**

Atlassian rates this vulnerability as high, according to the scale published in Confluence Security.

**Risk Assessment**

We have identified and fixed a cross-site scripting (XSS) vulnerability in the Atlassian database check utility that some customers may have installed. The utility is a JSP file, supplied as an attachment to a documentation page.

Note that this utility is not bundled with Confluence. This vulnerability applies to you only if you have downloaded and installed the JSP.

**Vulnerability**

An attacker can inject their own JavaScript when invoking the database check utility. The rogue JavaScript will be executed when a user invokes the URL. For more details, please refer to CONF-19406.

**Risk Mitigation**

If you have previously downloaded and installed the testdatabase.jsp utility from the documentation page, you should now remove the testdatabase.jsp file from your <confluence-install>\confluence directory.

When you need to use the utility again, you can download the updated version from the same documentation.
Fix

If you have previously downloaded and installed the `testdatabase.jsp` utility from the [documentation page](#), you should now remove the `testdatabase.jsp` file from your `<confluence-install>` directory.

When you need to use the utility again, you can download the updated version from the same documentation page.

⚠️ This fix is not part of Confluence 3.2.1

Because the JSP file is not shipped with the Confluence installation, there is no patch for this vulnerability and there is no fix for it in Confluence 3.2.1. Please check your installation and remove or update the JSP if present.

Unnecessary Exposure of and Access to Information

**Severity**

Atlassian rates these vulnerabilities as **high** and **moderate**, according to the scale published in [Confluence Security](#).

**Risk Assessment**

We have identified a number of areas where Confluence exposes an unnecessary amount of information that may be useful to an attacker if such an attacker gained access to the information.

**Vulnerability**

We have identified a number of areas where Confluence exposes an unnecessary amount of information, including sensitive information such as usernames and passwords. If an attacker gains access to such information, it may allow such an attacker to gain access to administrative areas and functions of Confluence that they are not authorised to use. Details of each vulnerability are in the table below.

For more details please refer to the related JIRA issues, also shown in the table below.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Daily site backup</td>
<td>2.7.0 – 3.2.0</td>
<td>3.2.1 only</td>
<td>The path to the daily site backup is configurable via the Confluence Administration Console. It is possible to set the daily backup path and (partial) name through the web UI. This allows an attacker to put the backup in a location that is served by the application server. See CONF-19397</td>
<td>Moderate</td>
</tr>
<tr>
<td>SOAP and XML-RPC APIs</td>
<td>2.7.0 – 3.2.0</td>
<td>3.2.1 only</td>
<td>The SOAP and XML-RPC APIs give too much information when returning an error about an incorrect login. See CONF-19398</td>
<td>High</td>
</tr>
<tr>
<td>Information about Confluence administrators</td>
<td>2.7.0 – 3.2.0</td>
<td>3.2.1 only</td>
<td>The list of Confluence administrators is accessible via a URL and shows the username, full name and email address of all administrators. See CONF-19395</td>
<td>Moderate</td>
</tr>
</tbody>
</table>

**Risk Mitigation**

We recommend that you upgrade your Confluence installation to fix these vulnerabilities. Please see the 'fix' section below.

Alternatively, if you are not in a position to upgrade or patch immediately, consider applying these measures:

- Control the access to your administrator accounts, as described in our document on [best practices for configuring Confluence security](#).
- Disable access to the SOAP and XML-RPC APIs, if these remote APIs are not required. (Remote API access is disabled by default.) See the page about [enabling remote APIs](#).
- Manually remove the list of Confluence administrators that is accessible via a URL, by editing the relevant Velocity template file as follows:
  1. Edit the `administrators.vm` file, located in `{confluence-install}/confluence` for standalone installations, or at the root of the web app for WAR installations.
  2. Replace the content with a message that you would like to be displayed whenever someone accesses this URL. For example:
<html>
<head>
    <title>$action.getText("title.administrators")</title>
</head>
<body>
    The list of Confluence administrators is no longer available. If you would like to contact an administrator, please email admins at example dot com.
</body>
</html>

3. Save the file. (There is no need to restart Confluence.)

**Fix**

Confluence 3.2.1 fixes these issues. See the release notes. You can download Confluence 3.2.1 from the download centre.

**Changed Behaviour in Confluence**

In order to fix these problems, we have changed Confluence's behaviour as follows:

- We have removed all license, username and password information from the zip file generated by the Confluence support request form.
- It is no longer possible to specify a 'CC' email address on the Confluence support request form.
- By default, it is no longer possible to specify a site support email address in the 'General Configuration' section of the Confluence Administration Console. Administrators can restore this functionality by updating the confluence.cfg.xml file found in the Confluence Home Directory. Confluence now recognises a new property in this configuration file, called admin.ui.allow.site.support.email. If the value of the property is 'true', it will be possible to specify a site support email address via the Confluence Administration Console. If the value of this property is 'false' or the property is not present in the file, the email address is not configurable. By default in Confluence 3.2.1 and later, the value is 'false'.
- By default, the path to the daily site backup is no longer configurable via the Confluence Administration Console. Confluence now recognises a new property called admin.ui.allow.daily.backup.custom.location in the confluence.cfg.xml file. If the value of this property is 'true', the administrator can change the daily backup path. If the value of this property is 'false' or the property is not present in the file, the backup path is not configurable. By default in Confluence 3.2.1 and later, the value is 'false'.
- By default, it is no longer possible to download an XML backup of the Confluence site from the Confluence Administration Console. Instead, you need access to the Confluence server machine in order to retrieve the XML site backup file. Confluence now recognises a new property called admin.ui.allow.manual.backup.download in the confluence.cfg.xml file. If the value of this property is 'true', the Administration Console provides an option to download the XML site backup file. If the value of this property is 'false' or the property is not present in the file, the XML download is not available from the Administration Console. By default in Confluence 3.2.1 and later, the value is 'false'.
- On invalid login attempts, the SOAP and XML-RPC APIs no longer give away the specific information that the user does not exist or that the password is invalid.
- The administrators.action URL no longer opens a page showing the list of Confluence administrators. Instead, the URL will now present a form which you can use to email all the administrators of the site. This is preferable since it does not give the user any information about who these administrators are. See our documentation on configuring the administrator contact page.

**General Tightening of the Confluence Security Model**

**Severity**
Atlassian rates these vulnerabilities as **high** and **moderate**, according to the scale published in [Confluence Security](#).

**Risk Assessment**

We have improved the security of the following areas in Confluence:

- Prevention of brute force attacks by imposing a maximum number of repeated login attempts.
- Handling of decorator layouts.

**Vulnerability**

We have identified and fixed a problem where Confluence allows an unlimited number of repeated login attempts, potentially opening Confluence to a brute force attack. We have also improved the security around the handling of decorator layouts. Details of each improvement are in the table below.

For more details please refer to the related JIRA issues, also shown in the table below.

<table>
<thead>
<tr>
<th>Confluence action</th>
<th>Affected Confluence Versions</th>
<th>Fix Availability</th>
<th>More Details</th>
<th>Severity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Site and space decorator layouts</td>
<td>All versions up to and including 3.2.0</td>
<td>3.2.1 and patch</td>
<td>The BootstrapManager exposed in site and space layout templates should be read only. See <a href="#">CONF-19401</a></td>
<td>High</td>
</tr>
<tr>
<td>Login</td>
<td>All versions up to and including 3.2.0</td>
<td>3.2.1 only</td>
<td>Confluence does not set a maximum to the number of repeated login attempts. This makes Confluence vulnerable to a brute force attack. See <a href="#">CONF-19396</a></td>
<td>Moderate</td>
</tr>
</tbody>
</table>

**Risk Mitigation**

We recommend that you upgrade your Confluence installation to fix these vulnerabilities. Please see the 'fix' section below.

Alternatively, if you are not in a position to upgrade immediately, you can patch your existing installation using the patches listed below. The patch will fix the problem with the decorator layouts.

You can prevent brute force attacks by following our guidelines on using [Fail2Ban to limit login attempts](#).

**Fix**

Confluence 3.2.1 fixes these issues. See the [release notes](#). You can download Confluence 3.2.1 from the [download centre](#).

Alternatively, if you are not in a position to upgrade immediately, you can patch your existing installation using...
the patches listed below. The patch will fix the problem with the decorator layouts.

**Changed Behaviour in Confluence**

In order to fix these problems, we have changed Confluence's behaviour as follows:

- We have improved the security in the way Confluence handles decorator layouts. The BootstrapManager is now read only.
- After three failed login attempts, Confluence will display a Captcha form asking the user to enter a given word when attempting to log in again. This will prevent brute force attacks via the login screen. In addition, after three failed login attempts via the XML-RPC or SOAP API, an error message will be returned instructing the user to log in via the web interface. Captcha will automatically be activated when they attempt this login.

**Available Patches and Plugin Upgrades**

If for some reason you cannot upgrade to Confluence 3.2.1, you can apply the following patches and plugin upgrades to fix the most pressing vulnerabilities described in this security advisory.

**Step 1 of the Patch Procedure: Install the Patches**

Patches are available for Confluence 3.2.0, 3.1.2, 3.0.2, 2.10.4, 2.9.3 and 2.8.3. You need to upgrade to the specified bug-fix release of the relevant major version before applying the patches. For example, if your version is Confluence 3.0.0, first upgrade to 3.0.2 and then apply the relevant patch.

The available patches address the following issues:

- XSS in search (CONF-19382).
- XSS in attachment upload (CONF-19388).
- XSS in the index browser JSP (CONF-19404).
- XSS in the JSP that provides an administrator with the location on the file system where the attachments for a given space are stored (CONF-19404).
- XSS in the JSP that allows an administrator to reset null emails addresses (CONF-19404).
- XSS in colour scheme settings (CONF-19384).
- XSS in error messages (CONF-19390 and CONF-19402).
- XSS in content rendering (CONF-19441).
- Secure handling of site and space decorator layouts (CONF-19401).

Each patch covers all of the above issues, and is applicable to the specific version of Confluence. To install the patch, download the appropriate version and follow the instructions below.

<table>
<thead>
<tr>
<th>Your Confluence Version</th>
<th>File</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.2.0</td>
<td>confluence-project-3.2.0-stable.zip</td>
</tr>
<tr>
<td>3.1.2</td>
<td>confluence-project-3.1-stable.zip</td>
</tr>
<tr>
<td>3.0.2</td>
<td>confluence-project-3.0-stable.zip</td>
</tr>
<tr>
<td>2.10.4</td>
<td>confluence-project-2.10-stable.zip</td>
</tr>
<tr>
<td>2.9.3</td>
<td>confluence-project-2.9-stable.zip</td>
</tr>
<tr>
<td>2.8.3</td>
<td>confluence-project-2.8-stable.zip</td>
</tr>
</tbody>
</table>

**Applying the patch**
If you are using the Standalone distribution of Confluence:

1. Make a backup of the <confluence_install_dir>/confluence/ directory.
2. Download the confluence-x-patch.zip file from the location given in the table above, for your version of Confluence.
3. Expand the zip file into <confluence_install_dir>/confluence/, overwriting the existing files in that location.
4. Restart Confluence.

If you are using the WAR distribution of Confluence:

1. Make a backup of the <confluence_exploded_war>/confluence/ directory.
2. Download the confluence-x-patch.zip file from the location given in the table above, for your version of Confluence.
3. Expand the zip file into <confluence_exploded_war>/confluence/, overwriting the existing files in that location.
4. Run 'build.sh clean' on UNIX, or 'build.bat clean' on Windows.
5. Run 'build.sh' on UNIX or 'build.bat' on Windows.
6. Redeploy the Confluence web app into your application server.

Step 2 of the Patch Procedure: Upgrade your Plugins

Two of the above vulnerabilities exist in plugins and are therefore not included in the patch. To fix these vulnerabilities, you will need to upgrade the affected plugin to get the fixed version. You can upgrade the plugins in the normal manner, via the Confluence Plugin Repository. Please refer to the documentation for more details on installing plugins.

1. If you are running Confluence 3.1.0 or later, you will need to install the latest version of the Confluence Advanced Macros plugin. Earlier versions of Confluence are not affected and therefore do not need an upgraded plugin.
2. If you are running Confluence 3.0.0 or later, you will need to install the latest version of the Social Bookmarking plugin. Earlier versions of Confluence are not affected and therefore do not need an upgraded plugin.

Step 3 of the Patch Procedure: Remove the Database Check Utility if Previously Installed

If you have previously downloaded and installed the testdatabase.jsp utility from the documentation page, you should now remove the testdatabase.jsp file from your <confluence-install>\confluence directory. See above for more details of this utility.

Confluence Security Advisory 2010-06-02

This security advisory announces a vulnerability in the Confluence Mail Page plugin that may expose a Confluence site to XSS (cross-site scripting) attacks, if it is enabled (note, the Confluence Mail Page plugin is disabled by default). If you do not have this plugin enabled, your site will not be affected. However, we recommend that you still read the advisory below.

In this advisory:

- XSS Vulnerability in Confluence Mail Page Plugin
  - Severity
  - Risk Assessment
  - Vulnerability
  - Risk Mitigation
  - Fix

XSS Vulnerability in Confluence Mail Page Plugin
Severity

Atlassian rates this vulnerability as **high**, according to the scale published in [Severity Levels for Security Issues](https://confluence.org/security). The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security vulnerability which may affect Confluence instances in a public environment. This flaw is a cross-site scripting (XSS) vulnerability that could occur if you have the Confluence Mail Page plugin enabled. The Confluence Mail Page plugin is bundled with Confluence, although it is disabled by default.

- The attacker might take advantage of the vulnerability to steal other users’ session cookies or other credentials, by sending the credentials back to the attacker’s own web server.
- The attacker's text and script might be displayed to other people viewing the Confluence page. This is potentially damaging to your company's reputation.

You can read more about XSS attacks at [cguide](http://www.cguide.com) and other places on the web.

Vulnerability

An attacker can execute their own JavaScript when a user enters a custom URL into the browser address bar (e.g. the user clicks a crafted link in an email). The rogue JavaScript will be executed when the user invokes the URL. For more details, please refer to [CONF-19802](http://www.conf-19802.com).

Risk Mitigation

We recommend installing the updated Confluence Mail Page plugin into your Confluence installation to fix this vulnerabilities. Please see the 'Fix' section **below**.

Alternatively, if you are not in a position to undertake this immediately and you judge it necessary, you can disable the Confluence Mail Page plugin (note, the plugin is disabled by default). You may also wish to disable public access (e.g. anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.

Fix

These issues have been fixed in the latest version (v1.10) of the Confluence Mail Page plugin, which you can download from the [Atlassian Plugin Exchange](http://www.pluginexchange.com). Installation instructions are available on the [plugin documentation page](http://www.plugindocumentation.com).

Please note, version 1.10 of the Confluence Mail Page plugin will only work with Confluence 3.2. You will need to upgrade to Confluence 3.2 before installing the updated plugin.

Confluence Security Advisory 2010-07-06

This advisory announces a number of security vulnerabilities in earlier versions of Confluence that we have found and fixed in [Confluence 3.3](http://www.confluence.org). In addition to releasing Confluence 3.3, we also provide patches (in the form of plugin upgrades) for the vulnerabilities mentioned. You will be able to apply these plugin upgrades to older versions of Confluence. There will, however, be a number of security improvements in Confluence 3.3 that cannot be patched or backported. We recommend upgrading to Confluence 3.3 rather than applying the plugin upgrades.

In this advisory:

- XSS Vulnerabilities
- Severity
- Risk Assessment
• Vulnerability
• Risk Mitigation
• Fix
  • Option 1 (Recommended): Upgrade to Confluence 3.3
  • Option 2: Upgrade or Disable the Affected Plugins

**XSS Vulnerabilities**

**Severity**

Atlassian rates the severity level of these vulnerabilities as high, according to the scale published in [Severity Levels for Security Issues](#). The scale allows us to rank the severity as critical, high, moderate or low.

**Risk Assessment**

We have identified and fixed a number of cross-site scripting (XSS) vulnerabilities which may affect Confluence instances in a public environment. These vulnerabilities are exposed in the Confluence functions described in the table below.

- An attacker might take advantage of the vulnerability to steal other users' session cookies or other credentials, by sending the credentials back to such an attacker's own web server.
- XSS vulnerabilities potentially allow an attacker to embed their own JavaScript into a Confluence page. An attacker’s text and script might be displayed to other people viewing the page. This is potentially damaging to your company’s reputation.

You can read more about XSS attacks at [cisisecurity](#), [CERT](#) and other places on the web.

**Vulnerability**

We have identified and fixed vulnerabilities in the Confluence features described in the table below.

<table>
<thead>
<tr>
<th>Confluence Feature</th>
<th>Affected Confluence Versions</th>
<th>Issue Tracking</th>
</tr>
</thead>
<tbody>
<tr>
<td>PDF export</td>
<td>3.1.0 – 3.2.1</td>
<td>CONF-20121</td>
</tr>
<tr>
<td>Clickr theme</td>
<td>2.7.0 – 3.2.1</td>
<td>CONF-20126</td>
</tr>
<tr>
<td>Tasklist macro</td>
<td>2.8.0 – 3.2.1</td>
<td>CONF-20119</td>
</tr>
<tr>
<td>Contributors plugin (Contributors macro and Contributors Summary macro)</td>
<td>3.0.0 – 3.2.1</td>
<td>CONF-20122 CONF-20125</td>
</tr>
</tbody>
</table>

**Risk Mitigation**

We recommend that you upgrade your Confluence installation to fix these vulnerabilities. Please see the 'fix' section below.

Alternatively, if you are not in a position to upgrade immediately and you judge it necessary, you can apply one or both of the following mitigations:

- Disable every one of the affected plugins, as listed below. You can disable plugins via the Confluence Administration Console. See our documentation on [installing and configuring plugins](#).
- Disable public access (such as [anonymous access](#) and [public signup](#)) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted [groups](#).
In addition, please refer to our guidelines on best practices for configuring Confluence security. In particular, please read our guidelines on using Apache to limit access to the Confluence administration interface.

**Fix**

Please choose one of the options below that best suits your Confluence version and your ability to upgrade immediately.

**Option 1 (Recommended): Upgrade to Confluence 3.3**

We recommend that you upgrade to Confluence 3.3, which fixes all of the security issues reported in this advisory. See the Confluence 3.3 release notes. You can download Confluence 3.3 from the download centre.

**Option 2: Upgrade or Disable the Affected Plugins**

If you cannot upgrade your Confluence installation, you can upgrade or disable the affected plugins to fix the vulnerabilities described in this security advisory.

- You can upgrade the plugins in the normal manner, via the Confluence Plugin Repository or by manually uploading the JAR. Please refer to the documentation for more details on installing plugins.
- You can disable plugins via the Confluence Administration Console. See our documentation on installing and configuring plugins.

<table>
<thead>
<tr>
<th>Affected Feature</th>
<th>Confluence Versions that Can Update the Plugin</th>
<th>Upgrade or Disable Plugin</th>
</tr>
</thead>
<tbody>
<tr>
<td>PDF export plugin</td>
<td>3.1 – 3.3</td>
<td>If you cannot upgrade to Confluence 3.3:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>▶ If you are running Confluence 3.1.x or 3.2.x, you should install version 1.9 of the PDF Export plugin.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>▶ If you are running Confluence 3.0.2 or earlier, you do not need to take any action as these versions are not affected by the security flaw.</td>
</tr>
<tr>
<td>Clickr theme</td>
<td>3.2 – 3.3</td>
<td>If you cannot upgrade to Confluence 3.3:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>▶ If you are running Confluence 3.2.x, you should install version 2.10 of the Clickr Theme plugin.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>▶ If you are running Confluence 3.1.2 or earlier, you should disable the 'Clickr Theme' plugin.</td>
</tr>
</tbody>
</table>
Tasklist macro

<table>
<thead>
<tr>
<th>3.1 – 3.3</th>
</tr>
</thead>
</table>

If you cannot upgrade to Confluence 3.3:

- If you are running Confluence 3.1.x or 3.2.x, you should install version 3.2.5.2 of the Dynamic Task List 2 plugin.
- If you are running Confluence 2.8.x to 3.0.x, you should disable the 'Dynamic Task List 2' plugin.
- If you are running Confluence 2.7.x or earlier, you do not need to take any action as these versions are not affected by the security flaw.

Contributors plugin

<table>
<thead>
<tr>
<th>3.0 – 3.3</th>
</tr>
</thead>
</table>

If you cannot upgrade to Confluence 3.3:

- If you are running Confluence 3.0.x to 3.2.x, you should install version 1.2.6 of the Contributors plugin.
- If you are running Confluence 2.10.4 or earlier, you do not need to take any action as these versions are not affected by the security flaw.

Confluence Security Advisory 2010-08-17

This advisory announces a security vulnerability in Confluence 3.3 that we have found and fixed in Confluence 3.3.1. We recommend that you upgrade to Confluence 3.3.1 to fix this vulnerability.

In this advisory:

- Secure Administrator Session Vulnerability
  - Severity
  - Risk Assessment
  - Vulnerability
  - Risk Mitigation
  - Fix

Secure Administrator Session Vulnerability

Severity

Atlassian rates this vulnerability as **high**, according to the scale published in **Severity Levels for Security Issues**. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a vulnerability in the Secure Administrator Sessions feature, introduced in Confluence 3.3, that allows it to be bypassed.

Vulnerability
If an attacker is able to gain access to a session with administrator privileges, they will be able to access all administrator functions without having to re-authenticate.

This vulnerability exists in Confluence 3.3 only.

See CONF-20508 for more details.

Risk Mitigation

We recommend upgrading your Confluence installation to fix these vulnerabilities. Please see the ‘fix’ section below.

Alternatively, if you are not in a position to upgrade immediately and you judge it necessary, you can disable public access (such as anonymous access and public signup) to your wiki until you have applied the necessary upgrade. For even tighter control, you could restrict access to trusted groups.

Fix

Confluence 3.3.1 fixes this issue. See the release notes. You can download Confluence 3.3.1 from the download centre.

Confluence Security Advisory 2010-09-21

This advisory announces a number of security vulnerabilities in earlier versions of Confluence that we have found and fixed in Confluence 3.3.3. We recommend that you upgrade to Confluence 3.3.3 to fix these vulnerabilities.

Path Traversal Vulnerability in Various Confluence Actions

**Severity**

Atlassian rates this vulnerability as **critical**, according to the scale published in [Severity Levels for Security Issues](https://confluence.atlassian.com/doc/levels-of-security). The scale allows us to rank a vulnerability as critical, high, moderate or low.

**Risk Assessment**

We have identified and fixed a path traversal vulnerability in various Confluence actions. By exploiting a path traversal vulnerability, attackers may be able to retrieve any file on the server that is running Confluence, based on the permissions of the user under which Confluence is running. Path traversal attacks are also called 'directory traversal' or 'dot-dot-slash' (../) attacks.

The degree to which a Confluence instance is vulnerable depends on a number of factors in the implementation of the instance. See the mitigation strategies below, for details of how you can reduce your vulnerability.

You can read more about path traversal attacks at [Open Web Application Security Project](https://owasp.org) and other places on the web.

**Vulnerability**

The path traversal vulnerability exists in various Confluence actions, in **all versions of Confluence up to and including 3.3.1**.

See [CONF-20668](https://confluence.atlassian.com/doc/CONF-20668) for issue tracking.

**Risk Mitigation**

We recommend that you upgrade your Confluence installation to fix this vulnerability.

Alternatively, if you are not in a position to upgrade immediately, please consider the following mitigation strategies:

- Make sure that you do not start Confluence from the root directory when starting Confluence automatically. Instead, start it from a reduced-scope directory such as the *{Confluence-installation}/bin* directory.
- Upgrade your Tomcat version to 6.0.26 or later. This is relevant if you are using a WAR distribution of Confluence in your own Tomcat server.
- If you are running Confluence under UNIX, you should run Confluence inside a chroot jail. See [Best Practices for UNIX chroot() Operations](https://confluence.atlassian.com/doc/Best-Practices-for-UNIX-chroot-Operations) from Steve Friedl.
- In addition, please refer to our guidelines on [Tomcat security best practices](https://confluence.atlassian.com/doc/Tomcat-security-best-practices). (This is a JIRA document but the principles apply to Confluence.) In particular, you should restrict the file access of the username under which Confluence is running.

**Fix**

Confluence 3.3.3 fixes this issue. See the [release notes](https://confluence.atlassian.com/doc/release-notes). You can download Confluence 3.3.3 from the [download centre](https://confluence.atlassian.com/doc/download-centre).

If you cannot upgrade to Confluence 3.3.3, you can patch your existing installation using the patches listed below.

---

Our thanks to [Warren Leung](https://confluence.atlassian.com/doc/Warren-Leung) of UCLA, who reported this vulnerability. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.
Configuration of Office Connector Temporary Storage Location

Severity

Atlassian rates this vulnerability as **high**, according to the scale published in [Severity Levels for Security Issues](#).

Risk Assessment

Earlier versions of Confluence allow the administrator to set the temporary storage location for the View File **macro**, part of the Office Connector. Provided an attacker has gained administrative access to the system in some way, they could then exploit this vulnerability to save malicious files onto the file system.

Vulnerability

This vulnerability exists in the Office Connector configuration, made available to Confluence administrators via the Confluence Administration Console and the related Confluence action.

This vulnerability affects **versions of Confluence from 2.8 up to and including 3.3.1**, where the Office Connector is installed. Please note that the Office Connector is bundled in Confluence 2.10 and later.

See [CONF-20669](#) for issue tracking.

Risk Mitigation

We recommend that you upgrade your Confluence installation to fix this vulnerability.

Alternatively, if you are not in a position to upgrade immediately and you judge it necessary, you can choose one of the following mitigation strategies:

- Disable the Office Connector plugin. You can disable plugins via the Confluence Administration Console. See our documentation on [installing and configuring plugins](#).
- Disable public access (such as anonymous access and public signup) to your wiki until you have applied the necessary upgrade. For even tighter control, you could restrict access to trusted groups.

In addition, please refer to our guidelines on [best practices for configuring Confluence security](#).

Fix

Confluence 3.3.3 fixes this issue. Administrators must edit a properties file to configure the path. See the release notes for more information. You can download Confluence 3.3.3 from the [download centre](#).

If you cannot upgrade to Confluence 3.3.3, you can patch your existing installation using the patches listed below.

XSS Vulnerability in the Office Connector

Severity

Atlassian rates the severity level of this vulnerability as **high**, according to the scale published in [Severity Levels for Security Issues](#).

Risk Assessment

We have identified and fixed a cross-site scripting (XSS) vulnerability which may affect Confluence instances, including publicly available instances.

- An attacker might take advantage of the vulnerability to steal other users' session cookies or other credentials, by sending the credentials back to such an attacker's own web server.
- XSS vulnerabilities potentially allow an attacker to embed their own JavaScript into a Confluence page. An attacker's text and script might be displayed to other people viewing the page. This is potentially
damaging to your company’s reputation.

You can read more about XSS attacks at cgisecurity, CERT and other places on the web.

Vulnerability

The XSS vulnerability is exposed in the document import function of the Confluence Office Connector.

This vulnerability exists in Confluence 3.3.1 only, where the Office Connector is enabled. Please note that the Office Connector is bundled in Confluence.

See CONF-20670 for issue tracking.

Risk Mitigation

We recommend that you upgrade your Confluence installation to fix this vulnerability.

Alternatively, if you are not in a position to upgrade immediately and you judge it necessary, you can disable the Office Connector plugin. You can disable plugins via the Confluence Administration Console. See our documentation on installing and configuring plugins.

In addition, please refer to our guidelines on best practices for configuring Confluence security. In particular, please read our guidelines on using Apache to limit access to the Confluence administration interface.

Fix

Confluence 3.3.3 fixes this issue. See the release notes. You can download Confluence 3.3.3 from the download centre.

XSRF Vulnerability in Confluence Mail Page Plugin

Severity

Atlassian rates the severity level of this vulnerability as high, according to the scale published in Severity Levels for Security Issues.

Risk Assessment

We have identified and fixed a cross-site request forgery (XSRF) vulnerability which may affect Confluence instances, including publicly available instances.

An attacker might take advantage of the vulnerability to trick users into emailing the contents of restricted pages to an arbitrary address without their knowledge. An XSRF attack works by exploiting the trust that a site has for the user. If a user is logged in to Confluence and an attacker tricks their browser into making a request to a Confluence URL, then the task is performed as the logged in user.

You can read more about XSRF attacks at cgisecurity and other places on the web.

Vulnerability

The XSRF vulnerability is exposed in the Confluence Mail Page plugin.

This vulnerability exists in versions of Confluence from 2.4 up to and including 3.3.1, where the Mail Page plugin is enabled. Note that the Mail Page plugin is disabled by default. If you do not have this plugin enabled, your site will not be affected.

See CONF-20671 for issue tracking.

Risk Mitigation
We recommend that you upgrade your Confluence installation, or install the updated Confluence Mail Page plugin into your Confluence installation to fix this vulnerability.

Alternatively, if you are not in a position to upgrade immediately and you judge it necessary, you can disable the Confluence Mail Page plugin. (Note that the plugin is disabled by default).

**Fix**

Confluence 3.3.3 fixes this issue. See the release notes. You can download Confluence 3.3.3 from the download centre.

The latest version (v1.12) of the Confluence Mail Page plugin also fixes this issue. You can download the plugin from the Atlassian Plugin Exchange. Please refer to the documentation for instructions on installing plugins.

**Available Patches and Plugin Upgrades**

If for some reason you cannot upgrade to Confluence 3.3.3, you can apply the following patches and plugin upgrades to fix the vulnerabilities described in this security advisory.

**Step 1 of the Patch Procedure: Install the Patch**

A patch is available for Confluence 3.2.1. (That is, the Confluence 3.2.1_01 distribution.) If you have Confluence 3.2.0, you need to upgrade to Confluence 3.2.1 before applying the patch.

The patch addresses the following issue:

- Path traversal vulnerability (CONF-20668).

**Applying the patch**

If you are using the Confluence 3.2.1 distribution:

1. Shut down Confluence.
2. Make a backup of the `<confluence_install_dir>/confluence/` directory.
3. Download the `confluence-3.2.1-to-3.3.2-security-patch.zip` file.
4. Expand the zip file into `<confluence_install_dir>/confluence/`, overwriting the existing files.
5. Restart Confluence.

If you are using the WAR distribution of Confluence:

1. Shut down Confluence.
2. Make a backup of the `<confluence_exploded_war>/confluence/` directory.
3. Download the `confluence-3.2.1-to-3.3.2-security-patch.zip` file.
4. Expand the zip file into `<confluence_exploded_war>/confluence/`, overwriting the existing files.
5. Run `build.sh clean` on UNIX, or `build.bat clean` on Windows.
6. Run `build.sh` on UNIX or `build.bat` on Windows.
7. Redeploy the Confluence web app into your application server.
8. Restart Confluence.

**Step 2 of the Patch Procedure: Upgrade your Plugins**

Some of the above vulnerabilities exist in plugins and are therefore not included in the patch. To fix these vulnerabilities, you will need to upgrade the affected plugin to get the fixed version. You can upgrade the plugins in the normal manner, via the Confluence Plugin Repository. Please refer to the documentation for more details on installing plugins.

1. Install the latest version (v1.12) of the Mail Page plugin.
2. Install version 1.7.1 of the Office Connector plugin.
Confluence Security Advisory 2010-10-12

This advisory announces a number of security vulnerabilities in earlier versions of Confluence that we have found and fixed in Confluence 3.4. In addition to releasing Confluence 3.4, we also provide patches for the vulnerabilities mentioned below. You will be able to apply these patches to existing installations of Confluence 3.3.3. However, we recommend that you upgrade to Confluence 3.4 to fix these vulnerabilities.

In this advisory:

- **XSS Vulnerabilities**
  - **Severity**
  - **Risk Assessment**
  - **Vulnerability**
  - **Risk Mitigation**
  - **Fix**

- **Available Patches and Plugin Upgrades**
  - **Step 1 of the Patch Procedure: Install the Patch**
  - **Step 2 of the Patch Procedure: Upgrade the Affected Plugins**

**XSS Vulnerabilities**

**Severity**

Atlassian rates the severity level of these vulnerabilities as **high**, according to the scale published in [Severity Levels for Security Issues](#). The scale allows us to rank the severity as critical, high, moderate or low.

**Risk Assessment**

We have identified and fixed a number of cross-site scripting (XSS) vulnerabilities which may affect Confluence instances, including publicly available instances.

- An attacker might take advantage of an XSS vulnerability to steal other users’ session cookies or other credentials, by sending the credentials back to such an attacker's own web server.
- XSS vulnerabilities potentially allow an attacker to embed their own JavaScript into a Confluence page. An attacker’s text and script might be displayed to other people viewing the page. This is potentially damaging to your company’s reputation.

You can read more about XSS attacks at [cgisecurity](#), [CERT](#) and other places on the web.

**Vulnerability**

The table below describes the parts of Confluence affected by the XSS vulnerabilities.

<table>
<thead>
<tr>
<th>Confluence Feature</th>
<th>Affected Confluence Versions</th>
<th>Issue Tracking</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space names</td>
<td>2.9 – 3.3.3</td>
<td>CONF-20740</td>
</tr>
<tr>
<td>Office Connector</td>
<td>3.0 – 3.3.3</td>
<td>CONF-20963</td>
</tr>
<tr>
<td>Tasklist macro</td>
<td>1.3 – 3.3.3</td>
<td>CONF-20964</td>
</tr>
</tbody>
</table>

**Risk Mitigation**

We recommend that you upgrade your Confluence installation to fix these vulnerabilities.

Alternatively, if you are not in a position to upgrade immediately and you judge it necessary, you can disable...
public access (such as anonymous access and public signup) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.

We also recommend that you read our guidelines on best practices for configuring Confluence security and using Apache to limit access to the Confluence administration interface.

**Fix**

Confluence 3.4 fixes these issues. For a full description of this release, see the release notes. You can download Confluence 3.4 from the download centre.

If you cannot upgrade to Confluence 3.4, you can patch your existing installation using the patches listed below.

**Available Patches and Plugin Upgrades**

If for some reason you cannot upgrade to Confluence 3.4, you can apply the following patches and plugin upgrades to fix the vulnerabilities described in this security advisory.

**Step 1 of the Patch Procedure: Install the Patch**

A patch is available for Confluence 3.3.3.

The patch addresses the following issues:

- XSS vulnerability in space names (CONF-20740).
- XSS vulnerability in Office Connector (CONF-20963).

If you are using the Confluence distribution:

1. Shut down Confluence.
2. Make a backup of the `<confluence_install_dir>/confluence/` directory.
3. Download the `confluence-3.3.3-to-3.4-security-patch.zip` file.
4. Expand the zip file into `<confluence_install_dir>/confluence/`, overwriting the existing files.
5. Restart Confluence.

If you are using the WAR distribution of Confluence:

1. Shut down Confluence.
2. Make a backup of the `<confluence_exploded_war>/confluence/` directory.
3. Download the `confluence-3.3.3-to-3.4-security-patch.zip` file.
4. Expand the zip file into `<confluence_exploded_war>/confluence/`, overwriting the existing files.
5. Run 'build.sh clean' on UNIX, or 'build.bat clean' on Windows.
6. Run 'build.sh' on UNIX or 'build.bat' on Windows.
7. Redeploy the Confluence web app into your application server.
8. Restart Confluence.

**Step 2 of the Patch Procedure: Upgrade the Affected Plugins**

Some of the above vulnerabilities exist in plugins and are therefore not included in the patch. To fix these vulnerabilities, you will need to upgrade the affected plugins. You can upgrade the plugins in the normal manner, via the Confluence Plugin Repository. Please refer to the documentation for more details on installing plugins.

- Install the latest version (v3.3.1) of the Dynamic Tasklist 2 plugin.
- Install the latest version (v1.2.2) of the Documentation Theme plugin.

**Confluence Security Advisory 2010-11-15**

Security Vulnerability in Confluence Remote API
Severity

Atlassian rates the severity level of this vulnerability as critical, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank the severity as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a vulnerability in the Remote API which affects Confluence instances, including publicly available instances. The Remote API allows an attacker to escalate user privileges, excluding the level of system administrator privileges.

Vulnerability

The table below describes the Confluence versions and the specific functionality affected by the RPC vulnerability.

<table>
<thead>
<tr>
<th>Confluence Feature</th>
<th>Affected Confluence Versions</th>
<th>Fixed Version</th>
<th>Issue Tracking</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Access</td>
<td>2.7 – 3.4</td>
<td>3.4.2</td>
<td>CONF-21162</td>
</tr>
</tbody>
</table>

Risk Mitigation

We recommend that you upgrade your Confluence installation to fix this vulnerability.

We strongly advise that you disable the remote APIs until your Confluence instance is patched or upgraded. If the Remote API is vital, we recommend you disable anonymous access to the remote API.

We also recommend that you read our guidelines on best practices for configuring Confluence security.

Fix

Confluence 3.4.2 fixes this issue. For a full description of this release, see the release notes. You can download Confluence 3.4.2 from the download centre.

If you cannot upgrade to Confluence 3.4.2, you can patch your existing installation using the patch listed below.

Available Patch

If for some reason you cannot upgrade to the latest version of Confluence, you can apply the following patch to fix the vulnerability described in this security advisory.

<table>
<thead>
<tr>
<th>Vulnerability</th>
<th>Patch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security vulnerability in Confluence Remote API</td>
<td>confluence-3.4.2-security-patch-for-2.7-to-3.4.1.zip</td>
</tr>
</tbody>
</table>

Patch Procedure: Install the Patch

A patch is available for Confluence 2.7 – 3.4.1.

The patch addresses the following issue:

- Security vulnerability in Confluence RPC (CONF-21162).

Applying the patch
If you are using the Confluence 2.7 – 3.4.1 distributions:

1. Shut down Confluence.
2. Make a backup of the `<confluence_install_dir>/confluence/` directory.
3. Download the `confluence-3.4.2-security-patch-for-2.7-to-3.4.1.zip` file.
4. Expand the zip file into `<confluence_install_dir>/confluence/`, overwriting the existing files.
5. Restart Confluence.
6. Visit `<Confluence base url>/admin/patch342applied.jsp` and confirm that it reports: "The Patch for Confluence 3.4.2 has been correctly applied."

If you are using the WAR distribution of Confluence:

1. Shut down Confluence.
2. Make a backup of the `<confluence_exploded_war>/confluence/` directory.
3. Download the `confluence-3.4.2-security-patch-for-2.7-to-3.4.1.zip` file.
4. Expand the zip file into `<confluence_exploded_war>/confluence/`, overwriting the existing files.
5. Run `build.sh clean` on UNIX, or `build.bat clean` on Windows.
6. Run `build.sh` on UNIX or `build.bat` on Windows.
7. Redeploy the Confluence web app into your application server.
8. Restart Confluence.
9. Visit `<Confluence base url>/admin/patch342applied.jsp` and confirm that it reports: "The Patch for Confluence 3.4.2 has been correctly applied."

Confluence Security Advisory 2011-01-18

This advisory announces a number of security vulnerabilities that we have found and fixed in recent versions of Confluence. We also provide patches that you will be able to apply to existing installations of Confluence to fix these vulnerabilities. However, we recommend that you upgrade your Confluence installation rather than applying the patches. Enterprise Hosted customers should request an upgrade by raising a support request at http://support.atlassian.com. JIRA Studio is not vulnerable to any of the issues described in this advisory.

Atlassian is committed to improving product security. The vulnerabilities listed in this advisory have been discovered by Atlassian, unless noted otherwise. The reporter may also have requested that we do not credit them.

In this advisory:

- XSS Vulnerabilities
  - Severity
  - Risk Assessment
  - Vulnerability
  - Risk Mitigation
  - Fix
  - Patches

XSS Vulnerabilities

Severity

Atlassian rates the severity level of these vulnerabilities as high, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank the severity as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a number of cross-site scripting (XSS) vulnerabilities which may affect Confluence instances, including publicly available instances (that is, internet-facing servers). XSS vulnerabilities potentially allow an attacker to embed their own JavaScript into a Confluence page. You can read more about XSS attacks at cgisecurity.com, The Web Application Security Consortium and other places on the web.
**Vulnerability**

The table below describes the Confluence versions and the specific functionality affected by the XSS vulnerabilities.

<table>
<thead>
<tr>
<th>Confluence Feature</th>
<th>Affected Confluence Versions</th>
<th>Issue Tracking</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code macro</td>
<td>2.7 – 3.4</td>
<td>CONF-21098</td>
</tr>
<tr>
<td>Attachments macro</td>
<td>3.3 – 3.4</td>
<td>CONF-21099</td>
</tr>
<tr>
<td>Bookmarks macro</td>
<td>3.1 – 3.4.3</td>
<td>CONF-21390</td>
</tr>
<tr>
<td>Global Reports macro</td>
<td>2.7 – 3.4.3</td>
<td>CONF-21391</td>
</tr>
<tr>
<td>Recently Updated macro</td>
<td>3.0 - 3.4.3</td>
<td>CONF-21392</td>
</tr>
<tr>
<td>Pagetree macro</td>
<td>2.7 - 3.4.3</td>
<td>CONF-21393</td>
</tr>
<tr>
<td>Create Space Button macro</td>
<td>2.7 - 3.4.3</td>
<td>CONF-21394</td>
</tr>
<tr>
<td>Documentation Link macro</td>
<td>2.7 – 3.4.5</td>
<td>CONF-21508</td>
</tr>
</tbody>
</table>

Our thanks to dave b, who reported the vulnerability in the Documentation Link macro. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

**Risk Mitigation**

We recommend that you upgrade your Confluence installation to fix these vulnerabilities.

Alternatively, if you are not in a position to upgrade immediately and you judge it necessary, you can disable [pub lic signup](#) to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted [groups](#).

We also recommend that you read our guidelines on [best practices for configuring Confluence security](#).

**Fix**

Confluence 3.4.6 fixes these issues. For a full description of this release, see the [release notes](#). You can download the latest version of Confluence from the [download centre](#).

**Patches**

If for some reason you cannot upgrade to the latest version of Confluence, you can apply patches to fix the vulnerabilities described in this security advisory. The patches are attached to the relevant issues, as listed in the table above.
Please note that we have released a number of advisories about Confluence recently. We recommend that you review them and upgrade to the most recent release of the product or apply external security controls if you cannot. Most of the disclosed vulnerabilities are not critical and often present less risk when used in a corporate environment with no access from the Internet.

We usually provide patches only for vulnerabilities of critical severity, as an interim solution until you can upgrade. You should not expect that you can continue patching your system instead of upgrading. Our patches are often non-cumulative – we do not recommend that you apply multiple patches from different advisories on top of each other, but strongly recommend to upgrade to the most recent version regularly.

We recommend patching only when you can neither upgrade nor apply external security controls.

<table>

<td>Download</td>
</tr>
</tbody>
</table>

Update the `.jar` file with the fix contained in the file archive (zip). Follow these steps to do so:

- **Browse to** CONFLUENCE_INSTALL_DIR/confluence/WEB-INF/classes/com/atlassian/confluence/setup
- Open the file `atlassian-bundled-plugins.zip`
- Decompress the contents into another location
- Replace the current `socialbookmarking.jar` with the correct file according to your version.
- Compress all the `.jar` files into another zip with the same name as the original file (`atlassian-bundled-plugins.zip`)
- Please note, make sure you place the files directly inside the `zip`, not contained inside another folder.

<table>
<thead>
<tr>
<th>Supported Version</th>

### Confluence Security Advisory 2011-03-24

This cumulative advisory announces a number of security vulnerabilities that we have found in Confluence and fixed in recent versions of Confluence. We also provide upgraded plugins and patches that you will be able to apply to existing installations of Confluence to fix these vulnerabilities. However, we recommend that you upgrade your complete Confluence installation rather than upgrading only the affected plugins. **Enterprise** and **Hosted** customers should request an upgrade by raising a support request at [http://support.atlassian.com](http://support.atlassian.com). **JIRA Studio** is not vulnerable to any of the issues described in this advisory.

Atlassian is committed to improving product security. The vulnerabilities listed in this advisory have been discovered by Atlassian, unless noted otherwise. The reporter may also have requested that we do not credit them.

#### In this advisory:

- XSS Vulnerabilities
  - Severity
  - Risk Assessment
  - Vulnerability
  - Risk Mitigation
  - Fix
  - Patches
    - Include Page Macro
    - Activity Stream Gadget
    - Action links of attachments lists
    - Table of Contents macro

### XSS Vulnerabilities

**Severity**

Atlassian rates the severity level of these vulnerabilities as **high**, according to the scale published in [Severity Levels for Security Issues](http://security.com). The scale allows us to rank the severity as critical, high, moderate or low.

These vulnerabilities are **not** critical. This is an independent assessment and you should evaluate its applicability to your own IT environment.

**Risk Assessment**

We have identified and fixed a number of cross-site scripting (XSS) vulnerabilities which may affect Confluence instances, including publicly available instances (that is, Internet-facing servers). XSS vulnerabilities allow an attacker to embed their own JavaScript into a Confluence page. You can read more about XSS attacks at [ciscosity.com](http://ciscosity.com), [The Web Application Security Consortium](http://security.com) and other places on the web.
Vulnerability

The table below describes the Confluence versions and the specific functionality affected by each of the XSS vulnerabilities.

<table>
<thead>
<tr>
<th>Confluence Feature</th>
<th>Affected Confluence Versions</th>
<th>Issue Tracking</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include Page macro</td>
<td>2.7 – 3.4.6</td>
<td>CONF-21604</td>
</tr>
<tr>
<td>Activity Stream gadget</td>
<td>3.1 – 3.4.6</td>
<td>CONF-21606</td>
</tr>
<tr>
<td>Action links of attachments lists</td>
<td>2.7 – 3.4.7</td>
<td>CONF-21766</td>
</tr>
<tr>
<td>Table of Contents macro</td>
<td>2.9 – 3.4.8</td>
<td>CONF-21819</td>
</tr>
</tbody>
</table>

Our thanks to Dave B, who reported the vulnerability in the action links of attachments lists. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

Risk Mitigation

We recommend that you upgrade your Confluence installation to fix these vulnerabilities.

Alternatively, if you are not in a position to upgrade immediately and you judge it necessary, you can disable public signup to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.

We also recommend that you read our guidelines on best practices for configuring Confluence security.

Fix

Confluence 3.4.9 or later fixes all of these issues. Some issues have been fixed in earlier versions as described in the table above. For a full description of this release, see the release notes. You can download the latest version of Confluence from the download centre. The most recent version at the time of this advisory is Confluence 3.5.

Patches

If for some reason you cannot upgrade to the latest version of Confluence, you can upgrade the relevant plugins (below) in your Confluence installation to fix the vulnerabilities described in this security advisory.

For details on upgrading Confluence's plugins using the plugin manager, see:

- Upgrading your Existing Plugins (for Confluence 3.4.x) or
- Installing and Configuring Plugins using the Plugin Repository Client (for Confluence 3.3.x).

Patches are also attached to the relevant issues (listed in the table above) if you need to apply these fixes manually.
Please note that we have released a number of advisories about Confluence recently. We recommend that you review them and upgrade to the most recent release of the product or apply external security controls if you cannot. Most of the disclosed vulnerabilities are not critical and often present less risk when used in a corporate environment with no access from the Internet.

We usually provide patches only for vulnerabilities of critical severity, as an interim solution until you can upgrade. You should not expect that you can continue patching your system instead of upgrading. Our patches are often non-cumulative – we do not recommend that you apply multiple patches from different advisories on top of each other, but strongly recommend to upgrade to the most recent version regularly.

We recommend patching only when you can neither upgrade nor apply external security controls.

### Include Page Macro

<table>
<thead>
<tr>
<th>Supported Confluence Versions</th>
<th>Issue Tracking</th>
<th>File Name</th>
<th>Downloadable Patch</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.4.x</td>
<td>CONF-21604</td>
<td>confluence-advanced-macros-1.12.4.jar</td>
<td>Download</td>
</tr>
<tr>
<td>3.3.x</td>
<td>CONF-21604</td>
<td>confluence-advanced-macros-1.9.3.jar</td>
<td>Download</td>
</tr>
</tbody>
</table>

To apply this fix, use the plugin manager to upgrade the Advanced Macros plugin to a version greater than or equal to that specified in the file name above.

### Activity Stream Gadget

<table>
<thead>
<tr>
<th>Supported Confluence Versions</th>
<th>Issue Tracking</th>
<th>File Name</th>
<th>Downloadable Patch</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.3.x</td>
<td>CONF-21606</td>
<td>streams-confluence-plugin-3.3-CONF-21606.jar</td>
<td>Download</td>
</tr>
<tr>
<td>3.4.x</td>
<td>CONF-21606</td>
<td>streams-confluence-plugin-3.4.6.jar</td>
<td>Download</td>
</tr>
</tbody>
</table>

It's currently not possible to upgrade the Activity Streams Plugin automatically using the 3.4 plugin manager or the 3.3 plugin repository. Instead, you will need to manually install the plugin as follows:

1. Download the JAR file for your version of Confluence (see above).
2. Install the plugin manually using the "Upload Plugin" link on the "Install" tab of the plugin manager.

### Action links of attachments lists

<table>
<thead>
<tr>
<th>Supported Confluence Versions</th>
<th>Issue Tracking</th>
<th>File Name</th>
<th>Downloadable Patch</th>
</tr>
</thead>
</table>
To apply this fix, use the plugin manager to upgrade the Confluence Attachments Plugin plugin to a version greater than or equal to that specified in the file name above.

### Table of Contents macro

<table>
<thead>
<tr>
<th>Supported Confluence Versions</th>
<th>Issue Tracking</th>
<th>File Name</th>
<th>Download</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.3.x, 3.4.x</td>
<td>CONF-21766</td>
<td>confluence-attachments-plugin-2.20.jar</td>
<td>Download</td>
</tr>
</tbody>
</table>

To apply this fix, use the plugin manager to upgrade the Table of Contents Plugin plugin to a version greater than or equal to that specified in the file name above.

### Confluence Security Advisory 2011-05-31

⚠️ It has been incorrectly advised previously that CONF-22479 (User Preferences) affects all versions starting 2.7 while in fact it is exploitable only in 3.5 and above. Our sincere apologies, this will not happen again.

You can still apply the patch to 3.4 in order to remove the root cause of this bug and potentially prevent other similar vulnerabilities from appearing.

This advisory announces security vulnerabilities that we have found in Confluence and fixed in a recent version of Confluence. We also provide upgraded plugins and patches that you will be able to apply to existing installations of Confluence to fix these vulnerabilities. However, we recommend that you upgrade your complete Confluence installation rather than upgrading only the affected plugins. Enterprise Hosted customers should request an upgrade by raising a support request at [http://support.atlassian.com](http://support.atlassian.com). JIRA Studio is not vulnerable to the issues described in this advisory.

Atlassian is committed to improving product security. The vulnerabilities listed in this advisory have been discovered by Atlassian, unless noted otherwise. The reporter may also have requested that we do not credit them.

In this advisory:

- **XSS Vulnerabilities**
  - Severity
  - Risk Assessment
  - Vulnerability
  - Risk Mitigation
  - Fix
  - Patches
  - Patch Procedure: Install the Patch
    - Applying the patch

- **XSRF Vulnerability**
  - Severity
  - Risk Assessment
  - Vulnerability
  - Risk Mitigation
  - Fix
  - Patches
  - Patch Procedure: Install the Patch
Applying the patch

XSS Vulnerabilities

Severity

Atlassian rates the severity level of both these vulnerabilities as high, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank the severity as critical, high, medium or low. These vulnerabilities are not critical. This is an independent assessment and you should evaluate its applicability to your own IT environment.

Risk Assessment

We have identified and fixed cross-site scripting (XSS) vulnerabilities that may affect Confluence instances, including publicly available instances (that is, Internet-facing servers). XSS vulnerabilities allow an attacker to embed their own JavaScript into a Confluence page. You can read more about XSS attacks at cgisecurity.com, The Web Application Security Consortium and other places on the web.

Vulnerability

The table below describes the Confluence versions and the specific functionality affected by the XSS vulnerabilities.

<table>
<thead>
<tr>
<th>Confluence Feature</th>
<th>Affected Confluence Version</th>
<th>Fixed Version</th>
<th>Issue Tracking</th>
</tr>
</thead>
<tbody>
<tr>
<td>Login</td>
<td>3.5 – 3.5.2</td>
<td>3.5.3</td>
<td>CONF-22402</td>
</tr>
<tr>
<td>User Preferences</td>
<td>3.5 – 3.5.2</td>
<td>3.5.3</td>
<td>CONF-22479</td>
</tr>
</tbody>
</table>

Our thanks to Marian Ventuneac (http://www.ventuneac.net) who reported the vulnerabilities mentioned above. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

Risk Mitigation

We recommend that you upgrade your Confluence installation to fix these vulnerabilities.

Alternatively, if you are not in a position to upgrade immediately and you judge it necessary, you can disable public signup to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.

We also recommend that you read our guidelines on best practices for configuring Confluence security.

Fix

These vulnerabilities (CONF-22402 and CONF-22479) are both fixed in Confluence 3.5.3, and later versions. For a full description of the latest version of Confluence, see the release notes. You can download the latest version of Confluence from the download centre.

If you cannot upgrade to the latest version of Confluence, you can temporarily patch your existing installation using the patch listed below. We strongly recommend upgrading and not patching.

Patches
If you are running Confluence 3.5, we highly recommend that you upgrade to Confluence 3.5.3, or later.
If you are running Confluence 3.4, you can apply the following patch to fix the CONF-22479 vulnerability. The CONF-22402 vulnerability does not affect Confluence 3.4.

<table>
<thead>
<tr>
<th>Vulnerability</th>
<th>Patch</th>
<th>Patch File Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Preferences</td>
<td>Attached to issue CONF-22479</td>
<td>CONF-22479_patch.zip</td>
</tr>
</tbody>
</table>

**Patch Procedure: Install the Patch**

A patch is available for Confluence 3.4 – 3.4.9.

The patch addresses the following issue:

Security vulnerability in Confluence User Preferences (CONF-22479).

**Applying the patch**

If you are using Confluence 3.4 – 3.4.9:

1. Download the CONF-22479_patch.zip file that is attached to the CONF-22479 issue.
2. Stop Confluence.
3. Make a backup of the `<confluence_install_dir>` directory.
4. Expand the downloaded zip file into `<confluence_install_dir>`, overwriting the existing files.
5. Check that the following files were created:
   - `confluence/WEB-INF/classes/com/atlassian/confluence/core/ConfluenceActionSupport.properties`
   - `confluence/WEB-INF/classes/com/atlassian/confluence/languages/DefaultLocaleManager.class`
   - `confluence/WEB-INF/classes/com/atlassian/confluence/user/actions/EditMySettingsAction.class`

**XSRF Vulnerability**

**Severity**

Atlassian rates the severity level of both this vulnerability as medium, according to the scale published in **Severity Levels for Security Issues** for Security Issues. The scale allows us to rank the severity as critical, high, medium or low.

This vulnerability is not critical. This is an independent assessment and you should evaluate its applicability to your own IT environment.

**Risk Assessment**

We have identified and fixed a cross-site request forgery (XSRF) vulnerability that may affect Confluence instances, including publicly available instances (that is, Internet-facing servers). XSRF vulnerabilities allow an attacker to trick users into unintentionally adding bookmarks to Confluence spaces. You can read more about XSRF attacks at [http://www.cgisecurity.com/csrf-faq.html](http://www.cgisecurity.com/csrf-faq.html) and other places on the web.

**Vulnerability**

The table below describes the Confluence versions and the specific functionality affected by the XSRF vulnerability.

<table>
<thead>
<tr>
<th>Confluence Feature</th>
<th>Affected Confluence Version</th>
<th>Fixed Version</th>
<th>Issue Tracking</th>
</tr>
</thead>
<tbody>
<tr>
<td>Social Bookmarking plugin</td>
<td>3.0 – 3.4.9</td>
<td>3.5</td>
<td>CONF-22565</td>
</tr>
</tbody>
</table>
Risk Mitigation

We recommend that you upgrade your Confluence installation to fix these vulnerabilities.

Alternatively, if you are not in a position to upgrade immediately and you judge it necessary, you can disable public signup to your wiki until you have applied the necessary patch or upgrade. For even tighter control, you could restrict access to trusted groups.

We also recommend that you read our guidelines on best practices for configuring Confluence security for configuring Confluence security.

Fix

This vulnerability (CONF-22565) is fixed in Confluence 3.5, and later versions. For a full description of the latest version of Confluence, see the release notes. You can download the latest version of Confluence from the download centre.

If you cannot upgrade to the latest version of Confluence, you can temporarily patch your existing installation using the patch listed below. We strongly recommend upgrading and not patching.

Patches

If you are running Confluence 3.5, the CONF-22565 vulnerability is already fixed, but we highly recommend that you upgrade to the latest version of Confluence.

If you are running Confluence 3.4, you can apply the following patch to fix the CONF-22565 vulnerability.

For details on upgrading Confluence's plugins using the plugin manager, see:

- Upgrading your Existing Plugins

<table>
<thead>
<tr>
<th>Vulnerability</th>
<th>Patch</th>
<th>Patch File Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Social Bookmarking plugin</td>
<td>Attached to issue CONF-22565</td>
<td>socialbookmarking-1.3.9.jar</td>
</tr>
</tbody>
</table>

Patch Procedure: Install the Patch

A patch is available for Confluence 3.4 – 3.4.9.

The patch addresses the following issue:

- Security vulnerability in Confluence Settings Social Bookmarking plugin (CONF-22565).

Applying the patch

If you are using Confluence 3.4 – 3.4.9, use the plugin manager to upgrade the Social Bookmarking plugin to a version equal to or greater than that specified in the file name above. For details on using the plugin manager, see Upgrading your Existing Plugins.

Confluence Security Advisory 2012-05-17

This advisory discloses a critical security vulnerability that exists in all versions of Confluence up to and including 4.1.9.

- Customers who have downloaded and installed Confluence should upgrade their existing Confluence installations to fix this vulnerability.
- Enterprise Hosted customers need to request an upgrade by raising a support request at http://support.atlassian.com in the "Enterprise Hosting Support" project.
- JIRA Studio and Atlassian OnDemand customers are not affected by any of the issues described in
Atlassian is committed to improving product security. The vulnerability listed in this advisory has been discovered by Atlassian, unless noted otherwise. The reporter may also have requested that we do not credit them.

If you have questions or concerns regarding this advisory, please raise a support request at http://support.atlassian.com/.

In this advisory:

- **Critical XML Parsing Vulnerability**
  - **Severity**
  - **Description**
  - **Risk Mitigation**
  - **Fix**

**Critical XML Parsing Vulnerability**

**Severity**

Atlassian rates the severity level of this vulnerability as **critical**, according to the scale published in **Severity Levels for Security Issues**. The scale allows us to rank the severity as critical, high, moderate or low.

This is an independent assessment and you should evaluate its applicability to your own IT environment.

**Description**

We have identified and fixed a vulnerability in Confluence that results from the way third-party XML parsers are used in Confluence. This vulnerability allows an attacker to:

- execute denial of service attacks against the Confluence server, or
- read all local files readable to the system user under which Confluence runs.

The attacker does not need to have an account with the affected Confluence instance.

All versions of Confluence up to and including 4.1.9 are affected by this vulnerability. This issue can be tracked here: CONF-25077 - Authenticate to see issue details

The Gliffy for Confluence plugin is also vulnerable to this exploit. If you are using the Gliffy plugin for Confluence with any version of Confluence, you will need to upgrade it (see 'Fix' section below) or disable it.

**Risk Mitigation**

We recommend that you upgrade your Confluence installation to fix this vulnerability.

Alternatively, if you are not in a position to upgrade immediately, you should do **all** of the following until you can upgrade. Please note, these measures will only limit the impact of the vulnerability, they will not mitigate it completely.

- Disable access to the SOAP and XML-RPC APIs, if these remote APIs are not required. Note, remote API access is disabled by default. See [enabling remote APIs](#) for instructions.
- Disable the following plugins/plugin modules (see [Disabling or Enabling a Plugin](#)):
  - Office Connector plugin
  - JUnitReport macro module of the confluence-advanced-macros plugin (called "Advanced Macros" in the interface)
  - confluence-jira3-macros plugin (called "JIRA Macros" in the interface)
  - WebDAV
- Disable public access (such as [anonymous access](#) and [public signup](#)) to Confluence until you have
upgraded.

- Ensure that your Confluence system user is restricted as described in [best practices for configuring Confluence security](#).

**Fix**

**Upgrade**

1. Upgrade to Confluence 4.2 or later which fixes this vulnerability. For a full description of this release, see the [Confluence 4.2 Release Notes](#). The following releases have also been made available to fix these issues in older Confluence versions. You can download these versions of Confluence from the [download centre](#).

   - Confluence 4.1.10 for Confluence 4.1
   - Confluence 4.0.7 for Confluence 4.0
   - Confluence 3.5.17 for Confluence 3.5

2. Upgrade the following Confluence third-party plugins, if you are using them. The table below describes which version of the plugin you should upgrade to, depending on your Confluence version. See [Upgrading your Existing Plugins](#) for instructions on how to upgrade a plugin.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Confluence 4.2</th>
<th>Confluence 4.1</th>
<th>Confluence 4.0</th>
<th>Confluence 3.5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gliffy plugin for Confluence</td>
<td>4.2</td>
<td>4.2</td>
<td>4.2</td>
<td>4.2</td>
</tr>
</tbody>
</table>

**Patches**

There are no patches available for this vulnerability. Due to the extent of the changes required to fix the vulnerability, it is not possible to provide patches that resolve the issue without compromising the reliability of Confluence. You must upgrade to fix this vulnerability.

**Configuring Confluence Security**

This section gives guidelines on configuring the security of your Confluence site.

Confluence Cookies

This page lists cookies stored in Confluence users' browsers which are generated by Confluence itself. This page does not list cookies that may originate from 3rd-party Confluence plugins.

Authentication cookies

Confluence uses Seraph, an open source framework, for HTTP cookie authentication. Confluence uses two types of cookies for user authentication:

- The JSESSIONID cookie is created by the application server and used for session tracking purposes. This cookie contains a random string and the cookie expires at the end of every session or when the browser is closed.
- The 'remember me' cookie, seraph.confluence, is generated by Confluence when the user selects the Remember me check box on the login page.

ℹ️ You can read about cookies on the Wikipedia page about HTTP cookies.
The 'remember me' cookie

The 'remember me' cookie, seraph.confluence, is a long-lived HTTP cookie. This cookie can be used to authenticate an unauthenticated session. Confluence generates this cookie when the user selects the Remember me check box on the login page.

Cookie key and contents

By default, the cookie key is seraph.confluence, which is defined by the login.cookie.key parameter in the CONFLUENCE-INSTALLATION/confluence/WEB-INF/classes/seraph-config.xml file.

The cookie contains a unique identifier plus a securely-generated random string (i.e. token). This token is generated by Confluence and is also stored for the user in the Confluence database.

Use of cookie for authentication

When a user requests a web page, if the request is not already authenticated via session-based authentication or otherwise, Confluence will match the 'remember me' cookie (if present) against the token (also if present), which is stored for the user in the Confluence database.

If the token in the cookie matches the token stored in the database and the cookie has not expired, the user is authenticated.

Life of 'remember me' cookies

You can configure the maximum age of the cookie. To do that you will need to modify the CONFLUENCE-INSTALLATION/confluence/WEB-INF/classes/seraph-config.xml file and insert the following lines below the other init-param elements:

```xml
<init-param>
  <param-name>autologin.cookie.age</param-name>
  <param-value>2592000</param-value><!-- 30 days in seconds -->
</init-param>
```

Automatic cleanup of 'remember me' tokens

Every cookie issued by Confluence has a corresponding record in the database. A scheduled job runs on the 20th of every month to clean up expired tokens. The name of the trigger is clearExpiredRememberMeToken.

Note: The only purpose of this job is to prevent the database table from growing too big. For authentication purposes, Confluence will ignore expired tokens even if they still exist in the database.

Is it possible to disable the 'remember me' feature?

Confluence does not offer an option for disabling the 'Remember Me' feature. See the workaround.

Other Confluence cookies

There are several cookies that Confluence uses to store basic 'product presentation' states. Confluence users' authentication details are not stored by these cookies.

<table>
<thead>
<tr>
<th>Cookie Key</th>
<th>Purpose</th>
<th>Cookie Contents</th>
<th>Expiry</th>
</tr>
</thead>
</table>

Doc-sidebar

Remembers the user's preference for the width of the navigation sidebar in the Confluence documentation theme.
The width of the sidebar in pixels. For example, 300px
One year from the date it was set or was last updated.

Confluence.list.pages.cookie

Remembers the user's last chosen tab in the "list pages" section.
The name of the last selected tab. For example, list-content-tree
One year from the date it was set or was last updated.

Confluence.browse.space.cookie

Remembers the user's last chosen tab in the "browse space" section.
The name of the last selected tab. For example, space-pages
One year from the date it was set or was last updated.

Confluence-language

Remembers the user's language chosen on the login page. This cookie relates to a feature that allows a user to change Confluence's language from (and including) the login page, when the language presented to the user prior to logging in is not appropriate.
A locale relating to the chosen language. For example, de_DE
360 days from the date it was set or was last updated.

AJS.conglomerate.cookie

Tracks which general tabs were last used (e.g. in Confluence's plugin manager) or expansion elements were last opened or closed.
One or more key-value strings which indicate the states of your last general tab views or expansion elements.
One year from the date it is set or was last updated.

Notes

- The autocomplete feature in browser text fields (which are typically noticeable when a user logs in to Confluence) is a browser-specific feature, not a Confluence one. Confluence cannot enable or disable this autocompletion, which is typically set through a browser's settings.

 RELATED TOPICS

  Administrators Guide Home  Confluence Documentation Home

Configuring Secure Administrator Sessions

Confluence protects access to its administrative functions by requiring a secure administration session to use the Confluence administration console or administer a space. When a Confluence administrator (who is logged into Confluence) attempts to access an administration function, they are prompted to log in again. This logs the administrator into a temporary secure session that grants access to the Confluence/space administration console.

The temporary secure session has a rolling timeout (defaulted to 10 minutes). If there is no activity by the administrator in the Confluence/space administration console for a period of time that exceeds the timeout, then the administrator will be logged out of the secure administrator session (note, they will remain logged into Confluence). If the administrator does click an administration function, the timeout will reset.

⚠️ The information on this page does not apply to Confluence OnDemand.
To configure secure administrator sessions:

1. Choose Browse > Confluence Admin.
2. Click ‘Security Configuration’ in the ‘Security’ section. The ‘Edit Security Configuration’ screen will be displayed.
3. Click the ‘Edit’ link.
   - To disable secure administrator sessions (i.e. administrators will not be required to log into a secure session to access the administration console), uncheck the ‘Enable’ checkbox next to ‘Secure administrator sessions’.
   - To change the timeout for secure administrator sessions, update the value in textbox next to ‘minutes before invalidation’. The default timeout for a secure administration session is 10 minutes.
4. Click the ‘Save’ button.

![Screenshot above: Configuring secure administrator sessions](image)

Notes

- **Disabling password confirmation.** Confluence installations that use a custom authentication mechanism may run into problems with the Confluence security measure that requires password confirmation. If necessary, you can set the password.confirmation.disabled system property to disable the password confirmation functionality. See Recognised System Properties. See issue CONF-20958 "Confluence features that require password confirmation (websudo, captcha) do not work with custom authentication".

- **WebSudo.** The feature that provides secure administrator sessions is also called 'WebSudo'.

- **Manually ending a secure session.** An administrator can choose to manually end their secure session by clicking the ‘drop access’ link in the banner displayed at the top of their screen.

- **Note for developers.** Secure administrator sessions can cause exceptions when developing against Confluence or deploying a plugin. Please read this FAQ: How do I develop against Confluence with Secure Administrator Sessions? Note: The Confluence XML-RPC and REST APIs are not affected by...
Using Fail2Ban to limit login attempts

What is Fail2Ban?

We need a means of defending sites against brute-force login attempts. Fail2Ban is a Python application which trails logfiles, looks for regular expressions, and works with Shorewall (or directly with iptables) to apply temporary blacklists against addresses that match a pattern too often. This can be used to limit the rate at which a given machine hits login URLs for Confluence.

Prerequisites

- Requires Python 2.4 or higher to be installed
- Needs a specific file to follow, which means your Apache instance needs to log your Confluence access to a known logfile. You should adjust the configuration below appropriately.

How to set it up

This list is a skeletal version of the instructions

- There's an RPM available for RHEL on the download page, but you can also download the source and set it up manually
- Its configuration files go into /etc/fail2ban
- The generic, default configuration goes into .conf files (fail2ban.conf and jail.conf). Don't change these, as it makes upgrading difficult.
- Overrides to the generic configuration go into .local files corresponding to the .conf files. These only need to contain the specific settings you want overridden, which helps maintainability.
- Filters go into filter.d — this is where you define regexps, each going into its own file
- Actions go into action.d — you probably won't need to add one, but it's handy to know what's available
- "jails" are a configuration unit that specify one regexp to check, and one or more actions to trigger when the threshold is reached, plus the threshold settings (e.g. more than 3 matches in 60 seconds causes that address to be blocked for 600 seconds)
- Jails are defined in jail.conf and jail.local. Don't forget the enabled setting for each one — it can be as bad to have the wrong ones enabled as to have the right ones disabled.

Running Fail2Ban

- Use /etc/init.d/fail2ban {start|stop|status} for the obvious operations
- Use fail2ban-client -d to get it to dump its current configuration to STDOUT. Very useful for troubleshooting.
- Mind the CPU usage; it can soak up resources pretty quickly on a busy site, even with simple regexp
- It can log either to syslog or a file, whichever suits your needs better

Common Configuration

jail.local
# The DEFAULT allows a global definition of the options. They can be override
# in each jail afterwards.

[DEFAULT]

# "ignoreip" can be an IP address, a CIDR mask or a DNS host. Fail2ban will not
# ban a host which matches an address in this list. Several addresses can be
# defined using space separator.
# ignoreip = <space-separated list of IPs>

# "bantime" is the number of seconds that a host is banned.
bantime  = 600

# A host is banned if it has generated "maxretry" during the last "findtime"
# seconds.
findtime  = 60

# "maxretry" is the number of failures before a host get banned.
maxretry = 3

[ssh-iptables]

enabled  = false

[apache-shorewall]

enabled  = true
filter   = cac-login
action   = shorewall
logpath = /var/log/httpd/confluence-access.log
bantime = 600
maxretry = 3
findtime = 60
backend = polling

---

**Configuring for Confluence**

⚠️ The following is an example only, and you should adjust it for your site.

filter.d/confluence-login.conf
Securing Confluence with Apache

The following outlines some basic techniques to secure a Confluence instance using Apache. These instructions are basic to-do lists and should not be considered comprehensive. For more advanced security topics see the "Further Information" section below.

- **Using Apache to limit access to the Confluence administration interface**
- **Using Fail2Ban to limit login attempts**

**Further Information**

Running Confluence behind Apache

Warning: The information on this page does not apply to Confluence OnDemand.

Using Apache to limit access to the Confluence administration interface

**Limiting administration to specific IP addresses**

The Confluence administration interface is a critical part of the application; anyone with access to it can potentially compromise not only the Confluence instance but the entire machine. As well as limiting access to users who really need it, and using strong passwords, you should consider limiting access to it to certain machines on the network or internet. If you are using an Apache web server, this can be done with Apache's Location functionality as follows:

1. **Create a file that defines permission settings**

   This file can be in the Apache configuration directory or in a system-wide directory. For this example we'll call it "sysadmin_ips_only.conf". The file should contain the following:

   ```
   Order Deny,Allow
   Deny from All
   # Mark the Sysadmin's workstation
   Allow from 192.168.12.42
   ```

2. **Add the file to your Virtual Host**

   In your Apache Virtual Host, add the following lines to restrict the administration actions to the Systems Administrator:

```
This configuration assumes you've installed Confluence under '/confluence'. If you have installed under '/' or elsewhere, adjust the paths accordingly.

```xml
<Location /confluence/admin>
  Include sysadmin_ips_only.conf
</Location>
<Location /confluence/plugins/servlet/oauth/consumers/list>
  Include sysadmin_ips_only.conf
</Location>
<Location /confluence/plugins/servlet/oauth/view-consumer-info>
  Include sysadmin_ips_only.conf
</Location>
<Location /confluence/plugins/servlet/oauth/service-providers/list>
  Include sysadmin_ips_only.conf
</Location>
<Location /confluence/plugins/servlet/oauth/service-providers/add>
  Include sysadmin_ips_only.conf
</Location>
<Location /confluence/plugins/servlet/oauth/consumers/add>
  Include sysadmin_ips_only.conf
</Location>
<Location /confluence/plugins/servlet/oauth/consumers/add-manually>
  Include sysadmin_ips_only.conf
</Location>
<Location /confluence/plugins/servlet/oauth/update-consumer-info>
  Include sysadmin_ips_only.conf

Managing External Referrers

An external referrer is any site that links to your Confluence instance. Each time someone clicks on the external link, your Confluence site can record the click as a referral.

By default, external referrers for a page are listed under 'Hot Referrers' on the 'Info' screen of the page. (See Screenshot 1 below.) Confluence shows a maximum of 10 referrers. If there are more than 10, confluence shows the 10 with the highest number of hits.

Note that you do not need to enable trackback in order to have external referrers enabled.

To manage your external referrers:

1. Choose Browse > Confluence Admin.
2. Select the 'Manage Referrers' option (See Screenshot 2 below.).

The following actions will be available:

- **Record or ignore all external referrers**: By default, Confluence records the number of hits made to a page from the link on the external site. If you turn this option off, Confluence will not record the hits.
- **Show or hide all external referrers**: By default, Confluence lists the external referrers as 'Hot Referrers' on the 'Info' screen of a page, as shown below. If you turn this option off, external referrers will not be listed on the page.
- **Specify which external referrers to exclude**: You can decide which referrers you want to exclude from being displayed on your site.

Screenshot above: Hot Referrers showing on a page's Info screen
Excluding external referrers

An external referrer is any site that links to your Confluence instance. Each time someone clicks on the external link, your Confluence site can record the click as a referral.

You can exclude external referrers to prevent them from being recorded or displayed anywhere on your site. Once you have specified your list of blocked URLs, any incoming links from URLs that match the list will no longer be recorded. Referrer URLs are blocked if they start with any of the URLs in the exclusion list. So `http://evilspamsite.blogspot.com` will also match `http://evilspamsite.blogspot.com/nastypage.html`.

There are two instances where you may want to do this:

1. If you are running a Confluence installation that is open to public:
   In a site that is open to public, one unfortunate problem is that malicious sites can spam the display of a page’s incoming links statistics. This is usually done to get the site's URL to appear in the sidebar. By adding these sites to the ‘excluded referrers’ list, you can prevent them from being listed on your site.
2. If Confluence is installed on a server with multiple domain names or IP addresses:
   Confluence will consider any URL originating from the domain name where Confluence is installed as an internal link. However, if Confluence is installed on a server with multiple domain names or IP addresses, you will need to add the other domain name prefixes to this list to let Confluence know that any links from these domains should not be considered external links.

You need to be a Confluence administrator and to know the URL of the site to add it to the excluded referrers list.

To add a URL to the excluded referrers list:

1. Choose Browse > Confluence Admin.
2. Select Manage Referrers in the left-hand panel.
3. Add the URL to the ‘Excluded External Referrer Prefixes’ section.
   - You must include ‘http://’ at the front of the URL.
   - You can add more than one URL by putting each URL on a new line.
Hiding external referrers

By default, Confluence lists the external referrers as 'Hot Referrers' on the 'Info' screen of a page. If you turn this option off, external referrers will not be listed on the page.

To hide external referrers:

1. Choose **Browse** > **Confluence Admin**.
2. Select 'Manage Referrers' in the left-hand panel.
3. Click 'Off' beside 'Show Referrers in Page Info'.

Ignoring External Referrers

An external referrer is any site that links to your Confluence instance. Each time someone clicks on the external
link, your Confluence site can record the click as a referral. By default, Confluence records the number of hits made to a page from any link on an external site. If you turn this option off, Confluence will not record the hits.

To ignore external referrers:

1. Choose **Browse > Confluence Admin.**
2. Select ‘**Manage Referrers**’ in the left-hand panel.
3. Click ‘**Off**’ beside ‘**Record External Referrers**’.

<table>
<thead>
<tr>
<th>Record External Referrers:</th>
<th>On</th>
<th>Off</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Referrers in Page Info:</td>
<td>On</td>
<td>Off</td>
</tr>
<tr>
<td>Excluded External Referrer Prefixes:</td>
<td>![Add button]</td>
<td></td>
</tr>
</tbody>
</table>

**Best Practices for Configuring Confluence Security**

The best way to harden a system is to look at each of the involved systems individually. Contact your company’s security officer or department to find out what security policies you should be using. There are many things to consider, such as the configuration of your underlying operating systems, application servers, database servers, network, firewall, routers, etc. It would be impossible to outline all of them here.

This page contains guidelines on good security practices, to the best of our knowledge.

---

**The information on this page does not apply to Confluence OnDemand.**

---

**Configuring the Web Server**

Please refer to the following guides for system administrators:

- How to configure Apache to lock down the administration interface to those people who really need it: Using Apache to limit access to the Confluence administration interface.
- How to reduce the risk of brute force attacks: Using Fail2Ban to limit login attempts.

**Configuring the Application Server**

See the following system administrator guide for general hints on the application server level:

- **Tomcat security best practices**

**Configuring the Application**

The way you set up Confluence roles, permissions and processes makes a big difference in the security of your Confluence site.
Below are some more Confluence-specific items to consider. None of these provides 100% security. They are measures to reduce impact and to slow down an intruder in case your system does become compromised.

- Keep the number of Confluence administrators extremely low. For example, 3 system administrator accounts should be the maximum.
- Similarly, restrict the number of users with powerful roles or group memberships. If only one department should have access to particularly sensitive data, then do restrict access to the data to those users. Do not let convenience over-rule security. Do not give all staff access to sensitive data when there is no need.
- The administrators should have separate Confluence accounts for their administrative roles and for their day to day roles. If John Doe is an administrator, he should have a regular user account without administrator access to do his day to day work (such as writing pages in the wiki). This could be a ‘john.doe’ account. In addition, he should have an entirely separate account (that cannot be guessed by an outsider and that does not even use his proper name) for administrative work. This account could be ‘jane smith’ – using a username that is so obscure or fake that no outsider could guess it. This way, even if an attacker singles out the actual person John Doe and gets hold of his password, the stolen account would most likely be John’s regular user account, and the attacker cannot perform administrative actions with that account.
- Lock down administrative actions as much as you can. If there is no need for your administrators to perform administrative actions from outside the office, then lock down access to those actions to known IP adresses, for example. See Using Apache to limit access to the Confluence administration interface.
- Put documented procedures in place for the case of employees leaving the company.
- Perform security audits regularly. Know who can help in case a security breach occurs. Perform ‘what if’ planning exercises. (‘What is the worst thing that could happen if a privileged user's password were stolen while he's on vacation? What can we do to minimise damage?’).
- Make sure the Confluence database user (and all datasource database users) only has the amount of database privileges it really needs.
- Monitor your binaries. If an attacker compromises an account on your system, he will usually try to gain access to more accounts. This is sometimes done by adding malicious code, such as by modifying files on the system. Run routine scripts that regularly verify that no malicious change has been made.

As another precaution:

- Regularly monitor the above requirements. There are many things that could start out well, but deteriorate over time:
  - A system may start out with just 3 administrators, but over the course of a year this could grow to 30 administrators if no one prevents expansion.
  - Apache administration restrictions may be in place at the start of the year, but when the application server is migrated after a few months, people may forget to apply the rules to the new system.

Again, keep in mind that the above steps may only be a fraction of what could apply to you, depending on your security requirements. Also, keep in mind that none of the above rules can guarantee anything. They just make it harder for an intruder to move quickly.

**Hiding the People Directory**
The [People Directory](#) provides a list of all users in your Confluence system.

If you need to disable the People Directory set the following system properties on your application server command line:

- To disable the People Directory for [anonymous users](#),

  ```
  -Dconfluence.disable.peopledirectory.anonymous=true
  ```

- To disable the People Directory entirely,
This workaround will prevent the People directory from appearing on the dashboard, but if you navigate to the profile of a user, and then click on the "People" in the breadcrumb link (Dashboard >> People >> FullName >> Profile) or you go to the URL directly <CONFLUENCE_INSTALL>/browsepeople.action, you will be able to access the people directory.

To workaround this, set up Apache webserver in front of confluence and redirect requests to this URL.

To remove the link on the dashboard:

Procedure for Confluence 2.5.2 to 2.9.x. only

- This only applies to Confluence 2.5.2 to 2.9.x. Confluence 2.10.x or later only needs to configure system properties using the above.
- Edit the <confluence-install>/confluence/decorators/global.vmd:
- Comment out line 37:

```xml
<!--                    <img
 src="$req.contextPath/images/icons/people_directory_32.gif" 
 align='absmiddle' height="32" width="32"> <b><a class="fontSizeDefault" 
 href="$req.contextPath/peopledirectory.action"> 
 $action.getText("people.directory.title")</a></b><span 
 class="smalltext"> -
 $action.getText("people.directory.description")</span><br> -->
```

Configuring Captcha for Spam Prevention

- You need to be a Confluence administrator to configure Captcha for spam prevention in Confluence.

If your Confluence site is open to the public you may find that automated spam is being added, in the form of
comments or new pages.

You can configure Confluence to deter automated spam by asking users to prove that they are human before they are allowed to:

- Sign up for an account.
- Add a comment.
- Create a page.
- Edit a page.
- Send a request to the Confluence administrators.

Captcha is the technical term for a test that can distinguish a human being from an automated agent such as a web spider or robot. You can read more about Captcha on Wikipedia.

When Captcha is switched on, users will need to recognise a distorted picture of a word, and must type the word into a text field. This is easy for humans to do, but very difficult for computers.

![Captcha Test](Screenshot above: Example of a Captcha test)

You can configure Confluence to enforce Captcha for certain types of users. You can exempt logged-in users (they will have completed a Captcha when they signed up) or members of particular groups.

By default, Captcha for spam prevention is disabled. If you enable it, the default is that Captcha for spam prevention will apply to anonymous users only. Only anonymous users will have to perform the Captcha test when creating comments or editing pages. Captcha images will not be shown to logged-in users.

To enable Captcha for spam prevention in Confluence:

1. Choose Browse > Confluence Admin.
2. Select ‘Spam Prevention’ from the ‘Configuration’ menu on the left.
3. Turn on Captcha by clicking the ‘ON’ link.
4. If you want to disable Captcha for certain groups:
   - Select ‘No one’ if you want everyone to see Captchas.
   - Select ‘Signed in users’ if you want only anonymous users to see Captchas.
   - If you want everyone to see Captchas except members of specific groups, select the ‘Members of the following groups’ and enter the group names in the text box. You can click the magnifying-glass icon to search for groups. Search for all or part of a group name and click the ‘Select Groups’ button to add one or more groups to the list.
   - To remove a group from the list, delete the group name.
5. Click the ‘Save’ button.

Hiding External Links From Search Engines
Hiding external links from search engines helps to discourage spammers from posting links on your site. If you turn this option on, any URLs inserted in pages and comments will be given the 'nofollow' attribute, which prevents search engines from following them.

Shortcut links (e.g. CONF-2622@JIRA) and internal links to other pages within Confluence are not tagged.
To hide external links from search engines:

1. Choose Browse > Confluence Admin.
2. Click 'Security Configuration' in the left panel.
3. This will display the 'Security Configuration' screen. Click 'Edit'.
4. Check the 'Hide External Links From Search Engines' checkbox.
5. Click the 'Save' button.

**Background to the nofollow attribute**

As part of the effort to combat the spamming of wikis and blogs (Confluence being both), Google came up with some markup which instructs search engines not to follow links. By removing the main benefit of wiki-spamming it's hoped that the practice will stop being cost-effective and eventually die out.

---

**Configuring Captcha for Failed Logins**

If you have confluence administrator permissions, you can configure Confluence to impose a maximum number of repeated login attempts. After a given number of failed login attempts (the default is three) Confluence will display a Captcha form asking the user to enter a given word when attempting to log in again. This will prevent brute force attacks on the Confluence login screen. Similarly, after three failed login attempts via the XML-RPC or SOAP API, an error message will be returned instructing the user to log in via the web interface. Captcha will automatically be activated when they attempt this login.

'Captcha' is the technical term for a test that can distinguish a human being from an automated agent such as a web spider or robot. You can read more about Captcha on Wikipedia.

When Captcha is activated, users will need to recognise a distorted picture of a word, and must type the word into a text field. This is easy for humans to do, but very difficult for computers.
Enabling, Disabling and Configuring Captcha for Failed Logins

By default, Captcha for failed logins is enabled and the number of failed login attempts is set to three.

To enable, disable and configure Captcha for failed logins:

1. Choose **Browse > Confluence Admin.**
2. Select ‘Security Configuration’ from the ‘Security’ menu on the left.
3. Click the ‘Edit’ button.
4. To enable Captcha:
   - Check the ‘Enable’ checkbox next to ‘CAPTCHA on login’.
   - Set the maximum number of failed logins next to ‘Maximum Authentication Attempts Allowed’. You must enter a number greater than zero.
5. To disable Captcha, remove the check from the ‘Enable’ checkbox.
6. Click the ‘Save’ button.

![Security and Privacy](image)

Screenshot above: Configuring Captcha for failed logins

**Notes**

- **Disabling all password confirmation requests, including Captcha on login.** Confluence installations that use a custom authentication mechanism may run into problems with the Confluence security measure that requires password confirmation. If necessary, you can set the `password.confirmation.disabled` system property to disable the password confirmation functionality on administrative actions, change of email address and Captcha for failed logins. See [Recognised System Properties](#)

**Configuring XSRF Protection**

Confluence requires an XSRF token to be present on comment creation, to prevent users being tricked into unintentionally submitting malicious data (read more about XSRF (Cross Site Request Forgery)). All of the themes bundled with Confluence have been designed to use this feature. However, if you are using a custom theme that does not support this security feature, you can disable it.
Please carefully consider the security risks before you disable XSRF protection in your Confluence installation.

Some functionality described on this page is restricted in Confluence OnDemand.

To configure XSRF protection:

1. Choose Browse > Confluence Admin.
2. Click ‘Security Configuration’ in the ‘Security’ section. The ‘Edit Security Configuration’ screen will be displayed.
3. Click the ‘Edit’ link.
4. To disable XSRF protection, uncheck the ‘Add Comments’ checkbox in the ‘XSRF Protection’ section.
5. Click the ‘Save’ button.

User Email Visibility

Confluence provides three options for email address privacy which can be configured by a Confluence administrator from the Administration Console:

- **Public**: email addresses are displayed publicly.
- **Masked**: email addresses are still displayed publicly, but masked in such a way to make it harder for spam-bots to harvest them.
- **Only visible to site administrators**: only Confluence administrators can see the email addresses. Note that, if you select this option, email addresses will not be available in the ‘User Search’ popup (e.g. when setting Page Restrictions).
The information on this page does not apply to Confluence OnDemand.

To configure user email visibility:

1. Choose Browse > Confluence Admin.
2. Select 'Security Configuration' in the left-hand panel. The 'Security Configuration' screen will be displayed.
3. Click 'Edit'. The fields on the 'Security Configuration' screen will be editable.
4. Select one of the options from the 'User email visibility' dropdown: 'public', 'masked', or 'only visible to site administrators'.
5. Click the 'Save' button.

<table>
<thead>
<tr>
<th>User email visibility:</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
</tr>
<tr>
<td>masked (i.e. user at example dot com)</td>
</tr>
<tr>
<td>only visible to site administrators</td>
</tr>
</tbody>
</table>

Anonymous Access to Remote API

Sites may wish to disable anonymous access to the Remote API to make it harder for malicious users to write 'bots' that perform bulk changes to the site. If you wish to enable the Remote APIs but do not want anonymous users to access Confluence remotely, you can disable anonymous access from the Administration Console.

To disable anonymous access to Remote APIs:

1. Choose Browse > Confluence Admin.
2. Click 'Security Configuration' in the left panel. The 'Security Configuration' screen will be displayed.
3. Click 'Edit'. The fields on the 'Security Configuration' screen will now be editable.
4. Uncheck the 'Anonymous Access to API' checkbox.
5. Click the 'Save' button.

Running Confluence Over SSL or HTTPS

This page documents configuration of SSL, rather than of Confluence itself. Atlassian will support Confluence with this configuration, but we cannot guarantee to help you debug problems with SSL. Please be aware that this material is provided for your information only, and that you use it at your own risk.

This document tells you how to configure Confluence to enable access via HTTPS (HTTP over SSL), so that your Confluence logins and data are encrypted during transport to and from Confluence. SSL encryption is a good way to safeguard your Confluence data and user logins from being intercepted and read by outsiders.
These instructions apply to the following platforms:

- **Confluence or Confluence WAR distribution using Tomcat.** Apache Tomcat is the application server shipped with Confluence, and is the only supported application server. If you are using a different application server or Apache HTTP Server ("httpd"), see the page on [Apache with mod_proxy](http://httpd.apache.org/docs/2.2/ssl/mod_ssl.html) for instructions on how to terminate an SSL connection at the Apache web server.

- **Java 6.** JDK 1.6 is the [supported](http://java.sun.com/javase/downloads/) Java version for Confluence. Note that you need the JDK, since it includes the `keytool` utility used in the instructions below. The JRE is not enough. If you are using JDK 1.5, please refer to the [Java SE documentation](http://java.sun.com/javase/6/docs/technotes/guides/security/keytool Whiplet.html) to see the differences in the `keytool` utility from JDK 1.5 to JDK 1.6.

The default connector port for Confluence is 8090, while a plain Tomcat installation (used for EAR / WAR distribution) will default to 8080.

---

### On this page:

- [Step 1. Create or Request a New SSL Certificate](#step-1-create-or-request-a-new-ssl-certificate)
- [Step 3. Specify the Location of your Certificate](#step-3-specify-the-location-of-your-certificate)
- [Step 4. Change your Confluence Base URL to HTTPS](#step-4-change-your-confluence-base-url-to-https)
- [Step 5. Add a Security Constraint to Cause Redirect of All URLs to HTTPS](#step-5-add-a-security-constraint-to-cause-redirect-of-all-urls-to-https)
- [Notes](#notes)
- [Troubleshooting](#troubleshooting)

---

The information on this page does not apply to Confluence OnDemand.

### Step 1. Create or Request a New SSL Certificate

You will need a valid SSL certificate before you can enable HTTPS. If you already have a certificate prepared, skip to step 2 [below](#step-2-modify-the-server-configuration-file-in-your-confluence-installation).

You can choose to create a self-signed certificate or to use a certificate issued by a certificate authority (CA, sometimes also called a 'certification authority'). We described both options below.

**Certificate Option 1 – Create a Self-Signed Certificate**

Self-signed certificates are useful if you require encryption but do not need to verify the identity of the requesting website. In general, you might use a self-signed certificate on a test environment and on internal corporate networks (intranets).

Because the certificate is not signed by a certificate authority (CA), users may receive a message that the site is not trusted and may have to perform several steps to accept the certificate before they can access the site. This usually will only occur the first time they access the site.

Follow the steps below to generate a certificate using Java's `keytool` utility. This tool is included in the JDK.

1. Use Java's `keytool` utility to generate the certificate:
   - On Windows, run the following command at the command prompt:
     ```bash
     "%JAVA_HOME%\bin\keytool" -genkeypair -alias tomcat -keyalg RSA
     ```
On OS X or UNIX-based systems, run the following command at the command prompt:

```bash
$JAVA_HOME/bin/keytool -genkeypair -alias tomcat -keyalg RSA
```

2. When asked for a **password**:
   - Specify the password you want to use for the certificate (private key). Note that the password text will not appear as you type it.
   - Make a note of the password you choose, because you will need it in the next step when editing the configuration file.
   - The default password is 'changeit'.

3. Follow the prompts to specify your name, organisation and location. This information is used to construct the X.500 Distinguished Name (DN) of the entity. The CN ("What is your first and last name?") must match the fully-qualified hostname of the server running Confluence, otherwise Tomcat will not be able to use the certificate for SSL. For example for a Confluence running on a server named "confluence.example.com":
   
   CN=confluence.example.com, OU=Java Software Division, O=Sun Microsystems Inc, C=US
   
   Enter 'y' to confirm the details.

4. Enter 'y' to confirm the details.

5. When asked for the **password** for 'tomcat' (the alias you entered in the keytool command above), press the 'Enter' key. This specifies that your keystore entry will have the **same password** as your private key.
   
   You MUST use the same password here as was used for the keystore password itself. This is a restriction of the Tomcat implementation.

6. You certificate is now ready. Go to step 2 below.

**Certificate Option 2 – Use a Certificate Issued by a Certificate Authority**

When running Confluence in a production environment, you will need a certificate issued by a certificate authority (CA, sometimes also called a 'certification authority') such as VeriSign, Thawte or TrustCenter. The instructions below are adapted from the [Tomcat documentation](#).

First you will generate a local certificate and create a 'certificate signing request' (CSR) based on that certificate. You will submit the CSR to your chosen certificate authority. The CA will use that CSR to generate a certificate for you.

1. Use Java's `keytool` utility to generate a local certificate, as described in the previous section.
2. Use the `keytool` utility to generate a CSR, replacing the text `<MY_KEYSTORE_FILENAME>` with the path to and file name of the `.keystore` file generated for your local certificate:

   ```bash
   keytool -certreq -keyalg RSA -alias tomcat -file certreq.csr -keystore <MY_KEYSTORE_FILENAME>
   ```

3. Submit the generated file called `certreq.csr` to your chosen certificate authority. Refer to the documentation on the CA's website to find out how to do this.
4. The CA will send you a certificate.
5. Import the new certificate into your local keystore:

   ```bash
   keytool -importcert -alias tomcat -keystore <MY_KEYSTORE_FILENAME> -file <MY_CERTIFICATE_FILENAME>
   ```
If you receive an error, and you use Verisign or GoDaddy, you may need to export the certificate to PKCS12 format along with the private key.

1. First, remove the certificate added above from the keystore:

   ```
   keytool -delete -alias tomcat -keystore <MY_KEYSTORE_FILENAME>
   ```

2. Then export to PKCS12 format:

   ```
   openssl pkcs12 -export -in <MY_CERTIFICATE_NAME> -inkey <MY_PRIVATEKEY_NAME> -inkey <MY_ROOTCERTIFICATE_NAME> -out <MY_PKC12_KEYSTORE_NAME> -name tomcat -C Afile <MY_ROOTCERTIFICATE_NAME> -alsoCalledBundleCertificateInGoDaddy -caname root
   ```

3. Then import from PKCS12 to jks:

   ```
   keytool -importkeystore -deststorepass <MY_DESTINATIONSTORE_PASSWORD> -destkeypass <MY_DESTINATIONKEY_PASSWORD> -destkeystore <MY_KEYSTORE_FILENAME> -srckeystore <MY_PKC12_KEYSTORE_NAME> -srcstoretype PKCS12 -srcstorepass <MY_PKC12_KEYSTORE_PASSWORD> -alias tomcat
   ```

**Step 2. Modify the Server Configuration File in your Confluence Installation**

1. Edit the server configuration file at this location: {CONFLUENCE-INSTALLATION}/conf/server.xml.
2. Uncomment the following lines:

   ```
   <Connector port="8443" maxHttpHeaderSize="8192"
     maxThreads="150" minSpareThreads="25"
     maxSpareThreads="75"
     enableLookups="false" disableUploadTimeout="true"
     acceptCount="100" scheme="https" secure="true"
     clientAuth="false" sslProtocol="TLS" SSLEnabled="true"
     URIEncoding="UTF-8"
     keystorePass="<MY_CERTIFICATE_PASSWORD/>
   ```

3. Replace the text `<MY_CERTIFICATE_PASSWORD>` with the password you specified for your certificate.
4. Make sure that the attribute-value pair `SSLEnabled="true"` is part of the Connector element, as shown above. If this attribute is not present, attempts to access Confluence will time out.
5. Save the server configuration file.

**Step 3. Specify the Location of your Certificate**
By default, Tomcat expects the keystore file to be named .keystore and to be located in the user home directory under which Tomcat is running (which may or may not be the same as your own home directory). This means that, by default, Tomcat will look for your SSL certificates in the following location:

- On Windows: C:\Documents and Settings\#{CURRENT_USER}\.keystore
- On OS X and UNIX-based systems: ~/.keystore

You may decide to move the certificate to a custom location. If your certificate is not in the default location, you will need to update your server configuration file as outlined below, so that Tomcat can find the certificate.

1. Edit the server configuration file at this location: {CONFLUENCE-INSTALLATION}/conf/server.xml
2. Add the attribute `keystoreFile="<MY_CERTIFICATE_LOCATION>"` to the `Connector` element, so that the element looks like this:

   ```xml
   <Connector port="8443" maxHttpHeaderSize="8192"
      maxThreads="150" minSpareThreads="25"
      maxSpareThreads="75"
      enableLookups="false" disableUploadTimeout="true"
      acceptCount="100" scheme="https" secure="true"
      clientAuth="false" sslProtocol="TLS" SSLEnabled="true"
      URIEncoding="UTF-8"
      keystorePass="<MY_CERTIFICATE_PASSWORD>"
      keystoreFile="<MY_CERTIFICATE_LOCATION>"/>
   ```

3. Replace the text `<MY_CERTIFICATE_LOCATION>` with the path to your certificate, including the path and the name of the .keystore file.
4. Save the server configuration file.

**Step 4. Change your Confluence Base URL to HTTPS**

1. In your browser, go to the Confluence Administration Console.
2. Change the Server Base URL to HTTPS. See the documentation on configuring the server base URL.

**Step 5. Add a Security Constraint to Cause Redirect of All URLs to HTTPS**

Although HTTPS is now activated and available, the old HTTP URLs (http://localhost:8090) are still available. Now you need to redirect the URLs to their HTTPS equivalent. You will do this by adding a security constraint in web.xml. This will cause Tomcat to redirect requests that come in on a non-SSL port.

1. Check whether your Confluence site uses the RSS macro. If your site has the RSS macro enabled, you may need to configure the URL redirection with a firewall rule, rather than by editing the web.xml file. Skip the steps below and follow the steps on the RSS Feed Macro page instead.
2. Otherwise, Edit the file at `<CONFLUENCE_INSTALLATION>/confluence/WEB-INF/web.xml`.
3. Add the following declaration to the end of the file, before the </web-app> tag:
<security-constraint>
  <web-resource-collection>
    <web-resource-name>Restricted URLs</web-resource-name>
    <url-pattern>/</url-pattern>
  </web-resource-collection>
  <user-data-constraint>
    <transport-guarantee>CONFIDENTIAL</transport-guarantee>
  </user-data-constraint>
</security-constraint>

Confluence has two web.xml files. The other one is at `<CONFLUENCE_INSTALLATION>/conf/web.xml`. Please only add the security constraints to `<CONFLUENCE_INSTALLATION>/confluence/WEB-INF/web.xml`, as described above.

Notes

- **Background information on generating a certificate**: The `keytool -genkeypair` command generates a key pair consisting of a public key and the associated private key, and stores them in a keystore. The command packages the public key into an X.509 v3 self-signed certificate, which is stored as a single-element certificate chain. This certificate chain and the private key are stored in a new keystore entry, identified by the alias that you specify in the command. The [Java SE documentation](https://docs.oracle.com/javase/8/docs/technotes/guides/security/Configuring/keystores.html) has a good overview of the utility.

- **Custom SSL port**: If you have changed the port that the SSL connector is running on from the default value of 8443, you must update the `redirectPort` attribute of the standard HTTP connector to reflect the new SSL port. Tomcat needs this information to know which port to redirect to when an incoming request needs to be secure.

- **Multiple instances on the same host**: When running more than one instance on the same host, it is important to specify the `address` attribute in the `<CONFLUENCE_INSTALLATION>/conf/server.xml` file because by default the connector will listen on all available network interfaces, so specifying the address will prevent conflicts with connectors running on the same default port. See the Tomcat Connector documentation for more about setting the address attribute: [http://tomcat.apache.org/tomcat-5.5-doc/config/http.html](http://tomcat.apache.org/tomcat-5.5-doc/config/http.html)

```xml
<Connector port="8443" address="your.confluence.url.com"
  maxHttpHeaderSize="8192"
  maxThreads="150" minSpareThreads="25"
  maxSpareThreads="75"
  enableLookups="false" disableUploadTimeout="true"
  acceptCount="100" scheme="https" secure="true"
  clientAuth="false" sslProtocol="TLS" SSLEnabled="true"
  URIEncoding="UTF-8"
  keystorePass="<MY_CERTIFICATE_PASSWORD>"
  keystoreFile="<MY_CERTIFICATE_LOCATION>"/>
```

- **Protection for logins only or for individual spaces**: As of Confluence 3.0, Atlassian does not support HTTPS for logins only or for specific pages. We support only site-wide HTTPS. To see the reasoning behind this decision, please see [CONF-18120](https://jira.atlassian.com/browse/CONF-18120) and [CONF-4116](https://jira.atlassian.com/browse/CONF-4116).

**Troubleshooting**
• Check the Confluence knowledge base articles on troubleshooting SSL.

• If any of your users will access Confluence from Internet Explorer 7 on Vista, please note the following additional points when using Java’s keytool utility:
  • Make sure that you specify the -keyalg RSA option, as shown in the example of the keytool command above. The default is the SHA1 algorithm, which results in an error ‘Internet Explorer cannot display the webpage’ on IE7 on Vista.
  • You may also need to specify the -sigalg MD5withRSA option. Otherwise, SHA1 will be used even if you specify the -keyalg RSA option. See this Atlassian blogpost for more information.

• Problems with Internet Explorer being unable to download attachments: Applying SSL site wide can prevent IE from downloading attachments correctly. To fix this problem, edit `<CONFLUENCE_INSTALLATION>/conf/server.xml` and add the following line within the `<Context ... />` element:

```
<Valve className="org.apache.catalina.authenticator.NonLoginAuthenticator"
     disableProxyCaching="true" securePagesWithPragma="false" />
```

• Connecting to LDAP or JIRA or Other Services via SSL
• Supported Platforms

Connecting to LDAP or JIRA or Other Services via SSL

This page describes how to get Confluence connecting to external servers over SSL, via the various SSL-wrapped protocols.

Here are some examples of when you may need to connect to an external server over SSL/HTTPS:

• You need to connect to an LDAP server, such as Active Directory, if the LDAP server is running over SSL.
  For specific instructions for Active Directory, see Configuring an SSL Connection to Active Directory.
• You want to set up JIRA as a trusted application in Confluence, when JIRA is running over SSL.
• You want to refer to an https://... URL in a Confluence macro.

If you want to run Confluence itself over SSL, see Running Confluence Over SSL or HTTPS.

⚠️ The information on this page does not apply to Confluence OnDemand.

✓ There's a Beta version of a Confluence SSL plugin that facilitates this process.

Importing SSL Certificates

The following commands apply to JDK 1.5. For commands/syntax relevant to JDK 1.6, please refer to this document from Oracle.

1. Add the root certificate to your default Java keystore with the following command. This is the certificate that was used to authorise the LDAP server's certificate. It will be either the one that was used for signing it, or will come from further up in the trust chain, possibly the root certificate. This is often a self-signed
In Confluence, when both ends of the SSL connection are within the same network. Again, the exact alias is not important.

```shell
keytool -import -alias serverCert -file RootCert.crt -keystore %JAVA_HOME%/jre/lib/security/cacerts (Windows)
keytool -import -alias serverCert -file RootCert.crt -keystore $JAVA_HOME/jre/lib/security/cacerts (Linux/Unix/Mac)
```

2. Import your LDAP or JIRA server’s public certificate into the JVM Keystore. This is the certificate that the LDAP server will use to set up the SSL encryption. You can use any alias of your choosing in place of "JIRAorLDAPServer.crt".

```shell
keytool -import -alias ldapCert -file JIRAorLDAPServer.crt -keystore %JAVA_HOME%/jre/lib/security/cacerts (Windows)
keytool -import -alias ldapCert -file JIRAorLDAPServer.crt -keystore $JAVA_HOME/jre/lib/security/cacerts (Linux/Unix/Mac)
```

3. Verify that the certificate has been added successfully by entering the following command:

```shell
keytool -list -keystore %JAVA_HOME%/jre/lib/security/cacerts (Windows)
keytool -list -keystore $JAVA_HOME/jre/lib/security/cacerts (Unix/Linux)
keytool -list -keystore /Library/Java/Home/lib/security/cacerts (Mac)
```

4. Ensure that you have updated JAVA_OPTS to specify the path to the keystore, as specified in Connecting to SSL services, before restarting Tomcat/Confluence.

There is no need to specify an alias for Confluence to use. On connecting to the LDAP server, it will search through the keystore to find a certificate to match the key being presented by the server.

**Troubleshooting**

Check the following knowledge base articles:

- Unable to Connect to SSL Services due to PKIX Path Building Failed
- Sun.security.provider.certpath.SunCertPathBuilderException
- SSL troubleshooting articles

**Related Topics**

- Configuring an SSL Connection to Active Directory
- Configuring Web Proxy Support for Confluence
- Running Confluence Over SSL or HTTPS

**Configuring RSS Feeds**

A Confluence System Administrator can configure the following aspects of RSS feeds:

- The maximum number of items that Confluence returns to an RSS feed request.
- The maximum time period that Confluence allows to respond to an RSS feed request.

Both of these are set in the ‘Edit Security Configuration’ screen.
To configure RSS feeds:

1. Choose **Browse > Confluence Admin**.
2. Click **Security Configuration** in the left panel. The 'Edit Security Configuration' screen will be displayed.
3. Click **Edit**.
4. Edit the value for **Maximum RSS Items**. The default value is 200.
5. Edit the value for **RSS timeout**.
6. Click **Save**.

### Screenshot: Configuring RSS feeds

<table>
<thead>
<tr>
<th>Maximum RSS Items</th>
<th>200</th>
</tr>
</thead>
<tbody>
<tr>
<td>Limit the maximum number of items an RSS Feed can request.</td>
<td></td>
</tr>
<tr>
<td>RSS timeout</td>
<td>60</td>
</tr>
<tr>
<td>The time in seconds allowed to create each RSS Feed. Any items rendered within the timeout will still be returned.</td>
<td></td>
</tr>
</tbody>
</table>

### Notes

- When using the RSS **Feed Builder**, a user could potentially enter such a large value for the number of feed items returned that Confluence would eventually run out of memory.
- When using the **Feed Builder**, if a user's a value greater than this setting (or less than 0) they will get a validation error.
- If any pre-existing feeds are set to request more than the configured maximum, they will be supplied with only the configured maximum number of items. This is done silently - there is no logging and no message is returned to the RSS reader.
- If Confluence times out when responding to an RSS feed request, any items already rendered are returned.

- Preventing and Cleaning Up Spam

#### Using the RSS Feed Builder

**Preventing and Cleaning Up Spam**

If you have a public-facing Confluence site, your site may be affected by spammers.

**Stopping Spammers**

To prevent spammers:

1. Enable Captcha. See **Configuring Captcha for Spam Prevention**.
2. Run Confluence behind an **Apache webserver** and create rules to block the spammer’s IP address.

**Blocking Spam at Apache or System Level**

If a spam bot is attacking your Confluence site, they are probably coming from one IP address or a small range of IP addresses. To find the attacker’s IP address, follow the **Apache access logs** in real time and filter for a page that they are attacking.

For example, if the spammers are creating users, you can look for `signup.action:`
Compare the actual spam users being created with the log entries to make sure you do not block legitimate users. By default, Apache logs the client’s IP address in the first field of the log line.

Once you have the offender’s IP address or IP range, you can add it to your firewall’s blacklist. For example, using the popular Shorewall firewall for Linux you can simply do this:

```
# echo "1.2.3.4" >> /etc/shorewall/blacklist
# /etc/init.d/shorewall reload
```

To block an IP address at the Apache level, add this line to your Apache vhost config:

```
Deny from 1.2.3.4
```

You can restart Apache with a “graceful” command which will apply the changes without dropping any current sessions.

If this still does not stop the spam, then consider turning off public signup.

### Deleting Spam

#### Profile Spam

By ‘profile spam’, we mean spammers who create accounts on Confluence and post links to their profile page.

If you have had many such spam profiles created, it is easier to delete them via SQL, as described below.

**To delete a spam profile:**

1. Shut down Confluence and back up your database. **Note:** This step is essential before you run any SQL commands on your Confluence database.
2. Find the last real profile:

   ```
   SELECT bodycontentid, body FROM bodycontent WHERE contentid IN 
   (SELECT contentid FROM content WHERE contenttype='USERINFO')
   ORDER BY bodycontentid DESC;
   ```

3. Look through the bodies of the profile pages until you find where the spammer starts. You may have to identify an number of ranges.
4. Find the killset:
CREATE TEMP TABLE killset AS SELECT
  bc.bodycontentid, c.contentid, c.username FROM
  bodycontent bc JOIN content c ON bc.contentid=c.contentid WHERE
  bodycontentid >= BOTTOM_OF_SPAM_RANGE AND bodycontentID <=
  TOP_OF_SPAM_RANGE
  AND c.contenttype='USERINFO';

DELETE FROM bodycontent WHERE bodycontentid IN (SELECT
bodycontentid FROM killset);

DELETE FROM links WHERE contentid IN (SELECT contentid FROM
killset);

DELETE FROM content WHERE prevver IN (SELECT contentid FROM
killset);

DELETE FROM attachments WHERE pageid IN (SELECT contentid FROM
killset);

DELETE FROM content WHERE contentid IN (SELECT contentid FROM
killset);

DELETE FROM os_user_group WHERE user_id IN (SELECT id FROM killset
k JOIN os_user o ON o.username=k.username);

DELETE FROM os_user WHERE username IN (SELECT username FROM
killset);

5. Once the spam has been deleted, restart Confluence and rebuild the index. This will remove any references to the spam from the search index.

### Choosing a Default Language

Administrators can define a default language to be applied to all spaces in your Confluence site. Note that individual users can select a language preference for their session.

**Setting the Default Language**

To change the default language for the Confluence site:

1. Choose **Browse > Confluence Admin**.
2. Select 'Languages' in the 'Configuration' section of the left-hand panel.
3. The 'Language Configuration' screen will appear. Select the language that you want to use as the default language for your Confluence site.

**Other Settings that Affect the Language**

Individual users can choose the language that Confluence will use to display screen text and messages. Note that the list of supported languages depends on the language packs installed on your Confluence site.

The language used for your session will depend on the settings below, in the following order of priority from highest to lowest:

- The language preference defined in your user profile. Note that you need to be logged in for this setting to take effect.
- The language that you choose by clicking an option at the bottom of the Confluence login screen. Confluence stores this value in a cookie. When the cookie expires, the setting will expire too.
- The language set in your browser.
  - Note that your Confluence administrator can disable this option by setting a system property.
  - The browser sends a header with a prioritised list of languages. Confluence will use the first supported language in that list.
- The default language for your site, as defined by your Confluence site administrator.

**Showing User Interface Key Names for Translation**

For those customers working on creating translations of the Confluence user interface, from 4.1 onwards there is a feature that will help. After opening the Confluence dashboard, you can simply add this text to the end of your Confluence URL, like so:
Then press Enter.

This will then cause each element of the user interface to display its special key name while Confluence is still in an interactive mode. This makes it easier to find the essential context for each key, which can then be searched on http://translations.atlassian.com where you can enter an appropriate translation for your custom language pack.

The key names are displayed with a "lightning bolt" graphic between elements of the names. For example, the buttons will show up with elements shown like so:

For example, for the Browse button, the associated key system.space.menu can be found on http://translations.atlassian.com, allowing you to write a better translation for the term Browse, being able to see the full context of where the UI element belongs and what it means to the user.

To turn off the translation view, add this code to the end of the Confluence URL:

?i18ntranslate=off

Custom Decorator Templates

About Decorators

Confluence is built on top of the Open Source SiteMesh library, a web-page layout system that provides a consistent look and feel across a site. SiteMesh works through "decorators" that define a page's layout and structure, and into which the specific content of the page is placed. If you are interested, you can read more on the SiteMesh website.

What this means for Confluence is that you can customise the look and feel of almost all of your Confluence site through editing three decorators:

- The "Main" decorator defines the look and feel of most pages on the site
- The "Popup" decorator defines the look and feel of the popup windows such as the "Insert Link" and "History" pages.
- The "Printable" decorator defines the look and feel of the printable versions of pages (available through the icon on each page)

You can view and edit these decorators from within Confluence: they are available from the "Layouts" option on the site's Administration menu. Changes to the decorators will affect all spaces hosted on that Confluence
installation.

The decorator that is used to draw Confluence's administrative pages can not be edited from within Confluence. This means that if you make some editing mistake that renders the rest of the site unuseable, the administrative pages should still be available for you to fix the template.

⚠️ The information on this page does not apply to Confluence OnDemand.

**Browsing the Default Decorators**

At any time, you can browse the default decorators that come packaged with Confluence by following the "View Default" links on the "Site Layouts" page. The template browser also allows you to view the "#parsed" templates that are included within the template when it is compiled. While you can't edit these included templates, you will probably have to copy some or all of them into your custom template as you do your customisation.

**Editing Custom Decorators: Add a Logo**

To edit Confluence decorators, you should have a good knowledge of [HTML](https://www.w3.org/html), and some understanding of the [Velocity templating language](https://velocity.apache.org/).

The first thing you will see when you choose to create a custom "Main" decorator is... there's not much to edit. By default, most of the content of this decorator is included from other files:
We can add our logo, changing the "logocell" table cell:
When you insert this into the right section of the template and hit save, visitors to the site will see the logo at the top of each page. Note, the administrative pages will be unaffected: you will have to go to the dashboard or to a space to see the changes you have made.

**Macros**

Some parts of the page are drawn using Velocity macros, including the navigation bar. The macros you should know about when editing decorators are described in [Working With Decorator Macros](#).

**If Something Goes Terribly Wrong**

From the "Site Layouts" page in Confluence's administrative menu, you can delete your custom templates. When you do this, the default template will be restored, fixing anything that may have been broken.

Alternatively, the custom templates are stored in the DECORATOR table in the database. If you have somehow managed to render Confluence completely unuseable through editing your templates, delete the relevant entries from the DECORATOR table.

**For Advanced Users**

The `velocity` directory is at the front of Confluence's velocity template search path. As such, you can override any of Confluence's velocity templates by placing an identically named file in the right place.

While we don't recommend you do this unless you know exactly what you're doing, it does give you complete control over the look of every aspect of Confluence. It also means that you can edit your templates in a text-editor if you wish, rather than through the web interface.

There are, however, two important caveats:

1. Velocity is configured to cache templates in memory. When you edit a page from within Confluence, it knows to reload that page from disk. If you are editing the pages on disk, you will either have to turn off velocity's caching temporarily in `WEB-INF/classes/velocity.properties`, or restart the server to make your changes visible.
2. Because we only officially support the modification of the three global decorator files, other changes may interact unpredictably with future versions of Confluence. When upgrading, you should always test your custom modifications thoroughly before deploying them on a live site.

**Customising Look and Feel Overview**

You can customise the 'look and feel' of Confluence at both the global and space levels.

Any changes you make to the look and feel of the site at the global level will be applied as the default look and feel for all the spaces in the site. This means that any customisations will only be reflected in the "Default" theme. No other theme will have an impact from this change. An individual space can be configured to have its own look and feel through the [space administration screens](#).

⚠️ Some functionality described on this page is restricted in [Confluence OnDemand](#).

Here's how you can customise the look and feel of your site:

- **Colour Scheme** : Change the colour scheme of the user interface.
Layouts: Change the site layout, which determines how the controls are laid out in the site. This does not change the actual page layouts, but it does change the way the surrounding controls appear in the page.
Themes: Use themes for advanced layout customisation.

RELATED TOPICS

Customising Colour Schemes
A Confluence administrator can configure a new colour scheme for the site dynamically from the Administration Console.

The default colour scheme for the site will also become the default for all spaces within it. However, it is possible for space administrators to configure a different colour scheme for spaces from the space administration screens.

To change the site's colour scheme:

1. Choose Browse > Confluence Admin.
2. Select 'Colour Scheme' in the left-hand panel. This will bring up a new screen. See screenshot below.
3. Click 'Edit'. Enter standard HTML/CSS2 colour codes, or use the colour-picker to choose a new colour from the palette provided. Any changes you make will immediately be reflected across the Confluence installation.

The colour scheme applies to the following UI elements:

- Top Bar - the bar across the top of the page that contains the breadcrumbs
- Tab Navigation Background - the background colour of the tab navigation menus
- Tab Navigation Text - the text of the tab navigation menus
- Breadcrumbs Text - the breadcrumbs text in the top bar of the page
- Space Name Text - the text of the current space name located above the page title
- Heading Text - all heading tags throughout the space.
- Links - all links throughout the space.
- Borders and Dividers - table borders and dividing lines.
- Tab Navigation Background Highlight - the background colour of the tab navigation menu when highlighted
- Tab Navigation Text Highlight - the text of the tab navigation menu when highlighted
- Top Bar Menu Selected Background - the background colour of the top bar drop down menu when selected
- Top Bar Menu Item - the text colour of the menu items in the top bar drop down menu
- Page Menu Selected Background - the background colour of the drop down page menu when selected
- Page Menu Item Text - the text of the menu items in the drop down page menu
- Menu Item Selected Background - the background colour of the menu item when selected (applies to both the top bar and page drop down menus)
- Menu Item Selected Text - the text colour of the menu item when selected (applies to both the top bar and page drop down menus)

Please note that some UI elements are specific to the default theme and may not take effect for other themes.
Note

If you mess things up, just click the 'Reset' button and then try again.

Customising Site and Space Layouts

You can modify Confluence's look and feel by editing the 'decorator' (layout) files. Modifying these files allows you to change the look and feel of:

- The Confluence site as a whole, which includes all spaces within the Confluence site.
- An individual space within the Confluence site.

This page tells you how to customise the layout files for your Confluence site as a whole. These customisations:

- Modify the default 'decorator' files of each space in your site.
- Are reflected in every space unless the space's own equivalent layout files have been customised.

You need System Administrator permissions to perform these customisations.
You can also customise the layout files for a given space. For more information, refer to Customising Space Layouts. Space layout customisations override the equivalent site customisations.

⚠️ The information on this page does not apply to Confluence OnDemand.

⚠️ If you modify the look and feel of Confluence by following these instructions, you will need to update your customisations when upgrading Confluence. The more dramatic the customisations are, the harder it will be to reapply your changes when upgrading. Please take this into account before proceeding with your customisation. For more information on updating your customisations, please refer to Upgrading Customised Site and Space Layouts.

Confluence is built on top of the open source SiteMesh library, a web-page layout system. Read more on the SiteMesh website. To edit the layout of Confluence, you will need to modify these decorator files. A decorator file is a .vmd file and is written in a very simple programming language called Velocity. You can learn more from the Velocity User Guide.

Once you are familiar with Velocity, you can edit the decorator files to personalise the appearance of Confluence.

The decorator files in Confluence are grouped into the following categories:

- **Site layouts**: These are used to define the controls that surround each page in the site. For example, the header and the footer.
- **Content layouts**: These control the appearance of content such as pages and blog posts. They do not change the way the pages themselves are displayed, but allow you to alter the way the surrounding comments or attachments are displayed.
- **Export layouts**: These control the appearance of spaces and pages when they are exported to HTML. If you are using Confluence to generate a static website, for example, you will need to modify these layouts.

**Editing a site decorator file**

1. Choose Browse > Confluence Admin.
2. Select Layouts under Look and Feel in the left-hand navigation panel.
   - Click View Default to view the .vmd file.
   - Click Create Custom to edit the default .vmd file. This will open up the .vmd file in edit mode.
3. Make changes and click Update.

If something goes wrong: Click Reset Default to revert to the original layouts.

**Using Velocity macros**

When editing Custom Decorator Templates, there are a number of macros available to define complex or variable parts of the page such as menus and breadcrumbs. You may insert these macros anywhere in your templates. More information on Working With Decorator Macros.

**For advanced users**

**Overriding Velocity templates**

The velocity directory is at the front of Confluence's Velocity template search path. As such, you can override any of Confluence's Velocity templates by placing an identically named file in the right place. While we don't recommend you do this unless you know exactly what you're doing, it does give you complete control over the look of every aspect of Confluence. It also means that you can edit your templates in a text-editor if you wish, rather than through the web interface.
Caching

Velocity is configured to cache templates in memory. When you edit a page from within Confluence, it knows to reload that page from disk. If you are editing the pages on disk, you will either have to turn off velocity's caching temporarily in WEB-INF/classes/velocity.properties, or restart the server to make your changes visible.

Location of Velocity files

In Confluence 2.6 and later, some Velocity files are located inside the Confluence JAR file that can be found at confluence/WEB-INF/lib/confluence-x.x.x.jar. To override files inside this JAR (which you can open with any ZIP tool like WinZip or 7-Zip), put your customised file in the same directory structure under confluence/WEB-INF/classes/.

For example, the file templates/macros/alphaindex.vm inside confluence.jar can be replace by putting your custom file in WEB-INF/classes/templates/macros/alphaindex.vm. You do not need to modify the file inside the JAR.

See also How Do I Edit Files in Confluence JAR Files?

Finding the layout via the URL

If the layout has changed so extensively as to not be visible, you can browse to the URL directly:

```
http://<confluence base url>/admin/resetdecorator.action?decoratorName=decorators/main.vmd
```

Substitute the base URL and the appropriate .vmd file.

RELATED TOPICS

Velocity Template Overview
Basic Introduction to Velocity

Adding a Navigation Sidebar

You can include a left-hand navigation sidebar (table of contents) in your Confluence space. There are two ways to do this:

- **Recommended: Use the Documentation Theme** – The Documentation theme provides the left-hand navigation sidebar that you see in this documentation. Please go to the page that tells you how to configure the Documentation theme.
- **Customise the Space Layouts** — This is an alternative method (documented below) that is more complex to set up than the Documentation theme and requires more maintenance with Confluence major release upgrades.

⚠️ The information on this page does not apply to Confluence OnDemand.

Notes to Read before you Start
Please take note of the following points before you use the method documented on this page:

- **Reapply customisation whenever you upgrade Confluence.** Every time you upgrade Confluence, you must reapply the layout customisations described on this page. When you upgrade to a new major Confluence version (such as moving from Confluence 2.9.x to Confluence 2.10.x or from Confluence 3.0.x to Confluence 3.1.x) you will need to reapply the layout customisation. See instructions below.
- **Check your wiki permissions.** To customise a space layout as described below, you must be a space administrator in the given space and you must be a system administrator on the Confluence site. See the overview of permissions and the glossary entries for space administrator and system administrator.

Customising your Space Layouts to Add a Navigation Sidebar

**Screenshot: A left-hand navigation bar resulting from customising the space layouts**

Follow the instructions below to add the navigation sidebar to your Confluence space.

**Step 1. Create the TreeNavigation Page**

First, you will create a Confluence page containing the `pagetree` macro. This is just a normal Confluence page. The only slight oddity is that it should reside at the root of your space, instead of under the space’s home page.

Follow these instructions:

1. Go to the ‘Space Pages’ view for the current space. To do this:
   - Go to a page in the space and choose **Browse > Pages**.
   You are now at the ‘root’ level of your space. The ‘root’ level contains pages that are added above the space’s home page, not as children of the home page.
2. At the root level of the space, create a page named ‘TreeNavigation’.
3. On the page, insert the following text:

   ```
   {pagetree}
   ```
4. Now decide if you want to add extra functionality to your page tree. By default, using the code above, the page tree will use the home page of the space as its root. You can choose to:
   - Specify a different root for your page tree.
   - Add a search box at the top of the tree.
   - Allow the viewers to expand and collapse the whole tree.
   - Control other aspects of the display.
   For more information, read about the Pagetree macro.

**Step 2. Change the Space's Page Layout**

Now you will change the space's page layout, to include the above page on the left of every web page displayed.

1. Choose **Browse > Space Admin**.
   *Note:* 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
2. Make sure the Confluence Default theme is selected from the **Themes** menu.
3. Click **Layout** in the **Look and Feel** section.
   *Note:* The layout option is only displayed if you are a system administrator on the Confluence site.
4. Click **Create Custom** in the **Page Layout** section.
5. In the layout, locate the **VIEW** section, and find this code:

```html
<div class="wiki-content">
$body
</div>
```

6. Replace the above code block with this code:
7. If you want to, you can change the table title in the above code from 'Table of Contents' to something else. For example, it might say 'Confluence Documentation'.

8. Save the updated layout.

### Reapplying the Customisation on Upgrade

When you upgrade to a new major Confluence version (e.g. from Confluence 2.9.x to Confluence 2.10.x or from Confluence 3.0.x to Confluence 3.1.x), you will need to reapply this customisation.

**Reason:**
The new Confluence version may contain updates to the space layouts. Because you have customised the space layouts, Confluence will not overwrite your customisation. So your space will not get the latest updates until you set the layout to default and then reapply your changes.

**Here's how to do it:**

1. First make a copy of your customised code, if you have changed it from the code above:
   - Go to **Space Admin**, click **Layout** and edit the customised page layout (as created above).
   - Copy the section of code that inserts the customised left-hand navigation panel.
   - Close the page layout.
2. Click **Reset Default** next to **Page Layout**, to set the page layout back to default. This will bring in the new code for the upgraded version of Confluence.
3. Create a custom layout as described in step 2 above, and reinsert the custom left-hand navigation code.
4. Save the updated layout.

**Adding an All Versions Section to your Navigation Bar**

This page gives an example of how you might add an 'All Versions' section to your navigation side bar, as currently used in the Confluence documentation, Crowd documentation and the other Atlassian product documentation spaces.

If you are viewing this page online on the Atlassian documentation wiki, you will be able to see the 'All Versions' section at the top left of the navigation sidebar. Below is a screenshot.

A number of people have asked how we do it, so this page gives the answer. For details about creating the navigation side bar itself, please refer to Adding a Navigation Sidebar.

⚠️ The information on this page does not apply to Confluence OnDemand.

**Adding the Version Index to the Navigation Sidebar**

This is how we added the 'All Versions' section to the sidebar:

- For each product (Confluence, Crowd, Bamboo, etc) there is a page in the Inclusions Library of the ALLDOC space. The page lists all the versions of that product's documentation, linking to the relevant spaces. For example, here is the page for Confluence and the page for Crowd.
  - We put the 'all versions' page in ALLDOC because the page is used in a number of different spaces, via the {include} macro. For example, the 'all versions' page may be included:
    - In every documentation space (each version) for the product concerned, such as DOC, CONF29, CONF28, CROWD, CROWD013, CROWD012, etc.
    - In the Enterprise Hosting doc space.
    - As a panel on the documentation home page, as shown in the 'All Versions' panel of the above screenshot, as well as in the left-hand navigation bar.
    - Any other places where useful.
- In each documentation space, there is a page called 'TreeNavigationVersions' like this one or this one, which copies in the content of the above 'all versions' page.
- For each documentation space, the space's page layout now includes two pages instead of just one:
  - The 'TreeNavigation' page, as already described on the page above.
  - The new 'TreeNavigationVersions' page.

Here's the relevant section of our page layout as it is currently for the Confluence documentation (DOC) space:
Adding the Expand/Collapse Functionality to the Version Index

Another question we are asked is how we group the content of the included page under a collapsible control.

We use the Expand macro. The details are on the Expand macro’s documentation page.

Adding a Navigation Sidebar

Upgrading Customised Site and Space Layouts

As Confluence evolves, so do the default site and space layouts that drive the rendering of every page. As new functionality is added or current functionality is changed, the default layouts are modified to support these changes.

⚠️ If you are using custom layouts based on defaults from a previous Confluence version, you run the risk of breaking functionality, or worse, missing out on great new features!

Take care on each new release of Confluence to reapply your changes to the new default templates.
To reapply your custom layouts, you need to:

1. Obtain the source of your custom layouts from your current version of Confluence.
2. Reapply your customisations to the new default layouts.

⚠️ The information on this page does not apply to Confluence OnDemand.

Step 1. Obtain your Custom Layouts

Ideally, you should keep a record of each customisation you have applied to each of your Confluence site or space layouts.

If not, you should be able to find your customisations using the following method. This method extracts all site- and space-level layouts from your Confluence site as a single output. From this output, you should be able to identify your customisations.

☑ This method is handy to use if you have:

- Many spaces with space layout customisations, or
- Do not have an independent record of your site or space layout customisations.

Custom layouts are stored in the `DECORATOR` table within your Confluence database. You can **SELECT** for the source of the layout using SQL like this:

```sql
mysql> select SPACEKEY, DECORATORNAME, BODY from DECORATOR;
+----------+---------------------+------+
| SPACEKEY | DECORATORNAME       | BODY |
|----------+---------------------+------+
| NULL     | decorators/main.vmd | ...  |
+----------+---------------------+------+
```

This example was tested on MySQL, but should be applicable to all SQL databases.

Step 2. Reapply your Customisations

When you upgrade Confluence to another major release of Confluence, you will need to manually reapply any customisations you made to any site-wide or space-specific layouts. Unless otherwise stated, you should not need to reapply customisations after conducting a minor release upgrade of Confluence.

What are 'major' and 'minor' releases? Major release upgrades are ones where the 1st digit of Confluence's version number or the 1st digit after the 1st decimal place differ after the upgrade, for example, when upgrading from Confluence 3.0 to 3.1, or 2.8 to 3.0. Minor release upgrades are ones where the 1st digit of Confluence’s version number and the 1st digit after the 1st decimal place remain the same after the upgrade, for example, when upgrading Confluence 3.0 to 3.0.1.

If you have made Confluence site-wide layout customisations:

1. Choose **Browse > Confluence Admin**.
2. Select **Layouts** under **Look and Fee** in the left-hand navigation panel. The decorators are grouped under Site, Content and Export layouts.
3. Ensure you have all your customisations available (preferably in a form which can be copied and pasted).
4. Click **Reset Default** next to the layout whose customisations need to be reapplied.
5. Click **Create Custom** next to the same layout and reapply your customisations (by copying and pasting...
them) into the appropriate locations within the new default layout.
6. Click the **Save** button.
7. Repeat this procedure from step 4 for each layout whose customisations need to be reapplied.

If you have made space-specific layout customisations:

1. Visit any page in the relevant space.
2. Choose **Browse > Space Admin**.
   *Note:* ‘Space Admin’ is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
3. Click **Layout** under **Look and Feel** in the left-hand navigation panel. The decorators are grouped under **Site**, **Content** and **Export** layouts.
4. Ensure you have all your customisations available (preferably in a form which can be copied and pasted).
5. Click **Reset Default** next to the layout whose customisations need to be reapplied.
6. Click **Create Custom** next to the same layout and reapply your customisations (by copying and pasting them) into the appropriate locations within the new default layout.
7. Click the **Save** button.
8. Repeat this procedure from step 5 for each layout whose customisations need to be reapplied.

**Step 3. Test your Modifications Carefully**

Changes may interact unpredictably with future versions of Confluence. When upgrading, you should always test your custom modifications thoroughly before deploying them on a live site. It's beyond the scope of Atlassian Support to test and deploy these changes.

**Turning Off Caching**

Velocity is configured to cache templates in memory. When you edit a page from within Confluence, it knows to reload that page from disk. If you are editing the pages on disk, you will either have to turn off Velocity’s caching temporarily in `WEB-INF/classes/velocity.properties`, or restart the server to make your changes visible.

The `velocity.properties` file is available in the `confluence-x.x.x.jar` file, where `x.x.x` is the Confluence version number. The JAR file is located in the `WEB-INF/lib` directory. If you wish to make modification to the files in the JAR, we recommend the following steps:

1. Stop Confluence.
2. Make a backup copy of the JAR file.
3. Un-jar the file
4. Locate and edit the appropriate file that you wish to modify.
5. Re-jar the `confluence-x.x.x.jar` file.
6. Relocate the JAR file to the appropriate directory.
7. Restart Confluence.

**RELATED TOPICS**

**Customising Site and Space Layouts**

**Global Templates**

A template is a predefined page that can be used as a prototype when creating new pages. Templates are useful for giving pages a common style or format. See [Working with Templates](#).

**Importing Templates**

A template is a predefined page that can be used as a prototype when creating new pages. Templates are useful for giving pages a common style or format.
Confluence ships with a number of templates, including the 'Charts', 'Document List' and 'Meeting Notes' templates. These templates are not available for use by default. However, if you have the appropriate permissions to access the Administration Console, you can import any of these templates to be used globally or within a specific space.

In addition, you can download additional template bundles from the Atlassian Plugin Exchange and then make them available by importing them.

**Quick guide to importing a template:**

1. Go to the Confluence Administration Console and choose **Import Templates**.
2. Select the templates that you want to import.
3. Select the space to import the templates to, or choose to import them as global templates.
4. Choose **Import**.

The rest of this page gives more detail about the above steps.

**On this page:**

- Step 1. Check the templates installed on your Confluence site
- Step 2. (Optional) Upload additional templates from the Atlassian Marketplace
- Step 3. Import a template to make it available to users
- Notes

**Related pages:**

- Working with Templates
- Editing a template
- Removing a Template
- Working with Pages

**Step 1. Check the templates installed on your Confluence site**

To see the templates that are currently available for import on your Confluence site:

1. Log in to Confluence as a System Administrator or Confluence Administrator.
2. Choose **Browse > Confluence Admin**.
3. Select 'Import Templates' in the left-hand panel. The 'Import Templates' screen will appear, listing the template packages installed on your Confluence instance (for example, 'Default Templates Package') and the templates included in each package.

**Step 2. (Optional) Upload additional templates from the Atlassian Marketplace**

Additional templates are available as plugins, known as template packages. Follow the steps below if you want to add template packages to your site that were not shipped with your Confluence installation.

*Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.*

**To upload more templates:**

1. Go to the Atlassian Marketplace and download the template bundle that you need.
2. Log in to Confluence as a System Administrator or Confluence Administrator.
3. Choose **Browse > Confluence Admin**.
4. Choose **Plugins** in the left-hand panel.
5. The **Plugins** screen will appear. Choose the **Install Plugins** tab.
6. Choose **Upload Plugin**, browse to find the template bundle file that you downloaded, and upload it to Confluence.

**Step 3. Import a template to make it available to users**
To import a template:

1. Log in to Confluence as a System Administrator or Confluence Administrator.
2. Choose Browse > Confluence Admin.
3. Choose Import Templates in the left-hand panel. The Import Templates screen will appear, listing the template packages installed on your Confluence site (for example, 'Default Templates Package') and the templates included in each package.
4. Select the templates to be imported by ticking the check boxes next to the relevant template names. **You can see a preview of the template by clicking the template name.**
5. Select the import destination for the templates in the Import To dropdown. If you want the templates to be available to only a specific space, select the name of the space, otherwise select **Global Templates** to make the templates available to all spaces.
6. Choose Import.

**Screenshot: Importing a template**

**Screenshot: Previewing a template**

**Notes**

- **Building your own custom template bundles.** You can build a template bundle as a plugin and then
deploy it to your Confluence instance. You can then import the templates from your custom template bundle, as described above. You will need some programming knowledge to develop a custom template bundle. See Creating A Template Bundle.

- **Duplicate template names.** If a template with the same name already exists on import, a duplicate template of the same name will be created. You will need to check the templates and rename them manually.

- **Removing the template.** Removing the plugin that contains a template will not remove the template from your Confluence site if you have already imported it. You will need to remove the template manually via the administration console or space administration screen.

**Modify Confluence Interface Text**

All Confluence UI text is contained in a single Java properties file. This file can be modified to change the default text, and also to translate Confluence into other languages than English.

The UI text file is ConfluenceActionSupport.properties. From your Confluence install directory:

```
\confluence\WEB-INF\lib\confluence-3.x.jar
```

Within this File, the relevant file to edit is :
```
:\com\atlassian\confluence\core\ConfluenceActionSupport.properties.
```

Refer to Editing jar files for reference.

⚠️ The information on this page does not apply to Confluence OnDemand.

The file contains parameters with name=value pairs, in the format:

```
parameter.name=Parameter value
```

Parameter names are any text before the '=' character and should never be modified. Any text after the '=' character is the parameter value, which can be modified freely and can also contain variables. An example involving variables is:

```
popular.labels=The three most popular labels are {0}, {1} and {2}.
```

For more information on replacing values, check out Translating ConfluenceActionSupport Content. Note that plugins store their text internally, so you must modify plugin text individually.

**Steps For Modification**

1. Stop Confluence
2. Under your install directory, open `\confluence\WEB-INF\lib\confluence-3.x.jar\com\atlassian\confluence\core\ConfluenceActionSupport.properties`
3. Search for the text you wish to modify, replace it and save the file in `<Confluence-Install>\confluence\WEB-INF\classes\com\atlassian\confluence\core`. Please create this folder structure, if it does not exist already.
4. Restart Confluence

Common Modifications

- Rename 'Dashboard' by searching for Dashboard. To change "Dashboard" to "My Portal", change `dashboard.name=Dashboard` to `dashboard.name=My Portal`

<table>
<thead>
<tr>
<th>Task</th>
<th>Search For</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rename 'Dashboard'</td>
<td>Dashboard</td>
<td>The <code>dashboard.name</code> parameter has the name. To change 'Dashboard' to 'My Portal', change <code>dashboard.name=Dashboard</code> to <code>dashboard.name=My Portal</code> and update any other occurrences of the word 'Dashboard' in the instance</td>
</tr>
<tr>
<td>Modify login page text</td>
<td>login.</td>
<td>The <code>login.instructions</code> parameter has the &quot;Enter your account details below to login to Confluence&quot; text</td>
</tr>
</tbody>
</table>

Modify Keyboard Shortcuts

Confluence provides a set of keyboard shortcuts. You could customise the shortcuts by making modifications inside the `ConfluenceActionSupport.properties` file.

- To disable a particular shortcut, you can simply just comment out a respective line of code. One may like to disable the shortcut to one of the navigation links: View, Edit, Attachments, Info. For instance, to disable shortcut to Attachments one would comment out the following line:

  ```
  #navlink.attachments.accesskey=a
  ```

- To modify an access key, one could simply just change the letter, bearing in mind the fact that the letter must be unique.

Working With Decorator Macros

Decorator Macros are Velocity macros which are used to draw complex or variable parts of the page such as menus and breadcrumbs when editing Custom decorators. Decorator macros can be inserted anywhere in your templates.

The macro is called by inserting a string of the form: `#macroName("argument1" "argument2" "argument3")`. There are no commas between the arguments. Unless otherwise noted, these macros take no arguments.

**NOTE**: These macros will only work reliably when customising `main.vmd`. They may not work in other Velocity decorators. Decorator macros will not work inside normal confluence pages.
<table>
<thead>
<tr>
<th>Macro</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>#breadcrumbs()</td>
<td>Draws the &quot;You are here&quot; breadcrumbs list, like the one found above the page name in the default template.</td>
</tr>
<tr>
<td>#includePage(pageTitle)</td>
<td>Includes a confluence page with the specified title. If you have 2 or more pages with the same title across multiple spaces, this macro will include the page belonging to the space you are currently viewing.</td>
</tr>
<tr>
<td>#searchbox()</td>
<td>Inserts a search box into the page, like the one to the far right of the breadcrumbs in the default template.</td>
</tr>
<tr>
<td>#globalnavbar(type)</td>
<td>Draws the global navigation bar, as found in the top right-hand corner of the default template. The navigation bar can be displayed in two modes:</td>
</tr>
<tr>
<td></td>
<td>#globalnavbar(&quot;table&quot;) Displays the navigation bar in its default mode: drawn as a table of links with coloured backgrounds and mouse-over effects.</td>
</tr>
<tr>
<td></td>
<td>#globalnavbar(&quot;text&quot;) Displays the navigation bar as series of text links separated by</td>
</tr>
<tr>
<td></td>
<td>#usernavbar()</td>
</tr>
<tr>
<td></td>
<td>#helpicon()</td>
</tr>
<tr>
<td></td>
<td>#printableicon()</td>
</tr>
<tr>
<td></td>
<td>#pagetitle(class)</td>
</tr>
</tbody>
</table>
#poweredby()  
Writes out the "Powered by Confluence" and Confluence version-number boilerplate found at the bottom of the default template.

#bottomshadow()  
Draws the fading shadow-effect found at the bottom of the content area in the default template.

#dashboardlink()  
Inserts a link to the dashboard page.

#### Customising a Specific Page

If you'd like to change the appearance of a specific page, you can modify the corresponding Velocity template. Here's how to find out which one:

1. Access the page. Note the name of the action. For example, the "Contact Administrators" page is <baseURL>/administrators.action.
3. Unzip or unjar the file using a standard unzipper or the java jar utility.
4. Open xwork.xml. Search the file for the name of the action corresponding to the page you'd like to modify. You'll see an entry like:

   ```xml
   <action name="administrators"
   class="com.atlassian.confluence.user.actions.AdministratorsAction">
   <interceptor-ref name="defaultStack"/>
   <result name="success" type="velocity">/administrators.vm</result>
   </action>
   ```

5. The file to look for is the vm or vmd file. In the above example, it's administrators.vmd. Because there is no context path (just a / before the name of the file), it's in the root of the Confluence webapp. For the stand-alone, that's <confluence-install>/confluence folder.
6. Modify the file.

For details on how to configure the file, check the [Velocity Template Overview](#).

⚠️ The information on this page does not apply to Confluence OnDemand.

### RELATED CONTENT

No content found for label(s) customising-looknfeel.

#### Customising PDF or HTML Content

To customise Confluence's PDF output, you can edit the CSS stylesheets used by the PDF exporter. See [Customising Exports to PDF](#).

To customise the HTML output, you will need to modify the file `confluence-x.y.z.jar/com/atlassian/confluence/pages/Page.htmlexport.vm`. See [How Do I Edit Files in Confluence JAR Files?](#) to learn how
Customising the Dashboard

If you are a Confluence Administrator, you can customise the global dashboard, affecting the way all users will see the dashboard.

Confluence users can customise their own view of the dashboard too. See the user's guide.

Sending users to a space home page instead of the dashboard

See Configuring the Site Home Page.

Editing the top left-hand section of the dashboard

See Editing the Site Welcome Message.

Disabling the 'Popular' tab on the dashboard

In some environments, you may prefer not to display the new 'Popular' tab on the dashboard. For example, if your wiki allows only a small group of people to log in and contribute content or comments, then the tab may not be relevant to you.

To prevent the tab from appearing, you can disable the relevant plugin module. You need System Administrator permissions to do this. Go to the Dashboard Macros plugin (See Configuring a Plugin), click Manage plugin modules and disable the Popular Tab module.

On this page:

- Sending users to a space home page instead of the dashboard
- Editing the top left-hand section of the dashboard
- Disabling the 'Popular' tab on the dashboard
- Advanced customisations
  - Editing the bottom left-hand section of the dashboard
  - Editing the top right-hand action bar
  - Modifying the global template or layout

Related pages:

- Customising your Personal Dashboard
- Customising Look and Feel Overview

⚠️ The information on this page does not apply to Confluence OnDemand.

Advanced customisations

These configurations require knowledge of plugin development and/or the Velocity template language. See our guide to the Atlassian Plugin SDK and our introduction to Velocity.

Editing the bottom left-hand section of the dashboard

This section can be updated using Confluence web panels. You can add items to the dashboard by including a web panel with the key atl.dashboard.left:
Confluence 4.3 Documentation

<web-panel key="{key}" location="atl.dashboard.left">
<resource name="view" type="velocity"
location="{location}"/>
</web-panel>

You can remove the existing entities panel by disabling the global-entities-panel plugin from the dashboard
macros plugin.
Editing the top right-hand action bar

You can add more links to the top right navigation bar by adding web items to system.dashboard.button:

<web-item key="{key}" name="{name}" section="system.dashboard.button">
<label key="{label}"/>
<link/>
<styleClass/>
</web-item>

Modifying the global template or layout

You can also modify files to add content to the global dashboard.
To make modifications to the dashboard, modify the global template /confluence/decorators/global.vm
d or the layout at Administration > Layouts > Global Layout.
For example, search the global layout for these macros:

$helper.renderConfluenceMacro("{recently-updated-dashboard:dashboard|sho
wProfilePic=true}")

To modify the bundled plugin macros used in the Confluence dashboard:
1. Modify the atlassian-bundled-plugins.zip file located at <Confluence
install>/confluence/WEB-INF/classes/com/atlassian/confluence/setup.
2. Update the confluence-dashboard-macros-x.x.jar file, rezip it and then put it back to <Conflue
nce install>/confluence/WEB-INF/classes/com/atlassian/confluence/setup. Refer to
How Do I Edit Files in Confluence JAR Files?.
3. Delete the JAR from <confluence-home>/bundled-plugins.
4. Restart Confluence.
To customise the space list, you can work with spacelist.vm.

Customising the eMail Templates
Customisations to the Confluence email templates will need to be reapplied when you
upgrade Confluence. Consider this before making drastic changes to the layout, and be sure
to keep a list of what you have changed for your upgrade process later.

Only administrators with access to the server where Confluence is running can modify the Confluence email
templates.

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.

1366


Process to change the email templates

1. Shut down your test instance of Confluence.
2. In the Confluence web application folder, find the file `confluence/web-INF/lib/confluence-2.x.jar`.
3. Make a copy of this file as a backup.
4. Learn how to edit files within .jar archives.
5. Within the jar file, find the `/templates/email` folder. Find the appropriate file(s) within that folder.
6. Edit the file with a text editor to make the required changes. The content is mostly HTML, but has some Velocity template variables in it. See Velocity Template Overview for more information about how these work.
7. Again using the guide on editing files within .jar archives, either rejar the set of folders or drop the new files into the identical folder structure in the `WEB-INF/classes` directory.
8. Start Confluence up again and test your changes.
9. Apply the changes to your production Confluence instance.

The same process can be applied to modify most of the templates in the Confluence web application. For velocity files that are not in a jar file, you need not shut down and restart Confluence. Be careful to test your changes before applying them to a live site. The templates contain code that is vital for Confluence to function, and it is easy to accidentally make a change that prevents use of your site.

**RELATED TOPICS**

**Customising the Login Page**

This page gets you started on customising the Confluence login page, to add your own logo or custom text. This will not customise the login process, just what users sees when they log in.

**Notes:**
- Customisations to the Confluence login page will need to be reapplied when you upgrade Confluence. Consider this before making drastic changes to the layout, and be sure to keep a list of what you have changed for your upgrade process later.
- Please test your changes on a test Confluence site first.

Only administrators with access to the server where Confluence is running can modify the Confluence login page.

**Related pages:**
- Editing the Global Logo
- Velocity Template Overview
- Customising Site and Space Layouts
- Customising Look and Feel Overview
- Modify Confluence Interface Text

⚠️ The information on this page does not apply to Confluence OnDemand.
To change the login page:

1. Shut down your Confluence server.
2. In the Confluence installation directory, find the file `confluence/login.vm`.
3. Make a copy of this file as a backup.
4. Edit the file with a text editor to make the required changes. The content contains a mixture of HTML and Velocity. See Velocity Template Overview (in our developer documentation).
5. Start Confluence and test your changes.

The same process can be applied to modify most of the templates in the Confluence web application. Be careful to test your changes before applying them to a live site. The templates contain code that is vital for Confluence to function, and it is easy to accidentally make a change that prevents use of your site.

Themes Overview

Themes are pre-defined style sets that can be applied to alter the appearance of your site. Themes allow you to personalise the 'look and feel' of Confluence. You can apply a theme to your entire Confluence site and to individual spaces. Choose a specific theme if you want to add new functionality or significantly alter the appearance of Confluence.

Confluence comes with a selection of themes. In addition, a site administrator can install new themes as plugins via the Confluence Administration Console. Provided that the theme is installed into your Confluence site, any space administrator can apply a theme to a space.

By default when you create a new space, the space will have the Confluence default theme.

To look at the themes installed:

1. Choose Browse > Confluence Admin.
2. Select 'Themes' under 'Look and Feel' in the left-hand panel.
3. You will see a list of all installed themes.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Adaptavist's Theme Builder Plugin for Confluence allows you to customise your Confluence site by adding layouts, logo banners, menu-driven navigation, style sheets, footers and more.

Customising the Left Navigation Theme

⚠️ The Left Navigation theme is no longer part of Confluence

This theme is no longer part of Confluence and is not supported from Confluence 3.4 onwards. We suggest the Documentation theme, as it provides a customisable left-hand navigation panel and additional configurable features. If you are using an earlier version of Confluence, please refer to the documentation for your version. For example, go to the documentation for Confluence 3.3.

Modifying Look and Feel (for themes)

Here's how you can define a new look and feel for Confluence in your theme:

1. Layout: Edit Confluence’s layout by modifying the decorator files that are used to define it.
   - Working with Decorators
   - Velocity Template Overview
1. Configuring the `atlassian-plugin.xml` file to reference the decorators

2. **Colour schemes**: Configure a new colour scheme for your theme. **Optional**
   - **Configuring a new colour scheme**
   - **Configuring the `atlassian-plugin.xml` file to include the new colour scheme**

3. **Stylesheet**: Include a stylesheet to define your theme. **Optional**

   Note that for every component you edit, you will need to configure the `atlassian-plugin.xml` which is the central configuration file for the plugin to override the default files with the new files you’ve created.

   *The information on this page does not apply to Confluence OnDemand.*

---

**Layout: Working with decorators**

**What are decorators?**

Confluence is built on top of the Open Source SiteMesh library, a web-page layout system. To edit the layout of Confluence, you will need to modify these decorator files. A decorator file is a `.vmd` file and is written in a very simple programming language called **Velocity**. Learn more about **Velocity**.

Confluence comes bundled with a set of decorator or VMD files that you can customize. Broadly these are categorised into Site, Content and Export decorators. These are further grouped into categories called contexts and under each context has various modes (ways of viewing the context).

To make editing easier, layout for similar screens (example: view and edit page screens) is configured through the same VMD file. So, if you want to customize how the Confluence **View Page Screen** or **Edit Page Screen** looks, you can make both of these changes inside one decorator file: `page.vmd`.

<table>
<thead>
<tr>
<th>Decorator</th>
<th>Context</th>
<th>Mode</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>page.vmd</td>
<td>page</td>
<td>'view', 'edit', 'edit-preview', 'view-information', and 'view-attachments'</td>
<td></td>
</tr>
<tr>
<td>blogpost.vmd</td>
<td>blogpost (news)</td>
<td>'view', 'edit', 'edit-preview', and 'remove'</td>
<td>We prefer to use 'news' as an end-user term; all templates and classes use 'blogpost' to indicate RSS related content</td>
</tr>
<tr>
<td>mail.vmd</td>
<td>mail</td>
<td>'view', 'view-thread' and 'remove'</td>
<td></td>
</tr>
<tr>
<td>space.vmd</td>
<td>space-pages, space-mails, space-blogposts, space-templates, space-operations, space-administration</td>
<td>CONTEXT: &quot;space-pages&quot;. MODES: &quot;list-alphabetically&quot;, &quot;list-recently-updated&quot;, &quot;list-content-tree&quot;, &quot;create-page&quot;. CONTEXT: &quot;space-mail&quot;. MODES: &quot;view-mail-archive&quot;. CONTEXT: &quot;space-blogposts&quot;. MODES: &quot;view-blogposts&quot;, &quot;create-blogpost&quot;. CONTEXT: &quot;space-templates&quot;. MODES: &quot;view-templates&quot;. CONTEXT: &quot;space-operations&quot;. MODES: &quot;view-space-operations&quot;. CONTEXT: &quot;space-administration&quot;. MODES: &quot;view-space-administration”, “list-permission-pages&quot;.</td>
<td>space.vmd handles a wide range of options, this context is accessed by clicking on ‘browse space’ in the default theme of Confluence (tabbed theme)</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>global.vmd</td>
<td>global</td>
<td>'dashboard', 'view-profile', 'edit-profile', 'change-password-profile', 'edit-notifications-profile'</td>
<td></td>
</tr>
<tr>
<td>main.vmd</td>
<td>n/a (header and footer formatting)</td>
<td>main.vmd is used to control the header and footer of each page, not the page specific presentation logic</td>
<td></td>
</tr>
</tbody>
</table>

For example, if you wanted to remove the ‘Attachments’ tab on the view page screen, you would make this layout change in the page.vmd file - where the ‘view’ mode is handled (as shown below).
Step One: Copying the decorators

The easiest way to begin configuring a new layout is by copying the default decorator files and editing them to suit your theme.

1. Choose Browse > Confluence Admin.
2. Select Layouts in the left panel. This will display options to view and edit the default decorators.
3. Copy the files that you intend to modify and place them in a directory structure that makes sense to you.
   See example below.

Step Two: Creating a directory structure for the decorators:

You should place your decorators in a directory hierarchy which makes sense to you. We recommend that you place the atlassian-plugin.xml file at the top level of the directory structure, and then place the decorators in directories which make a meaningful division of what they do.

Here is an example:

```java
atlassian-plugin.xml
com/atlassian/confluence/themes/mytheme/
com/atlassian/confluence/themes/mytheme/global.vmd
com/atlassian/confluence/themes/mytheme/space.vmd
com/atlassian/confluence/themes/mytheme/mail.vmd
com/atlassian/confluence/themes/mytheme/blogpost.vmd
com/atlassian/confluence/themes/mytheme/main.vmd
com/atlassian/confluence/themes/mytheme/page.vmd
```

Step Three: Editing the decorators

To edit the decorators, you will require knowledge of a very simple programming language called Velocity. Learn more about Velocity.

Decorator Macros

When editing the decorators, you will need to use Decorator Macros to draw complex or variable parts of the page such as menus and breadcrumbs. See Working With Decorator Macros

Theme Helper Object
When editing decorator files you will also come across a variable called $helper - this is the theme helper object.

The following table summarises what this object can do:

<table>
<thead>
<tr>
<th>Behaviour</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>$helper.domainName</td>
<td>displays the base URL of your Confluence instance on your page. This is useful for constructing links to your own Confluence pages.</td>
</tr>
<tr>
<td>$helper.spaceKey</td>
<td>returns the current space key or null if in a global context.</td>
</tr>
<tr>
<td>$helper.spaceName</td>
<td>returns the name of the current space</td>
</tr>
<tr>
<td>$helper.renderConfluenceMacro(&quot;(create-space-button)&quot;)</td>
<td>renders a call to a Confluence Macro for the velocity context</td>
</tr>
<tr>
<td>$helper.getText(&quot;key.key1&quot;)</td>
<td>looks up a key in a properties file matching key.key1=A piece of text and returns the matching value (&quot;A piece of text&quot;)</td>
</tr>
<tr>
<td>$helper.action</td>
<td>returns the XWork action which processed the request for the current page.</td>
</tr>
</tbody>
</table>

If you are on a page or space screen you also have access to the actual page and space object by using $helper.page and $helper.space respectively.

If you want to deliver more into what other methods are available in this object, please see our API's for ThemeHelper.

Step Four: Configuring the central configuration file to reference the new decorators

How to do this is explained in Configuring the Theme Plugin

Working with colour schemes for themes

Configuring the colour scheme

The easiest way to configure a colour scheme is to do it dynamically from the Administration Console (as you would normally when you want to change the site's colour scheme online), and then express it as an xml file. This method makes it possible for you to experiment with different colours and test them out before including the colour scheme in your theme.

1. Choose Browse > Confluence Admin.
2. Select 'Colour scheme' in the left panel.
3. Use the colour picker to define the colours for the following UI elements:
   - Top Bar - the bar across the top of the page that contains the breadcrumbs.
   - Space Name Text - the text of the current space name located above the page title.
More information on customising colour schemes

Expressing the colour scheme as XML

Once, you have decided on the colours for the different UI elements, you will need to configure the atlassian.plugin.xml to include the new colour scheme. How to do this is explained in detail in Configuring the Theme Plugin.

RELATED TOPICS

No content found for label(s) themes-configuration.

The structure of an atlassian-plugin.xml file is fairly self-explanatory:

```
<atlassian-plugin key="com.atlassian.confluence.themes.tabless" name="Plain Theme">
  <plugin-info>
    <description>This theme demonstrates a plain look and feel for Confluence. It is useful as a building block for your own themes.</description>
    <version>1.0</version>
    <vendor name="Atlassian Software Systems Pty Ltd" url="http://www.atlassian.com/">
  </plugin-info>
  <theme key="tabless" name="Tabless Theme" class="com.atlassian.confluence.themes.BasicTheme">
    <description>plain Confluence theme.</description>
    <layout key="com.atlassian.confluence.themes.tabless:main"/>
    <layout key="com.atlassian.confluence.themes.tabless:global"/>
    <layout key="com.atlassian.confluence.themes.tabless:space"/>
    <layout key="com.atlassian.confluence.themes.tabless:page"/>
    <layout key="com.atlassian.confluence.themes.tabless:blogpost"/>
  </theme>
</atlassian-plugin>
```
Modifying the `atlassian-plugin.xml` file

We will configure this file section by section.

**Plugin information**

```xml
<atlassian-plugin key="com.atlassian.confluence.themes.tables" name="Plain Theme">
  <plugin-info>
    <description>This theme demonstrates a plain look and feel for Confluence. It is useful as a building block for your own themes.</description>
    <version>1.0</version>
    <vendor name="Atlassian Software Systems Pty Ltd" url="http://www.atlassian.com/"/>
  </plugin-info>
</atlassian-plugin>
```

**Plugin key**: Specify a key that uniquely identifies the plugin, eg. `com.example.themes.dinosaur`

**name**: Give the plugin a name.

**description**: Provide a short description of the plugin.

**vendor**: Replace the text with your information.

**Theme information**

```xml
<theme key="dinosaurs" name="Dinosaur Theme"
      class="com.atlassian.confluence.themes.BasicTheme">
  <description>A nice theme for the kids</description>
  <colour-scheme key="com.example.themes.dinosaur:earth-colours"/>
  <layout key="com.example.themes.dinosaur:main"/>
  <layout key="com.example.themes.dinosaur:mail-template"/>
</theme>
```

**theme key**: Specify a key that uniquely identifies the theme.

**class**: The class of a theme must implement `com.atlassian.confluence.themes.Theme`. The `com.atlassian.confluence.themes.BasicTheme` class provided with Confluence gathers together all the resources listed within the module definition into a theme.

**name**: Give the theme a name. Make sure that you replace all instances of the theme name with this name.

**description**: Provide a short description of your theme

**colour-scheme key**: A theme can contain an optional `colour-scheme` element that defines which colour-scheme module this theme will use. If you are using a new colour scheme, enter its key.

**layout key**: A theme can contain any number of `layout` elements that define which layouts should be applied in this theme. Refer to these modules by their complete module key as shown above.
Referencing the decorators

You will need to add a layout entity as shown below for each of the decorators you are using. See working with decorators

```xml
<layout key="page" name="Page Decorator"
        class="com.atlassian.confluence.themes.VelocityDecorator"
        overrides="/decorators/page.vmd">
  <resource type="velocity" name="decorator"
              location="com/atlassian/confluence/themes/tabless/page.vmd"/>
</layout>
```

**class** : The class which each decorator, or layout, is mapped to must implement `com.atlassian.confluence.themes.VelocityDecorator`.

**overrides** : The layout entry must provide an `overrides` attribute which defines which decorator within Confluence is being overridden by the theme.

**Location** : Specify the location of the new decorator file, so Confluence know where to look when overriding the default decorator.

ℹ️ It is possible for a theme to use modules that aren't in the same plugin as the theme. Just keep in mind that your theme will be messed up if the plugin that the theme depends on is removed.

Including the colour scheme

Colour schemes can be pre-configured for your theme dynamically from the Administration Console. See configuring colour schemes.

To transport them within a theme however, they need to be expressed in the `atlassian-plugin.xml` file as shown above.

```xml
<colour-scheme key="earth-colours" name="Brown and Red Earth Colours"
              class="com.atlassian.confluence.themes.BaseColourScheme">
  <colour key="topbar" value="#440000"/>
  <colour key="spacename" value="#999999"/>
  <colour key="headingtext" value="#663300"/>
  <colour key="link" value="#663300"/>
  <colour key="border" value="#440000"/>
  <colour key="navbg" value="#663300"/>
  <colour key="navtext" value="#ffffff"/>
  <colour key="navselectedbg" value="#440000"/>
  <colour key="navselectedtext" value="#ffffff"/>
</colour-scheme>
```

**colour-scheme key** : Specify a key that uniquely identifies the colour scheme.

**name** : Give a name to the colour scheme.

**class** : The class of the colour scheme must implement `com.atlassian.confluence.themes.ColourScheme`. The `com.atlassian.confluence.themes.BaseColourScheme` class provided with Confluence sets the colours based on the module's configuration.

**colour key** : For each UI element, you will need to add its name and value.
Including Cascading Stylesheets in Themes

Confluence allows you to integrate your own stylesheets within the theme plugin so you can have greater control over the appearance of your site. Confluence’s main stylesheet is a useful reference when overriding styles and can be found in the Confluence install directory under `...confluence/styles/site-css.vm`.

The information on this page does not apply to Confluence OnDemand.

Step One: Defining the stylesheet in the `atlassian-plugin.xml`

To make a stylesheet available to a decorator, you will need to reference it as a resource from within the central configuration file - `atlassian-plugin.xml`.

Here is an example where a stylesheet is being used to define the 'leftnavigation' theme:

```xml
<layout key="main" name="Main Decorator" class="com.atlassian.confluence.themes.VelocityDecorator" overrides="/decorators/main.vmd">
  <resource type="velocity" name="decorator" location="templates/leftnavigation/main.vmd"/>
  <resource type="stylesheet" name="leftnav.css" location="templates/leftnavigation/leftnav-css.vm">
  </resource>
</layout>
```

The resource parameter takes three arguments:

- **Type**: The type of resource-in this instance, 'stylesheet'.
- **Name**: The name of the stylesheet.
- **Location**: The location of the file represented in the jar archive you will use to bundle your theme.

Step Two: Using the stylesheet in the decorator

To reference the stylesheet in the decorator, you will need to use the `#pluginStylesheet` velocity macro.

For example, here’s how you reference the leftnav.css file defined in the layout entry above:

```velocityEngine
#pluginStylesheet("com.atlassian.confluence.themes.leftnavigation:main" "leftnav.css")
```

The macro takes two arguments:

- **completePluginKey**: The complete plugin key which is constructed from the pluginkey and the layout key like this: `[pluginKey]:[layoutKey]`  
  In the above example, `com.atlassian.confluence.themes.leftnavigation` is the key of the
plugin, and main is the key of the layout.

- **stylesheetName**: the name of the stylesheet

If you place your stylesheet after the `#standardHeader` macro in the decorator, the contents of your custom stylesheet will override those in Confluence's default stylesheet.

If your stylesheet needs to reference the colour scheme, you need to use the space stylesheet macro instead:

```
#pluginSpaceStylesheet("com.atlassian.confluence.themes.leftnavigation:main" "leftnav.css" $spaceKey)
```

You can then use colour scheme references in your stylesheet, similar to Confluence's stylesheets, and they will be replaced with the appropriate global or space-specific colour scheme:

```plaintext
.navItemOver {
  color: $action.navSelectedTextColor;
}
```

## RELATED TOPICS

Universal Wiki Converter
Importing Content Into Confluence

⚠️ The information on this page does not apply to Confluence OnDemand.

Importing Content from Another Wiki
The Universal Wiki Converter (UWC) allows you to import content from other wikis into Confluence. The Confluence Administration Console offers a link to the Universal Wiki Converter documentation and download sites.

⚠️ You need to install and run the UWC separately from Confluence.

The UWC is a standalone application that communicates with Confluence remotely. You cannot install the UWC directly into Confluence. Instead, download the UWC separately and run it according to the instructions below.

⚠️ The information on this page does not apply to Confluence OnDemand.

The UWC supports many wiki dialects. In addition, the UWC is an extensible framework, which means that developers can continue writing new conversion modules for other wikis. To see the latest list of conversions available, please refer to the UWC documentation.

- Download the latest version of the UWC.
- For information on installation and usage, see the UWC Quick Start Guide.
- For information on developing your own converter module, see the UWC Developer Documentation.
- For information about a specific wiki, including a list of currently supported wikis, see the UWC documentation.
- To ask a question, see the UWC discussions on Atlassian Answers.

Performance Tuning

This document describes tuning your application for improved performance. It is not a guide to troubleshooting Confluence outages. Check Troubleshooting Confluence Hanging or Crashing for help if Confluence is crashing.

Description

Like any server application, Confluence may require some tuning as it is put under heavier use. We do our best to make sure Confluence performs well under a wide variety of circumstances, but there's no single configuration that is best for everyone's environment and usage patterns.

If you are having problems with the performance of Confluence and need our help resolving them, you should read Requesting Performance Support.

Use the latest version of your tools

Use the latest versions of your application servers and Java runtime environments. Newer versions are usually
better optimized for performance. As an example, our internal performance tests show a **20% speed-up** (when viewing pages under load) between Tomcat 6 on Java 6 vs Tomcat 5.5 on Java 5 **out of the box**.

**Avoid swapping due to not enough RAM**

Always watch the swapping activity of your server. If there is not enough RAM available, your server may start swapping out some of Confluence's heap data to your hard disk. This will slow down the JVM's garbage collection considerably and affect Confluence's performance. In clustered installations, swapping can lead to a C**luster Panic due to Performance Problems**. This is because swapping causes the JVM to pause during Garbage Collection, which in turn can break the inter-node communication required to keep the clustered nodes in sync.

---

**On this page:**

⚠️ The information on this page **does not apply** to Confluence OnDemand.

---

**Being aware of other systems using the same infrastructure**

It may sound tempting: Just have one powerful server hosting your database and/or application server, and run all your crucial programs on that server. If the system is set up perfectly, then you might be fine. Chances are however that you are missing something, and then one application's bug might start affecting other applications. So if Confluence is slow every day around noon, then maybe this is because another application is using the shared database to generate complicated reports at that time? Either make sure applications can't harm each other despite sharing the same infrastructure, or get these systems untangled, for example by moving them to separate instances that can be controlled better.

**Choice of database**

The **embedded database** that is provided with Confluence is meant only to be used for evaluation, not for production Confluence sites. After the evaluation finishes, you will certainly need to switch to an external
relational database management system. Beyond this, we do not recommend any particular RDBMS over another. We recommend using what you are familiar with, because your ability to maintain the database will probably make far more difference to what you get out of it than the choice of database itself.

**Database connection pool**

If load on Confluence is high, you may need more simultaneous connections to the database.

- If you are using JNDI data-sources, you will do this in your application server's configuration files.
- If you have configured Confluence to access the database directly, you will need to manually edit the `hibernate.c3p0.max_size` property in the `confluence.cfg.xml` file in your `confluence.home` directory. After you have changed the URL in this file, restart Confluence.

To assess whether you need to tune your database connection pool, take thread dumps during different times (including peak usage). Inspect how many threads have concurrent database connections.

**Database in general**

If Confluence is running slowly, one of the most likely causes is that there is some kind of bottleneck in (or around) the database.

The first item you should check is the "Database Latency" field in the System Information tab in the admin console.  

<table>
<thead>
<tr>
<th>Database connection</th>
<th>Transaction</th>
<th>Isolation</th>
<th>Head committed</th>
<th>Database Latency</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Confluence Usage</td>
<td></td>
</tr>
</tbody>
</table>

The latency is calculated by sending a trivial request to the database, querying a table which is known to have only one column and one row. ("select * from CLUSTERSAFETY"). Obviously this query should be blazing fast, and return within 1 or 2 milliseconds. If the value displayed is between 3 and 5 milliseconds, you might already have an issue. If the value is above 10ms, then you **definitely** need to investigate and improve something! A few milliseconds may not sound so bad, but consider that Confluence sends quite a few database queries per page request, and those queries are a lot more complex too! High latency might stem from all sorts of problems (slow network, slow database, connection-pool contention, etc), so it’s up to you to investigate. Don't stop improving until latency is below 2ms on average.

Obviously, latency is just the very first thing to look at. You may get zero latency and still have massive database problems, e.g. if your tables are poorly indexed. **So don't let a low latency fool you either.**

**Database indexes**

Especially if you have more than a few thousand active users, and all most obvious measures have been tried out but the database still seems to be under high load, you should consider engaging a database administrator (DBA) to tune the database specifically to the demands that your particular Confluence installation is placing on it. If you do not have a full-time DBA and can't even get one for temporary consulting, you may want to consult the [database indexing advice](#) that we have been gathering from customer reports and our own experience running and developing Confluence. The instructions on that page are for Oracle, but most of the indexes can be applied to (and will help with) any database.

(These database indexes are now created automatically when Confluence is installed, but existing installations upgrading to a more recent version may still need to add them manually)

**Database statistics and query analysers**

Modern databases have query optimisers based on collecting statistics on the current data. Using the SQL `EXPLAIN` statement will provide you information on how well the query optimiser is performing. If the cost estimate is wildly inaccurate then you will need to run statistics collection on the database. The exact command
will depend on your database and version. In most cases you can run statistics collection while Confluence is running, but due to the increased load on the database it’s best to do this after normal hours or on a week-end.

**Cache tuning in Confluence and Apache**

To reduce the load on the database, and speed up many operations, Confluence keeps its own cache of data. Tuning the size of this cache may speed up Confluence (if the caches are too small), or reduce memory (if the caches are too big).

Please have a look at our documentation on [Cache Performance Tuning](https://confluence.org) for information on how to tune Confluence caches.

To improve performance of a large Confluence site, we recommend that you move the caching of static content from the JVM into Apache. This will prevent the JVM from having a number of long running threads serving up static content. See [Configuring Apache to Cache Static Content via mod_disk_cache](https://confluence.org).

**Antivirus software**

Antivirus software greatly decreases the performance of Confluence. Antivirus software that intercepts access to the hard disk is particularly detrimental, and may even cause errors with Confluence. You should configure your antivirus software to ignore the Confluence home directory, its index directory and any database-related directories.

**Enabling HTTP compression**

If bandwidth is responsible for bottlenecking in your Confluence installation, you should consider enabling HTTP compression. This may also be useful when running an external facing instance to reduce your bandwidth costs.

Take note of the [known issues with HTTP compression](https://confluence.org) in versions of Confluence prior to 2.8, which may result in high memory consumption.

**Virtual operating systems**

Virtual Environments such as VMWare can cause Confluence CPU to spike. Run Confluence on a native OS. Refer to the list of supported operating systems for Confluence in the [Supported Platforms](https://confluence.org) topic.

**Note:** In some situation the VMTools can crash, cause a excessive context switches and interrupts causing the JVM to run slowly and Confluence to start up very slowly.

**Performance testing**

You should try out all configuration changes on a demo system. Ideally, you should run and customize loadtests that simulate user behaviour. Learn about how to test performance issues using the [Performance Testing Scripts](https://confluence.org).

**Access logs**

You can find out which pages are slow and which users are accessing them by enabling Confluence’s built-in access logging.

**Built-in profiler**

You can identify the cause of page delays using Confluence’s built-in profiler according to [Troubleshooting Slow Performance Using Page Request Profiling](https://confluence.org).

**Application server memory settings**
See [How to Fix Out of Memory Errors by Increasing Available Memory](#).

**Web server configuration**

For high-load environments, performance can be improved by using a web server such as Apache in front of the application server. There is a configuration guide to [Running Confluence behind Apache](#).

When configuring your new web server, make sure you configure sufficient threads/processes to handle the load. This applies to both the web server and the application server connector, which are typically configured separately. If possible, you should enable connection pooling in your web server connections to the application server.

**Parallel GC**

If you have multiple CPU's on your server, you can add `-XX:+UseParallelOldGC` to your JAVA_OPTS options. This will allow garbage collection of the Tenured Space to happen in parallel with the application and can boost performance and can reduce slow performance spikes. For more information, please refer to our detailed page on [Garbage Collector Performance Issues](#), and Sun's [summary](#) of collectors.

**Troubleshooting possible memory leaks**

Some external plugins, usually ones that have been written a long time ago and that are not actively maintained anymore, have been reported to consume memory and never return it. Ultimately this can lead to a crash, but first this manifests as reduced performance. The [Troubleshooting Confluence Hanging or Crashing](#) guide is a good place to start. Some of the known causes listed there could result in performance issues short of a crash or hang.

**Plugins**

Some 3rd-party plugins were not written to scale to large enterprises' needs.

Confluence has been optimized to work under high load and with many pages. Some 3rd party plugins however have been written with small size companies in mind, and can't cope with large numbers of concurrent users, or large numbers of pages and permissions, or large numbers of spaces. It is impossible to tell which ones will fail under which conditions, but it will always help to turn off 3rd-party plugins that are not strictly mission-critical while investigating performance issues.

**RELATED TOPICS**

- [Garbage Collector Performance Issues](#)

- [Confluence Clustering Overview](#)
- [Requesting Performance Support](#)
- [Confluence Administrator's Guide](#)
- [Configuring Confluence](#)

**Cache Performance Tuning**

Confluence performance can be significantly affected by the performance of its caches. It is essential for the administrator of a large production installation of Confluence to tune the caches to suit its environment. There are several configurable parameters for each of the cache regions, most notably cache size, cache expiry delay and eviction policy. In the majority of the cases, cache size is the parameter you would want to change.
Fortunately, from Confluence 3.0, it is very easy to adjust cache sizes through the Administration Console. However, if you need to modify parameters other than a cache size, you would need to modify the relevant configuration files manually.

The cache performance information for your Confluence installation is available under Administration > Cache Statistics. For more information about the numbers displayed on that screen, see Cache Statistics.

Notes:

- To improve performance of a large Confluence site, we recommend that you move the caching of static content from the JVM into Apache. This will prevent the JVM from having a number of long running threads serving up static content. See Configuring Apache to Cache Static Content via mod_disk_cache.
- If you only need to modify Confluence's maximum cache sizes, you can do this through the Cache Statistics feature of the Administration Console.

Cache tuning example

As an example of how to tune Confluence's caches, let's have a look at the following table:

<table>
<thead>
<tr>
<th>Caches</th>
<th>% Used</th>
<th>% Effectiveness</th>
<th>Objects/Size</th>
<th>Hit/Miss/Expiry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachments</td>
<td>87%</td>
<td>29%</td>
<td>874/1000</td>
<td>78226/189715/187530</td>
</tr>
<tr>
<td>Content Attachments</td>
<td>29%</td>
<td>9%</td>
<td>292/1000</td>
<td>4289/41012/20569</td>
</tr>
<tr>
<td>Content Bodies</td>

</table>

The caches above are of size 1000 (meaning that it can contain up to 1000 objects), which is the default size for caches in the default cache scheme. Refer to Confluence Cache Schemes for more explanation.

You can tell when a cache size needs to be increased because the cache has both:

- a high usage percentage (above 75%)
- a low effectiveness percentage.

Check the 'effectiveness' versus the 'percent used'. A cache with a low percent used need not have its size lowered; it does not use more memory until the cache is filled.

Based on this, the sizes of the "Attachments", "Database Queries", and "Users" caches should be increased to improve their effectiveness.
As the stored information gets older or unused it will expire and be eliminated from the cache. Cache expiry may be based on time or on frequency of use.

There is not much that you can do with a cache that has both a low percentage of usage and effectiveness. Over time, as the cache is populated with more objects and repeat requests for them are made, the cache's effectiveness will increase.

⚠️ The information on this page does not apply to Confluence OnDemand.

Finding the configuration file

The caches are configured in ecache.xml (for standard editions) or confluence-coherence-cache-config-clustered.xml (for clustered editions) which is stored in `<confluence-home>/config/`.

Oracle Coherence Licensing Change:
- Due to a license agreement change, Confluence is now available in two editions:
  - **Standard Edition** — Confluence with Ehcache's caching technology (available to customers with non-clustered Confluence licenses).
    - If you are currently running a clustered installation of Confluence, please do not upgrade it with a standard edition of Confluence.
  - **Clustered Edition** — Confluence with Oracle's Coherence clustering and distributed caching technology (available to customers with Confluence clustered licenses only).
- For more information about these changes, please refer to the Coherence License Changes document.
- If you have a Confluence clustered license, are running a clustered installation of Confluence and wish to upgrade to Confluence version 2.6 or later, please ensure that you download only a clustered edition of Confluence and please refer to the Confluence 3.0.1 Upgrade Notes for additional upgrade information.

Cache key mappings
The cache configuration file configures caches by their keys. When you move your mouse over the cache names displayed on the cache statistics page, a tooltip will indicate the actual cache key for that cache name.

Using our example from the table above, if we were to modify parameters for the Users cache we would need to change the cache with the key com.atlassian.user.impl.hibernate.DefaultHibernateUser. Do not get confused with Users (External Mappings) and Users (External Groups) which are in themselves, two separate caches. "Users" is the friendly name for com.atlassian.user.impl.hibernate.DefaultHibernateUser.

Standard editions of Confluence

In standard editions of Confluence, the caching layer is Ehcache.

Understanding the Ehcache configuration file

For more information about the Ehcache configuration file and a full reference on Ehcache configuration, please refer to the Ehcache configuration documentation.

Converting your Coherence configuration to Ehcache

This section only applies to customers who:

- Have an installation of Confluence that was downloaded before the 4th of September 2009.
- Intend to (or have already) upgraded to Confluence 3.0.1 or later (or to Confluence versions 2.6.3, 2.7.4, 2.8.3, 2.9.3 and 2.10.4).
- Will use a non-clustered Confluence license for the Confluence upgrade.
- Have implemented customisations to their Confluence installation's cache configuration file (confluence-coherence-cache-config.xml).

To maintain your existing cache configuration file settings, you will need to transfer any cache customisations you have implemented in the Coherence cache configuration file (confluence-coherence-cache-config.xml) to the relevant entries in the Ehcache cache configuration file (ehcache.xml).

Each cache has a cache-mapping element in the Coherence file (of which there is an equivalent cache element in the ehcache.xml file). Unfortunately, copying across your customisations is not quite a straightforward process because the Coherence file defines several 'caching schemes' to store the actual cache values, which in turn are referenced by the cache-mapping elements. In contrast, the ehcache.xml file does not support caching schemes and a cache's values are expressed explicitly in separate parameters of a cache element.

To convert your Coherence cache configuration file customisations across to the equivalent Ehcache file:

1. Open both the confluence-coherence-cache-config.xml and ehcache.xml files in a text editor. These files are located in the <confluence-home>/config directory.

   If you implemented your customisations in a version of Confluence prior to 3.0, you will most likely find the confluence-coherence-cache-config.xml file in the <confluence-install>/confluence/WEB-INF/classes directory.

2. In the customised confluence-coherence-cache-config.xml file:
   a. Identify the caching schemes that were customised in this file and make a note of the values of all its child elements.
1. Typically, each caching scheme is located inside a local-scheme element and all of these are enclosed within the cache-schemes element, which appears towards the end of this file.

b. Note each customised caching scheme by the content of its scheme-name element.

c. For each cache-mapping element (which typically appears towards the top of this file), identify if it has a scheme-name element whose content matches one noted in the previous step and if so, make a note of its associated cache-name element.

3. In the ehcache.xml file:

   a. Identify each cache element whose 'name' parameter matches the cache-name elements noted in step '2c'.

   b. Using the mappings table below, apply the values noted in step '2a' to the appropriate parameters of the cache elements identified in the previous step ('3a').

Mappings table showing how elements of the Coherence cache configuration file map to parameters of the equivalent Ehcache file.

<table>
<thead>
<tr>
<th>Coherence Element</th>
<th>Ehcache Attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>high-units</td>
<td>maxElementsInMemory</td>
</tr>
<tr>
<td>expiry-delay &gt; 0s</td>
<td>timeToIdleSeconds - Use this attribute for expiry delays greater than 0s along with the eternal attribute set to 'false'</td>
</tr>
<tr>
<td>expiry-delay = 0s</td>
<td>eternal - For expiry delays of 0s, set this attribute to 'true'.</td>
</tr>
</tbody>
</table>

Clustered editions of Confluence

Understanding the Coherence configuration file

The Coherence configuration file is a mapping of cache keys to cache schemes. Each cache scheme controls the expiry, eviction policy and size of the caches linked to it. A cache scheme can extend another scheme.

For a full reference, see the [Oracle's Coherence cache configuration documentation](#).

Defining caching scheme mappings in Coherence cache config file

If a cache key does not have an explicit definition in the caching scheme mappings (defined in confluence-coherence-cache-config.xml) then it will use the "default" cache-mapping.

In our example, com.atlassian.user.impl.hibernate.DefaultHibernateUser is not explicitly defined in the caching scheme mappings. Hence to increase the expiry-delay to 2 hours, we will need to define the mapping ourselves and add the following within the <caching-scheme-mapping> tags:

```xml
<cache-mapping>
  <cache-name>com.atlassian.user.impl.hibernate.DefaultHibernateUser</cache-name>
  <scheme-name>cache:com.atlassian.user.impl.hibernate.DefaultHibernateUser</scheme-name>
</cache-mapping>
```

Then we will need to define a cache schema with name cache:com.atlassian.user.impl.hibernate.D
It's possible to define a local-scheme mapping for a cache key without defining certain parameters (e.g. `<high-units>`). In such a cases, their parameters will be inherited from `scheme-ref` scheme, which is the default scheme in our case.

**Important caches**

- `com.atlassian.confluence.core.ContentEntityObject` (known as Content Objects cache) should be set to at least 20-30% of the number of content entity objects (pages, comments, emails, news items) in your system. To find the number of content entity objects, use the query `SELECT COUNT(*) FROM CONTENT WHERE prevver IS NULL`.

- `com.atlassian.confluence.core.ContentEntityObject.bodyContents` (known as Content Body Mappings cache) should be set to at least 20% of the number of content entity objects (pages, comments, emails, news items) in your system. To find the number of content entity objects, use the query `SELECT COUNT(*) FROM CONTENT WHERE prevver IS NULL`.

- `com.atlassian.confluence.security.PermissionCheckDispatcher.isPermitted()` (known as User Authorized URLs cache) should be set to at least the number of concurrent users you expect to access Confluence at the same time.

- `com.atlassian.user.impl.hibernate.DefaultHibernateUser` (known as Users cache) should be set to the number of users you have: `SELECT COUNT(*) FROM users`. Note that by default, this will also control the LDAP user's cache, including expiration.

- `com.atlassian.confluence.security.SpacePermission` (known as Permissions cache) should be set to the number of space permissions in your deployment (a good rule of thumb is 20 times the number of spaces). You can find the number of space permissions using the query `SELECT COUNT(*) FROM SPACEPERMISSIONS`.

**Cache tuning follow-up**

After you have made changes to your cache config, doing a follow up on the changes in the next week or after the expected performance spike would be important.

Make sure that you take a screenshot of the cache statistics before and after the change. Then compare them with the cache statistics in the later period where performance improvement is expected.

**Notes**

You can monitor what's in the cache by using a JSP included in the Confluence distribution. Browse to `<base-URL>/admin/cachecontents.jsp` to monitor the cache contents.
Cache Performance Tuning for Specific Problems

The following are more specific performance problems that can be resolved from tuning the cache.

LDAP cache sizes and expiry does not appear to be picked up.

This is a known problem, please refer to CONF-11858 for the solution.

"Edit Page" screen takes a long time to load

If your installation of Confluence is suffering from this problem, it may be due to an insufficient SpacePermissions cache size. To address this problem, first determine the number of space permission objects in your Confluence instance. You can do this by running this query against your database:

```
> select count(*) from SPACEPERMISSIONS
```

Now locate the cache entry for SpacePermissions in your `confluence-coherence-cache-config.xml`:

```xml
<local-scheme>
  <scheme-name>cache:com.atlassian.confluence.security.CachingSpacePermissionManager</scheme-name>
  <scheme-ref>default</scheme-ref>
  <high-units>10000</high-units>
  <expiry-delay>0s</expiry-delay>
<local-scheme>
```

Adjust the `maxElementsInMemory` or `high-units` property to the number of space permissions you have (in the example above, I've used 10000). Also, just as important, you need to adjust the `timeToLiveSeconds` or `expiry-delay` property to 0.

Note: 10K of space permissions consumes approximately 8MB of memory. Please ensure there is enough memory allocated to your instance to cater for this.

How to set specific cache settings

1. Find the cache name from the cache name mappings:
   - For Confluence 2.5.x and earlier, the cache name mappings are in file `confluence/WEB-INF/classes/com/atlassian/confluence/admin/actions/cache-name-mappings.properties`.
   - For Confluence 2.6.0 and later, you will find the cache name mappings in the file `com/atlassian/confluence/core/ConfluenceActionSupport.properties` which is packed into the `confluence-2.x.*.jar` file.

2. Find the appropriate `<cache-mapping>` tag in `confluence-coherence-cache-config.xml` or `confluence-coherence-cache-config-clustered.xml`. If the tag doesn't exist, you can create it within the `<caching-scheme-mapping>` tag.
3. The `<scheme-name>` will correspond to a `<local-scheme>` tag below. It refers to a scheme reference. Either change the high-units tag in the scheme reference, or add a high-units tag to override the scheme reference. For example, the following tag would change the Content Bodies cache from the default 1000 units to 2000 units:

```xml
<local-scheme>
  <scheme-name>cache:com.atlassian.confluence.core.ContentEntityObject.bodyContents</scheme-name>
  <high-units>2000</high-units>
  <scheme-ref>default</scheme-ref>
  <expiry-delay>0s</expiry-delay>
</local-scheme>
```

Another popular cache to change is the LDAP related User cache:

```xml
<local-scheme>
  <scheme-name>user</scheme-name>
  <scheme-ref>default</scheme-ref>
  <high-units>5000</high-units>
  <expiry-delay>300s</expiry-delay>
</local-scheme>
```

4. After updating the appropriate file, you do not need to repack it into the jar to use it. You can simply place the file in your `confluence/WEB-INF/classes/` directory. The file in this directory will override the settings in your jar file. If you want to back out the changes, you only need to remove the file from your `confluence/WEB-INF/classes/` directory — then the default values in the `confluence-coherence-cache-config.xml` located in your jar file will apply.

You can find more information about configuring the Coherence cache in the Coherence cache documentation.

**RELATED TOPICS**

**Confluence Cache Schemes**

*Default Scheme*
If a cache has not been defined, then it will use the default cache size and expiry. As the start of your confluence/WEB-INF/classes/confluence-coherence-cache-config.xml file you will notice the following:

```
<cache-mapping>
  <cache-name>*</cache-name>
  <scheme-name>default</scheme-name>
</cache-mapping>
```

So basically all caches will default to using the default scheme, which is defined as below:

```
<!-- Default scheme -->
<local-scheme>
  <scheme-name>default</scheme-name>

  <class-name>com.atlassian.confluence.cache.tangosol.ExpiryCountingLocalCache</class-name>
  <high-units>1000</high-units>
  <expiry-delay>3600</expiry-delay>
</local-scheme>
```

I.e. with a size of 1000 Objects and an expiry of 3600 seconds. Other schemes use the above as their default and either override the size of the cache, or the length of the expiry.

⚠️ The information on this page does not apply to Confluence OnDemand.

**Common Schemes**

In addition to the default scheme, there are also common schemes used in Confluence caches:
<local-scheme>
  <scheme-name>large</scheme-name>
  <scheme-ref>default</scheme-ref>
  <high-units>10000</high-units>
</local-scheme>
<local-scheme>
  <scheme-name>medium</scheme-name>
  <scheme-ref>default</scheme-ref>
  <high-units>5000</high-units>
</local-scheme>
<local-scheme>
  <scheme-name>small</scheme-name>
  <scheme-ref>default</scheme-ref>
  <high-units>100</high-units>
</local-scheme>
<local-scheme>
  <scheme-name>large-transient</scheme-name>
  <scheme-ref>default</scheme-ref>
  <high-units>10000</high-units>
  <expiry-delay>300s</expiry-delay>
</local-scheme>
<local-scheme>
  <scheme-name>user</scheme-name>
  <scheme-ref>default</scheme-ref>
  <high-units>5000</high-units>
  <expiry-delay>300s</expiry-delay>
</local-scheme>

Configuring Confluence

Memory usage and requirements
Managing Confluence’s performance and memory usage really depends on what resources are available - Confluence will run faster if you give it lots of memory for its caches, but it should still be able to run quite well in low-memory environments, with the right tuning. Below are some tips on getting the most out of your Confluence site.

On this page:

⚠️ The information on this page does not apply to Confluence OnDemand.

Increasing the amount of memory available to Confluence

See Increasing JIRA Memory for details on how to increase the memory available to web application servers typically used to run Confluence.
**Embedded Database**

The embedded HSQL database that comes with Confluence essentially holds all your data in memory while the Confluence server is running. If you are running out of memory, you should consider migrating Confluence to some external RDBMS.

**Caching**

By default, Confluence keeps large in-memory caches of data to improve its responsiveness and the user experience. The trade off is an increase in memory requirements to support the cache. Administrators of larger Confluence sites may need to configure the size of their caches to improve performance.

To customise Confluence's cache to meet your needs, see cache tuning. To increase the amount of memory available to confluence, see How to Fix Out of Memory Errors by Increasing Available Memory.

**Mail error queue**

Confluence keeps a copy of all emails that it failed to send within an internal error queue. In the event of intermittent failures such as network connectivity issues, the emails in this queue can be manually resent when the problem is fixed. Under certain circumstances, the mail queue can fill up with large objects. The queue is regularly flushed, but if you get a lot of mail errors, you might get a spike in memory usage.

**Attachments**

The indexing of large attachments requires that the attachment be loaded into memory. In the case of large attachments, this can cause a temporary strain on the systems resources, and may result in indexing failing because the attachment could not be fully loaded into memory.

**System backup / restore**

The Confluence backup and restore process scales linearly with the size of data. This can have a significant impact on large Confluence instances where the amount of data exceeds the amount of available memory. If you are experiencing an OutOfMemoryError during either a backup or restore processes, then we strongly recommend that you choose and Production Backup Strategy.

If you encounter an OutOfMemoryError while restoring a backup and wish to overcome this issue by increasing memory, how much more will you need to make this process work? A good rule of thumb is to have a look at the size of the entities.xml file in your backup. This file contains all of the data Confluence will be loading, so at least that much is required. Add another 64-128Mb to ensure that Confluence has enough memory to load and function and that should be enough. To increase the amount of memory available to Confluence, see How to Fix Out of Memory Errors by Increasing Available Memory.

**Known issues that we do not have control over.**

There are also some memory issues we don't have any control over. For example,

- There's a memory leak in the Oracle 10g JDBC drivers. Not much we can do about that.
- one customer found a rather nasty memory leak that appeared to originate inside Tomcat 5, but only using the IBM JDK on PowerPC.

If you are having problems that appear to result from a memory leak, file an issue on http://support.atlassian.com. Our memory profiler of choice is YourKit. It would be helpful to us if you can provide us with a memory dump from that tool showing the leak.

**Confluence is taking long periods of time to respond to some actions**

A common cause of random pauses in Confluence is the JVM running garbage collection. To determine if this is what is happening, enable verbose garbage collection and look at how long Java is taking to free up memory. If
the random pauses match when Java is running its garbage collection, garbage collection is the cause of the pause.

Verbose garbage collection will generate log statements that indicate when Java is collecting garbage, how long it takes, and how much memory has been freed.

For example, with a Windows service, run:

```
tomcat5 //US//Confluence ++JvmOptions="-XX:+PrintGCDetails -XX:+PrintGCTimeStamps -verbose:gc -Xloggc:c:\confluence\logs\gc.log"
```

or in `bin/setenv.sh`, set:

```
export CATALINA_OPTS="$CATALINA_OPTS -XX:+PrintGCDetails -XX:+PrintGCTimeStamps -verbose:gc -Xloggc:${CATALINA_BASE}/logs/gc.log"
```

If you modify `bin/setenv.sh`, you will need to restart Confluence for the changes to take effect.

What can you do to minimise the time taken to handle the garbage collection? See [http://java.sun.com/docs/hotspot/gc1.4.2/](http://java.sun.com/docs/hotspot/gc1.4.2/) for details on tuning the JVM to minimise the impact that garbage collection has on the running application.

**Requesting Performance Support**

**Basic Performance Troubleshooting Steps**

Begin with the following procedures:

1. Go through the [Troubleshooting Confluence Hanging or Crashing](#) page to identify the major known performance problems
2. Proceed with the [Performance Tuning](#) tips to help optimize performance

⚠️ **The information on this page does not apply to Confluence OnDemand.**

**Requesting Basic Performance Support**

If those tips don't help or you're not sure where to start, open a [support ticket](#) starting with at least the basic information:

1. The [atlassian-confluence.log](#)
2. The catalina.out log (or your application server log), with a series of three thread dumps separated by 10 seconds
3. A description with as much detail as possible regarding:
   a. What changes have been made to the system?
   b. When did performance problems begin?
   c. When in the day do performance issues occur?
   d. What pages or operations experience performance issues?
   e. Is there a pattern?
Continue with as much of the Advanced Performance Troubleshooting information as you can.

**Advanced Performance Troubleshooting**

Please gather **all** of the information listed below and include it in your support request, even if you think you have a good idea what's causing the problem. That way we don't have to ask for it later.

**System Information**

**Confluence Server**
- Take a screenshot of Confluence's Administration System Information (or save the page as HTML)
- Take a screenshot of Confluence's Administration Cache Statistics (or save the page as HTML)
- Find out the exact hardware Confluence is running on
  - How many CPUs? What make and model? What MHz?
  - How much memory is installed on the machine?
  - How much memory is assigned to Confluence's JVM? (i.e. what are the -Xmx and -Xms settings for the JVM?)
  - What other applications are being hosted on the same box?

**Confluence Content**
- How many users are registered in Confluence?
- On average, to how many groups does each user belong?
- How many spaces (global and personal) are there in your Confluence server?
- How many of those spaces would be viewable by the average user?
- Approximately how many pages? (Connect to your database and perform 'select count(*) from content where prevver is null and contenttype = 'PAGE'')
- How much data is being stored in Bandana (where plugins usually store data)? (Connect to your database and perform 'select count(*), sum(length(bandanavalue)) from bandana')

**The Database**
- What is the exact version number of Confluence's database server?
- What is the exact version number of the JDBC drivers being used to access it? (For some databases, the full filename of the driver JAR file will suffice)
- Is the database being hosted on the same server as Confluence?
- If it is on a different server, what is the network latency between Confluence and the database?
- What are the database connection details? How big is the connection pool? If you are using the standard configuration this information will be in your confluence_cfg.xml file. Collect this file. If you are using a Data source this information will be stored in your application server’s configuration file, collect this data.

**User Management**
- Are you using external user management or authentication? (i.e. JIRA or LDAP user delegation, or single sign-on)
- If you are using external JIRA user management, what is the latency between Confluence and JIRA's database server?
- If you are using LDAP user management:
  - What version of which LDAP server are you using?
  - What is the latency between Confluence and the LDAP server?

**Diagnostics**

**Observed Problems**
- Which pages are slow to load?
  - If it is a specific wiki page, attach the wiki source-code for that page
- Are they always slow to load, or is the slowness intermittent?
Monitoring data

Before drilling down into individual problems, helps a lot to understand the nature of the performance problem. Do we deal with sudden spikes of load, or is it a slowly growing load, or maybe a load that follows a certain pattern (daily, weekly, maybe even monthly) that only on certain occasions exceeds critical thresholds? It helps a lot to have access to continuous monitoring data available to get a rough overview.

Here are sample graphs from the confluence.atlassian.com system, showing

Load

This graph shows the load for two consecutive days. The obvious pattern is that the machine is under decent load, which corresponds to the user activity, and there is no major problem.

Resin Threads and Database Connections

These two charts show the active threads in the application server (first chart) and the size database connection pool (second chart). As you can see, there was a sudden spike of server threads and a corresponding spike of db-connections.
The database connection pool size

The database connection pool size peaked over 112, which happened to be more than the maximum number of connections the database was configured for (100). So it was no surprise that some requests to Confluence failed and many users thought it had crashed, since many requests could not obtain the crucial database connections.

We were able to identify this configuration problem quite easily just by looking at those charts. The next spikes were uncritical because more database connections were enabled.

The bottom line being: it helps a lot to monitor your Confluence systems continuously (we use Hyperic, for example), and it helps even more if you are able to send us graphs when you encounter problems.

Access logs

- How to Enable User Access Logging, including redirecting the logs to a separate file
  - You can run this file through a log file analyser such as AWStats, or manually look through for pages which are slow to load.

Profiling and Logs

- Enable Confluence's built-in profiling for long enough to demonstrate the performance problem using Troubleshooting Slow Performance Using Page Request Profiling.
  - If a single page is reliably slow, you should make several requests to that page
  - If the performance problem is intermittent, or is just a general slowness, leave profiling enabled for thirty minutes to an hour to get a good sample of profiling times
- Find Confluence's standard output logs (which will include the profiling data above). Take a zip of the entire logs directory.
- Take a thread dump during times of poor performance

CPU Load

- If you are experiencing high CPU load, please install the YourKit profile and attach two profiler dumps taken during a CPU spike. If the CPU spikes are long enough, please take the profiles 30-60 seconds apart. The most common cause for CPU spikes is a virtual machine operating system.
- If the CPU is spiking to 100%, try Live Monitoring Using the JMX Interface, in particular with the Top threads plugin.

Instance Metrics and Scripts

- It is essential to understand the user access and usage of your instance. Please use the access log scripts and sql scripts to generate Usage statistics for your instance.

Next Step

Open a ticket on https://support.atlassian.com and attach all the data you have collected. This should give us the
information we need to track down the source of your performance problems and suggest a solution. Please follow the progress of your enquiry on the support ticket you have created.

If your site is non-responsive, please use our [Live Support](https://confluence.atlassian.com/live-support) during business hours once you have created the ticket to escalate your problem.

**Access Log Scripts**

The access log scripts are [attached to this page](https://confluence.atlassian.com/access-log-scripts). To use the scripts:

1. Unzip the 7z file.
2. Copy all the daily access logs to a folder called `logs`.
3. Run `Atlassian-processDailyLog.rb`. This will generate a csv file called `summary.csv` and several directories which contain the access logs of each defined user action.
4. Run the appropriate script `Atlassian-processDailyLog-hourly.rb` to use the scripts. For example, `Atlassian-processDailyLog-hourly.rb admin` will process the admin logs extracted in step 3.
5. Import the csv files to `www-log-Analysis.xls` (summary.csv to 'raw stats - daily' sheet and `admin`, `csv` to 'admin -hours' sheet, etc) to generate the load profiles and graphs. You may need to modify the number of rows in each sheet depending on the number of logs.

⚠️ The information on this page does not apply to Confluence OnDemand.

---

**Note**

All scripts are written in Ruby and assume the log file name contains the string 'confluence.atlassian.com-access.log'. Scripts need to be changed if another name is used.

Modify the line:

```ruby
filenameRegexp = Regexp.new('confluence.atlassian.com-access.log')
```

---

**Troubleshooting Slow Performance Using Page Request Profiling**

This page tells you how to enable page-request profiling. With profiling turned on, you will see a record of the time it takes (in milliseconds) to complete each action made on any Confluence page. If Confluence is responding slowly, an internal timing trace of the slow page request can help to identify the cause of the delay.

You will need access to the Confluence server to view a profile.

---

**On this page:**

- [Enabling Page-Request Profiling](#enabling-page-request-profiling)
- [Profiling an Activity](#profiling-an-activity)
- [Example of a Profile](#example-of-a-profile)

**Enabling Page-Request Profiling**

To see just the slow performing macros, see [Identifying Slow Performing Macros](https://confluence.atlassian.com/identifying-slow-performing-macros).
From Confluence 2.7, you can use the ‘Logging and Profiling’ option to enable or disable profiling.

ℹ️ You need to have System Administrator permissions in order to perform this function.

**To enable page profiling,**

1. Go to the 'Administration Console' and click ‘Logging and Profiling’ in the ‘Administration’ section of the left-hand panel.
2. The ‘Logging and Profiling’ screen appears. Click the ‘Enable Profiling’ button.
   ℹ️ If profiling is already enabled, the button will be labelled ‘Disable Profiling’ instead.

**To disable page profiling,**

1. Go to the 'Administration Console' and click ‘Logging and Profiling’ in the ‘Administration’ section of the left-hand panel.
2. The ‘Logging and Profiling’ screen appears. Click the ‘Disable Profiling’ button.
   ℹ️ If profiling is already disabled, the button will be labelled ‘Enable Profiling’ instead.

Profiling an Activity
1. Enable profiling, using either of the methods described above. Profiles for every page hit, for all users, will now be logged to your application server's default logs until Confluence is restarted. Note that each time a user visits a link, a single profile is printed.

2. Confirm that profiles are being written to the Confluence log file — see Working with Confluence Logs for location of the log files and other details.

3. Perform the activity that is resulting in unusually slow response time.

4. Copy the profile for that action. When deciding which profiles to copy, look for the links that took a long time to respond. If a single page is slow, only that profile is necessary. If Confluence is generally or intermittently slow, copy all profiles logged during the slowdown until a reasonable sample has been collected.

5. If you were instructed to profile your instance by Atlassian technical support, attach all relevant profiles to your support ticket.

6. Turn profiling off again, using either of the methods described above.

7. Confirm that profiles are no longer being printed to the Confluence log file.

Example of a Profile

Below are the first few lines of a normal profile for accessing a page called Confluence Overview.

```
[344ms] - /display/ds/Confluence+Overview
[313ms] - SiteMesh: parsePage:
http://localhost:8080/display/ds/Confluence+Overview
[313ms] - XW Interceptor: Before defaultStack:
/pages/viewpage.action (ViewPageAction.execute())
[0ms] - SpaceAwareInterceptor.intercept()
[16ms] - PageAwareInterceptor.intercept()
[0ms] - AOP: PageManager.getPage()
[16ms] - AOP: PermissionManager.hasPermission()
[0ms] - AOP: SpacePermissionManager.hasPermission()
[16ms] - AOP: SpacePermissionManager.hasPermission()
[0ms] - AOP: SpacePermissionManager.hasPermission()
[0ms] - AOP: SpacePermissionManager.hasPermission()
[0ms] - AOP: SpacePermissionManager.hasPermission()
[281ms] - XW Interceptor: After defaultStack:
/pages/viewpage.action (ViewPageAction.execute())
[281ms] - XW Interceptor: After validatingStack:
/pages/viewpage.action (ViewPageAction.execute())
...```

Start Confluence with Profiling Enabled

There may be some situations where you may wish to have Confluence profiling enabled during startup. This may be useful if you restart often and may forget to enable profiling for Support/Trouble-shooting purposes.

Edit the file `CONFLUENCE_HOME/confluence/WEB-INF/web.xml`. You should see a stanza similar to the one below. Set the parameter value for `autostart` to `true`:

```xml
<Parameter name="autostart" value="true"/>
```
Remember to turn it back to false or your logs will grow very large.

**Compressing an HTTP Response within Confluence**

Confluence supports HTTP GZip transfer encoding. This means that if a user's web browser supports it, Confluence will compress the data it sends to the user. This will speed up Confluence over slow or congested Internet links, and reduce the amount of bandwidth consumed by a Confluence server.

Gzipping the HTTP Response is available in Confluence 1.4 and later.

You should turn on Confluence's GZip encoding if:

- Users are accessing Confluence over the Internet, or a WAN connection with limited bandwidth.
- You wish to reduce the amount of data transfer between the Confluence server and client.

If you are accessing Confluence over a Local Area Network or over a particularly fast WAN, you may wish to leave GZip encoding disabled. If the network is fast enough that transferring data from Confluence to the user isn't a limiting factor, the additional CPU load caused by having to compress each HTTP response may in fact slow Confluence down.

⚠️ The information on this page does not apply to Confluence OnDemand.
Known issues in Confluence 2.7 and earlier

There are known issues with the GZip filter and memory consumption evident in versions 2.7 of Confluence and earlier (CONF-9930). If you are running a large instance of Confluence 2.7 or earlier and frequently experiencing 'out of memory' errors, we recommend that you do not enable HTTP compression. These issues have been resolved in Confluence 2.8.

Enabling HTTP Compression

1. Choose Browse > Confluence Admin.
2. Select 'General Configuration' in the left-hand panel.
3. Enable 'Compress HTTP Responses'.

In Confluence 2.8 and later, you can configure which types of content are compressed within Confluence. By default, the following mime types will be compressed:

- text/html
- text/javascript
- text/css
- text/plain
- application/x-javascript
- application/javascript

If you wish to change the types of content to be compressed, add a replacement `urlrewrite-gzip-default.xml` file within the `WEB-INF/classes/com/atlassian/gzipfilter/` directory in your Confluence Installation Directory. A sample file is provided as an attachment. Generally speaking, it is unlikely that you will need to alter this file.

Performance Testing Scripts
Load Testing Confluence

This page contains scripts and hints on load-testing your Confluence installations.

Introduction

Before making a new Confluence instance available to your users it is useful to get a feel for how it will perform under your anticipated load and where you may need to consider improving your configuration to remove bottlenecks. Likewise, before making changes to your Confluence instance it would again be useful to assess the impact of these changes before making them live in a production context.

This kind of testing is not an exact science but the tools and process described here are intended to be a straightforward, configurable and extensible way of allowing you to begin this kind of load testing.

It will rarely be the case that these scripts will perform representative testing for you 'out of the box'. But either through configuration or by extending the scripts it should be possible to build an appropriate load test.
Load testing scripts are not designed for a production environment

The load testing scripts will update the data within the targeted Confluence instance and are not designed to be run against a production server. If you want to load test your production environment you will need to perform these tests on a backup of your data and restore your real data after the tests.

On this page:

- Load Testing Confluence
- Introduction
- Setup
- Quick, Just Tell Me How To Run It.
- Creating the Test Data
- Running the Test

The information on this page does not apply to Confluence OnDemand.

Setup

You will need the following -

- A Confluence server, set up and running with an admin user. The scripts assume a default username and password for this user: ‘admin’/’admin’.
- Ensure the Confluence Remote API is enabled in the administration options. See Enabling the Remote API for details on how to configure this.
- Apache JMeter
- The load testing scripts and resources which are available in our public Maven repository — Please choose the version that most closely matches your Confluence version and download the ZIP or Gzip file in that directory. If in doubt, download the ZIP file archive.

Users have reported problems when using the Windows built-in unzip utility. Please use a third party file archiving and extraction program (for example, 7-Zip) to extract these performance tests.

The test scripts have been updated to work with Confluence 3.4 in version 3.4. Using an older version of the tests will result in errors when running the test.

Quick, Just Tell Me How To Run It.

If you don't want to read the rest of this document, here are the main points:

1. Download and Unzip the performance tests
2. Open a command prompt and change directory to the performanceTest directory that has just been unzipped.
3. Create the test data:
4. Run the test:

```bash
<jmeter location>/bin/jmeter -n -t jmeter-test-fixedload.jmx
```

The remainder of this document is just an elaboration of those two steps.

⚠️ For information on how to use JMeter please refer to the manual.

Creating the Test Data

A known data set is required to run the testing against. By default this is the Confluence demo space (space key = DS) although this can be changed (more on this later). If you decide to use the Confluence demo space, ensure that the group "confluence-users" is able to update content in this space.

The script `jmeter-test-setup.jmx` is used to:

- create a set of users to be used in the test
- import the Confluence demo space for running tests against.

You should first ensure that you don't already have the demo space (key = DS) on your test instance. Delete it if you do.

Run the script from the performanceTest directory as follows:

```bash
<jmeter location>/bin/jmeter -n -t jmeter-test-setup.jmx
-Jspace.zip=<path to a space export.zip>-Jadmin.user=<username>
-Jadmin.pass=<password>
```

Where:

- `<path to a space export.zip>` is the absolute path to the space export zip you want to be used in your testing. For example, the path to `demo-site.zip` as found in your Confluence distribution or
  **source:** `<confluence-install>/confluence/WEB-INF/classes/com/atlassian/confluence/setup/demo-site.zip`

- `<username>` and `<password>` are the username and password for an admin user that is able to create Confluence users and to import spaces.

By default the setup process will create 250 users — 50 each of the following formats: `tstreader<n>`, `tstcommentor<n>`, `tsteditor<n>`, `tstcreator<n>` and `tstsearcher<n>`. The password for each matches the username.

A typical run of the setup script will only take a few seconds.

Removing the Test Data
You can reverse the effects of the setup script by setting the `remove.data` parameter to `true`, e.g.:

```
<jmeter location>/bin/jmeter -n -t jmeter-test-setup.jmx
-Jremove.data=true -Jadmin.user=<username> -Jadmin.pass=<password>
```

**Setup Script Parameters**

You can modify the behaviour of the setup script via JMeter parameters. These are supplied on the command line in the form `-J<parameter name>=<parameter value>`.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>

</tr>
</tbody>
</table>
reader.max 250 The number of users to be created for viewing existing pages.

searcher.max 250 The number of users to be created for performing searches.

resource.max 250 The number of users to be created for downloading site resources.

attachments.max 250 The number of users to be created for downloading attachments.

Setup Script Output

On the console you will see no obvious indication of success or otherwise. JMeter will output something similar to this:

```
Created the tree successfully
Starting the test @ Mon Apr 14 17:35:08 EST 2008 (1208158508222)
Tidying up ... @ Mon Apr 14 17:35:08 EST 2008 (1208158508928)
... end of run
```

The scripts location/results directory will contain the file jmeter-result-setuptest.jtl. There were failures or errors if there are any assertions in this file that have the value true for the failure or error element, e.g.

```
<assertionResult>
  <name>Manage Users</name>
  <failure>true</failure>
  <error>false</error>
  <failureMessage>Test failed: URL expected to contain /browseusers.action/</failureMessage>
</assertionResult>
```

Running the Test

The test script itself will put Confluence under a fixed load. Each thread group will attempt to do a certain amount of work for a prescribed period of time (30 minutes by default). This is by design so that load during test runs can accurately be compared against each other.

Execute the test as follows:

```
<jmeter location>/bin/jmeter -n -t jmeter-test-fixedload.jmx
```

Where:
<scripts location> is the absolute path to where you extracted the scripts e.g. /Users/YourName/Down load/performanceTest. This is needed for the script to find its external resources.

Test Behaviour
The test has a number of parameters to tweak its behaviour but generally speaking it has the rough format of:

- 5 groups of users - readers, commentors, searchers, editors and creators.
  - readers simply view a set of individual pages or browse space functionality.
  - commentors add comments to a set of pages.
  - searchers perform searches on a fixed set of keywords.
  - editors make small additions to the end of a set of pages.
  - creators add new pages to a particular space.
- Each individual user in each group will repeat for a fixed amount of time with a small pause between each request.

Note that there is no execution of JavaScript by the client. Keep this in mind if you use this test to gauge Confluence performance in a production environment.

There is also very little use of permissions in these tests. All data involved is accessible to all of the test users.

**Test Script Parameters**

You can modify the behaviour of the test script via JMeter parameters. These are supplied on the command line in the form `-J<parameter name>=<parameter value>`.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>script.base</td>
<td>.</td>
<td>The absolute path to the script. Defaults to the current working directory.</td>
</tr>
<tr>
<td>confluence.context</td>
<td>confluence</td>
<td>The confluence webapp context.</td>
</tr>
<tr>
<td>confluence.host</td>
<td>localhost</td>
<td>The address or host name of the test instance.</td>
</tr>
<tr>
<td>confluence.port</td>
<td>8080</td>
<td>The port of the test instance.</td>
</tr>
<tr>
<td>create.page.prefix</td>
<td>Nihilist</td>
<td>The title prefix for any created page e.g. Nihilist00001.</td>
</tr>
<tr>
<td>script.runtime</td>
<td>1800</td>
<td>The amount of time the script will run for in seconds.</td>
</tr>
</tbody>
</table>

**Test Thread Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>threads.reader</td>
<td>15</td>
<td>Number of readers.</td>
</tr>
<tr>
<td>pause.reader</td>
<td>2000</td>
<td>The approximate (within 500ms) millisecond pause between reader repeats.</td>
</tr>
<tr>
<td>threads.searcher</td>
<td>8</td>
<td>Number of searchers.</td>
</tr>
<tr>
<td>Action</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>pause.searcher</td>
<td>2000</td>
<td>The approximate (within 500ms) millisecond pause between searcher repeats.</td>
</tr>
<tr>
<td>threads.creator</td>
<td>3</td>
<td>Number of page creators.</td>
</tr>
<tr>
<td>pause.creator</td>
<td>2000</td>
<td>The approximate (within 500ms) millisecond pause between creator repeats.</td>
</tr>
<tr>
<td>threads.editor</td>
<td>3</td>
<td>Number of page editors.</td>
</tr>
<tr>
<td>pause.editor</td>
<td>2000</td>
<td>The approximate (within 500ms) millisecond pause between editor repeats.</td>
</tr>
<tr>
<td>threads.commentor</td>
<td>4</td>
<td>Number of page commentors.</td>
</tr>
<tr>
<td>pause.commentor</td>
<td>2000</td>
<td>The approximate (within 500ms) millisecond pause between commentor repeats.</td>
</tr>
</tbody>
</table>

In version 3.0 of the tests, it's now possible to control the percentage executions of certain actions. These percentages are defined in the "Thread Details" configuration screen.

So with the default parameters, you are emulating a load on Confluence of 33 concurrent users who will each be hitting the server approximately every 2 seconds (16 users per second).

23 of these users are read only (searchers or readers) and 10 of them are read/write — 11 read only users per second and 5 read/write users per second.

**Test Script Output**

During the run of the test script Jmeter will output progress to the console of the form:
Garbage Collector Performance Issues

This document relates broadly to memory management with Oracle's Hotspot JVM. These are recommendations based on Support's successful experiences with customers and their large Confluence instances.

Please do not use the Concurrent Mark Sweep (CMS) Collector with Confluence, unless otherwise advised by Atlassian Support. It requires extensive manual tuning and testing, and is likely to result in degraded performance.

The information on this page does not apply to Confluence OnDemand.

Summary

1. Set the Young space up to 30-40% of the overall heap: `-XX:NewSize=<between 30% and 40% of your Xmx value, eg, 384m>`
2. Use a parallel collector: `-XX:+UseParallelOldGC (make sure this is Old GC)`
3. Limit the Tomcat connector's spare thread counts to minimize impact
4. Effectively disable explicit garbage collection triggered from distributed remote clients: `-Dsun.rmi.dgc.client.gcInterval=900000 -Dsun.rmi.dgc.server.gcInterval=900000`
5. Disable remote clients from triggering a full GC event: `-XX:+DisableExplicitGC`
6. Set the minimum and maximum Xmx and Xms values as the same (eg. `-Xms1024m -Xmx1024m`) to discourage address map swapping
7. Turn on GC logging (add the flags `-verbose:gc -Xloggc:<confluence-home>/logs/gc.log -XX:+PrintGCTimeStamps -XX:+PrintGCDetails`) and submit the logs in a support ticket
   a. (Optional) You can enable date stamps: `-XX:+PrintGCDateStamps` This makes the logs easier
to read via the naked eye, but may run into problems if you’re trying to use third-party applications to view the GC logs.

8. Use Java 1.6
9. Read below if heap > 2G

See Configuring System Properties for how to add these properties to your environment.

Background

Performance problems in Confluence, and in rarer circumstances for JIRA, generally manifest themselves in either:

- frequent or infrequent periods of viciously sluggish responsiveness, which requires a manual restart, or, the application eventually and almost inexplicably recovers
- some event or action triggering a non-recoverable memory debt, which in turn envelops into an application-fatal death spiral (Eg. overhead GC collection limit reached, or Out-Of-Memory).
- generally consistent poor overall performance across all Confluence actions

There are a wealth of simple tips and tricks that can be applied to Confluence, that can have a significantly tangible benefit to the long-term stability, performance and responsiveness of the application.

On this page:

- Summary
- Background
- Why Bad Things Happen
- Appreciate how Confluence and the JAVA JVM use memory
- Memory is contiguous
- Figure out which (default) collector implementation your vendor is using
- Use the Parallel Garbage Collector
- Restrict ability of Tomcat to ‘cache’ incoming requests
- Disable remote (distributed) garbage collection by Java clients
- Virtual Machines are Evil
- Use Java 1.6
- Use -server flag
- If using 64bit JRE for larger heaps, use CompressedOops
- Use NUMA if on SPARC, Opteron or recent Intel (Nehalem or Tukwila onwards)
- Use 32bit JRE if Heap < 2GB
- JVM core dumps can be instigated by memory pressures
- Artificial Windows memory limit
- Instigate useful monitoring techniques
- Tuning the frequency of full collections
- Performance tuning works

Why Bad Things Happen

Confluence can be thought of like a gel or a glue, a tool for bringing things together. Multiple applications, data-types, social networks and business requirements can be efficiently amalgamated, leading to more effective collaboration. The real beauty of Confluence, however, is its agility to mould itself into your organizations’ DNA - your existing business and cultural processes, rather than the other way around - your organization having to adapt to how the software product works.

The flip side of this flexibility is having many competing demands placed on Confluence by its users. Historically, this is an extraordinarily broad and deep set of functions, that really, practically can't be predicted for individual use cases.

The best mechanism to protect the installation is to place Confluence on a foundation where it is fundamentally more resilient and able to react and cope with competing user requirements.
Appreciate how Confluence and the JAVA JVM use memory

The Java memory model is naive. Compared to a unix process, which has four intensive decades of development built into time-slicing, inter-process communication and intelligent deadlock avoidance, the Java thread model really only has 10 years at best under its belt. As it is also an interpreted language, particular idiosyncrasies of the chosen platform Confluence is running can also influence how the JRE reacts. As a result it is sometimes necessary to tune the jvm parameters to give it a "hint" about how it should behave.

There are circumstances whereby the Java JVM will take a mediocre option in respect to resource contention and allocation and struggle along with oftentimes highly impractical goals. For example, The JRE will be quite happy to perform at 5 or 10% of optimum capacity if it means overall application stability and integrity can be ensured. This often translates into periods of extreme sluggishness, which effectively means that the application isn't stable, and isn't integral (as it cannot be accessed).

This is mainly because Java shouldn't make assumptions on what kind of runtime behavior an application needs, but it's plain to see that the charter is to assume 'business-as-usual' for a wide range of scenarios and really only react in the case of dire circumstances.

Memory is contiguous

The Java memory model requires that memory be allocated in a contiguous block. This is because the heap has a number of side data structures which are indexed by a scaled offset (ie n*512 bytes) from the start of the heap. For example, updates to references on objects within the heap are tracked in these "side" data structures.

Consider the differences between:

1. Xms (the allocated portion of memory)
2. Xmx (the reserved portion of memory)

Allocated memory is fully backed, memory mapped physical allocation to the application. That application now owns that segment of memory.

Reserved memory (the difference between Xms and Xmx) is memory which is reserved for use, but not physically mapped (or backed) by memory. This means that, for example, in the 4G address space of a 32bit system, the reserved memory segment can be used by other applications, but, because Java requires contiguous memory, if the reserved memory requested is occupied the OS must swap that memory out of the reserved space either to another non-used segment, or, more painfully, it must swap to disk.

Permanent Generation memory is also contiguous. The net effect is even if the system has vast quantities of cumulative free memory, Confluence demands contiguous blocks, and consequently undesirable swapping may occur if segments of requested size do not exist. See Causes of OutOfMemoryErrors for more details.

Please be sure to position Confluence within a server environment that can successfully complete competing requirements (operating system, contiguous memory, other applications, swap, and Confluence itself).

Figure out which (default) collector implementation your vendor is using

Default JVM Vendor implementations are subtly different, but in production can differ enormously.

The Oracle JVM by default splits the heap into three spaces

1. Young (New, divided into Eden and Survivor)
2. Tenured (Old)
3. Permanent Generation (classes & library dependencies)

Objects are central to the operation of Confluence. When a request is received, the Java runtime will create new objects to fulfill the request in the Eden Space. If, after some time, those objects are still required, they may be moved to the Tenured (Old) space. But, typically, the overwhelming majority of objects created die young, within
the Eden space. These are objects like method local references within a while or for loop, or Iterators for scanning through Collections or Sets.

But in IBM J9 the default policy is for a single, contiguous space - one large heap. The net effect is that for large Websphere environments, garbage collection can be terribly inefficient - and capable of suffering outages during peak periods.

For larger instances with performance issues, it is recommended to tune Confluence such that there is a large Young space, at up to 50% the overall size of the heap.

-XX:NewSize=XXXm where XXX is the size in megabytes, is the command line parameter. -XmnXXXm can also be used interchangeably. Ie. -XX:NewSize=700m, -Xmn700m

By setting a larger NewSize, the net effect is that the JRE will spend less time garbage collecting, clearing dead memory references, compacting and copying memory between spaces, and more time doing actual work.

Use the Parallel Garbage Collector

Confluence out of the box, and Oracle Java as default, uses the serial garbage collector on the Full Tenured heap. The Young space is collected in parallel, but the Tenured is not. This means that at a time of load if a full collection event occurs, since the event is a 'stop-the-world' serial event then all application threads other than the garbage collector thread are taken off the CPU. This can have severe consequences if requests continue to accrue during these 'outage' periods. As a rough guide, for every gigabyte of memory allocated allow a full second (exclusive) to collect.

If we parallelize the collector on a multi-core/multi-cpu architecture instance, we not only reduce the total time of collection (down from whole seconds to fractions of a second) but we also improve the resiliency of the JRE in being able to recover from high-demand occasions.

Additionally, Oracle provide a CMS, Concurrent Mark-Sweep Collector (-XX:+UseConcMarkSweepGC), which is optimized for higher-throughput, server-grade instances. As a general rule, the Parallel Collector (-XX:+UseParallelOldGC) is the right choice for JIRA or Confluence installations, unless otherwise advised by support.

Restrict ability of Tomcat to 'cache' incoming requests

Quite often the fatal blow is swung by the 'backlog' of accumulated web requests whilst some critical resource (say the index) is held hostage by a temporary, expensive job. Even if the instance is busy garbage collecting due to load, Tomcat will still trigger new http requests and cache internally, as well as the operating system beneath which is also buffering incoming requests in the socket for Tomcat to pick up the next time it gets the CPU.

Here the Tomcat Connector is configured for 150 "maxThreads" with an "acceptCount" of 100. This means up to 150 threads will awaken to accept (but importantly not to complete) web requests during performance outages, and 100 will be cached in a queue for further processing when threads are available. That's 250 threads, many of which can be quite expensive in and of themselves. Java will attempt to juggle all these threads concurrently and become extremely inefficient at doing so, exacerbating the garbage collection performance issue.

Resolution: reduce the number of maxThreads and acceptCount to something slightly higher than normal.
‘busy-hour’ demands.

Disable remote (distributed) garbage collection by Java clients

Many clients integrate third-party or their own custom applications to interrogate, or add content to Confluence via its RPC interface. The Distributed Remote Garbage Collector in the client uses RMI to trigger a remote GC event in the Confluence server. Unfortunately, as of this writing, a `System.gc()` call via this mechanism triggers a full, serial collection of the entire Confluence heap (as it needs to remove references to remote client objects in its own deterministic object graph). This is a deficiency in the configuration and/or implementation of the JVM. It has the potential to cause severe impact if the remote client is poorly written, or operating within a constricted JVM.

This can be disabled by using the flag `-XX:+DisableExplicitGC` at startup.

Virtual Machines are Evil

Vmware Virtual Machines, whilst being extremely convenient and fantastic, also cause particular problems for Java applications because it's very easy for host operating system resource constraints such as temporarily insolvent memory availability, or I/O swapping, to cascade into the Java VM and manifest as extremely unusual, frustrating and seemingly illogical problems. We already document some disk I/O metrics with VMware images. Although we now officially support the use of virtual instances we absolutely do not recommend them unless maintained correctly.

This is not to say that vmware instances cannot be used, but, they must be used with due care, proper maintenance and configuration. Besides, if you are reading this document because of poor performance, the first action should be to remove any virtualization. Emulation will never beat the real thing and always introduces more black box variability into the system.

Use Java 1.6

Java 1.6 is generally regarded via public discussion to have an approximate 20% performance improvement over 1.5. Our own internal testing revealed this statistic to be credible. 1.6 is compatible for all supported versions of Confluence, and we strongly recommend that installations not using 1.6 should migrate.

Use -server flag

The hotspot server JVM has specific code-path optimizations which yield an approximate 10% gain over the client version. Most installations should already have this selected by default, but it is still wise to force it with `-server`, especially on some Windows machines.

If using 64bit JRE for larger heaps, use CompressedOops

For every JDK release, Oracle also build a "Performance" branch in which specifically optimized performance features can be enabled; it is available on the Java SE page after a brief survey. These builds are certified production grade.

Some blogs have suggested a 25% performance gain and a reduction in heap size when using this parameter. The use and function of the `-XX:+UseCompressedOops` parameter is more deeply discussed on Oracle's Official Wiki (which itself uses Confluence!)

Use NUMA if on SPARC, Opteron or recent Intel (Nehalem or Tukwila onwards)

`-XX:+UseNUMA` flag enables the Java heap to take advantage of Non-Uniform-Memory-Architectures. JAVA will place data structures relevant to the thread which it owns / operates on, in memory locations closest to that particular processor. Depending on the environment, gains can be substantial. Intel market NUMA as Quick Path Interconnect™.
Use 32bit JRE if Heap < 2GB

Using a 64bit JRE when the heap is under 2GB will cause substantial degradation in heap size and performance. This is because nearly every object, reference, primitive, class and variable will use twice as much memory to be addressed.

A 64bit JRE/JDK is only recommended if heaps greater than 2GB are required. If so, use CompressedOops.

JVM core dumps can be instigated by memory pressures

If your instance of Confluence is throwing Java core dumps, it's known that memory pressure and space/generation sizings can influence the frequency and occurrence of this phenomena.

If your Tomcat process completely disappears and the logs record similar to:

```
# An unexpected error has been detected by HotSpot Virtual Machine:
# SIGSEGV (0xb) at pc=0xfe9bb960, pid=20929, tid=17
# Java VM: Java HotSpot(TM) Server VM (1.5.0_01-b08 mixed mode)
# Problematic frame:
# V [libjvm.so+0x1bb960]
#
--------------  T H R E A D  ---------------
Current thread (0x01a770e0):  JavaThread "JiraQuartzScheduler_Worker-1"[_thread_in_vm, id=17]
siginfo:si_signo=11, si_errno=0, si_code=1, si_addr=0x00000000
Registers:
  O0=0xf5999882 O1=0xf5999882 O2=0x00000000 O3=0x00000000
  O4=0x00000000 O5=0x00000001 O6=0xc24ff0b0 O7=0x00008000
  GI=0xe9bb80c G2=0xf5999a48 G3=0x0a67677d G4=0xf5999882
  G5=0xc24ff380 G6=0x00000000 G7=0xfd6c3800 Y=0x00000000
PC=0xe9bb960 nPC=0xe9bb964
```

then you should upgrade the JVM. See Sigsegv Segmentation Fault JVM Crash.

Artificial Windows memory limit

On Windows, the maximum heap allocatable to the Tomcat 32bit wrapper process is around 1400MB. If the instance is allocated too close to this limit, chronic garbage collection is likely to result, often producing JAVA core dumps similar to:
A fatal error has been detected by the Java Runtime Environment:

java.lang.OutOfMemoryError: requested 8388608 bytes for GrET in
C:\BUILD_AREA\jdk6_18\hotspot\src\share\vm\utilities\growableArray.cpp.
Out of swap space?

Internal Error (allocation.inline.hpp:39), pid=11572, tid=12284
Error: GrET in
C:\BUILD_AREA\jdk6_18\hotspot\src\share\vm\utilities\growableArray.cpp

JRE version: 6.0_18-b07
Java VM: Java HotSpot(TM) Server VM (16.0-b13 mixed mode windows-x86 )
If you would like to submit a bug report, please visit:
http://bugreport.sun.com/bugreport/crash.jsp

---------------  THREAD  ---------------
Current thread (0x002af800):  GCTaskThread [stack: 0x00000000,0x00000000] [id=12284]

Workarounds include:

- changing the server OS to something other than Windows. For example, Linux
- switching to the 64 bit Tomcat wrapper (this is not supported)
- reducing memory allocation to the Tomcat process. Try backing off 100MB at a time and observe the results.
Instigate useful monitoring techniques

At all times the best performance tuning recommendations are based on current, detailed metrics. This data is easily available and configurable and helps us **tremendously** at Atlassian when diagnosing reported performance regressions.

1. enable JMX monitoring
2. enable Confluence Access logging
3. enable Garbage Collection Logging
4. Take **Thread dumps** at the time of regression. If you can't get into Confluence, you can take one **externally**.
5. **Jmap** can take a memory dump in real time without impacting the application. **Syntax:**
   ```
   jmap -heap:format=b <process_id>
   ```

Great tools available include:

- The excellent **VisualVM**, [documentation](https://www.visualvm.org/).
- **Thread Dump Analyzer** - a great all-round thread debugging tool, particularly for identifying deadlocks.
- **Samurai**, an excellent alternative thread analysis tool, good for iterative dumps over a period of time.
- **GC Viewer** - getting a bit long in the tooth, but is a good mainstay for GC analysis.
- **GChisto** - A GC analysis tool written by members of the Sun Garbage Collection team.

Documentation:

- An [Excellent](http://www.ibm.com/developerworks/library/wa-20030212/) IBM document covering native memory, thread stacks, and how these influence memory constricted systems. Highly recommended for additional reading.
- The complete list of JRE 6 options

⚠️ **Atlassian recommends at the very least to get VisualVM up and running (you will need JMX), and to add Access and Garbage Collection logging.**

Tuning the frequency of full collections

The JVM will generally only collect on the full heap when it has no other alternative, because of the relative size of the Tenured space (it is typically larger than the Young space), and the natural probability of objects within tenured not being eligible for collection, i.e. they are still alive.

Some installations can trundle along, only ever collecting in Young space. As time goes on, some object will survive the initial Young object collection and be promoted to Tenured. At some point, it will be dereferenced and no longer reachable by the deterministic, directed object graph. However, the occupied memory will still be held in limbo as "dead" memory until a collection occurs in the Tenured space to clear and compact the space.

It is not uncommon for moderately sized Confluence installations to reclaim as much as 50% of the current heap size on a full collection; This is because full collections occur so infrequently. By reducing the occupancy fraction heap trigger, this means that more memory will be available at any time, meaning that fewer swapping/object collections will occur during the busy hour.

Atlassian would classify frequency tuning on collections as an **advanced** topic for further experimentation, and is provided for informational purposes only. Unfortunately, it's impractical for Atlassian to support these kinds of changes in general.

**Performance tuning works**
Atlassian has a number of high profile and some extremely high demanding, mission-critical clients who have successfully, usually through trial and error, applied these recommendations to production instances and have significantly improved their instances. For more information, please file a support case at support.atlassian.com.

### Operating Large or Mission-Critical Confluence Installations

This page gives guidelines for operational management teams who are responsible for a large Confluence installation, or for a Confluence installation which is crucial to the business of their organisation.

### Introduction to this Page

#### Motivation for Presenting these Guidelines

Most Confluence installations start off small. Ten people in an early-adoption department use it for a couple of weeks. Everything works well and the good news starts spreading. Adoption increases throughout the organisation. More and more people use the wiki, and more and more rely on Confluence being up and running. After a while even the CEO starts blogging. And then a system outage occurs.

Now what?

Wikis like Confluence often grow into mission-critical applications within just a few months. Often adoption is so fast that IT departments haven't had the time to scale up their support.

We have assembled some requirements to help you make sure that your installation of Confluence can be mission critical. There are no surprises to be found here — all of the requirements would apply to any other piece of software that is mission critical within your organisation.

#### Who should Read these Guidelines?

The guidelines do not apply to you if you are using Confluence with just a few dozen users, and no one really minds if Confluence is down for a couple of hours because your database has crashed.

But if any one of the following applies to you, then these guidelines are a must read for you!

- The wiki has become your organisation's documentation base.
- Your users can't work properly when Confluence is down.
- Your boss or customer threatens to terminate your contract if you don't meet a strict service level agreement (SLA), such as 99.9% availability.

### Requirements of Large or Mission-Critical Confluence Installations

**Confluence 4.3 Documentation**

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Dedicated Hardware for Confluence

In a small work group with a few dozen or even hundreds of users, your Confluence installation can happily share the CPUs, memory and disks with other low-profile applications and a database.

But with thousands or even tens of thousands of users, you need dedicated hardware that runs Confluence and nothing else, and it needs to be fast hardware with plenty of RAM. While you can run Confluence in a virtualised environment such as VMware, we suggest you don't do it for mission-critical or high-load installations unless you are a real expert in virtualisation. Otherwise your other VMs might have performance problems which propagate to Confluence.

If you experience database-related problems, you should consider moving the Confluence database to a dedicated machine. Confluence itself can run queries that impact the performance of other applications, and other application problems or scheduled tasks can have an adverse affect on the usability of Confluence.

Dedicated Qualified Staff

If your Confluence installation is mission critical and your service level agreements require 24/7 up time, you need to be able to pinpoint problems quickly. You need qualified staff, dedicated to looking after Confluence, who are available during business hours and possibly beyond.

If you require assistance from the Atlassian Support team, you may need to answer some pretty technical questions to help us diagnose what is going on in your systems. Also keep in mind that Atlassian support assists you in finding problems in Confluence, but we can't help you administer your systems.

In particular, we recommend that you have dedicated staff in the roles listed below.

**Operations Team with General Administrators**

If your organisation relies on Confluence being up and running around the clock with very little downtime, you need people who can set up, maintain, tune and improve your Confluence installation. This requires at least one person, but ideally you will have a team of operational engineers.

If your wiki is mission critical, chances are that other IT systems within your organisation have already made it necessary to have such an operations team. So you will probably not need to hire someone specifically to administrate Confluence. But it is vital that supporting and maintaining Confluence is added to the list of responsibilities of that operations teams, and that you can get them to troubleshoot and analyse Confluence at short notice.

If problems arise and you need to contact Atlassian Support, these engineers will be our first point of contact. We may ask them to provide details of log files, application-server settings, monitoring systems, and so on.

**Network Staff**

If Confluence is mission critical for large numbers of users, it is vital that you have dedicated network staff available to track down problems when they arise.

A mission-critical installation will usually be used by hundreds or even thousands of users, and you don't want to keep them waiting because a network card breaks, or because someone has made an undocumented change to the network and you don't have an expert around who can figure it out.

Again, this only applies to mission-critical systems. If you use Confluence for less critical collaboration and knowledge sharing, and a broken network cable causing a day's downtime is no major catastrophe, then you will not need dedicated networking staff.

**Database Staff**

If Confluence is mission critical for a large number of users, you need an experienced database administrator
(DBA) available to troubleshoot database performance issues and other potential problems. It is dangerous not to have an experienced full-time DBA at hand at short notice when running a mission critical application. While small installations of Confluence basically work ‘out of the box’, any system that involves high load or high-availability requirements needs continual monitoring, optimising and fine tuning of the Confluence database. Database monitoring is no trivial task — it's not something that anyone can learn quickly.

**Developers**

You may have decided to customise Confluence by changing its source-code, or by writing your own plugins. If your server is mission-critical, you must nominate staff who will be responsible for that code, and they must be up for the task. Otherwise you might end up in a situation in which your server experiences downtimes because of custom code is broken, or does not work with a newer version of Confluence anymore, but you can't fix the problem because no one knows how the customized code works, and you can't uninstall it either because it has become critical for your Confluence usage pattern. Keep good track of changes, and have someone available to jump into action if there is a problem. Don't let the summer intern write mission-critical plugins, unless you have more senior staff to maintain that code as long as it is in use.

**Constant Monitoring of Production Systems**

You will need to monitor your production systems constantly.

When the wiki is the lifeblood of your organisation, you need know exactly what is going on inside, so that you can plan for future needs and analyse potential bottlenecks.

Monitoring involves a number of essential tasks, including those listed below:

- Monitoring log files.
- Checking for HTTP-availability and performance (e.g. by getting the same page every five minutes and displaying the time on a graph).
- Looking at many different parameters such as load, connections, IO, database-trends, and so on.
- Charting long-term trends.
- Keeping an access log of requests to the web server. This is vital, especially when requesting performance support from Atlassian.

Monitoring a web application like Confluence implies also monitoring the subsystems it uses. Many outages and downtimes are caused by broken mail servers, databases running out of space, file systems filling up and so on. It is often possible to detect these trends way before the actual web application breaks down. Keep an eye on the file system, and if you see it is getting closer to 90% utilisation, you can mend the situation without Confluence breaking down. Or even if the worst case happens (e.g. the database breaks down and Confluence is affected straight away) then having the proper monitoring for the database server makes troubleshooting a lot easier.

**Tools for Monitoring Confluence**

At Atlassian we use [Hyperic](https://www.atlassian.com/software/hyperic). But the list of monitoring systems is long and we can't recommend a specific product over the other. If your organisation has a monitoring system already, make sure you hook up Confluence to it. If you don't have a monitoring system yet, you need to install one as soon as you feel Confluence is mission critical.

As an example of what our monitoring UI looks like, have a look at this screenshot:
The following screenshot shows one of our sensors looking at the HTTP response times of our documentation wiki over the last 8 days. You can clearly see an incident four days ago. Having the graph (and regularly looking at it) allowed us to pinpoint the problem. We analysed the access logs and found that webpage-profiling had been enabled but not disabled again, which caused performance problems.
This page would get too long if we described all our monitoring sensors - but just to give you an impression, this is what we monitor on the JVM level alone.

**JVM basics**

- Current Loaded Classes
- Daemon Thread Count
- Heap Memory Committed
- Heap Memory Max
- Heap Memory Used
- Loaded Classes
- Loaded Classes per Minute
- Object Pending Finalization Count
- Peak Thread Count
- Thread Count
- Unloaded Classes
- Unloaded Classes per Minute

**JVM garbage collection**

- Collection Count
- Collection Count per Minute
- Collection Time
- Collection Time per Minute

**JVM memory: (Metrics for Eden space, Old Gen, Survivor space, Perm Gen)**

- Committed Memory
- Used Memory

We get the same level of detail for our database, for the file system, for the CPU, for the network, and so on. Not all of this is needed all the time. But if your company depends on an application, then the more information you have at your fingertips the better. Fortunately these metrics can be extracted quite easily once you have a monitoring system in place.

**Adherence to Strict Upgrade Procedures**

Your organisation will have its own upgrading procedure. Here are a few recommendations that you should add to your list:

- **Our main recommendation:** Never change more than one component at a time. Sometimes it may be tempting to upgrade the server hardware when you upgrade Confluence, but we recommend you don't do that. It makes pinpointing errors much more difficult. So, for example, don't upgrade hard disks in conjunction with a Confluence version upgrade, don't change the Confluence configuration at the same time as you upgrade your Apache software, and don't upgrade a major third-party plugin the day you move your database system to a new machine. The list is endless, these were just a few examples to get you thinking.
- After each upgrade step, run Confluence for a couple of days to check that everything is still fine.
- Keep track diligently of what you change, and when. It will be nearly impossible for us to help you if you can't tell us what exactly you changed at what time.
- Keep a copy of all log files produced during the upgrade, together with notes about what changed between successive restarts.
Always take careful note of the upgrade notes published with the Confluence Release Notes of each Confluence version, as well as the Confluence Upgrade Guide.

**Example**

Here you can see an extract of our change log for [http://confluence.atlassian.com](http://confluence.atlassian.com) — the server that hosts this very page.

**Testing of Upgrades before Production Implementation**
You should test upgrades in a staging environment.

Before rolling out a new version of Confluence (or of the software or hardware that it uses, e.g. database systems, application servers, data storage), make sure that you test the upgrade with real data (e.g. a database dump) on a completely independent machine.

Here's an example of what such a test would pick up: The new release of Confluence may not be compatible with a custom third party plugin you have previously installed, thus breaking the plugin's functionality. You may not even know that anyone installed that plugin — but maybe many people are already using it. You'll want to find out about this before you actually roll out the new version of Confluence.

Here is an outline for a simple upgrade test:

1. Create a clone of your production environment, using a database dump to obtain a copy of the Confluence data. We'll call this your 'staging environment'.
2. Upgrade the staging environment to the new version of Confluence.
3. Ask a few selected users from different departments to check the pages they commonly access, but have them do it in the staging environment.

Hint: In addition to finding weirdnesses with plugins, this may also show whether training for new functionality is needed in some of the departments. The IT department staff may be able to handle the upgrade to a new version of Confluence without training, but perhaps the sales representatives who use the wiki less often will need some training.

Getting a license for your staging environment
The page Getting a License for a Staging Environment does not exist.

Enforcing Security Guidelines

Security is one of the most important issues for Confluence. We are constantly spending large amounts of effort to keep up with security threats and to Confluence's security model. We treat security breaches with utmost priority, and the recent releases have been improved to fend off advanced attack vectors like cross-site scripting (XSS), cross-site request forgery (XSRF) and header injection flaws. Altogether we believe that Confluence is a very secure product. But of course as with any software there are occasional bugs, and we are fixing security issues whenever they come up. We regularly release minor software releases that contain security fixes. This means you should upgrade your system frequently. Obviously this can affect your system's uptime. You should also make sure your whole infrastructure around Confluence is made robust as well (consider operating systems, webservers, application servers, networks, social engineering aspects, etc).

As with any other distributed system, you need to decide on a case by case basis if classified documents can be stored in it. It is common practice to store the most secure documents on computers that are not even connected to the physical intranet. Please contact your company's security officer to learn more about your enterprise's security procedures.

Make sure to have qualified staff around, so you can deal with security issues quickly. Once a security patch becomes available or a security incident happens, speed is essential.

Please refer to our dedicated Configuring Confluence Security page for more technical details.

Load-Testing Environments

Many customers ask us,

So, how many users and spaces can I put into Confluence, and what is the best hardware do to so?

The answer is, 'It depends'.

It depends a lot on your use case. Confluence is so successful because it can cover a huge range of use cases.
If most of your users only access Confluence infrequently, it is no problem to have 70,000 to 100,000 users. But if each user is a power-user who uses the system the whole day, there's a substantial decrease in number Confluence can take without tuning. If your pages are short, simple, and don't contain a lot of macros, then the situation will be vastly different from a system that relies heavily on macros, background-tasks, or other features.

If your system is large (for example serving more than 10,000 users or storing more than 1000 spaces) or mission-critical (which it could be with as few as 1000 users who use it all the time) you need one or more more load-testing environments.

Even if your system is working nicely for 20,000 users right now, it might take just another 2000 users to push it over the edge.

We recommend the following basic procedure:

- Set up an environment that closely resembles your production environment.
- Gather statistics from your production system.
- Regularly apply a similar kind of load (and slightly higher) to the load-testing environment.
- Analyse how well Confluence scales for your usage patterns.

The Confluence development team has load-testing scripts available which you can use to simulate load. You can also contact Atlassian Support for more details.

**Tuning**

You may need to be able to tune your installation in the ways mentioned below.

**Optimising your System**

If you have large numbers of users, then downloading all the static content (CSS, default images, JavaScript-files) may result in a high additional load on the application server that can be offloaded to a caching web server.

Please refer to the following additional information:

- Our general Performance Tuning page.
- Information on configuring a large Confluence installation.

**Limiting Third-Party Plugins**

You may have to restrict the number of third-party plugins installed on your Confluence instance.

Most third-party plugins are not specifically written for high-load environments. What works fine in low-load environments could have unexpected and adverse effects when thousands of users are competing for your application server's CPU time or for database IO.

A common source of problems is access to database connections. If you have fewer users than database connections, it does not matter if an operation holds on to a database connection for two seconds while it downloads some data from the internet. With hundreds of concurrent users, this could quickly become a bottleneck.

Confluence itself is tested and optimised to handle high loads and avoids these kinds of problems. But if you install a number of plugins that have not been tested against high load, your system may become unstable.

We recommend that you load test the common use cases of each unofficial third-party plugin if your Confluence installation is mission critical. Only activate plugins that are vital to your business, and never allow experimental plugins onto your production system until they have been tested in a staging environment.

**Selecting and Tuning your JVM**

You should select your JVM carefully and you may need to be able to tune it.
The selection of the JVM for your large Confluence instance can have a huge impact on the performance perceived by the users. Between versions 1.4 and 6 of the Sun Java JVM there have been some impressive improvements in performance, especially under high concurrent load.

Here are some essential guidelines:

- Always run the most recent point release of your selected JVM.
- Where ever possible run the most recent major release from your selected JVM manufacturer. The Sun JVM version 6 is much faster than 1.4, especially under high loads.
- Tune your garbage collection algorithms. Experiment with different algorithms and settings to get the response times you desire in your environment. Here are some specific guidelines for Sun JVM in the Sun documentation:
  - Java 6
  - Java 5
  - Java 1.4

Customising Confluence to Optimise Performance

You may need to customise Confluence for performance reasons. Depending on your usage scenario, there may be ways to enhance Confluence performance that become necessary when you reach a certain level of usage.

Here are some things you might decide to do:

- Remove the display of the space list on the Dashboard. See Customising the Dashboard.
- Configure any search appliances or other crawlers which are configured to index the Confluence site:
  - These should be suitably rate limited.
  - Configure them to crawl only pages in the /display/ URL path, and only current versions of pages.

Please refer to our general Performance Tuning page for more details.

Scheduled Jobs

The administration console allows you to schedule various administrative jobs in Confluence, so that they are executed at regular time intervals. The types of jobs which can be scheduled cover:

- Confluence site backups
- Storage optimisation jobs to clear Confluence's temporary files and caches
- Index optimisation jobs to ensure Confluence's search indexes are up to date
- Mail queue optimisation jobs to ensure Confluence's mail queue is maintained and notifications have been sent.

You need to have System Administrator permissions in order to configure and execute jobs.
Accessing Confluence’s Scheduled Jobs Configuration

To access Confluence’s Scheduled Jobs configuration page:

1. Choose Browse > Confluence Admin.
2. Click ‘Scheduled Jobs’ under ‘Administration’ in the left panel to open the ‘Scheduled Jobs’ page. For each job listed down this page, the following information is shown:
   - **Job** — the name of a job.
   - **Status** — the job’s status, which is either ‘Scheduled’ (it it is currently enabled) or ‘Disabled’. See below for details on disabling or re-enabling a job.
   - **Last Execution** — the date and time when the job was last executed. This field will be empty if the job was never executed.
   - **Next Execution** — the date and time when the job is next scheduled to be executed. This field will contain dash symbol (‘-’) if the job is disabled.
   - **Avg. Duration** — the length of time (in milliseconds) that it took to complete the job’s last execution.
   - **Actions** — allows you to configure the job, execute it manually, view a history of previous executions or disable the job.

Screenshot above: Scheduled Jobs

Executing a Job Manually

1. Access the ‘Scheduled Jobs’ configuration page (above).
2. Locate the job you wish to execute manually and click its ‘Run’ link in the ‘Actions’ column. The job will be run immediately.

   ✔ Refer to ‘Types of Jobs’ (below) for detailed descriptions about each job.
Not all jobs can be run manually.

### Configuring a Job's Schedule

1. Access the 'Scheduled Jobs' configuration page (above).
2. Locate the job whose schedule you wish to configure and click its 'Edit' link in the 'Actions' column. The job's 'Edit Schedule for job' dialog box opens.
   - Refer to 'Types of Jobs' (below) for detailed descriptions about each job.
3. Enter an appropriate cron expression to define the frequency with which the job is executed.
   - Refer to 'Cron Expressions' (below) for more details about their syntax. To revert the job's schedule back to its default settings, click the 'Default' button.
4. Click 'Save' to record your job's new schedule.

Not all jobs' schedules are configurable.

### Disabling/Re-enabling a Job

By default, all jobs in Confluence are enabled.

1. Access the 'Scheduled Jobs' configuration page (above).
2. Locate the job you wish to disable/re-enable.
   - Refer to 'Types of Jobs' (below) for detailed descriptions about each job.
   - If a job is enabled, click its 'Disable' link in the 'Actions' column to disable the job.
   - If a job is disabled, click its 'Enable' link in the 'Actions' column to enable the job.

Not all jobs in Confluence can be disabled.

### Viewing a Job's Execution History
1. Access the 'Scheduled Jobs' configuration page (above).
2. Locate the job whose execution history you wish to view and click the 'History' link.
   - If a job has not completed at least one execution, its 'History' link will not be available.
   - Refer to 'Types of Jobs' (below) for detailed descriptions about each job.

   The 'History for job' dialog box opens, showing a list of previous executions of the job in reverse chronological order, including the:
   - Start date and time
   - End date and time
   - The length of time (in milliseconds) that it took to complete the job

   Screenshot above: Job Execution History

### Types of Jobs

<table>
<thead>
<tr>

<td>Poll Mail</td>
<td>Polls POP accounts on all spaces that have them configured.</td>
<td>Per cluster Every minute</td>
</tr>
</tbody>
</table>

### Cron Expressions

A cron expression is a string of 6-7 'time interval' fields that defines the frequency with which a job is executed. Each of these fields can be expressed as either a numerical value or a special character and each field is separated by at least one space or tab character.

The table below is shows the order of time interval fields in a cron expression and each field's permitted numerical values.

You can specify a special character instead of a numerical value for any field in the cron expression to provide flexibility in defining a job's frequency. Common special characters include:

- `'*'` — a 'wild card' that indicates 'all permitted values'.
- `'?'` — indicates 'ignore this time interval' in the cron expression. That is, the cron expression will not be bound by the time interval (such as 'Month', 'Day of week' or 'Year') to which this character is specified.

For more information about cron expressions, please refer to the [Cron Trigger tutorial on the Quartz website](#).

**Setup Confluence To Index External Sites**

**Confluence Indexing External Sites**

Confluence cannot easily index external sites due to technical reasons, but there are two alternatives:

1. **Embed External Pages Into Confluence**
2. **Replace Confluence Search**

---

**Technical Reasons**

Confluence indexes pages using a customised Lucene search engine that returns matching pages, mail and blog posts for which the searcher has view permission. It would require significant source code modifications to enable Confluence to process search results from external pages, as the indexing process has been customised to utilise internal Confluence metadata. Note that users can still index content from new attachment filetypes.

**Embed External Pages Into Confluence**

If you only have a small number of external sites to index, you may prefer to enable the HTML-include Macro and use it embed the external content inside normal Confluence pages.

**Replace Confluence Search**

Use your own programmer resources to replace Confluence's internal search with a crawler that indexes both Confluence and external sites. This advanced option is easier than modifying the internal search engine. It requires removing Confluence internal search from all pages and replacing the internal results page with your own crawler front-end.

1. Setup a replacement federated search engine to index the Confluence site, as well as your other sites, and provide the results that way. You would need to host a web crawler, such as these open-source crawlers. Note that you can perform a search in Confluence via the remote API
2. Replace references to the internal search by modifying the site layout so that it links to your search front-end
3. Host another site containing the search front-end. You may wish to insert it into a suitable context path in your application server so that it appears to be from a path under Confluence. Tomcat sets Confluence's paths from the Confluence install\confluence\WEBINF\web.xml file.

---

**RELATED TOPICS**
Setup External Search Tool To Index Confluence

Setup External Search Tool To Index Confluence
Any web crawler can be configured to index Confluence content, for example the Google Search Appliance or similar. If a login is required to view content that will be indexed, you should create a Confluence user specifically for the search crawler to use. Grant this user view rights to all content you wish to index, but deny that user all delete and administration rights. This ensures that an aggressive crawler will not be able to perform actions that could modify the site. There is also a forum thread on Google Mini integration.

External applications can also use the search function in the Confluence Remote API.

The information on this page does not apply to Confluence OnDemand.

Working with Confluence Logs

Confluence uses Apache’s log4j logging service. This allows a developer or administrator to control the logging behavior and the log output file by editing a configuration file, without touching the application binary. There are six known log4j logging levels.

If you request help from Atlassian Support, we will almost always ask for the atlassian-confluence.log from the confluence-home/logs directory. You can access the logs from the Confluence Administration Console, via the support tool. If you cannot access the Confluence Administration Console, check the properties file at <confluence-installation>/confluence/WEB-INF/classes/confluence-init.properties, look for the confluence.home setting in that file, then find the logs in the Confluence home directory.

On this page:
- Finding the Confluence Log Files
- Finding the Log Configuration File
- Changing the Destination of the Log Files
- Changing the Logging Levels
- Using Some Specific Confluence Logging Options
- Scanning Log Files for Known Problems
- Notes

The information on this page does not apply to Confluence OnDemand.

Finding the Confluence Log Files

This section describes Confluence’s default logging behaviour, assuming that you have not changed the destination of the logs. In order to unify logging across different application servers, Confluence uses the atlassian-confluence.log as its primary log, not the application server log.

Both the Confluence and Confluence EAR/WAR distributions follow the same default behaviour:
- When you start Confluence, log entries will be sent to the application server logs until Confluence has completed its initial bootstrap. Any log entries written to the console will be repeated into the log in the Confluence home directory as described below.
• Once the initial startup sequence is complete, all logging will be to <confluence-home>/logs/atlassian-confluence.log. For example: c:/confluence/data/logs/atlassian-confluence.log.

Note that the default location is the Confluence home directory, not the application server’s log file. The home directory is specified in <confluence-installation>/confluence/WEB-INF/classes/confluence-init.properties.

Finding the Log Configuration File

Confluence’s logging behaviour is defined in the following properties file:
<CONFLUENCE-INSTALL>/confluence/WEB-INF/classes/log4j.properties

This file is a standard log4j configuration file, as described in the Apache log4j documentation.

Changing the Destination of the Log Files

Terminology: In log4j, an output destination is called an ‘appender’.

To change the destination of the log files, you need to stop Confluence and then change the settings in the ‘Logging Location and Appender’ section of the log4j.properties file. The location of this file is described above.

In the standard properties file, you will find entries for two appenders:

• com.atlassian.confluence.logging.ConfluenceHomeLogAppender – This is a custom appender which controls the default logging destination described above. This appender allows the following settings:
  • MaxFileSize
  • MaxBackupIndex

• org.apache.log4j.RollingFileAppender – If you want to log to a different location, uncomment the RollingFileAppender line and change the destination file in the line below it. Comment out the previous lines referring to the ConfluenceHomeLogAppender.

Confluence ships with the full suite of appenders offered by log4j. Read more about appenders in the log4j documentation.

Changing the Logging Levels

See Configuring Logging for instructions on how to change the logging configuration of Confluence.

Using Some Specific Confluence Logging Options

This section contains some pointers to specific log configurations you may need.

Log the Details of SQL Requests made to the Database

You may want to increase Confluence’s logging so that it records individual SQL requests sent to the database. This is useful for troubleshooting specific problems.

You can enable detailed SQL logging in two ways:

• At runtime – see instructions above.
• Via the logging properties file – see the detailed instructions.
Log the Details of Users Viewing/Accessing each Confluence Page

You can configure the log to show which users are accessing which pages in Confluence. This can only be done via the logging properties file – see the detailed instructions.

Scanning Log Files for Known Problems

Confluence provides an inbuilt log scanner that will check your Confluence logs for errors and attempt to match them against known issues in our knowledge base and bug tracker. See Troubleshooting Problems and Requesting Technical Support.

Notes

- **Finding the thread dumps.** Thread dumps are logged to the application server log file.

log4j Logging Levels

Logging Levels

- **DEBUG** - designates fine-grained informational events that are most useful to debug an application *(what is going on)*
- **INFO** - announcements about the normal operation of the system - scheduled jobs running, services starting and stopping, user-triggered processes and actions
- **WARN** - any condition that, while not an error in itself, may indicate that the system is running sub-optimally
- **ERROR** - a condition that indicates something has gone wrong with the system
- **FATAL** - a condition that indicates something has gone wrong so badly that the system can not recover
- **TRACE** - n/a within Confluence

There are two ways to modify the logging levels, as described in Working with Confluence Logs.

1. Modifying the runtime log levels via the Administration Console.
2. Manually modifying the `<Confluence-install>\confluence\WEB-INF\classes\log4j.properties` file.

The information on this page does not apply to Confluence OnDemand.

Default Log Level

The standard Confluence log level **WARN** is a way for Confluence to communicate with the server administrator. Logging at WARN level and higher should be reserved for situations that require some kind of attention from the server administrator, and for which corrective action is possible.
Integrating Confluence with Other Applications

You can integrate Confluence with other applications using Application Links. The Application Links feature allows you to link Confluence to applications like Atlassian’s JIRA. Linking two applications allows you to share information and access one application's functions from within the other. For example, if you linked your Confluence server with a JIRA server, you could view JIRA issues in a Confluence page via the JIRA Issues Macro.

Getting Started

The Application Links quick start guide provides instructions on how to set up the most common application link configuration.

Administrator’s Guide

The administrator's guide is for administrators who want to configure application links for their applications. The guide contains information on adding a new application link, configuring the authentication for an application link, setting up project links and more.

Developer Resources

These resources are for developers who want to develop with the Application Links plugin. Take a look at the Development Hub.

Configuring Application Links

An application link is a trust relationship between two applications. Linking two applications allows you to share information and to access one application's functions from within the other.

Notes

- In the above screenshot, the column titled 'Incoming Authentication' is visible in Confluence 3.5.1 and later. The column does not appear in Confluence 3.5.

Related Topics

- Adding an Application Link
Adding an Application Link

This page describes how to add a new application link in Confluence. The process for adding an application link is different depending on whether the application that you are linking Confluence to, supports Application Links (i.e. has Application Links installed) or not.

If you are linking Confluence to an application that does not have Application Links, you will need to do additional configuration in that application. This is because Application Links in Confluence will not be able to automatically configure authentication in your remote application.

Please read the appropriate set of instructions below:

- Linking to an application that supports Application Links.
- Linking to an application that does not support Application Links.

On this page:
- Adding an Application Link to an Application That Supports Application Links
- Adding an Application Link to an Application That Does Not Support Application Links
- Notes

⚠️ The information on this page does not apply to Confluence OnDemand.

Adding an Application Link to an Application That Supports Application Links

Before you begin:

- Make sure that the base URL is set correctly in Confluence. See Configuring the Server Base URL for instructions.
- Make sure that the base URL is set correctly in the application which you intend to link to. See the appropriate instructions: JIRA instructions | FishEye/Crucible instructions | Bamboo instructions. This is required for synchronisation to work correctly.

To link to an application that supports Application Links:

1. Log in as a system administrator and go to the administration page. Click ‘Application Links’ in the administration menu. The ‘Configure Application Links’ page will appear, showing the application links that have been set up.
2. Click ‘Add Application Link’. Step 1 of the link wizard will appear.
3. Enter the server URL of the application that you want to link to (the ‘remote application’).
4. Click the ‘Next’ button. Step 2 of the link wizard will appear.
5. Enter the following information:
   - 'Create a link back to this server' – Tick this check box if you want to create a two-way link between the remote application and your application. If you want to do this, you will need to enter the username and password of an administrator for the remote application.
     Note: These credentials are only used to authenticate you to the remote application, so that Application Links can make the changes required for the new link. The credentials are not saved.
   - 'Reciprocal Link URL' – The URL you give here will override the base URL specified in your remote application’s administration console, for the purposes of the application links connection.
Application Links will use this URL to access the remote application.

6. Click the 'Next' button. Step 3 of the link wizard will appear.

7. Enter the information required to configure authentication for your application link:
   - 'The servers have the same set of users' or 'The servers have different sets of users' – Select one of these options depending on how you manage users between the two applications.
   - 'These servers fully trust each other' – Tick this check box if you know that the code in both applications will behave itself at all times and are sure each application will maintain the security of its private key.

   For more information about configuring authentication, see Configuring Authentication for an Application Link.

8. Click the 'Create' button to create the application link.

---

Adding an Application Link to an Application That Does Not Support Application Links

Before you begin:

- Make sure that the base URL is set correctly in Confluence. See Configuring the Server Base URL for instructions.
- Make sure that the base URL is set correctly in the application which you intend to link to. See the appropriate instructions: JIRA instructions, FishEye/Crucible instructions, Bamboo instructions. This is required for synchronisation to work correctly.

To link to an application that does not support Application Links:

1. Log in as a system administrator and go to the administration page. Click 'Application Links' in the administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
2. Click 'Add Application Link'. Step 1 of the 'Link to another server' dialogue will be displayed.
3. Enter the server URL of the application that you want to link to, in the 'Server URL' field. Click the 'Next' button. Step 2 of the 'Link to another server' dialogue will be displayed.
4. Fill out the fields, as follows:
   - 'Application Name' — Enter the name by which this remote application will be referred to, in your application.
   - 'Application Type' — Select the type of application that you are linking to: Bamboo, FishEye/Crucible, JIRA, Confluence, Subversion.
5. Click the 'Create' button to create the application link. The 'Configure Application Links' page will be displayed, listing all of the application links that have currently been set up for your application including the one you just added.

6. Configure the desired authentication type (Trusted Applications, OAuth, basic HTTP, none) for your new application link. See Configuring Authentication for an Application Link.

7. In your application that does not support Application Links, configure the same type of authentication that you configured for your application link's outgoing authentication (in the previous step). For example, if you configured outgoing Trusted Applications authentication in your Application-Links-enabled application, you also need to log into your non-Application-Links application and manually configure Trusted Applications (see the relevant administrator's documentation for the application).

Configuring Authentication for an Application Link

Configuring authentication for an application link is essentially defining the level of trust between Confluence and the application that it is linked to.

On this page:

- Choosing Authentication for an Application Link
- Security Implications for each Authentication Type
- About Primary Authentication Types
- About Impersonating and Non-Impersonating Authentication Types

⚠️ The information on this page does not apply to Confluence OnDemand.
Choosing Authentication for an Application Link

The level of authentication that you should configure for your application link depends on a number of factors.

- Do the two applications you are linking trust each other? i.e. are you sure that the code in the application will behave itself at all times and that the application will maintain the security of its private key?
- Do the two applications you are linking share the same user base or not?
- Do you have administrative access to the application you are linking to?

Common scenarios include:

- If the two applications you are linking trust each other and share the same user base, configure two-way authentication using Trusted Applications for both incoming and outgoing authentication. For example, you may link your internal Confluence server to an internal JIRA server.
- If the two applications you are linking trust each other but do not share the same user base, configure two-way authentication using OAuth for both incoming and outgoing authentication. For example, you may link your internal Confluence server to an external (customer-facing) JIRA server.
- If you do not have administrative rights to the application that you are linking to (e.g. linking to a public FishEye server), configure a one-way outgoing link authenticated using basic HTTP authentication or do not configure any authentication for the link. For example, you may link your external Confluence server to a partner organisation’s Confluence server. An unauthenticated link will still allow the local application to render hyperlinks to the remote application or query anonymously-accessible APIs.

The flowchart below provides a guide to what authentication you should configure for your application link.

Read the following topics for information on how to configure authentication for an application link:

- Configuring Basic HTTP Authentication for an Application Link
- Configuring OAuth Authentication for an Application Link
- Configuring Trusted Applications Authentication for an Application Link
- Incoming and Outgoing Authentication
Flowchart above: Determining what authentication to configure for an Application Link

**Security Implications for each Authentication Type**

If you configure **Trusted Applications authentication** for your application (i.e. your servers have the same set of users and they fully trust each other), please be aware of the following security implications:

- Trusted applications are a **potential security risk**. When you configure Trusted Applications authentication, you are allowing one application to access another as any user. This allows all of the built-in security measures to be bypassed. Do not configure a trusted application unless you know that all code in the application you are trusting will behave itself at all times, and you are sure that the application will maintain the security of its private key.

If you configure **OAuth authentication** for your application (i.e. your servers have different sets of users and they fully trust each other), please be aware of the following security implications:

- Adding an OAuth consumer requires the transmission of sensitive data. To prevent *man-in-the-middle* attacks, it is recommended that you **use SSL** for your applications while configuring OAuth authentication.
- Do not link to an application using OAuth authentication, unless you **trust all code in the application** to behave itself at all times. OAuth consumers are a potential security risk to the applications that they are linked to.
About Primary Authentication Types

You can configure multiple authentication types for each application link. When a feature makes a request using an Application Link, it will use one of the configured authentication types. If more than one authentication type is configured, it will by default use the authentication type that is marked as the primary authentication type. The default authentication type is indicated by the green tick next to the authentication type on the list application link screen.

You cannot configure which authentication type is the primary authentication type. The primary authentication type is determined automatically by Application Links and depends on a weight defined by each authentication type. However, every feature that uses Application Links can also choose to use a specific authentication type and might not use the default primary authentication type.

About Impersonating and Non-Impersonating Authentication Types

Applications Links allows you to configure 'impersonating' and 'non-impersonating' authentication types:

- **Impersonating authentication types** make requests on behalf of the user who is currently logged in. People will see only the information that they have permission to see. This includes OAuth and Trusted Applications authentication.

- **Non-impersonating authentication types** always use a pre-configured user when making a request. Everyone logged into the system will see the same information. This includes basic HTTP authentication.

Configuring Basic HTTP Authentication for an Application Link

The instructions on this page describe how to configure Basic HTTP authentication for outgoing authentication and/or incoming authentication for an application link.

Basic HTTP authentication allows Confluence to provide user credentials to a remote application and vice versa. Once authenticated, one application can access specified functions on the other application on behalf of that user. For example, if you supply the credentials of a Confluence administrator on your Confluence server to a remote application, the remote application will be able to access all functions on your Confluence server that the Confluence administrator can access.

This method of authentication relies on the connection between Confluence and the remote application being secure. We recommend that you use Trusted Applications authentication or OAuth authentication for your application link instead, if possible.

On this page:

- **Before You Begin**
- Configuring Basic HTTP Authentication for Outgoing Authentication
- Configuring Basic HTTP Authentication for Incoming Authentication
- Notes

The information on this page does not apply to Confluence OnDemand.

Before You Begin

- The instructions assume that both of the applications that you are linking have the Application Links plugin installed. If the remote application that you are linking to supports Basic HTTP authentication, but does not have the Application Links plugin installed, you will need to configure Basic HTTP authentication from within the remote application (see the relevant administrator's documentation for the application). This is in addition to configuring the outgoing/incoming authentication for the application link (as described below).

- You must be a Confluence administrator to configure Basic HTTP authentication for an application link.
Configuring Basic HTTP Authentication for Outgoing Authentication

Configuring **outgoing basic http authentication** will allow Confluence to trust a remote application (i.e. allow the remote application to access specified functions in Confluence).

To configure basic http authentication for an outgoing application link:

1. Log in as a system administrator and go to the administration page. Click ‘Application Links’ in the administration menu. The ‘Configure Application Links’ page will appear, showing the application links that have been set up.
2. Click the ‘Configure’ link next to the application link that you want to configure authentication for.
3. Click the ‘Outgoing Authentication’ tab. The outgoing authentication page will be displayed.
4. Click the ‘Basic Access’ tab.
5. Click the ‘Configure’ button and enter the credentials (username and password) that the remote application will use to log into your application.
6. Click the ‘Apply’ button to save your changes.

Configuring Basic HTTP Authentication for Incoming Authentication

Configuring **incoming basic http authentication** will allow the remote application that you are linking to, to trust Confluence (i.e. allow Confluence to access specified functions on the remote application it is linked to).

To configure basic http authentication for an incoming application link:

1. Log in as a system administrator and go to the administration page. Click ‘Application Links’ in the administration menu. The ‘Configure Application Links’ page will appear, showing the application links that have been set up.
2. Click the ‘Configure’ link next to the application link that you want to configure authentication for.
3. Click the ‘Incoming Authentication’ tab. The incoming authentication page will be displayed.
4. Click the ‘Basic Access’ tab.
5. Click the ‘Configure’ button and enter the credentials (username and password) that your application will use to log in to the remote application.
6. Click the ‘Apply’ button to save your changes.

**Notes**

**Related Topics**

- Configuring OAuth Authentication for an Application Link
- Configuring Trusted Applications Authentication for an Application Link
- Configuring OAuth Authentication for an Application Link

The instructions on this page describe how to configure OAuth for outgoing authentication and/or incoming authentication for an application link.

**OAuth** is a protocol that allows a web application to share data/resources with any other OAuth-compliant external application. These external applications could be another web application (such as a JIRA installation or an iGoogle home page), a desktop application or a mobile device application, provided that they are accessible from within your network or available on the Internet.

For example, you could set up an application link between Confluence and an iGoogle page using OAuth authentication. This would allow you to view data from your Confluence server in a Confluence gadget on the iGoogle page (see Configuring Confluence Gadgets for Use in Other Applications).

A typical scenario is setting up an application link between two applications which trust each other, do not share the same set of users but both applications have the Application Links plugin installed. In this case, you would configure OAuth for both outgoing authentication and incoming authentication. See Configuring Authentication.
Key OAuth Terminology

- **Service provider** — An application that shares ('provides') its resources.
- **Consumer** — An application that accesses ('consumes') a service provider's resources.
- **User** — An individual who has an account with the Service Provider.

For more information about OAuth, see [Configuring OAuth](#) as well as the [OAuth specification](#).

---

### Before You Begin

- Adding an OAuth consumer requires the transmission of sensitive data. To prevent 'man-in-the-middle' attacks, it is recommended that you use SSL for your applications while configuring OAuth authentication.
- Do not link to an application using OAuth authentication, unless you trust all code in the application to behave itself at all times. OAuth consumers are a potential security risk to the applications that they are linked to.
- The instructions assume that both of the applications that you are linking have the Application Links plugin installed. If the remote application that you are linking to supports OAuth, but does not have the Application Links plugin installed, you will need to configure OAuth from within the remote application (see the relevant administrator's documentation for the application) in addition to configuring the outgoing/incoming authentication for the application link (as described below).
- You must be a Confluence administrator to configure OAuth authentication for an application link.

### Configuring OAuth for Outgoing Authentication

Configuring **outgoing OAuth authentication** will allow Confluence to access data in a remote application on behalf of a user (i.e. allow Confluence to access specified functions in the remote application).

**To configure OAuth authentication for an outgoing application link:**

1. Log in as a system administrator and go to the administration page. Click 'Application Links' in the administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
2. Click the 'Configure' link next to the application link that you want to configure OAuth for.
3. Click the 'Outgoing Authentication' tab. The outgoing authentication page will be displayed.
4. Click the 'OAuth' tab.
5. If you are not currently logged in to the remote application (or you logged in to the remote application under a variant of the application's hostname, such as the IP address), a login dialogue will display.
   - Enter the 'Username' and 'Password' for the remote server, not your local server, and click the 'Login' button. The remote server needs to learn the identity of your local server for the OAuth protocol to work and your admin credentials are used to store your local server's public key on the remote server. If you are already logged into your remote server, then the appropriate changes can be made without having to log in again.
6. Click the 'Enable' button to enable OAuth authentication for the outgoing link. Your application will be
automatically set up to be the 'consumer' and the remote application as a 'service provider'.

Configuring OAuth for Incoming Authentication

Configuring incoming OAuth authentication will allow the remote application that you are linking to, to access data in Confluence.

To configure OAuth authentication for an incoming application link:

1. Log in as a system administrator and go to the administration page. Click ‘Application Links’ in the administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
2. Click the ‘Configure’ link next to the application link that you want to configure OAuth for.
3. Click the ‘Incoming Authentication’ tab. The incoming authentication page will be displayed.
4. Click the ‘OAuth’ tab.
5. Click the ‘Enable’ button to enable OAuth authentication for the incoming link. The remote application will be automatically set up to be the 'consumer' and your local application as a 'service provider'.

- Configuring Confluence Gadgets for Use in Other Applications

Configuring Trusted Applications Authentication for an Application Link

The instructions on this page describe how to configure Trusted Applications for outgoing authentication and/or incoming authentication for an application link.

Trusted Applications authentication allows one application to allow access to specified functions on another application on behalf of any user, without the user having to log into the second application. For example, if you configure a JIRA server to trust a Confluence server, every Confluence user will see exactly the same list of issues when they view the Confluence jira issues macro as they see when they use the JIRA Issue Navigator as a logged-in JIRA user.

A typical scenario is setting up an application link between two applications which trust each other, have the same set of users and both have the application links plugin installed. In this case, you would configure Trusted Applications for both outgoing authentication and incoming authentication. See Configuring Authentication for an Application Link for other configurations.

On this page:

- Before You Begin
- Configuring Trusted Applications for Outgoing Authentication
- Configuring Trusted Applications for Incoming Authentication
- Notes

⚠️ The information on this page does not apply to Confluence OnDemand.

Before You Begin

- Trusted applications are a potential security risk. When you configure Trusted Applications authentication, you are allowing one application to access another as any user. This allows all of the built-in security measures to be bypassed. Do not configure a trusted application unless you know that all code in the application you are trusting will behave itself at all times, and you are sure that the application will maintain the security of its private key.
• The instructions below assume that **both of the applications that you are linking have the Application Links plugin installed**. If the remote application that you are linking to supports Trusted Applications, but does not have the Application Links plugin installed, you will need to configure Trusted Applications from within the remote application (see the relevant administrator's documentation for the application) in addition to configuring the outgoing/incoming authentication for the application link (as described below).
• You must be a Confluence administrator to configure Trusted Applications authentication for an application link.

### Configuring Trusted Applications for Outgoing Authentication

Configuring **outgoing Trusted Applications authentication** will allow the remote application to trust Confluence (i.e. allow Confluence to access specified functions and data on the remote application).

**To configure Trusted Applications authentication for an outgoing application link:**

1. Log in as a system administrator and go to the administration page. Click 'Application Links' in the administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
2. Click the 'Configure' link next to the application link that you want to configure Trusted Applications authentication for.
3. Click the 'Outgoing Authentication' tab. The outgoing authentication page will show, with the 'Trusted Applications' tab displayed.
4. If you are not currently logged into the remote application (or you logged into the remote application under a variant of the application's hostname, e.g. the IP address), a login dialogue will display.
   • Enter the 'Username' and 'Password' for the remote server, (not your local server), and click the 'Login' button. You need to enter the credentials for the remote server, as the remote server needs to be instructed to trust your local server for the Trusted Applications protocol to work. If you are already logged into your remote server, then the appropriate changes can be made without having to log in again.
5. Configure the settings for the Trusted Applications authentication:
   • 'IP Patterns' — Enter the IP addresses (IPv4 only) from which the remote application will accept requests (this effectively is the IP address your local server). You can specify wildcard matches by using an asterisk (*) (note, you cannot use netmasks to specify network ranges). If you are entering multiple IP addresses, separate them with commas or spaces. **Please note, if you are setting up Trusted Applications between two applications that both have the Application Links plugin installed, you can leave this field blank (or explicitly use *.*.*.*). However, if your remote application does not have the Application Links plugin installed and you are configuring the IP Patterns in the remote application (not the Application Links plugin), you must not leave this field blank nor use *.*.*.*. Failure to configure IP address restrictions in this scenario is a security vulnerability, allowing an unknown site to log into your site under a user's login ID.**
   Consider the following scenarios, if you want to limit access by using this field:
   • If your local application is using a proxy server, you need to add the proxy server's IP address to this field.
   • If your local application is a clustered instance of Confluence, you need to configure the remote server to accept requests from each cluster node. If you do not set up each node appropriately, your Confluence users may not be able to view any information from the remote server. You can set this up by either specifying each individual IP address for each node of the cluster (e.g. 172.16.0.10, 172.16.0.11, 172.16.0.12), or specifying the IP address for the clustered Confluence instance using wildcards (e.g. 172.16.0.*).
   • 'URL Patterns' — Enter the URLs in the remote application that your local application will be allowed to access. Each URL corresponds to a particular application function. Enter one URL per line, as follows:
     • If your remote application is JIRA, enter the following URL Patterns: /plugins/servlet/streams, /sr/jira.issueviews:searchrequest, /secure/RunPortlet, /rest, /rpc/soap
If your remote application is Confluence, enter the following URL Patterns: `/plugins/servlet/streams`, `/plugins/servlet/applinks/whoami`

- **'Certificate Timeout (ms)'** — Enter the certificate timeout. The default is 10 seconds. The certificate timeout is used to prevent replay attacks. For example, if a Trusted Applications request is intercepted and (maliciously) re-sent, the application will be able to check when the request was first sent. If the second request is sent more than 10 seconds (or whatever the certificate timeout is set to) after the initial request, it will be rejected. Please note, you should not have to change the default value of this field for most application links. Note that the certificate timeout relies on the clocks on both servers being synchronised.

6. Click the 'Apply' button to save your changes.

Configuring Trusted Applications for Incoming Authentication

Configuring incoming Trusted Applications authentication will allow Confluence to trust the remote application that you are linking it to (i.e. allow your 'trusted' remote application to access specified functions and data on Confluence).

To configure Trusted Applications authentication for an incoming application link:

1. Log in as a system administrator and go to the administration page. Click 'Application Links' in the administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
2. Click the 'Configure' link next to the application link that you want to configure Trusted Applications authentication for.
3. Click the 'Incoming Authentication' tab. The incoming authentication page will show, with the 'Trusted Applications' tab displayed.
4. The tab will show whether Trusted Applications is currently enabled or not. Use the 'Modify' or 'Configure' button to configure Trusted Applications. The Trusted Applications configuration settings will be displayed:

- **'IP Patterns'** — Enter the IP addresses (IPv4 only) from which our application will accept requests. You can specify wildcard matches by using an asterisk (*), e.g. '192.111.*.*' (note, you cannot use netmasks to specify network ranges). If you are entering multiple IP addresses, separate them with commas or spaces. Please note, if you are setting up Trusted Applications between two applications that both have the Application Links plugin installed, you can leave this field blank (or explicitly use *. *.*.*). However, if your remote application does not have the Application Links plugin installed and you are configuring the IP Patterns in the remote application (not the Application Links plugin), you must not leave this field blank nor use *. *.*.*. Failure to configure IP address restrictions in this scenario is a security vulnerability, allowing an unknown site to log into your site under a user's login ID.

Consider the following scenarios, if you want to limit access by using this field:

- If the remote application is using a proxy server, you need to add the proxy server's IP address to this field.
- If the remote application is a clustered instance of Confluence, you need to accept requests from each cluster node. If you do not specify each node's address, Confluence users may not be able to view any data from your application. You can set this up by either specifying each individual IP address for each node of the cluster (e.g. 172.16.0.10, 172.16.0.11, 172.16.0.12), or specifying the IP address for your clustered Confluence instance using wildcards (e.g. 172.16.0.*).

- **'URL Patterns'** — Enter the local URLs that the remote application will be allowed to access. Each URL corresponds to a particular application function. Enter one URL per line, as follows:
  - If your local application is JIRA, enter the following URL Patterns — `/plugins/servlet/streams`, `/sr/jira.issueviews:searchrequest`, `/secure/RunPortlet`, `/rest`, `/rpc/soap`
  - If your local application is Confluence, enter the following URL Patterns — `/plugins/servlet/streams`, `/plugins/servlet/applinks/whoami`
• ‘Certificate Timeout (ms)’ — Enter the certificate timeout. The default is 10 seconds. The certificate timeout is used to prevent replay attacks. For example, if a Trusted Applications request is intercepted and (maliciously) re-sent, the application will be able to check when the request was first sent. If the second request is sent more than 10 seconds (or whatever the certificate timeout is set to) after the initial request, it will be rejected. Please note, you should not have to change the default value of this field for most application links. Note that the certificate timeout relies on the clocks on both servers being synchronised.

5. Click the ‘Apply’ button to save your changes.

Configuring OAuth Authentication for an Application Link

Incoming and Outgoing Authentication

When you configure authentication for an application link, you are defining the level of trust between the two linked servers. When configuring a link from one application to another, you can set up:

• **Incoming authentication** (authentication of requests coming from a linked application into this application).
• **Outgoing authentication** (authentication of requests sent from this application to a linked application).

See Configuring Authentication for an Application Link.

⚠️ The information on this page does not apply to Confluence OnDemand.

Editing an Application Link

You can change the details, such as the application name and display URL, for an existing application link.

On this page:

- Editing an Application Link
- Notes

⚠️ The information on this page does not apply to Confluence OnDemand.

Edited an Application Link

To edit an application link:

1. Log in as a system administrator and go to the administration page. Click ‘Application Links’ in the administration menu. The ‘Configure Application Links’ page will appear, showing the application links that have been set up.
2. Click the ‘Configure’ link next to the application link that you want to edit the details for. The application details for the application link will be displayed.
3. Update the application details as desired. Please note, you cannot update the Application Type nor the Application URL.

  - ‘Application Name’ — Update this field to change the display name for the application that you are linking to.
  - ‘Display URL’ — This URL is used when displaying links to the application in the browser. When creating the application link, you may have used a URL that is not accessible to other users, such as an internal IP address. If so, you can change the display URL to an address in a domain that is
accessible to other users.

4. Click the 'Update' button to save your changes.

Configuring Authentication for an Application Link
Making an Application Link the Primary Link
Relocating an Application Link

**Making an Application Link the Primary Link**

If you have set up application links to more than one of the same application type, e.g. you have linked your application to two JIRA servers, then one of the servers will be marked as the 'Primary' link. This means that any outgoing requests will be directed to the primary link's application.

For example, if you have set up a Confluence server that is linked to two JIRA servers with two-way authentication for both links, you can nominate an application link to one of the JIRA servers as the primary link. Every time Confluence requests JIRA information (e.g. for a JIRA issues macro), it will request it from the primary link's JIRA server. Note, both JIRA servers can still make requests of the Confluence server (e.g. a Confluence page gadget on the dashboards of each JIRA instance).

*On this page:*

- [Making an Application Link the Primary Link](#)
- [Notes](#)

⚠️ The information on this page does not apply to Confluence OnDemand.
Making an Application Link the Primary Link

To make an application link the primary link:

1. Log in as a system administrator and go to the administration page. Click ‘Application Links’ in the administration menu. The ‘Configure Application Links’ page will appear, showing the application links that have been set up.
2. Click the 'Make Primary' link next to the application link that you want to make the primary link. A '✔' symbol will display in the 'Primary' column next to the application link.

   The 'Primary' column and 'Make Primary' link will only display if you have set up application links to more than one of the same application type, e.g. you have linked your application to two JIRA servers.

Notes

Please read Making a Project Link the Primary Link for information on how primary project links also influence the information shared between servers.

Making a Project Link the Primary Link

Relocating an Application Link

This page describes how to change the location of an application link. You will need to relocate an application link if the target application has been moved to a new address.

The information on this page does not apply to Confluence OnDemand.

To relocate an application link:

1. Log in as a system administrator and go to the administration page. Click ‘Application Links’ in the administration menu. The ‘Configure Application Links’ page will appear, showing the application links that have been set up.
2. If the remote application for an application link cannot be reached by your application, the 'List Application Links' page will display a warning message (see 'Relocate Link - Warning Message' screenshot below).
3. If your remote application has been moved to a different address (rather than just being offline temporarily), click the 'Relocate' link in the warning message (see 'Relocate Link - Updating URL' screenshot below).
4. Enter the new URL for the remote application of your application link and click 'Relocate'.
5. You will need to confirm the relocation, if the new URL cannot be contacted. Otherwise, the application link will be updated.

Screenshot above: Relocate link – The warning message
1. After your application upgrade, navigate to the administration console.
2. Click ‘Application Links’. The ‘Configure Application Links’ screen will be displayed with the following message:
   “There are existing Trusted Applications or OAuth relationships that should be upgraded to Application Links. Click here to upgrade.”
3. Click the ‘Click here to upgrade’ link. The ‘Existing Trust Relationships’ screen will be displayed showing
all Trusted Applications and OAuth relationships that can be upgraded to Application Links.

4. Click the 'Upgrade to Application Link' link next to the desired trust relationship. The 'Upgrade to Application Link' wizard will be displayed.

5. Complete the wizard. The process will be similar to adding a new link (described on Adding an Application Link), except that most fields should be pre-filled.

Screenshots above: Upgrading an application link for local application

**Upgrading an Application Link (Remote App Upgraded to Include Application Links)**

When an application link is created between a version of Confluence that supports Application Links, and a remote legacy application (either a non-Atlassian product, or an older version of an Atlassian product that did not ship with Application Links), this link is configured to run in "legacy mode". While there is no distinguishable difference to a user, connection and configuration without Application Links is a little different. For example:

- Setting up OAuth requires manual configuration by the administrator. In OAuth authentication for between applications that support Application Links, exchange of the consumer keys and public keys is done automatically.
- The Trusted Applications protocol (Atlassian-specific) will not be available for authentication.

If you upgrade your remote application to a version that does include Application Links, the application link will continue to work. However, upgrading your link may simplify link configuration and make additional authentication protocols available (as mentioned above).

**To upgrade an application link when your remote application has been upgraded to include Application Links:**

1. After you have upgraded your remote application to a version that includes Application Links, go to the administration console of your local application. A warning will be displayed, requesting that you upgrade the link to full Application Links mode.

2. Click 'Upgrade' in the warning message to start the upgrade wizard. Note the following:
   - You will be prompted to make your application link a reciprocal link. You will need to provide administrator credentials for your remote application, if you choose to do so.
   - If you make your application link a reciprocal link, you will also be able to make reciprocal links for your project links. For example, you may be able to link your JIRA project to a FishEye repository and also make a link from your FishEye repository back to the JIRA project.

- [Adding an Application Link](#)
- [Configuring Authentication for an Application Link](#)
Deleting an Application Link

Deleting an application link stops the two applications from sharing information. You will no longer be able to make requests from one application to the other. This means that certain features may not work, e.g. JIRA issues macro in Confluence, Confluence Page Gadget in JIRA, etc.

If you have set up application links to multiple servers of the same application type, e.g. you have linked your application to multiple JIRA servers, deleting the primary link will mean that another of the links will be made the primary link.

Deleting an application link will also delete all project links set up for that application link.

To delete an application link:

1. Log in as a system administrator and go to the administration page. Click 'Application Links' in the administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
2. Click the 'Delete' link next to the application link that you want to delete. A confirmation screen will be displayed.
3. Click the 'Confirm' button to delete the application link.

Configuring Project Links across Applications

Let's assume that you are managing a project or team. You would like to connect your project's Confluence space with your JIRA project, and link up your team's source repository too.

When you have connected your applications via Application Links, you can also connect the areas of those applications that contain information relating to your project or team. Using project links (also called entity links) you can associate one or more projects, spaces and repositories across the linked applications.

To connect all the information relating to the project or team that you are managing, you can link one or more of the following:

- JIRA projects.
- Confluence spaces.
- FishEye repositories.
- FishEye projects. A FishEye 'project' is the Crucible project if you have installed FishEye and Crucible, otherwise it is the paths associated via the 'FishEye Project Content' function in FishEye.
- Crucible projects.
- Bamboo projects.

On this page:

- Uses for Project Links
- Managing Project Links

The information on this page does not apply to Confluence OnDemand.
The following integration features use project links:

- Activity streams. For example, the project links determine the activity retrieved from JIRA to display in the activity stream of a FishEye repository or a Crucible project.
- The JIRA FishEye plugin. For example:
  - The link between a JIRA project and a FishEye repository determines the repository searched for a particular issue key when displaying the FishEye source tab in JIRA.
  - The link between a JIRA project and a Crucible project determines the Crucible project scanned for review activity when displaying the Crucible reviews tab in JIRA.
  - When you create a defect in Crucible, Crucible will know which JIRA project to put it in.
- Third-party plugins may make use of project links to enrich their functionality too.

**Managing Project Links**

- [Adding Project Links between Applications](#)
- [Making a Project Link the Primary Link](#)
- [Deleting a Project Link](#)

**Adding an Application Link**

**Adding Project Links between Applications**

Let's assume that you are managing a project or team. You would like to connect your project's Confluence space with your JIRA project, and link up your team's source repository too.

When you have connected your applications via Application Links, you can also connect the areas of those applications that contain information relating to your project or team. Using project links (also called entity links) you can associate one or more projects, spaces and repositories across the linked applications.

To connect all the information relating to the project or team that you are managing, you can link one or more of the following:

- JIRA projects.
- Confluence spaces.
- FishEye repositories.
- FishEye projects. A FishEye 'project' is the Crucible project if you have installed FishEye and Crucible, otherwise it is the paths associated via the 'FishEye Project Content' function in FishEye.
- Crucible projects.
- Bamboo projects.

⚠️ The information on this page does not apply to Confluence OnDemand.

To link a Confluence space to a project in another application:

1. Choose **Browse > Space Admin**.
   
   *Note*: 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).

2. Click 'Application Links' in the left-hand panel.

3. Choose the Confluence space that you want to link from.

4. The instructions for adding a project link will vary depending on whether the target application has the Application Links functionality installed:
   
   - If the target application has Application Links:
     a. Click 'Add Link'. A dropdown menu will appear listing the applications you have already linked to.
     b. In the dropdown menu, click the application that contains the project you want to link to. For example, if you want to link to a specific JIRA project, click the JIRA site that contains that...
project. If you want to link to a Confluence space, click the Confluence site that contains that space.

c. Click one of the options on the 'Authorization required' screen:
   - 'Authorize' — Click this option if you want to grant your project authorised access to the target project. The target application will open in a new window, so that you can log in and authorise access.
   - 'Skip – your access is anonymous' — Click this option if you only want to allow anonymous access to the target project.

d. In the 'Name or Key' field, enter the name/key of the project in the remote application that you want to link to. For example, if you want to link to a JIRA project, enter the project key. If you want to link to a Confluence space, enter the space key.

e. Click the 'Create' button to create the project link.

If the target application does not have Application Links:

a. Click 'Add Link'. A dropdown menu will display listing the applications you have already linked to.

b. In the dropdown menu, click the application that contains the project you want to link to. For example, if you want to link to a specific JIRA project, click the JIRA site that contains that project. If you want to link to a Confluence space, click the Confluence site that contains that space.

c. In the 'Key' field, enter the name/key of the project in the remote application that you want to link to. For example, if you want to link to a JIRA project, enter the project key. If you want to link to a Confluence space, enter the space key.

d. (optional) Enter the alias for the project in the 'Alias' field. This is the display name for the project in your administration console.

e. Click the 'Create' button to create the project link.

**RELATED TOPICS**

*Adding Project Links between Applications*

*Deleting a Project Link*

**Deleting a Project Link**

Deleting a project link stops the two projects from sharing information.

If you have set up multiple project links to the same application, for example you have linked a Confluence space to multiple JIRA projects, deleting the **primary link** will mean that another of the links will be made the primary link.

**To delete a project link:**

1. Choose **Browse > Space Admin.**
   
   *Note:* ‘Space Admin’ is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).

2. Click ‘**Application Links**’ in the left-hand panel.

3. Click the ‘**Delete**’ link next to the link that you want to delete.

4. A confirmation screen will appear. Click the ‘**Confirm**’ button to delete the link.
Screenshot above: Confirming the deletion of a project link

⚠️ The information on this page does not apply to Confluence OnDemand.

Installing Confluence and JIRA Together
This page describes Atlassian’s recommendation for installing JIRA and Confluence on the same server. Refer to Here Be Dragons for instructions on integrating all Atlassian applications.

⚠️ Do not deploy multiple Atlassian applications in a single Tomcat container —
Deploying multiple Atlassian applications in a single Tomcat container is not supported. We do not test this configuration and upgrading any of the applications (even for point releases) is likely to break it. There are also a number of known issues with this configuration (see this FAQ for more information).

We also do not support deploying multiple Atlassian applications to a single Tomcat container for a number of practical reasons. Firstly, you must shut down Tomcat to upgrade any application and secondly, if one application crashes, the other applications running in that Tomcat container will be inaccessible.

Finally, we recommend not deploying any other applications to the same Tomcat container that runs Confluence, especially if these other applications have large memory requirements or require additional libraries in Tomcat’s lib subdirectory.
Recommended Setup - Separate Stand-Alone Installations

Atlassian recommends running JIRA and Confluence in separate stand-alone instances running behind an Apache Web Server. See the guides for:

- Installing Confluence
- Running Confluence behind Apache
- Installing JIRA
- Integrating JIRA with Apache

Advantages

- Each application can be restarted without affecting the other.
- If one webapp hangs for any reason (eg. running out of memory), it doesn't affect the other.
- Any problems can be debugged more easily. Logs are separate and product-specific, rather than everything going to catalina.out. Thread and heap dumps are smaller and more relevant.
- It reduces the likelihood of jar conflicts (eg. jars that must be installed in common/lib or lib for Confluence running off Apache Tomcat version 6 or above), particularly if you later want to install a third webapp not from Atlassian.
- Apache HTTP Web Server is well suited for running publicly available sites, with extensive modules for security and efficiency. It also allows for flexibility with URLs (ie http://confluence.atlassian.com, http://confluence, and so on).

Integrating JIRA and Confluence

Please refer to the guide to Installing Confluence and JIRA Together.

JIRA and Confluence are designed to complement each other. Collect your team's thoughts, plans and knowledge in Confluence, track your issues in JIRA, and let the two applications work together to help you get your job done.

Below are some ways you can get JIRA and Confluence working together.

On this page:

- Setting Up Trusted Communication between JIRA and Confluence
- Inserting JIRA issues
- Combining Confluence Shortcuts and JIRA Quick Search
- Viewing Confluence Content in JIRA or JIRA Content in Confluence
- Integrating JIRA and Confluence User Management
- Useful Plugins

Setting Up Trusted Communication between JIRA and Confluence

An administrator can configure JIRA (3.12.0 or later) and Confluence to communicate in a trusted way, so that Confluence can request information from JIRA on behalf of the currently logged-in user. JIRA will not ask the user to log in again or to supply a password.
Trusted communication is used when embedding information from one application (for example, a list of JIRA issues) into another application (for example, a Confluence page).

Read more about trusted communication.

**Inserting JIRA issues**

You can insert issues from a JIRA site onto your Confluence page using the 'Insert JIRA Issue' dialogue box. You can also use this dialogue box to create a new issue on the JIRA site. See Inserting JIRA Issues.

**Combining Confluence Shortcuts and JIRA Quick Search**

In our Confluence site's global configuration (Administration > Shortcut Links) we have the following shortcut defined:

```
JIRA: http://jira.atlassian.com/secure/QuickSearch.jspa?searchString=
```

Use the above option to create links using Confluence's shortcut notation.

- Link directly to JIRA issues like this: CONF-1000
- Use JIRA’s quick-search functionality to create links to particular groups of issues. The following link will display a list of all open issues in the Confluence project of type 'Improvement': CONF open improvements

**Viewing Confluence Content in JIRA or JIRA Content in Confluence**

**Using Gadgets**

You can embed a Confluence activity stream or a Confluence page in JIRA's dashboard. Likewise, JIRA gadgets can be rendered on a Confluence page. See Adding a Confluence Gadget to a JIRA Dashboard and Gadget Macro for information on how to set up gadgets.

**Using the JIRA Issues macro**

For versions earlier than Confluence 3.1 and JIRA 4.0, use the (jiraissues) macros to embed JIRA reports and portlets into your Confluence site.
Any JIRA search result can be embedded in a Confluence page using the JIRA Issues macro with your choice of included fields and field ordering, and any JIRA gadgets can be embedded in a Confluence page by Registering External Gadgets.

**Integrating JIRA and Confluence User Management**

To save you having to enter users into both JIRA and Confluence, you may benefit from using Atlassian Crowd as the user repository for both applications. Alternatively you can configure Confluence to use JIRA's user database. See Connecting to Crowd or JIRA for User Management.

**Useful Plugins**

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- The JIRA Linker plugin provides a custom field that helps you find an URL, particularly a Confluence page, so you can add a page link into a JIRA issue.

**Setting Up Trusted Communication between JIRA and Confluence**

An administrator can configure JIRA and Confluence to communicate in a trusted way, so that Confluence can request information from JIRA on behalf of the currently logged-in user. JIRA will not ask the user to log in again or to supply a password.

When JIRA is configured to trust Confluence in this way, we call Confluence the ‘trusted application’ and JIRA the ‘trusting application’.

Trusted communication is used when embedding information from one application (e.g. a list of JIRA issues) into another application (e.g. a Confluence page). Currently only JIRA can be configured to trust Confluence, and only the following macro has been enhanced to use trusted communication:

- JIRA Issues macro

Further implementations will follow, especially as we roll out the tight integration required between Atlassian products for JIRA Studio.

---

**Potential security risk**

Do not configure a trusted application unless you trust all code in that application to behave itself at all times. Trusted communication uses public/private key cryptography to establish the identity of the trusted server, so you must also be sure that the trusted application will maintain the security of its private key. Read the details of the security risks below.

---

**On this page:**

- Prerequisites
- Why do we need Trusted Communication?
- Overview
- Configuring JIRA to Trust Confluence Using Trusted Applications
- Configuring the Macro Plugin in Confluence
- Adding the Macro to a Confluence Page
- Viewing the Confluence Page
- Security Risks
- Troubleshooting
- Technical Overview of the Trusted Applications Authentication (TAA) Protocol

---

The information on this page does not apply to Confluence OnDemand.

**Prerequisites**

- JIRA 4.2.0 or later.
- Confluence 3.5.0 or later.
- In order to authenticate successfully against JIRA, the Confluence user must also be registered as a JIRA user with the same username.

⚠️ Common user base recommended

It is **highly recommended** that your JIRA and Confluence instances share a common user base, rather than two separate user bases with duplicated usernames. You will receive an error if Confluence passes JIRA a username which JIRA cannot recognise. Also, with separate user bases you run the risk that the same username may be used by two different people. The trusted application does not supply the user's password, so the trusting application will assume the username belongs to the user registered in the trusting application's own user base.

✅ Tip: Try [Atlassian Crowd](https://www.atlassian.com/software/crowd) for a tidy user management solution.

---

**Why do we need Trusted Communication?**

The [JIRA Issues](https://confluence.atlassian.com/display/CQ43/JIRA+Issues+Macro) macro allows you to embed a list of JIRA issues into a Confluence page. Prior to Confluence JIRA Issues 2.7, if you wanted to display JIRA issues that had restricted viewing, then you needed to store the JIRA user's credentials (username and password) in the macro code directly on the Confluence page. This was not very secure.

The reasons we require the user credentials are:

- Your JIRA instance might not be public, and you might not want to allow anonymous access to your issues.
- You might have security restrictions on some of your issues. So you don't want to allow someone to leak data from your JIRA project by using the JIRA Issues Macro on a Confluence page.

---

**Overview**

Here is a summary of the integration points in a trusted communications relationship. Each of the following points is described in more detail in the sections below.

- A JIRA System Administrator [configures JIRA to trust Confluence](https://confluence.atlassian.com/display/JIRA/JIRA+Trusted+Applications+Configuration).
- A Confluence System Administrator [configures the macro plugin](https://confluence.atlassian.com/display/DOC43/Configuring+Trusted+Applications+Authentication+for+an+Application+Link) to use (or not use) trusted communication.
- A Confluence user [adds one of the macros to a Confluence page](https://confluence.atlassian.com/display/DOC43/Configuring+Trusted+Applications+Authentication+for+an+Application+Link).
- A Confluence user or anonymous user [views the Confluence page](https://confluence.atlassian.com/display/DOC43/Configuring+Trusted+Applications+Authentication+for+an+Application+Link).

---

**Configuring JIRA to Trust Confluence Using Trusted Applications**

Trust only has to be established once between the two applications. Once trust has been established, it is entirely transparent to the Confluence users.

Application links are used to enable trust relationships between two applications. Linking two applications allows you to share information and access one application's functions from within the other.

You can configure an application link to use Trusted Applications as the authentication mechanism. For instructions, see [Configuring Trusted Applications Authentication for an Application Link](https://confluence.atlassian.com/display/DOC43/Configuring+Trusted+Applications+Authentication+for+an+Application+Link).
Configuring the Macro Plugin in Confluence

By default, Confluence ships with trusted communication enabled for the following macro:

- JIRA Issues macro

A Confluence System Administrator can decide on the level of trusted communication used by the macros. The different levels are:

- Ignore trusted communications altogether. Trusted communication is turned off at the global level.
- Perform trusted communications whenever the macro is used on a Confluence page, but do not show certain warning messages.
- Perform trusted communications whenever the macro is used on a Confluence page, and show all warning messages. This is the default configuration.

To change the default trusted communication level for the JIRA Macros plugin,

1. Choose Browse > Confluence Admin.
2. Select ‘Plugins’ in the left-hand panel.
3. The ‘Plugin Manager’ screen appears, showing a list of installed plugins. Scroll down and click the ‘JIRA Macros’ link.
4. The ‘JIRA Macros’ panel appears in the top middle of the screen, as shown below. Click ‘Enable’ or ‘Disable’ next to the following options:
   - ‘JIRA application trust support’ – With this option enabled, Confluence will attempt trusted communication with JIRA whenever a user views a page containing the JIRA Issues macro, provided criteria are met as described below. With this option disabled, Confluence will never attempt trusted communication with JIRA for these macros.
     - Disable the above option if you do not intend to configure trusted communication between JIRA and Confluence.
   - ‘JIRA application trust warnings’ – With this option enabled, Confluence will display all error and warning messages that may arise from a problem during trusted communication (assuming that trusted communication is enabled). With this option disabled, Confluence will suppress certain warnings. See troubleshooting below.
     - Disable the above option if you have a large number of existing JIRA macros already on your Confluence instance, pointing at a diverse range of JIRA servers. Some of those JIRA servers may have a trusted communication link established (requiring the functionality to be enabled) while other JIRA servers may have no trusted communication link. In this case, you may want to turn off the warning messages so they do not appear on your Confluence pages where the JIRA macros point to non-trusting JIRA servers.

Screenshot: JIRA Macros panel in Plugin Manager
Adding the Macro to a Confluence Page

The Confluence user can add and edit the macros as described on the following page:

- Using the JIRA Issues macro

Remove the username and password from your macro markup code

Prior to Confluence 2.7, you needed to include a username and password in the macro markup code if you wanted to display JIRA issues which had restricted viewing. Once your administrator has set up trusted communication between Confluence and JIRA, you no longer need to include a username and password in the markup code for your JIRA macros.

The following options are available for determining the issues which will be retrieved from JIRA and displayed on the Confluence page:

<table>
<thead>
<tr>
<th>What you want to do</th>
<th>Macro parameter</th>
<th>URL parameter</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable plugin</td>

<td></td>
<td>Enable</td>
</tr>
</tbody>
</table>

Macros to retrieve information from JIRA.
<table>
<thead>
<tr>
<th>Display the JIRA issues which the logged-in user is authorised to see. And if the user is not logged in, display only issues which allow unrestricted viewing.</th>
<th>Do not specify any authentication parameters. In this case, the behaviour depends on the way your administrator has set up trusted communication between JIRA and Confluence. Here is a summary of the behaviour. If trusted communication is <strong>enabled</strong>, the authorisation will work seamlessly. When a logged-in user views your page, they will see only the JIRA issues they are allowed to see. And if they are not logged in, they will see only the issues which allow unrestricted viewing. If trusted communication is <strong>disabled</strong>, the Confluence page will show only the JIRA issues which allow unrestricted viewing.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ensure that Confluence will display only the JIRA issues which allow unrestricted viewing.</td>
<td><strong>anonymous</strong></td>
</tr>
<tr>
<td>Use a pre-determined username and password to access the JIRA issues.</td>
<td>&amp;os_username=MYUSERNAME&amp;os_password=MYPASSWORD</td>
</tr>
</tbody>
</table>
Refer to the section below for details of what happens when a user views a Confluence page containing a JIRA macro.

**Viewing the Confluence Page**

When a user views a Confluence page which contains a JIRA Issues macro, this is what happens:

- If the macro markup contains an explicit username and password in the URL parameter, Confluence will not request trusted communication with JIRA. Confluence will retrieve the JIRA issues which the specified username is authorised to see. This behaviour is the same as Confluence versions prior to 2.7.
- If the macro markup contains the `anonymous` parameter, Confluence will retrieve only the JIRA issues which allow unrestricted viewing. Confluence will not attempt to set up a trusted communication link with JIRA in this case.
- If the user is anonymous (not logged in), Confluence will retrieve only the JIRA issues which allow unrestricted viewing. Confluence will not attempt to set up a trusted communication link with JIRA in this case.
- If trusted communication is disabled via the Plugin Manager in Confluence, then Confluence will not request trusted communication with JIRA. So if there is no explicit username and password in the markup code, Confluence will retrieve only the JIRA issues which allow unrestricted viewing. This behaviour is the same as Confluence versions prior to 2.7.
- If trusted communication is enabled via the Plugin Manager in Confluence:
  - If the user is logged in, then Confluence attempts trusted communication with JIRA. Confluence sends the username to JIRA. JIRA returns a set of issues which that username is authorised to access, based on the JIRA user base and the JIRA groups and permissions. Confluence displays those issues on the page.
  - If JIRA or Confluence encounters a problem during the trusted communication process, an error message may appear on the Confluence page above the macro output – see troubleshooting below.

**Security Risks**

Please take the following considerations into account when setting up trusted communication:

- When you configure JIRA to trust an application, you are allowing the application to access JIRA in the name of a particular user. The trusted application passes JIRA the user's login name, but no other authentication information. JIRA does not request the user's password. By doing this, you are bypassing JIRA's authentication mechanism.
- Do not configure a trusted application unless you trust all code in that application to behave itself at all times.
- Trusted communication uses public/private key cryptography to establish the identity of the trusted server. The trusted application needs to maintain the security of its private key. Confluence stores its private key in the database. So you must be sure that the Confluence database is secure, and also any full backups of the database.
- Ensure that you specify an IP address for your Confluence site when configuring trusted applications in JIRA. Do not use the wild card `*.*.*.*` as the IP address. Failure to configure IP address restrictions is a security vulnerability, allowing an unknown site to log into your JIRA site under a user's login ID.
- Be aware of the risks associated with using separate user bases, as explained above. We strongly recommend a common user base between the trusted and trusting applications.
- When configuring an application to trust another application, you should use a trusted network or SSL to protect the sensitive information passed between the applications during the configuration procedure. This will help to prevent man-in-the-middle attacks.

**Troubleshooting**

Below are the warning messages which may appear on your Confluence page, above the output of the JIRA
## Issues macro.

<table>
<thead>
<tr>
<th>Warning Message</th>
<th>Cause</th>
<th>Solution</th>
<th>Warning Message Can be Turned Off?</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>javax.net.ssl.SSLHandshakeException: sun.security.validator.ValidatorException: PKIX path building failed: sun.security.provider.certpath.SunCertPathBuilderException: unable to find valid certification path to requested target</code></td>
<td>JIRA is running over SSL</td>
<td><a href="#">Add JIRA's SSL Certificate to the Java Keystore</a></td>
<td>No</td>
</tr>
<tr>
<td>The JIRA server does not recognise your user name. Issues have been retrieved anonymously.</td>
<td>The logged-in Confluence user is not registered in the JIRA user base.</td>
<td>Add the username to your JIRA user base. It is highly recommended that your JIRA and Confluence instances share a common user base.</td>
<td>No</td>
</tr>
</tbody>
</table>
| The JIRA server does not trust this Confluence instance for user authentication. Issues have been retrieved anonymously. You can set the macro to always use an anonymous request by setting the 'anonymous' parameter to 'true'. | Your JIRA instance has not been configured to trust your Confluence instance. | One of the following solutions:  
- [Configure JIRA](#) to trust Confluence.  
- [Disable trusted communications](#) for the JIRA macros in Confluence.  
- Use the [anonymous parameter](#) in all your JIRA Issues macros. | Yes                                  |
The JIRA server does not support trust requests. Issues have been retrieved anonymously. You can set the macro to always use an anonymous request by setting the 'anonymous' parameter to 'true'.

Your JIRA instance is not able to handle trusted communications (i.e. the JIRA version is earlier than 3.12.0).

One of the following solutions:
- **Download** the latest version of JIRA and then [configure JIRA](https://confluence.atlassian.com/tdo developersguide-integrations-jira.html) to trust Confluence.
- **Disable trusted communications** for the JIRA macros in Confluence.
- Use the **anonymous parameter** in all your JIRA Issues macros.

<table>
<thead>
<tr>
<th>Failed to login trusted application: confluence:14159892 due to: com.atlassian.security.auth.trustedApps.CertificateTooOldException: OLD_CERT; Certificate too old.</th>
<th>There is a date/time difference between the JIRA server and Confluence server.</th>
<th>Yes</th>
</tr>
</thead>
</table>

Consult [Troubleshooting the JIRA Issues Macro and Trusted Applications](https://confluence.atlassian.com/tdo developersguide-integrations-jira.html) for further troubleshooting.

**Technical Overview of the Trusted Applications Authentication (TAA) Protocol**

- **Read** this section if you want a bit more information on the technical side of things.

Atlassian has developed its own protocol to set up trust between JIRA and Confluence. Below is a technical overview of the process.

**Configuring JIRA to trust Confluence:**

1. When the JIRA System Administrator provides the base URL of the Confluence instance, JIRA requests a trusted application authentication certificate from Confluence. The certificate contains Confluence's trusted application ID and public key (generated specifically for use with the TAA protocol).
2. JIRA validates the certificate and asks the System Administrator for a few extra details about the trust relationship, such as a name for the Confluence instance, timeout, allowed IP addresses and allowed request URLs.
3. JIRA stores all this information in the database.

**Making a trusted request from Confluence to JIRA:**

1. Confluence sends a web request to JIRA, appending additional headers to the request, including:
   - Timestamp (nonce) of the request + user name of the currently logged-in Confluence user, encrypted with a symmetric key (generated on the fly).
   - The symmetric key, encrypted with Confluence's private key.
   - Confluence's application ID (as displayed when trusted communication was established).
2. JIRA attempts to decode the encrypted headers, using the stored information about the relationship. It conducts the following checks to validate the request:
   - The trusted application ID refers to a valid trusted application.
• The given username exists in the JIRA user base.
• The agreed timeout has not expired.
• The request originated from a trusted IP address.
• The resource being requested matches those specified in the URL match list.

3. If any of these checks fails, a response is sent to Confluence indicating the reason for failure. Otherwise, JIRA will authenticate the specified user for the duration of the single request, and respond with the resources (i.e. the JIRA issues).

  • Migrating from Confluence OnDemand to a Confluence Installed Site

System Requirements

Confluence works with a broad range of operating systems, database systems and application servers. Provided you have the technical knowledge, it is very likely that you will be able to run Confluence with an 8-year-old database or even on some 8-year-old hardware. Realistically, it is not technically feasible for us to provide our legendary support service on all environments available. There can only be a finite number of platforms and release versions of those that we support.

Our rule of thumb when releasing a new version of Confluence is that we will officially support platforms that have been released within the last one to two years (or the latest version of that platform if no new version of it was released in that period). This does not necessarily mean that you will need to upgrade your database or
application server every time you upgrade Confluence. However, if you do run into problems with an unsupported version of a database or application server, we may have to ask you to upgrade to something newer.

Please refer to our Supported Platforms topic for details on platforms that we currently support in this version of Confluence and our Supported Platforms FAQ topic for details on our support handling procedures.

On this page:
- Confluence Software Requirements
  - Operating Systems
  - Application Servers
  - Databases
  - Java
  - Please Note: Impact of Antivirus Software
- Confluence Hardware Requirements
- Atlassian Hosted Solutions

Confluence Software Requirements

Please read the Supported Platforms page for Confluence. That page contains a list of specific software that Confluence will work with.

Operating Systems

Atlassian supports the operating systems listed on the Supported Platforms page.

If you would like to run Confluence on VMware, please read our Running Confluence in a Virtualised Environment document first.

Confluence on Virtualised Environments

Atlassian officially supports non-clustered installations of Confluence 3.0 and later on VMware. Although possible, we do not recommend (nor support) running versions of Confluence prior to 3.0 on VMware, since Confluence 3.0 resolved many performance issues that were present in earlier versions. Be aware that we also do not support clustered installations of Confluence on VMware. Please comment or vote on the feature request at CONF-19559.

Application Servers

An application server is required to run Confluence. Apache Tomcat is bundled with the distribution.

Atlassian only supports the application servers listed on the Supported Platforms page, provided they are running on Windows, Linux, or Solaris. If you are using a different application server or earlier version, we may ask you to migrate to one of the supported application servers before we can provide you with further support.

Databases

A database is required to run Confluence. Atlassian supports the databases listed on the Supported Platforms page.

If you have no preference for a particular database and wish to set up Confluence for production purposes, we highly recommend using PostgreSQL. This is a scalable, robust and free database server that is also easy to set
up. For database setup information, please refer to Database Setup For Any External Database.

Confluence should work with the database versions listed below. However, we do not test these versions regularly and we may ask you to migrate to one of the supported databases before we can provide you with further support.

- **PostgreSQL** — 8.2, 8.3, 8.4, 9.0
- **MySQL** — 5.1 (using the InnoDB storage engine, not MyISAM)
- **Oracle** — 11.1, 11.2
- **Microsoft SQL Server** — 2005, 2008, 2008 R2
- **DB2** — 9.7

**Java**

Confluence requires the Java Runtime Environment (JRE) installed.

If using the Zip or archive distribution of Confluence, you will need to install a supported JRE. The automated installer bundles Java and will install this for you. For instructions on installing the JRE for Windows and Linux/Solaris, please refer to Installing Java for Confluence.

**Please Note: Impact of Antivirus Software**

The presence of antivirus software on your operating system running Confluence greatly decreases the performance of Confluence. Antivirus software that intercepts access to the hard disk is particularly detrimental and may even cause errors in Confluence.

You should configure your antivirus software to ignore the following directories:

- Confluence home directory
- Confluence's index directory
- All database-related directories

⚠️ This recommendation above is particularly important if you are running Confluence on Windows. No matter how fast your hardware is, antivirus software will almost always have a negative impact on Confluence's performance and may render Confluence impossible to use.

**Confluence Hardware Requirements**

Please be aware that while some of our customers run Confluence on SPARC-based hardware, Atlassian only officially supports Confluence running on x86 hardware and 64-bit derivatives of x86 hardware.

See Server Hardware Requirements Guide for details.

Refer also to the tips on reducing out of memory errors, in particular the section on Permanent Generation Size.

**Atlassian Hosted Solutions**

If you do not have the resources to set up and maintain a Confluence installation locally, consider Atlassian hosted solutions. Atlassian can run and maintain your own installation of Confluence, handling all the testing, monitoring and upgrading processes for you. For more information, please refer to our Confluence Hosted and our integrated JIRA Studio solutions on our website.
Server Hardware Requirements Guide

Server administrators can use this guide in combination with the free Confluence trial period to evaluate their server hardware requirements. Because server load is difficult to predict, live testing is the best way to determine what hardware a Confluence instance will require in production.

Peak visitors are the maximum number of browsers simultaneously making requests to access or update pages in Confluence. Visitors are counted from their first page request until the connection is closed and if public access is enabled, this includes internet visitors as well as logged in users. Storage requirements will vary depending on how many pages and attachments you wish to store inside Confluence.

Minimum Hardware Requirements

The values below refer to the minimum available hardware required to run Confluence only, eg the minimum heap size to allocate to Confluence is 512mb. You will need additional physical hardware, of at least the minimum amount required by your Operating System, and any other applications that run on the server. Also please note that these are a guide only, and your configuration may require more.

On small instances, server load is primarily driven by peak visitors.

5 Concurrent Users
- 2GHz+ CPU
- 512MB RAM
- 5GB database space

25 Concurrent Users
- Quad 2GHz+ CPU
- 2GB+ RAM
- 10GB database space

Please be aware that while some of our customers run Confluence on SPARC-based hardware, Atlassian only officially supports Confluence running on x86 hardware and 64-bit derivatives of x86 hardware.

Example Hardware Specifications

These are example hardware specifications for non-clustered Confluence instances. It is not recorded whether the RAM refers to either total server memory or memory allocated to the JVM, while blank settings indicate that the information was not provided.

<table>
<thead>
<tr>

### Server Load & Scalability

When planning server hardware requirements for your Confluence deployment, you will need to estimate the server scalability based on peak visitors, the editor to viewer ratio and total content.

- The editor to viewer ratio is how many visitors are performing updates versus those only viewing content
- Total content is best estimated by a count of total spaces

Confluence scales best with a steady flow of visitors rather than defined peak visitor times, few editors and few spaces. Users should also take into account:

- Total pages is not a major consideration for performance. For example, instances hosting 80K of pages can consume under 512 meg of memory
- Always use an external database, and check out the performance tuning guides.

As mentioned on the documentation for Operating Large or Mission-Critical Confluence Installations, some important steps are loadtesting your usecase and monitoring the system continuously to find out where your system could do better and what might need to improve in order to scale further.

### Maximum Reported Usages

These values are largest customer instances reported to Atlassian or used for performance testing. Clustering for load balancing, database tuning and other performance tuning is recommended for instances exceeding these values.

<table>
<thead>
<tr>
<th>Visits</th>
<th>Updates</th>
<th>Pages</th>
<th>Editors</th>
<th>Ratio</th>
<th>Scalability</th>
</tr>
</thead>
<tbody>
<tr>
<td>150</td>

<td>2.6</td>
<td>4,048</td>
</tr>
</tbody>
</table>

3 machines total: application server, database server, Apache HTTPD + LDAP tunnel server. See Accenture's slides and video for full video details (That link isn't working, but the slides can be found here).
### Hard Disk Requirements

All wiki content is stored in the database, while attachments use either the database or filesystem. For example, the wiki instance you are reading now uses approximately 1 GB of database space and 9.4 GB of disk space.

Here is a breakdown of the disk usage requirements for this wiki, as at December 2008:

<table>
<thead>
<tr>
<th>Data</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database size</td>
<td>1003 MB</td>
</tr>
<tr>
<td>Home directory size</td>
<td>9.4 GB</td>
</tr>
</tbody>
</table>

#### Size of selected database tables

<table>
<thead>
<tr>
<th>Data</th>
<th>Rows</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content bodies (incl. all versions of blogs, pages and comments)</td>
<td>170462</td>
<td>145 MB</td>
</tr>
<tr>
<td>Content metadata (incl. title, author)</td>
<td>188697</td>
<td>48 MB</td>
</tr>
<tr>
<td>Content and user properties</td>
<td>193652</td>
<td>42 MB</td>
</tr>
<tr>
<td>Users</td>
<td>20679</td>
<td>5.8 MB</td>
</tr>
<tr>
<td>Attachment metadata</td>
<td>25718</td>
<td>5.0 MB</td>
</tr>
<tr>
<td>Labels</td>
<td>43235</td>
<td>4.5 MB</td>
</tr>
</tbody>
</table>

Note: not all database tables or indexes are shown, and average row size may vary between instances.

#### Size of selected home directory components

<table>
<thead>
<tr>
<th>Data</th>
<th>Files</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachments (incl. all versions)</td>
<td>27484</td>
<td>5.9 GB</td>
</tr>
<tr>
<td>Usage index (now disabled)</td>
<td>240</td>
<td>2.6 GB</td>
</tr>
<tr>
<td>Search index</td>
<td>10</td>
<td>236 MB</td>
</tr>
<tr>
<td>Office Connector cache</td>
<td>44</td>
<td>222 MB</td>
</tr>
</tbody>
</table>
Temporary files | 7269 | 201 MB
Plugin files | 1508 | 139 MB
Thumbnails | 10154 | 84 MB
Did-you-mean search index | 3 | 9.9 MB

Note: not all files are shown, and average file size may vary between instances.

**Private & Online Comparison**

Private instances manage their users either internally or through a user repository such as LDAP, while online instances have public signup enabled and must handle the additional load of anonymous internet visitors. Please keep in mind that these are examples only, not recommendations:

<table>
<thead>
<tr>
<th>Use Case</th>
<th>Space s</th>
<th>User Accounts</th>
<th>Editor s</th>
<th>Editor To Viewer Ratio</th>
<th>Pages</th>
<th>Page Revisions</th>
<th>Attachments</th>
<th>Comments</th>
<th>Total Data Size (GB)</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Professional Assistance**

For large instances, it may be worthwhile contacting an [Atlassian Expert](https://www.atlassian.com/experts) for expertise on hardware sizing, testing and performance tuning. Simply contact a local Expert directly or email our Experts team for a recommendation.

### Confluence Installation Guide

#### Prerequisites

Before beginning to install Confluence, please check that:

- Your system meets the [minimum system requirements](#) to run Confluence.
- This version of the Confluence documentation matches the version of Confluence that you are installing. The Confluence documentation version you are currently viewing is indicated toward the top of the page tree on the left or in the 'breadcrumb trail' in the top banner of this page. If you need to access a different version of the Confluence documentation, use the control at the top of the page tree on the left or you can access it from the [documentation home page](#).

#### Choose the Confluence Installation Type

Choose the type of Confluence installation you'd like from the table below, and follow the link(s) to the installation instructions.

<table>
<thead>
<tr>
<th>Installation Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Installing Confluence on Windows</td>
<td>Install Confluence via the Atlassian installer. This is the easiest method of installing Confluence. This is the best option for evaluators.</td>
</tr>
<tr>
<td>Installing Confluence on Linux</td>
<td></td>
</tr>
<tr>
<td>Installing from a Zip File on Windows</td>
<td>This option requires you to manually carry out installing the files and configuring system properties. Use this option if there is no specific installer for your operating system.</td>
</tr>
<tr>
<td>Installing From an Archive File on Linux</td>
<td></td>
</tr>
<tr>
<td>EAR/WAR distribution (Zip Archive)</td>
<td>This distribution allows you to deploy Confluence onto your own existing application server, instead of the Apache Tomcat server bundled with the regular distribution.</td>
</tr>
</tbody>
</table>
Confluence Clusters (Zip Archive)

Install Confluence as a series of clusters, to improve performance or availability. Please read the Confluence Clustering Overview and the Cluster Checklist before you consider installing Confluence in a cluster.

Please read Running Confluence in a Virtualised Environment if you are interested in running Confluence in a virtual machine.
If you wish to upgrade Confluence, see Upgrading Confluence.

</tr>
<tr>
<td>• Installing From an Archive File on Linux</td>
<td>Use this option if there is no specific installer for your operating system.</td>
</tr>
</tbody>
</table>

If you have not already done so, please verify that this version of the Confluence documentation matches that of the Confluence version you are installing. The Confluence documentation version you are currently viewing is indicated toward the top of the page tree on the left or in the 'breadcrumb trail' in the top banner of this page. If you need to access a different version of the Confluence documentation, use the control at the top of the page tree on the left or you can access it from the documentation home page.

Take me back to the Confluence Installation Guide.

Installing Confluence on Windows

This guide describes how to install a new Confluence installation on Windows using the automated 'Windows Installer'. You can also install Confluence from a 'zip' archive — see Installing Confluence on Windows from Zip File for details.
If you are upgrading Confluence, please refer to the Upgrading Confluence guide.

⚠️ Please Note:

• Some anti-virus or other Internet security tools may interfere with the Confluence installation process and prevent the process from completing successfully. If you experience or anticipate experiencing such an issue with your anti-virus/Internet security tool, disable this tool first before proceeding with the Confluence installation.

• Before you begin installing Confluence, please read the System Requirements page.
On this page:

- **Using the Installation Wizard**
  - 1. Download and Run the Confluence 'Windows Installer'
  - 2. Starting Confluence
  - 3. Run the Setup Wizard
  - 4. Next Steps

- **Performing an Unattended Installation**
  - Download and Run the Confluence 'Windows Installer' in Unattended Mode

---

**Using the Installation Wizard**

Use the installation wizard if you are installing Confluence on your server for the first time or you wish to specify your installation options.

If you have previously installed Confluence using the installation wizard and wish to re-install Confluence again with the same installation options, you can re-install Confluence in 'unattended mode' without any user input required (see below for details).

1. **Download and Run the Confluence 'Windows Installer'**

   - To install Confluence as a service, the Windows Installer must be run using a Windows administrator account. While you can run the Windows Installer with a non-administrator account, your installation options will be much more limited.
   
   1. Download the Confluence 'Windows Installer' (.exe) file from the Confluence Download page.
   2. Run the installer file to start the installation wizard.
   3. If a Windows 7 (or Vista) 'User Account Control' dialog box requests if you want to allow the installation wizard to make changes to your computer, click 'Yes'. If you do not, the installation wizard will have restricted access to your operating system and any subsequent installation options will be limited.
   4. Choose between the 'Express Install' or 'Custom Install' options:
      a. **Express Install** — If you choose this option, Confluence will be installed with default settings which are shown in the next step of the installation wizard. If you want to customise any of these options, click the 'Back' button and choose the 'Custom Install' option instead.
      b. **Custom Install** — If you choose this option, Confluence will prompt you to specify the following options (which are presented during subsequent steps of the installation wizard and pre-populated with default values):
         - The 'Destination Directory' in which to install Confluence.
         - The Confluence Home Directory (which must be unique for each Confluence installation).
         - The Windows 'Start' menu folder options.
         - The TCP ports (i.e. an HTTP connector port and a control port) that Confluence will operate on.
         - If you are running the installer using an administrator account, you will be prompted to 'Install Confluence as a service' (recommended). You can also do this manually later, as described in Start Confluence Automatically on Windows as a Service.
   5. If you installed Confluence as a service, you must start Confluence through the Windows 'Start' menu, since Confluence will not start if you run start-confluence.bat at the Windows Command Prompt.

4. The installation wizard will install Confluence onto your operating system and will start Confluence automatically when the wizard finishes. Confluence will also be launched automatically in your browser window if you chose this option.

**Please Note:**

- If you chose to install Confluence as a service, the Confluence service will be run as the Windows
'SYSTEM' user account. To change this user account, see Changing the Windows user that the Confluence service uses.

- If you do not install Confluence as a service, then once started, Confluence will be run as the Windows user account under which Confluence was installed.
- If you use Confluence running on a Windows Server in production, we strongly recommend creating a dedicated user account (e.g. with username 'confluence') for running Confluence.
  - For more information about creating a dedicated user account and defining which directories this account should have write access to, refer to our guidelines.
  - If your Windows Server is operating under Microsoft Active Directory, ask your Active Directory administrator to create a dedicated user account that you can use to run Confluence (with no prior privileges).
  - If Confluence is installed as a service, do not forget to change the user account that runs the Confluence service to your dedicated user account for running Confluence.

2. Starting Confluence

If Confluence is not already started, you can start Confluence using the appropriate Windows 'Start' menu shortcut or command prompt option.

Once Confluence is started, you can access Confluence from the appropriate Windows 'Start' menu shortcut or a browser on any computer with network access to your Confluence server.

2.1 Windows 'Start' Menu Shortcuts

The Installer will have created the following Windows 'Start' menu shortcuts:

- **Access Confluence** — opens a web browser window to access your Confluence application.
  - Your Confluence server must have been started for this shortcut to work.
- **Start Confluence Service** — starts up the Apache Tomcat application server which runs your Confluence installation, so that you can access Confluence through your web browser.
- **Stop Confluence Service** — stops the Apache Tomcat application server which runs your Confluence installation. You will not be able to access Confluence through your web browser after choosing this shortcut.
- **Uninstall Confluence** — uninstalls Confluence from your Windows operating system.

2.2 Starting and Stopping Confluence from a Command Prompt

Enter the bin subdirectory of your Confluence installation directory and run the appropriate file:

- **start-confluence.bat** (to start Confluence)
- **stop-confluence.bat** (to stop Confluence)

If you followed our guidelines for running Confluence with a dedicated user account, then to run Confluence as this user account (e.g. 'confluence'), use the runas command to execute start-confluence.bat. For example:

  ```
  > runas /env /user:<DOMAIN>\confluence start-confluence.bat
  (where <DOMAIN> is your Windows domain or computer name.)
  ```

2.3 Accessing Confluence from a Browser

You can access Confluence from any computer with network access to your Confluence server by opening a supported web browser on the computer and visiting this URL:
1. **http://<computer_name_or_IP_address>:<HTTP_port_number>**

where:

- `<computer_name_or_IP_address>` is the name or IP address of the computer on which Confluence is installed and
- `<HTTP_port_number>` is the HTTP port number specified when you installed Confluence (above).

If Confluence does not appear in your web browser, you may need to change the port that Confluence runs on.

3. **Run the Setup Wizard**

See the Confluence Setup Guide.

4. **Next Steps**

- See Confluence 101.
- If you did not install Confluence as a service, you will need to start Confluence manually every time you restart your computer. To change your Confluence installation to run as a service, please see Start Confluence Automatically on Windows as a Service.
- To get the most out of Confluence, please see Performance Tuning.

**Performing an Unattended Installation**

If you have previously installed Confluence using the installation wizard (above), you can use a configuration file from this Confluence installation (called `response.varfile`) to re-install 'unattended mode' without any user input required.

Installing Confluence in unattended mode saves you time if your previous Confluence installation was used for testing purposes and you need to install Confluence on multiple server machines based on the same configuration.

⚠️ **Please Note:**

- The `response.varfile` file contains the options specified during the installation wizard steps of your previous Confluence installation. Hence, do not uninstall your previous Confluence installation just yet.
- If you intend to modify the `response.varfile` file, please ensure all directory paths specified are absolute, for example, `sys.installationDir=C:\Program Files\Atlassian\Confluence`. Unattended installations will fail if any relative directory paths have been specified in this file.

**Download and Run the Confluence 'Windows Installer' in Unattended Mode**

1. Download the Confluence 'Windows Installer' (.exe) file from the Confluence Download Center to a suitable location.
2. Open the Windows command prompt and perform the remaining steps in the command prompt.
3. copy the `response.varfile` file located in the `install4j` subdirectory of your previous Confluence installation directory, to the same location as the downloaded 'Windows Installer' file.
   - You can uninstall your previous Confluence installation after this step. Save your `response.varfile` if you need to install Confluence on multiple machines.
4. Change directory (cd) to the location of the 'Windows Installer' file and run the following command:

   ```bat
   atlassian-confluence-X.Y.exe -q -varfile response.varfile
   ```

   Where:
   - `X.Y` — refers to the version of Confluence you are about to install.
- `-q` — instructs the installer to operate in unattended mode (i.e. 'quietly').
- `--varfile response.varfile` — specifies the configuration file containing the configuration options used by the installer. The location and name of the configuration file should be specified after the `--varfile` option.

5. Confluence will start automatically when the silent installation finishes. Continue from step 2 [Starting Confluence](#) (above).

### Installing Confluence on Windows from Zip File

These instructions apply to:
- Confluence distributed as an archive file. This distribution includes Apache Tomcat as the application server.
- Windows systems. For other operating systems please refer to the Confluence Installation Guide.
- Manual installation and configuration using a zipped download file. For a simpler installation process, please use the Confluence Installer instead.

Also, please check that the version of Confluence which you are installing coincides with the version that this documentation is written for.

**On this page:**

1. **Before you Start**

   Please check the following points:

   1. Ensure that your system meets the minimum requirements to run Confluence. For more information, please refer to our Supported Platforms topic and for further details, our System Requirements topic.
   2. Have your Confluence license key ready. You can obtain a trial, free or commercial license now, or retrieve your existing license key.

2. **Install Java**

   Please refer to Installing Java for Confluence. If you are certain that this has already been installed and that the JAVA_HOME environment variable has been correctly configured, then proceed to the next step.

3. **Download the Confluence Installation File**

   1. If you have not downloaded Confluence already, download the zip file.
   2. Please check your unzip program before extracting the downloaded zip file. You should use a third-party unzip program like 7Zip or Winzip. If you do not have one, please download and install one of these before continuing:
      - 7Zip (recommended). If in doubt, download the '32-bit.exe' version.
      - Winzip.
   3. Use your unzipped program to unzip the installation file to a directory such as `c:\confluence`.
      - Do not use spaces in your directory path.

   The directory into which you unzipped the Confluence installation is called the Confluence Installation directory. Next, you will define the Confluence Home directory.

4. **Define your Confluence Home Directory**

   Now you need to define the Confluence Home directory. This is where Confluence will store its configuration information, indexes and attachments.

   **Tip:** Another term for 'home directory' would be 'data directory'.

   We suggest using different paths for your installation and home directories. This will facilitate easier upgrades.
Examples of Installation and Home Directories

**Installation directory:** `c:\confluence\confluence-vX.X`

**Home directory:** `c:\confluence\data`

1. Open your Confluence Installation directory (created when you unzipped Confluence — see above).
2. Under the Installation directory, open this file: `confluence\WEB-INF\classes\confluence-init.properties` in a text editor such as Notepad.
3. Scroll to the bottom of the text and find this line:

   ```
   # confluence.home=c:/confluence/data
   ```

4. Remove the '#' and the space at the beginning of this line, so that Confluence no longer regards the line as a comment. The line should now begin with `confluence.home`.
5. If you decide to change the Confluence Home directory from the default, please note the following:
   - Avoid spaces in the directory path or file name.
   - Use forward slashes `/` to define the path.

   For example:

   ```
   confluence.home=c:/data/confluence-home
   ```

5. **Check the Ports**

If you have another application running on your machine which is using the same ports that Confluence uses by default, you may need to change the port which Confluence will use. For example, if you have an installation of JIRA running on this machine, JIRA might be already using the port which Confluence requests by default.

By default, Confluence listens on port '8090'. If this port is already in use in your installation, follow these instructions to change the ports:

- To change the ports for Confluence, open the file `conf/server.xml` under your Confluence Installation directory. The first four lines of the file look like this:

  ```
  <Server port="8000" shutdown="SHUTDOWN" debug="0">
  <Service name="Tomcat-Standalone">
  <Connector className="org.apache.coyote.tomcat4.CoyoteConnector" port="8090" minProcessors="5" maxProcessors="75" enableLookups="true" redirectPort="8443" acceptCount="10" debug="0" connectionTimeout="20000" useURIValidationHack="false"/>
  ...
  ```

  You need to modify both the `server` port (default is 8000) and the `connector` port (default is 8090) to ports that are free on your machine.

  **Hint:** You can use netstat to identify free ports on your machine. See more information on using netstat on Windows or on Linux.
For example, here are the first four lines of a modified server.xml file, using ports '8020' and '8099':

```
<Server debug="0" shutdown="SHUTDOWN" port="8020">
  <Service name="Tomcat-Standalone">
    <Connector className="org.apache.coyote.tomcat4.CoyoteConnector" port="8099" minProcessors="5" maxProcessors="75" enableLookups="true" redirectPort="8443" acceptCount="10" debug="0" connectionTimeout="20000" useURIVisualizationHack="false"/>
  ...
```

To access Confluence in this configuration, point your web browser to http://localhost:8099/.

You will find more information on this page.

6. Select an External Database

This step is optional for users evaluating Confluence. However, if you are installing Confluence for production purposes, this step is mandatory. Please refer to the database requirements listed on our System Requirements topic for help in choosing an external database.

External databases are those listed on our Supported Platforms topic, excluding HSQLDB, which is bundled with Confluence and should not be used in production.

When you have chosen your external database, follow the database setup guide for setting up your database to work with Confluence.

You can learn more about migration from an existing installation or use of the evaluation database here. You will continue to use the Database Setup Guide during the Confluence Setup Wizard. (See step 8 below.)

7. Start Confluence

1. Go to your Confluence Installation directory (created when you unzipped Confluence — see above).
2. Under your Confluence Installation directory, open the bin directory and run the startup script: startup.bat. A command prompt window should appear.
   Please do not close this command prompt window. If you do so, Confluence will stop running.

   Troubleshooting

   If the window closes immediately when started, this means that an error is preventing Confluence from starting. To view this error:
   a. Open a command prompt: Click on your 'Start' menu, then click 'Run'. In the Run box, type cmd and click 'OK'.
   b. From the command prompt, go to your Confluence Installation directory.
   c. Go into the bin subdirectory.
   d. Run catalina.bat run.
      You should not run startup.bat at this point, because that would still produce a popup window that would close straight away.
   e. Read the error message.
   f. Find the solution to that error in the Installation FAQ.

3. Once Confluence is running, open a web browser and visit http://localhost:8090/.
   ✔ If you changed the port earlier, use the port you specified in step 5 above.
   🚨 If your web browser window shows an error, try waiting for 30 seconds or so and then refresh the browser page.
8. Next Step is the Confluence Setup Wizard

The Confluence Setup Wizard should appear in your web browser, prompting you to enter your license key. Follow the instructions on the screens, and read more guidelines on the Confluence Setup Wizard.

If the web browser shows an error instead of the Setup Wizard, check the Installation FAQ.

9. Start Confluence automatically on Windows as a Service

Confluence should be run as a service.

Uninstalling Confluence from Windows

This page describes the procedure for uninstalling an instance of Confluence which has been installed using the Windows Installer.

To uninstall Confluence from Windows:

1. Log in to Windows as the same user that was used to install Confluence with the Windows Installer.
2. Start the uninstaller by doing either of the following:
   - Click the Windows Start Menu > All Programs > Confluence > Uninstall Confluence
   - OR
   - Open the Windows Control Panel, choose Add or Remove Programs (on Windows XP) or Programs and Features (on Windows 7, Vista) and then select Confluence X.Y from the list of applications and click Uninstall/Change.
   - OR
   - Open the Windows command prompt and do the following:
     a. Change directory to your Confluence installation directory
     b. Run the uninstall.exe file
3. Follow the prompts to uninstall Confluence from your computer.

Please note:

- The uninstaller will not delete the Confluence Home Directory.
- All log files that were generated while Confluence was running will not be deleted.
- All files within the Confluence Installation Directory will be deleted (with the exception of the Tomcat log older located in the Confluence Installation Directory).
- The uninstaller can be made to operate in unattended mode by specifying the -q option at the Windows command prompt — i.e. uninstall -q
- If you wish to re-install Confluence in 'unattended mode', do not uninstall your previous installation of Confluence just yet. See Using the Silent Installation Feature for more information.

Installing Confluence on Linux

This guide describes how to install a new Confluence installation on Linux using the automated 'Linux Installer'. You can also install from a 'zip' archive — see Installing Confluence on Linux from Archive File for details.

If you are upgrading Confluence, please see Upgrading Confluence.

Please Note:

- It is possible that any anti-virus or other Internet security tools installed on your Linux operating system may interfere with the Confluence installation process and prevent the process from completing.
successfully. If you experience or anticipate experiencing such an issue with your anti-virus/Internet security tool, disable this tool first before proceeding with the Confluence installation.

- Before you begin installing Confluence, please read the System Requirements page.

**Using the Console Wizard**

Use the console wizard if you are installing Confluence on your server for the first time or you wish to specify your installation options.

If you have previously installed Confluence using the installation wizard and wish to re-install Confluence again with the same installation options, you can re-install Confluence in 'unattended mode' without any user input required (see below for details).

1. **Download and install the Confluence 'Linux Installer'**

   - If you execute the Linux Installer with 'root' user privileges, the installer will create and run Confluence using a dedicated user account. You can also execute the Linux Installer without 'root' user privileges, although your installation options will be much more limited and a dedicated user account (to run Confluence) will not be created. To run Confluence as a service, the Linux Installer must be executed with 'root' user privileges.

   1. Download the appropriate Confluence 'Linux 64-bit / 32-bit Installer' (.bin) file from the Confluence Download page.

   - **Please Note:**
     - To access the 32-bit installer, you may need to click the 'Show all' link on the 'Confluence Download' page to access the other installation packages.
     - The difference between the 64-bit / 32-bit .bin installers relates to their bundled Java platforms that run Confluence. Bear in mind that a Confluence installation using the 64-bit installer may require additional memory (to run at a similar level of performance) to a Confluence installation using the 32-bit installer. This is because a 64-bit Java platform's object references are twice the size as those for a 32-bit Java platform.

   2. Open a Linux console and change directory (cd) to the '.bin' file's directory.

   - If the '.bin' file is not executable after downloading it, make it executable, for example:
     ```
     chmod a+x atlassian-confluence-X.Y.bin
     ```
     (where X.Y represents your version of Confluence)

   3. Execute the '.bin' file to start the console wizard.

   4. When prompted to choose between 'Express Install', 'Custom Install' or 'Upgrade an existing Confluence installation', choose either the 'Express Install' or 'Custom Install' options:

      - **Express Install** — If you choose this option, Confluence will be installed with default settings which are shown in the next step of the console wizard.

      - **Please Note:**
        - If you are running the installer with 'root' user privileges, Confluence will be installed as a service.
        - If you want to customise any of these options:
          i. Enter 'e' to exit the console wizard.
          ii. Execute the console wizard again (step 3 above).
          iii. Choose the 'Custom Install' option instead.

      - **Custom Install** — If you choose this option, Confluence will prompt you to specify the following options (which are presented during subsequent steps of the console wizard and pre-populated with default values):
        - The 'Destination Directory' in which to install Confluence.
        - The Confluence Home directory (which must be unique for each Confluence installation).
        - The TCP ports (i.e. an HTTP and a Control port) that Confluence will run through.
        - If you are running the installer 'root' user privileges, you will be prompted to 'Run Confluence as a service' (recommended). You can also do this manually later, as described in Start Confluence Automatically on Linux.

   5. The console wizard will install Confluence onto your operating system and will start Confluence automatically.
automatically when the wizard finishes.

**Please Note:**

if you executed the Linux Installer with 'root' user privileges, the Linux Installer creates a dedicated Linux user account with username 'confluence', which is used to run Confluence. This account has only:

- Full write access to your Confluence Home Directory.
- Limited write access to your Confluence Installation Directory.

If you executed the Linux Installer without 'root' user privileges, be aware that Confluence can still be run with 'root' privileges. However, to protect the security of your operating system, **this is not recommended**.

2. Start Confluence

If Confluence is not already started, you can start Confluence using the appropriate command at the Linux console.

Once Confluence is started, you can access Confluence from a browser on any computer with network access to your Confluence server.

2.1 Starting and Stopping Confluence manually

In the Linux console, enter the `bin` subdirectory of your Confluence installation directory and execute the appropriate file:

- `start-confluence.sh` (to start Confluence)
- `stop-confluence.sh` (to stop Confluence)

Confluence will be ready to access (from a browser window) when the following message appears in the application's log file:

```
******************************************************
... You can now access Confluence through your web browser.
******************************************************
```

2.2 Accessing Confluence from a Browser

You can access Confluence from any computer with network access to your Confluence server by opening a supported web browser on the computer and visiting this URL:

- `http://<computer_name_or_IP_address>:<HTTP_port_number>`

where:

- `<computer_name_or_IP_address>` is the name or IP address of the computer on which Confluence is installed and
- `<HTTP_port_number>` is the HTTP port number specified when you installed Confluence (above).

**Please Note:** If Confluence does not appear, you may need to change the port that Confluence runs on.

Note: Application server logs (i.e. for Apache Tomcat) will be written to `logs/catalina.out`.

3. Run the Setup Wizard
See the Confluence Setup Guide.

4. Next Steps

- See Confluence 101.
- If you did not install Confluence to run as a service, you will need to start Confluence manually every time you restart your computer. To change your Confluence installation to run as a service, please see Start Confluence Automatically on Linux.
- To get the most out of Confluence, please see Performance Tuning.

Performing an Unattended Installation

If you have previously installed Confluence using the console wizard (above), you can use a configuration file from this Confluence installation (called response.varfile) to re-install Confluence in ‘unattended mode’ without any user input required.

Installing Confluence in unattended mode saves you time if your previous Confluence installation was used for testing purposes and you need to install Confluence on multiple server machines based on the same configuration.

⚠️ Please Note:

- The response.varfile file contains the options specified during the installation wizard steps of your previous Confluence installation. Hence, do not uninstall your previous Confluence installation just yet.
- If you intend to modify the response.varfile file, please ensure all directory paths specified are absolute, for example, sys.installationDir=/opt/atlassian/confluence
Unattended installations will fail if any relative directory paths have been specified in this file.

Download and Run the Confluence 'Linux Installer' in Unattended Mode

1. Download the Confluence 'Linux Installer' (.bin) file from the Confluence Download Center to a suitable location.
2. Open a Linux console.
3. Copy (cp) the file .install4j/response.varfile located in your previous Confluence installation directory, to the same location as the downloaded 'Linux Installer' file.
   - You can uninstall your previous Confluence installation after this step. Save your response.varfile if you need to install Confluence on multiple machines.
4. Change directory (cd) to the location of the 'Linux Installer' file and execute the following command:
   ```
   atlassian-confluence-X.Y.bin -q -varfile response.varfile
   ```
   Where:
   - X.Y — refers to the version of Confluence you are about to install.
   - -q — instructs the installer to operate in unattended mode (i.e. 'quietly').
   - -varfile response.varfile — specifies the configuration file containing the configuration options used by the installer. The location and name of the configuration file should be specified after the -varfile option.
5. Confluence will start automatically when the silent installation finishes. Continue from the step above, Start Confluence.

Installing Confluence on Linux from Archive File
These instructions apply to:
- Confluence distributed as an archive file. The distribution includes Apache Tomcat as the application server.
- Linux or Solaris systems. If you are installing Confluence on a different system, please refer to Installing Confluence.

Also, please check the version of Confluence which you are installing. Refer to the documentation home page to verify the latest Confluence version and to find documentation for older versions.

**Hint:** If you are evaluating Confluence on Solaris or you are unsure which version to install, this is the one to use.

On this page:

- 1. Before you Start
- 2. Install Java
- 3. Download and Extract the Confluence Installation File
- 4. Define your Confluence Home Directory
- 5. Check the Ports
- 6. Select an External Database
- 7. Start Confluence
- 8. Confluence Setup Wizard

1. **Before you Start**

Please check the following points:

1. Ensure that your system meets the minimum requirements to run Confluence. For more information, please read the detailed System Requirements.
2. Have your Confluence license key ready. You can obtain a trial, free or commercial license now, or retrieve your existing license key.
3. You must be able to use a command prompt and install Java to continue. If not, please contact your system administrator to assist you or consider the Confluence Hosted evaluation option.
4. Make sure that you use a Gnu version of zip application - Solaris and AIX are known to have problems with zip, because they use their own (old) versions instead of the Gnu version.

2. **Install Java**

Please refer to the Supported Platforms for the required version of Java. (OpenJDK is currently **not** supported. A JIRA issue to request support for this JDK has **been created**.)

1. If you are not sure whether you have Java installed correctly, please confirm by doing the following:
   a. Open a shell console.
   b. Type `echo $JAVA_HOME` in the shell console and then press Enter.
   c. View the result:
      - If a line is displayed such as `/opt/jdk1.6.0_12` or `/usr/lib/jvm/java-6-sun`, then Java is installed and properly configured.
      - If nothing is displayed, then you either need to install Java or set the `$JAVA_HOME` environment variable. You can set this environment variable in your user account's 'profile' file. Alternatively, you can set this after installing Confluence ([in step 4 below](#)) by defining this path in your Confluence installation's `setenv.sh` file, usually located in the Confluence `bin` directory.
      - If you have installed an unsupported JDK and you want to use SSL then you need to install the Sun JSSE package.
2. If you need to install Java, follow these instructions:
3. Download and Extract the Confluence Installation File

1. If you have not downloaded Confluence already, download the TAR.GZ file.

Use your unzip program to unzip the installation file to a directory such as /home/jsmith/confluence-2.7.0-std/.

Most Linux/Solaris users can use any unzip program (such as GNU Tar) to extract the Confluence installer. However, Solaris users should not use the Solaris Tar program due to a known issue associated with its use in extracting Confluence. Use another application such as GNU Tar instead.

For example, change directory to your home directory in Linux and enter the following commands in the shell console:

- `gunzip confluence-<version>-std.tar.gz`
- `tar -xf confluence-<version>-std.tar` (where <version> refers to the Confluence version you downloaded.)

As usual on Linux/Solaris-based operating systems, avoid using spaces in your directory path. The directory into which you unzipped the Confluence installation is called the Confluence Installation directory.

4. Define your Confluence Home Directory

Now you need to define the Confluence Home directory. This is where Confluence will store its configuration information, indexes and attachments.

Tip: Another term for 'Home directory' would be 'data directory'.

We suggest using different paths for your installation and home directories. This will facilitate upgrades.

Examples of Installation and Home Directories:

- **Installation directory:** /usr/local/confluence/
  
  If you wish to install or maintain multiple versions of Confluence, you can add a version number to the Confluence installation directory name like /usr/local/confluence-3.1-std/ and optionally, create the symbolic link /usr/local/confluence/ that points to /usr/local/confluence-3.1-std/

- **Home directory:** /usr/local/confluence-data/

1. Open your Confluence Installation directory (created when you unzipped Confluence — see above).
2. Under the Installation directory, find this file: confluence/WEB-INF/classes/confluence-init.properties
3. Open the confluence-init.properties file in a text editor.
4. Scroll to the bottom and find this line:

   ```
   # confluence.home=c:/confluence/data
   ```

5. Remove the '#' and the space at the beginning of this line, so that Confluence no longer regards the line as a comment. The line should now begin with `confluence.home`
6. If you decide to change the Confluence Home directory from the default, use an absolute path rather than a symbolic link to specify the path and file name. For example:

```
confluence.home=/home/jsmith/confluence-data/
```

5. Check the Ports

If you have another application running on your machine which is using the same ports that Confluence uses by default, you may need to change the port which Confluence will use. For example, if you have a installation of JIRA running on this machine, JIRA might be already using the port which Confluence requests by default.

By default, Confluence listens on port '8090'. If this port is already in use in your installation, follow these instructions to change the ports:

- To change the ports for Confluence, open the file `conf/server.xml` under your Confluence Installation directory. The first four lines of the file look like this:

  ```xml
  <Server port="8000" shutdown="SHUTDOWN" debug="0">
    <Service name="Tomcat-Standalone">
      <Connector className="org.apache.coyote.tomcat4.CoyoteConnector" port="8090" minProcessors="5" maxProcessors="75" enableLookups="true" redirectPort="8443" acceptCount="10" debug="0" connectionTimeout="20000" useURIValidationHack="false"/>
    ...
  </Service>
  ...
  </Server>
  ``

  You need to modify both the `server` port (default is 8000) and the `connector` port (default is 8090) to ports that are free on your machine.

  <div style="color: green">Hint: You can use netstat to identify free ports on your machine. See more information on using netstat on <a href="http://www.windows.com">Windows</a> or on <a href="http://www.linux.com">Linux</a>.</div>

  For example, here are the first four lines of a modified `server.xml` file, using ports '8020' and '8099':

  ```xml
  <Server debug="0" shutdown="SHUTDOWN" port="8020">
    <Service name="Tomcat-Standalone">
      <Connector className="org.apache.coyote.tomcat4.CoyoteConnector" port="8099" minProcessors="5" maxProcessors="75" enableLookups="true" redirectPort="8443" acceptCount="10" debug="0" connectionTimeout="20000" useURIValidationHack="false"/>
    ...
  </Service>
  ...
  </Server>
  ```

  To access Confluence in this configuration, point your web browser to `http://localhost:8099/`.

  You will find more information on this page.

6. Select an External Database

This step is optional for users evaluating Confluence. However, if you are installing Confluence for production purposes, this step is mandatory. Please refer to the database requirements listed on our System Requirements.
External databases are those listed on our Supported Platforms topic, excluding HSQLDB, which is bundled with Confluence and should not be used in production.

When you have chosen your external database, follow the database setup guide for setting up your database to work with Confluence.

You can learn more about migration from an existing installation or use of the evaluation database here. You will continue to use the Database Setup Guide during the Confluence Setup Wizard. (See step 8 below.)

7. Start Confluence

1. Go to your Confluence Installation directory (created when you unzipped Confluence — see above).
2. Under your Confluence Installation directory, open the bin directory and run the startup script: start-confluence.sh.
3. Once Confluence is running, open a web browser and visit http://localhost:8090/
   ✔ Hint: If you changed the port earlier, use the port you specified in step 6 above.

8. Confluence Setup Wizard

The Confluence Setup Wizard should appear in your web browser, prompting you to enter your license key. Follow the instructions on the screens, and read more guidelines on the Confluence Setup Wizard.

If the web browser shows an error instead of the Setup Wizard, check the Installation FAQ.

Related Topics

- Change listen port for Confluence
- Running Confluence Over SSL or HTTPS
- Confluence Setup Guide
- Configuring Confluence
- Documentation Home

Uninstalling Confluence from Linux

This page describes the procedure for uninstalling Confluence, which had been installed using the Linux Installer.

To uninstall Confluence from Linux:

1. Open a Linux console.
2. Change directory (cd) to your Confluence installation directory.
3. Execute the command uninstall. This command must be executed as the same user account that was used to install Confluence with the Linux Installer.
4. Follow the prompts to uninstall Confluence from your computer.

Please note:

- The uninstaller will not delete the Confluence Home Directory.
- All log files that were generated while Confluence was running will not be deleted.
- All files within the Confluence Installation Directory will be deleted (with the exception of the Tomcat log folder located in the Confluence Installation Directory).
- The uninstaller can be made to operate in unattended mode by specifying the --q option — i.e. uninstall -q
- If you wish to re-install Confluence in ‘unattended mode’, do not uninstall your previous installation of Confluence just yet. See Using the Silent Installation Feature for more information.
Problem

This page tells you what to do if you get errors like the following when starting Confluence, when you can't access Confluence on port 8090.

If you see this error:

```
java.net.BindException: Address already in use: JVM_Bind:8090
```

This means you are running other software on Confluence's default port of 8090. This may be another other process running on the same port. It may also be a previous instance of Confluence that hasn't been shut down cleanly.

To find out what process is listening on that port, load a command prompt and type: `netstat -an`

- `a`: Displays all active TCP connections and the TCP and UDP ports on which the computer is listening.
- `n`: Displays active TCP connections, however, addresses and port numbers are expressed numerically and no attempt is made to determine names.

There is also Process Explorer tool available to determine what is binding port 8090.

Solution: Change the Ports which Confluence Listens On

To change the ports for Confluence, open the file `conf/server.xml` under your Confluence Installation directory.

The first four lines of the file look like this:

```
<Server port="8000" shutdown="SHUTDOWN" debug="0">
  <Service name="Tomcat-Standalone">
    <Connector className="org.apache.coyote.tomcat4.CoyoteConnector" port="8090" minProcessors="5" maxProcessors="75" enableLookups="true" redirectPort="8443" acceptCount="10" debug="0" connectionTimeout="20000" useURIVisualizationHack="false"/>
    ...
```

You need to modify both the `server` port (default is 8000) and the `connector` port (default is 8090) to ports that are free on your machine.

Hint: You can use netstat to identify free ports on your machine. See more information on using netstat on Windows or on Linux.

For example, here are the first four lines of a modified `server.xml` file, using ports '8020' and '8099':

```
<Server port="8020" shutdown="SHUTDOWN" debug="0">
  <Service name="Tomcat-Standalone">
    <Connector className="org.apache.coyote.tomcat4.CoyoteConnector" port="8099" minProcessors="5" maxProcessors="75" enableLookups="true" redirectPort="8443" acceptCount="10" debug="0" connectionTimeout="20000" useURIVisualizationHack="false"/>
    ...
```
Modified conf/server.xml using ports 8020 and 8099

```xml
<Server debug="0" shutdown="SHUTDOWN" port="8020">
  <Service name="Tomcat-Standalone">
    <Connector className="org.apache.coyote.tomcat4.CoyoteConnector" port="8099" minProcessors="5" maxProcessors="75" enableLookups="true" redirectPort="8443" acceptCount="10" debug="0" connectionTimeout="20000" useURIValidationHack="false"/>
    ...
  </Service>
</Server>
```

To access Confluence in this configuration, point your web browser to http://localhost:8099/

NOTES

[1] For more information on netstat, see using netstat on Windows, or netstat man page (Linux).

[2] The JIRA distribution runs on port 8080 by default. If you're looking to change the port of the JIRA distribution, see Changing JIRA Standalone's port.

Installing the Confluence EAR-WAR Edition

The Confluence EAR-WAR distribution is intended for deployment into an existing J2EE application server.

To use this method of installation, you need to know how to deploy a web application on an existing application server. If not, please use the Confluence distribution instead.

On this page:

- Step 1. Check the System Requirements and Known Issues
- Step 2. Download and Extract EAR-WAR Installation File
- Step 3. Review Application Server Memory Allocation
- Step 4. Configure confluence-init.properties
- Step 5. Edit Tomcat Context Descriptors
- Step 6. Add UTF-8 Encoding
- Step 7. (Optional) Configure Tomcat to Run on a Different Port
- Step 8. (Optional) Configure Confluence to Run as a Windows Service
- Step 8. Run the Confluence Setup Wizard
- Notes

Step 1. Check the System Requirements and Known Issues

1. Please check the Confluence system requirements.
2. In addition to the above requirements, the EAR-WAR distribution requires the Apache Tomcat application server. For more information on Confluence's supported application servers, please refer to our Supporte d Platforms page.
3. If deploying as an unexploded WAR, Ant 1.3 or later is required. This is bundled with the WAR download.
4. Confluence, the database and application server must use the same character encoding. UTF-8 is recommended.
5. Deploying multiple Atlassian applications in a single Tomcat container is not supported. We do not test this configuration and upgrading any of the applications (even for point releases) is likely to break it. There are also a number of known issues with this configuration (see this FAQ for more information).

We also do not support deploying multiple Atlassian applications to a single Tomcat container for a
number of practical reasons. Firstly, you must shut down Tomcat to upgrade any application and secondly, if one application crashes, the other applications running in that Tomcat container will be inaccessible.

Finally, we recommend not deploying any other applications to the same Tomcat container that runs Confluence, especially if these other applications have large memory requirements or require additional libraries in Tomcat's lib subdirectory.

6. Read through the Known Issues for Apache Tomcat.

Step 2. Download and Extract EAR-WAR Installation File

This section gives detailed instructions for installing Confluence EAR-WAR edition on an Apache Tomcat 5.5, or 6 server.

1. Download the Confluence EAR/WAR zip file. (You need to click the 'Show all' link to see the EAR/WAR zip file.)
2. Please check your unzip program before extracting the downloaded zip file. Some archive-extract programs cause errors when unzipping the Confluence zip file:
   - Windows users must avoid the Windows built-in unzip utility, as it doesn't extract all the files. Use a third-party unzip program like 7Zip or Winzip.
   - Solaris users will need to use GNU tar to handle the long file names.
3. Extract the downloaded zip file.
4. You have now unzipped your Confluence installation directory, which should contain the version number e.g. confluence-4.0.1 or confluence-4.0.2. This directory will be later referred to as the Confluence installation directory. Inside is a confluence subdirectory, referred to later as the (Exploded) Confluence WAR directory. Record the absolute path to the Confluence WAR directory.

Step 3. Review Application Server Memory Allocation

Confluence requires a maximum heap allocation (Xmx) of at least 256 MB for normal operation. Also, remember to set the maximum PermGen memory allocation (XX:MaxPermSize). See Increasing Application Server Memory.

⚠️ Do not configure a heap allocation so large that it does not allow enough remaining physical memory for your operating system and other applications on the server. The heap allocation should be large enough for Confluence, but not so large that the memory would be paged to disk during normal operation.

Step 4. Configure confluence-init.properties

1. Inside the Confluence installation directory, edit ...confluence/WEB-INF/classes/confluence-init.properties in a text editor.
2. Now define your Confluence Home directory, by setting the confluence.home property to a directory of your choosing. We suggest using different paths for your installation and home directories. This will facilitate upgrades. This is the directory that will contain all of Confluence's configuration, backup and attachment files.
   - Tip: Another term for 'Home directory' would be 'data directory'.

Step 5. Edit Tomcat Context Descriptors

1. Create a file called confluence.xml and save in the conf/Catalina/localhost sub-directory of Tomcat. If these directories don't exist you can create them manually.
2. Open your new confluence.xml file and add these lines:
3. For `docBase`, specify the value you noted down earlier.
4. Restart Tomcat, and Confluence should be accessible under `/confluence/` on your Tomcat server.
5. Follow the link below to proceed with the setup wizard.

**Step 6. Add UTF-8 Encoding**

1. Edit `conf/server.xml` and find the line where the Coyote HTTP Connector is defined. It will look something like this, possibly with more parameters:

   ```xml
   <Connector port="8080"/>
   ```

2. Add a `URIEncoding="UTF-8"` property to the connector:

   ```xml
   <Connector port="8080" URIEncoding="UTF-8"/>
   ```

**Step 7. (Optional) Configure Tomcat to Run on a Different Port**

See [Switching to Apache Tomcat](#).

**Step 8. (Optional) Configure Confluence to Run as a Windows Service**

Confluence can be [run as a service](#).

**Step 8. Run the Confluence Setup Wizard**

Once Confluence is running, open a web browser and visit [http://localhost:8080/](http://localhost:8080/) (Tomcat default port).

If you changed the port earlier, use the port you specified. Note that the Confluence installer normally uses port 8090 as the default, to avoid conflicts with JIRA (using port 8080).

The Confluence Setup Wizard should appear in your web browser, prompting you to enter your license key. Follow the instructions on screen, and read more guidelines on the [Confluence Setup Wizard](#).

**Notes**
Tomcat users, take care not to unzip the Confluence installation into your Tomcat `webapps` folder, as this may cause Confluence to be deployed more than once. It may cause a [Cluster Panic](#) error.

If you deploy Confluence on an unsupported server, server-related issues cannot be covered by Atlassian technical support. You can try [Atlassian Answers](#) for assistance instead.

### Known Issues for Apache Tomcat

**On this page:**

- [Supported Application Servers](#)

#### Installing Java for Confluence

This page contains instructions for installing a Java Runtime Environment (JRE). This is a manual step that is only required for Confluence installations where you are installing from a zip or archive file.

If you are using the automated installer, the required Java files are bundled and will be automatically put in place, hence you will not need to follow the instructions on this page.

Please refer to our [Supported Platforms](#) topic for details of the Java versions that are supported for Confluence.

#### Installing the JRE

A JRE (Java Runtime Environment) needs to be installed on the same server machine that will have Confluence installed.

### For Windows: (click to expand)

#### Installing the JRE on Windows

1. If you are not sure whether you have a JRE installed, please confirm by doing the following:
   - Check Control Panel > Programs and Features in Windows 7 (just Programs on older version of Windows).
   - Java should appear as a line item in the list. If not, you do not have Java installed.

2. To install the JRE, follow these instructions:
   - Go to the [Java download page](#).
   - Download the version entitled 'Java SE Update XX (JRE)', where 'XX' stands for some number. (The latest version will be available on that page.)
   - When the download has finished, run the Java installer. At one point, you will be asked to choose a directory to install to. Copy or write this directory down for use later.

3. Check that the `JAVA_HOME` environment variable has been set correctly.
   - Open the Start menu, choose Run, type `cmd` in the Run dialog box and click OK.
In the command prompt window, type `echo %JAVA_HOME%` and then press Enter.

View the result:

- If a directory path is displayed that looks similar to one of the following examples, with the letters 'jre' immediately preceding a series of version numbers, and this path matches the location where you installed the JRE in step 2, then your JRE has been successfully installed and your JAVA_HOME environment variable has been set correctly.

Examples of typical JAVA_HOME environment variable values:

- C:\Program Files\Java\jre6
- C:\Program Files\Java\jre6
- C:\Java\jre6
- C:\jre6

- If nothing is displayed or you do not see 'jre' immediately followed by a series of version numbers (like one of the examples above), then you need to set the JAVA_HOME environment variable. Please follow these instructions to set your JAVA_HOME environment variable to the directory you where you have just installed the Jre. By default, this directory is under C:\Program Files\Java.

For Linux: (click to expand)

**Installing the JRE on Linux**

1. If you are not sure whether you have JRE installed correctly, please confirm by doing the following:
   a. Open a shell console.
   b. Type `echo $JAVA_HOME` in the shell console and then press Enter.
   c. View the result:
      - If a line is displayed such as `/opt/jre6` or `/usr/lib/jvm/java-6`, then your JRE is installed and properly configured.
      - If nothing is displayed, then you either need to install the JRE or set the $JAVA_HOME environment variable. You can set this environment variable in your user account’s ‘profile’ file. Alternatively, you can set this after installing Confluence (in step 4 below) by defining this path in your Confluence installation’s `setenv.sh` file, usually located in the Confluence bin directory.
      - If you have installed an unsupported JRE and you want to use SSL then you need to install the Sun JSSE package.

2. If you need to install the JRE, follow these instructions:
   - Go to the Java download page.
   - Download the version entitled ‘Java SE Update XX (JRE)’, where 'XX' stands for some number. (The latest version is available on that page.)
   - When the download has finished, run the Java installer. Detailed installation instructions are provided on Oracle’s website.

**Setting the JAVA_HOME Variable in Windows**

This information is only relevant if you are installing Confluence on a Windows server.

After you have installed the Java Runtime Environment (JRE) in Windows, you must set the JAVA_HOME environment variable to point to the JRE installation directory.

**Stage 1. Locate the JRE Installation Directory**

If you already know the installation path for the Java Runtime Environment, go to Stage 2 below. Otherwise, find the installation path by following these instructions:

1. If you didn’t change the installation path for the Java Runtime Environment during installation, it will be in a directory under C:\Program Files\Java. Using Explorer, open the directory C:\Program Files\Java.

2. Inside that path will be one or more subdirectories such as C:\Program Files\Java\jre6.
Once you have identified the JRE installation path:

1. Right-click the **My Computer** icon on your desktop and select **Properties**.
2. Click the **Advanced** tab.
3. Click the **Environment Variables** button.
4. Under **System Variables**, click **New**.
5. Enter the variable name as **JAVA_HOME**.
6. Enter the variable value as the installation path for the Java Development Kit.
   - If your Java installation directory has a space in its path name, you should use the shortened path name (e.g. `C:\Progra~1\Java\jre6`) in the environment variable instead.

   **Note for Windows users on 64-bit systems**

   ```
   Progra~1 = 'Program Files'
   Progra~2 = 'Program Files(x86)'
   ```

7. Click **OK**.
8. Click **Apply Changes**.
9. Close any command window which was open before you made these changes, and open a new command window. There is no way to reload environment variables from an active command prompt. If the changes do not take effect even after reopening the command window, restart Windows.
10. If you are running the Confluence EAR/WAR distribution, rather than the regular Confluence distribution, you may need to restart your application server.

#### Overview

There are two methods of installing Confluence in a cluster, depending on whether you have existing data. **This page describes a fresh installation with no existing data.**

See also [Confluence Cluster Installation with Existing Data](#).  

---

**Oracle Coherence Licensing Change:**

- Due to a license agreement change, Confluence is now available in two editions:
  - **Standard Edition** — Confluence with Ehcache's caching technology (available to customers with non-clustered Confluence licenses).
    - If you are currently running a clustered installation of Confluence, please do not upgrade it with a standard edition of Confluence.
  - **Clustered Edition** — Confluence with Oracle's Coherence clustering and distributed caching technology (available to customers with Confluence clustered licenses only).
- For more information about these changes, please refer to the [Coherence License Changes](#) document.
- If you have a Confluence clustered license, are running a clustered installation of Confluence and wish to upgrade to Confluence version 2.6 or later, please ensure that you download only a [clustered edition of Confluence](#) and please refer to the [Confluence 3.0.1 Upgrade Notes](#) for additional upgrade information.
Installation with no existing data

To get Confluence running in a two-node cluster, you must do the following:

1. Ensure you meet the clustering requirements, including obtaining a clustered license key from Atlassian for each node.
2. Install Confluence on a single node, configuring an external database and a cluster name.
3. Load test the single node installation, see whether clustering is required.
4. Shut down the first node, copy the Confluence application and Confluence home directory to the second node.
5. Start the first node, wait until it is running, then bring up the second node and it will automatically join the cluster.
6. Test the cluster is working correctly.
7. Configure a load balancer in front of the two clustered nodes.

Each of these steps will be described in detail below.

1. Clustering requirements

Your Confluence cluster installation must meet all the following criteria for clustering:

- You must have a clustered license.
- You must use an external database.
- You must use a load balancer with session affinity in front of the cluster.

Clustered commercial licenses may be purchased through Confluence website. Clustered evaluation licenses may be obtained by emailing sales@atlassian.com.

A cluster can run using two copies of Confluence. However, cluster administrators must understand how to configure an application server and web server with load balancing, so we recommend you are comfortable installing Confluence as a EAR/WAR in your application server before proceeding with a clustered installation.

2. Installation on first node

Cluster administrators should already be comfortable with the normal installation method, so it won't be repeated here. There are two differences in the Confluence Setup Wizard from a normal installation:

- You must use an external database.
- You must enter a cluster name.

![Enter a cluster name to create a new cluster](image)

**Technical note**

The cluster name will be converted into a unique multicast IP address and port for your Confluence cluster. UDP multicast traffic is used for Confluence to automatically discover other nodes in the cluster when they start up.

3. Load test the single node

Most Confluence installations do not need to be clustered. Ensure you have tested your single node installation with the number of users you expect to host before going ahead with the additional complexity of clustering.
Check out our performance tuning tips for ways to improve the performance of a single instance of Confluence.

You can upgrade your single node to a multi-node cluster at any time by resuming this guide from step 4 below.

4. **Copy Confluence to second node**

Confluence clusters must use the same JDK, application server and application. The easiest way to ensure this is to shut down Confluence on the first node, then copy its web application and home directory to the second node:

1. Shut down Confluence on node #1.
2. Shut down your application server on node #2, or stop it automatically loading web applications.
3. Copy the Confluence web application from node #1 to node #2.
4. Copy the Confluence home directory from node #1 to node #2.

Copying the web application ensures any modifications you have made to the application itself, custom LDAP settings (atlassian-user.xml), and any other advanced configuration are copied to node #2.

Copying the home directory ensures the Confluence search index (the index/ directory), the database and cluster configuration (confluence.cfg.xml), and any other home directory settings are copied to node #2.

5. **Start Confluence on the first node, wait, then start Confluence on second node**

For the most stable start-up process, it is important to start Confluence one server at a time.

1. Start Confluence on node #1.
2. Wait for Confluence to become available on node #1.
3. Start Confluence on node #2.
4. Wait for Confluence to become available on node #2.

6. **Test cluster connectivity**

The Cluster Administration page (Administration, Cluster Configuration) includes information about the active cluster. When the cluster is running properly, this page displays:

- a correct count of the nodes in the cluster
- a status display for each node in the cluster
- an uptime for each node that is accurate.

A simple process to ensure your cluster is working correctly is:

1. Create a new document on node #1.
2. Ensure the new document is visible by accessing it directly on node #2.
3. Wait one minute (Confluence does batch indexing once per minute).
4. Search for the new document on node #1, ensure it appears.
5. Search for the new document on node #2, ensure it appears.
7. Configure load balancer

For the moment, configuring the load balancer is outside the scope of this document.

However, a simple [Apache and Tomcat load-balancing configuration](#) is available, which includes sample configuration for the Apache Tomcat and the Apache web server, using its load-balancing JK connector.

**Troubleshooting**

If you have problems with the above procedure, please see our [Cluster Troubleshooting guide](#).

**Upgrading a cluster**

It is important that upgrades follow the procedure for [Upgrading a Confluence Cluster](#).

**Related documentation**

- [Overview of Confluence Clusters](#)
- [Clustering in Confluence](#)
- [Confluence Cluster Installation with Existing Data](#)

- [Cluster Administration page](#)

**Confluence Cluster Installation with Existing Data**

**Overview**

There are two methods of installing Confluence in a cluster, depending on whether you have existing data. This page describes how to upgrade an existing Confluence instance into a cluster.

See also [Cluster installation without existing data](#).

---

**Oracle Coherence Licensing Change:**

- Due to a license agreement change, Confluence is now available in two editions:
  - **Standard Edition** — Confluence with Ehcache's caching technology (available to customers with non-clustered Confluence licenses).
    - If you are currently running a clustered installation of Confluence, please do not upgrade it with a standard edition of Confluence.
  - **Clustered Edition** — Confluence with Oracle's Coherence clustering and distributed caching technology (available to customers with Confluence clustered licenses only).
- For more information about these changes, please refer to the [Coherence License Changes](#) document.
- If you have a Confluence clustered license, are running a clustered installation of Confluence and wish to upgrade to Confluence version 2.6 or later, please ensure that you download only a clustered edition of Confluence and please refer to the [Confluence 3.0.1 Upgrade Notes](#) for additional upgrade information.
BEFORE ATTEMPTING THIS, PLEASE MAKE A BACKUP. To upgrade an existing copy of Confluence to run in a two-node cluster, you must do the following:

1. Ensure that your version of the Confluence distribution has been upgraded to the version you want to run the Cluster on. **Do not upgrade your version of Confluence and switch to the clustered version at the same time.** First upgrade your system (e.g. from Confluence 2.5.8 to 2.7.1) and make sure everything works fine (e.g. for a week) before switching (e.g. from Confluence 2.7.1 to 2.7.1 Clustered).
2. Ensure you meet the clustering requirements, including obtaining a clustered license key from Atlassian for each node.
3. Due to **CONF-8959**, you need to perform attachment migration to the database before you change your license to a clustered license.
4. Upgrade the existing Confluence instance to a clustered license. Do this by going to Admin> Licence Details. Confluence should warn you that this version of Confluence is not capable of clustering.
5. Shutdown Confluence. Deploy a clustered version of Confluence (Do not attempt to install any version of Confluence that is not the Clustered equivalent to your current release). Edit confluence-init.properties (confluence-ver-clustered/confluence/WEB-INF/classes/confluence-init.properties) to set confluence.home to the same path as the old home. Start the first node, and verify that things are working correctly.
6. Shut down the first node, copy the Confluence application and Confluence home directory to the second node.
7. Start the first node, wait until it is running, then bring up the second node and it will automatically join the cluster.
8. Test the cluster is working correctly.
9. Configure a load balancer in front of the two clustered nodes.

Each of these steps will be described in detail below.

1. Clustering requirements

Your Confluence cluster installation must meet **all** the following criteria for clustering:

- you must be running Confluence 2.3 or later
- you must have a clustered license
- you must use an external database
- you must use a load balancer with session affinity in front of the cluster.

Clustered commercial licenses may be purchased through [Confluence website](https://confluence.atlassian.com). Clustered evaluation licenses may be obtained by emailing sales@atlassian.com.

A cluster can run using two copies of the Confluence distribution. However, cluster administrators must understand how to configure an application server and web server with load balancing, so we recommend you are comfortable installing Confluence as a EAR/WAR in your application server before proceeding with a clustered installation.

You can follow the instructions to [Migrate Confluence to an external database](https://confluence.atlassian.com).

2. Upgrade existing instance to clustered license

Once you've obtained your clustered license from Atlassian, you can simply update the license in your running Confluence instance:

1. Go to ‘Administration’.
2. Go to 'License Details', and paste in the new license.
3. Click ‘Save’.

When you enter a clustered license, you will see a new line appear on this page: **Licensed Clustered Nodes**. This tells you how many nodes your Confluence license will allow.
License Details page shows the number of cluster nodes permitted

3. Migrate your attachments to the Database

You can do this by navigating to Admin > Attachment Storage > Edit, and changing it to “Database”.

4. Copy Confluence to second node

For the remaining steps in setting up a cluster with existing data, please continue from step 4 in the normal Confluence cluster installation guide.

5. Start Confluence on the first node, wait, then start Confluence on second node

See comment in step 4.

6. Test cluster connectivity

See comment in step 4.

7. Configure load balancer

See comment in step 4.

Troubleshooting

If you have problems with the above procedure, please see our Cluster Troubleshooting guide.

Upgrading a cluster

It is important that upgrades follow the procedure for Upgrading a Confluence Cluster.

Upgrading a Confluence Cluster

This page contains instructions for upgrading an existing Confluence cluster to a new version of Confluence. If you are not running a clustered instance of Confluence and wish to, see Confluence Cluster Installation with Existing Data.
Oracle Coherence Licensing Change:

- Due to a license agreement change, Confluence is now available in two editions:
  - **Standard Edition** — Confluence with Ehcache’s caching technology (available to customers with non-clustered Confluence licenses).
    - **Warning**: If you are currently running a clustered installation of Confluence, please do not upgrade it with a standard edition of Confluence.
  - **Clustered Edition** — Confluence with Oracle’s Coherence clustering and distributed caching technology (available to customers with Confluence clustered licenses only).
- For more information about these changes, please refer to the [Coherence License Changes](#) document.
- If you have a Confluence clustered license, are running a clustered installation of Confluence and wish to upgrade to Confluence version 2.6 or later, please ensure that you download only a **clustered edition of Confluence** and please refer to the [Confluence 3.0.1 Upgrade Notes](#) for additional upgrade information.

You can download the latest version of Confluence from [here](#).

**Overview**

The steps involved in upgrading a multi-node Confluence cluster are:

1. Backup your Confluence instance.
2. Read the Release Notes for this version and check you have the required expertise to perform the upgrade.
3. Stop each node in the cluster.
4. Install the new version into the application server on the first node.
5. Install the new version into the application server onto the remaining nodes.

**Step One: Backing up**

We highly recommend that you backup your Confluence home and install directories and your database before proceeding.

For specific files to backup see [Upgrading Confluence](#).

**Step Two: Things you need to check ...**

- Always check the [release-notes](#) for the version of Confluence you are installing for upgrade instructions specific to that version.
- To perform this upgrade you must be familiar with the usage of the application server running your Confluence Cluster, and the web server load balancing it.
- Check the [Configuring Confluence](#) for your application server and database, to make sure there isn't anything extra you need to do to get Confluence running.
- Check that you know what configurations or customisations have been made to your Confluence instance. These may include specialised user management configurations and changes to Confluence’s Java classes and Velocity templates.

**Step Three: Stopping the cluster**

It is vital that all nodes in the cluster are running the same version of Confluence. That's why the first step is to stop all the nodes.

Stop the Confluence application on each node using your application server.

**Step Four: Upgrading the first node**
We advise configuring your load balancing web server to redirect traffic away from Confluence until the upgrade is complete on multiple nodes.

Upgrading a cluster node uses the same process as Upgrading Confluence.

1. Unzip the new version.
2. Edit its confluence-init.properties to point to the existing home directory.
3. Port any immediately required customisations from the old version to the new one. Eg atlassian-user .xml.
4. Install the new version into the application server. Eg for Tomcat edit confluence.xml or server.xml to point to the new location, and restart Tomcat.
5. Wait for the Node to finish upgrading and confirm that you can log in and view pages before continuing to Step Five.
6. Port any additional customisations from the old version to the new version. Eg modifications to Java classes or Velocity templates.

Step Five: Upgrading other nodes

Copy the confluence installation, complete with customisations, to the next node.

1. Edit its confluence-init.properties to point to the existing home directory.
2. Install the new version into the application server. Eg for Tomcat 5 edit confluence.xml to point to the new location, and restart Tomcat.
3. Wait for the Node to finish upgrading and confirm that you can log in and view pages before continuing with the next node.

Troubleshooting

For suggested troubleshooting techniques, see our Cluster Troubleshooting page.

Apache and Tomcat load balancing

Overview

The following is a description of how to set up a Confluence Cluster on a Windows machine using Apache and mod_jk to handle the load-balancing.

The characteristics of this cluster are:

- Session affinity: sessions are associated with single servers.
- Failover: if a server dies, a connection will be directed to the nearest available server. (NOTE: sessions are not replicated)
- Failback: when a server comes back online, it will rejoin the cluster.
- Weighted load balancing: the load balancing can be controlled to take into account machine differences. (See the mod_jk documentation for details on this.)

What do you need?

1. Download and install one copy of Apache httpd. Do not install Apache as a service, but set it to listen on port 8080. (Tested with Apache httpd 2.0.55.)
2. Download the latest version of mod_jk. Copy this file into the Apache modules/ directory and rename it to mod_jk.so. (Tested with JK-1.2.19.)
3. Download and extract one copy of the ZIP distribution of Apache Tomcat. (Tested with Tomcat 5.5.)

Apache configuration

Edit the main Apache config file, conf/http.conf:

- add the following immediately after the other LoadModule directives:

```bash
LoadModule jk_module modules/mod_jk.so
```

- add the following just before the end of the file:

```bash
JkWorkersFile conf/workers.properties
JkLogFile logs/mod_jk.log
JkLogLevel info

JkMount /confluence loadbalancer
JkMount /confluence/* loadbalancer
```

Create a workers.properties file in the Apache conf/ directory. This version of the workers.properties file is configured to use 2 Tomcat instances: tomcat1 and tomcat2.

```bash
worker.list=loadbalancer
tomcat1.port=18081
tomcat1.host=localhost
tomcat1.type=ajp13
tomcat1.lbfactor=1
tomcat2.port=28081
tomcat2.host=localhost
tomcat2.type=ajp13
tomcat2.lbfactor=1

worker.loadbalancer.type=lb
worker.loadbalancer.balance_workers=tomcat1, tomcat2
worker.loadbalancer.method=Busyness
```

Tomcat configuration

The Tomcat configuration below will run multiple instances from the same binaries in the main Tomcat directory. For complete documentation of this configuration, see the RUNNING.txt file in the Tomcat distribution.

Create instance home directories

Create a directory for each instance of Tomcat, somewhere outside where you installed Tomcat. For example, if you extracted Tomcat to /opt/apache/tomcat-5.5, your instances could be in /var/tomcat-instances/tomcat1, /var/tomcat-instances/tomcat2. These folders will be referred to as the instance home directories.
Copy the following folders from the Tomcat installation directory into each instance home directory. Some of the folders may be empty, but copy them anyway.

- conf
- logs
- shared
- webapps

### Configure server.xml in each instance

Edit conf/server.xml in the instance home directories to include the Confluence application and have distinct listen ports for Server, HTTP Connector and AJP13 Connector. All nodes can use the same Confluence webapp as long as you set confluence.home via a system property (see startup scripts below).

Attached are two sample configurations:

- **tomcat1/conf/server.xml** - listens on port 18080 (http) and 18081 (ajp13)
- **tomcat2/conf/server.xml** - listens on port 28080 (http) and 28081 (ajp13)

To use these sample config files, you will need to edit them to set the Confluence web-app location and the data source configuration.

If editing the configuration files yourself, the points to note are:

- 'Server' port must be distinct
- 'Connector' for HTTP must be uncommented and use a distinct port. Use this port for testing the node individually.
- 'Connector' for AJP13 must be uncommented and use a distinct port. This port must match the port of the worker in the Apache workers.properties.
- 'Engine' for localhost must have jvmRoute matching the name of the worker in Apache's workers.properties.
- 'Context' for Confluence must be added inside the 'Host' tag, and include a 'Resource' for the datasource, as per normal Confluence installation under Tomcat.

### Create a startup script for each instance

The startup scripts for each instance must set the CATALINA_BASE environment variable and confluence.home system property. The variables in the sample scripts below should reference:

- CATALINA_HOME - Tomcat installation directory
- CATALINA_BASE - Tomcat instance home directory (distinct for each node)
- JRE_HOME - Java runtime directory
- JAVA_OPTS - include a confluence-home system property (distinct for each node)

**tomcat1/startup.bat:**

```
set CATALINA_HOME=C:\home\mryall\opt\apache\apache-tomcat-5.5.16
set CATALINA_BASE=C:\home\mryall\var\tomcat-instances\tomcat1
set JRE_HOME=C:\Java\jre1.5.0_06
set JAVA_OPTS=-Dconfluence.home=C:\home\mryall\data\confluence\cluster\tomcat1
              -Xmx512m
%CATALINA_HOME%\bin\startup.bat
```

**tomcat2/startup.bat:**
Continue setting up Confluence

Follow the [Confluence Cluster Installation](#) procedure with the steps following the app server setup.

### Troubleshooting

#### General advice

The above tomcat configurations enable HTTP connectors on each Tomcat instance so that you can connect to the nodes individually. To check whether the load balancer (Apache & mod_jk) is causing the problem, try connecting to the individual Tomcat instances. Please note that you should not allow users to directly access individual nodes in production mode: You don’t want people to bookmark nodes since the node details might change, or single nodes may be taken out of the cluster for maintenance while the cluster itself is still available.

**Session-affinity doesn’t seem to be working?**

Ensure the name you use for your worker in workers.properties (e.g. tomcat1) matches the jvmRoute attribute of the engine tag in your Tomcat server.xml. For an example, search for 'Engine' in the [attached sample config](#).

For troubleshooting your Confluence cluster, see [Cluster Troubleshooting](#).

#### Creating a Dedicated User Account on the Operating System to Run Confluence

![This step is optional if you are evaluating Confluence, but should be mandatory for Confluence installations used in production. If you have used the Confluence installer on Linux, this user will be created automatically.](#)

A dedicated user should be created to run Confluence, because Confluence runs as the user it is invoked under and therefore can potentially be abused. For example:

- If your operating system is *nix-based (for example, Linux or Solaris), type the following in a console:
  
  ```
  $ sudo /usr/sbin/useradd --create-home --comment "Account for running Confluence" --shell /bin/bash confluence
  ```

- If your operating system is Windows:
  
  1. Create the dedicated user account by either:
     
    - Typing the following at the Windows command line:
      ```
      > net user confluence mypassword /add /comment:"Account for running Confluence"
      ```
(This creates a user account with user name 'confluence' and password 'mypassword'. You should choose your own password.)

- Opening the Windows 'Computer Management' console to add your 'confluence' user with its own password.

2. **(Optional)** Use the Windows 'Computer Management' console to remove the 'confluence' user's membership of all unnecessary Windows groups, such as the default 'Users' group.

   - If Windows is operating under Microsoft Active Directory, ask your Active Directory administrator to create your 'confluence' account (with no prior privileges).

Ensure that only the following directories can be written to by this dedicated user account (e.g. 'confluence'):

- The following subdirectories of your Confluence Installation Directory:
  - logs
  - temp
  - work
- Your Confluence Home Directory.

⚠️ Do not make the Confluence Installation Directory itself writeable by the dedicated user account.

ℹ️ See also Best Practices for Configuring Confluence Security.

### Getting a Confluence License

Need a Confluence license or license key?

- If you do not yet have a license, you can get a **free multi-user evaluation license** or a **10-user starter license** immediately.
- If you already have a Confluence license, you can retrieve your key or generate a new key from the **license viewer**.
- For enterprise, non-profit, open source and educational licenses, see **Confluence licensing and pricing**.
- If you cannot find your key or are having problems, contact **sales@atlassian.com**.

### Running Confluence in a Virtualised Environment

This page provides some performance data and observations on running Confluence with **VMware**. The information on this page is intended to help you decide whether or not to run Confluence using a VMware product. It does not contain detailed instructions on how to set this up (please refer to the appropriate VMware product documentation instead).

**On this page:**

- **Summary**
- **Recommendations**
  - General
  - VMware ESX 3.5
  - VMware ESX 4i
- **Performance Testing Setup**
  - Server Configuration
  - Installed Software
  - Testing Tool
- **Test Results**
  - Result Descriptions
  - Low-to-Medium-load Confluence
Medium-to-High-load Confluence

Summary

**Confluence on Virtualised Environments**

Atlassian officially supports non-clustered installations of Confluence 3.0 and later on VMware. Although possible, we do not recommend (nor support) running versions of Confluence prior to 3.0 on VMware, since Confluence 3.0 resolved many performance issues that were present in earlier versions. Be aware that we also do not support clustered installations of Confluence on VMware. Please comment or vote on the feature request at CONF-19559.

Confluence is generally slower in a virtualised environment. As can be seen in the test results below, the amount by which Confluence slows down varies based on the workload.

Under low load there are several operations which are in fact faster under VMware. This is probably due to the 4CPU VM instance running on 8 real CPUs as opposed to there being only 4 real CPUs on the baseline machine.

**Please note, no performance tuning was applied to VMware for these tests. It may be possible to improve Confluence's performance by tuning VMware. However, this may cause other applications to run more slowly in the virtual environment. We recommend that you consult the VMware documentation before deciding whether to do this.**

Recommendations

**General**

- If you are a running a medium-to-high-load instance, your biggest performance gain will be to run the application and database on a real machine and not on virtual infrastructure.
- Under medium-to-high-load, moving the database onto another machine will help.
- Always ensure that there are enough virtual CPUs and memory allocated to the virtual instance. This may not be possible under VMware ESX 3.5 due to limitations of 4 vCPUs per VM.
- Always ensure that there is enough CPU time and memory available on the physical host to service all VMs. Applications should not go into swap.
- Use modern CPUs with VT extensions — there is still a noticeable performance penalty for using a VM with these CPUs, but it will likely be much higher when using old CPUs.
- Carefully monitor your VMware hosts to ensure that there is no resource starvation.

**VMware ESX 3.5**

- If possible, upgrade to VMware ESX 4i.
- Under low-to-medium-load, using a non-virtualised database will generally result in better response times.

**VMware ESX 4i**

- Under low-to-medium-load, keep the database inside the virtual machine if there is enough CPU time for both the database and application.
- Using VMware EX 4i and virtual machine version 7, you will be able to allocate up to 8 vCPUs to an instance.

Performance Testing Setup

**Server Configuration**

All testing was performed on the following hardware. In the case of virtual machines, one VM per machine was configured.
<table>
<thead>
<tr>
<th>Platform</th>
<th>CPU</th>
<th>Real Ram</th>
<th>Disk</th>
<th>Virtualisation Software</th>
<th>Virtual machine version</th>
<th>Virtual CPU's</th>
<th>Virtual Ram</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dell R610</td>
<td>2 x Intel 'Nehalem' Xeon E5520 (Quad Core)</td>
<td>32Gb (8x 4Gb DDR3)</td>
<td>2 x 15K 146Gb SAS, Raid 1 4,5</td>
<td>VMware ESX 3.5</td>
<td>4</td>
<td>4</td>
<td>32Gb</td>
</tr>
<tr>
<td>Dell R610</td>
<td>2 x Intel 'Nehalem' Xeon E5520 (Quad Core)</td>
<td>32Gb (8x 4Gb DDR3)</td>
<td>2 x 15K 146Gb SAS, Raid 1 4,5</td>
<td>VMware ESXi 4</td>
<td>7</td>
<td>4</td>
<td>32Gb</td>
</tr>
<tr>
<td>Dell R610</td>
<td>2 x Intel 'Nehalem' Xeon E5520 (Quad Core)</td>
<td>32Gb (8x 4Gb DDR3)</td>
<td>2 x 15K 146Gb SAS, Raid 1 4,5</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Notes:**

1. VT extensions were enabled in the BIOS on the machines running VMWare.
2. VT extensions were disabled in the BIOS on the machines not running VMWare, as per Dell best practices.
3. In order to limit the CPUs in the baseline test to match the number in VMWare, the kernel boot parameter `maxcpus=4` was added to the startup.
4. The full disk was allocated to VMWare.
5. The filesystem used in all machines was EXT3.

**Installed Software**

Each server was set up with identical software, as follows:

<table>
<thead>
<tr>
<th>Atlassian Product</th>
<th>Confluence 3.0.1-rc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database</td>
<td>PostgreSQL 8.2.6</td>
</tr>
<tr>
<td>Application Server</td>
<td>Tomcat 6.0.14</td>
</tr>
<tr>
<td>Java</td>
<td>Java(TM) SE (build 1.6.0_07-b06), Java HotSpot(TM 64-Bit Server VM (build 10.0-b23, mixed mode)</td>
</tr>
</tbody>
</table>
Operating System

Redhat Enterprise Linux 5.3 (Tikanga) 64bit (Kernel 2.6.18-128.2.1.el5). The file system used for all tests was EXT3 with the default options. The following tuning was applied to the operating system, in order to allow for more memory usage by the database server and better network throughput:

```plaintext
net.ipv4.ip_forward = 0
net.ipv4.conf.default.rp_filter = 1
net.ipv4.conf.default.accept_source_route = 0
kernel.sysrq = 0
kernel.core_uses_pid = 1
net.ipv4.tcp_syncookies = 1
kernel.msgmnb = 65536
kernel.msgmax = 65536
kernel.shmmmax = 1310720000
kernel.shmall = 4294967296
net.core.rmem_max = 16777216
net.core.wmem_max = 16777216
net.ipv4.tcp_rmem = 4096 87380 16777216
net.ipv4.tcp_wmem = 4096 65536 16777216
net.ipv4.tcp_no_metrics_save = 1
net.ipv4.tcp_moderate_rcvbuf = 1
net.core.netdev_max_backlog = 2500
```

Testing Tool

Performance tests were conducted with **Apache Jakarta JMeter 2.3.4** using the standard Confluence performance tests.

Test Results

The following tests were performed for each application. In each case, the test was performed with a database local to the host instance (i.e. in the same operating system image) and also with the database residing on a separate, non-virtualised physical server of the same specifications as above.

Result Descriptions

The following descriptions relate to the result graphs below.

- **Average time Comparison** — The average response time of the requests in the scenario - the lower the better.
- **95 percent Comparison** — The time (in milliseconds) by which 95% of all requests in the scenario have completed. This is not an average value — rather, you can think of it as a ‘how long the slowest requests (except the very worst 5% cases) take to complete’ scenario.
- **Scenarios:**
  - **Dashboard** — Simulates visiting the Confluence dashboard.
  - **Edit Page** — Simulates saving a page back to Confluence and notifying all people who are
watching this page.

- **View Page** — Simulates loading one out of hundreds of different Confluence pages. Some are short, others are long. Some have many images, others have many comments. Some have many macros, others do not. The pages are accessed through their full URL, as if someone had clicked link within the application or a bookmark.

- **Search Site** — Simulates a search across the whole system.

- **Browse User Personal Space** — Simulates regular browsing of pages in a user's personal space.

- **Ext-DB** (In the legend of each graph) — Indicates scenarios in which the database resides on a separate non-virtualised physical server.

### Low-to-Medium-load Confluence

This test performs around **18 requests/second** on the Confluence instance. This is not enough to saturate the host CPU time and during the test there is around **50-75% idle time**. You could expect to see similar results if your Confluence instance has enough resources available to it.

![Average time Comparison](image)

![95 percent Comparison](image)

### Medium-to-High-load Confluence

This test tries to perform double the requests/second of the lower load test (i.e. approximately **36 requests/second**) on the Confluence instance. This is enough load to saturate the available CPU time on a 4 CPU machine. This test is designed to simulate an instance which does not have enough resources to serve the number of requests being made to it.
## Confluence Setup Guide

Before running the Confluence Setup Wizard, as described below, you should have already completed **installing Confluence**.

When you access Confluence in your web browser for the first time, you will see the **Confluence Setup Wizard**. This is a series of screens which will prompt you to supply some default values for your Confluence site. It will also offer some more advanced options for setting up data connections and restoring data from a previous installation.

1. **Start the Setup Wizard**
   1. If Confluence is not already running, start it now:
      - If you are running the Confluence distribution on Windows, click Start > Programs > Confluence > Start Confluence Server.
      - Or, run the start-up script found in the bin folder of your installation directory:
        - `start-confluence.bat` for Windows.
        - `start-confluence.sh` for Linux-based systems.
   2. Go to the following web address in your web browser: [http://localhost:8090](http://localhost:8090)
      - The above web address uses port '8090'. If you chose a different port during installation, change '8090' to the number you chose.
      - You should see the licensing screen described **below**.
      - If an error message appears, first check that you are using the port which you specified during installation. Then check the **Installation FAQ**.
On this page:
- 1. Start the Setup Wizard
- 2. Enter your License Key
- 3. Choose your Installation Type
- 4. Production Installation: Database Configuration
- 5. Production Installation: External Database
- 6. Production Installation: Load Content
- 7. Production Installation: Restore Data from Backup
- 9. Production Installation: Connect to JIRA
- 10. Set Up System Administrator
- 11. Setup is Complete

2. Enter your License Key

Confluence Setup Wizard

Confluence needs some information before it is fully installed. If at any stage of the installation you need more information, check out the online setup guide. If you get stuck, you can lodge a support request with us and we will assist you further with your licensing query.

Enter License

Please enter your Confluence license key below - either commercial or evaluation. You can generate an evaluation license online and then return to this page.

Server ID: BYWJ-P433-BABM-EXTA
License Key: 

Choose Installation Type

There are two ways to install Confluence:

Evaluation Installation

Install Confluence with default settings and an embedded database. This is recommended for anyone evaluating or demonstrating Confluence, as it will get you up and running as quickly as possible. This option is not advised for running a production instance of Confluence.

Evaluation Installation

Production Installation

Perform a custom setup. Select this option if you want to configure Confluence with an external database, or initialise the server with your own data. This is strongly recommended for running a production instance, as the use of an external database is essential for data integrity.

Production Installation

Screenshot above: Licensing and installation type

✔ Hint: The above image and all the images on this page are screenshots. Clicking an image will not configure Confluence.

Find your Confluence license key and paste it into the License Key field, shown on the screenshot above.

If you already have a license key, you can retrieve it from the Atlassian website.
If you do not already have a Confluence license, you can obtain one now:

- To get a free evaluation license:
  1. Click **generate an evaluation license online** on the setup wizard, shown on the screenshot above.
  2. Follow the prompts to generate your license key and insert it into the setup wizard's licensing screen automatically.

- To get a commercial, academic, non-profit or open source license:
  1. Copy your **Server ID** from the setup wizard's licensing screen, shown on the screenshot above.
  2. Choose the license type you need from the list on the **Atlassian website**.
  3. Complete the **online order form**.

3. **Choose your Installation Type**

Refer to the screenshot *above*. In this step, you will choose whether you want an evaluation or a production installation.

**Option 1: Evaluation Installation** — Set up Confluence with the embedded **HSQLDB database** and default settings. This option will also install a Demonstration space with some example content to get you working with Confluence as quickly and easily as possible. You may upgrade to another type of database later on.

Who should choose this option?

- Choose the evaluation installation if you are evaluating Confluence or if you are new to Confluence.
- This option is not recommended for production instances of Confluence.

⚠️ **For production use, we strongly recommend that you connect to an external database rather than using the embedded database. The evaluation installation is therefore not suitable for production environments.**

Next, you will be asked for details of your system administrator. Go to **step 10 below**. Yes, you really can skip all the steps between. 😊

**Option 2: Production Installation** — Customise your Confluence instance to use your own database and your own data.

The production installation offers the following options:

- Connect Confluence to an external database. **Recommended for Confluence used in production environments.**
- Restore data from an existing Confluence database.
- Install Confluence without the demonstration content.

4. **Production Installation: Database Configuration**
Screenshot above: Database configuration

The above screen appears if you have chosen a production installation of Confluence. You can choose to use the embedded database supplied with your Confluence installation, or to connect to an external database.

- **Option 1: Embedded Database** — If you select this option, Confluence will use an embedded [HSQLDB database](https://hsqldb.org/). You should only select this option for the purposes of evaluating or demonstrating the use of Confluence. You can migrate to an external database later on if you wish.

- **Option 2: External Database** — If you wish Confluence to use an external database, select your database type from the database dropdown list and then click the 'External Database' button.
  - For production purposes, you **should use an external database** to ensure your data is kept safe and consistent.
  - If you choose PostgreSQL, please make sure that the version you install is supported by Atlassian. It is possible that we do not yet support the latest version of PostgreSQL.
  - Read the page about supported platforms for more information about which databases are supported. For details about choosing an external database, refer to the page on [system requirements](https://confluence.atlassian.com/display/DOC/Choose+a+Database+Configuration).

5. Production Installation: External Database

**Before you Start**

- **Character encoding:**
  - We strongly recommend that character encoding is consistent across your database, application server and web application, and that you use UTF-8 encoding.
  - Before setting up your database, please read about configuring character encoding.
- **Database name:** When creating a new external database, give it the name ‘confluence’.

You can choose to configure your database via a standard JDBC connection or via a server-managed
Datasource connection. Choose one of the two options below.

**Option 1: Standard Database Connection** — This uses a standard JDBC database connection. Connection pooling is handled within Confluence.

### Setup Standard Database

<table>
<thead>
<tr>
<th><strong>Driver Class Name</strong></th>
<th>com.mysql.jdbc.Driver</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Database URL</strong></td>
<td>jdbc:mysql://localhost/confluence</td>
</tr>
<tr>
<td><strong>User Name</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Password</strong></td>
<td></td>
</tr>
</tbody>
</table>

*Screenshot above: Standard (JDBC) connection*

Supply the following information:

- **Driver Class Name** — The Java class name for the appropriate database driver. This will depend on the JDBC driver, and will be found in the documentation for your database. You will also need to put the appropriate database driver 'jar' file in the server's classpath. For the Confluence distribution, this means copying the jar file into the `<confluence-install>/lib` directory.
- **Database URL** — The JDBC URL for the database you will be connecting to. This will depend on the JDBC driver, and will be found in the documentation for your database.
- **User Name** — A valid username which Confluence will use to access your database.
- **Password** — The password corresponding to the above username.

You will also need to know:

- The size of the connection pool Confluence should maintain. If in doubt, just go with the default provided.
- What kind of database you're connecting to, so you can tell Confluence which dialect it needs to use.

**Option 2: Datasource Connection** — This asks the Java application server for a database connection. You will need to have configured a datasource into your application server.

### Setup Datasource Connection

If `java:comp/env/jdbc/DataSourceName` doesn't work, try `jdbc/DataSourceName` (or vice versa)

| **Datasource Name** | java:comp/env/jdbc |

*Screenshot above: Datasource connection*

Supply the following information:

- **Datasource Name** — The JNDI name of the datasource, as configured in the application server. Note: Some servers will have JNDI names like `jdbc/DataSourceName`; others will be of the form `java:comp/env/jdbc/DataSourceName`. Consult your application-server documentation.

You will also need to know:
What kind of database you're connecting to, so you can tell Confluence which dialect it needs to use.

6. Production Installation: Load Content

**Load Content**

If you are evaluating or demonstrating Confluence, or are introducing Confluence to users who are new to the idea of a Wiki, we recommend the example site as the best way to become acquainted with what Confluence can do for you. More experienced users will want to start with an empty site, or restore a backup of their own.

- **Example Site**
  
  Recommended: Load the 'Demonstration Space' to begin working with Confluence immediately.

- **Empty Site**
  
  Start with an empty site. After finishing the setup you will need to create at least one space before you can add any content of your own.

- **Restore From Backup**
  
  Use data from a previous installation of Confluence. If you are upgrading or replicating Confluence you will probably want to select this option.

**Screenshot above: Load content**

Select one of the following options:

- **Example Site** — This option will load Confluence's 'Demonstration Space'. Select this if you are using Confluence for the first time, or if you want the Demonstration Space for your other Confluence users. The Demonstration Space helps to familiarise you with Confluence and what it can do for you. You can then continue using your Confluence deployment as normal — there's no need to reinstall later.
- **Empty Site** — Select this option if you are already familiar with Confluence. You will need to create at least one space before you can start adding content to the site.
- **Restore from Backup** — Select this option if you want to use Confluence data from a previous installation.

7. Production Installation: Restore Data from Backup

This option allows you to reload your data from an existing Confluence installation into your new Confluence site during the initial setup procedure. You can choose to upload data from a zipped backup file, or to restore from a backup file on your file system.

**Option 1: Upload a zipped backup to Confluence** — This option will load the data from a zipped backup file.

- To create a backup file from your existing version of Confluence, go to the 'Backup & Restore' section of your Administration Console.

- To restore from a zipped backup:
  1. Browse for the relevant daily backup file or a file you have created via a manual backup.
  2. Check 'Build Index' to build the data index, used for the search.
  3. Click the 'Upload and Restore' button.

**Option 2: Restore a backup from the filesystem** — This option is recommended if you have a very large daily backup file (greater than 100MB), or a daily backup file that is already on the server and doesn't require
1. Copy the XML backup file into the `restore` directory inside your Confluence Home directory and then refresh the page. You should now see your backup file appear on the 'Restore Data' screen (pictured above), in the box beneath the heading 'Restore a backup from the filesystem'.

2. Check 'Build Index' to build the data index, used for the search.

3. Click the 'Restore' button.

When the restore process has finished, you are ready to log in to Confluence. The system administrator account and all other information has been transferred from your previous Confluence installation.

8. Production Installation: Set Up User Management

You can choose to manage Confluence's users and groups inside Confluence or in JIRA.

- If you do not have Atlassian JIRA installed, or if you would prefer to set up external user management later, choose Manage users and groups within Confluence.
- If you have JIRA installed, the setup wizard gives you the opportunity to configure the JIRA connection automatically. This is a quick way of setting up your JIRA integration with the most common options. It will configure a JIRA user directory for Confluence, and set up application links between JIRA and Confluence for easy sharing of data. Choose Connect to JIRA.

9. Production Installation: Connect to JIRA
Enter the following information:

- **JIRA Base URL** – The web address of your JIRA server. Examples:
  
  http://www.example.com:8080/jira/
  http://jira.example.com

- **JIRA Administrator Login: Username** – Enter the username of a user with the ‘JIRA System Administrators’ global permission in JIRA.
- **JIRA Administrator Login: Password** – Enter the password that the above user uses to sign in to JIRA.
- **Confluence Base URL** – JIRA will use this URL to access your Confluence server. The URL you give here will override the base URL specified in your Confluence administration console, for the purposes of the JIRA connection.
- **User Groups** – Specify one or more JIRA groups whose members should be able to use Confluence. The default group is jira-users. (These groups will receive the ‘can use’ permission in Confluence.)
- **Admin Groups** – Specify one or more JIRA groups whose members should have administrative access to Confluence. The default group is jira-administrators. (These groups will receive the ‘Confluence system administrator’ and ‘Confluence administrator’ permissions in Confluence.)

For full details and a troubleshooting guide, see [Configuring JIRA Integration in the Setup Wizard](#).

**10. Set Up System Administrator**
The system administrator has full administrative power over your Confluence instance. This person will be able to add more users, create spaces, and set further Confluence options. Please refer to the overview of global permissions for more information.

**Hint:** If you are evaluating Confluence, set yourself up as the administrator.

1. Enter the following information to set up your system administrator's user account:
   - **Username** — The username under which the system administrator will log in to Confluence, e.g. 'jsmith'.
   - **Password** — The password which the system administrator will use to log in.
   - **Confirm** — Enter the same password again.
   - **Name** — The system administrator's full name, e.g. 'John Smith'.
   - **Email** — The system administrator's email address, e.g. 'jsmith@example.com'.

2. Click 'Next'.

### 11. Setup is Complete

**Confluence Setup Successful**

Confluence has now been installed with the Demonstration Space!

Start using Confluence now.

Learn how to import data from another wiki.

**Screenshot above: Setup is complete**

Congratulations! You have installed and set up Confluence. Click the Start using Confluence now link to open the Demonstration space in your Confluence wiki. This space contains some sample content and ideas, to help you get started quickly.

If you wish, you can click the link to learn how to import data from another wiki. This link leads to an overview page on your own Confluence server, containing information about the Universal Wiki Converter, an application that you can use to import data from other wiki types such as MediaWiki, DokuWiki and others.

Confluence 101
External Database

Custom Installation - Connecting to an External Database

This page is part of the Confluence Setup Guide.

**Before you Start**
- **Character encoding:**
  - We strongly recommend that character encoding is consistent across your database, application server and web application, and that you use UTF-8 encoding.
  - Before setting up your database, please read about configuring character encoding.
  - **Database name:** When creating a new external database, give it the name 'confluence'.

You can choose to configure your database via a standard JDBC connection or via a server-managed datasource connection. Choose one of the two options below.

**Option 1: Standard Database Connection** — This uses a standard JDBC database connection. Connection pooling is handled within Confluence.

[Screenshot above: Standard (JDBC) connection]

Supply the following information:

- **Driver Class Name** — The Java class name for the appropriate database driver. This will depend on the JDBC driver, and will be found in the documentation for your database. You will also need to put the appropriate database driver 'jar' file in the server's classpath. For the Confluence distribution, this means copying the jar file into the `<confluence-install>/lib` directory.

- **Database URL** — The JDBC URL for the database you will be connecting to. This will depend on the JDBC driver, and will be found in the documentation for your database.

- **User Name** — A valid username which Confluence will use to access your database.

- **Password** — The password corresponding to the above username.

You will also need to know:

- The size of the connection pool Confluence should maintain. If in doubt, just go with the default provided.
- What kind of database you're connecting to, so you can tell Confluence which dialect it needs to use.

**Option 2: Datasource Connection** — This asks the Java application server for a database connection. You will need to have configured a datasource into your application server.
Setup Datasource Connection

If "java:comp/env/jdbc/DatasourceName" doesn't work, try "jdbc/DatasourceName" (or vice versa)

Datasource Name: java:comp/env/jdbc/

Next >>

Screenshot above: Datasource connection

Supply the following information:

- **Datasource Name** — The JNDI name of the datasource, as configured in the application server. Note: Some servers will have JNDI names like jdbc/datasourcename; others will be of the form java:comp/env/jdbc/datasourcename. Consult your application-server documentation.

You will also need to know:

- What kind of database you’re connecting to, so you can tell Confluence which dialect it needs to use.

**Restoring from Backup During Setup**

This page is part of the Confluence Setup Guide.

This option allows you to reload your data from an existing Confluence installation into your new Confluence site during the initial setup procedure. You can choose to upload data from a zipped backup file, or to restore from a backup file on your file system.

**Option 1: Upload a zipped backup to Confluence** — This option will load the data from a zipped backup file.

To create a backup file from your existing version of Confluence, go to the 'Backup & Restore' section of your Administration Console.

To restore from a zipped backup:

1. Browse for the relevant daily backup file or a file you have created via a manual backup.
2. Check 'Build Index' to build the data index, used for the search.
3. Click the 'Upload and Restore' button.

**Option 2: Restore a backup from the filesystem** — This option is recommended if you have a very large daily backup file (greater than 100MB), or a daily backup file that is already on the server and doesn't require uploading.

1. Copy the XML backup file into the `restore` directory inside your confluence Home directory and then refresh the page. You should now see your backup file appear on the 'Restore Data' screen (pictured above), in the box beneath the heading 'Restore a backup from the filesystem'.
2. Check 'Build Index' to build the data index, used for the search.
3. Click the 'Restore' button.

When the restore process has finished, you are ready to log in to Confluence. The system administrator account and all other information has been transferred from your previous Confluence installation.
Configuring JIRA Integration in the Setup Wizard

This page describes the Connect to JIRA step in the Confluence setup wizard.

Overview

You can connect your application to a JIRA server, to manage your users via JIRA and share information with JIRA. When you are installing the application, the setup wizard gives you the opportunity to configure the JIRA connection automatically. This is a quick way of setting up your JIRA integration with the most common options.

You can also configure the JIRA connections via the application administration screens. In that case, you will need to set up connections individually. There are two parts to the integration process:

- A peer-to-peer link between JIRA and the application for sharing information and facilitating integration features. This link is set up via Application Links.
- A client-server link between the application and JIRA for delegating user and group management to your JIRA server.

Requirements: You need JIRA 4.3 or later.

Connecting to JIRA in the Setup Wizard
Confluence 4.3 Documentation

Screenshot above: Connecting to JIRA in the Confluence setup wizard

Enter the following information:

- **JIRA Base URL** – The web address of your JIRA server. Examples:
  
  http://www.example.com:8080/jira/
  http://jira.example.com

- **JIRA Administrator Login: Username** – Enter the username of a user with the ‘JIRA System Administrators’ global permission in JIRA.
- **JIRA Administrator Login: Password** – Enter the password that the above user uses to sign in to JIRA.
- **Confluence Base URL** – JIRA will use this URL to access your Confluence server. The URL you give here will override the base URL specified in your Confluence administration console, for the purposes of the JIRA connection.
- **User Groups** – Specify one or more JIRA groups whose members should be able to use Confluence. The default group is jira-users. (These groups will receive the ‘can use’ permission in Confluence.)
- **Admin Groups** – Specify one or more JIRA groups whose members should have administrative access to Confluence. The default group is jira-administrators. (These groups will receive the ‘Confluence system administrator’ and ‘Confluence administrator’ permissions in Confluence.)

**Troubleshooting**

This section describes the possible problems that may occur when integrating your application with JIRA via the setup wizard, and the solutions for each problem.
<table>
<thead>
<tr>
<th>Symptom</th>
<th>Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>

| The setup wizard displays one of the following error messages:          | The setup wizard failed to complete registration of the client-server link with JIRA for user management. The peer-to-peer link was successfully created, but integration is only partially configured.        | Remove the partial configuration if it exists, try the 'Connect to JIRA' step again, and then continue with the setup. Detailed instructions are below.                                                     |
| - Failed to register <application> configuration in JIRA for shared user management. Received invalid response from JIRA:  
- Failed to register <application> configuration in JIRA for shared user management. Received:  |                                                                                                                                                                                                     |                                                                                                                                                                                                         |
| The setup wizard displays the following error message:                  | The setup wizard successfully established the peer-to-peer link with JIRA, but could not persist the client-server link for user management in your config.xml file. This may be caused by a problem in your environment, such as a full disk. | Please investigate and fix the problem that prevented the application from saving the configuration file to disk. Then remove the partial configuration if it exists, try the 'Connect to JIRA' step again, and then continue with the setup. Detailed instructions are below. |
| - Error setting Crowd authentication                                    |                                                                                                                                                                                                     |                                                                                                                                                                                                         |
| The setup wizard displays the following error message:                  | The setup wizard has completed the integration of your application with JIRA, but is unable to start synchronizing the JIRA users with your application.                                             | Restart your application. You should then be able to continue with the setup wizard. If this solution does not work, please contact Atlassian Support.                                                      |
| - Error reloading Crowd authentication                                  |                                                                                                                                                                                                     |                                                                                                                                                                                                         |
The setup wizard displays the following error message:

- An error occurred: java.lang.IllegalStateException: Could not create the application in JIRA/Crowd (code: 500). Please refer to the logs for details.

The setup wizard has not completed the integration of your application with JIRA. The links are only partially configured. The problem occurred because there is already a user management configuration in JIRA for this <application> URL.

Remove the partial configuration if it exists, try the ‘Connect to JIRA’ step again, and then continue with the setup. Detailed instructions are below.

No users can log in after you have set up the application with JIRA integration.

Possible causes:
- There are no users in the group that you specified on the ‘Connect to JIRA’ screen.
- For FishEye: There are no groups specified in the ‘groups to synchronize’ section of your administration console.
- For Stash: You may not have granted any JIRA groups or users permissions to log in to Stash.

Go to JIRA and add some usernames to the group.
- For FishEye: Go to the FishEye administration screens and specify at least one group to synchronize. The default is ‘jira-users’.
- For Stash: Grant the Stash User permission to the relevant JIRA groups on the Stash Global permissions page.

If this solution does not work, please contact Atlassian Support.

Solution 1: Removing a Partial Configuration – The Easiest Way

If the application’s setup wizard fails part-way through setting up the JIRA integration, you may need to remove the partial configuration from JIRA before continuing with your application setup. Please follow the steps below.

Remove the partial configuration if it exists, try the ‘Connect to JIRA’ step again, and then continue with the setup wizard:

1. Log in to JIRA as a user with the ‘JIRA System Administrators’ global permission.
2. Click the ‘Administration’ link on the JIRA top navigation bar.
3. Remove the application link from JIRA, if it exists:
   a. Click ‘Application Links’ in the JIRA administration menu. The ‘Configure Application Links’ page will appear, showing the application links that have been set up.
   b. Look for a link to your application. It will have a base URL of the application linked to JIRA. For example:
      - If you want to remove a link between JIRA and FishEye, look for the one where the ‘Application URL’ matches the base URL of your FishEye server.
      - If you want to remove a link between JIRA and Confluence, look for the one where the ‘Application URL’ matches the base URL of your Confluence server.
      - If you want to remove a link between JIRA and Stash, look for the one where the ‘Application URL’ matches the base URL of your Stash server.
   c. Click the ‘Delete’ link next to the application link that you want to delete.
   d. A confirmation screen will appear. Click the ‘Confirm’ button to delete the application link.
4. Remove the user management configuration from JIRA, if it exists:
   a. Go to the JIRA administration screen for configuring the applications that have been set up to use JIRA for user management:
      - In JIRA 4.3: Click ‘Other Applications’ in the ‘Users, Groups & Roles’ section of the JIRA administration screen.
      - In JIRA 4.4: Select ‘Administration’ > ‘Users’ > ‘JIRA User Server’.
   b. Look for a link to your application. It will have a name matching this format:
<Type> - <HostName> - <Application ID>

For example:

FishEye / Crucible - localhost -
92004b08-5657-3048-b5dc-f886e662ba15

Or:

Confluence - localhost - 92004b08-5657-3048-b5dc-f886e662ba15

If you have multiple servers of the same type running on the same host, you will need to match the application ID of your application with the one shown in JIRA. To find the application ID:

- Go to the following URL in your browser:

  `<baseUrl>/rest/applinks/1.0/manifest`

  Replace `<baseUrl>` with the base URL of your application.

  For example:

  http://localhost:8060/rest/applinks/1.0/manifest

- The application links manifest will appear. Check the application ID in the `<id>` element.

  c. In JIRA, click ‘Delete’ next to the application that you want to remove.

  5. Go back to the setup wizard and try the ‘Connect to JIRA’ step again.

**Solution 2: Removing a Partial Configuration – The Longer Way**

If solution 1 above does not work, you may need to remove the partial configuration and then add the full integration manually. Please follow these steps:

1. Skip the ‘Connect to JIRA’ step and continue with the setup wizard, to complete the initial configuration of the application.
2. Log in to JIRA as a user with the ‘JIRA System Administrators’ global permission.
3. Click the ‘Administration’ link on the JIRA top navigation bar.
4. Remove the application link from JIRA, if it exists:
   a. Click ‘Application Links’ in the JIRA administration menu. The ‘Configure Application Links’ page will appear, showing the application links that have been set up.
   b. Look for a link to your application. It will have a base URL of the application linked to JIRA. For example:
      - If you want to remove a link between JIRA and FishEye, look for the one where the ‘Application URL’ matches the base URL of your FishEye server.
      - If you want to remove a link between JIRA and Confluence, look for the one where the ‘Application URL’ matches the base URL of your Confluence server.
      - If you want to remove a link between JIRA and Stash, look for the one where the ‘Application URL’ matches the base URL of your Stash server.
   c. Click the ‘Delete’ link next to the application link that you want to delete.
d. A confirmation screen will appear. Click the 'Confirm' button to delete the application link.

5. Remove the user management configuration from JIRA, if it exists:
   a. Go to the JIRA administration screen for configuring the applications that have been set up to use JIRA for user management:
      • In JIRA 4.3: Click 'Other Applications' in the 'Users, Groups & Roles' section of the JIRA administration screen.
      • In JIRA 4.4: Select 'Administration' > 'Users' > 'JIRA User Server'.
   b. Look for a link to your application. It will have a name matching this format:

   ```
   <Type> - <HostName> - <Application ID>
   ```

   For example:

   ```
   FishEye / Crucible - localhost - 92004b08-5657-3048-b5dc-f886e662ba15
   ```

   Or:

   ```
   Confluence - localhost - 92004b08-5657-3048-b5dc-f886e662ba15
   ```

   If you have multiple servers of the same type running on the same host, you will need to match the application ID of your application with the one shown in JIRA. To find the application ID:
      • Go to the following URL in your browser:

   ```
   <baseUrl>/rest/applinks/1.0/manifest
   ```

   Replace `<baseUrl>` with the base URL of your application.
   For example:

   ```
   http://localhost:8060/rest/applinks/1.0/manifest
   ```

   • The application links manifest will appear. Check the application ID in the `<id>` element.
   c. In JIRA, click 'Delete' next to the application that you want to remove.

6. Add the application link in JIRA again, so that you now have a two-way trusted link between JIRA and your application:
   a. Click 'Add Application Link'. Step 1 of the link wizard will appear.
   b. Enter the server URL of the application that you want to link to (the 'remote application').
   c. Click the 'Next' button.
   d. Enter the following information:
      • 'Create a link back to this server' – Tick this check box to add a two-way link between the two applications.
      • 'Username' and 'Password' – Enter the credentials for a username that has administrator access to the remote application.
      Note: These credentials are only used to authenticate you to the remote application, so that Application Links can make the changes required for the new link. The credentials are not saved.
      • 'Reciprocal Link URL' – The URL you give here will override the base URL specified in your remote application's administration console, for the purposes of the application links
connection. Application Links will use this URL to access the remote application.

e. Click the 'Next' button.

f. Enter the information required to configure authentication for your application link:
   - 'The servers have the same set of users' – Tick this check box, because the users are the same in both applications.
   - 'These servers fully trust each other' – Tick this check box, because you trust the code in both applications and are sure both applications will maintain the security of their private keys.

   For more information about configuring authentication, see Configuring Authentication for an Application Link.

g. Click the 'Create' button to create the application link.

7. Configure a new connection for user management in JIRA:

   a. Go to the JIRA administration screen for configuring the applications that have been set up to use JIRA for user management:
      - In JIRA 4.3: Click 'Other Applications' in the 'Users, Groups & Roles' section of the JIRA administration screen.
      - In JIRA 4.4: Select 'Administration' > 'Users' > 'JIRA User Server'.

   b. Add an application.

   c. Enter the application name and password that your application will use when accessing JIRA.

   d. Enter the IP address or addresses of your application. Valid values are:
      - A full IP address, e.g. 192.168.10.12.
      - A wildcard IP range, using CIDR notation, e.g. 192.168.10.1/16. For more information, see the introduction to CIDR notation on Wikipedia and RFC 4632.

   e. Save the new application.

8. Set up the JIRA user directory in the application.
   - For Confluence:
     a. Go to the Confluence Administration Console.
     b. Click 'User Directories' in the left-hand panel.
     c. Add a directory and select type 'Atlassian JIRA'.

   d. Enter the following information:
      - Name – Enter the name of your JIRA server.
      - Server URL – Enter web address of your JIRA server. Examples:

        http://www.example.com:8080/jira/
        http://jira.example.com

      - Application name and Application password – Enter the values that you defined for Confluence in the settings on JIRA.

   e. Save the directory settings.

   f. Define the directory order by clicking the blue up- and down-arrows next to each directory on the 'User Directories' screen.

   For details see Connecting to Crowd or JIRA for User Management.

   - For FishEye/Crucible:
     a. Click 'Authentication' on the FishEye/Crucible 'Admin Menu'.
     b. Click 'Edit' in the section titled 'JIRA or Crowd Authentication'.

     c. Enter the following information:
        - Application name and Application password – Enter the values that you defined for your application in the settings on JIRA.
        - JIRA/Crowd URL – The web address of your JIRA server. Examples:

        http://www.example.com:8080/jira/
        http://jira.example.com
• **Auto-add** – Select ‘Create a FishEye/Crucible user on successful login’ (default) to ensure that your JIRA users will be automatically enrolled into FishEye/Crucible when they first log in via JIRA.

• **Synchronize users with JIRA/Crowd** – Select ‘Yes’ (default) to ensure that JIRA will synchronize all changes in the user information on a regular basis. The **synchronization interval** is set to 60 minutes (1 hour) by default.

• **Single sign on (SSO)** – Select ‘Disabled’. This option is not available when using JIRA for user management and if enabled will make the integration fail.

• **Groups of users to synchronize** – Select at least one group to synchronize. The default is ‘jira-users’.
  
d. Click ‘Apply changes’.

• For Stash:
  
a. Go to the **Stash Administration Console**.
  
b. Click ‘**User Directories**’ in the left-hand panel.
  
c. **Add** a directory and select type ‘**Atlassian JIRA**’.
  
d. Enter the following information:
    
    • **Name** – Enter the name of your JIRA server.
    
    • **Server URL** – Enter web address of your JIRA server. Examples:
      
      ```
      http://www.example.com:8080/jira/
      http://jira.example.com
      ```
    
    • **Application name** and **Application password** – Enter the values that you defined for Stash in the settings on JIRA.
    
e. Save the directory settings.
  
f. Define the **directory order** by clicking the blue up- and down-arrows next to each directory on the ‘**User Directories**’ screen.
    
    For details see **Connecting to JIRA for user management**.

**Notes**

• When you connect to JIRA in the setup wizard, the setup procedure will configure **Trusted Applications** authentication for your application. Please be aware of the following security implications:
  
  • Trusted applications are a potential security risk. When you configure Trusted Applications authentication, you are allowing one application to access another as any user. This allows all of the built-in security measures to be bypassed. Do not configure a trusted application unless you know that all code in the application you are trusting will behave itself at all times, and you are sure that the application will maintain the security of its private key.
  
  • In the next step, you will specify the username and password of your **Confluence system administrator**. If you have connected to JIRA, the setup wizard will add the Confluence administrator's username and password to both JIRA and Confluence. This is done so that you can still access Confluence even if JIRA is down. Please note that the password in Confluence is not linked to the password in JIRA. If you subsequently change the administrator's password, only the password in JIRA will change. This is because the JIRA user directory is placed first in the list of user directories. See **Managing Multiple Directories**.

**Upgrading Confluence**

This document describes the standard, recommended procedure for upgrading to **Confluence Latest**. Use this procedure when upgrading from Confluence version 3.5 or later on Windows or Linux.
Notes:

- **Clustered Confluence.** The automatic installer/upgrader does not support upgrading clustered installations of Confluence. See Upgrading a Confluence Cluster.
- **Upgrading from an early version of Confluence.** If you are upgrading from a version earlier than Confluence 3.5, you will need to use manual upgrade procedure. See Upgrading Confluence Manually.
- **Moving to a different OS, database or file location.** If you are changing the operating system that will run Confluence, the database it is using, or the location of its files, you will need to use manual upgrade procedure. See Upgrading Confluence Manually.

### Upgrading to Confluence 4.3?

If so, please review the [Confluence 4.3 Release Notes](https://confluence-atlassian.com/release-notes) for important information about this version of Confluence. Ensure that you have read the [Confluence 4.3 Known Issues](https://confluence-atlassian.com/known-issues) in the Confluence Knowledge Base.

Also, we strongly recommend that you check the upgrade notes for every major version of Confluence that you are skipping, since there might be specific changes between Confluence versions that could affect your Confluence installation. The upgrade notes for recent major versions of Confluence are accessible from the [Upgrade Notes Overview](https://confluence-atlassian.com/upgrade-notes-overview) page.

Finally, please check the [Supported Platforms](https://confluence-atlassian.com/supported-platforms) page to ensure that your Java version, operating system, application server, database and browser are supported for this release of Confluence. The [End of Support Announcements for Confluence](https://confluence-atlassian.com/end-of-support-announcements) page has important information regarding supported platforms.

    - Upgrading Confluence on Linux
  - Upgrade Check List
    - Back Up Your External Database
    - Check Plugin Compatibility

### Before you Start

#### Changing your Database?

If you are planning to change to a different database, we recommend that you complete the Confluence upgrade first. Then follow the instructions on [migrating to a different database](https://confluence-atlassian.com/migrating-to-a-different-database).

1. Note that you need current software maintenance to perform the upgrade.
2. Confirm that your license support period is still valid before you try to upgrade.
3. If your current license has expired but you have a new license with you, please update your license in Confluence before performing the upgrade. **⚠️** If you forget to do this and your license has expired, you will receive errors during the upgrade process. Refer to the instructions on [upgrading beyond current license period](https://confluence-atlassian.com/upgrading-beyond-current-license-period).
4. Check the release notes for the new version of Confluence you are installing, plus the upgrade notes for...
any major versions you are skipping. It is important to read these upgrade notes as there might be specific changes between Confluence versions that could affect your Confluence instance. The upgrade notes pages for recent major versions of Confluence are accessible from the Upgrade Notes Overview page. (Each upgrade notes page is a 'child' of its respective release notes page.)

5. Make sure that your environment (e.g. the database system, the operating system, the application server and so on) still complies with the Confluence System Requirements. A newer version of Confluence may have different requirements than the previous version.

6. If you are using Confluence EAR-WAR edition, check Installing the Confluence EAR-WAR Edition to see if there is anything extra you will need to do to get Confluence running.

7. If you are using an external database, familiarise yourself with all known issues for your specific database. Also make sure the Confluence database connector principal (the database user account) has sufficient permissions to modify the database schema.

8. Note which plugins are installed and enabled on your current Confluence instance. Please verify whether a compatible version of the plugin is available in the version of Confluence you are upgrading to. This information is available via the 'Plugins' menu in your Administration screens, and selecting Confluence Upgrade Check. This will tell you which plugins have an updated version which is compatible with your target upgrade version. You can also check the respective home pages for these plugins on the Atlassian Plugin Exchange. Once you have confirmed the availability of compatible versions, you should upgrade your plugins after successfully upgrading Confluence. Please test these first by applying them to the latest Confluence version in a test environment.

9. If you have made any customisations to Confluence, please verify their compatibility in the latest version. For example, if you have modified any layouts or are using your own custom theme, please test these first by applying them to the latest Confluence version in a test environment. You can see the customisations applied to your Confluence installation.

10. Some anti-virus or other Internet security tools may interfere with the Confluence upgrade process and prevent the process from completing successfully. If you experience or anticipate experiencing such an issue with your anti-virus/Internet security tool, disable this tool first before proceeding with the Confluence upgrade.

11. After upgrading, Confluence may need to rebuild its indexes. If this happens, there may be some extra load placed on the server following the upgrade. Make sure to schedule any upgrade of production Confluence outside of hours where people need to use it.

**Backing Up**

Before you begin the Confluence upgrade, you must back up the following:

1. **Back up your Confluence Home directory.** The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   
   Tip: Another term for 'Home directory' would be 'data directory'. The location of the Home directory is stored in a configuration file called `confluence-init.properties`, which is located inside the `confluence/WEB-INF/classes` directory in your Confluence Installation directory. The Confluence installer will automatically prompt you to run a backup, storing the files in a .zip archive at the same level as your Confluence Home directory.

2. **Back up your database.** Perform a manual backup of your external database before proceeding with the upgrade, and double check that the backup was actually created properly. If you are not a database expert, or unfamiliar with the backup-restore facilities of your database, simply restore the backup to a different system to ensure the backup worked before proceeding. This recommendation is generally a good best practice. Surprisingly, many companies get in trouble for broken database backups because they skip this basic but vital "smoke test" of the operation. The 'embedded database' is the HSQLDB database supplied with Confluence for evaluation purposes. You don't need to back it up since it is stored in the Confluence home directory. You should not be using this database for production systems at all, so if you happen to be using HSQLDB in a production system, please migrate to a proper database before the upgrade. Read about the various shortcomings of HSQLDB.

3. **Back up your Confluence Installation directory or your Confluence webapp** (if you are using
Confluence EAR-WAR edition). The Confluence installer will automatically back up these files, storing the files in a .zip archive at the same level as your Confluence installation directory. The 'Confluence Installation directory' is the directory into which the Confluence application files and libraries have been unpacked (unzipped) when Confluence was installed. Confluence does not modify or store any data in this directory. This directory is also sometimes called the 'Confluence Install directory'.

Testing the Upgrade in a Test Environment

1. Create a snapshot of your current production Confluence environment on a test server, as described in the page on Moving Confluence Between Servers.

XML imports

⚠️ Importing an old XML backup file to a new major version (i.e Confluence 3.5 to Confluence 4.0) is not recommended. Please recreate your production instance in a test environment first.

2. Perform the upgrade on your cloned environment.

3. Test all your unsupported plugins and any customisations with the new version before proceeding on your production server. You can read more about supported and unsupported plugins.

RELATED TOPICS

Upgrading Confluence

Upgrade Overview

The upgrade feature of the Linux and Windows Installers automates the following tasks for you:

1. Backs up the Installation and Home Directories of the existing Confluence installation to be upgraded.
2. Installs Confluence Latest whilst migrating the following from your existing Confluence installation to the new Confluence Latest installation:
   - TCP port values in your existing Confluence installation's server.xml file. Be aware that other configurations or customisations in this file are not migrated during upgrade, and will need to be re-applied.
   - Custom values in your existing Confluence installation's confluence-init.properties (confluence.home property) and setenv.sh/setenv.bat files (JAVA_OPTS parameters)

The upgrade feature detects and notifies you of any files in the confluence subdirectory of your existing Confluence Installation Directory which have been deleted, added or modified from a 'default' Confluence installation. This informs you of any customisations you will need to migrate manually over to your upgraded Confluence installation directory. Note that modifications to files in directories other than confluence will not be detected when you upgrade to Confluence 4.0, for example any modifications to start-up scripts under the bin directory will not be detected. The next time you upgrade (e.g. to version 4.0.1) the the upgrade feature will cover modifications across the whole Confluence Installation Directory.

⚠️ Please Note:

- The upgrade process requests that you conduct a backup of your database using your database's backup utilities. If your database does not support online backups, you can stop the upgrade process, shut down Confluence, perform your database backup and then restart the upgrade process to continue on.
- If you have made customisations to your server.xml file or any other files in your Confluence
installation directory which are not handled by the upgrade wizard, these must be re-applied manually.

- If your attachments and index files are located outside your Confluence Home Directory, then backups of these directories must be performed manually.

Performing the Upgrade

Refer to the appropriate upgrade instructions below for your operating system:

Upgrading Confluence on Windows

1. Download the Confluence 'Windows Installer' (.exe) file (for the new version of Confluence) from the Confluence Download Center.
2. Run the '.exe' file to start the upgrade wizard.
   - If a Windows 7 (or Vista) 'User Account Control' dialog box requests if you want to allow the upgrade wizard to make changes to your computer, specify 'Yes'. If you do not, the installation wizard will have restricted access to your operating system and any subsequent installation options will be limited.
3. At the 'Upgrading Confluence?' step, choose the 'Upgrade an existing Confluence installation' option.
4. In the 'Existing Confluence installation directory' field, specify the Confluence Installation Directory of your Confluence installation to be upgraded.
   - The upgrade wizard will attempt to find an existing Confluence installation and use its location to pre-populate this field. However, always verify this location, particularly if you have multiple Confluence installations running on the same machine.
5. During subsequent steps of the upgrade wizard, you will be prompted to specify or do the following options:
   a. At the 'Back up Confluence directories' step, ensure the 'Back up Confluence home' option is selected. This creates 'zip' archive file backups of your existing Confluence Installation and Confluence Home Directories in their respective parent directory locations.
      - Please Note:
        - Choosing this option is strongly recommended!
   b. At this point, the upgrade wizard notes any customisations in your existing Confluence Installation Directory which it cannot automatically migrate to your upgraded Confluence installation. If you are notified by the installer about any files containing such customisations, please make a note of the locations of these files as you will need to manually migrate their customisations (which are not mentioned in the overview above) to your upgraded Confluence installation. One relatively common customisation that the upgrade wizard cannot automatically migrate is an SSL configuration defined in the conf/server.xml file of the Confluence Installation Directory. Please Note: when upgrading from the version that was not installed by the installer the customisations can only be detected in the confluence subdirectory of your existing Confluence Installation Directory. Modifications to files in directories other than confluence will not be detected when you upgrade, for example, modifications to conf/server.xml. However the next time you upgrade (e.g. to version 4.1.1) the upgrade feature will cover modifications across the whole Confluence Installation Directory.
   c. At the 'Upgrade Check List' step, back up your external database and check that any non-bundled plugins will be compatible with your upgraded Confluence version. You may have already conducted the latter (in step 5 of the Before You Start section above).
   d. Upon clicking 'Next', your existing Confluence installation will be shut down if it is still running. The upgrade wizard will then:
      i. Back up your existing Confluence installation.
      ii. Delete the contents of the existing Confluence Installation Directory.
      iii. Install the new version of Confluence to the existing Confluence Installation Directory.
      iv. Starts your new (upgraded) Confluence installation.
         - If you noted any files that contain customisations which must be migrated manually to your upgraded Confluence installation (above), then:
           1. Stop the upgraded Confluence installation.
           2. Migrate the customisations from these files into the upgraded Confluence Installation Directory.
3. Restart the upgraded Confluence installation.

6. At the last step of the upgrade wizard, select the option to launch the upgraded Confluence installation in a browser so you can check the upgrade.

Congratulations, you have completed upgrading your Confluence installation on Windows!

**Upgrading Confluence on Linux**

1. Download the appropriate Confluence 'Linux 64-bit / 32-bit Installer' (.bin) file that suits your operating system (for the new version of Confluence) from the Confluence Download Center.

2. Open a Linux console and change directory (cd) to the '.bin' file's directory.
   
   If the '.bin' file is not executable after downloading it, make it executable, for example:
   ```bash
   chmod a+x atlassian-confluence-X.Y.bin
   ```
   (where X.Y represents your version of Confluence)

3. Execute the '.bin' file to start the upgrade wizard.

4. When prompted to choose between creating a new Confluence installation or upgrading an existing installation, choose the 'Upgrade an existing Confluence installation' option.

5. Specify the Confluence Installation Directory of your Confluence installation to be upgraded.
   
   The upgrade wizard will attempt to find an existing Confluence installation and will provide its location as a choice. However, always verify this location, particularly if you have multiple Confluence installations running on the same machine.

6. During subsequent steps of the upgrade wizard, you will be prompted to specify or do the following options:
   
   a. Choose the option to back up Confluence's directories. This creates 'zip' archive file backups of your existing Confluence Installation and Confluence Home directories in their respective parent directory locations.
   
   Please Note:
   
   - **Choosing this option is strongly recommended!**
   
   At this point, the upgrade wizard notes any customisations in your existing Confluence Installation Directory which it cannot automatically migrate to your upgraded Confluence installation. If you are notified of any files containing such customisations, please make a note of the locations of these files as you will need to manually migrate their customisations (which are not mentioned in the overview above) to your upgraded Confluence installation. One relatively common customisation that the upgrade wizard cannot automatically migrate is an SSL configuration defined in the conf/server.xml file of the Confluence Installation Directory. Please Note: when upgrading from the version that was not installed by the installer the customisations can only be detected in the confluence subdirectory of your existing Confluence Installation Directory. Modifications to files in directories other than confluence will not be detected when you upgrade, for example, modifications to conf/serv er.xml. However the next time you upgrade (e.g. to version 4.1.1) the upgrade feature will cover modifications across the whole Confluence Installation Directory.

   b. At the 'Upgrade Check List' step, back up your external database and check that any non-bundled plugins will be compatible with your upgraded Confluence version. You may have already conducted the latter (in step 5 of the Before You Start section above).

   c. Upon proceeding, your existing Confluence installation will be shut down if it is still running. The upgrade wizard will then:
      
      i. Back up your existing Confluence installation.
      
      ii. Delete the contents of the existing Confluence installation directory.
      
      iii. Install the new version of Confluence to the existing Confluence installation directory.
      
      iv. Starts your new (upgraded) Confluence installation.
      
      Please Note: if you noted any files that contain customisations which must be migrated manually to your upgraded Confluence installation (above), then:
      
      1. Stop the upgraded Confluence installation.
      
      2. Migrate the customisations from these files into the upgraded Confluence Installation Directory.
      
      3. Restart the upgraded Confluence installation.

7. The last step of the upgrade wizard provides you with a link to launch the upgraded Confluence
installation in a browser, so you can check the upgrade.

Congratulations, you have completed upgrading your Confluence installation on Linux!

**Upgrade Check List**

The upgrade wizard requests that you perform the following tasks before it actually commences the upgrade of your existing Confluence installation.

**Back Up Your External Database**

Perform a backup of your external database (using your database's native backup tools) and verify that the backup was created correctly.

- If your database's native backup tools support 'online backups' (i.e. which would typically create a 'snapshot' of your Confluence database while the database is still in use), you can leave the upgrade wizard running while you perform the database backup and then continue on with the wizard after verifying that the database backup was created correctly.
- If your database's native backup tools do not allow you to perform an 'online backup' of your Confluence database, you should:
  1. Quit the upgrade wizard now.
  2. Use your database's native backup tools to perform an 'offline backup' of your Confluence database and verify that this backup was created correctly.
  3. Re-run the Linux / Windows Installer to start the upgrade wizard again and continue from where you left off.
- If you are using HSQLDB as the Confluence internal database, please note that this should be used for evaluating Confluence only. If you happen to accidentally use the HSQLDB database for a production system, quit the upgrade wizard now and use the [Migrating Confluence Between Servers](#) procedure to upgrade Confluence.

⚠️ **Inconsistent database backups may not restore correctly!** If you are unfamiliar with your database's native backup/restore facilities, then test your database backup's integrity by doing the following:

1. Restoring the database backup to a different (test) system,
2. Connecting a test instance of your current Confluence version to this restored database.

Alternatively, use the [Migrating Confluence Between Servers](#) procedure to upgrade Confluence instead.

**Check Plugin Compatibility**

If you have installed any 3rd-party Confluence plugins (i.e. not included in Confluence), please verify that they will be compatible with the version of Confluence you are upgrading to. You can find a plugin's compatibility information from the the plugin's home page on the [Atlassian Plugin Exchange](#). Once you have confirmed the availability of compatible versions, you should upgrade your plugins after successfully upgrading Confluence. This can be done by navigating to **Browse > Confluence Admin > Configuration > Plugins**.

**Upgrading Beyond Current Licensed Period**

This page explains the recovery process should you mistakenly try to upgrade your Confluence installation to a version beyond your current license entitlement.

**License warnings**

During an upgrade an obvious indication that your license has expired can be found in your log file. You will see a 'WARN' level entry similar to this:
[confluence.upgrade.impl.DefaultUpgradeManager] isUpgradeAllowed
Your license is now outside of it's support period.
You need to renew the license before you can upgrade to this version of Confluence.

<td>If you wish to renew your license, please contact <a href="mailto:sales@atlassian.com">sales@atlassian.com</a>. If you</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>have a new license, please enter it on this <a href="#">page</a> and <a href="#">restart</a>.</td>
<td></td>
</tr>
</tbody>
</table>

**Updating the Confluence license**

1. Contact [Atlassian Sales](#) to arrange for a new license to be issued, as instructed on the warning screen illustrated above.
2. Once you have received a suitable license, supply the license key to Confluence:
   - Click link given on the license warning screen, illustrated above.
   - You will first be asked to log in as a Confluence administrator.
   - Then you will be presented with a simplified license administration screen. Enter the credentials of a Confluence system administrator.
   - Copy the license key into the **License** field and choose **Save**.

   ![Confluence License Administration Screen](#)

3. Restart Confluence to continue the upgrade.

**Confluence Post-Upgrade Checks**

This article provides a list of items for Confluence Administrators to check after a [Confluence upgrade](#) to ensure...
that it has completed successfully. This list is not exhaustive, but it does cover common upgrade mistakes.

On this page:

- **Before You Begin**
- **Upgrade Checklist**
  - **1. Layout and Menu**
  - **2. Search**
  - **3. Permissions**
  - **4. Attachments**
  - **5. Plugins**

**Before You Begin**

After you have completed an upgrade, you should see the following message in the `atlassian-confluence.log` file:

```
2010-03-08 08:03:58,899 INFO [main] [atlassian.confluence.upgrade.AbstractUpgradeManager] upgradeFinished
Upgrade completed successfully
```

If you do not see the line in your log similar to the one above, this means that your upgrade has not completed successfully. Please check our [Troubleshooting Upgrades](#) documentation to check for a suitable recommendation or fix. If there are no errors logged or if none of the errors are referenced in the [Troubleshooting Upgrades](#) documentation, please contact Atlassian Support using the [Support Utilities](#) in your administration console.

**Upgrade Checklist**

Below is a recommended list of items to check after completing an upgrade.

1. **Layout and Menu**

   Visit the [Confluence dashboard](#) and check that it is accessible and displays as expected. Test the different Internet browsers that you have in use in your environment. In addition, confirm that the layout appears as expected and that the menus are clickable and functioning.

2. **Search**

   Try searching for content, for example pages, attachments or user names. Check that the expected results are returned.

3. **Permissions**

   Confirm that you can visit a page that has viewing restrictions, but you have permission to view. Confirm that you can edit a page that has edit restrictions but you have permission to edit. Make sure that the permissions of child pages are functioning as well. Involve as many space administrators as possible to confirm they are working. Confirm that anonymous or forbidden users cannot access or modify restricted pages.

4. **Attachments**

   Confirm that attachments are accessible and searchable.

5. **Plugins**
Outdated third-party plugins can cause upgrade failure. Quite often, they will just be incompatible and simply do not work anymore. If you discover that your plugin is no longer working, please check for the latest version for your plugin in the Atlassian Plugin Exchange.

✅ Universal Plugin Manager

Use the Universal Plugin Manager to easily check for plugin compatibility.

**Upgrading Confluence EAR-WAR Distribution**

This document tells you how to upgrade from one version of Confluence to a later version. These instructions apply to the EAR-WAR Distribution of Confluence, deployed on your own existing application server.

If you want to upgrade the regular Confluence distribution, which includes Apache Tomcat as the application server, please refer to Upgrading Confluence instead.

Please also check the following before you start using this guide:

- The version of Confluence that you will be upgrading to. Refer to the documentation home page to verify the latest Confluence version and to find documentation for older versions.
- The supported platforms for the version that you will be upgrading to. Please see the Supported Platforms page for the version of Confluence that you will be upgrading to, as well as the End of Support Announcements for Confluence.
- If you are running Confluence on a cluster, please see Upgrading a Confluence Cluster instead of this document.

💡 Upgrading to Confluence 4.3?

If so, please review the Confluence 4.3 Release Notes for important information about this version of Confluence. Ensure that you have read the Confluence 4.3 Known Issues in the Confluence Knowledge Base.

Also, we strongly recommend that you check the upgrade notes for every major version of Confluence that you are skipping, since there might be specific changes between Confluence versions that could affect your Confluence installation. The upgrade notes for recent major versions of Confluence are accessible from the Upgrade Notes Overview page.

Finally, please check the Supported Platforms page to ensure that your Java version, operating system, application server, database and browser are supported for this release of Confluence. The End of Support Announcements for Confluence page has important information regarding supported platforms.

On this page:

- Before you Start
- Backing Up
- Testing the Upgrade in a Test Environment
- Performing the Upgrade
- Reapplying Customisations to your New Confluence
- Checking for Known Issues and Troubleshooting the Confluence Upgrade

**Before you Start**
Changing your Database?

If you are planning to change to a different database, we recommend that you complete the Confluence upgrade first. Then follow the instructions on migrating to a different database.

1. Note that you need current software maintenance to perform the upgrade.
2. Confirm that your license support period is still valid before you try to upgrade.
3. If your current license has expired but you have a new license with you, please update your license in Confluence before performing the upgrade.
   ▲ If you forget to do this and your license has expired, you will receive errors during the upgrade process. Refer to the instructions on upgrading beyond current license period.
4. Check the release notes for the new version of Confluence you are installing, plus the upgrade notes for any major versions you are skipping. It is important to read these upgrade notes as there might be specific changes between Confluence versions that could affect your Confluence instance. The upgrade notes pages for recent major versions of Confluence are accessible from the Upgrade Notes Overview page. (Each upgrade notes page is a 'child' of its respective release notes page.)
5. Make sure that your environment (e.g. the database system, the operating system, the application server and so on) still complies with the Confluence System Requirements. A newer version of Confluence may have different requirements than the previous version.
6. If you are using Confluence EAR-WAR edition, check Installing the Confluence EAR-WAR Edition to see if there is anything extra you will need to do to get Confluence running.
7. If you are using an external database, familiarise yourself with all known issues for your specific database. Also make sure the Confluence database connector principal (the database user account) has sufficient permissions to modify the database schema.
8. Note which plugins are installed and enabled on your current Confluence instance. Please verify whether a compatible version of the plugin is available in the version of Confluence you are upgrading to. This information is available via the 'Plugins' menu in your Administration screens, and selecting Confluence Upgrade Check. This will tell you which plugins have an updated version which is compatible with your target upgrade version. You can also check the respective home pages for these plugins on the Atlassian Plugin Exchange. Once you have confirmed the availability of compatible versions, you should upgrade your plugins after successfully upgrading Confluence. Please test these first by applying them to the latest Confluence version in a test environment.
9. If you have made any customisations to Confluence, please verify their compatibility in the latest version. For example, if you have modified any layouts or are using your own custom theme, please test these first by applying them to the latest Confluence version in a test environment. You can see the customisations applied to your Confluence installation.
10. Some anti-virus or other Internet security tools may interfere with the Confluence upgrade process and prevent the process from completing successfully. If you experience or anticipate experiencing such an issue with your anti-virus/Internet security tool, disable this tool first before proceeding with the Confluence upgrade.
11. After upgrading, Confluence may need to rebuild its indexes. If this happens, there may be some extra load placed on the server following the upgrade. Make sure to schedule any upgrade of production Confluence outside of hours where people need to use it.

Backing Up

Before you begin the Confluence upgrade, you must back up the following:

1. Back up your Confluence Home directory. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   □ Tip: Another term for 'Home directory' would be 'data directory'. The location of the Home directory is stored in a configuration file called confluence-init.properties, which is located inside the confl
1. **Back up your database.** Perform a manual backup of your external database before proceeding with the upgrade, and double check that the backup was actually created properly. If you are not a database expert, or unfamiliar with the backup-restore facilities of your database, simply restore the backup to a different system to ensure the backup worked before proceeding. This recommendation is generally a good best practice. Surprisingly, many companies get in trouble for broken database backups because they skip this basic but vital "smoke test" of the operation.

2. **Back up your Confluence Installation directory or your Confluence webapp** (if you are using Confluence EAR-WAR edition). The Confluence installer will automatically back up these files, storing the files in a .zip archive at the same level as your Confluence installation directory. The 'Confluence Installation directory' is the directory into which the Confluence application files and libraries have been unpacked (unzipped) when Confluence was installed. Confluence does not modify or store any data in this directory. This directory is also sometimes called the 'Confluence Install directory'.

### Testing the Upgrade in a Test Environment

1. Be sure to test the upgrade in a test environment before proceeding on your production server.

2. Perform the upgrade on your cloned environment.

3. Test all your unsupported plugins and any customisations with the new version before proceeding on your production server. You can read more about supported and unsupported plugins.

### Performing the Upgrade

If you are migrating servers or migrating databases, perform those operations in separate steps.

The upgrade process allows you to unzip the new Confluence installation into a directory of your choice and then edit the configuration files to point your new installation to your existing data files. Follow these instructions:

1. Shut down your existing Confluence instance.
2. Download the Confluence EAR-WAR zip file: Go to the Download Center, and click 'Show all' to find the EAR-WAR zip file.
3. If you are on Windows, please check your unzip program before extracting the downloaded zip file. Some archive-extract programs cause errors when unzipping the Confluence zip file. You should use a third-party unzip program like 7Zip or Winzip. If you do not have one, please download and install one before continuing.
7Zip — Recommended. If in doubt, download the ‘32-bit.exe’ version
Winzip

4. Use your unzip program to unzip the installation file. You should now have a new directory called confluence-<version>.
   • In the rest of this document, we will refer to this as the <Installation-Directory>.
   • Do not use spaces in your directory path.
   • You can read more about the Confluence Installation directory.

5. Edit the confluence-init.properties file found at: <Installation-Directory>\confluence \WEB-INF\classes\confluence-init.properties and update 'confluence.home' to point to your existing Confluence Home directory.
   • Make sure you have first backed up your Home directory.
   • Open the confluence-init.properties file in a text editor such as Notepad.
   • Scroll to the bottom and find this line:

```
# confluence.home=c:/confluence/data
```

   • Remove the '#' and the space at the beginning of this line, so that Confluence no longer regards the line as a comment. The line should now begin with confluence.home.
   • Update the directory name after the = sign, to point to your existing Confluence Home directory.

6. If you are using Tomcat, you need to update either your confluence.xml or server.xml (depending on where you have defined the Confluence context descriptor) to point to the location of the new Confluence installation (also remember to copy over any customisations such as a tomcat datasource if you have one).

7. If you have delegated your user management to JIRA, LDAP or any other external user management system, copy the following files from your old Confluence installation to your new Confluence installation:
   • <Installation-Directory>/confluence/WEB-INF/classes/osuser.xml.
   • <Installation-Directory>/confluence/WEB-INF/classes/atlassian-user.xml (if you are upgrading from Confluence 2.2 or later).

   Upgrading to Confluence 3.5+ and using JIRA user management?
   Please review our KB article first: Upgrade to Confluence 3.5 with JIRA User Management Fails

   If you are upgrading from an earlier version of Confluence (2.5.5 and earlier) and are copying your existing atlassian-user.xml file from your previous instance, please ensure that the hibernate cache parameter in this file has been enabled, to avoid performance related issues. (NOTE: If you use Crowd for your user management, you do not need to do this.):

```
<hibernate name="Hibernate Repository"
key="hibernateRepository"
description="Hibernate Repository" cache="true"
/>`

8. If you have delegated your user management to Crowd, you will also need to copy the Crowd client library and configuration files from your old Confluence installation to your new Confluence installation: <Installation-Directory>/confluence/WEB-INF/lib/crowd-integration-client-X.X.X.jar and <Installation-Directory>/confluence/WEB-INF/classes/crowd.properties. If you need more information, please refer to the Crowd documentation.

9. Restart your application server and start Confluence.
Please note that Confluence will need to re-index attachments and this can take 5-10 minutes. Please wait until Confluence has finished indexing the attachments before trying to access Confluence via your web browser. (There is no easy and quick way to determine if the indexing process is completed. Please wait for approximately 10 minutes after the server start up before accessing Confluence via a web browser.)

10. During the startup process Confluence will create any missing database indexes. If you created any database indexes on your own, please check those afterwards and remove those that duplicate the indexes added by Confluence. Just in case you run into any errors which prevent Confluence from starting up, you can set the system property hibernate.hbm2ddl.skip Creating Missing Indexes to true to skip automatic index creation.

11. Visit Confluence in your web browser and log in using a username from your previous Confluence installation. You should be able to log in immediately, without seeing the Setup Wizard.

12. Take a quick look around your Confluence site to confirm that all your spaces and pages are present and everything looks normal. You should see the new Confluence version number in the page footer.

13. Consider any adjustments you need to make to customisations and special configurations, as described below.

Reapplying Customisations to your New Confluence

Hint: The steps below are for advanced Confluence users, who have applied special settings to their Confluence server and/or Confluence look and feel

After upgrading your Confluence installation to a later version of Confluence, you need to consider any customisations you have applied to your system and other special configurations:

- If you had previously installed Confluence/Tomcat as a Windows service, uninstall the service (to ensure that the old Confluence cannot start automatically when the server restarts) and reinstall the new one. For details please see Start Confluence Automatically on Windows as a Service.
- If you are using the Confluence distribution and you have previously defined a CATALINA_HOME environment variable, please check that it points to the correct path for the new Confluence Tomcat server.
- If you had previously connected your Confluence installation to an external database via a JNDI datasource or you implemented SSL, edit your new web.xml file and and copy over any relevant modifications from your old web.xml file, which relate to these customisations.
- If you were previously running Confluence on a non-standard port, edit your new <Installation-Directoy>\conf\server.xml file as described in Change listen port for Confluence.
- If you had previously defined a Tomcat datasource, edit your new <Installation-Directoy>\conf\server.xml and copy over the datasource definition from your old server.xml.
- If you were previously using any plugins, install the latest compatible version and disable any plugins that are incompatible with your new version of Confluence. The easiest way to do this is to use the Plugin Repository in the Confluence Administration Console.
- If you are using any customised themes, please check that they are displaying as expected. Some further customisation may be required to ensure compatibility with your new version of Confluence.
- If you had previously customised the default site or space layouts, you will need to reapply your changes to the new defaults as described here.
- If you had previously modified the Confluence source code, you will need to reapply your changes to the new version.
- If you were previously running Confluence over SSL, you will need to reapply your configuration as described in Running Confluence Over SSL or HTTPS.
- If you had previously modified the memory flags (Xms and Xmx) in either the <Installation-Directoy>\bin\setenv.sh or the <Installation-Directory>\bin\setenv.bat file, you may want to make the modifications in your new installation. The parameters are specified in the JAVA_OPTS variable.
- If you had changed the Confluence interface text, you will need to pull over the ConfluenceActionSupport.properties file.
• If you were using a custom SSO authenticator, change seraph-config.xml to the correct authenticator.

Checking for Known Issues and Troubleshooting the Confluence Upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the **Confluence post-upgrade checklist** to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

• **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

• **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

Migration from Wiki Markup to XHTML-Based Storage Format

If you are upgrading to **Confluence 4.0 or later** from an older version (From Confluence 3.5.x or earlier) then as part of the upgrade an automatic migration of your content will take place. This is a non-destructive process. Your existing content is not overwritten. Instead, the migration process will create a new version of each wiki markup page. The new version will use the new XHTML-based storage format, so that you can edit the page in the Confluence rich text editor.

In addition, if you are **upgrading to Confluence 4.3 or later** from an older version then as part of the upgrade an automatic migration of your page templates will take place. See [Migration of Templates from Wiki Markup to XHTML-Based Storage Format](#).

**Note:** Even though the process is non-destructive, you must be sure to perform a backup of your database and home directory prior to starting the new version of Confluence, as we recommend for any Confluence upgrade.

**Migration process**

Depending on the size of your Confluence installation, the migration from wiki markup to the new XHTML-based storage format could prove time consuming. The duration of the migration is difficult to estimate; this is due to a number of site specific factors. As a rough guide, a test dataset we migrated was 130,000 pages, totalling approximately 700Mb, which took six minutes.

---

**On this page:**

- Migration process
- Watching the migration logs during the upgrade
- Re-running the migration – for content that completely failed the migration
- Re-attempting the migration – for content in 'unmigrated-wiki-markup' macro
- Notes

**Related pages:**

- [Migration of Templates from Wiki Markup to XHTML-Based Storage Format](#)
- [Upgrading Confluence](#)
The following properties that can be modified to allow finer control over the migration process:

<table>
<thead>
<tr>
<th>Property</th>
<th>Purpose</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>confluence.wiki.migration.threads</td>
<td>The number of concurrent worker threads migrating content</td>
<td>4</td>
</tr>
<tr>
<td>confluence.wiki.migration.batch.size</td>
<td>The number of items migrated in each batch of work</td>
<td>500</td>
</tr>
<tr>
<td>confluence.wiki.migration.versioncomment</td>
<td>The comment associated with the newly migrated version of each piece of content</td>
<td>&quot;Migrated to Confluence 4.0&quot;</td>
</tr>
</tbody>
</table>

(For instructions on setting Confluence system properties see [this document](#).)

Again, due to the large variability in Confluence installations it is hard to give specific recommendations for the above settings. One point to note though that both increasing batch size and the number of threads (or both) will increase the peak memory required for migration. If memory is an issue then as you increase one of these settings consider decreasing the other.

Another factor to be aware of if modifying these defaults is that of the cache settings employed in your site. The migration will quickly populate certain Confluence caches so be sure that if you have customised caches as described here that there is enough memory on the server for these caches should they reach maximum capacity.

**Watching the migration logs during the upgrade**

To monitor the progress of a site migration you should watch the output in the application log.

Typical logging progress will be shown by multiple log entries at the INFO level of the following format:

```
WikiToXhtmlMigrationThread-n - Migrated 2500 of 158432 pages, this batch migrated 500/500 without error
```

There may be a wide array of messages logged from each individual page but any errors are also collected for display in a single migration report once all content has been processed. Here is a typical example of such a report:
Wiki to Xhtml Exception Report:
Summary:
0 settings values failed.
0 PageTemplates failed.
2 ContentEntityObjects failed.
Content Exceptions:
1) Type: page, Id: 332, Title: Release Notes 1.0b3, Space: DOC - Confluence 4.0 Beta. Cause:
com.atlassian.confluence.content.render.xhtml.migration.exceptions.UnknownMacroMigrationException: The macro link is unknown. Message: The macro link is unknown.
2) Type: comment, Id: 6919, Title: null, Global Scope. Cause:
com.atlassian.confluence.content.render.xhtml.migration.exceptions.UnknownMacroMigrationException: The macro mymacro is unknown. Message: The macro mymacro is unknown.

Each entry in the report will identify the content that caused migration exceptions as well as displaying the exceptions themselves.

In almost all cases any content reported as errored will have been migrated to the new Xhtml-based storage format, but will actually consist of wiki markup content wrapped within an xml 'unmigrated-wiki-markup' macro. This content will still be viewable in Confluence and editable within the new Confluence Editor.

However, in some cases a batch of content may actually have completely failed to migrated. This is most typically due to an unhandled exception causing a database transaction rollback. This would be reported in the log with a message like this:

Unable to start up Confluence. Fatal error during startup sequence:
confluence.lifecycle.core:pluginframeworkdependentupgrades (Run all the upgrades that require the plugin framework to be available) - com.atlassian.confluence.content.render.xhtml.migration.exceptions.MigrationException: java.util.concurrent.ExecutionException: org.springframework.transaction.UnexpectedRollbackException: Transaction rolled back because it has been marked as rollback-only

Confluence provides no further report about this scenario and will also allow Confluence to restart as normal without retrying a migration. If a user tries to view any such unmigrated content they will see an exception similar to this:

java.lang.UnsupportedOperationException: The body of this ContentEntityObject ('Page Title') was 'WIKI' but was expected to be 'XHTML'

The solution is to ensure you manually re-run the site migration after the restart.

Re-running the migration – for content that completely failed the migration

A Confluence Administrator can restart the site migration if there was any content that failed migration (see previous section). Only the content that is still formatted in wiki markup will be migrated, so typically a
re-migration will take less time than the original migration.

To manually re-run migration:

1. Open this URL in your browser: <Confluence Address>/admin/force-upgrade.action
2. Select wikiToXhtmlMigrationUpgradeTask in the Upgrade task to run dropdown list.
3. Choose Force Upgrade.

![Force Upgrade](image)

**Re-attempting the migration – for content in 'unmigrated-wiki-markup' macro**

The previous section was about dealing with the exceptional circumstance where certain content was left completely unmigrated. The most common migration problem is that the content was migrated but remains formatted as wiki markup on the page, within the body of an 'unmigrated-wiki-markup' macro. Any content which is referenced in the migration report will be found in this state. This content is still viewable and editable but since it is wiki markup it cannot be edited using the full feature set of the rich text editor.

The most common reason for content to be in this state is that the page contains an unknown macro, or a macro that is not compatible with Confluence 4.x.

There are two possible fixes for this situation:

1. Install a version of the macro that is compatible with Confluence 4.x. See [Plugin Development Upgrade FAQ for 4.0](#).
2. Edit the page and remove the problematic macro.

Regardless of the solution you choose, you can then force a re-migration of all the content (including content in templates) that was left wrapped in an 'unmigrated-wiki-markup' macro. This feature is found at <Confluence Address>/admin/unmigratedwikicontent.action

![Update with incompatible macros](image)

**Notes**
We refer to the Confluence storage format as 'XHTML-based'. To be correct, we should call it XML, because the Confluence storage format does not comply with the XHTML definition. In particular, Confluence includes custom elements for macros and more. We're using the term 'XHTML-based' to indicate that there is a large proportion of HTML in the storage format.

**Migration of Templates from Wiki Markup to XHTML-Based Storage Format**

If you are **upgrading to Confluence 4.3 or later from an older version** (from Confluence 4.2.x or earlier) then as part of the upgrade an automatic migration of your page templates will take place. This is a non-destructive process. Your existing content is not overwritten. Instead, the migration process will create a new version of each space template and each global template on your Confluence site. The new version will use the new XHTML-based storage format, so that you can edit the template in the Confluence rich text editor.

**Note:** Nevertheless, you must be sure to perform a backup of your database and home directory prior to starting the new version of Confluence, as we recommend for any Confluence upgrade.

**Watching the migration logs during the upgrade**

To monitor the progress of a site migration you should watch the output in the application log.

A typical logging progress will be shown by multiple log entries at the INFO level of the following format:

```
WikiToXhtmlMigrationThread-n - Migrated 22 of 29 PageTemplates.
```

There may be a wide array of messages logged from each individual template, but any errors are also collected for display in a single migration report once all content has been processed. Here is a typical example of such a report:
Wiki to XHTML Exception Report:

Summary:
0 settings values failed.
2 PageTemplates failed.
0 ContentEntityObjects failed.

Content Exceptions:
1) Type: page, Id: 332, Title: Release Notes 1.0b3, Space: DOC - Confluence 4.0 Beta. Cause:
com.atlassian.confluence.content.render.xhtml.migration.exceptions.UnknownMacroMigrationException: The macro link is unknown.. Message: The macro link is unknown.
2) Type: comment, Id: 6919, Title: null, Global Scope. Cause:
com.atlassian.confluence.content.render.xhtml.migration.exceptions.UnknownMacroMigrationException: The macro mymacro is unknown.. Message: The macro mymacro is unknown.

Each entry in the report will identify the content that caused migration exceptions as well as displaying the exceptions themselves.

In almost all cases any content reported as errored will have been migrated to the new XHTML-based storage format, but will actually consist of wiki markup content wrapped within an XML 'unmigrated-wiki-markup' macro. This content will still be viewable in Confluence and editable within the Confluence rich text editor.

However, in some cases a batch of content may actually have completely failed to migrate. This is most typically due to an unhandled exception causing a database transaction rollback. This would be reported in the log with a message like this:

Unable to start up Confluence. Fatal error during startup sequence: 
confluence.lifecycle.core:pluginframeworkdependentupgrades (Run all the upgrades that require the plugin framework to be available) - com.atlassian.confluence.content.render.xhtml.migration.exceptions.MigrationException: java.util.concurrent.ExecutionException: org.springframework.transaction.UnexpectedRollbackException: Transaction rolled back because it has been marked as rollback-only

Confluence provides no further report about this scenario and will also allow Confluence to restart as normal without retrying a migration. If a user tries to view or edit an unmigrated template, the wiki template editor will be used.

The solution is to manually re-run the site migration after the restart, as described below.

Re-running the migration

A Confluence administrator can restart the template migration if any templates have failed the migration (see previous section). Only the templates that are still formatted in wiki markup will be migrated again. Typically, a re-migration will take less time than the original migration.

To manually re-run the migration:

1. Open this URL in your browser: <Confluence Address>/admin/force-upgrade.action
2. Select pageTemplateWikiToXhtmlMigrationUpgradeTask in the Upgrade task to run dropdown list.
3. Choose Force Upgrade.
Notes

We refer to the Confluence storage format as 'XHTML-based'. To be correct, we should call it XML, because the Confluence storage format does not comply with the XHTML definition. In particular, Confluence includes custom elements for macros and more. We're using the term 'XHTML-based' to indicate that there is a large proportion of HTML in the storage format.

Upgrading Confluence Manually

This document tells you how to upgrade from one version of Confluence to a later version. This document refers to the Confluence distribution, which includes Apache Tomcat as the bundled application server.

If you want to upgrade a Confluence EAR/WAR distribution deployed on your own existing application server, please refer to Upgrading Confluence EAR-WAR Distribution instead.

Please also check the following before you start using this guide:

- The version of Confluence that you will be upgrading to. Refer to the documentation home page to verify the latest Confluence version and to find documentation for older versions.
- The supported platforms for the version that you will be upgrading to. Please see the Supported Platforms page for the version of Confluence that you will be upgrading to, as well as the End of Support Announcements for Confluence.
- If you are running Confluence on a cluster, please see Upgrading a Confluence Cluster instead of this document.

Upgrading to Confluence 4.3?

If so, please review the Confluence 4.3 Release Notes for important information about this version of Confluence. Ensure that you have read the Confluence 4.3 Known Issues in the Confluence Knowledge Base.

Also, we strongly recommend that you check the upgrade notes for every major version of Confluence that you are skipping, since there might be specific changes between Confluence versions that could affect your Confluence installation. The upgrade notes for recent major versions of Confluence are accessible from the Upgrade Notes Overview page.

Finally, please check the Supported Platforms page to ensure that your Java version, operating system, application server, database and browser are supported for this release of Confluence. The End of Support Announcements for Confluence page has important information regarding supported platforms.

Upgrading from Confluence 3.4 or earlier?

Please upgrade to Confluence 3.5 before upgrading to Confluence 4.x.
On this page:

- Before you Start
- Backing Up
- Testing the Upgrade in a Test Environment
- Performing the Upgrade
- Reapplying Customisations to your New Confluence
- Checking for Known Issues and Troubleshooting the Confluence Upgrade
- Useful Plugins

Before you Start

1. Note that you need current software maintenance to perform the upgrade.
2. Confirm that your license support period is still valid before you try to upgrade.
3. If your current license has expired but you have a new license with you, please update your license in Confluence before performing the upgrade.
   - If you forget to do this and your license has expired, you will receive errors during the upgrade process. Refer to the instructions on upgrading beyond current license period.
4. Check the release notes for the new version of Confluence you are installing, plus the upgrade notes for any major versions you are skipping. It is important to read these upgrade notes as there might be specific changes between Confluence versions that could affect your Confluence instance. The upgrade notes pages for recent major versions of Confluence are accessible from the Upgrade Notes Overview page. (Each upgrade notes page is a 'child' of its respective release notes page.)
5. Make sure that your environment (e.g. the database system, the operating system, the application server and so on) still complies with the Confluence System Requirements. A newer version of Confluence may have different requirements than the previous version.
6. If you are using Confluence EAR-WAR edition, check Installing the Confluence EAR-WAR Edition to see if there is anything extra you will need to do to get Confluence running.
7. If you are using an external database, familiarise yourself with all known issues for your specific database. Also make sure the Confluence database connector principal (the database user account) has sufficient permissions to modify the database schema.
8. Note which plugins are installed and enabled on your current Confluence instance. Please verify whether a compatible version of the plugin is available in the version of Confluence you are upgrading to. This information is available via the 'Plugins' menu in your Administration screens, and selecting Confluence Upgrade Check. This will tell you which plugins have an updated version which is compatible with your target upgrade version. You can also check the respective home pages for these plugins on the Atlassian Plugin Exchange. Once you have confirmed the availability of compatible versions, you should upgrade your plugins after successfully upgrading Confluence. Please test these first by applying them to the latest Confluence version in a test environment.
9. If you have made any customisations to Confluence, please verify their compatibility in the latest version. For example, if you have modified any layouts or are using your own custom theme, please test these first by applying them to the latest Confluence version in a test environment. You can see the customisations applied to your Confluence installation.
10. Some anti-virus or other Internet security tools may interfere with the Confluence upgrade process and prevent the process from completing successfully. If you experience or anticipate experiencing such an issue with your anti-virus/Internet security tool, disable this tool first before proceeding with the Confluence upgrade.
11. After upgrading, Confluence may need to rebuild its indexes. If this happens, there may be some extra load placed on the server following the upgrade. Make sure to schedule any upgrade of production
Confluence outside of hours where people need to use it.

Back up

Before you begin the Confluence upgrade, you must back up the following:

1. **Back up your Confluence Home directory.** The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   
   Tip: Another term for ‘Home directory’ would be ‘data directory’. The location of the Home directory is stored in a configuration file called confluence-init.properties, which is located inside the confluence/WEB-INF/classes directory in your Confluence Installation directory. The Confluence installer will automatically prompt you to run a backup, storing the files in a .zip archive at the same level as your Confluence Home directory.

2. **Back up your database.** Perform a manual backup of your external database before proceeding with the upgrade, and double check that the backup was actually created properly. If you are not a database expert, or unfamiliar with the backup-restore facilities of your database, simply restore the backup to a different system to ensure the backup worked before proceeding. This recommendation is generally a good best practice. Surprisingly, many companies get in trouble for broken database backups because they skip this basic but vital "smoke test" of the operation.

   The 'embedded database' is the HSQLDB database supplied with Confluence for evaluation purposes. You don't need to back it up since it is stored in the Confluence home directory. You should not be using this database for production systems at all, so if you happen to be using HSQLDB in a production system, please migrate to a proper database before the upgrade. Read about the various shortcomings of HSQLDB.

3. **Back up your Confluence Installation directory or your Confluence webapp** (if you are using Confluence EAR-WAR edition). The Confluence installer will automatically back up these files, storing the files in a .zip archive at the same level as your Confluence installation directory. The 'Confluence Installation directory' is the directory into which the Confluence application files and libraries have been unpacked (unzipped) when Confluence was installed. Confluence does not modify or store any data in this directory. This directory is also sometimes called the 'Confluence Install directory'.

Testing the Upgrade in a Test Environment

Be sure to test the upgrade in a test environment before proceeding on your production server.

1. Create a snapshot of your current production Confluence environment on a test server, as described in the page on Moving Confluence Between Servers.

   **XML imports**

   Importing an old XML backup file to a new major version (i.e Confluence 3.5 to Confluence 4.0) is not recommended. Please recreate your production instance in a test environment first.

2. Perform the upgrade on your cloned environment.

3. Test all your unsupported plugins and any customisations with the new version before proceeding on your production server. You can read more about supported and unsupported plugins.

Performing the Upgrade
To install Confluence, unzip the new Confluence installation zip file into a directory of your choice and then edit the configuration files to point your new installation to your existing data files. Follow these instructions:

1. Shut down your existing Confluence instance.
2. Download the Confluence zip file.
3. If you are on Windows, please check your unzip program before extracting the downloaded zip file. Some archive-extract programs cause errors when unzipping the Confluence zip file. You should use a third-party unzip program like 7Zip or Winzip. If you do not have one, please download and install one before continuing:
   - 7Zip — Recommended. If in doubt, download the '32-bit.exe' version
   - Winzip
4. Use your unzip program to unzip the installation file. You should now have a new directory called confluence-<version>, e.g. confluence-4.0.0-std.
   - In the rest of this document, we will refer to this as the <Installation-Directory>.
   - If you decide to change the location from the default, make sure that you choose a different location from your existing Confluence installation, because legacy files may cause problems if you install the new Confluence version into an existing directory.
   - Do not use spaces in your directory path.
   - You can read more about the Confluence Installation directory.
5. Edit the confluence-init.properties file found at: <Installation-Directory>/confluence/WEB-INF/classes/confluence-init.properties and update 'confluence.home' to point to your existing Confluence Home directory.
   - You can read more about the Confluence Home directory.
   - Make sure you have first backed up this directory, as instructed above.
   - Open the confluence-init.properties file in a text editor such as Notepad.
   - Scroll to the bottom and find this line:
     ```
     # confluence.home=c:/confluence/data
     ```
   - Remove the '#' and the space at the beginning of this line, so that Confluence no longer regards the line as a comment. The line should now begin with confluence.home.
   - Update the directory name after the = sign, to point to your existing Confluence Home directory.
6. If you are running Confluence as a Windows service, use the command prompt and type <Installation-Directory>/bin/service.bat remove Confluence.
   - It is vital that you stop and remove the existing service prior to uninstalling the old instance of Confluence! For more information on running Confluence as Windows service, please refer to the Start Confluence Automatically on Windows as a Service topic.
   - To remove the service installed by the Confluence installer, you need to run the <confluence auto installer installation folder>/UninstallService.bat.
7. If you are using an external database (i.e. not the embedded HSQLDB database supplied for evaluation purposes), copy the jdbc driver jar file from your old Confluence installation to the new Confluence installation. The jdbc driver jar file in the old Confluence installation should be located in either the <Installation-Directory>/common/lib or <Installation-Directory>/confluence/WEB-INF/lib directories. Once you have identified this file, copy it to either the <Installation-Directory>/lib or <Installation-Directory>/confluence/WEB-INF/lib directories of your Confluence installation.
8. If you have delegated your user management to JIRA, LDAP, Crowd, or any other external user
management system, copy the following files from your old Confluence installation to your new Confluence installation:

- `<Installation-Directory>/confluence/WEB-INF/classes/osuser.xml`
- `<Installation-Directory>/confluence/WEB-INF/classes/atlassian-user.xml` (if you are upgrading from Confluence 2.2 or later).

If you are upgrading from an earlier version of Confluence (2.5.5 and earlier) and are copying your existing `atlassian-user.xml` file from your previous instance, please ensure that the hibernate cache parameter in this file has been enabled, to avoid performance related issues. (NOTE: If you use Crowd for your user management, you do not need to do this.):

```xml
<hibernate name="Hibernate Repository" key="hibernateRepository" description="Hibernate Repository" cache="true" />
```

9. If you have delegated your user management to Crowd, you will also need to copy the Crowd configuration file from your old Confluence installation to your new Confluence installation: `<Installation-Directory>/confluence/WEB-INF/classes/crowd.properties`. If you need more information, please refer to the Crowd documentation.

10. Consider any adjustments you need to make to customisations and special configurations, as described below. Your new version of Confluence may not function correctly or could encounter problems or errors if these are not implemented.

11. Start your new version of Confluence.

   Please note that Confluence will need to re-index attachments and this can take 5-10 minutes. Please wait until Confluence has finished indexing the attachments before trying to access Confluence via your web browser.

12. During the startup process Confluence will create any missing database indexes. If you created any database indexes on your own, please check those afterwards and remove those that duplicate the indexes added by Confluence. Just in case you run into any errors which prevent Confluence from starting up, you can set the system property `hibernate.hbm2ddl.skip_creating_missing_index` to `true` to skip automatic index creation.

13. Visit Confluence in your web browser and log in using a username from your previous Confluence installation. You should be able to log in immediately, without seeing the Setup Wizard.

14. Take a quick look around your Confluence site to confirm that all your spaces and pages are present and everything looks normal. You should see the new Confluence version number in the page footer.

**Reapplying Customisations to your New Confluence**

Hint: The steps below are for advanced Confluence users, who have applied special settings to their Confluence server and/or Confluence look and feel

After upgrading your Confluence installation to a later version of Confluence, you need to consider any customisations you have applied to your system and other special configurations:

- If you had previously installed **Confluence/Tomcat as a Windows service**, uninstall the service (to ensure that the old Confluence cannot start automatically when the server restarts) and reinstall the new one. For details please see [Start Confluence Automatically on Windows as a Service](#).
- If you are using the Confluence distribution and you have previously defined a `CATALINA_HOME`
environment variable, please check that it points to the correct path for the new Confluence Tomcat server.

- If you had previously connected your Confluence installation to an external database via a JNDI datasource or you implemented SSL, edit your new web.xml file and and copy over any relevant modifications from your old web.xml file, which relate to these customisations.

- If you were previously running Confluence on a non-standard port, edit your new <Installation-Directory>\conf\server.xml file as described in Change listen port for Confluence.

- If you had previously defined a Tomcat datasource, edit your new <Installation-Directory>\conf\server.xml and copy over the datasource definition from your old server.xml.

- If you were previously using any plugins, install the latest compatible version and disable any plugins that are incompatible with your new version of Confluence. The easiest way to do this is to use the Plugin Repository in the Confluence Administration Console.

- If you are using any customised themes, please check that they are displaying as expected. Some further customisation may be required to ensure compatibility with your new version of Confluence.

- If you had previously customised the default site or space layouts, you will need to reapply your changes to the new defaults as described here.

- If you had previously modified the Confluence source code, you will need to reapply your changes to the new version.

- If you were previously running Confluence over SSL, you will need to reapply your configuration as described in Running Confluence Over SSL or HTTPS.

- If you had previously modified the memory flags (Xms and Xmx) in either the <Installation-Directory>\bin\setenv.sh or the <Installation-Directory>\bin\setenv.bat file, you may want to make the modifications in your new installation. The parameters are specified in the JAVA_OPTS variable.

- If you had changed the Confluence interface text, you will need to pull over the ConfluenceActionSupport.properties file.

- If you were using a custom SSO authenticator, change seraph-config.xml to the correct authenticator.

Checking for Known Issues and Troubleshooting the Confluence Upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin’s information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Appfire’s Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

1. Confluence is a pure Java application and should run on this platform provided the JRE or JDK requirement is satisfied.
2. While some of our customers run Confluence on SPARC-based hardware, Atlassian only officially supports Confluence running on x86 hardware and 64-bit derivatives of x86 hardware.
3. Ensure that you configure your Confluence MySQL database to use the InnoDB storage engine as the MyISAM storage engine could lead to data corruption.
4. Confluence ships with a built-in HSQL database. While this database is fine for evaluation purposes, it is somewhat susceptible to data loss during system crashes. Hence, for production environments, we recommend that you configure Confluence to use an external database.
5. Internet Explorer 8 and 9 do not support the drag-and-drop functionality of HTML5. As Confluence relies on this functionality, the drag-and-drop experience in Internet Explorer 8 and 9 is not complete.
6. Confluence is tested with these versions of Internet Explorer in standards-compliant rendering mode, not compatibility mode. Enabling compatibility mode may cause problems because it emulates older, unsupported rendering modes.
7. Chrome does not have WEBDAV / plugin support so features such as Edit in Word for attachments will not work. Please refer to CONF-23322 for information on the progress of the issue.
8. Confluence does not support editing in Mobile Safari on iOS devices (such as iPhone and iPad). Please refer to CONF-19524 for information on the progress of this issue.

End of Support Announcements for Confluence

This page contains announcements of the end of support for various platforms and browsers when used with Confluence. This is summarised in the table below. Please see the sections following for the full announcements.

End of Support Matrix for Confluence

The table below summarises information regarding the end of support announcements for upcoming Confluence releases. If a platform (version) has already reached its end of support date, it is not listed in the table.

<table>
<thead>
<tr>
<th>Platform</th>
<th>Confluence End of Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tomcat 5.5.x</td>
<td>Confluence 5.0 (announcement)</td>
</tr>
<tr>
<td>Java 6</td>
<td>Confluence 5.0 (announcement)</td>
</tr>
</tbody>
</table>
Why is Atlassian ending support for these platforms?

Atlassian is committed to delivering improvements and bug fixes as fast as possible. We are also committed to providing world class support for all the platforms our customers run our software on. However, as the complexity of our applications grows, the cost of supporting multiple platforms increases exponentially. Each new feature has to be tested on several combinations of application servers, databases, web browsers, etc, with setup and ongoing maintenance of automated tests. Moving forward, we want to reduce the time spent there to increase Confluence development speed significantly.

On this page (most recent announcements first):

### Deprecated Tomcat platform for Confluence (29 August 2012)

This section announces the end of Atlassian support for Tomcat 5.5.x for Confluence. Please note: Apache has announced that support for Apache Tomcat 5.5.x will end on 30 September 2012: [End of life for Apache Tomcat](https://httpd.apache.org/lists/html/apr/2009/apr09-03.html).

End of support means that Atlassian will not fix bugs related to the specified version of Tomcat, past the support end date for your version of Confluence. The details are below. Please refer to the list of [supported platforms](https://www.atlassian.com/software/confluence/products#confluence-platforms) for details of platform support for Confluence. If you have questions or concerns regarding this announcement, please email [eol-announcement at atlassian dot com](mailto:eol-announcement@atlassian.com).

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tomcat 5.5.x</td>
<td>When Confluence 5.0 is released, due in early 2013</td>
</tr>
</tbody>
</table>

**Tomcat 5.5.x notes:**

- Confluence 4.3 is the last major version that will support Tomcat 5.5.x. The Confluence 4.3.x bug-fix releases will also continue to support Tomcat 5.5.x.
- Tomcat 6.0.x will still be supported in Confluence 5.0.
- Confluence 4.3.x and previously-released versions will continue to work with Tomcat 5.5.x. However, we will not fix bugs affecting Tomcat 5.5.x after the end-of-life date for your version of Confluence.
- Confluence 5.0 will not be tested with Tomcat 5.5.x.

**Deprecated Java platform for Confluence (6 August 2012)**

This section announces the end of Atlassian support for Java 6 for Confluence. Please note that Oracle has announced the end of public updates for Java 6: [Java SE 6 End of Public Updates Notice](#).

End of support means that Atlassian will not fix bugs related to the specified version of Java, past the support end date for your version of Confluence. The details are below. Please refer to the list of supported platforms for details of platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

**End of Life Announcement for Java 6 Support**

<table>
<thead>
<tr>
<th>Platform</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java 6 (JRE and JDK 1.6)</td>
<td>When Confluence 5.0 is released, due in early 2013</td>
</tr>
</tbody>
</table>

**Java 6 notes:**

- Confluence 4.3 is the last major version that will support Java 6. The Confluence 4.3.x bug-fix releases will also continue to support Java 6.
- Java 7 (JRE and JDK 1.7) will still be supported in Confluence 5.0.
- Confluence 4.3.x and previously-released versions will continue to work with Java 6. However, we will not fix bugs affecting Java 6 after the end-of-life date for your version of Confluence.
- Confluence 5.0 will not be tested with Java 6.

**Deprecated Databases for Confluence (1 May 2012)**

This section announces the end of Atlassian support for certain databases for Confluence. End of support means that Atlassian will not fix bugs related to the specified database past the support end date for your version of Confluence.

The details are below. Please refer to the list of supported platforms for details of platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

**End of Life Announcement for Database Support**

<table>
<thead>
<tr>
<th>Database</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>PostgreSQL 8.2</td>
<td>When Confluence 4.3 is released, due in mid 2012</td>
</tr>
</tbody>
</table>

**PostgreSQL 8.2 notes:**

- Confluence 4.2 is the last version that will support version 8.2 of PostgreSQL.
- Versions 8.3, 8.4 and 9.0 will still be supported in Confluence 4.3.
• Confluence 4.2 and previously-released versions will continue to work with PostgreSQL 8.2. However, we will not fix bugs affecting PostgreSQL 8.2 after the end-of-life date for your version of Confluence.
• Confluence 4.3 will not be tested with PostgreSQL 8.2.

Deprecated Databases for Confluence (13 March 2012)

This section announces the end of Atlassian support for certain databases for Confluence. End of support means that Atlassian will not fix bugs related to the specified database past the support end date for your version of Confluence.

The details are below. Please refer to the list of supported platforms for details of platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

End of Life Announcement for Database Support

<table>
<thead>
<tr>
<th>Database</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2</td>
<td>When Confluence 4.3 is released, due in mid 2012</td>
</tr>
</tbody>
</table>

DB2 notes:
• Confluence 4.2 is the last version that will support DB2.
• From Confluence 4.3, no versions of DB2 will be supported.
• Confluence 4.2 and previously-released versions will continue to work with DB2. However, we will not fix bugs affecting DB2 after the end-of-life date for your version of Confluence.
• Confluence 4.3 will not be tested with DB2.
• For help with moving from DB2 to a supported database, please refer to the list of supported databases and the guide to migrating to another database.

Deprecated Operating Systems for Confluence (21 July 2011)

This section announces the end of Atlassian support for certain operating systems for Confluence. End of support means that Atlassian will not fix bugs related to running Confluence server on that operating system past the support end date.

We will stop supporting the following operating systems from Confluence 4.0, due in late 2011:
• Mac OS X (as a Confluence server platform).

The details are below. Please refer to the list of supported platforms for details of platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

End of Life Announcement for Operating System Support

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mac OS X (as a Confluence server platform)</td>
<td>When Confluence 4.0 releases, due in late 2011</td>
</tr>
</tbody>
</table>
Mac OS X Notes:
- Atlassian intends to end support for Mac OS X (as a server platform) in Confluence 4.0 (due for release in late 2011). Confluence 3.5 is the last version that will support Mac OS X.
- The Sun/Oracle JDK/JRE 1.6 is the only JDK platform officially supported by Atlassian. This means that Apple Mac OS X is not a supported operating system for the Confluence server, as the Sun/Oracle JDK does not run on Mac OS X.
- Accessing Confluence as a user from Mac OS X via a compatible web browser will still be supported for the foreseeable future.

Deprecated Databases for Confluence (7 January 2011)

This section announces the end of Atlassian support for certain database versions for Confluence. End of support means that Atlassian will not fix bugs related to certain database versions past the support end date.

We will **stop supporting the following database versions** from Confluence 4.0, due in late 2011:
- MySQL 5.0.

The details are below. Please refer to the list of supported platforms for details of platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

<table>
<thead>
<tr>
<th>Database</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>MySQL (version 5.0 only)</td>
<td>When Confluence 4.0 releases, due in late 2011</td>
</tr>
</tbody>
</table>

MySQL Notes:
- Atlassian intends to end support for MySQL 5.0 in Confluence 4.0 (due for release in the middle of 2011). Confluence 3.5 is the last version that will support MySQL 5.0.
- MySQL 5.1 will still be supported.
- ‘Support End Date’ means that Confluence 3.5 and previously released versions will continue to work with MySQL 5.0. However, we will not fix bugs affecting MySQL 5.0 past the support end date.
- Confluence 4.0 will not be tested with MySQL 5.0.

Deprecated Web Browsers for Confluence (7 January 2011)

This section announces the end of Atlassian support for certain web browser versions for Confluence. End of support means that Atlassian will not fix bugs related to certain web browser versions past the support end date.

We will **stop supporting the following web browser versions** from Confluence 4.0, late middle of 2011:
- Microsoft Internet Explorer 7 (IE7).
- Safari 4.
- Firefox 3.5.

The details are below. Please refer to the list of supported platforms for details of platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

End of Life Announcement for Web Browser Support
<table>
<thead>
<tr>
<th>Web Browser</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft Internet Explorer (version 7 only)</td>
<td>When Confluence 4.0 releases, late of the middle of 2011</td>
</tr>
<tr>
<td>Safari (version 4 only)</td>
<td>When Confluence 4.0 releases, due in late of 2011</td>
</tr>
<tr>
<td>Firefox (version 3.5 only)</td>
<td>When Confluence 4.0 releases, due in late of 2011</td>
</tr>
</tbody>
</table>

- **Internet Explorer Notes:**
  - Atlassian intends to end support for IE7 in Confluence 4.0 (due for release in the middle of 2011). Confluence 3.5 is the last version that will support IE7.
  - IE8 will still be supported.
  - ‘Support End Date’ means that Confluence 3.5 and previously released versions will continue to work with IE7. However, we will not fix bugs affecting IE7 past the support end date.
  - Confluence 4.0 will not be tested with IE7.

- **Safari Notes:**
  - Atlassian will introduce support for Safari 5 in Confluence 3.5.
  - We intend to end support for Safari 4 in Confluence 4.0 (due for release in the middle of 2011). Confluence 3.5 is the last version that will support Safari 4.
  - ‘Support End Date’ means that Confluence 3.5 and previously released versions will continue to work with Safari 4. However, we will not fix bugs affecting Safari 4 past the support end date.
  - Confluence 4.0 will not be tested with Safari 4.

- **Firefox Notes:**
  - Atlassian will end support for Firefox 3.0 in Confluence 3.5, as previously announced.
  - We intend to end support for Firefox 3.5 in Confluence 4.0 (due for release in the middle of 2011). Confluence 3.5 is the last version that will support Firefox 3.5.
  - Firefox 3.6 will still be supported.
  - ‘Support End Date’ means that Confluence 3.5 and previously released versions will continue to work with Firefox 3.5. However, we will not fix bugs affecting Firefox 3.5 past the support end date.
  - Confluence 4.0 will not be tested with Firefox 3.5.

**Deprecated Databases for Confluence (12 October 2010)**

This section announces the end of Atlassian support for certain database versions for Confluence. End of support means that Atlassian will not fix bugs related to certain database versions past the support end date.

We will stop supporting the following database versions:

- From Confluence 3.5, due in the first half of 2011, Confluence will no longer support PostgreSQL 8.1. *Note, PostgreSQL 8.2 and PostgreSQL 8.4 will still be supported.*

The details are below. Please refer to the Supported Platforms for more details regarding platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

**End of Life Announcement for Database Support**

<table>
<thead>
<tr>
<th>Database</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>PostgreSQL (version 8.1 only)</td>
<td>When Confluence 3.5 releases, due in the first half of 2011</td>
</tr>
</tbody>
</table>
- **PostgreSQL (version 8.1 only) End of Support Notes:**
  - Atlassian intends to end support for PostgreSQL 8.1 in Confluence 3.5 (due to release in the first half of 2011), with the final support for these platforms in Confluence 3.4. PostgreSQL 8.2 and PostgreSQL 8.4 will still be supported.
  - ‘Support End Date’ means that Confluence 3.4 and previous released versions will continue to work with the PostgreSQL 8.1. However, we will not fix bugs affecting PostgreSQL 8.1 past the support end date.
  - Confluence 3.5 (due to release in the first half of 2011) will not be tested with PostgreSQL 8.1.

**Deprecated Web Browsers for Confluence (12 October 2010)**

This section announces the end of Atlassian support for certain web browser versions for Confluence. End of support means that Atlassian will not fix bugs related to certain web browser versions past the support end date.

We will **stop supporting the following web browser versions:**

- From Confluence 3.5, due in the first half of 2011, Confluence will no longer support Firefox 3.0.
  
  Note, Firefox 3.5 and Firefox 3.6 will still be supported.

The details are below. Please refer to the **Supported Platforms** for more details regarding platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

**End of Life Announcement for Web Browser Support**

<table>
<thead>
<tr>
<th>Web Browser</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firefox (version 3.0 only)</td>
<td>When Confluence 3.5 releases, due in the first half of 2011</td>
</tr>
</tbody>
</table>

- **Firefox (version 3.0 only) End of Support Notes:**
  - Atlassian intends to end support for Firefox 3.0 in Confluence 3.5 (due to release in the first half of 2011), with the final support for these platforms in Confluence 3.4. Firefox 3.5 and Firefox 3.6 will still be supported.
  - ‘Support End Date’ means that Confluence 3.4 and previous released versions will continue to work with Firefox 3.0. However, we will not fix bugs affecting Firefox 3.0 past the support end date.
  - Confluence 3.5 (due to release in the first half of 2011) will not be tested with Firefox 3.0.

**Deprecated Databases for Confluence (6 July 2010)**

This section announces the end of Atlassian support for certain database versions for Confluence. End of support means that Atlassian will not fix bugs related to certain database versions past the support end date.

We will **stop supporting the following database versions:**

- From Confluence 3.4, due in the second half of 2010, Confluence will no longer support Oracle 10g (i.e. Oracle 10.1 and Oracle 10.2).
  
  Note, Oracle 11g (i.e. Oracle 11.1 and Oracle 11.2) will still be supported.

We have made these decisions in line with Oracle's decision to stop support for Oracle 10g, as per the "Oracle Database (RDBMS) Releases Support Status Summary [ID 161818.1]" article on the Oracle Support site (note you will need an Oracle Support account to find and view the article). This also will reduce the testing time required for each release and help us speed up our ability to deliver market-driven features. We are committed to helping our customers understand this decision and assist them in upgrading to Oracle 11g if needed.
The details are below. Please refer to the Supported Platforms for more details regarding platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

### End of Life Announcement for Database Support

<table>
<thead>
<tr>
<th>Database</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle (version 10.1 and 10.2 only)</td>
<td>When Confluence 3.4 releases, due in the second half of 2010</td>
</tr>
</tbody>
</table>

- **Oracle (version 10.1 and 10.2 only) End of Support Notes:**
  - Atlassian intends to end support for Oracle 10.1 and Oracle 10.2 in Confluence 3.4 (due to release in the second half of 2010), with the final support for these platforms in Confluence 3.3. Oracle 11.1 and Oracle 11.2 will still be supported.
  - ‘Support End Date’ means that Confluence 3.3 and previous released versions will continue to work with the Oracle 10.1 and Oracle 10.2. However, we will not fix bugs affecting Oracle 10.1 or Oracle 10.2 past the support end date.
  - Confluence 3.4 (due to release in the second half of 2010) will not be tested with Oracle 10.1 and Oracle 10.2.

### Deprecated Web Browsers for Confluence (6 July 2010)

This section announces the end of Atlassian support for certain web browser versions for Confluence. End of support means that Atlassian will not fix bugs related to certain web browser versions past the support end date.

We will stop supporting the following web browser versions:

- From Confluence 3.4, due in the second half of 2010, Confluence will no longer support Safari 3 or Safari 3.1.
  
  Note, Safari 4 will still be supported.

The details are below. Please refer to the Supported Platforms for more details regarding platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

### End of Life Announcement for Web Browser Support

<table>
<thead>
<tr>
<th>Web Browser</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Safari (version 3 and 3.1 only)</td>
<td>When Confluence 3.4 releases, due in the second half of 2010</td>
</tr>
</tbody>
</table>

- **Safari (version 3 and 3.1 only) End of Support Notes:**
  - Atlassian intends to end support for Safari 3 and Safari 3.1 in Confluence 3.4 (due to release in the second half of 2010), with the final support for these platforms in Confluence 3.3. Safari 4 will still be supported.
  - ‘Support End Date’ means that Confluence 3.3 and previous released versions will continue to work with the Safari 3 and Safari 3.1. However, we will not fix bugs affecting Safari 3 and Safari 3 past the support end date.
  - Confluence 3.4 (due to release in the second half of 2010) will not be tested with Safari 3 and Safari 3.1.

### Deprecated Databases for Confluence (24 March 2010)
This section announces the end of Atlassian support for certain database versions for Confluence. End of support means that Atlassian will not fix bugs related to certain database versions past the support end date.

We will **stop supporting the following database versions:**

- From Confluence 3.3, due in Q3 2010, Confluence will no longer support DB2 8.2.
  
  *Note, DB2 9.7 will still be supported.*

We are reducing our database support to reduce the amount of testing time and help us speed up our ability to deliver market-driven features. We are committed to helping our customers understand this decision and assist them in upgrading to DB2 9.7 if needed.

The details are below. Please refer to the [Supported Platforms](#) for more details regarding platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

### End of Life Announcement for Database Support

<table>
<thead>
<tr>
<th>Database</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB2 (version 8.2 only)</td>
<td>When Confluence 3.3 releases, due Q3 2010</td>
</tr>
</tbody>
</table>

- **DB2 (version 8.2 only) End of Support Notes:**
  - Atlassian intends to end support for DB2 8.2 in Q3 2010, with the final support for these platforms in Confluence 3.2. DB2 9.7 will still be supported.
  - ‘Support End Date’ means that Confluence 3.2 and previous released versions will continue to work with the DB2 8.2. However, we will not fix bugs affecting DB2 8.2 past the support end date.
  - Confluence 3.3 (due to release in Q3 2010) will not be tested with DB2 8.2.

**Deprecated Application Servers for Confluence (27 January 2010)**

This section announces the end of Atlassian support for certain application servers for Confluence. End of support means that Atlassian will not fix bugs related to certain application servers past the support end date.

We will **stop supporting the following application servers:**

- From Confluence 3.2, due late Q1 2010, Confluence will no longer support JBoss application servers.
- From Confluence 3.3, due in Q3 2010, Confluence will no longer support Oracle WebLogic, IBM WebSphere or Caucho Resin.

We are reducing our application server platform support to reduce the amount of testing time and help us speed up our ability to deliver market-driven features. We are committed to helping our customers understand this decision and assist them in migrating to Tomcat, our supported application server.

The details are below. Please refer to the [Supported Platforms](#) for more details regarding platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

### End of Life Announcement for Application Server Support

<table>
<thead>
<tr>
<th>Application Servers</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>JBoss 4.2.2</td>
<td>When Confluence 3.2 releases, due late Q1 2010</td>
</tr>
</tbody>
</table>
Oracle WebLogic 9.2 | When Confluence 3.3 releases, due Q3 2010
---|---
IBM WebSphere 6.1 | When Confluence 3.3 releases, due Q3 2010
Caicho Resin 3.0, 3.1.6, 3.1.7 | When Confluence 3.3 releases, due Q3 2010

- **JBoss End of Support Notes:**
  - 'Support End Date' means that Confluence 3.1 and previous released versions will continue to work with stated application servers. However, we will not fix bugs affecting JBoss application servers.
  - Confluence 3.2 will not support JBoss application servers.

- **WebLogic, WebSphere and Resin End of Support Notes:**
  - Atlassian intends to end support for Oracle WebLogic, IBM WebSphere, and Caicho Resin in Q3 2010, with the final support for these platforms in Confluence 3.2.
  - 'Support End Date' means that Confluence 3.2 and previous released versions will continue to work with the stated application servers. However, we will not fix bugs affecting Oracle WebLogic IBM WebSphere, and Caicho Resin application servers past the support end date.
  - Confluence 3.3 (due to release in Q3 2010) will only be tested with and support Tomcat 5.5.20+ and 6.0.
  - If you have concerns with this end of support announcement, please email eol-announcement at atlassian dot com.

**Why is Atlassian doing this?**

We have chosen to standardise on Tomcat, because it is the most widely used application server in our user population. It is fast, robust, secure, well-documented, easy to operate, open source, and has a huge community driving improvements. It is the de facto industry standard, with several companies available that specialise in providing enterprise grade support contracts for it, ranging from customisations to 24/7 support.

**Deprecated Java Platforms for Confluence (27 January 2010)**

This section announces the end of Atlassian support for certain Java Platforms for Confluence.

We will **stop supporting the following Java Platforms:**

- From Confluence 3.3, due Q3 2010, support for Java Platform 5 (JDK/JRE 1.5) will end.

We are ending support for Java Platform 5, in line with the [Java SE Support Roadmap](https://java.oracle.com/roadmap.html) (i.e. "End of Service Life for Java Platform 5 dated October 30, 2009). We are committed to helping our customers understand this decision and assist them in updating to Java Platform 6, our supported Java Platform.

The details are below. Please refer to the [Supported Platforms](https://confluence.atlassian.com/display/DOC/Supported+Platforms) for more details regarding platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

**End of Life Announcement for Java Platform Support**

<table>
<thead>
<tr>
<th>Java Platform</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java Platform 5 (JDK/JRE 1.5)</td>
<td>When Confluence 3.3 releases, due Q3 2010</td>
</tr>
</tbody>
</table>

- **Java Platform 5 End of Support Notes:**
  - Atlassian intends to end support for Java Platform 5 in Q3 2010.
  - 'Support End Date' means that Confluence 3.2.x and previous released versions will continue to...
work with Java Platform 5 (JDK/JRE 1.5), however we will not fix bugs related to Java Platform 5 past the support end date.

- Confluence 3.3 will only be tested with and support Java Platform 6 (JDK/JRE 1.6).
- If you have concerns with this end of support announcement, please email eol-announcement at atlassian dot com.

Deprecated Web Browsers for Confluence (14 December 2009)

This section announces the end of Atlassian support for certain web browsers for Confluence.

We will stop supporting older versions of web browsers as follows:

- From Confluence 3.2, due late Q1 2010, support for Firefox 2 and Safari 2 will end.
- From 13 July 2010, in line with Microsoft's Support Lifecycle policy, support for IE6 will end.

The details are below. Please refer to the Supported Platforms for more details regarding platform support for Confluence. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

End of Life Announcement for Web Browser Support

<table>
<thead>
<tr>
<th>Web Browsers</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firefox 2</td>
<td>When Confluence 3.2 releases, late Q1 2010</td>
</tr>
<tr>
<td>Safari 2</td>
<td>When Confluence 3.2 releases, late Q1 2010</td>
</tr>
<tr>
<td>Internet Explorer 6</td>
<td>When Confluence 3.3 releases (target Q3 2010) or 13 July 2010, whichever is sooner</td>
</tr>
</tbody>
</table>

- Firefox 2 and Safari 2 Notes:
  - Confluence 3.1 is the last version to officially support Firefox 2 and Safari 2.
  - You may be able to use these older browser for the most common use cases like viewing and editing content, but official support for these browsers will end once you upgrade to Confluence 3.2.
  - Confluence 3.2 is currently targeted to release late Q1 2010 and will not be tested with Firefox 2 and Safari 2. After the Confluence 3.2 release, Atlassian will not provide fixes in older versions of Confluence for bugs affecting Firefox 2 and Safari 2.

- Internet Explorer 6 Notes:
  - Confluence 3.2 (due late Q1 2010) will be the last version to officially support Internet Explorer 6.
  - Confluence 3.3 is currently targeted to release Q3 2010 and will not support IE6.
  - Atlassian will support IE6 in Confluence until the 13th of July 2010, in line with Microsoft's Support Lifecycle policy. Beyond that date, released versions of Confluence will continue working with IE6 just as they did before, but we will not fix bugs affecting Internet Explorer 6.
  - You may be able to use Internet Explorer 6 for the most common use cases like viewing and editing content, but official support for this browser will end once you upgrade to Confluence 3.3.

Supported Platforms FAQ

Q: How does Atlassian choose which JRE versions, application servers and databases to support?

For application servers and databases, we try to pick a good cross-section of open source options and popular commercial platforms. We then choose which JRE versions to support based on the recommended environments for these servers.
Q: What is a supported platform?

A supported platform is one that:

- Confluence is regularly tested on during the development cycle
- One that is available within Atlassian for support technicians and developers to reproduce problems
- Bugs raised against it will be given a high priority

Supporting a platform means we know how to get Confluence running in that environment and can troubleshoot Confluence issues within it. It does not mean we have any particular expertise beyond that. As such, we may not be able to provide assistance with customising or tuning that application server or database. (Atlassian support is not a substitute for a good database administrator.)

Q: Can I get assistance with running Confluence on a platform that is not supported?

If you are running Confluence on an unsupported platform, then we can not guarantee providing any support for it. Furthermore, we will recommend that you switch to a platform which is supported.

Q: If you write your application to standards like J2EE, JDBC and SQL, doesn’t that mean it should run on any compliant server?

Confluence is a complicated application and we commonly encounter interesting edge-cases where different servers have interpreted the specifications differently. Then again, each server has its own different collection of bugs.

Q: How can I get Atlassian to support Confluence on a new platform?

Supporting a new platform involves a significant investment of time by Atlassian, both up-front costs to set up new testing environments and fix any issues we might encounter and the ongoing costs involved in maintaining the application against this new environment in the future. As such, supporting a new platform is not something we will do unless we know there is significant demand for it.

Please be aware that your interest alone will not be enough for us to add support for your application server or database. We would need to see a significant number of votes on the issue raised in our public JIRA site or a significant level of interest in our forums, before considering supporting that platform.

Q: My organisation has standardised on an operating environment that Confluence does not support. What can I do?

In this situation, you have the following two options:

1. Run Confluence in the unsupported environment, with the caveats mentioned above.
2. Make an exception to your standardised operating environment and set up Confluence based on its supported platforms.

Migrating Confluence Between Servers

This page describes how to move Confluence between physical servers. It is distinct from other functions. It does not cover database migration, application server migration, or upgrading. Atlassian suggests doing each of these steps separately. See also:

- [Upgrading Confluence](#)
- [Migrate to Another Database](#)
- [Switching to Apache Tomcat](#)

How to Create a Test or Development Site

Administrators may need to move a Confluence site from one server to another for upgrades or downtime. This page tells you how to copy a Confluence site from one server to another. For example, you may want to transfer your current production snapshot to a test server as permitted in the licence agreement.
Avoid upgrades while migrating. If you are planning to switch databases, application servers or Confluence versions, firstly perform the application transfer in isolation, and test that it was successful before making other changes.

Development licenses are available for any Commercial or Academic license. Create one or contact Atlassian for help.

On this page:

- How to Create a Test or Development Site
- Transferring Confluence To Another Server Using The Same Operating System
- Transferring Confluence To Another Server Using a Different Operating System
- Ensuring no contact with production systems
- Migrating from HTTPS to HTTP
- Notes

The information on this page does not apply to Confluence OnDemand.

Transferring Confluence To Another Server Using The Same Operating System

If the operating systems on both servers are the same, then the home and install folders can be copied straight into an identical external database and user management setup.

1. On the original server, create zips of the Confluence install and home directories. Copy the zips to the new server.
2. On the new server, unzip the install and home directories. Windows users should avoid unzipping with the Windows built-in extractor, instead use Winzip or the free 7Zip.

If you are changing the location of the home directory, open the Confluence install\confluence\WEB-INF\classes directory and edit confluence-init.properties by changing the line starting with 'confluence.home='.

Modify the location of your war file if need be. If using Tomcat, this is likely in /Conf/Catalina/localhost. You'll want to make sure the docbase attribute is pointing to the right location.

This next step is dependent on your database:

a. Database configuration:
   i. For users of the internal database, the database content is stored inside the home directory. You should switch to an external database after the transfer is successful.
   ii. For external databases stored on another server: change the user account or datasource permissions so that the new server has the same network access permissions as the original. Then confirm from the new server that the hostname can be resolved and is listening for database connections on the expected port.
   iii. For external databases hosted locally (ie. localhost): on the original server, create a manual database backup using a native db dump backup tool. Copy the database backup to the new server.

b. On the new server, install or upgrade the database version to match the original server.
c. Import the database backup.
d. Add a database user account with the same username and password as the original.
e. Provide the user with the full access to the imported database.
f. Use a database administration tool to confirm that the user can login from the localhost.
g. To modify any database connection information, go to the Confluence home directory and edit confluence.cfg.xml. The connection URL is set under hibernate.connection.url. Ensure it does not
point to your production database server.

h. If you are using internal user management, skip this step. For users who have JIRA or LDAP integration, provide the new server with network or local access to the same hosts as the original. If this is a true test site, set up a test of your JIRA site or LDAP server so as not to disrupt production systems and change the server.xml or atlassian-user.xml files to point to the appropriate test servers. Note that it might be acceptable to use a production connection here, as users won’t be logging on to the test system in high volume.

i. If appropriate, make sure no emails are sent out from the test system.

j. Start Confluence.

k. Go to Administration > License Details and add your development license key. You can generate one at http://my.atlassian.com. There are more details in How Can I Get a License for a Staging Environment?

l. If you configured Confluence as a Windows service, repeat those instructions.

m. Add your development license key.

5. Some customers have experienced problems with Confluence’s search functions after performing a migration, or that the content of their [recently-updated] macro is not being updated correctly. Errors in the atlassian-confluence.log file corroborate such problems. Hence, to avoid these issues, it is strongly recommended that you perform a rebuild of your content indices after performing a migration.

Transferring Confluence To Another Server Using a Different Operating System

Migrating from Windows to Linux

You will need to replace the backslash with forward slash in the following lines in confluence.cfg.xml:

```xml
<property
  name="attachments.dir">${confluenceHome}/attachments</property>
<property name="lucene.index.dir">${confluenceHome}/index</property>
<property
  name="webwork.multipart.saveDir">${confluenceHome}/temp</property>
```

Using database tools (preferred option)

If you are using the Production backup strategy, follow these steps:

1. Download the proper distribution (the same one you have from your original site) from the Download Archive.
2. Copy your Confluence home (not install) directory from your original server (even if it was a different OS).
3. If you are changing the location of the home directory, open the Confluence install\confluence\WEB-INF\classes directory and edit confluence-init.properties by changing the line starting with 'confluence.home='.
4. For external databases stored locally, on the original server, create a manual database backup using a native db dump backup tool.
5. Copy the database backup to the new server.
6. On the new server, install or upgrade the database version to match the original server.
7. Import the database backup.
8. Add a database user account with the same username and password as the original.
9. Provide the user with the full access to the imported database.
10. Use a database administration tool to confirm that the user can login from the localhost.
11. To modify any database connection information, go to the Confluence home directory and edit confluence.cfg.xml. The connection URL is set under hibernate.connection.url. Ensure it does not point to your production database server.
12. If you are using internal user management, skip this step. For users who have JIRA or LDAP integration, provide the new server with network or local access to the same hosts as the original.
13. Copy server.xml, atlassian-user.xml, osuser.xml, any patches, and any other customized files velocity or
properties files. If you are using internal user management, skip this step. For users who have JIRA or LDAP integration, provide the new server with network or local access to the same hosts as the original. If this is a true test site, set up a test of your JIRA site or LDAP server so as not to disrupt production systems and change the server.xml or atlassian-user.xml files to point to the appropriate test servers. Note that it might be acceptable to use a production connection here, as users won’t be logging on to the test system in high volume.

14. If appropriate, make sure no emails are sent out from the test system.
15. Start Confluence.
16. Go to Administration > License Details and add your development license key. You can generate one at http://my.atlassian.com. There are more details in How Can I Get a License for a Staging Environment?

17. If you configured Confluence as a Windows service, repeat those instructions.
18. Add your development license key.
19. Some customers have experienced problems with Confluence’s search functions after performing a migration, or that the content of their {recently-updated} macro is not being updated correctly. Errors in the atlassian-confluence.log file corroborate such problems. Hence, to avoid these issues, it is strongly recommended that you perform a rebuild of your content indices after performing a migration.

Using XML data backups (only for small to medium sized installations)

Note: The XML export built into Confluence is not suited for the backup or migration of large data sets. There are a number of third party tools that may be able to assist you with the data migration. If you would like help in selecting the right tool, or help with the migration itself, we can put you in touch with one of the Atlassian Experts.

If you're not yet using the Production backup strategy, you can migrate Confluence to a different server machine by creating an XML data backup as usual, and then importing that to Confluence on the new server.

1. Create an XML data backup from Confluence as follows:
   a. Choose Browse > Confluence Admin.
   b. Select Backup & Restore.
   c. Check the Backup Attachments option and click Backup.
2. Identify the version of Confluence that you are currently using. This is displayed at the bottom of each Confluence page.
3. Download Confluence to the new server. Get the version of Confluence that you identified above, but for the operating system of the new server. You may be using either the latest Confluence version, or an older version.
4. Install Confluence on the new server.
5. Go to Administration > License Details and add your development license key. You can generate a license at http://my.atlassian.com. You can find more details in How Can I Get a License for a Staging Environment?
6. Restore your XML data backup from Administration > Backup and Restore.
7. If appropriate, make sure that no email contact can be made with the test system.
8. Some customers have experienced problems with Confluence’s search functions after performing a migration, or that the content of their {recently-updated} macro is not being updated correctly. Errors in the atlassian-confluence.log file corroborate such problems. Hence, to avoid these issues, it is strongly recommended that you rebuild your content indices after performing a migration.

Ensuring no contact with production systems

To ensure no contact with external systems, you will need to disable both inbound and outbound mail services.

1. Disable global outbound mail by running the following database query:
2. Disable space-level mail archiving by running the following database query:

```
SELECT * FROM BANDANA WHERE BANDANAKEY = 'atlassian.confluence.space.mailaccounts';
```

Change 'SELECT' to 'DELETE' in the above queries once you are sure you want to remove the specified accounts.

Once this is done, you can start your test site without any mails being sent or retrieved. Think carefully about other plugins which may access production systems (SQL macro, JIRA macro, etc.). If these write content, or create unwanted load on external systems, they should be disabled promptly after starting the test site.

### Migrating from HTTPS to HTTP

You may want to migrate from a server secured by SSL to one which is not secured by SSL. For example, this may be useful if you are copying a Confluence site from a production to a test site.

To migrate from HTTPS to HTTP, undo the HTTPS-specific settings that are described on this page: Adding SSL for Secure Logins and Page Security.

### Notes

- Ricky Sheaves ([calebscreek](#)) has written an interesting blog post on Moving Confluence from Windows to (Ubuntu) Linux.
- If you wish to merge two Confluence sites, you can consider using the [remote import plugin](#). This plugin is currently not supported. The supported method would be to export a space and then import each space one by one. The two Confluence sites must be running the same version of Confluence.

### Migrating from Confluence OnDemand to a Confluence Installed Site

This page is for people who are currently using a Confluence OnDemand site, and wish to move to a Confluence site that is hosted on their own servers.

#### Summary

You will need to download and install a special [OnDemand release](#) of Confluence (for example, ‘Confluence 5.0-OD-1’) and then move your data from your hosted Confluence OnDemand site into your newly installed site. You cannot move your data from Confluence OnDemand to a site installed from the standard Confluence download.

#### Instructions

**Note:** You must do the data export and the Confluence download (both described in the steps below) **on the same day**. This will ensure that your data and your Confluence installation are of the same version and are therefore compatible.

**To migrate from Confluence OnDemand to a Confluence installed site:**

1. Export the data from your Confluence OnDemand site, using the Confluence backup manager.
   - For instructions, see this page in the Confluence OnDemand documentation: Exporting wiki data.
   - You now have a backup file, also called an XML export, of your Confluence OnDemand data.
2. Download the OnDemand release of Confluence. Go to the [Confluence OnDemand download page](https://confluence.atlassian.com/confluenceondemand-manual-upgrade-1201382506.html) and get the latest 'OD' release for your operating system. The latest downloads are at the top of the list. For example, get the following files, replacing 'x' with the latest number available:

- **For Windows 64-bit**: Get '5.0-OD-x - Windows Installer (64 bit)'
- **For Windows 32-bit**: Get '5.0-OD-x - Windows Installer (32 bit)'
- **For Linux 64-bit**: Get '5.0-OD-x - Linux Installer (64 bit)'
- **For Linux 32-bit**: Get '5.0-OD-x - Linux Installer (32 bit)'
- To install Confluence from an archive on UNIX or Mac OS X: Get '5.0-OD-x - Standalone (TAR.GZ Archive)'
- To install Confluence from an archive on Windows: Get '5.0-OD-1 - Standalone (ZIP Archive)'
- EAR/WAR archives are also available.

3. Install Confluence as described in the [Confluence Installation Guide](https://confluence.atlassian.com/confluenceinstallguide-1003538173.html).

4. Import the data from your backup file (XML export) into your new Confluence installation. See [Restoring a Site](https://confluence.atlassian.com/confluenceondemand-manual-upgrade-1201382506.html).

5. Log in to your new Confluence site, using the following credentials:

- **Username**: sysadmin
- **Password**: sysadmin

6. Change the password immediately after logging in.

---

**Background**

Backups taken from Confluence OnDemand are only compatible with the current OnDemand release (for example, 'Confluence 5.0-OD-1'). The reason is that Confluence OnDemand is typically ahead of the downloadable version of Confluence, meaning that you will have new features in Confluence OnDemand that are not yet available in the downloadable version.

It is therefore not possible to migrate your data to a Confluence site installed from the standard Confluence download. You will need to download and install the special OnDemand release of Confluence (for example, 'Confluence 5.0-OD-1') as described above.

The advantage is that you will be able to keep the Confluence OnDemand features currently not available to other customers who are using the standard downloadable version of Confluence. However, there are a few major limitations as noted below.

**Support, limitations, and recommendations**

Please note the following points about your Confluence site installed from an OnDemand release.

**Upgrade required as soon as full release is available**

Atlassian Support will support your newly installed Confluence site, running the OnDemand release, until the full Confluence release is available.
For example, if your OnDemand release is ‘Confluence 5.0-OD-1’, then we will support it until Confluence 5.0 is released.

When the full version is released, you will need to upgrade to the full release in order to continue to receive support.

**Compatibility of third-party plugins**

Because Confluence OnDemand is typically ahead of the downloadable version of Confluence, most third-party plugins will not be compatible with the OnDemand release. You may have some problems with third-party plugins on your Confluence site, until you are able to upgrade to the full release. Note, however, that any third-party plugins that you were using in Confluence OnDemand should be compatible with your newly installed site too.

If you have any questions about the compatibility of third-party plugins with your OnDemand release, please contact the plugin vendors. Contact details are on the [Atlassian Marketplace](https://marketplace.atlassian.com).

**PostgreSQL database recommended**

If you are uncertain about which database to choose for your Confluence site, we recommend PostgreSQL. See [Database Setup for PostgreSQL](https://confluence.atlassian.com/display/DEV/Database+Setup+for+PostgreSQL). The Confluence OnDemand site runs on PostgreSQL, and we therefore know it to be compatible with your OnDemand release.

If you decide to choose another supported database and discover any problems with compatibility, please contact [Atlassian Support](https://confluence.atlassian.com/display/DEV/Atlassian+Support). For a list of supported databases, see [Supported Platforms](https://confluence.atlassian.com/display/DEV/Supported+Platforms).

**Confluence license**

Your Atlassian OnDemand license cannot be used in a site installed from the downloadable version of Confluence. Please get your new Confluence license at [https://my.atlassian.com](https://my.atlassian.com).

**Confluence Release Notes**

Welcome to this page about all production releases of Confluence wiki. The release notes give up-to-date information about the improvements made in each release. If you are upgrading from an earlier version of Confluence, you will find essential information in the upgrade notes associated with the relevant release notes.

**Latest major release: Confluence 4.3**

With great pleasure, Atlassian presents **Confluence 4.3**. Keep up with what's happening, rediscover your team's focus, and take action faster – even while on the go!

Read the [full release notes](https://confluence.atlassian.com/display/DEV/Confluence+4.3+Release+Notes).

Notes

How to find a list of known issues

To find a list of known issues in a particular Confluence version, you can create a filter in the Atlassian issue tracker and use the permalink located at the top right of the issue tracker's page to access the filtered report. The following example filter is the list of bugs reported for Confluence 4.3 and now fixed:

https://jira.atlassian.com/secure/IssueNavigator.jspa?reset=true&jqlQuery=project +%3D+CONF+AND+issuetype+%3D+Bug+AND+affectedVersion+%3D+%224.3%22+AND+resolution+ +%3D+Fixed

Read the JIRA documentation on creating filters.

Confluence Release Summary

This page shows the highlights of the major Confluence releases.

Current Release

For information about the latest release, please go to the Confluence Release Notes.
Confluence 4.3 — 4 September 2012

- Workbox notifications
- Personal tasks
- Tasks on pages
- Confluence mobile
- Table sorting and highlighting
- Draggable images and macros
- Rich text templates
- Space archiving
- Improved user invitations and signup options
- Default space permissions
- More in the Confluence 4.3 Release Notes

Confluence 4.2 — 10 April 2012

- Page layouts
- Likes
- Quick comments
- Popular content on the dashboard
- Recommended content by email
- Labels on attachments
- Signup invitations via URL
- Easy upgrade, try and buy for plugins
- More in the Confluence 4.2 Release Notes

Confluence 4.1 — 13 December 2011

- Autoconvert for Pasted Links
- Image effects
- Quick find and replace
- Follow Your Network On the Dashboard
- Space attachments macro
- Global PDF stylesheets
- Use any character in page titles
- New translation feature
- More in the release notes

Confluence 4.0 — 19 September 2011

- Brand New Editor
- Simplified Editing Experience
- New Macros
- Faster Editing Experience
- Introducing @mentions
- Improved Page Comparison Functionality
- Email Notification Improvements
- New Confluence Installer and Guided Upgrades
- New Editor Plugin Points for Developers
- More in the release notes

Confluence 3.5 — 16 March 2011

- Easy, Powerful Connections to Active Directory, LDAP and Crowd
- Improved JIRA Integration
- Drag-and-Drop for HTML5 Browsers
- Autowatch and Improved Notification Settings
- Sharing Pages and Blog Posts
- Enhanced Code Macro
- More Administrative Improvements
Confluence 3.4 — 12 October 2010

- New Keyboard Shortcuts, Mac-Friendly Too
- Keyboard Shortcut Dialog
- User Macros in Macro Browser and Autocomplete
- New Plugin Manager
- Improved Performance
- Infrastructure Changes
- More in the release notes

Confluence 3.3 — 7 July 2010

- Confluence Page Gadget
- Autocomplete for Inserting Macros
- Property Panels for Links
- Property Panels for Images
- Manage Watchers
- Email Notifications for Network Activity and Blogs
- Blog Improvements
- Context-Sensitive Help Links
- Security Features
- Infrastructure Changes
- More in the release notes

Confluence 3.2 — 24 March 2010

- Autocomplete for Inserting Links
- Autocomplete for Embedding Images and Documents
- A Link Browser that's Smarter, Smoother, Faster
- New Documentation Theme
- New Easy Reader Theme
- Template Bundles
- Reordering while Moving a Page
- New Keyboard Shortcuts and Editor Hints
- User Interface Enhancements
- More in the release notes

Confluence 3.1 — 8 December 2009

- Introducing Gadgets
- Drag-and-Drop
- Office 2007 Support
- New 'Move Page' Feature
- Enhanced Image Browser
- Draft Comparisons
- Page Restrictions Dialog Box
- Other Editor Enhancements
- New Web Browser Versions Supported
- More in the release notes

Confluence 3.0 — 1 June 2009

- Introducing the Macro Browser
- Enhanced User Profiles
• Introducing Your Network
• New User Status
• New Hover Profile Feature
• Customisable Enhanced PDF Exports
• Improved Rich Text Editor
• Performance Improvements
• Engine Room and Developer Community
• Administration Improvements
• More in the release notes

Confluence 2.10 — 3 December 2008
• Introducing the Widget Connector
• Improved Office Connector Now Bundled
• Introducing Quick Navigation
• ‘Did You Mean’, OpenSearch and More
• Custom Stylesheets for Confluence Spaces
• Updated JIRA Issues Macro with Custom Fields and Dynamic Display
• Enhanced User and Group Management
• Upgraded Rich Text Editor
• Universal Wiki Converter now with SharePoint Import and More
• Improved Activity Macros
• Plugin Framework 2
• More in the release notes

Confluence 2.9 — 7 August 2008
• Streamlined Search
• Auto Save
• Charts
• Page Tree
• Gallery
• New Tutorial
• More in the Menus
• Alphabetical Page Ordering
• Better Spam Prevention
• Plugin Repository
• Engine Room and Developers’ Community
• More in the release notes

Confluence 2.8 — 10 April 2008
• Dynamic menus and simplified screen design
• Page ordering
• Collapsible comments
• Multiple-label filter
• Confluence installer
• Task list
• Performance enhancements
• Administration, management and monitoring
• More in the release notes

Confluence 2.7 — 12 December 2007
• JIRA Issues and Portlet macros use new trusted authentication
• Two-tier administrator permissions
• Inserting images and attaching files during page creation
• Sorting of images in Gallery macro
• Simplified and improved logging
• Performance, maintainability and administration
• More in the release notes

Confluence 2.6 — 27 September 2007
• Fresh look for the Default theme
• Personalised comments and Dashboard
• Space description on Dashboard
• Labels on templates
• Default content for space home pages
• Social Bookmarking plugin now bundled with Confluence
• Back-dating and renaming news items
• More in the release notes

Confluence 2.5 — 29 April 2007
• Introducing flexible page restrictions
• Dynamic task list JRE incompatibilities
• contentbylabel macro supports AND condition
• More in the release notes

Confluence 2.4 — 14 March 2007
• Editable comments
• Page mailing
• More in the release notes

Confluence 2.3 — 5 January 2007
• Confluence Massive — cluster support
• People directory
• Activity plugin — usage statistics
• Blogging RPC plugin — manage news in Confluence using blogger-compatible desktop clients
• WebDAV client support via WebDAV plugin — create, edit, move pages, attachments, etc via WebDAV
• More in the release notes

Confluence 2.2 — 27 April 2006
• Personal spaces
• Localisation/internationalisation — drop-in language packs (similar to JIRA)
• CAPTCHA support — spam protection
• Improved searching
• Improved LDAP performance
• Confluence ships with Tomcat 5.5
• More in the release notes

Confluence 2.1 — 20 December 2005
• Autosave
• Concurrent edit warnings
• LDAP integration with Atlassian User/POLIS
• More in the release notes

Confluence 2.0 — 17 November 2005
• Rich Text Editing — WYSIWYG editor
• Labels
• Dashboard tabs — All, My, Team, New
• RSS builder
• Export pages as Word documents
• Copy pages
Confluence 1.4 — 23 May 2005
- New user interface
- Enhanced editing — doing more in the edit interface
- Page permissions
- New plugin types
- Configurable themes
- Completely rewritten Wiki to HTML conversion engine
- More in the release notes

Confluence 1.3 — 30 November 2004
- Mail archiving
- Themes
- Trash can
- More granular space permissions
- More in the release notes

Confluence 1.2 — 23 August 2004
- Page list views — alphabetical, directory view and search view of all pages in a space
- Image thumbnails and thumbnail galleries
- Threaded comments
- Enhanced Search - indexing attachment comments and file names and contextual searching
- New permissions interface
- More in the release notes

Confluence Release Cycle

New versions of Confluence are released frequently. Our goals are to:

- Make bug-fixes available to customers sooner
- Give interested customers early access to new features and API changes
- Make Confluence major releases predictable

Feature Releases

We aim to release new versions of Confluence every three to four months. These releases will contain the bulk of new functionality.

Feature releases are numbered by incrementing Confluence's minor version number, so the move from Confluence 2.0 to 2.1 and 2.1 to 2.2 both introduced significant new features to the product. Occasionally we may change to a whole new major version number (Confluence 2.0 was originally slated to be released as 1.5), but that is mostly done for marketing purposes, and shouldn't be considered to have any practical meaning.

Feature releases may not be API-compatible with the previous release. This means that you should test RPC clients, macros and plugins before running them on a newer version of Confluence.

You can find the time line history of our major releases at the downloads archive.

Bug-Fix Releases

Confluence bug-fix releases are scheduled every three to four weeks, depending on the number and urgency of the bugs that have been fixed during that particular development cycle. We aim to minimise the time between a bug being reported and a fix being available, without either us or our customers having to manage clumsy sets of manual patches.

Bug-fix releases will contain mostly bug-fixes, plus the occasional minor new feature or enhancement. Enhancements will be limited, however, as the main aim of these point releases is to improve stability, and make
no significant API changes.

Bug-fix releases are numbered by incrementing the patch-level. So the first bug-fix release after Confluence 2.2 is 2.2.1, followed by 2.2.2. Occasionally, we will re-issue a bug-fix release because something was faulty with the original download. In that case we will create a “re-issue” release number, for example 2.1.5a or 2.2.1a.

Obviously, we don’t expect anyone to upgrade Confluence every two weeks, administrators should keep their own schedule, based on how much of an inconvenience is being caused by any bugs that may have been fixed since. Sometimes, however, a security issue or serious application bug will arise that we feel it is in everyone’s best interests to fix as soon as possible. In such cases, we will recommend in the Confluence Release Notes that all customers upgrade to the latest version.

**Milestone Releases**

Occasionally, when possible, we will release preview “milestone releases” of the next major Confluence version. How often and when we do so depends on the particulars of the current development cycle. In situations where we are working on a number of disparate features we may be able to do a number of progressive development releases, whereas in iterations where we are making significant changes to the Confluence internals, we may not have anything suitable for public consumption until quite late in the release cycle.

Milestone releases will be announced in the developer release notes. Milestone releases are published for testing plugins and early feedback about our work, please don’t use them on production systems.

The version number of a milestone release will be the version number of the next major release, suffixed with -m. So Confluence 2.3-m1 will be followed by 2.3-m2, and so on until the ultimate release of the finished Confluence 2.3.

**Upgrade Notes Overview**

Typically, each major release of Confluence comes with upgrade notes, which are specific recommendations for upgrading from the previous major version. If you plan to upgrade and skip a few Confluence versions, you must read the upgrade notes for all major versions between your current version and the version to which you are upgrading, to make sure you do not miss something important.

Please read our general information about upgrading Confluence.

**For example:**

When upgrading from Confluence 3.4 to Confluence 4.0, read the upgrade notes for Confluence 3.5, as well as those for Confluence 4.0.

Also, we strongly recommend that you read the upgrade notes for any minor releases in-between, since they contain important information that will affect your Confluence upgrade.

**Below is a list of upgrade notes for previous major releases of Confluence, as well as the upgrade notes for important minor releases:**

- [Confluence 4.3 Upgrade Notes](#)
- [Confluence 4.2 Upgrade Notes](#)
- [Confluence 4.1 Upgrade Notes](#)
- [Confluence 4.0 Upgrade Notes](#)
- [Confluence 3.5 Upgrade Notes](#)
- [Confluence 3.4 Upgrade Notes](#)
- [Confluence 3.3 Upgrade Notes](#)
- [Confluence 3.2 Upgrade Notes](#)
- [Confluence 3.1 Upgrade Notes](#)
Confluence 4.3 Documentation

- Confluence 3.0.1 Upgrade Notes
- Confluence 3.0 Upgrade Notes
- Confluence 2.10 Upgrade Notes
- Confluence 2.9 Upgrade Notes
- Confluence 2.8 Upgrade Notes
- Confluence 2.7 Upgrade Notes
- Confluence 2.6 Upgrade Notes

You will find the upgrade notes attached to the release notes for the relevant version.

Useful plugins

Before installing a plugin into your Confluence site, please check the plugin’s information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

Confluence 4.3 Release Notes

4 September 2012

With great pleasure, Atlassian presents Confluence 4.3. Keep up with what's happening, rediscover your team focus, and take action faster – even while on the go!

Highlights of Confluence 4.3

- Workbox notifications
- Personal tasks
- Tasks on pages
- Confluence mobile
- Table sorting and highlighting
- Draggable images and macros
- Rich text templates
- Space archiving
- Improved user invitations and signup options
- Default space permissions
- Other improvements
- Infrastructure changes

More

- Read the upgrade notes for important information about this release.
- See the full list of issues resolved in this release.

Thank you for your feedback

⭐ Over 20 feature and improvement requests fulfilled
⭐ More than 960 votes satisfied

Video of what's new
Workbox notifications

The new Confluence workbox collects your notifications from page watches, shares and mentions. Use the inline actions to comment on, like, or watch a page. More...

Do you want to mark a notification for later attention? Add it to your task list and come back to it later.
Personal tasks

As part of your workbox, you can now create and manage all your tasks in Confluence: personal tasks, tasks from notifications, and tasks assigned to you on Confluence pages. Plan your day’s work, drag your tasks into order of priority, make notes, and mark your tasks as complete – all in one place. More...

Tasks on pages

It’s now really simple to track your team’s tasks on a page: project tasks, meeting action items, checklists, and whatever takes your fancy.

1. **Create task lists**
   Choose the new task icon in the editor to add a task list.

2. **Assign tasks using mentions**
   You can @mention a user within a task to assign it to that person. The task will appear in the user’s personal task list.

3. **Notify assignees**
   Users receive a notification when a task has been assigned to them. In addition, page watchers will be notified when tasks in a page are marked as complete.

4. **Track tasks from anywhere**
   View all your assigned tasks in your workbox. Add notes, prioritise the tasks, and mark them as complete.
Confluence mobile

Stay productive on the go with a new, super-responsive interface optimised for iOS 5. With Confluence mobile you can:

- Manage your personal tasks and notifications.
- Browse popular content, recent blog posts and network activity.
- Search Confluence for content and people.
- Like pages, blog posts and comments.
- Add comments to pages and blog posts.
- View the profiles of your colleagues. Tap to call, SMS or email them directly from your mobile device.

More...
Table sorting and highlighting

Sortable tables are here! They're colourful and easier to read too.

- **Column sorting**
  When viewing a page, click a column header to sort the table by the values in the column.
- **Cell highlighting**
  Fill cells, rows and columns with a background colour to highlight important information.

Custom **Highlighting**
Highlight important information with custom background colors for cells and rows.
Draggable images and macros

Within the Confluence editor, you can drag and drop images and macros anywhere on the page that you are editing. This feature is supported in the following browsers: Chrome, Firefox, and Internet Explorer 9.

Rich text templates

The template editor now supports rich text content, just like the page editor. You no longer need to use wiki markup to create and update templates. This means that you can convert an existing page to a template. And it's easy to add form fields, known as variables, to your templates. More...
Space archiving

Do you need to make a space’s content less visible, but keep the space available on your Confluence site? Archive it! When a space is archived, the pages and other content do not appear in the Confluence search results, activity streams, or dropdown menus. In the space directory, the archived space will appear on a new archive tab. More...

Improved user invitations and signup options
If you want to invite people to sign up to Confluence, you can email an invitation directly from the Confluence user administration screen. To further encourage people to sign up, the login screen includes a signup option too.

If you choose to add users manually, Confluence can send them an email message informing them of their new account.

If you want to allow only people from within your organisation to sign up, use the new domain restriction option. People will only be able to sign up if their email address belongs to one of the domains specified. Confluence will send the person an email message, asking them to click a link to confirm their email address. More...

Default space permissions

Confluence administrators can now set the default permissions that will be applied to new spaces. The default permissions are configurable for groups, and not for individual users or anonymous users. Note that the space permissions scheme remains as flexible as before. Space administrators can change the space permissions at any time, including the anonymous permissions, group permissions and individual user permissions. More...
We've also simplified the way you create spaces. The quick 'Add Space' option at the top of the dashboard lead you into the new, simplified dialog for adding global spaces, shown below. Adding a personal space is even simpler.

**Lightning Fast**
A new dialog loads in the blink of an eye.

**Automagic Space Keys**
Just type and let Confluence suggest a Space key for you. No thinking required.

**Intuitive Permissions**
Public or private? Yes, it's that simple.

**Other improvements**
- **Removing attachment versions.** You can now delete a specific version of an attachment.
Mentions now available via the 'Insert' menu. In Confluence 4.0 we introduced @mentions, a handy way of mentioning someone in a page or comment. Now we have added this user mention option to the editor’s ‘Insert’ menu, to help new users discover this useful feature.

Multiple new drafts. You can now have more than one draft of a new page or blog post in the same space. (In earlier versions of Confluence, you could have multiple drafts of existing pages, but only one new draft.)

Reduced memory usage by up to 2 MB per plugin. We have improved the implementation of the Atlassian template renderer, reducing memory usage by up to 2 megabytes per plugin, for those plugins that bundle their own Velocity templates.

Support for MySQL 5.5. Reminder: We support MySQL 5.5 as well as 5.1. We announced this support with the Confluence 4.2.3 release, and made it applicable to Confluence 4.2 and later.

Session resource management. Confluence now aggressively expires HTTP sessions that appear to come from bots or web crawlers, by lowering the idle timeout for sessions that only perform a single request. This significantly reduces the resource consumption by HTTP sessions on public-facing Confluence servers, or on servers integrated with third-party search appliances. This functionality is supplied by the Atlassian Bot Session Killer plugin, now bundled with Confluence.

Faster switching of dashboard tabs. Switching between the activity tabs on the dashboard no longer causes the entire dashboard to reload.

Infrastructure changes

Here are some points of interest for plugin developers.

JIRA Portlets gone. We have removed the JIRA Portlet code from Confluence. We deprecated the use of JIRA portlets in Confluence 4.2 (see the Confluence 4.2 upgrade notes) and the JIRA Portlet plugin is no longer bundled in Confluence 4.3.

Improved data storage for plugin developers. In previous versions of Confluence, Bandana was the primary data storage mechanism available to plugin developers. Confluence 4.3 ships with Active Object, a new ORM (object relational mapping) layer for Atlassian products, implemented as a plugin. It enable easier, faster, and more scalable data access and storage than the existing Bandana and PluginSettings APIs. Active Objects in Confluence is still under rapid development, and is currently used by only a few plugins. If you would like to experiment with it, we would love to hear your feedback.

API changes. Please see our guide to preparing for Confluence 4.3.

Experimental API for workbox notifications and tasks. Confluence 4.3 introduces the workbox for managing notifications and tasks. We have an experimental API available and we're requesting your feedback! Here is your chance to help us shape the notifications and tasks API. Details are in our guide preparing for Confluence 4.3.

Confluence 4.3 Upgrade Notes

Below are some important notes on upgrading to **Confluence 4.3**. For details of the new features and improvements in this release, please read the [Confluence 4.3 Release Notes](#).

On this page:

- **Preparing your team for Confluence 4**
- **Upgrade notes**
  - End of support for DB2 and PostgreSQL 8.2
  - Removal of JIRA Portlet macro
  - Active Objects bundled
  - Migration of templates from wiki markup to the rich text format
  - Advance notice: End of support for Java 6 in Confluence 5.0
  - Advance notice: End of support for Tomcat 5.5.x in Confluence 5.0
- **Upgrade procedure**
- **Checking for known issues and troubleshooting the Confluence upgrade**

Preparing your team for Confluence 4

If you are **upgrading to Confluence 4 for the first time** (coming from Confluence 3.5 or earlier) then please note that the change to the Confluence editing experience is significant. People in your organisation will need to be aware of the coming changes, so that they can plan and prepare for them. We have written some guides to help you:

**Planning for Confluence 4**

- [Confluence 4 Editor FAQ](#)
- [Confluence 4 Editor - What's Changed for Users of the Old Rich Text Editor](#)
- [Confluence 4 Editor - What's Changed for Wiki Markup Users](#)
- [Quick Administrator Tips To Prepare for Confluence 4](#)
- [Trying Confluence 4 Yourself](#)
- [Giving Feedback on Confluence Releases](#)
- [Confluence 4 Editor - Customer Feedback](#)

Upgrade notes

**End of support for DB2 and PostgreSQL 8.2**

As previously announced, **from this release onwards** we no longer offer support for the following database platforms:

- No versions of DB2 database are supported. For help with moving from DB2 to a supported database, please refer to the list of [supported databases](#) and the guide to [migrating to another database](#).
- Version 8.2 of PostgreSQL database is not supported.

Please see [End of Support Announcements for Confluence](#).

**Removal of JIRA Portlet macro**

The JIRA Portlet macro is no longer supported. Gadgets replaced portlets in JIRA 4.0 and Confluence 3.1. We deprecated the use of JIRA portlets in Confluence 4.2 (see the [Confluence 4.2 upgrade notes](#)) and have removed the portlet code in Confluence 4.3. Pages that contain the macro will no longer display information drawn from JIRA. Instead, they will show an error reporting that the macro does not exist. To prevent this...
behaviour, please upgrade to a version of JIRA that supports gadgets, and follow the instructions in How to Migrate from JIRA Issues and JIRA Portlets to Gadgets.

**Active Objects bundled**

Confluence 4.3 ships with the Active Objects plugin. If you have previously installed Active Objects into your Confluence 4.2 site, you will need to uninstall it before upgrading to Confluence 4.2. This is because user-installed plugins override bundled plugins.

**Migration of templates from wiki markup to the rich text format**

As part of the Confluence upgrade, an automatic migration of your page templates will take place. This is a non-destructive process. Your existing content is not overwritten. Instead, the migration process will create a new version of each space template and each global template on your Confluence site. The new version will use the new XML storage format, so that you can edit the templates in the Confluence rich text editor.

This process is automatic, and you should not need to take any action. For more details about the upgrade process, see Migration of Templates from Wiki Markup to XHTML-Based Storage Format.

**Advance notice: End of support for Java 6 in Confluence 5.0**

We are planning to end support for Java 6 (JRE and JDK 1.6) in Confluence 5.0. See End of Support Announcements for Confluence.

**Advance notice: End of support for Tomcat 5.5.x in Confluence 5.0**

We are planning to end support for Tomcat 5.5.x in Confluence 5.0. See End of Support Announcements for Confluence.

**Upgrade procedure**

**Note: Upgrade to a test environment first.** Test your upgrades in your test environment before rolling them into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home Directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.
   2. If your version of Confluence is earlier than 3.5, then you must upgrade to Confluence 3.5.x before upgrading to Confluence 4.x. There are several reasons for this:
      - There were major changes to user management and LDAP in Confluence 3.5.
      - From version 3.5, you will be able to use our new automated installer / upgrader to move to 4.0. The Confluence 4.0 installer does not support upgrading from Confluence versions earlier than 3.5.
      - We recommend that you fix any issues arising from the upgrade to version 3.5.x, separately from those that may arise from upgrading to version 4.x. Please contact Atlassian Support for assistance.
      - Please read the Upgrade Notes Overview and the upgrade notes for each version of Confluence listed on that page. (There are hyperlinks to each one.)
   If you are upgrading from 2.1 or earlier, please read the 2.2 Release Notes.
   If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade from version 2.7.x to version 3.5.x, then upgrade to the latest version. For more details, please refer to CONF-11767.
2. Download the latest version of Confluence.
3. Follow the instructions in the Upgrade Guide.
Checking for known issues and troubleshooting the Confluence upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

Issues Resolved in Confluence 4.3

Below are the issues resolved in Confluence 4.3, ordered by number of votes. For the full details of the fixes, improvements and new features, please take a look at our issue tracker. The Confluence 4.3 Release Notes describe the new features in this release.

Confluence 4.2.13 Release Notes

20 August 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.2.13, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

Don’t have Confluence 4.2 yet?

Take a look at the new features and other highlights in the Confluence 4.2 Release Notes.
Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.2.13 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.2.x.

Confluence 4.2.13 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.2.13. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:
1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

   Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.2.x.

3. If your version of Confluence is earlier than 4.2, read the release notes and upgrade guides for all releases between your version and the latest version.
   In particular:
   - Please read the Confluence 4.2 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

4. Download the latest version of Confluence.

Confluence 4.2.12 Release Notes

7 August 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.2.12, which is a bug-fix release.

Don't have Confluence 4.2 yet?

Take a look at the new features and other highlights in the Confluence 4.2 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.2.12 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.2.x.

Confluence 4.2.12 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.2.12. For details of the fixes in this release, please read the release notes.

Upgrade notes

⚠️ Note: An API change in Confluence 4.2.6 and later is incompatible with the current version of the Refined Wiki theme. The changed API may result in problems with other plugins too. Please watch this issue for news:

CONF-25981 - Authenticate to see issue details

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.2.x.

3. If your version of Confluence is earlier than 4.2, read the release notes and upgrade guides for all releases between your version and the latest version.

In particular:

• Please read the Confluence 4.2 Upgrade Notes.
• Please read the Confluence 3.5 Upgrade Notes.
• If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

4. Download the latest version of Confluence.

5. Follow the instructions in the Upgrade Guide.

Confluence 4.2.11 Release Notes

24 July 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.2.11, which is a bug-fix release.

Note: Confluence 4.2.9 and 4.2.10 were internal releases, not publicly available.

Don't have Confluence 4.2 yet?

Take a look at the new features and other highlights in the Confluence 4.2 Release Notes.

Confluence 4.2.7 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.2.7. For details of the fixes in this release, please read the release notes.

Upgrade notes

⚠️ Note added on 10 July 2012: An API change in Confluence 4.2.6 and Confluence 4.2.7 is incompatible with the current version of the Refined Wiki theme. The changed API may result in problems with other plugins too. Please watch this issue for news: CONF-25981 - Authenticate to see issue details

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   ✅ Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.2.x.

3. If your version of Confluence is earlier than 4.2, read the release notes and upgrade guides for all releases between your version and the latest version.
   In particular:
   - Please read the Confluence 4.2 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.2.6 Release Notes

25 June 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.2.6. This release includes the option to set default permissions for new spaces, and a simplified dialog for adding spaces. We have also fixed some bugs.

Don't have Confluence 4.2 yet?

Take a look at the new features and other highlights in the Confluence 4.2 Release Notes.

Default space permissions

Confluence administrators can now set the default permissions that will be applied to new spaces. The default permissions are configurable for groups only, not for individual users or anonymous users.

Simplified option for adding a space

In Confluence 4.2.3, we introduced a simple dialog for adding spaces. Now in Confluence 4.2.6, it has become even simpler. Just enter the space name and key, and indicate whether the space is private or not. A private space will be visible only to the person who created it. If you do not make it private, the space will have the default space permissions. Adding a personal space is even simpler – just say whether it is private or not. You can change the space permissions later.
Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.2.6 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.2.x.

4. Download the latest version of Confluence.

5. Follow the instructions in the Upgrade Guide.

Confluence 4.2.5 Release Notes

14 June 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.2.5. This release includes a new option for administrators to send an email message directly from Confluence, inviting new users to the site.

We have also fixed some bugs.

Don't have Confluence 4.2 yet?

Take a look at the new features and other highlights in the Confluence 4.2 Release Notes.
Inviting new users by email

You can now send an email message directly from the Confluence user administration screen, inviting people to join the site. We have also clarified the signup modes as public, private, or disabled.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.2.5 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.2.x.

Confluence 4.2.4 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.2.4. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

   Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.2.x.
3. If your version of Confluence is earlier than 4.2, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 4.2 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.2.3 Release Notes

21 May 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.2.3. This release includes a faster and simpler dialog for adding spaces. We have also added support for MySQL 5.5, and fixed some bugs.

Don't have Confluence 4.2 yet?

Take a look at the new features and other highlights in the Confluence 4.2 Release Notes.

Download Latest Version

Adding spaces quickly and simply

Confluence 4.2.3 introduces a quick 'Add Space' option at the top of the dashboard, which leads you to the new, simplified dialog for adding global spaces, shown below. Adding a personal space is even simpler.

Support for MySQL 5.5

Confluence 4.2 and later now support MySQL 5.5 as well as 5.1. See Supported Platforms. This announcement is retrospectively applicable to the Confluence 4.2 release.

Release notices
Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.2.3 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.2.x.

### Confluence 4.2.3 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.2.3. For details of the fixes in this release, please read the release notes.

#### Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

   Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5.x, then you **should** upgrade to Confluence 3.5.x before upgrading to Confluence 4.2.x.

3. If your version of Confluence is earlier than 4.2, read the release notes and upgrade guides for all releases between your version and the latest version.

   In particular:
Confluence 4.3 Documentation

- Please read the Confluence 4.2 Upgrade Notes.
- Please read the Confluence 3.5 Upgrade Notes.
- If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.2.2 Release Notes

8 May 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.2.2, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

Don't have Confluence 4.2 yet?

Take a look at the new features and other highlights in the Confluence 4.2 Release Notes.

Download Latest Version

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.2.2 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.2.x.

### Confluence 4.2.2 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.2.2. For details of the fixes in this release, please read the release notes.

#### Upgrade notes

**Bug sends the recommended updates email message to all LDAP users**

Confluence now sends a regular email report to subscribers, containing the top content that is relevant to the person receiving the message. By default Confluence will send a weekly update to all users, except under these conditions:

- If you have public signup enabled, the Recommended Updates email notification is turned off by default.
- If you are connected to LDAP and a user has never logged in to Confluence, that user will not receive the Recommended Updates notification.

⚠️ Due to a bug in Confluence 4.2, 4.2.1 and 4.2.2, the Recommended Updates email notification may be sent to all LDAP Confluence users, whether they have logged in or not. The problem is tracked on this issue:

</tr>
<tr>
<td>Resolved</td>
<td>CONF-25170</td>
<td>Fix French translation for the comment summary in &quot;Confluence Like Plugin&quot;</td>
</tr>
</tbody>
</table>
The problem will be fixed in Confluence 4.2.3. Until then, you may wish to disable the notification as described in the next paragraph, if your Confluence site is connected to a large LDAP user base.

You can turn off the Recommended Updates notification, or change its settings for the site. See Configuring the Recommended Updates Email Notification. Confluence users can choose their personal settings, which will override the defaults. See Subscribing to Email Notifications of Updates to Confluence Content.

Advance notice: End of support for PostgreSQL 8.2 in Confluence 4.3

We are planning to end support for version 8.2 of PostgreSQL in Confluence 4.3. See End of Support Announcements for Confluence.

Upgrade procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.2.x.
3. If your version of Confluence is earlier than 4.2, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   • Please read the Confluence 4.2 Upgrade Notes.
   • Please read the Confluence 3.5 Upgrade Notes.
   • If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.2.1 Release Notes

23 April 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.2.1, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

Don’t have Confluence 4.2 yet?

Take a look at the new features and other highlights in the Confluence 4.2 Release Notes.

Download Latest Version

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.2.1 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.
If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.2.x.

Confluence 4.2.1 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.2.1. For details of the fixes in this release, please read the release notes.

Upgrade Notes

Confluence now sends a regular email report to subscribers, containing the top content that is relevant to the person receiving the message. By default Confluence will send a weekly update to all users, except under these conditions:

- If you have public signup enabled, the Recommended Updates email notification is turned off by default.
- If you are connected to LDAP and a user has never logged in to Confluence, that user will not receive the Recommended Updates notification.

Due to a bug in Confluence 4.2, 4.2.1 and 4.2.2, the Recommended Updates email notification may be sent to all LDAP Confluence users, whether they have logged in or not. The problem is tracked on this issue: CONF-25213 - Authenticate to see issue details The problem will be fixed in Confluence 4.2.3. Until then, you may wish to disable the notification as described in the next paragraph, if your Confluence site is connected to a large LDAP user base.

You can turn off the Recommended Updates notification, or change its settings for the site. See Configuring the Recommended Updates Email Notification. Confluence users can choose their personal settings, which will override the defaults. See Subscribing to Email Notifications of Updates to Confluence Content.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and
**database.** The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

*Tip:* Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5.x, then you *should* upgrade to Confluence 3.5.x before upgrading to Confluence 4.2.x.

3. If your version of Confluence is earlier than 4.2, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 4.2 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

4. Download the latest version of Confluence.

5. Follow the instructions in the Upgrade Guide.

---

**Confluence 4.2 Release Notes**

**10 April 2012**

With great pleasure, Atlassian presents **Confluence 4.2**. Create content that pops, see what’s trending, and be a trendsetter.

**Highlights of Confluence 4.2**

- Page layouts
- Likes
- Quick comments
- Popular content on the dashboard
- Recommended content by email
- Labels on attachments
- Signup invitations via URL
- Easy upgrade, try and buy for plugins
- Other improvements
- Infrastructure changes

**More**

- Read the upgrade notes for important information about this release.
- See the full list of issues resolved in this release.

**Thank you for your feedback**

- Over 440 votes recognised
- More than 40 requests fulfilled

**Video of What’s New**

---

**Highlights of Confluence 4.2**
Page layouts

Page layouts offer a quick and easy way to add sections and columns to a page. Choose a predefined layout, add the content to each section, and you're done. It's a great way of creating a common page structure, so that readers know where to find the information on each page. Don't worry, the Section and Column macros are still available too. See the video.

![Example of a two-column page layout](image)

A two-column page layout in edit mode. (It's all laid out in the documentation.)

Likes

Has someone written a mind-bogglingly clever post on Confluence? Did you laugh out loud at someone's comment? Click Like to let them know. Confluence has like buttons on every page, blog post and comment. If enough people like the post, it will show up on the dashboard's new 'Popular' tab and in the 'Recommended Updates' summary sent by email. See the video.
Quick comments

Showing people a picture of themselves is a great way to encourage them to say something! We have added an enticingly empty comment at the bottom of every page, with the user's profile picture. This replaces the rather uninviting Add Comment button in earlier versions of Confluence. And here's what we are really proud of: When you click the box to write a comment, the full editor loads instantly. No page refresh required. See the video. Pow!
So let's talk about chocolate

Two penguins find themselves together on an ice floe, drifting helplessly into warmer waters. The penguins are very fond of each other. Suddenly, "crac-a-ack", the ice floe splits in half. Right between the penguins. As they drift apart, one penguin sadly waves a flipper and calls out, "Chocolate milk!"

Popular content on the dashboard

Want to see what's trending? The new 'Popular' tab on the dashboard shows the pages, blog posts and comments that are attracting most attention, based on the number of comments and likes they have received. The items are listed in order of popularity, with the most popular at the top. Activity that involves people in your network ranks higher than activity not involving your network, and the most recent activity ranks higher than earlier activity. See the video.
Recommended content by email

Confluence sends out a daily or weekly email message summarising the top news that is relevant to you. This is a great way of drawing people into the wiki discussions even if they are infrequent users of Confluence. The report shows the most popular content in the wiki, based on the number of likes and comments, and recently-created pages or blog posts. Confluence gives a higher ranking to activity by people in your network or in your favourite spaces. A link in the email message allows you to choose daily or weekly notifications, or to turn the notification off. See the video.

Note: All Confluence users will receive this email message by default. For instructions on turning it off, see the Confluence 4.2 Upgrade Notes.
Labels on attachments

You can now label attachments, just as you can label pages and blog posts.

- Using the Gallery macro, you can display a selection of images on your page filtered by label.
- The Attachments macro and the Space Attachments macro can show documents or other attachments with a specific label.
- The Content by Label macro also displays attachments (alongside pages, blog posts and spaces) with a given label, and you can filter by content type to show only attachments.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Labels on attachments. (Become attached to our documentation.)
Signup invitations via URL

It's what you have been dreaming of: a quick and easy way of inviting people to sign up to Confluence. Just send them a URL. You can also choose between public and private signup modes, and decide whether you want a notification each time someone signs up.

Inviting users and setting the signup mode. (You're invited to see the documentation too.)

Easy upgrade, try and buy for plugins

Now you can view, manage and upgrade your existing plugins from just one tab, called Manage my plugins. Simple, logical, clean. You will also notice some shiny Try, Buy, and Renew buttons appearing, for plugins that support the new functionality in the Universal Plugin Manager. Clicking one of those buttons takes you straight to MyAtlassian.com, where you can get an evaluation or full license on the spot. The license is automatically added to Confluence, and you are returned to the plugin manager. And the plugin manager looks much prettier too.
## Manage my plugins

The Universal Plugin Manager allows you to view, manage and update your installed plugins, as well as install new ones from the [Atlassian Plugin Exchange](https://plugins.atlassian.com).

### Available Updates

These plugins have updates that are compatible with your current version of Confluence and may be updated immediately.

**Reporting Plugin**

- **This plugin will generate reports on collected information in a flexible manner.**
- **Plugin key:** net.customware.confluence.plugin.reporting
- **Available plugin version:** 4.0.0
- **Plugin system version:** 2.0
- **License:** Commercial

### User-installed Plugins

These plugins may be configured, enabled, disabled or uninstalled.

**Adaptavist Advanced Search**

- A plugin to provide an alternative and advanced AJAX searching interface.

**Adaptavist Content Formatting Macros**

- This is a plugin for Confluence which provides advanced formatting options.

Plugins offered for upgrade under ‘Available Updates’ (See the [documentation](https://plugins.atlassian.com)).

---

### Other improvements

- **Author lozenge on blog post comments:**
  
  You will see an ‘author’ lozenge on blog comments, making it easy to scan a post for comments from the author. The author lozenge appears only on blog posts, and only for the original creator of the post.

  ![John Masson](https://via.placeholder.com/150)

  **John Masson**  
  Mar 01, 2012

  I think since 100% is out we need to keep it narrower. I didn't think it was that bad before, but right now it looks odd because it's "almost" 100% but not quite... Perhaps 50% looks better? Seems more intentional?

  Edit · Remove · Reply · Like

- **Share notifications showing all people notified:**
  
  When someone shares a page with you, the email message shows the other people they shared it with too.
Mouse-free macros, links and images:
This is one for wiki markup fans! Now you can add macros, links and images by wiki markup alone. Type the macro, including its parameters and the closing curly bracket. Add a link, such as an anchor link, and end it with a square bracket. Insert an image or other embedded object, enclosed between exclamation marks. As soon as you close the macro, link, or embedded image, Confluence will convert it to rich text format and add it to the page. See the video.

Fixed images in Word exports:
We have fixed this bug: CONF-6246 - Authenticate to see issue details

Personal spaces more open:
The permissions for personal spaces are now more in line with Confluence's philosophy of encouraging collaboration. When you create your personal space, the option that allows registered users to update content is selected by default. You will also be assigned as a watcher of your new personal space. (Existing settings will not be changed on upgrade.)

Gadget subscriptions:
An administrator can quickly add all the gadgets from a JIRA, Bamboo, FishEye or Crucible site – or from another Confluence site – to your Confluence gadget directory. People can then pick and choose the gadgets to add to their Confluence pages. Before this release, the administrator had to register the gadgets one by one. To subscribe to another site's gadgets, go to Confluence Admin > External Gadgets and open the new Gadget Feeds tab.

Infrastructure changes
- PostgreSQL 9.0: From this release of Confluence, we support PostgreSQL 9.0 as well as 8.2, 8.3 and 8.4. See Supported Platforms.
- Java 7: We now support Oracle JRE / JDK 1.7 as well as 1.6. See Supported Platforms.
- MySQL 5.5: Confluence 4.2 and later now support MySQL 5.5 as well as 5.1. See Supported Platforms.
Announcement made on 11 May 2012, retrospectively applicable to the Confluence 4.2 release.)

- Confluence 4.2 includes version 2.0.5 of the Universal Plugin Manager (UPM).
- Confluence 4.2 includes Atlassian Gadgets 3.2
- The implementation of quick comments required some significant changes to the editor’s initialisation code. This will have consequences for some Confluence plugins. Details are in this blog post: JavaScript Changes Required for Confluence 4.2 Compatibility.

Confluence 4.2 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.2. For details of the new features and improvements in this release, please read the Confluence 4.2 Release Notes.

On this page:

- Upgrade Notes
  - Checking for compatible plugins before upgrading
  - Disabling notification of signups
  - Configuring the Recommended Updates notification
  - Disabling the new ‘Popular’ tab on the dashboard
  - Advance notice: End of support for DB2 in Confluence 4.3
  - Advance notice: Removal of JIRA Portlet macro in Confluence 4.3
  - Advance notice: End of support for PostgreSQL 8.2 in Confluence 4.3

- Upgrade Procedure
  - Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

Upgrade Notes

Checking for compatible plugins before upgrading

Before upgrading to Confluence 4.2, please consider the plugins that are essential for your installation, and use the plugin upgrade check to see whether there is a compatible version of those plugins available for Confluence 4.2.

In particular, the implementation of quick comments required some significant changes to the editor’s initialisation code. This will have consequences for some Confluence plugins. Details are in this blog post: JavaScript Changes Required for Confluence 4.2 Compatibility.

Disabling notification of signups

This release includes an automatic notification, sent by email to all administrators, each time someone signs up to the Confluence site. This notification is part of the feature that allows you to invite people to sign up via a URL, and to set your signup mode to public or private. See the documentation.

The notification is enabled by default on the first upgrade to Confluence 4.1.9 or later. If you are upgrading to Confluence 4.2 from Confluence 4.1.7 or earlier, you may want to disable the notification after upgrading, especially if you allow public signup and are expecting a large number of signups.

To disable the notification:

The email notification includes a link to change notification settings. Alternatively, follow these steps:

1. Click Add Users on the dashboard.
   
   Or take the longer route: Choose Browse > Confluence Admin. Click Users > Add User.
2. Remove the tick from Notify administrators when users sign up.

Configuring the Recommended Updates notification

Confluence now sends a regular email report to subscribers, containing the top content that is relevant to the person receiving the message. By default Confluence will send a weekly update to all users, except under these conditions:
If you have public signup enabled, the Recommended Updates email notification is turned off by default.

If you are connected to LDAP and a user has never logged in to Confluence, that user will not receive the Recommended Updates notification.

⚠️ Due to a bug in Confluence 4.2, 4.2.1 and 4.2.2, the Recommended Updates email notification may be sent to all LDAP Confluence users, whether they have logged in or not. The problem is tracked on this issue: CONF-25213 - Authenticate to see issue details. The problem will be fixed in Confluence 4.2.3. Until then, you may wish to disable the notification as described in the next paragraph, if your Confluence site is connected to a large LDAP user base.

You can turn off the Recommended Updates notification, or change its settings for the site. See Configuring the Recommended Updates Email Notification. Confluence users can choose their personal settings, which will override the defaults. See Subscribing to Email Notifications of Updates to Confluence Content.

Disabling the new 'Popular' tab on the dashboard

In some environments, you may prefer not to display the new 'Popular' tab on the dashboard. For example, if your wiki allows only a small group of people to log in and contribute content or comments. Then the tab may not be relevant to you.

To prevent the tab from appearing, you can disable the relevant plugin module. You need System Administrator permissions to do this. Go to the Dashboard Macros plugin (See Configuring a Plugin), click Manage plugin modules and disable the Popular Tab module.

Advance notice: End of support for DB2 in Confluence 4.3

We are planning to end support for DB2 in Confluence 4.3. See End of Support Announcements for Confluence.

Advance notice: Removal of JIRA Portlet macro in Confluence 4.3

The JIRA Portlet macro, for JIRA 3.x and earlier, allows you to display a JIRA dashboard portlet on a Confluence page. Gadgets replaced portlets in JIRA 4.0 and Confluence 3.1.

In Confluence 4.1 and 4.2, it is no longer possible to add a JIRA Portlet macro via the Confluence macro browser. It is still possible to add the macro using wiki markup or by copying an existing JIRA Portlet macro. The macro still displays information correctly.

In Confluence 4.3, we will remove the JIRA Portlet macro from Confluence. Pages that contain the macro will no longer display information drawn from JIRA. Instead, they will show an error reporting that the macro does not exist. To prevent this behaviour, please upgrade to a version of JIRA that supports gadgets, and follow the instructions in How to Migrate from JIRA Issues and JIRA Portlets to Gadgets.

Advance notice: End of support for PostgreSQL 8.2 in Confluence 4.3

Update added on 1 May 2012: We are planning to end support for version 8.2 of PostgreSQL in Confluence 4.3. See End of Support Announcements for Confluence.

Upgrade Procedure

⚠️ Upgrade a test environment first

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest
version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home Directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 3.5, then you must upgrade to Confluence 3.5.x before upgrading to Confluence 4.x. There are several reasons for this:
   - There were major changes to user management and LDAP in Confluence 3.5.
   - From version 3.5, you will be able to use our new automated installer / upgrader to move to 4.0. The Confluence 4.0 installer does not support upgrading from Confluence versions earlier than 3.5.
   - We recommend that you fix any issues arising from the upgrade to version 3.5.x, separately from those that may arise from upgrading to version 4.x. Please contact Atlassian Support for assistance.
   - Please read the Upgrade Notes Overview and the upgrade notes for each version of Confluence listed on that page. (There are hyperlinks to each one.)

   If you are upgrading from 2.1 or earlier, please read the 2.2 Release Notes.
   If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade from version 2.7.x to version 3.5.x, then upgrade to the latest version. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

Issues Resolved in Confluence 4.2

Below are the issues resolved in Confluence 4.2, ordered by number of votes. For the full details of the fixes, improvements and new features, please take a look at our issue tracker. Please also take a look at the Confluence 4.2 Release Notes for the new features in this release.

Confluence 4.1.10 Release Notes

17 May 2012

Confluence 4.1.10 is a bug-fix release. The full list of fixes is provided at the bottom of this page.
Don't have Confluence 4.1 yet?

Take a look at the new features and other highlights in the Confluence 4.1 Release Notes.

Release Notices

- **Security advisory:** This release fixes some security flaws. Please refer to the [security advisory](#) for details of the security vulnerabilities, risk assessment and mitigation strategies.
- Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.1.10 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 4.1.10 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.1.10. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.
3. If your version of Confluence is earlier than 4.1, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 4.1 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.1.9 Release Notes

27 March 2012
The Atlassian Confluence team is pleased to announce the release of Confluence 4.1.9. This release includes the new invitation URL, providing a quick and easy way of inviting people to sign up to Confluence. We have also fixed some bugs.

Note: Confluence 4.1.8 was an internal release, not available publicly.

Don’t have Confluence 4.1 yet?

Take a look at the new features and other highlights in the Confluence 4.1 Release Notes.

Inviting people to sign up via a URL

It's what you have been dreaming of: a quick and easy way of inviting people to sign up to Confluence. Just send them a URL. You can also choose between public and private signup modes, and decide whether you want a notification each time someone signs up. See the documentation.

Inviting users and setting the signup mode.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.1.9 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.

Confluence 4.1.9 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.1.9. For details of the fixes in this release, please read the release notes.

Upgrade Notes

Disabling notification of signups

This release includes an automatic notification, sent by email to all administrators, each time someone signs up to the Confluence site. This notification is part of the feature that allows you to invite people to sign up via a URL, and to set your signup mode to public or private. See the documentation.

The notification is enabled by default on the first upgrade to Confluence 4.1.9 or later. You may want to disable the notification after upgrading to Confluence 4.1.9, especially if you allow public signup and are expecting a large number of signups.

To disable the notification:

The email notification includes a link to change notification settings. Alternatively, follow these steps:

1. Click Add Users on the dashboard.
   Or take the longer route: Choose Browse > Confluence Admin. Click Users > Add User.
2. Remove the tick from Notify administrators when users sign up.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.
3. If your version of Confluence is earlier than 4.1, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   • Please read the Confluence 4.1 Upgrade Notes.
   • Please read the Confluence 3.5 Upgrade Notes.
If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.1.7 Release Notes

12 March 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.1.7, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

Don’t have Confluence 4.1 yet?

Take a look at the new features and other highlights in the Confluence 4.1 Release Notes.

Download the latest version of Confluence.

Follow the instructions in the Upgrade Guide.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.1.7 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.

Confluence 4.1.3 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.1.3. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.
3. If your version of Confluence is earlier than 4.1, read the release notes and upgrade guides for all releases between your version and the latest version.
   In particular:
   - Please read the Confluence 4.1 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.1.2 Release Notes

03 January 2012

The Atlassian Confluence team is pleased to announce the release of Confluence 4.1.2, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

Don't have Confluence 4.1 yet?

Take a look at the new features and other highlights in the Confluence 4.1 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.1.2 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.

Confluence 4.1.2 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.1.2. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.1.x.
3. If your version of Confluence is earlier than 4.1, read the release notes and upgrade guides for all releases between your version and the latest version.
   In particular:
   - Please read the Confluence 4.1 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.1 Release Notes

13 December 2011

With great pleasure, Atlassian presents Confluence 4.1. With numerous improvements for content presentation, it delivers the extraordinary new Autoconvert feature, along with attractive new image effects, find and replace, new icons, improved translation features and global PDF stylesheets.

Highlights of Confluence 4.1:

- Autoconvert for Pasted Links
- Image effects
- Quick find and replace
- Follow Your Network On the Dashboard
- Space attachments macro
- Global PDF stylesheets
- Use any character in page titles
- New translation feature
- Other improvements
- Helping you transition to the Confluence 4.x generation
- Confluence Quick Reference Guide
- Release notices

Thank you for your feedback:

⭐ More than 35 requests implemented
⭐ Over 185 votes fulfilled

More:

- Read the Upgrade Notes for important information about this release.
- See the full list of issues resolved in this release.

OnDemand Customers

Confluence OnDemand customers will be automatically upgraded to Confluence 4.1 in the next scheduled maintenance window.

Highlights of Confluence 4.1

1

Autoconvert for Pasted Links

When you paste URLs into Confluence, Autoconvert will now analyse what you are pasting and automatically convert it into something that will display well in Confluence. Examples include YouTube videos, JIRA issue queries and Google Maps; many other content types are supported.

YouTube URLs

Create the widget below with Autoconvert, simply by pasting the YouTube URL onto the page.

Paste this:
http://www.youtube.com/watch?feature=player_embedded&v=2XqIqGi0lnk

To get this:
JIRA Issues URLs

Create the JIRA list below with Autoconvert, simply by pasting the JIRA query URL onto the page.

Paste this:  
https://jira.atlassian.com/sr/jira.issueviews:searchrequest-xml/temp/SearchRequest.xml?jqlQuery=project...

To get this:

<table>
<thead>
<tr>
<th>JIRA Issues (20 issues)</th>
<th>Key</th>
<th>Summary</th>
</tr>
</thead>

<td></td>
</tr>
<tr>
<td>CONF-26411</td>
<td>Blog post macro documentation for excerpts not consistent with functionality</td>
<td></td>
</tr>
</tbody>
</table>

**Google Maps URLs**

Create the **Google Maps Widget** below with Autoconvert, simply by pasting the Google Maps URL onto the page.

**Paste this:**
http://maps.google.com/maps?f=q&source=s_q&hl=en&geocode=&q=san+francisco+golden+gate+bridge...

**To get this:**
Other supported content types:

- Confluence page, blog, comment, status, user links,
- Shared screenshot links from Skitch,
- Google search results links,
- Confluence shortcut links: when pasting these, just the name of the link content (minus the URL prefix) will be used as the link display name.

Image effects

Enhance the presentation of your images and screenshots with slick new border effects.

Click **Effects** to apply taped style, instant camera style, drop shadow style, captions and more.
Quick find and replace

Updating your wiki content is now easier with the new find and replace feature. Using familiar conventions, automatically find and replace specific text strings within your Confluence page or blog. It’s also accessible with a keyboard shortcut **Ctrl-F** (Windows) or **Cmd-F** (Mac OS).

See the documentation for more details.
Follow Your Network On the Dashboard

See recent updates from just the people you follow in Confluence, with the new network tab on the Confluence dashboard. With this, following a few people in different parts of your company to make a quick filter of the main events happening outside your immediate team.

Space attachments macro

The new Space Attachments macro allows you to show all the attachments in the current space on your page. You can even filter them by file extension. Previously, you've only been able to show the attachments on the current page, using the Attachments macro.
Simply type `{space-attachments}` into a page to use it.

## Global PDF stylesheets

Set your custom PDF stylesheets at the global level, as with custom layouts. When there is no specific individual space stylesheet defined, PDF space exports will fall back to this global stylesheet. This means that users won’t have to re-apply the same stylesheet to all their individual spaces. This is an efficient way of achieving one look and feel.

See the [documentation](#) for more details.

## Use any character in page titles

Confluence now allows "special" characters in your page titles, such as semicolons and exclamation marks. This allows more descriptive page names and generally removes restrictions when creating page titles and naming your content.
New translation feature

For those customers working on creating translations of the Confluence user interface, the 4.1 release has a new feature that will help. After opening the Confluence dashboard, you can simply add this text to the end of your Confluence URL, like so:

```
?i18ntranslate=on
```

Then press Enter.

This will then cause each element of the user interface to display its special **key name** while Confluence is still in an interactive mode. This makes it easier to find the essential context for each key, which can then be searched on [http://translations.atlassian.com](http://translations.atlassian.com) where you can enter an appropriate translation for your custom language pack.

The key names are displayed with a "lightning bolt" graphic between elements of the names. For example, the buttons will show up with elements shown like so:

![Example interface with key names](image)

For the **Browse** menu, you can find its associated `system.space.menu` key on [http://translations.atlassian.com](http://translations.atlassian.com). When you use this new translation feature, you can see the full context of the user interface elements. By understanding where a feature appears on the interface, for example the **Browse** menu, you can write a more meaningful translation for your users.

To turn off the translation view, use this:

```
?i18ntranslate=off
```
Other improvements

As always, we have made various small improvements to Confluence.

General improvements

- **Favourites have been refined**
  You'll now see a newly named and cleaner Favourites tab in your personal space. Additionally, the list of favourites is now paginated and you can click the stars to remove favourites.

- **Global plugin & macro timeout setting**
  There is now a globally configurable timeout setting. This will stop pages going into a permanent loading state. In the past, this could lead to instability issues.

- **New JSON RPC**
  Confluence now has a JSON RPC library. This offers a way for Javascript developers to more easily access the Confluence API. For more details, see the documentation.

Editor improvements

- **Copy and paste table improvements**
  You can now copy and paste multiple table rows and entire tables. There are also new keyboard shortcuts. You can now use **Alt+Up Arrow** or **Alt+Down Arrow** to add a row above or below the current row.

- **Copy and paste list improvements**
  If you copy and paste list items from one list to another, the list content will now be joined together as expected.

New icons

- Based on customer feedback, this version of Confluence has a number of redesigned interface and installer icons. These new designs add more of a contemporary look and feel and are aimed at improving icon consistency and ease of use in Confluence.

General Confluence Icon

![General Confluence Icon](image)

Installer icons

Helping you transition to the Confluence 4.x generation

We've created a set of resources to help you manage the transition to Confluence 4.x. The change management resources are listed under the current documentation.

Note: The Wiki Markup editor has been removed in Confluence 4.x and replaced with a new XHTML-based editor. Please see Why We Removed the Wiki Markup Editor in Confluence 4.0 for full details.

Confluence Quick Reference Guide

Kick-start Confluence adoption with the Origami Necktie – full of tips and tricks to help your users get off the ground running. Get yours now!

Release notices

Upgrading from a previous version of Confluence

We strongly recommend that you back up your Confluence Home directory and your database before upgrading. Follow the normal upgrade instructions to upgrade your test instance to this release.

When upgrading from a previous version of Confluence, if you have customised your cache settings (as documented in Cache Performance Tuning) then you may run into memory problems during the wiki to XHTML
migration. We are working to fix this in a later release, but in the meantime you can revert your ehcache.xml to the default version.

**Removed functionality**

Features removed from Confluence

- **Personal labels**
  The ability to create personal labels is being removed in Confluence 4.1. You will still be able to access any personal labels you have created previously by going directly to http://<confluence_url>/users/viewmylabels.action

- **Mail archiving**
  This feature is being disabled by default in Confluence 4.1. However, it is still bundled as the Confluence Mail Archiving plugin, and easy to restore. Current users of the feature will not suffer any interruption, as the feature will be automatically kept in an operational state if you are using it. See details.

- **The SVG graphics library Batik**
  Any plugins that previously relied on the Batik package being provided by Confluence will now have to bundle their own version of Batik into their plugin. See details.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better!

Confluence 4.1 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.1. For details of the new features and improvements in this release, please read the Confluence 4.1 Release Notes.

On this page:

- Upgrade Notes
  - Confluence Clustered reactivated
  - Personal labels deprecated
  - Legacy Crowd SSO Authenticator removed
  - Reduced functionality for JIRA Portlets macro

- Upgrade Procedure
- Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

Upgrade Notes

Confluence Clustered reactivated
Please be aware that **Confluence Clustered** is now available again, following a brief hiatus after the release of Confluence 4.0.

**Personal labels deprecated**

The tab that displays personal labels in the user profile has been hidden in Confluence 4.1. We are planning to remove personal labels altogether from Confluence in a future release. The functionality for creating personal labels is still in Confluence, but we recommend that you stop using them. People can still see their existing personal labels by visiting the following URL:

```plaintext
CONFLUENCE-URL/users/viewmylabels.action
```

Where CONFLUENCE-URL is the URL of your Confluence site.

For example: [https://confluence.atlassian.com/users/viewmylabels.action](https://confluence.atlassian.com/users/viewmylabels.action)

**Legacy Crowd SSO Authenticator removed**

For customers with Crowd SSO authentication who ever used Confluence 3.4.9 or earlier: Customers who were using the `com.atlassian.crowd.integration.seraph.v22.CrowdAuthenticator` in their `seraph-config.xml` must replace this with `com.atlassian.confluence.user.ConfluenceCrowdSSOAuthenticator`. This has been the default Crowd SSO authenticator since Confluence 3.5, so users who installed from scratch with Confluence 3.5 or higher are not affected.

**Reduced functionality for JIRA Portlets macro**

*Upgrade notes updated in March 2012:* In Confluence 4.1, it is no longer possible to add a [JIRA Portlet macro](https://confluence.atlassian.com/display/CONFDOC100987788/Upgrade+Notes+for+JIRA+Portlets+macro) via the Confluence macro browser. It is still possible to add the macro using wiki markup or by copying an existing JIRA Portlet macro. The macro still displays information correctly.

**Upgrade Procedure**

⚠️ **Upgrade a test environment first**

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your [Confluence Home Directory](https://confluence.atlassian.com/display/CONFDOC100987788/Backing+up+your+Confluence+site) and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 3.5.x, then you *should* upgrade to Confluence 3.5.x before upgrading to Confluence 4.1. There are several reasons for this:
   - There were major changes to user management and LDAP in Confluence 3.5.
   - From version 3.5, you’ll be able to use our new automated Installer / Upgrader to move to 4.1. The
Confluence 4.1 Installer does not support upgrading from earlier versions of Confluence than 3.5.x.

- We recommend that any issues arising from the upgrade to version 3.5.x be fixed separately to those that may arise from upgrading to version 4.1. Please contact Atlassian Support for assistance.
- Please read the Upgrade Notes Overview and the Upgrade Notes for each version of Confluence listed on that page. (There are hyperlinks to each one.)

If you are upgrading from 2.1 or earlier, please read the 2.2 Release Notes.
If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade from version 2.7.x to version 3.5.x, before upgrading to the latest version. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

Confluence 4.0.7 Release Notes

17 May 2012

Confluence 4.0.7 is a bug-fix release. The full list of fixes is provided at the bottom of this page.

Don’t have Confluence 4.0 yet?

Take a look at the new features and other highlights in the Confluence 4.0 Release Notes.

Release Notices

- **Security advisory**: This release fixes some security flaws. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.
- Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.0.7 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 4.0.7 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.0.7. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   ▶ Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.0.x.
3. If your version of Confluence is earlier than 4.0, read the release notes and upgrade guides for all releases between your version and the latest version.
   In particular:
   - Please read the Confluence 4.0 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.0.5 Release Notes

⚠️ Note: The Wiki Markup editor has been removed in Confluence 4.x and replaced with a new XHTML-based editor. Please see Why We Removed the Wiki Markup Editor in Confluence 4.0 for full details

25 November 2011

The Atlassian Confluence team is pleased to announce the release of Confluence 4.0.5, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

Don't have Confluence 4.0 yet?

Take a look at the new features and other highlights in the Confluence 4.0 Release Notes.

Download Latest Version

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.0.5 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.
If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.0.x.

Confluence 4.0.5 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.0.5. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database.** The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

   - Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5.x, then you **should** upgrade to Confluence 3.5.x before upgrading to Confluence 4.0.x.

3. If your version of Confluence is earlier than 4.0, read the release notes and upgrade guides for all releases between your version and the latest version.

   - Please read the Confluence 4.0 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

4. **Download** the latest version of Confluence.

5. Follow the instructions in the Upgrade Guide.

Confluence 4.0.4 Release Notes

**Note:** The Wiki Markup editor has been removed in Confluence 4.x and replaced with a new XHTML-based editor. Please see Why We Removed the Wiki Markup Editor in Confluence 4.0 for full details

08 November 2011

The Atlassian Confluence team is pleased to announce the release of Confluence 4.0.4, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

**Don’t have Confluence 4.0 yet?**

Take a look at the new features and other highlights in the Confluence 4.0 Release Notes.
Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.0.4 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.0.x.

Confluence 4.3 Documentation

### Confluence 4.0.4 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.0.4. For details of the fixes in this release, please read the [release notes](#).

#### Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you [back up your Confluence Home directory and database](#). The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

   Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about [finding your Home directory](#).

2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.0.x.

3. If your version of Confluence is earlier than 4.0, read the [release notes and upgrade guides](#) for all releases between your version and the latest version.

   In particular:
   - Please read the [Confluence 4.0 Upgrade Notes](#).
   - Please read the [Confluence 3.5 Upgrade Notes](#).
If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.0.3 Release Notes

⚠️ Note: The Wiki Markup editor has been removed in Confluence 4.x and replaced with a new XHTML-based editor. Please see Why We Removed the Wiki Markup Editor in Confluence 4.0 for full details.

19 October 2011

The Atlassian Confluence team is pleased to announce the release of Confluence 4.0.3, which is a bug-fix release. 4.0.1 and 4.0.2 were internal releases only.

The complete list of fixes is at the bottom of this page.

Don't have Confluence 4.0 yet?

Take a look at the new features and other highlights in the Confluence 4.0 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 4.0.3 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.0.x.

Updates and Fixes in this Release

Confluence 4.0.3 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.0.3. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration.
information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.0.x.

3. If your version of Confluence is earlier than 4.0, read the release notes and upgrade guides for all releases between your version and the latest version.

In particular:
- Please read the Confluence 4.0 Upgrade Notes.
- Please read the Confluence 3.5 Upgrade Notes.
- If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

4. Download the latest version of Confluence.

5. Follow the instructions in the Upgrade Guide.

### Confluence 4.0 Release Notes

Confluence 4.3 has now been released – see the Confluence 4.3 Release Notes.

**19 September 2011**

With great pleasure, Atlassian presents Confluence 4.0. This is one of the most significant updates to Confluence since its initial release in 2004. With a brand new WYSIWYG editor and wide-ranging user interface improvements, we're confident that Confluence 4.0 is the most productive and user-friendly version to date.

**Highlights of Confluence 4.0:**

- Brand New Editor
- Simplified Editing Experience
- New Macros
- Faster Editing Experience
- Introducing @mentions
- Improved Page Comparison Functionality
- Email Notification Improvements
- New Confluence Installer and Guided Upgrades
- New Editor Plugin Points for Developers
- Other Improvements
- Helping You Transition to Confluence 4.0
- Release Notices

**More:**

- Read the Upgrade Notes for important information about this release.
- See the full list of issues resolved in this release.

**Video of What's New:**

Thank you for your feedback:
More than 215 requests implemented

Over 1050 votes fulfilled

⚠️ Note: The Wiki Markup editor has been removed in Confluence 4.x and replaced with a new XHTML-based editor. Please see Why We Removed the Wiki Markup Editor in Confluence 4.0 for full details

Highlights of Confluence 4.0

1

Brand New Editor

We've rebuilt the Confluence editor from the ground up, bringing you an editing experience that's simpler, faster and richer.

The new Confluence editor delivers many advantages:

- Just one editor!
- New, streamlined user interface.
- Redesigned toolbar with enhanced text formatting (indent paragraphs) and alignment controls.

2

Simplified Editing Experience

Editing in Confluence 4.0 is more visual and more contextual, putting more power at your fingertips.

Table Editing

We've made table operations better in Confluence 4.0 with the following features:

- Drag to Insert Tables
  Inserting tables is now easier and truly "WYSIWYG" with this new feature. Just click on the new Table
dropdown and drag your mouse to choose the number of rows and columns you'd like in your new table.

Oh, and don't worry if you like inserting tables with your keyboard, you can still use autoformatting or CTRL+SHIFT+I to insert a table.

- **New In-Context Table Toolbar**
  The new table toolbar removes the need for a context menu and only appears when you add a table to the page.

- **Merge and Split Table Cells.**

- **Highlight cells, rows or columns.**

- **Cut, copy and paste table rows.**

---

**Improved Image Handling**

- **Paste Images From Clipboard (Firefox and Chrome only)**
  Just copy any image to your clipboard and hit CTRL+V in the editor. The image will get attached and embedded directly into your page. There's nothing to install on your desktop, it just works!

- **Turn Images Into Links**
  Now you can turn images into links. This is especially handy for turning images into a button.

- **Custom Image Sizes**
  If you don't like the preset image sizes, you can now specify an exact image width.

---

- **Search Images**
You can now embed images from other pages using the new Search tab in the image browser.

Simplified Macro Editing

Confluence 4.0 introduces macro placeholders, a visual representation of your macros while editing. Create rich content with new and existing macros, without the tools getting in the way. Makes macros easier to manage while editing.

- **A More Visual Experience**
  Making it easier to visualise what the page will look like when you save it.

- **Macro Properties Panel**
  Every macro has a properties panel. The property panels for particular macros, such as the Status and View PowerPoint macros have additional functionality, as shown in the screenshot below.

- **Quick Access to Macro Editing**
  Double-click the macro to open the Macro Browser for parameter editing. The contents of some macros can be modified directly from the editor.
New Macros

We've bundled more macros with Confluence, and made some of the existing macros better, to help you easily include and present relevant content:

- **Status Macro**
  The Status macro is an easy way to show your status in reports (i.e. red, yellow or green) as a coloured lozenge. You can use the properties panel to quickly change the status.

- **Expand Macro**
  The Expand macro allows you to add a dynamically expandable section of text to your page.
Faster Editing Experience

*Write Wiki Markup ... Fast!*

Many of Confluence’s biggest fans are avid wiki markup users. For you aficionados, we wanted to give you the fastest editing experience possible, while preserving the speed and efficiency of your existing wiki markup skills. So, we present you with Autoformatting!

*Video of Autoformatting in Action:*

*What is Autoformatting?*

Autoformatting lets you type wiki markup into the editor. This new feature will "auto-format" your text on the fly.

To learn more, click on the help button in the editor and select the **Editor Autoformatting** tab.

Try these and see what you think:

- **Font Formatting**
  - Bold, underline, strikethrough, italic, superscript, subscript – just type the markup, such as *Bold*, and watch it convert to **Bold** on the fly!

- **Basic Tables**
  - Try typing |||||, or || **Heading 1** || **Heading 2** ||, then hit enter to to instantly see this:
• **Emoticons**
  All of our emoticons convert on the fly. Try typing :-) into the editor to instantly see this: 😊. It even works for (():), showing this: ✌.

• **Lists**
  For numbered lists, type # and a space at the start of each line.
  For bulleted lists, type * and a space at the start of each line.

• **Headings**
  Type h4. then some heading text to see a level 4 heading.

**New Page Links**

Quickly insert a link to create a page with Autocomplete for links. Simply type `[` in the editor and as you type, Confluence will display a Create Page link if a page with that title does not already exist in your current space.

![Create Page Link](image)

[Introduced in a previous release of Confluence (see details in this blog post), adding links, media and macros can still be quickly added by typing [], ! or { in the editor to add various kinds of content to your page.](image)

**Introducing @mentions**

Confluence 4.0 includes the new @mentions feature. This allows you to easily bring collaborators into a conversation: if you are mentioned in any Confluence content (a page, blog post or comment) you will be notified by email.

To mention someone, type @ and their name, when editing. Mentions will instantly suggest people you are following in your network, so you can quickly find and involve your friends.
Improved Page Comparison Functionality

We've got a better way to view changed content in Confluence.

**Improved Page Diffs**

We've simplified page diffs to make them easier to read. Now, page differences appear exactly as they do in Confluence. Images, text and tables are displayed as rendered. Additionally, page diffs now show changes to both formatting and macros.
Diffs in Email

Where possible, email notifications are now rendered in your email view with the correct diff colour coding.

Email Notification Improvements

New Email Design

All email notifications in Confluence now have a new design. This works in major email clients as well as on the iPhone.
Follow Notifications

Confluence now sends email when someone follows you.

New Confluence Installer and Guided Upgrades

Much to the delight of any sysadmins that are looking after Confluence, the Windows and Linux guided installers are now available.

Guided Upgrades

The new Linux and Windows Installers include an option that allows you to upgrade an existing Confluence 3.5 (or later) installation. This upgrade automates the following tasks for you:

1. Backs up the Installation and Home Directories of the existing Confluence installation.
2. Installs **Confluence 4.0.x** whilst migrating the following from your existing Confluence installation:
   - TCP port values in your existing Confluence installation's server.xml file,
   - The upgrade feature detects and notifies you of any other files in the Confluence subdirectory of your existing Confluence Installation Directory, which have been deleted, added or modified from the default. This informs you of any customisations you will need to manually migrate across to your upgraded Confluence installation directory.

**Simplified Installation Process**

- **Guided installer**: The guided install wizard has been implemented for Confluence 4.0 on both Windows and Linux operating systems. Installing a new instance is a breeze.
- **Easy JIRA Integration**: Hook Confluence up with JIRA, right within the Confluence setup wizard.

**New Editor Plugin Points for Developers**

We've added more editor plugin points for developers. Notable improvements include:

**Editor Plugin Points**

- **Extend the Macro Property Panel**
  Plugin developers can add buttons to the Macro Property Panel in the editor. For example, insert a Gliffy diagram or [see the tutorial](#) on how to do this.

- **Render an Image in the Macro Placeholder**
  A plugin developer can now render an image instead of a placeholder for bodyless macros. For more information, [check out the tutorial](#) on how to do this.

- **Custom Parameter Rendering in Placeholders**
  You can choose to display any parameter in the macro placeholder in the editor, instead of having the placeholder automatically show the first few parameters.

- **New Pluggable More Menu**
  Plugin developers can add items to the editor's More menu. See this [tutorial](#) for details.

**Developer Resources**
• **View Storage Format**
  To assist with plugin developers and help with developer issues, developers running in Dev mode and Confluence administrators can view the page storage format from the Tools menu in Confluence.

• **New API Changes**
  We have disabled the getPage() and getBlogEntry() read methods in the XML-RPC/SOAP API. If you have a script that primarily reads or appends to existing pages, it will break. Creating pages and overwriting existing pages will still work.

• **Plugin Developer Documentation**
  We have created a landing page for Confluence 4.0 planning. This includes resources for plugin developers to help you create new plugins, and make use of the new plugin points, as well as upgrade your existing plugins.

*Infrastructure Changes*

This release includes a number of improvements in the APIs and under the covers as well.

• **Anti-XSS Mode**
  This is now enabled by default for plugins.

• **Alignment and Border Parameters**
  The `alignment` and `border` properties in the macro definition template have been removed.

• **Thumbnail Settings**
  The `Thumbnail maximum height` and `Thumbnail maximum width` settings have been removed from the General Configuration page.

• **Link Browser**
  The Link browser is no longer built in GWT and is now built in core JavaScript.

• **Integration Platform 2.12.0**

• **Upgrade to AUI 3.5.0**

*Other Improvements*

As always, we have made various small improvements to Confluence screens, functionality and supported platforms.

• **Chrome and Internet Explorer 9 Support**
  See the upgrade notes for more information about browser support.

• **Administrator’s task list in the Admin Console**
  This new task list in the Admin Console helps administrators get started after a new install.

• **New keyboard shortcut:**
  `CTRL+SHIFT+E` to preview when you are in the editor; hit 'E' to get back to the editor.

• **Administration UI**
  Help tips have been added to the field descriptions.

• **Quicknav Improvements**
  Quicknav now indicates the space the page is coming from. This helps you find a page that might have the same title across multiple spaces, as well as selecting the first search result by default, making it quicker to open the link.

• **Advanced Linking**
  We’ve updated the Link dialog to cater for these link types: shortcut links, anchor Links, and undefined links (which you can do using Autocomplete).
Helping You Transition to Confluence 4.0

We've created a set of resources to help you manage the transition away from wiki markup. We know your people have become experts with using wiki markup in Confluence, but we think you'll really appreciate the new editor, and we want to make it as easy as possible for you to make the change. The change management resources are listed under the current documentation.

Release Notices

Upgrading from a previous version of Confluence

⚠️ You can only upgrade to Confluence 4.0 from Confluence 3.5. From version 3.5, you'll be able to use our now automated upgrader to move to 4.0. See the Confluence 4.0 Upgrade Notes.

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.

When upgrading from a previous version of Confluence, if you have customised your cache settings (as documented in Cache Performance Tuning) then you may run into memory problems during the wiki to XHTML migration. We are working to fix this in a later release, but in the meantime you can revert your ehcache.xml to the default version.

- If you still experience problems, try reducing the 'maxElementsInMemory' attribute on each cache to a very small value such as 50.
- Note that any cache changes you make to work around migration problems should only be considered temporary. You should restore caching to its original settings again after migration has been successful.

Removed Functionality

Features removed from Confluence

- The Edit Page in Word functionality
  This is being removed in Confluence 4.0. Note: This is a different feature to "Edit attachment in Word".
- Mail Page Plugin
  The Mail Page plugin is no longer bundled in Confluence. With the introduction of the “Share Page” feature in 3.5 this is no longer needed.
- Social Bookmarking Plugin
  The Social Bookmarking plugin is no longer bundled in Confluence but is still supported.
- The SnipSnap importer has been removed from the admin console.
- Please be aware that Confluence Clustered is not available for version 4.0 yet. It will be forthcoming in a minor release, following the launch of version 4.0.

Settings removed from Confluence

These settings were removed due to low recorded usage and the ongoing goal of simplifying Confluence.

- The CamelCase Links setting, from general configuration.
- The Number of Ancestors to Show in Breadcrumbs setting.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better!

Confluence 4.0 Upgrade Notes

Below are some important notes on upgrading to Confluence 4.0. For details of the new features and improvements in this release, please read the Confluence 4.0 Release Notes.

On this page:

- Upgrade Notes
  - Content updates after upgrade
  - User macros migration
  - Email notifications
  - Plugins may not be compatible with Confluence 4.0
  - Functionality removed: converting a Global Space to a Personal Space
  - Functionality removed: editing a Confluence page in an Office application
  - Functionality removed: linking to comments using commentid
  - Functionality removed: Mail Page plugin
  - Functionality removed: Social Bookmarking plugin
  - Drag-and-drop in Internet Explorer 9
  - Various admin settings removed
Upgrade Procedure
Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

Upgrade Notes

Content updates after upgrade

You will notice once you upgrade to Confluence 4.0, every page will have been edited during the migration process. This manifests itself in the appearance of changes to every page's content by various different users. When migrating pages, Confluence will show the same username that last contributed to your content as the author of the change. This is the upgrade task of migrating your wiki page storage format to XHTML from Wiki Markup. Do not be alarmed by this. This will only happen once for all current versions of content. This will not trigger email notifications, but will update your RSS feeds. Where possible, a change comment of "Upgraded to Confluence 4" will be added to pages and blog posts.

User macros migration

After upgrading, user macros will not be able to be inserted until they have defined macro parameters. See Guide to User Macro Templates. Defining macro parameters will mean that they can once again insert these user macros.

Email notifications

With the update of the email templates, the textual content of the notifications has also changed. These wording changes may invalidate any email filters set up to label or organise your email notifications.

Plugins may not be compatible with Confluence 4.0

To check your plugins are compatible with Confluence 4.0, see the Universal Plugin Manager (UPM) under Confluence Admin > Plugins > Confluence Upgrade Check. Here, you can select the new version of Confluence and see whether your existing plugins are compatible. If your custom plugins are not working following the upgrade to Confluence 4.0, see the Plugin Development Upgrade FAQ for 4.0 for guidance on how to solve this issue.

Functionality removed: converting a Global Space to a Personal Space

Confluence 4.0 does not offer the ability to convert a global space to a personal space. Our research has shown that this feature is not used much. We have decided to remove it as part of our ongoing mission to simplify Confluence where possible. We deprecated this functionality in the Confluence 3.5 Upgrade Notes.

Functionality removed: editing a Confluence page in an Office application

After extensive usability testing, we are confident the new Confluence 4.0 editor will be easier to learn and more reliable to use than the previous editor. Therefore this feature is no longer required. Other functions of the Office Connector (e.g. "Edit Attachments in Office") remain.

Functionality removed: linking to comments using commentid

Confluence 4.0 does not allow linking to comments by comment ID. Users will now have to use the permalink URL to link to comments. This will primarily affect plugin developers.

Functionality removed: Mail Page plugin

The Mail Page plugin is no longer bundled in Confluence. With the introduction of the "Share Page" feature, this is no longer needed.

Functionality removed: Social Bookmarking plugin

The Social Bookmarking plugin is no longer bundled with Confluence as of the 4.0 release. Our research has
shown that this feature is not used much. If you are currently using this plugin, you will need to reinstall it from plugins.atlassian.com. Atlassian continues to fully support this plugin.

**Drag-and-drop in Internet Explorer 9**

Internet Explorer 9 does not support the drag-and-drop functionality of HTML5. This means that when using IE9, you will not be able to use the attachments drag-and-drop feature in Confluence 4.0.

**Various admin settings removed**

In Confluence 4.0, rarely used admin settings have been taken out. These are as follows:

- The Set Site Support Address setting,
- The CamelCase Links general configuration setting,
- The Number of Ancestors to Show in Breadcrumbs setting,
- The SnipSnap Importer settings.

**Confluence Clustered delayed**

Please be aware that Confluence Clustered is not available for version 4.0 yet. It will be forthcoming in a minor release, following the launch of version 4.0.

**Upgrade Procedure**

⚠️ **Upgrade a test environment first**

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home Directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.
2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.0. There are several reasons for this:
   - There were major changes to user management and LDAP in Confluence 3.5.
   - From version 3.5, you’ll be able to use our new automated Installer / Upgrader to move to 4.0. The Confluence 4.0 Installer does not support upgrading from earlier versions of Confluence than 3.5.x.
   - We recommend that any issues arising from the upgrade to version 3.5.x be fixed separately to those that may arise from upgrading to version 4.0. Please contact Atlassian Support for assistance.
   - Please read the Upgrade Notes Overview and the Upgrade Notes for each version of Confluence listed on that page. (There are hyperlinks to each one.)

If you are upgrading from 2.1 or earlier, please read the 2.2 Release Notes.

If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade from version 2.7.x to version 3.5.x, before upgrading to the latest version. For more details, please refer to CONF-11767.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

**Checking for Other Known Issues and Troubleshooting the Confluence Upgrade**

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence...
after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to [troubleshooting upgrades](#) in the Confluence Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a [support ticket](#) and one of our support engineers will help you.

Confluence 3.0.1 Release Notes

20 August 2009

Confluence 3.0.1 is a recommended upgrade which fixes some security flaws and other issues.

Please refer to the security advisory for details of the security vulnerabilities, risk assessments and mitigation strategies.
Critical issue affecting non-clustered implementations of Confluence 3.0.1

Non-clustered (i.e. you do not have a clustered license) implementations of Confluence 3.0.1 are affected by an issue that can cause Confluence to crash. Please read the Confluence 3.0.1 Upgrade Notes for details on the issue and instructions on how to address it.

Attachment Handling Fixes

When a hierarchy of pages was moved from one space to another, the attachments on child or descendent pages of the parent page were not correctly moved. Instead, users would have to move one page at a time between spaces in order to maintain page attachment integrity. This issue has now been resolved.

Sporadic issues associated with attachment migration occurred when upgrading from either Confluence 2.9.x or 2.10.x, to 3.0. These have now been fixed.

Macro Fixes

A bug was identified in which excerpted content would not be rendered in a blog post macro until the source page containing that content had first been viewed. This phenomenon could occur when excerpt include macros were used in a blog post. It could also occur when excerpt macros were used in a blog post in conjunction with the content=excerpts blog post macro parameter. This problem has now been fixed.

An issue was found with the tasklist macro whereby special characters used in its title were not correctly escaped. This has now been resolved.

Rich Text Editor Fixes

A bug was identified in which the Rich Text Editor's link removal feature (available from the right-click context menu) did not work with external links. This has now been resolved.

In the Firefox web browser, the spell checker is now automatically enabled by default in the Rich Text Editor. Users no longer have to first disable the link removal menu and then enable and select 'Check Spelling' from the Firefox's own right-click context menu.

An issue was identified, which prevented the ability to escape from the quote text effect once it had been selected. This has now been addressed, such that a paragraph is automatically added after selecting this text effect.

Other Enhancements and Fixes

When a Confluence administrator first installs Confluence, runs through the Confluence Setup Wizard and then reaches the database configuration step, the database password is now hidden and is no longer shown in clear text.

It is now possible to filter network RSS feeds by different content types. This is achieved by implementing parameter modifications to the RSS feed link in your RSS newsreader. For more information, please refer to Subscribing to a Network RSS Feed.

Some customers experienced problems importing their site backup from a previous version of Confluence into version 3.0. This has now been resolved in Confluence 3.0.1.

An issue was identified in which multiple blog posts posted on a single day would be listed out of chronological order. This has now been fixed and multiple blog posts posted on a single day are now ordered according to their time of creation.

A problem was identified when accessing Confluence content in Internet Explorer that caused file downloads to fail over an SSL connection. This problem has now been fixed in this release of Confluence.
An issue was found in the page tree views on instances of Confluence running on Weblogic 10.x. This has now been resolved.

There's a complete list of fixes below. Click a specific issue to see details of the fix.

**Don't have Confluence 3.0 yet?**

Take a look at the new features and other highlights in the [Confluence 3.0 Release Notes](https://confluence.3.0). [Download Latest Version]

**Upgrading from a Previous Version of Confluence**

Upgrading Confluence should be fairly straightforward. Please read the [Confluence 3.0.1 Upgrade Notes](https://confluence.3.0.1). We **strongly recommend** that you back up your confluence.home directory and database before upgrading.

**Updates and Fixes in this Release**

**Coherence license changes SEPT 2009 - new Standard and Clustered Confluence Editions**

**Summary**

**Oracle Coherence** (formerly known as Tangosol Coherence) is the technology that provides clustering and distributed caching in Confluence. It has also been used for caching purposes in non-clustered Confluence deployments.

The Oracle Coherence technology was first incorporated into Confluence version 2.3. Since then, Atlassian has been able to distribute the Coherence technology library files via the following means:

- Included with all versions and distributions of Confluence downloadable from our web site since version 2.3, regardless of whether these were intended for clustered or single-server installations.
- From the Atlassian Maven repositories.

However, Atlassian is about to enter a new license agreement with Oracle over the Coherence technology. This means that from late September 2009, Atlassian will only be permitted to distribute the Coherence library files to customers who have purchased a license for it (that is, a Confluence clustered license).
As a result, the following changes will occur:

- The next version of Confluence (3.0.1) will be released in two editions:
  - **Standard** — Editions of Confluence without the Coherence library files. Ehcache will replace the local caching functionality previously provided by the Coherence technology.
  - **Clustered** — Editions of Confluence containing the Coherence library files.
- Customers who have purchased a non-clustered Confluence license will only be able to download standard editions of Confluence from the Atlassian web site, whereas customers who have purchased a Confluence clustered license will be able to download clustered editions of Confluence.
- **From late September 2009:**
  - **Standard editions of Confluence will be made available for each previous major releases of Confluence back to version 2.6.** These will be available as Confluence versions 2.10.4, 2.9.3, 2.8.3, 2.7.4 and 2.6.3 and will be available to customers with non-clustered licenses.
  - **All other previous versions of Confluence currently available from our download page (from 2.6 to 3.0 inclusively), will be re-released as clustered editions and will only be available to customers with Confluence clustered licenses.**
  - The Coherence library files will no longer be available in any form from the Atlassian Maven repositories.
  - The installation files for all versions of Confluence prior to 2.6 (which are no longer supported) will be removed from the Atlassian web site and will no longer be available for download and installation.

⚠️ If you are currently running a **clustered installation of Confluence**, please do not upgrade it with a **standard edition** of Confluence.

**What are the implications?**

**I am a Confluence customer with a non-clustered Confluence license, running Confluence 2.3 or later.**

The Confluence distribution you are running will continue to function and if it is Confluence version 2.6 or later, be supported by Atlassian in accordance with our standard support policy.

However, if you upgrade to Confluence version 3.0.1 or later or obtain any Confluence version released after late September 2009, you will only be able to download and upgrade to standard editions of Confluence.

**I run a customised installation of Confluence 2.3 or later and must build Confluence from source.**

Confluence source code downloaded before late September 2009 requires that the Coherence library files are present in either your local or the Atlassian Maven repositories for automated Maven builds to complete successfully.

If you have Confluence source code downloaded before late September 2009 (excluding version 3.0.1) but conduct an automated Maven build of Confluence using this source code after this date, your build will fail if the Coherence library files are not available in your local Maven repository. This is because the Coherence library files will also not be available in the Atlassian Maven repository.

Hence, to build a customised installation of Confluence using this source code, we recommend that you locate the `tangosol-3.3.jar` and `coherence-3.3.jar` from the `WEB-INF/lib` directory of your own existing Confluence installation and install them into your local Maven repository using the following commands:

---

*Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.*
These commands will install the Coherence library files into your local Maven repository, which should be available to you only. Please do not upload these files to any public Maven repository nor make them publicly available by any other means. Atlassian's End User License Agreement does not grant permission to redistribute any part of Confluence, which includes these Coherence library files.

Alternatively, you can download the sources for one of the new standard or clustered editions of Confluence and reapply your customisations. These will compile without any additional problems.

**I am a plugin developer and wish to compile plugins against old or existing versions of Confluence**

This will affect plugin developers in two ways:

1. When building a plugin, Maven will complain about the absence of the Coherence library files in the Atlassian Maven repository.
2. When using the Atlassian Plugin Toolkit to test a plugin, Maven will be unable to download the appropriate Confluence EAR-WAR distribution file (from the Atlassian Maven repository), against which to perform integration tests.

Therefore, we recommend that as soon as possible, plugin developers start compiling their plugins based on the new standard editions of Confluence (without the Coherence library files). Standard editions of Confluence will be binary-compatible with clustered editions and existing clustered instances of Confluence. Hence, plugins developed against standard editions of Confluence will also run on any clustered editions and existing clustered instances of Confluence.

**I am a plugin developer concerned about API changes and multiple Confluence editions resulting from these changes**

As long as you are using only Confluence APIs to develop plugins, your plugins will be binary compatible with both standard and clustered editions of Confluence. The interfaces of the Confluence CacheManager, Cache and ClusterManager will be the same in both editions of Confluence, although there will be only one important change from previous versions of Confluence.

In existing versions of Confluence, the ClusterManager exposes the Coherence InvocationService to allow clients to execute code or perform queries across all nodes of the cluster. This API will be unavailable in all standard edition versions of Confluence from version 3.0.1 back to 2.6. If your plugin uses this service (and Atlassian is not aware of any that do) you should instead use Confluence's RemoteEvent API to send messages to other cluster nodes and direct them to perform the work.

Also, if for some reason your plugin references some other Coherence classes directly (or imports the Coherence-specific implementations of the CacheManager, Cache or ClusterManager), you will need to rewrite your plugin to use the generic interfaces only.

**I am a plugin developer and want to test my plugin**
against Confluence in a cluster

For testing purposes, you must own a Confluence clustered license and have access to a clustered Confluence installation (either an existing one or one based on the new Confluence clustered edition).

Confluence 3.0.1 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.0.1. Confluence 3.0.1 is a recommended upgrade which fixes some security flaws as well as other bugs. For more details, please read the Confluence 3.0.1 Release Notes.

On this page:

- Upgrade Notes
  - ClusterManager for Non-Clustered Licenses causes Critical Errors
  - Introduction of 'Standard' and 'Clustered' editions
  - Confluence Caching Layer Changes
- Upgrade Procedure
- Useful Plugins

Upgrade Notes

⚠️ If you have customised the cache settings in your installation of Confluence (e.g. for performance reasons), then please read ALL information on this page before upgrading to Confluence 3.0.1 or to a 'standard edition' of Confluence. This page also contains important information for customers who are upgrading their installation of Confluence to version 2.6 or later from September 2009.

ClusterManager for Non-Clustered Licenses causes Critical Errors

The ClusterManager in the non-clustered (i.e. you do not have a clustered license) implementations of Confluence 3.0.1 and Confluence 3.0.2 does not perform any locking (e.g. for job synchronisation). As a result, your Confluence instance may crash due to certain jobs being executed concurrently when they shouldn't be.

We strongly recommend that you upgrade to Confluence 3.1 or later to avoid this issue, if possible. If you wish to install or upgrade to a non-clustered implementation of Confluence 3.0.1 or 3.0.2, you must apply the patch attached to CONF-17136 after upgrading.

Introduction of 'Standard' and 'Clustered' editions

ℹ️ Oracle Coherence Licensing Change:

- Due to a license agreement change between Atlassian and Oracle over the Coherence technology, from September 2009, Confluence will be made available in two editions:
  - **Standard Edition** — Confluence with Ehcache's caching technology (available to customers with non-clustered Confluence licenses).
    - If you are currently running a clustered installation of Confluence, please do not upgrade it with a standard edition of Confluence.
  - **Clustered Edition** — Confluence with Oracle's Coherence clustering and distributed caching technology (available to customers with Confluence clustered licenses only).
- For more information, please refer to the Coherence License Changes document.
- In standard editions of Confluence, Ehcache replaces the local caching functionality previously provided by the Coherence technology.
Confluence 3.0.1 is the first Confluence version to be released in two editions 'standard' and 'clustered'.

Also, from September 2009:

- Standard editions will be released for each previous major version of Confluence back to 2.6. These will be:
  - Available as Confluence versions 2.10.4, 2.9.3, 2.8.3, 2.7.4 and 2.6.3.
  - Available to customers with non-clustered Confluence licenses.

- The remaining previous versions of Confluence currently available from our download page (from 2.6 to 3.0 inclusively), will be re-released as clustered editions and will only be available to customers with Confluence clustered licenses.

- The installation files for all versions of Confluence prior to 2.6 (which are no longer supported) will be removed from the Atlassian web site and will no longer be available for download and installation.

### Confluence Caching Layer Changes

Due to the caching layer changes in the 'standard editions' of Confluence, you will need to reapply any cache customisations made to your cache sizes and/or cache configuration file, if all three of the following points are applicable:

- You have implemented cache customisations to your Confluence installation's cache sizes (either via the Administration Console or cache configuration file).

- You have an existing installation of Confluence 3.0 or earlier (excluding the 'standard edition' versions) and will be upgrading to Confluence 3.0.1 or later (or one of the earlier standard editions).

- Your Confluence installation is using a non-clustered Confluence license.

If you customised your Confluence instance's cache settings via the Administration Console, please refer to the Reapplying Cache Size Modifications via the Administration Console section below.

If you customised your Confluence instance's cache settings by modifying the cache configuration file, please refer to the Reapplying Cache Configuration File Modifications section below.

### Reapplying Cache Size Modifications via the Administration Console

To reapply your cache size modifications via the administration console:

1. Before you upgrade, use the procedure described on the Cache Statistics page to open the 'Cache Statistics' section of the Administration Console in the 'Advanced' view.

2. Print out this view or save a copy of the web page for later reference. (This contains your existing individual cache settings.)

3. After upgrading Confluence, view the 'Cache Statistics' section of your upgraded Confluence installation in the 'Advanced' view.

4. Use the same procedure describe on the Cache Statistics page to re-adjust the size of each cache based on the previous settings that you had printed out (or saved).

### Reapplying Cache Configuration File Modifications To
maintain your existing cache configuration file settings, you will need to transfer any cache customisations you have implemented in the Coherence cache configuration file (confluence-coherence-cache-config.xml) to the relevant entries in the Ehcache cache configuration file (ehcache.xml).

Each cache has a cache-mapping element in the Coherence file (of which there is an equivalent cache element in the ehcache.xml file). Unfortunately, copying across your customisations is not quite a straightforward process because the Coherence file defines several 'caching schemes' to store the actual cache values, which in turn are referenced by the cache-mapping elements. In contrast, the ehcache.xml file does not support caching schemes and a cache's values are expressed explicitly in separate parameters of a cache element.

To convert your Coherence cache configuration file customisations across to the equivalent Ehcache file:

1. Open both the confluence-coherence-cache-config.xml and ehcache.xml files in a text editor. These files are located in the <confluence-home>/config directory.
   - If you implemented your customisations in a version of Confluence prior to 3.0, you will most likely find the confluence-coherence-cache-config.xml file in the <confluence-install>/confluence-e/WEB-INF/classes directory.

2. In the customised confluence-coherence-cache-config.xml file:

   a. Identify the caching schemes that were customised in this file and make a note of the values of all its child elements.
      - Typically, each caching scheme is located inside a local-scheme element and all of these are enclosed within the cache-schemes element, which appears towards the end of this file.
   b. Note each customised caching scheme by the content of its scheme-name element.
   c. For each cache-mapping element (which typically appears towards the top of this file), identify if it has a scheme-name element whose content matches one noted in the previous step and if so, make a note of its associated cache-name element.

3. In the ehcache.xml file:

   a. Identify each cache element whose 'name' parameter matches the cache-name elements noted in step '2c'.
   b. Using the mappings table below, apply the values noted in step '2a' to the appropriate parameters of the cache elements identified in the previous step ('3a').

Mappings table showing how elements of the Coherence cache configuration file map to parameters of the equivalent Ehcache file.

<table>
<thead>
<tr>
<th>Coherence Element</th>

</tr>
</tbody>
</table>
Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your `confluence.home` directory and database.

2. If your version of Confluence is earlier than 3.0.1, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 3.0.1 release notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Useful Plugins

**Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.**

- Appfire's [Upgrade Assistant for Confluence (UAC)](https://www.appfire.com/products/upgrade-assistant) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.0.2 Release Notes

**6 October 2009**

Confluence 3.0.2 is a recommended upgrade which fixes some security flaws and other issues.

Please refer to the [security advisory](https://confluence.atlassian.com/display/DOCS/Confluence+3.0.2+Release+Notes) for details of the security vulnerabilities, risk assessments and mitigation strategies.

⚠️ Critical issue affecting non-clustered implementations of Confluence 3.0.2

Non-clustered (i.e. you do not have a clustered license) implementations of Confluence 3.0.2 are affected by an issue that can cause Confluence to crash. Please read the [Confluence 3.0.2 Upgrade Notes](https://confluence.atlassian.com/display/DOCS/Confluence+3.0.2+Upgrade+Notes) for details on the issue and instructions on how to address it.

Editing and Visual Improvements

A bug in the Rich Text Editor lead to the generation of line break and other character formatting problems after saving a page. This bug has been fixed.

The sizes of some headings were considered too similar to be visually distinguishable on a page, especially when the headings were separated by intervening text content. This was particularly the case for heading sizes 2 and 3. Hence, the sizes of headings were modified to make them visually more distinct.

The format of colours used in Confluence's user profile areas has been modified slightly to make headings more prominent and form labels clearer.

The blog posts macro was missing the 'Restrict to These Authors' (author) parameter from the macro browser. However, this parameter is now available in the macro browser.

Other Enhancements and Fixes
Some customers’ users experienced long delays while logging into Confluence, especially when their user accounts belonged to groups containing a large number of other user accounts. This issue was fixed.

Customers were able to generate Confluence page PDF exports directly from external web sites by adding the ‘Export to PDF’ link (accessible via a Confluence page’s ‘Tools’ menu) to their external web pages. Unfortunately, this function was broken by the introduction of the form token handling security enhancement feature introduced in Confluence 3.0. In Confluence 3.0.2, however, this issue was resolved.

Some customers experienced an issue in which automatic content indexing would stop. This problem has been resolved.

When browsing Active Directory groups in Confluence, it was not possible to view group members if the LDAP Distinguished Names (DN) did not include the username. This bug was fixed.

There’s a complete list of fixes below. Click a specific issue to see details of the fix.

**Don’t have Confluence 3.0 yet?**

Take a look at the new features and other highlights in the [Confluence 3.0 Release Notes](#).

![Download Latest Version](download.png)

### Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the [Confluence 3.0.2 Upgrade Notes](#). We strongly recommend that you back up your confluence.home directory and database before upgrading.

**Confluence 3.0.2 Upgrade Notes**

Below are some important notes on upgrading to **Confluence 3.0.2**. Confluence 3.0.2 is a recommended upgrade which fixes some security flaws as well as other bugs. For more details, please read the [Confluence 3.0.2 Release Notes](#).

On this page:

- [Upgrade Notes](#)
  - ClusterManager for Non-Clustered Licenses causes Critical Errors
  - New License Key Requirements for Confluence 3.1
  - Upgrading an Existing Confluence License for Confluence 3.1 Compatibility
- [Upgrade Procedure](#)
- [Useful Plugins](#)
Upgrade Notes

ClusterManager for Non-Clustered Licenses causes Critical Errors

The ClusterManager in the non-clustered (i.e. you do not have a clustered license) implementations of Confluence 3.0.1 and Confluence 3.0.2 does not perform any locking (e.g. for job synchronisation). As a result, your Confluence instance may crash due to certain jobs being executed concurrently when they shouldn't be.

We strongly recommend that you upgrade to Confluence 3.1 or later to avoid this issue, if possible. If you wish to install or upgrade to a non-clustered implementation of Confluence 3.0.1 or 3.0.2, you must apply the patch attached to CONF-17136 after upgrading.

New License Key Requirements for Confluence 3.1

The next major release of Confluence (version 3.1) will require Confluence administrators to upgrade (or have upgraded) their Confluence license to Atlassian's new license key format. We are undertaking this change to enhance and improve the support we provide our customers. Bear in mind that this license upgrade will not incur any additional costs and does not change Confluence's functionality in any way.

Confluence 3.0.2 will still operate as usual under your existing Confluence license. However, any customers running Confluence 3.0.0 or later will be able to upgrade their Confluence license to the new license key format before Confluence 3.1 is released. Customers whose licenses expire before Confluence 3.1 is released will be required to upgrade their license to the new license key format.

As a consequence of these imminent licensing changes, relevant pages of the Administration Console area in Confluence 3.0.2 contain warnings about Atlassian's new license key requirement, which will be mandatory in Confluence 3.1. Links to upgrade old licenses to the new license key format are provided in these warnings.

Upgrading an Existing Confluence License for Confluence 3.1 Compatibility

If you have just upgraded to Confluence 3.1:

Please refer to the License Upgrade procedure for Confluence 3.1 in the Confluence 3.1 Upgrade Notes instead.

The following procedure can only be performed by Confluence Administrators, on Confluence versions 3.0.0 or later.

To upgrade your existing license to the new license key format, which will be required for continued use of Confluence 3.1:

1. Visit the license upgrade area in your account at my.atlassian.com.

   If you are using Confluence 3.0.2, you can also access this site by visiting the opening page of the Administration Console (by selecting 'Browse' --> 'Confluence Admin' menu item) or the License Details page of your Confluence installation and clicking on the 'Upgrade this license key now' link. If you are already using an upgraded Confluence license, this link will not appear on these pages.

2. Enter your Atlassian account details (email address and password) to access and manage your Atlassian product licenses.
3. Select the appropriate Confluence license to expand its details.

4. In the 'info' note below your license on the right-hand side of the page, click the 'update your license key' link (as shown in screenshot 1 below). Once this is done, the note changes to that shown in screenshot 2 below.

- If the 'info' note looks like the one in screenshot 2, then your license key has been upgraded and you should not need to take any further action.

**Screenshot 1: License Key Update Function**

![License Key Update Function](image)

**Screenshot 2: Updated License Key Note**

![Updated License Key Note](image)

5. Copy the new license from the text box above this message to your clipboard.

6. Visit the License Details page in your Confluence installation and paste the new license from your clipboard into the 'License' field.

7. Click the 'Save' button. You will notice two changes:

   - If you are using Confluence version 3.0.2, the links to upgrade your license on the License Details and Administration Console opening pages will vanish.
   - A 'Support Entitlement Number' (SEN) will be assigned to your license on the License Details page.

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your confluence home directory and database**.

2. If your version of Confluence is earlier than 3.0.2, read the [release notes and upgrade guides](https://confluence.org/upgrade) for all releases between your version and the latest version. In particular:
   - Please read the [3.0.2 release notes](https://confluence.org/3.0.2-release-notes).
   - If you are upgrading from 2.1 or earlier, please also read the [2.2 release notes](https://confluence.org/2.2-release-notes).

3. Download the latest version of Confluence.

4. Follow the instructions in the [Upgrade Guide](https://confluence.org/upgrade).

**Useful Plugins**

**Before installing a plugin into your Confluence site,**
Confluence 3.0 Release Notes

⚠️ Confluence 3.0 fixes some security flaws. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

1 June 2009

With great pleasure, Atlassian presents Confluence 3.0.

Confluence 3.0 is a major release which presents a number of new features and enhancements. With Confluence 3.0, we introduce the new Macro Browser feature, which provides a simple, point-and-click interface for discovering and inserting any of Confluence’s 80+ bundled macros into a page. Macros greatly enhance the functionality of Confluence pages by allowing users to add tools like task lists, RSS feeds and multi-media content. The macro browser makes it easy to select the macro you need and preview its output with your chosen settings before finally adding it to your page. It also makes it easy to edit and modify the parameters of existing macros on a page.

Confluence 3.0 also provides a range of social features that allow you to discover and connect with other users in your Confluence site. User Profiles have been redesigned with a more intuitive layout and provide additional fields for users to share information about themselves like their IM handle or personal website. The new Network feature lets you follow other users inside your Confluence site and view an aggregated stream of all the activity such as page edits, blogs posts and status updates they undertake. The new Hover Profile feature displays a user’s summary profile information whenever you hover your mouse pointer over their name anywhere in Confluence. Hover profiles provide easy access to the user’s email address and profile details and allow you to add them to your network. Finally, you can let others know what you are working on, share a link or simply broadcast a short message to your team by setting your User Status. Once your current status message has been updated, it will appear in various activity streams, your profile views and your profile sidebar.

The new PDF Export feature addresses one of the most highly voted requests for Confluence. You have full control over your PDF exports using Cascading Style Sheet (CSS) modifications. You also have the ability to customise page and margin sizes, add a title page or table of contents list to your exported document, add customisable headers and footers and easily select a subsection of documentation for export.

The Rich Text Editor now includes a right-click context menu that makes it easier to insert links, images, macros and tables into your Confluence page. It is now also possible to copy/cut and paste rows within tables.

Confluence’s performance has been substantially improved, with dramatic improvements in response times. Furthermore, scalability has been enhanced, with significantly improved CPU utilisation compared to previous Confluence versions.

**Highlights of this Release:**

- Introducing the Macro Browser
- Enhanced User Profiles
- Introducing Your Network
- New User Status
- New Hover Profile Feature
- Customisable Enhanced PDF Exports
- Improved Rich Text Editor
- Performance Improvements
- Engine Room and Developer Community
Responding to your Feedback:
⭐ 680+ votes satisfied

Thank you for all your issues and votes. Keep logging, to help us keep improving!
Below is a list of the highlights in this release.
Attached is the full list of issues resolved in this release.

Upgrading from a previous version of Confluence

- Upgrading Confluence should be fairly straightforward. **We strongly recommend that you back up your Confluence Home directory and your database before upgrading.**
- Please refer to the Confluence 3.0 Upgrade Notes for further essential information about plugins and other factors affecting your upgrade.

Highlights of Confluence 3.0

1

*Introducing the Macro Browser*

Now you can choose from Confluence's plugin-based macros and implement them with ease, from a single point.

- Using the macro browser's fast filtering capabilities, you can quickly find any bundled macro, including additional plugin-based macros installed on your Confluence system.
- Select your macro and modify and preview its parameters before adding it to your Confluence page or blog post.
- Take a look at our documentation for more details on the new macro browser feature.
**Enhanced User Profiles**

Confluence's enhanced user profiles area has been augmented to incorporate Confluence 3.0's new community-based features and to improve the overall user experience.

- User profiles now allow users to enter 'structured' information about themselves, which can be used by Confluence's community-based features.
- Each user's profile view shows a list of their own recent activities, such as page or blog post updates, changes to their profile information and status updates (described below).
- A summary of each user's profile information is displayed in a 'profile sidebar' on the right-hand side of pages within their personal space and their blog posts too. The profile sidebar appears on pages based on the default Confluence theme.
- Take a look at our documentation for more details on the enhanced user profiles feature.

*The new user profile view*

![User Profile Image](image)

*The new profile sidebar which appears on your blog posts or pages within your personal space*
Introducing Your Network

The new network feature helps you keep track of what other users are doing throughout your Confluence site, by allowing you to ‘follow’ their recent activities.

- The activities tracked by the network feature include:
- Additions or edits to pages or blog posts, including comments of users you are following.
- Updates to statuses or profile details of users you are following.
- From the network view, you can set up an RSS feed which provides notifications on the activities of users you are following.
- Take a look at our documentation for more details on the network feature.

New User Status

User status allows you to broadcast a short message of up to 140 characters rapidly for others to see.

- Your messages could include anything from what you are currently working on to a message or a hyperlink you want to share immediately with other users.
- Other users can see your status messages on various activity streams throughout Confluence and on your profile views and personal space pages.
- Take a look at our documentation for more details on the new user status feature and your status updates page.

What are you working on?

Touching up the Community-based features.

New Hover Profile Feature

Hover profile is a convenient tool that provides quick access to key information about other Confluence users, their user profile features and their network functions. Whenever you hover your mouse pointer over a Confluence user's name, key details about them appears in a popup balloon, such as their name, profile picture, email address and their current status.

- From a user's hover profile popup balloon, you can access the following functions:
  - Follow the user to track their recent activities via your network (or stop following them).
  - Directly send the user an email message via your email client.
- You can also access the following features of their user profile via their hover profile popup:
  - The user's personal space.
  - The user's profile, network or status updates views.

Customisable Enhanced PDF Exports

The enhanced PDF export feature in Confluence 3.0 has been rebuilt from the ground up and provides full customisation of your PDF exports with CSS modifications, to suit your particular requirements.

- Key enhancements to PDF export customisations include the ability to:
  - Customise page and margin sizes.
  - Add a table of contents or add headers and footers with customisable content.
  - Add a title page to your document.
  - Select a subsection of a space (for example, a chapter or section) to export more easily.
- PDF exports are now up to four times faster on large spaces.
- This feature addresses some of the most highly voted Confluence issues. Important bugs in the old PDF export feature have been fixed in this new version, including:
  - Fixed width columns — Table columns were consistently presented with fixed widths using the old PDF export function. However, the new PDF export function presents table columns with variable widths, as they appear on screen.
  - Ability to handle landscape page exports.
- Take a look at our documentation for more details on the enhanced PDF export and PDF stylesheet features.
The old PDF export function only generated fixed-width table columns

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>no</td>
<td>none</td>
<td>Uniquely identifies the Liveseach when there are multiple liveseach macros in one page.</td>
</tr>
<tr>
<td>spaceKey</td>
<td>no</td>
<td>all spaces</td>
<td>Specify a space key to limit the search to the given space.</td>
</tr>
</tbody>
</table>

The new PDF export feature now generates variable-width table columns

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>no</td>
<td>none</td>
<td>Uniquely identifies the Liveseach when there are multiple liveseach macros in one page.</td>
</tr>
<tr>
<td>spaceKey</td>
<td>no</td>
<td>all spaces</td>
<td>Specify a space key to limit the search to the given space.</td>
</tr>
</tbody>
</table>

Easily add a title page when you export a space as a PDF

A table of contents is generated in the PDF by default when you export a space
It's easy to add custom headers and footers

Introduction to Confluence

7

Improved Rich Text Editor

The rich text editor contains several interface enhancements and bug fixes that improve its overall user experience.

- The rich text editor includes a right-click context menu, making it easier to insert links, images, macros and tables into your Confluence page or blog post.
- It is now possible to cut/copy and paste rows.
- Take a look at our documentation for more details on the rich text editor overview to see more information about its enhancements and redesigned interface.

Right-click context menu
Performance Improvements

A number of performance improvements have been implemented.

- Confluence is now able to use more available resources under high load conditions.
- For Confluence installations, actions are up to 2 times faster.
- For Confluence Clustered installations:
  - Viewing pages is up to 2.5 times faster under medium, high and peak load.
  - Other actions are up to 5 times faster under medium load and 10 times faster under high and peak load.
- For more information, please refer to the [Confluence 3.0 performance improvements documentation](#).

Confluence installations - Medium Load

![Average time Comparison](chart)

**Average time Comparison**

- Dashboard
- Edit Page
- View Page
- Search Site
- Reader RSS Comments

- [2.10](#) vs [3.0](#)
Engine Room and Developer Community

- Confluence 3.0 now implements the Atlassian Plugin Framework 2.2 and the new Shared Access Layer (SAL).
- For more information, please refer to the Plugin Framework Documentation.

Administration Improvements

Confluence contains a number of improvements to its administrative features, many of which are easily accessible from the Administration Console.

- Security improvements:
  - A new form token authentication mechanism provides Confluence with the means to validate the origin and intent of requested actions, thus adding an additional level of security against phenomena such as cross-site request forgery. This feature also provides a mechanism for Confluence plugin developers to protect their plugins. For more information, please refer to the form token handling documentation.
  - Anti-XSS mode is now enabled by default and the remaining encoding bugs have been fixed.
- You can now generate a thread dump from the Administration Console. See our documentation on generating a thread dump.
- It is now possible to adjust the size of Confluence's internal caches, allowing administrators to fine tune Confluence's cache handling and performance at runtime without the need to restart Confluence. For more information on using this feature, refer to our page on cache statistics.
- The Office connector contains additional configuration options and provides simplified handling of the {viewfile} macro for the new Macro Browser.

More than 240 Fixes and Improvements

Page comparisons have been improved such that deletions or additions of single words (and short phrases) within a single line are highlighted red or green, respectively. Furthermore, large sections of unchanged text are compacted to reduce page length, but their content and context can easily be revealed at a click.

- Page comparisons now appear in email notifications, whenever a user edits a page or blog post.
- As well as the enhanced PDF export feature, you can now choose a subsection of a space (such as a document chapter) more easily, to export to XML or HTML.
- Using the new network, profile and user status list macros, you can incorporate components of Confluence 3.0's new community-based features directly into your page or blog post.
- Atlassian now provides support for recently added features to the widget macro, which include Widgetbox, Yahoo Video, Dailymotion, Wufoo HTML Form Builder, DabbleDB, Google Calendar and BackType micro-blogging.
- The Activity Macros now incorporate improved handling of the 'author' parameter.
- Take a look at the complete list of issues resolved in Confluence 3.0.

Known Issues in this Release

We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Confluence release, and report any problems so that we can fix them quickly.

We would like to highlight a known issue affecting the rich text editor, in which text cannot be added to the end of line that already ends with a link. Refer to CONF-15053 for more information about this issue. For more information on other known issues associated with the release of Confluence 3.0, please refer to Confluence 3.0 Known Issues.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

Confluence 3.0 Known Issues

We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Confluence release, and report any problems so that we can fix them quickly. Below is a list of known issues. We're working on them, and will have a point release out as soon as possible.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

While you're waiting, take a look at the great new features in Confluence 3.0 Release Notes.

You can also browse the Confluence project in our issue tracker to see what's fixed and what's not, for each release.

<table>

</tr>
</tbody>
</table>

Other Issues

⚠️ Early 3.0 Build Issue

Note that an early build of 3.0 (Build number 1626) had a problem when moving a page from one space to another. If the default filesystem attachment storage was configured then any attachments on the page would fail to be moved if the page was moved to a new space. The attachment would only be accessible again if the page was moved back to its original space.

The current 3.0 release (3.0.0_01) does not have this problem. See CONF-15986 for more details.

Confluence on MySQL databases

Some customers who run Confluence on a MySQL database may find that when they upgrade to Confluence 3.0 or later, their Confluence 3.0 upgrade fails, with the Confluence logs revealing a "Specified key was too long" error. This issue is known to occur when MySQL's MyISAM storage engine and UTF-8 character set is used with Confluence.

If this is the case, please refer to the Upgrade to Confluence 3.0 with MySQL database fails with messages like "specified key was too long" knowledge base article on how to resolve this upgrade issue.

Confluence 3.0 Upgrade Notes

Below are some essential notes on upgrading to Confluence 3.0. For details of the new features and improvements in this release, please read the Confluence 3.0 Release Notes.

On this page:

- Upgrade Notes
Anonymous Access to User Profiles

Confluence 3.0 introduces a new Anonymous Access Global Permission, *View User Profiles*, which prevents individuals who have not logged in to Confluence from viewing other users' profiles. This permission, which is accessible from the Administration Console was introduced to protect the identity and security of Confluence user accounts and details associated with the Confluence 3.0 Community-based features.

In all new installations of Confluence 3.0, this permission is disabled for Anonymous users by default, such that an individual will not be able to view another user's profile details until they have logged in to Confluence.

Plugins

If you are having trouble with any screens in Confluence 3.0, which could be related to potentially incompatible or unsupported third-party plugins, try using the plugin safe mode to disable all unsupported plugins.

The Usage Tracking Plugin is disabled by default

Due to performance issues in high load environments, the Confluence Usage Tracking Plugin is disabled by default in Confluence 3.0. While upgrading to Confluence 3, the plugin will be turned off even if it was active before. We do still deliver the plugin as part of Confluence (and have even improved its performance since 2.10), so if you don't have a high load environment and are happy with the performance of the plugin, you can easily reactivate this plugin through the Administration Console.

Upgrade Procedure

⚠️ Upgrade a test environment first

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence home directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 2.10.x, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.10 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade again from version 2.7.x to the latest. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

5. If you encounter a problem during the upgrade, please create a support ticket and one of our support
useful plugins

before installing a plugin into your confluence site, please check the plugin's information page to see whether it is supported by atlassian, by another vendor, or not at all. see our guidelines on plugin support.

- appfire's upgrade assistant for confluence (uac) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

related topics

confluence 3.0 release notes

confluence 3 performance improvements

confluence 3.0 has significant performance improvements over confluence 2.10 and earlier versions. this page explains the performance characteristics of confluence 3.0 and shows the improvements that were made when compared to its predecessor confluence 2.10. in brief, compared to version 2.10, confluence 3.0 response times are down by 30% to 40%, and response times in a cluster are down by 50%. in other words, the clustered version of confluence 3.0 is now twice as fast as before. confluence also scales a lot better than before: More or faster cpu's are better utilised with confluence 3.0 than they were with 2.10 and earlier versions.

1 specific performance improvements

we have fixed a few bottlenecks that were so specific that you might have encountered them while analysing logfiles and thread dumps. even if you did not see them, they might have been slowing your system down, depending on your use-case.

- rebuilding the search index is significantly faster, up to factor 2. in our performance testing, a sample set of 20,000 pages that took 30 minutes using confluence 2.10 now just takes 16 minutes in confluence 3.0.
- improved database queries
  - conf-14488 : added composite database index to spacepermissions table. this will speed up installations with many page or space restrictions
  - conf-14422 : now, only the most recent version of an attachment is loaded when retrieving it for the first time. this had slowed down pages (and the dashboard) when an attachment had hundreds or thousands of revisions
  - conf-14273 : reduced overall db load when rendering pages, which can help overall performance in case the database server was under high load already

- caching enhancements
  - conf-12894 : improved resource caching to improve https/ssl speed. this will make the screen render faster when you are using https.
  - conf-8034 : now serving caching headers for attachments to improve user interface responsiveness: Attachments (this includes user avatars) will not be downloaded again by the browser, leading to faster page loads

- others:
  - viewing pdf files through the office connector will use less memory and therefore significantly reduce garbage collection, which has caused some systems to perform a lot slower than needed
  - usgtrk-37 : a bug was fixed in the usage statistics plugin that enables it to work smarter. it is still a plugin that is not made for high load so we suggest you disable it on high load scenarios

2 general performance improvements

we have been improving confluence response time and scalability by implementing small improvements across the board. they are too many and too small to be presented individually, so we will use the results of our general
In our general Confluence performance tests, we execute a standardised set of commonly-used functions that simulates the activity of concurrent users. We base this profile on the actual usage patterns of our public Confluence installation, a rather large and active instance. To cater for irregular usage spike, we increase the load by factor 10. On average, this load test performs 10 to 15 Confluence requests per second. Most customer installations do not even get close to these numbers during normal operation. Under normal (low) load, the response times are actually a lot better than what we present here. But we prefer to use this medium load scenario because it simulates cases which may occur infrequently, and in which Confluence still needs to perform reasonably well. In addition to this scenario, we defined two additional, more extreme scenarios that perform the same requests, but at 20 to 35 requests per second to simulate an even higher load.

How to read and understand the statistics

Please note that we use the term "request" for anything that requests or posts data to Confluence. So viewing a Confluence page is a request, performing a search is a request, posting a comment is a request, and also using the quick navigation drop-down performs requests.

The data table

Each row in the table represents one use case. All use cases are run in parallel for 30 minutes, with a 5 minute ramp-up period.

- **Samplers**: The first column is the name of the requests performed in this scenario, like reading pages, commenting pages, or performing searches.
- **95% Percentile**: This is the time (in milliseconds) by which 95% of all requests of this scenario have completed. This is not an average value, you rather can think of it as a "how long the slowest requests (except the very worst 5% cases) take" - scenario.
- **Average**: the third column shows the average response time of the requests in this scenario - the lower the better.

The most important use-cases are the following:

- **View Page**: This loads one out of hundreds of different Confluence pages. Some are short, others are long. Some have many images, others have many comments. Some have many macros, others do not. The pages are accessed through their full URL, as if someone had clicked a link within the application or a bookmark.
- **Search Site**: A search across the whole system.
- **Quick Nav**: This simulates typing a character into the search field and getting back suggestions in real time. This is one of the most popular and time-critical operations. Therefore, this operation needs to be very fast.
- **Dashboard**: Simulates visiting the Confluence dashboard.
- **Edit Page**: This saves a page back to Confluence, and notifies all people who are watching this page.

The graph

The chart shows how many concurrent requests per second are being processed. The blue line indicates the moving average per second, and they green lines indicate variation. The blue line is not constant, since the pages and operations requested are extremely different in their CPU usage: A short page with no comments will render faster than a long page with many macros and comments, which in turn, will render faster than a page-edit that triggers many notifications. These differences in requests result in different CPU loads over time.

The more stable the blue average line is, the more consistent the user experience. The higher the line is, the more users can access and use Confluence simultaneously.
Applying the numbers to your company's usage patterns

The notes on this page geared at showing the performance differences between 2.10 and 3.0, using the same tests we used to test Confluence 2.10.

Hardware specification

All tests were conducted on two to four servers, each of which had the following specifications:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server model</td>
<td>Dell 2950</td>
</tr>
<tr>
<td>CPU type</td>
<td>Intel(R) Xeon(R) CPU E5405 @ 2.00GHz (4 Cores)</td>
</tr>
<tr>
<td>CPUs per server</td>
<td>1 or 2, depending on test. See test details</td>
</tr>
<tr>
<td>RAM</td>
<td>32Gb (but just 2Gb are used for the JVMs, and the database uses 3Gb)</td>
</tr>
<tr>
<td>Disks</td>
<td>2 x 15K, 72Gb SAS</td>
</tr>
<tr>
<td>Network</td>
<td>1Gbps</td>
</tr>
<tr>
<td>Webserver</td>
<td>Tomcat 6, Java 6</td>
</tr>
<tr>
<td>Database</td>
<td>Postgres 8.2.4</td>
</tr>
</tbody>
</table>

When testing the Confluence distribution, one server acts as the application server and one as the database server, which is the setup we recommend to customers to enable high performance. A third server is used to generate the load, using JMeter. In the cluster, we use two application servers and one database server. In the cluster configuration we use the Pound load balancer, which runs on the same (fourth) server as the load generator JMeter. We do not use any webserver or caching proxy for our tests, and we cannot make any recommendations about which one to use. We want to measure the raw performance of the application server and suggest that you use the webservers/proxies with which you are most familiar.

Software and Settings

The JVM settings we used were -XX:MaxPermSize=192m -Xmx2000m -X:+PrintGCTimeStamps -verbosegc -XX:+PrintGCDetails -XX:+PrintTenuringDistribution -XX:NewSize=384m -XX:SurvivorRatio=2 -XX:+UseParallelGC -XX:+UseParallelOldGC.

The usage tracking plugin was disabled during these tests because it is known to have performance issues and we recommend that it be turned off in high load deployments.

Confluence

Confluence is most frequently installed on one physical machine. Unless you know you are using (or are planning to use) a cluster, then this section is for you.

Confluence 3.0 has significantly better performance characteristics than Confluence 2.10. We compare three load scenarios and give the details below.

Medium Load scenario, 1 CPU
We define Medium Load as requesting roughly 15 requests per second from the loadtest. Most customers with smaller user bases never get even close to this usage, so they will experience a lot faster response times than what you can see below. But occasionally even customers with less than 1000 active users might experience spikes in usage, so we chose 15 requests per second as our medium load scenario.

We are using modest hardware (see above) with just one Xeon CPU with 4 cores, since we assume this is what a medium sized company would be using.

**Average time Comparison**

![Average time Comparison Graph](image-url)
Confluence 2.10 throughput

Confluence 3.0 throughput

Medium Load comparison between 2.10 and 3.0

The most important scenario ("View Page") used to take about 900ms in Confluence 2.10, but in 3.0 it is down to 600ms, which is a performance improvement of about 50%. Almost all other scenarios have improved as well, some even by more than 100% (e.g. more than twice as fast). The throughput in this scenario has only changed from approximately 13/s to 14/s. However, this is because the test itself is not making more requests. The main improvement here is that the throughput has less variations (ups/downs) for example when rendering very complicated or large pages. You can improve the smoothness of the line even further by using a different garbage collector, as explained on our tuning page.

High Load Scenario, 2 CPUs

We define a High Load Scenario as one in which the load generation equates to approximately 25 requests per second. In this test, we are using the same hardware as above, but with 2 CPUs. We assume that any company which expects 20 or more requests per second, even if this occurs during a short time frame, will have greater hardware resources (of equivalent cost) than to what is used in this test.

**Average time Comparison**

**95 percent Comparison**
Confluence 2.10 throughput

Confluence 3.0 throughput

High Load comparison between 2.10 and 3.0

This scenario shows the performance improvements between Confluence 2.10 and 3.0 best. Confluence 2.10 managed about 22 requests per second, Confluence 3.0 about 27 requests per second. Although this is a significant improvement, those in response times are even more impressive. If you have times when there are 20 requests per second, Confluence will respond a lot better and end users will notice the difference.

Peak Load Scenario, 2 CPUs

We define a Peak Load Scenario as one in which approximately 35 requests per second from the load generator. Very few of our customers ever reach these high levels of requests per second, but if you do have 100,000 users and many of them view pages at the same time, then the peak load scenario may occasionally be reached. Again, these tests are run on a 2CPU hardware.

Average time Comparison

95 percent Comparison

Confluence 2.10 throughput
Confluence 3.0 throughput:

Please note that this test is slightly skewed by the Load generator sitting one the same machine. The actual results will look a bit better.

Peak Load comparison between 2.10 and 3.0

Confluence 2.10 is able to deliver about 22 requests per second, but response times are not so good. Rendering a page takes 3s and rendering the dashboard takes 2s on average. Confluence 3.0 delivers improved throughput of about 28 requests per second and response times are significantly better than 2.10 (rendering a page is down to 2s, and rendering the dashboard is down to 1.4s). However, response times under Peak Load in 3.0 are still not ideal. Even with 2 CPUs Confluence 3.0 starts reaching its limits here. While Confluence 3.0 is able to deliver results, what we really recommend for this peak load scenario is a clustered solution. Read on for more details.

Confluence Clustered

When rolling out Confluence to a larger amount of users, Clustering becomes important to balance spikes in load. The most commonly used deployment is a 2-node cluster, running on three physical machines (two application servers connected to one database server).

Clustering does not make a single request faster in low load scenarios, but it helps the system dealing with a larger number of requests in parallel, without degrading in performance.

Medium Load Scenario, Clustered, 2 nodes, 1 CPU per node

As above, we define the Medium Load scenario as making 15 requests per second. This test uses just 1 CPU per machine.

Confluence 2.10 throughput
As you can see, the response time of each request is a lot better in Confluence 3.0. On average the performance has doubled, leading to response times that are just 50% of what they used to be. This means that a clustered Confluence installation provides the same responsiveness as a Confluence installation, while still being much better at scaling, which will be shown below. In this example the load was so low that throughput did not increase very much.

High Load Scenario, Clustered, 2 nodes, 2 CPUs per node

As above, we define the High Load scenario as making 25 requests per second. Few customers will reach these levels of requests per second, but if you have several ten thousand users these levels can be reached during peak business hours. This test is run on servers with 2 CPUs per machine.

High Load comparison between 2.10 and 3.0 in clustered mode

In this test we show how using a Cluster for high load instances can increase throughput and reduce response time. Confluence 3.0 has many improvements which benefit the clustered version. In the case of the test above, we can see that as the load is increased, Confluence is able to use more of the available CPU power on the 8 core machines to scale up and handle the higher load with an very good response time. This is where clustering makes a lot of sense now.

Peak Load Scenario, Clustered, 2 nodes, 2 CPUs per node

As above, we define peak load as the load generator making around 35 requests per second. During this test we used 2 CPUs per machine.

Confluence 2.10 throughput

Confluence 3.0 throughput

Peak Load comparison between 2.10 and 3.0 in clustered mode
This test highlights how well Confluence 3.0 can now scale. Response times remain low as the load is increased. Confluence 3.0 is able to make far better use of more powerful hardware than Confluence 2.10 which is shown by the improved response times for key scenarios like Page view and Dashboard.

Above are the issues resolved in Confluence 3.0, ordered by number of votes. For the full details of the fixes, improvements and new features, please take a look at our [issue tracker](https://confluence.atlassian.com/display/CONFLUENCE/Issue+Tracker).

### Confluence 3.1.1 Release Notes

**27 January 2010**

**Confluence 3.1.1** is a recommended upgrade which fixes a number of issues.

**Performance Enhancements and Fixes**
This release fixes two bugs that affected configuration of Confluence's internal caches. The first bug caused an error to be thrown when a Confluence internal cache was either increased to over 5000 elements (from under 5000) or resized when it was already over 5000 elements, via the Administration Console. The second bug caused changes made to Confluence's internal caches via the Administration Console to be lost after a Confluence restart. This meant that caches could only be resized by manually editing the cache configuration files (XML).

We identified an issue where Hibernate was not cleaning up its session correctly when closed, causing memory leaks. We have changed the way that Hibernate SessionImpl objects are stored which should fix this problem and reduce memory consumption.

A system property (atlassian.user.experimentalMapping) was introduced in Confluence 2.10 to fix performance problems noted when adding a local user to a local user group. We have fixed an bug with this system property that prevented users from being removed from user groups via the Administration Console, when the system property is set.

Other Fixes

We have found a bug that periodically caused an error to display when trying to view the ‘Confluence Gadgets’ window. This has now been fixed.

There’s a complete list of fixes below. Click a specific issue to see details of the fix.

Don’t have Confluence 3.1 yet?

Take a look at the new features and other highlights in the Confluence 3.1 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 3.1.1 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.1.1 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.1.1. Confluence 3.1.1 is a recommended upgrade which fixes a number of issues. For more details, please read the Confluence 3.1.1 Release Notes.

On this page:

- Upgrade Procedure
- Useful Plugins

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.
2. If your version of Confluence is earlier than 3.1.0, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.1.1 Release Notes.
   - If you are upgrading from 2.1 or earlier, please pay careful attention to the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see...
whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.
- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.1.2 Release Notes

3 March 2010

Confluence 3.1.2 is a recommended upgrade which fixes a number of bugs. Please see the 'Updates and Fixes in this Release' section below for details.

We identified a bug (see CONF-18437) that caused errors to be thrown whenever the macro browser was used in a theme other than the default theme. This bug also caused the preview mode to hang when the preview tab was clicked (i.e. the loading icon would spin forever without the preview mode loading). This has been fixed for all themes bundles with Confluence. If you are using a custom theme, you will need to implement a custom workaround, as described in the related JIRA issue.

Don't have Confluence 3.1 yet?

Take a look at the new features and other highlights in the Confluence 3.1 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 3.1.2 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.1.2 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.1.2. Confluence 3.1.2 is a recommended upgrade which fixes a number of bugs. For more details, please read the Confluence 3.1.2 Release Notes.

On this page:
- Upgrade Notes
- Upgrade Procedure
- Useful Plugins

Upgrade Notes

There are no upgrade tasks specific to Confluence 3.1.2. Please refer to the ‘Upgrade Procedure’ section below.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest
Before you upgrade, we strongly recommend that you [backup your Confluence home directory and database](https://confluence.jetbrains.com/doc/23080).

If your version of Confluence is earlier than 3.1.2, read the [release notes and upgrade guides](https://confluence.jetbrains.com/doc/23080) for all releases between your version and the latest version. In particular:

- Please read the [Confluence 3.1.2 Release Notes](https://confluence.jetbrains.com/doc/23080).
- If you are upgrading from 2.1 or earlier, please also read the [2.2 release notes](https://confluence.jetbrains.com/doc/23080).

Download the latest version of Confluence.

Follow the instructions in the [Upgrade Guide](https://confluence.jetbrains.com/doc/23080).

### Useful Plugins

**Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on [plugin support](https://confluence.jetbrains.com/doc/23080).**

- Appfire’s [Upgrade Assistant for Confluence (UAC)](https://confluence.jetbrains.com/doc/23080) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

### Confluence 3.1 Release Notes

Confluence 3.1 fixes some security flaws. Please refer to the [security advisory](https://confluence.jetbrains.com/doc/23080) for details of the security vulnerabilities, risk assessment and mitigation strategies.

8 December 2009

With great pleasure, Atlassian presents Confluence 3.1.

Confluence 3.1 is a major release which presents a number of new features and enhancements. With Confluence 3.1, we introduce [OpenSocial Gadgets](https://confluence.jetbrains.com/doc/23080), which allow you to add functionality from other web applications or websites, such as JIRA 4.0+, iGoogle or Gmail, directly into a Confluence page or blog post. Confluence also provides its own Gadgets that can be embedded into other web applications.

The new [Drag-and-Drop](https://confluence.jetbrains.com/doc/23080) feature is a major step forward in Confluence file attachment. With Drag-and-Drop, you can attach one or more files to a page or blog post simply by dragging them from your desktop onto the Confluence page. You can also embed images, Office documents and PDF files into a page or blog post while in edit mode simply by dragging and dropping them into the rich text editor.

Office 2007 documents are now fully supported in Confluence so features like document import, edit in Word and embedding documents in a page now work with Office 2007 files. With the new [Move Page](https://confluence.jetbrains.com/doc/23080) feature, you can more quickly and reliably move the page you are editing or viewing to a new parent page, even to one within a new space. An enhanced [Image Browser](https://confluence.jetbrains.com/doc/23080) lets you preview images before embedding them into a page. You can also attach image files to a page by dragging and dropping them into the Image Browser window itself. A new [Page Restrictions](https://confluence.jetbrains.com/doc/23080) dialog lets you view and apply page restrictions without editing the page. [Draft Comparisons](https://confluence.jetbrains.com/doc/23080) allow you to view changes made to a page or blog post before they are actually saved.

Other editor enhancements include [Exit Notifications](https://confluence.jetbrains.com/doc/23080) to prevent the loss of unsaved content in a page, blog post or comment, a new [Insert Menu](https://confluence.jetbrains.com/doc/23080) for the rich text editor, fields that auto-completes in the macro browser and improved rich text editor speed.

Confluence 3.1 now fully supports Internet Explorer 8, Safari 4 and Firefox 3.5. Other smaller improvements include the ability to add pages or blog posts directly from the Confluence dashboard, a facility to link to Confluence pages more easily and the ability to expand activity streams at the click of a button.

Finally, we have also introduced a simplified installation process for evaluators to help get Confluence up and running.
running quickly. Simplified Confluence evaluation installers have been created for MacOS X and Windows operating systems.

**Highlights of this Release:**

- **Introducing Gadgets**
- **Drag-and-Drop**
- **Office 2007 Support**
- **New 'Move Page' Feature**
- **Enhanced Image Browser**
- **Draft Comparisons**
- **Page Restrictions Dialog Box**
- **Other Editor Enhancements**
  - Edit Mode Exit Notification
  - New Rich Text Editor Insert Menu
  - Macro Browser Smart Fields
  - Rich Text Editor Speed
- **New Web Browser Versions Supported**
- **Other Improvements**
  - Add Pages or Blog Posts from the Dashboard
  - New 'Link to this page' feature
  - Get 'More' from your Activity Streams
  - User Interface Performance Improvements
  - Other Small Enhancements and Improvements to Confluence

**Responding to your Feedback:**

🌟 300+ votes satisfied

Thank you for all your issues and votes. Keep logging, to help us keep improving!

Below is a list of the highlights in this release.

Attached is the full list of issues resolved in this release.

---

**Upgrading from a previous version of Confluence**

- Upgrading Confluence should be fairly straightforward. **We strongly recommend that you back up your Confluence Home directory and your database before upgrading.**
- Please refer to the Confluence 3.1 Upgrade Notes for further essential information about plugins and other factors affecting your upgrade.

---

**Highlights of Confluence 3.1**

### Introducing Gadgets

Gadgets are small objects that offer dynamic content and functionality which may be served by any OpenSocial-compliant web application, such as JIRA 4.0+, Confluence or non-Atlassian applications such as iGoogle and Gmail. Confluence can interact with any gadgets that support the OpenSocial specification.

- Confluence supports the use of gadgets in pages and blog posts, which are accessible through the macro browser.
- Confluence can also serve its own gadgets, for use in any other OpenSocial-compliant web application. Gadgets bundled with Confluence include:
  - **Activity Stream** — This gadget shows a list of recent activities that have occurred on the...
Confluence server, such as the addition of new pages, blog posts or comments, content edits, status updates and so on.

- **Quick Navigation Aid** — This gadget provides heading and content search capabilities on a Confluence server.
  
  Your Confluence installation can also serve these gadgets in any of its own pages or blog posts.
  
  For more information on using these gadgets, refer to [Confluence Gadgets](#).

### Inserting a JIRA Gadget onto a Confluence Page

![Insert 'Created vs Resolved Chart' Macro](image)

**Drag-and-Drop**

The new 'drag-and-drop' feature allows you to drag one or more file(s) which are accessible from your computer and drop them directly into a Confluence page or blog post.

- Files can be attached to a page or blog post by dropping them directly onto the page view or the 'Attachments' list associated with the page.
- Image files can be attached to a page or blog post by dragging them from your computer directly onto the Image Browser.
- Image and Office files can be added directly into your Confluence page or blog post content by dropping them into the rich text editor's editor window.

For more information about this feature and on how to set it up, refer to the [Drag-and-Drop](#) documentation.

**Screenshot: 'Drag-and-Drop' Images or Other Files Directly onto a Page**
**Video: Using Drag-and-Drop**

app.episodic.com

**Download Video**

**Screenshots: Attaching an Image to the Image Browser**

**Screenshot: Attaching Multiple Files to an 'Attachments' list**
Office 2007 Support

Confluence now provides full support for the new Office 2007 file formats, allowing you to view and edit content from Microsoft Word 2007 (.docx and .dotx), PowerPoint 2007 (.pptx and .potx) and Excel 2007 (.xlsx) files.

- Along with existing Microsoft Office versions, Confluence now fully indexes Microsoft Office 2007 files and their content can be searched by Confluence.
- Using Confluence's Office connector macros, you can insert Word, PowerPoint or Excel 2007 files directly into your Confluence page or blog post.
- Office files can be edited directly from any page or blog post or their list of attachments.

   If you use the Firefox browser to work with Confluence, don't forget to reconfigure the Firefox add-on (WebDAV Launcher options) to handle the new Office 2007 file extensions. Otherwise, you will not be able to edit these new Office 2007 file formats from Confluence.

Screenshot: Embedding an Office 2007 Document

This feature uses technology licensed from Aspose.
**New 'Move Page' Feature**

Confluence introduces a new page moving feature, that easily allows you to move the page you are currently viewing, adding or editing, to another page in the same or another space within your Confluence site. This feature is available through a new 'Move Page' dialog box, which provides the following flexible methods for moving pages:

- **Known Location** – Allows you to type the name of a space and within that space, the 'parent' page under which to move your page.
- **Search** – Allows you to search for a 'parent' page (within a selected space or set of spaces) under which to move your page.
- **Recently Viewed** – Allows you to select one of your recently viewed pages to be the 'parent' of your page to be moved.
- **Browse** – Allows you to select a space and page that will be the 'parent' of your page to be moved. Pages are browsed via a tree view.

For more information, refer to [Moving a Page](#).

**Screenshot: Moving a Page to a Known Parent Page**

---

**Enhanced Image Browser**

A new 'Image Browser' has been introduced to replace the old 'Insert Image' window. The image browser provides a less-cluttered and enhanced interface that allows you to:

- Preview an image in detail before inserting it into a page. This is done by hovering over any image in the browser and clicking the 'magnifying glass' icon in the lower-right corner.
- Preview an image elsewhere on the web via its URL before inserting it into a page.

**Screenshot: Previewing an Image in the Image Browser**
Confluence’s drafts feature has been enhanced, such that you can now view unsaved changes in your drafts as a ‘diff’ before you decide to resume editing them. This nifty ‘draft comparison’ feature comes in handy, particularly when other people have made subsequent changes to a page or blog post in your drafts list and you need to merge changes or resolve a conflict.

**Screenshots: Accessing and Viewing Changed Content with Draft Comparisons**

<td>12 minutes ago</td>
<td>View Changes</td>
</tr>
</tbody>
</table>
Page Restrictions Dialog Box

Confluence’s page restrictions feature has been incorporated into a convenient and accessible dialog box, which is now easier to use than before.

- The page restrictions dialog box can be accessed from the padlock icon or the ‘Tools’ – ‘Restrictions’ menu item whilst viewing any Confluence page. From this dialog box, you can see all viewing and editing restrictions associated with the current page. You no longer need to view the page’s associated ‘Info’ page to see the page’s restrictions.
- You no longer have to edit a page to modify its page restrictions. You can edit all page restrictions from this easily accessible dialog box.
- The page restrictions dialog box is still accessible when a page is in edit mode.
- In addition to user and group names, the name field also accepts a user's full name. Full names are 'auto-completed' to help you find the relevant person more rapidly.

Screenshot: The Page Restrictions Dialog Box

Other Editor Enhancements

Edit Mode Exit Notification

Whenever you add or edit a page, comment or blog post and then click onto another Confluence feature that
navigates away from your unsaved content, a message box appears, warning that your content will be saved as a draft (if it is a page) or lost (if a comment). This allows you to cancel out of this action if it was accidental.

New Rich Text Editor Insert Menu

Confluence's rich text editor now combines a number of its commonly used editing features into a new convenient 'Insert' menu.

- The Horizontal line, Insert Symbol and Insert Emoticon Toolbar icons have been moved into the new insert menu.
- The functionality to insert images, links or attachments into a page can now also be accessed from this menu.
- The macro browser, as well as a number of commonly-used macros are conveniently accessible from this menu too.

Macro Browser Smart Fields

When using the Macro Browser, an 'auto-complete' feature is now provided on any parameters that require the entry of a single item, such as a page title, username or space key. This greatly facilitates the customisation of macros and minimises the need to know the exact item names in advance.
Rich Text Editor Speed

Thanks to many individual technical improvements, the rich text editor opens up a lot faster than in previous Confluence releases. In a local network environment, the rich text editor is accessible almost instantly. When accessing a Confluence server on a different continent, the rich text editor still opens up rapidly. In our Sydney office for instance, accessing the rich text editor from our Confluence server in the US takes less than 3 seconds.

New Web Browser Versions Supported

Confluence 3.1 now fully supports the following recent web browser versions:

- Internet Explorer 8
- Safari 4
- Firefox 3.5

Confluence now provides full usability with these recent browser versions as many bugs associated with these browsers have been fixed.

Other Improvements

Add Pages or Blog Posts from the Dashboard

You can now add pages or blog posts directly from the Dashboard without having to browse to a specific space first. To do this, click on either the 'Add Page' or 'Add Blog Post' buttons to open the pop-up balloon, which allows you to choose the space in which to add the new page or blog post and in the case of pages, a template on which to base the page content.
New 'Link to this page' feature

If you wish to link to a Confluence page from any other location on the web, use the convenient 'Link to this Page' feature (available from any page's or blog post's 'Tools' menu). Upon selecting this feature, the 'Link to this Page' dialog box opens, from which you can copy three versions of the link to embed elsewhere:

- **Link** – Standard URL which should work from any other accessible location on the web.
- **Tiny Link** – A reduced-length version of the 'Link', which can be used in text fields of limited length, such as tweets or Confluence Status Updates.
- **Wiki Markup** – A wiki markup version of the link, which can be used in any other location within your Confluence site.

![Link to this Page dialog box](image)

Get 'More' from your Activity Streams

A 'More' feature has been added to various activity streams throughout the Confluence interface, including the user profile sidebar, user profile page and recently updated macro. Clicking 'More' expands the list of results, providing a convenient means of accessing progressively more distant user activities.
User Interface Performance Improvements

Most JavaScript and Cascading Style Sheet (CSS) files are now downloaded in one batch, greatly improving the performance of Confluence's editing features and general page rendering.

Other Small Enhancements and Improvements to Confluence

- Support for OAuth — With the introduction of gadgets (above) in this release, Confluence 3.1 now allows you to establish OAuth relationships with other web applications such as JIRA 4.0+, iGoogle, Gmail etc., thereby allowing them to share resources via gadgets.
- New Log In and Log Out screens.
- In an aim to minimise confusion, 'News Items' are now consistently called 'Blog Posts' throughout the Confluence interface and a list of blog posts is collectively referred to as a 'Blog'.
- Macro developers are now able to specify whether the macro body should or should not be displayed in Rich Text editor. For more information, please refer to CONF-12149.
- Other minor interface improvements.

Known Issues in this Release

We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Confluence release and report any problems so that we can fix them quickly.

We value this feedback, which means that we can tell you about some minor known issues in Confluence 3.1. Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the important technical advisories on the front page of the Knowledge Base.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

Confluence 3.1 Known Issues

Below are some known issues associated with Confluence 3.1.

On this page:

- JIRA/Crowd and Confluence deployment
- JIRA Gadgets in Confluence
- Bamboo integration
- PDF exports only render gadgets as links
- Problematic Confluence Gadgets window when running Confluence on Java 6
- Other issues

JIRA/Crowd and Confluence deployment

Confluence will not start up or will display strange behaviour (drop down menus not working) if JIRA 4.0/4.0.1 or Crowd 2.0.x is running on the same application server installation, for example, by attempting to run Confluence and JIRA 4.0 in the same Apache Tomcat server installation. This problem results from a bug in JIRA (tracked as JRA-19894) that is scheduled to be fixed in JIRA 4.0.2. Crowd will be fixed in the 2.1 release. In the meantime, please read our KB article on how to resolve this issue.

In the meantime, you can run JIRA or Crowd and Confluence in different 'instances' of the same application server, for example two separate Apache Tomcat server installations. If you already do so, or have installed both the Confluence distribution and JIRA 4.0 distribution, or Crowd 2.0.x, you can ignore this known issue.

JIRA Gadgets in Confluence

As of Confluence 3.1, users can embed gadgets into Confluence pages. When integrating JIRA gadgets into
Confluence pages, you may encounter UI problems like a missing "Login"-button which is required to make the gadget authenticate with the JIRA server. This problem can be circumvented by setting up JIRA and Confluence to use Trusted Apps communication (since it removes the need for manual authentication). See KB article for details.

**Bamboo integration**

Our continuous integration product Bamboo exposes gadgets which can be embedded into Confluence pages. However, some of these exhibit problems once embedded onto a Confluence page:

- `BAM-4900`: Unable to edit Bamboo gadgets in Confluence
- `BAM-4890`: Bamboo gadget added in JIRA dashboard is not saving the preferences

These bugs are being fixed in Bamboo 2.5, which will ship in January 2010.

**PDF exports only render gadgets as links**

If you place any gadget on a Confluence page and export the page to PDF, the gadget output will not be rendered in the PDF output. Instead, each gadget is rendered on a page as a box containing the name of the gadget, the latter of which is hyperlinked. Clicking this hyperlink, opens the gadget contents itself in a new browser window or tab.

**Problematic Confluence Gadgets window when running Confluence on Java 6**

The Confluence Gadgets window may indicate that ‘**An error has occurred while trying to load the Gadget Directory**’ and prevent you from accessing the URLs of your Confluence gadgets. This problem can occur if you are running Confluence on Java 6. After you install Confluence 3.1 or upgrade an existing Confluence installation to this version, please check the Confluence Gadgets window immediately after starting the Confluence server.

If you see this error message and cannot access your Confluence gadgets, it can be resolved by restarting Confluence. (You may need to do this more than once.)

For more information about this issue, please refer to [CONF-17417](#).

**Other issues**

Refer to our JIRA site for a list of Confluence 3.1-specific bugs.

**Confluence 3.1 Upgrade Notes**

Below are some important notes on upgrading to **Confluence 3.1**. For details of the new features and improvements in this release, please read the [Confluence 3.1 Release Notes](#).

On this page:

- **Upgrade Notes**
  - New License Key Requirements for Confluence 3.1
  - Upgrading an Existing Confluence License for Confluence 3.1 Compatibility
  - Custom layouts must be re-implemented after upgrading Confluence
  - Customers running Confluence on Weblogic are required to specify the `prefer-web-inf-classess` element in the `weblogic.xml` file prior to upgrading Confluence
  - The Drag-and-Drop feature disables the ability to drag and drop links or text in Firefox 3.0
  - Clarification of supported user management configurations in Confluence

- **Upgrade Procedure**
- Checking for Known Issues and Troubleshooting the Confluence Upgrade
Useful Plugins

Upgrade Notes

New License Key Requirements for Confluence 3.1

牢记使命，在继续使用Confluence时，您必须升级您的Confluence许可到Atlassian的新许可密钥格式。

我们已经采取了这一改变，以增强和改善我们为客户提供支持的方式。请注意，这个许可升级将不会产生任何额外的费用，也不会改变Confluence的功能。

升级现有Confluence许可的Confluence 3.1兼容性

此过程只能由Confluence管理员进行。

为了将您的现有许可证升级到新的许可密钥格式，这将要求继续使用Confluence 3.1，您需要:

1. 访问您账户的许可升级区域，网址为my.atlassian.com。
2. 输入您的Atlassian账户详细信息（电子邮件地址和密码）以访问和管理Atlassian产品许可证。
3. 如果您的Confluence许可已经被关联到一个Confluence服务器ID（大多数运行最近版本的Confluence的客户），请遵循下面的步骤b。如果my.atlassian.com提示您在升级许可之前输入服务器ID，请遵循步骤a:
   a. ** Procedure for associating a Confluence license with your Confluence Server ID:**
      i. 如果您尚未升级您的Confluence安装到版本3.1，请访问您的Confluence安装的许可证详情页面以获取关联到您的许可的服务器ID。记下这个服务器ID。
      ii. 如果您已经升级到Confluence 3.1且无法访问许可证详情页面，请打开文件confluence.cfg.xml（位于Confluence数据目录）并在文本编辑器中查看服务器ID。
      iii. 如果您无法访问Confluence安装的服务器ID，请联系我们客户服务团队以获取进一步的帮助。此问题可能在升级到非常旧的Confluence版本时出现。
      iv. 按照my.atlassian.com上显示的剩余提示输入服务器ID，然后升级您的Confluence许可。
   b. ** Procedure for upgrading a Confluence license associated with a Server ID:**
      i. 选择合适的Confluence许可证以扩展其详细信息。
      ii. 在您的许可证的右侧“info”注释下方，点击“更新您的许可密钥”链接（如图1所示）。完成这一步后，注释将更改为图2所示的内容。
Screenshot 1: License Key Upgrade Function

If you are using Confluence 3 or above, you will need to update your license key.

Screenshot 2: Upgraded License Key Note

This license key is compatible with Confluence 3 or above.

iii. Copy the new license from the text box above this message to your clipboard.

4. Ensure your upgraded Confluence installation has been started, enter your Confluence site's URL into a web browser and on the Confluence license upgrade screen, click the 'page' link in the 'Description' field to begin updating Confluence with your upgraded Confluence license to open the 'Update Confluence License' page.

Screenshot: Confluence License Upgrade Screen

Confluence

You cannot access Confluence at present. Look at the table below to identify the reasons.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Exception</th>
</tr>
</thead>
<tbody>
<tr>
<td>upgrade</td>
<td>Thank you for upgrading Confluence. The license format for this new version has changed. In order to complete your upgrade and continue using Confluence, you will need to upgrade your current Confluence license. This upgrade does not incur any additional costs and does not change Confluence's functionality in any way. You can upgrade your license here or for step-by-step instructions please refer to our documentation. If you cannot upgrade your existing Confluence license, please generate a temporary evaluation license. This will allow you to proceed with the upgrade and give you time to generate a compatible license. Once you have an upgraded license (or a temporary one), please enter it on this page and restart.</td>
<td></td>
</tr>
</tbody>
</table>

5. On the 'Update Confluence License' page, paste your new license details into the 'License' field.

6. Enter the Confluence administrator account's username and password details and click the 'Save' button.

Screenshot: Update Confluence License Page

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
If your license update was successful, you will be prompted to restart Confluence.

Screenshot: Successful Confluence License Update Screen

Custom layouts must be re-implemented after upgrading Confluence

If you have customised your Main Layout on either the space or the global level, or if you have a custom theme plugin, the new Link to this Page, Page Restrictions and 'Move Page' dialog box features in Confluence 3.1 will not immediately work for you.

To resolve these issues, you will need to re-implement your custom layouts or reset these custom layouts back to the Confluence default settings.

Other Issues:

The following other issues may occur prior to resolving these issues:

- The Atlassian Confluence footer may appear fixed on the page and obscure content that extends below the length of the web page.
- Some pages may not render at all.

Depending on the version of Confluence you upgraded from and the customisations that had been implemented, other user interface problems or problems with Confluence's functionality may be found.

Re-implementing custom layouts:
To re-implement your custom layouts, please refer to Upgrading Customised Site and Space Layouts for details on retrieving the customisations made to your layouts and re-implementing them into your upgraded version of Confluence.

**Customers running Confluence on Weblogic are required to specify the prefer-web-inf-classes element in the weblogic.xml file prior to upgrading Confluence**

If you are a customer running Confluence on Weblogic, then before upgrading to Confluence 3.1, you must ensure that the prefer-web-inf-classes element in the weblogic.xml file has been specified with the content value of true. For more information, please refer to Installing Confluence EAR-WAR on Weblogic.

To do this:

1. Ensure that Confluence and Weblogic have been stopped.
2. Open the weblogic.xml file in a text editor. (This file is located in the `<confluence install directory>` directory.)
3. Ensure that `<prefer-web-inf-classes>true</prefer-web-inf-classes>` has been added as a child element of the `<container-descriptor>` element, such that your `<container-descriptor>` element looks something like:

   ```xml
   <container-descriptor>
   <prefer-web-inf-classes>true</prefer-web-inf-classes>
   </container-descriptor>
   ```

   Your particular weblogic.xml may have other child elements of the `<container-descriptor>` element, so leave these intact.
4. Save any changes made to the weblogic.xml file.
5. Follow the upgrade procedure.

**The Drag-and-Drop feature disables the ability to drag and drop links or text in Firefox 3.0**

Some browsers like Firefox and Safari allow Confluence users to create links easily by dragging and dropping hyperlinks from other web pages directly into the rich text editor window. This browser-specific feature also allows the rearrangement of text when editing Confluence wiki page content, by highlighting text and dragging and dropping it elsewhere.

However, the Confluence 3.1 Drag-and-Drop feature is not compatible with these link creation and text rearrangement features of Firefox 3.0 and setting up Confluence's Drag-and-drop feature will disable these Firefox 3.0 features.

To allow the Confluence 3.1 Drag-and-Drop feature to work together with these link creation and text rearrangement features of Firefox, upgrade your Firefox browser to version 3.5.

**Clarification of supported user management configurations in Confluence**

In Confluence 3.1, Atlassian is clarifying our support for user management configurations and code-level customisations. This is being done so that we can deliver significant improvements in our user management performance and configuration in a future release.
Confluence is fully supported with the following configurations provided and documented by Atlassian:

- Built-in user management with Atlassian-User Hibernate managers ("default user management")
- Built-in user management, with OSUser LDAP authentication (deprecated since 2.7, moving to Atlassian-User LDAP is recommended)
- External user management with read-only JIRA JDBC providers ("JIRA delegated user management")
- External user management with Atlassian-User LDAP providers ("standard LDAP user management")
- External user management with Atlassian Crowd.

Unfortunately, we cannot offer complete support for code-level customisations in our user management system. The following caveats apply to customers who are using extensions to our user management systems:

- Custom implementations of Atlassian-User managers are supported for problems which are not related to user management.
- Custom Seraph authenticators are supported for problems which are not related to user management or authentication.
- Custom implementations of OSUser providers are not supported with Confluence. The OSUser APIs required for implementing custom providers were deprecated in Confluence 2.7, so customers with custom OSUser implementations will need to migrate their code to the Atlassian-User API to have support for their Confluence instance.

Advance warning: In Confluence 3.2, Atlassian will be removing functionality required for custom OSUser providers. From this point, custom OSUser providers will not work correctly with Confluence 3.2, so we recommend porting any custom OSUser providers to the Atlassian-User interfaces as part of your Confluence upgrade process.

Upgrade Procedure

⚠️ Upgrade a test environment first

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence home directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 3.0.x, then please read the Upgrade Notes Overview and the Upgrade Notes for each version of Confluence listed on that page. (There are hyperlinks to each one.) Furthermore:
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade again from version 2.7.x to the latest. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Checking for Known Issues and Troubleshooting the Confluence Upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:
Check for known issues. Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

Did you encounter a problem during the Confluence upgrade? Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will assist you through the process.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.2.1 Release Notes

This release fixes some security flaws. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

4 May 2010

Confluence 3.2.1 is a recommended upgrade which fixes some security flaws and other bugs.

As part of the security update we have made changes to Confluence functionality, including some parts of the Administration Console. Please refer to the security advisory for a summary of changed behaviour. We have updated the documentation where relevant.

We have also fixed a bug that caused an out of memory error when attempting to display an Excel spreadsheet on a Confluence page. Before this fix, the error might occur if the spreadsheet has a large number of empty cells. Confluence now limits the number of spreadsheet cells it will display. By default, the maximum is 10000 cells. The Confluence administrator can adjust this value in the Office Connector configuration screen, as described in the documentation.

Purging items from a space's trash can was very slow and blocked all other database updates. This is now fixed.
A bug introduced in Confluence 3.2 prevented people from adding a page when using the Left Navigation theme. We have fixed this too.

In Confluence 3.2, we mistakenly introduced the words ‘Needs to be updated’ into the French and German translations of the UI text in the left navigation theme. We have now removed the extra text. The UI wording is still in English, not translated into French or German, but at least it no longer calls attention to this fact.

**Don’t have Confluence 3.2 yet?**

Take a look at the new features and other highlights in the Confluence 3.2 Release Notes.

![Download Latest Version](image)

**Upgrading from a Previous Version of Confluence**

Upgrading Confluence should be fairly straightforward. Please read the Confluence 3.2.1 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

## Confluence 3.2.1 Upgrade Notes

Below are some important notes on upgrading to **Confluence 3.2.1**. Confluence 3.2.1 is a recommended upgrade which fixes some security flaws as well as other bugs. For more details, please read the [Confluence](http://www.atlassian.com/software/confluence).
3.2.1 Release Notes.

On this page:

- Upgrade Notes
- Upgrade Procedure
- Useful Plugins

Upgrade Notes

As part of the security update we have made changes to Confluence functionality, including some parts of the Administration Console. Please refer to the security advisory for a summary of changed behaviour. We have updated the documentation where relevant.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database.**
   - The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   - Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.2, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.2 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Useful Plugins

**Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.**

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.2 Release Notes

24 March 2010

With great pleasure, Atlassian presents the seemingly omniscient, drop dead gorgeous Confluence 3.2.

Highlights of this Release:

- Autocomplete for Inserting Links
- Autocomplete for Embedding Images and Documents
- A Link Browser that's Smarter, Smoother, Faster
- New Documentation Theme
- New Easy Reader Theme
- Template Bundles
- Reordering while Moving a Page
Responsive to your Feedback:
🌟 100+ votes satisfied

Thank you for all your issues and votes. Keep logging issues to help us keep improving!
Below is a list of the highlights in this release.
Attached is the full list of issues resolved in this release.

Upgrading from a previous version of Confluence
- Upgrading Confluence should be fairly straightforward. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.
- Please refer to the Confluence 3.2 upgrade notes for further essential information about plugins and other factors affecting your upgrade.

Highlights of Confluence 3.2

1

Autocomplete for Inserting Links

Wouldn't it be awesome to have the WYSIWYG ease of a rich text editor combined with the speed of a wiki markup editor? We're working towards that sweetness. In the rich text editor you can now enter a trigger character to call up a list of suggested links to add to your page. A keyboard shortcut does it too.

Quick guide:

- Enter '[' and start typing to see the suggested links that match your text.
- Or press Ctrl+Shift+K to convert text to a link.
Autocomplete for Embedding Images and Documents

The new autocomplete also offers a quick way of adding images and documents to your page.

In the rich text editor:

- Enter '!' and start typing, to see a matching list of images and documents.
- Or press Ctrl+Shift+M immediately after a word or highlighted phrase.
A Link Browser that’s Smarter, Smoother, Faster

Do you think the autocomplete is sweet? Good, because it’s in the new link browser too. We’ve also made it easier and faster to link to images, attachments and recently-viewed pages. The link browser pops up when you click the ‘Insert Link’ icon in the editor toolbar.
New Documentation Theme

Want an inbuilt table of contents for your wiki space? Lusting after a configurable header and footer? Hankering for sophisticated styling? You got it!

Features in a nutshell:

- Configurable left-hand panel. By default, the panel contains a search box and a table of contents (page tree).
- Resizable panels. People viewing the page can drag the thick bar between the left-hand panel and the content. They can also remove the panel altogether, by clicking the sidebar icon at top right.
- Customisable page header and footer.
- Text styles designed to enhance the content typically found in a documentation space.
- The [Space Jump macro](http://confluence.36x.group/pages/viewpage.action?pageId=12345) for linking from a page in one wiki space to a page with the same name in another space.
- Easy upgrade path from now on. Because the left-hand panel is part of the theme, it will be upgraded whenever Confluence is upgraded. There is no need to remove and then re-apply your customisations on each upgrade, as you would do if you added your own left-hand navigation bar.
New Easy Reader Theme

With today's huge monitors, it can become hard to read text that spans the width of the screen. Confluence 3.2 introduces the Easy Reader theme that uses only a portion of the screen, to make reading easier. Many websites are formatted this way. The Easy Reader theme is a fixed-width variation of the default Confluence theme. Its larger fonts, smooth gradient background and comfortable line length make it ideal for displaying and reading longer documents.
Template Bundles

Confluence page templates make it easy for people to collaborate, yet maintain a consistent document format. We've extended the template functionality in this release so that you can import templates from template bundles via the Confluence Administration Console. Confluence administrators will be able to preview templates before importing them to a specific space or as global templates.

Template bundles are built as plugins, so developers should find it easy to whip up a new template bundle. Confluence 3.2 also ships with a default template bundle. Just import the templates from the default template bundle and your users will have access to a number of handy page templates.
Reordering while Moving a Page

You can now move a page and position it sequentially amongst its siblings at the same time. In earlier versions of Confluence this was only possible on the space's page tree view, accessed via the browse pages menu. The page tree is problematic in big spaces, so some people could not reorder pages at all. Now you can select the new ‘Reorder’ option when moving a page, and then drag a horizontal bar to put your page in the right spot amongst the other child pages.
New Keyboard Shortcuts and Editor Hints

We’re on a mission to improve your editing experience. We’ve added a number of new keyboard shortcuts for the rich text editor in this release. Format text into bulleted/numbered lists, manipulate tables, open the macro browser and more, with a few simple key presses. Check out the new keyboard shortcuts below:

<table>
<thead>
<tr>
<th>Keystroke</th>
<th>Action (Rich Text Editor)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+Shift+A</td>
<td>Opens the macro browser</td>
</tr>
<tr>
<td>Ctrl+Shift+B</td>
<td>Formats text as a bullet list</td>
</tr>
<tr>
<td>Ctrl+Shift+K</td>
<td>Autocomplete for links. Calls up a list of suggested pages or other locations to link to from your page. More...</td>
</tr>
<tr>
<td>Ctrl+Shift+M</td>
<td>Autocomplete for embedding images and files. Calls up a list of suggested images, documents and other files to embed in your page. More...</td>
</tr>
<tr>
<td>Ctrl+Shift+N</td>
<td>Formats text as a numbered list</td>
</tr>
<tr>
<td>Ctrl+Shift+S</td>
<td>Formats text with a strike through</td>
</tr>
<tr>
<td>Ctrl+Shift+C</td>
<td>Copies a table row</td>
</tr>
<tr>
<td>Ctrl+Shift+X</td>
<td>Cuts a table row</td>
</tr>
<tr>
<td>Ctrl+Shift+V</td>
<td>Pastes a table row</td>
</tr>
<tr>
<td>Ctrl+Shift+I</td>
<td>Inserts a table</td>
</tr>
</tbody>
</table>

The rich text editor will also display handy hints along the bottom of the screen, including common keyboard shortcuts and autocomplete tips.

User Interface Enhancements

- **Image Previews in Search Results.** Confluence 3.2 helps you search more efficiently by displaying thumbnail image previews in your search results. You can also opt to display images attached to pages/blog posts in your search results. We’ve also made the rendering of search results in Confluence pluggable. If you are a developer, you may wish to write your own search result renderer to change how
the search results are displayed.

- **Improved page history.** We've redesigned the header for the page history to make it easier to use. Check it out!

- **Handling of oversized content.** Taking advantage of modern browsers, the new Easy Reader theme includes CSS to handle common types of oversized content. Specific sections of a page will now have a localised scroll bar instead of making the whole page scroll. You will see this in action in the code macro, for example.

- **Better RSS feeds.** We have improved and simplified the RSS feed builder. As before, you can choose to include either pages or blog posts or both in your feed. Now you can also choose to include comments from pages and/or comments from blog posts independently. Similarly, you can choose attachments from pages and/or blog posts. In addition, if you filter by label you can now track updates to labelled pages and
Fixed colour scheme issue. We have removed the hard-coded colours that prevented colour schemes from applying correctly.

Fixed editor issue. We’ve also fixed an issue that caused white space to overlap the right-hand side of the editor. This has now gone, making more space available to the editor.

And Even More Improvements

Hot installation of language packs. You can now install language packs without restarting the server. More...

Purging the trash is now incremental and logged. Purging the deleted items from the Confluence trash has caused problems for people with a large number of items in the trash. The operation is slow and prevents other database updates while in progress. Confluence now breaks the operation into separate transactions and tracks progress in the logs.

More REST resources. If you are a plugin developer or use our APIs in some other way, you’ll find the REST API improvements in this release useful. The previous release of Confluence introduced a prototype REST API. With Confluence 3.2, we have added the following REST resources: attachments, recently viewed pages, search and user history. There are other small improvements too. More...

Important Bug Fixes:

Custom PDF stylesheets are unique to spaces. We’ve addressed an issue that caused changes made in one space’s custom stylesheet to be reflected in the stylesheets for all other spaces. For more information, please see CONF-18843.

Full index rebuilds now work correctly. A Confluence bug caused a database exception to be thrown during full index rebuilds, which prevented further indexing jobs from being run correctly. This has now been fixed. For more information, please see CONF-18452.

Confluence now upgrades correctly when using Crowd integration. If you have integrated your Confluence instance with Atlassian’s Crowd, you can now upgrade to this version of Confluence without the manual workaround required for Confluence 3.1. For more information, please see CONF-18150.

Circular references are no longer possible with the {excerpt-include} macro. The {excerpt-include} macro could previously be used to create circular references that would crash Confluence. This has been fixed. For more information, please see CONF-15247.

Confluence upgrades do not disable enabled plugins. Plugins that are disabled by default would previously be disabled during a Confluence upgrade, even if they had been enabled prior to
the upgrade. This has been fixed. For more information, please see CONF-18417.

Known Issues in this Release

We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Confluence release and report any problems so that we can fix them quickly.

We value this feedback, which means that we can tell you about some minor known issues in Confluence 3.2. Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the important technical advisories on the front page of the Knowledge Base.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

**Confluence 3.2 Upgrade Notes**

Below are some important notes on upgrading to Confluence 3.2. For details of the new features and improvements in this release, please read the Confluence 3.2 release notes.
Clickr Theme and Left Navigation Theme are now Deprecated

Confluence 3.2 introduces two new themes, the Documentation theme and the Easy Reader theme. At the same time, we are announcing the deprecation of the following two themes:

<table>
<thead>
<tr>
<th>Deprecated Theme</th>
<th>Description</th>
<th>Suggested Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clickr theme</td>
<td>This theme was inspired by the Flickr user interface, with Confluence content centred on the page. Please note that some features of Confluence 3.x are not fully supported by this theme.</td>
<td>Easy Reader theme</td>
</tr>
<tr>
<td>Left Navigation theme</td>
<td>This theme provides a navigation bar on the left hand side of the screen. Please note that some features of Confluence 3.x are not fully supported by this theme.</td>
<td>Documentation theme</td>
</tr>
</tbody>
</table>

We recommend that you move to a different theme as soon as possible. In the table above, we have suggested new themes that will give you similar and better-supported functionality.

⚠️ Advance Notice --- Clickr Theme and Left Navigation Theme will not be bundled with Confluence 3.3

Please note, the Clickr Theme and Left Navigation Theme will not be bundled with Confluence 3.3. We will not support these themes from Confluence 3.3 onwards.

End of Support for JBoss, Firefox 2 and Safari 2

As previously announced, we are no longer providing support for:

- JBoss (all versions) from this release onwards.
- Firefox 2 and Safari 2 from this release onwards.

Please see End of Support Announcements for Confluence for further details.

Advance Notice of End of Support for Oracle Weblogic,
IBM Websphere, Caucho Resin, DB2 8.2, Java Platform 5 (JDK/JRE 1.5) and Internet Explorer 6

As previously announced, we are planning on ending support for:

- Oracle Weblogic, IBM Websphere and Caucho Resin in Confluence 3.3.
- DB2 version 8.2 in Confluence 3.3. DB2 9.7 will still be supported.
- Java Platform 5 (JDK/JRE 1.5) in Confluence 3.3.
- Internet Explorer 6 in Confluence 3.3 or 13 July 2010, whichever is sooner.

Please see End of Support Announcements for Confluence for further details.

Link Browser will Remove Tooltips

In Confluence 3.2 and later, the link browser no longer offers the option to include a tooltip for your link. If you have existing links with tooltips, the tooltip will disappear if you edit the link with the link browser. The tooltip will remain if you edit the link using wiki markup. See issue CONF-18668.

Upgrade Procedure

⚠️ Upgrade a test environment first

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence home directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 3.1.x, then please read the Upgrade Notes Overview and the Upgrade Notes for each version of Confluence listed on that page. (There are hyperlinks to each one.) Also:
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade again from version 2.7.x to the latest. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.

4. Follow the instructions in the upgrade guide.

Troubleshooting the Upgrade

This section lists some specific issues that may occur during or as a result of the upgrade process, and guidelines on fixing the problem if it does happen to you.

- **Left-hand navigation bar in Documentation theme is empty.** If your existing Confluence installation already has the Documentation theme plugin installed, you may find that after upgrading to Confluence 3.2 the left-hand navigation bar is empty in the spaces that use the theme. The fix is to enable all modules of the Documentation theme plugin. See the knowledge base article.

Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working...
correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

**Useful Plugins**

*Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.*

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.3.1 Release Notes

17 August 2010

Confluence 3.3.1 is a recommended upgrade which fixes some security flaws and other bugs.

We have fixed a security flaw in this release that compromised the Secure Administrator Sessions (WebSudo) feature that was introduced in Confluence 3.3. Read the security advisory for more details.

Don't have Confluence 3.3 yet?

Take a look at the new features and other highlights in the Confluence 3.3 Release Notes.

Security Advisory

This release fixes a security flaw. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 3.3.1 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.3.1 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.3.1. Confluence 3.3.1 is a recommended upgrade which fixes some security flaws as well as other bugs. For more details, please read the Confluence 3.3.1 Release Notes.

On this page:

- Upgrade Notes
- Upgrade Procedure
- Useful Plugins

Upgrade Notes

- We have fixed a security flaw in this release that compromised the Secure Administrator Sessions (WebSudo) feature that was introduced in Confluence 3.3. Read the security advisory for more details.

- There is known issue in this release where you will not be able to add permissions to a page when copying it. We are addressing this issue. In the meantime, you can work around this by creating a new page, copying the wiki markup from the page that you want to copy and applying permissions to the new page. See CONF-20584 for more information.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database.
   - The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   - Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.3, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.3 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.3.3 Release Notes

21 September 2010
Confluence 3.3.3 is a recommended upgrade which fixes some security flaws and other bugs. Note that Confluence 3.3.2 was an internal release only.

- **Security fixes in Confluence 3.3.3.** Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

- **Office Connector temporary storage location.** When configuring the temporary storage location for the Office Connector's View File macro, you can no longer enter a specific file location via the Confluence Administration Console. Instead, the Administration Console offers three options, as described below. If you have previously entered a specific file location, the location will still be valid. However, if you want to change the location you will need to choose one of the three options described below, to hold the temporary file:
  - In memory.
  - In your Confluence Home directory.
  - In a file location that you can specify in the directories.properties file, located in the Office Connector JAR. Instructions are in the documentation.

- **Preview pane now shows full content.** When previewing a wiki page in Firefox, the preview pane will now show the entire content of the page. This fixes a problem experienced with Firefox 3.6.7 and later, caused by a change in Firefox.

- **Other noteworthy fixes.** The complete list of bug fixes is at the bottom of this page. Highlights:
  - You can now set page restrictions when copying a page.
  - Confluence will retain your setting when you turn on the 'Did You Mean' feature in the search.
  - When you edit a wiki page in Word, your changes are now saved.

**Don't have Confluence 3.3 yet?**

Take a look at the new features and other highlights in the Confluence 3.3 Release Notes.

[Download Latest Version]

**Release Notices**

- **Security advisory:** This release fixes some security flaws. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

- **Upgrading from a previous version of Confluence:** Upgrading Confluence should be fairly straightforward. Please read the Confluence 3.3.3 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

**Confluence 3.3.3 Upgrade Notes**

Below are some important notes on upgrading to Confluence 3.3.3. Confluence 3.3.3 is a recommended upgrade which fixes some security flaws as well as other bugs. For more details, please read the [Confluence 3.3.3 Release Notes](https://confluence.atlassian.com/display/CONF33/Confluence+3.3.3+Release+Notes).

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. **Before you upgrade**, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   
   **Tip:** Another term for 'Home directory' would be 'data directory'. Read more about [finding your Home directory](https://confluence.atlassian.com/display/CONFLUENCE/FAQ+for+Confluence+3.3).

2. **If your version of Confluence is earlier than 3.3**, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the [Confluence 3.3 Upgrade Notes](https://confluence.atlassian.com/display/CONF33/Confluence+3.3+Upgrade+Notes).
   - If you are upgrading from 2.1 or earlier, please also read the [2.2 release notes](https://confluence.atlassian.com/display/CONF22/Confluence+2.2+Release+Notes).

3. **Download** the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Useful Plugins

**Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.**

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.3 Release Notes

7 July 2010

With great pleasure, Atlassian presents Confluence 3.3 now with more ways to integrate with JIRA and an even faster and simpler editor.

Highlights of this Release:

- Confluence Page Gadget
- Autocomplete for Inserting Macros
- Property Panels for Links
- Property Panels for Images
- Manage Watchers
- Email Notifications for Network Activity and Blogs
- Blog Improvements
- Context-Sensitive Help Links
- Security Features
- Infrastructure Changes
- Even More Improvements

More:

- Thank you for all your issues and votes. Keep logging issues to help us keep improving!
- Read the release notices for important information about this release.
- Attached is the full list of issues resolved in this release.

Highlights of Confluence 3.3

1
**Confluence Page Gadget**

You wanted to display Confluence content in other applications and we’ve delivered. The Confluence Page Gadget is the newest addition to our suite of gadgets. You can specify a Confluence page or blog post to be shown in the gadget, which you can then add to your JIRA dashboard or even another Confluence site. The gadget also renders macros from your Confluence page or blog post, allowing you to embed rich content like tasklists, spreadsheets, videos and more, in your applications via the gadget.

More...

**Autocomplete for Inserting Macros**

Confluence 3.3 builds on the autocomplete for links and autocomplete for attachments features introduced in Confluence 3.2. You can now take advantage of the speed and convenience of autocomplete to insert macros via the rich text editor. Just enter ‘{’ and start typing to see the suggested macros that match your text.
Property Panels for Links

Keep common link functions at your fingertips with property panels for links. You no longer need to leave the rich text editor to see where a link is pointing to, or to remove the link. Click a link and a properties panel will appear. Simply click the appropriate button to view/go to the link location, edit the link or unlink it.

Property Panels for Images

Property panels have also been added for images. You no longer need to leave the rich text editor to resize an
image or add a border. You can easily perform these functions via the property panel.

**Rich Text**

Today's meeting was extremely productive, due in no small part to the chocolate on the table.

More...

5

**Manage Watchers**

Confluence 3.3 now allows you to manage the watchers for all pages and blog posts in a space, if you are a space administrator for that space. You can view, add and remove watchers of a page or blog post, as well as view all watchers of the space on a single screen.

More...
Email Notifications for Network Activity and Blogs

We've extended the email notifications functionality in Confluence. You can now subscribe to email notification for all blog activity in your Confluence site and all activity by people that you follow.

More....

Blog Improvements

A number of improvements have been made to Confluence blogs in this release.

- **Change Comments in Blog Posts** — We've implemented change comments on blog posts, so you can comment on the updates you make to blog posts, in the same way as you can for pages.

- **Blog Navigation Improvements** — The blog view has also been redesigned to present more informative with less clutter. The old calendar has been replaced with a new sidebar listing blog posts for the month and you can now see the profile pictures of the bloggers in posts.
Context-Sensitive Help Links

Context-sensitive help links are now available in Confluence. These links will redirect you to the appropriate online documentation for the version of Confluence that you are using. You can also use this feature to configure your own local Confluence documentation, e.g. if your deployment is in an environment without an Internet connection.

More...

Security Features

- **Confluence secure administrator sessions.** Confluence has another line of defence against hijackers of administrator sessions. All features in the Administration section of Confluence (and some in the Space Administration section) will require the user to validate their credentials before proceeding. After validating, a message at the top of each page reminds you of your temporary administrator session. The temporary session will expire after 10 minutes of administrator inactivity and can also be terminated manually.

  More...

- **Login CAPTCHA.** Confluence now requires the user to answer a CAPTCHA question after a given number of failed login attempts. This security mechanism protects not only the login page but the
RPC-interface as well. After a configurable number of failed login attempts via the RPC interface, the user is required to log in using the web interface which then presents the CAPTCHA image.

More...

- **XSRF protection on comment creation.** An XSRF token is now required to be present when adding a comment. Don’t worry though, a system is in place so that your session will not expire and you can take your time to write the perfect comment! All the bundled themes have been updated to use this feature, but you can disable it if you are using a custom theme.

More...

- **Login information.** Confluence now captures metadata about login attempts, including the dates of the last failed and successful login and the number of failed logins. A Confluence administrator can also reset the number of failed logins for a particular user.

More...

### Infrastructure Changes

We’ve made a number of infrastructure changes to aid plugin development:

- DWR deprecated. See the [Confluence 3.3 Upgrade Notes](https://confluence.atlassian.com/display/DOC/Confluence+3.3+Upgrade+Notes) for more details.
- Upgraded to Atlassian User Interface (AUI) 3.0.5. See the features in [AUI 3.0](https://confluence.atlassian.com/display/DOC/AUI+3.0).
- Upgraded to [Shared Access Layer (SAL) 2.1](https://confluence.atlassian.com/display/DOC/Shared+Access+Layer+(SAL)+2.1).
- Upgraded to Atlassian Events 2.0.1
- Upgraded to Atlassian REST Module 2.0.0
- Upgraded to Atlassian Plugin Framework 2.5.1. See the features in [Atlassian Plugin Framework 2.5](https://confluence.atlassian.com/display/DOC/Atlassian+Plugin+Framework+2.5), including:
  - New [web panel](https://confluence.atlassian.com/display/DOC/web+panel) and [web panel renderer](https://confluence.atlassian.com/display/DOC/web+panel+renderer) plugin modules, allowing you to add sections of HTML to a Confluence page.
  - Trigger control for your servlet filters, allowing you to specify the conditions under which your [servlet filter](https://confluence.atlassian.com/display/DOC/servlet+filter) plugin module is triggered.
  - Additional contexts in [web resources](https://confluence.atlassian.com/display/DOC/web+resources), so that Confluence now supports the standard contexts provided by the plugin framework as well as the existing Confluence contexts.
- Upgraded to Bandana 2.0. See our documentation on [persistence in Confluence](https://confluence.atlassian.com/display/DOC/persistence+in+Confluence), including:
  - Custom context objects.
  - Key enumeration.
  - Item removal.
  - Custom serialisation.

### Even More Improvements

- **Streamlined 'Import Word Document' wizard.** The screens in the 'Import Word Document' wizard have been redesigned to make this feature much more intuitive.

- **Redesigned default dashboard.** We’ve made a number of minor improvements to the default dashboard, including new buttons and a new welcome message.

- **Improved ‘General Configuration’ user interface.** The General Configuration screen in the Administration Console has been given a face lift.
• **Accessibility Improvements.** We've added labels, legends and skip links so that Confluence now complies with more of the [Section 508 Web Accessibility Standards](https://www.section508.gov/). We still have a long way to go, but these pages should now be more screen-reader friendly:
  • Dashboard
  • General pages
  • Profiles
  • Set your Password
  • Attachments
  • People Directory
  • User Status

**Release Notices**

Security advisory

This release fixes some security flaws. Please refer to the [security advisory](https://confluence.atlassian.com/release-notices/33-release-notes) for details of the security vulnerabilities, risk assessment and mitigation strategies.

Upgrading from a previous version of Confluence

• Upgrading Confluence should be fairly straightforward. **We strongly recommend that you back up your Confluence Home directory and your database before upgrading.**
  • Please refer to the [Confluence 3.3 upgrade notes](https://confluence.atlassian.com/release-notices/33-release-notes) for further essential information about plugins and other factors affecting your upgrade.

**Known Issues**

We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Confluence release and report any problems so that we can fix them quickly.

We value this feedback, which means that we can tell you about some minor known issues in Confluence 3.3. Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the [important technical advisories](https://confluence.atlassian.com/important-technical-advisories) on the front page of the Knowledge Base.

A big **thank you** to everyone who helps us ensure that Confluence keeps getting better and better.

Confluence 3.3 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.3. For details of the new features and improvements in this release, please read the Confluence 3.3 release notes.

On this page:

- Upgrade Notes
  - End of Support for WebSphere, WebLogic, Resin, Internet Explorer 6 and Java Platform 5 (JDK/JRE 1.5)
  - DWR Deprecation Notice
- Upgrade Procedure
- Checking for Other Known Issues and Troubleshooting the Confluence Upgrade
- Useful Plugins

Upgrade Notes

End of Support for WebSphere, WebLogic, Resin, Internet Explorer 6 and Java Platform 5 (JDK/JRE 1.5)

As previously announced, we are no longer providing support for:

- IBM WebSphere (all versions) from this release onwards.
- Oracle WebLogic (all versions) from this release onwards.
- Cauch Resin (all versions) from this release onwards.
- Internet Explorer 6 from this release onwards.
- Java Platform 5 (JDK/JRE 1.5) from this release onwards.

Please see End of Support Announcements for Confluence for further details.
DWR Deprecation Notice

We have replaced DWR with XWork actions (returning JSON, implementing the Beanable interface). The DWR servlet still works, however the client-side JavaScript files are not embedded into pages anymore. Support for the client side Javascript proxies has been moved into the Confluence Legacy Web Resources plugin. This plugin is disabled by default.

If you need any of the following web resources you will need to enable the Confluence Legacy Web Resources plugin:

- DWR framework
- DWR Javascript proxies for label (add, remove, suggest) or editor operations (heartbeat, draft saving, editor preferences)

You will also need to make the following resource a required resource in your view template: `legacy.confluence.web.resources:dwr-confluence`

This will embed the DWR client-side JavaScript files in your plugin's view output.

Upgrade Procedure

⚠️ Upgrade a test environment first

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence home directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.
2. If your version of Confluence is earlier than 3.2.x, then please read the Upgrade Notes Overview and the Upgrade Notes for each version of Confluence listed on that page. (There are hyperlinks to each one.) Also:
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade again from version 2.7.x to the latest. For more details, please refer to CONF-11767.
3. Download the latest version of Confluence.
4. Follow the instructions in the upgrade guide.

Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- **Did you encounter a problem during the Confluence upgrade?** Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

- **If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.**
Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Above are the issues resolved in Confluence 3.3, ordered by number of votes. For the full details of the fixes, improvements and new features, please take a look at our issue tracker.

Confluence 3.4.1 Release Notes

1 November 2010
**Confluence 3.4.1** is a bug-fix release. The full list of fixes is at the bottom of this page. Here are the highlights:

- **Edit in Word on Windows 7.** This release fixes a problem where the 'Edit in Word' functionality did not work on Windows 7. Before this fix, opening a Confluence page as a Word document would cause the document to be loaded in read-only mode for users running Windows 7.

- **Word wrap for long words in PDF exports.** A bug caused long words, or text without spaces, to be cut off in PDF exports. This is now fixed, so that long words are wrapped onto the next line. This is particularly relevant for languages where text does not contain spaces, such as Chinese and Japanese.

**Don’t have Confluence 3.4 yet?**

Take a look at the new features and other highlights in the [Confluence 3.4 Release Notes](#).

### Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the [Confluence 3.4.1 Upgrade Notes](#). We strongly recommend that you back up your `confluence.home` directory and database before upgrading.

**Confluence 3.4.1 Upgrade Notes**

Below are some important notes on upgrading to **Confluence 3.4.1**. For details of the fixes in this release, please read the [Confluence 3.4.1 Release Notes](#).

**Upgrade Procedure**
If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory. 
   Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.4, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.4 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.4.2 Release Notes

15 November 2010

Confluence 3.4.2 is a bug-fix release. The full list of fixes is provided at the bottom of this page.

Don't have Confluence 3.4 yet?

Take a look at the new features and other highlights in the Confluence 3.4 Release Notes.

Get the Latest Version

Release Notices

- Security advisory: This release fixes some security flaws. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.
- Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.4.2 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.4.2 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.4.2. Confluence 3.4.2 is a recommended upgrade which fixes some security flaws as well as other bugs. For more details, please read the Confluence 3.4.2 Release Notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   - Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.4, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.4 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Useful Plugins

**Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.**

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.4.3 Release Notes

29 November 2010

Confluence 3.4.3 is a bug-fix release. The list of fixes is at the bottom of this page.

In addition to releasing Confluence 3.4.3, we have also updated the code for the Expand user macro so that the body of the macro now visible in PDF exports. To take advantage of this improvement, please copy the macro ‘template’ from this documentation page: Writing the Expand User Macro. Note that you do not need to upgrade to Confluence 3.4.3 in order to use the updated macro. Simply updating your macro template is enough.

Don't have Confluence 3.4 yet?
Take a look at the new features and other highlights in the Confluence 3.4 Release Notes.

**Release Notices**

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.4.3 Upgrade Notes. We strongly recommend that you back up your `confluence.home` directory and database before upgrading.

Confluence 3.4.3 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.4.3. For details of the fixes in this release, please read the Confluence 3.4.3 Release Notes.

Upgrade Notes

We have updated the code for the Expand user macro, so that the body of the macro now visible in PDF exports. To take advantage of this improvement, please copy the macro ‘template’ from this documentation page: Writing the Expand User Macro.

Note that you do not need to upgrade to Confluence 3.4.3 in order to use the updated macro. Simply updating your macro template is enough.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.4, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   • Please read the Confluence 3.4 Upgrade Notes.
   • If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see
whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.4.5 Release Notes

15 December 2010

Confluence 3.4.5 is a bug-fix release. Please see the list of updates and fixes below.

Note that Confluence 3.4.4 was an internal release and was not made available to customers.

Don't have Confluence 3.4 yet?

Take a look at the new features and other highlights in the Confluence 3.4 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.4.5 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

### Confluence 3.4.5 Upgrade Notes

Below are some important notes on upgrading to **Confluence 3.4.5**. For details of the fixes in this release, please read the [Confluence 3.4.5 Release Notes](#).

---

#### Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. **Before you upgrade**, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   
   ![Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.](#)

2. **If your version of Confluence is earlier than 3.4**, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the [Confluence 3.4 Upgrade Notes](#).
   - If you are upgrading from 2.1 or earlier, please also read the [2.2 release notes](#).

3. **Download** the latest version of Confluence.

Confluence 3.4.7 Release Notes

27 January 2011

Confluence 3.4.7 is a bug-fix release.

This release solves a problem that caused the Confluence index build to fail without reporting any errors. Symptoms of the problem included missing blog posts, and missing pages in the list returned by the Content by Label macro. This is now fixed.

We have also fixed some issues experienced when editing a page or document in Word.

- When using Firefox, editing pages in Word failed if the page title contained special characters.
- Editing pages in Word failed for long path names. This problem could occur when the combination of Confluence space name and page title exceeded a certain number of characters. (The exact number depended on your environment.) Editing attachments with long path names in Office also failed.

Don't have Confluence 3.4 yet?

Take a look at the new features and other highlights in the Confluence 3.4 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.4.7 upgrade notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.4.8 Release Notes

7 February 2011

Confluence 3.4.8 is a bug-fix release.

This release adds OpenOffice MIME type handling capabilities to Confluence file uploads. Hence, if you now upload any OpenOffice file to Confluence and then download it, the file will be downloaded with the correct file extension instead of .zip.

We also fixed a bug in the spaces list macro, which caused this macro to fail on Confluence instances with large numbers of spaces.

Finally, if your Confluence site was started with the password.confirmation.disabled system property set to false, a bug in Confluence prevented site administrators from saving configuration changes made to any of the fields on the Edit Security Configuration page. This bug, which has now been resolved, will most likely only affect Confluence sites configured with a custom authenticator.

Don't have Confluence 3.4 yet?

Take a look at the new features and other highlights in the Confluence 3.4 Release Notes.

Download Latest Version

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.4.8 upgrade notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.4.8 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.4.8. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   - Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.4, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.4 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Confluence 3.4.9 Release Notes
21 February 2011

Confluence 3.4.9 is a bug-fix release.

Don't have Confluence 3.4 yet?

Take a look at the new features and other highlights in the Confluence 3.4 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.4.9 upgrade notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.4.9 Upgrade Notes

Below are some important notes on upgrading to **Confluence 3.4.9**. For details of the fixes in this release, please read the release notes.

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   - **Tip**: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.4, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the **Confluence 3.4 Upgrade Notes**.
   - If you are upgrading from 2.1 or earlier, please also read the **2.2 release notes**.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

**Confluence 3.4 Release Notes**

**12 October 2010**

With great pleasure, Atlassian presents Confluence 3.4, with more ways to **extend** your wiki, **manage** your plugins and **go places quickly**.

**Highlights of this Release:**

- **New Keyboard Shortcuts, Mac-Friendly Too**
- **Keyboard Shortcut Dialog**
- **User Macros in Macro Browser and Autocomplete**
- **New Plugin Manager**
- **Improved Performance**
- **Other Improvements**
- **Infrastructure Changes**

More:

- Read the release notices for important information about this release.
- See the full list of issues resolved in this release.

**Responding to your Feedback:**

- Over 180 votes satisfied.
- Thank you for all your issues and votes. Keep logging issues to help us keep improving!

**Video of What's New:**

**Highlights of Confluence 3.4**
New Keyboard Shortcuts, Mac-Friendly Too

Confluence has a number of new keyboard shortcuts to aid both navigation and editing. If you are already using JIRA 4.1, you will notice that we have made an effort to be as consistent as possible. Confluence shortcuts now support the standard Mac 'Cmd' key.

Some examples of shortcuts to use when viewing a page or blog post:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Create a child page.</td>
</tr>
<tr>
<td>b</td>
<td>Create a blog post.</td>
</tr>
<tr>
<td>m</td>
<td>Comment on a page or a blog post.</td>
</tr>
<tr>
<td>e</td>
<td>Open the editor.</td>
</tr>
</tbody>
</table>

Try these from within the Rich Text Editor:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+s or C Cmd+s</td>
<td>Save the page.</td>
</tr>
<tr>
<td>Ctrl+Alt+7 or C Cmd+Alt+7</td>
<td>Apply the default paragraph style.</td>
</tr>
</tbody>
</table>

Read more about [keyboard shortcuts](#).

Keyboard Shortcut Dialog

Confluence has many useful keyboard shortcuts. Now it's easy to discover them. Select 'Keyboard Shortcuts' from the 'Browse' menu or just press '?' on your keyboard. The new keyboard shortcut dialog shows shortcut keys for the editor as well as for general use.
User Macros in Macro Browser and Autocomplete

Looking for a macro to add to your page?

- **User macros easy to find.** User macros are short pieces of code that perform an often-used function or add some custom formatting to a page. You can now choose which of your user macros are visible to everyone in the macro browser and autocomplete.

- **New options for writing user macros.** It’s easy to create a user macro. Just go to the Confluence Administration Console and enter the details. Confluence 3.4 offers new options for making your macro look good in the macro browser. Read all about writing user macros. You can specify the macro category, link to an icon, define the parameters that the macro browser will use to prompt the user for information, and more.

- **Working examples of user macros.** To help you get started, we have documented the Expand and Stat us user macros. These are working examples that you can add to your Confluence site.

Here is an example of a user macro, the Expand macro, appearing in the autocomplete dropdown:

```
{ expand
```

It looks like this in the macro browser:
### New Plugin Manager

Managing plugins and performing Confluence upgrades is now much easier with the brand new plugin manager. The Universal Plugin Manager (UPM) is now bundled with Confluence and will soon make its way into our other tools, including JIRA. With the UPM you can:

- Perform a plugin compatibility check before upgrading Confluence.
- Install new plugins from the Atlassian Plugin Exchange.
- Manage existing plugins.
- With just one click, upgrade all plugins that have updates available.
- View and track updates via the audit log.

### Confluence Upgrade Check

The Universal Plugin Manager allows you to view, manage and upgrade your installed plugins, as well as install new ones from the Atlassian Plugin Exchange.

The Plugin Exchange Manager can help you prepare for a Confluence upgrade. Choose one of the newer versions of Confluence below and click the "Check" button. The Plugin Exchange Manager will examine the compatibility of the plugins you have installed and let you know the steps you should perform to ensure Confluence and all the plugins you have installed are upgraded successfully.

**Check compatibility for:** 3.2.1  

**Incompatible**

These plugins have not yet been marked as compatible with Confluence 3.2.1. We recommend you perform your own testing or contact the plugins' authors before proceeding with the product upgrade.

**Compatible if upgraded**

These plugins have updates that are compatible with Confluence 3.2.1. To proceed with your product upgrade, you should first upgrade each of these plugins now.

See the documentation on managing plugins. Discover, download and install new plugins from the Atlassian Plugin Exchange without leaving Confluence.
Improved Performance

Confluence is faster in a couple of ways.

- **Loading of the dashboard.** If your Confluence site has a large number of spaces, you may notice that the dashboard now loads much faster. For details, see issue CONF-5446.
- **Daily email updates.** The performance of the job that sends the daily email updates has been improved significantly. The job may run up to 100 times faster depending on your configuration. For details, see issue CONF-13875.

Other Improvements

We have made a number of small improvements to Confluence screens and other functionality described below.

- **Space permissions.** A new dropdown menu on the space permissions screen enables you to select or deselect all the permission types at once.

![Permission dropdown menu](image)

- **Dashboard 'Recently Updated' section.** The list of recent updates on the dashboard now tells you what action the user performed (for example, created, updated or commented) and has a timestamp for each activity.

- **Permissions for PDF stylesheets.** Space administrators can now edit the PDF stylesheets and layouts. Previously, you had to be a system administrator to have access to these options in the space administration screen.

- **Space details and space exports.** The space details screen has a new, fresh look. Similarly, we have redesigned the screen for PDF, HTML and XML exports.

- **Database Support.** We have added support for the following database servers:
  - Microsoft SQL Server 2008.
  - PostgreSQL 8.4.
  
  See the page about supported platforms.

- **Improved security for users.** This release brings an improved workflow for resetting your password. Confluence now requires an additional confirmation check before allowing a password change. We have also tightened the security of the 'remember me' functionality. As an additional security measure, Confluence will prompt you for your password when you change your email address.
Infrastructure Changes

Plugin developers will find some improvements in this release too.

- **Atlassian User Interface (AUI).** We have upgraded to AUI 3.2, bringing jQuery live events and redesigned drop shadows. See [AUI 3.1 Release Notes](#) and [AUI 3.2 Release Notes](#).

- **Plugin Framework.** Now with the Atlassian Plugin Framework 2.6, you have easy access to plugin objects, the plugin module tracker, ChainingClassLoader and more. See [Plugin Framework 2.6 Release Notes](#). Confluence now also bundles the [Web Resource Transformer plugin module](#).

- **Shared Access Layer.** SAL 2.2 includes support for secure administrator sessions ('WebSudo') and a cross-application API for accessing user profiles. See [Shared Access Layer 2.2 Release Notes](#).

- **REST plugin module.** We have upgraded from version 2.0 to version 2.2 of the Atlassian REST Plugin. Now you have more reliable detection of automatic logout, the ability to include JSON examples in your documentation, and support for secure administrator sessions ('WebSudo'). See [REST Plugin 2.1 Release Notes](#) and [REST Plugin 2.2 Release Notes](#).

- **Atlassian Plugin Development Platform.** With Confluence 3.4 comes the first public announcement of the [Atlassian Plugin Development Platform](#). Using Atlassian's plugin development tools, developers can create plugins that extend the functionality of Atlassian applications such as JIRA, Confluence and others. The Atlassian Plugin Development Platform defines the set of tools a plugin developer can use. See [Plugin Development Platform 2.8 Release Notes](#).

Release Notices

- **Security advisory.** This release fixes some security flaws. Please refer to the [security advisory](#) for details of the security vulnerabilities, risk assessment and mitigation strategies.

- **Upgrading from a previous version of Confluence.** Upgrading Confluence should be fairly straightforward. We strongly recommend that you back up your Confluence Home directory and your database before upgrading. Please refer to the [Confluence 3.4 upgrade notes](#) for further essential information about plugins and other factors affecting your upgrade.

- **Known Issues.** We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Confluence release and report any problems so that we can fix them quickly. We value this feedback, which means that we can tell you about any minor known issues in Confluence 3.4. Please check the [important technical advisories](#) on the front page of the Knowledge Base.

    A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

Confluence 3.4 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.4. For details of the new features and improvements in this release, please read the Confluence 3.4 release notes.

On this page:

- Upgrade Notes
  - Visibility of User Macros in the Macro Browser
  - Crowd 2.0.7 Upgrade Required if your Confluence is Integrated with Crowd
  - Configuration Option for Disabling Password Confirmation (Useful if Using a Custom Authenticator)
  - Existing 'Remember Me' Cookies No Longer Valid
  - End of Support for Oracle 10g and Safari 3 and 3.1
  - Advance Notice of End of Support for PostgreSQL 8.1 and Firefox 3.0
  - Clickr Theme and Left Navigation Theme No Longer Bundled with Confluence
  - Plugin Repository Macros No Longer Work
  - Wiki Markup in Space Description No Longer Rendered
Upgrade Notes

Visibility of User Macros in the Macro Browser

As stated in the release notes, the Confluence Macro Browser and autocomplete can now show user macros as well as other macros. If your Confluence site already has some user macros, when you upgrade to Confluence 3.4 the upgrade task will set all existing user macros to be visible only to system administrators.

After upgrading, you will need to set each macro individually to be visible to all users, depending on your requirements. See the documentation on writing user macros.

Crowd 2.0.7 Upgrade Required if your Confluence is Integrated with Crowd

If your Confluence installation is integrated with Atlassian Crowd for user management and single sign-on, you will need to upgrade to Crowd 2.0.7 when upgrading to Confluence 3.4. Note also that for Confluence 3.4, there is a new Seraph authenticator to be specified in the CONFLUENCE-INSTALLATION/confluence/WEB-INF/classes/seraph-config.xml file.

```xml
<authenticator
class="com.atlassian.crowd.integration.seraph.v22.ConfluenceAuthenticator"/>
```

Please follow the Crowd integration guide for complete instructions, including the update to the Seraph authenticator configuration. See our knowledge base article for symptoms of the problem that occurs if Crowd is not upgraded. And here are the Crowd 2.0.7 release notes.

Configuration Option for Disabling Password Confirmation (Useful if Using a Custom Authenticator)

This section is relevant to Confluence installations that use a custom authentication mechanism. You may run into problems with the Confluence security measure that requires password confirmation for administrative actions, change of email address and actions.

If necessary, you can set the password.confirmation.disabled system property to disable the password confirmation functionality. See Recognised System Properties. We provide this configuration option as a workaround for issue CONF-20958.

Existing 'Remember Me' Cookies No Longer Valid

We have tightened the security of Confluence's 'remember me' functionality. As a result of this change, any existing 'remember me' cookies will be invalid after you upgrade your Confluence installation. When accessing Confluence for the first time after the upgrade, users will be prompted to log in as usual.

End of Support for Oracle 10g and Safari 3 and 3.1

As previously announced, we no longer offer support for:

- Oracle 10g from this release onwards.
- Safari 3 and 3.1 from this release onwards.

Please see End of Support Announcements for Confluence.

Advance Notice of End of Support for PostgreSQL 8.1 and Firefox 3.0

We are planning on ending support for:
Confluence 3.2 introduced two new themes, the Documentation theme and the Easy Reader theme. At the same time, we announced the deprecation of the following two themes:

<table>
<thead>
<tr>
<th>Deprecated Theme</th>
<th>Description</th>
<th>Suggested Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clickr theme</td>
<td>This theme was inspired by the Flickr user interface, with Confluence content centred on the page.</td>
<td>Easy Reader theme</td>
</tr>
<tr>
<td>Left Navigation theme</td>
<td>This theme provided a navigation bar on the left hand side of the screen.</td>
<td>Documentation theme</td>
</tr>
</tbody>
</table>

Please note the following:

- The Clickr theme and Left Navigation theme are no longer bundled with Confluence and are not supported from Confluence 3.4 onwards.
- When you upgrade your Confluence installation to Confluence 3.4, the upgrade process will automatically migrate your spaces to the following themes:
  - Spaces using the Left Navigation theme will be converted to the Documentation theme.
  - Spaces using the Clickr theme will be converted to the Easy Reader theme.
- If you do not wish your spaces to be migrated, you can start Confluence with the following JVM parameter to prevent the conversion of the space themes:

```
-Dconfluence.theme.skip.migration=true
```

During the upgrade, the Left Navigation and Clickr themes will be removed from your Confluence site but, if you specify the above parameter, your spaces will still expect to use those themes. After the upgrade, you will need to download and install the Left Navigation and Clickr themes from the Atlassian Plugin Exchange so that your spaces can continue to use them. If you do not reinstall those themes, the affected spaces will use the default theme.

- If the upgrade process converts your spaces to the new themes and you later decide to revert to the old themes, you can get some help from the Confluence logs written during the upgrade process. The logs contain a SQL query that you can run to revert the theme migration. The relevant part of the log file looks like this:
The words '-SPACE-KEY1', 'SPACE-KEY2', etc represent the keys of the spaces that were converted. If you run the SQL statements and install the Left Navigation and Clickr themes (see below), your spaces will be in the same state as before the upgrade task ran.

- If you restore a space from an XML backup at some time after upgrading to Confluence 3.4, the space will not be migrated to a new theme. You will need to apply a different theme manually. See Applying a Theme to a Space. Alternatively, you can download and install the Left Navigation and Clickr themes from the Atlassian Plugin Exchange if you wish to continue to use them.

### Plugin Repository Macros No Longer Work

Some macros were never intended for external use, and we have always recommended that you do not add them to a wiki page. Nevertheless, it is possible that some Confluence sites have these macros on some pages. Please note that these macros no longer work in Confluence 3.4 onwards. They were part of the Plugin Repository, which we have now replaced with a new plugin manager.

These macros no longer work:

- {repository-plugin}
- {recentlyupdated-plugins}
- {popular-plugins}
- {download-stat}
- {confluence-status}
- {plugin-status}
- {plugin-repository}
- {plugins-supported}

### Wiki Markup in Space Description No Longer Rendered

Please note that the space description no longer renders wiki markup. If your space descriptions include wiki markup, the markup will display as plain text.

### Upgrade Procedure
Upgrade a test environment first
As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence home directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 3.3.x, then please read the Upgrade Notes Overview and the Upgrade Notes for each version of Confluence listed on that page. (There are hyperlinks to each one.) Also:
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade again from version 2.7.x to the latest. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.
4. Follow the instructions in the upgrade guide.

Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- Check for known issues. Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the Knowledge Base and follow the instructions to solve the problem.

- Did you encounter a problem during the Confluence upgrade? Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

Useful Plugins

**Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.**

- Appfire's Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

Confluence 3.5 Release Notes

16 March 2011

With great pleasure, Atlassian presents Confluence 3.5. Discover what's happening to your content and share with your colleagues. Let people see for themselves what's new after a Confluence upgrade. Get cosy with LDAP and intimate with JIRA. Love that HTML5 drag-and-drop and more!

Highlights of this Release:

- Easy, Powerful Connections to Active Directory, LDAP and Crowd
- Improved JIRA Integration
- Drag-and-Drop for HTML5 Browsers
- Autowatch and Improved Notification Settings
- Sharing Pages and Blog Posts
- Enhanced Code Macro
- More Administrative Improvements
- "What's New" Feature Tour
- Categories, a New Way of Organising Spaces
- Embedding Audio and Video with the Multimedia Macro
- Other Improvements
- Infrastructure Changes

More:

- Read the release notices for important information about this release.
- See the full list of issues resolved in this release.

Responding to your Feedback:

- More than 1,000 votes satisfied.
- Thank you for all your issues and votes. Keep logging issues to help us keep improving!

Video of What's New:

Previous Releases:

- Confluence 3.4
- Confluence 3.3
- Release Summaries

Highlights of Confluence 3.5
Easy, Powerful Connections to Active Directory, LDAP and Crowd

Connecting Confluence to an external user directory used to be painful, whether it was Active Directory, other LDAP servers or Atlassian Crowd. You had to edit XML files, and the configuration options were limited. Confluence 3.5 brings a simple, powerful and flexible directory management interface:

- Choose from a list of supported directory types, including Microsoft Active Directory and ten other popular LDAP schemas.
- Add as many directory servers as you need. Connect directory servers of different types, including the internal directory (default), LDAP, Crowd and/or JIRA.
- Configure all your LDAP settings via the Confluence Administration Console: Permissions, server and schema settings. We pre-populate the fields with default values depending on your choice of directory type. Choose the LDAP permissions to suit your needs: Read/write, read only, local groups or authentication only. Make use of the caching and copy-as-required configurations to optimise the performance of your LDAP searches. More...
- Turn on support for nested groups.
- Configure your LDAP connection pool.
- For larger and more complex installations, you may need to install Atlassian Crowd. If so, you will now enjoy the simple, quick setup via the Confluence and Crowd administration consoles. Clever synchronisation and caching ensure the best response times. More...
- Are your users already in JIRA? Confluence 3.5 offers a much improved integration with JIRA for user management. See below.

![Directory Management Interface]

Improved JIRA Integration

Integrating Confluence and JIRA has just become much easier. Watch a short overview video.

- Connect JIRA and Confluence via application links. It's now so much easier to set up a trust relationship between JIRA and Confluence, then share information across your applications. More...
• **Create, find and insert JIRA issues.** The new ‘Insert JIRA issue’ option in the editor toolbar offers a number of methods for displaying JIRA issues on a Confluence page or blog post. Insert individual issue within the text. Generate a list of issues using JIRA Query Language (JQL) or by specifying each issue individually on the page or blog post. You can also use this option to create an issue in JIRA and insert i within the text. [More...]

• **Connect to JIRA for user management.** JIRA 4.3 offers a powerful user management capability. JIRA now able to act as your directory manager, interacting with one or more user directories and ensuring that you have the same set of users and groups across both applications. Confluence 3.5 can connect direct to JIRA’s new directory management feature. Clever synchronisation and caching ensure the best response times for your directory searches. [More...]

---

Drag-and-Drop for HTML5 Browsers

Confluence’s drag-and-drop feature now supports HTML5 in preference to Google Gears. If your browser fully supports HTML5 and you no longer need the Google Gears browser add-on for anything else, you can uninstall this add-on without any loss of functionality in Confluence. The following browsers support HTML5-based drag-and-drop:

- Firefox 3.6
- Safari 5
- You can try it with Chrome too. (Official Chrome support coming soon!)
**Autowatch and Improved Notification Settings**

Confluence's new autowatch makes it easier than ever to keep track of pages and blog posts that interest you. Other improvements help you optimise your notifications. [Watch a short overview video.]

- **Watch your own content automatically.** With autowatch turned on, you will receive an email notification each time someone edits or comments on a page that you added or updated. You can turn autowatch on or off by editing the email settings in your user profile.
- **Adjust your settings directly from the email notification.** The notification email message has useful links to help you manage your notifications and watches.
- **Watch for new blog posts only.** If you have subscribed to all blog posts on the Confluence site, you will now receive notification for new blog posts only. Earlier versions of Confluence sent a notification for every change to existing blog posts, and for all comments on blog posts too. More...
- **Watch blog posts in a space.** Would you like to know when someone adds a blog post in a space, without having to see all other updates too? Now you can! More...
- **Configure the from address in email notifications.** Your Confluence administrator can configure the Confluence mail server so that the 'From' field of the email notification contains the full name or email address of the Confluence user who made the change. More...

---

**Sharing Pages and Blog Posts**

Want to email a Confluence page or blog post quickly? Simply visit that page or blog post, click the new 'Share' button and specify the people you want to share the page with. Add an optional note then click 'Share'. More...
Enhanced Code Macro

The code macro offers several new options.

- More language and environment support for syntax highlighting.
- Expandable code blocks.
- Wrap long lines of code into a new line.
- Sequential line numbering.
- Themed colour schemes.
- More...
More Administrative Improvements

- **Scheduled jobs.** Gone are the days of having to shut down your Confluence site to change a job's schedule! From the administration console you can execute jobs, configure job schedules, disable or re-enable jobs and view the execution history. More...

- **Log scanner and improved support request form.** The Support Tools plugin is now bundled with Confluence. It includes Hercules the Atlassian support bot, a superhero with extraordinary powers dedicated to protecting the public against known bugs. Hercules will scan your logs for error messages, matching them to existing bug reports and knowledge base articles. With the power of Hercules, you can find solutions in seconds. The plugin also provides a new, simple support request form with clear information about the details that will be sent to Atlassian when you submit a support request. More...
"What's New" Feature Tour

Managing change when rolling out a new software release can be a challenge. We've automated some of the work for you with the "What's New" feature tour in Confluence 3.5. The first time a user logs in after a major Confluence upgrade, the "What's New" window pops up showing screenshots, videos and links to documentation. We've designed this feature as a plugin, so you can change where the popup gets its information from or disable it altogether. More...

Categories, a New Way of Organising Spaces

Categorise your spaces then view and manage them in the new space directory. As an alternative to the dashboard, the space directory displays a list of all the global and personal spaces in the Confluence site that you have permission to see. You can choose to see all spaces, the spaces you have marked as favourite, or the spaces in a specific space category. (Space categories were previously known as 'team labels'.) You can further restrict the list to spaces containing a given word or words in the space name or description. More...
Embedding Audio and Video with the Multimedia Macro

Use the new Multimedia macro to display movies, videos and animations and embed audio files in a Confluence page. Before now, the only way to display multimedia content was using Wiki Markup. Now it’s simple – just drag and drop the multimedia file into the Rich Text Editor. Confluence will attach the file and add the Multimedia macro for you. Alternatively, add the Multimedia macro via autocomplete or the macro browser, and tell it which file to display.  

 Watch a short overview video. More...
Other Improvements

As always, we have made a number of small improvements to Confluence screens and functionality.

- **Keyboard shortcut and restricted search in the Documentation theme.** The Documentation theme offers a few new goodies for our technical documentation fans.
  - Press ‘[’ on your keyboard to show/hide the left-hand navigation bar.
  - Configure the Documentation theme to show quick search results from all spaces (default) or from the current space only. People can override this restriction when entering their search term.

- **Colour in panel titles.** The Panel macro has a new parameter, allowing you to choose the colour of the text in the title as well as the background colour.
• **Embedding blog posts into pages.** The Include Page macro now accepts blog posts as well as pages for embedding into other pages or blog posts.

• **Cool new avatars.** Take a look at the fresh design of the profile pictures that come standard with Confluence. Below are just a few of them. Of course, you can still upload your own picture too.

![Edit 'Panel' Macro](image)

- **Improved filtering on the Confluence dashboard.** The list of recent updates on the right of the dashboard now offers separate tabs, allowing you to view recent content updates from all spaces you have permission to see, your favourite spaces only, or spaces belonging to specific space categories. The list of spaces on the left is no longer tied to your list of recent content updates on the right. You can now use these dashboard features independently of one another.

- **Automatic language detection.** Flummoxed by a Confluence site in a foreign language? Confluence will now detect your language preference from your browser and offer you UI text and messages in that language. Alternatively, you can click the handy new option on the Confluence login screen to set your personal default language. Once you have logged in, Confluence will look at the language preference in your user profile too.
Infrastructure Changes

This release includes a number of improvements in the APIs and under the covers too.

- **Support for Safari 5.** We now offer support for Safari 5 in Confluence 3.5. See the [upgrade notes](#) for more information about browser support.

- **HTML5, character encoding and IE rendering.** Confluence's DOCTYPE declaration has been switched from 'HTML 4.01 Strict' to 'HTML5', which is automatically strict. In addition, 'X-UA-Compatible' is now explicitly set to 'EDGE', to ensure that Internet Explorer attempts to render the page in the latest standards mode. (If the browser is set to 'Compatibility View', that will override the 'X-UA-Compatible' setting.) Character encoding is now set at the document level, based on the encoding setting in the General Configuration section of the Confluence Administration Console.

- **Additions to the remote API.**
  - Trash management. Confluence's [RPC API](#) offers new space management methods (`getTrashContents`, `purgeFromTrash`, `emptyTrash`) and data objects (`ContentSummaries`, `ContentSummary`). These make purging trash across a large number of spaces much easier. You can list trash items for a given space, purge a given page, and purge all pages from a space's trash.
  - Watching and managing watchers. New notification methods in the remote API mimic the watch functionality exposed through the UI: `watchPage`, `watchSpace`, `watchPageForUser`, `getWatchersForPage`, `getWatchersForSpace`. You can watch a page, blog post or space, or add a watch on behalf of another user. You can check whether a user is watching a page or space, and return the watchers for a page or space.
  - Blog post retrieval. The new method `getBlogEntryByDateAndTitle` allows you to look up a blog post by specifying its date and title.

- **New WebDAV Resource plugin module.** Plugin developers can use the [WebDAV Resource module](#) to define new kinds of content that can be accessed remotely via the [Confluence WebDAV plugin](#). Expose your own custom entities over WebDAV, or expose existing Confluence content that is not currently accessible via WebDAV. This plugin module is available in Confluence 3.4 too, but we forgot to let you know about it until now.

- **Search engine upgraded.** We have upgraded from Lucene 2.2.0 to 2.9.3.

- **New version of the Atlassian User Interface.** Confluence 3.5 ships with AUI 3.3.1. See the [AUI 3.3 release notes](#).

Release Notices

- **Upgrading from a previous version of Confluence.** Upgrading Confluence should be fairly straightforward. [We strongly recommend that you back up your Confluence Home directory and your database before upgrading](#). Please refer to the [Confluence 3.5 upgrade notes](#) for further essential information about plugins and other factors affecting your upgrade.

- **Known issues.** We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Confluence release and report any problems so that we can fix them quickly. We value this feedback, which means that we can tell you about any minor known issues in Confluence 3.5. Please check the [important technical advisories](#) on the front page of the Knowledge Base.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

Confluence 3.5 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.5. For details of the new features and improvements in this release, please read the Confluence 3.5 release notes.

On this page:

- Upgrade Notes
  - Autowatch Turned On by Default
  - New Profile Pictures
  - Team Labels (Now Called ‘Space Categories’) May Need Tidying Up
  - New Support Tools Plugin
  - Changes to User Management in Confluence
    - For Customers with Internally Managed Users
    - For Customers using LDAP for User Management
    - For Customers Using JIRA for User Management
    - For Customers Using Crowd for User Management and SSO
    - For Customers Using Custom Authenticators
    - For Customers Using Custom Directory Connectors
  - Trusted Apps and OAuth Superseded by Unified Application Links
  - Upgrade Task Will Reindex Confluence Automatically
  - Changes to Recognised System Properties
  - Connections to MySQL Databases
  - Deprecation of Functionality
    - Converting a Global Space to a Personal Space
    - The ‘Mail Page’ Feature
  - Notes about Supported Platforms and Libraries
    - End of Support for PostgreSQL 8.1, Firefox 3.0
    - Advance Notice of End of Support for MySQL 5.0, Firefox 3.5, Safari 4, Internet Explorer 7
    - Added Support for Safari 5
    - Lucene Upgraded – Some Methods Now Deprecated
    - Scriptaculous and Prototype JavaScript Libraries Removed
    - X11 Dependencies/Libraries No Longer Required

- Upgrade Procedure
- Checking for Other Known Issues and Troubleshooting the Confluence Upgrade
- Useful Plugins
Autowatch Turned On by Default

This release includes the new 'autowatch' feature, as described in the release notes. With autowatch turned on, you will receive an email notification each time someone edits or comments on a page that you added or updated.

Note that autowatch is enabled by default for all new and existing users on upgrade. We recommend that you let all Confluence users know that autowatch will be turned on for their usernames when you upgrade to Confluence 3.5. People can turn autowatch off by editing the email settings in their user profile.

New Profile Pictures

This release brings a fresh set of profile pictures. After you have upgraded to Confluence 3.5, the old set will no longer be available for selection. Users who have already chosen one of the old pictures will keep that picture. If they later choose a new picture or upload their own picture, they will not be able to go back to the old picture again.

Team Labels (Now Called 'Space Categories') May Need Tidying Up

In Confluence 3.5, we have changed the term 'team labels' to the more descriptive term 'space categories'. These are keywords that you can apply to spaces, in order to group logically-related spaces.

Confluence 3.5 also introduces a new space directory that displays a list of spaces and offers them grouped by space category.

If your Confluence site has a number of team labels (now called space categories) already applied to the spaces, you may want to tidy up the categories to optimise your space directory.

More information:

- The Confluence 3.5 release notes describe the new space directory.
- The documentation explains how to use space categories.

New Support Tools Plugin

As mentioned in the release notes, the Atlassian Support Tools plugin is now shipped with Confluence. If you installed the earlier version of the plugin, you will need to uninstall it before upgrading Confluence.

Changes to User Management in Confluence

The way Confluence stores, accesses and manages users and groups is completely different in Confluence 3.5. You will notice many improvements, as described in the release notes. When you upgrade to Confluence 3.5, the upgrade process will automatically migrate your data by doing the following:

- Copying the configuration data from the existing OSUser or Atlassian User XML files into the Confluence database.
- Migrating your user and group data into the new database tables. It will not destroy the old data. The old tables remain in the database.
- Migrating internal and external user preferences. So if an LDAP user has logged in to Confluence before, all the same preferences will be there on next login after upgrade.

The sections below describe the upgrade considerations for each supported configuration type.

For Customers with Internally Managed Users

If your Confluence installation currently manages its users and groups in the Confluence database then there are no actions required on upgrade. This applies to Confluence sites that are not connected to Crowd, JIRA, LDAP or a custom directory for user management.

For Customers using LDAP for User Management
If your Confluence currently uses the standard method of connecting to an LDAP server for authentication and user management then the upgrade process will migrate the configuration.

To ensure that the upgrade process can migrate your configuration, please follow the Confluence upgrade guide. In particular, make sure that you:

- Copy the following files from your old Confluence installation to your new Confluence installation:

  `<Installation-Directory>/confluence/WEB-INF/classes/atlassian-user.xml`
  `<Installation-Directory>/confluence/WEB-INF/classes/osuser.xml`

Please follow these steps after the upgrade is complete:

- Ensure that the LDAP connection is correctly configured. See Connecting to an LDAP Directory and Connecting to an Internal Directory with LDAP Authentication.
- Ensure that the directory order is set to match your environment and requirements. See Managing Multiple Directories.
- Enable nested groups, if required in your organisation. To understand the performance ramifications of this, see Managing Nested Groups.
- Note that people will need to wait until the automatic synchronisation task has copied their user and group information from the LDAP directory to the internal cache before they can log in. The synchronisation task will start automatically in the background when the directory is configured. If someone tries to log in to Confluence before the synchronisation task has finished, the user authentication will fail. See Synchronising Data from External Directories.

If you are using a legacy LDAP configuration (such as OSUser with LDAP authentication only), you'll need to reconfigure your LDAP support as covered on Connecting to an LDAP Directory and Connecting to an Internal Directory with LDAP Authentication. In case you encounter an issue, please refer to Upgrade to Confluence 3.5 with OSUser LDAP Authentication Fails for more details.

For Customers Using JIRA for User Management

If you are already using JIRA to manage your Confluence users, via the JDBC connection to the JIRA database, you must upgrade Confluence to version 3.5 before upgrading JIRA to version 4.3.

JIRA 4.3 has a significantly different database schema and exposes a new REST interface, which Confluence will depend on for continued JIRA user management. If you upgrade to JIRA 4.3 before upgrading to Confluence 3.5, your Confluence users will no longer be able to log in once you upgrade to Confluence 3.5.

Confluence 3.5 does not ship with an OSUser migrator, and it will not recognise the OSUser definition in your `atlassian-user.xml` file. When upgrading Confluence:

1. Do not copy the modified `atlassian-user.xml` and `osuser.xml` to your Confluence 3.5 installation directory.
2. Ensure that previous Confluence's `server.xml` file is copied to your Confluence 3.5 installation directory, in order to retain the JIRA datasource.
3. Upgrade to Confluence 3.5.

Please follow these steps after the upgrade is complete:

- Log in to Confluence 3.5.x using the administration username and password you used prior to configuring JIRA user management in Confluence. (Confluence is not yet configured to point to JIRA, so your JIRA credentials will not work.)
  - If you cannot remember or do not have a password which allows you to log in, reset the administrator's password in the database and restart Confluence to log in.
Ensure that the JIRA connection is correctly configured:
- If you plan to connect to JIRA 4.2 or earlier, set up the ‘Legacy JIRA Database Connector’. See [Connecting to JIRA 4.2 or Earlier for User Management](#).
- When you upgrade to JIRA 4.3 or later, set up the new JIRA server connection. See [Connecting to Crowd or JIRA for User Management](#).
- Ensure that the directory order is set to match your environment and requirements. See [Managing Multiple Directories](#).

**For Customers Using Crowd for User Management and SSO**

If you are using Confluence with Atlassian Crowd for user management and SSO:

- You will need to upgrade to Crowd 2.1 or later, before upgrading to Confluence 3.5. Earlier versions of Crowd are not compatible with Confluence 3.5. Confluence 3.4 and earlier will work with Crowd 2.1.
- Copy the following files from your old Confluence installation to your new Confluence installation:

```
<Installation-Directory>/confluence/WEB-INF/classes/atlassian-user.xml
```

- You no longer need to copy the Crowd integration JAR files into Confluence's `WEB-INF/lib/` directory.
- If you are using `com.atlassian.crowd.integration.seraph.v22.ConfluenceAuthenticator` for SSO (defined in `$CONFLUENCE$/WEB-INF/classes/seraph-config.xml), please use the newer version instead: `com.atlassian.confluence.user.ConfluenceCrowdSSOAuthenticator`. Specifically, change this:

```
<authenticator class="com.atlassian.crowd.integration.seraph.v22.ConfluenceAuthenticator"/>
```

to this

```
<authenticator class="com.atlassian.confluence.user.ConfluenceCrowdSSOAuthenticator"/>
```

- After the upgrade, you may notice a difference when first connecting Confluence to Crowd: People will need to wait until a synchronisation task has copied their user and group information from Crowd to the internal cache before they can log in. If someone tries to log in to Confluence before the synchronisation task has finished, the user authentication will fail.
- Ensure that the directory order is set to match your environment and requirements. See [Managing Multiple Directories](#).

See [Connecting to Crowd or JIRA for User Management](#).

**For Customers Using Custom Authenticators**

Custom authenticators, as defined in `seraph-config.xml`, are not affected and should work in the same way as in earlier versions of Confluence.
For Customers Using Custom Directory Connectors

Custom directory types are not possible and not supported in Confluence 3.5 and later. If you have custom providers defined in OSUser or in Atlassian-User, thus defining your own storage for users and groups, the upgrade procedure will prevent you from starting Confluence.

Please see if one of the following solutions will work for you:

- If you have written a custom provider to support an LDAP schema not natively supported by Confluence 3.4 or earlier, you may no longer need your custom directory connector. Please check the supported LDAP schemas to see if you can use the new LDAP connectors supplied with Confluence 3.5.
- If you have written a custom provider to support nested groups, you can now use the new directory connectors supplied with Confluence 3.5. See Managing Nested Groups.
- If you have written a custom provider to connect to your own database, please consider loading the data into Confluence via the database instead. You will then need to flush the relevant caches in the application.

If you need to keep the custom directory connection, please consider whether Atlassian Crowd meets your requirements. See the documentation on developing a custom directory connector for Crowd.

Trusted Apps and OAuth Superseded by Unified Application Links

Confluence 3.5 includes the Unified Applications Link (UAL) plugin which manages trust relationships. Authentication for trust relationships, such as Trusted Apps and OAuth, is now configured via Application Links in your administration console. When you first navigate to the Application Links screen, you will be prompted to upgrade your existing Trusted Apps and OAuth trust relationships to application links.

For instructions on how to upgrade your links, see Upgrading an Application Link.

Please note, there is a known issue with the upgrade dialog. This will affect you if you have set up two different types of authentication (e.g. Trusted Apps and OAuth) to the same remote server. The upgrade message displayed on your Application Links screen will prompt you to upgrade two application links. However, you actually only need to have one application link with two authentication types configured, i.e. upgrade one application link and then configure the missing authentication type on that upgraded link.

Upgrade Task Will Reindex Confluence Automatically

We have upgraded the Confluence search engine from Lucene 2.2.0 to 2.9.3. As a result, a reindex is highly recommended when you upgrade. The search will continue to work after upgrade even without a reindex, but you will see exceptions in the logs and reduced capabilities.

When you upgrade to Confluence 3.5, an upgrade task will run automatically to rebuild the index. During the rebuild task, the upgrade process will require three times the size of the index on disk in order to perform the upgrade task. This space will be freed up when the upgrade process has finished.

If you would prefer to rebuild your index later, you can pass the following argument to Confluence when starting up after the upgrade:

```
-Dconfluence.skip.reindex=true
```

The initial startup will show an error message from ConfluenceSearcherInitialisation in the logs, because the warming query is run before the upgrade task. This is not a problem.

Changes to Recognised System Properties

We have removed the following system property: confluence.import.use-legacy-importer. Specifying...
this property will no longer have any effect in Confluence. See Recognised System Properties. (See the Confluence 3.3 documentation for the behaviour in earlier versions of Confluence.)

Connections to MySQL Databases

If your Confluence installation is connected to a MySQL database, please ensure that this database uses the ‘READ-COMMITTED’ transaction isolation level. MySQL's default transaction isolation mode:

- will cause issues with missing LDAP and other remote directory user permissions.
- is no longer supported in Confluence 3.5.

See the last step of the MySQL server installation procedure for details.

Deprecation of Functionality

This section provides advanced warnings of features in Confluence 3.5 that will be deprecated in Confluence 4.0 (a future release of Confluence).

Converting a Global Space to a Personal Space

Confluence 4.0 will no longer support the ability to convert a global space to a personal space. Our research has shown that this feature is used very little. Hence, we have decided to remove this feature as part of our ongoing mission to simplify Confluence where possible.

The 'Mail Page' Feature

In Confluence 4.0, the 'Mail Page' plugin will no longer be bundled with Confluence. This means that the 'Mail Page' feature for e-mailing a page will not be available in Confluence (out of the box) and the Share button will be the recommended method for e-mailing pages to others.

Notes about Supported Platforms and Libraries

End of Support for PostgreSQL 8.1, Firefox 3.0

As previously announced, from this release onwards we no longer offer support for:

- PostgreSQL 8.1.
- Firefox 3.0.

Please see End of Support Announcements for Confluence.

Advance Notice of End of Support for MySQL 5.0, Firefox 3.5, Safari 4, Internet Explorer 7

We are planning to end support for the following database and browsers in Confluence 4.0:

- MySQL 5.0.
- Firefox 3.5.
- Safari 4.
- Internet Explorer 7 (IE7).

Please see End of Support Announcements for Confluence.

Added Support for Safari 5

We now offer support for:

- Safari 5 in Confluence 3.5.
Lucene Upgraded – Some Methods Now Deprecated

This section is of interest to plugin developers. As stated above, we have upgraded the Confluence search engine from Lucene 2.2.0 to 2.9.3. A number of Lucene methods are now deprecated. These methods will be listed when you compile your plugin. We recommend that you consult the Lucene documentation and replace these methods as soon as possible. They will no longer be available when Confluence upgrades to Lucene 3. This further upgrade is not yet scheduled, but we plan to do it sometime.

Scriptaculous and Prototype JavaScript Libraries Removed

jQuery is the supported JavaScript library for plugin developers.

We first announced the deprecation of other JavaScript libraries with Confluence 2.8. Please note that we have now removed the following libraries from Confluence:

- Prototype
- Scriptaculous

X11 Dependencies/Libraries No Longer Required

X11 dependencies/libraries on Unix-/Linux-based operating systems are no longer required by Confluence 3.5 or later. Hence, these libraries do not need to be installed for your Confluence 3.5 upgrade or when installing a new instance of Confluence 3.5 or later.

Upgrade Procedure

Upgrade a test environment first

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home Directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 3.4.x, then please read the Upgrade Notes Overview and the Upgrade Notes for each version of Confluence listed on that page. (There are hyperlinks to each one.) Also:
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.x first, confirm the upgrade was successful, then upgrade again from version 2.7.x to the latest. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.

4. Follow the instructions in the upgrade guide.

Checking for Other Known Issues and Troubleshooting the Confluence Upgrade

After you have completed the steps required to upgrade your Confluence installation, check all the items on the Confluence post-upgrade checklist to ensure that everything works as expected. If something is not working correctly, please check for known Confluence issues and try troubleshooting your upgrade as described below:

- Check for known issues. Sometimes we find out about a problem with the latest version of Confluence after we have released the software. In such cases we publish information about the known issues in the Confluence Knowledge Base. Please check the known issues for the relevant release on this page of the
Knowledge Base and follow the instructions to solve the problem.

- Did you encounter a problem during the Confluence upgrade? Please refer to the guide to troubleshooting upgrades in the Confluence Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

Useful Plugins

Before installing a plugin into your Confluence site, please check the plugin’s information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

- Appfire’s Upgrade Assistant for Confluence (UAC) is a commercial plugin that simplifies the upgrade process into an easy-to-use wizard.

### Confluence 3.5.1 Release Notes

**1 April 2011**

Confluence 3.5.1 is a bug-fix release. It includes fixes for LDAP and user management, with several improvements for customers upgrading from versions earlier than Confluence 3.5.

### Don’t have Confluence 3.5 yet?

Take a look at the new features and other highlights in the Confluence 3.5 Release Notes.

[Download Latest Version](#)

### Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.5.1 upgrade notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.5.1 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.5.1. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   
   Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 3.5.2 Release Notes

18 April 2011

Confluence 3.5.2 is a bug-fix release.

Don’t have Confluence 3.5 yet?

Take a look at the new features and other highlights in the Confluence 3.5 Release Notes.

Download Latest Version

Release Notices
Upgrading from a previous version of Confluence should be fairly straightforward. Please read the [Confluence 3.5.2 upgrade notes](#). We strongly recommend that you back up your confluence.home directory and database before upgrading.

**Confluence 3.5.2 Upgrade Notes**

Below are some important notes on upgrading to **Confluence 3.5.2**. For details of the fixes in this release, please read the [release notes](#).

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database
supplied for evaluation purposes, the database files are also stored in this directory.

Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Confluence 3.5.3 Release Notes

5 May 2011

The Atlassian Confluence team is pleased to announce the release of Confluence 3.5.3.

This release introduces the option to configure the synchronisation interval for Crowd and JIRA user directory types. The synchronisation interval is set to an hour by default. In previous releases of Confluence, you could change the default setting for LDAP directories only. Now you can set the interval for directories managed in Crowd and JIRA too. Details are in the documentation.

We have also fixed a number of bugs. The complete list of fixes is at the bottom of this page.

Don’t have Confluence 3.5 yet?

Take a look at the new features and other highlights in the Confluence 3.5 Release Notes.

Download Latest Version

Release Notices

Confluence 3.5.5 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.5.5. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   • Please read the Confluence 3.5 Upgrade Notes.
   • If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 3.5.6 Release Notes

20 June 2011

The Atlassian Confluence team is pleased to announce the release of Confluence 3.5.6, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.
Don't have Confluence 3.5 yet?

Take a look at the new features and other highlights in the Confluence 3.5 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.5.6 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 3.5.6 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.5.6. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

   Tip: Another term for ‘Home directory’ would be ‘data directory’. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Confluence 3.5.7 Release Notes

30 June 2011

The Atlassian Confluence team is pleased to announce the release of Confluence 3.5.7. This release contains fixes for Atlassian JIRA Studio and hosted Confluence customers. It is a recommended upgrade for all Confluence customers.

Don’t have Confluence 3.5 yet?

Take a look at the new features and other highlights in the Confluence 3.5 Release Notes.

Confluence 3.5.7 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.5.7. For details of the fixes in this release, please read the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Confluence 3.5.9 Release Notes

27 July 2011

The Atlassian Confluence team is pleased to announce the release of Confluence 3.5.9, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

Note that Confluence 3.5.8 was not a public release, as problems were discovered with it during final testing. Issues marked as fixed in 3.5.8 are available for the first time in this release.

Don’t have Confluence 3.5 yet?

Take a look at the new features and other highlights in the Confluence 3.5 Release Notes.

Confluence 3.5.9 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.5.9. For details of the fixes in this release, please read the release notes.
As of Confluence 3.5.9, the queue that backs the re-indexing workers has been improved to remove contention. This means two important changes.

1. Re-indexing is now more CPU-bound. This means that if you had previously adjusted the indexing thread count you may want to revisit that number as it can put significant load on your server if this number is too high.
2. Each thread will make use of a connection to the database. If the number of threads are configured to a high number this means that there will be a significantly bigger load on the database.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   • Please read the Confluence 3.5 Upgrade Notes.
   • If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Confluence 3.5.11 Release Notes

25 August 2011

The Atlassian Confluence team is pleased to announce the release of Confluence 3.5.11, which is a bug-fix release.

The complete list of fixes is at the bottom of this page.

Note that Confluence 3.5.10 was not publicly released. Issues marked in JIRA as fixed in 3.5.10 are available for the first time in this release.

### Confluence 3.5.11 Upgrade Notes

Below are some important notes on upgrading to Confluence 3.5.11. For details of the fixes in this release, please read the release notes.

**Upgrade Procedure**

---

*Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.*
If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your Confluence Home directory and database**. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   - Tip: Another term for 'Home directory' would be 'data directory'. Read more about [finding your Home directory](https).
2. If your version of Confluence is earlier than 3.5, read the [release notes and upgrade guides](https://) for all releases between your version and the latest version. In particular:
   - Please read the [Confluence 3.5 Upgrade Notes](https://).
   - If you are upgrading from 2.1 or earlier, please also read the [2.2 release notes](https://).
3. Download the latest version of Confluence.
4. Follow the instructions in the [Upgrade Guide](https://).

### Confluence 3.5.13 Release Notes

6 September 2011

The Atlassian Confluence team is pleased to announce the release of Confluence 3.5.13, which is a bug-fix release.

Internal directories with LDAP authentication ("delegated LDAP authentication") can now update a user’s membership information when they log in, in addition to the user’s information. This is now our recommended configuration for connecting Confluence to LDAP servers with very large numbers of users, groups or memberships.

Note that Confluence 3.5.12 was not publicly released. Issues marked in JIRA as fixed in 3.5.12 are available for the first time in this release.

The complete list of fixes is at the bottom of this page.

**Don't have Confluence 3.5 yet?**

Take a look at the new features and other highlights in the [Confluence 3.5 Release Notes](https://).

**Download Latest Version**

### Release Notices

- **Warning**: If you are upgrading from Confluence 3.5.2 and using Microsoft SQL server, please refer to this [workaround](https://) to prevent errors in the upgrade progress.

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the [Confluence 3.5.13 Upgrade Notes](https://). We **strongly recommend** that you back up your `confluence.home` directory and database before upgrading.

### Confluence 3.5.13 Upgrade Notes

Below are some important notes on upgrading to **Confluence 3.5.13**. For details of the fixes in this release, please read the release notes.

#### Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

   ☑ Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.

2. If your version of Confluence is earlier than 3.5, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

#### Confluence 3.5.16 Release Notes

**17 May 2012**
**Confluence 3.5.16** is a bug-fix release. The full list of fixes is provided at the bottom of this page.

**Don't have Confluence 3.5 yet?**

**Confluence 3.5.16 Upgrade Notes**

Below are some important notes on upgrading to Confluence 3.5.16. For details of the fixes in this release, please read the release notes.

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   - Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the Confluence 3.5 Upgrade Notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

**Confluence 3.5.17 Release Notes**

25 June 2012
The Atlassian Confluence team is pleased to announce the release of Confluence 3.5.17. This release fixes some security flaws. Please refer to the security advisory for details of the security vulnerabilities, risk assessment, and mitigation strategies.

Note: This release contains the same fixes as Confluence 3.5.16. The difference is that we have backdated this release so that customers can upgrade even if their maintenance license has expired.

Don’t have Confluence 3.5 yet?

Take a look at the new features and other highlights in the Confluence 3.5 Release Notes.

Release Notices

Upgrading from a previous version of Confluence should be fairly straightforward. Please read the Confluence 3.5.17 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Atlassian is proud to announce the release of Confluence 2.6.1. This is a highly recommended upgrade from 2.6, because it fixes some security flaws which may affect Confluence instances in a public environment. We will release more details of the security fixes within a few days, giving our customers a chance to upgrade before the details are made public. This point release also includes more than 40 other fixes and improvements.

We're especially glad that anonymous comments will no longer show the profile picture of the previous commenter, and newly-created spaces no longer seem to have been created by an anonymous user. The {excerpt} and {excerpt-include} macros now behave better. And we've fixed some issues with internationalisation.

There's a complete list of fixes below.

You can download Confluence 2.6.1 from the download centre.

Security Advisory 19 November 2007

We have now published the details of the security vulnerabilities, which are fixed in Confluence 2.6.1. Please refer to the security advisory for more information.

Upgrading from a previous version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the upgrade instructions. We strongly recommend that you back up your confluence.home directory and database before upgrading!

Updates and fixes in this release

Error rendering macro 'jiraissues' : Unable to determine if sort should be enabled.

Confluence 2.6.1 Upgrade Guide

Atlassian is proud to announce the release of Confluence 2.6.1. This is a highly recommended upgrade from 2.6, because it fixes some security flaws which may affect Confluence instances in a public environment. We will release more details of the security fixes within a few days, giving our customers a chance to upgrade before the details are made public. This point release also includes more than 40 other fixes and improvements.

We're especially glad that anonymous comments will no longer show the profile picture of the previous commenter, and newly-created spaces no longer seem to have been created by an anonymous user. The {excerpt} and {excerpt-include} macros now behave better. And we've fixed some issues with internationalisation.
Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you **back up your confluence.home directory and database.**

2. If your version of Confluence is earlier than 2.6.0, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from a version earlier than 2.6.0, please read the 2.6 upgrade notes.

3. **Download** the latest version of Confluence.

4. Follow the instructions in the **Upgrade Guide.**

Confluence 2.6.2 Release Notes

27 November 2007

Atlassian is proud to announce the release of Confluence 2.6.2. This is a **highly recommended** upgrade, because it fixes some security flaws which may affect Confluence instances in a public environment. These flaws are XSS (cross-site scripting) vulnerabilities in some of Confluence's macros and Wiki Markup, which potentially allowed a user to insert malicious HTML tags or script into a Confluence page. Please refer to the **Security Advisory** for details.

This point release also includes more than 20 other fixes and improvements.

As part of our drive to tighten up the security in Confluence, we have removed support for the 'style' attribute in the Wiki Markup for images. This was an undocumented feature, which is now no longer available. To help those who may have used the 'style' tag to add coloured borders, we have added a new 'bordercolor' attribute to the image markup.

The PDF and HTML space exports are now more reliable than in Confluence 2.6.0 and 2.6.1. We've fixed the failure to send daily digest email notifications. (This problem occurred when the Confluence instance contained draft pages.) This release also contains some improvements in the wiki's support of internationalisation. And you'll be delighted to see that the plus and minus buttons are back, next to the 'Recently Updated' section of the Dashboard – so you can now increase or decrease the number of items you see in that section.

There's a complete list of fixes below. You can download Confluence 2.6.2 from the **download centre.**

Upgrading from a previous version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the **upgrade instructions.** We **strongly recommend that you back up your confluence.home directory and database before upgrading!**

**Updates and fixes in this release**

**Error rendering macro 'jiraissues' : JIRA project does not exist or you do not have permission to view it.**

Confluence 2.6.2 Upgrade Guide

27 November 2007

Atlassian is proud to announce the release of Confluence 2.6.2. This is a **highly recommended** upgrade, because it fixes some security flaws which may affect Confluence instances in a public environment. These
flaws are XSS (cross-site scripting) vulnerabilities in some of Confluence's macros and Wiki Markup, which potentially allowed a user to insert malicious HTML tags or script into a Confluence page. Please refer to the Security Advisory for details.

This point release also includes more than 20 other fixes and improvements.

As part of our drive to tighten up the security in Confluence, we have removed support for the 'style' attribute in the Wiki Markup for images. This was an undocumented feature, which is now no longer available. To help those who may have used the 'style' tag to add coloured borders, we have added a new 'bordercolor' attribute to the image markup.

The PDF and HTML space exports are now more reliable than in Confluence 2.6.0 and 2.6.1. We've fixed the failure to send daily digest email notifications. (This problem occurred when the Confluence instance contained draft pages.) This release also contains some improvements in the wiki's support of internationalisation. And you'll be delighted to see that the plus and minus buttons are back, next to the 'Recently Updated' section of the Dashboard – so you can now increase or decrease the number of items you see in that section.

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.

2. If your version of Confluence is earlier than 2.6.1, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from a version earlier than 2.6.0, please read the 2.6 upgrade notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

**Confluence 2.6.3 Release Notes**

**Confluence 2.6.3** is the standard edition version of Confluence 2.6.x. This version of Confluence is equivalent to Confluence version 2.6.2, but it does not include Oracle's Coherence technology. Due to licensing changes with Oracle over the Coherence clustering and distributed caching technology, Atlassian is no longer able to distribute this technology to customers without a Confluence clustered license.

Therefore, Atlassian has released 'standard editions' for each previous major version of Confluence back to 2.6, which includes Confluence versions 2.10.4, 2.9.3, 2.8.3, 2.7.4 and 2.6.3. Confluence 2.6.3 will be the only Confluence 2.6.x version available to customers with a non-clustered Confluence license.

For its caching functionality, Confluence 2.6.3 utilises Ehcache. This functionality was provided by the Coherence technology in previous Confluence 2.6.x versions.

For more information about the features, updates and fixes in Confluence 2.6.2, please refer to the Confluence 2.6.2 Release Notes.

**Upgrading from a Previous Version of Confluence**

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.6.2 Upgrade Notes. However, if you have customised the cache settings in your installation of Confluence (e.g. for performance reasons), then please read the Confluence 3.0.1 Upgrade Notes for important information about transferring your caching layer customisations from Coherence to Ehcache.

We strongly recommend that you back up your confluence.home directory and database before upgrading.
Confluence 2.6 Release Notes

The Atlassian Confluence team is delighted to present Confluence 2.6.

Confluence 2.6 brings many popular features which save you time and improve the your wiki's usability. Upgrading to Confluence 2.6 is free for all customers with active Confluence software maintenance as at 27th September 2007.

A new theme brings a fresh, clean look and feel. This is for our customers who have asked for a friendlier interface and improved readability. We've included more social networking features, to enhance the sense of community in your wiki. For example, author photos are now shown in comments and in the 'Recent Updates' on the Dashboard. And the Social Bookmarking plugin is now shipped with Confluence, allowing you to share bookmarks with your team.

Other popular new features include default content for spaces, labels on templates, the ability to backdate or rename news items (blog posts), official MySQL 5.0 support and PDF export of images.

- Many thanks for your issues and votes. They help us keep improving our products.
- We've highlighted the main features of this release below.
- Attached is a full list of issues resolved in 2.6.

### Upgrading to Confluence 2.6

- Upgrading Confluence should be fairly straightforward. Please refer to the upgrade instructions and notes. We strongly recommend that you back up your confluence.home directory and database before upgrading!
- All draft pages will be destroyed during the upgrade process. Confluence administrators should warn users of the Confluence site that drafts will not survive the upgrade.
- If you are using any third-party plugins, please test them thoroughly before rolling 2.6 into production.

#### Responding to your feedback:

🌟 5 new feature requests implemented
🌟 275 votes satisfied

#### Highlights of this release:

- Fresh look for the Default theme
- Personalised comments and Dashboard
- Space description on Dashboard
- Labels on templates
- Default content for space home pages
- Social Bookmarking plugin now bundled with Confluence
- Back-dating and renaming news items
- Plus over 90 other fixes and improvements
- Special thanks

#### Highlights of Confluence 2.6

1

**Fresh look for the Default theme**

- Default font now Arial instead of Verdana.
- Fresh, clean look and feel - these release notes are an example of the new style.
- If you prefer the original Confluence look and feel, select the Confluence Classic Theme when creating...
a space.

- Improved layouts for email and RSS feeds, helping you to skim-read and classify information quickly.

**Demo of the new default theme**

**Labels on templates**

- You can include labels when adding a page template.
- New pages based on the template will automatically include the labels.
- Read the documentation.

**Default content for space home pages**

- Confluence site administrators can define default content for a space.
- Home page for newly-added spaces will include the default content.
- Read the documentation.
Social Bookmarking plugin now bundled with Confluence

- Use Confluence to share bookmarks with your team.
- Plugin will be enabled by default.
- You can create a bookmark for any space in which you have 'create page' permission.
- To view your bookmarks, go to the ‘Bookmarks’ tab under ‘Browse Space’.
- Drag the bookmarklet from the ‘Bookmarks’ tab onto your browser toolbar to create bookmarks any time.
- Use the bookmarks macro to display a list of bookmarks anywhere in Confluence.
- Subscribe to an RSS feed for your bookmarks.
- Read the documentation.
Back-dating and renaming news items

- Rename a news item at any time.
- When creating a news item, you can now set the posting date to earlier than today.
- Backdating is also supported by the RPC interface - useful for migrating blog posts from other systems.

Plus over 90 other fixes and improvements

- MySQL 5.0 is officially supported, when used with Confluence 2.5 and above.
- Images generated by macro plugins will now export to PDF, .doc and .html formats.
- For plugin developers, the Joda-time library has been upgraded from 0.98 to 1.4 in Confluence 2.6. Plugins that use the date formatting or parsing functionality of Joda-time will need to be recompiled to work with Confluence 2.6.
- Administrators can configure a non-standard port for the Confluence outgoing mail server. The host address can now be specified as hostname:port.
• Improved **user migration** when integrating with LDAP: If you have existing Confluence users with the same usernames as LDAP users, you can now avoid duplicate users by configuring the LDAP repository before running the migration. The migration will then ignore users who have the same username as an LDAP user. Read the [documentation](#).

• And more.

**Special thanks**

We'd like to thank some of our valued community members whose contributions to the open source plugin library have made this version of Confluence even stronger:

• Shannon Krebs, for the [BloggingRPC plugin](#), the [Contributors plugin](#) and the [Social Bookmarking plugin](#).
• David Peterson and Bob Swift for the [Chart Plugin](#).
• David Peterson for the [IM Presence Plugin](#) and the [Table of Contents plugin](#).
• Dan Hardiker & [Adaptavist](#) for the [Plugin Repository Client](#).

**Confluence 2.6 Upgrade Guide**

*Confluence 2.6* brings many popular features which save you time and improve the your wiki's usability. Upgrading to Confluence 2.6 is free for all customers with active Confluence software maintenance as at 27th September 2007.

A new theme brings a fresh, clean look and feel. This is for our customers who have asked for a friendlier interface and improved readability. We've included more social networking features, to enhance the sense of community in your wiki. For example, author photos are now shown in comments and in the 'Recent Updates' on the Dashboard. And the Social Bookmarking plugin is now shipped with Confluence, allowing you to share bookmarks with your team.

Other popular new features include default content for spaces, labels on templates, the ability to backdate or rename news items (blog posts), official MySQL 5.0 support and PDF export of images.
Upgrade Notes

Draft Pages

All draft pages will be discarded during the upgrade process. Confluence administrators should warn users of the Confluence site that drafts will not survive the upgrade.

Plugins

If you are using any third-party plugins, please test them thoroughly before rolling 2.6 into production.

For plugin developers: the Joda-time library has been upgraded from 0.98 to 1.4 in Confluence 2.6. Plugins that use the date formatting or parsing functionality of Joda-time will need to be recompiled to work with Confluence 2.6.

Custom Themes

Custom Confluence 2.5.x themes are expected to be compatible with 2.6 without authors needing to make any change to their existing themes. This is because Confluence will, by default, include all Confluence 2.5.x specific styles automatically. But if you would like to upgrade your theme to use the latest Confluence 2.6 style and typography, you will need to update the way you include stylesheets in your theme. You can read full instructions here.

Custom Page Layout

1. If a space uses a custom decorator page layout, the new Confluence 2.6 decorator is not applied. This may causes GUI oddities, such as:
   - On a page, the View, Edit, Info and Attachments tabs are shown as a vertical bulleted list instead of tabs.
   - Comments do not show properly.
   **Fix:** Apply the Default Page Layout, then re-insert the custom code.

2. In addition, if you are using pagetree navigation to form a table of contents on the left, you may find that your wiki text becomes italic after upgrading to Confluence 2.6.
   - Cause: To create the left-hand panel, you have probably inserted a chunk of HTML/CSS in the space’s page layout. The chunk of code may use a <blockquote> element to align the body of the page and draw a blue line on its left. Confluence 2.6 stylesheets apply the italic style to blockquotes.
   - Fix: Use a new format for your left-hand panel. One possible example is given here.

Steps in detail:

1. Go to the Space Admin screen and click ’Edit’ to view your customised Page Layout.
2. Copy the customised code.
3. Cancel the edit.
4. Click ’Reset Default’ to apply the new Confluence 2.6 default page layout.
5. If you are using the pagetree navigation panel, edit your customised code as described above.
6. On the Space Admin screen, click ’Create Custom’ to create a custom page layout.
7. Reinsert your customised code and click ’Save’.

Upgrade Procedure

Upgrading Confluence should be pretty easy. We strongly recommend that you backup your confluence.home directory and database before upgrading!

You can get the latest version of Confluence here.

If you are upgrading from Confluence 2.2.x or a later version, you can find instructions here.

If you are upgrading directly from 2.1 or earlier, you should also read the 2.2 Release Notes for warnings about...
the 2.1 -> 2.2 upgrade.

**Issues resolved in Confluence 2.6**

<tr>
<td>Type</td>
</tr>
<tr>
<td>Authenticate to retrieve your issues</td>
</tr>
</tbody>
</table>

**Confluence 2.7.1 Release Notes**

24 January 2008

Presented with pleasure by the Atlassian Confluence team: **Confluence 2.7.1** is a recommended upgrade which fixes a security flaw and other bugs, and brings a couple of improvements.

We have identified and fixed an XSS (cross-site scripting) security flaw which may affect Confluence instances in a public environment. For details, please refer to the [security advisory](#).

Recording of authorship and history for page attachments is improved, so that attachment history is now retained after operations such as editing the attachment or moving it to a new page.

A new option on the Export Space screen allows administrators to export all pages to XML even when page-restrictions deny the administrator access to some of the pages.

This release also fixes problems in the following areas:

- The SOAP API, which was broken in Confluence 2.7.0.
- Logging.
- Internationalisation (support for different languages).
- Case-sensitivity for usernames and group names when using LDAP integration, and problems with upper-case letters in usernames when applying space permissions.

There's a complete list of fixes below. Click a specific issue to see details of the fix, and to download any patches where relevant.

Confluence 2.7.1 is available from the [download centre](#).

**Upgrading from a previous version of Confluence**

Upgrading Confluence should be fairly straightforward. Please read the [upgrade instructions](#). We strongly recommend that you back up your confluence.home directory and database before upgrading!

**Updates and fixes in this release**

**Error rendering macro 'jiraissues' : JIRA project does not exist or you do not have permission to view it.**

**Confluence 2.7.1 Upgrade Guide**

Confluence 2.7.1 is a recommended upgrade which fixes a security flaw and other bugs, and brings a couple of improvements. You'll find details of the fixes in the [release notes](#).
Upgrade Notes

As part of the fix for case-sensitivity in usernames and group names when using LDAP integration ([CONF-9469](#)), an upgrade task will consolidate permissions for the same user or groups where they differ only by case.

Depending on the size of your Confluence installation (number of spaces and the permissions applied to them) the upgrade task could result in a longer-than-usual delay when starting Confluence for the first time after the upgrade. Please be patient while this happens — it could take a few minutes.

During this process there will be regular progress reports in the log, something like this:

```
[atlassian.confluence.upgrade.ConsolidatePermissionsUpgradeTask]
doUpgrade Consolidating SpacePermissions for Space Monkeys in a Barrel
(key=MONBAR)
```

⚠️ Backup essential, because permissions will be modified

The upgrade task will modify permissions in your Confluence database. So that our usual 'strong recommendation' to back up the database becomes even stronger.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.

2. If your version of Confluence is earlier than 2.7.0, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.7 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 2.7.2 Release Notes

6 March 2008

Confluence 2.7.2 is a recommended upgrade which fixes a security flaw and other bugs.

We have fixed a security flaw which allowed users who have 'View' permission (or higher) on a space to purge any page in that space. For details, please refer to the security advisory and related JIRA issue.

Other good fixes in this point release:

- The Rich Text editor no longer breaks links to pages in other spaces.
- Some customers have reported problems with permissions after upgrading to Confluence 2.7.1, where some space permissions or global permissions were lost if using a case-sensitive database. From Confluence 2.7.2, the space permissions and global permissions screens will display a message highlighting any case-sensitivity problems. We have also provided a routine to fix existing permissions affected by this issue — read the detailed instructions on running the routine.
- The JIRA Portlet macro now displays correctly when using trusted communication between JIRA and Confluence.
• Confluence 2.7.2 also clarifies the procedures around renewing your license before upgrading.

There's a complete list of fixes below. Click a specific issue to see details of the fix, and to download patches where relevant.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 2.7.4 Release Notes

Confluence 2.7.4 is the standard edition version of Confluence 2.7.x. This version of Confluence is equivalent to Confluence version 2.7.3, but it does not include Oracle's Coherence technology. Due to licensing changes with Oracle over the Coherence clustering and distributed caching technology, Atlassian is no longer able to distribute this technology to customers without a Confluence clustered license.

Therefore, Atlassian has released 'standard editions' for each previous major version of Confluence back to 2.6, which includes Confluence versions 2.10.4, 2.9.3, 2.8.3, 2.7.4 and 2.6.3. Confluence 2.7.4 will be the only Confluence 2.7.x version available to customers with a non-clustered Confluence license.

For its caching functionality, Confluence 2.7.4 utilises Ehcache. This functionality was provided by the Coherence technology in previous Confluence 2.7.x versions.

For more information about the features, updates and fixes in Confluence 2.7.3, please refer to the Confluence 2.7.3 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.7.3 Upgrade Notes. However, if you have customised the cache settings in your installation of Confluence (e.g. for performance reasons), then please read the Confluence 3.0.1 Upgrade Notes for important information about transferring your caching layer customisations from Coherence to Ehcache.

We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 2.7 Release Notes

12 December 2007: With great pleasure, the Atlassian Confluence team presents Confluence 2.7.
Confluence 2.7 has improvements for administrators and end-users alike. Administrators can set up trusted communication between Confluence and JIRA. The result? The JIRA Issues and JIRA Portlet macros will show only the issues which the Confluence user is authorised to see. You no longer need to include a username and password in the markup code.

The two-tier administrator permissions allow system administrators to delegate some functions to team leaders or managers. Logging is simplified, and administrators can change logging levels at runtime. The improved user management framework speeds up your user searches.

Sorting of images is now possible in the Gallery macro. And when creating a page or news item, you can attach images or files immediately, without waiting until you have saved the page.

- Upgrading to Confluence 2.7 is free for all customers with active Confluence software maintenance as at 12 December 2007.
- Thank you for all your issues and votes. Keep on logging!
- We've highlighted our favourite bits of this new release below.
- And there's more.

### Upgrading to Confluence 2.7

Upgrading Confluence should be fairly straightforward. **We strongly recommend that you back up your confluence.home directory and database before upgrading!** Please refer to the [upgrade instructions](#). There you will find instructions on upgrading, and details of the following:

- If you are using any third-party plugins, please test them thoroughly before rolling 2.7 into production.
- If you are using the Resin application server, you will need to configure Resin to use an XML parser that is XSD-aware.
- When upgrading, you should consider turning off the new JIRA/Confluence trusted communication feature and/or warnings.
- Your users will be automatically migrated to AtlassianUser during the Confluence upgrade process.
- All users and groups with the old ‘Administer Confluence’ permission will be converted to the new ‘System Administrator’ permission.
- By default, all installations of Confluence will now write log messages to the Confluence home directory instead of the application server’s log file.
- Java 1.4 will be deprecated after Confluence 2.8.
- Read [more information](#).

---

**Responding to your feedback:**

- ★ 4 new feature requests implemented
- ★ 380 votes satisfied

**Download latest version**

---

**Highlights of this release:**

- [JIRA Issues and Portlet macros use new trusted authentication](#)
- [Two-tier administrator permissions](#)
- [Inserting images and attaching files during page creation](#)
- [Sorting of images in Gallery macro](#)
- [Simplified and improved logging](#)
- [Performance, maintainability and administration](#)
- [Plus over 90 fixes and improvements](#)
Highlights of Confluence 2.7

1. JIRA Issues and Portlet macros use new trusted authentication

- The JIRA Issues macro and the JIRA Portlet macro allow you to display a list of JIRA issues on your Confluence page.
- Prior to Confluence 2.7, you had to include a username and password in the markup code if you needed to display issues with restricted viewing. This release and JIRA 3.12 solve the problem.
- Read more about trusted communication.

Example markup— User will see the issues they are authorised to see (provided trusted communication is enabled):

```
{jiraissues:url=CONTENT|columns=type;key;summary}
```

Example markup— User will see only the issues authorised for anonymous viewing:

```
{jiraissues:url=CONTENT|columns=type;key;summary|anonymous=true}
```

2. Two-tier administrator permissions

- The original 'Administer Confluence' permission is now called 'System Administrator'.
- A new permission level, called 'Confluence Administrator', is similar to 'System Administrator' but excludes the functions which may compromise the security of the Confluence system.
- You can delegate administrator privileges to project managers or team leaders while preserving the security of your Confluence site, by granting the managers the new 'Confluence Administrator'
Inserting images and attaching files during page creation

- You can now attach an image or other file during creation of new page – before you have saved the page.
- This applies to pages and news items.
- We have standardised the options for Wiki Markup mode and the Rich Text editor:
  - The 'Insert Image' popup allows you to select thumbnails and alignment.
  - The 'Insert Link' popup allows aliases and tooltips.
- Read more about inserting an image and attaching a file to a page.
Sorting of images in Gallery macro

- The new 'sort' argument allows you to order the images by file name, comment or date last modified.
- Read the documentation.

Example: Sorting the images by file name

```text
{gallery:title=Some office photos, and a waterfall|sort=name}
```

Example: Sorting the images by date and showing the most-recently-modified first
Simplified and improved logging

- Confluence now writes its logs to the Confluence home directory. Both the Confluence and Confluence EAR/WAR distributions behave in the same way. For more information, see the logging documentation.
- We have rationalised the reporting to the different levels (ERROR, INFO, WARN, etc) and removed many unnecessary exceptions and stacktraces from the logs.
- You can change the logging levels while Confluence is running. Read more information.

Performance, maintainability and administration

- If you are currently using the standard configuration for user management, your users will be automatically migrated to the AtlassianUser framework on upgrade to Confluence 2.7. See the upgrade notes. This will result in a dramatic increase in the speed of user searches.
- Confluence now supports Java 6, allowing you to take advantage of its performance improvements.
- A further set of improvements to the stability of your Confluence system.

Plus over 90 fixes and improvements

- You'll no longer see those annoying browser messages when you click the browser's 'Back' button, for example after viewing search results.
- We've fixed some problems with the image and file attachment popups, and made them behave in the same way for both the Rich Text Editor and Wiki Markup.
- See the list of features, improvements and bug fixes.

**Confluence 2.7 Upgrade Guide**

Confluence 2.7 has improvements for administrators and end-users alike. Administrators can set up trusted communication between Confluence and JIRA. The result? The JIRA Issues and JIRA Portlet macros will show only the issues which the Confluence user is authorised to see. You no longer need to include a username and password in the markup code.

The two-tier administrator permissions allow system administrators to delegate some functions to team leaders or managers. Logging is simplified, and administrators can change logging levels at runtime. The improved user management framework speeds up your user searches.

Sorting of images is now possible in the Gallery macro. And when creating a page or news item, you can attach images or files immediately, without waiting until you have saved the page.
Plugins

If you are using any third-party plugins, please test them thoroughly before rolling 2.7 into production.

Configuring Resin

This note applies if you are using the Resin application server. Due to an upgrade to one of the core components of Confluence (namely Spring), it will no longer work against an out-of-box configuration of Resin. To resolve this, you will need to configure Resin to use an XML parser that is XSD-aware. More information:

- Troubleshooting a Resin configuration
- Spring Framework documentation

Trusted communication between JIRA and Confluence

Confluence 2.7 provides a new trusted communication protocol, to allow secure authentication for the JIRA Issues and JIRA Portlet macros.

When upgrading, consider whether to disable warning messages or turn off trusted communication altogether. You may like to do this if you have a number of existing JIRA Issues or JIRA Portlet macros in your Confluence pages, and you do not intend to set up trusted communications soon. Read more about configuring trusted communications.

By default, trusted communication will be enabled when you upgrade to Confluence 2.7. This will affect your existing macros as follows:

- If the macro markup contains a username and password, the functionality is unchanged.
- If you have already set up trusted communication with a JIRA instance, the macro output will be as described in the guide on trusted communication.
- If the macro markup does not contain a username and password and you have not set up trusted communication with a JIRA instance, your Confluence pages will show a warning message above the macro output. See more information on troubleshooting.

WebDAV attachment manager deprecated

The option to store Confluence attachments on a WebDAV server has never worked in a useful fashion, and has not been maintained for many versions.
The WebDAV attachment manager is deprecated from Confluence 2.7, and will be removed from a future version of Confluence. If you store attachments on external WebDAV servers, we recommend that you migrate to file-system or database-backed attachment storage immediately. Refer to CONF-9313 and CONF-2887.

This DOES NOT affect the operation of the WebDAV plugin.

User migration

Confluence 2.7 replaces OSUser with AtlassianUser as the underlying user management framework, greatly improving performance. Read more information about Managing Confluence Users.

When you upgrade from an earlier version of Confluence to release 2.7.0 or later, your users will be automatically migrated to AtlassianUser (but see the exceptions in the next paragraph). You may notice that your upgrade takes longer than usual, due to this migration process.

Automatic migration will not occur if any of the following is true:

- You have delegated user management to either JIRA or LDAP, or you have changed your user management from the standard configuration. If this is the case, you should upgrade as usual, ensuring that you retain your existing atlassian-user.xml or osuser.xml file.
- You have already migrated to AtlassianUser.

The progress of the migration will be shown in your log files. For example, a successful migration will show:

```
2007-10-08 21:33:07,979 INFO [main]
[atlassian.confluence.upgrade.OSUserToAtlassianUserMigrationUpgradeTask]

```

System Administrator and Confluence Administrator
permissions

Confluence 2.7 brings two administrator-level permissions in place of one. The new permissions are 'System Administrator' and 'Confluence Administrator'. Refer to the documentation for details.

When you upgrade to version 2.7, all users and groups with the old 'Administer Confluence' permission will be converted to the new 'System Administrator' permission. The powers of the 'confluence-administrators' group remain unchanged.

Location of Confluence logs

Confluence’s default logging behaviour has changed with Confluence 2.7. Both the Confluence and Confluence EAR/WAR distributions follow the same default behaviour:

- When you start Confluence, log entries will be sent to the application server logs until Confluence has completed its initial bootstrap. Any log entries will be repeated into the \(<\text{confluence-home}\>\log\) described below.
- Once the initial startup sequence is complete, all logging will be to \(<\text{confluence-home}\>/\text{logs/atlassian-confluence.log}\). For example: \(c:/\text{confluence/data/}\text{logs/atlassian-confluence.log}\).

Note that the default location is now the Confluence \text{home directory} instead of the application server's log file.

Java versions

Confluence 2.7 supports Java 1.4, Java 5 and Java 6. We recommend Java 6 because of its increased performance and easier troubleshooting, due to enhanced memory dump and profiling capabilities.

Advance notice: Java 1.4 will be deprecated in a future release. Confluence 2.8 will be the last version that supports Java 1.4.

Upgrade procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your \text{confluence.home directory and database}.
2. If your version of Confluence is earlier than 2.6.x, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from a version earlier than 2.6.0, please read the 2.6 upgrade notes.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Confluence 2.8.1 Release Notes

21 May 2008

Confluence 2.8.1 is a recommended upgrade which fixes some security flaws as well as other bugs in Confluence 2.8. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

Two of the bug fixes resolve problems with rendering a wiki page in Internet Explorer 6. Additionally, these fixes will significantly improve performance in some configurations of Confluence 2.8.

We have created some performance testing scripts, which will be particularly useful for large or mission-critical
Confluence installations.

Using a custom space logo caused some problems, particularly with Resin application server, where the page would sometimes hang and then display incorrectly. This is now fixed. There's a complete list of fixes below. Click a specific issue to see details of the fix.

**Don't have Confluence 2.8 yet?**  
Take a look at the new features and other highlights in the [Confluence 2.8 Release Notes](#).

![Download Latest Version]

### Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the [Confluence 2.8.1 Upgrade Notes](#). We strongly recommend that you back up your `confluence.home` directory and database before upgrading.

### Updates and Fixes in this Release

**Error rendering macro 'jiraissues' : JIRA project does not exist or you do not have permission to view it.**

Confluence 2.8.1 Upgrade Notes

Confluence 2.8.1 is a recommended upgrade which fixes some security flaws as well as other bugs. You'll find details of the fixes in the release notes.

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your `confluence.home` directory and database.

2. If your version of Confluence is earlier than 2.8.0, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.8 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 2.8.2 Release Notes

**3 July 2008**

**Confluence 2.8.2 is a recommended upgrade which fixes some security flaws and other bugs. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.**

This release fixes the ‘remember me’ problem encountered when using Confluence with Tomcat 5.5.26 or Tomcat 6, where logins are not remembered.

Confluence administrators will see a new link on the user profile screen, allowing them to move directly to the user management screen for that user.
This release also addresses some performance bugs:

- Label links, as well as the label summary pages, now include the 'nofollow' attribute to prevent search engines like Google from indexing them.
- We have increased the size of the UI templates cache, which should reduce the number of times Confluence needs to load resources.
- CSS caching has been improved. (Refer to CONF-11755 if you’d like to know the details.)
- When generating a URL for the multiple label filter, Confluence now sorts the labels in the URL alphabetically, ensuring that there is just one URL for each filter instead of possible multiple URLs. This should reduce the load on the server when search engine crawlers visit the Confluence site, because the crawlers no longer need to index multiple URLs.

The JIRA Issues macro now has improved caching. When trusted communication was first introduced, Confluence did not cache results for anonymous users or results retrieved using trusted communications. With Confluence 2.8.2, caching is implemented for both those cases. This fix should improve the performance of your JIRA site, because Confluence no longer needs to access the JIRA site as often.

There’s a complete list of fixes below. Click a specific issue to see details of the fix.

**Don’t have Confluence 2.8 yet?**

Take a look at the new features and other highlights in the Confluence 2.8 Release Notes.

---

**Upgrading from a Previous Version of Confluence**

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.8.2 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

**Updates and Fixes in this Release**

**Error rendering macro 'jiraissues' : JIRA project does not exist or you do not have permission to view it.**

Confluence 2.8.2 Upgrade Notes

Confluence 2.8.2 is a recommended upgrade which fixes some security flaws as well as other bugs. You’ll find details of the fixes in the release notes.

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database. See the documentation on backing up your Confluence site.

2. If your version of Confluence is earlier than 2.8.0, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.8 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.0 first, confirm the upgrade was successful, then upgrade again from version 2.7.0 to version 2.8.2. For more
details, please refer to CONF-11767.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 2.8.3 Release Notes

Confluence 2.8.3 is the standard edition version of Confluence 2.8.x. This version of Confluence is equivalent to Confluence version 2.8.2, but it does not include Oracle's Coherence technology. Due to licensing changes with Oracle over the Coherence clustering and distributed caching technology, Atlassian is no longer able to distribute this technology to customers without a Confluence clustered license.

Therefore, Atlassian has released 'standard editions' for each previous major version of Confluence back to 2.6, which includes Confluence versions 2.10.4, 2.9.3, 2.8.3, 2.7.4 and 2.6.3. Confluence 2.8.3 will be the only Confluence 2.8.x version available to customers with a non-clustered Confluence license.

For its caching functionality, Confluence 2.8.3 utilises Ehcache. This functionality was provided by the Coherence technology in previous Confluence 2.8.x versions.

For more information about the features, updates and fixes in Confluence 2.8.2, please refer to the Confluence 2.8.2 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.8.2 Upgrade Notes. However, if you have customised the cache settings in your installation of Confluence (e.g. for performance reasons), then please read the Confluence 3.0.1 Upgrade Notes for important information about transferring your caching layer customisations from Coherence to Ehcache.

We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 2.8 Beta Release Notes

28 March 2008

Confluence 2.8 will be launched in a few weeks' time. These release notes apply to Confluence 2.8 Beta, which is currently undergoing internal testing. These release notes show the highlights of the upcoming release, although we have not included all the enhancements and bug fixes. We'll publish the final and complete release notes with the release of Confluence 2.8.0.

If you are interested in trying out a developer's release, please take a look at the information and warnings in Confluence Development Releases.

What's Coming in Confluence 2.8

1. Page Ordering

- One of the most popular feature requests is now reality — Confluence allows manual page ordering.
- You can choose the order in which wiki pages are displayed.
- Use a dynamic tree view to drag and drop your pages into the right position.
• Page order is reflected in all tree views for a space or a page family, including the PageTree macro and exports to PDF, HTML and XML.
• Read the documentation.

2 Dynamic Menus and Simplified Editing

• Drop-down menus replace tabs and links.
• Grouping of functions is more intuitive.
• Features are more visible than before — you may even come across things you didn't know Confluence had!
• Simplified screen design allows you to focus on editing the page content.
• There is more space for entering text.
• See an overview of the new menu structure and what's changed.

3 Collapsible Comments

• We’ve beautified the display of comments on pages and news items.
• You can collapse comments to a single line — just click the subject line of a single comment, or 'Collapse All'.
• It's easier to keep track of multi-level comment threads.
• When collapsed, a comment shows a single-line excerpt.
• The time stamp is relative for recent comments — for example, it might say 'less than a minute ago'.
• The new 'permanent link' icon makes it easier to link directly to a comment from another page.

4 Multiple Label Filter

• Combine more than one label in your label searches.
• Use ‘+’ and ‘-’ links to add or subtract labels from your search.
• Browse labels simply by typing in a URL, such as:

  http://CONFLUENCE_HOSTNAME/label/ShipIt+ideas

• Read the documentation.

5 And Lots More

• Enhanced Dynamic Tasklist.
• An installation wizard for the Confluence distribution on Windows and Mac.
• Significant performance improvements.
• More administration, management and monitoring tools.
• Plenty of bug fixes to keep everyone happy.

Confluence 2.8 Release Notes

10 April 2008

The Atlassian Confluence team is delighted to present Confluence 2.8.

We have simplified the screen design to focus on content. There's a totally new menu structure for editing or adding content and many other actions. We've also grouped the menu functions so that they are easier to use and understand. This will help new users start using Confluence quickly. For our faithful customers, you may find existing features you didn't know Confluence had!

The much voted for page-ordering feature allows you to define the order of your wiki pages yourself — just drag and drop your pages into the right position.
We've beautified the display of comments on pages and news items. With the multiple-label filter, you can combine more than one label in your label searches and surf labels directly via a sensible URL. Getting Confluence up and running is easier than ever with our new installer. An enhanced task list is bundled with Confluence, bringing faster response times and a simple yet powerful user interface.

There are some great performance enhancements and a lot for administrators and developers too.

- Thank you for all your issues and votes. Keep on logging, to help us keep improving!
- Below is a list of the highlights in this release.
- Attached is the full list of issues resolved in this release.

### Upgrading to Confluence 2.8?

- Upgrading Confluence should be fairly straightforward. **We strongly recommend that you back up your Confluence Home directory and your database before upgrading.**
- If you are using any third-party plugins, please test them thoroughly before rolling 2.8 into production.
- Please refer to the Confluence 2.8 Upgrade Notes for further essential information about upgrading.

### Responding to your feedback:

- ★ 14 new feature requests implemented
- ★ 300+ votes satisfied

### Highlights of this release:

- Dynamic menus and simplified screen design
- Page ordering
- Collapsible comments
- Multiple-label filter
- Confluence installer
- Task list
- Performance enhancements
- Administration, management and monitoring
- Highlights for developers
- Over 100 fixes and improvements
- Special thanks

### Highlights of Confluence 2.8

1

**Dynamic menus and simplified screen design**

- Drop-down menus replace tabs and links.
- Grouping of functions is more intuitive.
- Features are more visible than before — you may even come across things you didn't know Confluence had!
- A cleaner screen design lets you focus on the page's content.
- It's simpler than ever to edit a page.
- There is more space for entering text.
- See an overview of the new menu structure and what's changed.
Page ordering

- One of the most popular feature requests is now a reality — Confluence allows manual page ordering.
- You can choose the order in which wiki pages are displayed.
- Use a dynamic tree view to drag and drop your pages into the right position.
- Page order is reflected in all tree views for a space or a page family, including the PageTree macro and exports to PDF, HTML and XML.
- Take a look at the documentation to learn more.

Collapsible comments

- We’ve beautified the display of comments on pages and news items.
You can collapse comments to a single line.
It's easier to keep track of multi-level comment threads.
When collapsed, a comment shows a single-line excerpt.
The time stamp is relative for recent comments — for example, it might say 'less than a minute ago'.
The 'permanent link' icon is back, after a temporary absence in Confluence 2.6. Instead of lurking behind the date, it's now a link icon at the bottom right of each comment.

Multiple-label filter
- Combine more than one label in your label searches.
- Use the `-` link next to the label name to subtract a label from your multiple-label search.
- Browse labels simply by typing in a URL, such as:

```plaintext
http://CONFLUENCE_HOSTNAME/label/fedex+ideas
```

- Take a look at the documentation to learn more.
Confluence installer

- The installation wizard lets you install the Confluence distribution without fuss or bother.
- Your Java environment is automatically configured.
- Confluence starts up in your browser after installation and leads you straight into the Setup Wizard.
- You can choose to install Confluence as a Windows service.
- Confluence appears in your Windows Start Menu.
- Read the documentation.

Task list

- The enhanced task list plugin is now bundled with Confluence.
- Permissions in the task list match the permissions of the page containing it.
- New user and group pickers help you to choose the right person or group.
- The sophisticated visual design suits the Confluence look and feel — take a look at the borders, icons,
Confluence 4.3 Documentation

Performance enhancements

- You will notice significant performance improvements in this release.
- A new gzip compression filter speeds up the transfer of data from Confluence and uses far less memory than the earlier implementation.
- The PDF space export uses less server memory.
- And more for the technically-minded:
  - The commonly-accessed resources use permanent client-side caching.
  - We have optimised some operations that were performed on every request, decreasing the average time taken to load a page.
  - We have optimised the database access for labels and attachments.
  - Where users belong to many groups, the retrieval of groups from LDAP is faster.
  - Access to Confluence's data storage mechanism (Bandana) has been made more granular, so that we don't load the entire context when retrieving individual keys from large contexts.

Administration, management and monitoring

- Confluence now supplies statistics and other information via a Java Management Extensions (JMX) interface. A number of third-party consoles will allow you to view the information and monitor your Confluence instance. There's more information in the documentation.
- The Plugin Repository client shows you which plugins are officially supported.
- You can raise a support request via the Administration Console.
- Troubleshoot your LDAP user management directly from the Administration Console.
- A new field on the System Information page displays the current access latency to the Confluence database — useful for diagnosing database network problems.
Highlights for developers

- Install custom path-mapping as part of your plugin, using the new Path Converter plugin modules — prettify your URLs.
- Include your JavaScript and CSS resources neatly, using the Web Resource plugin type.
- The Velocity template engine has been upgraded to version 1.5.
- We have begun a cleanup of the HTML and CSS for viewing and editing a page, moving towards semantic markup and web standards.
- We are moving towards standardisation on a single JavaScript library, based on jQuery. This is the supported JavaScript library for plugin developers. The benefits? No more conflicts between libraries. jQuery is fast. And there's less to learn!

Over 100 fixes and improvements

- The People Directory uses the hCard microformat for simple integration with a variety of microformat-enabled tools.
- And more.

Special thanks

We'd like to thank Shannon Krebs, David Peterson and David Chui in particular for their continuing contributions to the open-source Confluence plugin library.

Issues resolved in Confluence 2.8

Below is the full list of issues resolved by Confluence 2.8. You can read the release notes here.

Error rendering macro 'jiraissues' : Unable to determine if sort should be enabled.

Confluence 2.8 Screen and Menu Changes

Can't find a menu item in Confluence 2.8? That's understandable, because the user interface (layout of the screens and menus) in Confluence 2.8 has changed dramatically. This page contains a quick summary of the changes. Please read on for a quick and easy introduction.

Refer to Using the Confluence Screens for an overview of the new Confluence menu structure.

On this page:

- What's on this page?
- Confluence 2.8 User Interface in Detail
- New Menu Structure in Confluence 2.8
Changes to Menu Items in Confluence 2.8

Some of the Confluence documentation will not immediately reflect the new user interface in Confluence 2.8. We are working to rectify the situation as quickly as possible. In the interim, please use this page as a guide.

What's on this page?

The image below shows a Confluence 2.8 screen, with numbers added to the image. The numbers relate to a table of menu commands below the image, showing the new menu structure. Finally, there is a comprehensive table of menu commands, their new locations and how to get there.

Confluence 2.8 User Interface in Detail

The following screenshot and numbered list show the new menu layout in Confluence 2.8.

Screenshot: Confluence 2.8 Annotated User Interface Changes

New Menu Structure in Confluence 2.8

The numbers in this list relate to the numbers added onto the image above.

<table>
<thead>
<tr>
<th></th>
<th>'Space Menu' containing Pages, News, Labels, Attachments, Bookmarks, Mail, Advanced and Space Admin.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>'User Menu' containing Personal Space, Preferences, History, Administration (Confluence Administrators only) and Log Out.</td>
</tr>
<tr>
<td>2</td>
<td>'Edit Button' which opens the current page for editing.</td>
</tr>
<tr>
<td>3</td>
<td></td>
</tr>
</tbody>
</table>
There may also be other items in this menu, depending upon the plugins you have installed on your Confluence site. For example, Add Diagram (Gliffy plugin) and Add Spreadsheet (EditGrid plugin).

- **Tools Menu** containing Attachments, History, E-mail, Favourite, Watch, Info, View Wiki Markup, Export to PDF, Export to Word, Copy, Move and Remove.

- **Labels**. This line shows tags attached to the current page.

### Changes to Menu Items in Confluence 2.8

This table lists every change to the menu structure that has occurred in Confluence 2.8. Names for some commands have changed, so the old menu option names are listed, next to the new names, with instructions for finding them. (You can search the text on this page for the name of a menu item you used to use in an earlier version of Confluence – you'll find instructions next to it.)

Confluence 2.8 Upgrade Notes

Below are some essential notes on upgrading to Confluence 2.8. For details of the new features and improvements in this release, please read the Confluence 2.8 Release Notes.

On this page:

- Upgrade Notes
  - Crowd Integration
Confluence 2.8 introduces the ability to move pages into any order you choose.

As part of the above feature, we have changed the default page order in Confluence, from simple alphabetical ordering to a 'natural' ordering. The natural ordering handles numeric values correctly when doing string comparisons.

Impact:

- The new natural ordering is the same as the ordering already used by the PageTree plugin, which some customers use to create a left-hand navigation panel.
- The change to natural ordering should have little effect on most users because, under most situations, natural ordering and alphabetical ordering will produce the same results.
- For customers who have inserted chapter or page numbers to force the correct order, the new natural ordering will show the existing pages in the correct order.

⚠️ If you do find that the order of your pages is adversely affected, you can use the new page-ordering function to move the pages.

Plugins

Please check the following if you have added any plugins to Confluence:

- If you are using any third-party plugins, please test them thoroughly before rolling 2.8 into production.
- The PageTree plugin has been updated. If you are using this plugin, please download the latest version to ensure compatibility with Confluence 2.8.

Velocity Template Engine

Confluence’s Velocity template engine has been upgraded from 1.3 to 1.5. Please test carefully for compatibility problems with existing third-party themes and plugins. For developers, there’s more information about Migrating to Velocity 1.5.

Dynamic Tasklist 2

The Dynamic Tasklist 2 plugin is now bundled with Confluence. The new tasklist macro replaces the older tasklist and dynamicTasklist macros. What happens to existing tasklists?
• By default, the new macro will be enabled and the older macros disabled in your Plugin Repository.
• When someone views a page containing an older version of the task list, the display will show the new format but the page will not be updated.
• When someone first adds a task or changes anything in the task list, the data will be converted to the new format.

Customised Page Layouts

The Confluence Upgrade Guide includes instructions on re-applying your customisations after the upgrade. We’re repeating some of that information here, because it’s particularly important due to the UI changes in this release.

If a space uses a customised page layout, the new Confluence 2.8 layout will not be applied. This means that you will not see the new menu structure within that space. For example, this will happen if you are using page tree navigation to form a table of contents on the left.

Fix: Apply the Default Page Layout, then re-insert your custom code.

Steps in detail:

1. Go to the Space Admin screen and click ‘Edit’ to view your customised Page Layout.
2. Copy the customised code.
3. Cancel the edit.
4. Click ‘Reset Default’ to apply the new Confluence 2.8 default page layout.
5. On the Space Admin screen, click ‘Create Custom’ to create a custom page layout.
6. Reinsert your customised code and click ‘Save’.

JavaScript Libraries

jQuery is the supported JavaScript library for plugin developers.

Advance notice — deprecated libraries: We have decided to standardise on jQuery as the JavaScript library for Confluence. This library will eventually replace all others. For this reason, use of the following JavaScript libraries in Confluence is deprecated:

- The Yahoo! User Interface Library (YUI)
- Prototype
- Scriptaculous

Because there is a lot of legacy plugin code using Prototype and Scriptaculous, these will continue to be available for at least one more major release of Confluence.

Java Versions

Confluence 2.8 supports Java 1.4, Java 5 and Java 6. We recommend Java 6 because of its increased performance and easier troubleshooting, due to enhanced memory dump and profiling capabilities.

Advance notice — Java 1.4 will be deprecated in a future release. Confluence 2.8 will be the last version that supports Java 1.4. Please refer to the Java 1.4 Support Timeline for more information.

Upgrade Procedure

⚠️ As always please test your upgrades in your TEST environment before rolling into PRODUCTION.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence installation directory and
your Confluence home directory, as directed in the Upgrade Guide. If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 2.7.x, read the release notes and upgrade guides for all releases between your version and the latest version.
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.0 first, confirm the upgrade was successful, then upgrade again from version 2.7.0 to version 2.8. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

5. If you encounter a problem during the upgrade, please create a support ticket and one of our support engineers will assist you through the process.

Confluence 2.8 Release Notes

Confluence 2.9.1 Release Notes

8 September 2008

Confluence 2.9.1 is a recommended upgrade which fixes some security flaws and other issues.

Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

This release also addresses an issue relating to contributor filtering with LDAP. In the previous version, the search function was not able to filter results by authors from an LDAP directory. This fix requires an upgrade action; see the Confluence 2.9.1 Upgrade Notes for more information.

There's a complete list of fixes below. Click a specific issue to see details of the fix.

Don't have Confluence 2.9 yet?

Take a look at the new features and other highlights in the Confluence 2.9 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.9.1 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Updates and Fixes in this Release

Error rendering macro 'jiraissues' : JIRA project does not exist or you do not have permission to view it.

Confluence 2.9.1 Upgrade Notes

Confluence 2.9.1 is a recommended upgrade which fixes some security flaws as well as other bugs. You'll find
details of the fixes in the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.

2. If your version of Confluence is earlier than 2.8.0, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.9 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Fix for Contributor Filtering LDAP Users

An issue was fixed in this release relating to search functionality and filtering by contributor. Authors from LDAP directories are now taken into account, however you will need to carry out the instructions to make sure all users are included in this feature.

Enabling Contributor Filtering for Search

Confluence 2.9 includes an enhancement to the search functionality which allows the filtering of search results by author or contributor. Unfortunately an existing bug in Confluence prevented this functionality from being used on sites that use LDAP for their user management.

Monitoring the Upgrade Task in Confluence 2.9.1

Confluence 2.9.1 fixes this defect and also includes an upgrade task that should ensure any existing content contributors are properly indexed and therefore available in the contributor filter auto-complete box.

Enabling this functionality is simply a case of installing Confluence 2.9.1 and watching your log file during start up for specific messages, such as the following.

```
Beginning PersonalInformation repair.
Found <n> usernames that need to be retrieved.
Finished Personal Information repair.
```

On a large external directory of users, it is possible that this task may take many minutes to run. However, the processing of this task will not delay the startup of Confluence.

Enabling Detailed Progress Reporting during Upgrade

If you wish to see more detailed progress reporting during the upgrade, you will need to carry out the following steps.

To enable detailed progress reporting,
1. Enable **Debug** level logging for the logger called `com.atlassian.confluence.upgrade.PersonalInformationRepairTask`.

2. During startup of Confluence, you should also see additional progress reporting messages similar to the following:

   Created 10 from `<n>` missing Personal Information objects.
   Created 20 from `<n>` missing Personal Information objects.
   Created 30 from `<n>` missing Personal Information objects.

---

**Manually Instigating the Fix**

Should you discover any problems during the repair task (as reported in the logs), then a Confluence Administrator can manually rerun the task by visiting the following page.

```<confluence base URL>/admin/createMissingPersonalInfo.jsp```

That page presents a single button that will re-run the repair task. In addition to the logging noted previously, the same messages will be returned to the administrator's browser.

**Actions Taken when Running the Fix**

There is no functional cost to running this fix. Should you accidentally run it too frequently, there is no functional implication. It is worth being aware of what is happening in the back-end so you can schedule a relevant time to perform it. While the fix is running, the following occurs:

- Two database queries are run to find the missing contributors, each involving an inner join against the same table.
- Each missing user is requested from the LDAP server by username.
- Each missing user will lead to a row insert in the database (these are batched).

---

**Restoring Inherited Page Permissions After 2.9 Upgrade**

Confluence instances that were upgraded to Confluence 2.9 are affected by a vulnerability. Child pages under a page protected by permissions are not protected by inherited permissions, as they should be. Please note that new installs of Confluence 2.9 which were not an upgrade from an old version are **not** affected.

Carry out the steps below to rectify the situation.

**To Restore Inherited Page Permissions After Upgrading to Confluence 2.9,**
1. Log into Confluence as 'Administrator'.
2. Access this specific page in Confluence:

   CONFLUENCE_HOME/admin/permissions/pagepermsadmin.action

   (replace 'CONFLUENCE_HOME' with the domain name of your own Confluence instance).
3. On that page, a single button is visible, entitled 'Rebuild Ancestor Table'. Click that button. It will report its success.
4. Now, go to the 'Confluence Admin' page. Here, click 'Cache Statistics' from the left navigation bar. A long list appears.
5. Find 'Inherited Content Permissions' in the list. Now, click the 'Flush' button to the right of 'Inherited Content Permissions'.
6. Inherited permissions will now be applied.

Read more about this vulnerability in the Security Advisory.

Confluence 2.9.2 Release Notes

14 October 2008

Confluence 2.9.2 is a recommended upgrade which fixes some security flaws and other issues.

Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

You can now view the Wiki Markup code for previous versions of a page as well as the current version. Open a previous version from the page history, then select 'View Wiki Markup' from the 'Tools' menu. Previously, a bug caused Confluence to show the Wiki Markup only for the current version of the page.

Another bug caused an error to occur when you copied a page and tried to add an attachment before saving the page. This is now fixed, along with a number of other issues.

Don't have Confluence 2.9 yet?

Take a look at the new features and other highlights in the Confluence 2.9 Release Notes.

Upgrade from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.9.2 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

Updates and Fixes in this Release

Error rendering macro 'jiraissues': JIRA project does not exist or you do not have permission to view it.

Confluence 2.9.2 Upgrade Notes

Confluence 2.9.2 is a recommended upgrade which fixes some security flaws as well as other bugs. You'll find details of the fixes in the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest
1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.

2. If your version of Confluence is earlier than 2.9.0, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.9 upgrade notes and the 2.9.1 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 2.9.3 Release Notes

Confluence 2.9.3 is the standard edition version of Confluence 2.9.x. This version of Confluence is equivalent to Confluence version 2.9.2, but it does not include Oracle’s Coherence technology. Due to licensing changes with Oracle over the Coherence clustering and distributed caching technology, Atlassian is no longer able to distribute this technology to customers without a Confluence clustered license.

Therefore, Atlassian has released 'standard editions' for each previous major version of Confluence back to 2.6, which includes Confluence versions 2.10.4, 2.9.3, 2.8.3, 2.7.4 and 2.6.3. Confluence 2.9.3 will be the only Confluence 2.9.x version available to customers with a non-clustered Confluence license.

For its caching functionality, Confluence 2.9.3 utilises Ehcache. This functionality was provided by the Coherence technology in previous Confluence 2.9.x versions.

For more information about the features, updates and fixes in Confluence 2.9.2, please refer to the Confluence 2.9.2 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.9.2 Upgrade Notes. However, if you have customised the cache settings in your installation of Confluence (e.g. for performance reasons), then please read the Confluence 3.0.1 Upgrade Notes for important information about transferring your caching layer customisations from Coherence to Ehcache.

We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 2.9 Release Notes

7 August 2008

With great pleasure, Atlassian presents Confluence 2.9.

First up is the Search. The new screen design focuses the eye on your search term and results. To help you find information more quickly, Confluence now searches all content types by default and puts the most relevant results at the top of the list. Because a wiki is all about people, Confluence treats personal information as the most relevant. With author filtering, you can now find content written by a specific person.

The macros bundled with Confluence have been treated to a major overhaul. The Chart and Gallery macros offer sophisticated new displays and more interactivity. The revised Pagetree macro is now included in the Confluence download. Try using the Pagetree to add a navigation panel to your pages. We have added some popular new features and fixed a number of much-voted-for bugs in other macros too.

When you are editing a page, Confluence now automatically saves your work and displays the time of the last auto-save. If something goes wrong, you can quickly retrieve your work by selecting 'Drafts' from the user menu.

Other features include resetting page order to alphabetical and some much-needed help in the ongoing battle
Highlights of this Release:

- Streamlined Search
- Auto Save
- Charts
- Page Tree
- Gallery
- New Tutorial
- More in the Menus
- Alphabetical Page Ordering
- Better Spam Prevention
- Plugin Repository
- Engine Room and Developers' Community
- More than 140 Fixes and Improvements
- Special Thanks

Responding to your Feedback:

⭐ 210 votes satisfied

Upgrading from a previous version of Confluence

- **Confluence 2.9 requires Java 5 at a minimum**, and will no longer work with Java 1.4. Before upgrading to Confluence 2.9, please refer to the [Confluence 2.9 Upgrade Notes](https://confluence.org) for more details on this change.
- Upgrading Confluence should be fairly straightforward. **We strongly recommend that you back up your Confluence Home directory and your database before upgrading.**
- Please refer to the [Confluence 2.9 Upgrade Notes](https://confluence.org) for further essential information about plugins and other factors affecting your upgrade.

Highlights of Confluence 2.9

1

**Streamlined Search**

- The redesigned Search screen helps you to focus on the search term and results, by simplifying the filter box and other parts of the screen.
- By default, the search now includes all spaces and all content types: pages, news items, comments and so on.
- You can filter the search results by space, content type and date modified.
- If your Confluence site uses the standard out-of-the-box configuration for user management, you can also filter the search results by contributor.
- The search results are weighted to give personal information the highest relevance, followed by pages, news items and the other content types.
- When using the [Search macro](https://confluence.org) or the [Search API](https://confluence.org), you can now also filter by contributor.
- Take a look at our documentation for more details on the search and the ranking of search results.
### Auto Save

- Confluence automatically saves your work to a draft while you are adding or editing a page.
- Now with release 2.9, a message near the ‘Save’ button shows the time of the latest auto-save.
- If something goes wrong, retrieve the saved draft easily from the dropdown menu under your name.
- You can read more about drafts in the documentation.

## Charts

- The Chart macro presents a sophisticated new look.
- Below are some example charts displayed on a Confluence page.
- The [documentation](#) shows you how to add the macro to your page and choose different formats and types.

![My charts](image)

**Revenue and expenses**

**Fish sold**

**Customer satisfaction**

**Customer satisfaction**

---

## Page Tree

- The Pagetree macro is now bundled as part of your Confluence installation.
- It displays a dynamic, hierarchical list of pages which you can use as a table of contents or a navigation tool.
panel.
- You can choose to include a search box above the tree of pages or on its own.
- New links allow viewers to collapse or expand all branches in the tree at once.
- There are a number of options for specifying the root of the page tree. For example, you can show children of the current page, or children of the current page's parent, or all pages in the space.
- Take a look at the [documentation](#) to see the complete list of options.

### Gallery

- Use the Gallery macro to display a set of pictures on a page.
- Now you can include or exclude individual pictures, or simply display all the images at once.
- Choose pictures from the current page or another Confluence page.
- Take a look at the [documentation](#) for help on these and other options.

![My picture gallery](image)

**Add** by [Sarah Maddox](#), last edited by [Sarah Maddox](#) on Jul 23, 2008 (view change)

**Atlassian T-shirts**

- Viewers can click an image to zoom in and view the gallery as a slide show.
New Tutorial

- When you download Confluence and choose to include the sample content, you will receive a new Demonstration Space.
- There's a tutorial for those are new to Confluence or new to wikis.
- Other users will enjoy the advanced topics and links to more information.
- You can use the tutorial as a quick-start guide for new starters in your organisation.
More in the Menus

- The Space menu which appeared in Confluence 2.8 has now been renamed to ‘Browse’. Faithful Confluence users will recognise and welcome this old friend.
- The Browse menu now includes the People Directory, Space administration and Confluence administration for authorised users.
- You can now reach your personal labels, watches and drafts directly from the dropdown menu under your name on any Confluence page.

Alphabetical Page Ordering

- By default Confluence orders your pages alphabetically, but you can drag and drop them into any order you like.
- Now Confluence 2.9 allows you to reset the page order to alphabetical, just by clicking the icon next to the parent page.
- The documentation tells you more.
Better Spam Prevention

- A new link on the user profile screen allows administrators to jump directly to the user management screen — handy for dealing with those pesky spammers of the human variety.
- We have enhanced Confluence’s Captcha functionality to strengthen the barrier against non-human spammers such as bots or web spiders.
- Captcha is now active on user profile pages as well as other pages.
- The image which Captcha displays is now even more difficult for non-humans to read. Take a look at the word ‘brihter’ in the screenshot below.
- You can read the instructions on configuring Captcha behaviour.
Plugin Repository

- The Plugin Repository shows more consistent information about the plugins on your Confluence site, including the system and bundled plugins which are shipped with Confluence.

Engine Room and Developers' Community

- Confluence's request throughput has been improved, thanks to better class- and resource-loading strategies.
- Startup time has also been reduced. This is particularly good for developers and anyone who needs to restart Confluence often.
- The Search API now allows you to filter search results by contributor.
- As part of the ongoing work to make it easier for internal developers and plugin developers to work on Confluence, this release includes re-factorings of some web action classes.
- To improve Confluence's resistance to cross site scripting security vulnerabilities, we have added an experimental automatic HTML entity encoding feature. This is the first step to providing a more secure product by default.

More than 140 Fixes and Improvements

- Take a look at the complete list of issues resolved in Confluence 2.9.

Special Thanks

We'd like to say thank you to Zohar Melamed and Shannon Krebs, who wrote the original Pagetree and Pagetree Search plugins.

Confluence 2.9 Upgrade Notes

Below are some essential notes on upgrading to Confluence 2.9. For details of the new features and improvements in this release, please read the Confluence 2.9 Release Notes.
Upgrade Notes

Plugins

Please check the following if you have added any plugins to Confluence:

- If you are using any third-party plugins, please test them thoroughly before rolling 2.9 into production.
- If you have installed the Gallery plugin onto your Confluence site, please remove it (or do not reinstall it after upgrading Confluence) in order to get the benefit of the new Gallery macro. The Gallery macro has been significantly improved in this release. It now incorporates features which were previously available only in the separate Gallery plugin.
- If you have installed the PageTree plugin or the Pagetree Search plugin onto your Confluence site, please remove them (or do not reinstall them after upgrading Confluence) in order to get the benefit of the new Pagetree macro. The Pagetree macro has been significantly improved in this release. It replaces the previous PageTree plugin, and incorporates the pagetree search option.
- If you are using the Blog Posts macro, be aware that invalid space keys will now be detected and cause the macro to fail. Previously they were ignored and blog posts from all spaces were returned.

Java Versions

Java 1.4 is not supported in Confluence 2.9 and later. Please refer to the Java 1.4 Support Timeline for more information.

Before upgrading to Confluence 2.9, you will need to ensure your environment is running at least Java 5.

Confluence 2.9 supports Java 5 and Java 6. We recommend Java 6 because of its increased performance and easier troubleshooting, due to enhanced memory dump and profiling capabilities.

You can check your current Java version in Confluence:

1. Choose Browse > Confluence Admin.
2. Select 'System Information' from the 'Administration' section in the left-hand panel.
3. Refer to 'Java Version'.
   - If the version is 1.5 or higher, you do not need to do anything.
   - If the version is 1.4, you need to upgrade your JDK before you can upgrade to Confluence 2.9.

If you are running the Confluence EAR-WAR edition against your own application server, you will need to check with your application server vendor about which JDK versions are supported.

Supported Databases and Application Servers Additions to Application Server Support

We have added the following versions to the list of officially supported application servers:

- Resin 3.0 and 3.1
- Tomcat 6 (see known issue with authenticated datasources)

Platforms No Longer Supported
The following platforms were on the ‘unsupported but working’ list for Confluence 2.8. They are not on that list as of Confluence 2.9. They probably still work, but we have not tested them. Please upgrade soon.

- MySQL 4.0 — please upgrade to MySQL 5
- SQLServer 2000 — please upgrade to SQLServer 2005
- Websphere 6.0 — please upgrade to Websphere 6.1
- Weblogic 8.1 — please upgrade to Weblogic 9.2

Please refer to the list of supported application servers and databases on our Supported Platforms topic for the updated matrix.

**Advance Notice — Changes to Supported Platforms in the Next Release**

The next major release of Confluence after 2.9 will **not** support the following platforms/versions any more. We will still test those platforms infrequently, and Confluence will probably still work fine with them for a while, but they will be not officially supported.

- MySQL 4.1 — please upgrade to MySQL 5
- Tomcat 5.0 — please upgrade to Tomcat 5.5 or 6
- Resin 2 — please upgrade to Resin 3
- JBoss 4.0.x — please upgrade to JBoss 4.2.x

**JavaScript Libraries**

**jQuery** is the supported JavaScript library for plugin developers.

**Advance notice — deprecated libraries:** We have decided to standardise on **jQuery** as the JavaScript library for Confluence. This library will eventually replace all others. For this reason, use of the following JavaScript libraries in Confluence is **deprecated**:

- **Prototype**
- **Scriptaculous**

Because there is a lot of legacy plugin code using Prototype and Scriptaculous, these will continue to be available for this release of Confluence.

The **Yahoo! User Interface Library (YUI)** has been removed from this release, following its deprecation in Confluence 2.8.

**Confluence Themes**

**Advance notice — The Confluence Classic Theme will be deprecated in a future release.** Confluence 2.9 will be the last version that supports the Confluence Classic Theme. This theme uses outdated typography and formatting, which was replaced by the new-look Default Theme in Confluence 2.6. At that time, we introduced the Classic Theme to minimise the impact on customers who relied on the older typography. After Confluence 2.9, the Classic Theme will no longer be supported.

**Upgrade Procedure**

**Upgrade a test environment first**

As always please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:
1. Before you upgrade, we strongly recommend that you back up your Confluence home directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.

2. If your version of Confluence is earlier than 2.8.x, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.8 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.7.0 first, confirm the upgrade was successful, then upgrade again from version 2.7.0 to version 2.8.2. For more details, please refer to CONF-11767.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

5. If you encounter a problem during the upgrade, please create a support ticket and one of our support engineers will assist you through the process.

Confluence 2.9 Release Notes

Issues resolved in Confluence 2.9

Below is the full list of issues resolved by Confluence 2.9. You can read the release notes here.

Error rendering macro 'jiraissues' : Unable to determine if sort should be enabled.

Confluence 2.10.1 Release Notes

7 January 2009

Confluence 2.10.1 is a recommended upgrade which fixes some security flaws and other issues.

Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

A bug was identified in Confluence version 2.10.0 that made the label parameter of the Content by Label Macro case-sensitive. This resulted in link breakages where differences existed in case usage between {contentbylabel} label parameter values and the page labels they referenced. However, this issue has now been fixed.

Another issue was identified in Confluence version 2.10.0 that prevented specific Confluence components (for example, those of the Rich Text Editor) from loading correctly when running Confluence behind certain proxy server configurations. For example, this may have become apparent when running Confluence behind an Apache HTTP Server using the mod_proxy connection module. This issue has also been fixed in Confluence version 2.10.1, along with a number of other issues.

There's a complete list of fixes below. Click a specific issue to see details of the fix.

Don't have Confluence 2.10 yet?

Take a look at the new features and other highlights in the Confluence 2.10 Release Notes.

Confluence 2.10.1 Upgrade Notes

Confluence 2.10.1 is a recommended upgrade which fixes some security flaws as well as other bugs. You'll find details of the fixes in the release notes.

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.

2. If your version of Confluence is earlier than 2.10, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.10 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

Confluence 2.10.2 Release Notes

18 February 2009

Confluence 2.10.2 is a recommended upgrade which fixes a security flaw and other issues.

Please refer to the security advisory for details of the security vulnerability, risk assessment and mitigation strategies.

Rich Text Editor fixes

A bug was identified in Confluence version 2.10, which affected the Rich Text Editor in Internet Explorer browsers. This bug prevented new content that was entered into a single line break between existing chunks of
Confluence 4.3 Documentation

text from being saved. For instance, if a user placed their cursor on a single blank line (or line break) between two existing sections of text, entered new text (consisting of any number of paragraphs) and saved it, the new text would not be saved. This issue has now been fixed.

Another issue was identified in the Rich Text Editor which made text appearing immediately under an image concatenate with the image's Wiki Markup when the page content was saved. This prevented the image from being displayed. While inserting an additional line break between the image and text provided a workaround, this issue has now been fixed and this workaround is no longer required.

Content by Label Macro fixes

A bug was identified in the Content by Label Macro that prevented its sort parameter from functioning correctly. However, this has now been fixed. Furthermore, the performance of the Content by Label Macro has been improved.

With the release of Confluence 2.10, the default behaviour of the Content by Label Macro's space parameter was modified to @self. Due to customer feedback and popular demand, however, we reverted this parameter's default behaviour back to @all.

Other fixes

A stability issue was identified in Confluence version 2.10 which has now been fixed. However, a minor side effect has been identified which can result in some superfluous non-breaking spaces not being removed from the end of lines, when either saving a page or switching from the Rich Text Editor to Wiki Markup modes.

A bug was identified in Confluence version 2.10 that prevented Confluence from playing SWF files with Flash Player 10 in Internet Explorer. This has now been fixed.

Some issues were identified with the Code Block Macro in Confluence 2.10, which resulted in the removal of white space within a code block when switching from Wiki Markup to Rich Text Editor modes. However, a fix was introduced to mitigate these issues.

An issue was identified when Viewing Pages Alphabetically, which prevented Confluence from listing pages by specific letters of the alphabet when 1,000 or more pages started with any one letter of the alphabet. This issue has now been fixed.

When writing content in Wiki Markup, URLs containing accented characters now render correctly into links. Additionally, Confluence's French and German product interface translations have been improved.

There's a complete list of fixes below. Click a specific issue to see details of the fix.

Don't have Confluence 2.10 yet?

Take a look at the new features and other highlights in the Confluence 2.10 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.10.2 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

**Confluence 2.10.2 Upgrade Notes**

Confluence 2.10.2 is a recommended upgrade which fixes some security flaws as well as other bugs. You’ll find details of the fixes in the release notes.

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.

2. If your version of Confluence is earlier than 2.10, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.10 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.

Confluence 2.10.3 Release Notes

15 April 2009

Confluence 2.10.3 is a recommended upgrade which fixes some security flaws and other issues.

Please refer to the security advisory for details of the security vulnerabilities, risk assessments and mitigation strategies.

General Fixes

A bug was identified, whereby viewing or editing restrictions could not be assigned to a page, whose parent page contained an apostrophe in its title and also possessed existing page restrictions. This bug has now been fixed.

When a user is restricted from viewing a page, Confluence presents them with a more informative Access Denied error rather than a general Page Not Found error.

When the {gallery} macro is used on a page with no parameters or image attachments, it would render into an error in HTML or PDF exports. This issue has now been fixed.

An issue was identified whereby under certain circumstances, clicking on a page's or blog's thumbnail image to expand it would result in a Runtime Error in Internet Explorer versions 6 and 7. This issue has now been fixed.

Widget Connector Plugin

Several new features have been added to the Widget Connector Plugin packaged with Confluence 2.10.3, including support for new widget, video and micro-blogging sites. Other supported features include Google Calendar and the Wufoo HTML Form Builder. For more information on how to add these features to your Confluence page or blog, refer to Widget Connector Macro.

Episodic made changes to the format of IDs they designate for all new videos, allowing them to be alphanumeric rather than solely numeric. The Widget Connector plugin has been updated to support this new URL format.

Engine Room Fixes

An issue was identified in Confluence's PDF Export feature that could result in memory leaks. These in turn may have affected the performance and stability of Confluence instances. This issue has now been fixed.

A few other issues were identified which under certain or specific circumstances, could affect the stability of Confluence. However, these have now been fixed.

There’s a complete list of fixes below. Click a specific issue to see details of the fix.

Don’t have Confluence 2.10 yet?

Take a look at the new features and other highlights in the Confluence 2.10 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.10.3 Upgrade Notes. We strongly recommend that you back up your confluence.home directory and database before upgrading.

**Confluence 2.10.3 Upgrade Notes**

Confluence 2.10.3 is a recommended upgrade which fixes some security flaws as well as other bugs. You'll find details of the fixes in the release notes.

**Upgrade Procedure**

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your confluence.home directory and database.

2. If your version of Confluence is earlier than 2.10, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.10 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

3. Download the latest version of Confluence.

4. Follow the instructions in the Upgrade Guide.

**Confluence 2.10.4 Release Notes**

Please skip this version and upgrade to Confluence 3.0 or later

Please be advised that there is a known bug in Confluence 2.10.4, whereby the ehcache.xml file is completely missing and there is no 'Cache Statistics' link on the Administration console. If the link http://.../admin/cachestatistics.action is directly accessed, a blank page is returned with no cache statistics details. Please upgrade to the latest version of Confluence 3.x, as indicated in the release notes. If you cannot upgrade to Confluence 3.x, please contact our support team.

**Confluence 2.10.4** is the standard edition version of Confluence 2.10.x. This version of Confluence is equivalent to Confluence version 2.10.3, but it does not include Oracle's Coherence technology. Due to licensing changes with Oracle over the Coherence clustering and distributed caching technology, Atlassian is no longer able to distribute this technology to customers without a Confluence clustered license.

Therefore, Atlassian has released 'standard editions' for each previous major version of Confluence back to 2.6,
which includes Confluence versions 2.10.4, 2.9.3, 2.8.3, 2.7.4 and 2.6.3. Confluence 2.10.4 will be the only Confluence 2.10.x version available to customers with a non-clustered Confluence license.

For its caching functionality, Confluence 2.10.4 utilises Ehcache. This functionality was provided by the Coherence technology in previous Confluence 2.10.x versions.

For more information about the features, updates and fixes in Confluence 2.10.3, please refer to the Confluence 2.10.3 Release Notes.

Upgrading from a Previous Version of Confluence

Upgrading Confluence should be fairly straightforward. Please read the Confluence 2.10.3 Upgrade Notes. However, if you have customised the cache settings in your installation of Confluence (e.g. for performance reasons), then please read the Confluence 3.0.1 Upgrade Notes for important information about transferring your caching layer customisations from Coherence to Ehcache.

We strongly recommend that you back up your confluence.home directory and database before upgrading.

Confluence 2.10 Release Notes

⚠️ Confluence 2.10 fixes some security flaws. Please refer to the security advisory for details of the security vulnerabilities, risk assessment and mitigation strategies.

3 December 2008

With great pleasure, Atlassian presents Confluence 2.10.

Confluence 2.10 is a major release which presents a number of new features and enhancements. With Confluence 2.10 we introduce the new Widget Connector, an easy way to embed multi-media content from all over the web directly into your Confluence page. Add Youtube videos, Flickr slide shows and Google Gadgets just to name a few. Now that the improved Office Connector is bundled with Confluence 2.10, you can also display the contents of attached documents, spreadsheets, presentations, and PDFs directly on any page. Also, with the new Office Connector, you can now view the contents of attachments using the new 'View' feature from the attachments page, or from a search.

In Confluence 2.10, finding all your content in Confluence is a lot easier. With Quick Navigation just start typing in the search box and immediately see suggested results. With OpenSearch autodiscovery, you can add Confluence search to your Firefox or IE7 search box with just one click. And with 'Did You Mean', you no longer have to worry about mistyping search terms since Confluence now suggests corrections to misspelled words. Take a look at the new search results page, you'll find the right page, attachment or person far more easily.

You can better control your avatar with new profile picture cropping and spruce up your personal space with custom stylesheets. Page editing has become more reliable through an upgrade to our rich text editor which now supports Safari and has a new styles dropdown. JIRA users will be delighted to use our new JIRA Issues Macro with drag and drop column sorting, paging and support for custom fields.

Confluence administrators will benefit from improved user management, a broader range of supported wikis for the Universal Wiki Converter and some good performance improvements.

Please see our overview video to see a demonstration of the new features in Confluence 2.10.

Highlights of this Release:

- Introducing the Widget Connector
- Improved Office Connector Now Bundled
- Introducing Quick Navigation
- 'Did You Mean', OpenSearch and More
- Custom Stylesheets for Confluence Spaces
- Updated JIRA Issues Macro with Custom Fields and Dynamic Display
• Enhanced User and Group Management
• Upgraded Rich Text Editor
• Universal Wiki Converter now with SharePoint Import and More
• Improved Activity Macros
• Plugin Framework 2
• More than 250 Fixes and Improvements

Responding to your Feedback:
🌟 720+ votes satisfied
🌟 11 new feature requests implemented

Thank you for all your issues and votes. Keep logging, to help us keep improving!
Below is a list of the highlights in this release.
Attached is the full list of issues resolved in this release.

Upgrading from a previous version of Confluence

• Upgrading Confluence should be fairly straightforward. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.
• Please refer to the Confluence 2.10 Upgrade Notes for further essential information about plug-ins and other factors affecting your upgrade.

Highlights of Confluence 2.10

1

Introducing the Widget Connector

Now you can embed multi-media content from other web sites into a Confluence page. Bring your wiki page to life with Google Gadgets, videos, slide shows, Twitter messages and more. Simply type the word '{widget}' and give it the web address of the content you want to embed.

• Gadgets: Google Gadgets.
• Videos: YouTube, MySpace Video, Google Video, Episodic, Vimeo, Metacafe, blip.tv, Viddler.
• Photos and images: Flickr, Skitch.com.
• Micro-blogging: Twitter, FriendFeed.
• Documents and presentations: SlideShare, SlideRocket, Scribd, presentations on Google Docs.
• Our documentation shows you what to do.
Improved Office Connector Now Bundled

The Office Connector is shipped as part of Confluence 2.10. There is no need to install it separately. Use the Office Connector to create and edit rich content for Confluence using Microsoft Office or OpenOffice.

- The new 'View' feature lets you view Office documents from the Search results, from the Attachments page and from a list of attachments displayed by the Attachments macro. You do not need to have Office installed on your machine to view an Office document in Confluence.
- We have also fixed a number of bugs in the Office Connector. See the list of fixes.
- See all the features of the Office Connector in our documentation.
Introducing Quick Navigation

Confluence's search box now offers a quick navigation feature, the fastest way to find content in Confluence.

- Start typing your search term. Confluence matches titles as you type, showing a quickly-adjusting list of pages, news items, personal profiles, attachments and so on.
- The matching items are grouped by content type so that you can quickly find the type you want.
- When the matching item is a person's name, their profile picture appears next to their name in the list.
- Still not found what you are looking for? Click the 'Search' option at the bottom of the list to do a full search.
'Did You Mean', OpenSearch and More

Confluence 2.10 includes a number of improvements to the Search functionality.

- Find what you're looking for even if you mistype your search term. Confluence's new 'Did you mean' feature analyses your search term and suggests an alternative spelling to give you more relevant search results.
- You can now search Confluence from the convenience of your browser's search box, if you are using Firefox or IE7. Just add your Confluence site as a search provider, via the dropdown menu next to the browser's search box. This is because Confluence now supports the autodiscovery part of the OpenSearch standard.
- We have also improved the layout of the Search screen so that it is easier to read. The titles now stand out more and a longer extract is shown.
- If the matching item is a person, the profile picture and other profile information appear in the search results.
- If the matching item is an attached Office document, a new 'View' link allows you to view the document online.
- There is a search box at the bottom as well as the top of the screen, so you do not need to scroll up to enter a new search term.
- The 'Clear Filter' link replaces the old 'Clear Search', and now just clears the filter criteria instead of the entire search.
- When ranking the search results, Confluence now gives slightly higher priority to pages created recently.
- Take a look at our documentation for full details of the new features.
Custom Stylesheets for Confluence Spaces

Change the look of your Confluence space by specifying your own CSS styles. Cascading Style Sheets (CSS) are the standard way of styling web pages.

- For example, you might choose to change the background for the header at the top of each Confluence page. See our tutorial.
- Or you might change the look of the tabs in your Space Admin screens, as described in this example.
- To get started, take a look at our documentation.
Updated JIRA Issues Macro with Custom Fields and Dynamic Display

The JIRA Issues macro now gives you more control both when viewing the output and when coding the macro.

- Specify any JIRA field as a column for display, including custom fields.
- Click the column headers to sort the output.
- Drag and drop the columns into a different order.
- Temporarily remove a column from the display.
- Click the triangle at top right of the issue table to collapse the table.
- Retrieve a page of issues at a time, rather than a huge list all at once.
- Take advantage of the improved performance of your JIRA site. The JIRA Issues macro now caches the results for anonymous users and for results retrieved using trusted communication. This should improve the performance of your JIRA site if you have set it up for trusted communication, because Confluence no longer needs to access the JIRA site as often.
- Our documentation tells you how to use the macro.
Enhanced User and Group Management

Searching for users and adding users to groups is now much easier.

- You can add and remove users directly from the group management screen. This allows you to manage the group membership for a number of users at the same time.
- The new user search offers a simple and an advanced option. With the simple option, just type all or part of the person's name, username or email address. If you want to restrict your search, use the advanced option to specify the field you want searched. Or you can search for users in a specific group.
- A new user picker lets you select the people you need from the list of matching users. This makes things much easier when adding members to a group, or when assigning page permissions and space permissions.
Upgraded Rich Text Editor

Confluence 2.10 brings many improvements to the Rich Text Editor and is a big step along the way to a great WYSIWYG experience.

- You can now use Safari to create and edit Confluence pages.
- The styles dropdown list now illustrates the format of each style, such as 'Heading 1', 'Heading 2' and so on.
- Tables are easier to insert and edit.
Universal Wiki Converter now with SharePoint Import and More

The Universal Wiki Converter (UWC) allows you to import content from other wikis into Confluence. Coinciding with the release of Confluence 2.10, there are some great improvements to this useful tool.

- You can now import pages from SharePoint wiki libraries, as well as other wikis, into Confluence.
- The UWC's enhanced user interface allows you to drag and drop wiki pages onto the UWC screen for conversion to Confluence.
- A new link on the Confluence Administration Console gives easy access to the Universal Wiki Converter documentation and download pages.
- There is a new command-line interface to the UWC.
- The UWC also offers a new converter for Vqwiki, improvements to the Swiki converter, and more.
Improved Activity Macros

The Blog Posts macro, Recently Updated macro and Content by Label macro now support a common set of parameters, making it easier to code the macros and display the content you need.

- Filter content by author, label, space or content type.
- Use a minus sign (-) to exclude specific values. For example, using the ‘author’ parameter you can specify author=-hpotter,hgranger,adumbledore. You will get content which has been created/updated by either ‘hgranger’ or ‘adumbledore’ (or both) but ‘hpotter’ has not touched.
- Sort the resulting list of items by title, date created or date modified, in ascending or descending order.

For the HTML Include macro and the RSS macro, you can now specify a ‘whitelist’ of allowed URLs. This will improve the security of your Confluence site, because it can be dangerous to include content from untrusted external sites. Our documentation shows you how to specify the whitelist.

Plugin Framework 2
Confluence 2.10 comes with Atlassian's new Plugin Framework 2.1, based on Spring Dynamic Modules using the embedded OSGi container. The new framework lays the groundwork for the following improvements:

- More robust Spring component plugins.
- The ability for plugins to depend on each other.
- Control over plugin load order.
- The ability for plugins to define their own extension points.
- More consistent plugin APIs between products.
- More consistent plugin behaviour across different versions of Confluence.

Take a look at our developer documentation. The new plugin framework is under development. Here are some guidelines on converting your existing plugins to the new framework. We'd be delighted to have your feedback via our JIRA project.

More than 250 Fixes and Improvements

- A new attachments icon 📂 on the first line under the title of a page tells you that there are files attached to the page, as well as how many attachments.
- A new lock icon 🔒 marks pages which have view or edit restrictions.
- The Demonstration Space included in the Confluence download now has more sample content. We have adapted pages from our own development, human resources and sales teams, to give some ideas on how your organisation might use Confluence.
- The default home page for a space now includes a list of recently updated content, a search input box and a tree view of the pages in the space. The default home page is created when you add a space. You can edit the home page to include or remove any content as required.
- You can now crop and tailor your profile picture and delete any profile pictures that you no longer want.
- There is no longer any need to re-create the database indexes manually during the upgrade procedure. From Confluence 2.10, the upgrade process will automatically re-create the indexes.
- Trusted authentication and other Seraph-based authentication methods are now available for calls to the Confluence RPC methods. This makes it practical to write front-end AJAX functionality which uses the remote API to retrieve or modify Confluence data.
- Take a look at the complete list of issues resolved in Confluence 2.10.

Confluence 2.10 Upgrade Notes

Below are some essential notes on upgrading to Confluence 2.10. For details of the new features and improvements in this release, please read the Confluence 2.10 Release Notes.

On this page:

- Upgrade Notes
  - Enabling the New Quick Navigation Feature on Customised Confluence Sites
  - Crowd and the User Search
  - RSS and HTML macro whitelists
  - Plugins
  - Java Versions
  - Platforms No Longer Supported
  - JavaScript Libraries
  - Confluence Themes
  - End of Life of SnipSnap Import
  - No Need to Re-Create Database Indexes Manually

- Upgrade Procedure

Upgrade Notes

Enabling the New Quick Navigation Feature on Customised Confluence Sites

If you have customised your Main Layout on either the space or the global level, or if you have a custom theme plugin, the new quick navigation feature will not work immediately for you.

To enable quick navigation, you need to add the following statement to your Main Layout anywhere before the #standardHeader() statement:

```
#requireResourcesForContext("main")
```

Crowd and the User Search

Confluence 2.10 includes a much-enhanced user search. (See the release notes.) If you are using Atlassian’s Crowd for user management, you will need Crowd 1.5.1 or later to use the ‘Simple’ option in the user search. If your version of Crowd does not support the simple user search, you will see only the ‘Advanced’ search form. Please consider upgrading your Crowd version, to take advantage of the advanced user search.

RSS and HTML macro whitelists

To improve the security of a default installation of Confluence, macros which display HTML from external sources now use a whitelist of URLs configured by the Confluence administrator. This affects the RSS and HTML include macros.
See [Configuring a URL Whitelist for Macros](#) for instructions on how to configure a list of allowed URL patterns for the RSS and HTML macros in Confluence 2.10.

## Plugins

If you are using any third-party plugins on your Confluence instance, please test them thoroughly before rolling 2.10 into production.

## Java Versions

**Java 1.4 is not supported in Confluence 2.9 and later.** Please refer to the [Java 1.4 Support Timeline](#) for more information.

Before upgrading to Confluence 2.10, you will need to ensure your environment is running at least Java 5. Confluence 2.10 [supports Java 5 and Java 6](#). We recommend Java 6 because of its increased performance and easier troubleshooting, due to enhanced memory dump and profiling capabilities.

You can check your current Java version in Confluence:

1. Choose **Browse > Confluence Admin**.
2. Select 'System Information' from the 'Administration' section in the left-hand panel.
3. Refer to 'Java Version'.
   - If the version is 1.5 or higher, you do not need to do anything.
   - If the version is 1.4, you need to [upgrade your JDK](#) before you can upgrade to Confluence 2.10.

If you are running the Confluence **EAR-WAR edition** against your own application server, you will need to check with your application server vendor about which JDK versions are supported.

### Platforms No Longer Supported

The following platforms were on the 'unsupported but working' list for Confluence 2.9. They are not on that list as of Confluence 2.10. We will still test those platforms infrequently, and Confluence will probably still work fine with them for a while, but they will not be officially supported.

- MySQL 4.1 — please upgrade to MySQL 5
- Tomcat 5.0 — please upgrade to Tomcat 5.5 or 6
- Resin 2 — please upgrade to Resin 3
- JBoss 4.0.x — please upgrade to JBoss 4.2.x

Please refer to the list of supported application servers and databases on our [Supported Platforms](#) topic for the updated matrix.

There is a [workaround](#) to enable MySQL 4.1.x.

## JavaScript Libraries

jQuery is the supported JavaScript library for plugin developers.

**Advance notice — deprecated libraries:** We have decided to standardise on jQuery as the JavaScript library for Confluence. This library will eventually replace all others. For this reason, use of the following JavaScript libraries in Confluence is deprecated:

- Prototype
- Scriptaculous

Because there is a lot of legacy plugin code using Prototype and Scriptaculous, these will continue to be available for this release of Confluence.
Confluence Themes

**The Confluence Classic Theme is no longer supported**, following its deprecation in Confluence 2.9. This theme uses outdated typography and formatting, which was replaced by the new-look Default Theme in Confluence 2.6. At that time, we introduced the Classic Theme to minimise the impact on customers who relied on the older typography.

When you upgrade to Confluence 2.10, an upgrade task runs to do the following:

- Any space with the Classic Theme configured will be migrated to use the Default Theme.
- If your Global Theme is set to use the Classic Theme, the Global Theme is also migrated to the Default Theme.
- The Classic Theme plugin is uninstalled. (The Classic Theme entry in the database is removed.)

End of Life of SnipSnap Import

**Advance notice — EOL SnipSnap import:** Confluence 2.10 is the last release which will include the SnipSnap option in the Confluence Administration Console. From the next release after Confluence 2.10, the SnipSnap import will no longer be available.

No Need to Re-CREATE Database Indexes Manually

In previous releases of Confluence, you needed to manually re-create the database indexes during the upgrade procedure. For this purpose, we provided a set of SQL statements as an attachment to the Upgrade Guide. From Confluence 2.10, the upgrade process will automatically re-create the indexes. Please refer to the Upgrade Guide.

Upgrade Procedure

⚠️ **Upgrade a test environment first**

As always, please test your upgrades in your test environment before rolling into production.

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home Directory and database. See the documentation on backing up your Confluence site. If you are using an external database, perform a database backup.
2. If your version of Confluence is earlier than 2.9.x, read the release notes and upgrade guides for all releases between your version and the latest version. In particular:
   - Please read the 2.9 upgrade notes.
   - If you are upgrading from 2.1 or earlier, please read the 2.2 release notes.
   - If you are upgrading from 2.2 or earlier, you will need to upgrade to Confluence 2.5.8 first, confirm the upgrade was successful, then upgrade again from version 2.5.8 to the latest. For more details, please refer to CONF-11767.
3. Download the latest version of Confluence.
4. Follow the instructions in the Upgrade Guide.
5. If you encounter a problem during the upgrade, please create a support ticket and one of our support engineers will assist you through the process.

Confluence 2.10 Release Notes
Issues resolved in Confluence 2.10

Below are the issues resolved in Confluence 2.10, ordered by number of votes. For the full details of the fixes, improvements and new features, please take a look at our issue tracker. You can also take a look at the Confluence 2.10 Release Notes.

Error rendering macro 'jiraissues' : Unable to determine if sort should be enabled.

Above are the issues resolved in Confluence 2.10, ordered by number of votes. For the full list of fixes, improvements and new features, please take a look at our issue tracker.

Workaround For Enabling MySQL 4.1.x with Confluence 2.10

With the release of Confluence 2.10, MySQL 4.1.x is no longer supported and will not work by default. See the Supported Platforms topic for further details.

However, there is a workaround to enable MySQL 4.1.x with Confluence 2.10.

To enable MySQL 4.1.x with Confluence 2.10:

1. When launching Confluence from the command line, add the following parameter:

   -Dmysql4Compatibility=true

2. This will enable MySQL 4.1.x to work with Confluence 2.10. Please note however, that use of this database will not be supported by Atlassian.

Release Notes 2.0

Atlassian Software is proud to present Confluence 2.0 (otherwise known as Yarra). Yarra is the result of five months of solid work by the Confluence team, and we're really glad to be able, finally, to share it with the world. Existing customers who wish to upgrade, or new users who wish to try out Confluence for 30 days, can download Confluence from the Atlassian website: http://www.atlassian.com/software/confluence

Yarra is the fifth major update to Confluence. Among the improvements in Confluence 2.0 are an easy-to-use WYSIWYG editor for writing pages, labels for categorising them, and a powerful RSS builder for keeping track of what's new.

Confluence 2.0 is a free upgrade for any customer who purchased their Confluence license after November 16th, 2004. If the maintenance period of your license has expired, or is about to expire, why not contact our friendly sales staff and get it renewed? It's the only way to keep up with all the great new features we're adding.

A big thanks to everyone who reported bugs and offered suggestions over the last few months, especially everyone who helped by trying out our Confluence Development Releases. Also, congratulations to the Socceroos for getting Australia into the World Cup for the first time in 32 years. It almost makes up for losing the Ashes.
Upgrading From a Previous Version of Confluence

Upgrading Confluence should be pretty easy. **We strongly recommend that you backup your confluence.home directory and database before upgrading!**

⚠️ **Upgrades from 1.4.2 and earlier**

If you are upgrading from Confluence 1.4.2 or earlier, you may experience problems with some space-related functionality (see CONF-4765), such as adding a space as a favourite. To work around this, please restart the Confluence instance after the upgrade. This will be fixed in Confluence 2.0.2.

### Important Migration Notes

⚠️ **Macro/Plugin Compatibility**

Necessary changes were made to the Confluence rendering subsystem during the development of Confluence 2.0 that may render some third-party plugins (especially macros) inoperable. If you upgrade Confluence and find that macros or plugins are not operating correctly, try removing all files from `confluence-home`/plugins and restarting Confluence.

⚠️ **HSQL 1.8 Upgrade**

If you are using the embedded HSQL database, it is possible that Confluence will not be able to automatically upgrade your data. If this happens, Confluence 2.0 will refuse to start, and you will be directed to the following Confluence page which contains instructions on how to upgrade the database manually: [Upgrading From HSQL 1.7.1 to 1.8](https://confluence.atlassian.com/display/C20/Upgrading+From+HSQL+1.7.1+to+1.8).

⚠️ **SSO update**

If you are using some third-party Seraph authenticator with Confluence, or have written your own, you should read CONF-4581 before upgrading. Confluence now uses the Seraph defined login.link.url property to define its login link urls, which may cause issues with authenticators that relied on Confluence's previous, incorrect behaviour.

⚠️ **Weblogic Performance**

Confluence 2.0 may perform very badly under Weblogic. There is a workaround for this problem described in CONF-4634, and a full fix IS included in 2.0.1.

⚠️ **JDK 1.5**

If you are running Confluence 2.0 on the JDK 1.5, you will need to download some additional dependencies as described in CONF-4643. A full fix is included in a 2.0.1.
**MySQL 5**

If you are running Confluence 2.0 on the MySQL 5 database, you may encounter some problems. One fix is described [here](#).

---

**Upgrading from 1.4.4**

After upgrading to 2.0, administrators will need to rebuild the site's search-index to ensure all the new search features are enabled. Do this from the *Content Indexing* section of the global administration menu.

**Upgrading from 1.3.5 or Earlier**

Users upgrading from an earlier version of Confluence should check the release-notes of the other major Confluence releases:

- [Release Notes 1.4](#)
- [Release Notes 1.3](#)
- [Release Notes 1.2](#)
- [Release Notes 1.1](#)

---

**New Features**

The four major new features in Confluence 2.0 are:

- [Rich Text Editing](#)
- [Labels](#) for content
- New [Dashboard Features](#) for managing sites with large numbers of spaces.
- A dynamic [RSS Builder](#)

.. but there's a [lot more](#) on top of that.

---

**Rich Text Editing**

**Browser Compatibility**

The Confluence Rich Text editor is currently only compatible with Internet Explorer 6 on Windows, plus Mozilla and Firefox across platforms. Javascript must be enabled in the browser for the editor to function. Support for Safari under Mac OS X is currently not available. To track Safari compatibility, please follow this JIRA issue: [CONF-3864](#)

It almost goes without saying that the most highly requested feature in Confluence has been the ability to create pages without having to learn wiki markup. We're glad we can finally offer a powerful "what you see is (pretty much) what you get" rich text editor built into Confluence, making it easier for anyone to contribute to the site.

The WYSIWYG editor is enabled when you install or upgrade to Confluence 2.0. Global Administrators can disable the editor if they want to stick with pure wiki markup, and can also choose which editor users should be presented with by default. (The setting is under "General Configuration" in the administrative console). Users can also choose which editor they prefer simply by clicking on the "Make this my default editor" link that appears on the edit screen.

For the "feature mad" amongst us, here are some neat things you can do with the WYSIWYG editor:

- Full screen view - really useful for editing large pages. Click in the menu bar.
- Quickly switch between WYSIWYG and Wiki markup without a page refresh
Another highly requested feature was the ability to categorise content within Confluence beyond the rigid hierarchy allowed by spaces and parent-child relationships between pages. To this end we have introduced labels: simple one-word 'tags' that can be added to any page or blog-post the user has permission to edit. Labels can be used to categorise content, bookmark it, flag it for attention, or anything else you can think of.

A Tag By Any Other Name

Picking a name for labels wasn't easy. Google's GMail service calls them labels, while other collaborative categorisation systems such as del.icio.us and Flickr call them tags. We decided that 'label' was a more natural description. For more information about our choice, see Labels vs Keywords on our new Developer Blog and for more on the overall philosophy behind labels and tags, check out the Folksonomy page on Wikipedia.

Labels can be added to any page from the edit screen, or through a dynamic interface right when you're viewing a page.

Once a page is labeled, then clicking on the label's name allows you to browse other pages with the same label, or view related labels that commonly occur on the same pages. You can also view the space's most popular labels from the space browser, to get an idea of the most popular topics within the space.

Personal Labels

If you prepend my: to a label (for example, my:todo or my:favourite, then the label is a personal label - only visible to you. Personal labels allow you to tag content for your own purposes: for example to keep track of
pages you feel need your attention, or that contain information you refer to frequently. You can browse your personal labels from your user profile. Any user can add their personal labels to any page, even when they don't have editing permission.

---

**Favourites**

Favourites are a special personal label: `my:favourite` or `my:favorite`. Whenever you see the icon, it means you can label this content as being your favourite, and whenever you see the icon, it means that the content is currently in your list of favourites. You can view your favourites from the Labels tab of your user profile, or keep track of them on your dashboard.

**Label-Aware Macros**

Many existing macros have been improved to allow you to filter content based on labels: including the `{recent-pages}`, `{recently-updated}` and `{blog-posts}` macros. We've also added macros that provide more information about labels and labelled content:

- `{related-labels}` gives a list of labels that might be related to a page
- `{listlabels}` lists all the labels in a space
- `{contentbylabel}` lists content that has a particular label
- `{recently-used-labels}` lists labels that have been recently added or applied
- `{navmap}` draws a nice-looking table of links to pages with a particular label

**Dashboard Features**

The Confluence dashboard has been improved to make it easier for you to keep track of only those spaces you are interested in: a big improvement for Confluence sites with large numbers of spaces. The list of spaces is now divided into four tabs (although all four may not be visible):

- **All** shows you all spaces
- **My** shows you all spaces you have marked as your favourites (you can mark a space as your favourite from the **All** tab by clicking on the icon)
- **Team** shows you all the available 'teams', and the spaces that have been assigned to them
- **New** shows you any space that has been added in the last week

The recently updated content list on the dashboard will reflect the spaces in your chosen tab. So if you're looking at the **My** tab, the dashboard will only be showing you the recent updates in your favourite spaces.

**"Teams"**

A team label is used to group together a list of spaces relevant to a project team. You can display a team's spaces by selecting a label from below:

---

**View Spaces for Team:**

```
JIRA
JIRA Community Space
JIRA Extensions
```

Teams are a simple, and very wiki-like way to group spaces together. Space administrators can add "team labels" to a space, which are then used to group those spaces under the team tab on the dashboard. So if your
wiki has 100 spaces, but only five of them are of any interest to your sales team, just add a "sales" team label to those five spaces. That will group those spaces together on the dashboard under the 'team' tab, and your sales team need never look at the other 95 spaces.

**RSS Builder**

Confluence has always provided a brace of useful RSS feeds, but the problem is that for every feed we provided, users asked for half a dozen more. The obvious answer is to let users build RSS feeds based on their own chosen criteria. You can access the RSS builder from the Confluence dashboard.

Once in the builder, you can choose:

- Which spaces to include in the feed
- Which types of content should be tracked
- Which labels, if any, you are interested in
- How many items to include in the feed
- Whether you want a single RSS entry per page or one for each time the page is edited
- Whether you want an RSS 2.0 or Atom 0.3 feed
- Whether Confluence should require authentication to view the feed

Once you have decided what you want, Confluence will give you a URL to paste into your RSS reader. These URLs can be shared with other Confluence users, although they will only ever be allowed to see content that they have permission to view. If you have asked to authenticate, Confluence will require HTTP Basic Authentication, which is supported by most RSS readers.

We've also taken the opportunity to improve the presentation of our RSS feeds - including a lot more information in each feed so you can follow your Confluence site entirely from your newsreader.

⚠️ **The Atom Working Group has blessed the final Atom 1.0 standard, and are recommending that all applications remove support for Atom 0.3. However, as of the release of Confluence 2.0, there is no stable Atom 1.0 library from which we could generate feeds. In some future release of Confluence, Atom 0.3 support will be removed in favour of Atom 1.0.**

**Other New Features**

**Record "Change Comments" When Editing a Page**

There is now a field on the edit screen for recording a "change comment" when you edit a page. These comments are stored in the page history, and can be used to keep a more complete history of why a page has been edited.
Embed Flash and Movies
You can now embed Flash content or movies (Quicktime or Windows Media) into a page as easily as you can an image: just attach the Flash or movie file to the page, then include it as you would include an image (!filename.mov!).

Export Pages as Word Documents
You can now export pages straight into Word from the Info tab. This is extremely useful for emailing around content to non-Confluence users, printing a document or just creating a backup in Word.

Copy Pages
Also on the Info tab is a "Copy" link that allows you to clone a page in a single click - including making copies of any attachments.

Improved Search Interface
Results returned from Confluence's search engine now have:

- Improved contextual results, showing the most important text around where your query was matched in the page
- Contextual results for any attachment: see where a search was matched even inside PDF, Word, PowerPoint or Excel documents!
- Search results for attachments give you more (and clearer) information about what the attachment is, and where it's from!

Chart Plugin
The Chart Macro is now shipped with Confluence, allowing you to dynamically generate neat looking charts like this:

Fish Sold

![Fish Sold Chart](image.png)
Wiki Source

<table>
<thead>
<tr>
<th>Fish Type</th>
<th>2004</th>
<th>2005</th>
</tr>
</thead>
<tbody>
<tr>
<td>Herring</td>
<td>9,500</td>
<td>8,300</td>
</tr>
<tr>
<td>Salmon</td>
<td>2,900</td>
<td>4,200</td>
</tr>
<tr>
<td>Tuna</td>
<td>1,500</td>
<td>1,500</td>
</tr>
</tbody>
</table>

Improved Gallery Macro

The gallery macro has been spruced up, and now has a slideshow view:

My personal labels! Only for me!

View page label interface showing autocomplete.

Improved search showing fragments from attachments, file sizes and types.

Screenshot of the new 2.0 rich text editor

A very basic (quite boring - sorry, it's late) example
The new Dashboard space tabs, here showing the "jira" team tab and one favourite space.

Some release notes exported to Word (even on a Mac!) - great for printing too.

Popular labels for a given space.

Additions to the Remote API

Additions to the Confluence Remote API include:

- Comment manipulation
- Label manipulation
- Attachment uploading and editing
- Improved user- and permissions management

⚠️ Confluence now uses version 2.0 of the Apache XML-RPC library. Java XML-RPC clients using earlier versions of the Apache XML-RPC libraries (i.e. 1.3 or earlier) may experience problems with responses containing non-ASCII data.

Also...

- You can download all the attachments on a page in a single zip-file
- Import and restore now have progress indicators
- Backup and restore use significantly less memory
- The embedded database has been upgraded to HSQL 1.8, which should be significantly more reliable
- Collapsed breadcrumbs now expand with a single mouse click

Notable Bug Fixes

We resolved a lot of issues between Confluence 1.4.4 and Confluence 2.0. The best way to see what we've fixed is to ask JIRA, the world's best issue-tracker: Issues Resolved for 2.0
Outstanding Bugs

Some bugs were introduced during the Confluence 2.0 development cycle that we could not fix in time for the final release. Of note are:

- Some pernicious Javascript errors when changing styles in the rich text editor under Internet Explorer
- The rich text editor may not perfectly handle complex pages with structural macros
- Attachments containing high-bit characters in their filenames may not be correctly retrieved by Confluence

Once again, if you find any bugs in Confluence, or have any feature suggestions, you can report them online in JIRA.

Release Notes 2.0.1

Confluence 2.0.1 is a maintenance release that resolves some issues users may have encountered using Confluence 2.0. In particular, this includes issues relating to failures to upgrade and javascript problems.

2.0.1 is a free upgrade for all customers who purchased their Confluence license after November 28th, 2004.

Who should upgrade?
Confluence 2.0.1 is a recommended upgrade for all users who have not yet upgraded to 2.x and for those users of 2.0 that are encountering issues fixed in this release.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.4 or earlier of Confluence, please check the release-notes of the other major Confluence releases:

- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

**Changes in 2.0.1**

See also: Issues resolved for 2.0.1

- Javascript failing with a class not found. (CONF-4643)
- Confluence 2.0 hangs on weblogic. (CONF-4634)
- Disabling WYSIWYG editor causes AJAX error in Preview mode. (CONF-4745)
- Ancestors table hangs on to foreign key relationships if it can't be deleted. (CONF-4700)

**Issues resolved for 2.0.1**

<td></td>
<td><img src="authenticate.png" alt="Authenticate to retrieve your issues" /></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Release Notes 2.0.2**

Confluence 2.0.2 is a maintenance release that resolves a security issue, along with various issues users may have encountered using Confluence 2.0.1.

⚠️ A security flaw as described by the Confluence Security Advisory 2005-12-05 has been identified to exist in Confluence 1.4.x and 2.0.x. This has been fixed in 2.0.2. We recommend to all customers that they either upgrade to 2.0.2 or follow the instructions provided on the Confluence Security Advisory 2005-12-05 to patch there installation.

⚠️ The release of Firefox 1.5 resulted in new bugs and issues with the Rich Text editor. Therefore every version of Confluence up to 2.0.2 isn't very compatible with this browser in terms of Rich Text editing.

Confluence 2.0.3 will feature an updated version of the editor which will solve most of the problems with Firefox 1.5 (CONF-4809).

2.0.2 is a free upgrade for all customers who purchased their Confluence license after December 5th, 2004.
Who should upgrade?

Confluence 2.0.2 is a recommended upgrade for all users as it contains a security patch for the Confluence Security Advisory 2005-12-05. If you are unable to upgrade to 2.0.2, then please see Confluence Security Advisory 2005-12-05 for details on how to patch your installation.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.0, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.4.4 or earlier of Confluence, please check the release-notes of the other major Confluence releases:

- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3

Changes in 2.0.2

See also: Issues resolved for 2.0.2

- Search results page needs to XML encode the query string provided by the user (CONF-4825).
- Recently updated does not list any items (CONF-4770).
- CamelCase linking interferes with rendering of attachment link (CONF-3447).
- Umlaute in links are causing encoding problems with the Rich Text editor (CONF-4775).
- Disabled accounts still receive (blank) daily reports (CONF-4802).

Release Notes 2.0.3

Confluence 2.0.3 is a maintenance release. It contains a upgrade of the WYSIWYG editor and numerous bug fixes.

2.0.3 is a free upgrade for all customers who purchased their Confluence license after December 12th, 2004.

Who should upgrade?

Confluence 2.0.3 is a recommended upgrade for all users who are having problems with the WYSIWYG editor. This release contains an upgrade to the WYSIWYG module that contains numerous bug fixes.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.0, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!
If you are upgrading from Confluence 1.4.4 or earlier of Confluence, please check the release-notes of the other major Confluence releases:

- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3

Changes in 2.0.3

See also: Issues resolved for 2.0.3

- Upgrade to TinyMCE 2.0.1 (CONF-4808)
- Backup restore progress monitor does not refresh during restore, making it look like the backup is hanging (CONF-4895)
- Information leak when accessing url directly (CONF-4794)
- Personal labels showing up on the {contentbylabel} macro (CONF-4894)

Issues resolved for 2.0.3

Release Notes 2.1

Atlassian is happy to offer our customers an early Christmas present: Confluence 2.1 (otherwise known as Bogan). Existing customers who wish to upgrade, or new users who wish to try out Confluence for 30 days, can download Confluence from the Atlassian website: http://www.atlassian.com/software/confluence

Bogan is the Sixth major update to Confluence, offering vastly improved LDAP integration through our new atlassian-user library, as well as introducing the much-requested autosave feature to protect you from losing your precious edits.

Upgrading from 2.0

Upgrading Confluence should be pretty easy: you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Plugin Compatibility

Any plugin written for Confluence 2.0 and earlier that interfaces with the User system will need to be updated for Confluence 2.1. Plugin developers can find more information on the Atlassian developer blog.

LDAP Integration Configuration Changes

Customers who have already integrated Confluence with LDAP through the OSUser LDAP providers will need to make changes to their osuser.xml file before upgrading. You can find full details in step 3 of LDAP Authentication with OSUser.
**OSUSer or Seraph Customisations**

Customers who have performed their own customisations on OSUser or Seraph within Confluence must be sure to test their changes with Confluence 2.1 before upgrading any production system. While we have tried to maintain backwards compatibility, the integration of atlassian-user may adversely affect existing customisations.

Upgrading from 1.4 and earlier

Users upgrading directly from 1.4 or earlier should also read the 2.0 Release Notes for caveats regarding the 1.4 -> 2.0 upgrade.

Contents

1. New Features
2. Improvements
3. Notable Bug-fixes

See also: Issues Resolved for 2.1

**New Features**

**Autosave**

If you’ve used wikis for long enough, you know the pain of losing a long, involved editing session to a browser crash, session timeout, or just not thinking and clicking on a link to another page. As of Confluence 2.1, this is no longer a problem: the most you’ll lose is half a minute of your work.

Every thirty seconds (this interval is configurable by the global administrator), the browser will save your unfinished edit to the server. This autosave will hang around until you either hit the "Save" or "Cancel" button yourself, even if the server is restarted. So if you lose your changes, all you have to do is navigate back to the edit page, and will be given the chance to begin editing again where you left off.

You can view your outstanding autosaved documents from your profile under the "Drafts" tab.

**Concurrent Edit Warnings**

A useful side-effect of autosave is that now Confluence has an accurate way of measuring who is editing which page. If two people start editing the same page at the same time, Confluence will display a warning message telling you who else is editing the page. You can then negotiate between yourselves who gets to save first.
Even better, Confluence will let you know how long it was since the other editor made any changes to the page, so if somebody has just left their browser open on the edit page for a couple of hours, you'll know you can sneak your changes in while they're asleep.

**User Management**

Confluence 2.1 sees the landing of our new `atlassian-user` user management library. Most Confluence customers will not see any significant change from this move, but for anyone looking to integrate Confluence with an external user-base (especially LDAP), `atlassian-user` is a big step forward.

Confluence can now integrate fully with an LDAP directory server, without the previously annoying practice of having to mirror the users and groups locally on Confluence: [Confluence LDAP Documentation Index](#).

**Improvements**

**Performance**

A lot of work was done improving the performance of the Confluence dashboard and edit pages, especially for customers who may have thousands of spaces and hundreds of thousands of pages in their Confluence installation. Both of these pages should now respond significantly faster.

**Other**

- You can now manually set the MIME type under which embedded objects should be served – [CONF-490](#).
- The system info and error pages include more information about your database configuration – [CONF-4957](#).
- Email attachments no longer show up on the recently updated list (this seems to have regressed in the final release) – [CONF-4684](#).
- Added an icon mapping for sub-tasks in the jiraissues macro – [CONF-4921](#).
- Allow attached Windows Bitmap files to be displayed as embedded resources – [CONF-4922](#).

**Notable Bug-fixes**

Confluence 2.1 includes all bug-fixes that were made up to Confluence 2.0.3, and also includes fixes for the following issues:

- Preview now works correctly when rich text editor is disabled – [CONF-4935](#).
- Info tab no longer shows incoming links from pages in the trash – [CONF-4815](#).
- Trying to set a page as its own parent now presents a validation error instead of a system error – [CONF-4941](#).
- Confluence no longer removes every second character from the filenames of email attachments – [CONF-4938](#).
- JiraJdbcProfileProvider problems reliably accessing profile information from JIRA resolved – [CONF-4933](#).
- Unresolved images now replaced with placeholders in WYSIWYG editor – [CONF-4929](#).
- Removing the {excerpt} macro from a page now deletes the excerpt – [CONF-4918](#).

Release Notes 2.1.1

Confluence 2.1.1 is a maintenance release that resolves some issues users may have encountered using Confluence 2.1, including issues related to user management, the editing UI and email notifications.

2.1.1 is a free upgrade for all customers who purchased their Confluence license after December 24th, 2004.

Who should upgrade?

Due to the severity of the issues that it resolves, Confluence 2.1.1 is a recommended upgrade for all Confluence customers.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.1, you can find instructions here. We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

If you are upgrading from Confluence 2.0.3 or earlier, please check the release-notes of the other major Confluence releases:

- [Release Notes 2.1](#)
- [Release Notes 2.0](#)
- [Release Notes 1.4](#)
- [Release Notes 1.3](#)
- [Release Notes 1.2](#)
- [Release Notes 1.1](#)

Changes in 2.1.1

See also: [Issues resolved for 2.1.1](#)

- Users can not change their passwords [CONF-5005](#)
Cursor jumps to the beginning of the rich text editor periodically [CONF-4993]
Change comments not being displayed correctly [CONF-4979]
Email notifications do not correctly report the user who made the change [CONF-4973]
Pages cannot be created or saved in some custom atlassian-user or OSUser configurations [CONF-4978]

Release Notes 2.1.2

Confluence 2.1.2 is a maintenance release that resolves some issues users may have encountered using Confluence 2.1.1 or earlier, including issues related to page editing, Javascript errors in Firefox and Safari and PDF exports.

2.1.2 is a free upgrade for all customers who purchased their Confluence license after January 12th, 2005.

Who should upgrade?

Confluence 2.1.2 fixes a number of bugs found in Confluence 2.1.1 and earlier. Customers are recommended to upgrade if they are experiencing any of the issues fixed in this release.

Upgrade Procedure

> If you are using MySQL, please apply the patch detailed in this bug report [http://jira.atlassian.com/browse/CONF-5153](http://jira.atlassian.com/browse/CONF-5153). That is, please download 2.1.2, extract it, and copy the above mentioned patch into the unpacked 2.1.2 distribution and then go about your upgrade. We will be releasing a version with this patch bundled soon.

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.1 or 2.1.1, you can find instructions here. We strongly recommend that you backup your [confluence.home](#) directory and database before upgrading!

If you are upgrading from Confluence 2.0.3 or earlier, please check the release-notes of the other major Confluence releases:

- [Release Notes 2.1](#)
- [Release Notes 2.0](#)
- [Release Notes 1.4](#)
- [Release Notes 1.3](#)
- [Release Notes 1.2](#)
- [Release Notes 1.1](#)

Changes in 2.1.2

See also: Issues resolved for 2.1.2

Improvements

- JiraPortlet macro now has an optional "baseUrl" parameter for when Confluence accesses JIRA from a
different URL to regular users – CONF-4897
• Children listed at the bottom of pages are now sorted alphabetically – CONF-4878
• Confluence warns space administrators when they permit anonymous access to a space, but global anonymous access is disabled – CONF-4898

Bugs Fixed

• NS_ERROR_NOT_AVAILABLE popup no longer appears when editing certain pages in Firefox – CONF-5038
• "Error converting parameters" popup no longer appears when editing certain pages in Safari – CONF-4976
• Edit page no longer returns NoSuchElementException error under some circumstances – CONF-5007
• "Last week" and "Last month" searches no longer fail when time period spans the new year – CONF-5056
• News items marked as favourites are now listed on the dashboard – CONF-4998
• Mail attachments no longer show up in recent changes on dashboard – CONF-4684
• PDF Export no longer fails with error parsing background-color attributes – CONF-4976
• Anonymous users do not cause a crash when exporting a space – CONF-5129
• Disabling a servlet plugin no longer causes a NullPointerException – CONF-5021
• Notification emails no longer prepend the site's context path twice to certain URLs – CONF-5024
• It is now possible to move a page between spaces and change its parent in the same operation – CONF-5103
• Dashboard favourite selection now works in Opera 8.5 – CONF-5012
• Username links no longer cause a NullPointerException in certain configurations – CONF-5028

Release Notes 2.1.3

Confluence 2.1.3 is a maintenance release that resolves some issues users may have encountered using Confluence 2.1.2 or earlier, including issues related to Rich Text editing, LDAP user management, restoring to MySQL, and Unicode on MS SQL Server

2.1.3 is a free upgrade for all customers who purchased their Confluence license after January 23rd, 2005.

Who should upgrade?

Confluence 2.1.3 fixes a number of bugs found in Confluence 2.1.2 and earlier. Customers are recommended to upgrade if they are experiencing any of the issues fixed in this release.

Confluence is a recommended upgrade for all customers using Confluence's new atlassian-user LDAP user management with dynamic group mappings. For more information see USER-95

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.1 to 2.1.2, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!
If you are upgrading from Confluence 2.0.3 or earlier, please check the release-notes of the other major Confluence releases:

- Release Notes 2.1
- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Changes in 2.1.3

See also: Issues resolved for 2.1.3

Improvements

- You can now suppress camel-case linking with \{nl:CamelCaseWord\} – CONF-3700
- Confluence RSS macro is now compatible with Google News RSS – CONF-4892
- The \{contentbylabel\} macro supports a wider range of options – CONF-5137

Bugs Fixed

- Many fixes related to Rich Text editing, and switching between Rich Text and Wiki Markup editing.
- Further PDF export fixes – CONF-4930
- The upload option in the attachments macro works – CONF-5127
- Fixed a bug where Word exports would open in the wrong application – CONF-5163
- Handling of situation where site exceeds its licensed user limit and then removes users is improved – CONF-5208
- Restoring a site to MySQL now properly removes and re-creates database tables – CONF-5153
- Confluence now uses correct NVARCHAR type for multibyte text in MS SQL Server – CONF-5204

Issues resolved for 2.1.3

<table>
<thead>
<tr>

</tbody>
</table>

Release Notes 2.1.4

Confluence 2.1.4 is a maintenance release that resolves some issues users may have encountered using Confluence 2.1.3 or earlier. Confluence 2.1.4 fixes more than 55 issues, including bugs related to space import/export, the WYSIWYG editor, page breadcrumbs, and many more

2.1.4 is a free upgrade for all customers who purchased their Confluence license after February 16th, 2005.

Who should upgrade?

Confluence 2.1.4 fixes a number of bugs found in Confluence 2.1.3 and earlier. Customers are recommended to upgrade if they are experiencing any of the issues fixed in this release.

Confluence is a recommended upgrade for all customers using Confluence's new atlassian-user LDAP user management, as it fixes important issues related to user login validation.
Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from an earlier Confluence 2.1 release, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

⚠️ If you are running a Sybase or Microsoft SQL Server database, please replace confluence/WEB-INF/classes/com/atlassian/confluence/upgrade/UpgradeUtils.class with this version before upgrading.

You should also install this if your upgrade fails with the message: Session is currently disconnected

If you are upgrading from Confluence 2.0.3 or earlier, please check the release-notes of the other major Confluence releases:

- Release Notes 2.1
- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Changes in 2.1.4

More than 55 issues were resolved between 2.1.3 and 2.1.4. For the complete list, see: Issues resolved for 2.1.4

Note about markup for embedded content

A bug was fixed in 2.1.4 that previously allowed spaces as attribute separators in embedded content wiki markup (CONF-5406). This means !image.jpg|alt=Great pic! now works correctly, but !image.jpg|border=1 alt=test! doesn't. The correct and documented way to write the latter continues to be !image.jpg |border=1,alt=test!.

Improvements

- {livesearch} macro results can now be limited to a particular space – CONF-3432
- A setting was added to General Configuration to control the maximum number of attachments that can be uploaded at once – CONF-5447
- A setting was added to General Configuration to enable or disable GZip content encoding – CONF-5257
- "Insert Link" and "Insert Image" now work correctly on Safari in OS X 10.4.4 and later – CONF-5435
- A draft is automatically saved when moving from 'Edit' to 'Preview' – CONF-5366
- A getPermissionsForUser method was added to the remote API to allow administrators to retrieve the permissions of particular users – CONF-5439

Notable Bugs Fixed

- Many fixes related to the maintenance of the ancestors table while moving or renaming pages, which may have resulted in the misplacing of page breadcrumbs or inherited page-level permissions – CONF-5104, CONF-5243, CONF-5244
- Many fixes related to Rich Text editing, including the handling of tables and whitespace – CONF-5299, CONF-5231, CONF-5492, CONF-5294, CONF-5324, CONF-5247, CONF-5362, CONF-5265
- Space import no longer overwrites part of global configuration – CONF-5370
- Confluence no longer tries to create indexes with names bigger than DB2 can handle – CONF-5316
- "Insert Link" and "Insert Image" no longer erase contents of edit field in Safari on OS X 10.4.4 and later – CONF-5329
- Links from the {labels} macro are now space-relative – CONF-5346
- Emoticons no longer mistaken for embedded image markup – CONF-3369
- "Profile:" no longer mistaken as the start of a file: URL

## Release Notes 2.1.5

Confluence 2.1.5 is a maintenance release that resolves some issues users may have encountered using Confluence 2.1.4 or earlier.

Confluence 2.1.5 fixes around 50 issues, including a number of fixes for LDAP support, the WYSIWYG editor, and other areas.

2.1.5 is a free upgrade for all customers who purchased their Confluence license after March 16th, 2005.

⚠️ Confluence 2.1.5 has a problem which disables the rich text editor link dialog. Please replace the file WEB-INF/classes/com/atlassian/confluence/user/actions/PagePickerAction.properties with this file: PagePickerAction.properties

This is fixed in 2.1.5a.

### Known Issues in 2.1.5a

Anonymous users may get a Javascript error under some circumstances. See CONF-5765 for details and a patch.

When using LDAP user management, changing passwords for local users won't work. See CONF-5775 for details and a patch.

### Who should upgrade?

Confluence 2.1.5 fixes a number of bugs found in Confluence 2.1.4 and earlier. Customers are recommended to upgrade if they are experiencing any of the issues fixed in this release.

Confluence is a **recommended upgrade** for all customers using Confluence's new atlassian-user LDAP user management, as it fixes important issues related to LDAP integration.

### Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from an earlier Confluence 2.1 release, you can find instructions here. **We strongly recommend that you backup your confluence.home directory and database before upgrading!**

If you are upgrading from Confluence 2.0.3 or earlier, please check the release-notes of the other major Confluence releases:

- [Release Notes 2.1](#)
- [Release Notes 2.0](#)
- [Release Notes 1.4](#)
- [Release Notes 1.3](#)
Changes in 2.1.5

More than 48 issues were resolved between 2.1.4 and 2.1.5. For the complete list, see: Issues resolved for 2.1.5

Improvements

- LDAP queries are cached to improve performance - CONF-5288
- Administrators can insert custom HTML on every Confluence page, see Administration, Custom HTML - CONF-5350
- Tables created in the rich text editor don't have non-breaking spaces added to each cell - CONF-5044
- News improvements - Info tab available including list of version, News can be exported as PDF - CONF-1989, CONF-5582, CONF-5594

Notable Bugs Fixed

- Anchor, user profile and attachment links now round-trip properly in the rich text editor - CONF-5678
- Paging of LDAP users works properly - CONF-5438
- Servlet plugins can be disabled - CONF-5598
- Forgotten username emails work again - CONF-5530
- User profiles fixes with LDAP - CONF-5225, CONF-5549

Release Notes 2.2

Atlassian is proud to announce the release of Confluence 2.2, otherwise known as Shoalhaven Existing customers who wish to upgrade, or new users who wish to try out Confluence for 30 days, can download Confluence from the Atlassian website: http://www.atlassian.com/software/confluence

Shoalhaven is the seventh major update to Confluence (in two years!). It introduces 'personal spaces', support for localisation/internationalisation, CAPTCHA spam protection, a multitude of new extension points for plugin developers, a simpler LDAP configuration syntax, and more.

Upgrading from 2.1

Upgrading Confluence should be pretty easy: you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

MySQL Driver Support

For users using MySQL with Confluence 2.2 (or higher), please ensure that you are using the latest (3.1.12) MySQL Java Connector. Earlier versions of the MySQL connector have a bug which may prevent Confluence from upgrading successfully. (more information below)
LDAP Authentication

If you are currently using LDAP authentication through OSUser (that is, you adjusted your osuser.xml file), please do not upgrade to 2.2. This feature is currently unavailable and an issue has been filed for it here. This issue has been resolved in Confluence 2.2.1.

User Management Bug

You must apply the patch attached on this bug report to be able to create users in this version. This issue has been resolved in Confluence 2.2.1.

Index Rebuilding

Upgrading to 2.2 will trigger a rebuild of Confluence’s search index. This will cause certain features such as search, the dashboard and RSS feeds to behave unpredictably for up to a few minutes after upgrading.

LDAP Integration Configuration Changes

The configuration file syntax for atlassian-user has changed. Customers who configured Confluence 2.1 to use AtlassianUser LDAP integration must follow the instructions on this page.

Anonymous Permission Changes

The way that anonymous permissions are applied to users who have logged in has changed. Administrators should understand how they have changed below before upgrading.

Plugin Loading Changes

Prior to Confluence 2.2, it was possible for an outdated plugin, or a plugin with unsatisfied dependencies, to break the entire plugin subsystem. Confluence 2.2 is much more careful about loading plugins, and isolating them if they break. This may, however, cause Confluence to refuse to load an entire plugin, simply because one of its contained plugin modules will not load.

Upgrading from 2.0 and earlier

Users upgrading directly from 2.0 or earlier should also read the 2.1 Release Notes for caveats regarding the 2.0 -> 2.1 upgrade.

Contents

1. New Features
2. Improvements
3. Notable Bug-fixes
4. Important note for MySQL users

See also: Issues Resolved for 2.2

New Features

Personal Spaces

Two of the most frequent questions we get from Confluence customers have been: "How do I give my users their
own wiki?” and “How do I give my users their own blog?” It seems everybody needs a little Personal Space.

Personal spaces belong to particular users, and rather than being listed on the dashboard, are available from the user’s profile. (Future versions of Confluence will feature a ‘people browser’ to make it easier to discover the interesting personal spaces on your server). They can contain pages and news items like any other space, be searched and browsed. They can be kept private, or opened up so the whole world can view and edit them, just like global spaces.

Who can contribute to your personal space?
You can customize these permissions once the space is created.

<table>
<thead>
<tr>
<th>Choose who can view content:</th>
<th>Choose who can contribute (create and edit) content:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Me</td>
<td>Me</td>
</tr>
<tr>
<td>Registered users - anyone logged into Confluence</td>
<td>Registered users - anyone logged into Confluence</td>
</tr>
<tr>
<td>Anonymous - anyone, logged in or not</td>
<td>Anonymous - anyone, logged in or not</td>
</tr>
</tbody>
</table>

Choose Theme
To change the theme of this space, select one below.

- **Default Theme**
  Use the globally configured look and feel. You can customise colour schemes and layouts manually.

- **Left Navigation Theme**
  Provides a navigation bar on the left-hand side of the screen.

Confluence’s search and RSS builder interfaces have been updated to make it easy to choose whether you’re interested in personal spaces or not.
Oh, and if you create a personal space, don't forget to upload (or choose) your own profile picture, so people can see who you are.

Confluence now supports drop-in language packs to change the language of the user interface. The global administrator can select a default language for the entire site, while individual users can set their preferred language in their preferences.

No language packs are currently available, but we are currently working with our global partners so we can begin to provide translations. If you are interested in translating Confluence into another language, you can find instructions on building a language pack here: Language Module.

CAPTCHA Support
Many of the more public Confluence wikis have been suffering at the hands of spammers. CAPTCHA support adds the familiar 'type in this word' question to signup, edit and comment forms, to defeat automated spamming bots. You can turn on CAPTCHA from the global administrative console, and also choose which users will, or will not be subject to the spam check.

**Exclusions**

By default, captchas are shown to only anonymous users. This streamlines the editing process for trusted, signed in users.

Exclude from captchas:

- No one (everyone will see captchas)
- Signed in users
- Members of the following groups

**Plugin Improvements**

Each version of Confluence is more customisable than the last. One of the most exciting things to come from our recent plugin competition was learning just how creative our plugin developers are, and discovering more ways we can help them add features to Confluence.

- **Job Module** and **Trigger Module** allow you to schedule periodic tasks to run within Confluence
- **Web UI Modules** allow plugin developers to add new links, buttons and tabs to the Confluence interface, and make it easier for theme developers to stay up to date with changes to the Confluence UI.
- **Code Formatting Module** allow you to plug support for new languages into the {code} macro (or override the existing language support with something better).

We've also made a number of improvements to the plugin system, including:

- Making sure that a single 'rogue' plugin can't bring down the whole plugin subsystem.
- Enabling 'conditional get' for plugin resources, so browsers don't download them again and again.
- Fixing problems that may occur when a servlet or component plugin is reloaded or upgraded. (With many thanks to Dan Hardiker of Adaptavist.)

**New atlassian-user Configuration Syntax**

As promised, we have cleaned up the configuration file syntax for our atlassian-user user management library. This should make it much easier to configure Confluence to use external user repositories such as LDAP. You can find details of the new configuration file format here: [Connecting to an LDAP Directory](http://confluenceforge.org/display/Confluence/Connecting+to+an+LDAP+Directory)

**Permissions Changes**
In Confluence 2.1 and earlier, permissions that were assigned to Anonymous users were not automatically assigned to logged-in users, leading to the confusing situation where you could view a page when not logged in, but not view it when you were logged in.

In Confluence 2.2 and later, permissions that are assigned to the Anonymous user are also assigned to all logged in users. The sole exception to this rule is the global Use Confluence permission, which must still be explicitly granted to any user who wishes to log in. (This exception is necessary due to licensing restrictions).

### Search

With help from Kelvin Tan, we've overhauled much of the underlying infrastructure of Confluence's search engine. Search in Confluence should now be more efficient, and some searches that were problematic before (such as wildcard* searches) now work as you would expect them to.

### LDAP Performance

Confluence's performance against external LDAP user repositories should now be significantly faster.

### Other

- The General Configuration screen is much better organised
- You can choose a space's initial permissions and theme when you create it
- The left-navigation theme has improved
- Themes may now be packaged with icons that will be displayed in the theme selector (see the screenshot of the "create personal space" screen above for an example)
- Confluence Standalone is now packaged with Tomcat 5.5
- Atom feeds are now generated to the Atom 1.0 standard
- The back-end storage of attachment files has been changed to resolve a number of problems that were caused when the underlying filesystem did not support the character-set of the attachment filename

### Important note for MySQL users

For users using MySQL with Confluence 2.2 (or higher), please ensure that you are using the latest (3.1.12) MySQL Java Connector. Earlier versions of the MySQL connector have a bug which is triggered by improvements in Confluence 2.2. These earlier connector versions will result in an error being recorded in your logs on upgrade (and will result in unstable operation of Confluence)

```
ERROR [hibernate.tool.hbm2ddl.SchemaUpdate] execute could not complete schema update
```

You can download the latest MySQL connector from the [MySQL Java Connector 3.1 download page](https://mariadb.com/downloads/mysql/mysql-connector-java/). Please be sure that you remove any older versions of the connector from your application server.

Release Notes 2.2.1

Confluence 2.2.1 is a maintenance release that resolves some issues users may have encountered using Confluence 2.2, including issues related to LDAP user management, i18n, personal spaces and drafts.

2.2.1 is a free upgrade for all customers who purchased their Confluence license after May 18th, 2004.

Who should upgrade?

Confluence is a recommended upgrade for all customers using Confluence with external LDAP user management. All other customers should consult the list of issues resolved, and determine if this release is necessary for their own deployments.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

⚠️ Draft Table Upgrade

Upgrading Confluence to 2.2.1 will cause all autosaved 'drafts' to be deleted from the database. Be sure everyone has saved their work before upgrading!

⚠️ Confluence 2.2.1 and 2.2.1a

The current version available for download is 2.2.1a. 2.2.1 was originally released with an old version of the atlassian-plugins library, which caused the plugin fixes listed below not to be included in the release. Confluence 2.2.1a resolves that problem.

⚠️ PageChildrenMacro IndexOutOfBoundsException error

Customers who downloaded 2.2.1 or 2.2.1a before the official announcement may encounter an error when using the {children} macro to view the children of other pages in the same space. There is a patch for this issue attached to CONF-6197

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

- Release Notes 2.2
- Release Notes 2.1
- Release Notes 2.0
- Release Notes 1.4
Changes in 2.2.1

For a complete list, see: Issues resolved for 2.2.1

External User Management

- Creating a new user will no longer cause a primary key violation on some Confluence installations. CONF-6092
- Fixed a regression where authentication against an external LDAP server via the old OSUser integration layer did not function. CONF-6052
- Fixed a possible ClassCastException on viewing a user's profile. CONF-6021

Plugins

Note: Due to a scheduling error, these fixes were not included in Confluence 2.2.1, but are in the supplementary 2.2.1a release.

- Component plugins are now correctly unregistered when they are removed. CONF-4041
- Plugins may now contain and reference dependent jar files. Thanks to Dan Hardiker of Adaptavist for the patch. PLUG-8
- Installing an older version of an already-installed plugin no longer causes an error. PLUG-12
- Removing an uploaded plugin no longer causes it to be deactivated the next time it is installed. PLUG-13

General Stability

- Confluence can now store drafts for spaces with long (>20 character) keys. CONF-6010
- Attachments stored in MySQL databases will no longer be silently truncated to 64KB. CONF-6120
- Global language setting is now saved correctly. CONF-6027
- Missing attachment data no longer causes PDF export to crash. CONF-6063
- Misleading “attachment missing” errors are no longer logged after a space import. CONF-6026

Improvements

- A Javascript alert warns users if they have left the CAPTCHA field blank. CONF-5984
- A link to the logged-in user’s personal space is included on every page (from their full name). CONF-6056
- The {children} macro can now show the children of pages in another space. CONF-5986

Release Notes 2.2.2

Confluence 2.2.2 is a maintenance release that resolves some issues users may have encountered using Confluence 2.2, including issues related to PDF generation, internationalisation, backup/restore and more.

2.2.2 is a free upgrade for all customers who purchased their Confluence license after May 31st, 2005.
Who should upgrade?

Confluence 2.2.2 resolves CONF-6237, a bug related to the backup and restore of personal spaces. As such it is a recommended upgrade for customers wishing to restore or import data containing personal spaces. Other users should consult the list of resolved issues, and determine if the upgrade is necessary for their installation.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2 or 2.2.1, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

- Release Notes 2.2
- Release Notes 2.1
- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Changes in 2.2.2

Over 25 issues were resolved between Confluence 2.2.1 and 2.2.2. For a complete list, see: Issues resolved for 2.2.2

Backup/Restore

- An issue was resolved that could cause personal spaces to be imported incorrectly from backups. Existing backup files are still valid, the error was only during the re-importing process – CONF-6237

PDF Export

- PDF exports can now be generated for pages containing non-latin characters. To enable these exports you will need to provide Confluence with the correct font – CONF-1457
- PDF exports created in Confluence are now properly searchable, both in Confluence (CONF-1360) and in Adobe Acrobat (CONF-4529)

Other

- (UI) Fixed a Javascript error when saving a page with CAPTCHA disabled – CONF-6221
- (User management) Resolved an error when deleting a non-empty group – CONF-6082
- (i18n) Resolved issues with hard-coded English text in various places – CONF-6202
- (i18n) Resolved issues with internationalisation keys showing up in the permissions guide – CONF-6053

Release Notes 2.2.3

Confluence 2.2.3 is a maintenance release that resolves some issues users may have encountered using Confluence 2.2, including issues related to LDAP user management, installation, backup/restore and more. This release also includes a patch for a serious security issue regarding global permissions.

2.2.3 is a free upgrade for all customers who purchased their Confluence license after June 8th, 2005.

Who should upgrade?

Confluence 2.2.3 resolves a security bug related to unauthorised modification of global permissions. As such this release is a recommended upgrade for all customers.

For users of older versions of Confluence who do not wish to upgrade, a patch for this issue will be available shortly.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2, 2.2.1 or 2.2.2, you can find instructions here. We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

- [Release Notes 2.2](#)
- [Release Notes 2.1](#)
- [Release Notes 2.0](#)
- [Release Notes 1.4](#)
- [Release Notes 1.3](#)
- [Release Notes 1.2](#)
- [Release Notes 1.1](#)

Changes in 2.2.3

As part of a new process for pushing out bug fix releases more quickly, this release follows just a week after the release of 2.2.2. Six issues were resolved between Confluence 2.2.2 and 2.2.3. For a complete list, see: [Issues resolved for 2.2.3](#)

Global Permissions

- A security problem was identified where unauthorised users could modify global permissions. For more information, including details on how to patch previous Confluence versions, please see [the security advisory](#)

Backup/Restore

- An issue was resolved where attachments were not imported from space exports. Existing backup files are still valid, the error was only during the re-importing process – [CONF-6286](#)

External user management

- Queries to LDAP repositories are now correctly escaped, so user and group names may contain commas – [USER-106](#)

Other

- (UI) Fixed parent link in preview of new page – [CONF-6275](#)
- (authentication) Fixed incorrect redirect from login when base URL contained an extra slash – [CONF-6261](#)
- (installation) Improved error handling during Confluence setup – [CONF-6276](#)

Release Notes 2.2.4

Confluence 2.2.4 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.2.

2.2.4 is a free upgrade for all customers who purchased their Confluence license after June 22nd, 2005.

Who should upgrade?

Confluence 2.2.4 is a minor bugfix release. Customers should consult the list of issues resolved in this release to determine if it is worth their while upgrading.

Customers still running Confluence 2.2.2 or earlier are recommended to upgrade, as a significant security vulnerability was resolved in Confluence 2.2.3

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2 - 2.2.3, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

- Release Notes 2.2
- Release Notes 2.1
- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Changes in 2.2.4

We are currently trialling a process of more frequent bugfix releases, to make fixes available as soon as possible to those people who want them. 2.2.4 resolves six issues:

See also: Issues Resolved for 2.2.4

User Interface

- The "Space Admin" tab is no longer displayed to non-administrators. (Even though the tab was visible, non-administrators could still not access any of the administrative functions) CONF-6385
- Personal spaces are no longer listed in the space picker in the feed builder CONF-6830
- Attempts to create news items with invalid characters now fail with the correct error message CONF-6358
Performance

- The velocity manager is no longer loaded twice, saving memory. [CONF-6355]
- The velocity cache now expires templates that have not been recently used, potentially saving memory. [CONF-6339]

Developer API

- Putting pages into, and removing them from the trash now trigger the correct events within Confluence [CONF-6353]

Release Notes 2.2.5

⚠️ Release notes are to follow ...

Issues Resolved

**Error rendering macro 'jiraissues' : Unable to determine if sort should be enabled.**

**2.2.5 Security Patch**

This patch fixes a minor security vulnerability regarding the administration of space mail accounts. It affects only Confluence 2.2.5.

To install this patch please download the three files attached to this page, stop Confluence and copy them to your WEB-INF/classes/com/atlassian/confluence/mail/actions directory, where they will replace the existing files. Then start Confluence.

**Release Notes 2.2.6a**

Confluence 2.2.6a is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.2.

2.2.6a is a free upgrade for all customers who purchased their Confluence license after June 22nd, 2005.
Who should upgrade?

Confluence 2.2.6a is a minor bugfix release. Customers should consult the list of issues resolved in this release to determine if it is worth their while upgrading. Customers running Confluence 2.2.5 should upgrade, as 2.2.6a fixes a security problem which could allow an unauthorised user to modify space mail box configuration. Only version 2.2.5 is affected by this vulnerability. Customers running 2.2.5 who don’t wish to upgrade can follow these instructions to patch the vulnerability.

Customers still running Confluence 2.2.2 or earlier are recommended to upgrade, as a significant security vulnerability was resolved in Confluence 2.2.3

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2 - 2.2.3, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

- Release Notes 2.2
- Release Notes 2.1
- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Changes in 2.2.6a

We are currently trialling a process of more frequent bugfix releases, to make fixes available as soon as possible to those people who want them. 2.2.6a resolves 20 issues.

A few of the issues are noted below, see Issues Resolved for 2.2.6a for a complete list.

User Interface

- The rich text editor allows underlining to be removed, and lists in tables are better behaved. CONF-6450, CONF-6508
- Users with capital letters in their names can watch pages and spaces. CONF-6489

LDAP

- LDAP users can be removed from local Confluence groups. CONF-6131
- The ‘Change Password’ link is no longer shown when LDAP is enabled. CONF-6360

Performance

- Indexing performance has been improved. CONF-6465

Release Notes 2.2.7

Confluence 2.2.7 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.2.

2.2.7 is a free upgrade for all customers who purchased their Confluence license after July 28th, 2005.

Who should upgrade?

Confluence 2.2.7 is a minor bugfix release. Customers should consult the list of issues resolved in this release to determine if it is worth their while upgrading.

Customers still running Confluence 2.2.2 or earlier are recommended to upgrade, as a significant security vulnerability was resolved in Confluence 2.2.3

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2 - 2.2.3, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

- Release Notes 2.2
- Release Notes 2.1
- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Changes in 2.2.7

We are currently trialling a process of more frequent bugfix releases, to make fixes available as soon as possible to those people who want them. 2.2.7 resolves 23 issues.

A few of the issues are noted below, see Issues Resolved for 2.2.7 for a complete list.

Task List Macro

- Tasks with the same name in different lists are now distinguished. CONF-5809

User Management

- The manage groups page can now display an unlimited number of groups. CONF-6458
- Users that belong to more than 100 groups are now always able to login. CONF-6292

PDF Export

- Exporting pages to PDF which include other pages will now have correct links and not lose images. CONF-1155

Internationalisation

- Tree view of page hierarchy will not be truncated when using multi-byte character sets. CONF-5872

Issues Resolved for 2.2.7

JIRA Issues
Confluence 2.2.8 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.2.

⚠️ Confluence 2.2.8 has slower indexing than previous versions. There is a fix for that regression here: CONF-6908

2.2.8 is a free upgrade for all customers who purchased their Confluence license after August 8th, 2005.

Who should upgrade?

Confluence 2.2.8 is a minor bugfix release. Customers should consult the list of issues resolved in this release to determine if it is worth their while upgrading.

Customers still running Confluence 2.2.2 or earlier are recommended to upgrade, as a significant security vulnerability was resolved in Confluence 2.2.3

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2 - 2.2.3, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

- Release Notes 2.2
- Release Notes 2.1
- Release Notes 2.0
- Release Notes 1.4
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Changes in 2.2.8

We are currently trialling a process of more frequent bugfix releases, to make fixes available as soon as possible to those people who want them. 2.2.8 resolves 22 issues.

A few of the issues are noted below, see Issues Resolved for 2.2.8 for a complete list.

- Exporting a space as HTML now creates an index page which includes all the pages in the export. CONF-6670
- Timeouts can be set for HTTP requests made from Confluence to RSS feeds and JIRA instances. CONF-6697
- RSS Autodiscovery works in Safari. CONF-4607
- When a group is deleted, space permissions for the group are now correctly removed. CONF-6733
- Change default background colour from grey to white. CONF-6733

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
• Non-breaking spaces are handled correctly when indexing. CONF-6685
• Rich text editor respects leading spaces in noformat macro. CONF-6527

Release Notes 2.2.9

Confluence 2.2.9 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.2. 2.2.9 resolves an indexing performance regression introduced in 2.2.8, and includes fixes for external user management, and MaxDB and Sybase compatibility.

2.2.8 is a free upgrade for all customers who purchased their Confluence license after September 9th, 2005.

Who should upgrade?

Confluence 2.2.9 is a minor bugfix release. Customers should consult the list of issues resolved in this release to determine if it is worth their while upgrading.

If you are running Confluence 2.2.8, but do not wish to upgrade to 2.2.9, we strongly recommend installing the patch attached to CONF-6908 instead to resolve an issue related to re-indexing performance.

Customers still running Confluence 2.2.2 or earlier are recommended to upgrade, as a significant security vulnerability was resolved in Confluence 2.2.3

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 2.2 - 2.2.3, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

• Release Notes 2.2
• Release Notes 2.1
• Release Notes 2.0
• Release Notes 1.4
• Release Notes 1.3
• Release Notes 1.2
• Release Notes 1.1

Changes in 2.2.9

2.2.8 resolves approximately 25 issues. See Issues Resolved for 2.2.9 for a complete list. A few of the issues are noted below.

External user management:

• LDAP users are no longer given the option to change their passwords in Confluence – CONF-6144
• External users belonging to more than 100 groups can log in successfully – CONF-6292
• External users can be removed from local groups – CONF-6832

Database Compatibility
• 'Review restricted pages' report now succeeds on MaxDB – CONF-6849
• Fixed Sybase error when removing a space – CONF-6715

Indexing
• A re-indexing performance regression introduced in 2.2.8 has been resolved – CONF-6908
• Advanced search queries for specific index fields now work as expected – CONF-6714
• Errors in text extractors no longer cause index queue flushing to fail – CONF-6857

Issues Resolved for 2.2.9

Release Notes 2.2.10

Confluence 2.2.10 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.2. 2.2.10 resolves an assortment of issues that were reported by customers.

2.2.10 is a free upgrade for all customers who purchased their Confluence license after November 30th, 2005.

*Who should upgrade?*

Confluence 2.2.10 is a minor bugfix release. Customers should consult the list of issues resolved in this release to determine if it is worth their while upgrading.

If you are running Confluence 2.2.8, but do not wish to upgrade to 2.2.10, we strongly recommend installing the patch attached to CONF-6908 to resolve an issue related to re-indexing performance.

Customers still running Confluence 2.2.2 or earlier are recommended to upgrade, as a significant security vulnerability was resolved in Confluence 2.2.3

*Upgrade Procedure*

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x version, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.1.5 or earlier, please check the release-notes of the other major Confluence releases:

• Release Notes 2.2
• Release Notes 2.1
• Release Notes 2.0
• Release Notes 1.4
• Release Notes 1.3
• Release Notes 1.2
• Release Notes 1.1

Changes in 2.2.10

2.2.10 resolves over 40 issues. All these issues are listed below:

<table>
<thead>

Release Notes 2.3

After much hard toil from the Confluence developers we are happy, nay ecstatic, to announce the availability of Confluence 2.3 (known affectionately as Snowy). Snowy is the eighth major update to Confluence. It supports clustered deployment as 'Confluence Massive', and introduces a people directory, activity statistics plugin, personal timezone preferences, and the ability to access Confluence via the Metaweblog and WebDAV APIs. Confluence 2.3 is a free upgrade for any customer who purchased Confluence after January 4th, 2006.

Upgrading from Confluence 2.2.x

Upgrading Confluence should be fairly straightforward: you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Installation Notes

Known Issues and Patches

Please read the Release Notes 2.3 section of the release-notes before installing Confluence 2.3.
These issues were resolved with a new maintenance release of Confluence 2.3.1

Contents

1. New Features
2. Improvements

See also: Issues Resolved for 2.3

New Features

Confluence Massive

Confluence is now a clusterable application. This means that it is possible to run multiple Confluence servers behind a load-balancer, to provide high availability, and to scale Confluence beyond the capacity of a single server.

Confluence Massive uses Tangosol Coherence to share data between nodes (and many other things besides).
If you are thinking of running Confluence in a cluster, and need to know what is required and how it works, you can read Technical Overview of Clustering in Confluence.

You can find instructions for installing a Confluence cluster here: Confluence cluster installation.

**Cluster Licensing**

Confluence Massive clustering is only enabled if you have a clustered licence. For information on purchasing clustered Confluence licences, please check our pricing page, or contact our friendly sales team.

**The People Directory**

In version 2.2 (Shoalhaven), we added personal spaces to Confluence. Because of the potential for the proliferation of personal spaces we kept them off the Dashboard and search results by default, but this made it quite hard to find people in a Confluence site.

The People Directory, which you can find linked from the bottom of the Dashboard, gives you a way to browse through the other people who use a Confluence instance, their profiles and personal spaces.

If you find people whose personal spaces you want to follow, you can mark them as favourites from the people directory. This will add their personal spaces to your 'My' tab on the Dashboard, and will also make sure they're included when you search or make RSS feeds from your favourite spaces.
Activity Tracking

The activity plugin lets you know what's happening in Confluence: how many pages are being visited or edited in each space or across the whole site, which spaces or pages are the busiest, who are the most prolific editors.

You can view activity statistics for a space in Browse Space, or globally from the administration console.

The plugin also provides macros that allow you to embed usage data into a Confluence page: \{usage\}, \{popular\} and \{topusers\}.

Activity tracking does not work in a cluster, and will be disabled for clustered deployments. We're working on making the activity tracker clusterable in a future release. You can follow this issue in JIRA: CONF-7520

Blogger and MetaWeblog API Support
Confluence 2.3 bundles the [Blogging RPC Plugin](#). This allows users to manage their News in Confluence using one of the many available blogger-compatible desktop clients.

You can read more about this plugin, including instructions for setting up various blogging clients for use with Confluence, on the [plugin information page](#).

**WebDAV Client Support**

The Confluence WebDAV plugin allows users to mount Confluence as a shared drive, using the WebDAV protocol.

This provides a familiar interface for anyone who uses Confluence as a repository for files: you can browse your wiki straight from Windows Explorer or the Mac Finder; view Word or PDF versions of pages; upload attachments and edit attachments in place; create, edit and move pages.
For more information on the WebDAV plugin, check out: WebDAV Plugin

WebDAV is supported natively in Windows XP (as “Web Folders”) and Mac OS X, although there are third-party clients that may provide different functionality or compatibility. We have a compatibility matrix if you’re interested.

⚠️ Experimental

WebDAV client support is currently experimental, and is disabled by default. You can turn it on from the Plugin management page in the global administration console.

Improvements

Plugins

- Adaptivist's fantastic Plugin Repository Client is bundled with Confluence.
- User Macro Module allow you to share user macros more easily.
- Lifecycle Module allow you to hook into Confluence startup and shutdown.
- Events are now produced when themes are applied, or colour-schemes modified.
- Confluence now ships with 'bundled' plugins that are installed when Confluence is installed, but are not hard-coded into the application (so they can be upgraded without upgrading Confluence).
- Plugin resources now set Last-Modified and ETag headers properly, so they can be conditionally retrieved by browsers.
- Confluence is now built entirely using Maven 2. More on this soon.

Other Changes

- Users can now choose to have dates and times displayed in their own timezone instead of the server’s - CONF-1026.
- Most Confluence configuration data has been moved from the filesystem into the database.
- The Clickr Theme is bundled with Confluence.
- HTML exports are more reliable for sites with non-ASCII page titles - CONF-4862.
- You can now get users from multiple LDAP repositories at the same time (or different search paths in the same LDAP repository) - CONF-6034.
- Shortcut links can now have the substitution string in the middle of the URL (CONF-3246), and have
custom display text and titles (CONF-514).

- User macros are more flexible: you can configure how macro bodies are pre-rendered (CONF-2293), and you can also specify that a user macro generates wiki markup instead of HTML (CONF-3780).
- Pages with large numbers of attached images no longer eat up too many database connections - CONF-6393.
- When creating an RSS feed with the feed builder, you can choose whether to see full content, diffs, or both - CONF-6321.
- Searches now default to AND rather than OR for combining search terms - CONF-5874.
- The login page no longer prompts you to log in when you're already logged in. - CONF-6843.
- Support for the Nintendo Wii.
- Various improvements to performance that should result in a faster display of pages, and fewer problems for servers with large numbers of space permissions.
- Many static resources in Confluence are cached more effectively, so browsers have to retrieve CSS and Javascript files significantly less often - CONF-7212.

**Known Issues and Patches**

- Confluence 2.3 was originally accidentally shipped with three testing-only language packs. Since Sunday January 14th, the language packs have been removed from the distribution, but if you downloaded Confluence before that date they will be present. These language packs are machine translations, and are not intended for use on production systems (unless you’re a native German speaker and really want a good laugh). If you downloaded an affected copy of Confluence and want to remove these packs, delete de_DE-1.0.jar, ja_JP-1.0.jar and ru_RU-1.0.jar from confluence/WEB-INF/lib.
- You need to apply this patch to enable LDAP user integration: CONF-7585.
- If you have problems restoring backups please apply the patch included in this issue: CONF-7584.
- Due to class name changes, if you're upgrading from an existing system running:
  2. DB2 - you need to edit confluence.home/confluence.cfg.xml and replace bucket.dialect.DB2Dialect with com.atlassian.hibernate.dialect.DB2Dialect. More information in this issue: CONF-7690
- Log file atlassian-confluence.log is not presently generated. Please see these instructions for enabling it.

| And one was there, a stripling on a small and weedy beast, |
He was something like a racehorse undersized,
With a touch of Timor pony — three parts thoroughbred at least —
And such as are by mountain horsemen prized.
He was hard and tough and wiry — just the sort that won't say die —
There was courage in his quick impatient tread;
And he bore the badge of gameness in his bright and fiery eye,
And the proud and lofty carriage of his head.

- The Man from Snowy River, A. B. 'Banjo' Paterson

FileAppender log4j.properties

The 2.3 log4j.properties file doesn't specify a file for the FileAppender (because the necessary lines haven't been uncommented). Hence the log files normally generated via the file appender, logs/atlassian-confluence.log, is presently missing?

If you experience this situation and see errors in the logs such as:

```
log4j:WARN File option not set for appender [confluencelog].
log4j:WARN Are you using FileAppender instead of ConsoleAppender?
log4j:ERROR No output stream or file set for the appender named [confluencelog].
```

- Please uncomment the following lines in the `log4j.properties` file located under `confluence/WEB-INF/classes` and restart Confluence
  (ie remove the #'s)

```
#log4j.appender.confluencelog.File=${catalina.home}/logs/atlassian-confluence.log
#log4j.appender.confluencelog.MaxFileSize=20480KB
#log4j.appender.confluencelog.MaxBackupIndex=5
```

Release Notes 2.3.1

Confluence 2.3.1 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.3.

2.3.1 is a free upgrade for all customers who purchased their Confluence license after January 23rd, 2006.

Who should upgrade?

Confluence 2.3.1 is a bugfix release which resolves some significant issues in Confluence 2.3. Customers running Confluence 2.3 should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.3 and wishing to upgrade should use this version also.

Significant issues for customers upgrading to Confluence 2.3

- **LDAP integration**: Confluence 2.3 shipped with a broken user migration script for customers wishing to integrate LDAP servers with their Confluence installation. 2.3.1 ships with a fixed version of this script which can also be obtained from CONF-7585.

- **Upgrading with MySQL**: Customers using Confluence with MySQL may have had difficulty upgrading their instances to Confluence 2.3. This issue has been resolved in 2.3.1.

Significant issues for existing Confluence 2.3 users

- **Backup import**: Confluence 2.3 users wishing to import backups into their Confluence instance should upgrade to 2.3.1 or apply the patch listed against CONF-7584.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or Confluence 2.3 version, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Changes in 2.3.1

2.3.1 resolves 20 issues. All these issues are listed below:

<table>
<thead>
<tr>
<th>JIRA Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td><img src="Authenticate" alt="Authenticate" /> to retrieve your issues</td>

Release Notes 2.3.2

Confluence 2.3.2 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.3.1

⚠️ Warning for LDAP users
Confluence 2.3.2 has a serious bug that prevents it from working with LDAP servers. Please use Confluence 2.3.3 instead.

2.3.2 is a free upgrade for all customers who purchased their Confluence license after February 12th, 2006.

Who should upgrade?

Confluence 2.3.2 is a bugfix release which resolves some significant issues in Confluence 2.3.1 Customers running Confluence 2.3.1 and 2.3 should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.3 and wishing to upgrade should use this version also.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or Confluence 2.3 version, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Changes in 2.3.2

2.3.2 resolves 22 issues. All these issues are listed below:

<table>
<thead>
<tr>
<th>JIRA Issues</th>

Release Notes 2.3.3

Confluence 2.3.3 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.3.2

2.3.3 is a free upgrade for all customers who purchased their Confluence license after February 14th, 2006.

Who should upgrade?

Confluence 2.3.3 is a bugfix release which resolves some significant issues in Confluence 2.3.2 Customers running Confluence 2.3.2, 2.3.1 and 2.3 should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.
Customers running releases older than 2.3 and wishing to upgrade should use this version also.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or Confluence 2.3 version, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Changes in 2.3.3

2.3.3 resolves 4 issues. All these issues are listed below:

<table>
<thead>
<tr>
<th>JIRA Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Authenticate to retrieve your issues</td>
</tr>
</tbody>
</table>

Release Notes 2.4

The Atlassian Confluence team is proud to present to you Confluence 2.4.2! What happened to 2.4 and 2.4.1? Let’s just say we gave them a good workout. Confluence 2.4 is the ninth release of Confluence. It introduces much awaited support for editable comments, the ability to mail a page to groups of users and includes the usual slew of fixes since the last stable release.

Confluence 2.4 is the first in a series of frequent, small releases planned for the first half or 2007, that will help us get the functionality you want from Confluence, faster. For more information on our new release schedule, you might want to read this blog post.

Confluence 2.4.2 is a free upgrade for any customer who purchased Confluence after March 13th, 2006.

Upgrading from Confluence 2.2.x and 2.3.x

Upgrading Confluence should be fairly straightforward: you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.
1. **New Features**
2. **Improvements**

See also: *Issues Resolved for 2.4.2*

**New Features**

**Editable Comments**

Say *so long!* to those annoying typos and ill-structured sentences as comments in Confluence are now editable. Comments may be edited by the original author or the administrator for the space in which the comment was posted.

Confluence has a ten minute grace period after the comment is posted in which updates will not be flagged in the user interface. This is in acknowledgment of the fact that most edits within this period are for correcting minor typos and formatting which will not impact the flow of conversation.

For more information, see the Confluence user guide: [Editing a Comment](#)

**Page Mailing**

Confluence 2.4 ships with the Mail Page plugin allowing users to conveniently send the contents of a Confluence page to other interested parties. You can easily specify who you want the page mailed to by using a combination of:

- Email addresses
- Confluence user names
- Confluence group names

For security reasons, the Mail Page plugin is disabled by default. If you want to use this feature, an administrator will have to [enable it](#). There must also be a mail server configured in the Confluence instance for this operation to be available.
This operation is reached via a page's Info tab.

For more information, see the Confluence user guide: E-mailing a Page

Improvements

- The People Directory no longer shows inactive users (CONF-7771)
- Log messages now have more context such as the URL of the page being displayed and the name of the logged in user (CONF-7878)

Changes to the Page Permission API in Confluence 2.4

Confluence 2.4 contains changes to the Confluence API that will affect any plugins that modify Page Permissions (aka ContentPermissions). Some methods have been deprecated, some new methods have been created, and one method now behaves differently from before.
Confluence 2.4 does not support having multiple view and edit permissions on a page. The Content Permission API allows such a state, but it should be avoided. For example, if a Page has multiple permissions set on it, these permissions will not be displayed properly via the user interface, and the pages may not be returned appropriately in a search.

### Summary of Changes

<table>
<thead>
<tr>
<th>Deprecated methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContentPermissionManager.getInheritedViewContentPermissions(Page)</td>
</tr>
<tr>
<td>ContentPermissionManager.getInheritedContentPermissions(ContentEntityObject contentEntityObject)</td>
</tr>
<tr>
<td>ContentEntityObject.getPermissions()</td>
</tr>
<tr>
<td>ContentEntityObject.getContentPermission(String permissionType)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Changed methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContentPermissionManager.addContentPermission(ContentPermission permission, ContentEntityObject content)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Added methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContentPermissionManager.setContentPermissions(List contentPermissions, ContentEntityObject content, String type)</td>
</tr>
<tr>
<td>ContentPermissionManager.getInheritedContentPermissionSets(ContentEntityObject contentEntityObject)</td>
</tr>
<tr>
<td>ContentEntityObject.getContentPermissionSet(String type)</td>
</tr>
<tr>
<td>ContentEntityObject.hasPermissions(String type)</td>
</tr>
<tr>
<td>ContentEntityObject.removeContentPermissionSet(ContentPermissionSet set)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Removed methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContentPermissionManager.saveContentPermission(ContentPermission permission)</td>
</tr>
<tr>
<td>ContentPermissionManager.getContentUserPermission(ContentEntityObject contentEntityObject)</td>
</tr>
<tr>
<td>ContentPermissionManager.onContentContextChanged(ContentEntityObject contentEntityObject)</td>
</tr>
<tr>
<td>ContentEntityObject.setPermissions(List permissions)</td>
</tr>
<tr>
<td>ContentEntityObject.clearPermissions(ContentPermissionManager permissionManager)</td>
</tr>
</tbody>
</table>

The change most likely to cause problems is:

ContentPermissionManager.addContentPermission(ContentPermission permission, ContentEntityObject content)

This method now adds a ContentPermission to the ContentEntityObject as one would expect. Previously if a ContentPermission already existed on the ContentEntityObject, then any existing ContentPermission would be
removed. That is, the method really behaved as one would expect "setContentPermission" to behave. As a result, any code that used addContentPermission in Confluence 2.3 or earlier, should now use setContentPermissions with a single entry list.

<table>
<thead>
<tr>
<th>Example conversion of old addContentPermission usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>replace ContentPermissionManager.addContentPermission(p, c) with ContentPermissionManager.setContentPermissions(java.util.Collections.singletonList(p), c, p.getType())</td>
</tr>
</tbody>
</table>

Most methods that used to return a ContentPermission have been replaced with methods that return a ContentPermissionSet. In some places we have used deprecation to point to the new method and reimplemented the old method to extract the first ContentPermission from the ContentPermissionSet.

As usual, the methods on the ContentPermissionManager should be used rather than those on the ContentEntityObject. The only ContentEntityObject method that should be used is getContentPermissionSet. Even that method should be used only to display the existing Permissions. All writes to the ContentPermissionSets should be performed via the ContentPermissionManager.

The onContentContextChanged method of the ContentPermissionManager was previously used to notify a ContentPermissionManager that cached permissions on a ContentEntityObject may be invalid. This is now accomplished by publishing a ContentPermissionEvent. That event is published automatically when changing ContentPermissions via the ContentPermissionManager.

No changes have been made yet to the the XML RPC API. It does not currently allow modification of ContentPermissions.

**Release Notes 2.4.1**

The Atlassian Confluence team is proud to present to you Confluence 2.4.2! What happened to 2.4 and 2.4.1? Let’s just say we gave them a good workout. Confluence 2.4 is the ninth release of Confluence. It introduces much awaited support for editable comments, the ability to mail a page to groups of users and includes the usual slew of fixes since the last stable release.

Confluence 2.4 is the first in a series of frequent, small releases planned for the first half of 2007, that will help us get the functionality you want from Confluence, faster. For more information on our new release schedule, you might want to read this blog post.

Confluence 2.4.2 is a **free upgrade** for any customer who purchased Confluence after March 13th, 2006.

**Upgrading from Confluence 2.2.x and 2.3.x**

Upgrading Confluence should be fairly straightforward: you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

**Upgrading from Confluence 2.1 and earlier**

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Release Notes 2.4.3

Confluence 2.4.3 is a maintenance release that resolves an assortment of issues users may have encountered using Confluence 2.4.2

2.4.3 is a free upgrade for all customers who purchased their Confluence license after March 22nd 2006.

Who should upgrade?

Confluence 2.4.3 is a recommended upgrade release which resolves some significant issues in Confluence 2.4.2. Customers running older versions of Confluence should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.4 and wishing to upgrade should use this version also.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or Confluence 2.3 version, you can find instructions here.

We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Changes in 2.4.3

2.4.3 resolves 15 issues. All these issues are listed below:

<table>
<thead>
<tr>
<th>JIRA Issues</th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

Release Notes 2.4.4

Confluence 2.4.4 is a recommended upgrade release that resolves issues users may have encountered using
Confluence 2.4.3 or earlier.

2.4.4 is a free upgrade for all customers who purchased their Confluence license after March 30th 2006.

Who should upgrade?

Confluence 2.4.4 is a recommended upgrade release that resolves issues users may have encountered using Confluence 2.4.3 or earlier. Customers running older versions of Confluence should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.4 and wishing to upgrade should upgrade directly to 2.4.4.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or Confluence 2.3 version, you can find instructions here.

We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Source Release

Please note that the source release for 2.4.4 is currently unavailable. We have scheduled a fix for this which should be included in 2.4.5. Please see CONF-8007 for more details.

Changes in 2.4.4

2.4.4 resolves 17 issues. All these issues are listed below:

<table>
<thead>
<tr>
<th>JIRA Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>-------------</td>
</tr>
<tr>
<td>Authenticating to retrieve your issues</td>

Release Notes 2.4.5

Confluence 2.4.5 is a maintenance release that resolves issues users may have encountered using Confluence 2.4.4 or earlier.

2.4.5 is a free upgrade for all customers who purchased their Confluence license after April 12th 2006.

Who should upgrade?

Confluence 2.4.5 is a recommended upgrade release which resolves some significant issues in Confluence 2.4.4. Customers running older versions of Confluence should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.4 and wishing to upgrade should upgrade directly to 2.4.5.

Upgrade Procedure
Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or Confluence 2.3 version, you can find instructions here.

We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Changes in 2.4.5

2.4.5 resolves these issues:

<table>

</tbody>
</table>

Release Notes 2.5

The Atlassian Confluence team is proud to present Confluence 2.5. Confluence 2.5 is the tenth release of Confluence. It introduces more flexible page restrictions, and also includes a number of minor fixes.

Confluence 2.5 is a free upgrade for any customer who purchased Confluence after April 27th, 2006.

Upgrading from Confluence 2.2 and later

Upgrading Confluence should be fairly straightforward: you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Introducing flexible page restrictions

Page restrictions give you the ability to choose who may read and/or edit any given page.

By popular request, page restrictions have been enhanced and can now be assigned to multiple people and/or groups.
Other significant issues resolved

**Dynamic task list JRE incompatibilities**

Many customers have been prevented from upgrading the Java runtime hosting their Confluence instance due to [CONF-4082](https://jira.atlassian.com/browse/CONF-4082), an issue which would prevent existing dynamic task lists from working with the new JRE. This issue has been resolved in Confluence 2.5 allowing dynamic task list users to upgrade and downgrade between Java versions without experiencing conversion exceptions.

**contentbylabel macro supports AND condition**

You may now use the `operator=AND` parameter with the `contentbylabel` macro to select pages that have all of the supplied labels. ([CONF-4969](https://jira.atlassian.com/browse/CONF-4969))

**Release Notes 2.5.1**
Confluence 2.5.1 is a maintenance release that resolves issues users may have encountered using Confluence 2.5 or earlier.

2.5.1 is a free upgrade for all customers who purchased their Confluence license after May 7th 2006.

Who should upgrade?

Confluence 2.5.1 is a bugfix release which resolves some significant issues in Confluence 2.5. Customers running older versions of Confluence should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.5 and wishing to upgrade should upgrade directly to 2.5.1.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or a later version, you can find instructions here.

We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Changes in 2.5.1

2.5.1 resolves these issues:

<table>

Release Notes 2.5.2

Confluence 2.5.2 is a maintenance release that resolves issues users may have encountered using Confluence 2.5 or earlier.

2.5.2 is a free upgrade for all customers who purchased their Confluence license after May 22nd 2006.

Who should upgrade?

Confluence 2.5.2 is a bugfix release which resolves some significant issues in Confluence 2.5. Customers running older versions of Confluence should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.5 and wishing to upgrade should upgrade directly to 2.5.2.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or a later version, you can find instructions here.
We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Changes in 2.5.2

2.5.2 resolves these issues:

<table>
<thead>
<tr>
<th>JIRA Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Authenticate to retrieve your issues</td>
</tr>
</tbody>
</table>

Release Notes 2.5.3

Confluence 2.5.3 is a maintenance release that resolves issues users may have encountered using Confluence 2.5 or earlier.

2.5.3 is a free upgrade for all customers who purchased their Confluence license after May 30th 2006.

Who should upgrade?

Confluence 2.5.3 is a bugfix release which resolves some significant issues in Confluence 2.5. Customers running older versions of Confluence should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

In particular, 2.5.3 fixes a problem which could cause indexing to fail when extracting text from unprintable encrypted PDF files.

Customers running releases older than 2.5 and wishing to upgrade should upgrade directly to 2.5.3.

Shared Mode Removed

This release removes the ‘Shared Mode’ setting from General Configuration. If you have shared mode enabled you should disable it before upgrading.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or a later version, you can find instructions here.

We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Changes in 2.5.3

2.5.3 resolves these issues:
Release Notes 2.5.4

Confluence 2.5.4 is a maintenance release that resolves issues users may have encountered using Confluence 2.5 or earlier.

2.5.4 is a free upgrade for all customers who purchased their Confluence license after June 13th 2006.

Who should upgrade?

Confluence 2.5.4 is a bugfix release which resolves some significant issues in Confluence 2.5. Customers running older versions of Confluence should review the list of resolved issues below, and upgrade if this release fixes any problems with their current Confluence installation.

Customers running releases older than 2.5 and wishing to upgrade should upgrade directly to 2.5.4.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from another Confluence 2.2.x or a later version, you can find instructions here.

We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from Confluence 2.1 and earlier

Users upgrading directly from 2.1 or earlier should also read the 2.2 Release Notes for caveats regarding the 2.1 -> 2.2 upgrade.

Changes in 2.5.4

2.5.4 resolves these issues:

Release Notes 2.5.5

Confluence 2.5.5 is a recommended upgrade that resolves issues you may have encountered in Confluence 2.5.4 or earlier. Confluence 2.5.5 resolves two security bugs, related to space permissions and invalid...
characters in space names and keys.

As such this release is a recommended upgrade for all customers.

Confluence 2.5.5 is a free upgrade for all customers who purchased their Confluence license or maintenance renewal after July 26th 2006.

Upgrading to Confluence 2.5.5

Upgrading Confluence should be fairly straightforward. You can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Changes in 2.5.5

Patch for security issues

Confluence 2.5.5 resolves two security bugs, related to:

- space permissions
- invalid characters in space names and keys.

For more information, please see the security advisory.

Server ID

Starting with release 2.5.5, Confluence will generate a server ID for you. Server ID has replaced License ID on the License Details page. You will find the server ID useful when contacting Atlassian support.

Server ID:

- is generated when you install Confluence for the first time
- exists for the life of the Confluence instance
- survives an upgrade
- is held in the database
- is not bound to a specific licence
- is the same for all servers in a cluster.

Translations for rich text editor now compatible with Confluence language pack plugins

⭐ Thank you to everyone who voted for this popular fix.

The rich text editor in Confluence shows text in tooltips, warnings and other messages. If you are using Confluence in a language other than English, you will want to translate these messages as well as the standard Confluence text.

With Confluence 2.5.5:

- The translations for the rich text editor can be part of a Confluence language pack plugin.
- If your language pack does not contain translations for the rich text editor, the text will show in English. (Before 2.5.5, it showed the 'key' value rather than English.)
- Partial translations of rich text editor messages are already included in the professional French and German language packs. Full translation is under construction.

This makes things much simpler!

You will find more information here:

- Overview of language pack translations
- Technical overview of language pack plugins
Specific information on translating the rich text editor

**Other fixes in 2.5.5**

2.5.5 resolves these issues:

Errors were reported by the JIRA trusted connection.

- APP_UNKNOW; Unknown Application: {0}; "confluence:4557196"

Upgrade Guide 2.5.5

Who should upgrade?

Confluence 2.5.5 is a recommended upgrade that resolves issues you may have encountered in Confluence 2.5.4 or earlier. Confluence 2.5.5 resolves two security bugs, related to space permissions and invalid characters in space names and keys.

As such this release is a recommended upgrade for all customers.

Confluence 2.5.5 is a free upgrade for all customers who purchased their Confluence license or maintenance renewal after July 26th 2006.

If you are running a release older than 2.5 and you want to upgrade, you should upgrade directly to 2.5.5. Refer to the upgrade procedure below.

Upgrade Procedure

Upgrading Confluence should be pretty easy. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.2.x or a later version, you can find instructions here.

If you are upgrading directly from 2.1 or earlier, you should also read the 2.2 Release Notes for warnings about the 2.1 -> 2.2 upgrade.

Release Notes 2.5.6

Confluence 2.5.6 is a recommended upgrade that resolves a number of security bugs and other issues you may have encountered in Confluence 2.5.5 or earlier.

As such this release is a recommended upgrade for all customers.

Confluence 2.5.6 can be downloaded from http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa, and is a free upgrade for all customers who purchased their Confluence license or maintenance renewal after August 8th 2006.

Upgrading to Confluence 2.5.6

Upgrading Confluence should be fairly straightforward. You can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!
Changes in 2.5.6

- For details about the security fixes, please see the security advisory.
- CONF-8944 resolves a Crowd integration issue for Confluence 2.5.6 and later.
- The Crowd integration fix will be ported to previous Confluence versions in the near future - please see CONF-9122.

Here's a complete list of the bug fixes in Confluence 2.5.6:

Error rendering macro 'jiraissues' : Unable to determine if sort should be enabled.

Upgrade Guide 2.5.6

Who should upgrade?

Confluence 2.5.6 is a recommended upgrade that resolves a number of security bugs and other issues you may have encountered in Confluence 2.5.5 or earlier.

As such this release is a recommended upgrade for all customers.

Confluence 2.5.6 can be downloaded from http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa, and is a free upgrade for all customers who purchased their Confluence license or maintenance renewal after August 8th 2006.

If you are running a release older than 2.5 and you want to upgrade, you should upgrade directly to 2.5.6. Refer to the upgrade procedure below.

Upgrade Procedure

Upgrading Confluence should be fairly straightforward. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 2.2.x or a later version, please see the Confluence Upgrade Instructions.

If you are upgrading directly from 2.1 or earlier, you should also read the 2.2 Release Notes for warnings about the 2.1 -> 2.2 upgrade.

Release Notes 2.5.7

Confluence 2.5.7 is a recommended upgrade that resolves two issues you may have encountered in Confluence 2.5.6:

- Indexing errors claiming 'too many open files', caused by duplicate libraries in the Confluence web application.
- Caching should be enabled by default for the LDAP configuration in atlassian-user.xml.

Confluence 2.5.7 can be downloaded from http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa, and is a free upgrade for all customers who purchased their Confluence license or maintenance renewal after 30 August 2006.

If you don't wish to upgrade to 2.5.7, but do want a fix for issue CONF-9251 ("Too many open files" error during index operations), you can manually remove the duplicate libraries shipped in the Confluence web application. Please follow the instructions on the JIRA issue.

Upgrading to Confluence 2.5.7

Upgrading Confluence should be fairly straightforward. You can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Changes in 2.5.7
Here is a complete list of the bug fixes in Confluence 2.5.7:

**Error rendering macro 'jiraissues' : Unable to determine if sort should be enabled.**

**Upgrade Guide 2.5.7**

**Who should upgrade?**

Confluence 2.5.7 is a recommended upgrade that resolves two issues you may have encountered in Confluence 2.5.6:

- Indexing errors claiming 'too many open files', caused by duplicate libraries in the Confluence web application.
- Caching should be enabled by default for the LDAP configuration in `atlassian-user.xml`.

Confluence 2.5.7 can be downloaded from [http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa](http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa), and is a free upgrade for all customers who purchased their Confluence license or maintenance renewal after 30 August 2006.

If you are running a release older than 2.5 and you want to upgrade, you should upgrade directly to 2.5.7. Refer to the upgrade procedure below.

**Upgrade Procedure**

Upgrading Confluence should be fairly straightforward. *We strongly recommend that you backup your `confluence.home` directory and database before upgrading!*

If you are upgrading from Confluence 2.2.x or a later version, please use the [Confluence Upgrade Instructions](http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa).

If you are upgrading directly from 2.1 or earlier, you should also read the [2.2 Release Notes](http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa) for warnings about the 2.1 -> 2.2 upgrade.

**Release Notes 2.5.8**

Confluence 2.5.8 is a **highly recommended** upgrade that resolves some issues in the user management framework and a memory leak in Confluence 2.5.x.

You can download Confluence 2.5.8 from [http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa](http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa). This upgrade is free for all customers with active Confluence software maintenance as at 3 October 2007.

⚠️ This release has been made available after the [Confluence 2.6 release date](http://www.atlassian.com/software/confluence/ConfluenceDownloadCenter.jspa). This 2.5.8 version is for customers who want to fix the issues listed below, but do not want all the new functionality and theme changes in Confluence 2.6 yet.

**Upgrading to Confluence 2.5.8**

Upgrading Confluence should be fairly straightforward. You can find instructions here. *We strongly recommend that you backup your `confluence.home` directory and database before upgrading!*

**Changes in 2.5.8**

Here is a complete list of the bug fixes in Confluence 2.5.8:

**Error rendering macro 'jiraissues' : Unable to determine if sort should be enabled.**

Ring the bells. Break out the champagne. Paint the town red. Dance naked in the streets. Or at least that’s what we’ll be up to tonight, because we’re finally releasing Confluence 1.0!

Confluence 1.0 represents the hard work and dedication of quite a few people. Obviously there’s the development team: Ara, Armond, Charles, Dave, Mike and Ross, but there’s also the JIRA team and the rest of the guys at Atlassian who have offered support, advice, and loud music. A huge thanks also goes out to everyone involved in the beta-testing program. Your real-world use of Confluence gave us invaluable suggestions and bug-reports, and we apologise for the times we’ve messed up your databases on the way.

We’re pretty proud of all the cool stuff we’ve managed to fit into Confluence already, and we’re looking forward to making it even better in forthcoming versions (Remember, a license entitles you to a year of upgrades).

The only sad moment for the day is that for the 1.0 release, we had to lose emoticons. The regular expression responsible for turning 😊 into a smiley-face was causing pages to take ten seconds to render. Commenting out the filter lowers the rendering time of even highly complex pages to a few hundred milliseconds. We promise, the smileys will return in a future version, faster and stronger than ever! Or if you don’t mind the cost, you can re-enable them by uncommenting the emoticonFilter line in wikiSubsystemContext.xml

Users of late Release Candidate builds will notice a substantial improvement in performance as a result.
New Features

For once, we managed to resist the urge to add any new features this week, since we were busy cleaning everything up for today’s release.

Notable Bug-fixes

- We have verified that you can now use Confluence's internal datasources with MySQL (for users of RC5 or earlier, see the upgrade section below for information on how to change to the production-ready datasources)
- Fixed the database transaction problems that were causing problems with user/group management, page renaming and commenting
- [-user] links no longer place the context path in the link twice
- Fixed a rendering regression that caused text to be spaced incorrectly within panels
- The 404 error page no longer causes a NullPointerException
- The 'diff' link now works in HTML edit notification emails when Confluence is installed in a non-root context.

Outstanding Issues

- The Emoticon filter is currently shipped disabled, because it was causing page-load times to go through the roof CONF-963
- You can not complete the Confluence setup process if you have external user-management enabled. Set up Confluence before setting up external user-management. CONF-950
- It is possible to make a "create page" link to a page with invalid characters in its title (which will thus fail to be created) CONF-810
- If you are using PostgreSQL, please make sure you use the JDBC3 version of the Postgres JDBC drivers. Some users have encountered problems with the JDBC2 drivers.
- Links to images that are page-attachments are broken in email notifications CONF-878
- There continue to be problems with high-bit characters in pages when Confluence is deployed on Resin CONF-569

Upgrading from RC6

We haven't made any changes to the database schema, so you should just be able to install the new version of Confluence, point it at your existing confluenceHome directory, and carry on as before. I would, however, recommend making a backup before you upgrade, just in case.

If you:

1. have not gone through the Confluence database setup steps since Confluence 1.0RC5
2. are running the embedded HSQL database, or are connecting to a database directly (not through an Application Server Datasource)

Then you will need to add a few connection pooling properties to confluence.cfg.xml file in your confluenceHome directory. Edit the file, and insert the following somewhere in the <Properties> section:

If you do not fall into the category described above, or if you find these lines are already in the file, you do not need to do this!

```
<property name="hibernate.c3p0.max_statements">0</property>
<property name="hibernate.c3p0.min_size">0</property>
<property name="hibernate.c3p0.timeout">30</property>
<property name="hibernate.c3p0.max_size">4</property>
```
This will enable c3p0 connection-pooling, which is far more reliable than the default pooling that we were using previously.

Notable Features from Previous Releases

Here’s a quick retrospective of some of the cool things we have added to Confluence during the beta- and RC-releases. It is by no means comprehensive, but you can follow the links to the original release notes for an idea of just how busy we’ve been in recent months.

Confluence 1.0a2 (November 6, 2003)
- Shortcut links allow you to create special URL Shortcuts to point to existing web services: i.e. CONF-195
- Undefined and Orphaned Pages reports
- Revert page to previous version

Confluence 1.0a3 (December 5, 2003)
- Comments for pages
- Links in exported PDFs are internal links if the destination page has also been exported, external links otherwise
- Personal History popup keeps track of the pages you have visited
- Page Information screen lists all the incoming and outgoing links on a page
- Printable version of every page

Confluence 1.0b1 (December 19, 2003)
- Pages that have changed since your last login are highlighted in the ‘recent changes’ list
- Pages can be organised in parent-child hierarchies, allowing for clearer organisation of pages within a space
- Page renaming refactors links to the page, wherever they may appear in the site
- Search works across all content in the site, including comments, space descriptions and user information
- A new permission was added for creating comments
- {color} macro for coloured text
- Parameters allowed on image links

Confluence 1.0b3 (January 19, 2004)
- Beta2 was released a few days earlier, but we'd prefer not to talk about it.
- Searching works across PDF, HTML, XML and Word attachments
- The colour-scheme and page decorators can be configured across the site
- The site homepage is configurable
- Emoticons 😊
- New macros: {include}, {include-html}, {rss}, {search}, {jiraissues}, {junitreport}
- User profiles can be longer than 255 characters
- Much better handling of anonymous contributions

Confluence 1.0b4 (January 26, 2004)
- FatCow, our acceptance-testing framework was introduced to the world
- Confluence now supports chronologically organised content: blog posts
- You can now move pages between spaces, and have their links updated accordingly
- en — and em — dashes are supported
- You can link directly to attachments
- New macros: {blog-posts}, {anchor}, and an improved {rss} macro

Confluence 1.0rc1 (February 6, 2004)
- XML-RPC and SOAP APIs allow you to programatically interact with Confluence
- Trackback allows Confluence to notify other sites of links, and be notified by them
- User notifications on page and space editing were overhauled
- Look and Feel configuration was enabled individually for each space
• Linking to space descriptions and user profile pages directly is now possible: Confluence User Community, Mike Cannon-Brookes
• History popup tracks more than just pages

**Confluence 1.0rc2 (February 13, 2004)**

• Improvements to the remote API
• RSS and HTML macros now use HTTP proxies if configured to

**Confluence 1.0rc5 (February 20, 2004)**

• RC3, RC4 and RC5 were released within days of each other, in a flurry of mad bug-fixing
• Page templates can now be filled in in-line
• If a page is moved or renamed and you go to the URL it used to inhabit, Confluence will try to direct you to its new location
• Exported PDFs now incorporate the site's stylesheet

**Confluence 1.0rc6 (March 5, 2004)**

• You can prevent people signing up, for private Confluence installations
• You can configure Confluence to mask user email addresses
• User management can now be shared with JIRA
• Page templates can now contain drop-down menus and text areas
• New macro: {{html}}

**Release Notes 1.0rc5**

**Confluence 1.0rc5**

It's time to release Confluence 1.0rc5 into the wild: it's the fourth Release Candidate since last Friday, and we're definitely getting close here. The last two release-candidates did not have their own release-notes, so these notes will also include things that were fixed for those versions.

**Contents**

1. **New Features**
2. **New Macros**
3. **Improvements**
4. **Notable Bug-fixes**
5. **Outstanding Issues**

See also: **Issues Resolved for 1.0rc5**

**New Features**

In keeping with our promise to not add any features during the Release Candidate process, we have been very restrained, and only added two new features 😊

**Template Preview**

Page templates have been given an overhaul: when filling in your template variables, you are presented with a template of the rendered page, with input fields where the variables will be inserted. If you have the same variable used in several places, the form will take care of keeping them all in synch.
Step 2: Fill in template variables

Choose values for the variables in this template. These values will be automatically inserted into the template for you in the correct locations.

New template (title)

By David Loeng (author)

February (month) 20th (day), 200[ ] (year)

After a week of frantic bug-fixing, we have released Confluence 1.0 Release Candidate 2. Thanks everyone for reporting all the bugs they found in RC1. While we really hope you’ll keep reporting anything you find that doesn’t work, we’re also hoping that there’s a lot less to report now.

(from) - (to)

(from) - (to)

(from) - (to)

We have released RC2 because it’s a lot more stable than RC1. We know a lot of you are already using Confluence in some kind of production capacity, and we don’t want to keep you waiting for the important fixes that we put in this week.

Since we’re in the middle of a feature freeze, there obviously aren’t any new major features in this release, but there are a number of incremental improvements, and a lot of fixes.

Regards.

David Loeng (author)

Page Redirection

When you rename or move a page, the page’s old URL will attempt to give users some clue as to where they should be looking: checking which pages have had this name in the past, or redirecting users to pages in another space with the same name.

In This Space

The page you were looking for may have been renamed to one of the following:

- *Ridiculous* (Fish Space)
  And yet another page to add to the confusion

- *Before* (Fish Space)
  Lorem ipsum dolor sit amet, consectetur adipiscing elit. Integer euismod tellus et sem. Aliquam ullamcorper hendrerit arcu. Sed lacinus odio, mattis ut, sollicitudin a, tincidunt vitae, magna. Integer aliquam nibh sed libero...

In Other Spaces

The page you were looking for may have moved to another space:

- *Cows* (Bouncy Space)
  This is the page before it was renamed.

New Macros

- (weblogs) is a synonym for (blog-posts)

Improvements
The user signup screen has a more friendly UI
Exported PDFs now incorporate the site's stylesheet, and thus look a lot better.
Confluence now has a useful "404" error page that gives the user some suggestions of how to find what they were looking for.
An Administrators page, linked from the footer of each page, lists those users in the "confluence-admin" group. (If you don't want your address to be made public on this page, create an administrative group with some other name)
The error you receive when you exceed your licensed user limit is more informative, and no longer directs users to email Atlassian.
The SnipSnap importer converts SnipSnap blog posts to Confluence blog posts.
Several methods added to the XML-RPC and SOAP APIs for managing users and spaces. (See Conf Remote API Additions)
The Daily Report email is more informative and more readable
Page comments and Parent/child relationships are maintained during HTML and PDF exports
news: and nntp: URL schemes are now recognised in bracketed links

Notable Bug-fixes

Since RC2
- Links between pages now work when you have a context path other than / (oops!)
- The daily report email is no longer sent every minute (oops!)
- You can no longer download attachments without being logged in (OOPS!)
- Search results no longer highlight words that were terms in previous searches

Since RC3
- Page redirects now work properly under Orion 2.0.2

Since RC4
- Removing a user no longer causes their notifications to hang around and crash things
- Removing a blog post works, too
- Many fixes to PDF rendering and exporting
- Many fixes to handling of Latin character set (See outstanding issues below)
- Invalid macros now give a more informative error than "no group 3"
- The 404 error page no longer requires you to log in to view it
- Macros that generate HTML (page include, HTML include, JIRA, RSS, FatCow) bypass the remainder of the page processing, and so should have far fewer formatting errors now.
- User browser filter remembers your search across pages

Plus, of course, innumerable fixed to annoying crashing bugs across all three releases.

Outstanding Issues

Latin Characters under Resin

We've tested creating pages with non-ASCII titles and content across several different browsers and several different operating systems, and they seem to be working reliably now... except on Resin. This will be quite noticeable since confluence.atlassian.com itself is running under Resin, but we have so far been unable to come up with a solution that works on this application server.

For users who need this functionality, we suggest running under Tomcat.
- On MySQL, the "orphaned pages" report may include the space's homepage CONF-766
- Combining block macros with lists is dangerous CONF-756
- Under some circumstances, paragraph tags will not be closed CONF-746

Issues Resolved for 1.0rc5
**Release Notes 1.0b1**

*Confluence 1.0b1*

Confluence 1.0b1 was released 19th December 2003.

That's right - we finally got it out the door! *cheers from around the room erupt as developers across in the Atlassian offices crack open a beer.*

**New Features**

- It's soooo much faster as we've implemented caching at multiple levels - trust me, it now *flies* in development. Here's hoping it flies for you too. (For those with a development bent, turn on profiling via the URL to see a beautiful profiling stack trace on stdout)
- The last login date is now tracked, pages and spaces changed since your last login are highlighted in green (as these are presumably pages you want to view), you can see a diff of the currently viewed page against the date you last logged in and there are various related reports of spaces/pages changed since your last login.
- Parent/child page hierarchies have been implemented. You can specify the parent for any pages and the ancestry is reflected in the breadcrumbs list. The full hierarchy is shown (including the current page's position) on the Page Information screen, and there is a related macro to show the children in various different types of trees (see the Notation Guide for details)
- Search has been completely overhauled - search now works across pages, comments and space descriptions and the results now display descriptions with highlighted search terms (this is really cool!)
- Page renaming and link refactoring now works across comments, space descriptions and pages - neat!
- The Notation Guide has been significantly improved with more useful examples, a list of the available macros and a tabbed interface. Also the edit/create pages now have a 'quick notation guide' to the most commonly used operations
- There is a new 'Create Comment' permission - so that you can make spaces which are publicly viewable/commentable, but not editable.
- The UI of the 'create link' and 'external link' links within a rendered page have been improved with subtle icons
- Page comments now have a sexy icon of their own, and can be shown/hidden at will. You can also permalink to any given comment and comments are fully indexed.
- Undefined and orphaned pages reports have been tightened significantly so that they now report truly undefined/orphaned pages
- You can create a list of URLs ignored from external referrers - this is useful where your server is known by multiple IP / domain name combinations, or you want to ignore all internal referrers (Admin / General configuration)
- `{color}` macro to colour blocks of text
- Logging in to Confluence now takes you to your intended destination, not the Dashboard
- There is an option to choose whether the default link for a space goes to the space homepage or the space summary (people internally and externally seem to be divided about which it should go to - so you can choose for yourselves)
- You can now edit and add SMTP servers through the web interface
- The administration interface has been completely overhauled and tightened
• Added a Mail Queue administration page
• Added a View System Information page
• Added a pretty error page, and the ability to submit but reports (including exports) directly to us
• The permissions viewing and editing pages have been greatly simplified and improved across the application
• Confluence now has a licensing system, so you will need a license key to evaluate (these can be generated online as with JIRA).
• Image embedding can now include parameters (such as height, width, alignment etc) - see the Notation Guide for details.
• https:// links are now treated just like ftp:// and http:// external links
• Various rendering bugs have been fixed.
• Many other minor fixes, improvements and performance tweaks

Release Notes 1.0b4

Confluence 1.0b4

To belatedly ring in the Year of the Code-Monkey, it’s time for Confluence 1.0 beta 4. We’ve had some great feedback on the last few betas, thanks to everyone for submitting bugs, and contributing to Atlassian Answers and the discussion space.

Contents

1. FatCow
2. New Features
3. New Macros
4. Improvements
5. Notable Bug-fixes
6. Outstanding Issues

See also: Issues Resolved for 1.0b4

Atlassian FatCow

Along with 1.0b4, we’re also releasing FatCow: Functional Acceptance Testing for the Confluence Wiki. Styled after Ward Cunningham’s Fit and Bob Martin’s Fitnesse, FatCow allows you to define web-based acceptance tests in wiki notation, and then run them from inside Confluence. Here’s a tutorial showing how to write a quick FatCow test suite that makes sure Confluence shows up on Google. 😊

FatCow is Open Source, and also serves as example code for anyone who wants to extend Confluence by writing their own macros (something that we’ll be looking to make easier in future releases).
New Features

Blog Posts

Each space can now host a "blog" of pages that are organised by date, rather than just by title. This is pretty useful if you want to attach some kind of updating news to a space. The "create blog post" button can be found on the right-hand toolbar.

Blogging support is pretty basic right now: you can create posts, and you can include the most recent posts in a page using the {blog-posts} macro. Rest assured, we'll be piling on the features in the next few releases.

Move Pages Between Spaces

A much requested feature, our newest refactoring lets you move pages cleanly from one space to another. We're using this already to maintain a private space where we stage documentation waiting to be transferred to the main documentation space.

Configurable Site Description

You can now change the text in the site description that appears on the user's dashboard: somewhere to put welcome messages or MOTDs. And, of course, it understands Confluence markup.

#includePage("Page") Velocimacro

For the decorator-editors, you can use this render the contents of a page anywhere inside a decorator. The page has to be in the space that the user is looking at, and if the page does not exist, nothing will be rendered.

New Macros

- {blog-posts} displays the most recent blog posts for a space.
- {rss} macro now has maxEntries and titleBar parameters.
- {anchor} macro allows you to create named anchors in a page (link to them with [SPACE:page#anchor])

Improvements

- You can now draw en – and em — dashes.
- mailto: links are now drawn as just the email address, like so user@example.com
- the {search} macro now excludes the page it was included in from the search results
- you can also link to attachments using #-anchors [SPACE:page#attachment.pdf]
- you are given the opportunity to pick a template when creating a page from a link, and any entered page title survives picking a page template

Notable Bug-fixes

- Spurious error message about editing a stale version of a page have been squashed.
- No longer crashes when you add a user to certain groups.
- Some database queries have been rewritten to work around the fact that MySQL doesn't understand sub-selects.
- Diffs more reliably highlight changed words
- Several minor rendering problems to do with deeply nested lists have been fixed.
- and many more...

Outstanding Issues

- You should restart Confluence immediately after finishing the initial setup steps, to avoid data loss CONF-493
- New-lines may not be drawn if the next line starts with whitespace CONF-475
Issues Resolved for 1.0

Release Notes 1.0rc2

Confluence 1.0rc2

After a week of frantic bug-fixing, we have released Confluence 1.0 Release Candidate 2. Thanks everyone for reporting all the bugs they found in RC1. While we really hope you'll keep reporting anything you find that doesn't work, we're also hoping that there's a lot less to report now.

We have released RC2 because it's a lot more stable than RC1. We know a lot of you are already using Confluence in some kind of production capacity, and we don't want to keep you waiting for the important fixes that we put in this week.

Since we're in the middle of a feature freeze, there obviously aren't any new major features in this release, but there are a number of incremental improvements, and a lot of fixes.

But first, a...

WARNING

If you are upgrading from Confluence 1.0rc1, do not perform a backup of your data from within Confluence. There was a serious bug with RC1 that caused user permissions to be corrupted during data exports.

There have been no database changes between RC1 and RC2, so you should simply be able to run RC2 against your existing data without performing a backup/restore.

If you wish to back your data up safely before the upgrade, you will need to do so manually: shut down Confluence, make a copy of your Confluence home directory (as defined in `confluence-init.properties`, and if you are storing your data in something other than HSQL, use your database's native backup procedure.

h4. Contents

1. Improvements
2. Other Bug Fixes
3. Other Outstanding Issues

See also: Issues Resolved for 1.0rc2

Improvements

* Remote XML-RPC and SOAP APIs now have a `{{getPermissions()}}` method
* `{noformat}` macro accepts a title parameter
* Page view and create links are no longer displayed if the user does not have permission to view or create the destination page.
* When you create a page from viewing a previous page, you are given another chance to make that page the new page’s parent.
* RSS and HTML include macros use HTML proxies if they are defined using the standard Java {{http.proxyHost}} and {{http.proxyPort}} system properties.
* Default session timeout is now 60 minutes
* Improvements to user browser and user profile page UI
* Shortcut link definitions are now backed up and restored

**Notable Bug-fixes**

**Stability**

We've done a lot of work tracking down the source of any exception and page error that has been reported to us, and fixing their causes. We've also made one or two improvements to the error reporting page, but we're hoping you won't see it nearly as often (if at all) any more.

**Page Templates**

The creation, editing and deletion of page templates should now be a lot more reliable and provide a smoother user experience.

**Also**

* You no longer have to restart Confluence after its initial setup [http://jira.atlassian.com/browse/CONF-493](http://jira.atlassian.com/browse/CONF-493).
* Performing a full data export no longer corrupts users' group membership data: [http://jira.atlassian.com/browse/CONF-645](http://jira.atlassian.com/browse/CONF-645).
* You can now link to profiles of users with an @ symbol in their usernames: [http://jira.atlassian.com/browse/CONF-639](http://jira.atlassian.com/browse/CONF-639).
* Trying to create a page with illegal characters in its name no longer loses your page content on some browsers: [http://jira.atlassian.com/browse/CONF-713](http://jira.atlassian.com/browse/CONF-713).
* Trackback pings are now sent for URLs that are not surrounded by square brackets: [http://jira.atlassian.com/browse/CONF-708](http://jira.atlassian.com/browse/CONF-708).
* And, of course, many more.

**Outstanding Issues**

The two major areas we still need to work on are the PDF export and the use of non-ASCII characters in pages (especially page titles). Handling of both are much better than they were a week ago, but there's still some work to do before they're completely reliable.

**Issues Resolved for 1.0rc2**

Release Notes 1.0rc6
Confluence 1.0rc6

Confluence 1.0rc6 fixes more bugs. Lots of them. There aren't many new and interesting features to report, although we have implemented the much-requested ability to mask email addresses and prevent public signup. Mostly, we've been toiling away fixing the lots of little problems that are getting in the way of us calling Confluence truly worthy of the 1.0 label.

Contents

1. New Features
2. New Macros
3. Improvements
4. Notable Bug-fixes
5. Outstanding Issues

See also: Issues Resolved for 1.0rc6

New Features

Private Confluence Configuration

In private mode, the only way to add users to Confluence is through the administrative interface: users can not sign up on their own. This way, you can prevent random passers-by from signing on to your Confluence installation. The site administrator can configure this in the general administration settings.

Email Address Privacy

Another much-requested feature, the site administrator has three options for email-address privacy:

- Public: just like pre-rc6, users email addresses are displayed publicly.
- Masked: email addresses are still displayed publicly, but masked in such a way to make it harder for spam-bots to harvest them.
- Private: only site administrators can see users' email addresses.

Administrators should be aware that even in private mode, anyone in the confluence-admin group will still be listed (with their email address) on the administrators page, although their addresses will be masked.

Share User Management with JIRA

For sites with both a Confluence and a JIRA installation, Confluence can be set up to delegate its user-management to JIRA.

Template Field Types

Templates now support drop-down menus and text-input areas.

@variablenametextarea(5,10)@ will give you a 5 x 10 text-area called ‘variablename’.
@variablename|list(one,two,three,four)@ will give you a drop-down list called ‘variablename’, with options one, two, three and four.
Step 2: Fill in template variables

Choose values for the variables in this template. These values will be automatically inserted into the template for you in the correct locations.

<table>
<thead>
<tr>
<th>Name of software:</th>
<th>postfix (name)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Installed on:</td>
<td>mail (server)</td>
</tr>
<tr>
<td>Installed by:</td>
<td>Charles Miller (installer)</td>
</tr>
</tbody>
</table>

Configuration Notes

Follow the instructions for installing SASL authentication from [here](http://ezine.daemonnews.org/200306/postfix-sasl.html)

New Macros

- The `{html}` will allow you to insert arbitrary HTML code into a page. This macro is turned off by default, as it is a security-risk on public systems. We only recommend you enable it on private or intranet-based Confluence installations where you trust your users not to write malicious HTML code. Here's a trivial example of its use:

  ```html
  <p>This HTML is <b>inserted</b> into the page</p>
  ```

- The `{junitreport}` macro has an option: "reportdetails=failuresonly" that will cause it to only show details of tests that have failed. For example: `{junitreport:directory=file://var/tests|reportdetails=failuresonly}

Improvements

- Users are now taken to their preferred homepage rather than the dashboard after logging in
- Text-fields in a template are disabled during preview and viewing
- Orphaned and Undefined page reports are now paginated
- Macros such as `{code}` or `{noformat}` are now made part of a list if they are placed adjacent to them

Notable Bug-fixes

- User->Group relationships should no longer disappear during manual or scheduled backups
- Search results no longer allow people to see content they might not be allowed to see
- Comments should no longer appear out of order on a page
- Moving a page between spaces no longer breaks #anchor links
- Many rendering fixes, some subtle, some not so
- Many stability fixes, especially regarding import and export

Outstanding Issues

Random MySQL Disconnections
If you are running Confluence against MySQL using Confluence's built-in datasource, the connection with the database server may be lost after long periods of inactivity. We are pretty sure we have a fix for this, but since the bug takes several hours to manifest, we were not able to test the fix before the release of rc6.

The good news is that if we are right, it will only require a quick edit of your configuration file to implement the fix. Further announcements will be made both on confluence.atlassian.com, and the confluence-user mailing-list.

In the meantime, the workaround is to not use Confluence's built-in datasource, but to configure Confluence to use your application-server's JNDI datasources instead. Instructions for doing this with Tomcat can be found here, and if you need more help, don't hesitate to contact us at confluence-support@atlassian.com.

Latin Characters under Resin

We've tested creating pages with non-ASCII titles and content across several different browsers and several different operating systems, and they seem to be working reliably now... except on Resin. This will be quite noticeable since confluence.atlassian.com itself is running under Resin, but we have so far been unable to come up with a solution that works on this application server.

For users who need this functionality, we suggest running under Tomcat.

Also..

- On MySQL, the "orphaned pages" report may include the space's homepage CONF-766
- You can create a link to a page with an illegal title: prompting the user to create a page that can not exist CONF-810
- Trackbacks are not sent for shortcut links CONF-888

Release Notes 1.0a3

Confluence 1.0a3

Confluence 1.0a3 was released December 5 2003

New Features

- Completely rearchitected around the spring framework
- Page comments (CONF-235) - users can now attach comments to a page.
- Email notification for new comments.
- Supports non-ASCII characters in page names (CONF-297)
- Improved handling of internal and external links in exported PDFs
- Editing popup to help with inserting links (internal and external) into pages (CONF-129)
- Personal history (CONF-196) - a popup window containing your recently visited pages.
- Page information screen (CONF-270) lists all the incoming and outgoing links for a page, and all attachments
- User profile UI has been enhanced (CONF-172)
- Dashboard and Space summary pages have had a big UI overhaul
• Brief help on Wiki notation now available on create and edit pages. (CONF-295)
• Improved available help on various pages.
• Enhanced mail-server administration.
• All pages have a printable version accessible from the icon at the top-right of the page (CONF-338)
• HTML and text email notifications have been greatly improved and are now much more useful. Links in HTML emails work seamlessly with online Confluence version.
• Many other minor fixes, improvements and performance tweaks

Release Notes 1.0b2

I see dead pages!

Confluence 1.0b2 was released on Friday January 16, 2004 with a major bug in its search indexing that caused it to index pages that no longer existed. It was replaced by 1.0b3 the next Monday.

See also: Release Notes 1.0b3 and Issues Resolved for 1.0b3

Feature List

The features listed on this page refer to Confluence version 1.0 beta1.

Content Management

• Content is organised into discrete spaces in which users can create and edit pages.
• Easy-to-learn, easy-to-read but powerful notation for designing pages and linking between them, based on the popular textile markup.
• Arbitrary files can be attached to pages.
• Comments can be left on pages.
• Page templating allows rapid creation of boiler-plate pages.
• Pages can be organised into hierarchies.

Update Tracking

• Each page has a full change history, accessible as coloured diffs highlighting each change made.
• Simple Reports which pages have been updated since you last logged in.
• Email subscription informs you of pages that have been added or updated, or comments left.
• RSS feeds available for new and updated pages across the site, or in individual spaces.

Searching

• Full-text searching of all content, including pages, comments and space descriptions

Site Management

• Smart page-renaming updates links across the entire site, even in comments or space descriptions.
• Pages or spaces can be imported from plain text files, or exported to PDF or HTML.
• Simple backup and restore to XML files.
• Automatic daily backup feature.
• Reports of "orphaned" pages that exist but are not linked to, and of links that point to pages that do not yet exist.

User Management and Security

• Flexible security, from a public site, to a personal space.
• User- and group-based permissions.
• Separate viewing, commenting, editing and administration permissions for each space.

Deployment and Compatibility

• Available on a wide variety of platforms, either as a stand-alone server, or as a web-archive deployable into a compatible Java application server.
• Compatible with a large number of databases
Support

- Confluence is under full-time development, with licensees entitled to a year of free updates.
- Atlassian's Legendary Service.

Release Notes 1.0rc1

Confluence 1.0rc1

It's Friday again, and that means it's time for us to release Murray; Confluence 1.0 Release Candidate 1.

RC1 marks the start of the feature-freeze as we plunge headfirst towards a stable 1.0 release. From now until 1.0-final we will be concentrating on fixing up the remaining bugs and polishing the interface. We are hoping that we won't need to send out a second release candidate, but we can't really make any promises until we've had a chance to go through the inevitable deluge of new issues that will follow this release.

Of course, this means that there are features you want to see in Confluence that won't make it into 1.0-final. [Keep those ideas and suggestions coming|DISC:]. Confluence isn't going to stop at 1.0 -- we just had to draw a line _somewhere_ or we'd end up perpetually in beta. We have no plans to slow down development after the first major release. Your Confluence licence includes a year of upgrades, and if you think Confluence is way cool now, it's just going to get better.

As always, before upgrading an existing Confluence installation, be sure to back up your data.

As you can see below, we've been busy the last two weeks. A hard-earned thirst needs a good cold beer.

Contents

1. New Features
2. New Macros
3. Improvements
4. Notable Bug Fixes
5. Outstanding Issues
6. Database Changes from Beta

See also: Issues Resolved for 1.0rc1

New Features

Remote API

![Confluence can now be browsed and edited remotely via SOAP or XML-RPC.](http://blogs.atlassian.com/rebelutionary/images/screeshots/conf-cocoa-client-shot-thumb.gif) Confluence can now be browsed and edited remotely via SOAP or XML-RPC. [There are more details of the XML-RPC API here](http://developer.atlassian.com/display/CONFDEV/Confluence+XML-RPC+and+SOAP+APIs), while the SOAP WSDL can be downloaded from `{$your_confluence_root$/rpc/soap/confluenceservice-v1.wsdl}`). Throwing together a GUI client for Confluence is now [pretty](http://blogs.atlassian.com/rebelutionary/archives/000385.html) [easy](http://fishbowl.pastiche.org/2004/02/05/a_confluence_gui_client_in_200_lines_of_code), so feel free to embed Confluence support into your favourite editor, web browser or IDE.

Blogging Enhancements

The sketchy blogging support from Beta4 has been upgraded and overhauled. Enhancements include:

- The look and feel of blog pages has been greatly improved.
- A "recent blog posts" list available from the Space Summary page.
- Daily and monthly views for blog posts.
- Blog posts can now be edited and deleted.
- You can now link to blog posts using the internal link syntax. Blog posts are addressed by their
posting-date and title, like so: \{SPACEKEY:/2004/01/03/Blog Post Title\}.

- You can link to the daily views, too: \{SPACEKEY:/2004/01/03/\.
- RSS feeds are available for new blog posts, both globally (from the dashboard), and for each space (from the space summary page).

Also, anonymous users are no longer allowed to post blog entries. We couldn't really think of a use-case where anonymous blog-posts would be wanted, but if you can, let us know!

### Configurable User Notification

With any knowledge-sharing application, it's important to keep informed as to what has changed. One way to do this is by subscribing to any of the RSS feeds offered by Confluence. Another is to have Confluence email you directly whenever there has been a change. Up 'til now, users have had to make do with the ad-hoc regular-expression based notifications that were put in for developers. With RC1, we now have a more fine-grained and user-friendly way to choose how you find out about changes to the site.

- Each day, Confluence can email you a summary of any changes that have been made to the site in the past 24 hours. You can activate this feature in your user preferences.
- You can subscribe to "watch" a page from the option in the right-hand operations menu. Whenever the page is modified, commented on, or a new attachment is added, you will receive an email. When you no longer want to watch the page, you can click the icon again to unsubscribe.
- You can subscribe to watch an entire space from the option on the space summary page. This subscribes you to all pages in that space, and also notifies you when new pages are created.

Each user can now also choose whether or not they will be notified of changes they make themselves.

### Trackbacks

While Confluence has always tracked links between pages within the Confluence site, it now has a way to track links to and from external sites: the Trackback API. In this way, a Confluence page can be informed when another site has mentioned it, and inform other sites that it has linked to them.

We have implemented the [Trackback](http://www.movabletype.org/docs/mttrackback.html) and [Trackback auto-discovery](http://www.movabletype.org/docs/mttrackback.html#autodiscovery%20of%20trackback%20ping%20urls) APIs across pages and blog-posts. Trackback is a widely implemented API that allows web pages to notify each other of links. You can enable (or disable) trackbacks from the Confluence general administration page.

When Trackbacks are enabled, each Page and Blog Post within Confluence is set up to receive trackback pings, and contains the auto-discovery code to allow clients to automatically find out how to send those pings. Trackbacks that are received are listed in the right-hand sidebar of the page.

Also when Trackbacks are enabled, Confluence will perform auto-discovery on each outgoing link from a page to see if the destination is equipped to receive trackbacks, and send its own trackback ping.

Look forward to future versions of Confluence making _very_ interesting use of this feature. :)

### Per-Space Look and Feel

The template-- and colour-scheme editing features that were available on a global basis in previous versions of Confluence can now be configured separately for each space, allowing you to apply a different look and feel to the various spaces within your Confluence site.

### New Macros

- [Panel Macro](#) allows you to draw a shaded box containing some content.
Improvements

- Import and Export should now be much faster, and use significantly less memory.
- The user browser now has a search function, to make it possible to manage large numbers of users effectively.
- Incoming links are no longer displayed on a page if the user is unable to view the page being linked from.
- The \{anchor\}, \{blog-posts\}, \{index\} and \{quote\} macros are now documented properly.
- You can escape smileys by putting a backslash before their last character, to cause them not to be rendered as images :).
- You can now link to peoples' user profile pages with \{~username\} (e.g. \{~cmiller\}).
- You can now link to space homepages with \{SPACEKEY:} (e.g. \{TEST:}.
- mailto: links have a nifty icon: mailto:user@example.com.
- The History popup now tracks your visits to blog posts, space summaries and user profile pages.
- Recent changes listings on the dashboard, user profile and space summary pages now includes changes to all content, not just pages.
- New Emoticons! (well, icons really)

| (y') | (n') | (i') | (') | (x') | (') |
| (y) | (n) | (i) | () | (x) | () |

Notable Bug-fixes

- Added HTML headers to detect and prevent RSS, HTML-Include and FatCow macros from being made to loop in on themselves. [CONF-525@JIRA]
- The \{anchor\} macro, and \{DOCPRIV:|null\} links now work as advertised. [CONF-616@JIRA], [CONF-605@JIRA]
- Fixed a divide-by-zero error in page diffs. [CONF-584@JIRA]
- Included \{javax.transaction\} libraries with release, to allow the WAR to run under Tomcat 5 [CONF-613@JIRA].
- And many more rendering and stability fixes...

Outstanding Issues

- Still some problems with character encoding in page titles. [CONF-569@JIRA]
- HTML include macro interacts badly with other Radeox filters. [CONF-549@JIRA]

Database Changes from Beta4

New Tables

TRACKBACK and NOTIFICATION tables were introduced. These tables should be generated automatically when you first start RC1.

New column in the EXTRNLINKS table

- alter table EXTRNLINKS add column CONTENTTYPE varchar(255);
- Constraint Change on LINKS Table*

The "not null" constraint was removed from the DESTPAGETITLE column of the LINKS table. Consult your database documentation on how to alter your database for this change. For example:

- _MySQL 3.23:_ alter table LINKS modify DESTPAGETITLE VARCHAR(255);
- _PostgreSQL 7.3.2:_ alter table LINKS alter DESTPAGETITLE drop not null;

Issues Resolved for 1.0rc1

JIRA Issues
Release Notes 1.0b3

Confluence 1.0b3

1.0b3 was released on January 19th, 2004. It replaces the short-lived 1.0b2 release, after 1.0b2 managed to escape into the wild with a bug in the search index that made it see pages that weren't there any more. Since 1.0b2 only existed for one weekend, the release-notes for both versions have been folded into a single document.

This is a massive release. Over 90 issues (new features, improvements and bug-fixes) were resolved between beta-1 and beta-3, with even more improvements made below the issue-tracking radar.

Contents

1. New Features
2. New Macros
3. Improvements
4. Notable Bug-fixes
5. Outstanding Issues

See also: Issues Resolved for 1.0b3

New Features

Search Attachments

Attachments are now indexed for searching just like any other content in the Confluence space. Alongside text, HTML and XML attachments, Confluence will also index Word, RTF and PDF documents.

Configurable Look and Feel

The site administrators can now customise the colour-scheme of the Confluence installation. More advanced configuration can be done by [editing the site's templates] through a web interface, changing the appearance of the whole site.

Site Homepage

The site administrator can now set the site homepage for users who have not logged in: choosing from either the dashboard (the default behaviour in beta1 and before), or any of the Space homepages within the site.

Users who have logged in can choose their own site homepage in their user profile.

RSS Feed for New Comments

You can subscribe to all new comments added to a space using an RSS newsreader. (The link to the RSS feed can be found on the Space Summary page)

Emoticons
New Macros

- **Include Page Macro** include the contents of one Confluence page within another.
- **HTML Include Macro** include the contents of an HTML document within a Confluence page (turned off by default. See [Enabling the html-include Macro](#) for more information).
- **RSS Feed Macro** include an external RSS feed
- **Search Results Macro** include the results of a Confluence search
- **JIRA Issues Macro** integrate Jira issue reports with your Confluence site
- **JUnit Report Macro** include JUnit test result data

Improvements

- Users' login names and full names are indexed for searching.
- Users' profiles may now be longer than 255 characters, and are also indexed for searching.
- Usernames are no longer case-sensitive.
- Anonymous contributions are clearly labeled.
- Users are warned if they are editing or commenting without having logged in.
- Notification emails now link to the appropriate "diff" page, so you can quickly see what has changed.
- Page diffs now highlight precisely what changed within each line: very useful when just one or two words change in a long paragraph.
- Lists of child pages and links are sorted alphabetically.
- Long lists of pages or search results are paginated.
- Shortcut links can be given different link text in the same way as other links.
- Incoming links and "hot referrers" are listed in the sidebar of the page view.
- Child pages are listed below the page contents in the page view.

Notable Bug-fixes

- You no longer get the old page (or don't see the comment) immediately after editing or commenting on a page [http://jira.atlassian.com/browse/CONF-453](http://jira.atlassian.com/browse/CONF-453).
- Persistent login cookies no longer conflict with a JIRA installation on the same server [http://jira.atlassian.com/browse/CONF-440](http://jira.atlassian.com/browse/CONF-440).
- Persistent login cookies no longer fail for users with certain characters in their username [http://jira.atlassian.com/browse/CONF-387](http://jira.atlassian.com/browse/CONF-387).
- Users who are not logged in no longer see strange table titles [http://jira.atlassian.com/browse/CONF-422](http://jira.atlassian.com/browse/CONF-422).
- And many more.

Outstanding Issues

- You should restart Confluence immediately after finishing the initial setup steps, to avoid data loss [http://jira.atlassian.com/browse/CONF-493](http://jira.atlassian.com/browse/CONF-493).
- New-lines may not be drawn if the next line starts with whitespace: [http://jira.atlassian.com/browse/CONF-475](http://jira.atlassian.com/browse/CONF-475).
- Emoticons are rendered inside \{noformat\} blocks: [http://jira.atlassian.com/browse/CONF-502](http://jira.atlassian.com/browse/CONF-502).
- If you put a \{children\} macro after an \{include\} macro, it will list the children of the included page: [http://jira.atlassian.com/browse/CONF-504](http://jira.atlassian.com/browse/CONF-504).

Release Notes 1.0a2

**Confluence 1.0a2**

Confluence 1.0a2 was released November 6, 2003.

**New Features**

- Shortcut links ([CONF-195 & CONF-247](#)) - shortcut links enable you to easily make links to any 'web service' from within the syntax of a Confluence page. Simply specify your shortcut and the URL to link to (e.g. "google", "http://www.google.com/search?q=$1") to add your own links. You could use this to link directly to JIRA installations, Google, intranets, searches or anything that has a 'URI' based interface.
- Revert page to a previous version ([CONF-32](#)) - revert to a previous version of any given page from the list of previous versions.
- Forgot password function ([CONF-88](#)) - retrieve your password if you happen to have forgotten it.
- Report: undefined pages ([CONF-197](#)) - list of all pages which are linked to from other pages, but not defined.
- Report: orphaned pages ([CONF-198](#)) - shows all the pages which are never linked to (ie have content but no way to get to them).
- Interstitial help page after creating a space ([CONF-251](#))
- 'Notify me', and HTML/text email preferences, with HTML email content
- Links to non-exported pages are now maintained in exported PDFs (the links point back to the online Confluence installation)
- Custom Radeox macros can now be used within Confluence - this enables you to write your own macros to produce custom content
- XML import/export of a single space ([CONF-199](#)) - useful for porting spaces between installations
- XML import/export of a single page ([CONF-200](#)) - useful for creating pages automatically, or sync'ing pages between installations.
- Many other minor fixes, improvements and performance tweaks

Release Notes 1.0.1

**Confluence 1.0.1**

Over the course of the last month of supporting Confluence 1.0, there are a number of patches that we have...
been distributing to fix specific problems our users have encountered. Confluence 1.0.1 is a maintenance release into which all these patches have been integrated.

Who Should Upgrade?

All the issues that were resolved for this release are listed below. We have not snuck in any other changes: what you see here in the release notes is precisely what you will get. If you find something on the list that directly affects you, or that you feel justifies the effort of an upgrade, then do so. Otherwise, feel free to stick with 1.0.

Upgrade Procedure

If You Have Customised osuser.xml

If you have customised Confluence’s user-management, for example to integrate it with LDAP or JIRA, you will have to integrate your changes to account for the caching OSUser providers we introduced in Confluence 1.0.1. See this document for more details: Confluence Caching OSUser Provider. Updated instructions for integrating with JIRA user management are here: Delegate user management to use JIRA logins.

Otherwise

To avoid the possibility of data-loss, you should back up your ConfluenceHome directory and your database before upgrading, and perform a full backup from within the application.

Changes in 1.0.1

See also Issues Resolved for 1.0.1

Direct Attachment Links

In response to a loud demand from users, links to attachments using the \^[attachment.jpg] syntax will download the attachment file directly, instead of linking to an anchor in the destination page.

Sybase ASE Support

Confluence 1.0.1 resolves the following problems that were causing Confluence not to work with Sybase ASE 12.5.1:

- ORDER-BY mappings failing on Sybase (CONF-1021)
- Can’t add users under Sybase (CONF-1022)
- Weird datatype error under Sybase (CONF-1024)
- Sybase doesn’t like complicated distinct selects (404 page fails) (CONF-1025)
- Backup import fails under Sybase (CONF-1063)

These bug-fixes may also improve Confluence’s compatibility with other untested databases. They will not, however, have any effect on Confluence’s operation against PostgreSQL, MySQL or HSQL.

Microsoft SQL Server Dialect in Setup Page

The Microsoft SQL Server database dialect was missing from the database setup page. It has now been added to the list. Confluence has not yet been tested on Microsoft SQL Server, and the usefulness of this option is not yet guaranteed. However, since the Sybase issues above are now resolved and SQL Server belongs to the same family as Sybase, it would be well worth a try.

JIRA User Provider Caching

Users who were linking their user management to JIRA’s using the supplied provider were experiencing significant performance problems as a result. 1.0.1 introduces caching to the user provider, which should speed up these installations significantly.

Global Reports Visibility
Under Confluence 1.0, the global "undefined pages" and "orphaned pages" reports did not properly filter out pages that the user could not see. The user could not see the content of any page they did not have access to, but they could learn of the existence of (and names of) pages and spaces they were not permitted to see. This bug is fixed in 1.0.1

Locale-Independent Dates in Backup/Restore

In Confluence 1.0, dates were written into backup files using a localised representation of the month. As such, if you exported Confluence data from a server in one locale it might not import successfully into a server with a different Locale setting. Confluence 1.0.1 still recognises the 1.0 export format, but its own exports will write out dates in a locale-independent format.

As noted above, this means that data exported from Confluence 1.0.1 can not be imported successfully into Confluence 1.0.

Fix Browser Crash on Viewing Some Templates

Previously, if you created a template containing no variables, then anyone attempting to preview or use that template would have their browser hang in an infinite Javascript loop. Confluence 1.0.1 fixes this bug.

Typo Fixed on User Group Editing Page

A single-character change from "privilage" to "privilege".

Issues Resolved for 1.0.1

Release Notes_1.0.1

Confluence 1.0.1

Over the course of the last month of supporting Confluence 1.0, there are a number of patches that we have been distributing to fix specific problems our users have encountered. Confluence 1.0.1 is a maintenance release into which all these patches have been integrated.

Who Should Upgrade?

All the issues that were resolved for this release are listed below. We have not snuck in any other changes: what you see here in the release notes is precisely what you will get. If you find something on the list that directly affects you, or that you feel justifies the effort of an upgrade, then do so. Otherwise, feel free to stick with 1.0.

Upgrade Procedure

If You Have Customised osuser.xml

If you have customised Confluence's user-management, for example to integrate it with LDAP or JIRA, you will have to integrate your changes to account for the caching OSUser providers we introduced in Confluence 1.0.1. See this document for more details: Confluence Caching OSUser Provider. Updated instructions for integrating...
with JIRA user management are here: [Delegate user management to use JIRA logins](#)

**Otherwise**

To avoid the possibility of data-loss, you should back up your ConfluenceHome directory and your database before upgrading, and perform a full backup from within the application.

## Changes in 1.0.1

See also [Issues Resolved for 1.0.1](#)

### Direct Attachment Links

In response to a loud demand from users, links to attachments using the \[^attachment.jpg\] syntax will download the attachment file directly, instead of linking to an anchor in the destination page.

### Sybase ASE Support

Confluence 1.0.1 resolves the following problems that were causing Confluence not to work with Sybase ASE 12.5.1:

- ORDER-BY mappings failing on Sybase ([CONF-1021](#))
- Can't add users under Sybase ([CONF-1022](#))
- Weird datatype error under Sybase ([CONF-1024](#))
- Sybase doesn't like complicated distinct selects (404 page fails) ([CONF-1025](#))
- Backup import fails under Sybase ([CONF-1063](#))

These bug-fixes may also improve Confluence's compatibility with other untested databases. They will not, however, have any effect on Confluence's operation against PostgreSQL, MySQL or HSQL.

### Microsoft SQL Server Dialect in Setup Page

The Microsoft SQL Server database dialect was missing from the database setup page. It has now been added to the list. Confluence has not yet been tested on Microsoft SQL Server, and the usefulness of this option is not yet guaranteed. However, since the Sybase issues above are now resolved and SQL Server belongs to the same family as Sybase, it would be well worth a try.

### JIRA User Provider Caching

Users who were linking their user management to JIRA’s using the supplied provider were experiencing significant performance problems as a result. 1.0.1 introduces caching to the user provider, which should speed up these installations significantly.

### Global Reports Visibility

Under Confluence 1.0, the global “undefined pages” and “orphaned pages” reports did not properly filter out pages that the user could not see. The user could not see the content of any page they did not have access to, but they could learn of the existence of (and names of) pages and spaces they were not permitted to see. This bug is fixed in 1.0.1

### Locale-Independent Dates in Backup/Restore

In Confluence 1.0, dates were written into backup files using a localised representation of the month. As such, if you exported Confluence data from a server in one locale it might not import successfully into a server with a different Locale setting. Confluence 1.0.1 still recognises the 1.0 export format, but its own exports will write out dates in a locale-independent format.

As noted above, this means that data exported from Confluence 1.0.1 can not be imported successfully into Confluence 1.0.
Fix Browser Crash on Viewing Some Templates

Previously, if you created a template containing no variables, then anyone attempting to preview or use that template would have their browser hang in an infinite Javascript loop. Confluence 1.0.1 fixes this bug.

Typo Fixed on User Group Editing Page

A single-character change from "privilage" to "privilege".

Release Notes 1.0.3

Confluence 1.0.3

Confluence 1.0.3 is another maintenance release, hopefully the last maintenance release we will need on the 1.0 branch before moving full steam ahead towards version 1.1. It fixes some bugs regarding the remote SOAP/XML-RPC API, the display of the 404 error page under Postgresql, and the display of the site's stylesheet under certain versions of Internet Explorer.

The Confluence development team are now working hard on 1.1, which will contain significant improvements and new features. Remember, a Confluence license entitles you to a year of upgrades, so if you buy 1.0.3 today, you'll be able to upgrade to 1.1 for no extra charge when the time comes.

See also: Issues Resolved for 1.0.3

Who should upgrade?

Confluence users should be running at least Confluence 1.0.2. Versions prior to 1.0.2 contain a bug that will cause their licenses to expire a month after the build date listed in the page footer, regardless of the true expiry date of the license. Versions 1.0.2 and later do not contain this bug. (Note: In the absence of this bug, only trial licenses ever expire. Purchased licenses for Confluence do not expire.)

All the issues that were resolved for this release are listed below. We have not snuck in any other changes: what you see here in the release notes is precisely what you will get. If you find something on the list that directly affects you, or that you feel justifies the effort of an upgrade, then do so. Otherwise, feel free to stick with 1.0.2

Upgrade Procedure

Confluence 1.0.3 contains no database or configuration file changes, so you should just be able to unpack it on top of your existing Confluence installation:

1. Shut down the Confluence server
2. Back up conflicense/WEB-INF/classes/confluence-init.properties, and if you have customised it, conflicense/WEB-INF/classes/osuser.xml
3. Unpack Confluence 1.0.3 in the same location as your existing Confluence installation
4. Restore the two files you backed up in step 1 to the 1.0.3 installation.
5. Start Confluence

To avoid the possibility of data-loss, you should back up your ConfluenceHome directory and your database before upgrading, and perform a full backup from within the application.

Changes in 1.0.3

Global RSS Feed Fixes

The global RSS feeds found on the Dashboard page were not being generated correctly: an extra ')' was being added to the end of links. This has been fixed in 1.0.3

Page Not Found Fix for Postgresql

Users running Confluence against a Postgresql database were encountering a system error whenever someone attempted to visit a page that did not exist. This has been fixed.
Remote API Fixes

Several outstanding issues with the remote API that were holding back the TimTam client have been fixed. In addition a getVersion method has been added to allow client authors to determine which version of Confluence a server is running, and adjust their features to match. The full description of Confluence's remote API is here: Confluence XML-RPC and SOAP APIs

- The WSDL file now respects the server's configured base URL, so SOAP can be used on servers that are behind a proxy.
- getVersion now recognises when a user is in the confluence-administrators super-user group.
- storePage handles re-parenting a page correctly
- storePage will now allow a page to be renamed (all links to the page are automatically redirected)

Other Fixes

- You can now comment on a blog post when the title contains non-US-ASCII characters
- The bug that was causing some versions of Internet Explorer 6 to not display the site's stylesheet has been fixed

Release Notes 1.1

Nymboida, Nym to his friends, is Confluence 1.1. He wants to be your friend.

Confluence 1.1 is the first major update to Confluence. It's faster, more reliable, and packed with new features. Thanks to our policy of a year's free upgrades, any current Confluence customer will be able to upgrade to 1.1 at no cost.

Current customers, or new users who wish to try out Confluence for 30 days can download either the standalone or WAR distributions from the Atlassian website: http://www.atlassian.com/software/confluence

Upgrading from 1.0.3a

Upgrading Confluence should be pretty easy: you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

- Users who have enabled external user-management by customising their osuser.xml file will need to read this document also.
- Users who have used MySQL or Postgresql with Confluence 1.0 should read this document which explains how to get rid of any extraneous triggers or indexes that might have been created.

Contents

1. New Features
2. New Macros
3. Improvements
4. **Notable Bug-fixes**
5. **Outstanding Issues**

See also: [Issues Resolved for 1.1](#)

**New Features**

*Macro Management*

The biggest Nymboida new feature from an end user point of view is going to be the rewritten macro support.

**Management** - You can now enable and disable macros from this convenient (and very attractive) console. Macros are now grouped into libraries to make the management and creation of related macros simpler. Libraries can be installed, activated or deactivated as a single entity.

**Macro Libraries**

Use this page to enable and disable macros and libraries below.

<table>
<thead>
<tr>
<th>Libraries</th>
<th>Basic Macros</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Basic Macros</strong></td>
<td>This library includes basic macros for linking and formatting content.</td>
</tr>
<tr>
<td>6 of 7 macros enabled</td>
<td></td>
</tr>
<tr>
<td>Compatibility Macros</td>
<td>Disable library</td>
</tr>
<tr>
<td>All macros enabled</td>
<td></td>
</tr>
<tr>
<td>Advanced Macros</td>
<td>Disable</td>
</tr>
<tr>
<td>All macros enabled</td>
<td></td>
</tr>
<tr>
<td>HTML Macros</td>
<td>Enable</td>
</tr>
<tr>
<td>Library disabled</td>
<td></td>
</tr>
</tbody>
</table>

**User Macros** - We've also had a lot of requests from users for simple formatting macros: people who wanted their code snippets or notes to be formatted in a certain way. Confluence 1.1 contains a simple way for administrators to create new macros from within the application without a restart: defining a template that the macro will apply to its arguments or content. User macros are very handy for providing consistent formatting and layouts across your pages.

**User Macros**

This library contains user created template macros for formatting content.

<table>
<thead>
<tr>
<th>Name:</th>
<th>alert</th>
</tr>
</thead>
</table>
| Template: | `<div class="errorbox">
# if ($param1)<div class="title">$param1</div># end
$body
</div>` |

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
**Custom Macros** - Installation of new macro libraries is a breeze: simply drop the library .jar file inside the web application, restart Confluence, and your new macros will appear in the management console. Confluence 1.1 also includes a custom macro toolkit (with Task List example shown below) to help users build their own complex macros easily using Java.

![Task List Example](image)

More information:

- [Guide to Confluence Macros](#) - a guide to the Macro Management console
- [Writing User Macros](#) - how to write User Macros
- [Custom Java Macros - obsolete](#) - a guide (and worked example) for writing and distributing your own Java macros for Confluence

**Attachments: versioning, comments and WebDAV support**

**Versioning** - The number one feature request for Confluence 1.0 was versioned attachments. You ask, we deliver! 😊 Confluence can now have multiple versions of the same file attached to a page. It will keep a history of different versions of attachments, expandable dynamically.

**Comments** - Each attachment can now be accompanied with a comment describing why it is there, what it's about or the reason for it being attached. This is useful for tracking the differences between attachment versions, as well as for informing users as to why they should be interested in a particular file.

![Attachment Example](image)

**WebDAV** - You can configure Confluence to store attachments in an external WebDAV server. This allows companies with an existing WebDAV infrastructure to give users alternative ways of accessing attachments and attaching files to Confluence pages.

**Improvements to Page and Space Exports**

- Exporting pages and spaces to PDF should be a great deal more reliable now. Whereas in Confluence 1.0, the export was likely to fail if the pages contained questionable markup, we now dynamically clean up each page before we export it.
- You can choose whether or not page comments are exported. Often you want to exclude comments if you want to send out a PDF of a page or publish a space as a website.
- The templates used to publish pages and spaces to HTML can be customised on a global and per-space basis. This makes it easy to publish a static website from the contents of a Confluence space: customise your templates, choose which pages to export, and voila.

**Customise Display of Blog Posts**
The templates used to display blog posts (both individually and in lists) can be edited either globally, or on a per-space basis, in the same way as the site's main decorators are editable. Also, the interface for editing templates has improved and will continue to do so in future releases.

**Page Locking**

If you want to prevent another user from editing, deleting or renaming a page, you can now lock it. You may want to do this because certain pages in an otherwise public space (for example, front pages, disclaimers or copyright notices) must remain un-edited, or just because you're working on the page and don't want anyone else to interfere just yet.

Locking a page restricts editing to a single user (yourself), or members of a particular group. Anyone with the space administrative permission can override or delete a lock.

**Oracle and Weblogic Support**

We have made a concerted attack on the various issues that were making Confluence unreliable on Oracle and Weblogic, and we're pleased to report that both have been running just fine in testing. Most importantly, the bug that was preventing pages being saved to Oracle when they were over 4Kb in length has been fixed.

For details of what precisely was fixed, see:

- [The Weblogic support super-issue in JIRA](#)
- [The Oracle support super-issue in JIRA](#)

**Search Powerpoint and Excel Attachments**

Confluence already searches across attached Word, PDF and RTF documents, XML, HTML and any plain text file. This search support has now been expanded in Nymboida to include searching and indexing of all text within Microsoft Powerpoint presentations and Excel spreadsheets.

In addition, the new attachment comments are also searchable.

**TinyURL**

Every page has a unique, short URL displayed at the top of its Page Information page. This makes it easier to send colleague's the URLs for pages with long titles via email, instant message or IRC.

**New and Improved Macros**

**New**

- \{excerpt\} allows you to mark a portion of the page as its "excerpt". This has no effect on the page itself, but other macros (such as \{blog-posts\} and \{children\}) can use the excerpt as a short summary of the content of the page.
- \{excerpt-include\} includes one page's excerpt in another page.

**Improved**

- \{code\} macro supports coloured highlighting for several more languages: JavaScript, ActionScript, XML and SQL.
- \{code\} macro can have its title and border customised in the same way as the \{panel\} macro.
- \{blog-posts\} takes an optional \texttt{time} parameter to indicate how far back it should look for blog posts. For example, \{blog-posts:time=7d\} will show all blog-posts within the last seven days.
- \{blog-posts\} takes an optional \texttt{content} parameter to change the way the blog-posts are displayed. \texttt{content=excerpts} displays excerpts instead of the full content of the blog entry (using the \{excerpt\} macro if available, otherwise extracting the first few hundred characters of the post). \texttt{content=titles} displays the entries as a list of titles.
- \{children\} takes an optional \texttt{excerpts=true} parameter: if any of the children have an excerpt available, the first line will be displayed in the list.
### Improvements to the Markup Engine

Many improvements have been made to the Confluence markup parser, fixing niggling inconsistencies, and allowing many more combinations of effects. If you want to produce something like the following, you can:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
</table>
| Some code| ```public static void main(String[] args)
  {
    System.out.println("Hello World");
  }```                                                                 |
| A list   | • Item 1
• Item 2
• Item 3
• Item 4                                                                 |
| A panel  | ![I like cheese](image.gif)                                             |
|          | • Brie
• Camembert
• Gruyere
• Cheddar                                                                 |

You can also center an image using ![image.gif](image.gif)\_align=center!

### Improvements to Linking

- You can specify a link title (which appears in the mouse-over tooltip) by adding another section to the link: [Link Body Text|Page Name|Link Title]
- ![//foo/bar/baz.html](link) will create a relative URL link to /foo/bar/baz.html on the same server as Confluence is running
- file: URL links work
- UNC-style links: ![\SERVER\share\directory\file.doc](link) will create a file:// link to the file on an external share

**Note:** Some web browsers (specifically Mozilla) consider file: URLs to be a security hazard, and do not follow them.

### And a whole lot more...

Here’s the quick fire version of some of the other improvements we’ve made in this release:

- You can resize the recent changes lists on the dashboard and space summary pages. This change is persisted in your user preferences.
- UI state (whether comments or attachments are open, size of recent changes lists) persists between sessions for registered users.
- The maximum attachment size can be configured from the General Configuration administration page.
- Going to ![http://yoursite.example.com/display](link) now brings up a list of spaces instead of an error page.
- The display of the space summary page is significantly faster.
- Newly created users don’t show up on the dashboard recent changes list unless they edit their profiles.
- The word "Confluence" has been moved to the end of page titles instead of the beginning, making them...
easier to distinguish in tabs and bookmarks.

- There are more ways to navigate to the "recent blog posts" page for a space.
- Removing a user is significantly faster.
- Headings in pages are automatically turned into anchors with the same name.
- Creating a space now creates an index page as well as a home-page.

Notable Bug-fixes

It's hard to know where to start. We've fixed a lot of bugs across the whole application. If you want to know what's been fixed, you're probably best off looking for yourself.

Two areas, however, have been improved enough to deserve special mention.

- **PDF Export** - as mentioned above, we've made the PDF export much, much more reliable than it once was. Where before a page or space may have confused the PDF converter into not working, it should now be able to handle any markup you throw up at it.
- **International characters** - Many issues related to the use of non-ASCII characters in page titles, links, page contents and RSS feeds have been resolved since Confluence 1.0. Our users in non-English-speaking countries should find Confluence a much more pleasant and seamless experience now than they may have before.

Issues Resolved for 1.1

Release Notes 1.1.1

Confluence 1.1.1 is a maintenance release that fixes some bugs regarding attachments, page links and notifications. Remember, a Confluence license entitles you to a year of upgrades, and this upgrade along with future updates will be free of charge.

**Who should upgrade?**

This release mainly fixes the bugs discovered in our recent 1.1 release. The major issues resolved are listed below, or you can see the full list here. As some of the issues resolved have a significant impact on the user experience of Confluence, we recommend that anyone currently running 1.1 upgrade to 1.1.1.

**Upgrade Procedure**

1. Shut down the Confluence server
2. Back up confluence/WEB-INF/classes/confluence-init.properties, and if you have customised it, confluence/WEB-INF/classes/osuser.xml
3. Unpack Confluence 1.1.1 in the same location as your existing Confluence installation
4. Restore the two files you backed up in step 1 to the 1.1.1 installation.
5. Start Confluence

To avoid the possibility of data-loss, you should back up your ConfluenceHome directory and your database before upgrading, and perform a full backup from within the application.

**Changes in 1.1.1**
Attachment fixes

- Attachment versioning introduced a new table in Confluence that had a column whose name conflicted with some databases like Sybase
- Links to older version of attachments could not be accessed if the webapp was deployed with a context path
- Attaching files that contained '+' and '&' symbols caused certain pages in Confluence to break

These have been fixed in 1.1.1.

Notification fixes

Users opting to receive html formatted email received emails with the correct subject but no content. In addition, the "View Changes" link in the daily change email was broken. These are now fixed.

Email Server fixes

An upgrade to an email component used in Confluence in 1.1, caused an error to be displayed when users attempted to modify their email server settings. An upgrade has been added in 1.1.1 that will fix this problem to save users from having to perform the fix manually.

Export to PDF fix

Spaces labelled with names containing an ' &' symbol could not be exported to PDF. This has been fixed.

Wiki Notation fix

The notation for a horizontal ruler was changed to five dashes (up from 4) in 1.1. This stopped the ruler from showing. This has been changed back in 1.1.1.

Issues Resolved for 1.1.1

Error rendering macro 'jiraissues' : Unable to determine if sort should be enabled.

Release Notes 1.1.2

This fixes an upgrade problem in 1.1.1 where users attempting to upgrade from 1.0.x directly to 1.1.1 encountered an "Upgrade Failed" error. Therefore, if you are still using a version older than 1.1, and am planning to upgrade, please upgrade to 1.1.2 to avoid this problem.

If you have already upgraded to 1.1.1 from 1.0.3a and cannot start Confluence due to the upgrade error, simply download 1.1.2 and upgrade to it. This should fix the problem.

If you have already upgraded successfully to 1.1.1 from 1.1 then you may safely ignore this upgrade.

Useful tips when upgrading from 1.0.3a

Upgrading Confluence should be pretty easy: you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

- Users who have enabled external user-management by customising their osuser.xml file will need to read this document also.
- Users who have used MySQL or Postgresql with Confluence 1.0 should read this document which explains how to get rid of any extraneous triggers or indexes that might have been created.

Release Notes 1.2

Atlassian is proud to present Confluence 1.2, otherwise known as Swan, to the world. Existing customers who wish to upgrade, or new users who wish to try out Confluence for 30 days can download either the standalone or WAR distributions from the Atlassian website: http://www.atlassian.com/software/confluence
Swan is the second major update to Confluence, and once again all existing customers can upgrade for free, thanks to the provision for one year of free upgrades in your license. You will find that Swan contains significant new features in the areas of user management, search and space browsing, as well as the usual raft of enhancements, bug fixes and things we just couldn’t resist throwing in at the last minute.

In all, 109 issues were resolved between 1.1.2 and 1.2. You can see the full list here: [Issues Resolved for 1.2](#).

Looking towards the future, we are going to attempt to increase the frequency of releases. While having one release every three months makes for impressively long release notes, it also means that customers are often left waiting longer than might be necessary for important enhancements or bug-fixes.

Upgrading from 1.1.2

Upgrading Confluence should be pretty easy: you can find [instructions here](#). We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

You will need to reindex your site after upgrading to enable some of the new site search features. You can do this from the "Rebuild Search Index" link on the Administration Console.

Site administrators upgrading from 1.1.2 or earlier should take particular note of the changes to global and space permissions. Confluence should automatically upgrade old permissions to the new scheme when upgrading from or importing data from earlier versions, but it is a good idea to check that your spaces are still secure and accessible after the upgrade, just in case.

Upgrading from 1.0.3a

Users upgrading directly from 1.0.3a should also read the [Nymboida Release Notes](#) for caveats regarding the 1.0 -> 1.1 upgrade.

New Features

Page List Views

The old "list pages" screen has been enhanced, almost to the point of being unrecognisable. In its place, we now offer three ways to browse the contents of a space.

The **Alphabetical View** looks like the "list pages" screen from 1.1 and earlier, but it has been enhanced to allow you to find pages quickly by the first letter of their title.

The **Directory View** presents the contents of a space as a tree, allowing you to drill down the hierarchy of parent and child pages (You will need Javascript turned on to use this view).

The **Search View** presents Swan's enhanced search interface, already focused on the space you are looking at.

Image Thumbnails and Thumbnail Galleries
You can now display a thumbnail of any image attached to a page. Clicking on the thumbnail will pop up a window containing the full-sized image. For example, the nice picture of the waterfall from my holiday in California was generated by the following wiki-markup.

```
!waterfall.jpg|align=right thumbnail!
```

In addition, the {gallery} macro will create a thumbnail gallery of all the images that are attached to the page the macro is included in. You can see an example of this macro in action here: Thumbnail and Gallery Example.

The maximum sizes for thumbnails are configured in the General Configuration section of the Administrative Console.

**Threaded Comments**

Bowing to public demand, we have added the ability to arrange comments by thread: users may respond to a particular comment, and the comments will be arranged in accordance with who responded to what.

The default is still for comments to be presented as a flat list, but you can enable comment-threading in the General Configuration section of the Administrative Console.

**Improvements**

**Enhanced Search**
The site-search functionality of Confluence has been enhanced, both subtly behind the scenes, and quite obviously in front of them.

Behind the scenes, we now index more information such as attachment comments and filenames. We have improved the indexing of Powerpoint presentations so that more text is extracted from the Powerpoint file. We have also tweaked the ranking algorithms behind the search so that you are more likely to find the page (space, comment, blog post, attachment, user...) you are looking for.

More obviously, we have given the user a lot more control over searching with an intuitive user interface that allows you to limit searches by space, type of content, or date last modified, and to group search results by type and space.

The (search) macro has also been updated to take advantage of the new search features (the options are described more fully in the notation guide linked from Confluence's edit page):

```
{search:query=Confluence|maxLimit=5|spacekey=DISC|type=page}
```

New Permissions Interface
Two of the biggest issues users have been having with permissions in Confluence were:

- The interface for setting permissions was confusing.
- It was hard to keep sites that allowed anonymous access below the workgroup license 25-user limit, especially if they used external user management.

Both of these issues have been fixed in Swan, but it has involved a slight change in the way permissions are checked. This should not be a problem for new Confluence users: the new system is easier to use than the old. However, if you are upgrading from 1.1.2 or earlier, you should read this document to see what’s different.

And a whole lot more...

Here’s the quick fire version of some of the other improvements we’ve made in this release:

- The "double-click to edit" feature has been removed.
- Blog views now come with a monthly calendar showing nearby posts
- Macro libraries can now include images, or any other content the macro needs to serve over the web: look out for new example code in the macro documentation soon.
- Users can set their profile page to be their site homepage
- You can delete all referrer links that match your exclusion list (in General Configuration), to rid the site of referrer spam
- The site's administrative, search and editing pages are served with robots exclusion meta tags so that only the site's main content will be indexed by well-behaved search engines
- Restoring backups should be significantly faster for installations with many users
- Administrators can choose to restore backups from the filesystem instead of uploading them (important if your backup is quite large)
- Confluence now serves files with a proper Content-Length header, so browsers can display the download accurately
- CSS stylesheets are hidden in emails so they don’t mess up Lotus Notes
- Export and backup filenames use a neater yyyymmdd date format

Notable Bug-fixes

- Exports created on Windows can now be imported on Unix-like operating systems without having to fix the path separators
- Hyphens in page headings or anchors will no longer render strangely
- Restoring a backup during setup now properly generates the search indexes
- Page "short links" now respect the configured site URL, regardless of which URL the user is accessing the site from
- Strange Powerpoint files no longer choke the indexer
- Users with Admin privileges can now see the link to the Administration Console without being in the 'confluence-administrators' superuser group
- Space administrators can modify space templates without having global administrator privileges.
- User macros are now lower-cased by default
- It is now possible to change the case of a page title by renaming the page

Issues Resolved for 1.2

JIRA Issues
Permissions Changes in 1.2

For Swan, changes were made to the way Confluence manages and checks permissions. This document is a guide for anyone migrating from Confluence 1.1.2 or earlier describing why the changes were made, and what this means to existing Confluence installations.

Why Change?

There were two goals behind changing permissions in Confluence:

1. Fix a significant problem whereby users with external user management enabled could not also enable Confluence anonymous access without blowing out their 25-user workgroup license.
2. Make the user interface for assigning and viewing permissions easier to use and understand.

What Changed?

"Anyone" User Removed

In Confluence 1.1.3, there was an "Anyone" user, who represented anyone using the system, whether logged in or not.

This user was the source of the licensing problem, and no longer exists in Confluence 1.2

Anonymous Permissions Added

Confluence 1.2 has explicit permissions for anonymous users. These permissions are only granted to users who are not logged in.

There is nothing stopping an administrator granting some permission to anonymous users, but not granting it to logged-in users. This results in the slightly bizarre possibility that a user might be able to do more before logging in than they can after. Luckily, this is a pretty easy situation for administrators to avoid.

Enabling anonymous access has no effect on Confluence’s user count for licensing purposes.

Guard Permissions Added

The roles of the "Use Confluence" and "View Space" permissions have been expanded so that now they are required permissions before a user or group can be granted any more rights.

Before a user has access to anything in the Confluence server, they must first have "Use Confluence" permission, and likewise before a user has access of any kind to a space, they must first have the "View Space" permission.

For licensing purposes, your number of users is equivalent to the number of non-anonymous users with the "Use Confluence” guard permission.

Migrating from 1.1 to 1.2

Migrating Automatically

Authenticate to retrieve your issues
When you upgrade from Confluence 1.1, or when you restore a backup created in 1.1 into Confluence 1.2, an upgrade task will run to automatically migrate your permissions to the new scheme, while keeping them consistent with your 1.1 security settings. The task will make the following changes:

- All "Anyone" permissions will be converted into two separate permissions: one for Anonymous access, and one for the **confluence-users** group. (If the **confluence-users** group does not exist, this step will be skipped)
- Any user or group with some global or space permission will also be granted the equivalent guard permission.

After starting up with the new version of Confluence, we suggest that you check that the permissions have migrated successfully. While we have tested the migration code, maintaining your site's security is important enough to warrant a double-check, just in case.

### Migrating Manually

If the automatic migration does not complete successfully, which would most likely happen if you have removed the "confluence-users" group, you will need to perform the above steps manually, through the user administration interface.

### Release Notes 1.2.1

Confluence 1.2.1 is a maintenance release that fixes some bugs that users may have encountered using Confluence 1.2. It incorporates improvements to performance for large Confluence installations, and fixes bugs related to the remote API, over-use of disk space, and a few annoying errors users were experiencing when setting up a new Confluence instance.

1.2.1 is a free upgrade for all existing Confluence customers.

**Who should upgrade?**

The issues resolved below are all either fixes to problems that have affected small numbers of users, or improve areas of Confluence that may not be used in your installation. As such, we recommend you read through the release notes and decide whether this upgrade is necessary.

If 1.2 is working fine, and none of the issues below are bothering you, there is no need to upgrade.

### Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2, you can find instructions here. **We strongly recommend that you backup your confluence.home directory and database before upgrading!**

If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the Confluence 1.2 release notes.

### Changes in 1.2.1

See also: [Issues Resolved for 1.2.1](#)

### Remote API Fixes

- `getBlogEntries()` will no longer erroneously return SQL Timestamps instead of date objects — [CONF-175](#)
- `getPage()` will now successfully retrieve a previous page version — [CONF-1721](#)
- `renderContent()` can now successfully render a page containing the `{blog-posts}` macro — [CONF-1717](#)

### Setup Fixes

- Some users were encountering the following error during setup: "Unable to store Trigger with name:
'backupTrigger' and group: 'DEFAULT', because one already exists with this identification.” This should no longer occur — CONF-1760

- Some users were encountering a NullPointerException in org.apache.lucene.store.FSDirectory.create() during setup when connecting to an external datasource. This should no longer occur — CONF-1767

Performance and Efficiency Fixes

- Installations with large search indexes will no longer experience a performance degradation when saving content — CONF-1759
- Backups will no longer leave a redundant exploded copy of the files being backed up in the temp directory — CONF-1752
- Deleting a space was not deleting its attachments from the confluence home directory. This is now fixed — CONF-1765
- Thumbnails are now stored in their own directory, so they won’t be included unnecessarily in backups — CONF-1785

Other Issues Resolved

- Confluence now generates significantly higher-quality image thumbnails (Thanks to Mike Aizatsky for the tip) — CONF-1725

Note

Unless you are running JDK 5.0 (which we do not recommend as it is still in pre-release), this improvement will only be visible if you are running Confluence on Mac OS X

- URLs longer than 255 characters will no longer cause an exception when saving a page — CONF-1743
- Pages with titles containing quotes no longer break PDF exports — CONF-1719
- Internet Explorer 6 SP2 will no longer corrupt zip-files downloaded from Confluence — CONF-1669

Release Notes 1.2.2

Confluence 1.2.2 is a maintenance release that fixes some bugs that users may have encountered using Confluence 1.2 and 1.2.1. It fixes problems with attachment downloading, text file imports and text-only emails.

1.2.2 is a free upgrade for all existing Confluence customers.

Who should upgrade?

Confluence 1.2.2 includes a fix for CONF-1810. This bug will cause serious problems for anyone who attaches multiple versions of the same file to a Confluence page, corrupting subsequent downloads.

As such, Confluence 1.2.2 is a recommended upgrade for anyone running 1.2 or 1.2.1.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2 or 1.2.1, you can find ins.
We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the [Confluence 1.2 release notes](#).

### Changes in 1.2.2

See also: [Issues Resolved for 1.2.2](#)

- The correct file size will now be stored for multiple versions of the same attachment, fixing a serious download corruption bug – CONF-1810
- Long (excerpt) blocks no longer overrun their database field – CONF-1705
- The code macro will no longer garble XML – CONF-1829
- Page diffs now escape HTML tags correctly – CONF-1830
- Fixed Postgresql error when you try to import text files that contain the nul (\0) character – CONF-1739
- "New Blog Post" icon in Page Operations URL now goes to the correct URL – CONF-1848
- "Next" link at the bottom of the alphabetical page listing now works – CONF-1797
- Text-formatted Confluence daily emails are now sent as text – CONF-1724
- The search input box on the "404 Not Found" page has been fixed – CONF-1800

### Issues Resolved for 1.2.2

**Release Notes 1.2.3**

Confluence 1.2.3 is a maintenance release that fixes some bugs that users may have encountered using the 1.2 series of Confluence. It fixes problems with Oracle support on Weblogic, thumbnail display, errors moving pages between spaces.

1.2.2 is a free upgrade for all existing Confluence customers.

**Who should upgrade?**

The issues resolved below are all either fixes to problems that have effected small numbers of users, or improve areas of Confluence that may not be used in your installation. As such, we recommend you read through the release notes and decide whether this upgrade is necessary.

Of particular note should be CONF-1911 which might effect customers trying to use Confluence with Oracle under Weblogic, and CONF-1914, a security issue where users may determine the names of attachments that they can not access.

If Confluence 1.2.2 is working fine for you, feel free to stick with it.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2 or higher, you can find [upgrade instructions here](#). We strongly recommend that you backup your `confluence.home` directory and database before upgrading!
If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the Confluence 1.2 release notes.

Changes in 1.2.3

See also: Issues Resolved for 1.2.3

- Oracle LOB handler now works correctly under Weblogic – CONF-1911
- Attachments are no longer listed in search results if the user is not permitted to download them – CONF-1914
- Tomcat no longer hijacks Confluence's logging – CONF-1934
- Incoming page links no longer listed multiple times – CONF-1928
- Comments in daily update report are now linked properly – CONF-1904
- Thumbnails and the gallery macro no longer draw images with width and height of 0 – CONF-1861
- Fixed a system error moving pages between spaces when they are linked to from a comment – CONF-1851
- Fixed a system error when removing an attachment – CONF-1861

Release Notes 1.3

Atlassian Software is proud to present Confluence 1.3 (otherwise known as Murrumbidgee). Existing customers who wish to upgrade, or new users who wish to try out Confluence for 30 days can download either the standalone or WAR distributions from the Atlassian website: http://www.atlassian.com/software/confluence

Murrumbidgee is the third major update to Confluence (in less than nine months!), and once again we've raised the bar of what you should expect from a professional wiki. Confluence 1.3 looks better, performs better, installs more easily and does far more than it ever has before.

A big thanks to everyone who reported bugs, and offered suggestions over the last few months, especially everyone who helped by trying out our Confluence Development Releases.

Upgrading from 1.2.3

Upgrading Confluence should be pretty easy. We strongly recommend that you backup your confluence.home directory and database before upgrading!

You will need to reindex your site after upgrading to enable some of the new site search features. You can do this from the "Rebuild Search Index" link on the Administration Console.

Also, we've added a bunch of space-level permissions since 1.2. While our upgrade process should make sure everyone has the same permissions after the upgrade as they did before, it's a good idea to check to make sure nothing has been missed.

Upgrading from 1.1.2 or Earlier

Users upgrading from an earlier version of Confluence should check the release-notes of the other major
Confluence releases:

- Release Notes 1.2
- Release Notes 1.1

Contents

- New Features
- New Macros
- Improvements
- Notable Bug-fixes

See also: Issues Resolved for 1.3

New Features

Many of the features added to Confluence 1.3 are of interest only to site administrators. To get an idea of what's changed from the perspective of a user, you should read What's New in 1.3

Mail Archiving

| Location: Dashboard > BUGTRAQ > Mail Archive > MySQL Authentication Bypass |
|---|---|
| Subject: **MySQL Authentication Bypass** |
| From: NGSSoftware Insight Security Research |
| Date: Oct 22, 2004 |

NGSSoftware Insight Security Research Advisory

- Name: MySQL Authentication Bypass / Buffer Overflow
- Systems Affected: MySQL 4.1 prior to 4.1.3, and MySQL 5.0.
- Severity: High
- Vendor URL: http://www.mysql.com
- Author: Chris Anley [ chris@ngssoftware.com ]
- Date of Advisory: 1st July 2004

Confluence is a collaboration tool. When communication happens through Confluence, it gets archived, indexed and interlinked so the whole team can benefit from the information. But what happens to communication that happens via email? At best it gets hidden away in the corner of one team member’s inbox, at worst it just falls into nowhere.

Now, you can put that mail into Confluence as well.

Each Confluence space has a mail archive. You can import mail directly by uploading an mbox file, or you can have Confluence regularly poll a POP mailbox for new mail. Once mail is imported into Confluence it can be browsed chronologically or by thread, and searched using Confluence's powerful full-text search functionality.
The threading and searching functionalities within Confluence are more powerful, and more useable than most dedicated mail archives that you will find online! For more information about Confluence’s mail support, read the Mail Archiving FAQ.

**Themes**

It is now possible to package a particular Confluence look and feel into a theme. Themes can be dropped into a Confluence installation, after which they will be available for global or space administrators to customise the look and feel of the site.

Themes are built using the new plugin architecture that has been built into Confluence: for more details on how to create your own theme, see Theme Module.

The Trash Can
One of the most popular feature-requests, it is now possible to undelete pages, mail and blog-posts. When content is deleted from a space it is moved to that space’s trash can. Space administrators can restore deleted pages, or consign them to oblivion.

More Granular Space Permissions

Another of our most popular feature-requests, we've divided up the space permissions so administrators have more control over what users can and can not do.

Because you can never have enough neat-looking graphics.

Macros

- {note}, {information}, {warning} and {tip} macros let you add coloured notes to your page.
- The {section} and {column} macros give you an alternative to wiki-markup tables
- The {jiraportlet} macro allows you to embed a JIRA 3 portlet into a Confluence page
- The {excerpt} macro has an optional hidden=true parameter to hide the contents of the excerpt within the page
- The {excerpt-include} macro has an optional nopanel=true parameter to display the excerpt without any decoration
The \{jiraissues\} macro has an optional `count=true` parameter to display only the number of issues found, not the details of those issues. It also has an optional `cache=off` parameter to ensure that a list of Jira issues will refresh on each request.

The \{blog-posts\} macro consistently displays blog-posts in reverse chronological order.

The \{search\} macro can be limited to particular types of content.

The notation guide has been reorganised to be more friendly to users who don’t know what a macro is.

**Improvements**

**Referrer Management**

For public sites, referrer management has been vastly improved in Confluence 1.3, with a new management screen, the ability to block unwanted referrers right from where they are displayed, and the ability to turn off referrer tracking with a single click.

**Setup Wizard**

The Confluence setup wizard has been rewritten from the ground up. We’ve made it task-oriented, and stripped it back to just the stuff you need to get Confluence running. The result is a much smoother, much faster installation.

**User Interface**

We’ve made a lot of improvements to Confluence’s user interface. You’ll notice some improvements on the Dashboard, making it easier to see exactly what’s changed recently. You’ll notice some huge changes to the space summary/space administration section of the site.

**Backups**

- You can now exclude attached files from your backups. Of course, this means you have to back up your attachment directory separately, but if you already have a good backup regime for your filesystem (and can thus restore attachments separately), it means your Confluence data backups will take a lot less space.

- We now include important system configuration in your backups, so that when you restore a site from backup, it will work the same way as it did when you backed it up.

**Indexing**

We have improved the way we index content within Confluence, which means your searches are even more likely to find the right result.

If the primary language of your Confluence site is not English, you should change the "Indexing Language" preference in Confluence’s General Configuration.

**Site Performance**
We've identified a number of places that were slowing down the performance of Confluence sites, from the dashboard to the spaces list page, to the search indexer, to the storing of referrers. Confluence should now perform faster than ever.

Also...

- Pages in an export are now in alphabetical, not creation order.
- The remote API can be accessed by anonymous users (this must be turned on in General Configuration)
- When previewing a page, you can continue editing without having to go back to the edit page
- You can link to anything in Confluence if you know its ID in the database (currently this is how you must link directly to mail) using the following link format: [$1234]
- You can link to anything relative to the root of the Confluence installation (useful for pointing to parts of the site that can't otherwise be linked) using three leading slashes: [///pages/editpage.action?pageId=1234]
- A whole lot more that we've forgotten...

Notable Bug Fixes

We resolved a lot of issues between Confluence 1.2.3 and Confluence 1.3. The best way to see what we've fixed is to ask JIRA, the world's best issue-tracker: Issues Resolved for 1.3

Confluence Presentation

This presentation was relevant to Confluence 1.3, so it was rather outdated.

We have removed it from this documentation space. You can find a copy of it here.

What's New in 1.3

Many of the changes between Confluence 1.2 and 1.3 are really of interest only to Confluence administrators. Here we detail the changes that will be important to all Confluence users.

The Trash

Previously, when you deleted a page or blog post, it was unrecoverable. In 1.3, deleting a page moves it to the Trash. Space administrators can retrieve pages from the trash, or purge them forever. If a page has been deleted (or you have deleted a page by mistake), contact a space administrator to get it back.

Note Macros

There are new macros for inserting coloured notes into a page:

{note}:
Mail Archiving

Confluence now includes the capability to store email. This allows you to store mailing-list archives, or records of conversations amongst your team inside Confluence. Mail archiving must be set up by a space administrator.

All mail is indexed, but by default we exclude it from search results because the volume of email can often overwhelm the content of the Confluence site. When you do a search, you might see a reminder that there could be an answer to your question in the email archives.

To link to an email from a Confluence page, you must find the numeric ID of that mail from the end of its URL, and put that in your link like so: [$12572], which Confluence will draw like this: 12572

Improved JIRA Macros

The {jiraissues} macro has two new optional parameters:
- count=true makes the macro only return the number of issues matched by your filter, not the whole list of issues
- cache=off makes the macro retrieve the filter results from JIRA every time the page is loaded, ensuring the results are accurate. (Be careful if the filter returns a lot of results, though, you don't want to overload your servers)

There is a new {jiraportlet} macro that allows you to retrieve any portlet from a server running JIRA 3, and display it in a Confluence page, like so:

Unknown macro: 'jiraportlet'
Easy Column Layout

You can use the {section} and {column} macros to organise your page into columns. This is especially useful when you combine it with the {jiraportlet} macro: you can arrange a Confluence page just like a JIRA dashboard!

Here's a simple two-column layout:

For more information, check the notation guide

Other Things

- Take a look at how the space summary page has been reorganised
- If you hit alt-E on any wiki page or blog post (ctrl-E if you're using a Mac), you'll be taken to the edit page.
- If you start a link with three slashes, you can link to something relative to the root of the Confluence installation. This is useful for creating links to pages that are part of Confluence, such as the dashboard ([/]) or the space list ([/spaces/listspaces.action]).
- The {excerpt} macro can take a hidden=true parameter to hide the contents of the excerpt within the page.
- The {excerpt-include} macro can take a nopanel=true parameter to display the excerpt without any decoration or tables.

Release Notes 1.3.1

Confluence 1.3.1 is a maintenance release that fixes some bugs that users may have encountered using Confluence 1.3.

1.3.1 is a free upgrade for all existing Confluence customers.

Who should upgrade?

Confluence 1.3.1 fixes a number of bugs that were found in Confluence 1.3. However, none of the bugs that were fixed were considered critical or likely to cause data-loss. Administrators should only upgrade Confluence if they are affected by (or feel they would be affected by) one of the issues resolved by this release.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.
Changes in 1.3.1

See also: [Issues Resolved for 1.3.1](#)

- Preferences for hiding or masking email addresses are no longer ignored on some screens – [CONF-2352](#)
- The plugin manager will no longer fail with an error when trying to return a plugin to its default state after activating or deactivating it – [CONF-2396](#)
- Disabling hot referrers in the referrer manager screen now works as expected – [CONF-2397](#)
- The save option has been restored to the comment preview screen – [CONF-2321](#)
- Deleting a blog post or a page no longer leaves possible orphaned comments in recent changes lists – [CONF-2323](#)
- Also, some edge cases in the setup wizard were fixed, the demonstration content was tidied up, and a few minor UI issues were resolved.

Release Notes 1.3.2

Confluence 1.3.2 is a maintenance release which includes 30 bug fixes and improvements that users may have requested using Confluence 1.3.

1.3.2 is a free upgrade for all existing Confluence customers.

Who should upgrade?

We recommend that all 1.3.x users upgrade to Confluence 1.3.2. It includes, among other things, the fix of a memory leak which had been occurring in our error monitoring (see below or [CONF-2540](#)); if you have been encountering performance issues within Confluence, this could be of benefit.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or 1.3.1, you can find instructions here. **We strongly recommend that you backup your `confluence.home` directory and database before upgrading!**

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

Changes in 1.3.2

See also: [Issues Resolved for 1.3.2](#)

We've closed 30 issues, so we will not name them all. Among the most prominent in the list are:

- A memory leak in our collection of logging events as a threadlocal, see [CONF-2540](#).
- Consistent UI handling for editing and previewing blogs and comments, see [CONF-2479](#) and [CONF-2470](#).
- Improved IO handling when building exports, see [CONF-2510](#).
- Better cleaning up attachments when pages are removed, see [CONF-2567](#).
- etc ...
Release Notes 1.3.4

Confluence 1.3.4 is a maintenance release which includes a few important bug fixes for anyone running Confluence. These release-notes include information about the (briefly available) 1.3.3 version of Confluence, which 1.3.4 has superseded.

1.3.4 is a free upgrade for all existing Confluence customers.

Who should upgrade?

We recommend that all 1.3.x users upgrade to Confluence 1.3.4. For customers running 1.3.2 and earlier, it includes a fix to the security issue described in Confluence Security Advisory 2005-02-09, and it thus an important upgrade for anyone who is still running an un-patched system.

For customers running 1.3.3, the upgrade is also recommended as this version fixes CONF-2740, a regression in 1.3.3 which could cause referrer and trackback data to disappear.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or 1.3.1, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

Changes in 1.3.4

See also: Issues Resolved for 1.3.4

Since only five bug-fixes were made for this release, here is a quick run-down.

- The patch for the security issue described in Confluence Security Advisory 2005-02-09 has been applied to 1.3.4
- A regression in 1.3.3 that caused trackback and referrer data to be lost has been fixed – CONF-2731
- An intermittent ClassCastException when viewing blog-posts has been fixed – CONF-1671
- The image cache for Apache FOP is now cleared between exports, preventing a case where the wrong version of an attachment may end up in a PDF export – CONF-2647
- A spurious "Connection already closed" log message in the JIRA user management bridge no longer occurs CONF-2656

Issues Resolved for 1.3.4

Issues resolved for 1.3.3
Release Notes 1.3.5

Confluence 1.3.5 is a maintenance release which fixes a number of bugs found in earlier 1.3.x Confluence releases. Some areas improved in this release are space export/import, search and LDAP user management. 1.3.5 is also the first Confluence version to be successfully tested against Resin 3.0: see below for the special steps you need to take to get it running.

1.3.5 is a free upgrade for all existing Confluence customers.

Who should upgrade?

We recommend that all 1.3.x users upgrade to Confluence 1.3.5. For customers running 1.3.2 and earlier, it includes a fix to the security issue described in Confluence Security Advisory 2005-02-09, and it thus an important upgrade for anyone who is still running an un-patched system.

For customers running 1.3.4, the upgrade is also recommended as this version fixes CONF-2750, a regression in 1.3.4 that made it impossible to page through search results.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 – 1.3.4, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

Changes in 1.3.5

Resin 3.0 Compatibility

Confluence 1.3.5 is the first Confluence version to be successfully tested against Resin 3.0.12. Customers wishing to run Confluence under Resin 3 should read the special instructions at Known Issues for Resin 3.x

Issues Resolved
• Paging through search results no longer results in an error. CONF-2750
• Space export and import now performs much more reliably. CONF-2678
• Setup wizard no longer complains about an incomplete setup if you restore a backup from disk. CONF-2637
• Special characters in search no longer cause parser to explode. CONF-2527, CONF-2532, CONF-2728, CONF-2735...
• Attachment filenames containing spaces are no longer truncated when downloading using Firefox. CONF-2739
• For the full list of fixes, see Issues Resolved for 1.3.5

Release Notes 1.3.6

Confluence 1.3.6 is a special maintenance release for customers who are using Confluence with an Oracle database. It contains a number of fixes, originally developed for Confluence 1.4, to Confluence's behaviour against Oracle databases.

1.3.6 is available as a free upgrade for all existing Confluence customers from the archive download page.

Who should upgrade?

We recommend that customers skip Confluence 1.3.6 and upgrade to Confluence 1.4. Confluence 1.4 includes a great many new features and bug-fixes that are not included in 1.3.6. We do, however, recognise that 1.4 is a significant upgrade and some customers wish to continue with Confluence 1.3 for the time being.

Confluence 1.3.6 is recommended only for Confluence customers who:

• are not yet ready to upgrade to Confluence 1.4, and
• are running Confluence with an Oracle database

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 – 1.3.4, you can find instructions here. *We strongly recommend that you backup your confluence.home directory and database before upgrading!*

Changes in 1.3.6

Confluence 1.3.6 addresses a number of situations in which Confluence could lock up, consume additional resources, or fail to perform backup or restore operations against an Oracle database.

Release Notes 1.4

Atlassian Software is proud to present Confluence 1.4 (otherwise known as Hunter). Existing customers who wish to upgrade, or new users who wish to try out Confluence for 30 days can download either the standalone or WAR distributions from the Atlassian website: [http://www.atlassian.com/software/confluence](http://www.atlassian.com/software/confluence)
Hunter is the fourth major update to Confluence, and the biggest yet in terms of new features and improvements both visible to the user or hidden "under the hood". Between 1.3.5 and 1.4, we resolved a massive 480 issues.

A big thanks to everyone who reported bugs, and offered suggestions over the last few months, especially everyone who helped by trying out our Confluence Development Releases.

Contents
- Upgrading
- Migration
- New Features
- Notable Bug Fixes
- Outstanding Bugs

Upgrading From a Previous Version of Confluence

Upgrading Confluence should be pretty easy: you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

Upgrading from 1.3.5

Because of the significant UI changes between 1.3 and 1.4 (see below), we highly recommend disabling any themes or UI customisations before upgrading Confluence.

After upgrading to 1.4, administrators will need to rebuild the site's search-index to ensure all the new search features are enabled. Do this from the Content Indexing section of the global administration menu.

⚠️ Upgrade Migration

The database migration tasks that must be run to upgrade Confluence from 1.3 to 1.4 may take several minutes to run. During this time, Confluence will be unavailable.

埂 Confluence License Expiration

A commercial Confluence license entitles you to a year of free upgrades. As such, Confluence 1.4 is the first release of Confluence to which some customers may not be able to upgrade.

If you were issued your Confluence license before May 24th 2004, you will not be able to upgrade to Confluence 1.4. Confluence 1.4 will refuse to run with any license issued before this date, and you will be required to downgrade to a previous Confluence version.

Upgrading from 1.2.3 or Earlier

Users upgrading from an earlier version of Confluence should check the release-notes of the other major Confluence releases:
- Release Notes 1.3
- Release Notes 1.2
- Release Notes 1.1

Migration

The best place to find out about the new features available in Confluence 1.4 is by checking out our What's New in Confluence 1.4 pages. However, there are a few features of specific interest to Confluence administrators that will be mentioned here:

v2Renderer
The engine by which Confluence converts wiki-text to HTML has been rewritten from scratch for Confluence 1.4. This was necessary, as the complexity of Confluence's markup was overwhelming the capabilities of the previous engine and leading to an increasing number of bugs, some of which had the potential to bring down the entire server.

v2Renderer is in every way more powerful (and better, more predictable) than the previous engine, and has undergone a lot of testing to make sure that it renders wiki pages the same way as its predecessor. However, pages that made use of bugs or undocumented features in the original engine may no longer render the same in 1.4 as they did in 1.3. If you come across something that is a bug or a missing feature in the new renderer, please file an issue in JIRA.

One side-effect of the new renderer is that custom Java macros written for Confluence 1.3 and earlier may not be compatible with Confluence 1.4 (although most should continue to function). For more information, macro authors should read this document.

New User Interface

In response to a lot of feedback from customers and users of Confluence, the User Interface has undergone a major overhaul between Confluence 1.3 and 1.4. While the changes are mostly self-explanatory, and we believe the new interface is significantly easier for everyone to use and understand than its predecessor, it may be a good idea to make the following resource available to your users as part of the transition: 1.4 Interface - Where Did Everything Go?

Because of the substantial changes to the interface, themes and UI customisations made for Confluence 1.3 and earlier are not compatible with Confluence 1.4, and should be disabled before you upgrade.

Blogs have become News

Also in response to a lot of feedback, blogs in Confluence have now been renamed to news. We feel this makes it a lot easier to explain them to new and non-technical Confluence users. None of the functionality of blogs has been changed, just the name.

New Features

Confluence 1.4 has a lot of cool new stuff. Over the next week we'll be releasing a new section of the Confluence website that will examine the new features in detail. Stay tuned.

Notable Bug Fixes

We resolved a lot of issues between Confluence 1.3.5 and Confluence 1.4. The best way to see what we've fixed is to ask JIRA, the world's best issue-tracker: Issues Resolved for 1.4

Outstanding Bugs

Some bugs were introduced during the Confluence 1.4 development cycle that we could not fix in time for the final release. Of note are:

- Index rebuilding may fail on multi-processor systems (for a workaround, see CONF-3168)
- You can not install an XWork plugin by uploading through the web interface, it must be copied into WEB-INF/lib (CONF-3184)
- Uploading a malformed plugin through the web interface may make other plugins cease to function (CONF-3183)
- Under certain circumstances, the mbox mail import may fail against Oracle databases (CONF-3284)
- The Insert Image and Insert Link popups jump the cursor to the top of the text input area on browsers other than Internet Explorer (CONF-3232)

Once again, if you find any bugs in Confluence, or have any feature suggestions, you can report them online in JIRA.

Issues Resolved for 1.4
Release Notes 1.4.1

Confluence 1.4.1 is a maintenance release that resolves some issues users may have encountered using Confluence 1.4. Issues include an occasional failure to display Confluence pages, Oracle and MySQL database issues, and a slow memory-leak.

1.4.1 is a free upgrade for all customers who purchased their Confluence license after June 2nd, 2004.

Who should upgrade?

Confluence 1.4.1 is a recommended upgrade for all users of Confluence 1.4, as it addresses a memory-leak which, while slow, would progressively degrade Confluence's performance and ultimately cause the server to exhaust available memory.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4, you can find instructions here. **We strongly recommend that you backup your confluence.home directory and database before upgrading!**

If you are upgrading from Confluence 1.3.6 or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.

Changes in 1.4.1

See also: Issues Resolved for 1.4.1

- A slow memory leak has been fixed. ([CONF-3347](#))
- An issue where Confluence pages would intermittently only display their header when loading has been resolved. ([CONF-3295](#))
- Confluence will now deploy reliably on MySQL 4.1 with UTF-8 encoding. ([CONF-3306](#))
- Several issues regarding Confluence's use of the Oracle database have been resolved.
- A recurring bug preventing PNG images from being exported to PDF on some application servers has been fixed. ([CONF-731](#))
- Inconsistencies with custom colour-schemes have been resolved ([CONF-3314](#))

**Release Notes 1.4.2**

Confluence 1.4.2 is a maintenance release that resolves some issues users may have encountered using previous Confluence 1.4 releases. 1.4.2 introduces Websphere and DB2 compatibility, and fixes issues related to content indexing and the mail queue.

1.4.2 is a free upgrade for all customers who purchased their Confluence license after June 30th, 2004.

**Who should upgrade?**

Confluence 1.4.2 is a bugfix release. Customers should consult the list of issues resolved for this release to decide whether it is worth their while upgrading. Since this release includes a number of important performance and reliability fixes for content indexing, anyone who relies on Confluence’s search functionality should consider upgrading.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4 or 1.4.1, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.3.6 or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.

**Database Connection Pool Changes**

Dependent on the size of your Confluence installation, the new re-indexing task may use up to 10 database connections simultaneously. As such, you may need to increase the size of your database connection pool in order to allow Confluence to continue to operate during and after rebuilding the search index.

If Confluence has been set up to use direct JDBC connections, then you will find the setting for Confluence's connection pool size in confluence.cfg.xml in your confluence home directory. Confluence should update this value automatically when you upgrade, so after starting up Confluence 1.4.2 for the first time, you should check to make sure it has been updated to 15 connections, as seen below:

```
<property name="hibernate.c3p0.max_size">15</property>
```

If Confluence has been configured to use a datasource supplied by the application server, you should ensure the application server is configured to supply Confluence with sufficient connections to run.

**Changes in 1.4.2**

See also: Issues Resolved for 1.4.2

- Confluence has now been tested on Websphere 5.1.1.3 (see Known Issues for Websphere)
- Confluence has now been tested against DB2 8.1 (Linux and Windows)
- The mechanism by which Confluence rebuilds its full-text search index has been rewritten to be significantly less memory-intensive (but may be 10-15% slower). CONF-3340
- An issue that could cause comments or attachments to be removed from the search index when a page was edited has been resolved. CONF-3349
- An issue that could cause index rebuilding to fail (especially on multi-processor systems) has been resolved. CONF-3168
- Issues related to the size and reliability of the mail queue were resolved. CONF-3334 CONF-3474
- An exception when creating global templates was fixed. CONF-3386
- Some Javascript errors that were being flagged on Internet Explorer no longer occur. CONF-3422, CONF-3424

**Database Connection Pool Changes**

Dependent on the size of your Confluence installation, the new re-indexing task may use up to 10 database connections simultaneously. As such, you may need to increase the size of your database connection pool in order to allow Confluence to continue to operate during and after rebuilding the search index.

If Confluence has been set up to use direct JDBC connections, then you will find the setting for Confluence's connection pool size in confluence.cfg.xml in your confluence home directory. Confluence should update this value automatically when you upgrade, so after starting up Confluence 1.4.2 for the first time, you should check to make sure it has been updated to 15 connections, as seen below:

```
<property name="hibernate.c3p0.max_size">15</property>
```

If Confluence has been configured to use a datasource supplied by the application server, you should ensure the application server is configured to supply Confluence with sufficient connections to run.

Release Notes 1.4.3

Confluence 1.4.3 is a maintenance release that resolves some issues users may have encountered using previous Confluence 1.4 releases. 1.4.3 introduces a new SOAP service provider, and fixes issues related to incoming link tracking, notifications management, serving resources from dynamically loaded plugins, and much more.

1.4.3 is a free upgrade for all customers who purchased their Confluence license after August 17th, 2004.

Who should upgrade?

Confluence 1.4.3 is a bugfix release. While Atlassian recommends customers always run the most recently available stable Confluence release, customers should consult the list of issues resolved to decide whether it is worth their while upgrading.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4 to 1.4.2, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.3.6 or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.

Changes in 1.4.3

See also: Issues Resolved for 1.4.3

Remote API Changes

Confluence now ships with an second SOAP provider running Apache Axis, alongside the existing Glue SOAP provider. This is the first step towards migrating entirely to Axis as our sole SOAP provider over the next few major Confluence releases. If you use Confluence's SOAP API, you should read this document for information about the migration process and timeframe.

⚠️ All SOAP clients that worked with Confluence 1.4.2 will continue to work with Confluence 1.4.3 with no change.

Other changes made to the remote API:
A condition under which SOAP faults could be masked by HTML error pages on some application servers was resolved. (CONF-3043)
Deleting a page via the remote API now places that page in the trash. (CONF-3403)
Adding space level permissions to a user through the remote API now works as expected. (CONF-3596)

Other Changes and Fixes

A bug that would cause a page's most recent editor to change when the page was previewed has been fixed (CONF-3424)
A bug that could cause a page's incoming links not to be displayed has been fixed (CONF-3509)
A bug that could cause "Watch this space" not to function has been fixed (CONF-3510)
A bug that could cause Confluence to run out of available file descriptors when exporting a space has been fixed (CONF-3517)
A bug that could cause an email notification to be sent regarding a page that was restricted by page-level permissions has been fixed (CONF-3553)
The attachment upload form in the "Insert Image" is more robust against error (CONF-3677, CONF-3676)
Searching for a page in the Parent Page Picker Popup now functions as expected (CONF-3364)
Deleting a user now correctly deletes their email notifications (CONF-3619)
Restoring a page from the trash now re-adds that page's comments to the search index (CONF-3564)
Attachment links are now not rendered if the user can not view the attachment due to page level permissions (CONF-3553)
The list of recently edited pages in a user's profile is now more accurate (CONF-2430)
Plugins uploaded through the web interface can now correctly serve downloadable resources (CONF-3387)
The {recently-updated} macro and recent blogs pages now work under JDK 1.5 (CONF-3528, CONF-3601)
The {section} macro's "border" property now works correctly (CONF-3736, CONF-3433)
The {noformat} macro now has a "nopanel" parameter that will suppress drawing a background or border (CONF-3656)
Several issues regarding the {tasklist} macro were fixed (CONF-3622, CONF-3633, CONF-3632)
The {dynamictasklist} macro no longer breaks PDF exports (CONF-3513)
The informational macros no longer center their text when viewed in Internet Explorer (CONF-3537)
Links are now parsed in the title of a (panel) macro (CONF-3560)
The string ?!!? is no longer interpreted by the Wiki/HTML renderer as a broken image

See also: Issues Resolved for 1.4.3

Confluence SOAP Provider Migration

Starting with the release of Confluence 1.4.3, and stretching through the next three major releases, Confluence will be transitioning from using the Glue library to provide a SOAP remote API, to using Apache Axis. Unfortunately, while the SOAP services will stay the same, the WSDL that these libraries generate to interact with the same services will change, so SOAP applications that interact with Confluence will need to migrate with us.

The migration should be relatively painless. Since the underlying objects represented by the WSDL are still the same, the process should involve regenerating your SOAP stubs, and a few cosmetic code changes.

The XML-RPC API is unaffected by this change.

<tr>
<td>(unscheduled)</td>
<td>Allow configuration of default SOAP provider, the default at installation being Axis</td>
<td>✗ Incomplete</td>
</tr>
</tbody>
</table>
Progress on these issues can also be tracked via [CONF-3141](#).

### The Plan

As of version 1.4.3, Confluence ships with three SOAP endpoints:

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>WSDL URL</th>
<th>Provider</th>
</tr>
</thead>
<tbody>
<tr>
<td>/rpc/soap/confluencesoapservice-v1</td>
<td>/rpc/soap/confluenceservice-v1.wsdl</td>
<td>Glue</td>
</tr>
<tr>
<td>/rpc/soap-glue/confluencesoapservice-v1</td>
<td>/rpc/soap-glue/confluenceservice-v1.wsdl</td>
<td>Glue</td>
</tr>
<tr>
<td>/rpc/soap-axis/confluencesoapservice-v1</td>
<td>/rpc/soap-axis/confluenceservice-v1?wsdl</td>
<td>Axis</td>
</tr>
</tbody>
</table>

⚠️ The Axis and Glue providers produce slightly different WSDL URLs

💡 Third-party SOAP [RPC Plugins](#) deployed in Confluence will be similarly deployed in three locations

Over the next three major Confluence releases we will:

1. Make the provider of /rpc/soap/confluenceservice-v1 configurable, then
2. Change the default provider to Axis (but leave it configurable), then finally
3. Remove the Glue provider entirely

### What This Means for SOAP Clients

Confluence major releases occur every three or four months. Thus, authors of SOAP clients should keep in mind this timeline, starting with the release of Confluence 2.0 (November 2005)

<table>
<thead>
<tr>
<th>0-3 months</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• All existing SOAP clients written against the Glue provider will continue to function normally.</td>
<td></td>
</tr>
<tr>
<td>• New clients should be written to the Axis provider in /rpc/soap-axis</td>
<td></td>
</tr>
<tr>
<td>• Existing clients should change their SOAP endpoints to point to /rpc/soap-glue (or, better still, move directly to Axis)</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>3-6 months</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• Confluence will require configuration to work with any client of the Glue provider that has not changed its endpoint</td>
<td></td>
</tr>
<tr>
<td>• New clients should be written to the Axis provider in /rpc/soap-axis</td>
<td></td>
</tr>
<tr>
<td>• Existing clients will need to migrate to the Axis provider</td>
<td></td>
</tr>
</tbody>
</table>
6+ months

- Confluence will no longer work with clients written against the Glue provider
- Both /rpc/soap and /rpc/soap-axis endpoints will continue to be served by the Axis provider

**Issues Resolved for 1.4.3**

<table>
<thead>
<tr>
<th>JIRA Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td><strong>Authenticate</strong> to retrieve your issues</td>
</tr>
</tbody>
</table>

**Release Notes 1.4.4**

Confluence 1.4.4 is a maintenance release that resolves some issues users may have encountered using previous Confluence 1.4 releases. 1.4.4 fixes a number of issues, including many related to the reliability of uploaded plugins.

1.4.4 is a free upgrade for all customers who purchased their Confluence license after September 23rd, 2004.

**Who should upgrade?**

Confluence 1.4.4 is a bugfix release. While Atlassian recommends customers always run the most recently available stable Confluence release, customers should consult the list of issues resolved to decide whether it is worth their while upgrading.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence versions between 1.4 and 1.4.3, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.3.6 or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.

**Changes in 1.4.4**

**Uploaded Plugin Fixes**

Prior to Confluence 1.4.4, plugins containing Spring components, XWork actions or velocity templates could not be uploaded through the web interface, and needed to be installed manually in WEB-INF/lib. Confluence 1.4.4 fixes these issues.

**Database Indexes**

Confluence 1.4.4 now correctly creates database indexes on a clean installation. If you are upgrading an existing Confluence instance, you should consult Performance Tuning for information on indexes that can improve Confluence’s performance significantly.

**Other Changes and Fixes**

See: Issues Resolved for 1.4.4
Confluence Development Releases

Development releases are interim builds of Confluence that we make available so that interested customers can try out new features, especially those features that you may have been waiting for, and don't want to wait another month for the next official release. Development releases are also called early access program (EAP) releases.

Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Current Development Release Cycle

The links below show the latest development releases:

- [Confluence 4.3-RC1 Release Notes](#) – 1 August 2012
- [Confluence 4.3-Beta1 Release Notes](#) – 6 July 2012
- [Confluence 4.3-m11 EAP Release Notes](#) – 31 May 2012

Previous Development Release Cycles

4.2 development

- [Confluence 4.2-Beta3 Release Notes](#) – 27 March 2012
- [Confluence 4.2-Beta2 Release Notes](#) – 16 March 2012
- [Confluence 4.2-Beta1 Release Notes](#) – 13 March 2012

4.1 development

- [Confluence 4.1-rc1 Release Notes](#) – 5 December 2011
- [Confluence 4.1-m5 ("Milestone 5") Release Notes](#) – 15 November 2011
4.0 development

- Confluence 4.0-beta2 ("Beta 2") Release Notes – 18 August 2011
- Confluence 4.0-m36 ("Milestone 36") Release Notes – 1 August 2011
- Confluence 4.0-m29 ("Milestone 29") Release Notes – 27 June 2011
- Confluence 4.0-m27 ("Milestone 27") Release Notes – 3 June 2011

3.5 development

- Confluence 3.5-rc1 ("Release Candidate 1") Release Notes – 9 March 2011
- Confluence 3.5-beta3 ("Beta 3") Release Notes – 4 March 2011
- Confluence 3.5-beta2 ("Beta 2") Release Notes – 4 March 2011
- Confluence 3.5-beta1 ("Beta 1") Release Notes – 10 February 2011
- Confluence 3.5-m4 ("Milestone 4") Release Notes – 22 December 2010
- Confluence 3.5-m3 ("Milestone 3") Release Notes – 17 December 2010
- Confluence 3.5-m2 ("Milestone 2") Release Notes – 7 December 2010
- Confluence 3.5-m1 ("Milestone 1") Release Notes – 22 November 2010

3.4 Development

- Release Notes 3.4-m4 ("Milestone 4") 2/SEP/2010
- Release Notes 3.4-m2 ("Milestone 2") 8/AUG/2010
- Release Notes 3.4-m1 ("Milestone 1") 20/JUL/2010

3.3 Development

- Release Notes 3.3-m3 ("Milestone 3") 18/MAY/2010
- Release Notes 3.3-m1 ("Milestone 1") 8/APR/2010

3.2 Development

- Release Notes 3.2-beta ("Beta") 1/MAR/2010
- Release Notes 3.2-m4 ("Milestone 4") 22/FEB/2010
- Release Notes 3.2-m3 ("Milestone 3") 5/FEB/2010

3.1 Development

- Release Notes 3.1-rc1("Release Candidate 1") 27/NOV/2009
- Release Notes 3.1-m7 ("Milestone 7") 5/NOV/2009
- Release Notes 3.1-m6 ("Milestone 6") 26/OCT/2009
- Release Notes 3.1-m5 ("Milestone 5") 8/OCT/2009
- Release Notes 3.1-m4 ("Milestone 4") 22/SEPT/2009
- Release Notes 3.1-m3 ("Milestone 3") 10/SEPT/2009
- Release Notes 3.1-m1 ("Milestone 1") 22/JULY/2009

Confluence 4.3-RC1 Release Notes
1 August 2012

With great pleasure, Atlassian presents Confluence 4.3 Release Candidate 1 (RC1). This EAP (early access program) release is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance. Feel free to comment on the page if you want to provide any feedback or ask any questions. EAP releases also give plugin developers an opportunity to test and fix their plugins in advance of an official release.

What's in this release?

Please see the new features of Confluence 4.3 described in the Confluence 4.3-Beta1 Release Notes. For plugin developers, please see our developer's guide to preparing for Confluence 4.3.

This release candidate is primarily a bug-fix release. These are the changes in Confluence 4.3 RC1:

- Changes to drafts functionality
- Image zoom and table scrolling in Confluence mobile
- Mentions now available via the 'Insert' menu
- Existing templates now migrated on upgrade
- Other items of interest

Downloading Confluence

The Confluence 4.3 RC1 release is available at the download site. When upgrading, please follow the upgrade notes below.

Please note the following

- Development releases are not safe — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Changes in this release
Changes to drafts functionality

Confluence 4.3 offers the same draft-handling capabilities as Confluence 4.2, with one improvement: You can now have more than one draft of a new page or blog post in the same space. In earlier versions, you could have multiple drafts of existing pages, but only one new draft.

(You may have noticed that the beta release offered you the option to save a draft when creating or editing a page or blog post. This was a new, experimental way of handling drafts. After usability testing, we decided that this feature is not yet ready for release. For that reason, the ability to explicitly save drafts will not be in the final release of Confluence 4.3.)

Image zoom and table scrolling in Confluence mobile

Have you tried viewing Confluence 4.3 content on your iPhone, iPod touch or Android device?

- You can now tap an image to zoom in, then pinch and expand the image using the standard mobile gestures.
- When a page includes a wide table, you can tap and drag to scroll horizontally.

See the beta release notes for a full description of the new mobile interface in Confluence 4.3.

Mentions now available via the 'Insert' menu

In Confluence 4.0 we introduced @mentions, a handy way of mentioning someone in a page or comment. If you type '@' and someone’s name, Confluence sends that person an email notification. Now we have added the user mention option to the editor’s ‘Insert’ menu to help new users discover this useful feature.
Existing templates now migrated on upgrade

As you know from the beta release notes, Confluence 4.3 introduces a rich text editor for templates. When we released the beta, we had not yet included an upgrade task to migrate your existing templates from wiki markup to the new storage format required by the rich text editor. That upgrade task is now present in the RC1 release. This process is automatic, and you should not need to take any action. For more details about the upgrade process, see Migration of Templates from Wiki Markup to XHTML-Based Storage Format.

Other items of interest

- **Comment and edit alerts not in Confluence 4.3.** The Confluence 4.3 Beta 1 release contained a feature that popped up a message when a new comment arrived or someone updated the page you were viewing. This feature is not in the final release of Confluence 4.3, as it needed more work to make it shippable.
- **Discoverable space administrators not in Confluence 4.3.** The beta release included a feature that listed space administrators in the space directory and on the 'Advanced' tab of the space. This feature requires more performance tuning, and is not in the final release.

Upgrade notes

These notes assist you in upgrading your test site to this EAP release.

1. **The JIRA Portlet macro is no longer supported.**
   Gadgets replaced portlets in JIRA 4.0 and Confluence 3.1. We deprecated the use of JIRA portlets in Confluence 4.2 (see the Confluence 4.2 upgrade notes) and have removed the portlet code in Confluence 4.3. Pages that contain the macro will no longer display information drawn from JIRA. Instead, they will show an error reporting that the macro does not exist. To prevent this behaviour, please upgrade to a version of JIRA that supports gadgets, and follow the instructions in How to Migrate from JIRA Issues and JIRA Portlets to Gadgets.

2. **Active Objects is now bundled.**
   Confluence 4.3 ships with the Active Objects plugin. If you have previously installed Active Objects into your Confluence 4.2 site, you will need to uninstall it before upgrading to Confluence 4.3. This is because user-installed plugins override bundled plugins.

Follow the usual upgrade instructions to upgrade your test site to this release.

Confluence 4.3-Beta1 Release Notes

6 July 2012

With great pleasure, Atlassian presents Confluence 4.3 Beta 1. This EAP (early access program) release is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance. Feel free to comment on the page if you want to provide any feedback or ask any questions. EAP releases
also give plugin developers an opportunity to test and fix their plugins in advance of an official release.

Highlights of Confluence 4.3 Beta 1:

- Confluence mobile
- In-app notifications
- Personal tasks
- Tasks on the page
- Rich text templates
- Space archiving
- Improved user invitations and signup options
- Table sorting and highlighting
- Simpler space creation
- Draggable images and macros
- Other improvements
- Infrastructure changes
- A note about changes to drafts – not in Confluence 4.3 final release
- Upgrade notes

⚠️ Please note the following

- Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

## Highlights of Confluence 4.3 Beta 1

1

### Confluence mobile

Introducing a new, super-responsive interface optimised for iPhone and Android (currently with beta support) devices. With Confluence mobile you can:
- Browse popular content, recent blog posts and network activity.
- Like pages, blog posts and comments.
- Add comments to pages and blog posts.
- Search Confluence for content and people.
- View the profiles of your colleagues. Tap to call, SMS or email them directly from your mobile device.
- Manage your personal tasks and notifications.

In-app notifications

Now you can manage your notifications, mentions and shares all in one place – the new notifications dialog in Confluence. Use the handy inline actions to like and watch pages, and reply to comments. Want to track the items you need to take action on? Convert a notification to a personal task.
Personal tasks

Personal tasks help you stay focused on the task at hand and plan your day's work. You can create tasks, prioritise them by dragging them into order, and manage them entirely within Confluence.
Tasks on the page

It’s now really simple to track team tasks inside your pages – project tasks, meeting action items and checklists.

- **Create task lists**
  
  Click the new task icon in the editor to start a new task list.

- **Assign tasks using mentions**
  
  You can @mention a user within a task to assign it to them. These tasks then appear in the personal task list.

- **Receive instant notifications**
  
  Users receive a notification when a task has been assigned to them. Page watchers will be notified when tasks in a page are marked as complete.

- **Track tasks from anywhere**
  
  View all your assigned tasks in your personal tasks list where you can add notes, prioritise them, and mark them as complete.

Rich text templates

You can now create templates using the rich text editor, so you no longer need to use wiki markup to make and update your templates. This means that you can now convert an existing page to a template.
Space archiving

You can archive a space, so that its content is less visible but still available on your Confluence site. When a space is archived, the pages and other content do not appear in the Confluence search results, activity streams, or dropdown menus. In the space directory, the archived space will appear on a new archive tab.

Improved user invitations and signup options

If you want to invite people to sign up to Confluence, you can send an invitation via email directly from the
Confluence user administration screen, inviting people to join the site. To further encourage people to sign up, the login screen includes a signup option too.

If you choose to add users manually, Confluence can send them an email message informing them of their new account.

If you want to allow only people from within your organisation to sign up, use the new domain restriction option. People will only be able to sign up if their email address belongs to one of the domains specified. Confluence will send the person an email message, asking them to click a link to confirm their email address.

Table sorting and highlighting

Enjoy your tables even more!

- **Column sorting**
  When viewing a page, just click the header to sort on any column.

- **Cell highlighting**
  Fill table cells with a custom background colour to highlight important information.
Simpler space creation

The quick ‘Add Space’ option at the top of the dashboard leads you into the new, simplified dialog for adding global spaces, shown below. Adding a personal space is even simpler.

Confluence administrators can now set the default permissions that will be applied to new spaces. The default permissions are configurable for groups only, not for individual users or anonymous users.
Draggable images and macros

You can now drag and drop images and macros anywhere on a page that you’re editing. This is often a lot faster and definitely feels more natural than using cut/paste to move things around. Please note that this feature is not supported in Internet Explorer 8.

Other improvements

- **Comment and edit alerts.** You don't want to miss out on comments and updates just because you've been sitting on the page for a while. Now Confluence will pop up a message when a new comment arrives or someone updates the page you're busy with.

- **Removing attachment versions.** You can now delete a specific version of an attachment.

Infrastructure changes

Here are some points of interest for plugin developers.

- **JIRA Portlets gone.** We have removed the JIRA Portlet code from Confluence. We deprecated the use of JIRA portlets in Confluence 4.2 (see the [Confluence 4.2 upgrade notes](#)) and the JIRA Portlet plugin is no longer bundled in Confluence 4.3.

- **Active Objects bundled.** Confluence 4.3 ships with the [Active Objects](#) plugin. Active Objects is a new...
ORM (object relational mapping) layer into Atlassian products, implemented as a plugin. It enables easier, faster, and more scalable data access and storage than the existing Bandana and PluginSettings APIs. Active Objects in Confluence is still under rapid development, and is currently used by only a few plugins. If you would like to experiment with it, we would love to hear your feedback.

- **API changes.** Please see our [guide to preparing for Confluence 4.3](#).
- **Experimental API for in-app notifications and tasks.** Confluence 4.3 introduces a new in-app notifications and tasks feature. We have an [experimental API](#) available and we’re requesting your feedback! Here is your chance to help us shape the notifications and tasks API. Details are in our [guide preparing for Confluence 4.3](#).

### A note about changes to drafts – not in Confluence 4.3 final release

You may notice that this beta release offers you the option to **Save Draft** when creating or editing a page or blog post. This is a new, experimental way of handling drafts. After usability testing, we have decided that the drafts feature is not yet ready for release. For that reason, it will not be in the final release of Confluence 4.3.

Confluence 4.3 will therefore have the same draft-handling capabilities as Confluence 4.2.

### Upgrade notes

These notes assist you in upgrading your test site to this EAP release.

1. **The JIRA Portlet macro is no longer supported.**
   Gadgets replaced portlets in JIRA 4.0 and Confluence 3.1. We deprecated the use of JIRA portlets in Confluence 4.2 (see the [Confluence 4.2 upgrade notes](#)) and have removed the portlet code in Confluence 4.3. Pages that contain the macro will no longer display information drawn from JIRA. Instead, they will show an error reporting that the macro does not exist. To prevent this behaviour, please upgrade to a version of JIRA that supports gadgets, and follow the instructions in [How to Migrate from JIRA Issues and JIRA Portlets to Gadgets](#).
2. **Active Objects is now bundled.**
   Confluence 4.3 ships with the [Active Objects](#) plugin. If you have previously installed Active Objects into your Confluence 4.2 site, you will need to uninstall it before upgrading to Confluence 4.3. This is because user-installed plugins override bundled plugins.

Follow the [usual upgrade instructions](#) to upgrade your test site to this release.

### Confluence 4.3-m11 EAP Release Notes

31 May 2012

With great pleasure, Atlassian presents Confluence 4.3 Milestone 11 EAP. This is our first public EAP in Confluence 4.3.

This EAP (early access program) release is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance. Feel free to comment on the page to provide any feedback or ask any questions. EAP releases also give plugin developers an opportunity to test and fix their plugins in advance of an official release.
Highlights of Confluence 4.3 Milestone 11 EAP:

- **Confluence mobile**
- **In-app and mobile notifications**
- **Personal tasks**
- **Tasks in pages**
- **Table improvements**
- **Other improvements**
- **Infrastructure changes**
- **Upgrade notes**

### Downloading Confluence

The Confluence 4.3 Milestone 11 EAP release is available at the [download site](#). When upgrading, please follow the upgrade notes below.

### Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

### Highlights of Confluence 4.3 EAP

We recommend that you use Chrome when testing features in this milestone.

**1**

**Confluence mobile**

Introducing a new, super-responsive interface optimised for iPhone and Android devices. With Confluence mobile you can:

- Browse popular, recent blog posts and network activity.
- Like pages, blog posts and comments
- Add new comments to pages and blog posts.
- Search Confluence for content and people.
- View the profiles of your colleagues - tap to call, SMS or email them directly from your mobile device.
In-app and mobile notifications

Now you can view and take action on all your important notifications in one place, including:

- Shares and mentions
- Comments and likes
  Note: In order to be able to comment and reply inline, the Confluence remote API must be enabled (see Enabling the Remote API).
- JIRA comments, shares and mentions
  Note: For JIRA notifications to appear, you must create a trusted apps link between JIRA and Confluence and install plugins in JIRA to push notifications to Confluence (see Confluence 4.3 EAP only - JIRA Integration with Confluence Notifications).
On the run? Confluence Mobile supports in-app notifications too.

Personal tasks
Personal tasks help you stay focused on the task at hand and plan your day's work.

Tasks in pages

It's now really simple to track team tasks inside your pages – project tasks, meeting action items and checklists

1. **Create task lists**
   
   Click the new task icon in the editor to start a new task list.

2. **Assign tasks using mentions**
   
   You can mention a user within a task to assign it to them.

3. **Receive instant notifications**
   
   Users receive a notification when a task has been assigned to them. Page watchers will be notified when tasks in a page are marked as complete.

4. **Track tasks from anywhere**
   
   View all your assigned tasks in your personal tasks list where you can add notes, prioritise them, and mark them as complete.
Table improvements

1. **Column sorting**
   When viewing a page, just click the header to sort on any column.

2. **Cell highlighting**
   Fill table cells with a custom background colour to highlight important information.

![Table with column sorting and cell highlighting](image)

Other improvements

1. **Send user invitations from Confluence**
   Now Confluence can send emails directly to people inviting them to create an account.

2. **Add spaces quickly and simply**
   A new ‘Add Space’ button in the top right of the dashboard opens a simplified dialog for adding global spaces.

Infrastructure changes

Here are some points of interest for plugin developers.

1. **JIRA Portlets removed**
   We have removed the JIRA Portlet code from Confluence. We deprecated the use of JIRA portlets in Confluence 4.2 (see the Confluence 4.2 upgrade notes) and the JIRA Portlet plugin is no longer bundled in Confluence 4.3. Portlets have been superceded by gadgets. Refer to Adding JIRA Gadgets to a Confluence Page for more information.

2. **Active Objects bundled**
   Confluence 4.3 ships with Active Objects. Active Objects is a new ORM (object relational mapping) layer implemented as a plugin. It enables easier, faster, and more scalable data access and storage than the existing Bandana and PluginSettings APIs. Active Objects in Confluence is still under rapid development.
and is currently used by only a few plugins. Please see the [Active Objects documentation](#) for more information.

3. **API changes.** Please see our [guide to preparing for Confluence 4.3](#).

## Upgrade notes

These notes assist you in upgrading your test site to this EAP release.

1. **The JIRA Portlet macro is no longer supported.**
   Gadgets replaced portlets in JIRA 4.0 and Confluence 3.1. We deprecated the use of JIRA portlets in Confluence 4.2 (see the [Confluence 4.2 upgrade notes](#)) and have removed the portlet code in Confluence 4.3. Pages that contain the macro will no longer display information drawn from JIRA. Instead, they will show an error reporting that the macro does not exist. To prevent this behaviour, please upgrade to a version of JIRA that supports gadgets, and follow the instructions in [Migrating from JIRA Issues and JIRA Portlets to Gadgets](#).

2. **Active Objects is now bundled.**
   Confluence 4.3 ships with the [Active Objects](#) plugin. If you have previously installed Active Objects into your Confluence 4.2 site, you will need to uninstall it before upgrading to Confluence 4.3. This is because user-installed plugins override bundled plugins.

Follow the [usual upgrade instructions](#) to upgrade your test site to this release.

### Confluence 4.3 EAP only - JIRA Integration with Confluence Notifications

**Note:** This page does not apply to the Confluence 4.3 production release.
The information on this page relates to the [Confluence 4.3-m11 early access (EAP) release](#) only. In-app notifications in Confluence 4.3 do not support JIRA integration.

You can try JIRA integration with Confluence in-app notifications by installing the notification provider plugin on a test JIRA site.

1. Create a [Trusted Apps application link](#) between your Confluence 4.3 EAP site and a test site running the last release of JIRA. In order to create a Trusted Apps link, you will need to make sure you have the same userbase in JIRA and Confluence.
2. Download and install the notifications client plugin in JIRA: [myworkday-client-0.9.1426.1.jar](#)
3. Download and install the notifications provider plugin in JIRA: [myworkday-jira-provider-0.9.1426.1.jar](#)
4. Test in-app notifications in JIRA by commenting an issue that a user is watching. The user should then receive the notification in Confluence.

Keep in mind that in-app notifications is an EAP feature and comes with the standard caveats for EAP builds. Do not install the client/provider plugins on a production JIRA site.

### Confluence 4.2-Beta3 Release Notes

**27 March 2012**
With great pleasure, Atlassian presents **Confluence 4.2 Beta 3**.

This beta release is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance. This also provides Atlassian with useful feedback. Beta releases also give plugin
developers an opportunity to test and fix their plugins in advance of an official release.

**In this release**

This release contains minor fixes only. In particular, we have fixed the LabelManager API, so that is is now backwards compatible. (We broke backwards compatibility in beta 1.) Details are in this issue:

[CONF-24902 - Authenticate](#) to see issue details

Please see the new features of Confluence 4.2 described in the [Confluence 4.2-Beta1 Release Notes](#).

**Upgrade notes**

Upgrading from a previous version of Confluence

Follow the [usual upgrade instructions](#) to upgrade your test instance to this release. *We strongly recommend that you back up your Confluence Home directory and your database before upgrading.*

A big **thank you** to everyone who helps us ensure that Confluence keeps getting better and better!

---

### Downloading Confluence 4.2 Beta 3

The Confluence 4.2 Beta 3 release is available at the [download centre](#). When upgrading, please follow the [upgrade notes](#) below.

---

### Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

---

### Confluence 4.2-Beta2 Release Notes

**16 March 2012**

Confluence 4.0 Beta 2 is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance. This also provides Atlassian with useful feedback. Beta releases also give plugin developers an opportunity to test and fix their plugins in advance of an official release.

This release contains minor fixes only. Please see the fixes and improvements reported in the [Confluence 4.2-Beta1 Release Notes](#).

---

### Downloading Confluence 4.2 Beta 2

The Confluence 4.2 Beta 2 release is available at the [download centre](#). When upgrading, please follow the [upgrade notes](#) below.
Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. **Confluence 4.2-Beta1 Release Notes**

12 March 2012

With great pleasure, Atlassian presents Confluence 4.2 Beta 1.

Confluence 4.0 Beta 1 is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance. This also provides Atlassian with useful feedback. Beta releases also give plugin developers an opportunity to test and fix their plugins in advance of an official release.

**Highlights of Confluence 4.2 Beta 1:**

- Page Layouts
- Likes
- Quick Comments
- Popular Content on the Dashboard
- Personalised Summary Email
- Attachment Labels
- Share Notifications Showing All People Notified
- Gadget Subscriptions
- Other Improvements
- Infrastructure Changes
- Upgrade Notes

**Highlights of Confluence 4.2 Beta 1**

1

**Page Layouts**

Page layouts offer a quick and easy way to add sections and columns to a page. Choose a predefined layout, add the content to each section, and you're done. It's a great way of creating a common page structure, so that readers know where to find the information on each page. Don't worry, the Section and Column macros are still available too.
A two-column page layout in edit mode

**Likes**

Has someone written a mind-blowingly cool post on Confluence? Click the **Like** button to them know. It's quick and easy to make their day! Confluence has like buttons on every page, blog post and comment. If enough people like your post, it will show on the dashboard's new popular tab. The information in your personalised summary email is based on the number of people in your network who have liked the content.
Quick Comments

Showing people a picture of themselves is a great way to encourage them to say something! We want to encourage people to comment on Confluence pages and blog posts, so we have added an inviting empty comment, showing the user's avatar, at the bottom of the page. This replaces the rather uninviting Add Comment button in earlier versions. And here's what we are really proud of: When you click the box to write a comment, the full editor loads instantly. Boom! No page refresh required.
All about chocolate

Chocolate is inevitable.

So let's talk about chocolate

Two penguins find themselves together on an ice floe, drifting helplessly into warmer waters. The penguins are very fond of each other. Suddenly, craaaaack, the ice floe splits in half. Right between the penguins. As they drift apart, one penguin sadly waves a flipper and calls out, "Chocolate milk!"

Popular Content on the Dashboard

Want to see what's trending? The new Popular tab on the dashboard shows the pages and blog posts that attracting most attention, based on the number of comments and likes.
New popular content tab on the dashboard

5

Personalised Summary Email

Confluence sends out a weekly summary of the news that interests you. Each email message is tailored according to the spaces you follow and your network. This is a great way of drawing people into the wiki discussions even if they are infrequent users of Confluence. You can opt in or out of the recommended update summary via an option on the email settings page of your user profile.
6

Attachment Labels

You can now label attachments, just as you can label pages and blog posts. Using the Attachments macro, you can filter to show documents or other attachments with a specific label. The Content by Label macro also displays attachments (alongside pages, blog posts and spaces) with a given label.

7

Share Notifications Showing All People Notified

If someone shared a page with you, it's nice to know who else they shared it with. We introduced sharing of pages and blog posts in Confluence 3.5. Just click Share and follow the prompts. Confluence sends an email message to the people that you have specified. In this release, when someone shares a page with you, the email message shows the other people they shared it with too.
Other people sharing the page

Gadget Subscriptions

Confluence 4.2 includes Atlassian Gadgets 3.2, with gadget subscriptions. This means that you can quickly add all the gadgets from your JIRA, Bamboo, FishEye or Crucible site – or from another Confluence site – to your Confluence gadget directory, for easy addition to your Confluence pages. To subscribe to another site's gadget go to Confluence Admin > External Gadgets and click the new Gadget Feeds tab.
Other Improvements

- We have fixed the following bug: CONF-6246 - Authenticate to see issue details
- The permissions for personal spaces are now more in line with Confluence's philosophy of encouraging collaboration. When you create a personal space, the option that allows registered users to update content is selected by default. You will also be assigned as a watcher of your new personal space.
- Blog comments now include an 'author' lozenge to allow you to quickly scan a page for comments from the author.

John Masson  AUTHOR
Mar 01, 2012
I think since 100% is out we need to keep it narrower. I didn't think it was that bad before, but right now it looks odd because it's "almost" 100% but not quite... Perhaps 50% looks better? Seems more intentional?

Infrastructure Changes

- Confluence now uses version 2.0 of the Universal Plugin Manager (UPM).
- Confluence 4.2 includes Atlassian Gadgets 3.2
- From this release of Confluence, we support PostgreSQL 9.0 as well as 8.2, 8.3 and 8.4.
- The implementation of quick comments required some pretty significant changes to the editor's initialisation code. This will have consequences for some Confluence plugins. Details are in this blog post: JavaScript Changes Required for Confluence 4.2 Compatibility.

Upgrade Notes

Upgrading from a previous version of Confluence

Follow the usual upgrade instructions to upgrade your test instance to this release. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better!

Confluence 4.1-rc1 Release Notes

Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in
subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

⚠️ Do not use in production

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

Who should try this out?

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.

⚠️ Please note the following

- Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.

Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.

Upgrade Procedure

If you wish to upgrade your existing Confluence installation with this version, ensure you have created a separate copy of your current Confluence production installation first and using that copy, follow the normal upgrade instructions to upgrade it to this development release. If you have also implemented customised site- or space-specific layouts, you will need to re-implement them after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

Downloads

All development releases are available from Development Releases on the Atlassian website.
Important information for plugin developers

If you are a plugin developer testing for compatibility against Confluence 4.1, it is very important that you read the information at the bottom of these release notes about Velocity templates and deprecation.

Highlights of this Release

1. Image Effects

After inserting an image, you can now apply one of five effects to the image by clicking the new Effects button and choosing from one of the following:

- Taped,
- Instant Camera,
- Curl Shadow,
- Snapshot,
- Drop Shadow.
The images above are displayed using the 'Snapshot' Image Effect.

2. Autoconvert Pasted Links

Linking to things in Confluence is much too hard. Sometimes you already have the URL from some other tab and just want to paste it in. If it's a link to a system Confluence knows about, why should you have to mess around with doing it "properly" by looking it up in the link dialog or the issue dialog just because you want it to get refactored later?

For example, if you paste in https://jira.atlassian.com/browse/CONF-23567 then some people will give you grief for not using the insert JIRA issue link to make it

| CONF-23567 | Authenticate | to see issue details | . The new Autoconvert feature will automatically convert pasted links into a useful macro. You have to see it to believe it. It works for:

- Pasting Links to JIRA issues
- Pasting JIRA JQL links
- Pasting Youtube URLs
- Most widget connector URLs (like Skitch links)
- Any shortcut link

3. Editor Find & Replace

This will be a welcomed feature to users who used to copy wiki markup out into another text editor to do a find replace then paste it back in. Now everyone will be able to do it right from the editor.

4. Dashboard Network Tab

Having a difficult time finding relevant content in the dashboard activity stream? This allows you to see recent updates from just the people you follow in Confluence. As part of this work there were some changes made in the background to the way the Dashboard works meaning

- a lot less DB queries
- the dashboard recent updates macro now accepts a 'users' parameter (which drives the Network tab)
- adding any new tabs will be a lot easier for the developers
5. Editor Copy / Paste Improvements

Copy / Paste Multiple Rows or Whole Tables

We've spent time focusing on a number of editor efficiency issues, most recently being the ability to easily copy and paste multiple table rows or whole tables within a page, across pages, across Confluence installs or even from other sources (eg: HTML tables on the web). Additionally (which didn't happen in Wiki Markup where users could previously copy/paste rows fairly simply) you can now overwrite existing cells by pasting into them and where the clipboard contents are bigger than the existing table, it will automatically be adjusted with additional columns to fit. This is a big usability improvement.

Oh and one more thing, you can now use Alt+Up Arrow or Alt+Down Arrow to add a new row above or below your current one, which works beautifully with the new easy to copy/paste rows.

CONF-23408
CONF-23929

Copy / Paste list items

Fixing another similar pain point, we also spent some time working on the pasting of list items into existing lists, making this more consistent with what you'd expect. If you copy a couple of list items from one part of a list, or another one, and paste them into the middle of a list, they are added at the same level, not indented. This is the first of a number of tweaks to the way lists work which will be a big usability improvement.

CONF-23842

6. Favourites Page

The concept of a personal label has been removed and you'll now see a newly named and cleaner Favourites tab in your personal space. Additionally the list of favourites is now paginated and uses AJAX to un-favourite pages on the page.
7. Global Stylesheets

Now a custom PDF stylesheet can be set at the global level, just like custom layouts, so where there is no specific individual space stylesheet defined when a PDF space export is done it will fall back to this global stylesheet, meaning users won't have to apply the same stylesheet to all their individual spaces if they want the same behaviour.

8. (No More) Page Title Character Restrictions

You can now use "special" characters such as : or @ or % in your page titles, as in the screenshot below. Various new features like this are now possible, thanks to the move to the new Confluence editor.
9. Global plugin & macro timeout setting

CONF-9344, CONFDEV-27

There is now a globally configurable timeout setting which will stop pages going into a permanent loading state leaving users no easy way to edit them to sort out the offending macros or plugins. In the worst case scenario this had the potential to bring down Confluence itself before.
10. New Logo and Icons

As you may know, Atlassian introduced a new logo in October. Now, Charlie 2.0 has made it to Confluence.

You’ll also notice a bunch of new icons to give some of your favourite features in Confluence a fresh look. Here are some examples of the new page and blog post icons.

Important note for plugin developers

As of Confluence 4.1, Confluence will now log a warning every time a Velocity template makes a call to a deprecated Java class or method. Under Confluence's deprecation policy, deprecated code is likely to be removed in future releases of the product, and plugin developers are strongly advised to stop using it as early as possible.

When you run Confluence in Developer Mode, these warnings will instead cause an exception to be thrown and the processing of the template to be aborted. This is to give plugin developers much more immediate (and harder to ignore) feedback about potentially dangerous code. Developer Mode is turned on by the Atlassian SDK, so if you use the SDK to build or test your plugin you should know right away if there's something dangerous going on in your Velocity files.

If you want to switch this behaviour back to just logging a warning, you should start Confluence with the -Dconfluence.velocity.deprecation.strictmode=false system property set.

Confluence 4.1-rc1 Upgrade Notes

Upgrade Procedure

If you are already running a version of Confluence, please follow these instructions to upgrade to the latest version:

1. Before you upgrade, we strongly recommend that you back up your Confluence Home directory and database. The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.
   Tip: Another term for 'Home directory' would be 'data directory'. Read more about finding your Home directory.
2. If your version of Confluence is earlier than 3.5.x, then you should upgrade to Confluence 3.5.x before upgrading to Confluence 4.0.x.
3. If your version of Confluence is earlier than 4.0, read the release notes and upgrade guides for all releases between your version and the latest version.
   In particular:
   - Please read the Confluence 4.0 Upgrade Notes.
   - Please read the Confluence 3.5 Upgrade Notes.
If you are upgrading from 2.1 or earlier, please also read the 2.2 release notes.

4. Download the latest version of Confluence.
5. Follow the instructions in the Upgrade Guide.

Confluence 4.1-m5 EAP Release Notes

Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

Do not use in production

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

Who should try this out?

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.

Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.

Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.

Upgrade Procedure
If you wish to upgrade your existing Confluence installation with this version, ensure you have created a separate copy of your current Confluence production installation first and using that copy, follow the normal upgrade instructions to upgrade it to this development release. If you have also implemented customised site- or space-specific layouts, you will need to re-implement them after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

Downloads

All development releases are available from Development Releases on the Atlassian website.

Highlights of this Milestone

Image Effects

After inserting an image, you can now apply one of five effects to the image by clicking the new Effects button and choosing from one of the following:

- Taped,
- Instant Camera,
- Curl Shadow,
- Snapshot,
- Drop Shadow.
The images above are displayed using the 'Snapshot' Image Effect.

(No More) Page Title Character Restrictions

You can now use "special" characters such as : or @ or % in your page titles, as in the screenshot below. Various new features like this are now possible, thanks to the move to the new Confluence editor.
Confluence 4.0-beta2 ("Beta 2") Release Notes

18 August 2011

With great pleasure, Atlassian presents Confluence 4.0, Beta 2.

Confluence 4.0 Beta 1 was an internal release. This beta release is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance. This also provides Atlassian with useful feedback. Beta releases also give plugin developers an opportunity to test and fix their plugins in advance of an official release.

Highlights of Confluence 4.0 Beta 2:

- Brand New Editor
- Simplified Editing Experience
- New Macros
- Faster Editing Experience
- Introducing @mentions
- Improved Page Comparison Functionality
- Email Notification Improvements
- New Confluence Installer and Guided Upgrades
- New Editor Plugin Points for Developers
- Other Improvements
- Helping You Transition to Confluence 4.0
- We Welcome Your Feedback
Upgrading from Confluence 3.x

More:

- Read the Upgrade Notes for important information about this release.
- See the full list of issues resolved in this release.

### Downloading the Confluence 4.0 Beta

The Confluence 4.0 Beta release is available [here](#). When upgrading, please follow the Upgrade Notes below.

Got Questions? Want to learn more?
We have a lot of resources available for Administrators, Plugin Developers and End Users to help you transition to Confluence 4.0. Checkout our Planning for Confluence 4.0 page for resources.

### Do not use in production

- **EAP releases are not safe** — EAP releases are snapshots of the ongoing Confluence development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a Confluence EAP release may not be able to be migrated to a future Confluence release.

### Highlights of Confluence 4.0

1

#### Brand New Editor

We've rebuilt the Confluence editor from the ground up, bringing you an editing experience that's simpler, faster and more intuitive.
The new Confluence editor delivers many advantages:

- Just one editor!
- Align left, centre or right, without using macros.
- Indent paragraph blocks and lists from the toolbar.
- A new colour picker.
- A new, streamlined user interface.

Simplified Editing Experience

Confluence 4.0 introduces macro placeholders, a visual representation of your macros while editing. Create rich content with new and existing macros, without the tools getting in the way.

Simplified Macro Editing

Makes macros easier to manage when editing.

- **A more visual experience**
  Making it easier to visualise what the page will look like when you publish it.

- **Macro properties panel**
  Every macro has a properties panel. The property panels for particular macros, such as the Status and View File macros have additional functionality, described below.

- **Quick access to macro editing**
  Double-click the macro to open the Macro Browser for parameter editing. Contents of some macros can be modified directly from the editor.
Improved Image Handling

- **Paste Images From Clipboard (Firefox and Chrome only)**
  Just copy any image to your clipboard and hit CTRL-V in the editor. The image will get attached and embedded directly into your page. There's nothing to install on your desktop, it just works!

- **Turn Images into Links**
  Now you can turn images into links. This is especially handy for turning images into a button like the Atlassian Documentation team is known to do. Previously, this was only available in wiki markup but can now be done in the shiny new Confluence 4.0 editor via the properties panel. We're still working on the link icon.

- **New Default Image Sizes**
  We've received a lot of feedback indicating that there isn't much difference between the preset image sizes. So, we've tweaked the sizes so that you can choose from a wider range of options. The small option remains the same at 100 pixels, medium has increased slightly to 300 pixels and large has changed to 500 pixels.

- **Custom image sizes**
  If you don't like the preset image sizes, you can now specify an exact image width.

- **Search Images**
  You can now embed and search images through a new "Search" tab in the image browser. Previously, this could only be done through Autocomplete (!).
Advanced Table Editing

We've made table operations better in Confluence 4.0 with the following features:

- **Drag to Insert Tables**
  Inserting tables is now easier and truly "WYSIWYG" with this new feature. Just click on the New Table dropdown and drag your mouse to choose the number of rows and columns you'd like in your new table. Oh, and don't worry if you like inserting tables with your keyboard, you can still use autoformatting or CTRL+SHIFT+I to insert a table.

- **New In-Context Table Toolbar**
  The new table toolbar removes the need for a context menu and only appears when you add a table to the page.

- **Merge and Split Table Cells.**
- **Highlight cells, rows or columns.**
- **Cut, copy and paste table rows.**
New Macros

We've bundled more macros with Confluence, and made some of the existing macros better, to help you easily include and present relevant content:

- **Status Macro**
  The Status macro displays a coloured lozenge in the editor, so you can see the status directly. You can use the properties panel to change the status while editing, without having to use the Macro Browser.

- **Expand Macro**
  The Expand macro allows you to add a dynamically expandable section of text to your page.

- **Profile Picture Macro**
  The Profile Picture macro displays a users profile picture on a page. Useful for creating Team Pages.
Faster Editing Experience

Write Wiki Markup ... Fast!

Many of Confluence's biggest fans are avid wiki markup users. For you aficionados, we wanted to give you the fastest editing experience possible, while preserving the speed and efficiency of your existing wiki markup skills. So, we present you with Autoformatting!

Autoformatting lets you type wiki markup into the editor this new feature will "auto-format" your text on the fly. To learn more, click on the "?” help button in the editor and select the Wiki Markup tab.

Try these and see what you think:

- **Font Formatting**
  Bold, underline, strikethrough, italic, superscript, subscript – just type the markup, such as "**Bold**", and watch it convert to **Bold** on the fly!

- **Basic Tables**
  Try typing |||||, or || **Heading 1** || **Heading 2** ||, then hit enter to to instantly see this:

<table>
<thead>
<tr>
<th>Heading 1</th>
<th>Heading 2</th>
</tr>
</thead>
</table>

- **Emoticons**
  All of our emoticons convert on the fly. Try typing (:) in the editor to instantly see this: 😊.

- **Lists**
  For numbered lists, type # and a space at the start of each line.
  For bulleted lists, type * and a space at the start of each line.

- **Headings**
  Type h4, then some heading text to see a level 4 heading.

**Instant Links, Media and Macros**

Introduced in a previous release of Confluence (see details in this blog post), adding links, media and macros
can be quickly added by typing [, ! or { in the editor to add various kinds of content to your page. There’s also some small improvements added onto previous autocomplete functionality:

- The first item in the list is pre-selected to make editing faster,
- The macro autocomplete list now loads much faster,
- The macro autocomplete list now inserts most macros directly, without launching the Macro Browser, unless the macro requires a parameter.

**New Page Links**

Quickly insert a link to create a page with Autocomplete for links. Simply type ’[’ in the editor and as you type, Confluence will display a Create Page link if a page with that title does not already exist in your current space.

---

**Introducing @mentions**

Confluence 4.0 includes the new @mentions feature. This allows you to easily bring collaborators into a conversation: if you are mentioned in any Confluence content (a page, blog, comment or status update), you will be notified by email.

To mention someone, type @ and their name, when editing. Mentions will instantly suggest people you are following in your network, so you can quickly find and involve your friends.
Improved Page Comparison Functionality

We've got a better way to view changed content in Confluence.

Improved Page Diffs

We've simplified page diffs to make them easier to read. Additionally, page diffs now show changes to both formatting and macros.
Diffs in Email

Where possible, email notifications now show page differences exactly as they appear in Confluence. These are now rendered in your email view with the correct diff colour coding.
Email Notification Improvements

New Email Design

All email notifications in Confluence now have a new design. This works in major email clients as well as on the iPhone.

Follow Notifications

Confluence now sends email when someone follows you.
New Confluence Installer and Guided Upgrades

Much to the delight of any sysadmins that are installing any new instances of Confluence, the Windows (.exe) and Linux (.bin) guided installers are now available.

Simplified Installation Process

- **Guided installer**: The guided install wizard has been implemented for Confluence 4.0 on both Windows and Linux operating systems. Installing a new instance is a breeze.
- **Windows UAC support**: You will be prompted for elevated privileges in order to permit the full array of install options.
- **New instance vs Upgrade selection**: You can choose to install a new instance or upgrade an existing instance.
- **Install & Home directory selection**: Default folders are provided depending on the user being an admin/root or standard user (based on respective OS write permissions).
- **Port selection**: Choose your ports during the guided install process. Also, the ports in Confluence have changed! Take note: The default running port is now 8090 with the control port at 8009.
- **Install as a service**: Assuming you have elevated privileges, you have the option on both Windows and Linux to install Confluence as a service. This is practical for production instances.
- **Evaluation license generation**: As a recap, we added a simplified workflow in Confluence 3.5 to assist in generating licenses for evaluators.

Easy JIRA Integration

- **Setup wizard process improvements**: Hook Confluence up with JIRA, right within the in-application setup wizard.

New Guided Upgrades

The new Linux and Windows Installers from our EAP release now include an option that allows you to upgrade an existing Confluence 3.5.x or later installation. This upgrade automates the following tasks for you:

1. Backs up the Installation and Home Directories of the existing Confluence installation to be upgraded,
2. Installs Confluence 4.0.x whilst migrating the following from your existing Confluence installation to the new installation:
   - TCP port values in your existing Confluence installation's server.xml file,
   - The upgrade feature detects and notifies you of any other files in the confluence subdirectory of your existing Confluence Installation Directory, which had been deleted, added or modified from a ‘default’ Confluence installation. This informs you of any customisations you will need to migrate manually over to your upgraded Confluence installation directory.

New Editor Plugin Points for Developers
We've added more editor plugin points for developers. Notable improvements include:

**Extend the Macro Property Panel**

Plugin developers can add buttons to the Macro Property Panel in the editor. For example, insert a Gliffy diagram or see the tutorial on how to do this.

**Render an Image in the Macro Placeholder**

A plugin developer can now render an image instead of a placeholder for bodyless macros. For more information, check out the tutorial on how to do this.

**Custom Parameter Rendering in Placeholders**

You can choose to display any parameter in the macro placeholder in the editor, instead of having the placeholder automatically show the first few parameters.

**New Pluggable Format Menu**

Plugin developers can add items to the editor's Format menu. See this tutorial for details.

**View Storage Format**

To assist with plugin developers and help with developer issues, developers running in Dev mode and Confluence administrators can view the page storage format form the "Tools" menu in Confluence.

**New API Changes**

We have disabled the getPage() and getBlogEntry() read methods in the XML-RPC/SOAP API. If you have a script that primarily reads or appends to existing pages, it will break. Creating pages and overwriting existing pages will still work.

**Plugin Developer Resources**

We have created a landing page for Confluence 4.0 planning. This includes resources for plugin developers to help you create new plugins and make use of the new plugin points available as well as upgrade your existing plugins.

```
Learn more about Confluence 4.0
```

**Infrastructure Changes**

This release includes a number of improvements in the APIs and under the covers as well.

- **Anti-XSS Mode**
  Anti-XXS mode is now enabled by default for plugins.

- **Alignment and Border Parameters**
  The alignment and border properties in the macro definition template have been removed.

- **Thumbnail Settings**
  The 'Thumbnail maximum height' and 'Thumbnail maximum width' settings have been removed from the General Configuration page.

- **Link Browser**
  The Link browser is no longer built in GWT and is now built in core JavaScript.

- **Integration Platform 2.12.0**

- **Upgrade to AUI 3.5.0**

**Other Improvements**

As always, we have made various small improvements to Confluence screens, functionality and supported
platforms.

- **Microsoft Office 2010 support**
  The Office Connector now supports Microsoft Office 2010.

- **Chrome and Internet Explorer 9 Support**
  See the [upgrade notes](#) for more information about browser support.

- **Administrator's task list in the Admin Console**
  This new task list in the Admin Console helps administrators get started after a new install.

- **New keyboard shortcuts:**
  - CMD+S to save a page from the change comment field.
  - CMD+SHIFT+e to preview when you are in the editor; hit 'e' to get back to the editor.
  - CMD+SHIFT+d to display the Wiki Markup dialog.

- **Option to disable the "secure" cookie**
  When using HTTPS, you can disable the "secure" cookie, just for the login page.

- **Help tips in the administration screens**
  The help tips have been moved into the field descriptions.

- **Backup and Restore page**
  The Backup and Restore page has been redesigned.

- **404 page**
  The 404 page now has a dashboard breadcrumb.

- **Quicknav Improvements**
  Quicknav now indicates the space the page is coming from. This helps you find a page that might have the same title across multiple spaces, as well as selecting the first search result by default, making it quicker to open the link.

- **New Emoticons**
  Confluence 4.0 comes with a shiny new set of emoticons.

- **Remember Last Tab**
  Some of the feedback you gave us:
  "...I find it frustrating that "add a web link" is an extra click away after I open the link dialog. I use that at least as often as I link to another Confluence page..."
  We've taken some of the pain out of this process, by having the link browser remember the last tab you clicked. So if always use web links, it will always open to the web links tab for you. We're investigating taking this a step further, by allowing users to insert a web link from the "search tab as well."

- **Advanced Linking**
  We've updated the Link dialog to cater for these link types: shortcut links, anchor Links, and undefined links (which you can do via Autocomplete).
  To round out this improvement, we've implemented an "Advanced" tab in the Links Dialog. This basically covers the "remaining link types" that were available in Wiki Markup.

- **Improved Conflict Merging**
  Make this one sentence: Now if you're editing a page at the same time as someone else, Confluence will intelligently merge your changes with the other person's change when you save. This means you'll be seeing the "another user has made changes to this page since you started editing" warning a lot less often. In the cases where Confluence cannot merge the changes, it will show the diffs and prompt you to either overwrite or discard your changes. We've also made merging table conflicts much more reliable.

---

**Helping You Transition to Confluence 4.0**

We've created a set of resources to help you manage the transition away from wiki markup. We know your people have become experts with using wiki markup in Confluence, but we think you'll really appreciate the new editor, and we want to make it as easy as possible for you to make the change. The [change management resources](#) are listed under the current documentation.
Support for Macros that are not yet Confluence 4.0 Compatible
You can upgrade to Confluence 4.0 with macros that are not yet 4.0 compatible. If you upgrade and a macro is not yet 4.0 compatible, wiki markup will be maintained for that macro. Once these plugins are 4.0 compatible, an administrator will receive a new task in the administration console to run an update. We will have some more information on this shortly.

Copy and Paste Wiki Markup

Many people tell us they like to take notes in wiki markup, then paste them into Confluence. We've also spoken to customers who have lots of scripts that produce wiki markup and are manually inserted into pages. For these folks, we present the Insert Wiki Markup dialog. Simply select 'Wiki Markup' from the 'Insert' menu to launch the Wiki Markup dialog. From there you can insert any wiki markup, even macros.

"View Source" for the new editor

Some of you might be thinking, "what about the view wiki markup?". A lot of people used the View Wiki Markup option to see how pages were made and to copy the underlying markup. We've implemented "view source" (accessible from the Tools menu) so that you can see what macros were used to create the selected page and copy them to your own page.

We Welcome Your Feedback

To make it easy for you to provide EAP feedback we've created a simple "Got Feedback" button in the Confluence navigation bar:

Let the Confluence team know what you think of the EAP by providing feedback!

Upgrade Notes

Upgrading from a previous version of Confluence

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.

When upgrading from a previous version of Confluence, if you have customised your cache settings (as documented in Cache Performance Tuning) then you may run into memory problems during the wiki to XHTML migration. We are working to fix this in a later release, but in the meantime you can revert your ehcache.xml to the default version.

- If you still experience problems, try reducing the 'maxElementsInMemory' attribute on each cache to a very small value such as 50.
- Note that any cache changes you make to work around migration problems should only be considered temporary. You should restore caching to it's original settings again after migration has been successful.

Removed Functionality

Features removed from Confluence
The **Edit Page in Word** functionality
This is being removed in Confluence 4.0. **Note:** This is a different feature to "Edit attachment in Word".

**Mail Page Plugin**
The Mail Page plugin is no longer bundled in Confluence. With the introduction of the "Share Page" feature in 3.5 this is no longer needed.

**Social Bookmarking Plugin**
The Social Bookmarking plugin is no longer bundled in Confluence but is still supported.

**SnipSnap importer** has been removed from the admin console.

**Settings removed from Confluence**
- The **CamelCase Links** setting, from general configuration.
- The **Number of Ancestors to Show in Breadcrumbs** setting.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better!

**Confluence 4.0-m36 EAP Release Notes**

1 August 2011

Today we are happy to announce our third public EAP build for Confluence 4.0. An Early Access Preview (EAP) release is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release.

Please see previous 4.0 EAP release notes for the complete list of 4.0 changes:

- [Confluence 4.0-m27](#)
- [Confluence 4.0-m29](#)

**Highlights of Confluence 4.0 EAP:**

- [New Confluence Installer](#)
- [Improved Image Handling](#)
- [Links Dialog: Remember My Tab](#)
- [Improved Conflict Merging](#)
- [Set Page Location On Save](#)
- [Infrastructure changes](#)
- [We Welcome Your Feedback](#)

**More:**

- Read the [upgrade notes](#) for important information about this release.
- See the full list of [issues resolved in this release](#).

**Downloading the Confluence 4.0 EAP**

The Confluence 4.0-m36 EAP Release is available [here](#). When upgrading, please follow the [upgrade notes](#) below.
Warning: Do not use in production

- **EAP releases are not safe** — EAP releases are snapshots of the ongoing Confluence development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a Confluence EAP release may not be able to be migrated to a future Confluence release.

## Highlights of this Milestone

### New Confluence Installer

Much to the delight of any sysadmins that are installing any new instances of Confluence, the Windows (.exe) and Linux (.bin) guided installers are now available.

### Simplified Installation Process

- **Guided installer**: The guided install wizard has been implemented for Confluence 4.0 on both Windows and Linux operating systems. Installing a new instance is a breeze.
- **Windows UAC support**: You will be prompted for elevated privileges in order to permit the full array of install options.
- **New instance vs Upgrade selection**: You can choose to install a new instance or upgrade an existing instance (the upgrade capability will be available in a subsequent release)
- **Install & Home directory selection**: Default folders are provided depending on the user being an admin/root or standard user (based on respective OS write permissions)
- **Port selection**: The ports in Confluence have changed! Take note: The default running port is now 8090 with the control port at 8009
- **Install as a service**: Assuming you have elevated privileges, you have the option on both Windows and Linux to install Confluence as a service. This is practical for production instances.
- **Evaluation license generation**: As a recap we added a simplified workflow in Confluence 3.5 to assist generating licenses for evaluators.

Sample screenshots below:
Easy JIRA Integration

- **Setup wizard process improvements**: Hook up Confluence with JIRA right within the in-app setup wizard (huge thanks to the Integration team for taking this work on)

Improved Image Handling

**Turn Images Into Links**

Now you can turn images into links. This is especially handy for turning images into a button like the Docs team is known to do. (Previously this was only available in wiki markup but can now be done in the shiny new Confluence 4.0 editor via the properties panel.) - We're still working on the link icon.
New Default Image Sizes
We've gotten a lot of feedback that there isn't much difference between the pre-set image sizes. So we've tweaked the sizes so you can choose from a wider range of options. Small remains the same at 100px, medium has increased slightly to 300px and large is now 500px.

Custom image sizes
If you don't like the pre-set image sizes you can now specify an exact image width:

Links Dialog: Remember My Tab
Some of the feedback you gave us:
...I find it frustrating that "add a web link" is an extra click away after I open the link dialog. I use that at least as often as I link to another confluence page...

We’ve taken some of the pain out of this by having the link browser remember the last tab you clicked. So if always use web links, it will always open to the web links tab for you. We’re investigating taking this a step further by allowing users to insert a web link from the “search tab as well.”

Improved Conflict Merging

This feature is back into Confluence 4.0. Now if you’re editing a page at the same time as someone else, Confluence will intelligently merge your changes with the other person’s change when you save. This means you’ll be seeing the “another user has made changes to this page since you started editing” warning a lot less often. We’ve also made merging table conflicts much more reliable.

Set Page Location On Save

We’ve heard a lot of feedback from new users that understanding where their page fits in the Confluence page hierarchy is not very intuitive. To help solve this problem when you create a new page and save it, users will be prompted and asked where they would like to save the page.

Infrastructure changes

- Remove ‘Thumbnail maximum height’ and ‘Thumbnail maximum width’ settings from the General Configuration page
- Update upgrade task to blow away thumbnails directory
- Link browser is no longer build in GWT and is in core JavaScript
- Upgrade Plugins to 2.8.0
- Integration Platform 2.12
- Update personal sidebar preference to use browser local storage instead of cookies
We Welcome Your Feedback

To make it easy for you to provide EAP feedback we've created a simple "Got Feedback" button in the Confluence navigation bar: 🎈<strong>GOT FEEDBACK?</strong> Let the Confluence team know what you think of the EAP by providing feedback!

Important Note - Comments Editor

You will notice in this milestone we have a new, simplified comments design. Please note - this design was experimental for internal dogfooding and will not be shipping in Confluence 4.0. It will be removed in the next EAP release.

Upgrade Notes

- **Upgrading from a previous version of Confluence.** Follow the normal upgrade instructions to upgrade your test instance to this release. **We strongly recommend that you back up your Confluence Home directory and your database before upgrading.**

- When upgrading from a previous version of Confluence, if you have customised your cache settings (as documented in Cache Performance Tuning) then you may run into memory problems during the wiki to XHTML migration. We are working to fix this in a later milestone release but in the meantime you can revert your `ehcache.xml` to the default version:
  - If you still experience problems you should try reducing the 'maxElementsInMemory' attribute on each cache to a very small value such as 50.
  - **Note** that any cache changes you make to work around migration problems should only be considered temporary. You should restore caching to it's original settings again after migration has been successful.

- Note that the 'Edit Page in Word' functionality of Confluence is being removed in Confluence 4.0.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

**Confluence 4.0-m29 EAP Release Notes**

**27 June 2011**

Following our first public EAP milestone of Confluence 4.0 earlier this month, we present you with our 2nd public EAP build. An Early Access Preview (EAP) release is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release.

**Highlights of Confluence 4.0 EAP:**

- Paste images into the editor (Firefox and Chrome)
- Drag to Insert Tables
- New "View Source" for pages and blogs
- Other Features and Improvements
- We Welcome Your Feedback

More:
• Read the upgrade notes for important information about this release.
• See the full list of issues resolved in this release.

Downloading the Confluence 4.0 EAP

The Confluence 4.0-m29 EAP Release is available here. When upgrading, please follow the upgrade notes below.

Default Port Number Change

The default port for the Confluence installer has changed from 8080 (http) and 8005 (shutdown) to 8880 and 8805 respectively. If you are upgrading from the previous EAP you may have to update your deployment configuration to reflect this change.

Do not use in production

- **EAP releases are not safe** — EAP releases are snapshots of the ongoing Confluence development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a Confluence EAP release may not be able to be migrated to a future Confluence release.

Highlights of this Milestone

Paste images into the editor (Firefox and Chrome)

Just copy any image to your clipboard and hit CTRL-V in the editor. The image will get attached and embedded directly into your page. There's nothing to install on your desktop...it just works!

This is turned off by default at the moment. You'll need to turn it on from the Universal Plugin Manager.
Drag to Insert Tables

Inserting tables got even more "WYSIWYG" and easier with this feature. Just click on the new Table dropdown and drag your mouse to choose the number of rows and columns you want in your new table. Oh, and don't worry if you like inserting tables with your keyboard, you can still use autoformatting or CTRL+SHIFT+I to insert a table.

New "View Source" for pages and blogs
A lot of people used the "view wiki markup" option to see how pages were made and to copy the underlying markup. Now that wiki markup is gone, we've implemented "view source" (accessible from the Tools menu) so that you can see what macros were used to create the selected page and copy them to your own page.

Other Features and Improvements

- HTML Diffs can display a macro's icon
- Allow administrators to specify the number of reindexing threads at reindex time
- Render tables inside a wrapping DIV to make them easier to style in themes
- Implement end of link markers as a dark feature
- Expose image uploader in drag and drop plugin so it can be used by paste plugin

We Welcome Your Feedback
To make it easy for you to provide EAP feedback we've created a simple "Got Feedback" button in the Confluence navigation bar:

Let the Confluence team know what you think of the EAP by providing feedback!

Upgrade Notes

- **Upgrading from a previous version of Confluence.** Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.

- When upgrading from a previous version of Confluence, if you have customised your cache settings (as documented in Cache Performance Tuning) then you may run into memory problems during the wiki to XHTML migration. We are working to fix this in a later milestone release but in the meantime you can revert your ehcache.xml to the default version.
  - If you still experience problems you should try reducing the 'maxElementsInMemory' attribute on each cache to a very small value such as 50.
  - **Note** that any cache changes you make to work around migration problems should only be considered temporary. You should restore caching to its original settings again after migration has been successful.

- Note that the 'Edit Page in Word' functionality of Confluence is being removed in Confluence 4.0.

A big thank you to everyone who helps us ensure that Confluence keeps getting better and better.

Confluence 4.0-m27 EAP Release Notes

3 June 2011

With great pleasure, Atlassian presents our first public milestone of Confluence 4.0.

An Early Access Preview (EAP) release is a snapshot of our work in progress, primarily focused on allowing Confluence users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release.

Highlights of Confluence 4.0 EAP:

- Simplified Editing Experience
- Introducing Macro Placeholders and New Macros
- Autoformatting – Write Wiki Markup In the Editor
- New Wiki Markup Dialog
- Autocomplete Improvements
- Introducing Confluence Mentions
- Improved Table Operations
- Improved Page Comparison Functionality
- New Email Design
- New Editor Plugin Points for Developers
- Other Improvements
Infrastructure Changes
Helping You Transition to Confluence 4.0
We Welcome Your Feedback

More:
• Read the upgrade notes for important information about this release.
• See the full list of issues resolved in this release.

Downloading the Confluence 4.0 EAP

The Confluence 4.0-m27 EAP Release is available here. When upgrading, please follow the upgrade notes below.

Do not use in production
• EAP releases are not safe — EAP releases are snapshots of the ongoing Confluence development process. As such:
  • While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  • Features in development releases may be incomplete, or may change or be removed before the next full release.
• No upgrade path — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a Confluence EAP release may not be able to be migrated to a future Confluence release.

Highlights of Confluence 4.0

Simplified Editing Experience

We've rebuilt the Confluence editor from the ground up, to bring you an editing experience that's simpler, faster and more intuitive.

Below is some of the artwork proposed for the Angry Nerds website:

ANGRY NERDS
THIS DEV TEAM DON'T STAND FOR NO BUGS
• Just one editor!
• Left, Centre, Right align, without any macros.
• Indent paragraph blocks and lists from the toolbar.
• New Colour Picker.
• The user interface has been streamlined.

Introducing Macro Placeholders and New Macros

Confluence 4.0 introduces macro placeholders, a visual representation of your macros while editing. Create rich content with existing and new macros, but without them getting in the way.

Easy Macro Management

To make macros easier to manage when editing, the editor now uses macro placeholders. Placeholders offer the following advantages:

• Quick access to macro editing
  Edit the content of a macro directly in the editor, or double-click the placeholder to open the Macro Browser for parameter editing.

• Macro placeholder properties panel
  Every macro placeholder has a properties panel. The properties panels for particular macros, such as the Status and View File macros, have additional functionality, as described below.

New and Improved Macros

We've bundled more macros with Confluence, and made some of the existing macros better, to help you easily include and present relevant content:

• New: Status Macro
  The Status macro displays a coloured lozenge in the editor, so you can see the status directly. You can use the properties panel to change the status while editing, without having to use the Macro Browser.

• New: Expand Macro
  The Expand macro allows you to add a dynamically expandable section of text to your page.
  ```
<table>
<thead>
<tr>
<th>Expand</th>
</tr>
</thead>
<tbody>
<tr>
<td>This text in the body of this macro placeholder can be dynamically expanded when viewing the page...</td>
</tr>
</tbody>
</table>
  ```

• Improved: Include Page Macro
  The properties panel for the Include Page macro has a ‘Go to included page’ button that allows you to quickly check the page you have included, while still in the editor.
• **Improved: JIRA Issues Macro**
You can quickly open up the JIRA issue or filter, right from the editor, using the new 'View in JIRA' button in the properties panel.

• **Improved: View File Macro**
The placeholder for the View File macro displays an image according to the file type (for example PDF or Word file). And you can easily download the file while you are editing the page, using the new 'Download file' button in the properties panel.

**Autoformatting – Write Wiki Markup In the Editor**
Many of Confluence’s biggest fans are avid wiki markup users. For you aficionados, we wanted to give you the fastest editing experience possible, while preserving the speed and efficiency of your existing wiki markup skills. So, we present you with Autoformatting!
Autoformatting lets you type wiki markup into the editor and "auto-formats" your text on the fly. To learn more, click on the "?” help button in the editor and select the "Wiki Markup" tab.

Try these and see what you think:

- **Font Formatting**
  Bold, underline, strikethrough, italic, superscript, subscript – just type the markup, such as *Bold*, and watch it convert to **Bold** on the fly!

- **Basic Tables**
  Try typing |||||, or || Heading 1 || Heading 2 ||, then hit enter to get a table header like this:

<table>
<thead>
<tr>
<th>Heading 1</th>
<th>Heading 2</th>
</tr>
</thead>
</table>

- **Emoticons**
  All of our emoticons convert on the fly. Try typing (/) in the editor to instantly see this: 😊.

- **Lists**
  For numbered lists, type # and a space at the start of each line.
  For bulleted lists, type * and a space at the start of each line.

- **Headings**
  Type h4. then some heading text to see a level 4 heading.

---

**New Wiki Markup Dialog**

Many people tell us they like to take notes in wiki markup, then paste them into Confluence. We've also spoken to customers who have lots of scripts that produce wiki markup and are manually inserted into pages. For these folks, we present the Wiki Markup dialog. Simply select 'Wiki Markup' from the 'Insert' menu to launch the Wiki Markup dialog. From there you can insert any wiki markup, even macros.
Autocomplete Improvements

Autocomplete uses wiki markup syntax to quickly link to content, embed images and other media and insert macros into the page. If you haven’t experienced autocomplete, you should see this blog post. Be sure to try the following:

New Page Links

 Quickly insert a link to create a page with Autocomplete for links. Simply type ‘[]’ in the editor and as you type, Confluence will display a Create Page link if a page with that title does not already exist in your current space.

Instant Link, Media and Macro Creation

Type [, ! or { in the editor to add various kinds of content to your page:

- The first item in the list is pre-selected to make editing even faster.
- The macro autocomplete list now loads much faster.
- The macro autocomplete list now inserts most macros directly, without launching the Macro Browser, unless the macro requires a parameter.

Introducing Confluence Mentions

Confluence 4.0 includes the new Mentions feature. This allows you to easily bring in collaborators to a conversation: if you are mentioned in any Confluence content (a page, blog, comment or status update), you will be notified by email.

To mention someone, type @ and their name, when editing. Mentions will first suggest people you are following in your network, so you can quickly find and involve your friends.
Improved Table Operations

We've made table operations better in Confluence 4.0 with the following features:

New In-Context Table Toolbar

The new table toolbar removes the need for a context menu and only appears when you add a table to the page.

New Table Operations

New table manipulation buttons are available for highlighting discrete cells, rows or columns and for copying or pasting rows.

Merge and Split Table Cells

You can now merge and split cells in a table. This feature satisfies the single most popular issue on our issue tracker!
**Improved Page Comparison Functionality**

We've got a better way to view changed content in Confluence.

**Improved Page Diffs**

We've simplified page diffs to make them easier to read. Additionally, page diffs now show changes to both formatting and macros.

**Diffs in Email**

Where possible, email notifications now show page differences as they appear in Confluence. These come through with the diff colour coding.

---

**Versions Compared**

<table>
<thead>
<tr>
<th></th>
<th>Current</th>
</tr>
</thead>
<tbody>
<tr>
<td>Paul Watson</td>
<td>less than a minute ago</td>
</tr>
</tbody>
</table>

**Key**

- This line was added.
- This line was removed.
- Formatting was changed.

---

**Improved Page Diffs**

We've simplified page diffs to make them easier to read. Additionally, page diffs now show changes to both formatting and macros.

**Diffs in Email**

Where possible, email notifications now show page differences as they appear in Confluence. These come through with the diff colour coding.

---

**New Email Design**

All email notifications in Confluence now have a new design. This works in major email clients as well as on the iPhone.
New Editor Plugin Points for Developers

We've added more editor plugin points for developers. Notable improvements include:

Extend the Macro Property Panel

Plugin developers can add buttons to the Macro Property Panel in the editor. For example, insert a Gliffy diagram or see the tutorial on how to do this.

Render an Image in the Macro Placeholder

A plugin developer can render an image instead of a placeholder for bodyless macros. Here is an example, showing a Gliffy image rendered inside the editor:

For more information, check out the tutorial on how to do this.
Custom Parameter Rendering in Placeholders

You can choose to display any parameter in the macro placeholder in the editor, instead of having the placeholder automatically show the first few parameters.

New Pluggable Format Menu

Plugin developers can add items to the editor's Format menu. See this tutorial for details.

Other Improvements

As always, we have made various small improvements to Confluence screens and functionality.

- **Administrator's task list in the Admin Console**
  This new task list in the Admin Console helps administrators get started after a new install.

- **New keyboard shortcuts:**
  - CMD+S to save a page from the change comment field.
  - CMD+SHIFT+e to preview when you are in the editor; hit 'e' to get back to the editor.
  - CMD+SHIFT+d to display the Wiki Markup dialog.

- **Better Image Handling**
  In the Insert Image dialog, we've introduced the Search tab so you can insert images from other pages. And all images now embed as clickable thumbnails.

- **Option to disable the "secure" cookie**
  When using HTTPS, you can disable the "secure" cookie, just for the login page.

- **Help tips in the administration screens**
  The help tips have been moved into the field descriptions.

- **Backup and Restore page**
  The Backup and Restore page has been redesigned.

- **404 page**
  The 404 page now has a dashboard breadcrumb.

Infrastructure Changes

This release includes a number of improvements in the APIs and under the covers as well.

- **Support for Chrome**
  We now offer support for Chrome in Confluence 4.0. See the upgrade notes for more information about browser support.

- **API Changes**
  We have disabled the getPage() and getBlogEntry() read methods in the XML-RPC/SOAP API. If you have a script that primarily reads or appends to existing pages, it will break. Creating pages and overwriting existing pages will still work.

- **Upgrade to AUI 3.4**
  Confluence 4.0 uses AUI 3.4.

- **Anti-XSS Mode**
  Anti-XSS mode is now enabled by default for plugins.

- **Mail Page Plugin**
The Mail Page plugin is no longer bundled in Confluence.

- **Alignment and Border Parameters**
  The alignment and border properties in the macro definition template have been removed.

### Helping You Transition to Confluence 4.0

We've created a set of resources to help you manage the transition away from wiki markup. We know your people have become experts with using wiki markup in Confluence, but we think you'll really appreciate the new editor, and we want to make it as easy as possible for you to make the change. The change management resources are listed under the current documentation.

### Upgrade Notes

- **Upgrading from a previous version of Confluence.** Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you back up your Confluence Home directory and your database before upgrading.

- When upgrading from a previous version of Confluence, if you have customised your cache settings (as documented in [Cache Performance Tuning](#)) then you may run into memory problems during the wiki to XHTML migration. We are working to fix this in a later milestone release but in the meantime you can revert your `ehcache.xml` to the default version.
  - If you still experience problems you should try reducing the 'maxElementsInMemory' attribute on each cache to a very small value such as 50.
  - **Note** that any cache changes you make to work around migration problems should only be considered temporary. You should restore caching to it's original settings again after migration has been successful.

- Note that the 'Edit Page in Word' functionality of Confluence is being removed in Confluence 4.0.

A big **thank you** to everyone who helps us ensure that Confluence keeps getting better and better.

### Confluence 3.5-rc1 ("Release Candidate 1") Release Notes

Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official
release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

⚠️ Do not use in production

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

Who should try this out?

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.

⚠️ Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.

Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.

Upgrade Procedure

If you wish to upgrade your existing Confluence installation with this version, ensure you have created a
separate copy of your current Confluence production installation first and using that copy, follow the normal upgrade instructions to upgrade it to this development release. If you have also implemented customised site- or space-specific layouts, you will need to re-implement them after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

Downloads

All development releases are available from Development Releases on the Atlassian website.

Previous Betas and Milestones

- **Confluence 3.5-beta3 ("Beta 3") Release Notes** – 4 March 2011
- **Confluence 3.5-beta2 ("Beta 2") Release Notes** – 4 March 2011
- **Confluence 3.5-beta1 ("Beta 1") Release Notes** – 10 February 2011
- **Confluence 3.5-m4 ("Milestone 4") Release Notes** – 22 December 2010
- **Confluence 3.5-m3 ("Milestone 3") Release Notes** – 17 December 2010
- **Confluence 3.5-m2 ("Milestone 2") Release Notes** – 7 December 2010
- **Confluence 3.5-m1 ("Milestone 1") Release Notes** – 22 November 2010

Bugs fixed

- **Scheduled jobs administration bug fixes**
- **Editor bug fixes**
- **Dashboard bug fixes**
- **User management bug fixes**
- **Other bug fixes**

Scheduled jobs administration bug fixes

- Fixed an unhandled exception in the scheduled jobs administration screen when Gliffy is installed.
- Removed the daily backup job from the scheduled jobs administration screen. It can still be controlled via the backups screen.
- Made wording changes in the scheduled jobs administration screen.

Editor bug fixes

- Fixed drag and drop not working properly in the editor in Internet Explorer.
- Fixed position of the comment editor, which was showing below the notation guide when using the Easy Reader theme.
- Fixed JavaScript error thrown by drag and drop in IE8 when native XMLHttp support is disabled.

Dashboard bug fixes

- Added backwards compatibility with 3.4 for dashboard-recently-updated macro parameters.
- Fixed problem: Unable to select certain category labels with special characters on the dashboard spaces and updates lists.

User management bug fixes

- Improved incremental license counting, so the licensed user count is now accurate immediately after adding or removing users.
- The old-style seraph group joining authenticators will now work with the new user management system, so users don’t have to edit their seraph-config.xml to get Confluence 3.5 working. We still recommend customers use the standard Confluence (or Crowd SSO) authenticators, and configure whether users from their directories should join groups when they log in through the User Directories administration console.
- Fixed migration of local groups with LDAP users.

Other bug fixes

- The "what's new" dialog will no longer show for milestone and beta development releases.
• Comments are back to being correctly imported during a site or space restore.
• Better handling of failure to create unique constraint in DB2.
• Fixed: Mail servers configured before Confluence 2.8 trigger ClassCastException when extracting email from name.
• French and German translations have been updated for 3.5.
• Space directory filter no longer removes search results on every keystroke.
• Space Directories will now show in two-column layout on screens with a resolution as low as 1024x768.
• Upgraded to Social Bookmarks plugin 1.3.8, to resolve sort ordering issues.
• Reduced memory footprint when loading bundled plugins and the demo site.

Known Issues
• The bundled Support Tools plugin does not start up and outputs a stack trace to the server logs at startup. This will be fixed in the final release.

Confluence 3.5-beta3 ("Beta 3") Release Notes

Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

⚠️ Do not use in production

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

Who should try this out?

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.
Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.

Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.

**Upgrade Procedure**

If you wish to upgrade your existing Confluence installation with this version, ensure you have created a separate copy of your current Confluence production installation first and using that copy, follow the normal upgrade instructions to upgrade it to this development release. If you have also implemented customised site- or space-specific layouts, you will need to re-implement them after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

**Downloads**

- [Confluence 3.5-m1 ("Milestone 1") Release Notes](#) – 22 November 2010

**New Features and Improvements**

**Highlights of this release:**

- Improved Crowd SSO configuration
- Bugs fixed

**Improved Crowd SSO configuration**

Confluence 3.5 now ships with everything you need to configure SSO when using a Crowd server for centralised user authentication. To enable this, administrators just need to:

1. Ensure the Crowd directory is configured in the User Directories administration console
2. Configure crowd.properties with the details for the Crowd server (including the application name and
password)

3. Configure seraph-config.xml with the new SSO authenticator:

```xml
<authenticator
    class="com.atlassian.confluence.user.ConfluenceCrowdSSOAuthenticator"/>
```

Customers with an existing Confluence 3.4 SSO configuration should not need to change anything for this to work, but we recommend all customers using SSO switch to use this new authenticator.

### Bugs fixed

- JIRA Issues macro can now show on a single line when it shows a single issue.
- Resolved issues migrating user configurations with multiple LDAP directories configured.
- Crowd System Password Encoders is now properly listed in the System Plugins section of the plugins administration console.
- Upgraded to Share plugin 1.5, to resolve javascript errors in IE7.
- Upgraded to Drag and Drop plugin 1.0.16, to resolve more corner cases.
- Fixed font sizes and colours in the Macro Browser and Preview dialogs.
- Fixed square buttons on dialogs on Mac OSX
- Insert image dialog shows previews once again
- Added migration for mail server configurations so customers with mail settings unchanged since Confluence 2.7 will still be able to send emails.
- Fixed invalid HTML markup for dashboard updates with profile pictures disabled

### Confluence 3.5-beta2 ("Beta 2") Release Notes

Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

- [Confluence 3.5-m1 ("Milestone 1") Release Notes](#) – 22 November 2010

**New Features and Improvements**

**Highlights of this release:**

- [Support Tools Plugin](#)
- [Improved Share Button](#)
- [Improved Delegated LDAP User Directory Configuration](#)
- **Bugs fixed**
  - [Space Directory bug fixes](#)
  - [Other bug fixes](#)
- [Improvements for developers](#)
- [Known issues](#)

**Support Tools Plugin**
Support’s Support Tools Plugin is now bundled into Confluence. It provides a log analyser to help sysadmins identify known issues with their instance, and a new improved support request feature.

**Improved Share Button**

We’ve improved the new "Share" button introduced in Confluence 3.5. Notable changes:

- **Share with email**
  You can now easily share a page with someone by entering just their email address.

  ![Share Button Screenshot](image)

- **Share for blog posts**
  The Share button now works for blog posts as well as pages.

- **New email style and short link in email**
  We’ve been using the Share button as an opportunity to explore some new email notification designs.

  ![Email Notification Screenshot](image)

We hope to follow this format for all the other email notifications in the near future. Additionally, to make sure your link doesn’t break we now email users the "short link" for a Confluence page instead of the full page URL.

**Improved Delegated LDAP User Directory Configuration**

We have added an option to copy users automatically from the LDAP server to Confluence when they authenticate for the first time. Copied users can also be assigned automatically to default groups.
Users in directories marked as “Read Only, with Local Groups” can also automatically be added to default groups.

Bugs fixed

**Space Directory bug fixes**

- Search filters now fire more reliably, and results are now sorted by the DB, reducing result rendering time
- Only team categories are shown for each space, rather than personal labels or favourites.
- We now show personal space icons rather than the generic space icon.
- Pagination fixes

**Other bug fixes**

- Performance results are much improved across the board.
- Probably the last ever WYSIWYG round-trip bug fix: the HTML macro now safely round-trips its content ([CONF-8441](#)).
- The demonstration space (example site) has been updated with content for Confluence 3.5
- Reshuffled administration console entries, so that security is no longer the top of the list.
- Fixed a bug with watch all blog posts for space receiving notifications for any change, not just blog posts. Also fixed who is listed as watching the space, rather than watching just the blog posts on that space.
- Fixed notification emails showing the wrong unsubscribe links for space blog watches.
- The username for anonymous users can now be translated for email notifications.
- Notifications are now sent using the right locale.
- Global logo descriptions will now be autogenerated, if none was found.
Errors from the old lucene index format should now be much less verbose or worrying.

Child page lists are now loaded via AJAX, rather than on initial page render. Users no longer have to wait for a page refresh to expand this list.

Fixed a bug where malformed label names were always reported as being too long.

Upgraded to Tomcat 6.0.32 in the Confluence distribution.

Upgraded to Social Bookmarks Plugin 1.3.7.

Upgraded to Drag and Drop Plugin 1.0.15.

Upgraded to Plugin Framework 2.7.1, to reduce the amount of logging for some minor issues.

**Improvements for developers**

- Added support for EventPublisher @EventListener style listeners to the listener plugin module descriptor. Developers can now configure their listeners in their atlassian-plugin.xml using the standard:

  ```xml
  <listener name="Something Happened Listener" key="SomethingHappenedListener" class="com.example.SomethingHappenedListener">
    <description>Listener for something happened events</description>
  </listener>
  ```

**Known issues**

**Local users cannot log in when using Crowd or Delegated LDAP**

Whatever directories appear after a Crowd or Delegated LDAP directory in the User Directories admin UI will not be consulted, as these two directories currently throw an authentication-failed error, rather than a user-not-found error for users they do not contain. This is being fixed in Crowd now, and will be included in the next build.

**Migration error when importing from backup ([CONFDEV-3172](#))**

The performance fix for caching crowd Application objects introduced this issue. It's fixed in Crowd now, and will be included in the next build.

**What's New showing for beta software**

The What's New dialog should not be enabled on a beta install of Confluence, but it is. We're investigating why, and will have a fix before we build another beta/milestone.

**Local groups are not imported when doing in place upgrades or restoring from backup**

Users currently have to be manually reassOCIated with their old groups. We're working on fixing it!

**Note about CONFDEV issues**

The Confluence team is using an internal JIRA project for tracking development with GreenHopper. The CONFDEV issues refer to our internal tracking numbers for user stories or bugs discovered and fixed within the scope of a release.

**Confluence 3.5-beta1 ("Beta 1") Release Notes**

Confluence versions marked "Milestone", "Beta" or
"Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

Do not use in production

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

Who should try this out?

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.

Please note the following

- Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.

Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.
Upgrade Procedure

If you wish to upgrade your existing Confluence installation with this version, ensure you have created a separate copy of your current Confluence production installation first and using that copy, follow the normal upgrade instructions to upgrade it to this development release. If you have also implemented customised site- or space-specific layouts, you will need to re-implement them after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

New Features and Improvements

Highlights of this release:

- "What's New"
- Revised Dashboard Layout
- New Insert JIRA Issue dialog
- Improved JIRA issues macro
- Share a Page
- More Notification Improvements
  - One-click 'stop watch' links
  - Even more improvements
  - Space Blog Watches
- Drag-and-Drop Improvements
- New (code) macro
- Space Directory Improvements
- Scheduled Job Administration
- Applinks
- Performance / Stability
- Security
- Other improvements
- Small Improvements Gallery

"What's New"

When a user first logs in to Confluence 3.5, they'll be presented with an AUI dialog box promoting new product features. (We aim to eventually work this feature into all our products.)

The content on this dialog is retrieved from Atlassian's web servers - the following screenshot is a mockup of what the final dialog box might look like.
Like other products that encourage you to actually read their release notes before continuing, the What's New dialog will keep appearing on login until the user clicks "Don't show again". However, you can always access this dialog box again from the Browse Menu:

Revised Dashboard Layout

Previously in Confluence, you could filter the "Recently Updated" section on your dashboard by selecting a tab in the spaces list. For example, clicking on the Favourite tab in the spaces list on the left would limit recent updates on the right to your favourite spaces only).

This was a source of confusion for many users not expecting a tab change on the bottom left to update the recent updates on the top right.

To address the issue, the recent updates section has been given its own set of tabs (which now function independently of the spaces list). In the process, the tabs were also given a face lift and the recent updates section now takes up the entire right hand side of the dashboard.

New Insert JIRA Issue dialog

If you have configured one or more application links (aka 'applinks') to a JIRA server, you can insert a JIRA Issue link into your Confluence page while you're editing the page. You can access this feature via a new JIRA
button on the editor toolbar.

When you click it or press Ctrl + Shift + J, you get:

From here you can:
- Embed recently viewed issues
- Create a new issue
- Search for issues

Improved JIRA issues macro

Completely overhauled to support applinks, the JIRA issues macro now supports a single issue key, multiple comma separated issue keys or a JQL query. We’ve also changed the macro to use the name “jira” (although “jiraissues” will still work).

Finally, the macro now supports OAuth-based authentication from Confluence to JIRA. Note that all new features of the JIRA issues macro require a JIRA application link to be configured.

Here are some examples of using the improved JIRA issues macro:

<table>
<thead>
<tr>
<th>What you type</th>
<th>What you get</th>
</tr>
</thead>
<tbody>
<tr>
<td>{jira:JRA-9}</td>
<td></td>
</tr>
<tr>
<td>{jira:assignee=currentUser()}</td>
<td>a table with all issues assigned to you</td>
</tr>
<tr>
<td>{jira:JRA-9,JRA-10,JRA-12}</td>
<td>a table containing the individual issue keys listed</td>
</tr>
</tbody>
</table>

Share a Page

How many times have you copied a page link, pasted it into an email and sent it off to someone with a little note? The new "Share a page" feature makes this common activity super quick.
More Notification Improvements

One-click ‘stop watch’ links

- **Ask and you shall receive** - Clicking the ‘Stop watching this page’ link in email notifications now automatically removes the watch for you without requiring a confirmation. You can still undo this if you clicked the link by accident.

Even more improvements

- **Straight to edit mode** - Clicking the ‘Change notification preferences’ link now takes you directly to edit mode for your email preferences.
- **More information** - We've added more information at the bottom of email notifications for when you're watching all blogs.
- **Links in Plain text** - The stop watch links have been made available for those of you receiving emails in plain text.

**Space Blog Watches**

**CONF-6478** is a highly voted for issue, with over 100 votes. The idea is that blog posts are newsworthy updates so you might want to get email notifications for new blog posts without getting emailed for all other activity in the space.
Drag-and-Drop Improvements

**Powered by HTML 5** - Drag-and-drop is now powered by HTML5. That means:

- Drag-and-drop works in all browsers, including Chrome!
- If you use a browser that fully supports HTML 5, you'll never get that annoying prompt to install Gears again. It just works.

**Drag-and-drop multimedia files** - Confluence 3.5-m4 introduced the Multimedia Macro. In this release we added drag and drop - Dragging a multimedia file onto a page will automatically insert the multimedia macro for you.

**New {code} macro**

The newcode macro project has now been bundled into Confluence, replacing the original code macro in atlassian-renderer. The new code macro has a number of improvements over the original macro (wider syntax support, copy/paste without getting line numbers in the clipboard).

Space Directory Improvements

We've improved the Space Directory since last milestone. Notable additions since then are:

- Clicking on the space category now switches tabs to that category
- Partial name search in space directory

Scheduled Job Administration

A new Confluence administration screen to monitor, and manage scheduled jobs. This is available through the "Scheduled Job Administration" link in the Confluence admin console. Here are some screenshots:
Applinks

The first cut of applinks has been integrated into Confluence. We will use this as the basis for delivering deeper JIRA integration later in this release.

Performance / Stability

A cache has been added to store page diffs. This should prevent the situation where RSS feeds with diffs can slow down Confluence.

Security

The underlying user management code has been updated so that it now enforces permissions on directories at a low level. This means remote API calls that create or modify users or groups on read only directories will fail and no longer write to the directory as they did in previous 3.5 milestones.

Other improvements

- Fix CSS vendor prefix antipattern
- Multimedia macro UX/UI improvements
- Media items in the image/media autocomplete now display an appropriate icon
- Change Team Labels to Space Categories
- Change blue collapsing arrows to grey
- Display the default welcome message on the General Configuration Admin page
- Display default contact administrator message on General Configuration admin page
- Fix for broken fonts on Windows
- Upgrade to AUI 3.3
- Fix and improve printing DOC theme in IE7
- Log in and Sign up links misaligned
- Capitalise the first letter of category labels in the spaces list and recently updated dashboard macros

Small Improvements Gallery

Bugs fixed
**MySQL Configuration Change Required**

The default transaction isolation mode of MySQL will cause issues with missing LDAP and other remote directory user permissions, and is no longer supported. Users must reconfigure their MySQL instances to use READ_COMMITTED instead. See MySQL Crowd configuration for instructions.

---

**User management bug fixes**

- CONFDEV-2404 - Fix migration of crowd user directories
- CONFDEV-2068 - Infinite redirect during login for users with confluence admin but not system admin permission
- CONFDEV-1638 - Fix duplicate initialisation of application object
- CONFDEV-1414 - User Directories menu option should only appear for system administrators

**Drag and drop bug fixes**

- CONFDEV-2711 - Drag and Drop should indicate multiple file uploads
- CONFDEV-2155 - Drag and drop produces incorrect file size if the file already exists

**Other bug fixes**

- CONFDEV-2678 - Blog comment links contain {0}

**Improved Thumbnail Rendering**

- Thumbnails for transparent images (PNG & GIF) now render properly.
- Thumbnail rendering does not cause OOM errors even if the image is very large by delegating to a stream based renderer (this should solve the problem mentioned in Studio Multi-Tenant Reliability Proposal)

---

**Improvements for developers**

- CONFDEV-2730 - Bump AUI version from 3.3.0 to 3.3.1
- CONFDEV-2359 - Crowd upgraded to 2.2.0-m4. Embedded Crowd upgraded to 1.0-alpha26

**Known Issues**

- Insert JIRA issue dialog does not work if you are running confluence on the root context path. For example, http://servername, instead of http://servername/confluence. You can download a new version [here](http://servername/confluence) that fixes it
- Imports from XML site backups may not work under certain circumstances if running an Oracle database.
- Installers for Mac and Windows have not been released for this version. They will be released for beta 2.

**Note about CONFDEV issues**

The Confluence team is using an internal JIRA project for tracking development with GreenHopper. The CONFDEV issues refer to our internal tracking numbers for user stories or bugs discovered and fixed within the scope of a release.

**Confluence 3.5-m4 ("Milestone 4") Release Notes**

*For testing use only*

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.
Who should upgrade?

⚠️ Please note the following
- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the [normal upgrade instructions](https://confluence.atlassian.com) to upgrade your test instance to this release. *We strongly recommend that you backup your Confluence home directory and database before upgrading!*

**Downloads**

All development releases are available from the [development releases page](https://confluence.atlassian.com) on the Atlassian website.

**Previous Milestone(s)**

- [Confluence 3.5-m3 (“Milestone 3”) Release Notes](https://confluence.atlassian.com)

**Features**

**Notification Improvements**

We have continued work further notification improvements in this milestone. Notifications about changes are now sent with From address of the email including the name of the user who made the change. This behaves the same as in JIRA and should make it a lot easier to decipher Confluence notifications in your inbox.
The format of the From address used in emails can be customised by Confluence administrators under the Mail Servers configuration, using the same formats as in JIRA. The default format is "<user’s full name> (Confluence)".

**Automatic Language Detection**

This milestone includes the ability to select a user's preferred language automatically, by respecting the Accept-Language header which the user's browser sends. Unless a language preference has been made in the profile settings, the closest matching language to the one suggested by the browser will be used.

**New Space Directory**

One of the biggest problems facing customers with large installations of Confluence is the scalability of the dashboard. It's a well-known problem that the list of spaces on the dashboard doesn't scale for sites with more than a few dozen spaces. We've added a new screen called the Space Directory where you can browse every space without having to use the Dashboard.

The Space Directory will eventually make the 'All' list of spaces on the dashboard obsolete, and make the performance of the dashboard much better for our large customers.

**Multimedia Autocomplete**

We have also continued work on editor improvements for Confluence 3.5. In this milestone, you can now embed multimedia files into your page via autocomplete. Try it out by hitting “!” in the editor and entering the name of a movie file attached in Confluence.

**Remote API for Watching and Managing Watchers**

We've added a bunch of new methods into the Confluence SOAP and XML-RPC APIs for watching and
managing watchers. The new methods in the remote API mimic the watch functionality exposed through the UI:

- `boolean watchPage(String token, long pageld)` – watch a page or blog post, returns false if a space, page or blog is already being watched
- `boolean watchSpace(String token, String spaceKey)` – watch a space, returns false if the space is already watched
- `boolean watchPageForUser(String token, long pageld, String username)` – add a watch on behalf of another user (space administrators only)
- `boolean isWatchingPage(String token, long pageld, String username)` – check whether a user is watching a page (space administrators only, if the username isn't the current user)
- `boolean isWatchingSpace(String token, String spaceKey, String username)` – check whether a user is watching a space (space administrators only, if the username isn't the current user)
- `RemoteUser[] getWatchersForPage(String token, long pageld)` – return the watchers for the page (space administrators only)
- `RemoteUser[] getWatchersForSpace(String token, String spaceKey)` – return the watchers for the space (space administrators only).

There's also a very obscure old method called `getBlogEntryByDayAndTitle` which only allowed you to look up a blog post in the current month. We've added a new method to look up any blog post by date and title:

- `RemoteBlogEntry getBlogEntryByDateAndTitle(String token, String spaceKey, int year, int month, int dayOfMonth, String postTitle)` – retrieve a blog post by specifying the date it was published and its title.

**Small improvements**

- CONFDEV-1792 - Change edit-page "comment" to "what did you change? (user testing showed that "comment" was confusing)
- CONFDEV-1614 - Change link styling in Confluence
- CONFDEV-1409 - New set of avatars
- CONFDEV-977 - Add tips at the bottom of all dialogs for which there's a keyboard shortcut

**Bug fixes**

**Multimedia Macro bug fixes**

- CONFDEV-1955 - Fixed the help link in the multimedia macro

**User management bug fixes**

- CONFDEV-1682 - Attempting to remove an LDAP group in Confluence UI throws an unhandled exception
- CONFDEV-1499 - Update the message shown to users when there are more users than the license allows

**Other bug fixes**

**Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.**
• CONFDEV-1936 - Removed the BundleUserMacrosUpgradeTask upgrade task as it wasn't needed
• CONFDEV-1924 - Fixed broken personal sidebar layout in documentation theme
• CONFDEV-1855 - (attachments) macro ordering reversed
• CONFDEV-1840 - Support zip should no longer be created when atlassian-user.xml doesn't exist
• CONFDEV-1805 - External gadget urls don't work for https
• CONFDEV-1742 - LuceneUtils has very verbose warnings when index is using old format

Improvements for developers
• CONFDEV-1896 - Updated AUI to 3.2.1
• CONF-21462 - Plugin authors can now sign their plugins
• CONFDEV-1877 - Fix Confluence in IDEA 10: webapp has compile dependency on confluence core

Known issues
• CONFDEV-2112 - Spaces with custom decorators built after 3.5-m3 fail with an error
• CONFDEV-2120 - Logos don't work in the Space Directory

Note about CONFDEV issues
The Confluence team is using an internal JIRA project for tracking development with GreenHopper. The CONFDEV issues refer to our internal tracking numbers for user stories or bugs discovered and fixed within the scope of a release.

Confluence 3.5-m3 ("Milestone 3") Release Notes

⚠️ For testing use only
Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following
• Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  • While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  • Features in development releases may be incomplete, or may change or be removed before the next full release.
• No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.
However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the [normal upgrade instructions](#) to upgrade your test instance to this release. *We strongly recommend that you backup your Confluence home directory and database before upgrading!*

**Downloads**

All development releases are available from the [development releases page](#) on the Atlassian website.

**Previous Milestone(s)**

- Confluence 3.5 Milestone 2

**Features**

*HTML5, character encoding and IE rendering mode*

A bundle of small markup improvements have been made for Confluence 3.5-m3:

- Confluence's DOCTYPE declaration has been switched from HTML 4.01 Strict to HTML5, which is automatically strict as well.
- X-UA-Compatible is now explicitly set to EDGE, to ensure IE always renders in latest standards mode
- Character encoding is now set at the document level according to the encoding setting in General Configuration

**Multimedia Macro**

The new multimedia macro has been expanded to support many more file types. You can now embed MP3, MOV, AVI files and many more. Try it out by searching for 'multimedia' in the macro browser.

**User management improvements and bug fixing**

- CONFDEV-1642 - Membership caching handles nested groups correctly
- CONFDEV-1636 - Build against Crowd 2.1.0 release version
- CONFDEV-1441 - Test migration of user preferences when upgrading
- CONFDEV-1318 - Handle exception when removing a directory that is synchronising

**Notifications bug fixing**

- CONFDEV-1819 - Unwatching a page via email no longer says "Stopped watching 'null'"

**Administrative improvements**
• **CONF-3987** - Confluence now respects `atlassian.mail.senddisabled` and `atlassian.mail.featuredisabled`, as in JIRA
• **CONF-21323** - Improved RSS feed contextual logging information (also in 3.4.5)

**Small improvements**

• CONFDEV-977 - Tips displayed for dialogs with keyboard shortcuts
• CONFDEV-1023 - Title colour attribute added to panel macro
• CONFDEV-1013 - Include page macro is now able to render blog posts
• CONFDEV-1409 - New set of standard profile pictures

**Small improvement screenshots**

![Small improvement screenshot](image)

**Bug fixes**

• **CONF-21144** - Copy and paste of emoticons is working again (also in 3.4.5)

**Performance Fixes**

• **CONF-21376** - Improve performance of attachments in RSS feeds (also in 3.4.5)

**Known issues**

• CONFDEV-1924 - Personal sidebar looks broken in documentation theme

**Note about CONFDEV issues**

The Confluence team is using an internal JIRA project for tracking development with GreenHopper. The CONFDEV issues refer to our internal tracking numbers for user stories or bugs discovered and fixed within the scope of a release.

**Confluence 3.5-m2 ("Milestone 2") Release Notes**

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.

**Who should upgrade?**
Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the [normal upgrade instructions](#) to upgrade your test instance to this release. *We strongly recommend that you backup your Confluence home directory and database before upgrading!*

**Downloads**

All development releases are available from the [development releases page](#) on the Atlassian website.

**Previous Milestone(s)**

- [Confluence 3.5 Milestone 1](#)

**Features**

*Improved Notifications*

_Autowatch your content_

How many times have you created a page or blog post and then forgot to watch it? Confluence now lets you automatically watch any pages you add, edit or comment on. This is turned on by default for all new users and upgraded users (yes, that means you!), and you can turn off autowatch via your Email Settings page.
Enabling this setting will improve your ability to keep track of your contributions on the wiki:

- Automatically watch any page/blog post that you add
- Automatically watch any page/blog post that you edit
- By default, have the 'watch this page' checkbox ticked when you write a new comment.

**Easier to stop watching content**

Getting too many emails from Confluence? In this milestone, we've made it much easier to stop watching pages, spaces and users. When you get a notification email now, (most of the time) there's a handy link at the bottom allowing you to quickly unsubscribe from your existing watches. The link will change depending on why you got the email in the first place (e.g. whether you were watching the space, page or network).

The link takes you straight to your Manage Watches page (for space and page watches) or to your network page (for users you follow) and gives you a prompt to easily remove the appropriate watch:

These notification improvements are the result of a 20% project by Anna Katrina Dominguez, who joined our team earlier this year. The project is still a work-in-progress, so please let us know what you think as per the Feedback section below.

**Multimedia Macro**

Previously, the only way to embed multimedia items (videos and audio) in Confluence was through Wiki Markup. This milestone introduces a new *multimedia macro* so you can embed multimedia using the macro browser, eliminating the dependency on wiki markup. The first cut of this macro only supports SWF files but we will be adding support to more formats and advanced settings in later milestones. This macro is available via Autocomplete for Macros and the Macro Browser.
Small Improvements

- Previously, it was not possible to differentiate between two gadgets with the same name and description. We’ve now updated the macro browser to show a gadget’s URL so users can more easily distinguish between gadgets with the same name and description (CONF-17991):

Note: This style will change slightly in a later milestone.

- Minor UI tweaks:
  - Black headings on the dashboard for consistency with other Atlassian applications
  - All dialog close and cancel buttons have now been changed to links

- When adding a new user macro, the template field is shown pre-populated with a simple example
• Prototype and Scriptaculous libraries have been removed. This can lead to a minor improvement in page load time.
• The number of images requested on the dashboard have been reduced leading to a small improvement in dashboard load time.

**Performance Fixes**

• Re-enabled caching of PropertySet results. This will allow high performance lookups of UserPreferences once again.
• Added caching for plugin module descriptors inside the plugin framework. All callers of the PluginAccessor methods that return these objects should see a noticeable improvement in lookup time.

With these fixes, page rendering is now much faster than m1 – more than 100ms in our own testing – and roughly on par with 3.4.x. Work continues to make performance even better.

**Bugfixes**

• [CGP-153](#): Gadget security token is "malformed" when page is open for a long time
• [CGP-155](#): Gadget dialog close button should be a link

**Known issues**

• [CONFDEV-1742](#): Lots of error messages generated until reindex is completed
• [CONFDEV-1752](#): Card and deck macros no longer work properly
• [CONFDEV-1686](#): Unless you've come from an email link, the Watches page always shows 'You have already stopped watching "null".'

**Feedback**

We'd love to hear any feedback you have from testing this milestone of Confluence. Please raise any issues you discover in [our issue tracker](#) against the Confluence project with affects-version "3.5 (EAP)", or comment on this page.

**Confluence 3.5-m1 ("Milestone 1") Release Notes**

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use [the latest official release](#).

This release is a public development release ("milestone") leading up to the next Confluence major release.
Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following
- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. *We strongly recommend that you backup your Confluence home directory and database before upgrading!*

**Downloads**

All development releases are available from the development releases page on the Atlassian website.

**Previous Milestone(s)**

This is the first milestone in Confluence 3.5 development.

**Features**

*Improved user management – better LDAP support and more*

This milestone includes the first release of the new improved user management in Confluence trunk bringing a number of significant user management improvements to Confluence:

- **Support for nested groups in LDAP, the most highly-voted issue for Confluence** ([CONF-17150](#))
- Much improved support for LDAP integration, with configuration UI for administrators and many bug fixes
- Predefined configuration settings for all LDAP servers supported by Confluence and Crowd
- Improved performance and consistent behaviour across all remote directory types – LDAP, Crowd and
JIRA – through a new database-backed storage and periodic synchronisation system

- New, faster database schema for user management with improved foreign keys, constraints and indexes
- Integrated support for JIRA as a user management system, supporting JIRA 4.2 and earlier via read-only JDBC access, and JIRA 4.3 and later via read-write REST API
- Integrated support for Crowd as a user management system, offering a new faster REST API with Crowd 2.1 and later
- Improved permission checking performance (CONF-20475)
- Improved user management caching, with fewer bugs and better performance
- Read-write LDAP support for most LDAP servers
- In-application testing of LDAP configuration before saving
- Consistent UI for user management configuration in JIRA 4.3+ and Confluence
- Automatic migration from `atlassian-user.xml` and `crowd.properties` configuration into the new administration UI for all supported configurations (not yet complete)
- Data migration for users, groups, memberships and user preferences into the new database schema (not yet complete).

That said, there is still a bit of work to get this ready for release. Outstanding work on user management for Confluence 3.5 includes:

- Further work on performance improvement
- Completion of work on testing and documenting the upgrade process for all the supported existing user management configurations
- Improving a few areas of our user management with the new search and management APIs
- Writing automated tests to verify several of the new features are actually fixed and working correctly. (All are automatically tested in isolation, but not in Confluence.)

**Feedback welcome.** If you can test an upgrade of Confluence in your test environment and Confluence does not correctly upgrade your user management configuration or data, we would love to hear from you. Please raise an issue as covered in the **Feedback** section below.

**Screenshots**

**Documentation theme improvements**

We have added a neat improvement to the [Documentation theme](http://example.com) where you can configure the search box to limit searches to the current space by default. We think this will be really useful for knowledge base or documentation spaces, where searching in the current space is the most common use case.

- You configure the search setting in the theme configuration screen:
To override the space-specific search when entering your search terms, you can prefix the search with 'all:' or just change the filter setting when you arrive at the search page.

**Keyboard shortcut improvements**

Building on top of the Confluence 3.4 keyboard shortcut improvements:

- 'I' – New keyboard shortcut added to show/hide the Documentation theme's sidebar. This shortcut is the same as the one used in the Issue Navigator in JIRA 4.2, and is handy for getting a quick glimpse of the full content of a page.
- 'k' – When you open the 'Link to this page' dialog, the 'Tiny Link URL' is now automatically selected in Chrome and Safari. Previously, it only worked this way in Firefox and Internet Explorer.

![Link to this Page](image)

**Other improvements**

The dashboard icons now use CSS sprites, which should make for faster initial and subsequent load times when viewing the Confluence dashboard.

**API changes**

The user management changes have results in significant API changes in this area of the application. Specifically, the following change has broken some of our plugin test code:

- To modify an existing user, you need to create a new `com.atlassian.user.impl.DefaultUser` instance to call `setFullName()` or `setEmail()` because these methods are no longer on the `com.atlassian.user.User` interface.

We aim to preserve complete backwards-compatibility for plugins where possible, so please raise an issue if your plugin is broken in a way that cannot be backwards-compatible.

**Feedback**

We'd love to hear any feedback you have from testing this milestone of Confluence. Please raise any issues you discover in [our issue tracker](#) against the Confluence project with affects-version 3.5.

**Release Notes 3.4-beta1 ("Beta 1")**
Milestone release advisory

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.
Previous Milestone(s)

Previous milestones in the 3.4 release:

- Release Notes 3.4-m4 ("Milestone 4")
- Note: 3.4-m3 was not released due to some critical bugs.
- Release Notes 3.4-m2 ("Milestone 2")
- Release Notes 3.4-m1 ("Milestone 1")

Features

There are no new features in this release, it's mostly improvements and bug fixes to prior releases.

Other Improvements

- Universal Plugin Manager has been upgraded and minor issues addressed
- Browse > Advanced > PDF/HTML/XML Export page layouts updated for spaces.
- Dropdown menu containing 'select all' and 'deselect all' options added to Edit Space Permissions form. (CONF-7817)

- New AUI version includes new, redesigned shadows (now true drop shadows rather than the old three-side shadow effect)

Known issues

- AUI drop shadows disabled in IE while a Confluence bug is resolved (this means no shadows on dropdowns and dialogs in IE for beta1)
- IE renders some JavaScript errors for the new keyboard shortcuts

**Release Notes 3.4-m4 ("Milestone 4")**
Milestone release advisory

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

**Downloads**

All development releases are available from the development releases page on the Atlassian website.
Previous Milestone(s)

Previous milestones in the 3.4 release:

- Note: 3.4-m3 was not released due to some critical bugs.
- Release Notes 3.4-m2 ("Milestone 2")
- Release Notes 3.4-m1 ("Milestone 1")

Features

Keyboard shortcuts dialog

Confluence now has a keyboard shortcuts dialog. This dialog is accessible by pressing '?' on your keyboard or going to Browse > Keyboard Shortcuts.

![Keyboard Shortcuts dialog](image)

New Keyboard shortcuts

- 'e' to edit
- 'm' to comment
- 'l' to label
- '/' to quick search
- 'g' then 'd' to go to the dashboard
- ... and lots more. Go to Browse > Confluence Keyboard Shortcuts to discover more of them...

Note: There are some known issues with Safari for Mac, but we are ironing them out and they should be fixed next release. Some of these keyboard shortcuts are likely to change.

Notable Bug Fixes

- Preview in FireFox now works
- Move page dialog now works

Other Improvements

- Recently updated on dashboard now tells you what the user did (eg updated, commented) and has a timestamp for each activity.
  Note: The space description no longer renders wiki markup
- UPM has been upgraded to the latest milestone
- Browse > Advanced > Space details form has been converted to AUI style forms

Previous Milestone(s)

Previous milestones in the 3.4 release:

- Release Notes 3.4-m1 ("Milestone 1")

New Features

Universal Plugin Manager

Confluence is now bundled with Universal Plugin Manager (UPM). The UPM allows you to see and manage the plugins that you have installed in Confluence, and it allows you to discover, download and install new plugins from the Atlassian Plugin Exchange. You can read more about the UPM here.

User Macros in the Macro Browser

User macros are now available in the Macro Browser and can have the same amount of metadata as existing plugin macros. The current default is to hide user macros from browse/search in the Macro Browser until the admin updates them. Below is a screenshot of what the user macro form looks like (Note: This will slightly change in a later milestone)

Confluence administrators and user macro developers can enter macro and parameter meta-data via the admin console. This meta-data will reflected in the macro browser. Below is an example snippet of the new syntax that is available in a user macro:
More detailed User Macro API docs will be provided later, explaining how to enable user macros in the macro browser and how to develop user macros for the macro browser.

Improvements

Faster

Confluence 3.4-m1 contains some performance boosts (CONF-20264). The green bar below highlights current performance.

![Average Response Times (ms)](chart)

Supportability

Database Support

Confluence 3.4 now has support for:

- SQL Server 2008 (CONF-12879)
- Postgres 8.4 Support (CONFDEV-28)

Lots of bug fixes

**Release Notes 3.3-beta3 ("Beta3")**

**Beta release advisory**

---

*Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.*
Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

Do not use in production

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

Who should try this out?

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.

Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.

Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.

Upgrade Procedure
If you wish to upgrade your existing Confluence installation with this version, ensure you have created a separate copy of your current Confluence production installation first and using that copy, follow the normal upgrade instructions to upgrade it to this development release. If you have also implemented customised site- or space-specific layouts, you will need to re-implement them after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

Downloads

All development releases are available from Development Releases on the Atlassian website.

Welcome to the Confluence 3.3 Beta program

The Confluence team is really excited to share with you the Confluence 3.3 Beta 3 release. We still have a few bugs to fix, but overall we feel that most of the features below will be ready to ship by the final 3.3 release later this month.

New Features

Highlights of this release:

- **Confluence Page Gadget**
- **Editing Features**
  - Image Properties Panel
  - Link Properties Panel
  - Macro Autocomplete
- **Notification Features**
  - Email Notification for Network and Blogs
  - Manage Page Watchers
  - Change Comments on Blog Posts
- **Engine Room**
  - Secure Administrator Sessions ('Web Sudo')
  - Login Captcha
  - XSRF Protection on Comment Creation
  - Login Information
  - Infrastructure Changes
  - Deprecation Notice
- **General Improvements**
  - General Configuration UI
  - Accessibility Improvements
  - Improvements to Importing Word Documents
  - Version-Specific Help Links
  - Library Upgrades
  - New Dashboard Actions
  - New Welcome Message
  - Slimmer Blog View

Confluence Page Gadget

Confluence now provides a gadget many have been requesting: the Page Gadget. This allows the display of any Confluence page within a gadget, with optional 'View' and 'Edit' links. You can embed this gadget into your JIRA dashboard or another Confluence instance.

Page gadget configuration
With autocomplete for space names and page titles:

Rendering macros in the gadget

The gadget renders macros that occur in the page. Most major macros work within the Confluence Page gadget, such as the Content by Label and the Recently Updated macros:

Additionally, you can embed rich content with the View File macro within a Page gadget:

There are still a few minor issues with the Confluence Page gadget. At present the gadget supports most bundled macros within Confluence, but not all. We will publish the full details of the supported macros in the next release. Additionally, iGoogle/Gmail integration requires further testing.

Editing Features
Image Properties Panel

Introducing a new image properties panel! Manipulating images is now possible in the Rich Text Editor. Simply click (or select via keyboard with shift and arrow keys) an existing image and the image property panel will be available.

You can resize an image into small, medium and large preset sizes as well as add a border to an image without having to leave the Rich Text Editor.

Link Properties Panel

Editing links in the Rich Text Editor is now easier with the new properties panel. You can easily see the link and edit or unlink existing links on the page. Just place your cursor somewhere inside the link.

google

Macro Autocomplete

We have extended the autocomplete feature introduced in Confluence 3.2 to include macros. You can now type '{' in the Rich Text Editor to trigger macro autocomplete. Just continue typing to search for a particular macro and open it in the macro browser.
Notification Features

Email Notification for Network and Blogs

For their Atlassian FedEx 14 project, Don Willis and David Taylor enhanced email notifications for blogs and networks. The 'Subscribe to all Blog Posts' option gives you notifications for all the blogs in the system, subject to permissions. If you select 'Subscribe to Network', you will get notifications when anyone you are following edits content or changes their status, also subject to permissions. You can configure these options in your email settings:

Manage Page Watchers

An implementation of Matt Ryall's FedEx 14 project is available in this version of Confluence: a dialogue to view and manage watchers on pages and blog posts, as well as view all watchers of a space. This option is only currently available to space administrators. It addresses CONF-5032 and most of CONF-3703 for approximately 150 votes. Screenshots below:

New menu option
A few minor issues with icons, keyboard navigation, displaying usernames and wrapping of long names will be fixed in the next release.

**Change Comments on Blog Posts**

You can now comment on the updates you make to blog posts, in the same way as you can for pages.
Engine Room

**Secure Administrator Sessions ("Web Sudo")**

Confluence has another line of defence against hijackers of administrator sessions. All features in the Administration section of Confluence (and some in the Space Administration section) will require the user to validate their credentials before proceeding.

After validating, a message at the top of each page reminds you of your temporary administrator session. The temporary session will expire after 10 minutes of administrator inactivity and can also be terminated manually.

The secure administrator settings are configurable via the Confluence Administration Console.

**Login Captcha**

As another important security improvement Confluence now requires the user to answer a Captcha question after a given number of failed login attempts.

This security mechanism protects not only the login page but the RPC-interface as well. After a configurable number of failed login attempts via the RPC interface, the user is required to log in using the web interface which then presents the Captcha image.

This feature is enabled by default but can be disabled in the Confluence Administration Console. The configuration options include the number of failed login attempts. The default threshold for login attempts is three.

**XSRF Protection on Comment Creation**

This security mechanism requires an XSRF token to be present when adding a comment. Don't worry though, a system is in place so that your session will not expire and you can take your time to write the perfect comment!

All the bundled themes have been updated to use this feature. There is also an option in the new Security Configuration screen to disable this feature if you need to keep using a theme that does not yet support the feature.

**Login Information**
Confluence now captures metadata about login attempts, including the dates of the last failed and successful login and the number of failed logins.

In addition, a Confluence administrator can now reset the number of failed logins for a particular user.

Infrastructure Changes

Various changes to aid plugin development:

- All ContentEntityObjects can now be commented on
- UserStatus now optionally belongs to a space
- Custom space types are available
- Upgrade to Bandana 2.0
  - Custom context objects
  - Key enumeration
  - Item removal
  - Custom serialisation

Deprecation Notice

DWR has been deprecated as of 3.3-m1. Support for the client side JavaScript proxies has been moved into the Confluence Legacy Web Resources plugin which is going to be disabled by default. If you need any of the following web resources you will need to enable this plugin:

- DWR framework
- DWR JavaScript proxies for label operations (add, remove, suggest) or editor operations (heartbeat, draft saving, editor preferences)

You will also need to make the following resource a required resource in your view template: legacy.confluence.web.resources:dwr-confluence

This will embed the DWR client-side JavaScript files in your plugin's view output.

General Improvements

General Configuration UI

The General Configuration screen in the Administration Console has finally been given a face lift. It now uses an AUI form style.

Accessibility Improvements

We've added labels, legends and skip links so that Confluence is now more 508-compliant. We still have a long way to go, but these pages should now be more screen-reader friendly:

- Dashboard
- General pages
- Profiles
- Set your Password
- Attachments
- People Directory
- User Status

Improvements to Importing Word Documents
The structure of the ‘Tools’ > ‘Import Word Document’ feature has been improved to make it more intuitive.

**Version-Specific Help Links**

Confluence now follows the Atlassian Help Link specification. All help links will now redirect to the version of the Confluence documentation that matches the version of the Confluence application that you are using.

If you wish, you can configure the redirecting of the help links by editing the `help-paths.properties` file. You could do this if you need to point Confluence help links to an internal documentation site.

**Library Upgrades**

- AUI 3.0-m3
- Atlassian Plugins 2.5

**New Dashboard Actions**

The dashboard actions are now buttons. On mouse-over, the text turns blue. When clicked, the button is indented. They have also been moved – they appear above ‘Spaces’.

**New Welcome Message**

The dashboard welcome message has been updated.

**Slimmer Blog View**

The blog view has been modified as shown in the screenshot below.

Changes shown in the screenshot:

- The old calendar has gone. It has been replaced by a sidebar that simply lists the month and all the blog posts for that month. You can scroll through the months that have blog posts in them.
- The view has been streamlined. We have removed some unnecessary information on the page.
- In a global space, the view you see via ‘Browse’ > ‘Blogs’ has the blogger's picture attached to the blog for easier identification.
Other changes not visible:

- The dates have been internationalised. Until now they were restricted to English.
- The 'Browse' > 'Blogs' view allows you to see older and newer posts, no longer restricted to the most recent 15.

**Release Notes 3.3-m3 ("Milestone 3")**
### Milestone release advisory

- **For testing use only**

  Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

### Who should upgrade?

**⚠️ Please note the following**

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we **can not** provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

### Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. **We strongly recommend that you backup your Confluence home directory and database before upgrading!**

### Downloads

All development releases are available from the development releases page on the Atlassian website.
Back after a month of silence...

Hello everyone! As you might have noticed, we went dark for a whole month, skipping Milestone 2. Why is that, you wonder? To be quite honest with you, M2 was considered too rude. What was supposed to be an easter-egg went berserk, telling its unassuming user to ... well, we can't print that here. So we decided to not publish M2, and waited until M3 was complete. We have since then washed Connie's mouth with soap, and Confluence 3.3 Milestone 3 presents itself shiny, friendly and non-abusive as ever. :-)

We're currently planning to go Beta in about 2 weeks, just in time for Atlassian Summit, and to ship in mid to late June.

New Features

Macro Autocomplete

You can now type '{' in the Rich Text Editor to trigger macro autocompletion! Just continue typing to search for a particular macro and open it in the macro browser.

Known issue: The searching/ordering is not ideal yet, and you get quite unspecific search results at time (as
seen above). Sometimes it's good to be fuzzy, sometimes not. We'll probably disable searching by description (and just do that in the macro browser). Watch (and provide feedback on) CONF-19598.

**Link Properties Panel**

Editing links in the RTE is now easier with the new properties panel. You can now easily see the link, edit and unlink existing links on the page. Simply place your cursor somewhere inside the link!

![Link Properties Panel](image)

There's a known issue (CONF-19608) in IE where the "Unlink" button is deleting the link text as well; this will be fixed for the next milestone.

The next two weeks we'll be applying property panels to images as well. If you have any feedback on this panel already, please tell us so we can fix it up before the Beta.

BTW, we're planning to make the UI between Autocomplete and Property Panel a bit more consistent in the next milestone, and we will display the URL that the link points too as well. It's just a beta, after all.

**General Improvements**

**General Configuration UI**

The Admin General Configuration screen has finally been given a face lift! It has been converted over to use an AUI form style.

![General Configuration](image)

**Accessibility Improvements**

We've added labels, legends and skiplinks so that Confluence is now more 508-compliant. We still have a long way to go but these pages should now be more screen-reader friendly:

- Dashboard
- General pages
- Profiles
- Set your Password
- Attachments
Import Word Improvements

The ‘Tools’ > ‘Import Word Document’ feature structure has been improved to make it more intuitive.

Login CAPTCHA

As another important security improvement Confluence now requires a CAPTCHA after 3 failed login attempts.

This security mechanism not only protects the login page but the RPC-interface as well. After 3 failed login attempts via the RPC interface the user is required to log in using the web interface which then presents the
CAPTCHA image.

This feature is enabled by default but can be disabled in the admin panel. The configuration options include the number of failed login attempts. The default threshold is 3.

Login information

Confluence now captures login meta information. This includes the dates of the last failed and successful login and the number of failed logins.
The administrator is now able to reset the number of failed logins for a particular user.

| Login: CAPTCHA required at next login |
| Last Login: May 18, 2010 16:29 |
| Last Failed Login: May 18, 2010 16:30 |
| Total Failed Login Count: 6 |
| Current Failed Login Count: 6 |
| (Reset Failed Login Count) |

View Profile | Edit Groups | Edit Details |

Version-Specific Doc Links

Confluence now follows the Atlassian Help Link spec and all help links will now redirect to the version of the Confluence Documentation that matches the version that you are using.

Users can edit where the links are directed by editing help-paths.properties.

Library Upgrades

- AUI 3.0-m3
- Atlassian Plugins 2.5

New dashboard actions

The dashboard actions are now buttons, which on mouse over the text turns blue and when clicked is indented. They have also been moved to be above 'Spaces'.

Old:

Create a space - share information with your team.
Feed Builder - create your custom RSS feed.
People Directory - browse users and personal spaces.

New:

Add Space Feed Builder People Directory

New welcome message

The dashboard welcome message has been updated.

Old:
Welcome to Confluence

Confluence is the enterprise wiki designed to make it easy for you and your team to share information with each other, and with the world.

Where do I start?

All content in Confluence is organised into spaces. So to start browsing content, simply click on one of the spaces listed below.

New:

Welcome to Confluence

Confluence combines powerful online authoring capabilities, deep Office integration and an extensive plugin catalog to help people work better together and share information effortlessly.

Get started by creating a new space and adding users to join you.

You can change this message to whatever you like.

Change comments on blog posts.

Don W changed 1 line of vm and wrote some tests so that change comments are enabled on blog posts.

All Implemented Issues

XSRF Protection on Comment Creation

This security mechanism requires an XSRF token to be present when adding a comment. Don't worry though, a system is in place so your session will not expire and you can take your time to write the perfect comment!

All the bundled themes have been updated to use this feature, and an option in the new Security Configuration screen to disable it if you still can't live without an old theme.

Release Notes 3.3-m1 ("Milestone 1")
Milestone release advisory

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

**Downloads**

All development releases are available from the development releases page on the Atlassian website.
Overview

Milestone 1 is a fairly minor step from a user perspective, but since there are a number of changes that could potentially impact plugin development we wanted to get it to you as soon as we could. Read on for the changes as described directly by the developers.

Infrastructure Changes

Various changes to aid plugin development

- All ContentEntityObjects can now be commented on
- UserStatus now optionally belongs to a space
- Custom space types
- Bandana 2.0
  - Custom context objects
  - Key enumeration
  - Item removal
  - Custom serialisation

Deprecation notice

DWR has been deprecated as of 3.3-m1. Support for the client side Javascript proxies has been moved into the Confluence Legacy Web Resources plugin which is going to be disabled by default (it currently isn't - automatically disabling the DWR web resources when updating Confluence will be in Milestone 2). If you need any of the following web resources you have to enable this plugin:

- DWR framework
- DWR Javascript proxies for label (add, remove, suggest) or editor operations (heartbeat, draft saving, editor preferences)

Slimmer Blog View

The blogs view has been modified as shown in the screenshot below.

Changes shown in the screenshot:

- The old calendar has gone. It's been replaced by a sidebar that simply lists the month and all the blogposts for that month, and allows you to scroll between the months that have blogposts in them.
- The view's been streamlined - we've gotten rid of some of the unnecessary information on the page.
- In a global space, the view you get in Browse > Blogs has the user's picture attached to the blog for easier identification.

And the additional changes not visible:
- The dates have been internationalised - until now they were stuck in English.
- The Browse > Blogs view allows you to see older/newer posts, not just the most recent 15.

### Confluence 3.2 Beta Release Notes

⚠️ **These are not the release notes you are looking for! The final Confluence 3.2 Release Notes are over here.**
Milestone release advisory

⚠️ For testing use only
Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. *We strongly recommend that you backup your Confluence home directory and database before upgrading!*

**Downloads**

All development releases are available from the development releases page on the Atlassian website.
Welcome to the Confluence 3.2 Beta program

With great pride we bring to you the Confluence 3.2 Beta release. We still have a few bugs to fix, but overall, this is how 3.2 will get rolled out to customers in mid March. And we want your feedback.

Note to partners and translators: The preliminary translation diff files can be found as a subpage of this overview page: Translations for Confluence Releases

Advance warning

This release is the last one to officially support Internet Explorer 6. Read the upgrade notes and the original announcement over here.

This release is the last one to officially support application servers other than Tomcat. From the next release on, Websphere and Weblogic and JBoss will not be supported anymore. For further information on this, please see the end of support announcements page

Autocomplete in the editor

We are adding a new feature called Autocomplete to the Rich Text Editor. In this beta it only works in Firefox and Safari, but the goal is to make it work on Internet Explorer as well by the time the 3.2 release ships. You can type "I" at the start of a line to display your browsing history and link to those pages, and if you keep typing you'll get recommendation for pages that match what you types:

If you type "I" you'll see the attached images to the current page, and if you keep typing you'll be able to link to any image in your deployment.
This feature’s goal is to make the RTE even faster than using wiki markup. Try it out and tell us what you think!

**Note:** May require a re-index of your system to show attachments

**Known issues**

- [CONF-18281](CONF-18281) - doesn't work in IE yet

**New Links Dialog**

We have rewritten the way you add links in Confluence. The new links dialog is faster, better looking, and more powerful.
New "Documentation Theme"

Confluence now comes bundled with our hugely successful "Documentation Theme". See https://plugins.atlassian.com/plugin/details/16393 for details about the theme.

This theme replaces the old "Left Navigation Theme". We are still shipping the Left Nav theme, but it is deprecated and will stop shipping in a later release.

New "Easy Reader" Theme

With today's huge monitors, it can become hard to read large amounts of text that spans the whole screen. We are introducing a new theme which, like most websites, only uses a portion of the screen, to facilitate readability.
This theme replaces the old "Clickr Theme". We are still shipping the Clickr theme, but it is deprecated and will stop shipping in a later release.

Bundled templates and new template marketplace

The Bundled Templates 20% project is actually a framework to allow customers and Atlassian to deploy bundles of templates to a Confluence instance.

3.2 includes the framework plugin and a bundle of default templates[1]; these are available to the administrator to import into their instance as either space templates or global templates.

The templates import framework allows the administrator to preview a template before importing it as well as view the associated wiki-markup.

[1] Current default template bundle will be changed, pending list from Matt and Bill.

Documentation on how to write your own template plugin can be found here: Creating A Template Bundle.

Please visit PAC for the new category. TODO: add link
Better Move Page Dialog

We introduced a new page move dialog in Confluence 3.1 but the ability to change the order of pages fell out of scope. This has now been implemented and is accessed as shown -

And looks like -
**REST APIs**

**New REST Resources**

- Attachment Resource

**Useful Improvements and Enhancements**

**Page History**
What used to look like this...

⚠️ You are viewing an old version (v. 7) of this page.
The latest version is v. 8, last edited on Feb 15, 2010 ([View differences] [restore this version])
<< View previous version | view page history | view next version >>

.. now is a bit more understandable:

RTE Shortcuts Added

The following RTE shortcuts have been added, please try them out!

- Ctrl+Shift+C Copy table row
- Ctrl+Shift+X Cut table row
- Ctrl+Shift+V Paste table row
- Ctrl+Shift+B Bullet lists
- Ctrl+Shift+N Numbered lists
- Ctrl+Shift+F Full screen mode
- Ctrl+Shift+S Strikethrough
- Ctrl+Shift+T Insert Table
- Ctrl+Shift+A Macro Browser

RTE Hints

At the bottom of the RTE, useful editor hints get displayed. This will help promote the new keyboard shortcuts and the autocomplete feature.

Images in search results

If an image is found, it will be displayed in the search results. The main point here is that we've made it possible to write plugins to spice up search results. You could write custom display for any kind of attachment types, or
even change what the regular pages look like.

A tutorial for how to write your own renderer is located over at the Confluence Dev space.

Bundled JDBC drivers

To improve the Evaluator experience, we're now bundling a few of the most common JDBC drivers.

Improved RSS feed builder screen

The RSS feed builder looks a bit more polished and less scary.

Bug fixes and stability improvements

A host of old bugs have been fixed. Most notable:

- it is now possible to install language packs without restarting the server.
- When adding new pages or posts, there used to be a white-space overlapping the right part of the editor. This is now fixed.
- Removed many instances of hard-coded colours (mostly blue) that prevented colour schemes applying correctly.
- Enhancement for modern browsers: added CSS to handle common forms of over-sized content, so it gets a localised scrollbar instead of making the whole page scroll
- Properly set backgrounds for email and editor popups, so they don't (incorrectly) pick up backgrounds from the main wiki window.

Release Notes 3.2-m3 ("Milestone 3")
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ("milestone") leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. *We strongly recommend that you backup your Confluence home directory and database before upgrading!*

**Downloads**

All development releases are available from the development releases page on the Atlassian website.
Welcome back

it's been a while since we shipped Confluence 3.1 in December. Since then, we've been having heaps of fun at our second Lab Week, during which we experimented with all sorts of new technology and crazy ideas, mainly around the editor. We've been busy coding up new features over the last weeks, but also various back-end changes. Milestones 1 and 2 were internal only and didn't show much visual anyway, but now we're getting there.

The Confluence 3.2 development cycle is going to be a short one. We are currently aiming at shipping in Mid March. There will probably be one a M4 milestone in two weeks, but then we're in Beta mode already.

The features

New Links Browser

The new link browser is now available in the editor toolbar (the old one is still there as a backup).

Note: this funky icon is temporary

This new browser now has all the functionality present in the current link popup, except for the recently modified tab. You can now add links to attachments and recently viewed pages, which weren't available in m2. Please raise any bugs found against the linking component in Confluence.

Know issues

- quick search only returns pages
- error messages from the server aren't displayed yet
- usability work still to come (like cursor placement and keyboard navigation)

Documentation theme

We are going to bundle the new Documentation Theme,

Fixed Width Theme

We are introducing a theme that by default has sidebars. The main work here is behind the scenes, fixing up our HTML and CSS so that 3rd-party theme developers will benefit and be able to write such themes more easily.
If you’re wondering where the ‘sudden green’ has come from, it has originated from Confluence’s product colour on our website.

Naturally the colour scheme is customisable:

Known issues

- Space Admin screens still need work (site admin screens don’t get themes applied, but space admin does)
- There’s more polish to go into this theme - mostly small spacing and font size adjustments
- Our minimum resolution is 1024x768; content that doesn’t fit at that size won’t fit in the fixed width theme either.
- There is a certain discussion around the colours, and whether we should be a bit more conservative in terms of the background. We will keep discussing.
- The main point here is that many bugs have been fixed, and that 3rd-party theme developers will benefit from many under-the-hood bugfixes to our html and css.

Anatoli’s 20% project: RSS improvements

- CONF-18372 : changed the feed builder UI so that now you can choose comments/attachments for either pages, blogs, both or none. The new UI will generate slightly different parameters so that they don’t interfere with old RSS query format.
There are plans to further improve the UI.

- **CONF-9312**: changed the behavior of rss feed when filtering by label. Now when you ask for comments and pages with a particular label you will get the labeled pages and comments on those pages.

**Backend changes**

The Engine Room has upgraded plenty of libraries:

- Many common modules were upgraded.
- Migrated our [Sal Plugin](http://example.com) into Confluence
- REST Service for retrieving Recently Viewed pages
- Start of REST service for Confluence searches

More documentation about REST will soon follow.

**Next steps**

There are still heaps of improvements that will make it into 3.2, so stay tuned for M4 and Beta1, both due this month.

Cheers,
The Confluence Development Team

**Release Notes 3.2-m4 ("Milestone 4")**
Milestone release advisory

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- Development releases are not safe—Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path—Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.
With great pride we bring to you the best milestone of this release cycle. We are now more or less feature-complete. There are a few usability issues which we still want to fix, and yes, there are still plenty of bugs. We didn't manage to bundle a few of our new great plugins yet, and have large chunks of code to review. That's why we didn't call this Beta yet, but named it M4.

But overall, this is how 3.2 will get rolled out to customers. We want your feedback: Speak now or forever hold your peace.

Note to partners and translators: The preliminary translation diff files can be found as a subpage of this overview page: [Translations for Confluence Releases](#).

### Engine Room

**New REST Resources**

- Attachment Resource
  - **Request:** [https://confluence.example.com/rest/prototype/1/attachment/161](https://confluence.example.com/rest/prototype/1/attachment/161)

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>

**Other News**

- Integrate auto-complete and Link Browser to use REST search and attachment resources
- Bug Fixes

### Autocomplete

We are adding a new feature called Autocomplete to the Rich Text Editor, which currently only works in Firefox and (try your luck!) Safari. You can type "I" at the start of a line to display your browsing history and link to those pages, and if you keep typing you'll get recommendation for pages that match what you types. If you type "I" you'll see the attached images to the current page, and if you keep typing you'll be able to link to any image in your deployment.
This feature's goal is to make the RTE even faster than using wiki markup. Try it out and tell us what you think!

**Note:** May require a re-index of your system to show attachments

### Known issues

- [CONF-18281](#) - doesn't work in IE yet
- [CONF-18584](#) - when both the RTE and outer frames are scrolled the dropdown location is incorrect
- Plenty of small niggly bugs.

### New Links Browser

The Links Browser is now feature complete and has been enabled as the default insert link button in the editor.

The breadcrumbs in the search panel of the dialog is new in this milestone. This is particularly helpful when editing existing links.
Know issues

- CONF-18589 IE 6 caches responses for recently viewed and attachments tabs
- CONF-18575 Pressing enter on the search field leaves the page in IE7
- CONF-18455 After viewing a user profile, the recently viewed tab displays no pages

New Theme

Our new Fixed Width Theme (proper name still tba) now has

- new fancy gradient
- soothing blue colour scheme
- personal sidebar folds away neatly
  - we tried floating it over content, but people weren’t so keen on that.
- tidier grid than last milestone
- comment threading now far more robust, comments RTE toolbar collapses or scrolls instead of truncating (this solution will be migrated to core code after trial use in fixed width - the problem can also happen in default)
- key bugfixes: space admin screens and RTE spacing

![Dashboard Image]

Known issues

- The header nav dropdowns don't line up with the bottom of the header yet
- Personal info sidebar has some bugs to resolve after final design change (mainly: IE6 breaks, sidebar overlaps "navigate space" in some browsers)
- Attachments page is getting truncated in some circumstances
- Some RTE messages wrap poorly

Note for bug tracking: bugs that also occur in the default Confluence at 1024x768 are not theme bugs per se, even if they're being investigated at the same time.
### Bugfixes

Errors were reported by the JIRA trusted connection.

**Daniel's 20% project: Images in search results**

If an image is found, it will be displayed in the search results. **The main point here is that we've made it possible to write plugins to spice up search results.** You could write custom display for any kind of attachment types, or even change what the regular pages look like.

A tutorial for how to write your own renderer is located over at the [Confluence Dev space](#).
Paul's 20% project: Finishing the page move dialog

We introduced a new page move dialog in Confluence 3.0 but the ability to change the order of pages fell out of scope. This has now been implemented and is accessed as shown -

![Move Page Dialog](image)

And looks like -

![Move Page Dialog](image)
Small (yet awesome) Improvements

Page History

You are viewing an old version (v. 7) of this page.
The latest version is v.8, last edited on Feb 15, 2010 (view differences | restore this version )
<< View previous version | view page history | view next version >>

Say Hi to the new and (largely) improved Page History navigation.

RTE Shortcuts Added

The following RTE shortcuts have been added, please try them out!

- Ctrl+Shift+C Copy table row
- Ctrl+Shift+X Cut table row
- Ctrl+Shift+V Paste table row
- Ctrl+Shift+B Bullet lists
- Ctrl+Shift+N Numbered lists
- Ctrl+Shift+F Full screen mode
- Ctrl+Shift+S Strikethrough
- Ctrl+Shift+T Insert Table
- Ctrl+Shift+A Macro Browser

RTE Hints

At the bottom of the RTE, useful editor hints get displayed. This will help promote the new keyboard shortcuts and the autocomplete feature.
Confluence 3.1 Release Candidate 1 Release Notes
Milestone release advisory

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**—Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**—Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.
While you were away...

You can see all the feature details in the beta 2 announcement. This update about the Release Candidate is just for developers and evaluators who want to know what changed between the Beta 2 and the Release Candidate. Not much! 😊

Changes in RC1

It's should come as no surprise that we have mainly been bugfixing since the Beta 2.

Faster Editor

But, in order to make our Selenium builds pass more reliably, Agnes had to spend some time on making the editor faster. And she did! 😊

UI tweaks

Matt came up with a better widget connector icon, we've added the table-of-content which had been forgotten, and Stephen came up with a great fullscreen icon that really grabs your attention and means something.

Office file preview has a more prominent edit button

A common complaint at Atlassian Summit was that people didn't realize that you could launch your editor directly from the file preview so we've made it more obvious.

Road ahead

We aim at turning the RC into the Final Release and ship it on Thursday the 3rd December.
Confluence 3.1 Beta 2 Release Notes

Confluence 3.1 Beta 2 is a public development release ("Beta") leading up to the official release of Confluence 3.1, which we aim to ship in Q4, 2009.

Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

⚠️ Do not use in production

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

Who should try this out?

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.

⚠️ Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.

Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.

Upgrade Procedure

If you wish to upgrade your existing Confluence installation with this version, ensure you have created a
separate copy of your current Confluence production installation first and using that copy, follow the normal upgrade instructions to upgrade it to this development release. If you have also implemented customised site- or space-specific layouts, you will need to re-implement them after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

Downloads

All development releases are available from Development Releases on the Atlassian website.

Known Issues

Below are some known issues associated with Confluence 3.1.

On this page:

- JIRA/Crowd and Confluence deployment
- JIRA Gadgets in Confluence
- Bamboo integration
- PDF exports only render gadgets as links
- Problematic Confluence Gadgets window when running Confluence on Java 6
- Other issues

JIRA/Crowd and Confluence deployment

Confluence will not start up or will display strange behaviour (drop down menus not working) if JIRA 4.0/4.0.1 or Crowd 2.0.x is running on the same application server installation, for example, by attempting to run Confluence and JIRA 4.0 in the same Apache Tomcat server installation. This problem results from a bug in JIRA (tracked as JRA-19894) that is scheduled to be fixed in JIRA 4.0.2. Crowd will be fixed in the 2.1 release. In the meantime, please read our KB article on how to resolve this issue.

In the meantime, you can run JIRA or Crowd and Confluence in different 'instances' of the same application server, for example two separate Apache Tomcat server installations. If you already do so, or have installed both the Confluence distribution and JIRA 4.0 distribution, or Crowd 2.0.x, you can ignore this known issue.

JIRA Gadgets in Confluence

As of Confluence 3.1, users can embed gadgets into Confluence pages. When integrating JIRA gadgets into Confluence pages, you may encounter UI problems like a missing "Login"-button which is required to make the gadget authenticate with the JIRA server. This problem can be circumvented by setting up JIRA and Confluence to use Trusted Apps communication (since it removes the need for manual authentication). See KB article for details.

Bamboo integration

Our continuous integration product Bamboo exposes gadgets which can be embedded into Confluence pages. However, some of these exhibit problems once embedded onto a Confluence page:

- BAM-4900 : Unable to edit Bamboo gadgets in Confluence
- BAM-4890 : Bamboo gadget added in JIRA dashboard is not saving the preferences

These bugs are being fixed in Bamboo 2.5, which will ship in January 2010.

PDF exports only render gadgets as links

If you place any gadget on a Confluence page and export the page to PDF, the gadget output will not be rendered in the PDF output. Instead, each gadget is rendered on a page as a box containing the name of the gadget, the latter of which is hyperlinked. Clicking this hyperlink, opens the gadget contents itself in a new browser window or tab.

Problematic Confluence Gadgets window when running Confluence on Java 6
The [Confluence Gadgets](#) window may indicate that ‘**An error has occurred while trying to load the Gadget Directory**’ and prevent you from accessing the URLs of your Confluence gadgets. This problem can occur if you are running Confluence on Java 6. After you install Confluence 3.1 or upgrade an existing Confluence installation to this version, please check the Confluence Gadgets window immediately after starting the Confluence server.

If you see this error message and cannot access your Confluence gadgets, it can be resolved by restarting Confluence. (You may need to do this more than once.)

For more information about this issue, please refer to [CONF-17417](#).

**Other issues**

Refer to our JIRA site for a [list of Confluence 3.1-specific bugs](#).

**Highlights of Confluence 3.1**

**Highlights of this Release:**

- JIRA/Crowd and Confluence deployment
- JIRA Gadgets in Confluence
- Bamboo integration
- PDF exports only render gadgets as links
- Problematic Confluence Gadgets window when running Confluence on Java 6
- Other issues

**Introducing Gadgets**

**Drag & Drop**

**Office 2007 Support**

**New ‘Move Page’ Feature**

**Enhanced Image Browser**

**Draft Comparisons**

**Page Restrictions Dialog Box**

**Web Browser Version Support**

**Other Editor Enhancements**

- Edit Mode Exit Notification
- New Rich Text Editor Insert Menu
- Macro Browser Smart Fields
- Editor speed

**Other Improvements**

- Add Pages or Blog Posts from the Dashboard
- New ‘Link to this page’ feature
- ‘More’ option on Activity Streams
- User Interface Performance Improvements
- Other Small Enhancements and Improvements to Confluence

**Introducing Gadgets**

Gadgets are small objects that offer dynamic content and functionality which may be served by any OpenSocial-compliant web application, such as JIRA 4.0+, Confluence or non-Atlassian applications such as iGoogle and Gmail.

- Confluence supports the use of [gadgets in pages and blog posts](#), which are accessible through the [macro](#).
Confluence can also serve its own gadgets, for use in any other OpenSocial-compliant web application. Two such gadgets are bundled with Confluence:

- **Activity Stream** — This gadget shows a list of recent activities that have occurred on the Confluence server, such as the addition of new pages, blog posts or comments, content edits, status updates and so on.
- **Quick Navigation Aid** — This gadget provides heading and content search capabilities on a Confluence server.

Your Confluence installation can also serve these gadgets in any of its own pages or blog posts.

### Inserting a JIRA Gadget onto a Confluence Page

![Confluence gadget](image)

**Drag & Drop**

The new 'drag and drop' feature allows you to drag one or more file(s) which are accessible from your computer and drop them directly into a Confluence page or blog post.

- Files can be attached to a page or blog post by dropping them directly onto the page view or the 'Attachments' list associated with the page.
- Image files can be attached to a page or blog post by dragging them from your computer directly onto the Image Browser.
- Image and Office files can be added directly into your Confluence page or blog post content by dropping them into the rich text editor's editor window.

**Download Video**

For more information about this feature and on how to set it up, refer to the Using Drag-and-Drop in Confluence documentation.

**Screenshots: Attaching an Image to the Image Browser**
Office 2007 Support

Confluence now provides full support for the new Office 2007 file formats, allowing you to view and edit content from Microsoft Word 2007 (.docx and .dotx), PowerPoint 2007 (.pptx and .potx) and Excel 2007 (.xlsx) files.

- Along with existing Microsoft Office versions, Confluence now fully indexes Microsoft Office 2007 files and their content can be searched by Confluence.
- Using Confluence’s Office connector macros, you can insert Word, PowerPoint or Excel 2007 files directly into your Confluence page or blog post.
- Office files can be edited directly from any page or blog post or their list of attachments.

⚠️ If you use the Firefox browser to work with Confluence, don’t forget to reconfigure the Firefox add-on (WebDAV Launcher options) to handle the new Office 2007 file extensions. Otherwise, you will not be able...
New 'Move Page' Feature

Confluence introduces a new page moving feature, that easily allows you to move the page you are currently viewing, adding or editing to another page elsewhere in the same or another space of your Confluence site. This feature is available through a new 'Move Page' dialog box, which provides the following flexible methods for moving pages:

- **Known Location** – Allows you to type the name of a space and within that space, the 'parent' page under which to move your page.
- **Search** – Allows you to search for a 'parent' page (within a selected space or set of spaces) under which to move your page.
- **Recently Viewed** – Allows you to select one of your recently viewed pages to be the 'parent' of your page to be moved.
- **Browse** – Allows you to select a space and page (within the tree of pages in the space) that will be the 'parent' of your page to be moved.

For more information, refer to [Moving a Page](#).

Enhanced Image Browser
A new ‘Image Browser’ has been introduced to replace the old ‘Insert Image’ window. The image browser provides a less-cluttered and enhanced interface that allows you to:

- Preview an image in detail before inserting it into a page. This is done by hovering over any image in the browser and clicking the ‘magnifying glass’ icon in the lower-right corner.
- Preview an image elsewhere on the web via its URL before inserting it into a page.

**Draft Comparisons**

Confluence’s drafts features have been enhanced, such that you can now view any of your unsaved draft changes before deciding to resume editing them. This nifty feature comes in handy, particularly when other people have made subsequent changes to a page or blog post in your drafts list and you need to merge changes or resolve a conflict.

<table>
<thead>
<tr>

<td>View Changes</td>
</tr>
<tr>
<td>Page with a Conflict</td>
<td>12 minutes ago</td>
<td>View Changes</td>
</tr>
</tbody>
</table>
Page Restrictions Dialog Box

Confluence's page restrictions feature has been incorporated into a convenient and accessible dialog box that is now easier to use than before.

- The page restrictions dialog box can be accessed from the padlock icon or the 'Tools' -> 'Restrictions' menu item whilst viewing any Confluence page. From this dialog box, you can see all viewing and editing restrictions associated with the current page. You no longer need to view the page's associated 'Info' page to see the page's restrictions.
- You no longer have to edit a page to modify its page restrictions. You can edit all page restrictions from this easily accessible dialog box.
- The page restrictions dialog box is still accessible when a page is in edit mode.
- In addition to user and group names, the name field also accepts a user's full name. Full names are 'auto-completed' to help you find the relevant person more rapidly.

Web Browser Version Support

Confluence 3.1 now fully supports the following recent web browser versions:

- Internet Explorer 8
- Safari 4
- Firefox 3.5
**Other Editor Enhancements**

**Edit Mode Exit Notification**

Whenever you add or edit a page, comment or blog post and then click onto another Confluence feature that navigates away from your unsaved content, a message box appears, warning that your content will be saved as a draft (if it is a page) or lost (if a comment). This allows you to cancel out of this action if it was accidental.

**New Rich Text Editor Insert Menu**

Confluence’s rich text editor now combines a number of its commonly used editing features into a new convenient 'Insert' menu.

- The Horizontal line, Insert Symbol and Insert Emoticon Toolbar icons have been moved into the new insert menu.
- The functionality to insert images, links or attachments into a page can now also be accessed from this menu.
- The macro browser, as well as a number of commonly-used macros are conveniently accessible from this menu too.

**Macro Browser Smart Fields**

When using the macro browser, an 'auto-complete' feature is now provided on any parameters that require the
entry of a single item, such as a page title, username or space key. This greatly facilitates the customisation of macros and minimises the need to know the exact item names in advance.

Editor speed

Thanks to many individual technical improvements, the Rich Text Editor opens up a lot faster than in previous Confluence releases. On a local network it appears almost instantly, and even when accessing a Confluence server on a different continent (in our case, accessing a Confluence server in the US from Australia) it takes less than 3 seconds to start editing a page.

Other Improvements

Add Pages or Blog Posts from the Dashboard

You can now add pages or blog posts directly from the Dashboard without having to browse to a specific space first. To do this, click on either the 'Add Page' or 'Add Blog Post' buttons to open the pop-up balloon, which allows you to choose the space in which to add the new page or blog post and in the case of pages, a template on which to base the page content.

New 'Link to this page' feature
If you wish to link to a Confluence page from any other location on the web, use the convenient 'Link to this Page' feature (available from any page's or blog post's Tools menu). Upon selecting this feature, the 'Link to this Page' dialog box opens, from which you can copy three versions of the link to embed elsewhere:

- **Link** – Standard URL which should work from any other accessible location on the web.
- **Tiny Link** – A reduced-length version of the 'Link', which can be used in text fields of limited length, such as tweets or Confluence Status Updates.
- **Wiki Markup** – A wiki markup version of the link, which can be used in any other location within your Confluence site.

"More" option on Activity Streams

A 'More' option has been added to various activity streams throughout the Confluence interface, including the profile sidebar, a user's profile page and via the recently updated macro. Clicking 'More' expands the list of results, providing a convenient means of accessing progressively more distant user activities.
User Interface Performance Improvements

Most JavaScript and Cascading Style Sheet (CSS) files are now downloaded in one batch, greatly improving the performance of Confluence’s editing features and general page rendering.

Other Small Enhancements and Improvements to Confluence

- Support for OAuth — With the introduction of gadgets (above) in this release, Confluence 3.1 now allows you to establish OAuth relationships with other web applications such as JIRA 4.0+, iGoogle, Gmail etc., thereby allowing them to share resources via gadgets.
- New Log In and Log Out screens.
- In an aim to minimise confusion, ‘News Items’ are now consistently called ‘Blog Posts’ throughout the Confluence interface and a list of blog posts is collectively referred to as a ‘Blog’.
- Macro developers are now able to specify whether the macro body should or should not be displayed in Rich Text editor. For more information, please refer to CONF-12149.
- Other minor interface improvements.

Confluence 3.1 Beta 1 Release Notes

⚠️ Confluence 3.1 Beta 2 has been released!

Please refer to the Confluence 3.1 Beta 2 Release Notes for updated information on the enhancements available in this version.

Confluence 3.1 Beta 1 is a public development release (“Beta”) leading up to the official release of Confluence
3.1, which we aim to ship in Q4/2009.

Confluence versions marked "Milestone", "Beta" or "Release Candidate" (RC) are development releases, which are preliminary releases leading up to the official release of a major Confluence version. They are a snapshot of our work in progress and provide an advance preview of new features to our customers and the general public. Confluence plugin developers can also use development releases to test and fix their plugins in advance of an official release.

The main distinction between a beta and a milestone release is that milestone releases typically acquire new features with each subsequent milestone version, whereas beta releases are predominantly feature-complete. Beta releases still undergo bug fixing and occasionally, existing features may be enhanced or added in subsequent beta versions. Release candidates are close to being ready for final release, but may still undergo changes before the final release.

![Do not use in production]

Development releases should not be used in production environments as they are not officially supported.

For all production use and testing of Confluence, please use the latest official release.

Who should try this out?

With development releases, the Confluence development team aims to provide plugin developers with an opportunity to see the latest changes in the code.

Furthermore, if you are a Confluence customer who is eager to see the new features and provide us with feedback on our upcoming major release, we encourage you to try out our development releases.

![Please note the following]

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Each development release has passed all our automated tests, has undergone some performance testing and has been used for one week on our official internal Confluence server. Furthermore, most of the solved issues have been reviewed.

Be aware that our development releases are still undergoing final performance and compatibility testing for databases and application servers. Hence, we recommend that you use development releases on installations with small (as opposed to full production-level) user bases.

**Upgrade Procedure**

If you wish to upgrade your existing Confluence installation with this version, ensure you have created a separate copy of your current Confluence production installation first and using that copy, follow the normal
upgrade instructions to upgrade it to this development release. If you have also implemented customised site- or space-specific layouts, you will need to re-implement them after the upgrade. Otherwise, some of the new features in Confluence (or possibly existing features) may not function correctly.

Downloads

All development releases are available from Development Releases on the Atlassian website.

Known Issues

There are several bugs outstanding which will be resolved before the official release. Some bugs you are most likely to come across are:

- **Page Preview** — When editing a page or blog post and you click the 'Preview' tab, only the first section of content is shown. You will not be able to scroll down to view the remaining content on a page.
- **Widget Connector Icon** — The current icon has not yet been finalised and will change before the official release of Confluence 3.1.
- **Quick Navigation Aid** — The Quick Navigation Aid does not work in Internet Explorer 6.0.

Refer to our JIRA site for a list of Confluence 3.1-specific bugs.

Highlights of Confluence 3.1

Highlights of this Release:

- Introducing Gadgets
- Office 2007 Support
- New 'Move Page' Feature
- New Image Browser
- Draft Comparisons
- New Page Restrictions Dialog Box
- New Rich Text Editor Insert Menu
- Other Editor Enhancements
  - Macro Browser Smart Fields
  - Edit Mode Exit Notification
- Other Improvements

Introducing Gadgets

Gadgets are small objects that offer dynamic content and functionality which may be served by any OpenSocial-compliant web application, such as JIRA 4.0+, the same or another Confluence installation, or non-Atlassian applications such as iGoogle and Gmail.

- Confluence supports the use of gadgets in pages and blog posts, which are accessible through the macro browser.
- Confluence can also serve its own gadgets, for use in any other OpenSocial-compliant web application including the same or another Confluence installation. Two such gadgets are bundled with Confluence:
  - **Activity Stream** — This gadget shows a list of recent activities that have occurred on the Confluence server, such as the addition of new pages, blog posts or comments, content edits, status updates and so on.
  - **Quick Navigation Aid** — This gadget provides heading and content search capabilities on a Confluence server.

Inserting a JIRA Gadget onto a Confluence Page

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Confluence now provides full support for Office 2007 files, allowing you to view and edit content from Microsoft Word 2007 (.docx and .dotx), PowerPoint 2007 (.pptx and .potx) and Excel 2007 (.xlsx) files.

- Along with existing Microsoft Office versions, Confluence now fully indexes Microsoft Office 2007 files and their content can be searched by Confluence.
- Office files can be edited directly from any page's or blog post's list of attachments.
- Using Confluence's Office connector macros, you can insert Word, PowerPoint or Excel 2007 files directly into your Confluence page.

New ‘Move Page’ Feature

Confluence introduces a new page moving feature, that easily allows you to move the page you are currently viewing, adding or editing to another page elsewhere in the same or another space of your Confluence site. This feature is available through a new ‘page move’ dialog box, which provides the following flexible methods for moving pages:
- **Known Location** – Allows you to type the name of a space and within that space, the 'parent' page under which to move your page.
- **Search** – Allows you to search for a 'parent' page (within a selected space or set of spaces) under which to move your page.
- **Recently Viewed** – Allows you to select one of your recently viewed pages to be the 'parent' of your page to be moved.
- **Browse** – Allows you to select a space and page (within the tree of pages in the space) that will be the 'parent' of your page to be moved.

For more information, refer to [Moving a Page](#).

---

**New Image Browser**

A new 'Image Browser' has been introduced to replace the old 'Insert Image' dialog box. The image browser provides a less-cluttered and enhanced interface that allows you to:

- Hover over any image in the browser and expand the image (to preview it in detail) by clicking its 'magnifying glass' icon in the lower-right corner, before inserting it onto a page.
- Add a link to an image elsewhere on the web via the image's URL.
5 Draft Comparisons

Confluence's drafts features have been improved, such that you can now view any of your unsaved draft changes before deciding to resume editing them. This nifty feature comes in handy, particularly when other people have made subsequent changes to a page or blog post in your drafts list and you need to merge changes or resolve a conflict.

<table>
<thead>
<tr>
<th>Title</th>
<th>Last Saved Date</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page with Partial Content</td>
<td>less than a minute ago</td>
<td>Resume Editing</td>
</tr>
<tr>
<td>Page with Content to Merge</td>
<td>2 minutes ago</td>
<td>View Changes</td>
</tr>
<tr>
<td>Page with a Conflict</td>
<td>12 minutes ago</td>
<td>View Changes</td>
</tr>
</tbody>
</table>

Unpublished Changes for 'Working with Drafts Overview'

At regular intervals, Confluence will automatically save the page you are editing and maintain a copy of it as a draft. If some system failure or error prevents you from saving your changes, you can retrieve the draft and continue working on it.

A draft is a snapshot version of a page which Confluence saves automatically at regular intervals while you are editing the page. Confluence saves these interim versions even if you do not save the page yourself. This is a useful feature that minimises loss of work if your Confluence site experiences a problem.

At regular intervals, Confluence will automatically save the page you are editing and maintain a copy of it as a draft. If some system failure or error prevents you from saving your changes, you can retrieve the draft and continue working on it.

* Drafts are created while you are adding and editing a page or blog post.

...
Confluence’s page restrictions feature has been incorporated into a convenient and accessible dialog box that is now easier to use than before.

- The page restrictions dialog box can be accessed from the padlock icon or the ‘Tools’ → ‘Restrictions’ menu item on any Confluence page. From this dialog box, you can view all viewing and editing restrictions associated with the page you are viewing. You no longer need to view the page’s associated ‘Info’ page in order to view these restrictions.
- It is no longer necessary for a page to be in edit mode in order to modify its page restrictions. You can edit all page restrictions from this dialog box.
- The page restrictions dialog box is still accessible when a page is in edit mode.

New Rich Text Editor Insert Menu

Confluence’s rich text editor now combines a number of its commonly used editing features into a new convenient ‘Insert’ menu.

- The Horizontal line, Insert Symbol and Insert Emoticon Toolbar icons have been moved into the new insert menu.
- The functionality to insert images, links or attachments into a page can now also be accessed from this menu.
- The macro browser, as well as a number of commonly-used macros are conveniently accessible from this menu too.
Other Editor Enhancements

Macro Browser Smart Fields

When using the Macro Browser, an 'auto-complete' feature is now provided on any parameters that require the entry of a single item, such as a page title, username or space key. This greatly facilitates the customisation of macros and minimises the need to know the exact item names in advance.

Edit Mode Exit Notification

Whenever you add or edit a page, comment or blog post and then click onto another Confluence feature that navigates away from your unsaved content, a message box appears, warning that your content will be saved as a draft (if it is a page) or lost (if a comment). This allows you to cancel out of this action if it was accidental.
Other Improvements

Other small enhancements and improvements to Confluence include:

- Support for Internet Explorer 8 — Confluence 3.1 now fully supports Internet Explorer 8, released around mid-2009.
- Support for OAuth — With the introduction of gadgets (above) in this release, Confluence 3.1 now allows you to establish OAuth relationships with other web applications such as JIRA 4.0+, iGoogle, Gmail etc., thereby allowing them to share resources via gadgets.
- New 'Link to this page' feature — If you wish to link to a Confluence page from any other location on the web, use the convenient 'Link to this Page' feature (available from any page's or blog post's 'Tools' menu). Upon selecting this feature, the 'Link to this Page' dialog box opens, from which you can copy three versions of the link to embed elsewhere:
  - Link — Standard URL which should work from any other accessible location on the web.
  - Tiny Link — A reduced-length version of the 'Link', which can be used in text fields of limited length, such as tweets or Confluence Status Updates.
  - Wiki Markup — A wiki markup version of the link, which can be used in any other location within your Confluence site.
- 'More' links on activity streams — 'More' links have been added to various activity streams throughout the Confluence interface, including the profile sidebar, a user's profile page and via the recently updated macro. Clicking on a 'More' link expands the list of results, providing a convenient means of accessing progressively more distant user activities.
- New Log In and Log Out screens.
- In an aim to minimise confusion, 'News Items' are now consistently called 'Blog Posts' throughout the Confluence interface and a list of blog posts is collectively referred to as a 'Blog'.
- Other minor interface improvements.

Confluence 3.1 Newly Deprecated Code

This page should show all the code that was deprecated (not deleted!) during the Confluence 3.1 release cycle.

This is work in progress, and may not be a complete summary. As always, the truth is in the code. This page is more for explaining and discussing our decisions.

Release Notes 3.1-m7 (“Milestone 7”)
For testing use only
Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

Please note the following

- **Development releases are not safe**—Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**—Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

**Downloads**

All development releases are available from the development releases page on the Atlassian website.
Not quite a beta yet!

While this release is almost feature complete there are still one major technical improvement (superbatching) and one feature (the dashboard-widget) outstanding, so we can't call it beta just yet. Apart from that though, M7 is feature complete. Anything that you don't see here, you won't see in the final product. We will keep fixing bugs (yes, there are still quite a few unfortunately), but if something else in the functionality really annoys you, please raise it with us now! You can add a comment, or you can send us a mail, or of course raise JIRA issues.

Files are not available for download at the moment, they will be added on Thursday. This page is a teaser, and for use by our translators.

Gadgets & Office Team

Indexing and Searching of Office 2007 files

The contents of Confluence attachments created by PowerPoint 2007, Excel 2007, and Word 2007 are now fully searchable inside Confluence. This includes files with pptx, xlsx, and docx extensions as well as other extensions like potx (PowerPoint template) and dotx (Word template).

PowerPoint 2007 previews

You can now preview PowerPoint 2007 files directly in Confluence. We're proud to say that this completes the goal of supporting the new 2007 file formats for the three main Microsoft Office products (Word, Excel, and PowerPoint) in Confluence 3.1. This is in addition to already supporting the legacy binary format.

Keyboard navigation of full-screen PowerPoint and PDF slideshows

If you are using Flash player 10 or higher, you will no longer see any controls when previewing Powerpoint or PDF files in full screen mode. Instead, you must use the spacebar or the arrow keys to move between the slides. Press escape to exit full screen mode.
Launch Microsoft Office from the Attachments screen.

Previously, you had to preview a file to get the option to edit it. We've added a new 'Edit' option to each attachment that will launch the appropriate desktop editor for that attachment. The old 'Edit' option has been renamed to 'Properties'.

Editing user preferences of OpenSocial gadgets in the Macro Browser

As promised in the last release notes we moved the editing of non hidden user preferences to the usual location for macro parameters on the right hand side:

Activity Stream Gadget

We've added an activity stream gadget for Confluence. This means you can now have your Confluence Activity on your JIRA dashboard or on a Confluence page! You can also directly comment from the activity stream.
Dialogs Team

Page move dialog

We've added new tabs and improved the design of the new Move Page dialog based on feedback from earlier iterations. Some key improvements:

- A quick way of specifying a known location in the wiki using space and page title autocomplete (quick-nav style)
- Search and Recently Viewed tabs for locating a parent page in different ways
- An improved tree component which gives better loading feedback
- Fixed description panels so helpful text doesn't disappear when you scroll the tree
- A new location panel in the dialog so you know where you're moving a page from and to
- Immediately highlight problems with the new location, such as attempting to move a page beneath itself or its children.

The move dialog is feature-complete for this release, but we still have a few remaining improvements to make. In particular, scrolling the tree to the correct location when it opens and making the tree completely undraggable will be fixed for the next release.

Image browser

The new image browser dialog now supports uploading files. The upload proceeds faster than before (because the entire window doesn't need reloading), and you'll get a thumbnail of your image preselected, ready to insert.

We've fixed the bugs with image borders that prevented them working properly in the rich text editor, and enabled borders by default for newly inserted images. The dialog also includes some simple keyboard navigation that should make it more intuitive to interact with. All features of the image dialog have been tested with all our supported browsers.
We also spent some time on improved validation of uploaded attachments and thumbnail generation. The old insert image window is now disabled, so please let us know if you have any problems with the new functionality.

![Insert Image Dialog](image.png)

The image dialog is feature-complete for this release, but also has a few issues which will be fixed before the final release. Better handling of server outages and not being able to attach due to permissions is coming in the next release.

**Page "Permissions" dialog**

We have reverted to the two row layout to avoid permission-restriction-inconsistencies, and fixed a few bugs along the way. Most notably, inherited restrictions are now displayed separately from the current level's restrictions, and hidden by default. This avoids cluttering the page with stuff you usually know about already (when working in restricted page hierarchies).

![Page Restrictions](image.png)

**Engine Room**

Nothing big went into M7, the super-batching work is ongoing and will mean faster page loads from 3.0-beta1 onwards.

**Small Improvements**

The footer is now always at the bottom at the viewport, rather than the bottom of the content. This makes the layout a lot cleaner on short pages:
Open bugs

Plenty.

What's next?

Beta 1 is due next week

Release Notes 3.1-m6 ("Milestone 6")
Milestone release advisory

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- Development releases are not safe — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.
Overview

We are pretty close to Beta now, so if you are a plugin author and haven't checked out the latest milestones of 3.1, you should do it now. The API won't change much anymore, from now on it's mainly bugfixing.

Gadgets & Office Team

Editing user preferences of OpenSocial gadgets in the Macro Browser

You can now edit user preferences of OpenSocial gadgets directly in the Macro Browser. Let's take our all time favourite Hamster gadget as an example:

![Hamster Macro UI](image)

The UI will be slightly different in the next milestone, as we are going to move the form fields in the center of to the right hand side and make them part of the normal macro parameters.

Gadget Directory

You can now discover which gadgets are exposed by Confluence and can be used in other OpenSocial containers like JIRA 4 or iGoogle. There is a new "Gadget Directory" menu item in the browse menu which allows you to browse through the list of available gadgets.

Dialogs Team
There's a new "Insert" menu in the editor that helps you insert links, attachments, images and some default macros without having to already know which little button you’re meant to press. (On IE the macro icons look odd, that’s a bug and will be addressed soon)

**Help us choose the right macros!**

We picked a few macros that we thought users should know about, which are simple enough to use right away, and which represent a decent spread across a range of macros to stimulate your interest in the "add more" button. Our constraint is 5 macros max, since the menus gets too long on stupid good old IE6 on a 1024x768 screen.

Apart from the edit menu, some bug fixes of note: Problems with links in the RTE have been fixed; pressing escape in the new image dialog doesn't prevent it working next time; and move page works in IE8.

A lot of work has gone into the new page move dialog but it's not quite ready, so we didn't put it into M6.

**Engine Room**

A setting (under General Config) to serve the Javascripts back in the header has been introduced. This has been disabled by default for this milestone but will eventually be turned on as the default for 3.1. Reasoning behind this is that quite a few plugins have been broken and unusable by moving the scripts to the bottom of the page.

Work has been continued on the REST API however these were purely back end changes and the API itself has not changed since m5.

**Bugfix Team**

CONF-17171 - made selecting a page version on a page history view easier
General bug fixing.

**Small Improvements**

New Login Screen design, which looks more consistent with other products like JIRA. Another step forward in terms of making Confluence look better
Known Issues

Errors were reported by the JIRA trusted connection.

**Release Notes 3.1-m5 ("Milestone 5")**
Milestone release advisory

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. *We strongly recommend that you backup your Confluence home directory and database before upgrading!*

**Downloads**

All development releases are available from the development releases page on the Atlassian website.
Gadgets & Office Team

Gadgets in the Macro Browser

Want to embed one of those fancy new JIRA gadgets into your page? This has become really easy with the new Macro Browser integration. Just have a look in the “External Content” category to find available gadgets. Confluence comes with the Confluence QuickNav gadget by default, but the administrator can add as many gadgets as you like.

Configure your JIRA gadgets in the Macro Browser

You can now configure your JIRA gadgets using the macro browser. Just pick a JIRA gadget from the Macro Browser, configure it and add it to your Confluence page or blog post.

Office 2007 support

We've fixed a couple of minor issues with the Word 2007 integration. But the really good news is that we've started working on PowerPoint 2007 support! Nothing to see yet, but stay tuned.

Dialogs Team

The new image browsing dialog has been restyled and as a bonus now works in new pages and blogs.

Engine Room

The Confluence REST plugin (prototype API) has now been enabled for this milestone. In addition to spaces (in previous milestone) we now have an API for viewing Confluence content (pages, blogs, comments) with page children expansion supported.

Some very basic documentation can be found here: Prototype REST API

Bugfix Team

Fixed multiple bugs.
Misc

Faster editor load

With a few improvements we have made to the way we load TinyMCE, it should appear faster across all the browsers.

This is an Agnes Ro 20% production

Prototype REST API

This page documents the Prototype REST API supported for Confluence 3.1.

Space

Getting a List of Spaces

Resource: `/space`
Description: List all spaces (maximum page size of 50) visible to the current user
Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start-index</td>
<td>start offset of the list</td>
</tr>
<tr>
<td>max-results</td>
<td>maximum number of results to return</td>
</tr>
<tr>
<td>type</td>
<td>space type e.g. personal, all</td>
</tr>
<tr>
<td>expand</td>
<td>use 'space' to expand the spaces details of each space listed</td>
</tr>
</tbody>
</table>

Result:

```
<spaceEntityList expand="space">
  <space name="FOO" key="FOO">
    <link rel="self" href="http://localhost:8080/confluence/rest/prototype/1/space/FOO"/>
    <rootpages size="1"/>
  </space>
  <space name="Test Space" key="TST">
    <link rel="self" href="http://localhost:8080/confluence/rest/prototype/1/space/TST"/>
    <rootpages size="2"/>
  </space>
</spaceEntityList>
```

Looking up Details of a space

Resource: `/space/{key}`
Description: Displays the details of the space identified by {key}
Parameters:
Content

Getting Content

Resource: /content/{id}
Description: Gets confluence content by id
Parameters:

```
| expand | use 'children' to list all the child pages of the page |
```

Result:

```
<content type="page" id="1180211" expand="children">
  <link rel="self" href="http://localhost:8080/confluence/rest/prototype/1/content/1180211"/>
  <title>Home</title>
  <spaceKey>FOO</spaceKey>
  <children size="1"/>
  <body>This is the home of the FOO space.</body>
</content>
```

Release Notes 3.1-m4 ("Milestone 4")
Milestone release advisory

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

**Downloads**

All development releases are available from the development releases page on the Atlassian website.
Features!

As you may know, we have started a major hiring campaign, and this has slowed us down a little in the past few weeks. M4 however is back with a vengeance, boasting quite a few improvements. See for yourself

Editor Team

Move Page

We are reworking the way you can move pages around. It is now possible to move pages without editing the page, and you don't drag&drop anymore, you simply pick your parent in the tree. The next Milestones will allow you to search for a parent, and to use your recently viewed pages to move. At the moment, you can not re-order while moving the page (is this a problem though? What do you think?)

Macro Browser

David Taylor's "Smart Fields" 20% project has been included in the Macro Browser although only for macro parameters that take single entries. i.e. if a macro takes a single username, space, or page then a suggestion drop down will be presented (See the screenshot). If a macro takes multiple usernames or spaces or pages then there will be no assistance.

Displays the excerpted contents from another page within the same space. Documentation

Page Containing the Excerpt

David's "Smart Fields" work also included some custom fields for the Office Connector viewfile macros to provide assistance with referencing the MS Office document you are trying to view. Instead of separate fields for
space and page name these have been combined into a singe field with a suggest drop down. The file name field has been converted to a select box showing the appropriate attachments for the selected page.

Embeds an Office Excel document (.xls) into your Confluence page. Documentation

**Page Name**

Monkey Trousers

Confluence page containing the attached .xls file. If not specified, the current page is assumed.

**File Name**

editorteamtracking.xls

Name of the attached .xls file to view in a page.

**Show Grid?**

✔

Shows or hides grid lines.

**Worksheet Name**

Name of worksheet to show. If not specified, the first worksheet is shown.

**Last Row**

Number of last row to show, where the first row starts at 0. Example: to show the first 2 rows, use 1. If not specified, all rows are shown.

**Image Browser**

Some further progress has been made on the second "insert image" button on the RTE and wiki editor toolbars. You can now view and insert images that are already attached to the page.

This dialog is still missing some obvious functionality such as image configuration options and image upload hence the reason the original dialog is still present for now.

**Known Issue:** You should also note that in the current milestone this new dialog is only working correctly when editing pages, not when creating new pages.

**Engine Room**

**JS/CSS rearrangements**

As you saw on our previous milestone notes, we have rearranged CSS to the top and JS to the bottom of the page, making the rendering experience better. This might have consequences for your macros/plugins, so DO have a look, and tell us what you think.

**REST**

The Confluence REST plugin (prototype API) has been added, however it will be disabled for this release. Hopefully we will be able to enable this in next milestone when the plugin is a bit more stable.

Some space level resources have been implemented.

**Getting a List of Spaces**

**Resource:** /space
Description: List all spaces (maximum page size of 50) visible to the current user

Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start-index</td>
<td>start offset of the list</td>
</tr>
<tr>
<td>max-results</td>
<td>maximum number of results to return</td>
</tr>
<tr>
<td>type</td>
<td>space type</td>
</tr>
</tbody>
</table>

Result:

```xml
<spaces>
  <space name="Demonstration Space" key="ds">
    <link rel="self" href="http://localhost:8080/rest/prototype/1/space/ds"/>
  </space>
</spaces>
```

Looking up Details of a space

Resource: `/space/{key}`

Description: Displays the details of the space identified by `{key}`

Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expand</td>
<td>set expansion options for children elements</td>
</tr>
</tbody>
</table>

Result:

```xml
<space name="Demonstration Space" key="ds" expand="children">
  <link rel="self" href="http://localhost:8080/rest/prototype/1/space/ds"/>
  <children size="2"/>
  <home>
    <id>32799</id>
    <link rel="self" href="http://localhost:8080/rest/prototype/1/content/32799"/>
    <type>page</type>
    <title>Home</title>
    <url>/display/ds/Home</url>
    <children size="6"/>
  </home>
</space>
```

⚠️ Some of the names of the elements in the space details example are subject to change. The `children` element for example will likely be changed to something more appropriate (it refers to the top level pages of a space).

Small Improvements Team

Driving on the left shouldn't be so hard, so we've updated the left hand navigation panel.
Bugfix Team

Fixed multiple bugs. Most notably:
CONF-12864 - improved performance of PageNotFound action
CONF-9575  - fixed concurrency issue that was breaking reindexing job

Gadgets & Office 2007 Team

Word 2007 & Excel 2007

We added Word 2007 support for document import and the view-file macro, as well as Excel 2007 support for the view-file macro. We don't support PowerPoint 2007 for the view-file macro yet and can't index any Office 2007 documents yet. Work in progress.
Support for importing other document formats

You can now import RTF and ODT files in addition to DOC and DOCX.

Gadget Macro

We are happy to introduce the new gadget macro! It's currently not very usable as we don't have any UI yet to change the user preferences for a gadget, which means you have to enter them manually.

Example Markup:

```
{gadget:url=[baseurl]/rest/gadgets/1.0/g/com.atlassian.confluence.plugins.gadgets:gadget-search/gadgets/gadget-search.xml}{gadget}
```

Jira chart gadget and Confluence QuickNav gadget on a Confluence page:

QuickNav gadget

We are also stoked to show off our first Confluence gadget which can be embedded in other gadget containers. The gadget URL is:

```
[baseurl]/rest/gadgets/1.0/g/com.atlassian.confluence.plugins.gadgets:gadget-search/gadgets/gadget-search.xml
```

Unfortunately you can't embed that gadget into iGoogle or GMail yet, because we have to upgrade to a newer version of the OAuth plugin first. This will work starting in 3.1-m5.
Gadget Directory

For every gadget you want to embed on a page, it needs to be added to the gadget directory first. This is to make sure you can’t just embed any third party gadgets because those might contain malicious JavaScript which will then be executed as coming from the same security domain as Confluence.

OAuth Integration

We have also integrated the OAuth admin plugin which allows you to configure your consumer information as well as adding OAuth consumers and service providers. Detailed documentation will be available on CAC in the future.

20% and miscellaneous

Thumbnail Dialogs

Thumbnail images previously opened the full image in a new popup window, when clicked. Now clicking on a thumbnail opens the image in a fancy dialog (same as the image gallery).

Sprite Image for Macro Browser

On the edit page, the macro browser is built up in the background with its pretty macro icons. Although the macro icons are cached, there are quite a number of requests made on a cold browser cache (we have 52 macro icons, so 52 requests are made just for the macro browser). This has been reduced to one request by generating a sprite image for all the icons and using it with css and background-image positioning.

hod has been added for macros to more clearly define their desire to be kicked out of paragraphs, and code macros do that. This change is still awaiting review, so it may be temporary.

AUI upgraded to 1.2.1!

Release Notes 3.1-m3 ("Milestone 3")
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

Please note the following

- Development releases are not safe — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.
**Maintenance mainly**

Milestones 2 and 3 don't have many feature-changes, because a lot of the development happens on branches and under the hood. We have been doing some UI polish, but nothing large is to be seen yet.

We did however split up resource-loading, so CSS is now at the top of the page, and JS is at the bottom, resulting in faster page views. If you are a plugin author using resource bundles and JS/CSS (which you should, obviously), then definitely check out this milestone to see if your plugin works as expected.

Stay tuned for M4 in about two weeks, which will show off some nice new feature improvements.

Cheers,
Per and the Confluence development team

**Confluence 3.1 Deprecated Code Cleanup**

This document contains information for Confluence plugin developers regarding changes to the Confluence codebase in the upcoming 3.1 release.

Confluence 3.1 Deprecation Cleanup

Every major Confluence release, we clean up the codebase by removing classes and methods that have been deprecated in previous releases. These changes were included in the Milestone 2 release of Confluence 3.1. We strongly encourage plugin developers to test their plugins against our milestone releases.

If the removal of these classes or methods causes you significant problems maintaining your plugins, please let us know. We will work with you to find a workaround, or possibly reinstate the code before the final release. (Note that the longer the code in question has been deprecated, the less inclined we will be to replace it. Some of the stuff we've removed here will have been giving you compiler warnings for years.)

More information on our guidelines for removing deprecated code: [Deprecation Guidelines](#)

Changes in Confluence 3.1 Milestone 2

For the sake of brevity, the `com.atlassian.confluence` part of package names has been omitted.

**Removed Classes**

<table>
<thead>
<tr>
<th>Class</th>
<th>Deprecated Since</th>
</tr>
</thead>
<tbody>
<tr>
<td>.pages.BreadcrumbsManager .pages.DefaultBreadcrumbsManager</td>
<td>2.7</td>
</tr>
<tr>
<td>.plugin.descriptor.web.conditions.user.UserHasHistoryCondition</td>
<td>2.8</td>
</tr>
<tr>
<td>.util.VelocityUtils</td>
<td>2.0</td>
</tr>
<tr>
<td>.util.PageComparator</td>
<td>2.3</td>
</tr>
<tr>
<td>.util.ResourceManager com.atlassian.confluence.util.DefaultResourceManager</td>
<td>2.8</td>
</tr>
<tr>
<td>Class</td>
<td>Constant</td>
</tr>
<tr>
<td>-------</td>
<td>----------</td>
</tr>
<tr>
<td>.search.lucene.extractor.PageContentEntityObjectExtractor</td>
<td>PAGE_REAL_TITLE</td>
</tr>
<tr>
<td>.security.SpacePermission</td>
<td>ADMINISTER_CONFLUENCE_PERMISSION</td>
</tr>
<tr>
<td>.setup.Bandana.ConfluenceDaoBandanaPersister</td>
<td>GLOBAL_BANDANA_CONTEXT</td>
</tr>
</tbody>
</table>

**Removed Methods**

<table>
<thead>
<tr>
<th>Class</th>
<th>Method</th>
<th>Deprecated Since</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>.core.ConfluenceActionSupport</td>
<td>ThemeHelper getGlobalHelper()</td>
<td>2.0</td>
<td>Support for pre-2.0 themes</td>
</tr>
<tr>
<td></td>
<td>ThemeHelper getSpaceHelper()</td>
<td>2.0</td>
<td>Support for pre-2.0 themes</td>
</tr>
<tr>
<td>.core.ContentEntityManager</td>
<td>Iterator getRecentlyModifiedEntities(int maxResults)</td>
<td>2.0</td>
<td>use the SearchManager for this kind of query</td>
</tr>
</tbody>
</table>

1 While the ResourceDownload class was only deprecated in 2.10, it could only ever be used in the context of the ResourceManager which was deprecated earlier. It is very unlikely that code exists that relies on one but not the other.

2 These Radeox macros were superseded by the equivalent V2Renderer macros in Confluence 1.4, but only marked as deprecated in the 2.7 release.

---

**Removed Constants**

Since Java inlines constant references during compilation, the removal of constants should not break binary compatibility with any plugin that references them.
<table>
<thead>
<tr>

Release Notes 3.1-m1 ("Milestone 1")

ℹ️ Outdated page

These are not the release notes you are looking for

This page is outdated, but has high Google ranking 😞

Please refer to the official Confluence 3.1 release notes over here.
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

Please note the following

- Development releases are not safe — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.
Yay, we are back!

After 3.0 came out, we spent some time in bugfix-mode, then we had a 20% week, 2 devspeed weeks, and the last week was mainly spent planning the next release. So that’s why there has not been much visible progress recently lately. Development on core 3.1 features has started, but in this milestone we mainly ship all the bugfixes we did for 3.0.1, some small improvements, and three 20% projects.

New Webstart Installer

We are trying something new. While we will provide the downloadable files too, we encourage you to try our webstart based evaluation installer. Visit http://webstart.atlassian.com/confluence-3.1-m1-r2/confluence.jnlp for a snappy installation experience.

New Native Mac Installer

When you go to the download section, you will notice a new DMG file. This contains our new native experimental Mac installer. Give it a try and tell us what you think. Instructions coming soon!

And here are all the cool features in M1 you will get.

1

Interactive "Get more"

Recently updated macros are now interactive. You will get a little "More" link to load new updates dynamically within the page. This small but awesome feature can also be found on your network page, and in the space’s recent update tab. It doesn’t screenshot too well, so try it out for yourself. Anyway here is what the macro looks like:

And here is what the network tab looks like:
Caveats:

- We feel that the link is a bit small and can be mistaken for a normal link. Especially on the static pages (network, updates in space) it makes sense to make the button much larger and more prominent. We will work with Design to find a solution.
- The link also needs to go into the profile page (so you can see more updates on everyone’s stream), and into the status tab. Dave will add that soon.

This is a Dave Loeng 20% production

Draft diffs and visibility

Always wondered what your old drafts were about? Or when a draft is being saved, what part of that huge document you’re editing has actually changed? Well, now you can, thanks to DraftDiffs.

View the diff right from the edit page:

Which takes you to this screen:
Known issues: Annoying Javascript alert when there are no changes at all. This feature unfortunately also highlights our roundtripping bugs... ahem...

This is a Brian Nguyen 20% production

Small Improvements

Edit loss warning

Whenever you are in edit mode and decide to leave the page or close it, you will now get a warning popup. This is especially useful when writing comments (no drafts...) and for technically challenged people who don’t understand drafts in the first place. As raised in the JIRA issue, we may have to provide a setting to disable these warnings (it can be a bit annoying if you like to change your mind often), so watch CONF-16075 for updates. The idea has been raised that we may only want this feature for comments when no drafts are being saved. We will dogfood this over the next few weeks, and see how we like it or not.
Gradient

This is just an experiment, probably not shipping as a default for 3.1, but worth a look. Do you like it?

Dashboard › People › Per Fragemann › Network

Per Fragemann

More options to search for by time

We added two more options to filter by time: Last 6 months, Last year, Last 2 years, and fixed the calculation for today/yesterday by making it work by 24h instead of what the server thinks is midnight. 48h obviously encompasses the last 24 hours two, which was awkward in the old system, where yesterday would really just mean yesterday, but not today.

Plugin points in the editor

We were approached by a developer who wants to write a spellchecker plugin for Confluence, so Agnes volunteered to pluginpointinize the editor. You won’t see anything right now, but it will make many plugin authors
happy. Read the documentation for how to write plugins for the editor.

This is an Agnes Ro 20% production

"Link to this page" Dialog

In order to make Tiny Links more accessible, we added a new Menu option which opens a new dialog, which shows the three ways to link to a page. Full URL, TinyURL, and Wiki Link. Probably the Full URL is not as important, but the dialog looked a bit unbalanced, and it makes it clearer that both URL’s are equivalent.

Selecting the menu opens up this dialog, with the Tiny Link conveniently selected.
We didn't rename Tiny Links to Permalinks, as has been suggested. What do you think, should we?

This is the final Chris Broadfoot 20% production.

**Release Notes 3.0-rc1 ("Release Candidate 1")**

Hi everyone,

we are approaching the 3.0 release date. We have built our first release candidate, and we hope to turn this into the final release unchanged soon.

There have been a few changes since the last two betas: The translations are now up to date, more icons have been added to the macro browser, and we have tweaked a few screens, like the profile page. And of course we have fixed dozens of bugs (see JIRA URLs below). We are very pleased with the quality of the release and we are currently not aware of any showstoppers or critical issues. Chances are that the final release will be just a rebranded RC, however you should still not use the RC on production systems, since we still have some final testing planned. We encourage you to use it for staff training purposes and for your upgrade testing though, since no more UI changes or changes to the upgrade process are scheduled.
Milestone release advisory

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- Development releases are not safe — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.

Thanks for your feedback so far, it has helped us track down a few bugs, which will result in a smoother upgrade for everyone!

Cheers,
The Confluence Team

**Release Notes 3.0-beta2 ("Beta 2")**

**Welcome to our Beta Phase**

The Confluence team is proud to present the first public beta release of our upcoming Confluence 3 release. It contains all the features we intend to ship. We will be publishing Beta 3 next week, and then a rapid succession of Release Candidates in two weeks. We aim at shipping Confluence 3.0 in (very) early June.

So, calling all plugin developers: If you want to make sure your plugin plays nicely with 3.0 on the launch date, and if you maybe even want to use our new features from within your plugin, this is really the last chance to get started. Download the Beta right now

Note: This is still not a stable release, it is not meant for production use. So our normal Milestone disclaimer still applies:
**Milestone release advisory**

⚠️ **For testing use only**

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the [latest official release](#).

This release is a public development release ("milestone") leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

### Who should upgrade?

⚠️ **Please note the following**

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we **can not** provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

### Upgrade Procedure

Follow the [normal upgrade instructions](#) to upgrade your test instance to this release. *We strongly recommend that you backup your Confluence home directory and database before upgrading!*

### Downloads

All development releases are available from the [development releases page](#) on the Atlassian website.
What is in it?

All the features we intend to ship are available in this beta. Unfortunately, the official documentation is not ready yet, so until we get a more official summary of the new features, please refer to our recent Milestone release notes, and try the beta out yourself.

Improvements

Since publishing Milestone 9, we have focussed on polishing our existing features. Here is a rundown on the changes since then:

Community features

Some important bug fixes:

Some IE issues: CONF-15497, CONF-15137, CONF-15474, CONF-15421, CONF-14593
Improvemnets to User Follow: CONF-15335, CONF-15279, CONF-15427, CONF-15286, CONF-15016
Removed the annoying page reload when following a user, CONF-15290

Macro Browser

Preview button removed and replaced by a refresh icon:

Old:

![Old refresh button]

New:

![New refresh button]

Some important bug fixes:

CONF-14720 Inserting a macro via the macro browser would always scroll to the top, which is very annoying if you are editing the end of the page.

CONF-15487 It is now possible to insert more than one macro in Safari via the macro browser!

Office Connector

CONF-14798 Performance improvements on the backend for the viewfile macro.

Also, the initial loading of the Flash front end should be a little snappier. There was a default “pre-load” screen that added 1-2 seconds to the load time. We also changed the background color to white so it also adds the impression of not appearing until it’s loaded.

<table>
<thead>
<tr>
<th>old</th>
<th>new</th>
</tr>
</thead>
</table>

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
**Engine Room**

Confluence has been upgraded to the latest releases of Plugins 2 and SAL.

We did a small performance improvement by caching PersonalInformation objects by user name ([CONF-15484](#)), which will in particular speed up the rendering of profile pictures.

As part of this release cycle we fixed a lot of smaller bugs, but the most notable ones were related to content indexing:

- **CONF-15352** Fixed a race condition during content indexing which would result in leaked file handles, which had been introduced in M9
- **CONF-15483** Fixed a problem with a reindex being started before the plugin system was loaded. This would result in empty documents in the index.

**Random**

**CONF-14322** was fixed, so change comments containing ampersands and angle brackets will no longer affect the system.

**Known Issues**

The Flash preview is broken in Office Connector that is bundled with beta 2. See [CONF-15612](#). It's already fixed and it will be bundled in Beta 3 next week.

**Release Notes 3.0-m9 ("Milestone 9")**
Milestone release advisory

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

Summary

We are one week away from feature freeze, so this is the last major milestone before we enter beta next week. We are still working on some wording, on some plugin upgrades, and a few UI tweaks, but M9 is pretty much how Confluence 3 will look like. From now on, it's mainly about fixing up non-critical bugs and doing code reviews. Many Code reviews! 😊

Enjoy:

Community

Followed Users and Favourite Spaces

The terminology has been cleaned up and made consistent across the application. If you want to see what a user is doing you follow them, if you want to see what happens in a space, you mark that space as favourite. You can mark a personal space as favourite, and this is independent of following the user who owns the space.

One area we still want to improve is the 'User Follow' menu item and profile tab, which needs a better name.

Follow Tab RSS and Design Improvements

You can now get an RSS feed on any user's 'User Follow' tab. This feed will include all activity of the users followed by that person. This is a great new way of monitoring content on the Extranet.

We've redesigned the follow tab to highlight the activity information more and handle large lists of followers. We also added some clarifying text to this tab to better describe the different sections of this page.

There is now a maximum number of followers shown on this page, and separate pages to show the complete list. This addresses the performance and usability problems discovered in the previous milestone when you had a large number of followers or people following you.

Profile Page Updates

The layout of the profile page has been changed to try to improve the visibility of the activity. This puts the user's personal information over on the right hand side of the page.

On the left hand side, we now have new links to follow a user and favourite their space.
Update User Status Permission

A new global permission was introduced to give system administrators control over who can use the user status feature.

If the permission is turned off for a user (or their group) then they will not have the ability to set their user status, nor will they have an 'Status Updates' tab in their profile.

Macro Browser

Macro Browser in the RTE

The Macro Browser is now finally available in the Confluence rich text editor (RTE)! It will assist you in inserting and editing macros, without having to understand the wiki markup.

Editing a macro can be done by placing the cursor in the start or end tags of the macro wiki markup. If you have context menus enabled, you will also see a new option for insert/editing macros.

Upgraded Macro Icons

Thanks to Stephen, we have even better icons for the macros in the macro browser. Check 'em out!

AUI 1.0

Confluence is now using the first release of AUI, 1.0.
PDF Export

Many bug fixes have been done for the new PDF export:

- **CONF-15220** - PDF Export converts a bulleted sublist into a numbered sublist
- **CONF-15148** - Follow macro should not include the 'Add' action when exported to PDF
- **CONF-15042** - PDF Space Export text uses US spelling instead of Australian
- **CONF-15038** - PDF Export from a page with non-default theme is trying to use the old method, and so it fails with an error
- **CONF-14909** - column and section macros render differently in PDF export when they have borders
- **CONF-14904** - IM presence macro shows a roque nbsp when exporting to PDF
- **CONF-14901** - The PDF export doesn't recognize all literal colors when used in the color macro
- **CONF-14889** - PDF Export from the Info pages is trying to use the old method, and so it fails with an error

Engine Room

Confluence has been upgraded to the latest releases of Plugins 2 and SAL.

Release Notes 3.0-m8 ("Milestone 8")
Milestone release advisory

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

All development releases are available from the development releases page on the Atlassian website.
Summary

The Confluence team is excited to bring you our latest milestone release: Confluence 3.0-m8, "Milestone 8". This release includes a huge amount of improvements to the community features, additional performance improvements and many bug fixes.

Community

Be sure to check out the great improvements in Confluence's new community features:

- Improved Activity list on Profile Page - The user status list has been moved to its own tab and the new Recently Updated Macro has been put in its place. It's also been given a face lift and fits nicely into the profile page. Facebook eat your heart out.

- Status list moved to separate tab with pagination - The user status list now has a proper location, it's own tab. This tab is the central place where you manage and view your historical status updates. Links to delete old status updates will be found on this tab.

- Each status item has its own page so you can link to a status - You can now create links to old status objects allowing for historical references as each status can be displayed on its own page.

- Personal space sidebar has been updated to include an activity list and your follower information - The personal space sidebar is coming along nicely and looks great with the new recently updated macro and the follow information.

- Adding a follower on your Favourite People tab (or using the hover) will refresh the page and update the list immediately - We changed how the follower information was looked up as to not use the lucene index and hooked into the hover so most changes on this page will trigger a refresh and the updates will be seen immediately! No more wondering if your new follower actually worked

- Those extra fields on your User Profile page are now run through the wiki renderer allowing links and simple formatting
**Macro Browser**

The macro browser team spent the past two weeks working behind the scenes on placeholders for the rich text editor. Unfortunately, this change is too complex and risky to get into 3.0, so we have just a few small improvements in the macro browser this milestone:

- More parameters and documentation are available for macros in the macro browser. We now have 100% of the bundled macros with documented parameters, and will be just fine-tuning the documentation for the remainder of the release.
- The Office Connector (viewfile) macro shows up in the macro browser as separate macros for Word, Excel, PDF and Powerpoint documents.

**PDF Export**

Balsamiq Mockups and several other complex macros now export to PDF correctly ([CONF-14792](https://{0})).

🌟 Why don't you try out the new PDF export right now? On any page, go to Tools, Export as PDF.

**Engine Room**

The Engine Room team implemented several important performance improvements for this milestone. Specifically:

- Searching should be faster and not blocked by index updates every minute. This should also make the dashboard and macros that use the search index slightly faster. ([CONF-7749](https://{0}), [CONF-14803](https://{0})).
- Image attachments embedded in a page are now cached by your web browser. This should make pages with lots of images faster to load and reduce the load on the server. ([CONF-8034](https://{0})).
- Upgraded the WebDAV plugin to 2.0-beta2. This plugin has been released to the community for a while now, to very positive response. It should be more compatible with more clients now, though there is still some special configuration needed for Windows Clients. Read the documentation about client-configuration in order to test it.

**20% Projects**

Administrators can now customise the size of Confluence's caches from the web interface. Previously, you needed to edit an XML file and restart Confluence whenever you wanted to adjust the caches. This addresses one of the most popular supportability feature requests in the Confluence JIRA project, with 34 votes: ([CONF-12836](https://{0})).

**Bugs Fixed**

Several macros which were broken in M7 are now fixed: `{flowchart}`, `{rsvp}` and `{pagetree}`. ([CONF-14615](https://{0}), [CONF-14829](https://{0}), [CONF-14581](https://{0})).

The Gliffy plugin and Beanshell macros now work with Confluence 3.0; previously customisation was required to get them to work properly with our latest development versions.

Below is a complete list of issues resolved in Confluence 3.0-m8.

Errors were reported by the JIRA trusted connection.

- APP_UNKNOWN; Unknown Application: (0); ["confluence:4557196"]

**Release Notes 3.0-m7 ("Milestone 7")**
Milestone release advisory

ℹ️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

**Downloads**

All development releases are available from the development releases page on the Atlassian website.
Summary
The Confluence team is proud to present another incremental milestone, called M7. We are currently aiming at shipping M8 in two weeks and M9 in four weeks. M9 will be almost feature-complete and therefore similar to a beta release. After a couple of betas and release candidates we intend to ship Confluence 3 in late May. As always, things can still change a little, so there is no fixed date. But if you are a plugin developer, you want to have your plugin tested well before the big marketing buzz kicks in. We try to remain as backward-compatible as we can for Confluence 3, but if something slipped through the cracks we need your feedback, and we need it now. So do have a look at this milestone release and tell us what you think.

Macro Browser and Rich Text Editor
You can now choose the kind of right-click context menu you want in the Rich Text Editor. A new button on the toolbar, handily called "Toggle context menu", toggles between the browser's default context menu and our TinyMCE one.

You can also tell the TinyMCE context menu that it isn't wanted via the "Disable context menu" option.

Macro Browser search has been improved and now accepts multiple words (order not important) and camel-casing (matches either case in consecutive words). The filtering logic has been added to AUI as a new commented method of AJS, "filterBySearch" - feel free to use it.

Community Improvements
This milestone shows a number of improvements from the Community Team.

Profile Layout
In the spirit of making the profile page actually page you want to visit, it's been given a facelift and has now come closer in line with out standard UI.

It also includes your current status is clearly visible at the top of the profile page.

For now you have a Status Updates section on the right hand side of the profile page, the next milestone will see this will be replaced with the new Recently Updated Macro (see below) so it will include other kinds of activity as well. It's here now because otherwise you wouldn't have anywhere to delete or clear your status, eventually will be moved to another tab and/or page.

User Status Updates

- **Delete And Clear Status**
  You can delete status entries from the list on the right. Someone hacks in your status, you can now always delete it. You can also clear your current status, so any location showing your current status will show nothing. This won't remove it from your history but your current status will now be considered cleared.

- **Status Icon**
  A new status Icon was introduced by the Design team. The lightbulb has been replaced with some sexy quotes (""").

- **Immediate Updates**
  Updating your status will use Javascript-Magic to update your status on the current page, giving you immediate feedback, with no need to refresh the page.
Recently Updated Macro

This is the first milestone that shows the hard work that David Loeng and Chris Broadfoot have been doing with our Recently Updated Macro.

To build up activity in the old recently updated macro the process would simply query the lastModified date of all the relevant content, then sort it accordingly. The side effect of this was, if two people edited the same page, you would only see the one edit in your list. Not only that, if you wanted to follow a certain user’s activity and someone edited a page after them, you wouldn’t see any update!

We’ve worked very hard on this and changed the way Confluence stores changes to documents and now tracks all changes every time a document, page, profile, status, anything, is updated.

This screen shot shows two edits from two different people on the same document, something that wasn’t previously possible. These changes were critical for implementing a proper follow feature for 3.0.

Bug Fixes

A number of bugs have been fixed by the community team, here are a list of some of the main ones:

- CONF-14773 Expanding and collapsing the personal sidebar will no longer affect the comments on that page/blogpost.
- CONF-14870 Delete links for user status items are now properly integrated with the new XSRF protection and actually work.
- CONF-14778 Printing pages from a personal space no longer includes the sidebar

Other bug fixes:
- CONF-14689 Comment edits now send notifications

Plus a number of other fixes.

PDF export team

Removed the PDF Export++ option. The new PDF export is what you get when you select just PDF Export. The old PDF export was removed.
Added javascript to the space export tree that will select/deselect all descendants of the clicked node. This change applies to all export formats not just PDF. This should save hours for the Atlassian Techwriting team.

Bugs fixed

CONF-14906 - Fonts are too large in the page index macro when exported to PDF
CONF-14905 - Note macro missing colored background in PDF export
CONF-14902 - content by label macro looks ugly when exported to PDF
CONF-14900 - Bookmarks macro is producing really large font when exported to PDF
CONF-14899 - Attachments macro is showing velocity junk when exported to PDF
CONF-14898 - Panel macros (warning, note, info) could use some extra padding in PDF export
CONF-14897 - Spaces macro renders as a single bullet item list when exported to PDF
CONF-14895 - Recently-used-labels macro with a table style doesn't look like a table at all
CONF-14894 - Blockquote text too large in pdf export

Release Notes 3.0-m6 ("Milestone 6")
Milestone release advisory

⚠️ For testing use only
Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following
- Development releases are not safe—Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.
Summary

This milestone is mainly about polishing features that were introduced previously, and a bit of back-end work for security and performance. We have fixed plenty of bugs of M5 too, and will keep fixing for M7.

Known issues

Given the recent work that has been done to improve "recent updates" (CONF-14434), updates shown on the dashboard will be affected shortly after the upgrade. You may notice that only changes made _after_ the upgrade will show. This will be rectified as soon as the index is rebuilt.

Improvements and new Features

New PDF Export

- This milestone contains the first cut of the Improved PDF export, which also give you more control over the conversion process by allowing you to use CSS. Please find the [detailed documentation](#) on CAC. [CONF-2079]

There are still plenty of known bugs with the new PDF, we included it a bit early to be able to get feedback on the CSS-styling process, not for beta-testing purposes...

Engine Room

The ER team has implemented several more important fixes and improvements in this milestone:

- **supportability** - integrated thread-dump tool in the administration screen ([CONF-12395](#))
- **security** - editing comments in wiki markup is no longer double-HTML-escaped in anti-XSS mode ([CONF-14601](#))
- **cluster performance** - avoid unnecessary updates to distributed cache to improve cluster performance ([CONF-14657](#))
- **general performance** - improve performance of retrieving many attachments, like on the attachments page ([CONF-14422](#))
- **front-end performance** - add caching headers to attachments rendered with a "?version=x" parameter ([CONF-8034](#)).

Office Connector

- When launching an external editor from Confluence, you don't have to login again. [CONF-14705](#)
- You can now monitor what is in the conversion queue and what is actually being converted [CONF-14707](#)

Macro Browser

The following bugs have been fixed:

Errors were reported by the JIRA trusted connection.

- APP_UNKOWN; Unknown Application: (0); ["confluence:4557196"]

Bugfix-team

- It's safe to use Sections and Columns in the RTE again. ([CONF-13823](CONF-13823), [CONF-14282](CONF-14282))

Release Notes 3.0-m5 ("Milestone 5")
For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

- Development releases are not safe — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- No upgrade path — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

Downloads

All development releases are available from the development releases page on the Atlassian website.
Issues resolved or improved in this milestone since Milestone 3

Macro Browser (in Markup Editor)

The Macro Browser is now available in the wiki markup editor! Features are listed below.

Browse Macros

You can now browse through a list of categorised macros and select a macro to insert. Macros that do not have categories define can be found in the 'All' categories tab. To insert a macro, you can either double click on the macro or click it once and then click the 'Next' button.

Insert Macro

For macros that have parameter metadata defined, you will see parameter labels and descriptions with the appropriate input fields. So far we are handling boolean and select-one-from-list type parameters. Everything else is considered a string. Please note that there is no field validation.

For macros that don't have the parameter metadata defined, you will see a single input field for the macro parameters and its notation guide help (if any) below.

Preview Macro

A default preview will be loaded only if the macro doesn't have required parameters. The preview can be updated by clicking on the 'Preview' button. This button location will change in the future.

Edit Macro

You can also edit a macro by placing your cursor in the start tag of a macro and then clicking the Macro Browser icon. It should display the 'Insert X Macro' page with it's parameters populated.

Known Issues

- Macro summary and parameter descriptions are currently under review by the tech writing team, so please ignore grammar/spelling/crappy English for this milestone.
- The macro icons (displayed in browse macros) are temporary. Hopefully we will be able to get much sexier icons.
- Some macros falsely declare they have bodies (e.g. gallery) so you may see some unnecessary body text areas

Community

Several major community features have their debut in this milestone.

Status

This milestone, we are releasing the first version of the Status feature. There is still a lot of work to be done, it's
not particularly polished but we want your feedback.

First of all, set your status from the user menu, where you’ll get a dialog box allowing you to enter your new status.

You can see your status and others' statuses from user hover, under the "Status List" option in user profiles, the "Favourite People" tab (see below), personal space sidebar (see below).

Follow

Marking another user as "favourite" is now meaningful. In milestone 5, you'll be able to get a list of statuses from the people you follow.

Check out the "Favourite People" tab in your user profile – you can get there via your user menu.

It will show you who you're following, and who's following you. You can also quickly follow someone with the user search, and see a list of status updates from the people you follow.

Personal Space Sidebar

With this release, we now have some structured form of a user profile for every user. On the right of any personal space*, there'll be a sidebar with various details of the person's space you're viewing. Don't worry, you can easily collapse the sidebar and it'll shift out of sight. Once you collapse the sidebar, it will stay collapsed for all personal spaces for the duration of your login session.

Here's what it looks like:
We plan to put more information on the sidebar, at the moment it looks a little silly if the user doesn’t have a status set and hasn’t filled out any of the extra profile fields we added last milestone.

This only works in the Default Theme.

**Known Issues**

- There are a few known issues with the Community work, the biggest thing is what you see at the moment is a first cut of the functionality, we plan to "sexy" it up a bit and make the status and profile pages look a lot nicer.
- You will also notice that when you favourite another user you will need to wait for the index to be flushed for your changes to be applied. This will be improved in a future milestone.

**Bugfixes**

There are two relevant bug fixes in this milestone:

- Configuration to prevent anonymous users accessing user profile information ([CONF-13276](#))
- Cannot insert links with Unicode characters in the URL ([CONF-12707](#)).

**Engine Room**

The Engine Room team has delivered one more performance improvement and a significant security improvement this milestone:

- Attachment retrieval should cache attachment IDs ([CONF-14422](#))
- Anti-XSS mode is now enabled by default ([CONF-12573](#)).

We also fixed the regression in the previous milestone (M4) where pages with thousands of attachment versions brought all attachment retrievals to a grinding halt.

**Release Notes 3.0-m4 (“Milestone 4”)**
Milestone release advisory

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release ('milestone') leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

All development releases are available from the development releases page on the Atlassian website.
Issues resolved or improved in this milestone since Confluence 3.0 Milestone 3

Experimental Macro Browser

The Macro Browser is now available in the wiki markup editor, however it is currently not in a state for proper use. It is quite buggy and has been included for QA and the dev team, so please do not raise any issues against it yet.

Community

User Hover Fixes

A lot of outstanding issues with User Hover were fixed for m4.

First Cut of User Profiles

The profile tabs have been rearranged into a more intuitive order, with general and email preferences moved to a separate "Settings" tab:

![Profile Tabs](image)

Additional fields have now been added to your user profile.

Performance Improvements

We did the following small performance improvements:

- Caching/Queries optimized for page lookups ([CONF-14273](CONF-14273))
- Adjusted cache sizes ([CONF-14294](CONF-14294))
- Optimized access to attachments ([CONF-14342](CONF-14342))
- Less cache replication in a cluster ([CONF-14339](CONF-14339))

Although the performance improvement hasn’t been as dramatically as in M2, but we still see a solid trend towards shorter and less varying response times. The overall performance improvement is around 10%-15% with more to come in the next milestones.

Known issues

- Performance issues with frequently updated attachments. One of the performance tweaks in M4 can cause issues if you have attachments with thousands of versions. ([CONF-14422](CONF-14422))
- The Macro Browser is very fresh and contains many bugs.

Check out [JIRA](https://jira.atlassian.com) for the full list of known bugs

Release Notes 3.0-m3 ("Milestone 3")
Milestone release advisory

⚠️ For testing use only

Do not use this release to upgrade your production systems.

For all production use and evaluation of Confluence, please use the latest official release.

This release is a public development release (‘milestone’) leading up to the next Confluence major release. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we can not provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

In supplying milestone releases, our aim is to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and all of our milestone releases even have been performance tested for a while.

However, since our milestones releases are timeboxed (that is, they are released every two weeks, no matter how far we have come implementing features and bugfixes) there is always a chance that we have new known bugs that are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, we have not completed our performance testing and compatibility testing for all supported databases and user management systems. So, for example, a milestone release may behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade your test instance to this release. We strongly recommend that you backup your Confluence home directory and database before upgrading!

**Downloads**

All development releases are available from the development releases page on the Atlassian website.
Issues resolved or improved in this milestone since Confluence 2.10

**User Hover**

The first cut of User Hover has made it into m3. This mainly provides Confluence with the stepping block for features like Status. At present, it's only really useful to e-mail someone, or visit their user profile (both are notoriously difficult pre-m3).

Just hover over any user’s name or profile picture, you should see the following information:

Performance

The Engine Room Team has started attacking general performance and also cluster performance. Our loadtests already show a significant improvement for high loads, and we hope it will show on EAC too.

In particular we made the following changes:

- Remove blocking in OGNL ([CONF-14121](#))
- Rely on Coherence to do locking instead of using sychronized methods ([CONF-14093](#))
- Remove unncessary sychronization on Hibernates UpdateTimestampsCache ([CONF-14098](#))

More backend improvements related to caching and retrieval of macros have been done, which should make rendering long pages faster.

Overall we have seen a significant performance improvement under light to mid-level load, even more so on the clustered version of Confluence. This is mostly due to [CONF-14093](#).

**Rich Text Editor**

Context menus are now available in the RTE (Agnes' Fedex 9 project). Just right click in the editor! They are especially useful for table editing.
Notifications which show just relevant changes

When watching a page in Confluence, you normally get all the content whenever something changes. This isn't so useful, so we've added the option to get just the changes to the content emailed to you.

Just check the "Show changed content" box in Email Preferences. If enough people find this useful we are considering enabling it by default.

Viewing changes for content has also been similarly improved. By default, unchanged content is hidden and you can click the ellipsis to expand it.

Both improvements rely on 20% work done by David Taylor to dramatically improve the diffing algorithm used for Confluence content.

20% projects

Batching web resources

Confluence is now using Atlassian Plugins 2.2. beta4, which supports batching of web resources. This should result in a performance improvement, with fewer requests to the server for jss/css files.

See here for more details.

Roundtrip bugs

Yes, it's lame, but DonW fixed a couple of particularly annoying round-trip RTE bugs in his 20% time:

- Images no longer get attached to the previous paragraph
- Emoticons can all be escaped in wiki markup, and will automatically be escaped when going from Rich Text to wiki markup.

Known issues

Plenty of known bugs. Check out JIRA.

Release Notes 2.10-rc1 ("Release Candidate 1")

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.10. This is a public development release (DR) leading up to Confluence 2.10. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we're up to.

Who should upgrade?
Please note the following

- Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade from Confluence 2.9.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

Downloads

All development releases are available from Development Releases on the Atlassian website.

Issues resolved or improved in this release

We are now reaching the end of the 2.10 release cycle.

We have released our first release candidate RC1 today, you can see it on our public Confluence installation at http://confluence.atlassian.com. There should be no more code changes made to Confluence from this point on unless any important issues are found in this release candidate.

While this is not the final release, and the official release notes will be unveiled next week, you should definitely have a look now to confirm everything still works fine with your plugins.

The RC1 is functionally almost equivalent to M8 which was announced in early November, but has a number of additional bugfixes. Check out our roadmap in the JIRA project

Known problems

The Edit Grid plugin doesn't work with this version of Confluence. See the Jira issue for more details.

Release Notes 2.10-m8 ("Milestone 8")

Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.10 ("Two Ten"). This is a public development release (DR) leading up to Confluence 2.10. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

Who should upgrade?
Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, our performance-testing and compatibility testing for databases and application servers is not done to the full extent. So, for example, a milestone release might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the [normal upgrade instructions](#) to upgrade from Confluence 2.9.x to this release. *We strongly recommend that you backup your confluence-home directory and database before upgrading!*

**Downloads**

All development releases are available from [Development Releases](#) on the Atlassian website.

**Issues resolved or improved in this release**

**Writer**

Bug fixes:

- CONF-13670 : fixed bug when Html Export used to fail on recently updated macro displaying an attachment.

**Office Connector**

- CONF-13613 : fixed several bugs in the pdf preview
- CONF-13643 : fixed previewing viewfile macro gives error on a new page with attachments
- Numerous other bugs. See the [Office Connector release notes](#)

**Discovery**

- Added recentness boosting to QuickNav.
- Added the space name to the tooltips for QuickNav results.
- Fixed bug preventing Did-You-Mean feature being enabled via the admin console.
Plugins

- Upgraded to Jira Macros Plugin v2.8.7, which contains several bugfixes (m7 contained v2.8.6)

Bug Fixing

Significant bug fixes since M7 include:

- CONF-13580: a blocker bug when editing pages with certain types of macros.
- CONF-13543: a blocker bug causing drafts to not be saved in certain situations
- CONF-13521: a serious issue with the RTE forcing the use of the base url.
- Several bugs (CONF-13338) fixed relating to the escaping of attachment filenames.
- Fixed the HTML around the quick search box that was causing a large right hand margin on some browsers.

Release Notes 2.10-m7 ("Milestone 7")

Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.10 ("Two Ten"). This is a public development release (DR) leading up to Confluence 2.10. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

Who should upgrade?

**Please note the following**

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, our performance-testing and compatibility testing for databases and application servers is not done to the full extent. So, for example, a milestone release might behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure
Follow the normal upgrade instructions to upgrade from Confluence 2.9.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

Downloads

All development releases are available from Development Releases on the Atlassian website.

Issues resolved or improved in this release

Office Connector
- Changed the preview link to just "View". Previously it was "View Online" or "View as HTML". It will always be on the right of the actions links. This makes the alignment of the other links nicer.
- The slide viewer will always be downloading a few slides ahead of the current slide. This should make it appear to be loading slides faster when you advance the slides.
- Other minor refinements of the slide viewer UI.

RTE
- Keyboard shortcuts added for insert link/image (ctrl+k and ctrl+m)
- Keyboard shortcuts fixed for headings (ctrl+1 for heading one and so on)
- Links pasted into the rich text editor will work (for most browsers and to some extent for all browsers)
- Initial indent within a code macro is now displayed properly.
- Extra newlines are no longer added to bodies of most macros Eg {note}inline body(note) will be left alone by round-trip.
- Less extra whitespace will be added to wiki markup by going to rich text.
- Draft saving should now work in all browsers again.
- Editor tabs are now rounded in safari and firefox.

QuickNav
- A faulty optimisation that was causing problems with multi-word searches has been fixed.

Search
- Increased range of data boosting to cover a full year (instead of one month)

Did-you-mean

The administration screens for the did-you-mean configuration have been substantially improved.

Default Space Content

The default content used for the home page in a newly created space or personal space has been improved to show recently updated content, and a pagetree of the space.

Plugins

Included most recent bug-fix versions of:
- LeftNav Theme
- Userlister plugin
- ToC Plugin
- Social Bookmarking Plugin
- Email Page Plugin
- Live Search Plugin
- IM Presence Plugin
- Dashboard Macros Plugin
- Contributors Plugin
- Attachments Plugin
- JIRA Plugin
- Advanced Macros
Multiple bug fixes.

**Release Notes 2.10-m5 ("Milestone 5")**

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.10 ("Two Ten"). This is a public development release (DR) leading up to Confluence 2.10. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

However, since our milestone releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, our performance-testing and compatibility testing for databases and application servers is not done to the full extent. So, for example, a milestone release might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade from Confluence 2.9.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**Issues resolved or improved in this release**

**Office Connector**

- View Online" or "View as HTML" link for supported file types on the Attachments screen, Attachments.
Confluence 4.3 Documentation

New look for the PPT and PDF flash viewer with a download button, and an improved fullscreen.
• Conversion Queue for managing performance when you may have a lot of users using the Office Connector.

**Rich Text Editor**

• Tab & Shift+Tab in lists are now shortcuts for indent/outdent
• Lots of bug fixes (especially around table editing)
• Round tripping bugs around links were fixed (shortcut links, using colors & images in links)
• The format dropdown is now styled properly
Quick nav improvements
- Is now at least twice as fast since we have reduced the pause by half.
- More page results! 6 in fact.
- See more of each search result. You can see the whole title (just hover!), and more letters with better truncation.
- People should not be getting weird timeout messages anymore
- New administrative feature to limit the number of simultaneous quick nav searches, or to turn it off.

Open Search
- You can now search Confluence from the convenience of the search box in your browser (for FF and IE7). Just add the search provider from the search provider menu dropdown on the top right of your browser.

Site Search improvements
- Normal search is at least 5 times faster than it use to be.
Better relevancy algorithm relevant

### Miscellaneous Small Improvements

- Cleaner, sweeter breadcrumbs and 10 more rounded corners.

### Plugins

- New version of Dynamic Task List (3.1.1)
  - Fixes TASK-108
- New version of Chart Plugin (1.12)
  - Fixes CONF-12792
- SNAPSHOT version of JIRA Issues Macro
  - Fixes lots of stuff
- 1.5-SNAPSHOT version of Advanced Macros
  - removed RSS macro
  - upgrade content-by-label
  - upgraded blogposts
  - upgraded recently-updated
  - Fixed Gallery Macro: ADVMACROS-39, ADVMACROS-48, ADVMACROS-49
- 1.5-SNAPSHOT version of Dashboard Macros
  - renamed recently-updated to recently-updated-dashboard to make way for new code in Advanced Macros
- New version of HTML Macros (1.5)
  - Includes RSS Macros now to take advantage of shared whitelist

### atlassian-plugins upgrade to v 2.1.0.rc1

- added filter plugin type
- added standard decorators that are available to plugins
- added support for xml plugin artifacts

### Release Notes 2.10-m4 ("Milestone 4")

⚠ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.10 ("Two Ten"). This is a public development release (D R) leading up to Confluence 2.10. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we're up to.

Who should upgrade?
Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, our performance-testing and compatibility testing for databases and application servers is not done to the full extent. So, for example, a milestone release might behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade from Confluence 2.9.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

Downloads

All development releases are available from Development Releases on the Atlassian website.

Issues resolved or improved in this release

TinyMCE upgrade complete

- Colour Text, Insert Emoticons and Custom Character are now back in the editor!
- Fullscreen mode is also back and even better. It no longer pops up in a new window, but enlargens the editor in the current page you are editing.

Quick Navigation polish and performance improvements

- performance significantly better than m3
- can handle concurrent requests up to 30 users without breaking a sweat (on medium datasets) - this should address the timeout issues people have been having

Plugins

- New build of JIRA Issues macros. Bug-fixes, but new feature: all RSS and Email version of the macro will be static, and not require javascript or Ajax.
- Content Filtering Macros: contentbylabel and blogposts have a new, SearchAPI v2 backend.
  - All existing parameters should continue to work
- **New, standard set of parameters** for various kinds of filtering
  - Content Filtering macros: new `{recently-changed}` macro, which is a reimplementation of `{recently-updated}`. All existing recently-updated params should work, with the addition of the new standard params listed above. Will eventually replace `{recently-updated}`.
  - Added an optional whitelist for the RSS macro and the HTML-include macro.

**Release Notes 2.10-m3 ("Milestone 3")**

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

This release is a milestone development release for 2.10 ("Two Ten"). This is a public development release (DR) leading up to Confluence 2.10. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

**Who should upgrade?**

⚠️ Please note the following
- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because development releases represent work in progress, we **cannot** provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

**Issues resolved or improved in this release**
TinyMCE 3 is in

This milestone contains the long-awaited TinyMCE 3 upgrade. It comes at a cost (we had to disable the emoticons, special characters, colour-pickers and fullscreen mode) to make it into M3, but they will be back in M4, and this gives us a much more stable Rich Text Editor two weeks earlier than expected. Please note: we have **not** yet started working on roundtripping bugs (e.g. stuff that breaks when switching from RTE to WikiMarkup and back). We will start attacking bugs those towards the end of the release cycle and during the 3.0 cycle. But the improvements in the RTE itself are extremely valuable already, including **support for safari**. If you encounter problems please don’t hesitate to ask or raise issues. We want to make this a really solid experience.

Oh, and the new RTE starts up much faster too! Kudos to the relentless work of the Writer-Team (especially David T and Agnes), who have been working for many hours over the past months to get us here.

**Quick Navigation**

- Matches titles as you type
- Shows 3 pages, 3 news items, 2 attachments, 3 people, 2 spaces. If no titles are matched the category isn’t shown.
- People’s profile photos are shown
- Use your keyboard to navigate
- Now with % more rounded corners
Clear Search

- Improved search result page and results
  - Lighter ‘Showing ...’ line
  - Better fit with a grid, softening of filter panel corners and better spacing
  - Emphasis of the titles
  - Clearer, simpler result format
  - Real profile pictures of real people
- Clear filter instead of clear search
- Search field at the bottom of the page
Small improvements

Per's first 20% project displays a lock-icon next to documents that have restricted access.

Notes on deploying to your test-instance

With the TinyMCE upgrade, we have renamed the TinyMCE plugin key to match the Confluence version. Hence, you may find that there are two TinyMCE plugins installed which can cause errors when editing (e.g. the pop-ups not working). If so, you will need to disable both and then re-enable the 2.10-m3 version of TinyMCE. This will be fixed for the final 2.10 release with an upgrade task to uninstall the old plugin.

Release Notes 2.10-m2 ("Milestone 2")
Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.10 ("Two Ten"). This is a public development release (DR) leading up to Confluence 2.10. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following
- Development releases are not safe — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

Issues resolved or improved in this release

“Did you mean?”

Dave Loeng’s auto-suggest feature is the first major 20%-project to make it into Confluence. Try it out by mistyping a search, and you will find a link suggesting more relevant searches. This is an actual example of me typing way too fast: 😄
Try misspelling someone’s difficult surname, like say, ‘fraggeman’.

**User management**

Confluence Hosted developer Jens Schumacher has been very busy hacking on Confluence again, this time he improved the user-management a lot - so much more convenient than before.

- Improved Search
- Adding and removing users when viewing a group
- New table styles
- Improved User Picker

<table>
<thead>
<tr>
<th>User</th>
<th>Full Name</th>
<th>E-Mail</th>
</tr>
</thead>
<tbody>
<tr>
<td>admin</td>
<td>A. D. Ministrator</td>
<td><a href="mailto:admin@example.com">admin@example.com</a></td>
</tr>
</tbody>
</table>
Avatar cropping and deletion

Another, smaller 20%-project also made it into this release: Charles Miller and Dmitry baranovskiy enabled Confluence to allow cropping of uploaded avatar-images, and while they were at it the highly desired "delete images you never intended to upload in the first place" issue got solved too in order to make another 23 voters happy.
Backend changes

The Engine Room team has implemented several important backend changes in this milestone:

- Integrated the first version of Plugins 2.0, including an initial migration the Confluence plugin repository to Plugins 2. An updated version of this plugin and a converted dynamictasklist are planned for the next milestone.
- Trusted authentication and other Seraph-based authentication methods are now available for calls to the Confluence RPC methods (CONF-8680). This makes it practical to write Confluence gadgets which use the remote API to retrieve data. Tom Davies is using this to implement his Crucible Confluence review plugin.

Release Notes 2.10-m1 ("Milestone 1")

Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.10 ("Two Ten"). **Issues resolved or improved in this release**

It's all about small improvements this time.

During the last weeks we have fixed a whole bunch of bugs, worked on major functionality, and done a lot of planning. Therefore the M1 is a rather small release - it contains the bugfixes, but no major work yet. We have developed a new feature and two great smaller improvements which are almost done, but didn't make it into this Milestone, so expect a lot more in M2 in two weeks.

But wait, there is one small new feature that might have a big impact on EAC. Jens Schumacher, developer on Confluence Hosted, has been working on a top secret mission, and his new feature means you now can store CSS per space and for the whole installation.

Inside Atlassian we now have a small competition going with developers competing for the nicest/coolest/weirdest CSS-based design to be delivered within the next two weeks.

The competition only started yesterday, but there are some funky screenshots available already 😎. Obviously Confluence still has areas that are completely hardwired and not styleable yet, but we are working on this as we go.
Release Notes 2.9-rc1 ("Release Candidate 1")

Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.9. This is a public development release (DR) leading up to Confluence 2.9. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

Who should upgrade?

Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

All development releases are available from Development Releases on the Atlassian website.

Issues resolved or improved in this release

We are now at the end of the 2.9 release cycle.

We have released our first release candidate RC1 today, you can see it on our public Confluence installation at http://confluence.atlassian.com. We are aware of one remaining major bug that we want to fix (JIRA-issues macro not working in preview mode), but apart from that and some minor fixes we will not change the code anymore.

While this is not the final release, and the official release notes will be unveiled next week, you should definitely have a look now if everything still works fine with your plugins, if you haven’t done so yet. We made some changes to the plugin subsystem and to the action class hierarchy (please refer to the other milestone release notes), and we are aware of some plugins (such as the Gliffy plugin) which had to get changed a bit to be compatible with 2.9.

The RC1 is functionally almost equivalent to M5/M6 which was announced in early July, but has a big amount of additional bugfixes, check out our roadmap in the JIRA project at http://jira.atlassian.com/browse/CONF?report=com.atlassian.jira.plugin.system.project:roadmap-panel for more details.

Known problems

Jira-issues macro does not work in preview mode.

Release Notes 2.9-m5 ("Milestone 5")

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.9. This is a public development release (DR) leading up to Confluence 2.9. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.
Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, our performance-testing and compatibility testing for databases and application servers is not done to the full extent. So, for example, a milestone release might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the [normal upgrade instructions](#) to upgrade from Confluence 2.8.x to this release. **We strongly recommend that you backup your confluence-home directory and database before upgrading!**

**Downloads**

All development releases are available from [Development Releases](#) on the Atlassian website.

**Issues resolved or improved in this release**

We are rapidly approaching the end of the 2.9 release cycle. There will be a really small M6 later this week, and then that's it, we are going into bugfix and compatibility-testing mode, so we can release on the 29th of July.

**Plugins**

We have done a significant amount of work in the area of plugin loading (and the plugin classloaders) to improve performance. There are no API changes, but it is very possible that these changes may expose bugs. While we tried to remain backwards compatible, it is **crucial** that you test for compatibility of your plugins.

**Editor**

The **preview** in the editor is now capable of rendering content exactly as it appears on the page. However, to do this, we have had to disable interaction with the preview. You will no longer be able to follow links or interact with the preview in any other way.

When **drafts are saved** automatically to the server, this will be shown to you at the top of the editor.

**Engine room**

Whisper the words "Action class hierarchy" anywhere close to a Confluence developer and he or she will cringe. Not anymore as of this Milestone. Plenty of inheritance trees have been cut, and miraculously Confluence still works. This will enable us to work faster and more efficiently in the future.

**Page tree and UI**

We had a few nasty UI bugs recently where plugin JavaScript code would interfere with our menus and other JavaScript code, and we had a few Pagetree bugs. The most important ones have been fixed in this release.

**Discovery Team**

Author auto-complete field added to the search result screen to allow filtering searches by contributor (author or editor).

The 'new search' (or reset search) link on the search screen filter left the building somewhere around milestone 3. This has now been re-instated.

A couple of 2.9 specific bug fixes are also included.
Known problems

Several small bugs, specifically around the new author-search.

**Release Notes 2.9-m3 (“Milestone 3”)**

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.9. This is a public development release (DR) leading up to Confluence 2.9. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, our performance-testing and compatibility testing for databases and application servers is not done to the full extent. So, for example, a milestone release might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade from Confluence 2.8.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**Issues resolved or improved in this release**

Milestone 3 is all about the UI: It features major parts of the new search UI, and we have added two more menu...
items to the "Browse" menu.

Some effort was spent on making the page tree more stable, and we have spent more time on internal code improvements (which did however not ship in this milestone)

Known problems

Several small bugs. And a slowdown of search performance by 50%, which will be addressed in a later milestone release.

Release Notes 2.9-m2 ("Milestone 2")

Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release. This release is a milestone development release for 2.9. This is a public development release (DR) leading up to Confluence 2.9. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we're up to.

Who should upgrade?
**Please note the following**

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too, and usually milestone releases even have been load- and performance-tested for a while.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Additionally, our performance-testing and compatibility testing for databases and application servers is not done to the full extent. So, for example, a milestone release might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the [normal upgrade instructions](#) to upgrade from Confluence 2.8.x to this release. *We strongly recommend that you backup your confluence-home directory and database before upgrading!*

**Downloads**

All development releases are available from [Development Releases](#) on the Atlassian website.

**Issues resolved or improved in this release**

Page Ordering: We have been improving the page-tree a bit, fitting in some work that was intended for Confluence 2.8 but didn't make it. The tree now has a “revert to alphabetical mode” button which will revert manually ordered nodes back to the original alphanumeric ordering. Additionally we added one small improvement which will help to battle spam: administrators will see two additional buttons on the page tree that enable easy deletion and preview of pages. We are not entirely sure yet whether (and how) these two buttons will ship, so don't raise improvement issues for those two buttons yet. (If they ship with 2.9, then we will put in some more polish of course)

Unfortunately there are a few known (uncritical) bugs related to the revert-to-alphabetic-mode in edge-cases, which will be addressed by M3.

Search: The Search has improved internally (the ranking should be a bit more relevant than before), and also what is being searched has changed: mail and personal spaces are searched by default, and using the space key in the search boosts hits within that space.

**Known problems**
Some small issues, mainly with the UI, but nothing serious.

**Release Notes 2.8-m9 (“Milestone 9”)**

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

Confluence 2.8-m9 is a milestone development release for 2.8. This is a public development release (DR) leading up to Confluence 2.8. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

**Who should upgrade?**

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Milestone releases may not have not been load- or stress-tested, or maybe they have but some performance problems still persist. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade from Confluence 2.7.x to this release. *We strongly recommend that you backup your confluence-home directory and database before upgrading!*

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**Issues resolved or improved in this release**

All functional changes are now complete. We are only fixing some remaining bugs now.

**Known problems**

- We found a major performance problem during our loadtests. Confluence works exactly like before under
low load, but once you go above a request per second you will notice a much load than acceptable. We will fix that for the final release.

- a few glitches when viewing with IE6&7, and when using the new page tree. Will be fixed for the final version

Outlook

We are in bugfix-mode now. While a few icons and CSS-styles will still change, the main priority is now to iron out all our bugs during the next one or two weeks.

Release Notes 2.8-m7 (“Milestone 7”)

* Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

Confluence 2.8-m7 is a milestone development release for 2.8. This is a public development release (DR) leading up to Confluence 2.8. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:

Milestone releases may not have not been load- or stress-tested, or maybe they have but some performance problems still persist. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade from Confluence 2.7.x to this release. *We strongly recommend that you backup your confluence-home directory and database before upgrading!*

Issues resolved or improved in this release

This page describes the changes you can expect from Confluence 2.8 Milestone 7. M7 is a "small" milestone that delivers some features that just didn't make it into M6, but which can't wait for M8 nor RCs either because we need your feedback as soon as possible!

End-user improvements

User Interface improvements:

- Matt Ryall's ShipIt project: improved comment threading, with dynamic collapsing

  Not to be too picky but why is "View Source" listed under the actions list. That list seems like very valuable real estate and could not the same results be gotten by using the bro

  The "View source" action actually pops up a window with the wiki-markup of the current page, as I think this is a brilliant idea, but perhaps a term other than "View source" would be less confusing

  I like "View Wiki Source". It's cleaner and won't take up extra

  Thanks for the suggestion, guys.

  Funnily enough, this feature has existed since Confluence 1.0, and always be notice.

  We'll definitely have a look at the naming based on this discussion. Putting it

- Edit page title change

  The title is not duplicated anymore, you simply edit the title directly

- Put PDF, Watch and Favourite icons on Tools menu

- Replace printable view with an improved print stylesheet for better printing directly from the page
- Improved editor caching
- Fixed editor layout bug in Safari
- Menus appear on hover
- Move command in Tools menu
Page Ordering:

- Included the page ordering tree into the edit-page, ironed out some bugs

Misc:

- Our student developer Chris Broadfoot added a few missing links into our user-management section, and incorporated a pretty slick way to change the size of the pagination window. Well done!

API changes

For plugins which configure Confluence's web interface, Condition implementations which depend on GlobalHelper are now deprecated, and should be converted to use the new WebInterfaceContext interface. The easiest way for most plugins to do this is to extend BaseConfluenceCondition rather than the now-deprecated AbstractConfluenceCondition. (Javadoc links to come once this is published.)

Known problems

- We found a severe performance problem during our loadtests. Confluence works exactly like before under low load, but once you go above a request per second you will notice a much higher load than
acceptable. We will fix that for the final release.

- Upgrade issue for clustered deployments. Don’t use this Milestone on a Cluster.
- A few glitches when viewing with IE6&7, and when using the new page tree in a browser without FireBug installed.

Outlook

We are in bugfix-mode now. While a few icons and CSS-styles will still change, the main priority is now to iron out all our bugs during the next two weeks.

Release Notes 2.8-m6 (“Milestone 6”)

Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

Confluence 2.8-m6 is a milestone development release for 2.8. This is a public development release (DR) leading up to Confluence 2.8. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

Who should upgrade?

Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Milestone releases have not been load- or stress-tested. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the normal upgrade instructions to upgrade from Confluence 2.7.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

Downloads

All development releases are available from Development Releases on the Atlassian website.
**Issues resolved or improved in this release**

Milestone 6 incorporates Milestone 5 changes (which were released but never publicly documented, sorry)

**Milestone 5 (the missed one)**

The user interface improvements include the most drastic changes to be done for Confluence 2.8. After adding a new Actions menu to the page, we have removed the unnecessary tab navigation. This completes our migration to a menu-based user interface. The content of the page is now the most important aspect of the page, as all the editing and modification features are now out of the way when reading a page. The UI has also been improved in other small ways in this milestone, and we have fixed many bugs with the printable view and the default themes.

Plugin components that expect to be injected with the old, deprecated CacheManager interface will now work again. This means plugins such as the JIRA issues macro will be useable once more. Plugins that use the ContainerManager.getComponent method of obtaining the cache manager will continue to malfunction; there is no plan to support this usage. More commentary about this at CONF-10602.

The Page Ordering feature mostly contains bug fixes. The majority of changes are done in the back end as we prepare to remove extJS library and substitute the page tree widget with a custom component.

**Milestone 6 (the current one)**

User Interface improvements:

- performance improvements through better clientside-caching on the edit-page
- user menu has been included. The only thing missing to wrap up the UI changes is to move the remaining icon-buttons (PDF, watch pages, etc) to menu items as well. This will be delivered in two weeks.
- New and improved Tree component, that lets you drag more comfortably than before
- Added the ability to cancel a page move by pressing 'esc' after the user starts dragging a page
- Added automatic scrolling functionality. If a user drags a page to the top/bottom of the screen in an attempt to reach a page that is currently outside of the screen, it will automatically scroll up/down.
- Known problem: No indication of subnodes being loaded
- bugfixes

Technical improvements and API changes

- JMX has been added to the list of Confluence capabilities for improved monitoring
- Raising a support case is now possible directly from the admin console. This will attach logs and other relevent system information automatically.
- JQuery now default JS library. We have removed ExtJS as a Javascript-dependency, and will standardize on JQuery in all of Confluence
- Coherence cache lease duration has been set at 10 minutes to support system recovery when threads do not release their leases properly. A warning message will be logged detailing that a lease has timed out to help with tracking down errant lease management.

**Known problems**

- We found a severe performance problem during our loadtests. Confluence works exactly like before under low load, but once you go above a request per second you will notice a much higher load than acceptable. We will fix that for the final release.
- Upgrade issue for clustered deployments. Don't use this Milestone on a Cluster.
- a few glitches when viewing with IE6&7

**Release Notes 2.8-m4 ("Milestone 4")**

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use [the latest official release](#).
Confluence 2.8-m4 is a milestone development release for 2.8. This is a public development release (DR) leading up to Confluence 2.8. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we're up to.

Who should upgrade?

⚠️ Please note the following

- **Development releases are not safe** — Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we **cannot** provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Milestone releases have not been load- or stress-tested. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the [normal upgrade instructions](http://confluence.atlassian.com/display/DEVCON/Getting+Started) to upgrade from Confluence 2.7.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

**Downloads**

All development releases are available from [Development Releases](http://confluence.atlassian.com/display/DEVCON/Development+Releases) on the Atlassian website.

**Issues resolved or improved in this release**

This release mainly fixes bugs and glitches of the previous milestone, and extends the functionality slightly. You will notice that a new dropdown-menu has been added which allows you to access the browse-space actions easier, and that most macros now honor the new page ordering that can be set in recently added page-reorder-component.

We had forgotten to release the source code of the previous milestones, this has been taken care of now, thanks Alain from Adaptavist for pointing this out! 😊

The coolest improvement however is that we are able to deliver the first Shipt 7 project in this milestone - less than two weeks since the actual event! (see [http://blogs.atlassian.com/developer/2007/09/atlassian_ShipIt_day_vi.html](http://blogs.atlassian.com/developer/2007/09/atlassian_ShipIt_day_vi.html) for an overview of Shipt 6 last year). Use the new drop-down menu to "Browse Labels", select one of the most popular ones, and you will now be able to filter by multiple labels - just increase or decrease the
number of labels by using the plus- and minus-signs next to the related labels. Admittedly the UI still needs some finishing touches, but it works fine already and it will make 21 voters happy once released officially (http://jira.atlassian.com/browse/CONF-4577). More ShipIt-projects can be expected to make it into M5 and M6.

You can view the complete list of fixes and newly implemented features in JIRA. They contain all the issues resolved during development of 2.8, not just the ones fixed since the previous milestone.

**Known problems**

There are still a few known bugs in this release, most noticeably the broken printable view (CONF-10583) which will be fixed soon. Please continue reporting problems through JIRA, your feedback has been very helpful and a lot of it has been incorporated already.

The CacheManager API has changed in milestone 4, and all plugins that use the old CacheManager interface will be broken (CONF-10602). In milestone 5, Confluence has a workaround for plugins that get the cacheManager injected. That is, the following code will work correctly in 2.8-m5 (but is currently broken in 2.8-m4):

```java
import com.atlassian.user.impl.cache.CacheManager;

public class MyClass {
    private CacheManager cacheManager;

    public void setCacheManager(CacheManager cacheManager) {
        this.cacheManager = cacheManager;
    }
}
```

Plugins that access the CacheManager not via dependency injection, but statically through the ContainerManager will fail at runtime with a ClassCastException. These plugins should be rewritten to use dependency injection, or use the new com.atlassian.cache.CacheManager interface. The following code is broken in 2.8-m4, and will continue to be broken for the final release of 2.8:

```java
CacheManager cacheManager = (CacheManager) ContainerManager.getComponent("cacheManager");
```

Plugins that wish to avoid using the deprecated CacheManager interface should change to use com.atlassian.cache.CacheManager.

**Release Notes 2.8-m3 (“Milestone 3”)**

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

Confluence 2.8-m3 is a milestone development release for 2.8. This is a public development release (DR) leading up to Confluence 2.8. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

**Who should upgrade?**
Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we **cannot** provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

**Upgrade Procedure**

Follow the [normal upgrade instructions](#) to upgrade from Confluence 2.7.x to this release. **We strongly recommend that you backup your confluence-home directory and database before upgrading!**

**Downloads**

All development releases are available from [Development Releases](#) on the Atlassian website.

**Issues resolved or improved in this release**

- First draft of UI improvements: We are working hard on moving the HTML and CSS delivered by Confluence towards standards-compliance and accessibility. We are at the same time reworking our UI structure. We feel that the UI has been growing a bit too organically over the past years, resulting in somewhat confusing navigation like the "remove page"-button only available when you are editing a page, for example. We have implemented an initial dropdown-menu for adding content, thus already cleaning up the UI a bit. All the navigation-changes we make are targetted at the default theme, however some HTML&CSS changes may also affect the other themes.
  
  In the future our changes will enable plugin-developers to hook into Confluence easier than before, and skinning Confluence will be considerably easier. However, plugin-developers should be aware of the changes we are making, and check (by examining this Milestone release) whether they have to schedule some maintenance work for their plugins. More changes will be made, so don't rush it - but plan for it.

- First draft of Page Reordering. We are working on implementing a highly anticipated feature that will dramatically improve the quality of content generated from a Confluence space. So far the PDF files you generate from Confluence have been alphabetically ordered - which for example makes even the Confluence User Manual quite awkward to read. With the new page ordering feature it will be able to structure your Wiki exactly as you like - or of course leave it in alphabetic mode if you prefer that. Our goal is to deliver a really useful solution, and this Milestone only shows you the first 50% of the feature.
  
  We are currently busy implementing all the feedback and bug-reports we get from Sarah (our documentation queen) and the next Milestone releases will deliver further improvements and bugfixes.
You can view the complete list of fixes and newly implemented features in JIRA. They contain all the issues resolved during development of 2.8, not just the ones fixed since the previous milestone.

**Known problems**

No major known problems, but plenty of smaller to medium sized bugs, mainly related to page reordering. They will get tackled in M4.

**Release Notes 2.8-m2 ("Milestone 2")**

Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

Confluence 2.8-m2 is a milestone development release for 2.8. This is a public development release (DR) leading up to Confluence 2.8. Development releases are a snapshot of our work in progress, allowing our customers and especially plugin-developers to see what we’re up to.

**Who should upgrade?**

Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Milestone releases have not been load- or stress-tested. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade from Confluence 2.7.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**Issues resolved in this release**

- Velocity template engine upgrade
Confluence’s velocity template engine has been upgraded from 1.3 to 1.5. This shouldn't mean too much to end users however there could be some compatibility problems with existing themes and plugins. Check this upgrade guide that we use internally as well: http://confluence.atlassian.com/display/DOC/Migrating+to+Velocity+1.5

- File upload component upgrade

Pell multipart has been replaced with the Jakarta Commons Fileupload component to handle web browser file uploads. Again this won’t have much impact on the Confluence experience but could cause some odd problems when attaching files to Confluence.

- PDF space export

There has been some optimizations made the space PDF export which should result in less server memory usage during export

- New GZIP compression filter

Confluence team have integrated a new GZIP compression filter to achieve more efficient downloads and page views. This is not currently enabled by default, so to test this with your plugin you need to turn it on in the management console. We are using it internally at Atlassian, and the performance improvement while browsing pages is quite substantial.

You can view the complete list of fixes and newly implemented features in JIRA. They contain all the issues resolved during development of 2.8, not just the ones fixed since the previous milestone.

**Known problems**

There are a few cosmetic UI problems related to space logos and to the login screen, none of them impact productivity. Notification mails are empty because of a Velocity macro bug.

**Release Notes 2.7-rc1 ("Release Candidate 1")**

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

Confluence 2.7-rc1 is a release candidate for 2.7. This is a public development release (DR) leading up to Confluence 2.7. Development releases are a snapshot of our work in progress, allowing our customers to see what we're up to.

**Who should upgrade?**

⚠️ Please note the following

- Development releases are not safe— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestones and release candidates aim to provide plugin developers with an opportunity to see the latest
changes in the code.

Each milestone/release candidate has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones and release candidates re timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bug fixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Milestone releases and release candidates have not been load- or stress-tested. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade from Confluence 2.6.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**Issues resolved in this release**

View the list of fixes and newly implemented features in JIRA. They contain all the issues resolved during development of this release, not just the ones fixed since the previous milestone.

**Known problems**

None.

You should really download this Release Candidate and check if your plugin works with it. If not, use the last few days before the official 2.7.0 release to fix it 😊

**Release Notes 2.7-m5 ("Milestone 5")**

⚠️ Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

Confluence 2.7-m5 is a milestone development release for 2.7. This is a public development release (DR) leading up to Confluence 2.7. Development releases are a snapshot of our work in progress, allowing our customers to see what we're up to.

**Who should upgrade?**
Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Milestone releases have not been load- or stress-tested. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

**Upgrade Procedure**

Follow the [normal upgrade instructions](http://confluence.atlassian.com/display/CONFNET/Upgrade+Instructions) to upgrade from Confluence 2.6.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

**Downloads**

All development releases are available from [Development Releases](http://confluence.atlassian.com/display/CONFNET/Development+Releases) on the Atlassian website.

**Issues resolved in this release**

View the list of fixes and newly implemented features in [JIRA](http://jira.atlassian.com/). They contain all the issues resolved during development of 2.7, not just the ones fixed since the previous milestone.

**Known problems**

For some reason, an outdated version of the new Dynamic Tasklist 2 was included in this milestone. Since Milestones are not real customer releases, we do ship them with bugs like this. If you want to see the latest and greatest Dynamic Tasklist 2 in action, please simply upgrade to the latest version using the plugin repository from the administration console.

Also, there is an annoying (2.7-specific) bug in this release that causes warnings for all colours used by the colour-macro: [http://jira.atlassian.com/browse/CONF-10001/](http://jira.atlassian.com/browse/CONF-10001/). It will be resolved by the time the next milestone gets released.

Apart from that, M5 is a nice Milestone release and definitely worth a look for all plugin developers - especially now that we are getting closer and closer to the end of the release cycle, and fewer and fewer major architectural changes will be made.

**Release Notes 2.7-m4 (“Milestone 4”)**
Do not use this release to upgrade your production systems.

For all production use and testing of Confluence, please use the latest official release.

Confluence 2.7-m4 is the second milestone development release for 2.7. (Milestone 3 has been skipped because of stability concerns.) This is a public development release (DR) leading up to Confluence 2.7. Development releases are a snapshot of our work in progress, allowing our customers to see what we’re up to.

Who should upgrade?

Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Our milestone releases aim to provide plugin developers with an opportunity to see the latest changes in the code.

Each milestone release has passed all our automatic tests, and has been used for one week on our official internal Confluence server. Most of the issues solved have been reviewed too.

However, since our milestones releases are timeboxed (i.e. they get released every two weeks, no matter how far we have come implementing features and bugfixes), there is always a chance that we have new known bugs, which are scheduled to be fixed in the next milestone, or completely new bugs unknown even to us.

Milestone releases have not been load- or stress-tested. So, for example, they might behave well on a small installation but show severe problems when subjected to many users.

Upgrade Procedure

Follow the [normal upgrade instructions](#) to upgrade from Confluence 2.6.x to this release. *We strongly recommend that you backup your confluence-home directory and database before upgrading!*

All development releases are available from Development Releases on the Atlassian website.

**Bugs fixed in this release**

View the list of fixes in JIRA.

**Release Notes 2.6-dr1**

Confluence 2.6-dr1 is a public development release leading up to Confluence 2.6. Development releases are a snapshot of our work in progress, allowing our customers to see what we're up to.

**Who should upgrade?**
Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

This development release is being made available specifically for Confluence plugin developers to test their existing plugins against the significant style changes that have been made.

For all production use and testing of Confluence, please use the latest official release.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade from Confluence 2.5.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**Note about themes**

Confluence 2.5.x themes are expected to be compatible with 2.6 without authors needing to make any change to their existing themes. This is possible because Confluence will, by default, include all Confluence 2.5.x specific styles automatically.

However, if you would like to upgrade your theme to use the latest style and typography changes in Confluence 2.6, you will need to update the way you include stylesheets in your theme. Full instructions on how to do so can be found here.

**Including Cascading Stylesheets in Themes for Confluence 2.6**

Firstly, you will need to disable the inclusion of Confluence 2.5.x styles. These were included by default to allow 2.5.x themes to remain compatible in Confluence version 2.6 and after.

To disable 2.5.x styles, add the following to your theme's `atlassian-plugin.xml`:

```xml
...<theme key="aqua" i18n-name-key="com.atlassian.confluence.themes.aqua.name" name="Aqua Theme" class="com.atlassian.confluence.themes.BasicTheme">
  <description key="com.atlassian.confluence.themes.aqua.desc"/>
  ...<param name="includeClassicStyles" value="false"/>
  ...
</theme>
...```

Note the flag `includeClassicStyles` is set to `false`. You will have to set this explicitly as the default is `true`.
Secondly, you will need to declare your custom theme style sheet in `atlassian-plugin.xml` like this:

```
...<theme key="aqua" i18n-name-key="com.atlassian.confluence.themes.aqua.name" name="Aqua Theme" class="com.atlassian.confluence.themes.BasicTheme">
  <description key="com.atlassian.confluence.themes.aqua.desc"/>
  ...
  <resource type="stylesheet" name="my.css" location="styles/my-css.vm"/>
  ...
</theme>
...
```

**Differences from Confluence 2.5.x**

- You no longer have to include your theme stylesheet in the main decorator using `#pluginStylesheet` anymore. Confluence will load your theme's stylesheet automatically provided that it's the active theme.
- The resource is declared in the `theme` module instead of the `layout` module.
- You need to start your custom style sheet (say `my-css.vm`), by copying over the latest styles from `http://yourhost/contextPath/styles/main-action.css`. This step is necessary as Confluence now includes either your theme stylesheet or the default stylesheet, **not both**. This implies:
  - you can no longer rely on the default styles being there to style parts of the Confluence you are not directly theming
  - you are no longer overriding styles with your plugin style sheet. It is now the primary stylesheet
  - you will need to merge any new styles in later versions of Confluence into your theme's style sheet

**Multiple style sheets**

It is possible to configure your theme to use multiple style sheets. This feature may useful if you want to break up your main style sheet into a few smaller style sheets with more defined purposes. You can declare these like so:

```
...<theme key="aqua" i18n-name-key="com.atlassian.confluence.themes.aqua.name" name="Aqua Theme" class="com.atlassian.confluence.themes.BasicTheme">
  <description key="com.atlassian.confluence.themes.aqua.desc"/>
  ...
  <resource type="stylesheet" name="my1.css" location="styles/my-css1.vm"/>
  <resource type="stylesheet" name="my2.css" location="styles/my-css2.vm"/>
  <resource type="stylesheet" name="my3.css" location="styles/my-css3.vm"/>
  ...
</theme>
...
```

These style sheets will be included in the order in which they are declared.

**Release Notes 2.3-DR2**

Confluence 2.3-DR2 is the second public development release leading up to Confluence 2.3. Development releases are a snapshot of our work in progress, allowing our customers to see what we're up to.

**Who should upgrade?**
Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual full release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

This development release is being made available specifically for Confluence plugin developers. The changes to the Confluence API discussed below mean that many plugins will need to be updated to work with Confluence 2.3.

For all production use and testing of Confluence, please use the latest official release.

This release should not be used for testing a clustered deployment; the clustering user interface is not yet complete.

**Upgrade Procedure**

Follow the normal upgrade instructions to upgrade from Confluence 2.2.x to this release. We strongly recommend that you backup your confluence-home directory and database before upgrading!

If you are upgrading from Confluence 2.1.x or earlier, be sure to read the upgrade instructions in the Confluence 2.2 release notes.

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**Things to look out for**

- The Tangosol Coherence jars included in this DR are now fully licensed.
- The API for retrieving historical versions of content has changed.

**Architecture changes between Confluence 2.3-DR1 and 2.3-DR2**

**Content history API changed**

The getPreviousVersions method of ContentEntityObject has been removed, because it was insanely inefficient as soon as a piece of content started having lots of versions. It has been replaced with the following methods on the ContentEntityManager:
Confluence 4.3 Documentation

ContentEntityObject getPreviousVersion(ContentEntityObject ceo);
ContentEntityObject getNextVersion(ContentEntityObject ceo);
ContentEntityObject getOtherVersion(ContentEntityObject ceo, int version);

/**
 * Get a VersionHistorySummary for all previous versions of a
 * ContentEntityObject, starting with the current
 * @param ceo the entity object to return the version history of
 * @return the full version history of that object, as VersionHistorySummary
 * objects.
 */
List getVersionHistorySummaries(ContentEntityObject ceo);

The VersionHistorySummary class defines a limited set of Content data that is relevant to viewing version histories.

Release Notes 2.3-DR1

Confluence 2.3-DR1 is the first public development release leading up to Confluence 2.3. Development releases are a snapshot of our work in progress, allowing our customers to see what we’re up to.

⚠️ Please note the following

- **Development releases are not safe**— Development releases are snapshots of the ongoing Confluence development process. For that reason:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path** — Because development releases represent work in progress, we cannot provide a supported upgrade path between development releases, or from any development release to the eventual final release. Thus, it is possible that you will not be able to migrate any data you store in a Confluence development release to a future Confluence release.

Who should upgrade?

This development release is being made available specifically for Confluence plugin developers. The changes to the Confluence API discussed below mean that many plugins will need to be updated to work with Confluence 2.3.

For all production use and testing of Confluence, please use the latest official release.

⚠️ The bundled Tangosol library with this development release has a license which expires on August 31, 2006. This release will not operate after that date.

This release should not be used for testing a clustered deployment; the clustering user interface is not yet complete.

Upgrade Procedure

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Follow the [normal upgrade instructions](#) to upgrade from Confluence 2.2.x to this release. *We strongly recommend that you backup your confluence-home directory and database before upgrading!*

If you are upgrading from Confluence 2.1.x or earlier, be sure to read the upgrade instructions in the [Confluence 2.2 release notes](#).

**Downloads**

All development releases are available from [Development Releases](#) on the Atlassian website.

**New features in Confluence 2.3**

In short, the new features of Confluence 2.3 are:

- Clustering support (not available in 2.3-DR1)
- People directory
- Bundled [Plugin Repository Client](#)

**Architecture changes between Confluence 2.2 and 2.3-DR1**

Summarised below are architectural changes that might be relevant to plugin developers. Please add a comment below if there is anything else that should be listed here.

*We've kicked the Bucket!*

Most of the functionality of Confluence’s biggest internal library, bucket, has been split into three new components: atlassian-config, atlassian-spring and atlassian-event.

Where practical, the old interface is still available as deprecated classes and methods. **However, some plugins will not compile unless modified to use the new package names.**

Please refer to the source code or [Javadoc](#) for details on the new interface.

**Tangosol Coherence replaces EhCache**

Tangosol Coherence is now the caching library used by Confluence, both in clustered and non-clustered mode. To facilitate this, some of the caching APIs have been updated.

As mentioned above, the Tangosol license included with this release is specifically for testing purposes and will expire on August 31, 2006.

**Bandana configuration stored in database**

The Bandana Confluence configuration files previously stored in confluence-home are now stored in the database. An upgrade from a previous version will automatically move existing configuration settings to the database.

**Release Notes 2.0-RC2**

Confluence 2.0-RC2 is the second release candidate for Confluence 2.0 (previously known as Confluence 1.5). It resolves almost 80 issues since the 1.5-RC1 release.

**Who should upgrade?**

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features. Developer releases are not suitable for running on production systems.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.
Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.3.x or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.

Important Notice

If, after you have upgraded Confluence, the "Recent Changes" list on the dashboard is empty, this may be because you need to re-build your site's search index. You can do this under Administration  Content Indexing  Rebuild Search Index

Important Notice 2

If, after you have upgraded Confluence and you find the page breadcrumbs do not show the page's parents correctly, log into your site as administrator, then visit http://yoursite.example.com/admin/permissions/rebuild_ancestor_table.action (substituting your own site's URL, obviously) to rebuild the ancestor table (this will be fixed for the final release.

Downloads

All development releases are available from Development Releases on the Atlassian website.

New Features in Confluence 2.0-RC2

The 2.0-RC2 has largely concentrated on fixing bugs and polishing existing features. If you are upgrading from Confluence 1.4 or earlier, you should read the 1.5-DR2 Release Notes for a description of the major new features in Confluence 2.0.

Consult JIRA for the full list of issues resolved for 2.0-RC2.

Error rendering macro 'jiraissues' : Unable to determine if sort should be enabled.

Release Notes 2.0-RC1

Confluence 2.0-RC1 is the first release candidate for Confluence 2.0 (previously known as Confluence 1.5). It resolves almost 150 issues since the 1.5-RC2 release.

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features. Developer releases are not suitable for running on production systems.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.3.x or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.
1.4 release notes.

**Important Notice**

If, after you have upgraded Confluence, the "Recent Changes" list on the dashboard is empty, this may be because you need to re-build your site's search index. You can do this under Administration Content Indexing Rebuild Search Index.

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**New Features in Confluence 2.0-RC1**

The 2.0-RC1 has largely concentrated on fixing bugs and polishing existing features. If you are upgrading from Confluence 1.4 or earlier, you should read the 1.5-DR2 Release Notes for a description of the major new features in Confluence 2.0.

Consult JIRA for the full list of issues resolved for 2.0-RC1.

**Notable Features and Improvements**

- You can now place markup such as bold or italics within a word if you are using the WYSIWYG editor
- The following characters are now permitted in page titles: ! & ( ) * ~ $ _ Pages can not, however, start with ~ or $.
- The most recent change comment for a page is now included in the page's searchable text
- rel="nofollow" added to links to printable versions of pages, to prevent them from being indexed by search engines
- The Recent Changes list on the dashboard now correctly reflects whether you are viewing all spaces, a team, or your favourite spaces
- Further improvements to the edit page UI including:
  - Improved label editing
  - Inline page previewing
  - Hiding of lesser-used functions such as moving a page or editing page permissions
- Attachment downloads now support HTTP conditional get
- Space exports now include that space's labels and page-level properties
- Support for labels in the SOAP and XML-RPC remote APIs has been completed
- Determining if a user exists via the remote API is now supported

**Release Notes 1.5-DR2**

Confluence 1.5-DR2 is the first public development release leading up to Confluence 1.5. (Confluence 1.5-DR1 was an internal release only). Developer releases are a snapshot of our work in progress, allowing our customers to see what we're up to, and provide feedback

**Who should upgrade?**

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features. Developer releases are not suitable for running on production systems.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.
Macro Compatibility

Incompatibilities exist that may cause Confluence not to start if custom macros are deployed. When upgrading to Confluence 1.5-DR2, be sure to remove any custom Macro plugins from your $confluencehome/plugins and WEB-INF/lib directories. These incompatibilities should be resolved before the final, stable release.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.3.x or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.

Downloads

All development releases are available from Development Releases on the Atlassian website.

New Features in Confluence 1.5-DR2

We've been pretty busy, but the four major new features you can find in 1.5-DR2 are:

- WYSIWYG Editing
- Labels for content
- A dynamic RSS Builder
- Change summaries

Consult JIRA for the full list of issues resolved for 1.5-DR2. 1.5-DR2 also incorporates all the bug-fixes that were made between TestTest.

WYSIWYG Editing

Browser Compatibility

The Confluence WYSIWYG editor is currently only compatible with Internet Explorer 6 on Windows, plus Mozilla and Firefox across platforms. Javascript must be enabled in the browser for the editor to function. Support for Safari under Mac OS X is currently not available. To track Safari compatibility, please follow this JIRA issue: CONF-3864

The WYSIWYG editor allows for Confluence pages to be edited directly through an editing GUI embedded in the web browser, without having to remember Confluence's wiki markup. It almost goes without saying that this has been our number one most requested features, and we're glad we can finally offer it!

Global administrators can enable WYSIWYG editing in the General Configuration screen of the site's preferences. They can also choose whether users are presented with the WYSIWYG editor by default, or whether users default to the old wiki markup text-field.
If WYSIWYG markup is enabled, but an individual user does not like the default set by the administrator, they are free to override it via a "make this my default" link that will appear on whichever editor is currently not your default.

For the “feature mad” amongst us, here are some neat things you can do with the WYSIWYG editor:

- Full screen view - really useful for editing large pages. Click in the menu bar.
- Quickly switch between WYSIWYG and Wiki markup without a page refresh
- Change the size of your editing window to suit your browser. Your size preference is remembered across sessions. To change it, drag the handle in the bottom right hand corner of the editor.
- Undo and redo!

**Labels for content**

Another highly requested feature was the ability to categorise content within Confluence beyond the rigid hierarchy allowed by spaces and parent-child relationships between pages. To this end we have introduced labels.

Labels are simple one-word ‘tags’ that can be added to any page or blog-post the user has permission to edit. Labels can be used to categorise content, bookmark it, flag it for attention, or anything else you can think of.

A Tag By Any Other Name

Picking a name for labels wasn't easy. Google's GMail service calls them labels, while other collaborative categorisation systems such as del.icio.us and Flickr call them tags. We decided that 'label' was a more natural description. For more information about the philosophy behind labels and tags, check out the Folksonomy page on Wikipedia

Labels can be added to any page from the edit screen, as a space-separated list of words. If you are browsing the site with a modern, Javascript-enabled browser, you’ll also be able to use the dynamic web UI to add labels while viewing the page through an interactive interface.

Once a page is labeled, then clicking on the label's name allows you to browse other pages with the same label, or view related labels that commonly occur on the same pages.

You can also view the space's most popular labels from the space browser, to get an idea of the most popular topics within the space.
Many other Confluence features interact with labels: they can be searched for through the search interface, the new RSS builder can filter pages by their label, and we’re looking forward to building label support into Confluence's packaged macros, and even the dashboard.

**Personal Labels**

If you prepend `my:` to a label (for example, `my:todo` or `my:favourite`), then the label is a personal label – only visible to you. Personal labels allow you to tag content for your own purposes. You can browse your personal labels from your user profile. Any user can add their personal labels to any page, even when they don't have editing permission.

---

**Personal Label Privacy**

It is possible in Confluence 1.5-DR2 to see other people's personal labels in various views through the system. This is a known issue and in the final release, personal labels will be private to the user. (sharing personal labels at the user's discretion is also planned for the future)

---

**Favourites**

Favourites are a special personal label: `my:favourite` or `my:favorite`. Whenever you see the ![heart](heart.png) icon, it means you can label this content as being your favourite, and whenever you see the ![check](check.png) icon, it means that the content is currently in your list of favourites. You can view your favourites from the Labels tab of your user profile, but they come in handy for...

---

**Labels and the Dashboard**

Labels can be used on the Dashboard to create different views of the Confluence site. The list of spaces now offers the following tabs:

- **My** shows you spaces that you have labelled as a Favourite. You can label any space you see on the dashboard by clicking its ![heart](heart.png) icon.
- **Team** allows space admins to dynamically create lists of spaces on particular topics (see below. This tab only appears if there are teams that the user can see)
- **New** shows any spaces that have been created in the last week (This tab only appears if there are new spaces)
- **All** shows all the spaces in the Confluence site
A "team" is a group of spaces that share a common team label. Spaces can be labeled from the Advanced tab of Browse Space.

As of Confluence 1.5-DR2, anyone can add space-level labels. This will be fixed in the final release.

The Recent Changes list on the dashboard will show only content that has been changed in the spaces that are currently listed in the space view. So if you are currently viewing the 'My' tab, only updates in your favourite spaces will be shown on the dashboard.

If you are logged in, Confluence will remember your most recently selected tab and team on the dashboard.

Dynamic RSS Builder

A third highly-requested feature. Confluence has always provided a brace of useful RSS feeds, but the problem is that for every feed we provided, users wanted half a dozen more. The obvious answer is to let users build RSS feeds based on their own chosen criteria. You can access the RSS builder from the Confluence dashboard.

Once in the builder, you can choose
- Which spaces to include in the feed
- Which types of content should be tracked
- Which labels, if any, you are interested in
- How many items to include in the feed
- Whether you want a single RSS entry per page or one for each time the page is edited
- Whether you want an RSS 2.0 or Atom 0.3 feed
- Whether Confluence should require authentication to view the feed

Once you have decided what you want, Confluence will give you a URL to paste into your RSS reader. These URLs can be shared with other Confluence users, although they will only ever be allowed to see content that they have permission to view. If you have asked to authenticate, Confluence will require HTTP Basic Authentication, which is supported by most RSS readers.

We've also taken the opportunity to improve the presentation of our RSS feeds - including a lot more information in each feed so you can follow your Confluence site entirely from your newsreader.
Change summaries

In a very late addition (added during our recent FedEx Day 2), Confluence now has change summaries. These allow you to add a comment to each edit that will appear in change histories, allowing you to keep a more complete record of how and why a particular page has been modified.

There is also a `{change-history}` macro to enable you to display a page's history within its body if you so desire.

Other Things to Check Out

Embed Flash and Movies

You can now embed Flash content or movies (Quicktime or Windows Media) into a page as easily as you can an image: just attach the Flash or movie file to the page, then include it as you would include an image (`!filename.mov!`).

Export Pages as Word Documents

You can now export pages straight into Word from the Info tab. This is extremely useful for emailing around content to non-Confluence users, printing a document or just creating a backup in Word.

Improved Search Interface

Results returned from Confluence's search engine now have:

- Improved contextual results, showing the most important text around where your query was matched in the page
- Contextual results for any attachment: see where a search was matched even inside PDF, Word, PowerPoint or Excel documents!
- Search results for attachments give you more (and clearer) information about what the attachment is, and where it's from!

Improved Gallery Macro

The gallery macro has been spruced up, and now has a slideshow view:
Alphabetically organised labels for a given space.

Popular labels for a given space.

A very basic (quite boring - sorry, it's late) example of change summaries.

The new RSS builder lets you construct RSS feeds of exactly the content you want.

These release notes exported to Word (even on a Mac!) - great for printing too.

Improved search showing fragments from attachments, file sizes and types.

Spaces:
- A start
- Alphabetic
- Popular
- View
- #1a
- #1b
- #1c
- #2a
- #2b
- #2c

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Screenshot of the new 1.5 WYSIWYG editor.

Also:

- Additions to the Confluence Remote API including:
  - Comment manipulation
  - Label manipulation
  - Attachment uploading and editing
  - Improved user- and permissions management
- Import and restore now have progress indicators
- Backup and restore use significantly less memory
- The embedded database has been upgraded to HSQL 1.8, which should be significantly more reliable
- Collapsed breadcrumbs now expand with a single mouse click

Known Bugs

Confluence 1.5-DR2 is a preview, not a full Confluence release, and as such there are a number of known bugs included in the release (at no extra cost!). Important bugs include:

- The left-navigation theme is currently broken
- The "make this my default editor" link does not always appear (try switching back and forth between views)
- The Info page may cause a Hibernate exception when its parent has page level permissions
- The space export may be unreliable, and does not properly back up labels.
- Incoming Trackback pings are not recognised
- Various WYSIWYG round-trip inconsistencies

Release Notes 1.5-DR1

Confluence 1.5-DR1 is the first development release leading up to Confluence 1.5. Developer releases are a snapshot of our work in progress, allowing our customers to see what we're up to, and provide feedback.

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features. Developer releases are not suitable for running on production systems.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

⚠️ DB2 Compatibility

At the time of release, there were a number of issues performing database queries for labels or RSS feeds against DB2 databases. These issues will be fixed for the next release. For now, though, we do not recommend testing this release on DB2.
Macro Compatibility

Incompatibilities exist that may cause Confluence not to start if custom macros are deployed. When upgrading to Confluence 1.5-DR1, be sure to remove any custom Macro plugins from your `$confluencehome/plugins` and `WEB-INF/lib` directories. These incompatibilities will be resolved before the final, stable release.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.4 or higher, you can find instructions here. We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

If you are upgrading from Confluence 1.4.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.4 release notes.

Downloads

All development releases are available from Development Releases on the Atlassian website.

New Features in Confluence 1.5-DR1

The three major features we've been working on are:

- **WYSIWYG Editing**
- **Labels** for content
- **A dynamic RSS Builder**

Consult JIRA for the full list of issues resolved for 1.5-DR1

1.5-DR1 also incorporates all the bug-fixes that were made between Confluence 1.4 and Confluence 1.4.3.

WYSIWYG Editing

⚠️ Browser Compatibility

The Confluence WYSIWYG editor is currently only compatible with Internet Explorer 6 on Windows, plus Mozilla and Firefox across platforms. Javascript must be enabled in the browser for the editor to function. Support for Safari under Mac OS X is currently not available. To track Safari compatibility, please follow this JIRA issue: [CONF-3864](https://jira.atlassian.com/browse/CONF-3864)

The WYSIWYG editor allows for Confluence pages to be edited directly through an editing GUI embedded in the web browser, without having to remember Confluence's wiki markup. It almost goes without saying that this has been our number one most requested features, and we're glad we can finally offer it!
Global administrators can enable WYSIWYG editing in the General Configuration screen of the site's preferences. They can also choose whether users are presented with the WYSIWYG editor by default, or whether users default to the old wiki markup text-field. If WYSIWYG markup is enabled, but an individual user does not like the default set by the administrator, they are free to override it in their preferences.

Labels for content

Another highly requested feature was the ability to categorise content within Confluence, beyond the rigid heirarchy allowed by spaces and parent-child relationships between pages. To this end we have introduced labels. Labels are simple one-word 'tags' that can be added to any page or blog-post that the user has permission to edit. Labels can be used to categorise content, bookmark it, flag it for attention, or anything else you can think of.

### A Tag By Any Other Name

Picking a name for labels wasn't easy. Google's GMail service calls them labels, while other collaborative categorisation systems such as del.icio.us and Flickr call them tags. We decided that 'label' was a more natural description. For more information about the philosophy behind labels and tags, check out the Folksonomy page on Wikipedia.

Labels can be added to any page from the edit screen, as a space-separated list of words. If you are browsing the site with a modern, Javascript-enabled browser, you'll also be able to use the dynamic web UI to add labels directly from the page itself. Once a page is labeled, then clicking on the label will enable you to browse other pages that have been similarly tagged, or browse other labels that commonly occur on the same page. You can also view the space's 200 most popular labels from the space browser, to get an idea of the most popular concerns within the space. Many other Confluence features interact with labels: they can be searched for through the search interface, the new RSS builder can filter pages by their label, and we're looking forward to building label support into Confluence's packaged macros, and even the dashboard.

### Personal Labels

If you prepend my: to a label (for example, my:todo or my:favourite, then the label is a personal label – only visible to you. Personal labels allow you to discreetly tag content for your own purposes. You can browse your personal labels from your user profile. Any user can add their personal labels to a page, even if they don't have permission to edit it.
A third highly-requested feature. Confluence has always provided a brace of useful RSS feeds, but the problem is that for every feed we provided, users wanted half a dozen more. The obvious answer is to let users build RSS feeds based on their own chosen criteria. You can access the RSS builder from the Confluence dashboard.

Once in the builder, you can choose

- Which spaces to include in the feed
- Which types of content should be tracked
- Which labels, if any, you are interested in
- How many items to include in the feed
- Whether you want a single RSS entry per page or one for each time the page is edited
- Whether you want an RSS 2.0 or Atom 0.3 feed
- Whether Confluence should require authentication to view the feed

Once you have decided what you want, Confluence will give you a URL to paste into your RSS reader. These URLs can be shared with other Confluence users, although they will only ever be allowed to see content that they have permission to view. If you have asked to authenticate, Confluence will require HTTP Basic Authentication, which is supported by most RSS readers.

We've also taken the opportunity to improve the presentation of our RSS feeds - including a lot more information in each feed so you can follow your Confluence site entirely from your newsreader.

The Atom 1.0 draft has just been accepted as an IETF standard. Future versions of Confluence will be phasing out use of Atom 0.3 in favour of Atom 1.0.

Known Bugs

Confluence 1.5-DR1 is a preview, not a full Confluence release, and as such there are a number of known bugs included in the release (at no extra cost!). Important bugs include:

- Label and RSS database queries do not work on DB2
- WYSIWYG editor adds extra information to browser history on Firefox
- Going to a page when not logged in will present you with a 404 error page, instead of giving you the chance to log in
- Various WYSIWYG round-trip bugs

Release Notes 1.4-RC2

Confluence 1.4 Release Candidate 2

1.4-RC2 is now available for download here.

Confluence 1.4-RC2 is (barring some absolute disaster) the final public developer build for Confluence 1.4. It incorporates all the changes that were deployed in the private DR7 build, as well as around 60 new bug fixes and improvements.

Confluence 1.4-RC2 is being released to give Confluence customers the opportunity to test the upgrade path for their existing Confluence installation. By testing your migration with this pre-release, you can ensure that any problems you may experience will be fixed before the final 1.4 release, rather than having to rely on ad-hoc patches or wait for 1.4.1.

Who should upgrade?

While 1.4-RC2 is still pre-release software, and we do not recommend upgrading production Confluence sites until the release of 1.4-final, we would recommend any existing Confluence customer install this release on a test server, and try to import their existing Confluence data into it.

Upgrade Procedure
Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

When you first start Confluence 1.4-RC2 after upgrading, the server may take a few minutes to become fully functional. This is because Confluence is rearranging information in the database so that it can be looked up more efficiently. This will only be done the first time Confluence is started after upgrading.

New Features in Confluence 1.4-RC2

The changes made between DR7 and RC2 are mostly correctness and polish issues - major feature development on Confluence 1.4 has been completed. A few notable changes however are:

- You can upload attachments while editing a page – from the "Insert Link" popup
- The dynamic content-tree degrades gracefully on unsupported browsers
- Many bugs related to PDF export (and images included in PDF exports) have been fixed
- Ü characters in page titles no longer confuse the database
- Text properties set via the contentPropertyManager can now be longer than 255 characters, fixing related bugs in the {tasklist} and {excerpt} macros
- The {attachments} macro can display the list of attachments inline within a page
- New XML-RPC and SOAP plugin types allow you to deploy web services dynamically into Confluence
- A potential connection leak that has been causing problems for Oracle users has been fixed.

And much much more.

Release Notes 1.4-DR7

Confluence 1.4-DR7

Confluence 1.4-DR7 is the first release-candidate build of Confluence 1.4. In 1.4-DR7 we have resolved over 120 issues: mostly related to fixing bugs and polishing up the application for a stable release. We anticipate that DR7 will be the last major build before the stable 1.4 release.

DR7 is not a public release. It has been built and deployed onto http://confluence.atlassian.com as part of our internal quality-control process, but we have decided that the developer time required to make this a public beta release would be better directed towards continuing the push towards a final, stable 1.4 build.

Who should upgrade?

Since Confluence 1.4-DR7 is not publicly available, nobody should upgrade. The upgrade note below is just for completeness, so when we come to gather all these release notes together into a single note for 1.4, we don’t miss the warning.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.
When you first start Confluence 1.4-DR7 after upgrading, the server may take a few minutes to become fully functional. This is because Confluence is rearranging information in the database so that it can be looked up more efficiently. This will only be done the first time Confluence is started after upgrading.

New Features in Confluence 1.4-DR7

The changes made between DR6 and DR7 are mostly correctness and polish issues - major feature development on Confluence 1.4 has been completed. A few notable changes however are:

- The space content tree is now updated dynamically, leading to much faster page-load times and much less load on the server (for large spaces, this page was turning into a reliable way to DOS Confluence). However, you must have a modern web browser with Javascript enabled for the tree to work. (A non-Javascript fallback will be included in 1.4-final - CONF-3098)
- You can now customise the site's name alongside the logo
- The display and navigation of page history diffs has been improved significantly
- Webdav configuration has been reinstated to the same functionality as 1.3.5
- An "insert image" popup has been added to the page editing screen, that can select images from the page's attachments. There is also an Attachments tab in the "insert link" popup. Allowing file upload from these popups has not yet been implemented (CONF-3099)
- Many improvements and fixes to email notifications
- Marking your change as a "minor edit" will prevent email notifications being sent
- The new Component plugin module adds new beans to the Spring context
- You can now uninstall plugins via the web interface
- The default theme has various keyboard shortcuts (see the tabs on this page)
- The Include Page Macro can now include pages from other spaces
- For developers, macros can now decide whether or not they have a body
- Report showing all attachments to pages in a space (check it out!)
- Generally improved notifications including a much more usable "File Attached" notification
- “View wiki source” link, for all those source junkies...

And much much more.

Release Notes 1.4-DR6

Confluence 1.4-DR6

Confluence 1.4-DR6 is the next development release in the cycle leading up to Confluence 1.4. In 1.4-DR6 we:

- introduce page-level view permissions,
- make Confluence radically more themeable,
- further improved the overall user interface and usability,
- add several interesting new plugin types,
- add file attachments to blog posts and user profile pages,
- let you customize Confluence logos at a space and global level, and
- help you keep track of all the email watches you might have set up in Confluence.

Phew! Got all that?

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.
Note for Oracle Users

Confluence 1.4-DR6 is currently not recommended for Oracle users, as it has not passed our test-suite against the Oracle database. This will (obviously) be fixed before we release Confluence 1.4.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

If you upgrade to Confluence 1.4-DR6 you will need to rebuild your search indexes before search will function correctly. Look for "Rebuild Search Index" on the global Administration page.

Downloads

All development releases are available from Development Releases on the Atlassian website.

New Features in Confluence 1.4-DR6

See also: Issues Resolved for 1.4-DR6

Page Level Permissioning

A highly-requested feature, and the reason this DR took so long to get out, you can now hide pages from other users. The option for hiding pages can be found at the bottom of the page's "Edit" screen.

- You can hide a page so it is only visible to yourself, or only visible to members of groups you belong to.
- Once a page is hidden, all its child pages (and their children, and so on) are also hidden.
- A new space-level permission has been introduced to determine which users are permitted to hide pages.

Please note that it may be possible for users to learn the names of hidden pages, even if they can't see their content. So don't make a page called "We Hate Bob Smith" if Bob Smith has access to your wiki. Just make a page called "We hate..." and put Bob's name in the body.

Improved Themes

While the overwhelming reaction to the User Interface changes we have made in the 1.4-DR series has been positive, it has sparked continuing discussions on the user mailing list about various aspects of the presentation of a Confluence site. From these discussions we have determined:

- Everyone wants something slightly different.
- Some people want something completely different.

In response, we've moved to vastly improve the level of themeability that Confluence offers. Almost all of the user interface elements have been pushed into customisable decorators, so if you don't like the tabs, you will be able to install a theme that removes them entirely! We're hoping to bring out some example themes with the 1.4 release that do just this, but for now you can read the documentation for the new decorators in the Theme Module documentation.

Plugin Improvements

To make Confluence more flexible, we're introducing more ways for advanced users to extend the system:
Uploadable Plugins

Confluence administrators can now upload new plugins through the administrative interface, and have them installed without restarting the server.

Search Extractor Plugins

Extractor plugins allow you to add custom information to Confluence's full-text index when Confluence content is saved or updated. The most obvious application for this plugin type is to allow you to index attachment formats that Confluence does not yet support, but more creative plugin authors might make use of this as a sneaky way to store and retrieve metadata about any content in the Confluence system. Documentation for Extractor plugins is coming soon.

XWork Plugins

XWork plugins allow you to add new XWork (Webwork 2) actions to Confluence. Advanced programmers can add entirely new behaviours to the application: take a look at the examples in [XWork-WebWork Module](#), in which we've implemented a rudimentary "Google Suggest"-like live search entry box for Confluence:

Servlet Plugins

Servlet plugins allow you to deploy servlets into Confluence dynamically – perfect for integrating Confluence with some legacy application that is only available as a servlet. See [Servlet Module](#) for an example.

Attachments for Blog Posts and User Profiles

You can now upload attachments to blog posts and user profiles, both frequently requested features. Users have the option to nominate one picture attached to their profile as their "profile picture", but we haven't quite decided what to do with this information yet. 😊

There is a new global permission to determine if users can attach files to their profile. This permission is not assigned by default, so you will need to explicitly give it to users if you want to enable this feature.

Customizing Logos at a Space and Global Level

Space and global administrators may now easily configure the image displayed as the Confluence logo. This can be done for each space, or at a global level, without having to actually edit a single file.

Keeping track of your Email Watches

A Notifications link on your profile displays a list of all currently configured email watches you might have set up on various spaces or pages. You can now delete them in one, central, place or simply visit them.

Bug fixes

All bugs fixes made between Confluence 1.3.2 and Confluence 1.3.5 have been merged into the developer release branch, fixing many annoying bugs including the crash on selecting "Next" in search results. See also: [Issues Resolved for 1.3.4](#), [Issues Resolved for 1.3.5](#).

Issues Resolved for 1.4-DR6

<table>
<thead>
<tr>
<th>JIRA Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>-------------</td>
</tr>
<tr>
<td>Authenticate to retrieve your issues</td>
</tr>
</tbody>
</table>
Confluence 1.4-DR4 is the fourth development release in the cycle leading up to Confluence 1.4. In 1.4-DR4 the user interface continues to improve, and our new wiki->HTML renderer lands, fixing a large number of bugs (but probably introducing a few more)

1.4-DR4a

One of the bugs that was introduced in 1.4-DR4 caused the edit option to disappear completely from the Confluence interface for anyone who was not a global administrator. Because that issue rendered Confluence mostly unusable, 1.4-DR4a has been released including a fix to that problem. 1.4-DR4a also includes the patch for Confluence Security Advisory 2005-02-09.

We would like to remind everyone who downloads the developer releases that they are not fully stable.

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or higher, you can find in instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

Downloads
All development releases are available from Development Releases on the Atlassian website.

**New Features in Confluence 1.4-DR4**

**User Interface Enhancements**

The user interface of Confluence continues to improve. A big thankyou to all the users who contributed feedback on DR3. While the changes between DR3 and DR4 aren't as radical as the last release, we've been able to polish up a lot of the edges, and make Confluence even easier and more pleasant to use.

We're still gathering feedback on the UI changes, add your input here: 1.4 UI Discussion

**Mail Archives**

- You can now bulk-delete all mail within a space (mail deleted this way does not go to the trash, and can not be recovered later!)
- Pagination on the mail archives is a bit more sane: it doesn't try to tell you about every single page of mail in the archives.
- The mbox importer detects if you're trying to import something that isn't an mbox file, making you much less likely to break anything if you upload the wrong file.

**Nofollow Support**

As part of the effort to combat spam on wikis and blogs (Confluence being both), Google came up with some markup that will cause search-engines not to follow links. By removing the main benefit of wiki-spamming (increased search-engine PageRank), it's hoped that the noxious practice will stop being cost-effective, and eventually die out.

By default, all URLs inserted in a page (or in comments) will be given the nofollow tag. Inter-page links or shortcut links (i.e. CONF-2622) will not be tagged. If your wiki doesn't support public editing or commenting, or you just disapprove of nofollow on principle, the site administrator can turn the feature off in General Configuration.

**V2Renderer**

Over the last few releases of Confluence, it has become apparent that the engine we were using to convert wiki text to HTML was starting to cause us problems. There were a growing number of bugs that we simply couldn't fix, because the nature of the engine meant that fixing one bug would cause ten worse bugs to spring up in its place. After a few false starts, we can now introduce 'v2Renderer', which fixes quite a few of these problems already, and promises to make fixing the rest of them much easier:

**Error rendering macro 'jiraissues' : Unable to determine if sort should be enabled.**

Because this is the first public release of v2Renderer, it's likely that there are some situations in which the markup of pages may change. We've been pretty careful, but users who have been making heavy use of undocumented (or accidental) features of the old markup may encounter situations in which the page displays differently to before. Please, please report these problems to us, so that we can fix the renderer for the final release, or perhaps provide you with a script to painlessly convert your pages to a markup that works.

**Renderer Bugs**

If you file a bug about the v2Renderer, PLEASE make sure you put it in the Wiki/XHTML component: this makes finding all the relevant bugs so much easier for me. – Charles Miller

**Macros**

There is a new macro API that we will be rolling out for 1.4. However, there's a compatibility layer in place to
make sure that most 1.3 macros will continue to function properly. Most macros written for Confluence 1.3 will continue to work in 1.4-DR4. Most of our macros are running without any changes at all, and many of the ones we did migrate were changed over in order to use the capabilities of the new engine to fix bugs.

We suggest that macro authors who are worried about compatibility test their macros with 1.4-DR4 and contact us as soon as possible to discuss how we can improve the compatibility layer before the final release, or help you migrate to the new API.

**Known Bugs**

The renaming of links when a page is moved or renamed is currently unreliable. This is a side-effect of the change in renderers, and will be fixed before the final version of 1.4 is released.

**Release Notes 1.4-DR3**

Confluence 1.4-DR3 is the third development release in the cycle leading up to Confluence 1.4. It is the first step in a process of making the Confluence User Interface simpler, and easier to navigate.

**Who should upgrade?**

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or higher, you can find instructions here. We strongly recommend that you backup your `confluence.home` directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

**Downloads**

All development releases are available from Development Releases on the Atlassian website.

**New Features in Confluence 1.4-DR3**

**User Interface Enhancements**
Some of the most frequent feedback we get about Confluence is that while users like the wealth of features on offer, the interface is often overwhelmed by too much information and too many options, making Confluence difficult to navigate, and difficult to introduce to non-technical users. Confluence 1.4-DR3 is the first step in an attempt to present a cleaner, more useable design for Confluence, while still providing a powerful interface for experienced users.

1.4-DR3 is a developer release. As such, some of the changes to the interface are incomplete, and some may not make it into the final version. Please offer your feedback on 1.4 UI Discussion.

While the obvious way to get a look at the new interface is just to explore this site, here are a few screenshots that might help:
I'm also compiling a page to help people who are used to Confluence Classic, and might be a little lost in the new interface: 1.4 Interface - Where Did Everything Go?

Known Bugs

A page has been created in the Discussion space to gather comments, suggestions, compliments and complaints about the new interface: 1.4 UI Discussion

1.4 Interface - Where Did Everything Go?

If you’re used to the Confluence Classic interface, the new 1.4 interface might be a little hard to navigate at first. We think that the new design is a vast improvement, but it's inevitable that people who have used the application since its release will be wondering where some of the buttons they were used to have gone...

Where Did They Go...

- Blogs?
- Rename Page?
- Move Page?
- Create Child Page?
- Page Locks?

Like it? Don’t? Join the discussion.

Blogs?

By incredibly popular demand, blogs have been renamed to "News" across the site. While blogs are all the rage at the moment (or, as my brother would say, very zeitgeisty), it's still far easier to explain "News" to someone familiar with blogs, than it is to explain blogs to someone who is familiar with news.

Rename Page?

Rename page is no longer a separate function. Just edit the page and change the page title, and Confluence will rename all the links to the page for you.
Move Page?

Move page is no longer a separate function. Just edit the page and change its space, and Confluence will move the page to the new space for you, renaming any links to the page. If the page has children, you will be given the option to move all the children as well.

Create Child Page?

Whenever you select the "Add Page" link from the top of the page, your current page will be automatically inserted into the Parent Page box. We've found that this is the way most people use Confluence anyway.

Page Locks?

Page locks have been renamed "Permissions" and moved to the bottom of the edit page. We found that most people didn't understand (or couldn't find) locks, and thus didn't understand that Confluence has page-level edit security.
Release Notes 1.4-DR2

Confluence 1.4-DR2 is the second development release in the cycle leading up to Confluence 1.4. Seeing as the DR2 development fortnight straddled Christmas it's not quite as feature-laden as some previous releases, but we thought we'd give you a few new toys to play with for the New Year.

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

New Features in Confluence 1.4-DR2

Consult JIRA for the full list of issues resolved for 1.4-DR2

Export Page Hierarchy

When you export a page to PDF or HTML, you have the option to include its children in the export.
**Popup Page Picker**

We now have a popup that can be used to select pages for inserting links, or choosing a page's parent. The picker lets you choose from your recently visited pages, the list of pages that link to the current page, or you can perform a search within the picker itself.

![Page Picker](image)

**New Macros**

As part of the process of making Confluence more flexible, we have implemented the various functions of the Confluence dashboard and space summary pages as macros. These macros are currently disabled by default, but if you're interested in using them within regular pages, you can enable them from your global plugin configuration.

This currently has no effect on the dashboard itself - but will become useful in the future when the dashboard becomes customisable. For example, the `{spaces-list}` macro will reproduce the list of spaces that appears on the dashboard:

**Spaces:**  All  Favourite  Category  New (2)

Known Bugs

There is a known bug that occurs whenever you enable or disable a plugin in Confluence 1.4-DR2. The error will appear to be 'null', but the following will appear in the logfiles:

```
[ERROR] Tue Jan 04 18:01:20 CST 2005
[com.atlassian.core.util.DateUtils]
java.util.MissingResourceException: Can't find resource for bundle
java.util.PropertyResourceBundle, key core.dateutils.minutes
```

This is issue CONF-2513 and will be fixed in the next DR.

Release Notes 1.4-DR1

Confluence 1.4-DR1 is the first development release in the cycle leading up to Confluence 1.4. On the surface, we have implemented one of Confluence's most requested features. Under the hood, there's a whole new event system to play with.

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.3 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.2.3 or earlier, be sure to read the upgrade instructions in the Confluence 1.3 release notes.

Downloads
All development releases are available from Development Releases on the Atlassian website.

New Features in Confluence 1.4-DR1

Consult JIRA for the full list of issues resolved for 1.4-DR1 (Note, this list doesn't include all the 1.3.1 fixes that were also merged into the development release)

Move Page Hierarchy

When you move a page between spaces, you now have the option to include all children of that page in the move. With 13 votes, this was one of Confluence's most requested features.

(Note, as of DR1, you can not both move a hierarchy of pages and rename the root page at the same time. This bug is filed as CONF-2452)

Attach Multiple Files

Another commonly requested feature, you can now attach multiple files to a page at once. By default, you can attach a maximum of five at a time, but this maximum is configurable.

GZip Content Encoding

Pages are served with GZip content encoding, which means less bandwidth consumption and faster page downloads.

Events and Listeners

We have implemented the beginnings of a pervasive system of events within Confluence.

By the final release of 1.4, all major actions within Confluence will trigger an event. These events can be listened for, and reacted to by a new plugin module type: "listener". This will allow Confluence to be further customised, as extensions can react to anything that happens within the system.

Creating an event listener plugin is insanely easy. Step one, implement this interface:
package com.atlassian.confluence.event;

import com.atlassian.confluence.event.events.ConfluenceEvent;

/**
 * Defines a listener for Confluence events.
 */
public interface EventListener {
    /**
     * Perform some action as a response to a Confluence event. The EventManager will
     * ensure that this is only called if the class of the event matches one of the
     * classes returned by getHandledEventClasses
     * @param event some event triggered within Confluence
     */
    void handleEvent(ConfluenceEvent event);

    /**
     * Determine which event classes this listener is interested in.
     * The EventManager performs rudimentary filtering of events by their class.
     * If you want to receive only a subset of events passing through the system,
     * return an array of the Classes you wish to listen for from this method.
     * For the sake of efficiency, only exact class matches are performed.
     * Sub/superclassing is not taken into account.
     * Returning an empty array will allow you to receive every event.
     * @return An array of the event classes that this event listener is
     * interested in, or an empty array if the listener should receive all events. Must
     * not return null.
     */
    Class[] getHandledEventClasses();
}

Step two: Package it as a plugin module with a descriptor like this:

```xml
<listener name="My Listener" key="mylistener"
    class="com.example.listeners.MyListener">
    <description>Listens for stuff.</description>
</listener>
```

And that's about it. We'll be adding information about the events that are being produced in Confluence over the next couple of days (We would have had them documented today, but Nick, who wrote most of them, was sick).
All bugs that were fixed in Confluence 1.3.1 are also fixed in Confluence 1.4-DR1.

Release Notes 1.3-final

Confluence 1.3-final is the stable release of Confluence 1.3. Woohoo! We made it! The full release-notes for Confluence 1.3 are located here, this page documents only the changes made since the 1.3-DR4 development release.

1.3-final contains over 100 improvements over 1.3-DR4, mostly focused around fixing bugs, polishing the interface, and making Confluence ready for a stable release.

Who should upgrade?

Confluence 1.3 is the new stable release of Confluence. It contains a huge raft of enhancements and fixes made since 1.2.3. If you are running Confluence (and not using Oracle, see below), you should upgrade to Confluence 1.3. If you are not running Confluence, you should install 1.3 immediately, regardless of your database.

Current users of Confluence on Oracle databases users may wish to delay upgrading.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the Confluence 1.2 release notes.

Note: You will need to rebuild the search index after you upgrade for certain features (including mail threading) to work properly.

New Features in Confluence 1.3-final

New Demonstration Content

As part of the DR4 setup improvements, users were given the option to install an example space, but the demonstration content that was loaded was pretty uninspiring. For the final release, the demonstration space now contains a suite of demonstration pages, examples of what Confluence can do, and a few pictures of the Sydney Opera House. This should make it much easier to get Confluence up and running quickly.

Referrer Performance Improvement

We discovered (from monitoring the http://confluence.atlassian.com site) that our recording of HTTP referrers was causing some serious performance problems for public Confluence sites. Upgrading to Confluence 1.3-final should make Confluence a lot more responsive, especially under heavy load.

Improved Notation Guide

The notation guide has been reorganised to be more user-focused, making it easier to find the markup or macro you are looking for.

It is also now possible for macro plugins to insert themselves into the notation guide. Just write your macro description as a two-column HTML table row, put it in a vm file, and include the following in your atlassian-plugin.xml file:

```xml
<resource type="velocity" name="help" location="/path/to/your/helpfile.vm">
  <param name="help-section" value="tables"/>
</resource>
```
The help section can be one of: texteffects, headings, breaks, links, lists, images, tables, advanced, confluence, external or miscellaneous. If you don't include a help section, it will be put in the 'macros' section.

**Improved Search Indexing**

We've updated the way we index content within Confluence. A lot of searches that came up empty before will now find something. In addition, you can now set your primary language for indexing under General Configuration, so that the indexer can better optimise itself for non-English content.

**Also**

- By popular demand (it was our most highly voted-for bug), pages are now exported in alphabetical order, not in order of creation.
- The Remote API can be accessed anonymously, if you wish (anonymous remote access must be turned on in the general configuration).
- When previewing a page, you can continue to edit on that screen, instead of having to go back to the edit page.
- The thread view on a mail page has been improved, and the full-thread view is no longer a pop-up.
- You no longer need to be in the confluence-admin group to access the administration pages, you just need global administrative privileges.
- You can link to anything in Confluence if you know its ID in the database (currently this is how you must link to email): [$1234]
- You can link to anything relative to the root of the Confluence site (useful for pointing to parts of the site that can't otherwise be linked): [///pages/editpage.action?pageId=1234]
- New macros: {jiraportlet}, {note} {tip}, {information} and {warning}
- A lot more...

**Issues Resolved for 1.3-final**

In all, over 130 issues were resolved between DR4 and 1.3-final. Unfortunately, merging all the versions together in JIRA means the list of precisely what went into those 130 has been lost, but if you sort this list by last-modification date, you'll get some idea... [Issues Resolved for 1.3]

**Release Notes 1.3-DR4**

Confluence 1.3-DR4 is the fourth development release in the cycle leading up to Confluence 1.3. We're on the home stretch! The final, stable 1.3 isn't far away.

Confluence 1.3-DR4 includes a raft of improvements to mail archiving, a redesigned setup wizard, significant improvements to the way we back up and restore your system configuration, and a truck-load of bug fixes.

**Who should upgrade?**

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

**Upgrade Procedure**

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2 or higher, you can find [instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!](http://confluencelassian.com)

If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the [Confluence 1.2 release notes](http://confluencelassian.com).

**Note:** You will need to rebuild the search index after you upgrade for certain features (including mail threading)
to work properly.

New Features in Confluence 1.3-DR4

Setup Improvements

Confluence's setup wizard was badly in need of an overhaul, so that's exactly what we've done. Among the improvements, we have:

- Improved the ordering of steps. For example, if you are importing straight from a backup, you no longer need a redundant administrative user.
- Added a quick, two-step setup process to get Confluence running straight away
- Made the database setup much more robust, and much better at reporting errors
- Removed those steps that weren't really necessary to get Confluence running

Hopefully this will make it a lot easier to get Confluence up and running, or show off Confluence to your friends and family.

Mail Archive Improvements

(CONF-2050)

We've been working hard to build on the basic mail-archiving features included in 1.3-DR3. Included in the new version are:

- Improved indexing of mail senders, message-ids and subjects
- Improved integration of mail with search
- The ability to delete mail (if you have been assigned the delete mail permission)
- Direct access to mail archives from the dashboard
- Display of mail attachments in the "view mail" page
- The ability to link to a single message by its internal Confluence ID ( [$1234] will link to message 1234)
- The ability to navigate forward and back through mails chronologically
- Email addresses are displayed or masked in accordance with your global preferences

We still have a few things to do (date based views, a calendar), but the mail archive is now very useable. Especially when you take into account...

Mail Threading

(CONF-2059)

Of course, it's important for your mail archive to be able to represent conversation threads. How you present thre ads, though, is just as important.

Here's how most mail-based web archives present your thread at the bottom of each message:

```
Follow-Ups:
  RE: DateModified
    From: Bob Wyman

References:
  RE: DateModified
    From: Tim Bray
```

Not very helpful, is it. Here's how that same bottom-of-the-message view looks in Confluence:
At a glance, you can see exactly where the message sits in a conversation.

Backup Improvements

(CONF-1090 and CONF-2046)

Confluence 1.3-DR4 contains two significant improvements to backing up and restoring the system.

- You can now exclude attached files from your backups. Of course, this means you have to back up your attachment directory separately, but if you already have a good backup regime for your filesystem (and can thus restore the attached files separately), it means that your Confluence data backups will take up far less room.
- We now include important parts system configuration in your backups. This means that colour-schemes and plugin preferences are now saved, and fixes a large number of issues that users have filed due to the restore process not bringing the system back up in the same state as when they saved it.

Library Upgrades

We have continued the process of upgrading to the most recent stable versions of those libraries Confluence is built on, which should result in improved stability and performance.

Bugs fixed for 1.3-DR4

We've also fixed a lot of bugs, as we ramp up for the stable 1.3 release. Take a look in JIRA for the full list.

Release Notes 1.3-DR3

Confluence 1.3-DR3 is the third development release in the cycle leading up to Confluence 1.3 - and a momentous day in the history of Confluence.

We've finally made it to that special point in every applications life.

Confluence has evolved.

1.3-DR3 is best summed up by Jamie Zawinski's Law of Software Envelopment:

Every program attempts to expand until it can read mail. Those programs which cannot so expand are replaced by ones which can.
That's right - Confluence now has more content than ever before. It reads, stores and indexes email. Oh, and as a nifty little bonus - it also indexes Word documents, PDF documents, RTF documents, Excel spreadsheets, PowerPoint files, text files, source files etc... attached to your mail!

Have we got your interest? How does all this magic happen you ask? Read on to pull back the curtain.

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the Confluence 1.2 release notes.

Note: Because we have made significant changes to permissions in 1.3-DR2, you should check that your user permissions have been correctly migrated. The upgrade manager should ensure permissions remain consistent between versions, but as with anything related to security, it’s best to double-check.

New Features in Confluence 1.3-DR2

Mail Archiving

(CONF-1965)

Confluence is a collaboration tool. When communication happens through email instead of through Confluence, information will get lost in the depths of someone's mail folders, instead of shared with the team, archived, interlinked and indexed.

While we would love to see all collaboration within a group to happen through Confluence, it's often not possible to change the way people work. So instead of finding new ways to force people to use Confluence instead of email, why not route all the relevant email into Confluence?

It is now possible to archive email within a Confluence space. The support for mail is only just getting started in DR3, but we believe this is an incredibly useful direction for Confluence to go, and will be expanding and improving the mail integration in future releases.
Confluence spaces can retrieve mail periodically from a POP mailbox (this will delete all mail from that POP account, so don't try it on an account you want to keep mail on), or space administrators can import mail directly from a standard mbox-format mail file.

Once mail is imported into Confluence, it can be browsed chronologically from the Content pane of the Space Summary page, and can be searched through Confluence's search interface.

In the future, we will be adding new ways to link to and between email (bringing the email closer to the other content of the wiki), proper representation of email threads, more flexible search, and much, much more.

Read the Mail Archiving FAQ for more information

Want to play with it now?

We love to play with features right now, so here's how you can:

- Testing mail search is a snap.
- Testing mailing content into Confluence is also easy. It will also be indexed.

Improved Indexing Performance

We now make much more efficient use of resources by batching updates to full-text search index. This should lead to improved performance for many tasks within Confluence, but will mean that it may take up to a minute for a change in the site to be reflected in the site's index. (CONF-2029)

In addition, we have made a number of improvements to the indexing of large PDFs, including fixing some cases where a PDF might cause indexing to freeze indefinitely. (CONF-1953, CONF=1954)

Library Upgrades

Many of the libraries Confluence is dependent on have been upgraded for this release, which should result in improved stability and performance.

Bugs fixed for 1.3-DR3

We've fixed a handful of issues specifically for 1.3-DR3, take a look in JIRA for the full list.

Release Notes 1.3-DR2

Confluence 1.3-DR2 is the second development release in the cycle leading up to Confluence 1.3. For DR2, we have made space-level permissions a lot more fine-grained, and added a new plugin manager which should open the way to making it easier for people to write extensions to Confluence:

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the Confluence 1.2 release notes.

Note: Because we have made significant changes to permissions in 1.3-DR2, you should check that your user
permissions have been correctly migrated. The upgrade manager should ensure permissions remain consistent between versions, but as with anything related to security, it’s best to double-check.

New Features in Confluence 1.3-DR2

New Space-Level Permissions

(CONF-1375, CONF-1764 and their linked issues)

We've been getting a lot of requests for more fine-grained control over who can do what in a space, so as a result, we've added a whole raft of new permissions at the space level:

<table>
<thead>
<tr>
<th>Object</th>
<th>Permissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page</td>
<td>create/edit, remove, export</td>
</tr>
<tr>
<td>Blog Post</td>
<td>create/edit, remove</td>
</tr>
<tr>
<td>Comment</td>
<td>create, remove</td>
</tr>
<tr>
<td>Attachment</td>
<td>create, remove</td>
</tr>
<tr>
<td>Space</td>
<td>export, administer</td>
</tr>
</tbody>
</table>

Create space permission is still managed at the global level.

The permissions editing screens have been changed a little, too, taking into consideration the feedback we received from the last DR. All editing functions are now firmly on the edit screen, and we have introduced a user-picker to avoid having to find users in a massive drop-down list.

New Plugin Architecture

(CONF-1877)

Confluence now incorporates the plugin architecture that was written for JIRA 3.0 (which in turn was adapted from Confluence's macro management. Who said code reuse was dead?). Right now, there’s not much you can do with it, but plugins pave the way to making Confluence a great deal more flexible and extensible.

See: Writing Confluence Plugins

New Macro Descriptor Format

(CONF-1878)

Macro libraries are now implemented as plugins, which means that if you have written a macro library, you will need to convert your macro-library.xml files to atlassian-plugin.xml files.
Themes

(CONF-1856)

It is now possible to package a colour-scheme and a set of customised decorators into a portable Confluence plugin. Just drop the theme jar into your server's classpath, restart the server and space administrators will be able to select the theme from the space administration console.

DR-2 comes with two very simple themes (look under themes/ in your Confluence directory), but we will have more (and more useful) themes available by the time 1.3.0 is released. In addition, we're hoping that users will continue to share their Confluence modifications in the Confluence Extensions Space, and that themes will help you continue to share neat things you've done with Confluence.

Bugs fixed for 1.3-DR2

All the bug-fixes that were part of the Confluence 1.2.3 release have also been incorporated into 1.3-DR2. In addition, we've fixed a handful of issues specifically for 1.3-DR2, take a look in JIRA for the full list.

Release Notes 1.3-DR1

Confluence 1.3-DR1 is the first development release in the cycle leading up to Confluence 1.3. In it, we have rewritten the Space Summary/Space Administration pages to be more useable, adn implemented a much-requested feature: the ability to undelete pages.

Who should upgrade?

Development releases are snapshots of the ongoing Confluence development process. We make them available for customers who are willing to risk an unpolished release in order to have early access to new features.

If you want to be running the most stable and most reliable version of Confluence, you should stick with the official, numbered releases.

Upgrade Procedure

Upgrading Confluence should be pretty easy. If you are upgrading from Confluence 1.2 or higher, you can find instructions here. We strongly recommend that you backup your confluence.home directory and database before upgrading!

If you are upgrading from Confluence 1.1.2 or earlier, be sure to read the upgrade instructions in the Confluence 1.2 release notes.

New Features in Confluence 1.3-DR1

Space Summary
The Space Summary page has been the dumping-ground for every space-related operation and report since Confluence's early alpha releases. As such, it had become confusing to navigate and hard to find anything on.

For 1.3-DR1, we have rewritten the space summary to be a suite of tabbed pages, making that whole area of Confluence easier to navigate, more self-explanatory, and much better-looking.

The Trash Can

When a page or blog post is deleted, it is no longer removed completely, but is placed in a space-wide trash can. The trash can be found in the Administration tab of the newly rearranged Space Summary pages. Space Administrators can choose to restore pages from the trash, or purge them so they are unrecoverable.

New Emoticons

Just because.

Bug Fixes

All the bug-fixes that were part of the Confluence 1.2.2 release have also been incorporated into 1.3-DR1. In addition, we've fixed one or two issues specifically for 1.3-DR1, take a look in JIRA for the full list.

Troubleshooting Problems and Requesting Technical Support

This document tells you how to troubleshoot problems in Confluence and how to obtain technical support from Atlassian.

Troubleshooting a Problem

If you have a problem with Confluence, please follow the steps below.

To diagnose a problem and search for a solution:

1. If you are not a Confluence administrator, report your problem to the person in charge of your Confluence site and ask them to follow up on the issue.
2. Use the inbuilt log scanner (see below) to check your Confluence logs for errors and attempt to match them against known issues in our knowledge base and bug tracker.
3. Check our knowledge base for solutions to known issues.
4. Check our issue tracker for known bugs.
5. If your problem may be related to a plugin, you can enter plugin safe mode by temporarily disabling any third party plugins.
6. If you are having problems configuring a feature, please take a look at the appropriate guides:
   - Confluence Installation Guide
   - Confluence Setup Guide
   - Confluence Administrator's Guide
   - Configuring Confluence
   - Database Configuration
7. Check the following guides for troubleshooting specific problems:
   - Issues related to your database server: Known Issues For Supported Databases.
   - Issues related to user management: Requesting Support for External User Management.
8. If the above tools and documentation do not solve your problem, please create a support request and attach your support zip file. If you believe you have found a bug, you may wish to create a bug report instead. Instructions for both are given below.
On this page:

- Troubleshooting a Problem
- Scanning your Confluence Logs to Match Known Issues
- Raising a Support Request with a Plugin Author
- Raising a Support Request with Atlassian
  - Method 1: Using the Support Request Form via the Confluence Administration Console
  - Method 2: Raising a Support Request via the Internet
- Creating a Support Zip File via the Confluence Administration Console
- Logging a Bug Report

Scanning your Confluence Logs to Match Known Issues

Confluence provides an inbuilt log scanner that will check your Confluence logs for errors and attempt to match them against known issues in our knowledge base and bug tracker.

The log scanner is known as Hercules, or the Atlassian support bot. It uses a set of patterns that we have discovered in our knowledge base and issue tracker.

To use the Confluence log scanner:

1. Log in as a user with Confluence Administrator or System Administrator permissions.
2. Choose Browse > Confluence Admin.
3. Click ‘Atlassian Support Tools’ under ‘Administration’ in the left-hand panel.
4. Click the ‘Log Scanner’ tab.
5. Click ‘Scan’ to scan the Confluence log file in its default location, or change the location if necessary then click ‘Scan’.
6. The log scanner will return a list of links, pointing to articles in our knowledge base and/or bug reports in our issue tracker.
   - The latest-reported problems are displayed first. By default only the most recent 10 matches are displayed. If you have more than 10 matches and want to display all results, click the ‘Show All’ link that appears on the top of the results page.
   - Click a link to read the reported problem and possible solutions or workarounds.

Screenshot above: The log scanner

Raising a Support Request with a Plugin Author

If you have a plugin-related issue, please check whether the plugin is supported by Atlassian or by the plugin developer.

- Visit the plugin’s home page in the Atlassian Plugin Exchange.
- Check the ‘Supported By’ entry under ‘Plugin Details’ on the right-hand side.
• If the plugin is not supported by Atlassian, you will need to contact the plugin author directly.

You can read more about [Atlassian support for plugins](https://confluence.atlassian.com/display/ATL/Atlassian+support+for+plugins).

### Raising a Support Request with Atlassian

There are two ways to raise a support request with Atlassian:

- **Method 1:** *(Recommended)* Complete the support request form via your Confluence Administration Console, as described below. A possible problem with this method is that your mail may not be forwarded correctly, due to restrictions imposed by your mail server. For example, the zip of your log files might be too large for your mail server to forward.
  
- **Method 2:** Raise a support request via our support site on the Internet, as described below. Create a support zip file via your Confluence Administration Console, as described below, and attach the zip file to the support request.

### Method 1: Using the Support Request Form via the Confluence Administration Console

The advantage of this method is that it is convenient. The disadvantage is that your mail may not be forwarded correctly due to a problem (for example, the zip file is too large) or due to a security restriction on your mail server.

You can also use this method to append system information to an existing support request.

**To submit a support request via the Confluence Administration Console:**

1. Log in as a user with Confluence Administrator or System Administrator permissions.
2. Choose [Browse > Confluence Admin](https://confluence.atlassian.com/display/CONFL/Confluence+Administration).
3. Make sure that [SMTP email](https://confluence.atlassian.com/display/CONFL/SMTP+Email) is set up on your Confluence site and your mail server allows zip files.
4. Click *Atlassian Support Tools* under *Administration* in the left-hand panel.
5. Click the *Support Request* tab.
6. Provide as much information as possible, following these guidelines:
   - *'Contact Email'* – This will default to the email address of the logged-in user.
     
     **Note:** This email address will be used to find your support account on the [Atlassian Support System](https://confluence.atlassian.com/display/ATL/Atlassian+support+system). If no matching account is found, a new account will be created. Confluence will also send all further notifications and updates to this address.
   - *'Summary'* – Enter a short and meaningful description of the problem.
   - *'Description'* – Enter as much information as possible, including any error messages that are appearing and any steps the support team can take to reproduce the problem.
7. In the section titled *'Support Data to Attach'*; select the types of additional information you would like to be included in a zip file that will be attached to your support request.
8. Click the *Send* button.
9. Confluence will submit your request via email to the Atlassian support site. If you do not already have a support account, Confluence will automatically request one for you. The submitted request will include all the system and environment information which you see on the support request form. It will also include a zipped copy of your Confluence log file. Refer to [Working with Confluence Logs](https://confluence.atlassian.com/display/CONFL/Working+with+Confluence+Logs) for information about the log files.

   | Log files can be very big. It is possible that your email server may bounce the message if it is too large. With the default log4j configuration, the log file could be up to 20Mb in size. If you have customised the log settings, the maximum size could be even larger. Please check whether the email message has been successfully sent, and consult your email administrator if you need special provisions for this email message.

10. Once you have submitted your support request, you will receive email updates about its progress. These emails will give you the support request number.

You can view the status of your support request and add any additional information required by visiting the [Atlassian Support Tools](https://confluence.atlassian.com/display/ATL/Atlassian+Support+Tools) page.
Method 2 Raising a Support Request via the Internet

If your Confluence instance is not configured with SMTP mail or your Confluence instance is not running, you can raise a support request via the Atlassian Support System on the Internet.

To raise a support request via the Internet:

1. If you do not already have a free Atlassian support account, create one here.
2. Log in to https://support.atlassian.com and select 'Create New Issue'.
3. Lodge a detailed description of your problem in the new support request.
4. Fill in all applicable information about your system, such as application server, database, etc.
5. If Confluence is running, go to the 'System Information' screen in your Administration Console and copy the text of your system information into the request.
6. Create a support zip file, as described below to attach to the request. If your instance does not start up, refer to Working with Confluence Logs for information about the log files.
7. If your problem concerns user management or performance, please take a look at the additional requirements in Requesting Support for External User Management or Requesting Performance Support.
8. Once your request is lodged, wait to be notified by email of updates.

Creating a Support Zip File via the Confluence Administration Console

We recommend that you attach a support zip file to every interaction with the Atlassian support team. You can use this method to append system information to an existing support request. The tool described below will also dump your system information to the logs before zipping them.
To create a support zip file via the Confluence Administration Console:

1. Log in as a user with System Administrator or Confluence Administrator permissions.
2. Go to the Administration Console and click ‘Atlassian Support Tools’ under ‘Administration’ in the left-hand panel. Click ‘Support Zip’. Ensure that everything is checked, then click the ‘Create’ button.
3. Confluence will create the support zip file and display its location on the screen. Log in to the Confluence server to retrieve the file.
4. Attach the zip file to the support case you raised on our support system, as described above.

Logging a Bug Report

If you have found a bug, the easiest way to report it is to:

- Create numbered instructions on how to reproduce the bug.
- Log it as a support request, as described above.
- The Atlassian support team will confirm your bug and lodge a bug report.

Alternatively, you can check to see if anyone else has reported the bug, then log a bug report yourself.

To log a bug report:

1. Go to the Confluence issue tracker.
2. Type keywords for your problem into the search box on the left under ‘Query’.
3. Click ‘Search’ to find any existing bug reports that match your problem.
4. Read through the summaries of the bugs shown. If any summary describes your problem, you may wish to set a watch to be notified of updates.
5. If there are no existing bug reports that match your problem, log the new bug in the issue tracker. Include information on how to duplicate the problem.
6. Sometimes it may be useful to include the result of the 500 error page, which you will find at this location:

   https://<domain><host>:<port>/500page.jsp

7. Once your issue is lodged, wait to be notified by email of updates.

RELATED TOPICS

- Requesting Support for External User Management
Content Anonymiser for Data Backups

Atlassian may request a copy of the entities.xml file from a customer's exported zip file (backup file), in order to diagnose database corruption or to find a bug in Confluence.

If your data is confidential, you can run an anonymiser program over your entities.xml file to remove all your data and leaving only the structure of the export.

Usage

To run the Content Anonymiser on your backup file:

1. Download the anonymiser JAR (attached to this page).
2. Extract the entities.xml file from your zipped backup file to the same directory as the JAR.
3. Use the command prompt to go to the directory where all three files are located.
4. To create cleaned.xml, run the command

   ```
   java -jar confluence-export-cleaner-1.1-jar-with-dependencies.jar
   entities.xml cleaned.xml
   ```

5. Re-ZIP cleaned.xml with its exportDescriptor.properties to ensure we (eg. Atlassian Support) knows exactly which version of Confluence does the XML backup exported from.

How it works

The Content Anonymiser program replaces all the text content in file entities.xml with ‘x’ characters. For example, the word “Atlassian” will be transformed to “xxxxxxxxxx”. The resulting cleaned.xml file is expected to have the same size as the original file.

This release of the Content Anonymiser uses STX, a fast and efficient XML transformation technology. It should not require a lot of memory to run, even for a large backup.

Development

For Atlassian developers:

- Source code.
- Maven repository.

Enabling Detailed SQL Logging

Confluence uses the open source persistence framework Hibernate. This page tells you how to configure Confluence’s logging to report individual SQL requests that are sent to the database by Hibernate. It is useful for troubleshooting the following events:
- **XML site backups** that fail to import.
- Exceptions caused by an illegal database operation.

### Enable SQL logging via the Administration Console

Since the 2.7 release, you can also enable SQL logging at runtime via the Administration Console — read the [instructions](#). This runtime option does not allow you to enable logging of SQL parameter values.

To enable detailed SQL logging in Confluence, you need to modify `log4j.properties`, located in `confluence/WEB-INF/classes`.

- After you have enabled hibernate logging, please replicate the action that is causing the error in the first place. This is the best way to ensure that the Confluence log file contains relevant SQL logging.

- **If you require support assistance with a database related problem, it is advisable to enable detailed SQL logging before sending us the log files. This will assist us in determining what SQL queries were running during the reported problem.**

- **If the entries mentioned below are not defined in the `log4j.properties` file, you can manually add the entries to the file in the 'Hibernate Logging' section.**

#### To Log SQL Queries

Stop Confluence, then change the following lines in `log4j.properties` from `ERROR` to `DEBUG`:

```
## log hibernate prepared statements/SQL queries (equivalent to setting 'hibernate.show_sql' to 'true')
## DEBUG, TRACE or ALL is required to see query strings
log4j.logger.net.sf.hibernate.SQL=DEBUG
```

#### To Log SQL Queries with Parameters

1. Stop Confluence
2. Uncomment the following lines in `log4j.properties`:

```
## log hibernate prepared statement parameter values. Note: due to caching in net.sf.hibernate.type_NullableType, requires restart to take effect
## TRACE or ALL is required to see parameter values
## Note that log4j.appender.confluencelog.Threshold (or other appenders) also must be TRACE or ALL to see any trace messages in the logs
log4j.logger.net.sf.hibernate.type=TRACE
```

3. Change the following lines in `log4j.properties` from `DEBUG` to `TRACE`:

```
log4j.appender.confluencelog.Threshold=TRACE
```

4. Restart Confluence
This needs to be done along with the changes to log SQL queries above (whether by the UI or by modifying the properties file).

To Disable Batched Updates for Simpler Debugging

Stop Confluence, then edit `databaseSubsystemContext.xml`:

- In Confluence 2.5.x and earlier, the `databaseSubsystemContext.xml` file is at `confluence/WEB-INF/classes/databaseSubsystemContext.xml`
- From Confluence 2.6.x, the `databaseSubsystemContext.xml` file is available in the `confluence-2.6.0.jar` file located in the `<confluence-install>/WEB-INF/lib` directory.

Uncomment the `<prop>` line in the following location:

```xml
<!-- it can be useful to disable batching during debugging, as HSQLDB doesn't report the exact statement which fails in batch mode -->
<prop key="hibernate.jdbc.batch_size">0</prop>
```

Generating a Heap Dump

Sometimes you may see that Confluence is holding onto a chunk of memory over a period of time (for example, tenured space is increasing close to Xmx). In such a situation, it is useful to find out what is stacking up in the memory by analysing the heap dump.

On this page:

- Automatically Generating a Heap Dump when Confluence Hits OutOfMemory Error
- Manually Generating a Heap Dump when Confluence Stops Responding
- Submitting a Heap Dump to Atlassian Support

Tips when getting a heap dump

If you have a large Xmx size, please limit your Xmx size to 1024m. This will help to keep Confluence heap dump smaller while still containing sufficient information to analyse it.

Automatically Generating a Heap Dump when Confluence Hits OutOfMemory Error

Typically, we would like to analyse the heap dump produced when Confluence died from an OutOfMemory Error. For this, you can add additional JVM parameters like below:

```sh
-XX:+HeapDumpOnOutOfMemoryError -XX:HeapDumpPath=<path to this heap dump file>
```

If you do not set the HeapDumpPath parameter, by default the heap dump will be saved in the folder where Tomcat is run from.

- If you are setting these parameters in the Windows registry (when running Confluence on Windows as a service), be sure that each parameter is on its own line.
Manually Generating a Heap Dump when Confluence Stops Responding

It is also possible to get a heap dump manually using a JDK bundled tool called `jmap`, although we recommend that you use the automatic method above for best result.

**For Linux/Solaris-based Operating Systems:**
Please execute the following command on Linux OS:

```
$JAVA_HOME/bin/jmap -dump:format=b,file=heap.bin <pid>
```

**For Windows:**
Please find your Confluence process ID (see below) and then execute the command below on a Windows command line:

```
%JAVA_HOME%\bin\jmap -dump:format=b,file=heap.bin <pid>
```

To find out the process ID for your Java process in Windows, you can use [Process Explorer](https://processexplorer.net/) from Microsoft. This is what it looks like:

Using Process Explorer to find your Tomcat process ID

![Tomcat process ID](image)

Tomcat run from startup.bat script  Tomcat run as Windows Service

**Submitting a Heap Dump to Atlassian Support**

Please zip the file and then send it to Atlassian Support.

**RELATED TOPICS**

- Getting Java Crash Log File
- Memory usage and requirements
- Garbage Collector Performance Issues
- Generating a Thread Dump
- How to Fix Out of Memory Errors by Increasing Available Memory

**Generating a Thread Dump**

- [Stack Traces and Security](#)
- **Method 1:** Generating a Thread Dump Externally
- **Method 2:** Generating a Thread Dump via the Administration Console

If Confluence is performing poorly, behaving unexpectedly or stops responding and you can generate a thread
dump to help diagnose the cause of the problem. Furthermore, if you wish to contact Atlassian Support for assistance about it, you should include a thread dump in your support enquiry to help the Support team determine the cause of the problem.

A thread dump will show the state of each thread in the JVM, including a stack trace. Thread dumps are only useful if they are taken at the appropriate time. They normally need to be taken at or close to the time when the application is experiencing problems.

Information about what locks are being held and waited upon by a thread are not produced by Confluence's Thread Dump tool. If you require this information, then generate a thread dump externally.

Stack Traces and Security

To help debug support cases and provide legendary support, Confluence provides stack traces through the web interface when an error occurs. These stack traces include information about what Confluence was doing at the time, and some information about your deployment server.

Only non-personal information is supplied such as operating system and version and Java version. With proper network security, this is not enough information to be considered dangerous. No usernames or passwords are included.

Method 1: Generating a Thread Dump Externally

If Confluence stops responding or you require information on locks being held and waited upon by threads, then use one of methods described in Generating a Thread Dump Externally.

Atlassian support may ask you to use this method if a thread dump generated using method 2 does not include enough information to diagnose the problem.

Method 2: Generating a Thread Dump via the Administration Console

To generate a Thread Dump from the Administration Console,

1. Choose Browse > Confluence Admin.
2. Select 'Thread Dump' in the left-hand panel.
3. Click the 'Generate Now' button in the centre of the page. The output is displayed in a new text box that appears just below the button.
4. Copy the contents of the thread dump in the text box and save it to a text file.

Screenshot: Example of a generated thread dump from the Confluence administration console
Scheduling Thread Dumps via the Administration Console

If you were asked by Atlassian Technical Support to generate regular thread dumps, please set the Thread Dump Scheduler to take 2 to 3 thread dumps with a 30 seconds time interval in between so the Support team can observe any important patterns that may assist with the diagnosis of the problem. Attach the log file to the support ticket.

Example: Scheduling thread dumps from the Confluence administration console

Generating a Thread Dump Externally

If Confluence stops responding and you cannot access its integrated Generate Thread Dump feature, it is possible to create thread dumps outside the application. External thread dumps are also useful if you require information on locks being held or waited upon by threads.

Take Multiple Thread Dumps

Typically you'll want to take several dumps about 10 seconds apart, in which case you can generate several dumps and output the stack traces to a single file as follows:

Generating a Thread Dump on Linux, including Solaris and other Unices

1. Identify the java process that Confluence is running in.: This can be achieved by running a command
similar to:

```
ps -ef | grep java.
```

2. Find the process ID of the JVM and use the `ps` command to get list of all processes:

```
kills -3 <pid>
```

⚠️ This will not kill your server (so long as you included the "-3" option, no space in between).

The thread dump will be printed to Confluence’s standard output (catalina.out).

**Generating Thread Dumps on Windows**

**From the console**

If you are running Confluence through a console, rather than as a service, you can click on the console and press <CTRL> + BREAK

**Using jstack**

The JDK ships with a tool named `jstack` for generating thread dumps.

1. Identify the process. Launch the task manager by, pressing Ctrl + Shift + Esc and find the Process ID of the Java (Confluence) process. You may need to add the PID column using View -> Select Columns ...

2. Run `jstack <pid>` to Capture a Single Thread Dump. This command will take one thread dump of the process id <pid>, in this case the pid is 22668:

```
adam@track:~$ jstack -l 22668 > threaddump.txt
```

This will output a file called threaddump.txt to your current directory.

⚠️ Common issues with jstack:

- You must run jstack as the same user that is running Confluence
- If the jstack executable is not in your $PATH, then please look for it in your
  `<JDK_HOME>/bin` directory
- If you receive `java.lang.NoClassDefFoundError:
  sun/tools/jstack/JStack check that tools.jar is present in your JDK’s lib
directory. If it is not, download a full version of the JDK.

**Output**

Standard logging for Confluence Stand-alone is sent to the `atlassian-confluence.log`, in the confluence-home directory, not in the confluence-install directory. Thread dumps are an exception since they dump the threads of the entire application server - they’ll appear in the catalina.out file in the application directory’s logs folder. You can search for the term "thread dump" in the log file for the beginning of the dump. Submit this along with the atlassian-confluence.log in your support ticket.

**Thread Dump Analysis Tools**
Confluence 4.3 Documentation

- Samurai
- Thread Dump Analyzer TDA TDA 1.0 Final can be obtained from the java.net

**Getting Java Crash Log File**

If you discovered that Confluence died without manual intervention, there may be something goes wrong during a local Java session. Java will produce a log file that looks like the following: `hs_err_pid20929.log`.

The location of this log file is usually in the directory where Tomcat is run eg. `/bin` folder. For Windows Services, it should be located in where Windows Services are run, eg. `c:\Windows\System32` if you are on 32 bit.

**Useful VM Option**

If using Java 6, it's possible to define the path to the `hs.err_pid` file.

Add the following JVM Parameter to your existing ones:

```
-XX:ErrorFile=./hs.err_pid<pid>.log
```

**RELEVANT TOPICS**

- Generating a Heap Dump
- Java Crashes
- Profiling using the YourKit Plugin

**Profiling using the YourKit Plugin**

There is a plugin for Confluence 2.2 and later which allows easy profiling using the YourKit profiler. No license is required to generate a memory or CPU snapshot, but you will need at least an evaluation license to analyse the results.

**On this page:**

- Configuring YourKit in your JVM
  - Windows Configuration
  - Linux/Mac OS X Configuration
- Performance Impact
- Installing the YourKit Plugin
- Why would I do this?
- Plugin Source Code

**Configuring YourKit in your JVM**

Download YourKit 6.0 for your platform and follow the installation instructions to install it.

⚠️ Note: YourKit version 7 is not compatible with the Confluence yourkit plugin.

The following instructions apply to Confluence and Tomcat installations with the Oracle (previously Sun) JDK. They should be easily applicable to other application servers and JVMs, however. The YourKit documentation covers this in more detail.

**Windows Configuration**

On Windows, add to your PATH environment variable the `bin/win32/` directory underneath the YourKit installation directory. For example, you might add "C:\Program Files\YourKit Java Profiler 6.0.12\bin\win32" to your PATH, via Control Panel, System, Advanced, Environment Variables.
To configure Confluence's JVM to use the YourKit agent, you need to add a parameter to JAVA_OPTS in the bin/setenv.bat file in your Confluence application directory. This file controls the startup parameters for Tomcat, so you'll need to restart it after making the changes.

Add the 'agentlib' parameter to the end like this:

```
set JAVA_OPTS=%JAVA_OPTS% -Xms128m -Xmx256m -agentlib:yjpagent
```

**Linux/Mac OS X Configuration**

On Unix-based systems, include the installation directory in the library path environment variable, as shown below:

- For the Mac: `export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:/path/to/yourKitAgent`
- For other Unix-based systems: `export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/path/to/yourKitAgent`

In general, to configure the JDK, you add the `agentlib` parameter:

```
java -agentlib:yjpagent ...
```

You can add this to Tomcat's `bin/setenv.sh` like this:

```
JAVA_OPTS="-Xms128m -Xmx256m $JAVA_OPTS -Djava.awt.headless=true -agentlib:yjpagent ">
```

**Performance Impact**

Running YourKit can have detrimental effects on performance.

To minimize performance problems use the following modifications to the `agentlib` parameter:

```
-agentlib:yjpagent=disablecounts,disablealloc,disablej2ee
```

See also [Profiling overhead: how to reduce or avoid](#) in the YourKit documentation.

**Installing the YourKit Plugin**

[Download the plugin](#) and upload it into Confluence through the Administration, Plugins page.

A new menu option will appear under the 'Administration' heading. Click it and you should see the options to take a memory or CPU snapshot.
Screenshot above: YourKit Profiling menu item

This profiler dump will be saved to a local temp directory, and the path shown once it is complete. For the CPU snapshot, this will take at least 30 seconds. For the memory snapshot, 10-15 seconds.

Screenshot above: You can take either a memory or CPU snapshot

Why would I do this?

Analysing a profiler dump enables Atlassian Support (or you, if you are interested) to see exactly what is happening in your application: what classes are using the memory, what is using CPU and so on. This can help us debug tricky performance problems which would otherwise be impossible to analyse remotely.

Take a CPU snapshot if:

- Confluence is sometimes unresponsive
- Pages take a long time to load
- Confluence's CPU usage is peaking.

Take a memory snapshot if:

- Confluence's memory usage is higher than you expect
- You are getting OutOfMemoryError's in your logs.

If you run into situations where Confluence is unresponsive and you are not able to trigger a memory snapshot, please ensure that you start Confluence with the onexit=memory parameter in the JVM options (as in the example below) and simply shut down Confluence. Before shutting down a memory snapshot will be created.

```
-agentlib:yjpagent=onexit=memory
```

Plugin Source Code
The source code for this Confluence plugin is available from Subversion and browseable in Fisheye. The JAR produced by 'mvn package' includes a copy of the YJP redistributable bundled in META-INF/lib/.

Trying Confluence in a Demonstration Site or Demo Space

Atlassian have set up a demonstration Confluence site called the Confluence Sandbox so that you can try out Confluence for yourself.

The Confluence Sandbox has been configured so that anyone can create or edit pages within it. When using it, you should keep the following in mind:

- This server may not be running exactly the same version of Confluence as is available for purchase. While we try to keep the two in sync, there may be differences between the Confluence Sandbox and the...
downloadable version of Confluence. The version that the Confluence Sandbox is running can be found at the bottom of each page.

- Because the Confluence Sandbox is open for anyone to edit, Atlassian cannot be responsible for the content on it. Do not rely on anything you read in the sandbox.
- The contents of the Confluence Sandbox may be edited or deleted at any time. Atlassian will restore the Confluence Sandbox from backup periodically (usually every night), deleting everything that visitors have been added to it.
- The Confluence Sandbox contains a demonstration space with a tutorial and some sample content.

For a full demonstration of Confluence, including its administrative features, you should download and install an evaluation version of Confluence instead.

- Get an evaluation version from our download site.
- Once you have set up your evaluation installation, you will see a demonstration space (with a space key of 'DS') in your Confluence site. This is your own version of the demo space, including a tutorial and some sample content.
- If you have any questions, contact us and we will be happy to answer them.

Local Confluence Documentation

This page tells you how to set up a copy of the Confluence documentation on your own local Confluence site.

On this page:

- Reasons for Setting up your own Local Documentation
- Setting up your Local Online Documentation
  - Additional Documentation Spaces Required
- Redirecting Confluence's Help Links to your Local Documentation
  - Changing the Base URL for your Help Links
  - Changing the Links for Individual Help Pages
  - Example of the Help Property File
  - Example of a Help Link
  - More Notes about Help Links

Reasons for Setting up your own Local Documentation

You may wish to run the documentation locally. In addition, you may want to point Confluence's links at your local documentation.

- If you are working in an environment without an internet connection, you will need a local copy of the documentation.
- If you have customised Confluence, you may wish to update the documentation to reflect your changes.
- You may want to change the look and feel of the documentation to integrate into your company's intranet.

Confluence's interface contains links to help pages in the online documentation on confluence.atlassian.com. You may wish to point these help links to a different destination. Possible reasons include:

- You want to point the help links to a destination behind your firewall.
- You may want to link to a translated version of the documentation.

Setting up your Local Online Documentation

To set up your own Confluence site with a copy of our Confluence documentation:

1. Install Atlassian Confluence, if you have not already installed it. (If you do not already have Confluence, ask for a free evaluation license or a starter license. You can use 'Anonymous' access to allow your users to view the documentation.)
2. Download the XML source code for the Confluence documentation. Note that the Confluence version of the XML source needs to be the same major Confluence version as your local Confluence site. For example, if the Confluence version in the XML is 3.0, you can import it into a Confluence site running version 3.0, 3.0.1 or 3.0.2. But you cannot import it into Confluence 2.9 nor into Confluence 3.1.
3. Import the XML file into your Confluence site. This will create a new space with key 'DOC'. Note: If there is already a 'DOC' space in your Confluence site, it will be overwritten. For detailed instructions, see the Confluence documentation on Restoring a Space.
4. Remove or adjust the customised header, footer and left-hand navigation bar in your new space. Explanation: When you create your new space from our XML source code, the space will inherit the Confluence 'Documentation' theme. The XML source code also includes the customisations we have made to the header, footer and left-hand navigation bar. These customisations include references to our Atlassian Documentation space. Since your Confluence site does not have that space, you will see errors like this in the left-hand navigation bar, header and footer in your new space:
Unable to render {include} Couldn't find a space with key: ALLDOC

To fix these errors, take one of the following steps:

- Customise the navigation, header and footer sections to suit your Confluence site or environment. See our documentation on configuring the Documentation theme.
- Or restore the default left-hand navigation bar, by removing all content from the navigation, header and footer sections and selecting the 'Page Tree' check box. See our documentation on configuring the Documentation theme.
- Or change the theme of your space to the Confluence default theme or another theme of your choice.

5. Download the XML source code for the additional documentation spaces listed below and import them into your Confluence site too.

6. (Optional) Follow the steps in the next section if you want to redirect Confluence's help links to point to your local documentation.

Additional Documentation Spaces Required

Why You Need the Additional Documentation Spaces

The Confluence documentation shares some content with other Atlassian products, such as JIRA. For the sake of efficiency, we reuse the same content across documentation spaces. You will notice that some of our pages contain an (include) macro that draws in content from another space.

For example, the following macro includes content from the Application Links (APPLINKS) space into the Confluence documentation space:

```
{include:APPLINKS:_securityTrustedApps}
```

You will need to import those documentation spaces into your Confluence site, to ensure that the reused content is accessible in your Confluence documentation.

Determining the Version Required

We supply different versions of the documentation, for each version of the software or plugin concerned. To see which version you need, take a look at the space key in the {include} macro concerned.

- If the space key has a number at the end, that number indicates the version. For example, 012 means version 1.2, and 011 means version 1.1.
- If the space key does not include a number, you need the latest version of the documentation.

Here is an example of an include macro that requires version 1.2 of the Application Links documentation:

```
{include:APPLINKS012:_securityTrustedApps}
```

This example requires the latest version of the Application Links documentation:

```
{include:APPLINKS:_securityTrustedApps}
```
List of Spaces Required

Retrieve the relevant version of the XML backups from these pages:

- Application Links
- Universal Plugin Manager
- User Management

Redirecting Confluence’s Help Links to your Local Documentation

In some parts of the Confluence user interface, you will see hyperlinks that point to the documentation for detailed information. These hyperlinks are Confluence's help links. You can redirect Confluence's help links to point to your local documentation.

There are two types of configuration changes you can make to the help property file:

- Change the base URL that determines the destination website of all your help links.
- Change the page name for each individual help link.

Changing the Base URL for your Help Links

You can set the base URL via the Confluence Administration Console.

To change the base URL for your help links:

1. Choose Browse > Confluence Admin.
2. Click 'General Configuration' in the left-hand navigation bar.
3. Click 'Edit'.
4. Change the 'Documentation Url Pattern' to determine the destination website for all your help links. This value forms the first part of the destination URL. For example, if you want to point your help links the 'DOC' space in your local Confluence site, your URL prefix will look like this:

   help.prefix=http://confluence.mycompany.com/display/DOC/

   In addition, you can use the following special characters in the URL:
   - {0} – Optional. This value will be replaced with the version of Confluence running on your site.
   - {1} – Optional. This value will be replaced with the page name from the configuration file.

Changing the Links for Individual Help Pages

If necessary, you can also change the individual page names to point to specific pages in your local documentation. You may want to do this if you are using a translated version of the documentation, for example, or your own custom guide rather than a copy of the Atlassian documentation.

The help links are contained in a property file. In summary, you will need to do the following:

- Make a copy of the property file that Confluence uses to control the help links.
- Place the copy in a given directory where it will override the default property file.
- Update the copy with your own values.

To change the destination of your Confluence help links:

1. Copy the confluence-x.x.x.jar file from your {CONFLUENCE-INSTALLATION}\confluence\WEB-INF\lib directory and place it in a temporary location.
   Note: Do not remove the JAR, just make a copy of it.
2. Unzip the confluence-x.x.x.jar file into your temporary location and copy the help-paths.prope
3. Put the copy of the help-paths.properties file into your {CONFLUENCE-INSTALLATION}\confluence\WEB-INF\classes directory.

   Note: The property file will override the file in the JAR.

5. Change the individual page names to point to specific pages in your local documentation. In our example file below, the first key-value pair looks like this:

   help.restore.site=Restoring+a+site

You could change it to something like this:

   help.restore.site=My+page+about+Restoring+Confluence

Example of the Help Property File

Below is an example of part of the Confluence help-paths.properties file.

```
help.prefix=http://docs.atlassian.com/confluence/docs-{0}/{1}

## Page Names
help.restore.site=Restoring+a+site
help.manually.backup.site=Manually+Backing+Up+The+Site
help.configure.server.URL=Configuring+the+Server+Base+URL
help.configure.time.date.format=Configuring+Time+and+Date+Formats
help.edit.user.details=Editing+User+Details
```

The first line (help.prefix) shows the destination website of the help links. This value forms the first part of the destination URL.

- {0} – Optional. This value will be replaced with the version of Confluence running on your site.
- {1} – Optional. This value will be replaced with the page name from the configuration file.

Below the description '## Page Names' there are a number of key-value pairs.

- The key (such as help.restore.site) is an identifier used by Confluence to find the help link for a specific screen or dialogue.
- The page name (such as Restoring+a+site) is the URL-encoded page name that forms the last part of the destination URL.

Example of a Help Link

Here is an example of a Confluence screen with two help links, one on the words 'our online documentation' and another on 'More about daily backups':

Screenshot: Example of help links in Confluence
More Notes about Help Links

- The ability to configure the destination of the help links is available only in Confluence 3.3.x and later.
- Make sure that you keep all the key-value pairs for the page names in the `help-paths.properties` file. If you want to point them all to the same location, you should retain all the keys and replace all the page names with the same name. For example:

```properties
help.prefix=http://myguide.mycompany.com
## Page Names
help.restore.site=My+guide
help.manually.backup.site=My+guide
help.configure.server.URL=My+guide
help.configure.time.date.format=My+guide
help.edit.user.details=My+guide
```

- In the above instructions on configuring help links, we assume that you want to host your local documentation on your own Confluence site. Instead, you could choose to point the Confluence help links to an entirely different set of documentation, on a website or intranet. After reading through the instructions above, you will have an idea of how to adapt them for your own purposes.
- The `help-paths.properties` file is currently in the `confluence-x.x.x.jar` in the `WEB-INF/lib` directory. Instead, it should be a config file in the `WEB-INF/classes` directory. This will make it easy for people to change the values in the file and repoint their help links. It will also standardise the help design with that of JIRA and other Atlassian applications. This issue is tracked at CONF-20105.

Confluence SharePoint Connector

- Latest version of the Confluence SharePoint Connector

Confluence SharePoint Connector 1.5.5 has now been released. See the [SharePoint Connector 1.5.5 Release Notes](#).

With the [Confluence SharePoint Connector](#) you can combine Confluence's free-form, easy to edit wiki with the document management and workflow strengths of SharePoint.

- Display SharePoint document libraries, calendars, links, discussions and more on your Confluence wiki
pages. Edit SharePoint's Office documents directly from Confluence and save them back to SharePoint.

- Embed Confluence pages and Confluence page trees into a SharePoint page. Click through from SharePoint to Confluence.
- Enjoy automatic login (single sign-on) between Confluence and SharePoint.
- Search Confluence and SharePoint content together, retrieving a unified set of results

Please refer to the SharePoint Connector documentation for more information.

**Support Policies**

Welcome to the support policies index page. Here, you'll find information about how Atlassian Support can help you and how to get in touch with our helpful support engineers. Please choose the relevant page below to find out more.

- Bug Fixing Policy
- How to Report a Security Issue
- New Features Policy
- Patch Policy
- Security Advisory Publishing Policy
- Security Patch Policy
- Severity Levels for Security Issues

To request support from Atlassian, please raise a support issue in our online support system. To do this, visit support.atlassian.com, log in (creating an account if need be) and create an issue under Confluence. Our friendly support engineers will get right back to you with an answer.

**Bug Fixing Policy**

**Summary**

- Atlassian Support will help with workarounds and bug reporting.
- Critical bugs will generally be fixed in the next maintenance release.
- Non critical bugs will be scheduled according to a variety of considerations.

![Report a Bug](image)

**Raising a Bug Report**

Atlassian Support is eager and happy to help verify bugs — we take pride in it! Please open a support request in our support system providing as much information as possible about how to replicate the problem you are experiencing. We will replicate the bug to verify, then lodge the report for you. We'll also try to construct workarounds if they're possible.

Customers and plugin developers are also welcome to open bug reports on our issue tracking systems directly. Use http://jira.atlassian.com for the stand-alone products and http://studio.atlassian.com for JIRA Studio and Atlassian OnDemand.

When raising a new bug, you should rate the priority of a bug according to our JIRA usage guidelines. Customers should watch a filed bug in order to receive e-mail notification when a "Fix Version" is scheduled for release.

**How Atlassian Approaches Bug Fixing**

Maintenance (bug fix) releases come out more frequently than major releases and attempt to target the most critical bugs affecting our customers. The notation for a maintenance release is the final number in the version (ie the 1 in 3.0.1).
If a bug is critical (production application down or major malfunction causing business revenue loss or high numbers of staff unable to perform their normal functions) then it will be fixed in the next maintenance release provided that:

- The fix is technically feasible (i.e. it doesn’t require a major architectural change).
- It does not impact the quality or integrity of a product.

For non-critical bugs, the developer assigned to fixing bugs prioritises the non-critical bug according to these factors:

- How many of our supported configurations are affected by the problem.
- Whether there is an effective workaround or patch.
- How difficult the issue is to fix.
- Whether many bugs in one area can be fixed at one time.

The developers responsible for bug fixing also monitor comments on existing bugs and new bugs submitted in JIRA, so you can provide feedback in this way. We give high priority consideration to security issues.

When considering the priority of a non-critical bug we try to determine a ‘value’ score for a bug which takes into account the severity of the bug from the customer’s perspective, how prevalent the bug is and whether roadmap features may render the bug obsolete. We combine this with a complexity score (i.e. how difficult the bug is). These two dimensions are used when developers self serve from the bug pile.

See [Atlassian Support Offerings](http://jira.atlassian.com) for more support-related information.

### How to Report a Security Issue

#### Finding and Reporting a Security Vulnerability

If you find a security bug in the product, please open an issue on [http://jira.atlassian.com](http://jira.atlassian.com) in the relevant project.

- Set the priority of the bug to ‘Blocker’.
- Provide as much information on reproducing the bug as possible.
- Set the security level of the bug to ‘Developer and Reporters only’.

All communication about the vulnerability should be performed through JIRA, so that Atlassian can keep track of the issue and get a patch out as soon as possible.

> If you discover a security vulnerability, please attempt to create a test case that proves this vulnerability locally before opening either a bug or a support issue. When creating an issue, please include information on how the vulnerability can be reproduced; see our [Bug Fixing Policy](http://jira.atlassian.com) for general bug reporting guidelines. We will prioritise fixing the reported vulnerability if your report has information on how the vulnerability can be exploited.

Further reading

See [Atlassian Support Offerings](http://jira.atlassian.com) for more support-related information.

### New Features Policy

#### Summary

- We encourage and display customer comments and votes openly in our issue tracking system, [http://jira.atlassian.com](http://jira.atlassian.com).
- We do not publish roadmaps.
- Product Managers review our most popular voted issues on a regular basis.
- We schedule features based on a variety of factors.
- Our [Atlassian Bug Fixing Policy](http://jira.atlassian.com) is distinct from our Feature Request process.
Atlassian provides consistent updates on the top 20 feature/improvement requests (in our issue tracker systems).

**How to Track what Features are Being Implemented**

When a new feature or improvement is scheduled, the 'fix-for' version will be indicated in the JIRA issue. This happens for the upcoming release only. We maintain roadmaps for more distant releases internally, but because these roadmaps are often pre-empted by changing customer demands, we do not publish them.

**How Atlassian Chooses What to Implement**

In every major release we aim to implement highly requested features, but it is not the only determining factor. Other factors include:

- **Direct feedback** from face to face meetings with customers, and through our support and sales channels.
- **Availability of staff** to implement features.
- **Impact** of the proposed changes on the application and its underlying architecture.
- **How well defined** the requested feature is (some issues gain in popularity rapidly, allowing little time to plan their implementation).
- **Our long-term strategic vision** for the product.

**How to Contribute to Feature Development**

**Influencing Atlassian’s release cycle**

We encourage our customers to vote on feature requests in JIRA. The current tally of votes is available online in our issue tracking system, [http://jira.atlassian.com](http://jira.atlassian.com). Find out if your improvement request already exists. If it does, please vote for it. If you do not find it, create a new feature or improvement request online.

**Extending Atlassian Products**

Atlassian products have powerful and flexible extension APIs. If you would like to see a particular feature implemented, it may be possible to develop the feature as a plugin. Documentation regarding the plugin APIs is available. Advice on extending either product may be available on the user mailing-lists, or at Atlassian Answers.

If you require significant customisations, you may wish to get in touch with our partners. They specialise in extending Atlassian products and can do this work for you. If you are interested, please contact us.

**Further reading**

See Atlassian Support Offerings for more support-related information.

**Patch Policy**

**Patch Policy**

Atlassian will only provide software patches in extremely unusual circumstances. If a problem has been fixed in a newer release of the product, Atlassian will request that you upgrade your instance to fix the issue. If it is deemed necessary to provide a patch, a patch will be provided for the current release and the last maintenance release of the last major version only.

Patches are issued under the following conditions:

- The bug is critical (production application down or major malfunction causing business revenue loss or high numbers of staff unable to perform their normal functions).
- A patch is technically feasible (i.e., it doesn't require a major architectural change)
  OR
- The issue is a security issue, and falls under our Security Patch Policy.

Atlassian does not provide patches for non-critical bugs.

Provided that a patch does not impact the quality or integrity of a product, Atlassian will ensure that patches
supplied to customers are added to the next maintenance release. Customers should watch a filed bug in order to receive e-mail notification when a "Fix Version" is scheduled for release.

Patches are generally attached to the relevant http://jira.atlassian.com issue.

Further reading

See Atlassian Support Offerings for more support-related information.

Security Advisory Publishing Policy

Publication of Security Advisories

When a security vulnerability in an Atlassian product is discovered and resolved, Atlassian will inform customers through the following mechanisms:

- We will post a security advisory in the latest documentation of the affected product at the same time as releasing a fix for the vulnerability. This applies to all security advisories, including severity levels of critical, high, medium and low.
- We will send a copy of all security advisories to the 'Technical Alerts' mailing list for the product concerned.
  
  Note: To manage your email subscriptions and ensure you are on this list, please go to my.atlassian.com and click 'Email Prefs' near the top right of the page.
- If the person who reported the vulnerability wants to publish an advisory through some other agency, such as CERT, we will assist in the production of that advisory and link to it from our own.

Early warning of critical security vulnerabilities:

- If the vulnerability is rated critical (see our criteria for setting severity levels), we may send an early warning to the 'Technical Alerts' mailing list approximately one week before releasing the fix. This early warning is in addition to the security advisory itself, described above.
- However, if the vulnerability is publicly known or being exploited, we will release the security advisory and patches as soon as possible, potentially without early warning.

Further reading

See Atlassian Support Offerings for more support-related information.

Security Patch Policy

Product Security Patch Policy

Atlassian makes it a priority to ensure that customers' systems cannot be compromised by exploiting vulnerabilities in Atlassian products.

Scope

This page describes when and how we release security patches and security upgrades for our products. It does not describe the whole of disclosure process that we follow. It also excludes JIRA Studio, since JIRA Studio will always be patched by Atlassian without additional notifications.

Critical vulnerabilities

When a Critical security vulnerability is discovered by Atlassian or reported by a third party, Atlassian will do all of the following:

- Issue a new, fixed release for the current version of the affected product as soon as possible, usually in a few days.
- Issue a binary patch for the current release.
- Issue a binary patch for the latest maintenance release of the previous version of the product.
Patches for older versions or releases normally will not be issued. Patches will be attached to the relevant JIRA issue. You can use these patches as a "stop-gap" measure until you upgrade your installation in order to fully fix the vulnerability.

**Non-critical vulnerabilities**

When a security issue of a **High, Medium or Low** severity is discovered, Atlassian will do all of the following:

- Include the fix into the next scheduled release, both for the current and previous maintenance versions.
- Where practical, provide new versions of plugins or other components of the product that can be upgraded independently.

You should upgrade your installation in order to fix the vulnerability.

**Other information**

Severity level of vulnerabilities is calculated based on [Severity Levels for Security Issues](https://confluence.atlassian.com/display/AtlassianPatchPolicy/Severity+Levels+for+Security+Issues).

Visit our general [Atlassian Patch Policy](https://confluence.atlassian.com/display/AtlassianPatchPolicy/Atlassian+Patch+Policy) as well.

**Examples**

**Example 1:** A critical severity vulnerability is found in a (hypothetical current release) JIRA 5.3.2. The last bugfix release in 5.2.x branch was 5.2.3. In this case, a patch will be created for 5.3.2 and 5.2.3. In addition, new bugfix releases, 5.3.3 and 5.2.4, which are free from this vulnerability, will be created in a few days.

**Example 2:** A high or medium severity vulnerability is found in the same release as in the previous example. The fix will be included into the currently scheduled releases 5.3.3 and 5.2.4. Release schedule will not be brought forward and no patches will be issued. If the vulnerability is in a plugin module, then a plugin upgrade package may still be supplied.

**Further reading**

See [Atlassian Support Offerings](https://www.atlassian.com/support) for more support-related information.

**Severity Levels for Security Issues**

**Severity Levels**

Atlassian security advisories include a severity level. This severity level is based on our self-calculated CVSS score for each specific vulnerability. CVSS is an industry standard vulnerability metric. You can learn more about CVSS at [FIRST.org](https://www.first.org) web site.

CVSS scores are mapped into the following severity ratings:

- Critical
- High
- Medium
- Low

An approximate mapping guideline is as follows:

<table>
<thead>
<tr>
<th>CVSS score range</th>
<th>Severity in advisory</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 2.9</td>
<td>Low</td>
</tr>
<tr>
<td>3 – 5.9</td>
<td>Medium</td>
</tr>
</tbody>
</table>
Below is a summary of the factors which illustrate types of vulnerabilities usually resulting in a specific severity level. Please keep in mind that this rating does not take into account details of your installation.

**Severity Level: Critical**

Vulnerabilities that score in the critical range usually have most of the following characteristics:

- Exploitation of the vulnerability results in root-level compromise of servers or infrastructure devices.
- The information required in order to exploit the vulnerability, such as example code, is widely available to attackers.
- Exploitation is usually straightforward, in the sense that the attacker does not need any special authentication credentials or knowledge about individual victims, and does not need to persuade a target user, for example via social engineering, into performing any special functions.

For critical vulnerabilities, is advised that you patch or upgrade as soon as possible, unless you have other mitigating measures in place. For example, if your installation is not accessible from the Internet, this may be a mitigating factor.

**Severity Level: High**

Vulnerabilities that score in the high range usually have some of the following characteristics:

- The vulnerability is difficult to exploit.
- Exploitation does not result in elevated privileges.
- Exploitation does not result in a significant data loss.

**Severity Level: Medium**

Vulnerabilities that score in the medium range usually have some of the following characteristics:

- Denial of service vulnerabilities that are difficult to set up.
- Exploits that require an attacker to reside on the same local network as the victim.
- Vulnerabilities that affect only nonstandard configurations or obscure applications.
- Vulnerabilities that require the attacker to manipulate individual victims via social engineering tactics.
- Vulnerabilities where exploitation provides only very limited access.

**Severity Level: Low**

Vulnerabilities in the low range typically have very little impact on an organisation's business. Exploitation of such vulnerabilities usually requires local or physical system access.

  • How we Manage Community Updates

Tweeting your Hints and Tips – Tips via Twitter
Do you have hints and tips about Confluence wiki to share with the world? Even more, would you like to see your tips appear on a page in the Atlassian documentation? Just tweet with the hash tag "#ConfluenceTips" and see your hint appear in our documentation. Then grab a badge for your blog! More...

Blogging your Technical Tips and Guides – Tips of the Trade
Have you written a blog post describing a specific configuration of Confluence or a neat trick that you have discovered? Let us know, and we will link to your blog from our documentation. More...

Contributing Documentation in Other Languages
Have you written a guide to Confluence in a language other than English, or translated one of our guides? Let us know, and we will link to your guide from our documentation. More...

Updating the Documentation Itself
Have you found a mistake in the documentation, or do you have a small addition that would be so easy to add yourself rather than asking us to do it? You can update the documentation page directly.

Getting Permission to Update the Documentation
Please submit the Atlassian Contributor License Agreement.

Our Style Guide
Please read our short guidelines for authors.

How we Manage Community Updates
Here is a quick guide to how we manage community contributions to our documentation and the copyright that applies to the documentation:
  • Monitoring by technical writers. The Atlassian technical writers monitor the updates to the documentation spaces, using RSS feeds and watching the spaces. If someone makes an update that needs some attention from us, we will make the necessary changes.
  • Wiki permissions. We use wiki permissions to determine who can edit the documentation spaces. We ask people to sign the Atlassian Contributor License Agreement (ACLA) and submit it to us. That allows us to verify that the applicant is a real person. Then we give them permission to update the documentation.
  • Copyright. The Atlassian documentation is published under a Creative Commons CC BY license. Specifically, we use a Creative Commons Attribution 2.5 Australia License. This means that anyone can copy, distribute and adapt our documentation provided they acknowledge the source of the documentation. The CC BY license is shown in the footer of every page, so that anyone who contributes to our documentation knows that their contribution falls under the same copyright.

Tips of the Trade

Below are some links to external blog posts, videos and articles containing technical tips and instructions on setting up and using Confluence. This page presents an opportunity for customers and community authors to share information and experiences.

The references here are specific to Confluence wiki and are technical 'how to' guides written by bloggers who use Confluence. For general information on wiki comparisons, wiki adoption, best practices and business cases, please refer to the Atlassian website and to our evaluator resources.

⚠️ Please be aware that these are external blogs and articles.

Most of the links point to external sites, and some of the information is relevant to a specific release of Confluence. Atlassian provides these links because the information is useful and relevant at the time it was written. Please check carefully whether the information is still relevant when you read it, and whether it is relevant to your version of Confluence. Unless explicitly stated, Atlassian does not offer support for third-party extensions or plugins. The information in the linked blog posts has not been tested or reviewed by Atlassian. We recommend that you test all solutions on a test server before trying them on your production site.

**Tips via Twitter**

This page displays a continuously-updated list of tweets from Atlassians and others, giving hints and tips about Confluence wiki. Anyone can write a tip and have it show on this page. The live Twitter stream shows recent tweets containing the word 'ConfluenceTips' or the tag '#ConfluenceTips'. We also include tweets from or to '@ConfluenceTips'.

Want to join in? Just tweet with the word '#ConfluenceTips' somewhere in the text. Then grab a badge for your blog.

- Viewing the Tweets in Twitter
- Adding a Confluence Tweets Badge to your Blog
- Adding your own Tip
Please be aware that anyone can tweet anything.

Atlassian does not monitor the tips in this Twitter stream. Anyone can tweet anything they like. We display these tips because we believe most people will do the right thing and tweet good tweets. Please check that a tweet is relevant to you before following its advice.

Viewing the Tweets in Twitter

If you prefer, you can view the search in Twitter itself.

Adding a Confluence Tweets Badge to your Blog

Would you like to let other people know that you tweet your Confluence tips? Use the code samples below to add a badge to your blog or another social site.

Choose one of these options to add the badge:

- **Badge only**
  Copy the code below and paste it into your blog to include just the badge with a link to this documentation page:

  ```html
  ```

  This is what you will get:

- **Badge and words**
  Copy the code below and paste it into your blog to include the badge and some words encouraging other people to tweet too:

  ```html
  ```
Got a Confluence tip? Tweet it now then see it in the Confluence docs.

Adding your own Tip

Quick guide to tweeting a tip

Just tweet with the word '#ConfluenceTips' somewhere in the text. Your tweet will appear in the Twitter stream on this page.

Would you like to share your information and experiences via Twitter and have your tweet appear on this page? Awesome! Here are the full instructions.

To tweet a Confluence tip,

1. Go to Twitter.com in your browser.
2. If you already have a Twitter username, sign in to Twitter now. If you do not have a Twitter username, sign up for one and follow the Twitter instructions to confirm your account details.
3. Enter your tip into the Twitter text box labelled 'What's happening'. Note that your tip can contain a maximum of 140 characters:
   - Type the words for your tip.
   - If you want people to click through to a web page to see more details about your tip, enter a web address. If the web address is long, you can convert it to a shortened address at bit.ly or one of the other web services that offer URL shortening.
   - Include the key word #ConfluenceTips somewhere in your tweet. This will ensure that your tip appears in the Twitter stream on this documentation page.
4. Click 'Tweet' to send your tweet.
5. Refresh this documentation page to see your tweet appear. It may take a few minutes, depending on the volume of tweets that Twitter is handling.
Confluence Documentation in Other Languages

Below are some links to Confluence documentation written in other languages. In some cases, the documentation may be a translation of the English documentation. In other cases, the documentation is an alternative guide written from scratch in another language. This page presents an opportunity for customers and community authors to share documentation that they have written in other languages.

⚠️ Please be aware that these are external guides.

Most of the links point to external sites, and some of the information is relevant to a specific release of Confluence. Atlassian provides these links because the information is useful and relevant at the time it was written. Please check carefully whether the information is still relevant when you read it, and whether it is relevant to your version of Confluence. The information in the linked guides has not been tested or reviewed by Atlassian.
