Confluence Documentation Home

Welcome to the documentation for Atlassian Confluence. We are so glad you have joined us on the wiki!

Getting started

- About Confluence
- Adding a page
- More things to try

Resources

- Evaluator
- Administrator
- Developer
- Knowledge base
- Getting support

Customising Confluence

- Applying a theme to a space
- Editing the colour scheme
- Changing the logo
- Choosing your home page
- Importing templates
Planning for Confluence 4

Use this page as a one-stop-shop to help you prepare for Confluence 4 and its new editor. This page is useful to people moving to Confluence 4.0 or later, from Confluence 3.5 or earlier.

⚠️ **Note:** The Wiki Markup editor has been removed in Confluence 4 and replaced with a new XHTML-based editor. Please see [Why We Removed the Wiki Markup Editor in Confluence 4.0](https://confluence.atlassian.com/x/XMHi) for full details.

✅ **Download or trial** [Confluence 4](https://www.atlassian.com/software/confluence/download).

**Confluence 4 Guides**
For Administrators

We’ve been working hard to make your life easier upgrading to Confluence 4. Here are some resources to help:

- Confluence 4.0 Release Notes
- Quick Administrator Tips To Prepare for Confluence 4
- Confluence 4 Editor FAQ
- Migration from Wiki Markup to XHTML-Based Storage Format

For Plugin Developers

Plugin developers - check out the guides we’ve created for you to help you migrate your plugins to Confluence 4:

- Preparing for Confluence 4.0
- Plugin points for the editor in 4.0
- Plugin Development Upgrade FAQ for 4.0
- Watch a webinar on preparing plugins for 4.0
- Atlascamp 2010 - Confluence 4.0 Plugin Migration Talk
- Changes to the remote API in Confluence 4.0

For Users

To make the transition easier to Confluence 4, we’ve created some guides for you:

- Confluence 4 high-level feature tour
- Quick Reference Guide for the Confluence Editor
- What’s Changed for Wiki Markup Users
- What’s Changed for Users of the Old Rich Text Editor
- Confluence 4 Editor FAQ

Need help upgrading? Don’t forget Atlassian has a large list of partners that can help you with your upgrade.

Confluence 4 Editor FAQ

Confluence 4 introduces a new editor. This page contains answers to common questions, to help you with your move to Confluence 4.

Why is Atlassian introducing a new editor in 4.0?

The editor is the single most important feature in Confluence. Confluence 3.5 has two editors: the rich text editor and the wiki markup editor. Each has its strong points and weak points.

- The rich text editor in particular has problems in stability and consistency, because it has to convert all content from rich text to wiki markup before storing content on the database. This leads to the so-called ‘round-tripping’ problems, where the page looks different in display mode than when created in edit mode.
- Many people find the wiki markup editor hard to use, particularly for long pages and complex layouts. We often hear from customers that the number one barrier to wiki adoption in their organisation is that people have to learn wiki markup.

Many customers have given us great feedback on the shortcomings of the current editors and the things they would like to see in a Confluence editor. We are introducing a single new editor to replace both the wiki markup editor and the rich text editor. The new editor will help us to solve the problems mentioned above and will provide a stable platform on which we can build high-demand features in future releases.

What about features that were previously available only in wiki markup?
We have identified these features and will add support for as many as possible in the new editor. For example, the new editor will include superscript and subscript text formatting, which is currently not available in the Confluence 3.5 rich text editor.

**So you are basically eliminating the wiki markup editor and keeping the rich text editor?**

No. While the new editor is WYSIWYG like the current rich text editor, the new editor has a completely different architecture based on a new XHTML-based storage format, and is faster and significantly more reliable. Our goal is to incorporate the strengths of wiki markup with the richness and intuitiveness of the WYSIWYG editor to produce a rich, hybrid editing experience. In particular, we are introducing options that offer the speed of the old wiki markup editor, via new features such as autocomplete and shortcut keys.

**On this page:**

- Why is Atlassian introducing a new editor in 4.0?
- What about features that were previously available only in wiki markup?
- So you are basically eliminating the wiki markup editor and keeping the rich text editor?
- Will you be able to paste wiki markup into the new Confluence editor?
- Will Confluence 4.0 support the Office Connector, including 'Edit Page in Word' functionality?
- In Confluence 4.0, will you be able to merge and split table cells?
- When will the new editor appear in Confluence?
- What does the new editor look like?
- Will Confluence still have a wiki markup editor?
- What format will Confluence use to store its page content?
- Will you be able to edit the source XML code directly?
- Will there be a tool to convert existing content from wiki markup to the new format?
- Will there be any API changes?
- How many Confluence 3.x releases will you have before 4.0?
- Will the remote XML-RPC API still work in Confluence 4.0?
- Will the new editor be included in JIRA?
- Does the SharePoint Connector support Confluence 4.0?

**Will you be able to paste wiki markup into the new Confluence editor?**

There will be multiple ways to insert wiki markup in the new editor.

For those of you that have learned wiki markup and are used to the speed of wiki markup we are really excited to let you know that you will still be able to write wiki markup in the new editor. This wiki markup converts 'on the fly', providing one of the fastest editing experiences yet.

For those of you that have scripts that produce wiki markup, or often write wiki markup in meetings, the new Confluence 4.0 editor introduces an **Insert > Wiki markup** dialog which will let you paste wiki markup for a one-way conversion.

**Will Confluence 4.0 support the Office Connector, including 'Edit Page in Word' functionality?**

Most of the features of the Office Connector (the View File macros, Import from Word) already work in 4.0. However, the 'Edit in Word' feature will be removed in Confluence 4.0.

When speaking to customers about the use of the 'Edit in Word' functionality, the primary reason for using this feature was ‘familiarity’. Business users in organisations have found the 3.5 editor and wiki markup hard to learn.

In Confluence 4.0, we have greatly simplified the new editor user interface. With extensive usability testing, we are confident the new editor will be easier to learn and more reliable to use. We also have a large majority of customers who do not use the 'Edit in Word' functionality.
Please Note: We are referring to the "Edit Page in Word" functionally - not the "Edit Attachment in Word" functionality. Editing attachments in Word will still work fine, i.e. launching Word to edit Word documents that are stored in Confluence.

In Confluence 4.0, will you be able to merge and split table cells?
Yes, you will be able to merge and split table cells. This is a brand new feature in Confluence 4.0.

When will the new editor appear in Confluence?
The new editor is in Confluence 4.0 and later.

What does the new editor look like?
To see the new editor, you can download or trial Confluence 4, or watch a tutorial video.

Will Confluence still have a wiki markup editor?
No. The vision is incorporating the best parts of the wiki markup editor into the new editor to provide the best of both worlds.

What format will Confluence use to store its page content?
A new XHTML-based storage format. Up to now, Confluence has stored its content in the database as wiki markup. In Confluence 4.0 and later, the content will be stored as XML, with a significant proportion of XHTML-based elements.

We refer to the Confluence storage format as 'XHTML-based'. To be correct, we should call it XML, because the Confluence storage format does not comply with the XHTML definition. In particular, Confluence includes custom elements for macros and more. We're using the term 'XHTML-based' to indicate that there is a large proportion of HTML in the storage format.

Will you be able to edit the source XML code directly?
Confluence 4.0 will not have an edit source mode by default. More sophisticated macro placeholders, images and link handling in Confluence 4.0 entail a lot of custom XML which make the new storage format much more complex than standard HTML. Editing this storage format by hand could result in corrupt content and the loss of page data. Source editing will still be editable via the APIs and the WebDAV client. There is also a Confluence Source Editor plugin which allows users to edit the storage format of the page. (You need Confluence 4.1.5 or later to use the plugin.)

Will there be a tool to convert existing content from wiki markup to the new format?
Yes. Where possible, Confluence will automatically upgrade existing content into the new storage format. There will be some API changes (we are trying to keep these to a minimum) and we will provide mechanisms to convert wiki markup to the new storage format.

Read the Plugin Development Upgrade FAQ for 4.0 or Planning for Confluence 4.0 to learn more about API changes.

Will there be any API changes?
Yes. There will be some API changes (we are trying to keep these to a minimum) and we will provide mechanisms to convert wiki markup to the new storage format.

Read the Plugin Development Upgrade FAQ for 4.0 or Planning for Confluence 4.0 to learn more about API changes.
How many Confluence 3.x releases will you have before 4.0?

There will be no more 3.x releases before 4.0. Confluence 3.5 is our last 3.x release.

Will the remote XML-RPC API still work in Confluence 4.0?

We currently plan to keep the existing XML-RPC API but only allow write access which will automatically convert wiki markup to the new XML storage format. This will allow you to create new pages or update existing pages as usual. We can't allow read access, however, because we can only return XML, which will break the existing APIs contract of returning wiki markup. To cover those use cases and to have a fully XML capable API, we will introduce a new API available through a separate URL which will also have a new method to migrate wiki markup to the new storage format.

Developers should read Preparing for Confluence 4.0 to learn more about API changes.

Will the new editor be included in JIRA?

At the moment we don't have any plans to do this. However, we are open to this idea and would welcome any customer feedback in this area.

Does the SharePoint Connector support Confluence 4.0?

The SharePoint Connector 1.5 is compatible with Confluence 4.x.

Confluence 4 Editor - What's Changed for Users of the Old Rich Text Editor

This page is a quick-reference guide describing the changes to the editor in Confluence 4.0 and later, showing you how to perform your day-to-day tasks in the new editor. This guide is for people who regularly used the Rich Text Editor in earlier versions of Confluence.

How to Get Started Quickly

1. Try the commands and menus you know from the old Rich Text Editor. The new editor incorporates much of the existing functionality.

2. Learn the keyboard shortcuts. Click the help icon on the editor toolbar to see a list of keyboard shortcuts.

3. Undo the autocomplete and autoformat actions. To undo something that autocomplete or autoformat has done, press Backspace on your keyboard. Alternatively, press Ctrl+Z (Windows) or Cmd+Z (Mac).

On this page:

- How to Get Started Quickly
- Before and After Guide
  - Using the Editor
  - Adding Macros
  - Formatting Text
  - Adding Symbols and Emoticons
  - Linking text
  - Using bulleted and numbered lists
  - Using tables
  - Displaying images
  - Embedding multimedia files
- Functionality that is No Longer Available
Before and After Guide

Below are the most commonly used menu options from the old Rich Text Editor, and instructions on how to perform the same actions in the new editor.

**Using the Editor**

<table>
<thead>
<tr>
<th>What You Did Before</th>
<th>What to Do Now</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Basic typing and editing:</strong> Typed your content directly into the editor window, using the toolbar buttons to insert other content.</td>
<td>Your experience should be much the same. Generally, the transition from using the Confluence 3.5 Rich Text Editor to the new Confluence 4 editor should be smooth. Try doing things the way you always did, and check the table below if you can’t find the feature you’re looking for.</td>
</tr>
</tbody>
</table>

**Adding Macros**

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now (press Enter to complete actions)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Adding a macro to your page:</strong> Clicked ‘Insert / Edit Macro’.</td>
<td>Type ‘{‘ and start typing the macro name to see a list of macros that match your text. Press the arrow keys to select the macro you want. Example:</td>
</tr>
</tbody>
</table>

![Macro suggestions]

Alternatively, use **wiki markup entirely**. Type the macro, including its parameters and the closing curly bracket. As soon as you close the macro, Confluence will convert it to rich text format and add it to the page. This means that you can skip the macro browser.

- This works if you have ‘Autoformatting’ enabled in the editor settings in your user profile.
- This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.
- Example: `(blogposts:content=titles)`

ℹ️ You can still click ‘Insert’ > ‘Other Macros’.

**Formatting Text**

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now</th>
</tr>
</thead>
</table>

---

*Confluence 4.3 Documentation*

*Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.*
<table>
<thead>
<tr>
<th><strong>Making text bold, italic or underlined:</strong></th>
<th>No change.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected text and clicked the respective menu button.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Heading levels:</strong></th>
<th>No change.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected text and chose a heading level from the menu.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Left, centre and right alignment:</strong></th>
<th>Click the left, centre and right alignment buttons on the editor toolbar:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not available in previous versions of Confluence.</td>
<td><img src="image" alt="Alignment buttons" /></td>
</tr>
<tr>
<td>This can also be used to align images independently of text.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Indentation:</strong></th>
<th>No change. Click the left and right indentation buttons on the editor toolbar:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the left and right indentation buttons on the editor toolbar:</td>
<td><img src="image" alt="Indentation buttons" /></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Making text strikethrough, monospace, superscript or subscript:</strong></th>
<th>Click this button on the editor toolbar and select from the drop-down list. Example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected text and clicked the respective menu button.</td>
<td><img src="image" alt="Formatting options" /></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Quoting text:</strong></th>
<th>No change: Use the <em>Quote</em> style – select <em>Quote</em> from the style dropdown menu or use the keyboard shortcut. Example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected text and chose the <em>Quote</em> style from the drop-down menu.</td>
<td><img src="image" alt="Paragraph styles" /></td>
</tr>
</tbody>
</table>
## Changing text colour:
Selected text and chose a colour from the menu bar.

No change: Click the colour options on the editor toolbar. Example:

![Colour palette](image)

## Adding Symbols and Emoticons

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now</th>
</tr>
</thead>
</table>
| **Smiley:**  Clicked 'Insert' > 'Emoticon' on the toolbar. 😊 | Type the globally-recognised markup for a smiley face (colon and round bracket), a wink (semicolon and round bracket), and so on. Autocomplete will convert it as you type. Example:  

: )  

ℹ️ You can still click 'Insert' > 'Emoticon' on the toolbar. |

| **Tick or check mark:**  Clicked 'Insert' > 'Emoticon' > ✅ | Type a forward slash in round brackets. Autocomplete will convert it as you type. Example:  

( / )  

ℹ️ You can still click 'Insert' > 'Emoticon' > ✅ |

## Linking text

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now (press Enter to complete actions)</th>
</tr>
</thead>
</table>

Linking to a Confluence page:
Clicked 'Insert' > 'Link' on the toolbar.

Type a square bracket '[' and start typing the page name to see the suggested pages to link to. Press the arrow keys to select the page you want. Example:

```
[ Modern Girl
```

Alternatively, use wiki markup entirely. Type the link, including the alias and the page name or URL. As soon as you type the closing square bracket, Confluence will convert the link to rich text format and add it to the page. This means that you can skip the link browser.

- This works if you have ‘Autoformatting’ enabled in the editor settings in your user profile.
- This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.
- Example: `[Modern Girl|Modern Girl song lyrics]`

ℹ️ You can still click 'Link' on the toolbar.
### Linking text to a web page:
Selected the text and clicked 'Link' > 'Web Link' on the toolbar and typed the URL into the dialog box.

<table>
<thead>
<tr>
<th><img src="image" alt="Insert Web Link" /></th>
</tr>
</thead>
</table>

Type a square bracket `[` and select 'Insert Web Link', then paste the URL into the link dialog. Example:

```
[ Modern Girl ]
```

Alternatively, use **wiki markup entirely**. Type the link, including the alias and the URL. As soon as you type the closing square bracket, Confluence will convert the link to rich text format and add it to the page. This means that you can skip the link browser.

- This works if you have 'Autoformatting' enabled in the editor settings in your user profile.
- This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.
- **Example:** [Modern Girl](http://www.example.com/song)

⚠️ You can still use 'Link' > 'Web Link' on the toolbar.
| Linking to a page that does not yet exist: | Type a square bracket '[' and the name of the non-existent page, then select 'Insert Link to Create Page'. Example: |
| Not available in previous versions of Confluence. | [ Future of the modern girl ] |
| Alternatively, use wiki markup entirely. Type the link, including the alias and the page name or URL. As soon as you type the closing square bracket, Confluence will convert the link to rich text format and add it to the page. This means that you can skip the link browser. | |
| • This works if you have 'Autoformatting' enabled in the editor settings in your user profile. | |
| • This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually. | |
| • Example: [Future of the Modern Girl] | |
| **Linking to a mailto link:** | **No change.** |
| Clicked 'Link' > 'Web Link' on the toolbar and typed mailto:username@example.com | You still click 'Link' > 'Web Link' on the toolbar and type mailto:username@example.com |
| **Linking to an anchor on a page:** | **No change.** |
| Clicked 'Link' > 'Web Link' on the toolbar and typed 'DestinationPage#AnchorName'. | You still click 'Link' > 'Web Link' on the toolbar and type 'DestinationPage#AnchorName'.
**Linking to an attachment:**
Clicked ‘Link’ > ‘Attachment’ on the toolbar.

Type a square bracket ‘[’ and start typing the attachment name to see the suggested attachments to link to. Press the arrow keys to select the item you want. Example:

```
[chos]
```

Alternatively, use **wiki markup entirely**. Type the link, including the alias (if required), the caret character ‘^’ and the attachment name. As soon as you type the closing square bracket, Confluence will convert the link to rich text format and add it to the page. This means that you can skip the link browser.

- This works if you have ‘Autoformatting’ enabled in the editor settings in your user profile.
- This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.
- **Example:** [^attachment name]

⚠️ You can still click ‘Link’ > ‘Attachment’ on the toolbar.

---

**Using bulleted and numbered lists**

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now (press Enter to complete actions)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Adding bullets:</strong></td>
<td>Type an asterisk ‘*’ followed by a space. Autoformat will convert the line to a bulleted list. You can continue typing your text immediately. Example:</td>
</tr>
<tr>
<td>Clicked ‘Unordered List’ on the toolbar.</td>
<td>My list:</td>
</tr>
<tr>
<td></td>
<td>⚫ bullet item</td>
</tr>
<tr>
<td></td>
<td>⚫ To add another line of text to an entry without creating a new list item, press Shift + Enter at the end of the line.</td>
</tr>
<tr>
<td></td>
<td>⚫ You can still click ‘Bullet List’ on the toolbar.</td>
</tr>
</tbody>
</table>

Created in 2012 by Atlassian. Licensed under a [Creative Commons Attribution 2.5 Australia License](https://creativecommons.org/licenses/by/2.5/).
### Adding numbered items

Clicked ‘**Ordered List**’ on the toolbar.

Type a hash or pound '#' followed by a space. Autoformat will convert the line to a numbered list. You can continue typing your text immediately. Example:

```
1. bullet item
```

- To add another line of text to an entry without creating a new list item, press Shift + Enter at the end of the line.
- You can still click ‘**Numbered List**’ on the toolbar.

### Adding line breaks in a numbered/bulleted list

Pressed **Shift+Enter**.

No change. You can still press **Shift+Enter**.

### Using tables

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Adding a table:</strong></td>
<td>Type a series of pipe characters '</td>
</tr>
<tr>
<td>Clicked ‘<strong>Insert Table</strong>’ on the toolbar.</td>
<td>```</td>
</tr>
<tr>
<td></td>
<td>You can still click ‘<strong>Insert</strong>’ &gt; ‘<strong>Table</strong>’ on the toolbar.</td>
</tr>
<tr>
<td><strong>Editing a table:</strong></td>
<td>No change, you can still use the toolbar table editing controls, with new features such as table merge and split.</td>
</tr>
<tr>
<td>Used the table buttons on the toolbar.</td>
<td></td>
</tr>
</tbody>
</table>

### Displaying images

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now (press Enter to complete actions)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displayed an image attached to the page:</td>
<td>Type an exclamation mark '!' and start typing the image name to see the suggested images to insert onto the page. Press the arrow keys to select the item you want. Example:</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Typed/pasted the image name inside exclamation marks '!'. Example:</td>
<td>!NoMatterWhat.png!</td>
</tr>
</tbody>
</table>

Alternatively, use **wiki markup entirely**. Type the wiki markup for the image insertion, including the exclamation marks, the space and/or page name (if different from the current page) and the image name, as well as any other allowed parameters. As soon as you type the closing exclamation mark, Confluence will convert the image to rich text format and add it to the page. This means that you can skip the image browser.

- This works if you have 'Autoformatting' enabled in the editor settings in your user profile.
- This does not work if you paste the wiki markup onto the page. You need to enter the closing exclamation mark manually.
- **Example:** !NoMatterWhat.png|align=right!

<table>
<thead>
<tr>
<th>Displaying an image attached to another page:</th>
<th>Click 'Insert' &gt; 'Search' and type search terms to find the image in Confluence. Once found, click the image and it will be added to the page.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clicked 'Insert Image' &gt; 'From the Web' and inserted the URL of the image on the other page.</td>
<td></td>
</tr>
</tbody>
</table>

**Embedding multimedia files**

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now (press Enter to complete actions)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Embedding a video, movie or audio file into a page:
Clicked 'Insert' > 'Macro' > 'Multimedia Macro' and chose content from the browser.

Use the Multimedia macro. Type an exclamation mark ‘!’ and select 'Insert Other Media'. Example:

![Multimedia macro](image)

Or type ‘{’ and start typing the macro name 'Multimedia'. Example:

```
{Multimedia}
```

Functionality that is No Longer Available

This section contains a list of things you could do in in earlier versions of Confluence, but can no longer do in Confluence 4.

1. Edit a page in Microsoft Word. See FAQ entry.

RELATED TOPICS

Planning for Confluence 4

Confluence 4 Editor - What's Changed for Wiki Markup Users

This quick-reference guide is for people who regularly used the wiki markup editor in earlier versions of Confluence. It shows you how to use the new editor to do the things you have always done. And more.

The editor offers a number of options in the toolbar. But did you know...?

- You can use autocomplete and autoformatting shortcuts instead of the toolbar.
- The trigger characters for autocomplete and autoformatting are derived from wiki markup.
- You can add macros, links and images by typing the entire wiki markup element. As soon as you close the macro, link, or image, Confluence will convert it to rich text format and add it to the page.

Hints to get you started quickly

1. Type wiki markup into the editor. Confluence’s autocomplete and autoformat will convert the wiki markup as you type.
2. **Learn the keyboard shortcuts.** Click the help icon on the editor toolbar to see a list of keyboard shortcuts.

3. **Undo the autocomplete and autoformat actions.** To undo something that autocomplete or autoformat has done, press Ctrl+Z (Windows) or Cmd+Z (Mac).

---

**Before and after guide for wiki markup fans**

Below are the most commonly used autocomplete and autoformatting triggers.

**Using wiki markup**

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Typing wiki markup:</strong> Typed text and wiki markup into the Wiki Markup Editor pane.</td>
<td>Start typing wiki markup – try it and see what happens!</td>
</tr>
</tbody>
</table>
Pasting wiki markup:
Pasted wiki markup into the Wiki Markup Editor pane.

Note: Confluence will convert the wiki markup to rich text as soon as you add it to your page. The wiki markup will not be available for editing after that. Example:

Click 'Insert' > 'Wiki Markup' on the editor toolbar.

Adding macros

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Adding a macro to your page:</strong> Typed curly brackets, the macro name and parameters. Example:</td>
<td></td>
</tr>
<tr>
<td>(blog-posts)</td>
<td>Type '{' and start typing the macro name to see a list of macros that match your text. Press the arrow keys to select the macro you want. Example:</td>
</tr>
<tr>
<td></td>
<td>{blog}</td>
</tr>
<tr>
<td>Alternatively, use <strong>wiki markup entirely.</strong> Type the macro, including its parameters and the closing curly bracket. As soon as you close the macro, Confluence will convert it to rich text format and add it to the page. This means that you can skip the macro browser.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• This works if you have 'Autoformatting' enabled in the editor settings in your user profile.</td>
</tr>
<tr>
<td></td>
<td>• This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.</td>
</tr>
<tr>
<td></td>
<td>• Example: (blogposts:content=titles)</td>
</tr>
</tbody>
</table>

Formatting text

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Bold text:</strong></td>
<td></td>
</tr>
<tr>
<td>----------------</td>
<td></td>
</tr>
<tr>
<td>Typed an asterisk ‘*’, your text, then another asterisk in wiki markup. Example:</td>
<td></td>
</tr>
<tr>
<td><em>Surf's Up</em></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Heading levels:</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Typed the heading level in wiki markup. Example:</td>
</tr>
<tr>
<td>h2. Midnight at the Lost and Found</td>
</tr>
</tbody>
</table>

| Confluence autoformat will convert the text to bold immediately. Example: |
| *Surf's Up* |

<table>
<thead>
<tr>
<th><strong>Underlining, italics, superscript, subscript:</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Typed the wiki markup characters before and after your text.</td>
</tr>
</tbody>
</table>

| Autoformatting will convert it as you type. |

<table>
<thead>
<tr>
<th><strong>Left, centre and right alignment:</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Not available in previous versions of Confluence.</em></td>
</tr>
</tbody>
</table>

| Click the left, centre and right alignment buttons on the editor toolbar: |
| ![Alignment buttons](image) |

| This can also be used to align images independently of text. |

<table>
<thead>
<tr>
<th><strong>Indentation:</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Not available in previous versions of Confluence.</em></td>
</tr>
</tbody>
</table>

| Click the left and right indentation buttons on the editor toolbar: |
| ![Indentation buttons](image) |

<table>
<thead>
<tr>
<th><strong>Line break:</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Started a new line with no empty line.</td>
</tr>
</tbody>
</table>

| Press **Shift + Enter** to force a line break without a paragraph break. This is a line break with no extra space. |
**Confluence 4.3 Documentation**

**Quotation:**
Typed the `quote` macro in wiki markup. Example:
```
{quote}Life is a lemon.{quote}
```

Use the *Quote* style – select 'Quote' from the style dropdown menu or use the keyboard shortcut. Example:

![Quote style in Confluence editor](image)

**Colour:**
Typed the `color` macro in wiki markup. Example:
```
{color:green}Bat out of Hell.{color}
```

Click the colour options on the editor toolbar. Example:

![Colour options in Confluence editor](image)

---

**Adding symbols and emoticons**

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now</th>
</tr>
</thead>
</table>
| **Smiley:**
Typed a colon and a round bracket. Example: :

<table>
<thead>
<tr>
<th>:</th>
</tr>
</thead>
</table>
| **Tick or check mark:**
Typed a forward slash in round brackets. Example: (/)

| (/) |

Type the globally-recognised markup for a smiley face (colon and round bracket), a wink (semicolon and round bracket), and so on. Autocomplete will convert it as you type. Example:

| :) |

Type a forward slash in round brackets. Autocomplete will convert it as you type. Example:

| (/) |

---

**Linking text**
<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now</th>
</tr>
</thead>
</table>
| **Linking to a Confluence page:**  
Typed the text and pasted the page name inside square brackets. Example:  
[Modern Girl|Modern Girl song lyrics] | Type a square bracket '[' and start typing the page name to see the suggested pages to link to. Press the arrow keys to select the page you want. Example:  
[Modern Girl|Modern Girl song lyrics]  
Alternatively, use **wiki markup entirely**. Type the link, including the alias and the page name or URL. As soon as you type the closing square bracket, Confluence will convert the link to rich text format and add it to the page. This means that you can skip the link browser.  
- This works if you have 'Autoformatting' enabled in the editor settings in your user profile.  
- This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.  
- Example: [Modern Girl|Modern Girl song lyrics] |
### Linking text to a web page:
Typed the text and pasted the link inside square brackets. Example:

```
[Modern Girl|http://www.example.com/song]
```

![Linking text to a web page](image)

Alternatively, use **wiki markup entirely**. Type the link, including the alias and the URL. As soon as you type the closing square bracket, Confluence will convert the link to rich text format and add it to the page. This means that you can skip the link browser.

- This works if you have 'Autoformatting' enabled in the editor settings in your user profile.
- This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.
- **Example:** `[Modern Girl|http://www.example.com/song]`

### Linking to a page that does not yet exist:
Typed the name of the non-existent page inside square brackets. Example:

```
[Future of the Modern Girl]
```

![Linking to a page that does not yet exist](image)

Alternatively, use **wiki markup entirely**. Type the link, including the alias and the page name or URL. As soon as you type the closing square bracket, Confluence will convert the link to rich text format and add it to the page. This means that you can skip the link browser.

- This works if you have 'Autoformatting' enabled in the editor settings in your user profile.
- This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.
- **Example:** `[Future of the Modern Girl]`
### Linking to an attachment:
Typed `^` and the attachment name inside square brackets. Examples:

```
[^attachment name]
[Page Name^attachment name]
```

Type a square bracket `[^` and start typing the attachment name to see the suggested attachments to link to. Press the arrow keys to select the item you want. Example:

```
[^chocs]
```

Alternatively, use wiki markup entirely. Type the link, including the alias (if required), the caret character `^` and the attachment name. As soon as you type the closing square bracket, Confluence will convert the link to rich text format and add it to the page. This means that you can skip the link browser.

- This works if you have 'Autoformatting' enabled in the editor settings in your user profile.
- This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.
  - Example: `[^attachment name]`

### Linking to an anchor within a page:
Typed the page name with the anchor name appended. Example:

```
{anchor:index}
[Page Two#index]
```

To create the anchor: Add an anchor macro using wiki markup. Confluence will convert the macro to rich text format and add it to the page. For example, to create an anchor named 'index', type the following:

```
{anchor:index}
```

To create the link: Use wiki markup too. Type the link, including the alias (if required), the hash character `#` and the anchor name. As soon as you type the closing square bracket, Confluence will convert the link to rich text format and add it to the page. This means that you can skip the link browser.

- This works if you have 'Autoformatting' enabled in the editor settings in your user profile.
- This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.
  - Example: `[Index#index]`

### Using bulleted and numbered lists

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now</th>
</tr>
</thead>
</table>

---

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Adding bullets:
Typed an asterisk '*' in wiki markup. Example:

My list:
* Bad Attitude

Adding numbered items:
Typed a hash '#' in wiki markup. Example:

My list:
# A Time for Heroes

Adding line breaks in a numbered/bulleted list:
Started a new line. Typed a double slash for an empty line. Example:

///

Using tables

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Adding a table:</strong></td>
<td>Type a series of pipe characters '</td>
</tr>
<tr>
<td>Typed pipe characters '</td>
<td>' in wiki markup. Example:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| Editing a table: | Learn the keyboard shortcuts for table editing. Click the help icon on the editor toolbar to see a list of shortcut keys. |
| Edited the text and shuffled the pipe characters around. | |

Displaying images

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now</th>
</tr>
</thead>
</table>

Type an asterisk '*' followed by a space. Autoformat will convert the line to a bulleted list. You can continue typing your text immediately. Example:

My list:

- **bullet item**

To add another line of text to an entry without creating a new list item, press Shift + Enter at the end of the line.

Type a hash or pound '#' followed by a space. Autoformat will convert the line to a numbered list. You can continue typing your text immediately. Example:

My list:

1. **bullet item**

To add another line of text to an entry without creating a new list item, press Shift + Enter at the end of the line.

Press Shift + Enter.
**Displayed an image attached to the page:**
Typed/pasted the image name inside exclamation marks '!'. Example:

```
!NoMatterWhat.png!
```

Type an exclamation mark '!' and start typing the image name to see the suggested images to insert onto the page. Press the arrow keys to select the item you want. Example:

![NoMatterWhat.png](image1.png)

Alternatively, use **wiki markup entirely**. Type the wiki markup for the image insertion, including the exclamation marks, the space and/or page name (if different from the current page) and the image name, as well as any other allowed parameters. As soon as you type the closing exclamation mark, Confluence will convert the image to rich text format and add it to the page. This means that you can skip the image browser.

- This works if you have 'Autoformatting' enabled in the editor settings in your user profile.
- This does not work if you paste the wiki markup onto the page. You need to enter the closing exclamation mark manually.
- **Example:** `!NoMatterWhat.png|align=right!`

**Displaying an image attached to another page:**
Typed/pasted the page name, a '^' and the image name inside exclamation marks. Example – to display an image that is attached to the page titled 'Home By Now':

```
!Home By Now^NoMatterWhat.png!
```

Exactly the same as when the image is attached to the same page, or use the new "Search" tab in "Insert" > "Image"

**Aligning images:**

```
!NoMatterWhat.png|align=right!
```

Click on the image and then:

Click the left, centre and right alignment buttons on the editor toolbar:

```
align-icons.png
```

This can also be used to align images independently of text.

### Embedding multimedia files

<table>
<thead>
<tr>
<th>What you did before</th>
<th>What to do now</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

---

Created in 2012 by Atlassian. Licensed under a [Creative Commons Attribution 2.5 Australia License](https://creativecommons.org/licenses/by/2.5/).
Embedding a video, movie or audio file into a page:
Used the wiki markup image format. Example: !HotPatootie.mov!

Use the Multimedia macro. Type an exclamation mark '!i' and select 'Insert Other Media'. Example:

Or type '{m}' and start typing the macro name 'Multimedia'. Example:

Functionality that is no longer available
This section contains a list of things you could do in in earlier versions of Confluence, but can no longer do in Confluence 4.

1. Edit a page in Microsoft Word. See FAQ entry.
2. Edit, copy or view the wiki markup source of a page. This is because content is no longer stored in wiki markup format.

New source editor plugin
The Confluence Source Editor plugin allows users to edit the XHTML-based storage format of the page. You need Confluence 4.1.5 or later to use the plugin.

Quick Administrator Tips To Prepare for Confluence 4
We've put together some quick tips on how Administrators can prepare for Confluence 4:

1. Stay Updated On The Latest Docs
Watch the Planning for Confluence 4 page. We will update that page with more resources as we make further progress - so make sure you stay updated!

2. Download, install and trial Confluence 4
We strongly encourage you to set aside some time to download and install the latest version of Confluence 4.x. You can be better prepared by conducting an upgrade of your data in a test environment to see how the upgrade
goes. Don't forget to get your internal users (especially the power users) to try Confluence 4. Ask them to go to their complex pages and see what they look like in the new editor and get feedback from them.

3. Give us feedback!

We really would love your feedback as you trial Confluence 4. We've made it really easy to do so. All you have to do is simply click the "Got Feedback" button you see in the Confluence toolbar:

![Click Me Button]

This feedback will go directly to the Confluence team.

⚠️ If you need support, please get in touch with our legendary support department at support.atlassian.com.

4. Upgrade your user macros - Now!

With the introduction of Confluence 4, all macros that are inserted in the editor will need to be entered using Macro Autocomplete, or through the Macro Browser. This includes User Macros too!

However, a problem with User Macros in the past was that the only way to insert them was if you knew what parameters were available - and that wasn't documented anywhere.

Now, if you are running Confluence 3.4 or higher, we introduced the ability for an Administrator to make their user macros visible in the Macro Browser and Macro Autocomplete. So the good news is you can prepare for that now, without having to wait for your Confluence 4 upgrade. How do you do this? You will need to define parameters for your user macros. All the documentation on how to do this can be found here. We've also created two examples to help you get started.

⚠️ Important: This is required to enable user macros in Confluence 4.

6. Test your plugins

Although not all plugins are compatible with Confluence 4 yet, you can still test a majority of your plugins in Confluence 4. We strongly recommend you try this and let Atlassian know if there are any issues. This is really important especially if you have custom plugins that you've built internally.

❓ How do I migrate my plugins to Confluence 4? All this information for plugin developers can be found from the Planning for Confluence 4 landing page.

**Trying Confluence 4 Yourself**

Confluence 4 is here! Try your own hosted or downloadable version, free for 30 days: Try Confluence.

Giving Feedback on Confluence Releases

Atlassian is an open company, and we welcome customer feedback on releases of our products.

To provide your feedback, there are several ways you can get in touch with Atlassian:

1. Atlassian Answers

If you have a question like "How do I do (a given task) with Confluence now?", then Atlassian Answers is the best place to visit. There, our vibrant community of power users and developers quickly answer questions of all kinds and provide information on advanced tips and tricks.

2. The Atlassian Public JIRA

Atlassian collects and tracks customer feature requests and bug reports in our public instance of our issue tracker, jira.atlassian.com. There, you can request new product features or report bugs, as well as see all of the other feature requests and bug reports that customers have raised. If you agree with another point that’s been raised, you can vote on it to help it along. The Atlassian product managers read and maintain the issues in JIRA, so this is the best place to lodge your opinion about the product.

Confluence 4 Editor - Customer Feedback

FAQs

Commonly brought up comments which may be of use to others who are following this page

<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is there a 'Confluence 4 for Wiki Markup users' guide available?</td>
<td>Yes, please see Confluence 4 Editor - What's Changed for Wiki Markup Users. If you have anything you'd like to see added to that page, please leave a comment there.</td>
</tr>
<tr>
<td>How can I edit the source / storage format of a page in Confluence or in</td>
<td>You can download the Source Editor, a free plugin maintained by Atlassian and available here.</td>
</tr>
<tr>
<td>an external editor.</td>
<td></td>
</tr>
<tr>
<td>I have a script that generates Wiki Markup, can I still insert it into</td>
<td>Yes. You can use the Insert Wiki Markup Dialog, just choose 'Insert' then 'Wiki Markup' or use the shortcut &quot;command/ctl + shift + D&quot;</td>
</tr>
<tr>
<td>a page?</td>
<td></td>
</tr>
<tr>
<td>I have a script that generates Wiki Markup and writes it to a Confluence</td>
<td>Yes. You can still send Wiki markup to the API which will convert it to the new source format and save. See this Answers discussion for more.</td>
</tr>
<tr>
<td>page using the API, can I still do this?</td>
<td></td>
</tr>
<tr>
<td>I have a script that consumed Wiki Markup from Confluence, do I need to</td>
<td>Yes. Wiki Markup is no longer available as an output from Confluence. Unfortunately this means you will need to re-write any scripts which consumed Wiki Markup from Confluence (often via the API as an example) to instead read the new XML based Storage Format.</td>
</tr>
<tr>
<td>re-write it?</td>
<td></td>
</tr>
<tr>
<td>I take notes in meetings etc offline in a text editor, formatted with</td>
<td>Take your notes as before then insert them into a page using the Insert Wiki Markup Dialog, just choose 'Insert' then 'Wiki Markup' or use the shortcut &quot;command(or ctrl)+shift+D&quot;</td>
</tr>
<tr>
<td>Wiki markup then add them to a page later, how can I do this now?</td>
<td></td>
</tr>
<tr>
<td>How can I move the cursor outside a Macro (eg: a {code} or {column}</td>
<td>You can just press the 'down' arrow until the cursor moves out of the macro and back onto the page.</td>
</tr>
<tr>
<td>macro) without using the mouse?</td>
<td></td>
</tr>
</tbody>
</table>
A macro I wrote that worked in 3.x no longer works for Confluence 4

See Upgrading and Migrating an Existing Confluence Macro to 4.0

Enter/Return gives me a new paragraph, how do I insert just a line break?

Press Shift+Enter

How can I quickly turn already entered text into a link?

You can highlight the string you want to convert, press [ and wait until the autocomplete menu appears then select from the available options to Search for a page with the title of that text, insert a web link with that text as the clickable link or to insert a link to create a page with that title.

A short "how-to" from Shannon Greywalker for doing unbalanced tables, tables within tables, etc. in the new 4.x editor.

Available here.

Why not make wiki-markup editor on top of XHTML storage? Just some engine, which would convert XHTML to wiki-markup and back on save.

Wiki markup can only represent a subset of what can be represented in XHTML. A wiki to XHTML conversion would be lossy meaning that when a 'wiki preferring' author made changes to the page of an 'xhtml preferring' author they would mangle (to some degree) the original author's page.

This is a reverse of the round-tripping bugs that used to be encountered when the storage was wiki but the editor was HTML.

One fairly typical example would be the case of merged table cells. Confluence Wiki markup cannot represent merged cells, whereas XHTML (and so therefore Confluence storage format) can.

I want to force something to stay as Wiki Markup on a page, not be converted.

You can use Bob Swift's Confluence Wiki Plugin, details here.

Is there a way to search across the instance for where a macro is used in a page?

You can do this with the use of the Confluence Macro Indexer plugin. Details on it's use are available here.

---

External Resources

Contributors to this page have kindly collated the following useful references which may assist anyone transitioning from Wiki Markup to the new Editor

- A short "how-to" from Shannon Greywalker for doing unbalanced tables, tables within tables, etc. in the new 4.x editor is available here.
- Advanced tips on the Confluence 4 editor, wiki markup and the XML storage format by Graham Hannington are available here: Advanced Confluence Tips. These include information about:
  - Wikifier, a tool for converting Confluence XML to wiki markup, and for converting Confluence rich text to wiki markup.
  - A Greasemonkey script for The Wiki markup toolbar button which selects the page contents and opens it in the Insert Wiki Markup Dialog for editing.

---

Bugs / Improvement / New Feature Requests

If you have feedback on a bug, a task you now find harder or are unable to do in the new editor then please
leave a comment below and we'll incorporate it into this page (and remove the comment afterwards). Please note that these are usually only updated once completely fixed, we track progress separately on an internal queue.

<td>Alex, I'd love to hear more details on your use case for this. Even before when both editors were using Wiki markup, it seems like a lot of manual work.</td>
<td></td>
</tr>
</tbody>
</table>
We do sometimes copy over parts of the text from JIRA to Confluence and back, and earlier the wiki markup mode allowed to keep text formatting fully same across both systems without any additional effort. Right now you can copy formatted text from JIRA to Confluence, if you highlight and copy it from the issue details page, not issue edit. However, this is not that handy, because you can't use Ctrl+A to actually highlight all the description text instantly. And obviously - there is no way now to copy formatted text parts from Confluence to JIRA.

Interested to know whether the new Remote Issue Links functionality that is coming in JIRA 5.0 would help you. You can see this working on jira.atlassian.com right now, eg: because I've referenced

`CONF-24038 - Authenticate` to see issue details on this page there is an automatic issue link created to point back to here (as well as the obvious link from here to the JIRA case). I find this handy as then say a spec will be written in Confluence and easily linked to the JIRA case.

Seems to me the goal for us should be that we allow Confluence and JIRA to integrate in such a way that more value is created by using them together, and you wouldn't feel the need to copy/paste descriptions between them, so very keen to hear if Remote Issue Links helps or if it doesn't, more details on your needs.

</tr>
</tbody>
</table>
Okay, as the WYSIWYG abilities are wider than wiki markup allows - let it be. But you can still provide a solution similar to one implemented in JIRA search. In there you have a search form for rather simple requests, and direct SQL edit for complicated requests. And if directly edited SQL is too complicated to show it as a form - it just tells you "search query is too complicated" and doesn't allow to switch back to form.

As earlier you have claimed that implementing XML-to-wiki transformation is easy - I see no problem to still allow wiki edit, but with XML format on backend and disallow wiki if something too complicated was created through WYSIWYG.

This can easily be added as a plugin, to solve your problem with complains on the core software.

This sounds like a very good idea, and I hope Atlassian will take the time to investigate it. By definition, people who still want to use wiki markup will not be using the most complex WYSIWYG-only formatting, so it should be possible to convert almost everything such users write back to markup.

Another suggestion would be to extend the Wiki Markup Styler plugin to do the same thing. Ideally, any content that can be converted back to markup, would be. And any complex elements that cannot be converted would just appear as they do in the normal WYSIWYG view. This would avoid the possibility of one complex piece of content causing a whole page to be marked as "too complicated to edit through wiki markup".

If Atlassian choose to do this, the other vital requirement (for me) is that we can copy the wiki markup from the editor. At the moment, the plugin displays markup elements on-screen, but if I try to copy them it just gives me the underlying text. In common with other commenters, sometimes I prefer to copy markup from a Confluence page into a text editor and edit it there, before pasting it back (either into a different page, or into another part of the same page).
<table>
<thead>
<tr>
<th>Todd Day</th>
<th>Keep wiki markup format by wrapping in a &quot;wiki markup&quot; macro</th>
</tr>
</thead>
<tbody>
<tr>
<td>Andrew Spina</td>
<td>----</td>
</tr>
</tbody>
</table>

Todd - Ability to wrap entire pages in the Wiki Markup macro and not have them auto-convert to storage format. Additionally:

- Macros that come from plugins I currently use in 3.5 continue to work the same way in the wiki code block. I'm willing to wait for the authors (Adapatvist, Customware, and the guy who wrote the LaTeX plugin) to upgrade their plugins for 4.0, but the end result must be that I can write in 4.0 wiki code blocks the same way I currently write in the 3.5 wiki editor.
- User macros I wrote for 3.5 need to also appear in the 4.0 wiki code blocks.
- When upgrading from 3.5 to 4.0, I want the upgrade process to wrap every page in a wiki markup block instead of converting it to the new XHTML format.
- Site and Space themes should be definable in terms of Wiki format.
- It would be nice if the wiki code blocks had a button on them that would convert to the new XHTML format if you pressed it. I understand this would be a one-time no-reversal operation, and that would be fine with me.

----

Andrew

- I haven't read through this post, but this page says to post requests here. I'm new to confluence (and like it a lot), but was wondering why wiki markup is translated into a wysiwyg format after entry. I was wondering if it made sense to allow people to make a container (like a new column) which would preserve wiki markup, but render it on the saved page as rich text? I know it's not as friendly to non-technical users, but it seems a bit closer to the middle ground. Just a thought...

- See related issue at CONF-23895 - Authenticate to see issue details
| Don Gamble                                      | Treat macros and all special editor objects (images, links, etc) the same - i.e. they would all have a frame.  
|                                               | Currently the new editor doesn't treat everything as equivalent. This results in issues with where the insertion point moves during editing, what is selected, what gets cut or pasted, etc. Treating everything special (i.e. macros, images, links - things with parameters and/or bodies) as a framed object allows everything to be treated as an object, just like a character of text. Providing the frame also now allows you to explicitly see what is inside and outside a special object and allows you to select the object. For example, there is currently no way to select a link. You can select text that is linked, you can select an image that is linked, but you can't select a link. Raised in CONF-24026. |
|                                               | Display the associated parameters of the object (macro, image, link, etc) as text in the header of the objects frame.  
|                                               | With macros and special objects now having a frame, the hidden parameters of a macro/special object can now be displayed. Entering edit mode should expose all of the hidden information that is not visible when the page is rendered. Currently entering edit mode results in still having to enter a deeper edit mode (i.e. the macro browser or the special popups) to see the true values to edit. An edit mode within an edit mode is a huge productive hit. Simply seeing how a page was created is not currently possible while in edit mode.  
|                                               | A guiding rule should be "While in edit mode the user will be able to inspect the page and see all the properties effecting how the page renders without needing to do any further activities." If this rule was true a majority of the productivity hit of the new editor would be resolved. To do this requires displaying the parameters of macros and special objects in their frame. Raised in CONF-24026. |
| **Don Gamble** | Allow the parameters in the frame to be edited as name value pairs and re-interpreted when focus leaves the frame.  

The final hit to productivity of the new editor is the need to enter a sub-edit mode (the macro editor or the special popups) when making a change to a parameter that is already applied to a macro or a link/image. Allowing the name value parameter pairs in the frame to be edited would allow rapid changes to be made with a few keystrokes with no loss of user focus caused by having to visit a dialog.  

Allowing new parameters to be added into the frame by just typing, for example "width" which is an obvious and easily remembered parameter on many macros, would allow common edits to occur quickly. Parameters that could not be parsed after the edit completes (i.e. after focus leaves the frame) could be handled by highlighting or in a similar way to how firebugs lets users change the parameters in the html editor window. Raised in [CONF-24026](https://jira.atlassian.com/browse/CONF-24026). |
| **Don Gamble & Eddie Fast** | The confluence editor should behave very similar to every other commonly used editor. At a high level, today's user's expectations of how an editor reacts is common across all editors. If the editor doesn't behave as commonly expected then the user's experience is compromised (some would say the editor is broken or unusable). I see these expectations as (please comment - do others agree?):  

1. The focus of all activity occurs at the insertion point or selection.  
2. Pressing backspace or delete, removes what is to the left/right of the insertion point or removes what is selected.  
3. Typing or pasting inserts the contents at the insertion point or replaces the selection and leaves the insertion point after what is selected.  
4. Moving left, right, up, down with the arrow keys or page up/down in a document, if the same key presses are reversed, should place the cursor back in exactly the same location as it was before the first key press.  
5. Holding the shift key while moving left, right, up, down should extend (or start a selection from the insertion point). Pressing the opposite key should reduce the selection. |

*Created in 2012 by Atlassian. Licensed under a [Creative Commons Attribution 2.5 Australia License](https://creativecommons.org/licenses/by/2.5/au/).*
In general, the new editor doesn't respect these user expectations. This makes it slow, hard to use, and I would argue filled with special situations that while can each be individually explained as correct - as a whole make it wrong. An editor should be a simple experience - not complex.

Specifically with respect to what should happen when the insertion point is at the beginning of a macro, i.e. just inside the body. I would suggest:

- Pressing the backspace key should do something, currently it does nothing when just within the body.
- Pressing the left arrow moves to the outside of the macro (CORRECT), but starting at the same spot and pressing the left arrow, while holding the shift key, doesn't appear to do anything.
- Unfortunately, it is more complex (in Firefox at least) continuing to press the left arrow while holding shift results in first the insertion point disappearing, with nothing selected, then nothing on the next key press. After some number of key presses the insertion point reappears with no selection. Reversing, i.e. pressing the right arrow with shift held, results in the insertion point appearing, then a selection appearing, then an insertion point, etc. Nothing is obvious as you attempt to select across a macro.

Open company, no bullshit

A Message from Atlassian's Founders

Hi there,

Most of you already know why we removed the wiki markup editor in Confluence 4.0. We pride ourselves on being an open company, so it should be no surprise that we were really upset to learn that a few customers felt we had 'betrayed them' with this decision.

Firstly, to those people, we are genuinely sorry that you did not know about this change. We want you to know that we fully understood the enormity of this change for our existing customers - hence why we began communicating our plans over a year in advance in order to give everyone ample time to prepare. We started this process 15 months before shipping Confluence 4.0. During this period we made many public announcements about our intentions, collected tons of feedback throughout our Early Access Program, and built a comprehensive set of resources including:
• **June 2010** - At Summit 2010 we publicly announced our plans to consolidate the wiki markup and rich text editors into one single editor in Confluence 4.0

• **July 2010** - Released an FAQ about the changes we had planned. Over the year we received a lot of questions and updated the FAQ very frequently

• **December 2010** - Atlassian began using Confluence 4.0 in production internally and began gathering feedback from heavy wiki markup users

• **June 2011** - Released a comprehensive Early Access Program ("EAP") where customers could download 4.0 and provide feedback. We received and responded to over 250 pieces of feedback during the Early Access Program

• **June 2011** - Included with the EAP we released a comprehensive set of "change management" documentation including:
  - A comprehensive set of release notes describing every new feature and planned change in 4.0
  - A comprehensive planning guide for Administrators, End Users and Developers
  - A quick-guide to help administrators prepare

• **June - September 2011** - Frequently updated EAP releases where we collected customer feedback and responded with changes / fixes

• **September 2011** - Released Confluence 4.0 with a microsite to help users discover new features and a complete change guide to help avid wiki markup users learn to be efficient in the new editor

If you did not hear about the new editor via all of these communiques, we're sorry. We will endeavour to communicate even more in the future, especially should there be another such major update.

**Collective customer feedback drove this decision**

We listen to our customers – a lot. The number one reason we made the decision to remove the wiki markup editor was the collective feedback we’d been gathering since we first released Confluence in 2004.

We've always encouraged you to publicly tell us how we can improve our products and make them work better for your organisation. We can't think of another company that is as open as Atlassian and we're proud of that.

Looking at the feedback we received and the things we heard time and time again in countless customer interviews, it was clear as day that the dual editing experience – Wiki Markup and Rich Text – was the number one hindrance to Confluence adoption.

The endless cycle of round-tripping bugs made the editor unreliable and unusable for the majority of users, and the lack of advanced features like the ability to merge table cells was stopping you from seeing the full value of Confluence.

You told us these things, we listened, and replacing wiki markup was the most viable solution to giving you what customers collectively asked for, a kick-ass editing experience with more powerful editing features.

**Customers love the new editor**

Has it been all bad news? No - far from it. We've been thrilled with the overall response from customers so far. Here's a sample of the feedback we've been seeing about the new editor in Confluence 4 – there's much **much, much more**. I didn't have time to list all of the tweets, emails and "Contact the CEO" submissions we've received:
Yet... there are two sides to every story

Up front communication and listening to users aside, we’re not blind to the fact that there are customers who were completely happy with the wiki markup editor and don’t see the need for a change.

Don’t get us wrong, we do understand their point of view. They just want a wiki markup editor and we understand their frustration at our decision to replace it with a higher fidelity storage format.

We still believe we made the best decision based on the collective feedback we received from the majority of our customers over the years – but, being completely frank, wiki markup is not coming back. The new editor is our path going forward.

We’ve been listening to your feedback

Thanks to all of you who took the time to provide constructive feedback about the new editor. You’ve helped us highlight issues that we need to address. Our Confluence team has been working really hard to get the following features and fixes into your hands:

1. Find and Replace within the editor – shipped in Confluence 4.1
2. Wiki Markup Autoformatting for Macros, Links, and Images – shipped in Confluence 4.1.2
3. WYSIWYG Page Layouts – coming in Confluence 4.2
4. WYSIWYG Page Templates – on our short-term roadmap

We’re 110% committed to making the new editor an even more kick-ass, reliable editing experience. Truly the best editing experience in the world. We’ve made huge leaps in the last year - but we’re not done yet.

We have a team of passionate, dedicated developers working full time to improve the editor and address niggles that arise.

We’re building a source editor!

We’ve learned from your feedback that customers have a number of valid reasons for directly editing the source of a page:
1. **They feel locked-in** - Because people were no longer able to edit a text based version of their page directly, they felt they were locked into Confluence. While you could always still get your content out via the API or through WebDAV but people wanted to be able to see it directly. This was never our intention and we’re rectifying it in two ways as you will see below.

2. **They want to fix formatting niggles** - Unfortunately over the years we trained everyone on this - what do you do when you hit a bug in the RTE? Switch to wiki markup. This wasn't really acceptable then and definitely isn't now, but people have asked for it over and over.

3. **Content workflows** - We underestimated how many people copy the source of their page out of Confluence to work with it in other ways, whether it be updating content offline, sharing with others via email, or using a preferred text editor for things like bulk changing of link properties.

Since we realise how important source access is to you, we're currently working on a free "Advanced Editor" plugin that will allow your users to edit your page's source amongst other advanced user editing. We hope it will address the major issues that some users have identified, like the ability to search for and update URLs and the file names of embedded images.

You can check out and comment on the spec at [Specification - Confluence Advanced Editor](http://www.specification.com).

⚠️ The beta for this plugin is now available on the plugin exchange under the name [Confluence Source Editor](http://www.pluginexchange.com).

We welcome your feedback - please file issues in the JIRA project at [http://jira.atlassian.com/browse/SOURCE](http://jira.atlassian.com/browse/SOURCE).

**Storage Format**

Some people have questioned whether this is a vendor lock-in play. It is not. The new storage format is based on XHTML with extension tags for Confluence specific functions. We've begun documenting it here so you can see exactly what is happening under the covers - to use in your plugins, remote applications, scripts, integrations etc. I think you'll agree this is pretty "standard stuff" and able to be understood by those who need to script it.

We refer to the Confluence storage format as 'XHTML-based'. To be correct, we should call it XML, because the Confluence storage format does not comply with the XHTML definition. In particular, Confluence includes custom elements for macros and more. We're using the term 'XHTML-based' to indicate that there is a large proportion of HTML in the storage format.

**Why didn't we do this in the first place?**

When we shipped Confluence 4.0 we decided to not offer a source editor for a number of reasons. First of all, the new XHTML-based storage format is more complex than wiki markup so it's not as readable to the average user. Secondly, we wanted to protect less technical users from breaking their pages by accidentally deleting a closing tag or entering invalid HTML. This is why we're proposing that the source editing plugin is only enabled for your advanced users - and the storage format is not meant for day-to-day human editing.

**Just try it.**

Seriously, I encourage you to give the new editor a go. Listening to your feedback we've seen that many of you have not yet tried the new editor. We spent a lot of time thinking about what most people use wiki markup for - why people love it - and we determined that it was speed. Speed to be able to create content without picking up your mouse. So we've built many features and made design decisions with this in mind.
If you haven't already, please give these editor features a try:

- **Autoformatting** of Wiki Markup
- **Autocomplete** for Links, Media, and Macros
- **Autoconvert** for Pasted Links

If you still feel that you just cannot live without wiki markup, there are many other wikis which have it as their lingua franca. We're happy to provide a list of [other wiki solutions](#), although I assure you none are as feature rich or flexible as Confluence.

**We won't stop listening**

As I mentioned, we'd love your feedback on the following:

- [Specification - Confluence Advanced Editor](#)
- [Documenting the Storage Format](#)

And as per the original purpose of this page, we'd love your feedback on the editor itself and how we can improve it for you. Thank you to everyone who has contributed constructively so far.

We see Confluence changing the way a company works and collaborates. That amazing change is why we come to work every day. Please help us make it a reality for you at your company.

- Mike Cannon-Brookes and Scott Farquhar

---

**Confluence Alternatives**

In September 2011 we [released Confluence 4.0](#). Underpinning the new functionality it included was a change to the way Confluence stored its pages, moving from wiki markup to a higher fidelity storage format. You can read more about this decision here – [Why We Removed the Wiki Markup Editor in Confluence 4.0](#).

For the overwhelming majority of customers, this was a huge, huge win. An end to the inherent problems of having two editors and the ability for us to deliver features people had long asked for. We did our best to make wiki markup gurus comfortable as well, with a number of features designed to make the new editor faster than wiki markup:

- **Autoformatting** of Wiki Markup
- **Autocomplete** for Links, Media, and Macros
- **Autoconvert** for Pasted Links

For a small number of users though, this never mattered – like users working within a small, purely technical team who don't:

- collaborate with other less technical teams like marketing, sales and product management
- require dedicated vendor support
- rely upon the various add-ons available on the Atlassian Plugin Exchange
- need a wiki that provides structure through page hierarchies
- require enterprise-grade security, permissions and native LDAP integration
- need deep JIRA integration

We hate losing customers – it upsets us. We still think we make the best enterprise wiki available today, but if wiki markup syntax is generally more useful to you than Confluence's extensive set of add-ons, structured
page hierarchies, robust security and permissions, JIRA integration, and an editor anyone can use, we genuinely think you should try an alternative.

In the spirit of being an open company, here's a list of the more popular wikis that provide a markup editor.

- MediaWiki
- TWiki / Foswiki

Wikipedia has a more exhaustive list here. Feel free to comment on this page if you know of other solutions.

**Feedback on Confluence Storage Format**

When upgrading from Confluence 3.x to Confluence 4.x, the underlying storage format for your content will be migrated from a wiki markup-based format to a new XHTML-based format. This page describes the new storage format, and provides an opportunity for people to discuss the storage format and related ideas.

**On this page:**

- [ Comments welcome ]
- [ Notes about the storage format ]
- [ Macros ]
- [ Headings ]
- [ Text effects ]
- [ Text breaks ]
- [ Lists ]
- [ Links ]
- [ Images ]
- [ Tables ]
- [ Page layouts ]
- [ Emoticons ]
- [ Resource identifiers ]
- [ Template variables ]
- [ Another page available for further discussion ]

Comments welcome

This page has attracted a lot of interest and a number of very valuable comments. Please have a read, to see the ideas that people have proposed.

**Notes about the storage format**

- You can view the Confluence storage format for a given page by choosing **Tools > View Storage Format**. This option is only available if one of the following is true:
  - You are a Confluence administrator.
  - Your Confluence site has the Confluence Source Editor plugin installed and you have permission to use the source editor.
- If you would like to edit the storage format for a page, your Confluence system administrator will need to install the Confluence Source Editor plugin.
- Clarification of terminology: If you choose **Tools > View Source**, you will see the format used within the editor panel, not the storage format of the page.
- We refer to the Confluence storage format as 'XHTML-based'. To be correct, we should call it XML, because the Confluence storage format does not comply with the XHTML definition. In particular, Confluence includes custom elements for macros and more. We're using the term 'XHTML-based' to indicate that there is a large proportion of HTML in the storage format.

![Under consideration]

Provide an XSD - "an XSD could make on the fly validation for persons having an editor supporting it (e.g. Visual Studio), and since an XSD would be a way to validate your input. [CONF-24884 - Authenticate to see issue details]
### Macros

See [Confluence Storage Format for Macros](#).

### Headings

<table>
<thead>
<tr>
<th>Format type</th>
<th>In Confluence 3.5 and earlier</th>
<th>In Confluence 4.0 and later</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td>Heading 1</td>
<td>h1. Heading 1</td>
<td>&lt;h1&gt;H1&lt;/h1&gt;</td>
<td><strong>Heading 1</strong> Underlined in the Documentation Theme</td>
</tr>
<tr>
<td>Heading 2</td>
<td>h2. Heading 2</td>
<td>&lt;h2&gt;H2&lt;/h2&gt;</td>
<td><strong>Heading 2</strong> Underlined in the Documentation Theme</td>
</tr>
<tr>
<td>Heading 3</td>
<td>h3. Heading 3</td>
<td>&lt;h3&gt;H3&lt;/h3&gt;</td>
<td><strong>Heading 3</strong></td>
</tr>
</tbody>
</table>

Headings 4 to 6 are also available and follow the same pattern.

### Text effects

<table>
<thead>
<tr>

</tbody>
</table>

<table>
<thead>
<tr>
<th>Link to an external site</th>
<th><a href="http://www.atlassian.com">Atlassian</a></th>
<th>Atlassian</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Anchor link</th>
<th><a href="#anchor">Anchor Link</a></th>
<th>Anchor Link</th>
</tr>
</thead>
</table>

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
| Link with an embedded image for the body | ![google.png|pagetitle#anchor] |
|-----------------------------------------|--------------------------------|
|                                         | <ac:link ac:anchor="Anchor Link"> |
|                                         |     <ac:link-body>               |
|                                         |     </ac:link-body>             |
|                                         | </ac:link>                      |

⚠️ For rich content like images, you need to use ac:link-body to wrap the contents.

A note about link bodies

All links received from the editor will be stored as plain text by default, unless they are detected to contain the limited set of mark up that we allow in link bodies. Here are some examples of markup we support in link bodies.
An example of different link bodies

```html
<ac:link>
  <!-- Any resource identifier -->
  <ri:page ri:content-title="Home" ri:space-key="SANDBOX" />
  <ac:link-body>Some <strong>Rich</strong> Text</ac:link-body>
</ac:link>

<ac:link>
  <!-- A link body isn't necessary. Auto-generated from the resource identifier for display. -->
  <ri:page ri:content-title="Plugin developer tutorial stuff" ri:space-key="TECHWRITING" />
  <ac:link-body><![CDATA[A plain <text> link body]]></ac:link-body>
</ac:link>

The markup tags permitted within the <ac:link-body> are <b>, <strong>, <em>, <i>, <code>, <tt>, <sub>, <sup>, <br> and <span>.

Images

<table>
<thead>
<tr>
<th>Format type</th>
<th>In Confluence 3.5 and earlier</th>
<th>In Confluence 4.0 and later</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attached image</td>
<td><img src="atlassian_logo.gif" alt="Atlassian logo" /></td>
<td><img src="atlassian_logo.gif" alt="Atlassian logo" /></td>
<td><img src="atlassian_logo.gif" alt="Atlassian logo" /></td>
</tr>
</tbody>
</table>
```
Confluence 4.3 Documentation

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ac:align</td>
<td>image alignment</td>
</tr>
<tr>
<td>ac:border</td>
<td>Set to &quot;true&quot; to set a border</td>
</tr>
<tr>
<td>ac:class</td>
<td>css class attribute.</td>
</tr>
<tr>
<td>ac:title</td>
<td>image tool tip.</td>
</tr>
<tr>
<td>ac:style</td>
<td>css style</td>
</tr>
<tr>
<td>ac:thumbnail</td>
<td>Set to &quot;true&quot; to designate this image as a thumbnail.</td>
</tr>
<tr>
<td>ac:alt</td>
<td>alt text</td>
</tr>
<tr>
<td>ac:height</td>
<td>image height</td>
</tr>
<tr>
<td>ac:width</td>
<td>image width</td>
</tr>
<tr>
<td>ac:vspace</td>
<td>the white space on the top and bottom of an image</td>
</tr>
<tr>
<td>ac:hspace</td>
<td>the white space on the left and right of an image</td>
</tr>
</tbody>
</table>

Supported image attributes (some of these attributes mirror the equivalent HTML 4 IMG element):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ac:align</td>
<td>image alignment</td>
</tr>
<tr>
<td>ac:border</td>
<td>Set to &quot;true&quot; to set a border</td>
</tr>
<tr>
<td>ac:class</td>
<td>css class attribute.</td>
</tr>
<tr>
<td>ac:title</td>
<td>image tool tip.</td>
</tr>
<tr>
<td>ac:style</td>
<td>css style</td>
</tr>
<tr>
<td>ac:thumbnail</td>
<td>Set to &quot;true&quot; to designate this image as a thumbnail.</td>
</tr>
<tr>
<td>ac:alt</td>
<td>alt text</td>
</tr>
<tr>
<td>ac:height</td>
<td>image height</td>
</tr>
<tr>
<td>ac:width</td>
<td>image width</td>
</tr>
<tr>
<td>ac:vspace</td>
<td>the white space on the top and bottom of an image</td>
</tr>
<tr>
<td>ac:hspace</td>
<td>the white space on the left and right of an image</td>
</tr>
</tbody>
</table>

Tables

<table>
<thead>
<tr>
<th>Format type</th>
<th>In Confluence 3.5 and earlier</th>
<th>In Confluence 4.0 and later</th>
<th>What you will get</th>
</tr>
</thead>
</table>

Two column, two row (top header row)

<table>
<thead>
<tr>
<th>Table Heading Cell 1</th>
<th>Table Heading Cell 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal Cell 1</td>
<td>Normal Cell 2</td>
</tr>
</tbody>
</table>

```html
<table>
  <tbody>
    <tr>
      <th>Table Heading Cell 1</th>
      <th>Table Heading Cell 2</th>
    </tr>
    <tr>
      <td>Normal Cell 1</td>
      <td>Normal Cell 2</td>
    </tr>
  </tbody>
</table>
```
Two column, three rows, 2nd and third with merged cells in first row

<table>
<thead>
<tr>
<th>Table Heading Cell 1</th>
<th>Table Heading Cell 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Merge Cell</td>
<td>Normal Cell 1</td>
</tr>
<tr>
<td>Normal Cell 1</td>
<td>Normal Cell 2</td>
</tr>
</tbody>
</table>

```html
<table>
  <tbody>
    <tr>
      <th>Table Heading Cell 1</th>
      <th>Table Heading Cell 2</th>
    </tr>
    <tr>
      <td>Table Heading Cell 1</td>
      <td>Table Heading Cell 2</td>
    </tr>
    <tr>
      <td colspan="2" rowspan="2">Merged Cell</td>
      <td>NORMAL Cell 1</td>
    </tr>
    <tr>
      <td>NORMAL Cell 2</td>
    </tr>
  </tbody>
</table>
```
Page layouts

Confluence supports page layouts directly, as an alternative to macro-based layouts such as those using the section and column macros. This section documents the storage format XML created when these layouts are used in a page.

Notes:

- Page layouts were introduced in Confluence 4.2, and are not available in earlier versions of Confluence.
- The word (content) in the layouts below indicates where further XHTML or Confluence storage format block content would be entered, such as <p> or <table> tags.

<table>
<thead>
<tr>
<th>Layout Type</th>
<th>In Confluence 4.2 and later</th>
</tr>
</thead>
<tbody>
<tr>
<td>Two columns</td>
<td></td>
</tr>
</tbody>
</table>
Three columns

```
<div class="contentLayout"
data-atlassian-layout="{"name":"pagelayout-three-simple","columns":["","",""]}">
  <div class="columnLayout threeColumns">
    <div class="cell">
      <div class="innerCell">
        {content}
      </div>
    </div>
    <div class="cell">
      <div class="innerCell">
        {content}
      </div>
    </div>
    <div class="cell">
      <div class="innerCell">
        {content}
      </div>
    </div>
  </div>
</div>
```
Right sidebar with header and footer

```html
<div class="contentLayout"
    data-atlassian-layout=""{name:"pagelayout-two-right",columns:["large","aside"],header:true,footer:true}">
    <div class="header">
        <div class="innerCell">
            {content}
        </div>
    </div>
    <div class="columnLayout twoColumns">
        <div class="cell large">
            <div class="innerCell">
                {content}
            </div>
        </div>
        <div class="cell aside">
            <div class="innerCell">
                {content}
            </div>
        </div>
    </div>
    <div class="footer">
        <div class="innerCell">
            {content}
        </div>
    </div>
</div>
```
Three columns with header and footer

```html
<div class="contentLayout"
data-atlassian-layout="{"name":"pagelayout-three","columns":["","",""],"header":true,"footer":true}">
  <div class="header">
    <div class="innerCell">
      {content}
    </div>
  </div>
  <div class="columnLayout threeColumns">
    <div class="cell">
      <div class="innerCell">
        {content}
      </div>
    </div>
    <div class="cell">
      <div class="innerCell">
        {content}
      </div>
    </div>
    <div class="cell">
      <div class="innerCell">
        {content}
      </div>
    </div>
  </div>
  <div class="footer">
    <div class="innerCell">
      {content}
    </div>
  </div>
</div>
```
Emoticons

<table>
<thead>

  ac:name="wink" )

(y)

*: (ac:emojis
  ac:name="thumbs-up" )

(n)

*: (ac:emojis
  ac:name="thumbs-down" )
## Resource identifiers

Resource identifiers are used to describe "links" or "references" to resources in the storage format. Examples of resources include pages, blog posts, comments, shortcuts, images and so forth.

<table>
<thead>
<tr>
<th>Resource</th>
<th>Resource identifier format</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page</td>
<td><code>&lt;ri:page ri:space-key=&quot;FOO&quot; ri:content-title=&quot;Test Page&quot;/&gt;</code></td>
</tr>
</tbody>
</table>

**Notes:**
- `ri:space-key:` *(optional)* denotes the space key. This can be omitted to create a relative reference.
- `ri:content-title:` *(required)* denotes the title of the page.
<table>
<thead>
<tr>
<th>Blog Post</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ri:blog-post ri:space-key=&quot;FOO&quot; ri:content-title=&quot;First Post&quot; ri:posting-day=&quot;2012/01/30&quot; /&gt;</td>
</tr>
</tbody>
</table>

Notes:
- **ri:space-key**: (optional) denotes the space key. This can be omitted to create a relative reference.
- **ri:content-title**: (required) denotes the title of the page.
- **ri:posting-day**: (required) denotes the posting day. The format is YYYY/MM/DD.

<table>
<thead>
<tr>
<th>Attachment</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ri:attachment ri:filename&gt; ... resource identifier for the container of the attachment ... &lt;/ri:attachment&gt;</td>
</tr>
</tbody>
</table>

Notes:
- **ri:filename**: (required) denotes the name of the attachment.
- The body of the `ri:attachment` element should be a resource identifier denoting the container of the attachment. This can be omitted to create a relative attachment reference (similar to [foo.png] in wiki markup).

Examples:

**Relative Attachment Reference**

```
<ri:attachment ri:filename="happy.gif" />
```

**Absolute Attachment Reference**

```
<ri:attachment ri:filename="happy.gif">
    <ri:page ri:space-key="TST" ri:content-title="Test Page"/>
</ri:attachment>
```
<table>
<thead>
<tr>
<th><strong>URL</strong></th>
<th><code>&lt;ri:url ri:value=&quot;http://example.org/sample.gif&quot;/&gt;</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Notes:</td>
<td>• <strong>ri:value</strong>: (required) denotes the actual URL value.</td>
</tr>
<tr>
<td><strong>Shortcut</strong></td>
<td><code>&lt;ri:shortcut ri:key=&quot;jira&quot; ri:parameter=&quot;ABC-123&quot;/&gt;</code></td>
</tr>
</tbody>
</table>
| Notes:  | • **ri:key**: (required) represents the key of the Confluence shortcut.  
• **ri:parameter**: (required) represents the parameter to pass into the Confluence shortcut.  
• The example above is equivalent to `[ABC-123@jira]` in wiki markup. |
| **User** | `<ri:user ri:username="fred"/>` |
| Notes:  | • **ri:username**: (required) denotes the name of the user. |
| **Space** | `<ri:space ri:space-key="TST"/>` |
| Notes:  | • **ri:space-key**: (required) denotes the key of the space. |
| **Content Entity** | `<ri:content-entity ri:content-id="123"/>` |
| Notes:  | • **ri:content-id**: (required) denotes the id of the content. |
### Template variables

This screenshot shows a simple template:

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Type</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>$MyText</td>
<td>Single-line text</td>
<td></td>
</tr>
<tr>
<td>$MyMulti</td>
<td>Multi-line text</td>
<td>Size: 5 x 100</td>
</tr>
<tr>
<td>$MyList</td>
<td>List</td>
<td>List items: Apples, Pears, Peaches</td>
</tr>
</tbody>
</table>

The XML export produces the following code for the template:

```xml
<at:declarations>
  <at:string at:name="MyText" />
  <at:textarea at:columns="100" at:name="MyMulti" at:rows="5" />
  <at:list at:name="MyList">
    <at:option at:value="Apples">Apples</at:option>
    <at:option at:value="Pears">Pears</at:option>
    <at:option at:value="Peaches">Peaches</at:option>
  </at:list>
</at:declarations>

<p>This is Sarah's template</p>
<p>A single-line text variable: $MyText</p>
<p>A multi-line text variable: $MyMulti</p>
<p>A selection list: $MyList</p>

End of page.
```

Another page available for further discussion

A new page is available as a place to continue discussions: [Confluence 4 further discussion](#).
Please feel free to add your comments anywhere. We are not shutting down discussion on this page. We are supplying the new page to alleviate the problems caused by slow response on this page, due to the number of comments here.

**Specification - Confluence Advanced Editor**

1.0 for this plugin is now available (3/Apr) on the plugin exchange under the name [Confluence Source Editor](https://plugins.atlassian.com/). 

**Fixed:**

- Support for using the source editor in comments.

**Beta 2 included enhancements include support for:**

- Find and replace within the page
- Restricting access to the Source Editor to particular user groups.

We welcome your feedback - please file issues in the JIRA project at [https://jira.atlassian.com/browse/SOURCE](https://jira.atlassian.com/browse/SOURCE).

- This is a draft of the "Source Editor" specification for Confluence.
- Please see [Feedback on Confluence Storage Format](https://confluence.atlassian.com/display/CONFLUENCE/Feedback+on+Confluence+Storage+Format) for an overview of Confluence’s storage format.

**Background and strategic fit**

Up until now, we haven't allowed users to edit the underlying editor storage format (though this was easy for anyone to hack, using Firebug). As customers upgrade to Confluence 4.0, we're learning there are three main reasons people want source access:

1. **Customers Feel "Locked-in"**

With the switch from wiki markup to the new XHTML-based storage format, and because people were no longer able to edit a text-based version of their page directly, they felt they were locked into Confluence. While you could always still get your content out via the API or through WebDAV but people wanted to be able to see it directly.

2. **Fixing Formatting Niggles**

When a user hits an occasional bug, he or she wants a quick workaround. Over the years we trained everyone on this - what do you do when you hit a bug in the RTE? Switch to wiki markup. This wasn't really acceptable then and definitely isn't now, but some customers are asking for it... "give me access to the source so I can quickly fix something that's gone wrong."

3. **Offline content editing**

Some users want to copy the source of their page out of Confluence to work with it in other ways, whether it be updating content offline, sharing with others via email, or using a preferred text editor for things like bulk changing of link properties. Use cases include:

- Bulk edit link properties
- Bulk edit macro properties
- Confluence offline editing
- Editing via preferred editor (emacs, textmate, etc)

**Requirements**
<table>
<thead>
<tr>
<th>User Story Title</th>
<th>User Story Description</th>
<th>Priority Order</th>
<th>Implementation Notes</th>
<th>Status</th>
</tr>
</thead>
</table>
| Editor Niggles    | User can access source view from inside the Confluence editor.                          | 1: Must have   | • This is a short-term solution to working around around minor bugs. Long term we should be solving these problems.  
• This will edit the storage format source.                                                                                                                                                                                                                                                                                             | Beta 1  |
| Copy paste source | User can copy / paste source in full fidelity. Users should be able to:                | 1: Must have   | |                                                                                                                                                                                                                                                                                                                                                         | Beta 1  |
|                   | 1. Copy the entire content of a page  
2. Paste into a separate editor  
3. Manipulate it and  
4. Paste it back into the source view of the editor  
5. Save the page | | | |                                                                                                                                  |        |
| Edit link source  | User should be able to change link source from inside the editor                        | 1: Must have   | This would help with bulk change operations like changing URLs, or parts of URLs in links.                                                                                                                                                                                                                                                                                      | Beta 1  |
| Edit macro parameters | Users should be able to change macro parameters from inside the editor | 1: Must have   | Example macro storage format:                                                                                                                                                                                                                                                                                                                                                                   | Beta 1  |
|                   | <ac:macro ac:name="status">\langle ac:parameter ac:name ="colour">Green</ac:parameter></ac:macro> | | | |                                                                                                                                  |        |
| Validation | • The user should not be able to save any content that will break the page.  
• The editor should do validation to make sure only supported markup is being submitted. | 1: Must have | There should be at least some basic validation (e.g. that the xml is well formed). This validation is performed when applying the changes in the source editor and returning to the Rich Text Editor.  
Other markup, that is considered invalid, is either tolerated or stripped when saving the file (the content itself is not lost, just the markup tags). It would be desirable to validate this before save, but this may not be available in the first release.  
If a save does result in a bad rendering of a page, then reverting an edit via the history is an acceptable trade-off. |

<tr>
<td>Search and replace</td>
<td>It should be possible to search and replace text in the source markup.</td>
<td>2</td>
<td>Should have some basic search and replace functionality. More sophisticated searching may be possible (e.g. the reg. ex) depending on the final editing framework used. See CONF-24200 - Authenticate to see issue details.</td>
</tr>
<tr>
<td>Group Permissions</td>
<td>Admin can specify which users / groups can have access to edit source.</td>
<td>3</td>
<td>Nice to have This is necessary so that only people who REALLY need access can get access.</td>
</tr>
</tbody>
</table>
**Validation**

User can see which markup he posts is invalid - editor should *refuse* bad mark-up

2: Should have

- The source editor does validation for malformed XML - so if you forget to open or close a tag, it will not let you post it and will move your cursor to where the error exists if that location is knowable.

- If you define a bad parameter in a macro, Confluence will ignore this parameter:

- If you erroneously put a macro or link parameter in a rich text field the tags get stripped

---

**UX**

- Expecting an icon to the left of help in the toolbar that will pop up a dialog when enabled for a user.

**Supportability**

- This will be implemented as a separate plugin that can be installed by a Confluence site administrator.
- The plugin will be maintained by Atlassian.

**Notes**

We refer to the Confluence storage format as 'XHTML-based'. To be correct, we should call it XML, because the Confluence storage format does not comply with the XHTML definition. In particular, Confluence includes custom elements for macros and more. We’re using the term 'XHTML-based' to indicate that there is a large proportion of HTML in the storage format.

**Confluence 101**

We are delighted that you have chosen Confluence. This guide will take you through installing Confluence and trying out the most relevant features.
Getting started

1. Installing Confluence

If you have not already got Confluence up and running, carry out the following steps:

For Windows: (click to expand)

1. Go to the Confluence download page.
2. Download the Confluence Windows Installer file for 32-bit or 64-bit Windows.
3. Run the installer, choose an installation directory, a home directory, and a port ('8090' will do). We recommend that, when prompted, you choose to install Confluence as a service.
4. Confluence will start automatically when the installer finishes. The installer will also add Windows ‘Start’ menu shortcuts which you can use to start and stop Confluence.
5. To access Confluence, go to your web browser and type this address: http://localhost:8090.
6. Follow the Setup Wizard. This will guide you through the process of setting up your Confluence server and creating an administrative user.

For more help on the technical procedures in this section, see the Confluence Installation Guide.

If you need assistance, please create a support ticket.

For Linux/Solaris: (click to expand)

Download the Confluence Linux Installer (.BIN) file from the Confluence download page, and follow the instructions. The Setup Wizard will guide you through the process of setting up your Confluence server and creating an administrative user.

If you need assistance, please create a support ticket.

2. Importing existing content

Why would I do this? (click to expand)

The best way to spur adoption is to get some content in Confluence. It is likely that you have existing documentation stored in another wiki or in static documents. Confluence makes it easy to import your existing content so that you do not have to re-invent the wheel or start from scratch.

How do I do this? (click to expand)

Refer to our documentation on Importing Content Into Confluence, for details on:

- Importing content from other Confluence sites
- Importing content from other wikis.
- Importing content from an Office document
- Importing web content
- Importing other non-wiki content

3. Adding users

Add people so that they can collaborate quickly.

Add users and/or enable anonymous access. Click here to expand...

1. Add or invite users — add user accounts for the people who will create the pages and blog posts in your Confluence site, or send people invitations to sign up themselves.
2. (Optional) Add users to groups — your users will be automatically added to the ‘confluence-users’ group. You can add them to other groups too.
3. (Optional) Set up public access — allow non-logged-in users to access your Confluence site. Note that
they will only be able to view content where the space permissions allow ‘Anonymous’ access.

4. Configuring mail

Confluence can send notifications based on user preferences, such as when people are watching the contributions to a particular space or page. To take advantage of this feature, you will first need to tell Confluence about your SMTP server.

Mastering the basics

Your users will need to access Confluence at http://<Confluence site name>:8090 (not http://localhost:8090).

5. Creating spaces, pages and blog posts

Your new Confluence site contains a 'Demonstration' space, which includes a tutorial. This will guide you through the basics of using the dashboard, creating a space, adding pages and publishing blog posts.

6. Searching Confluence

- Searching Confluence
- Advanced search
- Searching the content of attachments

7. Subscribing to updates

- Creating an RSS feed.
- Watching a page (or space) to be emailed whenever it is edited.
- Marking your favourite places so you can get to them quickly.

Customising Confluence

You need Confluence Administrator permissions to do the tasks in this section. see Global Permissions Overview.

8. Adding your own logo

Why would I do this? (click to expand)
If you replace the default Confluence logo with your organisation's logo, your Confluence site will immediately appear more familiar to visitors.

How do I do this? (click to expand)
See the following documentation:
- Changing the Confluence-wide 'global' logo
- Changing a space's logo

9. Changing Confluence’s colours

Why would I do this? (click to expand)
If you replace the default Confluence colours with your organisation's standard colours, your Confluence site will immediately appear more familiar to visitors.

How do I do this? (click to expand)
See the following documentation:
10. Choosing a different theme

Why would I do this? (click to expand)
Depending on what you are using Confluence for, you may want to alter the theme for an individual space or for the entire site. A theme determines the look and feel of the site, including colours, styles and page layouts. For example, for a space that contains documentation, you may prefer a theme that displays a table of contents on the left and allows you to configure a page header and footer.

How do I do this? (click to expand)
See the following documentation:
- Applying a theme to a site
- Applying a theme to a space

11. Using a page template

Why would I do this? (click to expand)
A page template is a form that is displayed when a user creates a page, so that the user can enter content in particular fields. A page template can be made available to your entire Confluence site or just to a particular space. For example, a human resources space might have a template called 'Leave Request', or an information technology space might have a template called 'Asset Configuration'.

How do I do this? (click to expand)
See the following documentation: Adding a template

12. Installing plugins

Why would I do this? (click to expand)
There are hundreds of new features and customisations available for Confluence as plugins. For example, many additions to Confluence's macros are available as plugins. Take a look at our most popular plugins.

How do I do this? (click to expand)
Confluence comes with a number of bundled plugins. You can install others via the Confluence administration screens.

Important next steps
You need Confluence Administrator permissions to do the tasks in this section. see Global Permissions Overview.

13. Connecting to an external database
Before using Confluence as a production system, you need to switch from the default HSQL database, which is provided for evaluation purposes only. Please see the documentation for details.

14. Backing up data
To back up your Confluence data, and establish processes for regular backups, please see the documentation.

We hope you have fun with Confluence
We're always happy to help. Feel free to contact us with any questions you have.
Confluence User's Guide

About this document
The Confluence user's guide begins with an overview of the key features of Confluence, and goes on to describe the use of Confluence as a knowledge management tool and a collaborative environment. If you still have a question that has not been answered, please ask us.

This guide assumes that your Confluence site uses the default theme. If your site's theme has been customised, then your site may look different and the menu items may appear in different locations from those in this guide.

For more documentation please visit Confluence Documentation Home.

Download
You can download the Confluence documentation in PDF, HTML and XML formats.

About Confluence

Confluence is a wiki. You can use it to collaborate on writing and sharing content with your team. Your team can be as small or as big as you like. It could encompass the whole world. Your content can be as simple or as rich as you like. It can be just words, or you can add images, diagrams, activity streams, web service integration and more.

In a nutshell, a wiki is a piece of software that runs on a server. It publishes web pages that you can read via a web browser such as Mozilla Firefox, Google Chrome or Microsoft Internet Explorer. The thing that makes wiki pages different from other web pages is the edit button. Provided that you have the right permissions, you can edit the page, save your changes, and the updates will be visible to other people immediately.

Confluence provides extra functionality that transforms it into a social collaboration platform:

- Add a space for your team, then add page or comment on someone else's page.
- Share content by writing a blog post, sharing a link or calling someone's attention to a page via @mention s. Form a social network and tell people what you are doing via a status update.
- Add images, picture galleries, videos and more.

Dashboard

The dashboard is the front page of a Confluence site. It provides an overview of the site, gives access to all spaces that you have permission to view, and displays a few different lists of the most recently updated content.

You can go to the dashboard from anywhere in your site by clicking Dashboard at the top left of the page. (By default, the first link at the top left of the page is named 'Dashboard'. If your administrator has customised your site, the link may say something else. For example, 'Documentation'.)

Overview of the dashboard

The dashboard is divided into three sections:

- Welcome message: The information that appears in the top left section of the dashboard. Confluence Administrators can customise this message.
- Spaces, Pages, Network: Tabs displaying your favourite content and people, displayed in the lower left
section of the dashboard..

- **Spaces** displays the [spaces](#) you have marked as favourites, followed by all the spaces that you have permission to view.
- **Pages** displays the [pages](#) you have marked as favourites.
- **Network** displays the [users](#) that you are following (or who are following you).

- **Recent activity**: Tabs on the right-hand section of the dashboard, displaying recently-updated content that is **Popular**, in **All** spaces, in your **Favourite** spaces, updated by people in your **Network**, or classified by space **Categories**.
  - **Popular** displays content that has been recently created, liked or commented on. See [below](#) for more details.
  - **All Updates** displays updates from all spaces that you have permission to view.
  - **Favourite Spaces** displays updates from your [favourite](#) spaces.
  - **Network** displays the [users](#) that you are following (or who are following you).
  - **Space Categories** displays updates from spaces in the [category](#) you have selected from the list.

On this page:

### Screenshot: The dashboard

![Dashboard](#)

### More about popular content

The 'Popular' tab on the dashboard displays recent activity of the following types:
• Pages, blog posts and comments that people have recently **liked**.
• Pages and blog posts that people have recently **commented** on, and threaded comments that people have recently replied to.
• Pages and blog posts that have recently been **created**.

'Recent' means any activity in the last seven days.

A **bold** link means that you have not yet visited the page.

The activities are listed in order of popularity, with the most popular at the top. Likes, comments and content creations are scored equally. Activity that involves people in your network ranks higher than activity not involving your network. The most recent activity ranks higher than earlier activity.

**Notes**

• If you have the right permission, you can **add a new space** from the dashboard. Click **Add Space** at the top right of the dashboard, or on the ‘Spaces’ tab.
• By default, the dashboard is the home page for the Confluence site. However, you can set any other page in Confluence as your home page using your **user profile** settings.
• Administrators can **customise the global dashboard** that all users see.
• Users can **customise the dashboard** for themselves.
• There are quick **Add Page** and **Add Blog Post** buttons at the top right of the dashboard. If you have 'Confluence Administrator' or 'System Administrator' **permissions**, you will also see an **Add Users** button. If you have permission to create spaces, you will also see an **Add Space** button.
• Click **view change** beside a page name to see a comparison of the current and previous versions of the content.
• Are you looking for a way to build an **RSS feed**? Choose **Browse > Feed Builder**.
• Are you looking for a list of the **people** in your site? Choose **Browse > People Directory**.

**Page in View Mode**

The image below shows the menus and other controls on a typical Confluence page.

**Confluence Glossary**

**Administration Console**

The Administration Console is the interface for the global administration of Confluence.

Only administrators can access the Administration Console.

**Administrators**

The Confluence permission scheme allows the following main levels of administrator permissions:

- System Administrator – full administrative access to Confluence.
- Confluence Administrator – access to most of the Confluence administrative functions, but excluding those which could compromise the security of the Confluence system.

Please refer to the overview of global permissions for details of the functions which each level of administrator can perform.

**CamelCase**

CamelCase is a form of markup commonly used in wikis where words compounded together LikeThis without spaces are used to create links.

In Confluence, Camelcasing can be turned on from the Administration Console.

**Change Comment**

A change comment is a short description entered during the edit of a page to record the changes being made in the edit.

**Child Pages**

Creating child pages is a means of hierarchically organising content in Confluence. A child page can only have one parent page.

**Comments**

A comment may be a remark, question, or any other additional information you wish to add to a page pertaining
to the topic the page covers. You can comment on any page or news item in Confluence.

**Confluence Administrators**

The Confluence permission scheme allows the following main levels of administrator permissions:

- System Administrator – full administrative access to Confluence.
- Confluence Administrator – access to most of the Confluence administrative functions, but excluding those which could compromise the security of the Confluence system.

Please refer to the [overview of global permissions](#) for details of the functions which each level of administrator can perform.

**Custom Decorators**

Decorator files are used to define layouts in Confluence. They are vmd files and require knowledge of the language, Velocity, to edit.

**Dashboard**

The dashboard is the front page of a Confluence site. It provides an overview of the site, access to all spaces, and displays a list of the most recently updated content within them.

**Form Field Markup**

Form field markup is a specialised markup used when creating page templates in Confluence 4.2 and earlier. It is no longer needed, because the template editor offers form fields as an option in the editor toolbar.

**Global Administrators**

A global administrator is the same as a system administrator.

**Global Spaces**

Global spaces contain content on any theme or topic of your choice.

For more information about global spaces and personal spaces, see [Working with Spaces](#).

**Hover Profile**

The hover profile is the pop-up you see when the mouse pointer pauses over a Confluence user’s name. Use the hover profile to follow the user, visit their profile, and more.

**JIRA**

JIRA is Atlassian's award winning Issue tracking and project management application.

Visit Atlassian's website to learn more about JIRA.

**Labels**

Labels are user-defined tag words assigned to pages to categorise content in Confluence.
Macros

A macro is a command wrapped inside curly braces {...} used to perform programmatic functions and generate more complex content structures in Confluence.

Blog Posts

A blog post may be a journal entry, status report or any other timely information pertaining to a space.

Notifications

A notification is an email message sent to you updating you of changes to pages and spaces you choose to 'watch'.

Orphaned Pages

An orphaned page is a page without any incoming links.

Pages

Pages are the primary means of storing information in Confluence and are the building blocks of spaces.

Parent Page

A parent page is a page that has one or more child pages. It may itself be a child of another page.

People Directory

The People Directory contains a list of all users in your Confluence site. Each user's name links to their personal space.

Permalink

A permalink is the url used to link to specific content items like comments.

Personal Spaces

Personal spaces belong to particular users, and rather than being listed on the Dashboard, are available from the People Directory.

For more information about global spaces and personal spaces, see Working with Spaces.

RSS Feeds

An RSS feed is a format for delivering summaries of regularly changing web content. RSS is read by RSS newsreader programs.

You will need an RSS reader to subscribe to feeds within Confluence.

Confluence acts as an RSS reader for feeds from sites outside of Confluence.
**RSS Reader**

An RSS reader is a specialised RSS program (also called aggregator) that displays the contents of RSS feeds for you. To subscribe to RSS feeds within Confluence, you will need an RSS reader.

---

**Site Administrators**

The Confluence permission scheme allows two levels of administrator permissions:

- **System Administrator** – full administrative access to Confluence.
- **Confluence Administrator** – access to most of the Confluence administrative functions, but excluding those which could compromise the security of the Confluence system.

Please refer to the overview of global permissions for details of the functions which each level of administrator can perform.

---

**System Administrators**

The Confluence permission scheme allows two levels of administrator permissions:

- **System Administrator** – full administrative access to Confluence.
- **Confluence Administrator** – access to most of the Confluence administrative functions, but excluding those which could compromise the security of the Confluence system.

Please refer to the overview of global permissions for details of the functions which each level of administrator can perform.

---

**Space Administrators**

A space administrator is a user with the ‘Space Admin’ permission for the space. A user with this permission can perform a host of functions relating to the management of a space and has complete access to the space regardless of any other control settings or permissions.

Permissions for a space are only assigned and modified by space administrators.

---

**Spaces**

A space is an area within Confluence, containing your wiki pages. You can think of each space as a sub-site, or mini-site, each with its own home page.

There are two types of spaces: global spaces and personal spaces.

---

**Templates**

A template is a pre-defined page that can be used as a prototype when creating pages. Templates are useful for giving pages a common style or format.

---

**Themes**

Themes are pre-defined 'look and feel' styles which are configured from the administration menu and can be applied across Confluence or to a single space.

---

** Thumbnails**
As of Confluence 4.0, all images on the page that aren't links are displayed as thumbnails: when you click on an image the full-size image is displayed in a pop-up.

**Tiny links**

A tiny link is the shortened url of a page which is useful when sending links to the page, for example, via email.

**Trackback**

Trackback is a mechanism by which two sites can stay informed each time one site refers to the other by means of trackback 'pings'.

In Confluence, Trackback is enabled from the Administration Console.

**Trackback Autodiscovery**

Trackback autodiscovery is a block of code that can be placed in a web-page to describe where trackback pings should be sent for that page. You can read the technical specification for autodiscovery here.

When Trackback is enabled, Confluence uses Trackback Autodiscovery to ping pages that are linked to, and to advertise its own pages as being able to receive pings.

**Undefined Links**

An undefined link is a link to a page that has not yet been created. Clicking on the page link allows you create the page.

**User Profile**

Every user account in Confluence is linked to a profile that contains user related information and options to configuring user preferences.

**Watching a Page or Blog Post**

When you watch a page, you are sent an email notification whenever that page has been modified.

**Watching a Space**

When you watch a space, you are sent an email notification whenever content has been added or modified in that space.

**Wiki**

Pioneered by Ward Cunningham, and named after the Hawaiian word for 'quick', a wiki is a website that makes it easy for anyone to contribute pages, and link them together.

**Wiki Markup**

This is the markup used to write and edit page templates in Confluence.

Icons Used in Confluence

Confluence uses icons on various pages and screens, to provide quick links and indicators. This page lists the most frequently used icons and their meaning.

If you are looking for information about adding icons to your page, see Using Symbols, Emoticons and Special Characters.

Keyboard Shortcuts

Confluence provides a number of keyboard shortcuts that you can use to speed up your editing and viewing. This page describes the keyboard shortcuts for the English language. The shortcut keys (letters of the alphabet) may be different in other languages.

Hint: Confluence can display a list of available keyboard shortcuts. There are a few ways to see this keyboard shortcuts dialog:

- Choose Browse > Keyboard Shortcuts.
- When viewing a page, press Shift+?
- In the editor, choose the question mark icon on the editor toolbar.

The keyboard shortcuts dialog shows the following information:

- **General** – global, page and blog post shortcuts.
- **Editor** – text editing and formatting shortcuts.
- **Editor Autoformatting** – wiki markup and autoformatting shortcuts.
Keyboard shortcuts

The first section below describes the keyboard shortcuts that are available on all Confluence screens. Subsequent sections describe the shortcuts specific to each type of screen.

Please note, for Safari on OSX please substitute 'control' for 'Cmd' in the shortcuts below.

</tr>
</tbody>
</table>

**Note:** The keyboard shortcuts are available for notifications only, not for tasks, inside the Confluence workbox.

See more about [managing notifications](#) and [tasks](#).

**Disabling and re-enabling keyboard shortcuts**

Keyboard shortcuts are enabled by default. You can disable general keyboard shortcuts. You cannot disable the editor keyboard shortcuts.

**To disable or re-enable general keyboard shortcuts:**

1. Choose **Browse > Keyboard Shortcuts** (or press the key combination Shift+?).
2. Choose the **General** tab.
3. Select or clear the **Enable General Shortcuts** check box as required.
Notes

- **Note about supported web browsers:** Please ensure that you are using one of the web browsers supported by Confluence. If you are using an unsupported browser or browser version, some features may not work correctly. You can find the list of supported web browsers and browser versions on this page: [Supported Platforms](#).
- The keyboard shortcuts dialog also displays the trigger characters for the Confluence autocomplete feature. See [Using Autocomplete](#).
- Confluence keyboard shortcuts are consistent with [JIRA keyboard shortcuts](#).

Creating Content

You can create the following types of content in Confluence:

- [Pages](#)
- [Blog posts](#)
- [Comments](#)

For each of these, you **use the editor** to enter and format the text, and to embed content, or add links to other pages.

When you first create the page, you can choose a **template** that the page should be based on.

When you first save the page, you can choose where the page should be located.

You can also **import content into Confluence** from a variety of other sources.

Related pages

- [Organising Content](#)
- [Managing Users](#)

Take me back to the [Confluence User's Guide](#).

Adding Pages

The usual ways to add a page are described below.

Once you have created a page, you can:

- add content to it **using the editor**
- set the **page's location** in the Confluence site, even before you save the page.

You can always move the page to a different location in the page tree, or to a different space, after you have saved the page.

You may like to read about **writing blog posts**.

**A note about permissions:** To create a page, you need the 'Create Pages' permission for that space, which is assigned by a [space administrator](#) from the Space Administration screens. See [space permissions](#) or contact a space administrator for more information.

On this page:

- Adding a page from the dashboard
- Adding a page from any page in a space
- Adding a page using an undefined link
- Setting Page Location
- Importing an Office Document into One or More Confluence Pages
- Related Topics
Adding a page from the dashboard

You can add a page from the dashboard without having to browse to a specific space. Confluence adds the new page at the root of the space.

To add a new page from the dashboard:

1. Click Add Page at the top right of the dashboard.
2. Select the space where you want to add the page and choose a template on which to base the page content. For more details about using a template, see Creating a Page using a Template.
3. Click Next. Confluence opens the page in 'Edit' mode.

Screenshot: The Add Page dialog on the Confluence dashboard

Adding a page from any page in a space

By default, Confluence adds the new page as a child page of the current page.

To add a new page:

1. Go to any page in the space.
2. Choose Add > Page.

Note that you will only see the Add Page link if you have permission to create pages for the space. You can also create a page using a template.

Pages with large amounts of text content

One user reported having problems saving a page that contained approximately 700 kilobytes (700,000 characters) or more of text content. Refer to CONF-16467 for more information. Some browsers appear to be more susceptible to this issue than others. While it is highly unlikely that your page content will ever reach this size, if you work with large pages, structuring your content into separate pages will help to avoid this issue.

Adding a page using an undefined link

You may want to insert a link pointing to a Confluence page that does not yet exist, but which you intend to create later. This type of link is called an undefined link.

To add an undefined link for later creation of a page:

1. Edit the page in which the link should appear.
2. Type '[' to trigger autocomplete, and type the name of the undefined page. Alternatively, type the text first,
then select the text and type ‘¢’.
3. Choose Insert Link to Create Page.

When you save the page, Confluence colours the undefined link red. When someone clicks the link, the new page opens in edit mode. That person can then enter the page name, add content and save the page, as usual.

Setting Page Location

While you are editing a new page you can set the page's location to any space of your Confluence site.

To set the location for a new page:

1. While editing the page, click Location.
2. Use the tabs on the left of the ‘Set Page Location’ dialog to help you find the new space and parent page for your page, that is, the location where you want to move your page. The ‘Current location’ and ‘New location’ breadcrumb trails at the bottom of the dialog indicate the current parent page and new parent page.
3. If you want to move a page to a different position amongst the child pages, select Reorder to see a list of sibling pages when you click Move.
4. Click Move.
5. If you are reordering the child pages, click in the list to set the new position for the page and click Reorder.

See also Moving a Page.

Screenshot: Setting page location for a new page

Importing an Office Document into One or More Confluence Pages

The Office Connector allows you to import a Word document into Confluence, optionally creating one or more new pages. See Importing a Word Document into Confluence.

Adding Blog Posts

To add a blog post for a space, you require 'Create Blog' permission which is assigned by a space administrator. See Space permissions or contact a space administrator for more information.

From the Dashboard

You can add a blog post to any space from the Dashboard, without having to browse to that space.

To add a blog post from the Dashboard:

1. Click Add Blog Post at the top right of the Dashboard.
2. Select the space where you want to add the blog post.
3. Click Next. Confluence will open the Add Blog Post screen in edit mode.
4. Type your content as you would for any other page in Confluence.
5. Preview and click Save when you are finished.

From Any Page

You can add a blog post from any page (other than the Dashboard) in the space.

To add a blog post from any page:

1. Click Add near the top right of the page and choose Blog Post. Confluence will open the Add Blog Post screen in edit mode.
2. Type your content as you would for any other page in Confluence.
3. Preview and click Save when you are finished.

Notes

- Add labels if you want to categorise information this way.
- If you want to backdate your blog post, edit the date in Posting Date. You cannot set a date after today's. Also, you can only set the date when creating the blog post, not when editing it.
- You can view the blog for the current space by opening the Browse menu and selecting Blog. Your blog post should be listed.

Adding Pages  
Working with Blog Posts
**Using the Editor**

The Confluence editor is the tool that you will use to create and edit Confluence pages, blog posts and comments. You can enter content as you would in a Word document, apply formatting, and embed other content and files into the page.

Looking for a quick start? See the Quick Reference Guide for the Confluence Editor.

To begin an editing session, choose Edit at the top of a page (or press E on the keyboard).

**A note about permissions:** To edit a page, you need the ‘Add Pages’ permission for the space. See space permissions. Someone may also apply page restrictions that may prevent you from editing the page.

**An editing session**

You start an editing session whenever you:

- create a new page, blog post or page comment
- edit an existing page, blog post or comment (by pressing ‘E’ on the keyboard, or choosing Edit).

While in an editing session, you can also:

- Name, or rename, a page or blog post. Note that renaming has effects that you should consider.
- Add a comment describing the changes you made.
- Choose whether or not people watching the page get notified of the change you made
- Add labels to the page.

Confluence automatically saves drafts of your page as you work. If another user begins editing the same page as you, Confluence will display a message, and will try to merge the changes when you save your page.

Click **Cancel** (at the bottom of the page) if you want to end the session without saving any changes.

The session ends when you click **Save**.

When you create a new page you can choose the location where the page should be saved. You can also move a page after it has been saved, to make it a child page of a different page, or to move it to another space.

To see changes between different versions of the page, look at the **history** of the page.
On this page:

- An editing session

</thead>
<tbody>
<tr>
<td>Page title</td>
<td>Type the name of the page. This name is used in links to the page.</td>
</tr>
<tr>
<td>Page content</td>
<td>Add the words, images and other content that forms the content of the page.</td>
</tr>
</tbody>
</table>
Editor toolbar

Use these tools to format and colour content, create lists and tables, indent and align text, and insert other content into the page, such as symbols, links, images, multimedia files and macros. The toolbar also provides the find and replace option, and the help option.

Restrictions

Control who can view or edit the page. See Page Restrictions.

Attachments

View, and manage, the attached files on the page.

Labels

Add labels to a page, to categorise the page content.

Change comment

Type a comment that describes the changes you have made.

Notify watchers

Select this option to prompt Confluence to send an e-mail notification of your changes to people who are watching the page.

Preview

See how your changes will appear, without saving the page.

Save

Save the changes you have made to the page. (Keyboard shortcut: Ctrl+S).

Cancel

End the editing session, without saving any changes.

The toolbar

You can use the editor toolbar to:

- Apply paragraph styles and character formatting (such as bold, italics, superscript).
- Choose colour for text.
- Create numbered and bulleted lists.
- Set the indenting and alignment for text and images.
- Create links to other pages, attachments, anchors and external resources.
- Add tables, and add, remove, cut and paste rows and columns, highlight cells, rows and columns, and merge and split cells.
- Insert other content into the page, such as images, multimedia, attachments, symbols and wiki markup.
- Use macros to add other types of content, such as a list of JIRA issues or a table of contents.
- Add layouts and columns and sections to your page.
- Find and replace content within the page that you are editing.

Screenshot: The editor toolbar
Embedding content in the page

Choose Insert on the editor toolbar to include any of the following types of content into your page:

- An image.
- A link to another Confluence page or external URL, or a link to an attachment or image.
- An emoticon or symbol, or a horizontal line.
- A macro. Choose either a specific macro, or Other Macros, from the Insert menu.

Things to help you work faster

Autoformatting

You can type Confluence wiki markup directly into the editor to have Confluence auto-format your text as you type. To learn more, choose ? on the editor toolbar and choose the Editor Autoformatting tab. See also See the Quick Reference Guide for the Confluence Editor.

Autocomplete

When editing a page or blog post, you can enter a trigger character to show a list of suggested links, media files or macros to add to your page. This feature is called ‘autocomplete’ and provides you with a fast editing solution if you prefer to use key strokes rather than pointing and clicking with the mouse.

Quick summary of autocomplete:

<table>
<thead>
<tr>
<th>Type:</th>
<th>To see suggested:</th>
</tr>
</thead>
<tbody>
<tr>
<td>[]</td>
<td>pages and blog posts</td>
</tr>
<tr>
<td>!</td>
<td>multimedia files</td>
</tr>
<tr>
<td>{}</td>
<td>macros</td>
</tr>
<tr>
<td>@</td>
<td>mentions</td>
</tr>
</tbody>
</table>

For details, see Using Autocomplete.

Autoconvert for pasted links

When you paste URLs into Confluence, the editor will analyse what you are pasting and automatically convert it into something that will display well in Confluence. Examples include:
• YouTube videos
• JIRA issue queries
• Google Maps
• Confluence pages, blog posts, comments, user statuses, user profiles.
• Shared screenshot links from Skitch
• And more.

Drag-and-drop for external images and files

You can drag a file from a location outside Confluence, and drop it directly into the editor. For example, try it with images, video files, audio files, Office documents, and PDF files. The contents of the file will be embedded into the page or blog post. Please refer to the following pages for more information:

• Using Drag-and-Drop in Confluence – Using Confluence’s drag-and-drop feature, including details about its requirements and configuration.
• Displaying Images – Embedding images onto a Confluence page or blog post.
• Embedding Multimedia Content – Embedding videos, audio files and other multimedia files onto a Confluence page or blog post.
• Displaying Office Files in Confluence – Embedding Office and PDF files onto a Confluence page or blog post.

Drag-and-drop within the editor

Working within the editor panel, you can drag an image or a macro from one location on the page and drop it into a different location on the page. Hover your cursor over the image or the macro placeholder. The cursor changes to a drag-and-drop icon and you can click the image or macro and drag it to a new location.

If you want to abandon the drag-and-drop action, press Escape. The image/macro will return to its original position.

Note: For the drag-and-drop of images and macros in the editor, Confluence supports the following browsers: Chrome, Firefox, and Internet Explorer 9. (Drag and drop in the editor does not work in Internet Explorer 8.)

Keyboard shortcuts

To see the keyboard shortcuts available, choose ? on the editor toolbar.

Finding and replacing text

Click the binoculars icon on the toolbar, or use the keyboard shortcut Ctrl+F (Windows) or Cmd+F (Mac OS).

Search matches are highlighted in yellow. You can step through the results one by one, replace the matching text strings one by one, or replace all matching strings at once. This find and replace feature works only within the current page.

Quick Reference Guide for the Confluence Editor

This page is a quick-reference guide to using the Confluence editor. The aim is to give you enough information about the editor’s features for you to experiment yourself, rather than describing every possible shortcut key, autocomplete feature or toolbar option.

This guide is for people who want to use the autocomplete, autoformatting and keyboard shortcuts provided by the editor. If you prefer to use the toolbar options, the editor itself should be mostly self-explanatory.

Introductory tips
1. **Jump in and start using the Confluence editor.** The editor toolbar contains the most important buttons you'll need for creating and editing content.

2. **Use the keyboard shortcuts.** For example, type these characters in the editor panel:
   - Type `[` (angle bracket) to insert a link.
   - Type `!` (exclamation mark) to insert an image or other media.
   - Type `{` (curly bracket) to insert a macro.
     These characters will trigger the autocomplete functionality, prompting you with a list of suggestions to finish off the entry. For more shortcuts, click the help icon on the editor toolbar.

3. **See how to undo the autocomplete and autoformatting actions.** To undo something that autocomplete or autoformatting has done, press **Ctrl+Z** (Windows) or **Cmd+Z** (Mac).

---

**On this page:**
- Introductory tips
- Seeing it in action
- Using the most common formats and features
  - Formatting text
  - Using symbols
  - Linking text
  - Using lists
  - Using tables
  - Using macros
  - Displaying images and multimedia

---

**Seeing it in action**

This short video shows the autoformatting and autocomplete features of the editor.

**See the video on YouTube**

This video shows how to add macros, links and images by wiki markup alone. Type the macro, including its parameters and the closing curly bracket. Add a link, such as an anchor link, and end it with a square bracket. Insert an image or other embedded object, enclosed between exclamation marks. As soon as you close the macro, link, or embedded image, Confluence will convert it to rich text format and add it to the page.

**See the video on YouTube.**

**Using the most common formats and features**

Below is a list of the most commonly used editor features, and the related keyboard shortcuts.

**Formatting text**

<table>
<thead>
<tr>
<th>Formatting text</th>
<th>What to do</th>
<th>Windows keyboard shortcuts (For Mac OS X, replace 'Ctrl' with 'Cmd')</th>
</tr>
</thead>
<tbody>
<tr>
<td>Heading levels</td>
<td>Type the heading level and a full stop. Autoformat will convert the line to the appropriate heading immediately. You can continue typing your heading text immediately. Example: h2.</td>
<td>Ctrl + 1 to 6</td>
</tr>
<tr>
<td>Bold text</td>
<td>Type an asterisk ‘*’, your text, then another asterisk. Confluence autoformat will convert the text to bold immediately. Example: <em>Surf’s Up</em></td>
<td>Ctrl + b</td>
</tr>
<tr>
<td>Italic text</td>
<td>Type an underscore ‘_’, your text, then another underscore. Confluence autoformatting will convert the text to italics immediately. Example: <em>Surf’s Up</em></td>
<td>Ctrl + i</td>
</tr>
<tr>
<td>Underlined text</td>
<td>Type a plus sign ‘+’, your text, then another plus sign ‘+’. Confluence autoformatting will convert the text to underlined immediately. Example: +Surf’s Up+</td>
<td>Ctrl + u</td>
</tr>
</tbody>
</table>
| Monospace text | Type two curly braces ‘{’, your text, then another two curly braces ‘}’. Confluence autoformat will convert the text to monospace immediately. Example: {{Surf's Up}} | {{
| Left, centre and right alignment | Click the left, centre and right alignment buttons on the editor toolbar: ![Alignment Buttons](image) ![Alignment Buttons](image) ![Alignment Buttons](image) | None |

This can also be used to align images independently of text.
<table>
<thead>
<tr>
<th>Indentation</th>
<th>Click the left and right indentation buttons on the editor toolbar:</th>
<th>Tab (right), Shift + Tab (left)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Line break</td>
<td>Press Shift + Enter to force a line break without a paragraph break. This is a line break with no extra space.</td>
<td>Shift + Enter</td>
</tr>
<tr>
<td>Quotation</td>
<td>Use the Quote style – select 'Quote' from the style dropdown menu or use the keyboard shortcut. Example:</td>
<td>Ctrl + 8</td>
</tr>
<tr>
<td>Colour</td>
<td>Click the colour options on the editor toolbar. Example:</td>
<td>None</td>
</tr>
</tbody>
</table>

**Using symbols**

<table>
<thead>
<tr>
<th>Adding symbols and emoticons</th>
<th>What to type</th>
<th>Keyboard shortcut (Windows)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tick or check mark</td>
<td>Type a forward slash in round brackets. Autocomplete will convert it as you type. Example:</td>
<td>( + / + )</td>
</tr>
<tr>
<td></td>
<td>(/)</td>
<td></td>
</tr>
<tr>
<td>Smiley</td>
<td>Type the globally-recognised markup for a smiley face (colon and round bracket), a wink (semicolon and round bracket), and so on. Autocomplete will convert it as you type. Example:</td>
<td></td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>: )</td>
<td>: + )</td>
<td></td>
</tr>
</tbody>
</table>

### Linking text

<table>
<thead>
<tr>
<th>Linking text</th>
<th>What to type</th>
<th>Keyboard shortcut (Windows)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linking to a Confluence page</td>
<td>Type a square bracket '[' and start typing the page name to see the suggested pages to link to. Press the arrow keys to select the page you want. Example:</td>
<td>[</td>
</tr>
</tbody>
</table>

Alternatively, use **wiki markup entirely**. Type the link, including the alias and the page name or URL. As soon as you type the closing square bracket, Confluence will convert the link to rich text format and add it to the page. This means that you can skip the link browser.

- This works if you have 'Autoformatting’ enabled in the editor settings in your user profile.
- This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.
- Example: [Modern Girl|Modern Girl song lyrics]
<table>
<thead>
<tr>
<th>Linking text to a web page</th>
<th>Type a square bracket <code>[</code> and select <strong>Insert Web Link</strong>, then paste the URL into the link dialog. Example:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><img src="image" alt="Link suggestions dialog" /></td>
</tr>
<tr>
<td></td>
<td>Alternatively, use <strong>wiki markup entirely</strong>. Type the link, including the alias and the URL. As soon as you type the closing square bracket, Confluence will convert the link to rich text format and add it to the page. This means that you can skip the link browser.</td>
</tr>
<tr>
<td></td>
<td>• This works if you have ‘Autoformatting’ enabled in the editor settings in your user profile.</td>
</tr>
<tr>
<td></td>
<td>• This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.</td>
</tr>
<tr>
<td></td>
<td>• Example: [Modern Girl</td>
</tr>
<tr>
<td>Linking to a page that does not yet exist</td>
<td>Type a square bracket ‘[‘ and the name of the non-existent page, then select 'Insert Link to Create Page'. Example:</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Link suggestions" /></td>
</tr>
<tr>
<td></td>
<td>Alternatively, use <strong>wiki markup entirely</strong>. Type the link, including the alias and the page name or URL. As soon as you type the closing square bracket, Confluence will convert the link to rich text format and add it to the page. This means that you can skip the link browser.</td>
</tr>
<tr>
<td></td>
<td>- This works if you have ‘Autoformatting’ enabled in the editor settings in your user profile.</td>
</tr>
<tr>
<td></td>
<td>- This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.</td>
</tr>
<tr>
<td></td>
<td>- Example: [Future of the Modern Girl]</td>
</tr>
</tbody>
</table>
Linking to an attachment

Type a square bracket '[' and start typing the attachment name to see the suggested attachments to link to. Press the arrow keys to select the item you want. Example:

```
[chocs]
```

Alternatively, use wiki markup entirely. Type the link, including the alias (if required), the caret character ^ and the attachment name. As soon as you type the closing square bracket, Confluence will convert the link to rich text format and add it to the page. This means that you can skip the link browser.

- This works if you have 'Autoformatting' enabled in the editor settings in your user profile.
- This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.
- Example: `[^attachment name]`
### Linking to an anchor

**To create the anchor:** Add an anchor macro using wiki markup. Confluence will convert the macro to rich text format and add it to the page. For example, to create an anchor named 'index', type the following: `{anchor:index}

**To create the link:** Use [wiki markup](https://confluence-docs.atlassian.com/display/DOC/Linking+to+an+anchor) too. Type the link, including the alias (if required), the hash character `#` and the anchor name. As soon as you type the closing square bracket, Confluence will convert the link to rich text format and add it to the page. This means that you can skip the link browser.

- This works if you have 'Autoformatting' enabled in the editor settings in your user profile.
- This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.
- Example: `[Index|#index]

### Using lists

<table>
<thead>
<tr>
<th>Using lists</th>
<th>What to type</th>
<th>Keyboard shortcut (Windows)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Adding a bullet list</strong></td>
<td>Type an asterisk <code>*</code> followed by a space. Autoformat will convert the line to a bulleted list. You can continue typing your text immediately. Example:</td>
<td>Ctrl + Shift + b</td>
</tr>
<tr>
<td></td>
<td>My list:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• bullet item</td>
<td></td>
</tr>
</tbody>
</table>

ℹ️ To add another line of text to an entry without creating a new list item, press Shift + Enter at the end of the line.
## Adding a numbered list

<table>
<thead>
<tr>
<th>What to type</th>
<th>Keyboard shortcut (Windows)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type a hash or pound '#' followed by a space. Autoformat will convert the</td>
<td>Ctrl + Shift + n</td>
</tr>
<tr>
<td>line to a numbered list. You can continue typing your text immediately.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>My list:</td>
<td></td>
</tr>
<tr>
<td>1. <strong>bullet item</strong></td>
<td></td>
</tr>
</tbody>
</table>

ℹ️ To add another line of text to an entry without creating a new list item, press Shift + Enter at the end of the line.

## Using tables

<table>
<thead>
<tr>
<th>What to type</th>
<th>Keyboard shortcut (Windows)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type a series of pipe characters '</td>
<td>' then press Enter. Autoformat will</td>
</tr>
<tr>
<td>convert the pipes to a table. Example – to create a table with three</td>
<td></td>
</tr>
<tr>
<td>columns:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

## Using macros

<table>
<thead>
<tr>
<th>What to type</th>
<th>Keyboard shortcut (Windows)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Adding a macro to your page.

Type '{' and start typing the macro name to see a list of macros that match your text. Press the arrow keys to select the macro you want. Example:

```
{ blog
```

Alternatively, use **wiki markup entirely**. Type the macro, including its parameters and the closing curly bracket. As soon as you close the macro, Confluence will convert it to rich text format and add it to the page. This means that you can skip the macro browser.

- This works if you have ‘Autoformatting’ enabled in the editor settings in your user profile.
- This does not work if you paste the wiki markup onto the page. You need to enter the closing bracket manually.
- **Example:** `{blogposts:content=titles}

---

**Displaying images and multimedia**

<table>
<thead>
<tr>
<th>Displaying images</th>
<th>What to type</th>
<th>Keyboard shortcut (Windows)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Display an image attached to the page</td>
<td>Type an exclamation mark '!' and start typing the image name to see the suggested images to insert onto the page. Press the arrow keys to select the item you want. Example:</td>
<td></td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="NoMatterWhat.png" /></td>
<td>Alternatively, use <strong>wiki markup entirely</strong>. Type the wiki markup for the image insertion, including the exclamation marks, the space and/or page name (if different from the current page) and the image name, as well as any other allowed parameters. As soon as you type the closing exclamation mark, Confluence will convert the image to rich text format and add it to the page. This means that you can skip the image browser.</td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="NoMatterWhat.png" /></td>
<td>• This works if you have ‘Autoformatting’ enabled in the editor settings in your user profile.</td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="NoMatterWhere.png" /></td>
<td>• This does not work if you paste the wiki markup onto the page. You need to enter the closing exclamation mark manually.</td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="NoMatchingPages.PNG" /></td>
<td>• Example: <img src="image" alt="NoMatterWhat.png" /></td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="Open Image Pages.png" /></td>
<td><img src="image" alt="InsertOther Media" /></td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="Displaying an image attached to another page" /></td>
<td><strong>Exactly the same as when the image is attached to the same page.</strong></td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="Embedding multimedia files" /></td>
<td><strong>What to type</strong></td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="Keyboard shortcut (Windows)" /></td>
<td><strong>Keyboard shortcut (Windows)</strong></td>
<td></td>
</tr>
</tbody>
</table>
Embedding a video, movie or audio file into a page

Type an exclamation mark '!' and select 'Insert Other Media'. Example:

![Media suggestions](image)

Or type '{' and start typing the macro name 'Multimedia'. Example:

```
{ mul
```

**Working with Text Effects**

The Confluence editor supports most text effects available in standard text editing applications.

**Applying paragraph styles**

Choose a paragraph style from the editor toolbar, or click in the paragraph and use one of the keyboard shortcuts Ctrl+(0–8).

Screenshot: Choosing paragraph styles from the editor toolbar
Applying character formats

To apply a character format, select the text and click one of the editor toolbar buttons, or use a keyboard shortcut. Some formats are available from the 'More' menu.

Screenshot: Text formatting buttons on the editor toolbar

<table>
<thead>
<tr>
<th>Format</th>
<th>Shortcut Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bold</td>
<td>Ctrl+B</td>
</tr>
<tr>
<td>Italics</td>
<td>Ctrl+I</td>
</tr>
<tr>
<td>Underline</td>
<td>Ctrl+U</td>
</tr>
<tr>
<td>Strikethrough</td>
<td>Ctrl+Shift+S</td>
</tr>
<tr>
<td>Subscript</td>
<td>none</td>
</tr>
</tbody>
</table>
Applying colours to text

To apply a colour to text, select the text and click the ‘Colour’ button. Choose the colour using the ‘More colours’ button.

Screenshot: Picking colours from the editor toolbar

Aligning text

You can align text to the left, right or centre of a content block. Select the text and click the appropriate alignment option on the editor toolbar.

Screenshot: Left, centre and right alignment options on the editor toolbar

Indenting text

You can move text to the left or right by a predefined sequence of indentations. Confluence determines the size of the indentation. Select the text and click the left or right indentation option on the editor toolbar.

Screenshot: Left and right indentation options on the editor toolbar

Working with Links

By adding a link on a Confluence page, you can link to content anywhere within the Confluence site or on another web site.

You can add links to the following types of content:

- Pages in the same space, in another space, or outside Confluence (webpages).
- Blog posts.
- Pages that haven't yet been created, but for which you require a placeholder on the current page.
- Attachments, such as images and multimedia files.
You can also link from an image, or use a link to begin composing a new email message.

You create all these kinds of links using the 'Insert Link' dialog that is available in the editor (click Link in the menu bar while editing the page). You can also create links using autocomplete as a shorthand way of creating the most common types of links.

You can edit and remove links while editing the page, using the link properties panel that appears when you click on a link in the editor:

Notes

- Links in Confluence will not break even when you rename pages or move them between spaces on your site. Confluence will rename the links, provided you have inserted them as relative links, not as full URLs.
- Looking for a link type not shown above? You might find a plugin can help you.

Linking to Pages
This page describes how to create a link in your Confluence page to another page.

You can create links on your page to:

- Other pages in the Confluence site.
- Webpages outside of Confluence.
- Anchors or headings, on the same page or other pages.

You can also create a link to a non-existent Confluence page.

You can use the following methods to create links:

- Autocomplete - to link to Confluence pages or a non-existent page.
- The 'Insert Link' dialog - to link to Confluence pages and webpages.
- Cutting and pasting a link from your browser - to link to Confluence pages and webpages.
On this page:

- Linking to Confluence Pages
  - Adding a Link using Autocomplete
  - Adding a Link using the Insert Link Dialog
  - Copying and Pasting a Link from your Web Browser
- Linking to Webpages
- Linking to an Anchor or Heading
- Linking to an Undefined Confluence Page
- Linking using a Shortcut Link

Linking to Confluence Pages

Adding a Link using Autocomplete

You can use autocomplete to create a link to any page in the Confluence site, if you know the name of the page you want to link to.

You can type [ to see a list of suggested links. For details, see Using Autocomplete.

Adding a Link using the Insert Link Dialog

To create a new link using the 'Insert Link' dialog:

1. While editing the page, place your cursor at the point where you want to create the link, or highlight the text that you want linked.
2. Click Link in the toolbar, or press Ctrl+K. See keyboard shortcuts for more information.
3. Choose one of the tabs on the left to help you find the page or other location that you want to link to:
   - Search—Use this option to link to a page or file in Confluence.
     - Start typing the page name into the text box. Confluence will suggest options as you type.
     - If necessary, limit the search to the current space.
     - Select your link destination from the autocomplete results, or click Search and select the link destination from the search results.
   - Recently Viewed—Use this option to link to a page in Confluence.
     - Select your link destination from recently-visited pages.
4. Enter link text that will be displayed on the page if required. If you have not highlighted text in the page, and leave the 'Link Text' text box empty, the link will display the destination page name or URL.
5. Click Insert.

Copying and Pasting a Link from your Web Browser

To paste a link from your web browser:

1. In your web browser, select and copy the title of a Confluence page.
2. Edit your Confluence page and paste the title where you want the link to appear.

Linking to Webpages

Use the 'Insert Link' dialog to link to an external web page.

To create a link to a webpage:

1. While editing the page, place your cursor at the point where you want to create the link, or highlight the text that you want linked.
2. Click Link in the toolbar, or press Ctrl+K. See keyboard shortcuts for more information.
3. Click Web Link and enter or paste the web address into the URL text box.
4. Enter link text that will be displayed on the page if required. If you have not highlighted text in the page,
and leave the 'Link Text' text box empty, the link will display the destination page name or URL.
5. Click **Insert**.

You can also simply copy and paste a link to a webpage into your Confluence page, as described above.

### Linking to an Anchor or Heading

You can link to an anchor or heading that is on the same page, on another page in the same space, or on a page in another space of the same Confluence site.

**To link to an anchor or heading:**

1. Click **Link** in the toolbar, or press **Ctrl+K**, while editing the page.
2. Click **Advanced** and enter the anchor name (or heading) into the **Link** box, using the following syntax:

<table>
<thead>
<tr>
<th>Anchor or heading location</th>
<th>Link syntax for anchor</th>
<th>Link syntax for heading</th>
</tr>
</thead>
<tbody>
<tr>
<td>Same page</td>
<td>#anchornname</td>
<td>#headingname</td>
</tr>
<tr>
<td>Different page</td>
<td>pagename#anchornname</td>
<td>pagename#headingname</td>
</tr>
<tr>
<td>Page in another space</td>
<td>spacekey:pagename#anchornname</td>
<td>spacekey:pagename#headingname</td>
</tr>
</tbody>
</table>

For more information about link syntax, see [Confluence Wiki Markup](#).
3. Enter link text that will be displayed on the page, if required. If you leave the **Link Text** box empty, the link will display the destination page name or URL.
4. Click **Insert**.
   - Note that when linking to a heading, **headingname** is case-sensitive and must be entered without spaces
   - Note that when linking to an anchor, **anchornname** is case-sensitive, and **pagename** must be entered with spaces as in the title.

See [Working with Anchors](#) for more information.

### Linking using a Shortcut Link

If you have configured shortcut links on your Confluence site, then you can link to an external site using a shortcut link that looks like this: `CONF-17025@jira`. Our Confluence site (where this documentation is housed)
is configured to allow shortcut links to our JIRA site, using the shortcut @jira. So the shortcut link CONF-17025 @jira produces this link.

To add a shortcut link using the 'Insert Link' dialog:

1. Click Link in the toolbar, or press Ctrl+K. See keyboard shortcuts for more information.
2. Click Advanced and enter or paste the shortcut link into the Link box. Shortcut links are case-insensitive.
3. Enter link text that will be displayed on the page, if required. If you leave the Link Text box empty, the link will display the destination page name or URL.
4. Click Insert.

You can also type ‘[’ and choose Insert Web Link > Advanced to enter a shortcut link.

See Configuring Shortcut Links for more details.

Linking to Images

This page describes how to insert a link on your Confluence page that points to an image. Linking to an image is a way to have text on a page that, when clicked, takes the user to that image.

Quick guide to linking to an image

1. Click Link on the editor toolbar.
2. Select one of these options:
   • Search – Search for and link to any image or file attached to any page in your Confluence site.
   • Attachments – Link to an image or file attached to the current Confluence page.

The rest of this page gives more details of the above procedure and additional options.

On this page:

- Adding a Link with the Link Browser
- Adding a Link using Autocomplete

Related pages:

- Linking to Attachments
- Displaying Images

Adding a Link with the Link Browser

To link to an image that is attached to the current page:

1. Edit the page where you want to insert the link.
2. Click Link on the toolbar.
3. Choose the Attachments tab in the left-hand panel. You will see a list of all files attached to the page. Now you can:
   • Select an image that is already attached to the page.
   • Attach a new image to the page by clicking Browse and uploading your file.
4. Enter the Link Text. These are the words that will appear as the hyperlink on the page.
5. Click Insert.
To link to an image that is attached to any Confluence page:

1. Edit the page where you want to insert the link.
2. Click **Link** on the toolbar.
3. Select the **Search** option in the left-hand panel.
4. Start typing the name of the image. Confluence will suggest image files. If the image does not appear in the list, click **Search**.
5. Click the image name in the autocomplete results or the search results.
6. Click **Insert**.

**Screenshot: The link browser, showing autocomplete in the 'Search' option**

Adding a Link using Autocomplete

You can use the autocomplete functionality to link to an image attached to any Confluence page.

You can type [ to see a list of suggested links. For details, see **Using Autocomplete**.

Linking from an Image

This page describes how to create a link from an image on one page to another page or URL. When the user clicks the image, they will be redirected to the linked page or other resource.

**To create a link from an image:**

1. Display the image on the page. The image can either be attached to the page or available on another page. See **Displaying Images**.
2. Create the link by clicking on the image and then clicking **Link** in the properties panel. Specify the link target using the 'Insert Link' dialog. See **Linking to Pages**.

You can edit the link by clicking on the image, when editing the page, and clicking **Edit Link** in the properties panel.

Take me back to Confluence User's Guide

Linking to Attachments
This page describes how to add a text link pointing to a file attached to your Confluence page. When a reader clicks the link, the file is displayed in the browser.

- Quick guide to linking to an attachment
  1. Click Link on the editor toolbar.
  2. Select one of these options:
     - Search – to search for and link to any image or file attached to any page in your Confluence site.
     - Recently Viewed – to link to a recently visited page.
     - Attachments – to link to an image or file attached to the current Confluence page.
     - Web Link – to link to any webpage.

On this page:
- Adding a Link using Autocomplete
- Adding a Link using the Link Browser

Related pages:
- Linking to Images

Adding a Link using Autocomplete

You can use autocomplete to add a text link to a file or image attached to any Confluence page.

You can type [ to see a list of suggested links. For details, see Using Autocomplete.

Adding a Link using the Link Browser

The 'link browser' is the 'Insert Link' or 'Edit Link' dialog that appears when you click Link in the editor toolbar.

To link to a file or image that is attached to the current page:
  1. Edit the page where you want to insert the link.
2. Click **Link** in the editor toolbar, and then the **Attachments** tab. You will see a list of all files attached to the page. Now you can do one of the following:
   - Click on the file that you want to link to, if it is already attached to the page.
   - Attach a new file to the page by clicking **Browse** and uploading your file.
3. Enter the **Link Text**. These are the words that will appear as the hyperlink on the page.
4. Click **Insert** to add the link.

**To link to a file or image that is attached to any Confluence page:**

1. Edit the page where you want to insert the link.
2. Click **Link** in the editor toolbar, and then the **Search** tab.
3. Start typing the name of the file or image. Confluence will offer a list of matching file names. If the file does not appear, click **Search** to find pages that contain the search text.
4. Click the required file in the list or the search results.
5. Enter the **Link Text**. These are the words that will appear as the hyperlink on the page.
6. Click **Insert** to add the link.

**Screenshot: The link browser, showing autocomplete in the 'Search' option**

---

**Linking to Blog Posts**

You can link to blog posts in similar ways to how you [link to pages](#). Only two methods are described on this page.

You can also use the Blog Posts macro to display a [dynamic list of blog posts](#) on your page.

---

ℹ️ **You must create the blog post first**

Linking to a blog post that has not been created yet will not result in a link. Blog posts are very tightly bound to the time at which they were created, so it makes no sense to link to them before they exist.
Linking to a Blog Post using Autocomplete

1. You need to know the title of the blog post.

You can use autocomplete to create a link to any blog post in the Confluence site, if you know the name of the post you want to link to.

You can type [ to see a list of suggested links. For details, see Using Autocomplete.

Linking to a Blog Post using its URL

1. You need to know the absolute path to the blog post.

To create a link to a blog post using the 'Insert Link' dialog:

1. While editing the page, place your cursor at the point where you want to create the link, or highlight the text that you want linked.
2. Click Link in the toolbar, or press Ctrl+K. See keyboard shortcuts for more information.
3. Click Web Link and enter or paste the absolute path to the blog post into the URL text box.
4. Enter link text that will be displayed on the page if required. If you have not highlighted text in the page, and leave the 'Link Text' text box empty, the link will display the destination page name or URL.
5. Click Insert.

Linking to Personal Spaces and User Profiles

This page describes how to add a link to a user's personal space or user profile from within another Confluence page.

You can link to a user's personal space (or user profile) easily if you know their username.

If the user does not have a personal space, then the link will go to their user profile.

Linking to a User's Personal Space using Autocomplete

You can use autocomplete to create a link to a user's personal space in the Confluence site. Trigger autocomplete and start typing their name.

You can type [ to see a list of suggested links. For details, see Using Autocomplete.

Linking to a User's Personal Space using the Insert Link Dialog

1. While editing the page, place your cursor at the point where you want to create the link, or highlight the text that you want linked.
2. Click Link in the toolbar, or press Ctrl+K. See keyboard shortcuts for more information.
3. Click the Search tab on the left.
4. Start typing the user's name into the search field. Confluence will suggest options as you type.
5. Select the user from the autocomplete results.
6. Enter link text that will be displayed on the page, if required. If you have not highlighted text in the page, and leave the 'Link Text' text box empty, the link will display the destination page name or URL.
7. Click Insert.

Working with Anchors

The Anchor macro allows you to link to specific parts of a page. Anchor links can be especially useful when navigating between sections of a long document or when you want to link to a segment of a page and not to the page as a whole.

Anchors are invisible to the reader when the page is rendered.

There are two steps to using an anchor:

1. Create the anchor for the content.
2. Create the link to the anchor.

On this page:

- Creating an Anchor
- Parameters
- Linking to an Anchor or Heading
- Notes

Related pages:

- Working with Links
- Confluence Wiki Markup for Macros
- Confluence Storage Format for Macros
- Confluence User's Guide

Creating an Anchor

You use the Anchor macro to create an anchor for content that you want to be able to link to.

To add the Anchor macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type { and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Linking to an Anchor or Heading

You can link to an anchor or heading that is on the same page, on another page in the same space, or on a page in another space of the same Confluence site.

To link to an anchor or heading:

1. Click **Link** in the toolbar, or press **Ctrl+K**, while editing the page.
2. Click **Advanced** and enter the anchor name (or heading) into the **Link** box, using the following syntax:

<table>
<thead>
<tr>
<th>Anchor or heading location</th>
<th>Link syntax for anchor</th>
<th>Link syntax for heading</th>
</tr>
</thead>
<tbody>
<tr>
<td>Same page</td>
<td>#anchorname</td>
<td>#headingname</td>
</tr>
<tr>
<td>Different page</td>
<td>pagename#anchorname</td>
<td>pagename#headingname</td>
</tr>
<tr>
<td>Page in another space</td>
<td>spacekey:pagename#anchorname</td>
<td>spacekey:pagename#headingname</td>
</tr>
</tbody>
</table>

For more information about link syntax, see [Confluence Wiki Markup](https://confluence.atlassian.com/pages-linking.html).

3. Enter link text that will be displayed on the page, if required. If you leave the **Link Text** box empty, the link will display the destination page name or URL.

4. Click **Insert**.

- Note that when linking to a heading, **headingname** is case-sensitive and must be entered without spaces.
- Note that when linking to an anchor, **anchorname** is case-sensitive, and **pagename** must be entered with spaces as in the title.

Notes

- If you are adding an anchor to the site welcome message, it can only be linked to from another page. Internal-only links will not render.
- Page titles and links to other spaces can be combined with anchors and attachments, but you can't use attachments and anchors in the same link.

Using a Link to Create a New Email Message

This page describes how to insert a link that, when clicked, launches the default email client.

💡 You can provide your own text to use as the link text instead of the 'mailto' tag.

To insert a link that creates a new email message:

1. Edit the page on which you want to insert the link.
2. Choose **Insert > Link** and select the **Web Link** tab.
3. Enter an email address, such as 'jsmith@nonexistent.corp.com'.
4. Enter your own link text, if required.
5. Click **Save**.

Linking to Confluence Pages from Outside Confluence

Sometimes you may want to link to a Confluence page from outside of Confluence, such as from another website or from within an email. In this case, you should consider using a link to a ‘permanent’ URL (also called a ‘permalink’), in case the name of the Confluence page changes.

If you are linking to a page from another page in the same Confluence site, it is better to use an internal wiki link rather than a permalink. Confluence can keep track of internal links and will let you know if the link is broken, such as when someone removes the linked page. See Linking to Pages. Internal wiki links are automatically updated if the page is renamed. This only works for page links that use the relative link syntax, for example [Renaming a Page].

To link to a page’s permanent URL:

1. Choose **Tools > Link to this Page**.
2. Copy the **Tiny Link** and paste it into your email or external web page. This will create a link to the latest version of your Confluence page.

Take me back to Confluence User's Guide

Inserting JIRA Issues

If your Confluence site is connected to a JIRA site using an application link, you can easily insert individual issues from this JIRA site directly into text on your Confluence page using the 'Insert JIRA Issue' dialog. Each issue inserted onto the page is linked to the issue in JIRA itself.

Using the 'Insert JIRA Issue' dialog, you can also:

- Create a new issue on the JIRA site and insert the issue onto your page.
- Insert a table of JIRA issues onto your page based on the results of a search (using JIRA Query Language (JQL) syntax).

If your Confluence site is not connected to any JIRA site via an application link, this feature will not be available. However, you can still list JIRA issues on a page or blog post using the JIRA issues macro.

On this page:

- Inserting a JIRA Issue from a List of Recently Viewed Issues
- Creating a New JIRA Issue and Inserting it
- Searching for JIRA Issues and Inserting them
- Notes
- Related Topics
Quick guide to inserting JIRA issues

- Choose Insert > JIRA Issue from the editor toolbar.
- To insert a single issue, use either:
  - Recently Viewed — Insert an issue onto your page from a list of issues you have recently viewed on the JIRA server.
  - Create New Issue — Create a new issue on the JIRA server and insert it into your page.
  - Search — Use JQL syntax to narrow down a list of issues, from which you can select one to insert onto a page.
- To insert a table of issues:
  - Click Search on the 'Insert JIRA Issues' dialog, use JQL syntax to narrow down a list of issues and choose to insert the list onto a page.

If Confluence is connected to more than one JIRA server, ensure that you choose the appropriate JIRA server before using this dialog to select, create or search for issues.

Inserting a JIRA Issue from a List of Recently Viewed Issues

To insert a JIRA issue onto a page from a list of recently viewed issues on a JIRA site:

1. Choose Insert > JIRA Issue from the editor toolbar.
2. Go to the Recently Viewed tab of the 'Insert JIRA Issue' dialog.
3. If necessary, select a JIRA server from the list. See the notes below regarding OAuth outgoing authentication.
4. Select an issue from your list of recently viewed JIRA issues on the JIRA site. The number of items in the list is defined in JIRA.

Creating a New JIRA Issue and Inserting it

This feature works best with JIRA issue types whose mandatory field requirements have not been altered. With the exception of a JIRA issue's 'Component/s' or 'Fix Version/s' fields, you cannot use this dialog to add an issue whose issue type has customised mandatory field requirements upon issue creation.

To create a new JIRA issue on a JIRA site and insert this issue onto a page:

1. Go to the Create New Issue tab of the 'Insert JIRA Issue' dialog.
2. Complete the dialog:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server</td>
<td>The available JIRA servers. See the notes below regarding OAuth outgoing authentication.</td>
</tr>
<tr>
<td>Project</td>
<td>The project on the selected JIRA server to which the new issue will be added.</td>
</tr>
<tr>
<td>Issue Type</td>
<td>The type of issue to log in this project.</td>
</tr>
<tr>
<td>Summary</td>
<td>A one-line summary for the issue.</td>
</tr>
<tr>
<td>Component/s</td>
<td>Choose one or more components which apply to this issue.</td>
</tr>
<tr>
<td>Version/s</td>
<td>Choose one or more versions in which the issue will be addressed.</td>
</tr>
</tbody>
</table>
To search a JIRA site for a subset of issues matching a JQL query and insert one or more of these issues:

1. Choose **Insert > JIRA Issue** from the editor toolbar.
2. Go to the **Search** tab of the 'Insert JIRA Issue' dialog.
3. Enter a **JQL query**.
4. If necessary, select the JIRA server whose issues you want to insert.
5. Click **Search** to find the issues on the JIRA server which match your JQL query. The first 20 issues retrieved by your JQL query are displayed.
   - To insert a single issue, select the issue from your list and click **Insert**.
   - To insert the full list of issues, select the **Insert all query results as a table** check box before clicking **Insert**.

Notes

The issues from a JIRA site which you can access in the 'Insert JIRA Issues' dialog depends on the application link's **outgoing authentication** used by Confluence to communicate with that JIRA site. While you can always access publicly visible issues:

- If 'Trusted Applications' outgoing authentication is used — you can also view issues restricted to an account on JIRA whose user name matches your user name in Confluence.
- If 'OAuth' outgoing authentication is used, you may need to click **Login & Approve** at this point to gain access to the JIRA server and restricted issues. You can also view issues restricted to the user account that you 'Login & Approve' (to the JIRA site) on the 'Insert JIRA Issues' dialog.
- If 'Basic Access' outgoing authentication is used — you can also view issues restricted to the user account configured for the JIRA site's 'outgoing authentication'.

**JIRA Issues Macro**

**Trackback**

Trackback is a mechanism by which two sites can stay informed each time one site refers to the other by means of trackback 'pings'.

In Confluence, Trackback is enabled by a [site administrator](Administration Console) from the Administration Console. When Trackback is enabled, any time you link to an external webpage that supports Trackback Autodiscovery, Confluence will send a Trackback ping to that page to inform it that it has been linked to.

Confluence pages also support Trackback Autodiscovery, and when Trackback is enabled can receive trackback pings sent by other sites.

To see who has sent a Trackback ping to a Confluence page:

1. Go to the page.
2. Choose **Tools > Info** to go to the 'Information' view for the page.

Any Trackback pings the page has received will be listed under the page's **Incoming Links**.
Confluence incoming trackback pings only work with referenced pages that are public (anonymously viewable)

See more information about the Information View.

Displaying Images

You can display an image on a Confluence page in the following cases:

- The image is attached to the page.
- The image is attached to another page of the same Confluence site, even if in another space.
- The image is on a remote web page.

Once the image is displayed on the page, you can:

- Move the image to a new position on the page simply by cutting and pasting.
- Change how the image appears on the page.
- Link from an image to another page.

Displaying an image attached to the page

There are several methods for attaching image files to a page.

Once you have attached an image to a page, there are different methods for choosing where on the page the image should appear:

Using the 'Insert Image' dialog

Once an image is attached to the page, you can edit the page to choose where the image should appear.

On this page:

- Displaying an image attached to the page
- Displaying an image attached to a different page
- Displaying an image from a remote web page
- Controlling the image appearance
- Setting other image attributes
- Displaying a gallery of images
- Image file formats

Related pages:

- Linking from an Image
- Linking to Images
- Working with Attachments
- Choosing a Profile Picture
- Confluence User's Guide

To position an attached image on the page:

1. While editing the page, position the cursor where you want to place the image.
2. Choose **Insert > Image** and choose the **Attached Images** tab.
3. Select the required image and choose **Insert** (or just double-click the image).

**Using autocomplete**

Once an image is attached to the page, you can use autocomplete while editing the page to choose where the image should appear.

**To position an attached image on the page:**

1. While editing the page, position the cursor where you want to place the image.
2. Trigger the autocomplete function by typing ‘!’.
3. Choose the image from the list that appears.

**Using drag-and-drop**

Depending on the browser you are using, you can attach and position an image in one step. While you are editing a page, simply drag-and-drop an image file on to the page. The image is attached to the page and is placed at the current cursor position.

**Displaying an image attached to a different page**

You can display an image that is attached to a different page of the same Confluence site, as long as you know the name of the image. This approach can make it easier to manage your images by allowing you to keep them all in the same place.

**To display an image attached to a different page:**

1. While editing the page, position the cursor where you want to place the image.
2. Choose **Insert > Image** and choose the **Search** tab.
3. Type in the name of the image.
4. Choose whether to search the current space or **All Spaces** and choose **Search**.
5. Select the required image from the search results and choose **Insert**.

Alternatively, you can simply cut and paste the image from another page.

**Displaying an image from a remote web page**

You can display an image from a remote web page on your Confluence page, without needing to attach it to your page. You need to know the URL for the image, not for the web page it appears on. Note that you should have permission to use that image on your page.

**To display an image located on a web page:**

1. While editing the page, position the cursor where you want to place the image.
2. Choose **Insert > Image** and choose **From the Web**.
3. Type in the URL for the image. An example is: `http://www.atlassian.com/software/confluence/images/icon_customerslove_big.png`
4. Choose **Preview** to check that the URL and image are correct.
5. Choose **Insert**.

Alternatively, you can simply cut and paste the image from a web page.

**Controlling the image appearance**

When editing the page, click the image to show the image properties panel. The panel allows you to set the display size for the image and choose whether the image has a border. See also **Linking from an Image**.

**To set the size of the image, do one of the following:**
• Choose one of the size 'preset' buttons (the image width in pixels is displayed to the left).
• Choose the image size text and enter a new image width in pixels (you can specify a size between 16px and 900px).

Note that images are displayed as thumbnails.

**To add a border to the image:**
• Choose **Border** in the image properties panel.

**To add a hyperlink to the image:**
• Choose **Link** in the image properties panel. For more detail, see [Linking from an Image](#).

**To align an image:**
• Select the image and choose the paragraph alignment buttons on the editor toolbars.
• If you choose the left or right alignment, the text will wrap around the image. The text does not wrap for centre alignment.

**To add border effects to an image:**
• Choose **Effects** in the image properties panel and make a choice.

**To add a caption to an image:**
• Choose **Effects** in the image properties panel and choose the **Instant Camera** image effect.
• Save the page.
• Choose **Tools > Attachments** to go to the 'Attachments' view of the page.
• Choose **Properties** next to the image file.
• Add a comment to the attachment. The text in your comment will appear as the image caption.

**Note:** You will need to re-do the comment each time you upload a new version of the image.

*Screenshot: The image properties panel beneath an image*
Setting other image attributes

Certain attributes such as alt-text, title and other HTML parameters can still be set by using the Insert > Wiki Markup function from the editor toolbar, then using the syntax described in Confluence Wiki Markup.
Displaying a gallery of images

See the Gallery Macro.

Image file formats

You can attach image files of any format to a page. Confluence supports the following image formats in the Gallery macro and when displaying an image on a page:

- gif
- jpeg
- png
- bmp (depending on browser support)

Working with Tables

Confluence pages can include multi-row and multi-column tables. You can highlight cells, rows and columns in different colours. When viewing the page, people can sort the table by clicking the column headers.

Inserting a table

To create a table:

1. While editing the page, place your cursor at the point where you want to insert the table.
2. Choose Table on the toolbar.
3. A dropdown menu will appear, showing a table with a variable number of rows and columns. Click in a cell to set the number of columns and rows for your table.

On this page:

- Inserting a table
- What you can do with your table in the editor
- Sorting the table in view mode

Related pages:

- Working with Page Layouts and Columns and Sections
- Using the Editor
- Confluence User's Guide

What you can do with your table in the editor

While editing a page, place your cursor inside a table to see the following table operations appear in the toolbar.

<table>
<thead>
<tr>
<th>Table operation</th>
<th>Toolbar button</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insert an empty row above the current one.</td>
<td>✞</td>
</tr>
<tr>
<td>Insert an empty row below the current one.</td>
<td>✓</td>
</tr>
<tr>
<td>Remove the current row.</td>
<td>✗</td>
</tr>
<tr>
<td>Cut the current row and copy it to the clipboard.</td>
<td>✓</td>
</tr>
</tbody>
</table>
Copy the current row to the clipboard.

Paste the row from the clipboard to the current row.

Insert an empty column to the left of the current one.

Insert an empty column to the right of the current one.

Remove the current column.

Merge the selected cells.

Split the selected merged cells.

Highlight the current row. You can choose a colour from the dropdown arrow next to the three highlight options.

Highlight the current column. You can choose a colour from the dropdown arrow next to the three highlight options.

Highlight the current cell. You can choose a colour from the dropdown arrow next to the three highlight options.

Remove the table.

**Sorting the table in view mode**

When readers view a table on a page, they can sort the table by clicking the sort icons in the header row.

*Screenshot: A colourful, sortable table*
Using Symbols, Emoticons and Special Characters

You can add various symbols and special characters to Confluence pages. You can also use them in other places that display content, such as blog posts, comments, the dashboard welcome message and the configuration panels offered by the Documentation theme.

**Inserting symbols and special characters**

To add a symbol to your page:

1. Edit the page.
2. Choose **Insert > Symbol**. This will display the 'Insert Custom Character' window.
3. Choose a symbol to insert it.

**On this page:**

- Inserting symbols and special characters
- Inserting emoticons
- Preventing emoticons from appearing

**Related pages:**

- Icons Used in Confluence
- Quick Reference Guide for the Confluence Editor
- Confluence Wiki Markup
- Confluence User's Guide

*Screenshot: Available symbols*
Inserting emoticons

There are two ways to add an emoticon, or smiley, to your page.

By choosing an emoticon from those available:
1. Choose Insert > Emoticon.
2. Choose an emoticon to insert it.

By typing a character combination:
You can insert emoticons by typing commonly-used character combinations. For example, the following code appears as an emoticon when the page is rendered.

```
;)
```

The above example creates this emoticon: 😊

This table shows the emoticons (and other icons) available in Confluence, and the character combinations that create them:
Preventing emoticons from appearing

To undo the conversion of a character combination into an emoticon, press Ctrl+Z (Windows) or Cmd+Z (Mac).

The Confluence knowledge base has an article on disabling emoticons.

Using Autocomplete

When using the Confluence editor, you can type a trigger character or press a keyboard shortcut to see a list of suggested links, files or macros to add to your page, or to mention another user (and automatically notify them of this).

Summary of autocomplete

<table>
<thead>
<tr>
<th>What you want to do</th>
<th>Trigger character</th>
<th>Keyboard shortcut</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a link on your page</td>
<td>[</td>
<td>Ctrl+Shift+K</td>
<td>See a list of suggested pages or other locations to link to from your page. More...</td>
</tr>
<tr>
<td>Display an image, video, audio file or document on your page</td>
<td>!</td>
<td>Ctrl+Shift+M</td>
<td>See a list of suggested images, multimedia files and documents to embed in your page. More...</td>
</tr>
<tr>
<td>Add a macro on your page</td>
<td>{</td>
<td>None</td>
<td>See a list of suggestions as you begin typing a macro name. More...</td>
</tr>
<tr>
<td>Notify another user by email that you have mentioned them on your page</td>
<td>@</td>
<td>None</td>
<td>See a list of suggested users to mention. More...</td>
</tr>
</tbody>
</table>

On this page:

- Summary of autocomplete
- Using autocomplete for links
- Using autocomplete for images, videos, audio files and documents
- Using autocomplete for macros
- Using autocomplete for mentions
- Cancelling autocomplete
- Enabling and disabling autocomplete
- Ignoring autocomplete

Related pages:

- Working with Links
- Using Images
- Working with Macros
- Keyboard Shortcuts
- User Profile Overview
- Confluence User's Guide

Using autocomplete for links
Type ‘[’, or press Ctrl+Shift+K, to see a list of suggested pages or other locations to link to from your page. You can link to pages, user profiles, images, documents and other file attachments.

**To autocomplete a link:**

1. Edit the page.
2. Click where you want to insert a link and do one of the following:
   - Type ‘[’ and then the first few characters of the page title, user's name, image name or file name.
   - Type the first few characters of the page title, user's name, image name or file name (or select relevant text) and then press Ctrl+Shift+K.
3. Click the relevant link from the list of suggestions.

If the item you need is not in the list, either:

- Choose **Search for 'xxx'** to continue looking for the page within Confluence, or
- Choose **Insert Web Link** to insert a link to an external web page using the link browser.

**Screenshot: Autocomplete for a link**

![Autocomplete for a link](image)

**Using autocomplete for images, videos, audio files and documents**

You can use the autocomplete as a fast way of embedding images, videos, audio files and documents into your page. Type an exclamation mark or press Ctrl+Shift+M to see a list of suggested images, multimedia files and documents to display on your page. You can use autocomplete to embed the following file types:

- Images – any format that Confluence supports. See [Displaying Images](#).
- Videos, audio files and all multimedia formats that Confluence supports. See [Embedding Multimedia Content](#).
- Office documents supported by the [Confluence Office Connector](#): Word, Excel and PowerPoint.
- PDF files.

*Autocomplete works most efficiently for files that are already attached to the Confluence page. See [Attaching Files to a Page](#).*
To embed an image, video, audio file or document:

1. Edit the page.
2. Click where you want to insert the image, video, audio file or document and do one of the following:
   - Type ‘!’ and then the first few characters of the image, file or document name.
   - Type the first few characters of the name of the image, file or document (or select relevant text) and then press Ctrl+Shift+M.
3. Choose the relevant file from the list of suggestions.

If the item you need is not in the list, either:

- Choose Open Image Browser to find images and documents using the image browser, or
- Choose Insert Other Media to embed videos, audio and other multimedia files using the macro browser. Insert the ‘Multimedia’ macro to display your multimedia file.

### Screenshot: Autocomplete for an image or document

![Autocomplete for an image or document](image.png)

**Using autocomplete for macros**

Type ‘{’ to see a list of suggested macros to add to your page.

Autocomplete provides access to all available macros in your Confluence site, including any user macros that your administrator has added and made visible to all.

ℹ️ You need to know the name of macro. Autocomplete for macros will only match the name of the macro, not the description.

**To autocomplete a macro using ‘{’:**

1. Edit the page.
2. Click where you want to insert the macro.
3. Type ‘{’ and then the first few characters of the macro name.
4. Choose the relevant macro from the list of suggestions.
5. Configure the macro by completing the form fields as prompted.

If the macro you need is not in the list, select Open Macro Browser in the list of suggestions to continue looking for the macro in the macro browser. See Working with Macros.
Using autocomplete for mentions

You can use autocomplete to automatically notify another Confluence user that you have mentioned them in a page, blog post, or comment. Type '@' and part of the person's name, to see a list of suggested users.

**Note:** Use the person's full name. Autocomplete will recognise users' full names only, not their usernames.

**To mention someone using '@':**
1. Edit the page.
2. Click where you want to insert a mention and type '@' and then the first few characters of the user's full name.
3. Choose the user's name from the list of suggestions.

Cancelling autocomplete

The autocomplete starts automatically when you press the trigger characters. You may want to close the autocomplete menu or escape from autocomplete once it has started.

There are a few different ways to stop the autocomplete once it has started:

- Press the escape key, 'Esc', on your keyboard.
- Click somewhere else in the editor panel.
Press an arrow key to move out of the autocomplete area.
For the link autocomplete only: enter a right-hand square bracket, like this: ]

**Enabling and disabling autocomplete**

You can turn off the triggering of autocomplete by the '[' and ']' characters. This will prevent the autocomplete from starting automatically when you press one of the trigger characters. You can also turn it back on again.

Notes:
- This setting does not affect the keyboard shortcuts for autocomplete (Ctrl+Shift+K and Ctrl+Shift+M).
- Even if the trigger characters are disabled, you can still use the keyboard shortcuts for autocomplete.
- This setting affects only you. Other people using Confluence can enable or disable the setting on their user profiles independently.
- Note that autocomplete is enabled by default.

**To enable or disable the autocomplete trigger characters:**

1. Go to your name (the 'User' menu) at the top of the page and choose Settings.
2. Choose Editor under 'Your Settings' in the left-hand panel.
3. Click Edit.
4. Either:
   - Disable autocompletion by selecting Disable Autocomplete.
   - Enable autocompletion by clearing Disable Autocomplete.
5. Click Submit.

**Screenshot: User Settings for the Editor**

![User Settings for the Editor]

**Ignoring autocomplete**

You can add macros, links and images by wiki markup alone. Type the macro, including its parameters and the closing curly bracket. Add a link, such as an anchor link, and end it with a square bracket. Insert an image or other embedded object, enclosed between exclamation marks. As soon as you close the macro, link, or embedded image, Confluence will convert it to rich text format and add it to the page.

More information about mouse-free macros, links and images:
- [Quick Reference Guide for the Confluence Editor](#)
- [Video](#)

**Working with Page Layouts and Columns and Sections**

When you want to add structure to the information on your page, it is often useful to split the information into columns. By 'column', we mean a vertical block of content. You may want more than one column across the width of the page.

You may also want to use a common structure on a number of pages, so that readers know where to find the information within each page. In addition to columns, sections are useful here. By 'section', we mean an area of...
the page. A section may contain one or more columns.

Confluence provides the following ways of creating columns and sections on a page:

- Page layouts offer a set of predefined columns and sections.
- The Section and Column macros allow more flexibility. You can set the width of the columns, and put the sections and columns in any part of the page.

### On this page:
- [Using page layouts](#)
- [Using the Section and Column macros](#)

### Related pages:
- [Confluence Wiki Markup for Macros](#)
- [Confluence Storage Format for Macros](#)
- [Using the Editor](#)
- [Working with Macros](#)
- [Working with Tables](#)

### Using page layouts

The Confluence editor offers a set of predefined page layouts. Each layout provides one or more columns. Some layouts also provide a horizontal block at the top and bottom of the page. The layout that you select determines the position of the sections and columns on the page, as well as the relative width of the columns. The page's content is confined within the borders of the layout. You cannot add content above or below the sections and columns provided by the layout.

#### To choose a page layout:

1. While editing the page, click the page layout icon. A dropdown list appears, showing icons that illustrate the available layouts.
2. Select a layout.

**Screenshot: Choosing a page layout**

If your page already has content on it, Confluence will put the existing content into the left-hand column of the new layout. If the page was using a different layout, Confluence will put the content into the appropriate sections and columns of the new layout.
Notes about page layouts

- **Very wide tables.** The width of each column is set to a percentage of the page width. The icons in the dropdown menu indicate the relative widths for each layout. In most cases, Confluence will adapt the width of the columns to fit the width of the page. If a column includes a large table, the content may not fit into the width of the page. You will see a horizontal scroll bar when viewing the page.

- **Mixing and matching.** You can put Section and Column macros inside page layouts. You can also put tables inside page layouts.

**Using the Section and Column macros**

You can use the Section and Column macros to add a set of columns to the page. The Section macro defines an area that will contain the columns. You can have as many sections as you like. Within each section, you can have as many columns as you like.

**To add a section and some columns to a page:**

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find the **Section** macro, select it and insert it onto the page.
3. Choose **Insert > Other Macros** again.
4. Find and insert the **Column** macro.
5. Add your content to the column.
6. Insert as many columns as you like within the section.

**Screenshot: A section and two columns in the editor**
Macro parameters

Parameters are options that you can set to control the content or format of the macro output.

**Parameters of the Section macro**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Border</td>
<td>false</td>
<td>Select this option to draw a border around the section and columns. <strong>Note:</strong> Without a Column macro, the border will not be displayed correctly.</td>
</tr>
</tbody>
</table>

**Parameters of the Column macro**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column Width</td>
<td>100% of the page width, divided equally by the number of columns in the section.</td>
<td>Specify the width of the column, in pixels (for example, 400px) or as a percentage of the available width (for example, 50%).</td>
</tr>
</tbody>
</table>

Notes about sections and columns

- All content within your section must be enclosed within a Column macro, otherwise the section layout will not work as expected.
- You can put tables inside columns.
- PDF exports do not handle page layouts. See this issue report:
Working with Macros

Using a macro, you can add extra functionality or include dynamic content on a page. For example, the Attachments macro will list a page's attachments in the page itself, so that readers do not have to visit the Attachments tab.

On this page:
- Adding a Macro to your Page
- Macros Shipped with your Confluence Installation
- Information about Other Macros
- Writing your own Macros
- Code examples

Adding a Macro to your Page

Including Macros with the Macro Browser

To add a macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type { and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Macro Parameters

Many macros allow you to include optional parameters to control the macro's output.

With the Attachments Macro, for instance, you have two optional parameters allowing you to:

- Specify the file formats of the attachments displayed.
- Choose whether or not you want old versions of the attachments displayed.

Macro Placeholders

Macro placeholders are displayed in the editor where you have added a macro to the page.

When editing a page, you can:

- Double-click a macro placeholder (or click the placeholder and choose Edit) to open the macro dialog window, where you can edit the macro's parameters.
- Select a macro placeholder to cut, copy and paste the macro.

Macros Shipped with your Confluence Installation

When you download your Confluence installation file, many macros are shipped with the download. Below is a list of the macros currently shipped with Confluence. Click a macro name for details of the usage, including optional parameters and examples.

Anchor Macro

Allows you to link to a specific part of a page.
**Attachments Macro**
Displays a list of attachments on a given page.

**Blog Posts Macro**
Lists the most recent news items in the space.

**Change-History Macro**
Displays a history of updates made to a page.

**Chart Macro**
Displays a chart based on tabular data.

**Cheese Macro**
Displays the words "I like cheese!"

**Children Display Macro**
Displays the children and descendants of the current page.

**Code Block Macro**
Displays code in your document with the appropriate syntax highlighting.

**Column Macro**
Used with the Section macro to define columns on a page. See Working with page layouts and columns and sections.

**Content by Label Macro**
Displays a list of content associated with specific labels.

**Content by User Macro**
Displays a list of the content items that have been created by a specified Confluence user.

**Contributors Macro**
Displays a list of Confluence users who have made a contribution of some type to a page.

**Contributors Summary Macro**
Displays a table of contribution-based statistics for a set of pages.

**Create Space Button Macro**
Renders a create space button linked to the create space page.

**Detailssummary Macro**
Presents a tabulated summary of selected metadata, which has been embedded using the Metadata Macro on any page or blog post in the current Confluence space.

**Excerpt Include Macro**

Allows you to display an excerpt from another page within the current page.

**Excerpt Macro**

Define a part of a page as the page's 'excerpt' which can then be displayed in another page.

**Expand Macro**

Displays an expandable/collapsible section of text.

**Favourite Pages Macro**

Displays a list of your favourite pages.

**Gadget Macro**

Allows you to add Confluence gadgets to pages or blog posts.

**Gallery Macro**

Forms a thumbnail gallery of all images attached to a page.

**Global Reports Macro**

Renders a list of links to global reports within a table.

**HTML Include Macro**

Includes the content of an external HTML file into a Confluence page.

**HTML Macro**

Renders your specified HTML code within the current page.

**IM Presence Macro**

Displays graphically when a contact is online.

**Include Page Macro**

Inserts the contents of the specified page into the current one.

**Info Macro**

Displays a block of text in a blue highlight box.

**JIRA Issues Macro**

Displays a list of JIRA issues in a page.
JIRA Macro
Displays one or more JIRA issues on your Confluence page.

JUnit Report Macro
Display a summary of JUnit test results.

Labels List Macro
Displays a hyperlinked alphabetical index of all labels within the current space.

LiveSearch Macro
Add a dynamic search box to a wiki page.

Lorem Ipsum Macro
Display a few paragraphs of pseudo-Latin text.

Metadata Macro
Allows you to embed metadata into pages and blog posts for presentation with the DetailsSummary Macro.

Multimedia Macro
Displays videos, animations and more, sourced from a file attached to a Confluence page and displayed on your page.

Navigation Map Macro
Renders the list of pages associated with a specified label as a navigable map.

Network Macro
Displays a list of Network activity for users in your Confluence site.

NoFormat Macro
Displays a block of text in monospace font.

Note Macro
Displays a block of text in a yellow highlight box.

Page Index Macro
Creates a hyperlinked alphabetical index of all page titles within the current space.

Page Tree Macro
Displays a dynamic, hierarchical list of pages starting from a specified parent (root) page.

Page Tree Search Macro
Adds a search box to your Confluence page and searches a hierarchy of pages starting from a specified parent (root) page.

**Panel Macro**

Displays a block of text within a fully customisable panel.

**Popular Labels Macro**

Displays the most popular labels used throughout your Confluence site or within a space.

**Profile Picture Macro**

Displays a user's profile picture on a page.

**Recently Updated Dashboard Macro**

Displays a list of the most recently changed content within Confluence and is intended for use on the Confluence dashboard.

**Recently Updated Macro**

Displays a list of recently changed content (pages, news items, comments, etc).

**Recently Used Labels Macro**

Lists labels most recently used in a specified scope (global, space, or personal)

**Related Labels Macro**

Lists labels frequently appearing on the same pages as the current page's labels.

**RSS Feed Macro**

Displays the contents of an RSS feed.

**Search Results Macro**

Searches Confluence, and includes the results in the page.

**Section Macro**

Used with the Column macro to define columns on a page. See Working with page layouts and columns and sections.

**Space Attachments Macro**

Displays a list of attachments belonging to the current space.

**Space Details Macro**

Includes the summary of a Confluence space in the page.

**Space Jump Macro**

 Allows you to link from a page in one space to a page with the same name in another space, without knowing
the name of the page when you create the link.

**Spaces List Macro**

Displays a list of all spaces visible to the user.

**Status Macro**

Displays a coloured lozenge, useful for reporting project status.

**Table of Contents Macro**

Displays a table of contents from your page headings.

**Table of Content Zone Macro**

Displays a table of contents from a defined page 'zone'.

**Tasklist Macro**

Displays a dynamic task list which can be modified in 'view' mode.

**Tip Macro**

Displays a block of text in a green highlight box.

**User List Macro**

Displays a list of Confluence users, from an optional group.

**User Profile Macro**

Displays a short summary of any Confluence user's profile on your Confluence page or blog.

**User Status List Macro**

Displays a history of any Confluence user's status updates on your Confluence page or blog.

**View File Macro**

Embeds an Office document or PDF file into your Confluence page.

**Warning Macro**

Displays a block of text in a red highlight box.

**Widget Connector Macro**

Displays videos, slide shows, twitter chats, documents and more, sourced from other web sites and displayed on your Confluence page.

**Information about Other Macros**

Other macros are available as **plugins** or as **user macros**, and can be installed by your Confluence administrator. Macros that may be of interest are also available from [Adaptavist](http://www.adaptavist.com), [CustomWare](http://customware.nu) and the [Confluence SharePoint connector](http://www.confluencesharepoint.com).
Writing your own Macros

To learn how to write your own macro, take a look at the following documentation:

- User macros are simple template-like macros that allow you to create simple formatting macros using the Confluence web interface. Read more about Writing User Macros.
- The Confluence Plugin Guide tells you how to develop a plugin for Confluence.

Code examples

See:

- Confluence Wiki Markup for Macros
- Confluence Storage Format for Macros

Anchor Macro

ℹ️ The Anchor Macro is documented in Working with Anchors.

Attachments Macro

See Displaying a List of Attachments.

Blog Posts Macro

The Blog Posts macro allows you to display blog posts on a Confluence page. Clicking on a title takes you to the blog post.

Using the Blog Posts Macro

To add the Blog Posts macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.
### Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content Type to Display</td>
<td>titles</td>
<td>Available values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>titles</strong> — Display only the title of each blog post.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>excerpts</strong> — Display a short excerpt from each blog post. If the post contains an Excerpt macro, the Blog Posts macro will display the content defined in the Excerpt macro. If the post does not contain an Excerpt macro, the Blog Posts macro will display the first few sentences of the post.</td>
</tr>
<tr>
<td>Time Frame</td>
<td>no limit</td>
<td>Specify how far back in time Confluence should look for the blog posts to be displayed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Available values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>m</strong> — Minutes</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>h</strong> — Hours, so '12h' displays blog posts created in the last twelve hours.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>d</strong> — Days, so '7d' displays blog posts created in the last seven days.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>w</strong> — Weeks</td>
</tr>
</tbody>
</table>
| **Restrict to these Labels** | None | Filter the results by label. The macro will display only the blog posts which are tagged with the label(s) you specify here.

You can specify one or more label values, separated by a comma or a space.

- To exclude content which matches a given label, put a minus sign (-) immediately in front of that label value. For example: If you specify a label value of `-badpage` you will get only content which is not labelled with 'badpage'.
- To indicate that the results **must** match a given label value, put a plus sign (+) immediately in front of that label value. For example: If you specify a label value of `+superpage,+goodpage` you will get only content which has at least two labels, being 'superpage' and 'goodpage'. |

| **Restrict to these Authors** | None | Filter the results by author. The macro will display only the blog posts which are written by the author(s) you specify here.

You can specify one or more authors, separated by a comma. |
| Restrict to these Spaces | @self, i.e. the space which contains the page on which the macro is coded | This parameter allows you to filter content by space. The macro will display only the pages which belong to the space(s) you specify here. You can specify one or more space keys, separated by a comma or a space.  
- To exclude content in a specific space, put a minus sign (-) immediately in front of that space key. For example: If you specify a space key of -BADSPACE you will get only content which is not in the BADSPACE.  
- To indicate that the results must come from a specific space, put a plus sign (+) immediately in front of that space key. For example: If you specify a space key of +GOODSPACE you will get only content in GOODSPACE. (Note that this is not particularly useful, because each content item belongs to one space only. If you put a plus sign next to one space key and list other space keys too, the other space keys will be ignored.) Special values:  
- @self — The current space.  
- @personal — All personal spaces.  
- @global — All global spaces.  
- @favorite — The spaces you have marked as favourite.  
- @favourite — The same as @favorite above.  
- @all — All spaces in your Confluence site.  
- * — The same as @all above. When specifying a personal space, remember to use the tilde (~) sign in front of the username, such as ~jbloggs or ~jbloggs@example.com. |
<table>
<thead>
<tr>
<th>Maximum Number of Blog Posts</th>
<th>15</th>
<th>Specify the maximum number of results to be displayed. Note that the results are sorted first, and then the maximum parameter is applied.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sort By</td>
<td>creation</td>
<td>Specify how the results should be sorted. If this parameter is not specified, the sort order defaults to descending order (newest first) based on the creation date. Values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• title — Sort alphabetically by title.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• creation — Sort by the date on which the content was added.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• modified — Sort by the date on which the content was last updated.</td>
</tr>
<tr>
<td>Reverse Sort</td>
<td>false</td>
<td>Select to change the sort from descending to ascending order (oldest first). Use this parameter in conjunction with the Sort By parameter. This parameter is ignored if the Sort By parameter is not specified.</td>
</tr>
</tbody>
</table>

**Change-History Macro**

The Change-History macro shows the history of updates made to a page: version number, author, date and comment. It displays the information inline.

**Screenshot: The Change-History macro in Confluence**

<table>
<thead>
<tr>
<th>Version</th>
<th>Date</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current Version (v. 3)</td>
<td>Apr 01, 2009 16:55</td>
<td>Conf Admin</td>
</tr>
<tr>
<td>v. 2</td>
<td>Apr 01, 2009 13:09</td>
<td>Conf Admin</td>
</tr>
<tr>
<td>v. 1</td>
<td>Apr 01, 2009 11:03</td>
<td>Conf Admin</td>
</tr>
</tbody>
</table>

**Related pages:**

- Confluence User's Guide

**To add the Change-History macro to a page:**

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{ and the beginning of the macro name, to see a list of
suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Note: There are no parameters for this macro.

Chart Macro
The Chart macro allows you to display a chart based on tabular data. When you add the macro to a page, you:

- supply the data to be charted by the macro as a table in the placeholder of the macro.
- edit the macro parameters in the Macro Browser to configure the format of the chart.

Screenshot 1: A table of data in the Chart macro placeholder

<table>
<thead>
<tr>
<th>Weeks</th>
<th>Issues Burndown</th>
</tr>
</thead>
<tbody>
<tr>
<td>04/07/2011</td>
<td>81</td>
</tr>
<tr>
<td>11/07/2011</td>
<td>68</td>
</tr>
<tr>
<td>18/07/2011</td>
<td>67</td>
</tr>
<tr>
<td>25/07/2011</td>
<td>66</td>
</tr>
<tr>
<td>01/08/2011</td>
<td>65</td>
</tr>
<tr>
<td>08/08/2011</td>
<td>65</td>
</tr>
<tr>
<td>15/08/2011</td>
<td>64</td>
</tr>
<tr>
<td>22/08/2011</td>
<td>44</td>
</tr>
<tr>
<td>29/08/2011</td>
<td>24</td>
</tr>
<tr>
<td>05/09/2011</td>
<td>0</td>
</tr>
</tbody>
</table>

Using the Chart Macro

To add the Chart macro to a page:

1. Edit the page and use autocomplete to add the Chart macro. (Type '{chart}'.)
2. Enter your chart data as one or more tables in the body of the macro placeholder. (See the screenshot above.)
3. Click the macro placeholder and choose Edit.
4. Select a chart type using the Type parameter (see below).
5. Choose other parameter settings in the macro browser, as described below.
6. Click Refresh in the 'Preview' area, to check that the chart appears as you expect.
7. Click Save to add the chart to your page.
8. Click Save again when you are ready to save the page.

Parameters

Chart Type Parameters | Display Control Parameters | Title and Label Parameters | Data Specification Parameters | Colour Parameters | Axis Parameters | Pie Chart Parameters | Attachment Parameters

Chart Type Parameters

These parameters determine the type of chart to display and the way the chart looks.

<table>
<thead>
<tr>

<tr>
<td>Show shapes</td>
<td>true</td>
<td>Applies to line charts. Shapes are shown at each data point.</td>
</tr>
<tr>
<td>Opacity</td>
<td></td>
<td>• 75 percent for 3D charts</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 50 percent for non-stacked area charts</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 100 percent for all other charts</td>
</tr>
<tr>
<td></td>
<td></td>
<td>A percentage value between 0 (transparent) and 100 (opaque) that determines how opaque the foreground areas and bars are.</td>
</tr>
</tbody>
</table>

**Display Control Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width</td>
<td>300</td>
<td>The width of the chart in pixels.</td>
</tr>
<tr>
<td>Height</td>
<td>300</td>
<td>The height of the chart in pixels.</td>
</tr>
<tr>
<td>Display rendered data</td>
<td>false</td>
<td>Sets whether to display the rendered body of the macro (usually the data tables). By default, the chart data table isn't rendered.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>before</strong> — the data are displayed before the chart.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>after</strong> — the data are displayed after the chart.</td>
</tr>
</tbody>
</table>

| | | - jpg

**Title and Label Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chart Title</td>
<td>none</td>
<td>The title of the chart.</td>
</tr>
<tr>
<td>Chart Subtitle</td>
<td>none</td>
<td>A subtitle for the chart, using a smaller font than for <strong>Title</strong>.</td>
</tr>
<tr>
<td>Horizontal-axis Label</td>
<td>none</td>
<td>The label for the x-axis (domain).</td>
</tr>
<tr>
<td>Vertical-axis Label</td>
<td>none</td>
<td>The label for the y-axis (range).</td>
</tr>
<tr>
<td>Show Legend</td>
<td>true</td>
<td>Show a legend or key.</td>
</tr>
</tbody>
</table>

**Data Specification Parameters**

The data for the chart is taken from tables found when the macro body is rendered. These options control how this data is interpreted. By default, numeric and date values are interpreted according to the Confluence global default language (locale) formats. If conversion fails, other languages defined in Confluence will be tried. Additional conversion options can be specified using the parameters below.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tables</td>
<td>all first level tables</td>
<td>Comma separated list of table ids and/or table numbers (starting at 1) contained within the body of the macro that will be used as the data for the chart. If data tables are embedded in other tables, then table selection will be required. This occurs when more complex formatting is done (for example using section and column macros).</td>
</tr>
<tr>
<td>Columns</td>
<td>all columns</td>
<td>Comma separated list of column labels and/or column titles and/or column numbers for tables used for chart data. This applies to all tables processed. Columns are enumerated starting at 1. Column label is the text for the column in the header row. Column title is the (html) title attribute for the column in the header row.</td>
</tr>
</tbody>
</table>
| Content Orientation | horizontal | - **vertical** — data table columns will be interpreted as series.
<p>| | | - <strong>horizontal</strong> — data table rows will be interpreted as series. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Series</td>
<td>false</td>
<td>• true — the x values in an XY plot will be treated as time series data and so will be converted according to date formats.</td>
</tr>
<tr>
<td>Date format</td>
<td>Confluence language defined date formats</td>
<td>For time series data, the date format allows for additional customization of the conversion of data to date values. If a Date format is specified, it will be the first format used to interpret date values. Specify a format that matches the time series data. See simple date format.</td>
</tr>
<tr>
<td>Time Period</td>
<td>Day</td>
<td>The time period for time series data. Defines the granularity of how the data is interpreted. Valid values are: Millisecond, Second, Minute, Hour, Day, Week, Month, Quarter, Year.</td>
</tr>
<tr>
<td>Language</td>
<td>none</td>
<td>Use in combination with the Country parameter to form a locale. These additional number and date formats will be used for data conversion before the default languages. Valid values are 2 character ISO 639-1 alpha-2 codes.</td>
</tr>
<tr>
<td>Country</td>
<td>none</td>
<td>Use in combination with the Language parameter to form a locale. Valid values are 2 character ISO 3166 codes.</td>
</tr>
<tr>
<td>Forgive</td>
<td>true</td>
<td>• true — the macro tries to convert numeric and date values that do not totally match any of the default or user-specified formats. • false — enforce strict data format. Data format errors will cause the chart to not be produced.</td>
</tr>
</tbody>
</table>

### Colour Parameters

Colours are specified using hexadecimal notation or HTML colour names.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Background Colour</td>
<td>White</td>
<td>Background of the chart.</td>
</tr>
<tr>
<td>Border Colour</td>
<td>no border</td>
<td>Border around the chart.</td>
</tr>
</tbody>
</table>
### Colours

Comma-separated list of colours used to customise category, sections, and series colours.

### Axis Parameters

Depending on the chart type, the range and domain axis may be customised. These values are automatically generated based on the data but can be overridden by specifying one or more more of these parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range Minimum Value</td>
<td>none</td>
<td>Range axis lower bound.</td>
</tr>
<tr>
<td>Range Maximum Value</td>
<td>none</td>
<td>Range axis upper bound.</td>
</tr>
<tr>
<td>Range Axis Tick Unit</td>
<td>none</td>
<td>Range axis units between axis tick marks.</td>
</tr>
<tr>
<td>Range Axis Label Angle</td>
<td>none</td>
<td>Angle for the range axis label in degrees.</td>
</tr>
<tr>
<td>Domain Axis Lower Bound</td>
<td>none</td>
<td>Only applies to XY plots. Domain axis lower bound. For a date axis, this value must be expressed in the date format specified by the <code>Date format</code> parameter.</td>
</tr>
<tr>
<td>Domain Axis Upper Bound</td>
<td>none</td>
<td>Only applies to XY plots. Domain axis upper bound. For a date axis, this value must be expressed in the date format specified by the <code>Date format</code> parameter.</td>
</tr>
<tr>
<td>Domain Axis Tick Unit</td>
<td>none</td>
<td>Only applies to XY plots. Domain axis units between axis tick marks. For a date axis, this value represents a count of the units specified in the <code>Time Period</code> parameter. The <code>Time Period</code> unit can be overridden by specifying a trailing character: y (years), M (months), d (days), h (hours), m (minutes), s (seconds), u (milliseconds).</td>
</tr>
<tr>
<td>Domain Axis Label Angle</td>
<td>none</td>
<td>Only applies to XY plots. The angle for the domain axis label, in degrees.</td>
</tr>
</tbody>
</table>
### Category Label Position

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category Label Position</td>
<td>none</td>
<td>Placement of the axis label text for categories.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- up45 — 45 degrees going upward</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- up90 — 90 degrees going upward</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- down45 — 45 degrees going downward</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- down90 — 90 degrees going downward</td>
</tr>
</tbody>
</table>

### Date Tick Mark Position

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date Tick Mark Position</td>
<td>start</td>
<td>Placement of the date tick mark.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- start — tick mark is at the start of the date period.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- middle — tick mark is in the middle of the date period.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- end — tick mark is at the end of the date period.</td>
</tr>
</tbody>
</table>

### Pie Chart Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pie Section Label</td>
<td>Show only the pie section key value</td>
<td>Format for how pie section labels are displayed. The format uses a string with special replacement variables:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- %0% is replaced by the pie section key.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- %1% is replaced by the pie section numeric value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- %2% is replaced by the pie section percent value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example 1: &quot;%0% = %1%&quot; would display something like &quot;Independent = 20&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example 2: &quot;%0% (%2%)&quot; would display something like &quot;Independent (20%)&quot;</td>
</tr>
<tr>
<td>Pie Section Explode</td>
<td>No exploded sections</td>
<td>Comma separated list of pie keys that are to be shown exploded. Note: requires jFreeChart version 1.0.3 or higher.</td>
</tr>
</tbody>
</table>

### Attachment Parameters

These are advanced options that can be used for chart versioning, to enable automation and to improve performance. Use these options carefully! Normally, the chart image is regenerated each time the page is displayed. These options allow for the generated image to be saved as an attachment and have subsequent...
access re-use the attachment. This can be useful especially when combined with the Cache Pluginto improve performance. Depending on the options chosen, chart images can be versioned for historical purposes.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>none</td>
<td>The name and location with which the chart image will be saved as an attachment. The user must be authorised to add attachments to the page specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- ^attachmentName.png — the chart is saved as an attachment to the current page.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- page^attachmentName.png — the chart is saved as an attachment to the page name provided.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- space:page^attachmentName.png — the chart is saved as an attachment to the page name provided in the space indicated.</td>
</tr>
<tr>
<td>Attachment Version</td>
<td>new</td>
<td>Defines the versioning mechanism for saved charts.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- new — creates new version of the attachment.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- replace — replaces all previous versions of the chart. To replace an existing attachment, the user must be authorized to remove attachments for the page specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- keep — only saves a new attachment if an existing export of the same name does not exist. An existing attachment will not be changed or updated.</td>
</tr>
<tr>
<td>Attachment Comment</td>
<td>none</td>
<td>Comment used for a saved chart attachment.</td>
</tr>
<tr>
<td>Thumbnail</td>
<td>false</td>
<td>• true — the chart image attachment will be shown as a thumbnail.</td>
</tr>
</tbody>
</table>

Cheese Macro
The Cheese macro simply displays the words "I like cheese!" You can use this macro to test the Confluence macro functionality.

To add the Cheese macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Note: There are no parameters for this macro.

Children Display Macro
Use the Children Display macro to list the child pages of a page and the further descendants (children’s children). By default, the macro displays links to the child pages as in the screenshot below. People viewing the page will see only the links for pages that they have permission to view.

Screenshot: The Children Display macro in Confluence
Using the Children Display macro

To add the Children Display macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type `{ and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Example

This list of child pages is generated by a Children Display macro on this page:

- Child Page 1
- Child Page 2

Parameters

Parameters are options that you can set to control the content or format of the macro output.

Children Display Macro

Code Block Macro

The Code Block macro allows you to display source code in your document with the appropriate syntax highlighting. The code block displays on the page as shown below:

```java
public static void main(String[] args) {
    System.out.println("Hello World!");
}
```

On this page:

- Using the Code Block Macro
- Parameters

Related pages:

Using the Code Block Macro

To add the Code Block macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type `{ and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

You can now type the code block directly into the macro placeholder in the editor. Note that any white space contained in the placeholder is not manipulated in any way by the Code Block macro. This is to provide the writer with flexibility over code indentation.

Parameters

Parameters are options that you can set to control the content or format of the macro output.

</table>
| Theme   | Default | Specifies the colour scheme used for displaying your code block. Many of these themes are based on the default colour schemes of popular integrated development environments (IDEs). The default theme is Confluence (also known as Default), which is typically black and coloured text on a blank background. However, you can also choose from one of the following other popular themes:  
|         |         | • Django  
|         |         | • Emacs  
|         |         | • FadeToGrey  
|         |         | • Midnight  
|         |         | • RDark  
|         |         | • Eclipse  
|         |         | • Confluence |

### Column Macro

**Used with the Section macro to define columns on a page.** See [Working with page layouts and columns and sections](#).

### Content by Label Macro

The Content by Label macro displays links to pages, blog posts and attachments that have been tagged with specific labels.

**A working example**

Below is a working example of the Content by Label macro, displaying content with the label 'LDAP'.

No content found for label(s) LDAP.

**Using the Content by Label Macro**

**To add the Content by Label macro to a page:**
1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

**To edit an existing macro:** Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

**Parameters**

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label(s)</td>
<td>None</td>
<td>Filter by label(s). The macro will display only the content tagged with the label(s) specified here. See also the Operator parameter below. This parameter is required. Specify one or more labels, separated by a comma or a single space. • To exclude content which matches a given label, put a minus sign (-) immediately in front of that label value. For example: If you specify a label value of -badpage you will get only content which is not labelled with 'badpage'. • To indicate that the results must match a given label value, put a plus sign (+) immediately in front of that label value. For example: If you specify a label value of +superpage,+goodpage you will get only content which has at least two labels, being 'superpage' and 'goodpage'.</td>
</tr>
<tr>
<td>Author(s)</td>
<td>None</td>
<td>Filter by author. The macro will display only the content created or updated by the author(s) specified here. Specify one or more authors, separated by a comma.</td>
</tr>
</tbody>
</table>
| **Include this Content Type Only** | all | Filter by content type. The macro will display only the content of the type specified here.

Specify one or more content types, separated by a comma or a space.

To exclude content of a given content type, put a minus sign (-) immediately in front of that content type. For example: If you specify a content type of -blogpost you will get pages and all other content except for blog posts.

Available values:
- page – [Pages](#)
- blogpost or news – [Blog posts](#), also known as news items.
- attachment – [Attachments](#)

<p>| <strong>Show Labels for Each Page</strong> | true | Show or hide labels in the results. |
| <strong>Show Space Name for Each Page</strong> | true | Show or hide spaces in the results. |
| <strong>List Title</strong> | None | Add a title or heading to the list. |
| <strong>Maximum Number of Pages</strong> | 15 | Limit the maximum number of results to be displayed. Note that the results are sorted first, and then the maximum parameter is applied. |
| <strong>Display Excerpts</strong> | false | Include excerpts from each page listed. Note that you must have defined excerpts on each of those pages, by adding the excerpt macro to the page. Only the first few lines of the excerpt for each page are displayed. |</p>
<table>
<thead>
<tr>
<th>Restrict to these Spaces</th>
<th>@all</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter by space. The macro will display only the content which belongs to the space(s) specified here.</td>
<td></td>
</tr>
<tr>
<td>Specify one or more space keys, separated by a comma or a space.</td>
<td></td>
</tr>
<tr>
<td>• To exclude content in a specific space, put a minus sign (−) immediately in front of that space key. For example: If you specify a space key of −BADSPACE you will get only content which is not in the BADSPACE.</td>
<td></td>
</tr>
<tr>
<td>• To indicate that the results must come from a specific space, put a plus sign (+) immediately in front of that space key. For example: If you specify a space key of +GOODSPACE you will get only content in GOODSPACE. (Note that this is not particularly useful, because each content item belongs to one space only. If you put a plus sign next to one space key and list other space keys too, the other space keys will be ignored.)</td>
<td></td>
</tr>
<tr>
<td>Special values:</td>
<td></td>
</tr>
<tr>
<td>• @self — The current space.</td>
<td></td>
</tr>
<tr>
<td>• @personal — All personal spaces.</td>
<td></td>
</tr>
<tr>
<td>• @global — All global spaces.</td>
<td></td>
</tr>
<tr>
<td>• @favorite — The spaces you have marked as favourite.</td>
<td></td>
</tr>
<tr>
<td>• @favourite — The same as @favorite above.</td>
<td></td>
</tr>
<tr>
<td>• @all — All spaces in your Confluence site.</td>
<td></td>
</tr>
<tr>
<td>• * — The same as @all above.</td>
<td></td>
</tr>
<tr>
<td>When specifying a personal space, remember to use the tilde (~) sign in front of the username, such as ~jbloggs or ~<a href="mailto:jbloggs@example.com">jbloggs@example.com</a>.</td>
<td></td>
</tr>
</tbody>
</table>
| **Operator** | OR | The operator to apply when matching content against the labels specified in the **Label(s)** parameter:  
| | | • **OR** – Display content with *any* of the non-prefixed labels.  
| | | • **AND** – Display content with *all* of the specified non-prefixed labels.  
| | | Note that this parameter only modifies the behaviour of the **Label(s)** parameter and only affects label values without a plus (+) or minus (-) sign prefix.  
| **Sort By** | modified | Specify how the results should be sorted.  
| | | Values:  
| | | • **title** — Sort alphabetically by title.  
| | | • **creation** — Sort by the date on which the content was added.  
| | | • **modified** — Sort by the date on which the content was last updated.  
| | | Note: If this parameter is not specified, the sort order defaults to descending, based on the last modification date (latest first). To change the sort order from ascending to descending, use the **Reverse Sort** parameter.  
| **Reverse Sort** | false | Select **Reverse Sort** to change the sort from descending to ascending. Use this parameter in conjunction with the **Sort By** parameter. **Reverse Sort** is ignored if **Sort By** is not specified.  

**Content by User Macro**

The Content by User macro generates a tabulated list of the content items, throughout the Confluence installation, that have been created by a specified Confluence user. The list includes all current pages, comments and spaces created by the user. Each item in the table is linked to its corresponding page, page comment or space dashboard.

Note that items for page comments contain a link to the page, followed by a second link to the comment itself, with these separated by a greater-than sign (>).

**Using the Content by User macro**

**To add the Content by User macro to a page:**
1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in [Using Autocomplete](#).

**To edit an existing macro:** Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

### Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Username</td>
<td>none</td>
<td>The Confluence username for a person who has created content.</td>
</tr>
</tbody>
</table>

**Contributors Macro**

The Contributors macro displays a list of Confluence users who have made a contribution of some type to a page. It can also be used to list watchers of the page.

The scope of this macro can be extended to include the immediate children or descendants of the specified page. The list of contributors can be based on people who have:

- authored or edited the page(s)
- contributed comments or added labels to the page(s), or
- are simply watching the page(s).

**Screenshot:** Example list of Contributors
In this example, the Display Format parameter has been set to list.

Using the Contributors Macro

To add the Contributors macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type `{ and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| Contribution Type| authors | Filters by either the type of contribution made to a page (and optionally its descendant pages), or the watches on the page. Contribution types are:
- authors - includes people who created or have edited the page(s)
- comments - includes people who have added comments to the page(s)
- labels - includes people who have added labels to the page(s)
- watches - includes people who are watching the page(s).

You can specify one or more contribution types, separated by commas.
| **Sort By**                  | count | Specifies the criteria used to sort contributors. Sort criteria are:  
|                            |       | • **count** - sorts people based on the total number of contributions to the page(s)  
|                            |       | • **name** - sorts people into alphabetical order  
|                            |       | • **update** - sorts people based on the date of their last contribution to the page(s).  
| **Reverse Sort**           | false | Reverses the sort order of contributors in the list. Must be used in conjunction with the **Sort By** parameter.  
| **Maximum Number of Contributors** | no limit | Limits the number of contributors in the list. If a number is not specified, all contributors are included.  
| **Display Format**         | inline | Sets how the list of contributor’s names is formatted:  
|                            |       | • **inline** — a comma-separated list  
|                            |       | • **list** — a bullet list.  
| **Show Anonymous Contributions?** | false | Sets whether to include those who contributed anonymously to a page.  
| **Show Count?**            | false | Sets whether to show the number of times each person made a contribution of the specified **Contribution Type**.  
| **Show Last Contribution Time?** | false | Sets whether to show the last time each person made a contribution of the specified **Contribution Type**.  
| **Page Name**              | current | Specifies the page to use when generating the list of contributors. If **Page Name** and **Space(s)** are left blank, the current page is assumed.  
| **Label(s)**               | none | Filters the list of contributors to those who created the specified labels from a page. You can specify one or more labels, separated by commas.

</thead>
</table>
| Space(s)                      | current        | Specifies the space key of the Confluence space that contains the page set in **Page Name** or alternatively, specifies the spaces to search. Space keys are case-sensitive. This parameter also takes special values, including:  
  - @global — All **global** spaces.  
  - @personal — All **personal** spaces.  
  - @all — All spaces in your Confluence site.  
  You can specify one or more space keys or special values, separated by commas. If no **Page Name** and **Label(s)** are specified, all pages from the specified set of spaces are included. |
| Content Type                  | both pages and blog posts | Restricts the content type to use when generating the list of contributors:  
  - pages — pages  
  - blogposts — blog posts. |
| Blog Post Date                | none           | Specifies the publish date for a blog post. The date format required is: YYYY/MM/DD.                                                      |
| Include Page Hierarchy        | specified page only | Specifies additional pages to include when generating the list of contributors:  
  - children — just the child pages of the specified page  
  - descendants — all descendants of the specified page. |
| Show Selected Pages           | false          | Sets whether to show a list of the pages used to generate the list of contributors.                                                           |
| Custom "None Found" Message   | default message | Specifies the message to be used to override the default message that is displayed when no contributors are found.                           |
The Contributors Summary macro displays a table of contribution-based statistics for a set of pages. These statistics can be grouped according to individual pages or individual contributors.

The default scope for this macro is an individual page, but this can be extended to include the immediate children or descendants of a specified page. The statistics cover the following types of contributions:

- edits to the page(s)
- comments added to the page(s)
- labels added to the page(s)
- people watching the page(s)

A simple example of the Contributors Summary macro is shown in the screenshot below. It lists statistics for the number of times each contributor has edited, added comments and added labels to this page.

**Screenshot: Example Contributors Summary table of statistics**

<table>
<thead>
<tr>
<th>User</th>
<th>Edits</th>
<th>Comments</th>
<th>Labels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sarah Maddox</td>
<td>2</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>Edwin Dawson</td>
<td>2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Giles Gaskell</td>
<td>2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Rosie Jameson</td>
<td>2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Andrew Lui</td>
<td>2</td>
<td>0</td>
<td>1</td>
</tr>
<tr>

<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Andrew Prentice</td>
<td>0</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

In this example, all default parameter settings are used. For more information about this macro's parameters, refer to the **Parameters** section below.

**Using the Contributors Summary Macro**

**To add the Contributors Summary macro to a page:**

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in **Using Autocomplete**.

**To edit an existing macro:** Click the macro placeholder and choose **Edit**. A macro dialog window will open, where you can edit the parameters of the macro.
Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Group By</strong></td>
<td>contributors</td>
<td>Specifies the basis for grouping contribution-based statistics:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- contributors — group by the people who have contributed</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- pages — group by the pages used to find contributors.</td>
</tr>
<tr>
<td><strong>Columns to Display</strong></td>
<td>edits, comments, labels</td>
<td>Sets the columns that should appear in the table. The statistics or type of information presented depends on the basis for grouping set with the <strong>Group By</strong> parameter. Statistics may be calculated for:</td>
</tr>
</tbody>
</table>
• edits — the number of times each contributor has edited the page(s) or the number of edits made to each page.
• edited — a list of the pages edited by each contributor or a list of contributors who have edited each page.
• comments — the number of times each contributor has added comments to the page(s) or the number of comments on each page.
• commented — a list of pages to which each contributor has added comments or a list of contributors who have commented on each page.
• labels — the number of times each contributor has added labels to the page(s) or the number of labels on each page.
• labeled — a list of pages to which each contributor has added labels or a list of contributors who have added a label to each page.
• labellist — a list of labels either added by each contributor or on each page.
• watches — the number of pages being watched by each contributor/person or the number of contributors/people watching each page.
• watching — a list of pages being watched by each contributor/person or a list of contributors/people watching each page.
• lastupdate — the last time each contributor made an update or when each page was last updated. Valid updates can include edit, comment or label modifications to a page.

One or more columns can be used.
| **Sort By** | edits | Sets the criterion used for sorting items in the table. The items sorted depend on the basis for grouping set with the **Group By** parameter. Sort criteria are:
|            |       | - **edits** — sorts items in the table based on the total number of edits made, either by a contributor or to a page.
|            |       | - **name** — sorts items in the table in alphabetical order, either by contributor or page name.
|            |       | - **editTime** — sorts items in the table based on when the contributor last edited a page (or a specified set of pages) or when the page was last edited.
|            |       | - **update** — sorts items in the table based on when the contributor last made any contribution to a page (or a specified set of pages) or when the page last had any contribution made to it.
| **Reverse Sort** | false | Reverses the sort order of items in the table, as specified using the **Sort By** parameter. (Used only in conjunction with the **Sort By** parameter.)
| **Maximum Number of Items** | no limit | Limits the number of contributors or pages in the table to the value specified. If no number is specified, all items are included.
| **Show Anonymous Contributions?** | false | Includes individuals who have made anonymous contributions to a page.
| **Show Zero Counts?** | false | Sets whether contributors or pages are included for which a calculated statistic is zero.
| **Page Name** | current | Sets the page for which to calculate the contribution-based statistics. If no values for **Page Name** and **Space(s)** are specified, the current page is assumed.
**Label(s)** | none | Restricts the contribution-based statistics to the specified labels only. You can specify one or more labels, separated by commas.
--- | --- | ---
**Space(s)** | current | Specifies the space key of the Confluence space which contains the specified page name or alternatively, specifies a scope of spaces to search. Space keys are case-sensitive.

This parameter also takes special values, including:
- `@global` — All global spaces.
- `@personal` — All personal spaces.
- `@all` — All spaces in your Confluence site.

You can specify one or more space keys or special values, separated by commas.

If no **Page Name** and **Label(s)** are specified, all pages from the specified set of spaces are included.

**Content Type** | both pages and blog posts | Restricts page types to either pages (pages) or blog posts (blog posts). If no value is specified in the Macro Browser, both pages and blog posts are included.
--- | --- | ---
**Blog Post Date** | none | Specifies the publish date for a blog post. The date format required is: YYYY/MM/DD.
--- | --- | ---
**Include Page Hierarchy** | specified page only | Includes either the immediate children or all descendants of the specified page. If no value is indicated in the Macro Browser, only the specified page is included.

**Create Space Button Macro**
The Create Space Button macro renders a create space icon that links to the 'Create Space' page. The icon appears as rendered below.

*Screenshot: The Create Space Button in Confluence*
To display this icon, you require ‘Create Space’ permission which is assigned by a site administrator from the Administration Console. See Security or contact your site administrator for more information.

Detailssummary Macro

The Detailssummary macro presents a tabulated summary of metadata that has been embedded on any page or blog post in the current Confluence space using the Metadata Macro. The Detailssummary macro collects metadata from only those pages or blog posts that have had a particular page label added to them.

The left-most column of the summary shows the name of each page or blog post with the specified label that contains metadata. Each page or blog post is presented on a single row and is hyperlinked to its appropriate destination page.

Each subsequent column represents a unique field within the selected metadata. The value associated with each metadata field on a page or blog post is presented in the appropriate cell of the summary table. For example, the following Detailssummary macro shows the pages in the current space that have metadata embedded using the Metadata macro, and also the 'test' label.

<table>
<thead>
<tr>
<th>Author-Firstname</th>
<th>Author-Nickname</th>
<th>Is-Secret</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
To add the Detailssummary macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata Label</td>
<td>none</td>
<td>Restricts the summary to the contents of Metadata macros on the pages in the current space that have this page label.</td>
</tr>
</tbody>
</table>

Another Metadata Macro Example

The following Metadata macro example generates the second line in the Detailssummary macro (above). Note that this current page requires the 'test' label for this to work.

<table>
<thead>
<tr>
<th>Author-Nickname</th>
<th>Strawberry Sundae</th>
</tr>
</thead>
<tbody>
<tr>
<td>Author-Firstname</td>
<td>Fred</td>
</tr>
</tbody>
</table>

Excerpt Include Macro

The Excerpt Include macro is used to display 'excerpted' (that is, a segment of) content from one page in another.

To use this macro, the excerpt must have been defined using the Excerpt macro and both pages must exist in the same space. Note that you can have more than one Excerpt Include macro on a page (although you can have only one Excerpt macro on a page).

The excerpt appears as shown below:
On this page:
- Using the Excerpt Include Macro
- Parameters
- Related Topics

**Excerpt Macro**
Define a part of a page as the page’s ‘excerpt’ which can then be displayed in another page.

For this example, we are taking content from a page called ‘Excerpt Macro’, where the Excerpt macro has already been placed. The title of the page is shown at the top of the panel and the content within the body of the macro placeholder is rendered in the panel.

**Using the Excerpt Include Macro**

To add the Excerpt Include macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{ and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

**Parameters**
Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page Containing the Excerpt</td>
<td>none</td>
<td>Specifies the page that contains the excerpt to be displayed.</td>
</tr>
<tr>
<td>Remove Surrounding Panel</td>
<td>false</td>
<td>Controls whether the panel border around the excerpt and the page title should be hidden. By default, the panel is always shown.</td>
</tr>
</tbody>
</table>

**Excerpt Macro**
The Excerpt macro is used to mark a part of a page’s content for re-use. By itself, the Excerpt macro does not change the display of a page. However, defining an excerpt enables other macros, such as the Excerpt Include and Blog Posts macros, to display the marked content elsewhere.

You can only define one excerpt per page. In other words, you can only add the Excerpt macro once to a page.
Using the Excerpt Macro

To add the Excerpt macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type { and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

To add reusable content to the macro:

1. Add your content inside the Excerpt macro placeholder.
2. Click the macro placeholder to see the options panel, and select the option to Display on new line or to Display inline. The default is to display the content of the macro on a new line. If you choose the inline option, the content of the macro will form part of the same paragraph as the text preceding and following it. Note that this option affects only the page that contains the Excerpt macro. It does not affect any pages where the content is reused.

Screenshot: The Excerpt macro placeholder and options panel

**Gadget Macro**

Gadgets are small applications that can offer dynamic content. They are typically served from a web application server and can be re-used in many other web applications. In Confluence, use the Gadget macro to add gadgets to pages or blog posts.

Confluence comes bundled with a few of its own gadgets that you can add to your pages or blog posts. The Confluence gadgets are listed in Confluence Gadgets. However, you can access additional gadgets in this list if your Confluence Administrator has:

- Installed additional gadgets in Confluence (typically as a Confluence plugin) or
- Registered gadgets served from an external web application or website (such as those from a JIRA installation or iGoogle) via the Registering External Gadgets page.

Unlike other macros, the name of each gadget macro is unique and follows the convention "<gadget-name> macro", where <gadget-name> is the name supplied by the gadget itself.
On this page:

- Inserting Gadgets into a Confluence Page or Blog Post
- Editing Gadgets on a Confluence Page or Blog Post
- Standard gadget parameters
- Contents of a Gadget Macro

Related pages:

- The big list of Atlassian gadgets
- Confluence User's Guide

Inserting Gadgets into a Confluence Page or Blog Post

To add a gadget to a page:

1. Edit your page or blog post.
2. Choose Insert > Other Macros.
3. Click External Content to see a list of gadgets configured for use in your Confluence installation. (Some Confluence macros like the JIRA Issues, RSS Feed, Tasklist and Widget Connector macros also appear in this category because they can also access external content.)
4. Click the desired gadget to access its parameters and properties.
5. Click the parameters to your requirements.
6. Click Refresh to preview your changes.
7. Click Insert to add the gadget to the page.

Editing Gadgets on a Confluence Page or Blog Post

To edit an existing gadget on a page or blog post:

1. Edit your page or blog post.
2. Click the Gadget macro placeholder and choose Edit (or double-click the placeholder).
3. Set the gadget's parameters to your requirements.
4. Click Refresh to preview your changes.
5. Save the gadget.

Standard gadget parameters

Almost all gadgets allow you to set basic parameters (listed below), which appear on the right of the macro dialog. Each gadget may also have its own set of parameters, which appear on the left of the macro dialog.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Width | 450 pixels | Set the width of the gadget in pixels, using one of the following conventions:
- Width in pixels, using px or plain numbers. For example, 500px or 500
- A percentage of the page width, using %. For example, 50%
- Automatic resizing of the gadget to fit 100% of the page width: auto

Border | false | Places a thin grey border around the gadget.

Contents of a Gadget Macro

The body of a gadget macro contains 'parameter-like' content, which represents specific property settings that are particular to each gadget. Hence they are not documented here. Typically, this content would only be changed by customising the gadget’s default properties using the macro browser.

Gallery Macro

The Gallery macro displays a collection of thumbnail images in a table, based on the images attached to a Confluence page. When viewing the page, a user can click a thumbnail image to zoom into a screen-sized image and then view the images as a slide show.

Overview:

- The images shown in the gallery are taken from the files attached to the Confluence page. You can also specify a different page where the attachments are located. For information about attaching images to a page, see Attaching Files to a Page.
- The captions below the images are drawn from the comments on the attachments. For information about adding comments to attachments, see Attaching Files to a Page.
- By default, the gallery will include all the images attached to the page. You can also exclude or include images using parameters.
- You can sort your images into a particular order.
- You can specify a title for the gallery and also configure how many columns you want for the table in which your images are displayed.

On this page:
- Using the Gallery macro

Using the Gallery macro

To insert the Gallery macro onto a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type { and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Parameters

Parameters are options that you can set to control the content or format of the macro output.

The full list of parameters is shown in the following table. If the name of an attached file or page contains a comma, you can refer to it in the relevant parameters below by enclosing it in single or double quotes, for example "this,that.jpg", theother.png

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gallery Title</td>
<td>Nothing</td>
<td>Specify a title for your gallery.</td>
</tr>
<tr>
<td>Number of Columns</td>
<td>4</td>
<td>Specify the number of columns for your table.</td>
</tr>
<tr>
<td>Images to Exclude</td>
<td>No exclusions. Include all the pictures on the page.</td>
<td>The gallery will ignore any pictures specified. You can specify more than one picture, separated by commas. Note: The filename and filetype for this parameter are case-sensitive. For example, ’my picture.PNG’ will not be recognised as ’my picture.png’.</td>
</tr>
<tr>
<td><strong>Include these Images Only</strong></td>
<td>Include all the pictures on the page.</td>
<td></td>
</tr>
<tr>
<td>-----------------------------</td>
<td>--------------------------------------</td>
<td></td>
</tr>
<tr>
<td><strong>Exclude Images with these Labels</strong></td>
<td>No exclusions. Include all the pictures on the page.</td>
<td></td>
</tr>
<tr>
<td><strong>Include Images with these Labels Only</strong></td>
<td>None. The images are not filtered by label.</td>
<td></td>
</tr>
<tr>
<td><strong>Use Images in these Pages</strong></td>
<td>If no page is specified, the gallery macro displays the images attached to the page on which the macro is used.</td>
<td></td>
</tr>
<tr>
<td><strong>Sort Images By</strong></td>
<td>None. The sort order is unspecified and therefore unpredictable.</td>
<td></td>
</tr>
<tr>
<td><strong>Reverse Sort</strong></td>
<td>Off. Sort order is ascending</td>
<td></td>
</tr>
</tbody>
</table>

**Image file formats**

You can attach image files of any format to a page. Confluence supports the following image formats in the Gallery macro and when displaying an image on a page:...
Global Reports Macro

The Global Reports macro renders a list of links to global reports.

This includes a list of new or updated pages Managing Undefined Pages on the site and RSS feeds for new pages and blog posts.

The Global Reports macro appears as shown in the screenshot below.

Screenshot: The Global Reports macro in Confluence

Using the Global Reports Macro

To add the Global Reports macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type `{ and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>

</tr>
</thead>
<tbody>
<tr>
<td>Width of Table</td>
<td>99%</td>
<td>Specifies the width of the table in which the links are displayed, as a percentage of the window width.</td>
</tr>
</tbody>
</table>

Related Topics

- Subscribing to RSS Feeds within Confluence
- Working with Macros
- HTML Include Macro

Take me back to the Confluence User's Guide.
The HTML Include macro allows you to include the contents of an external HTML file in a Confluence page.

⚠️ **CAUTION: Including unknown HTML inside a webpage is dangerous.**

HTML can contain active scripting components. This means that it would be possible for a malicious attacker to present a user of your site with script that their web browser would believe came from you. Such code could be used, for example, to steal a user's authentication cookie and give the attacker their Confluence login password.

Using the HTML Include Macro

**To insert the HTML Include macro into a page:**

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{ and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

**To edit an existing macro:** Click the macro placeholder and choose **Edit**. A macro dialog window will open, where you can edit the parameters of the macro.

**Parameters**

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTML Page's URL</td>
<td>None</td>
<td>The URL of the page to include.</td>
</tr>
</tbody>
</table>

**Troubleshooting**

- The HTML Include macro will only be available if it has been **enabled** by your Confluence administrator. Also, your Confluence Administrator can define a whitelist of trusted URLs. You will see an error message on the Confluence page if the included URL is not in the whitelist.
- You can only use the HTML Include macro for pages with absolute links. If you use the macro to include an HTML page that has relative links, navigating those links in the wiki results in a 'Page Not Found' error. See CONF-6567.

Working with Macros

Take me back to the Confluence User's Guide.

Include Page Macro

You can use the Include Page macro to display the contents of one Confluence page or blog post in another page or blog post.

Using the Include Page Macro

To add the Include Page macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>

**Page to Include** | None | This is the name of the Confluence page or blog post that you want to include in the current page.
- If the page or blog post is located in another space, add the space key and a colon in front of the page name. For example, DOC:My page name.
- To include a blog post, specify the date as well as the title of the blog post. For example: 2010/12/01/My blog post.
- The space key is case sensitive.
- You can include pages from personal spaces using ~username as the space key, where 'username' is the person's username. For example, ~jsmith:My page name.

**Notes**
- If you want to include part of a page rather than the whole page, use the **Excerpt** and **Excerpt Include** macros.
- To display a page's contents, you need 'View' permission for that page. Similarly, people who view the page will need 'View' permissions for the embedded page as well as the page into which it is embedded. See [space permissions](#) or contact your Confluence space administrator for more information.
- If someone changes the name of the included page after you have added the macro to your page, the page name does **not** change automatically in the macro. You will need to change the page name manually in the macro parameters.
- If you want to embed an external page into a Confluence page, you need the [HTML Include Macro](#).

JIRA Issues Macro

JIRA is the issue tracking and project management system supplied by Atlassian. The JIRA Issues macro allows you to display a list of issues from a JIRA site on a Confluence page.

You can list publicly accessible issues from any JIRA site, as well as issues restricted to your user account on a JIRA site, assuming:

- You are logged in to both the JIRA and Confluence sites, and
- Your usernames on both of these sites match.

You can also create, find and insert JIRA issues directly within text on a Confluence page or blog post. For more information, refer to Inserting JIRA Issues.

Screenshot: Example of JIRA issues shown on a Confluence page
Using the JIRA Issues Macro

To add the JIRA Issues macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type { and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Refer to the instructions below for details on obtaining the URL of the XML view of a search. An example URL is:

http://jira.atlassian.com/sr/jira.issueviews:searchrequest-xml/temp/SearchRequest.xml?jqlQuery=project%3DCONF+AND%28summary%7E+jiraissues+OR+description%7E+jiraissues+OR+comment%7E+jiraissues%29&tempMax=10

Displaying a List of JIRA Issues from any Accessible JIRA Site
Step 1 — Obtain the URL of the Issue Filter

1. Log in to your JIRA system.
2. Go to the 'Issues' screen and create a new filter. Do not modify an existing filter.
3. Set up your search parameters and use 'View' to check the issues returned.
4. Once the filter is finished, go to the Filter's 'View' tab/section in the top-left area of the JIRA interface.
5. Copy the XML link. To do this, follow the appropriate step below:
   - If you are using JIRA 4.0.x or later, choose Views, right-click on XML, and choose Copy Link Location.
   - If you are using JIRA 3.13.x or earlier, locate the 'Current View' links section, right-click on XML, and choose Copy Link Location.

Step 2 — Embed the Issue Filter URL onto your Confluence Page

1. Log in to your Confluence system.
2. Edit the page where you wish to display the list of JIRA issues.
3. Add the JIRA Issues macro to the page, as described above.
4. Edit the macro, and paste the JIRA filter URL from your clipboard into the URL box.
5. Customise the macro output using the optional parameters. See below.
6. Save the Confluence page.

Parameters

Parameters are options that you can set to control the content or format of the macro output.

The JIRA Issues macro allows the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
<table>
<thead>
<tr>
<th><strong>URL</strong></th>
<th>none</th>
<th>The URL of the XML view of your selected issues in the JIRA Issue Navigator. Note: If the URL in the URL parameter does not contain a <code>tempMax</code> argument, then the value of <code>tempMax</code> will default to 500. For JIRA 3.12 or earlier, the JIRA Issues macro will return a maximum of 500 issues. For JIRA 3.13 or later, the JIRA Issues macro will return a maximum of 500 issues per page.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>JIRA Field Columns to Display</strong></td>
<td>By default, the following columns are shown:</td>
<td>A list of JIRA column names, separated by semi-colons (;). Example columns are: key, summary, type, created, fixversion, updated, due, assignee, reporter, priority, status and resolution. You can include any columns recognised by your JIRA site, including custom columns. See the JIRA documentation for a list of names.</td>
</tr>
</tbody>
</table>
|  | - type  
|  | - key  
|  | - summary  
|  | - assignee  
|  | - reporter  
|  | - priority  
|  | - status  
|  | - resolution  
|  | - created  
|  | - updated  
|  | - due | |
| **Display Total Numbers Only** | false | When selected, the issue list will only show the number of issues in JIRA. The count will be linked to your JIRA site. |
| **Cache** | on | - **on** – the macro maintains a cache of the issues which result from the JIRA query.  
<p>|  |  | - <strong>off</strong> – the relevant part of the cache is cleared each time the macro is reloaded. |
| <strong>Anonymous Retrieval</strong> | false | When selected, JIRA will return only the issues which allow unrestricted viewing i.e. the issues which are visible to anonymous viewers, as determined by JIRA's viewing restrictions. Otherwise, the results depend on how your administrator has configured the communication between JIRA and Confluence. By default, Confluence will show only the JIRA issues which the user is authorised to view. See more details below. |</p>
<table>
<thead>
<tr>
<th>Width</th>
<th>100%</th>
<th>The width of the table displaying the JIRA issues. Can be indicated either as a percentage (%) or in pixels (px).</th>
</tr>
</thead>
</table>
| Height (pixel value only) | 480  | The height in pixels of the table displaying the JIRA issues. Note that this height specification is ignored in the following situations:  
  • If you set the **Render Mode** parameter (see below) to **static**.  
  • When the JIRA issues are displayed in a PDF or Word document, in an email message or in an RSS feed. |
| Title               | JIRA Issues | You can customise the title text at the top of the JIRA issues table with this parameter. For instance, setting the title to 'Bugs-to-fix' will replace the default 'JIRA Issues' text. This can help provide more context to the list of issues displayed. |
| Render Mode         | **static** – when the JIRA issues are displayed in a PDF or Word document, in an email message or in an RSS feed.  
  **dynamic** – for all other formats.  
  • **dynamic**– dynamic issue display with the following features:  
    • Click the column headers to sort the output.  
    • Drag and drop the columns into a different order.  
    • Temporarily remove a column from the display.  
    • View a page of issues at a time, for faster response times.  
  • **static** – disables the dynamic display features. |

**Displaying Issues which have Restricted Viewing**

Maybe your JIRA instance is not visible to anonymous visitors — everyone has to log in before they can see JIRA issues. Or maybe some of the JIRA issues are restricted to viewing by certain users only. This section explains how to handle JIRA issues that have restricted viewing.

**Using Confluence-to-JIRA Trusted Communication (Recommended)**
For Confluence 2.7.0 and later and JIRA 3.12 and later, your administrator can set up trusted communication between Confluence and JIRA. The entire process is described in the Confluence Administrator’s Guide. Provided that your administrator has set up trusted communication, you don’t need to add any extra parameters. Confluence and JIRA will work out the security between them, ensuring that the user will see only the issues they are authorised to see. Read the section below if you want more detail.

**Remove the username and password from your macro markup code**

Prior to Confluence 2.7, you needed to include a username and password in the macro markup code if you wanted to display JIRA issues which had restricted viewing. Once your administrator has set up trusted communication between Confluence and JIRA, you no longer need to include a username and password in the markup code for your JIRA macros.

The following options are available for determining the issues which will be retrieved from JIRA and displayed on the Confluence page:

<table>
<thead>
<tr>
<th>What you want to do</th>
<th>Macro parameter</th>
<th>URL parameter</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display the JIRA issues which the logged-in user is authorised to see. And if the user is not logged in, display only issues which allow unrestricted viewing.</td>
<td>Do not specify any authentication parameters. In this case, the behaviour depends on the way your administrator has set up trusted communication between JIRA and Confluence. Here is a summary of the behaviour. If trusted communication is enabled, the authorisation will work seamlessly. When a logged-in user views your page, they will see only the JIRA issues they are allowed to see. And if they are not logged in, they will see only the issues which allow unrestricted viewing. If trusted communication is disabled, the Confluence page will show only the JIRA issues which allow unrestricted viewing.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ensure that Confluence will display only the JIRA issues which allow unrestricted viewing.</td>
<td>anonymous</td>
<td>Regardless of who the user is (logged in or not), the Confluence page will show only anonymously-visible issues. Confluence will not attempt to set up a trusted communication link with JIRA in this case.</td>
<td></td>
</tr>
</tbody>
</table>
---|---|---|
| Use a pre-determined username and password to access the JIRA issues. | &os_username=MYUSERNAME&os_password=MYPASSWORD | Not recommended. Prior to Confluence 2.7, this was the only way of displaying issues with restricted viewing. For Confluence 2.7 and later, this method will still work. Confluence will not attempt to set up a trusted communication link with JIRA in this case. |

**Rendering HTML from JIRA**

Formatted fields from JIRA can be displayed in Confluence if you set up a Confluence-to-JIRA Trust as described above. Otherwise, such formatted fields will be escaped within the JIRA issues macro output. This is to prevent the possibility of malicious HTML being served by an untrusted JIRA server. The most likely field where you will notice this is in the description field.

So, for example, without the trust relationship, a description column that rendered in JIRA like this -

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This is</td>
</tr>
<tr>
<td>• the description</td>
</tr>
<tr>
<td>• of my issue</td>
</tr>
</tbody>
</table>

- would actually appear in the JIRA issues macro like this -

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;p&gt;This is&lt;ul&gt;&lt;li&gt;the description&lt;/li&gt;&lt;/ul&gt;of my issue&lt;/li&gt;&lt;/ul&gt;&lt;/p&gt;</td>
</tr>
</tbody>
</table>

Configuring Confluence-to-JIRA Trust as described above will enable the field to be rendered as expected.

**Troubleshooting**

**HTTPS**

The JIRA Issues macro can access a JIRA instance running under SSL as long as the Confluence server is set to accept the JIRA SSL certificate. Refer to the Confluence Knowledge Base article for more information about problems connecting to SSL services.
And see also Troubleshooting Trusted Communication between JIRA and Confluence

JIRA Macro

See Inserting JIRA Issues.

JUnit Report Macro

The JUnit Report macro displays a summary of JUnit test results from a directory accessible by the Confluence server. JUnit is a unit testing framework which allows programmers to ensure that individual units of Java source code are functioning correctly.

The JUnit Report macro appears as shown in the screenshot below.

Screenshot: The JUnit Report macro in Confluence

<table>
<thead>
<tr>
<th>Test</th>
<th>Time</th>
<th>Messages</th>
</tr>
</thead>
<tbody>
<tr>
<td>MoneyTest</td>
<td>100%</td>
<td>00:03.391</td>
</tr>
<tr>
<td>testAdd</td>
<td>00:03.0</td>
<td>1 0 0</td>
</tr>
</tbody>
</table>

When generating reports from the JUnit Report macro, set the Apache Ant formatter to 'XML'.

Using the JUnit Report Macro

To add the JUnit Report macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type { and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>

### URL of the test result XML file

| None |

URL of a particular test result XML file. Is overridden by the **Directory (URL) of your test result files** parameter if you use both.

Example, from a Confluence instance: `http://yourConfluenceInstance.com/download/attachments/<page id>/file.xml`

For Confluence installations without anonymous user access, you can specify logon credentials as part of this parameter in the form of URL parameters:

- **os_username** — The username of a Confluence user with permission to access to the JUnit test results.
- **os_password** — The password of the Confluence user specified in the `os_username` parameter.

### Directory (URL) of your test result files

| None |

URL of a directory containing your test result files. This must be a directory name and **not** the XML file itself. Overrides the **URL of the test result XML file** parameter if you use both.

Example, for a local drive: `file://C:/TEMP/`

Example, for a network drive: `http://*host*/*path*`

### Report Detail

| all |

Detail for the report. Can be **all**, **fixture**, **summary** or **failuresonly**.

### Debug

| None |

Shows the content of failures, as well as the error messages.

---

- [Labels List Macro](#)

The Labels List macro displays a hyperlinked alphabetical index of all labels within the current space.

The label index generated consists of numerous cells, each beginning with one or more letters of the alphabet or
a number. Each label within the space is grouped alphanumerically into its appropriately headed cell.

Each label in the list links to a page that displays all the pages on which the label occurs within the current space.

**Screenshot: Labels List Macro segment**

Below are the 562 labels used in Confluence Docs 2.10 listed alphabetically. Click on a label to see its associated content.

Using the Labels List Macro

**To add the Labels List macro to a page:**

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in **Using Autocomplete**.

**To edit an existing macro:** Click the macro placeholder and choose **Edit**. A macro dialog window will open, where you can edit the parameters of the macro.

**Parameters**

This macro has no parameters.

**Related Topics**

**Working with Macros**

Take me back to the Confluence User's Guide.

**Livesearch Macro**
The Livesearch macro allows you to add a search box to a Confluence page. When users enter a search term into the search box, Confluence will dynamically display matching results as they type.

**Using the Livesearch Macro**

**To add the Livesearch macro to a page:**

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{ and the beginning of the macro name, to see a list of suggested macros. Details are in **Using Autocomplete**.

**To edit an existing macro:** Click the macro placeholder and choose **Edit**. A macro dialog window will open, where you can edit the parameters of the macro.

**Parameters**

Parameters are options that you can set to control the content or format of the macro output.

<table>

**Loremipsum Macro**

The Loremipsum macro displays paragraphs of pseudo-Latin text ([more information](#)). You can use this macro to generate more-or-less meaningless text for demonstration purposes in pages showing a draft layout or arrangement of page elements. The text is deliberately non-meaningful so that it does not influence the viewer's perception of the page arrangement or design.

A basic example of the Loremipsum text:
Using the Loremipsum Macro

To add the Loremipsum macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type { and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Metadata Macro

The Metadata macro allows you to embed metadata into pages and blog posts for presentation with the Details Summary Macro. Each metadata item consists of a field name and an associated value. When a Metadata macro is rendered on a page, each metadata item is presented as a table row, with the field name followed by its value, for example:

<table>
<thead>
<tr>
<th>Is-Secret</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Author-Nickname</td>
<td>Banana Split</td>
</tr>
</tbody>
</table>

The metadata added to a page using the Metadata macro is 'tagged', or identified, by adding a label to the page. This allows the Details Summary macro to generate a summary based on Metadata macros from all pages that have each had the same page label added to them.

Using the Metadata Macro

1. Add the Metadata macro to a page:
   a. In the Confluence editor, choose Insert > Other Macros.
   b. Find and select the required macro.
**Speeding up macro entry with autocomplete:** Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in [Using Autocomplete](#).

**To edit an existing macro:** Click the macro placeholder and choose **Edit**. A macro dialog window will open, where you can edit the parameters of the macro.

2. **Add metadata items as rows in a table inserted into the macro placeholder.**

   For example, the screenshot below shows a table, with rows containing metadata items, in the macro's placeholder.

   ![Metadata Table](image)

<table>
<thead>
<tr>
<th>Is-Secret</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Author-Nickname</td>
<td>Banana Split</td>
</tr>
</tbody>
</table>

3. **Add a label to the page to 'tag' the page.**

   For example, the current page has a 'test' label. This label is used by the example Detailssummary macro on the [Detailssummary Macro](#) page.

**Parameters**

This macro has no parameters.

**Related Topics**

- [Working with Macros](#)
- [Working with Confluence Labels](#)

Take me back to the [Confluence User's Guide](#).

**Multimedia Macro**

See [Embedding Multimedia Content](#).

**Navigation Map Macro**

The Navigation Map macro displays the list of pages associated with a specified label as a navigation map.

A label must be specified for this macro.

**Using the Navigation Map Macro**

**To add the Navigation Map macro to a page:**

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{ and the beginning of the macro name, to see a list of suggested macros. Details are in [Using Autocomplete](#).

**To edit an existing macro:** Click the macro placeholder and choose **Edit**. A macro dialog window will open, where you can edit the parameters of the macro.

### Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>none</td>
<td>Specify the label associated with the pages you want to show in the navigation map.</td>
</tr>
<tr>
<td>Map Title</td>
<td>none</td>
<td>Specify a title for the navigation map.</td>
</tr>
<tr>
<td>Number of Cells Per Row</td>
<td>5</td>
<td>Specify the number of cells in a row</td>
</tr>
<tr>
<td>Cell Width (Pixels)</td>
<td>90 px</td>
<td>Specify the cell width</td>
</tr>
<tr>
<td>Cell Height (Pixels)</td>
<td>60 px</td>
<td>Specify the cell height</td>
</tr>
<tr>
<td>Navigation Map Theme</td>
<td>Confluence</td>
<td>Define a theme for the navmap.</td>
</tr>
</tbody>
</table>

If you want to create your own navmap 'look and feel' (for example, one with rounded corners), you need to add a customised navmap macro theme file to the `WEB-INF/classes/templates/macros` directory. The file name convention to use is `navmap-mytheme.vm`. Use the name of your choice for the `mytheme` part of the file name, which is also the value you use for this parameter. Hence, if your theme was called `navmap-roundededges.vm`, use the value of `rounded edges` for this parameter.

Network Macro

The Network macro displays a list of Network activity on a Confluence page or blog post. You can specify the user whose network activity you wish to show. These interactions include the users that the specified user is following or users who are following the specified user. The Network macro shows each listed user by their profile picture. It also provides a choice of two themes and the ability to limit the number of users in the list.

Screenshot: Network macro

Using the Network macro

To add the Network macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type \ and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Username</td>
<td>Current user's username</td>
<td>The username of the Confluence user whose network interactions you wish to show. If no username is specified, then current user's (that is, your) network interactions are shown.</td>
</tr>
</tbody>
</table>
| **Mode** | **following** | Determines which users are listed, with respect to the specified user:
|          |              |   - **following** – those who the user is following.
|          |              |   - **followers** – those who are following the user.
| **Theme** | **full** | Determines how the user’s network is displayed:
|          |              |   - **full** – shows a large version of user’s profile pictures and, if the **following** mode is set, provides an entry field function to follow more users.
|          |              |   - **tiny** – shows only the small version of user’s profile pictures.
| **Maximum Results** | **No limit imposed up to a maximum of 30** | Restricts the number of users displayed. If the number of users exceeds the specified maximum, then a **Show All** link is provided. This link leads to the specified user’s **Network view**, showing the complete list of network interactions.

**Disabling the Network macro**

The Network macro is provided by the 'network' module in the 'Profile Macros' plugin. To remove the macro from your site, you can disable the module in the plugin. See [Disabling or Enabling a Plugin](#).

**Noformat Macro**

The Noformat macro displays a block of text in monospace font with no other formatting.

**Using the Noformat Macro**

To add the Noformat macro to a page:

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in [Using Autocomplete](#).

**To edit an existing macro:** Click the macro placeholder and choose **Edit**. A macro dialog window will open, where you can edit the parameters of the macro.

Enter the content that is to be unformatted into the body of the macro placeholder.

**Working with Macros**
Page Index Macro

The Page Index macro creates a hyperlinked alphabetical index of all page titles within the current space.

The top section of the index contains a cell for each letter of the alphabet, with cells for numbers and symbols. Each cell indicates how many pages are in the corresponding list.

The lower section contains lists of page titles followed by the first few sentences of content on that page.

Each letter, number or symbol in the top section is hyperlinked to the corresponding cell in the lower section. Each page title in the lower section is hyperlinked to the page in the space.

Using the Page Index Macro

To add the Page Index macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.
Speeding up macro entry with autocomplete: Type { and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

This macro accepts no parameters.

Working with Macros

Take me back to the Confluence User's Guide.

Page Tree Macro

The Page Tree macro displays a dynamic, hierarchical list of pages starting from a specified parent (root) page. It can act as a table of contents or a list of related topics.

When viewing the page tree, your reader can click a link to view the relevant page. The page's current position is highlighted in the page tree.

Creating a navigation panel for your space

The Page Tree macro is used in the Confluence Documentation theme, to create a navigation panel showing a table of contents for your space. Read the instructions on Configuring the Documentation Theme.

Using the Page Tree Macro

To add the Page Tree macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type { and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Click Refresh in the Macro Browser to see the effect of changes to the macro parameters.

Macro Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>

</tr>
</thead>
</table>

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
| Root Page                        | The home page of the space                                                                 | Specify the parent page for the page tree. The tree will include all children of the given page, plus their children and grand-children etc. The tree will *not* include the root page itself. Specify the page title or a special value as follows:  
  • Your page title — to specify a page name for the parent or root of the tree. The tree will include all children and grand-children of the specified root. The tree will *not* include the specified root page itself.  
  • '@home' — will include all pages under the home page of the space (default).  
  • '@self' — will include all pages under the current page.  
  • '@parent' — will include all pages under the parent of the current page, including the current page.  
  • '@none' — will include all pages in the space, including orphaned pages and the home page. |
| Sort Pages By | position | Specify the order to display the pages in the tree. This sort order is for display purposes only. It does not permanently re-arrange the page order. The value may be one of the following:  
  • bitwise — sort alphabetically, for example: title1, title10, title2.  
  • creation — sort by date of creation.  
  • modified — sort by order of date last modified.  
  • natural — sort in 'natural' alphabetical order, for example: title1, title2, title10.  
  • position — sort by the default Confluence sorting rules. If your pages have been ordered manually, this sort will respect the defined order. Otherwise the pages will be displayed in the 'natural' alphabetical order, such as: title1, title2, title10. |
Include Excerpts in Page Tree  |  false  |  Select if you want the page tree to show excerpts from each page. The excerpts must be defined on each page by the Excerpt macro.

Reverse Order  |  false  |  Select to show the pages in reverse (descending) natural order. Must be used in combination with the Sort Pages By parameter.

Include Search Box above Page Tree  |  false  |  Select if you want to include a search box above the page tree. The search box allows your readers to search within the page tree for the specified value.

Show Expand/Collapse Links  |  false  |  Select if you want to display the 'expand all' and 'collapse all' links at the top of your page tree. Your readers can click these links to open or close all branches of the tree at once.

Start Depth  |  1  |  Enter any number greater than 0 to set how many levels of children the tree should show when it opens for the first time.

Sample Page Tree

This page is a sample, used to demonstrate the Pagetree macro.

For more information, take a look at the main page on the Page Tree Macro.

<table>
<thead>
<tr>
<th>What you need to type</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td>{pagetree:root=@parent</td>
<td>expandCollapseAll=false}</td>
</tr>
</tbody>
</table>

Another Sample Page Tree

We're using this page to demonstrate the Pagetree macro.
For more information, take a look at the main page on the [Page Tree Macro](https://confluence.atlassian.com/display/C43/Page+Tree+Macro).

<table>
<thead>
<tr>
<th>What you need to type</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td>`{pagetree:root=@parent</td>
<td>expandCollapseAll=true}`</td>
</tr>
</tbody>
</table>

**Sample Page Tree 2**

This is another sample page, used to demonstrate the Pagetree macro.

For more information, take a look at the main page on the [Page Tree Macro](https://confluence.atlassian.com/display/C43/Page+Tree+Macro).

<table>
<thead>
<tr>
<th>What you need to type</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td>`{pagetree:root=@parent</td>
<td>expandCollapseAll=true}`</td>
</tr>
</tbody>
</table>

**Page Tree Search Macro**

Using the Page Tree Search macro, you can add a search box to your Confluence page. When a viewer enters a search term, Confluence will search a hierarchy of pages starting from a specified parent (root) page and return the search results.

You can also add a search box as part of a dynamic page tree, which looks like a table of contents. See the [Page Tree macro](https://confluence.atlassian.com/display/C43/Page+Tree+Macro).

Using the Page Tree Search macro

**To add the Page Tree Search macro to a page:**

1. In the Confluence editor, choose [Insert > Other Macros](https://confluence.atlassian.com/display/C43/Insert+Other+Macros).
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in [Using Autocomplete](https://confluence.atlassian.com/display/C43/Using+Autocomplete).

**To edit an existing macro:** Click the macro placeholder and choose [Edit](https://confluence.atlassian.com/display/C43/Edit). A macro dialog window will open, where you can edit the parameters of the macro.

### Name of Root Page

| None |

The name of the root page whose hierarchy of pages will be searched by this macro. If this not specified, the root page is the current page.

**Note:** Unlike the Page Tree macro, the Page Tree Search macro does not accept the special values that start with an @ sign, such as @home or @self.

---

**Panel Macro**

The Panel Macro allows you to display a block of text within a customisable panel, like a text box. Here is an example:

```
My Title
A formatted panel.
```

**Using the Panel Macro**

**To add the Panel macro to a page:**

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:*** Type `}` and the beginning of the macro name, to see a list of suggested macros. Details are in [Using Autocomplete](#).

**To edit an existing macro:** Click the macro placeholder and choose **Edit**. A macro dialog window will open, where you can edit the parameters of the macro.

**Parameters**

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Panel Title</td>
<td>none</td>
<td>The title of the panel. If specified, this title will be displayed in its own title row.</td>
</tr>
<tr>
<td>Border Style</td>
<td>solid</td>
<td>The style of the panel's border. Accepted values are <strong>solid</strong>, <strong>dash</strong>, and other valid CSS border styles.</td>
</tr>
<tr>
<td>Border Colour</td>
<td></td>
<td>The colour of the panel's border.</td>
</tr>
<tr>
<td>Border Pixel Width (Value Only)</td>
<td></td>
<td>The width of the panel's border (in pixels).</td>
</tr>
</tbody>
</table>
Background Colour | The background colour of the panel.
Title Background Colour | The background colour of the title row of the panel.
Title Text Colour | The colour of the text in the title row of the panel.

Colours can be specified HTML colour names or hexadecimal codes.

Notes

- You can use panels within columns and table cells.

### Recently Updated Dashboard Macro

The Recently Updated Dashboard macro displays a list of the most recently changed content within Confluence. It is similar to the Recently Updated macro but is intended for use on the Confluence dashboard.

#### Using the Recently Updated Dashboard Macro

**To add the Recently Updated Dashboard macro to a page:**

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in [Using Autocomplete](#).

**To edit an existing macro:** Click the macro placeholder and choose **Edit**. A macro dialog window will open, where you can edit the parameters of the macro.

### Parameters

Parameters are options that you can set to control the content or format of the macro output.
| **Label(s)** | none | Filter content by label. The macro will display only the pages etc which are tagged with the label(s) you specify here. You can specify one or more labels, separated by commas. 

*Note:* If there are no pages matching any of the specified labels, then Confluence will ignore the labels and will list all recently updated pages, as well as showing a message, “These labels don't exist and were ignored: xxx “. This unexpected behaviour is noted in issue CONF-13860. Authenticate to see issue details |
| **User(s)** | all users | Filter by username of the user who updated the content. The macro will only display content created and updated by the user(s) you specify here. You can specify one or more usernames separated by commas. |
| **Width of Table** | 100% | Specify the width of the macro display, as a percentage of the window width. |
| **Show User Profile Pictures** | false | Select whether profile pictures of the users who updated the content are displayed. |

**Related Topics**

- Recently Updated Macro

Take me back to the Confluence User’s Guide.

### Recently Updated Macro

The Recently Updated macro displays a list of the most recently changed content within Confluence.

* Tip: The Recently Updated Dashboard macro is similar to this macro, but is intended for display on the Confluence dashboard.

#### Using the Recently Updated Macro

**To add the Recently Updated macro to a page:**

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.
**Speeding up macro entry with autocomplete:** Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in [Using Autocomplete](#).

**To edit an existing macro:** Click the macro placeholder and choose **Edit**. A macro dialog window will open, where you can edit the parameters of the macro.

**Parameters**

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Author(s) by username</strong></td>
<td>None specified i.e. display all content</td>
<td>Filter the results by author. The macro will display only the pages etc which were last modified by the author(s) you specify here. You can specify one or more authors, separated by a comma or a space.</td>
</tr>
</tbody>
</table>
| Space(s)                                           | @self, i.e. the space which contains the page on which the macro is used | This parameter allows you to filter content by space. The macro will display only the pages etc which belong to the space(s) you specify here. You can specify one or more space keys, separated by a comma or a space.  

- To exclude content in a specific space, put a minus sign (-) immediately in front of that space key. For example: If you specify a space key of -BADSPACE you will get only content which is not in the BADSPACE.  

- To indicate that the results must come from a specific space, put a plus sign (+) immediately in front of that space key. For example: If you specify a space key of +GOODSPACE you will get only content in GOODSPACE. (Note that this is not particularly useful, because each content item belongs to one space only. If you put a plus sign next to one space key and list other space keys too, the other space keys will be ignored.)  

Special values:  

- @self — The current space.  
- @personal — All personal spaces.  
- @global — All global spaces.  
- @favorite — The spaces you have marked as favourite.  
- @favourite — The same as @favorite above.  
- @all — All spaces in your Confluence site.  
- * — The same as @all above.  

When specifying a personal space, remember to use the tilde (~) sign in front of the username, such as ~jbloggs or ~jbloggs@example.com. |
| **Label(s)** | None specified i.e. display all content | Filter the results by label. The macro will display only the pages etc which are tagged with the label(s) you specify here. You can specify one or more label values, separated by a comma or a space.  
- To exclude content which matches a given label, put a minus sign (-) immediately in front of that label value. For example: If you specify a label value of `badpage` you will get only content which is not labelled with 'badpage'.  
- To indicate that the results **must** match a given label value, put a plus sign (+) immediately in front of that label value. For example: If you specify a label value of `superpage,goodpage` you will get only content which has at least two labels, being 'superpage' and 'goodpage'. |
| **Width of Table** | 100% | Specify the width of the macro display, as a percentage of the window width. |
| Include these Content Types Only | all types | This parameter allows you to filter content by content type. The macro will display only the content of the type you specify here. You can specify one or more types, separated by a comma or a space. To exclude content of a given content type, put a minus sign (-) immediately in front of that content type. For example: If you specify a content type of `-blogpost` you will get pages and all other content except for blog posts. Available values:  
* page — Pages.  
* blogpost or news — Blog posts, also known as news items.  
* comment — Comments on pages and blog posts.  
* attachment — Attachments.  
* status — Status updates made by other users. |
| Maximum Number of Results | 15 | Specify the maximum number of results to be displayed. If this parameter is omitted, then a maximum of 15 results are displayed. The theoretical maximum value that this parameter can accept is 2 to the power of 31, minus 1 (or 2147483647), though this has been limited to 200 in the code, for performance reasons. More details are [here](#). |
### theme

| 'concise' with the heading 'Recently Updated' |

Choose the appearance of this macro:

- **concise** — the default list, showing the names of pages which were updated or commented on, the users who made the page modifications and time when the modifications occurred.
- **social** — lists recent modifications in reverse chronological order, but groups them by user into short time segments. A 'sub' list appears within each user's time segment, showing the names of pages which they updated or commented on and time when these modifications occurred.
- **sidebar** — lists recent updates in reverse chronological order, showing the names of pages which were updated or commented on and time when the page modifications occurred. This theme does not show authorship.

### Show User Profile Pictures

| false |

Specify `showProfilePic=true` to display the profile pictures of the users who updated the content.

### Customising the wording

If you would like to change the wording displayed by the Recently Updated macro, please refer to the document on modifying the Confluence interface text.

### Related Topics

### Parameters of this macro

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of Labels to Display</td>
<td>10</td>
<td>Specifies the total number of labels to display in the list.</td>
</tr>
</tbody>
</table>
| Scope for Retrieving Labels| global  | Specifies the scope of labels to be displayed in the list. Valid values include:
|                            |         | • global — covers all non-personal spaces in the Confluence installation.
|                            |         | • space — the current space.
|                            |         | • personal — your own personal space. |
| List Style                 | list    | • list – displays the list of labels horizontally.
|                            |         | • table – includes additional information such as the page to which the label was added and the user who added it. |
| Table Title                | none    | Adds a title to the top of the list in table style. Titles are only visible when the List Style parameter has been set to table. |

**Related Labels Macro**
The Related Labels macro lists all labels from every page which has one or more labels in common with the current page.

**Using the Related Labels Macro**

**To add the Related Labels macro to a page:**

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in [Using Autocomplete](#).

Take me back to the [Confluence User's Guide](#).

**RSS Feed Macro**

The RSS Feed macro embeds an [RSS feed](#) on a page. It can display the contents of external feeds, or of internal feeds generated by Confluence. To display blog posts or to list recently updated pages in a space, use the [Feed Builder](#) to create an internal feed, then render it using this macro.

⚠️ **CAUTION:** Including unknown HTML inside a webpage is dangerous.

HTML inside an RSS feed can contain active scripting components. This means that it would be possible for a malicious attacker to present a user of your site with script that their web browser would believe came from you. Such code could be used, for example, to steal a user’s authentication cookie and give the attacker their Confluence login password.

The RSS Feed macro will only be available if it has been enabled by your Confluence administrator. Also, your Confluence administrator can define a [whitelist of trusted URLs](#). You will see an error message on the Confluence page, if the included URL is not in the whitelist.

⚠️ The information on this page does not apply to Confluence OnDemand.
Using the RSS Feed macro

To add the RSS Feed macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type { and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSS Feed URL</td>
<td>none</td>
<td>The URL of the RSS feed link you want to show.</td>
</tr>
<tr>
<td>Maximum Number of Entries</td>
<td>15</td>
<td>Limit the number of entries displayed.</td>
</tr>
<tr>
<td>Show Item Titles Only</td>
<td>false</td>
<td>Show only the titles of the news items, not the content.</td>
</tr>
<tr>
<td>Show Name/Title of RSS Feed</td>
<td>true</td>
<td>Hide the feeds title bar.</td>
</tr>
</tbody>
</table>

How up to date is the feed?

By default, the RSS Feed macro caches the feed results for 60 minutes before fetching the data again.

If you wish to change the default caching, use the Cache macro to define how often the RSS Feed macro fetches the feed updates. You will need to install the Cache plugin onto your Confluence site.

What happens to a page containing a disallowed URL?

Your Confluence Administrator can set up a whitelist of allowed URLs. If this is the case, you may see an error on the pages which contain the RSS Feed macro.

A user can add the RSS Feed macro or the HTML-include macro to a Confluence page. The macro code includes a URL from which the content is drawn. When the page is displayed, Confluence will check the URL against the whitelist. If the URL is not allowed, Confluence will display an error message on the page.

The error message says that Confluence “could not access the content at the URL because it is not from an allowed source” and displays the offending URL. If the person viewing the page is a Confluence Administrator, they will also see a link to the Administration page where they can configure the URL whitelist.

Here is an example of the error message, including the link shown only to Confluence Administrators:
Authentication

**Privatefeeds from external sites**

RSS feeds which require authentication cannot be accessed using the RSS Feed macro.

**Accessing internal HTTPS feeds**

This applies only to Confluence instances which have enabled HTTPS for all content. If your site is fully HTTPS, the RSS Feed macro cannot access internal feeds. To enable the RSS Feed macro to access internal feeds without affecting your HTTPS setup, enable local-only HTTP access:

1. Shut down Confluence.
2. Consult the [SSL guide](#) to enable HTTP access to Confluence. You'll want to ensure that you have an HTTP connector and an SSL connector, both commented in. This means that Confluence will be accessible via both HTTP and HTTPS. However, you should not have a redirect port, nor rules in web.xml to redirect all traffic.
3. Instead of using web.xml to redirect traffic, insert a firewall rule to redirect all HTTP requests not from the Confluence server to the equivalent HTTPS URL. This ensures that users will only be able to access Confluence via HTTPS, as intended. If you have still left HTTP access for attachments enabled (to avoid the IE download bug) you must selectively enable those URLs as well.
4. Modify your Confluence RSS Feed macro feed link to use the HTTP URL, and restart Confluence.

Enabling and disabling the RSS Feed macro

The RSS Feed macro is a module of the Confluence HTML Macros plugin.

**To enable or disable the RSS Feed macro:**

1. Enable the [Confluence HTML Macros](#) plugin by following the instructions in [Enabling HTML macros](#).
2. In the plugin module list of the HTML macros, find the [RSS](#) module and hover your cursor over it to enable or disable it.

Search Results Macro
The Search Results macro searches your Confluence site based on search terms specified in the macro code, and displays the results on the wiki page.

**Using the Search Results Macro**

**To add the Search Results macro to a page:**

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in [Using Autocomplete](#).

**To edit an existing macro:** Click the macro placeholder and choose **Edit**. A macro dialog window will open, where you can edit the parameters of the macro.

**Parameters**

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Search Terms</strong></td>
<td>none</td>
<td>The search terms which this macro will use to generate its results. You can refine your search query by using operators such as 'AND' and 'OR'. For example: <code>my_query1 AND my_query2</code> For more information, take a look at the documentation on the <a href="#">Confluence search syntax</a>.</td>
</tr>
<tr>
<td><strong>Maximum Number of Results</strong></td>
<td>10</td>
<td>Set a limit to the number of search results displayed.</td>
</tr>
<tr>
<td><strong>Restrict to this Space Key</strong></td>
<td>all</td>
<td>Specify the key of the space you want to search in. Note that this is case-sensitive.</td>
</tr>
<tr>
<td><strong>Content Type</strong></td>
<td>all</td>
<td>Specify the content type. The content types are: <code>page</code>, <code>comment</code>, <code>blogpost</code>, <code>attachment</code>, <code>userinfo</code> (the content of user profiles only) and <code>spacedesc</code> (the content of space descriptions only).</td>
</tr>
</tbody>
</table>
| Last Modified | all | Specify a period of time in weeks, days, hours and/or minutes, to see the content modified within that time frame. For example:
- 2h 35m
- 3d 30m
These are the values you can use:
- w = weeks
- d = days
- h = hours
- m = minutes
If no time category is specified, Confluence assumes minutes. If you specify more than one time period (e.g. weeks and days), the periods must be separated by a space and they can come in any order. The time categories are not case sensitive e.g. ‘4d’ is the same as ‘4D’.

| Restrict to this Username | all | Specify the username of a Confluence user, to show only content created or updated by that user.

---

**Permissions**

When a user views the page containing the Search Results macro, the search results will show only pages and other content types for which the user has 'View' permission.

Space Jump Macro

This page describes the Space Jump Macro, which is provided with the Documentation theme. You can use space jumping to link from a page in one space to a page with the same name in another space, without knowing the name of the page when you create the link.

The Space Jump macro inserts a link onto the page. When the reader clicks the link, they will jump to a page that has the same name in another space. You specify the space when you insert the Space Jump macro.

Example: We use the Space Jump macro to put a standard message at the top of our archive spaces, telling people that they’re reading an old version of the documentation and letting them jump quickly to the same page in the latest documentation. See the words ‘this page in the current documentation’ in the screenshot below.

Screenshot: One way of using the Space Jump macro

This documentation relates to an earlier version of Confluence. View this page in the current documentation or visit the current documentation home.

Configuring the Documentation Theme

Using the Space Jump Macro

To add the Space Jump macro to a page:
1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{ and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

**To edit an existing macro:** Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

**Parameters**

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td>None</td>
<td>The space key that contains a page with the same page title that you want the link to jump to. Space keys are case-sensitive.</td>
</tr>
<tr>
<td>Alias</td>
<td>None</td>
<td>The text to display as the hyperlinked text. If you do not supply an alias, Confluence will display the page name.</td>
</tr>
</tbody>
</table>

**More Information**

**What happens if there is no page with the same name in the target space?**

For the space jump to work, the target space must contain a page with the same name as the page that renders the Space Jump macro. If the target space does not contain such a page, you will see a broken link. Confluence handles this in its usual manner: the link is coloured red. If you click the link, Confluence offers to create the page for you.

**Can I use the Space Jump macro in any space?**

Yes. You can use the Space Jump macro in any space, even if that space is not currently using the Documentation theme. Provided that the Documentation theme plugin and its components are installed and enabled on your Confluence site, the Space Jump macro is available in any space.

### Status Macro

The Status macro displays a coloured lozenge (a rounded box) that is useful for reporting project status. You can choose the colour of the lozenge and the text that appears inside the lozenge. The macro also displays its current status in the editor, and you can change the status directly in the editor.

**All good!**

**Screenshot:** Click on the Status macro lozenge to change the status.
Using the Status Macro

To add the Status macro to a page using the Macro Browser:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type { and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Colour</td>
<td>Grey</td>
<td>The colour of the lozenge and its border. The border will be a darker version of the same colour. The following colours are available: Grey, Red, Yellow and Green.</td>
</tr>
<tr>
<td>Title</td>
<td>The colour that you select.</td>
<td>The text that will appear inside the lozenge. If you do not specify any text, the title will be the colour of the lozenge, that is 'Grey', 'Red', 'Yellow' or 'Green'.</td>
</tr>
</tbody>
</table>

Table of Contents Macro

The Table of Contents macro scans the headings of the current Confluence page to dynamically create a table of contents from your page headings. This helps readers navigate lengthy pages by summarising the content structure and providing links to headings. Headings are indented progressively.

Using the Table of Contents Macro
Hint: For quick access from the editor toolbar, choose Insert > Table of Contents.

To add the Table of Contents macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type { and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output Type</td>
<td>list</td>
<td>• <strong>list</strong> — produces a typical list type TOC.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>flat</strong> — produces a horizontal menu-type series of links.</td>
</tr>
<tr>
<td>Display Section Numbering</td>
<td>clear</td>
<td>Select the check box to apply outline numbering to your headings, for example: 1.1, 1.2, 1.3.</td>
</tr>
</tbody>
</table>
| **List Style** | none | Select the style of bullet point for each list item. You can use any valid CSS style. For example:  
  * none — no list style is displayed  
  * circle — the list style is a circle  
  * disc — the list style is a filled circle. This is the typical bullet list, and is used for this example list.  
  * square — the list style is a square  
  * decimal — the list is numbered (1, 2, 3, 4, 5)  
  * lower-alpha — the list is lower-case, alphabetised (a, b, c, d, e)  
  * lower-roman — the list style is lower roman numerals (i, ii, iii, iv, v, vi)  
  * upper-roman — the list style is upper roman numerals (I, II, III, IV, V, VI) |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Heading Indent</strong></td>
<td></td>
<td>Sets the indent for a list according to CSS quantities. Entering 10px will successively indent heading groups by 10px. For example, level 1 headings will be indented 10px and level 2 headings will be indented an additional 10px.</td>
</tr>
</tbody>
</table>
| **Separator** | brackets | This parameter applies to flat lists only. You can enter any of the following values:  
  * brackets — Each item is enclosed by square brackets: [ ].  
  * braces — Each item is enclosed by braces: { }.  
  * parens — Each item is enclosed by parentheses: ( ).  
  * pipe — Each item is separated by a pipe:  
  * anything — Each item is separated by the value you enter. You can enter any text as a separator, for example "***". If using a custom separator, be aware that text displays exactly as entered, with no additional white space to further separate the characters. |
<table>
<thead>
<tr>
<th>Minimum Heading Level</th>
<th>1</th>
<th>Select the highest heading level to start your TOC list. For example, entering 2 will include levels 2, and lower, headings, but will not include level 1 headings.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum Heading Level</td>
<td>7</td>
<td>Select the lowest heading level to include. For example, entering 2 will include levels 1 and 2, but will not include level 3 headings and below.</td>
</tr>
<tr>
<td>Include Headings</td>
<td></td>
<td>Filter headings to include according to specific criteria. You can use wildcard characters. See Sun's Regex documentation for examples of constructing regular expression strings.</td>
</tr>
<tr>
<td>Exclude Headings</td>
<td></td>
<td>Filter headings to exclude according to specific criteria. You can use wildcard characters. See Sun's Regex documentation for examples of constructing regular expression strings.</td>
</tr>
<tr>
<td>Printable</td>
<td>checked</td>
<td>By default, the TOC is set to print. If you clear the check box, the TOC will not be visible when you print the page.</td>
</tr>
<tr>
<td>CSS Class Name</td>
<td></td>
<td>If you have custom TOC styles in your CSS style sheet, use this parameter to output the TOC inside <code>&lt;div&gt;</code> tags with the specified class attribute.</td>
</tr>
</tbody>
</table>

**Examples**

The examples below are based on this table of contents:

1. **Places**
   1. Favourite Places
   2. Unknown Places
2. **Foods**
   1. Favourite Foods
   2. Unknown Foods
3. **Things**
   1. Favourite Things
   2. Unknown Things
Filtered Table of Contents

This example filters the headings to include those that contain 'Favourite', but excludes headings which end with 'Things'. The list is styled with Roman numerals.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>List Style</td>
<td>upper-roman</td>
</tr>
<tr>
<td>Include Headings</td>
<td>Favourite.*</td>
</tr>
<tr>
<td>Exclude Headings</td>
<td>.*Things</td>
</tr>
</tbody>
</table>

The resulting table of contents is:

I. Favourite Places
II. Favourite Foods

Flat List

This example filters all headings to render a flat list of 'Unknowns' enclosed in square brackets (the default list style).

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output Type</td>
<td>flat</td>
</tr>
<tr>
<td>Maximum Heading Level</td>
<td>2</td>
</tr>
<tr>
<td>Include Headings</td>
<td>Unknown.*</td>
</tr>
</tbody>
</table>

The resulting table of contents is:

[ Unknown Places ] [ Unknown Foods ] [ Unknown Things ]

Code examples

See:

- [Confluence Wiki Markup for Macros](#)
- [Confluence Storage Format for Macros](#)

Notes

- When you use a Table of Contents macro in a template, you will see an error when you preview the template itself. But the Table of Contents macro works on the pages that people create from the template – the table of contents shows up after they have saved the page. (This is probably because the template is not defined as a page, and the Table of Contents macro works for pages only.)

- Due to an outstanding issue in the Table of Contents macro ([CONF-10619](#)), the macro browser's Refresh function does not render any parameter modifications. Currently, the rendering of parameter value modifications to the Table of Contents macro occurs only after the page is saved.
• **Using HTML Heading Markup with the Table of Contents Macro**

The Table of Contents macro cannot handle HTML heading markup on its own. Hence, if you use the HT ML and HTML Include macros to render HTML heading markup in a Confluence page, the Table of Contents macro will not create a contents list out of these headings. (For more information about this issue, please refer to TOC-93.)

However, if you insert an HTML anchor into each HTML heading on your page (based on the following syntax), the Table of Contents macro will incorporate these headings into your contents list.

```html
<h2><a name="pagename-headingname"></a>Heading Name</h2>
```

The syntax for the anchor name is the page name and heading name separated by a hyphen, in which the page and heading names have all spaces removed and are converted to lowercase. If punctuation marks occur within a page or heading name, each mark should usually be converted to its URL escape code in the anchor name.

**Table of Content Zone Macro**

The Table of Content Zone macro enables you to mark out a 'page zone' from which to create a table of contents. Styling the headings as a flat list enables you to enclose the page text by top and bottom navigation bars similar to web navigation. When styled as a list, headings are indented progressively.

**On this page:**

### Using the Table of Content Zone Macro

**To add the Table of Content Zone macro to a page:**

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{ and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

**To edit an existing macro:** Click the macro placeholder and choose **Edit**. A macro dialog window will open, where you can edit the parameters of the macro.

**Parameters**

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>

**Example:**

```html
<h2><a name="pagename-headingname"></a>Heading Name</h2>
```
| **location** | both | Specifies where in the zone the output list is displayed: **top**, **bottom**, or **both**, which encloses the page zone content. |
| **Output Type** | list | Specifies the layout for the table of contents:  
  - **list** – produces a vertical list, typical of a TOC.  
  - **flat** – produces a horizontal menu-type series of links, for example: [Heading 1] [Heading 2] [Heading 3]. |
| **Display Section Numbering** | false | Select to apply outline numbering to your headings, for example: 1.1, 1.2, 1.3. |
| **List Style** | none | Specifies the style of bullet point for each list item. You can use any valid CSS style. For example:  
  - **none** — no list style is displayed  
  - **circle** — the list style is a circle  
  - **disc** — the list style is a filled circle. This is the typical bullet list, and is the one we’re using for this example list  
  - **square** — the list style is a square  
  - **decimal** — the list is numbered (1, 2, 3, 4, 5)  
  - **lower-alpha** — the list is lower-case, alphabetised (a, b, c, d, e)  
  - **lower-roman** — the list style is lower roman numerals (i, ii, iii, iv, v, vi)  
  - **upper-roman** — the list style is upper roman numerals (I, II, III, IV, V, VI) |
| **Heading Indent** | | Sets the indent for a list output type, according to CSS quantities. Entering "10px" will successively indent list heading levels by 10px. For example, h1 headings will be indented 10px and h2 headings will be indented an additional 10px. |
| **Separator** | brackets | Only applies to the flat output type. Specifies the display style of the links. You can enter any of the following values:

- **brackets** — Each item is enclosed by square brackets: [ ].
- **braces** — Each item is enclosed by braces: { }.
- **parens** — Each item is enclosed by parentheses: ( ).
- **pipe** — Each item is separated by a pipe:
- **anything** — Each is separated by the value you enter. You can enter any text as a separator, for example "***". If using a custom separator, be aware that text displays exactly as entered, with no additional white space to further separate the characters. |
| **Minimum Heading Level** | 1 | Select the largest heading level to start your TOC list. For example, 2 will list h2, h3, and h4 headings, but will not include h1 headings. |
| **Max Heading Level** | 7 | Select the smallest heading level to include in the TOC. For example, 2 will list h1 and h2, but will not include h3 and below. |
| **Include Headings** |  | Filter the included headings according to specific criteria. You can use wildcard characters. See Sun's Regex documentation for examples of constructing regular expression strings. |
| **Exclude Headings** |  | Exclude headings according to specific criteria. You can use wildcard characters. See Sun's Regex documentation for examples of constructing regular expression strings. |
| **Printable** | true | By default, the TOC is set to print. If you clear this parameter, the TOC will not be visible when you print the page. |
| **CSS Class Name** |  | If you have a custom TOC in your CSS style sheet, you can use this parameter to output the TOC with the specified "class" attribute. |
Examples

The examples are based on a page with the following headings:

1. Places
   1. Favourite Places
   2. Unknown Places
2. Foods
   1. Favourite Foods
   2. Unknown Foods
3. Things
   1. Favourite Things
   2. Unknown Things

Filtered Table of Contents

This example will filter all headings to include those that contain "Favourite", but will exclude any heading which ends with the word "Things". The list is styled with upper-case Roman numerals.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output Type</td>
<td>list</td>
</tr>
<tr>
<td>List Style</td>
<td>upper-roman</td>
</tr>
<tr>
<td>Include Headings</td>
<td>Favourite.*</td>
</tr>
<tr>
<td>Exclude Headings</td>
<td>.*Things</td>
</tr>
</tbody>
</table>

Screenshot: Filtered TOC 'zone' headings

- Favourite Places
- Favourite Foods

Flat List

This example will filter all headings to render a flat list of "Unknowns" enclosed in square brackets.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output Type</td>
<td>flat</td>
</tr>
<tr>
<td>Separator</td>
<td>brackets</td>
</tr>
<tr>
<td>Max Heading Level</td>
<td>2</td>
</tr>
<tr>
<td>Include Headings</td>
<td>Unknown.*</td>
</tr>
</tbody>
</table>

Screenshot: Filtered TOC 'zone' headings displayed as a flat list

[ Unknown Places ] [ Unknown Foods ] [ Unknown Things ]
Notes

- Due to an outstanding issue in the Table of Content Zone macro (CONF-10619), the Macro Browser’s Refresh function does not render any parameter modifications. Currently, the rendering of parameter value modifications to the Table of Content Zone macro occurs only after the page is saved.
- Using HTML Heading Markup with the Table of Content Zone Macro — The Table of Content Zone macro cannot handle HTML heading markup on its own. Hence, if you used the HTML and HTML Include macros to render HTML heading markup in a Confluence page, the Table of Content Zone macro will not create a contents list out of these headings. (For more information on about this issue, please refer to TOC-93.)

However, if you insert an HTML anchor into each HTML heading on your page (based on the following syntax), the Table of Content Zone macro will incorporate these headings into your contents list.

```html
<h2><a name="pagename-headingname"></a>Heading Name</h2>
```

The syntax for the anchor name is usually the page name and heading name separated by a hyphen, in which the page and heading names have all spaces removed and are converted to lowercase. If punctuation marks occur within a page or heading name, each mark should usually be converted to its URL escape code in the anchor name.

Tasklist Macro

The Tasklist macro allows you to create and update a list of tasks on the wiki page. Users viewing the page can modify the tasks without having to edit the page, provided they have the required permissions to modify the page.

You may also be interested in the lightweight task list that you can add directly onto your page, via the editor insert menu. This method also allows you to notify users that tasks have been assigned to them. See Managing Tasks in Confluence.

Using the Tasklist macro

To add the Tasklist macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type { and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

**To edit an existing macro:** Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.
Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>'Task List'</td>
<td>The name of the task list. This is displayed as the title above the list of tasks.</td>
</tr>
<tr>
<td>Width of List</td>
<td>530px</td>
<td>The width of the task list.</td>
</tr>
<tr>
<td>Enable Locking</td>
<td>clear</td>
<td>When selected, you can lock individual tasks so that they cannot be changed. See instructions below on editing the task list.</td>
</tr>
<tr>
<td>Prompt on Delete</td>
<td>clear</td>
<td>When selected, the user must confirm the deletion of a task in the list.</td>
</tr>
</tbody>
</table>

Editing the task list while viewing a page

While viewing a page, you can change the tasks in a task list as follows:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adding a task</td>
<td>Type the task description in the box under the list title, and click Add.</td>
</tr>
<tr>
<td>Completing/uncompleting a task</td>
<td>Click the check box next to a task to mark the task as complete. The task name will become a lighter color and the progress bar will be updated. Clear the check box to mark the task as uncompleted. You can also click Uncheck all to mark all tasks as uncompleted.</td>
</tr>
</tbody>
</table>
## Editing a task
Move your cursor over the task and click the edit icon (pencil) that appears to the right of the task. The task name will become editable and the edit icon will be replaced with a save icon. Make your change and press the ‘Enter’ key to save or click the save icon.

## Deleting a task
Move your cursor over the task and click the delete icon (trash can) that appears to the right of the task.

## Viewing details of a task
Click the arrow icon to the left of the task name. The task details will open in an expanded view.

## Locking a task
Provided that the **Enable Locking** parameter has been selected, you can click the lock icon to prevent the task from being edited, deleted, or otherwise changed.

## Changing the priority
When the task details are visible, click the appropriate option — **High**, **Medium** or **Low**.

## Assigning the task
When the task details are visible, change the assignee of the task by typing in or searching for a username.

---

### Screenshot: Task List showing task details

**Planning a Holiday**

- [ ] Book tickets
- [ ] Check passport expiry
  - Priority: [ ] High  [ ] Medium  [ ] Low
  - Assigned To: smaddox
  - Created: Mar 26, 2008

- [ ] Buy suitcases

**Sort by:** Custom

### Sorting the tasks

There are two ways to sort the tasks in the list:

- Using the **Sort by** list.
- Using drag and drop.

**Select one of the sort options from the 'Sort by' list:**
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Custom</td>
<td>This is the default option.</td>
</tr>
<tr>
<td>Priority</td>
<td>Sort the list in order of the priority you have allocated to each task.</td>
</tr>
<tr>
<td>Date Created</td>
<td>Sort the list in order of the dates upon which the tasks were created.</td>
</tr>
<tr>
<td>Completed</td>
<td>Move all completed tasks to the bottom or top of the list.</td>
</tr>
<tr>
<td>Name</td>
<td>Sort the list in order of the task names.</td>
</tr>
<tr>
<td>Assignee</td>
<td>Sort the list in order of the usernames assigned to the tasks.</td>
</tr>
</tbody>
</table>

Once you have selected a sort option, use the icon beside the **Sort by** box to reverse the sort order.

**Dragging and dropping a task into a new position:**

Drag a task up or down the list using the ‘drag me’ handle to the right of the task name. Make sure the task is positioned to the left of the existing tasks. A space will open and you will be able to drop the task into its new position.

**Viewing the progress on tasks completed**

The bar at the top of the task list displays two different colours, indicating the percentage of tasks completed.

**Screenshot: Progress Bar on Task List**

![Planning a Holiday](image)

**Notes**

- It is not possible to add a due date to the task list. If you interested in this improvement request, you can comment on or vote for this issue: [CONF-7371 - Authenticate](CONF-7371) to see issue details.
- The Tasklist macro does not notify users that a task has been assigned to them. But you can do that using the lightweight task list accessible from the editor tool bar. See [Managing Tasks in Confluence](Managing%20Tasks%20in%20Confluence).
Tip Macro
Using the Tip macro, you can highlight a helpful tip on a Confluence page. The macro creates a green-coloured box surrounding your text as shown below.

This text is rendered inside the tip macro.

Using the Tip macro

To add the Tip macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type `{ and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

On this page:
- Using the Tip macro
- Parameters

Related pages:

Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional Title</td>
<td>none</td>
<td>The title of the tip. If specified, it will be displayed in bold next to the icon.</td>
</tr>
<tr>
<td>Show Tip Icon</td>
<td>true</td>
<td>If cleared, the icon will not be displayed.</td>
</tr>
</tbody>
</table>

User List Macro

The User List macro displays a list of users registered in Confluence, based on their group membership. See also Configuring the User List Macro.
Using the User List Macro

To add the User List macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

**Parameters**

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group(s)</td>
<td>none</td>
<td>Specifies one or more groups whose Confluence users you want to list, using a comma-separated list of group names. To see all users registered in a Confluence installation, specify an asterisk ('*') for this parameter's value.</td>
</tr>
<tr>
<td>Display Online/Offline Users</td>
<td>none</td>
<td>Select to generate a list of online users. Clear to generate a list of offline users. In order to make this feature functional, a System Administrator needs to enable the User Log In Listener for your Confluence site.</td>
</tr>
</tbody>
</table>

**List of online users can be misleading**

When the **Display Online** parameter is used, Confluence uses a context listener to generate the list of online users. A context listener is a J2EE term for something that listens for events in the application server. We listen for session open and close events, so a user is 'online' if they have a session on the application server. Some application servers don't correctly despatch close events for sessions – in these cases, the list of online users may be misleading.

User Profile Macro
The User Profile macro displays a short summary of any Confluence user's profile on your Confluence page or blog. This is the same summary that appears in a Hover Profile, which appears whenever you mouse-over any user's name in the Confluence interface.

![Screenshot: Example of the User Profile Macro](image)

Using the User Profile Macro

To add the User Profile macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{ and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

**Parameters**

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Username</td>
<td>none</td>
<td>The username of the Confluence user whose profile summary you wish to show.</td>
</tr>
</tbody>
</table>

User Status List Macro

The User Status List macro displays a history of any Confluence user’s status updates on your Confluence page or blog. This is the same history that appears in the user’s Status Updates view.

![Screenshot: Example output of the User Status List macro](image)
Using the User Status List Macro

To add the User Status List macro to a page:

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

Speeding up macro entry with autocomplete: Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

To edit an existing macro: Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

Parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Username</td>
<td>none</td>
<td>The username of the Confluence user whose history of status updates you wish to show.</td>
</tr>
</tbody>
</table>

If you wish to list status updates made by more than just one user, you can use the Recently Updated macro with the following parameter-value combinations:

- Include these Content Types Only — status
- Author(s) by username — the user(s) whose status updates you want to include in the list. If you leave this field blank, the status updates of all users will be included.

**View File Macro**

The View File macro allows you to embed an Office or PDF document into your Confluence page. First attach the document to a wiki page and then use one of the View File macros to display the document's content.

When users view the page, they will see the content of the Office document. Users do not need to have Office installed in order to see the content of the Office document. If they do have Office installed, users will be able to open the document for editing in their Office application.

For a full list of Office Connector prerequisites and limitations, please refer to:

- [Office Connector Prerequisites](#)
- [Office Connector Limitations and Known Issue](#)

For an overview of all Office Connector features, please refer to [Working with the Office Connector](#).

**On this page:**

### Displaying an Office or PDF Document in Confluence

To display an Office or PDF document in a page, use one of the following View File macros in the macro browser:

- Office Excel
- Office Powerpoint
- Office Word
- PDF

To add one of the View File macros to a page:

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in [Using Autocomplete](#).

**To edit an existing macro:** Click the macro placeholder and choose **Edit**. A macro dialog window will open, where you can edit the parameters of the macro.

### Parameters for the Office and PDF Macros

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Macro</th>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All View File macros</td>
<td>Page Name</td>
<td>The page which contains the macro</td>
<td></td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------</td>
<td>----------------------------------</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Enter a page name, if you wish to display a document which is attached to another Confluence page.</td>
<td></td>
</tr>
<tr>
<td>File Name</td>
<td>none</td>
<td>The file name of the Office or PDF document to be displayed. The document must be attached to a page on your Confluence site.</td>
<td></td>
</tr>
<tr>
<td>Office Excel</td>
<td>Show Grid?</td>
<td>true</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Select to show grid lines around each cell of the Excel spreadsheet. Clear to hide these grid lines.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Worksheet Name</td>
<td>Last worksheet viewed in the spreadsheet</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Last Row</td>
<td>Last row with content</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Last Column</td>
<td>Last column with content</td>
<td></td>
</tr>
<tr>
<td>Office Powerpoint</td>
<td>Height</td>
<td>Specify the height of the display, in pixels (default) or as a percentage of the window's height.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Slide Number</td>
<td>none</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Specify the number of the slide that you want displayed on the Confluence page, where the first slide is numbered zero. Instead of a slide show, the page will display just the single slide, represented as a JPEG image.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Width</td>
<td>Specify the width of the display, in pixels (default) or as a percentage of the window's width.</td>
<td></td>
</tr>
</tbody>
</table>
Reducing the size of the spreadsheet

Use the **Last Column** and **Last Row** parameters to reduce the size of the spreadsheet displayed on the wiki page. This is especially useful to prevent the display from showing empty cells. This will also help to prevent 'out of memory' errors.

Presentation display options

By default, a presentation is displayed as a dynamic slide show, using Adobe Flash Player. However, you can use the **Slide Number** parameter to display just one of the slides as a static JPEG image.

Editing a Word Document or Excel Spreadsheet

When viewing a wiki page that displays an attached Office document, you can launch your Office editor directly from Confluence by clicking the title bar of the document.

You will find detailed instructions in [Editing an Office Document from Confluence](#).

Troubleshooting

Problems? Please refer to our guide to the [Office Connector limitations and known issues](#).

Warning Macro

The Warning macro allows you to highlight a warning note on a Confluence page.

It creates a red-coloured box surrounding your text as shown below.

Warning Macro Example

This text is rendered inside the warning macro.

Using the Warning Macro

**To add the Warning macro to a page:**

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{` and the beginning of the macro name, to see a list of suggested macros. Details are in [Using Autocomplete](#).

**To edit an existing macro:** Click the macro placeholder and choose **Edit**. A macro dialog window will open, where you can edit the parameters of the macro.

Parameters

Parameters are options that you can set to control the content or format of the macro output.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional Title</td>
<td>none</td>
<td>The title of the warning note. If specified, will be displayed in bold next to the icon.</td>
</tr>

</table>

**Live Example of Flickr Photos**

This example displays all photos from Flickr with the tag ‘Atlassian’. It uses this URL: [http://www.flickr.com/photos/tags/atlassian/](http://www.flickr.com/photos/tags/atlassian/)

**Live Example of Google Gadget**

**More Examples of Macro Code**

**Google Gadgets**

You need to find the URL for the Google Gadget you want to display.

Here is one way to find a gadget's URL:

1. Go to the [Google Gadgets directory](http://www.google.com/ig/directory).
2. Find the gadget you want then click its name, such as 'Spider'.
3. The gadget's summary page will open. Copy the URL from your browser's address bar. The URL looks something like this one:

   ![Example URL](http://www.google.com/ig/directory?synd=open&num=24&url=http://abowman.googlepages.com/spider.xml&output=html)

You can also use the URL of the 'add gadget' page. The page is called 'Add "gadgetx" to your iGoogle page':

1. There are a couple of ways to get to the 'add gadget' page:
   - Click a '+Google' button underneath the gadget when displayed on a page somewhere.
   - Or click 'Add Stuff' on your iGoogle page.
2. Copy the URL from your browser's address bar. The URL would look something like this one:

   ![Example URL](http://www.google.com/ig/add?synd=open&source=ggyp&moduleurl=abowman.googlepages.com/spider.xml)

**Widgetbox widgets**
You will need to find the URL for the Widgetbox widget you want to display.

Here is one way to find a widget's URL:

1. Ensure you are logged in to Widgetbox and that you are viewing the Widgetbox Gallery.
2. Find the widget you want then click its name, such as 'cyber-pet'.
3. The widget's summary page will open. Within the Get Widget section, click the Atlassian Confluence icon. The Widgetbox Add to Confluence dialog box appears, containing the URL required for the Add to Confluence Widget Macro.

   ![Widgetbox Add to Confluence dialog box](Image)

   If you cannot see this icon, click the more... link to reveal it.

4. In the Widgetbox Add to Confluence dialog box, click Copy.
5. Copy the URL from your browser's address bar. The URL looks something like this one:

   ![URL](Image)

**YouTube**

You will need to find the URL for the YouTube video that you want to display.

To find a YouTube video's URL:

1. Go to YouTube and search for the video you want.
2. Click the title of the video, such as 'Wikis in Plain English'.
3. The video's summary page will open. Copy the URL from your browser's address bar. The URL looks something like this one:

   ![URL](Image)

**MySpace Videos**

You will need to find the URL for the MySpace video that you want to display.

To find a MySpace video's URL:

1. Go to MySpace Video and search for the video you want.
2. Click the title of the video, such as 'Glacier Creek Confluence Time Lapse'.
3. The video's summary page will open. Copy the URL from your browser's address bar. The URL looks something like this one:

   ![URL](Image)

**Yahoo Video**

You will need to find the URL for the Yahoo video that you want to display.
To find a Yahoo video's URL:

1. Go to [Yahoo Video](http://video.yahoo.com) and search for the video you want.
2. Click the title of the video, such as 'Wiki Technology Trend: Past, Now and Future'.
3. The video's summary page will open. Copy the URL from the address bar of your browser. The URL looks something like this:

   http://video.yahoo.com/watch/423158/2424140

   If you are unable to obtain a unique URL from your browser’s address bar, click the envelope (Share) icon on the lower section of the video screen and copy the contents of the Link field.

**Dailymotion Video**

You will need to find the URL for the Dailymotion video that you want to display.

To find a Dailymotion video's URL:

1. Go to [Dailymotion](http://www.dailymotion.com) and search for the video you want.
2. Click the title of the video, such as 'Wiki Technology Trend: Past, Now and Future'.
3. The video's summary page will open. Copy the URL from the address bar of your browser. The URL looks something like this:

   http://www.dailymotion.com/user/spacevidcast/video/x7zevj_spacevidcast-2009-promo-video_tech

   If you are unable to obtain a unique URL from your browser’s address bar, click Menu at the lower right section of the video screen, select URL & Embed Code and copy the contents of the Link field.

**Episodic**

You will need an [Episodic](http://app.episodic.com) user account if you want to create and distribute videos via Episodic.

To embed an Episodic video onto a Confluence page:

1. Find the video and copy the URL from the address bar of your browser. The URL looks something like this:

   http://app.episodic.com/shows/13/episodes/493

2. Paste the URL into the Web Site's Widget URL box in the Macro Browser.

**Vimeo**

You will need to find the URL for the Vimeo video that you want to display.

To find a Vimeo video's URL:

1. Go to [Vimeo](http://vimeo.com) and search for the video you want.
2. Click the title of the video, such as 'The Wiki Show - Allison the Russian High Kicker'.
3. The video's summary page will open. Copy the URL from the address bar of your browser. The URL looks something like this one:

http://www.vimeo.com/909808

**Metacafe**

You will need to find the URL for the Metacafe video that you want to display.

To find a Metacafe video's URL:

1. Go to [Metacafe](https://www.metacafe.com) and search for the video you want.
2. Click the title of the video, such as 'Wikis In Plain English (How To)'.
3. The video's summary page will open. Copy the URL from the address bar of your browser. The URL looks something like this one:

http://www.metacafe.com/watch/679493/wikis_in_plain_english_how_to/

**blip.tv**

You will need to find the URL for the blip.tv video that you want to display.

To find a blip.tv video's URL:

1. Go to [blip.tv](https://www.blip.tv) and search for the video you want.
2. Click the title of the video, such as 'River cruising on the Rhine'.
3. The video's summary page will open. Copy the URL from the address bar of your browser. The URL looks something like this one:

http://blip.tv/file/996864/

**Viddler**

You will need to find the URL for the Viddler video that you want to display.

To find a Viddler video's URL:

1. Go to [Viddler](https://www.viddler.com) and search for the video you want.
2. Click the title of the video.
3. The video's summary page will open. Copy the URL from the address bar of your browser. The URL looks something like this one:

http://www.viddler.com/explore/Markus_Z/videos/1/

**Flickr**
You can embed a slide show of photos from Flickr by supplying a URL that specifies one of the following:

- Photos with a specific tag.
- Photos belonging to the photostream of a specific Flickr user.
- A set of photos as defined by the Flickr user.
- A user’s photostream starting at a specific photo.

If you want to do something else, we suggest that you try any Flickr URL. It should work.

Below are some examples of the Widget macro code for embedding Flickr images.

**Flickr Photos with a Specific Tag**

This URL displays a slide show of Flickr photos that are tagged with the word ‘Atlassian’ [http://www.flickr.com/photos/tags/atlassian/](http://www.flickr.com/photos/tags/atlassian/)

**Flickr Photos from a Specific User**

This URL displays a slide show of photos from the Flickr photostream of user ‘Atlassian’: [http://www.flickr.com/photos/atlassian/](http://www.flickr.com/photos/atlassian/)

**Flickr Photos from a Specific Set**

This URL displays a slide show of Flickr photos from the set ‘Melbourne Cup - November 2008’ created by user ‘Atlassian’: [http://www.flickr.com/photos/atlassian/sets/72157608657271078/](http://www.flickr.com/photos/atlassian/sets/72157608657271078/)

**A Specific Flickr Photo**

This URL displays a slide show of photos from the Flickr photostream of the user ‘Atlassian’, starting with a specific photo: [http://www.flickr.com/photos/atlassian/3003538919/](http://www.flickr.com/photos/atlassian/3003538919/)

**Skitch.com**

You will need to find the URL for the Skitch image that you want to display.

To embed a Skitch image onto a Confluence page:

1. Go to [Skitch.com](http://skitch.com/atlassian/411g/example-image).
2. Find the image and copy the URL from the address bar of your browser. The URL looks something like this:

   http://skitch.com/atlassian/411g/example-image

**Twitter**

Use a [Twitter](http://twitter.com/user) link in the Widget macro to display a dynamic list of the latest tweets sent by a user or matching a Twitter search.

To display the latest messages from a Twitter user, add the user’s Twitter link as the URL in the Widget macro.

http://twitter.com/username
This URL will display Mike Cannon-Brooke's Twitter messages: http://twitter.com/mcannonbrookes

To display the latest messages resulting from a Twitter search, add the Twitter search link as a URL in the Widget macro.

- Make sure you use the supported format of the search URL:

  http://search.twitter.com/search?q=my search term

  The following format is not supported:

  http://twitter.com/#search?q=my search term

  • The '#' tag is not supported (not even in its URL-encoded form %23).

This URL will display the most recent tweets containing the word 'AtlassianDragons': http://search.twitter.com/search?q=AtlassianDragons

**FriendFeed**

To display the latest messages from a FriendFeed user, add the user's FriendFeed link as the URL in the Widget macro. For example:

**BackType**

To display the latest blog or website comments from a BackType user, add the user's BackType widget link as the URL in the Widget macro. For example:

**SlideShare**

You will need to find the URL for the SlideShare presentation that you want to display.

To find a SlideShare presentation's URL:

1. Go to SlideShare and search for the presentation you want.
2. Click the title of the presentation, such as 'Using JIRA & Greenhopper for Agile Development'.
3. The presentation's summary page will open. Copy the URL from the address bar of your browser. The URL looks something like this one:

   http://www.slideshare.net/jleyser/using-jira-greenhopper-for-agile-development-presentation

**SlideRocket**

You will need to find the URL for the SlideRocket presentation that you want to display.

To find a SlideRocket presentation's URL:
1. Log in to SlideRocket and go to your library of presentations.
2. Copy the ‘web link’ for the presentation you want to display. This will give you a URL that looks something like this one:

   http://app.sliderocket.com/app/FullPlayer.aspx?id=132f9db7-b0fb-4f51-b974-36652774971b

3. Paste the URL into the Widget macro code on your Confluence page.

**Scribd**

You will need to find the URL for the Scribd presentation that you want to display.

To find a Scribd presentation's URL:

1. Go to Scribd and search for the presentation you want.
2. Click the title of the presentation, such as 'My Sea Friends Coloring Book'.
3. The presentation's summary page will open. Copy the URL from the address bar of your browser. The URL looks something like this one:

4. Paste the URL into the Widget macro code on your Confluence page.

**Google Docs Presentations**

You can embed presentations from Google Docs, but not other document types. You will need to find the URL for the Google Docs presentation that you want to display.

To find the URL of a Google Docs presentation:

1. Publish your presentation in Google Docs.
2. View your published document, then copy the URL from your browser's address bar. The URL will look something like this:

   http://docs.google.com/Presentation?docid=ddpqn8g5_0fx96zmmq6mm=en_GB

3. Paste the URL into the Widget macro code on your Confluence page.

**Google Calendar**

You can embed a Google Calendar into your page and to do this, you will need to add the URL for the Google Calendar that you want to display.

To find the URL for a Google Calendar:

1. Log in to Google Calendar.
2. In the calendar list on the left side of the page, ensure the appropriate calendar is selected, click the down-arrow button next to the calendar name and then select the Calendar settings option.
   (Alternatively, if available, click the Manage Calendars link at the bottom of the calendar list and then...
click the name of the appropriate calendar.)

3. In the Calendar Address section, click the HTML button. A pop-up message with your calendar's public URL appears.

4. Copy the URL from this pop-up message. The URL looks something like this:

   http://www.google.com/calendar/embed?src=somebody@example.com&ctz=Australia/Sydney

5. Paste the URL into the Widget macro code on your Confluence page.

### Wufoo HTML Form Builder

To display an HTML form built in the Wufoo HTML Form Builder, add the form's link as a URL to the Widget Macro. For example:

http://examples.wufoo.com/forms/contact-form/

### Dabble DB online database builder

To display a shared page built in Dabble DB, add the page's link as a URL to the Widget Macro. For example:

https://confluence-sample.dabbledb.com/page/confluence-sample/nSQqdgIg

> The Widget Macro supports shared Dabble DB view and form pages. You can insert a Dabble DB data entry form into a Confluence page. On the same page or another page, you can use a a Dabble DB view to display data submitted via the form.

### Get Satisfaction social support application

To display a feedback form for a Get Satisfaction community, add the community or company link as a URL to the Widget Macro. For example:

http://getsatisfaction.com/atlassian

#### Troubleshooting

If the URL given in the Widget Connector macro does not work, the macro displays an icon and the base URL.

For example, the following code:

http://example.com/invalid

will result in an image like the one below:

Working with Drafts

A draft is a 'snapshot' of unsaved page content, which Confluence creates automatically at regular intervals while you are editing a page or blog post. This can minimise the loss of work if your Confluence site experiences a problem, since you can retrieve the page content from your last saved draft.

**How do drafts work in Confluence?**

At regular intervals, Confluence automatically saves a draft of the page you are editing. If a network failure or system error prevents you from saving your page, you can retrieve its last saved draft and continue working on the page from the last saved draft.

Drafts are created while you are adding and editing a page or blog post. Each new draft replaces the previously saved draft. By default, Confluence saves a draft of your page once every thirty seconds. However, a Confluence administrator can configure how often drafts are saved. In addition, whenever you edit a page and then move to another screen, Confluence will automatically save a draft.

When you edit the page again, Confluence will let you know that a version of the page you are editing was not saved and will give you the option to resume editing it.

Each time Confluence saves a draft, it displays a message and the time of the last save near the **Save** button on the edit screen.
On this page:
- How do drafts work in Confluence?
- Viewing drafts
- Viewing your unsaved changes

Related pages:
- Resuming the Editing of a Draft
- Configuring the Time Interval at which Drafts are Saved
- Concurrent Editing and Merging Changes
- Confluence User's Guide

More about drafts:
- A user only has access to the drafts of pages they have been working on and whose content has not yet been saved.
- A user cannot create a draft explicitly.
- A user's drafts are listed in the 'Drafts' tab of their profile.
- Once a user has resumed editing a draft, or chosen to discard it, the draft is removed from their drafts tab.

**Viewing drafts**

Your drafts are listed on the Drafts tab of your user profile.

**To see your drafts:**

Go to your name (the 'User' menu) at the top of the page and choose Drafts.

**Viewing your unsaved changes**

While editing a page or blog post, you can view any 'unsaved' changes you have made since the last automatically saved draft, by clicking view change (near the Save button).
Configuring the Time Interval at which Drafts are Saved

By default, Confluence saves a draft of your page once every thirty seconds. However, as described below, a Confluence administrator can configure how often drafts are saved.

As a Confluence administrator, you can set the time interval at which drafts are saved as follows:

1. Choose Browse > Confluence Admin.
2. Click General Configuration in the left-hand panel.
3. Edit the setting for Draft Save Interval.

**Resuming the Editing of a Draft**

**Concurrent Editing and Merging Changes**

Sometimes, two or more people may edit a page at the same time. When this happens, Confluence will do its best to ensure that nobody's changes are lost.

**How will I know if someone else is editing the same page as I am?**

If another user is editing the same page as you, Confluence will display a message above your edit screen letting you know who the other user is and when the last edit was made.

Screenshot: Notification of Simultaneous Page Editing

![This page is being edited by [User] (last edit less than a minute ago)](image)

**What happens if two of us are editing the same page and the other user saves before I do?**

If someone else has saved the page before you, when you click 'Save', Confluence will check if there are any conflicts between your changes and theirs. If there are no conflicting changes, Confluence will merge both the edits successfully. If there are any conflicts, Confluence will display them for you and give you the option to either 'Overwrite' the other user's changes, 'Merge your changes' manually, or 'Discard' them.

Screenshot: Notification of Page Editing Conflict

![The following error(s) occurred:
- You were editing an outdated version of this page. Another user has updated this page before you. Your changes against the now updated version is shown below. Please decide whether your changes should overwrite it or you wish to discard your changes.](image)

**Example Scenario**

For example, Alice and Bob both edit the same page at the same time.

If Alice clicks save before Bob, Bob is now effectively editing an out-of-date version of the page. When Bob clicks save, Confluence will examine his changes to see if any overlap with Alice's. If the changes do not overlap (i.e. Alice and Bob edited different parts of the page), Bob's changes will be merged with Alice's automatically.

If Bob's changes overlap with Alice's, Confluence will display an error message to Bob showing where Alice has changed the page, and giving Bob the options to overwrite Alice's changes with his own, to re-edit the document to incorporate Alice's work, or to cancel his own changes entirely.

Working with Drafts

Take me back to Confluence User's Guide.

Resuming the Editing of a Draft

If you have typed some content into a Confluence page or blog post, Confluence will save a draft of it, even if you were not able to successfully save the page or blog post, or add a title to it.

There are two ways to resume editing an unsaved page or blog post:

A. Using your drafts view. To resume editing a draft from this view:
   1. Go to your name (the ‘User’ menu) at the top of the page and choose Drafts.
   2. Click Resume Editing next to the appropriate draft to resume editing that draft.

   If you had not yet entered a page title, the draft will be listed with the title ‘Untitled’.

B. If you had created a new page or blog post but did not save it, then when you next add a page or blog post in that space, Confluence will ask you if you want to resume editing the page that was not saved. If you click resume editing, the draft and its unsaved content will be restored, allowing you to continue editing it.

Screenshot: Resume Editing

What happens if I am editing the draft of a page that has since been updated?

When this happens, Confluence will display a message informing you that you are editing an outdated page. If there are no conflicts between the two versions, Confluence will give you the option to Merge and Resume editing.

If there are any conflicts, Confluence will give you the option to View the Conflict or to Discard your changes.

Recording Change Comments

A ‘change comment’ is a short description that summarises the changes made to a page during an editing session. Change comments are a useful way of keeping track of the history of a page.

A change comment is not the same as a comment added to a page. Refer to Commenting on pages and blog posts for information about that type of comment.

Note that once a change comment has been added and the page has been saved, it is not possible to update or remove the change comment.
On this page:
- Entering a Change Comment
- Viewing a Change Comment
- Viewing a History of Change Comments
- Related Topics

Entering a Change Comment

You can enter change comments in the field located below the edit screen:

*Screenshot: Entering change comments*

Viewing a Change Comment

Once a comment has been added, it becomes visible in the view mode of the page, so that users are aware of the most recent changes made to a page. If a comment has been recorded, you will see a *show comment* link below the page title. Click the link to view the comment.

*Screenshot: The 'show comment' link*

The *hide comment* link allows you to hide the comment again, so that it does not distract you from the content of the page.

*Screenshot: The 'hide comment' link*

Viewing a History of Change Comments

The change comments for a page are recorded under the 'Recent Changes' section of the page's 'Info' view and in the page's 'History' view.

*Screenshot: History of change comments on Info view*
When you add a new page, you do not have to write the content from scratch. Instead, you can base your new page on a template. A template is a Confluence page with predefined content.

Some examples of where templates are useful:

- A software development project may have a template for use cases.
- A systems administration space may have a template for defining what information is kept about each server.

Global templates and space templates

In Confluence, there are two places to store your page templates:

- **Space templates**: These page templates are available in a specific space only. People who have space administrator permission can define templates via the space administration screen.
- **Global templates**: These page templates are available in every space on the site. People who have Confluence Administrator permission can define the global templates via the Confluence Administration Console.

Confluence administrators can also import predefined templates.
Creating a template

You can write your template using the Confluence rich text editor. You can also add special variables to the page, if you want to include fields that the author will complete when adding the page. See Adding a Template for more information.

Using a template

Templates are used only when adding a page. Once a page has been added, the template is no longer linked to the page. All further editing is performed as if the template was never used. Some plugins provide enhanced template functionality. You can search the Atlassian Marketplace for template add-ons.

See Creating a Page using a Template for more information.

Useful plugins

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

Extended template functionality:

- Scaffolding plugin
- Search the Atlassian Marketplace

Adding a Template

A template is a predefined page that can be used as a prototype when creating new pages. Templates are useful for giving pages a common style or format.

In Confluence, there are two places to store your page templates:

- **Space templates**: These page templates are available in a specific space only. People who have space administrator permission can define templates via the space administration screen.
- **Global templates**: These page templates are available in every space on the site. People who have Confluence Administrator permission can define the global templates via the Confluence Administration Console.

Adding a space template

Space templates are available in one space only.

To add a template for a space:
1. From any page in the space, choose **Browse > Templates**.
2. Choose **Add New Space Template**.

The 'Create Template' screen will appear. Add content as described below.

---

**On this page:**
- Adding a space template
- Adding a global template
- A template illustration
  - Using the template editor
  - The resulting form when the template contains variables
- Adding content to your template
  - Labels
  - Images and other attachments
  - Variables used as form fields
- Converting an existing page to a template
- Notes

**Related pages:**
- Creating a Page using a Template
- Working with Templates
- Working with Confluence Labels
- Working with Macros
- Using the Editor
- Confluence User's Guide

---

**Adding a global template**

Global templates are available in all spaces in your Confluence site.

**To add a global template:**

1. Choose **Browse > Confluence Admin**.
2. Enter your password if prompted.
3. Choose **Global Templates** in the left-hand panel.
4. Choose **Add New Global Template**.

The 'Create Template' screen will appear. Add content as described below.

---

**A template illustration**

Using the template editor

This illustration shows the template editor with an image, some text, styling, and variables.
The resulting form when the template contains variables

This screenshot shows the form displayed when someone creates a page based on the template containing the above variables. (See Creating a Page using a Template.)
Adding content to your template

Add a name for your template.

Enter text into the body of the template, and use the editor toolbar to apply styles, layout and formatting. You can add links and macros. In general, you can use the Confluence editor in the same way as on a page. In addition, you can add variables which will produce a form for data collection when someone adds a page based on the template.

Below are some points of special interest in templates.

Labels

Choose **Labels** to add one or more labels to the template. These labels will be included in all pages created using this template.

Images and other attachments

You cannot attach an image or other file to a template. Instead, attach the file to another page, and insert it into the body of the template.

For example:

- You can attach an image to a page and then choose **Insert > Image** to embed the image into the template.
- You can attach a PDF file to a page and then choose **Insert > Other Macros > PDF** to embed the PDF file into the template.
The image or other file type will be displayed on all pages created using this template. The file will not be attached to the pages, but will be referenced from the page that you first attached it to.

**Variables used as form fields**

You can add variables to your template, to act as form fields. When someone creates a page based on the template, Confluence will display a text entry box for each field. The user can enter data into each field, and the data is inserted onto the new page.

Every variable must have a unique name. If you add the same variable more than once in the same template, Confluence will make sure that they have the same value when the user saves the page. This is useful if you need the same information in more than one place in the page.

**To insert a variable into a template:**

1. Place your cursor on the template where you want the variable to appear.
2. Choose **$ Variables** from the editor toolbar.
3. Choose **Add New Variable**. Alternatively, you can choose the name of an existing variable if you want the same variable to appear more than once in the template.
4. Enter the variable name.
5. Press **Enter**. By default this will create a single-line text input field.
6. To change the variable type, click the variable placeholder. The variable's property panel will appear.

Choose one of the variable types: **Text**, **Multi-line Text**, or **List**. See [below](#) for a description of each type.

**Speeding up variable entry with autocomplete:** Type `$` and the variable name, then press Enter, to add a new variable or to select an existing variable from a list of suggestions. The suggestions are drawn from variables already defined in this template.

These are the types of variable available:

<table>
<thead>
<tr>
<th>Variable type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Creates a single-line text input field.</td>
</tr>
</tbody>
</table>

*Screenshot: A template variable called $purpose and its property panel*

This tutorial helps you to $purpose.
**Multi-line text**

Creates a text box that allows more than one line of text.

By default, the text area is 5 rows depth and 100 characters wide. You can change the size by typing over the digits in the variable property panel.

*Screenshot: A multi-line variable and its property panel*

---

**List**

Creates a dropdown list.

You must specify the values that will appear in the dropdown list. The values:

- Must be separated by commas.
- Can include letters, numbers, special characters, and spaces.
- Cannot include commas (except as the list separation character).

*Screenshot: A list variable and its property panel*

---

**Converting an existing page to a template**

If you would like to convert an existing page to a template, you can copy the content from the page and paste it into the rich text editor pane in the template editor. There is no automated way of doing this.

Please note the section above about images and other attachments in templates.

**Notes**

- You cannot insert variables via the 'Insert wiki markup' option in the editor toolbar.
- Templates are used only when adding a page. Once a page has been added, the template is no longer linked to the page. All further editing is performed as if the template was never used. Some plugins provide enhanced template functionality. You can search the Atlassian Marketplace for template add-ons.
- When you use a Table of Contents macro in a template, you will see an error when you preview the template itself. But the Table of Contents macro works on the pages that people create from the template – the table of contents shows up after they have saved the page. (This is probably because the template is not defined as a page, and the Table of Contents macro works for pages only.)
- The rich text editor for templates is available only in Confluence 4.3 and later. Please refer to the earlier documentation for a description of the wiki markup editor templates.

**Creating a Page using a Template**
You can create a page based on a global template (available to all spaces) or a space template (available only to that space). Before reading this page, make sure that someone has already created a template on your Confluence site.

**Information copied from the template to the page**

When you create a page based on a template, Confluence will copy the following content and information from the template to the new page:

- Labels
- Text and styles
- Layouts and formatting
- Macros
- Embedded images and other files. Note that you cannot attach an image or other file to a template. But if the template displays an image or file from another page, the new page will display that image or file too.

**Form fields displayed by the template**

If the template author included variables in the template, Confluence will display a form prompting you to supply values for the variables when you add the page. See screenshot below.

---

**On this page:**

- Information copied from the template to the page
- Form fields displayed by the template
- Using a template to create a page
- Notes

**Related pages:**

- Adding a Template
- Using the Editor
- Working with Confluence Labels
- Confluence User's Guide

---

**Using a template to create a page**

To create a page based on a template:

1. Do one of the following:
   - Go to the dashboard and click Add Page. Choose the space and the template you want to use.
   - Or go to any page in the space where you want to add a page. Choose Add > Page from template, then choose a template.
   - Or go to the space where you want to add a page, and choose Browse > Templates. Then choose Create page from template next to the template you want to use.
2. If the template contains variables, you will now see a form. Type the relevant information into the form fields, and choose Next.
3. Now you will see a new page based on the template. If you added information in the form fields, the page content will include that information.
4. Type a name for the page where you see 'New Page'.
5. Add more content or make any other changes required.
6. Choose Save.

Screenshot: Form showing template variables when creating a page from a template
Notes

Templates are used only when adding a page. Once a page has been added, the template is no longer linked to the page. All further editing is performed as if the template was never used. Some plugins provide enhanced template functionality. You can search the Atlassian Marketplace for template add-ons.

Editing a template

A template is a predefined page that can be used as a prototype when creating new pages. Templates are useful for giving pages a common style or format. This page is about changing an existing template.

Note: Templates are used only when adding a page. Once a page has been added, the template is no longer linked to the page. All further editing is performed as if the template was never used. Some plugins provide enhanced template functionality. You can search the Atlassian Marketplace for template add-ons.

In Confluence, there are two places to store your page templates:

- **Space templates:** These page templates are available in a specific space only. People who have space administrator permission can define templates via the space administration screen.
- **Global templates:** These page templates are available in every space on the site. People who have Confluence Administrator permission can define the global templates via the Confluence Administration Console.
1. Go to a page in the space, and choose **Browse > Templates**. A list of templates for the space is displayed.
2. Choose **Edit** next to the template that you want to modify.
3. Make changes, or add new content, as you would when adding a template.
4. Choose **Save**.

**To edit a global template:**

1. Choose **Browse > Confluence Admin**.
2. Choose **Global Templates** in the left-hand navigation panel. A list of templates for the Confluence site is displayed.
3. Choose **Edit** next to the template that you want to modify.
4. Make changes, or add new content, as you would when adding a template.
5. Choose **Save**.

**Removing a Template**

A template is a predefined page that can be used as a prototype when creating new pages. Templates are useful for giving pages a common style or format. This page is about deleting an existing template, at space level or at site (global) level.

Templates are used only when adding a page. Once a page has been added, the template is no longer linked to the page. You can therefore remove the template without affecting any existing pages.

You need to be a **space administrator** to remove a space template, and you need **Confluence Administrator permissions** to remove a global template.

**Note:** Deleted templates cannot be restored.

1. Go to a page in the space, and choose **Browse > Templates**. A list of templates for the space is displayed.
2. Choose **Remove** next to the template that you want to delete.
3. Confirm the deletion when prompted.

**To remove a global template:**

1. Choose **Browse > Confluence Admin**.
2. Choose **Global Templates** in the left-hand navigation panel. A list of templates for the Confluence site is displayed.
3. Choose **Remove** next to the template that you want to delete.
4. Confirm the deletion when prompted.

**Working with the Office Connector**
The Office Connector is bundled with Confluence 2.10 and later. It allows you to:

- Import an Office document into Confluence format
- Attach an Office document to a Confluence page and display its content in Confluence, without converting the content.
- Edit the attached document in the Office application, directly from the Confluence page.

Please be aware that source code is currently not available for the Confluence Office Connector.

Table of Contents

- Office Connector Prerequisites
- Displaying Office Files in Confluence
- Importing a Word Document into Confluence
- Editing an Office Document from Confluence
- Editing an Office Spreadsheet from Confluence
- Editing an Office Presentation from Confluence
- Installing the Firefox Add-On for the Office Connector

Related Topics

View File Macro
Configuring the Office Connector in the Confluence Administration Guide

Take me back to Confluence User's Guide

Office Connector Prerequisites

The page describes the software and setup you need to use the Office Connector.

Your System Administrator can enable or disable the Office Connector or parts of it. The Office Connector options can appear in different places on your Confluence page, depending on the themes and configuration of your Confluence site. Please refer to Configuring the Office Connector in the Confluence Administration Guide and discuss any configuration problems with your administrator.

On this page:

- Overall Prerequisites
- Prerequisites for Viewing Office and PDF Files in Confluence
- Prerequisites for Importing Office Documents into Confluence
- Prerequisites for Editing Office Files Directly From Confluence
- Related Topics

The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Overall Prerequisites

- Ensure that Java 5 (JDK 1.5) or higher is installed on your Confluence server.
- The WebDAV plugin must be enabled, because the Office Connector uses WebDAV to transfer information to and from Office documents. Note that the WebDAV plugin is bundled with Confluence, and can be enabled or disabled by the System Administrator. If necessary, refer to the instructions on enabling plugins and configuring the WebDAV options.
• Ensure that your Confluence server's base URL is set correctly. (Check it by going to the 'General Configuration' screen in the Confluence Administration Console, as described in [Configuring the Server Base URL](#).) When a user edits a wiki page in Word and then uploads the page back to the Confluence server, the base URL determines where the document will be saved. If the base URL is incorrect, the documents may be saved to a different Confluence server.

**Prerequisites for Viewing Office and PDF Files in Confluence**

If you want to use the View File macro, or to view Office files attached to a Confluence page, you need the setup described below.

**Browsers and Flash Player**

You can use any browser to view an Office file on a wiki page or attachment view, provided that you have installed Adobe Flash Player version 9 or later. You do not need to have an Office desktop application installed on your computer in order to view Office files in Confluence.

**File Types**

Confluence can display files compatible with Microsoft Office 97-2007, and PDF files, of the following types:

- .doc and .docx
- .xls and .xlsx
- .ppt and .pptx
- .pdf

**Prerequisites for Importing Office Documents into Confluence**

- Document import can import Microsoft Word documents of the file types .doc and .docx. These must be valid Word 97-2007 format documents.

**Prerequisites for Editing Office Files Directly From Confluence**

The Office Connector allows you to edit Office files embedded in a wiki page or from the page's attachments view.

To make use of these editing capabilities, you will need the setup described below.

**Browsers**

- If you are using Firefox, you will need to install a Firefox add-on. Firefox will prompt you to do this, the first time the add-on is required. You will find instructions in [Installing the Firefox Add-On for the Office Connector](#).
- **Note: No Chrome support.** Chrome does not support WEBDAV clients, so this feature will not work. Please refer to this issue for more information: CONF-23322.

**Office editors**

To edit Office files, you will need to have Microsoft Office or OpenOffice installed. (See the configuration matrix below.)

- If you are using Firefox, you can choose which of the above editors you want to use. The Firefox add-on allows you to configure this option for each file type. See [Installing the Firefox Add-On for the Office Connector](#).
- If you are using Internet Explorer, you will need Microsoft Office. You cannot edit Office files in OpenOffice when using Internet Explorer.
## Configuration matrix

You need one of the following software combinations to edit Office files from your wiki page:

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Office Version</th>
<th>Browser</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Windows 7, Windows Vista, or Windows XP with Service Pack 2 or 3</td>
<td>• OpenOffice 2.x – 3.x, or Microsoft Office XP, 2003, 2007 or 2010</td>
<td>• Internet Explorer 8.x – 9.x, or Firefox – latest stable version</td>
</tr>
<tr>
<td>• Mac OS X 10.5 and 10.6</td>
<td>• OpenOffice 2.x – 3.x</td>
<td>• Firefox – latest stable version</td>
</tr>
<tr>
<td></td>
<td>• The “Edit in Word” feature is known to work in OpenOffice 3.2.0.</td>
<td></td>
</tr>
<tr>
<td>• Linux</td>
<td>• OpenOffice 2.x – 3.x</td>
<td>• Firefox – latest stable version</td>
</tr>
<tr>
<td></td>
<td>The only known supported Office editor for Linux is OpenOffice. But in theory it should work with any WebDAV-aware application.</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring the Office Connector** in the Confluence Administration Guide

Take me back to Confluence User's Guide

### Displaying Office Files in Confluence

Confluence can display Office files that are attached to a page. If you have an Office application installed, you will also be able to edit these Office files in your Office application.

These are two of the ways that Confluence can interact with Office files. For an overview of all Office Connector features, please refer to Working with the Office Connector.

ℹ️ Your System Administrator can enable or disable the Office Connector or parts of it. The Office Connector options can appear in different places on your Confluence page, depending on the themes and configuration of your Confluence site. Please refer to Configuring the Office Connector in the Confluence Administration Guide and discuss any configuration problems with your administrator.
Prerequisites

If you want to use the View File macro, or to view Office files attached to a Confluence page, you need the setup described below.

Browsers and Flash Player

You can use any browser to view an Office file on a wiki page or attachment view, provided that you have installed Adobe Flash Player version 9 or later. You do not need to have an Office desktop application installed on your computer in order to view Office files in Confluence.

File Types

Confluence can display files compatible with Microsoft Office 97-2007, and PDF files, of the following types:

- .doc and .docx
- .xls and .xlsx
- .ppt and .pptx
- .pdf

Attaching and Displaying Office Files and PDF Files

There are two ways to do this in Confluence:

- Attach Office files to a page and display them in a Confluence page using the View File or Attachments macros.
- Attach an Office or PDF file to a page and embed its contents onto the page by simply dragging and dropping it into the editor window.

To attach and display Office files in Confluence using macros:

1. Attach the Office file(s) to a Confluence page:
   - View the Confluence page on which you want to display your document.
   - Choose Tools > Attachments.
   - Browse for your Office files and upload them to the Confluence page.
   - Refer to detailed instructions in Attaching Files to a Page.
2. Now you have two options for displaying the attached document:
   - You can embed the document into the Confluence page, using one of the Office Word, Office Excel, Office PowerPoint or View PDF macros. These macros can be found using the macro browser. Refer to the detailed instructions in the View File macro topic.
   - You can display a list of page attachments using the Attachments macro. People viewing the page will be able to click the View link to see the Office or PDF document in Confluence.

To attach and display an Office file on a Confluence page using 'drag and drop':

- Drag the Office file from your computer and drop it into the editor window. Only one file can be dragged and dropped at a time. The appropriate View File macro placeholder will appear in the position where you dragged the file. However, the contents of the file will be rendered in full when you preview, or save and...
view, the page.

Older browser versions require Google Gears to have been installed for you to use drag and drop. Refer to Using Drag-and-Drop in Confluence for information about setting up Google Gears.

**Viewing and Editing the Attached Office Files**

If an Office document is attached to a Confluence page, you can view the attached Office document from within Confluence. View the Office document in one of the following ways:

- Search for the Office document by file name, then click **View** next to the Office document on the Search results page. (See Searching Confluence.)
- View the list of attachments for a specific Confluence page, then click **View** next to the Office document on the Attachments page. (See Viewing Attachment Details.)
- View a list of attachments displayed on a page via the Attachments macro, then click **View** next to the Office document in the list of attachments. (See Displaying a List of Attachments.)
- View a Confluence page which has the Office document embedded in the page via the View File macro. (See View File Macro.)

Any Confluence user who has an Office application installed will also be able to launch their Office editor from within Confluence:

- Editing an Office Document from Confluence.
- Editing an Office Presentation from Confluence.
- Editing an Office Spreadsheet from Confluence.

**Troubleshooting**

Problems? Please refer to our guide to the Office Connector limitations and known issues.

Configuring the Office Connector in the Confluence Administration Guide

Take me back to the Confluence User's Guide.

**Importing a Word Document into Confluence**

The Office Connector in Confluence allows you to import a Word document into Confluence, so that the document's content is copied onto one or more Confluence pages.

This is just one of the ways Confluence can interact with Office documents. For an overview of all Office Connector features, please refer to Working with the Office Connector.

Your System Administrator can enable or disable the Office Connector or parts of it. The Office Connector options can appear in different places on your Confluence page, depending on the themes and configuration of your Confluence site. Please refer to Configuring the Office Connector in the Confluence Administration Guide and discuss any configuration problems with your administrator.

The simplest way to import a Word document is to import the entire content of the document into a single wiki page. By default, the content of the document will be created as a new wiki page.
More advanced options allow you to import the content into a new page, to split a single document into more than one wiki page, and to resolve conflicts in the titles of your pages.

These options are described below.

**Prerequisites**

Prerequisites for the Office Connector’s document import feature:

- Document import can import Microsoft Word documents of the file types `.doc` and `.docx`. These must be valid Word 97-2007 format documents.

For a full list of Office Connector prerequisites and limitations, please refer to:

- Office Connector Prerequisites
- Office Connector Limitations and Known Issues

---

**Importing a Word Document**

The simplest way to import a Word document is to import the entire content of the document into a single wiki page.

This method will replace any existing content on the wiki page.

To import a Word document onto a single wiki page:

1. Create a page in Confluence (see [Creating a Page](#)) or go to an existing page whose content you want replaced. View the page in view mode (not edit mode).
2. Choose **Tools > Import Word Document**.
3. Click **Browse** and find the Word document on your local drive or network.
4. Click the **Open** or **Upload** button provided by your browser. The path and file name of the document will now appear in the text box on the Office Connector import screen.
5. Click **Next** on the Office Connector import screen. The import document options screen will display.
6. The import document options are:
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Root page title</td>
<td>The title of the wiki page that will contain the information from your imported document.</td>
</tr>
<tr>
<td>Import as a new page in the current space</td>
<td>A new wiki page will be created with the page title specified above.</td>
</tr>
<tr>
<td>Replace <code>&lt;pagename&gt;</code></td>
<td>The contents of the existing page will be replaced.</td>
</tr>
<tr>
<td></td>
<td>The page will be renamed to the page title specified above.</td>
</tr>
<tr>
<td>Delete existing children of <code>&lt;pagename&gt;</code></td>
<td>The existing child pages of the page you are replacing will be deleted.</td>
</tr>
<tr>
<td>Rename imported pages if page name already exists</td>
<td>Assign new names to any new page which would otherwise have a duplicate name. The content of existing pages will remain unchanged.</td>
</tr>
<tr>
<td>Replace existing pages with imported pages of the same title</td>
<td>If imported pages have titles equal to existing pages, then the content of the Word document will overwrite the content on the existing page. Page history will be preserved.</td>
</tr>
<tr>
<td>Remove existing pages with the same title as imported pages</td>
<td>If imported pages have titles equal to existing pages, then the existing pages will be deleted. This will remove the page history as well as the content.</td>
</tr>
<tr>
<td>Split by heading</td>
<td>The content of the Word document will be split over multiple wiki pages. If you don't want to split your document into multiple wiki pages, leave the default Don't split option selected. For more information on splitting your document, please see below.</td>
</tr>
</tbody>
</table>

7. Click **Import**.

When the upload has finished, the content of the Word document will have been transformed into Confluence page content. You can now view and edit this page in the usual way. There is no connection between the original Word document and this wiki page.

**Screenshot: Empty page ready for import**

**Screenshot: Selecting Word document to import**
Splitting a Word Document into Multiple Wiki Pages

When importing a Word document, you can split a single document into more than one wiki page, based on the heading styles in the document.

By default, the page names will be the same as the heading text. This may result in a conflict, if a page already exists with the same title. You can instruct the importer how to handle such conflicts.

To import a Word document into multiple wiki pages:

1. Import a Word document as described above. On the import document options screen, choose how to split your document in the 'Split by heading' field:
   * 'Split by heading' — If you want to split the content under each heading in your document into separate child pages, select the desired heading level to split by. A preview of the page hierarchy that will be created by the split will be displayed under 'Document Outline'. Each bullet point in the 'Document Outline' represents a new page after import into Confluence.
2. Click 'Import' to import your document.
3. When the upload has finished, the content of the Word document will have been transformed into Confluence page content. You can now view and edit this page in the usual way. There is no connection between the original Word document and this wiki page.

Screenshot: Splitting a single Word document into multiple wiki pages

Editing an Office Document from Confluence

When viewing a wiki page that displays an attached Office document, you can launch your Office editor directly from Confluence. This allows you to edit a Word document from within Confluence and save it back to Confluence.

This is just one of the ways Confluence can interact with Office documents. For an overview of all Office Connector features, please refer to Working with the Office Connector.

Your System Administrator can enable or disable the Office Connector or parts of it. The Office Connector options can appear in different places on your Confluence page, depending on the themes and configuration of your Confluence site. Please refer to Configuring the Office Connector in the Confluence Administration Guide and discuss any configuration problems with your administrator.

On this page:

- Prerequisites for Editing an Attached Office Document

Prerequisites for Editing an Attached Office Document

The Office Connector allows you to edit Office files embedded in a wiki page or from the page's attachments view.

To make use of these editing capabilities, you will need the setup described below.

Browsers

- If you are using Firefox, you will need to install a Firefox add-on. Firefox will prompt you to do this, the first time the add-on is required. You will find instructions in Installing the Firefox Add-On for the Office Connector.

- Note: No Chrome support. Chrome does not support WEBDAV clients, so this feature will not work. Please refer to this issue for more information: CONF-23322.

Office editors
To edit Office files, you will need to have Microsoft Office or OpenOffice installed. (See the configuration matrix below.)

- If you are using Firefox, you can choose which of the above editors you want to use. The Firefox add-on allows you to configure this option for each file type. See Installing the Firefox Add-On for the Office Connector.
- If you are using Internet Explorer, you will need Microsoft Office. You cannot edit Office files in OpenOffice when using Internet Explorer.

### Configuration matrix

You need one of the following software combinations to edit Office files from your wiki page:

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Office Version</th>
<th>Browser</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Windows 7,</td>
<td>• <strong>OpenOffice</strong> 2.x – 3.x, or</td>
<td>• Internet Explorer 8.x – 9.x, or</td>
</tr>
<tr>
<td>• Windows Vista, or</td>
<td>• Microsoft Office XP, 2003, 2007</td>
<td>• Firefox – latest stable version</td>
</tr>
<tr>
<td>• Windows XP with Service Pack</td>
<td>or 2010</td>
<td></td>
</tr>
<tr>
<td>2 or 3</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Mac OS X 10.5 and 10.6</td>
<td>• <strong>OpenOffice</strong> 2.x – 3.x</td>
<td>• Firefox – latest stable version</td>
</tr>
<tr>
<td></td>
<td>• The &quot;Edit in Word&quot; feature is</td>
<td></td>
</tr>
<tr>
<td></td>
<td>known to work in <strong>OpenOffice</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>3.2 .0.</td>
<td></td>

</table>

### Editing an Office Document in your Office Application

To edit an Office document in your Office application:

1. There are two ways to do this:

   - **From an Office document embedded on a page:**
     a. Open a Confluence page with an Office document embedded on it.
     b. Move your mouse pointer to the top of the document embedded in the Confluence page, until the hidden title bar appears.
1. Click the title bar above the embedded document.

   - **From an Office document in a list of attachments:**
     - If an Office file is attached to a Confluence page, you can edit this file directly in your compatible Office application, in one of the following ways:
       - View the list of attachments for a specific Confluence page, then click **Edit** next to the Office file on the Attachments page. (See Viewing Attachment Details.)
       - View a list of attachments displayed on a page via the Attachments macro, then click **Edit** next to the Office file in the list of attachments. (See Displaying a List of Attachments.)

2. A window will pop up, asking you to confirm that you want to open this document.

   **Screenshot: Confirmation window in Firefox**
3. Click ‘OK’. Now you may be asked to log in to your Confluence server.

4. Enter your Confluence username and password, then click ‘OK’.

5. The Office document will open in your Office application.

6. Make the necessary changes, then save the document. It will be saved back into Confluence.

Troubleshooting

Problems? Please refer to our guide to the Office Connector limitations and known issues.

Installing the Firefox Add-On for the Office Connector

If you are using Firefox as your browser, you will need to install an add-on into Firefox (the Firefox WebDAV Launcher) in order to use some features of the Office Connector. You will be prompted to install the add-on the first time you try to use a function which requires it.

For an overview of all Office Connector features, please refer to Working with the Office Connector.

Note about supported web browsers: Please ensure that you are using one of the web browsers supported by Confluence. If you are using an unsupported browser or browser version, some features may not work correctly. You can find the list of supported web browsers and browser versions on this page: Supported Platforms.

Installing the Firefox Add-On

You will be prompted to install the add-on the first time you try to use a function which requires it. The add-on is required for editing a wiki page in Office, or for editing an Office document which is displayed on a wiki page.

1. When you choose an option which requires the Firefox add-on, you will see a popup window like this one:

2. Click ‘OK’. Some browsers may now ask you to confirm the download with a message bar across the top of the page, beneath the browser’s address bar.

   - You may see a message like the yellow bar shown here:

   Click ‘Allow’.

   - Or you may see a similar message with an ‘Edit Options’ button like this:
• If you see the above message, click ‘Edit Options’. You will then see an ‘Allowed Sites’ window like this one:

This window lets you tell Firefox that your Confluence server is allowed to install add-ons into Firefox. The ‘Address of web site’ box should already contain the address of your Confluence server.
• Click the ‘Allow’ button to add your Confluence server to the list.
• Go back to your Confluence page and try to edit your Office document again, e.g. by clicking ‘Edit in Word’ again. Now you will see the option to install the add-on.

3. A ‘Software Installation’ window will appear, asking you to confirm the installation. The window will look something like the one below, but the URL will be the address of your own Confluence server:
4. Click 'Install Now'. The installation will happen and a window will pop up asking you to restart Firefox:

5. Make sure you have saved all your Confluence pages and any other work in your browser, then restart Firefox.
6. If Firefox asks you to confirm the restart, confirm it.
7. Firefox will close all the browser windows and will then start up again. You will see a window confirming that a new add-on has been installed, like this:
Configuring the Add-On

After you have installed the add-on into Firefox, you will need to configure it. Basically, you will associate a desktop application (editor) with each relevant file type. This tells the Office Connector which application to launch when it encounters a link to an editable file. The configuration is slightly different for each operating system, as described below.

**Configuring the Add-On in Windows**

The add-on can will automatically configure itself on Windows via the system registry. The first time you edit a new file type, the add-on will look up the default editor for that file type and make that the permanent setting.

If you want to override the registry settings, or if for some reason the automatic configuration is not working, you can configure the Firefox add-on manually.

1. In Firefox, go to the **Tools** menu and select **WebDAV Launcher Options**, as shown in this screenshot:
1. A 'WebDAV Launcher Options' window will appear, allowing you to associate a specific file type (file extension) with a desktop application (editor). The window looks like this one:

![WebDAV Launcher Options Window](image1)

2. In the 'File Extension' box, enter the extension for a particular file type. For example, you may want to associate the 'doc' file extension with Microsoft Word 2003 or earlier. To do this, you would type 'doc' in the File Extension text box.

3. If you use or have recently upgraded to Office 2007

   ![if you use or have recently upgraded to Office 2007](image2)

   In addition to the original Office 2003 file extensions (that is, 'doc', 'ppt' and 'xls'), you should additionally configure the WebDAV launcher to handle the new Office 2007-specific file extensions for Microsoft Word ('docx'), Microsoft Excel ('xlsx') and PowerPoint ('pptx').

   Screenshot: Configuring the WebDAV Launcher - adding the 'doc' file extension.
4. Enter the 'Application Path' — Use one of the following methods to specify the associated application for editing the given file type:

- Click the 'Auto' button to load the associated application from the Windows registry.
- Alternatively, you can click the 'Browse' button to find the application on your computer.
- Or you can manually type in the path to the application's executable file.

Screenshot: Configuring the WebDAV Launcher - adding the 'Application Path' for the 'doc' file extension.
5. Click the ‘Add’ button. The file extension association will be added to the list. For example, in the picture below you can see that the 'doc' extension has been associated with 'C:\Program Files\Microsoft Office\OFFICE11\WINWORD.EXE'. This is the path to the Microsoft Word 2003 executable on a specific Windows machine.

Screenshot: Configuring the WebDAV Launcher - configuration of the ‘doc’ file extension complete.

### Configuring the Add-On in Mac OS X

The configuration procedure is similar to Windows, as shown above. Note that there is no ‘Auto’ button in Mac OS X.

### Configuring the Add-On in Linux

The only known supported Office editor for Linux is OpenOffice. (See Office Connector Prerequisites.)

There is no automatic configuration on Linux. You will need to associate each file type with your Office editor in Firefox. Note that there is no ‘Auto’ button in Linux.

The configuration procedure is similar to Windows, as shown above.

For both Ubuntu and OpenSUSE, the configuration will look something like this:

<table>
<thead>
<tr>
<th>File Extension</th>
<th>Application Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>C:\Program Files\Microsoft Office\OFFICE11\WINWORD.EXE</td>
</tr>
</tbody>
</table>
Security Risks

⚠️ Please be aware that there are security risks in installing this add-on to Firefox. Internet Explorer is exposed to the same risks, because it can directly open Office documents. By installing the add-in into Firefox, you are exposing Firefox to the same risks.

Summary of the risks:

- Office documents can contain macro viruses. Before opening an Office document, make sure that you trust the source of the document.
- There are known flaws in the Office file formats and Microsoft Office that an attacker can exploit to gain control of your machine. Microsoft has fixed the known exploits in the latest Service Packs for all Microsoft Office versions. But new exploitations may arise at any time. Again, be sure that you trust the source of a document before opening it.

The add-on tries to reduce the risk by supporting the following:

- **Same origin policy** — The add-on can only open documents from the same host that initiated the action.
- **Digital signature** — The add-on is digitally signed. When you install the add-on please verify that it is signed by **Benryan Software Inc.**

- **Prompt the user for confirmation** — You will always be warned before a file is opened. **Please read these warnings carefully before opening a file.** The warning tells you the complete URL of the file as well as the complete application path of the application opening the file.

Information about this Firefox Add-On

| Add-on name: | WebDAV Launcher |
Description: Adds the ability to launch a WebDAV URL directly in a WebDAV-aware client.

Latest version: See the WebDAV Launcher add-on page at Mozilla

Compatible with: All versions of Firefox, up to and including the latest stable version.

Author: Atlassian Pty Ltd

Importing Content Into Confluence

This page describes how to get text, pages, images and other content into Confluence, by converting the content from another storage format and importing it into the Confluence wiki.

Importing Content from Other Confluence Sites

For content originating from other instances of Confluence:

- If the Confluence major versions are the same, export the space from the originating Confluence site and import it into the destination Confluence site.
- If the Confluence major versions are different, you can use an intermediate server to migrate versions.

Page history, attachments, and page content will be preserved and you will be able to do multiple pages at once. The drawbacks are that it may be inconvenient if the Confluence versions differ, and you cannot have a duplicate space key on the destination instance. (You cannot import a space with the same space key as a space that already exists.)

On this page:

- Importing Content from Other Confluence Sites
- Importing Content from Other Wikis
- Importing Content from an Office Document
- Importing Web Content
- Importing Other Non-Wiki Content
- Note about Plugin Support

Related pages:

- Working with the Office Connector
- Confluence User's Guide
Importing Content from Other Wikis

Check whether the Universal Wiki Converter can import the content. See Importing Content from Another Wiki.

Importing Content from an Office Document

The Office Connector in Confluence allows you to import an Office document into Confluence, so that the document's content is copied onto one or more Confluence pages. See Importing a Word Document into Confluence.

Importing Web Content

Here are some options for importing or displaying web content on a Confluence page:

- Use the Widget Connector Macro to display videos, slide shows, twitter chats, documents and more, sourced from other web sites and displayed on your Confluence page.
- Convert a HTML file to a Confluence page using the HTML To Confluence Converter plugin.
- Embed an external web page into Confluence with the HTML Include macro.
- Use HTML code in a page with the HTML macro.

Importing Other Non-Wiki Content

Importing non-wiki markup into Confluence requires a conversion process:

- Text with basic formatting can be pasted directly into the editor. This includes simple Word documents or web pages.
- Files such as Microsoft Excel documents can be imported using a content converter plugin.
- Confluence pages saved to disk can be imported from disk.
- Files can be uploaded in bulk using the Confluence WebDav Plugin.
- Full featured customisation is available using the Confluence remote APIs.

Note about Plugin Support

Before installing a plugin into your Confluence site, please check the plugin’s information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

Importing Pages from Disk

Confluence allows you to import text files from a disk or a directory on the Confluence server, and convert them into Confluence pages. Each file will be imported as a Confluence page that has the same name as the file.

The information on this page does not apply to Confluence OnDemand.

The text file needs to contain Confluence wiki markup to be converted accurately into a Confluence page.
- You need to be logged in as a System Administrator to import text files.
- You can import pages from disk into global spaces, but not into personal spaces. Please see Working with Spaces for information about differences between global spaces and personal spaces.

To import text files:

1. Choose Browse > Space Admin.
   Note: 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
2. Click Import pages from disk in the left panel under 'Import'.
3. Type the directory's path into the Import directory box.
4. Select **Trim file extensions** to remove file extensions from the page titles when converting the files to Confluence pages. Note that the Confluence pages will take their titles from the files' names (including their extensions). So to avoid having page titles with a suffix like '.txt', make sure you check this box.

5. Select **Overwrite existing pages** if you want to replace existing Confluence pages with the same page title.

6. Click **Import**.

**Screenshot: Importing text files**

**Sharing Content**

Confluence provides a number of ways for you to notify other people about content that may be of interest to them:

- You can [share a page link](#) with them.
- You can [mention](#) a user when you write a page, blog post or comment. Mentioning a user automatically emails a notification to them about that content.
- You can [broadcast a message](#) that appears in Confluence activity streams.
- You can [like](#) a page, blog post or comment. The author will receive a notification. If enough people like the content, it will appear in the list of popular content on the dashboard and in the recommended updates email message.

Other users can also find out about changes to content in Confluence by [watching](#) pages and spaces.

You may also be interested in [exporting Confluence content](#) to other formats such as XML, HTML, Microsoft Word and PDF.

**Related pages:**

- Creating Content
- Managing Changes and Notifications and Tasks

- Confluence User's Guide

**Network Overview**

The 'network' feature provides notifications on the activity of users that you choose to follow. This compares with Confluence’s other [content tracking](#) features, which provide notifications on specified types of content updates, made by any user.

The types of activities tracked by the network feature include:

- Additions or edits to [pages](#) or [blog posts](#)
- [Comments](#) added to a page or blog post or edits to existing comments
- Updates to a user's [User Status Updates](#)
- Updates to a user's [User Profile](#)
Accessing Your Network View

To see your network view:

- Go to the 'Network' view for your user profile. To do this:
  - Go to your name (the 'User' menu) at the top of the page and choose Network.
  - You can also access your 'Network' view by clicking More in the 'Network' section of your Profile Sidebar.

You can access another user's Network view using the Hover Profile or from their Profile Sidebar.

Screenshot: Example of the Network view

Following Another User

You can follow another user by using either the Hover Profile or your Network view.

To follow a user with the Hover Profile:

1. Open the user's Hover Profile popup. To do this:
   a. Log in to Confluence, if you have not already done so.
To follow a user from your Network view:

1. Go to the 'Network' view for your user profile. To do this:
   - Go to your name (the 'User' menu) at the top of the page and choose **Network**.
     - You can also access your 'Network' view by clicking **More** in the 'Network' section of your Profile Sidebar.
   2. In the 'Following' section, at the right of the page, type the first few characters of the name (or username) of the user you wish to follow.
   3. Choose the user from the list of suggestions.
   4. Click **Follow** in the popup.

If you now refresh or revisit your Network view, the profile picture(s) of the user(s) you just followed will appear within the 'Following' list on the right. Additionally, their tracked activities will start appearing in the 'Recent Activity' list on this page.

Stop Following a User

To stop following a user by using the Hover Profile:

1. Open the user's Hover Profile popup. To do this:
   - Log in to Confluence, if you have not already done so.
   - Move your mouse pointer over a user's linked name or profile picture. Wait until the hover profile popup appears.
   2. Click **Stop Following** in the popup.

You can also stop following a user by going to their Profile view.

If you now refresh or revisit your Network view, the profile picture(s) of the user(s) you just stopped following are removed from the 'Following' list on the right. Additionally, their tracked activities will stop appearing in the 'Recent Activity' list on this page.

Notes

Once you are following a user, you can see their activity in a number of ways:

- Your Network view: your Network view shows all the tracked activities that you have permission to view for all the users that you are following. In the same way, people who follow you will be able to see all your Confluence-based activities on their network views, provided they have permission to view the content. See below for instructions on accessing your network view.
- RSS feeds: you can subscribe to any Confluence user's network RSS feed and receive summaries on the activities of other users they are following in their network. See **Subscribing to a Network RSS Feed**.
- Email notifications: you can request email notifications of any activity in your network. See **Subscribing to Email Notifications of Updates to Confluence Content**.

Note that it is not possible to stop another user from following you. If you are interested in the ability to block followers, please watch **CONF-16285** for updates on the feature request.

Take me back to the **Confluence User's Guide**.
Subscribing to a Network RSS Feed

You can create an RSS Feed from any user’s network view, allowing you to receive summaries on the activities of users they are following in their network. The types of activities tracked in these RSS feed summaries include:

- Additions or edits to pages or blog posts
- Comments added to a page or blog post or edits to existing comments
- Updates to a user’s User Status
- Updates to a user’s User Profile

To subscribe to a user's network RSS feed,

1. Locate the following icon, which is available from the top-right of:
   - The 'Recent activity of the users you are following’ section of your network page, or
   - The 'Activity of followed users’ section of another user's network page.
2. Copy and paste the icon's link into your RSS newsreader.
3. To have your newsreader log into Confluence, you can [add your username and password to the feed URL](http://confluence.atlassian.com/feeds/network.action?username=ggaskell&max=60&publicFeed=false&os_authType=basic&rssType=atom).

   Please note that if you do this, someone with access to your RSS newsreader configuration can read these Confluence authentication details.

Customising your Network RSS Feed

Currently, Confluence does not provide a user interface mechanism for customising your network RSS feed. However, you can modify the maximum number of results and type of content displayed in these feeds by directly editing the RSS feed link in your RSS newsreader.

To modify the maximum number of results displayed in your RSS feed,

1. Edit the RSS feed link in your RSS newsreader.
2. Change the value of the max parameter from its default value of 40 to a value of your choice.
   The following example shows this parameter-value combination highlighted in red:
   `http://confluence.atlassian.com/feeds/network.action?username=ggaskell&max=60&publicFeed=false&os_authType=basic&rssType=atom`
3. Save the modified link in your RSS newsreader.

To modify the type of content displayed in your RSS feed,

1. Edit the RSS feed link in your RSS newsreader.
2. Append the parameter `contentType` to the end of the link, followed by an equals sign (=) and then add the appropriate content type value of your choice:
   - USER_STATUS — restricts the RSS feed to user status updates.
   - PAGE — restricts the RSS feed to page additions or updates.
   - BLOG — restricts the RSS feed to blog post additions or updates.
   - ATTACHMENT — restricts the RSS feed to attachment additions or updates.
   - COMMENT — restricts the RSS feed to comment additions or updates.
   
   Content type values are case-sensitive and when editing the network RSS feed link, ensure that each parameter is separated from the other by an ampersand (&).
   The following example shows the content type parameter-value combination highlighted in red:
   `http://confluence.atlassian.com/feeds/network.action?username=ggaskell&max=40&publicFeed=false&os_authType=basic&rssType=atom&contentType=USER_STATUS`
3. Save the modified link in your RSS newsreader.
Filtering for more than one type of content (by adding multiple values to the `contentType` parameter) is not supported.

### Likes and Popular Content

Has someone written a good blog post or page on Confluence? Or has someone added a comment that you agree with? Click the **Like** button to let them know.

Confluence has like buttons on every page, blog post and comment. If enough people like a page or post, it will show on the dashboard’s ‘Popular’ tab. The information in the ‘Recommended Updates’ email message is based on the number of people who have liked the content.

#### Liking a page, blog post or comment

Click the **Like** button to let people know that you agree with or enjoy a page, blog post or comment. Click **Unlike** to remove your name from the list of people who like the content.

You can also see:

- Up to three names of people in your network who have most recently liked the content.
- A link showing the number of people who have liked the comment. For example, **19 people like this**. Click the link to see the names. At the top of the list are people in your network, sorted with the most recent likes first. Then follow other people, also sorted chronologically with the most recent first.

**On this page:**

- Liking a page, blog post or comment
- Effects of liking content
- Disabling the 'like' feature

**Related pages:**

- Dashboard
- Subscribing to Email Notifications of Updates to Confluence Content
- Network Overview

*Screenshot: The Like button at the bottom of a page and on comments*
Effects of liking content

When you like a page, blog post or comment:

- The author of the content receives a notification.
- People in your network receive a notification. They will receive the notification only if they do not already know about the content. Let's assume Arthur is in your network. Arthur will not receive a notification if:
  - Someone else in his network has already liked the content.
  - Arthur himself has already liked the content.
  - Arthur has already commented on it.
  - Arthur has already replied to the comment.
- If enough people like the content, it will appear on the 'Popular' tab of the dashboard.
- Similarly, if the content is popular enough it will appear in the 'Recommended Updates' summary sent out by email.

Disabling the 'like' feature

The functionality is provided by a plugin called the 'Confluence Like Plugin'. To remove the 'like' functionality from your site, you can disable the plugin. See Disabling or Enabling a Plugin.

Note: It is not currently possible to disable this feature in Confluence OnDemand. We are tracking this issue here: CONF-25469 - Authenticate to see issue details.

User Status Updates

The 'user status' feature allows any Confluence user to broadcast a short message, which other users can see on various activity streams in Confluence. These short messages could include:

- A description about what you are working on.
- A question you may want answered quickly.
• A hyperlink that you share immediately with other users.
• Any other message you may want to share quickly with other users.

Your 'Status Updates' view shows a history of updates you have made to your status. Your current status message is shown on your:

• Profile view
• Profile sidebar
• Hover profile

On this page:

• Setting or updating your status
• Viewing your status updates
• Clearing your current status
• Deleting a status update
• More about user status updates
• Disabling status updates

Related pages:

• User Profile Overview
• User Status List Macro
• Confluence User's Guide

Setting or updating your status

To set or update your status:

1. Log in to Confluence, if you have not already done so.
2. Go to your name (the 'User' menu) at the top of the page and choose Update Status. The 'What are you working on' dialog will open.
3. Enter a short message (140 characters maximum) that describes your current status or what you are working on.
4. Click Update to publish your new or updated status to the activity streams (mentioned above), your personal space sidebar, your profile page and your status updates page.

Screenshot: User status window

Viewing your status updates

To view your status updates:

• Go to the 'Status Updates' view for your user profile. To do this:

  1. Go to your name (the 'User' menu) at the top of the page and choose Status Updates.
You can also view another user's status by going to their profile.

**Screenshot: Status updates view**

**Clearing your current status**

You can clear your current status message using your profile or your status updates view.

Clearing a message is not the same as deleting it. If you clear a message, it is still shown in your status updates view until it is deleted.

**Using your Profile view...**

To clear your current status using your profile view:

1. Go to **your name** (the 'User' menu) at the top of the page and choose **Profile**.
2. Click **Clear** in the status message at the top of the page.

**Screenshot: Clearing your current status message using your profile view**

</tbody>
</table>

**Using your Status Updates view...**

To clear your current status using your status updates view:
1. Go to the 'Status Updates' view for your user profile. To do this:
   a. Go to your name (the 'User' menu) at the top of the page and choose Status Updates.
2. Click Clear in the status message at the top of the page.

Deleting a status update

To delete your current or a previous status message:

1. Go to the 'Status Updates' view for your user profile.
2. Click Delete next to the appropriate status message. Your status updates view will be refreshed and the message you deleted removed from the list.

More about user status updates

There are a number of activity streams in Confluence that show different types of status updates. These include:

- The 'Recently Updated' list on the Confluence Dashboard, which shows all status updates (when the All tab is selected).
- Your Network page, which shows the status updates of Confluence users you are following.
- The Network page of Confluence users who are following you, which shows your status updates.
- The Recently Updated and Recently Updated Dashboard macros, which shows all status updates (provided that these macros' space parameters have been set to '@all').
- Any Confluence user's 'Activity' section of their Profile Sidebar, which is available on all pages within their personal space and shows their status updates.

While activity streams show recent status updates, they may soon disappear from the end of the list as subsequent user activity items appear on these streams. However, you can view any Confluence user's current status message in the following areas:

- Their Hover Profile.
- The Profile section of their Profile Sidebar, which is available on all pages within their personal space.
- Their Profile page.

You can also view any Confluence user's entire history of User Status updates in their Status Updates page.

Disabling status updates

The functionality is provided by a plugin called 'User Status'. To remove the status updates functionality from your site, you can disable the plugin. See Disabling or Enabling a Plugin.

You can also control which users can and cannot use status updates with the global permissions. By default,
users will not have permission to use this feature. See Global Permissions Overview.

**Using Mentions**

You can mention a person in a special way that prompts Confluence to send that person an email notification. This is called an @mention. It works on Confluence pages, blog posts and comments.

When you save the page, Confluence sends an email message to the user letting them know that they have been mentioned on that page (if they have permission to view the page) with a link to the relevant page.

**Note:** Use the person's full name. The user mention feature recognises the full name only, not the username.

There are two ways to mention someone:

- The quickest way is to start typing '@' and the person's name, then choose from the suggestions that Confluence offers. This is called autocomplete.
- Alternatively, you can choose Insert > User Mention from the editor toolbar.

Each of these methods is described in more detail below.

**Using autocomplete to mention someone**

**To mention someone using '@':**

1. Edit the page.
2. Click where you want to insert a mention and type '@' and then the first few characters of the user's full name.
3. Choose the user's name from the list of suggestions.

**Screenshot: Autocomplete for mentions**

![Autocomplete for mentions](image)

**On this page:**

- Using autocomplete to mention someone
- Accessing the user mention option in the editor toolbar
- Notes

**Related pages:**

- Using the Editor
- Using Autocomplete
- Keyboard Shortcuts
- Confluence User's Guide

**Accessing the user mention option in the editor toolbar**
To add a user mention via the editor toolbar:

1. Edit the page.
2. Choose Insert > User Mention. Confluence will add an ‘@’ sign to the page, and display a dropdown list of suggested users for you to choose from.
3. Start typing the person's name, to refine the list of suggestions.
4. Choose the person from the list of names.

Screenshot: The user mention option in the editor toolbar

Notes

- **Seeing your mentions in the Confluence workbox.** The Confluence workbox displays all notifications collected from page watches, shares and mentions. See Managing Notifications in Confluence.
- **Disabling the user mention feature.** The functionality is provided by a plugin called the 'Confluence Mentions Plugin'. To remove the user mention functionality from your site, you can disable the plugin. See Disabling or Enabling a Plugin.
- **Mentioning groups.** It is not possible to mention a group and then have the email sent to the entire group. You can only mention individual users. There is a feature request to allow mentions for groups: CONF-23015 - Authenticate to see issue details

Emailing a Page

You can share a Confluence page or blog post by emailing a link to recipients of your choice. The recipients can be Confluence users or any email addresses.

To email a link to a Confluence page or blog post using the Share button:

1. Go to the page or blog post you wish to share.
2. Click Share at the top right of the page.
   Note: The Share button will not be visible if your Confluence administrator has not configured an outgoing mail server for your Confluence site. See Configuring a Server for Outgoing Mail.
3. Enter the name or username of a Confluence user or any email address. As you start typing a name or username, or when you have typed a valid email address, an autocomplete dropdown will appear.
4. Select the appropriate user or email address from the dropdown. You can add multiple recipients to the
list.
5. Enter an optional message into the Note box.
6. Click Share to send the link via email.

Screenshot: Sharing a page

To remove a recipient from the list, click the bin icon to the right of the recipient.

### Exporting Confluence Pages and Spaces to Other Formats

You can convert a part of, or the entire contents of a space to various formats, including Microsoft Word, HTML, PDF and XML. This is called 'exporting' the space.

**What would you like to do?**

- Exporting Confluence Pages and Spaces to HTML
- Exporting Confluence Pages and Spaces to PDF
- Exporting to a Word document
- Exporting Confluence Pages and Spaces to XML

**Related topics**

- Working with Spaces
- Confluence User's Guide

### Exporting Confluence Pages and Spaces to HTML

Confluence allows you to export part of, or the entire contents of, a space into a zipped archive of HTML files. This is useful if you want convert your space into a static website.

To use the space export functionality, you need 'Export Space' permission. See the guide to space permissions.
or contact a [space administrator](#) for more information.

To export pages to HTML:

1. Go to a page in the space and choose **Browse > Advanced**.
2. Click **HTML Export** in the left-hand panel. This option will only be visible if you have 'Export Space' permission.
3. Select the **Include Comments** check box if you want to include comments for the pages you are exporting.
4. Select the pages you want to export by selecting the check boxes in the tree view of pages displayed. By default, all pages are selected. You have the option to **Select All** or **Deselect All** pages.
   - If you select the check box of a page that contains one or more child or descendant pages, all of these child and descendant pages will also be selected. Similarly, if you clear the check box of such a page, all of its child and descendant pages will also be cleared. This provides a convenient method of exporting subtrees, for example, chapters or sections within a document.
5. Click **Export**. This will create a zipped archive of HTML files.
6. When the export process has finished, download the zipped archive as prompted and extract the files into a folder.

**Screenshot: Selecting pages to export**

![Export Space](#)

**Notes**

- Page attachments are placed in individual folders with names in the following format: `...\download\attachments\xxxxxx` where `xxxxxx` is the page ID of the page containing the attachments.
- By default, the 'Space Details' page is exported as `index.html` and displays the space's details as well as a list of all available pages within it.
- Blog posts are not included in the HTML export. See the feature request: [CONF-14684](#).

**Related Topics**

- Exporting Confluence Pages and Spaces to PDF
- Exporting Confluence Pages and Spaces to XML
Exporting Confluence Pages and Spaces to PDF
This page explains how you can export individual Confluence pages, entire spaces or selections of pages into a single PDF file.

On this page:
- Exporting Single Pages
- Exporting Multiple Pages or the Entire Space
- Customising the Appearance of PDF Exports
- Notes
- Related Topics

Exporting Single Pages
You can export a Confluence page to PDF. This option exports a single page and is available to all users who have permission to view the page:

- Go to a page in the space and choose Tools > Export to PDF. Follow the prompts to export the page.

Note that the export of a single page to PDF applies any PDF stylesheet customisations, but does not apply any PDF layout customisations. To make your PDF layout customisations apply to a single page exported to PDF, use the ’multiple page’ method described below to export that single page only. See Customising Exports to PDF.

Comments on the page are not exported to the PDF file.

Exporting Multiple Pages or the Entire Space
Using Confluence's space export functionality, you can convert multiple pages or an entire space to PDF.

To use the space export functionality, you need ’Export Space' permission. See the guide to space permissions or contact a space administrator for more information.

To export a space or selected pages to PDF:

1. Go to a page in the space and choose Browse > Advanced.
2. Click PDF Export in the left-hand panel. This option will only be visible if you have the ’Export Space’ permission.
3. Select the pages you want to export.
   - You have the option to Select All or Deselect All pages.
   - When you select a page, all its child pages will also be selected. Similarly, when you deselect a page all its child pages will also be deselected.
4. Click Export.
5. When the export process has finished, download and save the PDF file as prompted.
Customising the Appearance of PDF Exports

You can add a title page, a table of contents and customised headers and footers to the PDF output. For more advanced customisations, you can apply Cascading Style Sheet (CSS) modifications. These customisations are specific to each space. You need the ‘Space Administrator’ permission to be able to apply these customisations. For more information, see Customising Exports to PDF.

Notes

- Only image attachments that have been inserted into a page are included when exporting to PDF.
- To export a PDF containing international text, you need to install a Unicode font in Confluence.
- Blog posts are not included within the PDF export. If you like, you can vote for this feature request: CONF-5599.
- If you have ‘Space Administrator’ permissions, the link to customise the PDF Stylesheet is provided at the top of the page tree, as shown in the screenshot above.
- Confluence's PDF Export feature is designed to handle a wide variety of content. However, on rare occasions the PDF Export process may fail due to an unrecognised customisation. If that happens the PDF export screen will indicate the title of the page in which the problem occurred, to help you diagnose the cause of the failure.

- Exporting Confluence Pages and Spaces to XML

Take me back to the Confluence User's Guide.

Customising Exports to PDF

Confluence administrators and space administrators can customise the PDF exports for individual spaces.
Please take note of the following points:

- PDF customisations are unique to each space.
- Confluence's PDF customisations use a combination of HTML and CSS (Cascading Style Sheets).
- To achieve a particular requirement in the exported PDF file, you make changes in one or both of the following:
  - The PDF Layout, where HTML is used to define the structure of the exported content, including features such as the title page, headers and footers.
  - The PDF Stylesheet, where CSS is used to define the style of elements in the exported content, such as page size and margins, font, colour, and list numbering.

For further customisations, see the Advanced PDF Export Customisations page.

On this page:

- Customising the PDF Layout
  - Setting a global PDF layout
  - Setting the PDF layout at space level
- Customising the PDF Stylesheet
  - Setting a global PDF Stylesheet
  - Setting a space-level PDF stylesheet
- Example Customisations
  - Page Size
  - Page Orientation: Landscape or Portrait
  - Page Margins
  - Page Breaks
  - Title Page
  - Table of Contents
  - Headers and Footers
  - Page Numbering
  - Wrapping Long Words
  - General Formatting

Customising the PDF Layout

You can add your own HTML to customise the title page, page headers and page footers in the PDF output.

To customise the PDF Layout:

Setting a global PDF layout

1. Open the Confluence Admin screen.
2. Select Look and Feel > PDF Layout. The following screens allows you to enter HTML and CSS that will be rendered on the PDF title page, as well as page headers and footers.

Setting the PDF layout at space level

1. Choose Browse > Space Admin.
   *Note:* ‘Space Admin’ is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
2. Click PDF Layout in the ‘Look and Feel’ section of the left-hand panel.
3. Click Edit, and customise the HTML that generates the following areas in the exported PDF document:
   - PDF Space Export Title Page – title page.
   - PDF Space Export Header – page headers.
   - PDF Space Export Footer – page footers.
4. Enter your customisations into each text box as required. The PDF layout section accepts HTML code.
You can include inline CSS in the HTML too. Save your work.

Customising the PDF Stylesheet

You can adjust the appearance of the PDF pages by making CSS customisations in the PDF Stylesheet screen as required.

- To get started, you can download the default CSS rules of the PDF stylesheet: `confluencedefaultpdf.css`. Any rule defined in this file can be customised and added to the 'PDF Export Stylesheet' section.
- Your customisations override any default CSS rule.
- If no PDF customisations are defined in the PDF Stylesheet screen, the default CSS rules will be applied to your PDF exports. By default, the export does not include a title page, headers or footers.

To customise the PDF Stylesheet:

Setting a global PDF Stylesheet

1. Open the Confluence Admin screen.
2. Click Look and Feel > PDF Stylesheet. The following screen allows you to enter and save CSS code that will render content on each page.

Setting a space-level PDF stylesheet

1. Choose Browse > Space Admin. Note: 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
2. Click PDF Stylesheet in the left-hand panel. The 'PDF Export Stylesheet' section appears, showing the current contents of your PDF stylesheet. It contains all CSS rule customisations applied to the pages in the space.
3. Click Edit and enter your customisations into the text box as required. The PDF stylesheet section accepts Cascading Style Sheets (CSS) rules. Save your work.

Example Customisations

This section provides examples of typical customisations that you can add. See also Advanced PDF Customisations.

Page Size

The default page size is based on the locale of your Confluence server. For example, if this server is located in the US then the default paper size of your PDF export will be US Letter (8.5 inches wide by 11 inches long). If the server is located in Australia, the default paper size will be A4 (210 mm wide by 297 mm long). More information about paper sizes can be found on Wikipedia.

To modify the page size to A4, edit the PDF Stylesheet to add a size property to the CSS `@page` rule, like this:

```css
@page
{
/*The A4 paper size is 210 mm wide by 297 mm long*/
size: 210mm 297mm;
}
```

Page Orientation: Landscape or Portrait

To change the page orientation of your PDF document, simply reverse the order of the values declared in the `@page` rule's size property. The first and second values of this property represent the width and height of the page, respectively.
For example, to generate PDF space exports in A4-sized landscape orientation, your @page rule might look like this:

```css
@page
{
/*A4-sized pages in landscape orientation are 297 mm wide by 210 mm long*/
size: 297mm 210mm;
}
```

**Page Margins**

To set all margins to 15 mm, with a paper size of A4, edit the CSS @page rule in the PDF Stylesheet, like this:

```css
@page
{
size: 210mm 297mm;
margin: 15mm;
}
```

To set the margins independently, edit the @page rule as follows:

```css
@page
{
margin-top: 2.54cm;
margin-bottom: 2.54cm;
margin-left: 1.27cm;
margin-right: 1.27cm;
}
```

To set margins to provide a gutter for binding a printed document, use the :left and :right pseudo-classes, as follows:
CSS - PDF Stylesheet

```css
@page :left
{
  margin-left: 4cm;
  margin-right: 3cm;
}

@page :right
{
  margin-left: 3cm;
  margin-right: 4cm;
}

@page :first
{
  margin-top: 10cm /* Top margin on first page 10cm */
}
```

Note the use of the `.first` pseudo-class in the example above to define distinct margins for a cover or title page.

**Page Breaks**

By default, Confluence pages are exported without page breaks, so that shorter pages will appear on the same PDF page.

To make each Confluence page appear on a separate page in the PDF file, add the following rule in the PDF Stylesheet:

CSS - PDF Stylesheet

```css
.pagetitle
{
  page-break-before: always;
}
```

**Title Page**

You can add a title page to your PDF document by adding HTML to the Title Page section of the PDF Layout screen. The following example creates the title page and adds a title:

**HTML - PDF Layout: Title Page Section**

```html
<div class="fsTitlePage">
  <img src="/download/attachments/590719/titlepage.png" /> 
  <div class="fsTitle">Planning for Confluence 4.0</div> 
</div>
```

Use CSS rules in the PDF Stylesheet to control the appearance of the title page and the title text:
Adding an Image to the Title Page

In the example above, the title page includes an image called 'titlepage.png', centred in the middle of the page. The "590719" in the src attribute is the ID number of the page to which the image is attached.

Follow these instructions to include an image on your title page:

1. Attach the image to a Confluence page.
2. View the list of attachments on that page, then right-click the image and copy its location.
3. Paste the link into the appropriate src="" attribute in your PDF Stylesheet, as shown above.
4. Edit the image URL so that it is relative, by removing the first part of the URL before /download/....

Table of Contents

By default, a table of contents will be generated after the title page, or at the beginning of the PDF document if no title page is defined in the PDF Layout. To see the default CSS rules applied to the table of contents, download the default CSS rules (confluencedefaultpdf.css) and examine the specific rules with toc in their name.

To make changes to the appearance of the table of contents, define CSS rules in the PDF Stylesheet.

Disabling the Table of Contents

To prevent the table of contents from being generated in your PDF document, add the div.toc rule to the PDF Stylesheet and set its display property to none:

```css
CSS - PDF Stylesheet

div.toc
{
    display: none;
}
```

Changing the Leader Character in the Table of Contents

The leader character is used to link a heading in the table of contents with its page number. By default, the...
leader character is the '.' (dot) character. Leader values of dotted, solid and space are allowed. You can also use a string, for example leader(" . . ").

To change the leader character to a solid line, modify the leader() value on the content property of the CSS rule as follows:

```css
span.toclead:before
{
  content: leader(solid);
}
```

Headers and Footers

You can add headers and footers to your PDF pages using the 'Header' and 'Footer' sections of the PDF Layout screen. By default, headers and footers only apply to a space export and not to exports of single pages (however, see Advanced PDF Export Customisations). The following example adds a simple copyright notice.

```html
Copyright © 2011, Atlassian Pty Ltd.
```

Page Numbering

To add page numbering, you need to combine customised HTML in the PDF Layout with customised CSS in the PDF Stylesheet.

1. PDF Layout HTML: In the Footer section (or the Header section), use an empty span element with a unique ID, for example pageNum, to act as a place holder for the page number.

   ```html
   <span id="pageNum"/>
   ```

2. PDF Stylesheet CSS: Create the following CSS selector rule for the empty span:

   ```css
   #pageNum:before
   {
   content: counter(page);
   }
   ```

   Analysing the above CSS selector rule in more detail:
   - The #pageNum rule selects the HTML element with the specified ID of "pageNum", which is the span element we created for the header or footer.
- The :before part of the selector is a pseudo class that allows the insertion of content before the span element is processed.
- The counter(page) is a function that returns the current page number as its content.
- The content property tells the CSS processor that dynamic content (that is, an incrementing page number) is to be inserted at the span tag.

Wrapping Long Words

In order to break long words or words that are not separated by whitespace, add a selector to the PDF stylesheet containing the word-wrap property with a value of break-word:

CSS - PDF Stylesheet

```css
div {
  word-wrap: break-word;
}
```

General Formatting

You can use the stylesheet to customise the output of just about anything else that will influence the look and feel of the final document. This includes fonts, tables, line spacing, macros, etc. The export engine works directly from the HTML output produced by Confluence. Therefore, the first step in customising something is to find a selector for the HTML element produced by Confluence or the Confluence macro. Then add a CSS rule to the PDF stylesheet. Your customisation will appear in the PDF export.

Notes

- **Demotion of heading elements:** h1, h2, and so on. Due to the hierarchical manner in which a space is exported, Confluence will modify the heading elements to generate a uniform appearance for the entire space export. This means that headings will be demoted. This will affect the application of custom PDF Stylesheets. It is possible to calculate the amount by which a heading will be demoted in order to have the correct CSS styling applied. A heading will be demoted by the value of its depth in the export tree. A page at the first level will be demoted by 1 (all <h1> elements will become <h2> elements, and so on). A page at the second level will be demoted by 2, and so on.

- **Atlassian support for PDF customisation is limited.** We support the mechanism for customising the PDF layout with HTML and CSS, and we will help if the mechanism is broken or does not work as we say it should in our published examples. But, since custom HTML and CSS offer potentially limitless possibilities, Atlassian will not support issues that are caused by or related to PDF customisations.

Related Topics

**Advanced PDF Export Customisations**

This page provides information about 'advanced' PDF export customisations. These expand upon the regular customisations described in [Customising Exports to PDF](#)

⚠️ The information below is for advanced users. Customisations are not supported by Atlassian. Be aware that the advanced customisations described below require knowledge of certain parts of Confluence, and of CSS and HTML. This documentation is intended for advanced users. Some of the suggestions below are moderately complex, or irregular in nature. If you are having trouble understanding them we strongly suggest you ask an expert. We do not support any of the customisations described below. This means that the Atlassian support engineers will not be able to help you with these modifications.
Adding Headers and Footers to Single Page Exports

By default, custom headers and footers set up in the PDF Layout screen (see Customising Exports to PDF), only apply to space exports and not to exports of single pages. However, it is possible to add CSS rules to your PDF Stylesheet that produce headers and footers in single page exports as well as space exports.

For custom headers, define @top-left, @top-center and @top-right rules within your @page rule. These rules apply respectively to content that appears on the left-hand side, centre and right-hand side of your page's header area.

For custom footers, define @bottom-left, @bottom-center and @bottom-right rules within your @page rule.

For example, the following rules add a document title at the centre of the header and a page number at the centre of the footer:

```
CSS - PDF Stylesheet

@page {
    @top-center {
        content: "Document Title Goes Here";
        font-family: ConfluenceInstalledFont, Helvetica, Arial, sans-serif;
        font-size: 8pt;
    }
    @bottom-center {
        content: "Page " counter(page);
        font-family: ConfluenceInstalledFont, Helvetica, Arial, sans-serif;
        font-size: 8pt;
    }
    /* Any other page-specific rules */
}
```

Notes:

- The font-family and font-size properties ensure that the header and footer text is rendered in the same default font style used for the body text, based on the default CSS rules.
- It is not possible to use this method to insert images (stored as attachments within your Confluence instance) into the headers and footers of single page exports.
Adding Images to Headers and Footers

To insert an image into the header or footer, add HTML to the Header or Footer section of the PDF Layout screen.

The following example uses an HTML `img` element with `src` attribute to add an image to the left of the header. The `src` attribute refers to an image attached to a Confluence page. The image element is usually placed within a `div` element container.

```
<div style="margin-top:10mm">
  <img src="/download/attachments/12346/header-image.png"/>
</div>
```

In the example above, the header includes an image called 'header-image.png'. The "12346" in the `src` attribute is the ID number of the page to which the image is attached.

Follow these instructions to include an image on your page:

1. Attach the image to a Confluence page.
2. View the list of attachments on that page, then right-click the image and copy its location.
3. Paste the link into the appropriate `src` attribute in your PDF Stylesheet, as shown above.
4. Edit the image URL so that it is relative, by removing the first part of the URL before `/download/`.

Notes:

- This example uses an inline CSS property `margin-top` in the `style` attribute to force the image away from the top of the page by 10mm. This comes in handy when your header image is large enough to touch or spill over the top of the page.
- Likewise, for footers, you can use the `margin-bottom:XXmm` property to force an image away from the bottom of the page by ‘XX’ mm.
- Very large images can spill over into the body of a page or alter the position of text or other elements used within a header or footer. In such situations, it is recommended that you reduce the size of the image and then attach it to your Confluence page again. If you prefer to keep the image size and want to move the content lower instead, you can do so by configuring the `margin-top` properties in the @page CSS rule.
- By default, a header or footer image is aligned to the left-hand side of the page. However, you can align this image to the centre or right-hand side of a page by adding either the `text-align:center` or `text-align:right` properties to your `style` attribute. For example, to align the header image to the right-hand side of the page, your `style` attribute would look similar to this: `style="margin-top:10mm; text-align:right"`.

Incorporating Other Fonts

By default, Confluence provides Times New Roman, Helvetica or Courier fonts for use in PDF exports. You can use your own fonts for PDF exports by declaring them in a `@font-face` CSS rule in your PDF Stylesheet.

The following CSS rule example shows how to declare the Consolas font and apply it to some elements for your PDF export:
The font path specified in the CSS must be the path to the font on the Confluence server.

Adding a Dynamic Title to the Title Page

When you export an arbitrary set of pages from Confluence, you may like to have a corresponding title added to the cover (or title) page automatically. This can be done (in a somewhat irregular way) by using the top level item from the default table of contents as the title. This method relies on having the exported pages structured as sub-pages of the top-level page. In other words, the pages to be exported should consist of a page (at the top-level) and all of its child pages. The result is that the title that appears on the cover page changes depending on the top-level page that is used for the export.

The CSS below moves, and styles, the top-level TOC item for use as the title on the cover page, and turns off the leader and page number normally associated with this item in the TOC.
Hiding Text from the PDF Output

This section describes a way to hide text from your PDF export. In other words, you can have text on the Confluence page that will not appear in the PDF export.

There are three steps:

1. Follow the instructions to define the NoPrint user macro.
2. Use the NoPrint macro to mark some text on a Confluence page.
3. Add the following CSS to your PDF stylesheet to make the PDF export recognise the NoPrint macro:

CSS - PDF Stylesheet

```css
.noprint
{
  display: none;
}
```

Indexing

To obtain an index at the end of the exported PDF file, consider using the Scroll Wiki PDF Exporter plugin that is produced by K15t Software GmbH.
Notes

If styling is not working as expected, it is useful to look at the intermediary HTML source to which the CSS is applied. This intermediary HTML is created whenever you create an HTML export that contains multiple pages, and is stored in the temp directory in Confluence's home directory. For example:

```
<confluence-home>/temp/htmlexport-20110308-154047-1/export-intermediate-154047-2.html
```

Customising Exports to PDF

Creating PDF in Another Language

To export a Confluence page written in a language other than English, you need to install the necessary font for that language. This means that you need to upload the font file to Confluence, as described below.

Uploading a Font File to Confluence

1. Find the appropriate font file:
   - **Windows users:** All font files in Windows are stored in a directory called:
     ```
     C:\WINDOWS\Fonts
     ```
   - **Unix users:** All font files in Unix are stored in:
     ```
     /usr/share/fonts
     ```
   - Microsoft True Type core fonts such as Verdana can be downloaded from this page: [http://corefonts.sourceforge.net/](http://corefonts.sourceforge.net/)
2. Copy the font file into a temporary folder, for example a folder on your desktop.
3. Go to the 'PDF Export Language Support' screen in the Confluence Administration Console and upload the file you copied in step 2.
4. Click **Install**.

Notes

- The only font files supported are true type fonts and true type collections. The accepted file extensions are *.ttf and *.ttc.
- We recommend that you use Unicode font Verdana for correct character encoding and exporting to PDF.
- If the font file size is bigger than your current attachment size limit, you won't be able to upload it. Please increase the attachment size limit temporarily and re-upload again. An improvement of the error messaging is tracked at [CONF-24706](https://jira.atlassian.com/browse/CONF-24706) - Authenticate to see issue details.

Related Topics

Exporting Confluence Pages and Spaces to PDF

Exporting to a Word document

Confluence allows you to export a single page into a Word document. This is useful for emailing content to people who do not have access to Confluence.
Exporting a page to Word

You will require ‘Export Pages’ permission to export a page to a Word document. By default, this will create a Word document with the same name as the Confluence page.

To export a page to a Word document:

Go to the page and choose Tools > Export to Word.

Useful plugins

Before installing a plugin into your Confluence site, please check the plugin’s information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

This plugin provides extended functionality for exporting Confluence pages to Microsoft Word: Scroll Office.

Exporting Confluence Pages and Spaces to XML

Confluence allows you to export a part of, or the entire contents of, a space into a zipped archive of XML files.

This is useful if you want to make a backup of the space, export the space to another Confluence instance, or use the data from the space in another application. Please note that there are a few restrictions when Restoring a Space, and that huge spaces exported for backup-purposes may benefit from other means of backup. See Production Backup Strategy.

To export to XML, you will need ‘Export Space’ permission which is assigned by a space administrator. See Space Permissions or contact a space administrator for more information.

Site administrators can import a space from a zipped XML archive.

To export to XML:

1. Go to a page in the space and choose Browse > Advanced.
2. Click XML Export in the left-hand panel.
   This option will only be visible if you have ‘Export Space’ permission.
3. Select Include Comments if you want to include comments made on the pages you are exporting.
4. Select Backup Attachments if you want include the images and other files attached to the pages.
5. Select the pages you want to export. Select the relevant check boxes in the tree view of pages displayed.
   By default, all the pages are selected. If you select a page that has one or more child or descendant pages, all of these child and descendant pages will also be selected. Similarly, if you clear the check box of such a page, all of its child and descendant pages will also be cleared. This provides a convenient method of exporting subtrees, for example, chapters or sections within a document.
6. Click Export. This will create a zipped archive of XML files. When the export has finished, Confluence will offer you the option to download the zip file.

Screenshot: Exporting a space with administrator permissions
Notes

- If you are running Confluence behind Apache HTTP Server and are facing timeout errors, please consider creating the export directly from Tomcat, instead of going through Apache. This will speed up the process and prevent timeouts.
- If you have **Space Administrator** or **Confluence Administrator** permissions, you can export either **All pages** or those pages **Visible to you**. **All** exports all content in the space, including pages that are protected by page-level restrictions which will prevent you from viewing the pages themselves. This option is available only to space administrators and Confluence administrators. It allows you to make a complete and comprehensive export of a space for backup purposes. **Visible to you** exports only content you can see. This is the default option.

Commenting on pages and blog posts

A comment is a remark, question, or any other additional information you wish to add to a page or blog post. Comments are a means by which a people can interact with each other on the site.

You can add a comment to any page or blog post, provided that you have the 'Add Comments' permission in the space. You can also show that you agree with or enjoyed someone else's comment, by liking it.

Comments are displayed at the bottom of the page, below the page content. Comments in Confluence are displayed in one of two views, configured globally by a **site administrator**:

- **Threaded** – This view shows the comments in a hierarchy of responses. Each subsequent reply to a comment is indented to indicate the relationships between the comments.
- **Flat** – This view displays all the comments in a single list and does not indicate the relationships between comments.
Adding a comment

You can add a new comment, on pages and blog posts in Confluence. If the Confluence site displays comments are in threaded view, you can respond to previous comments too.

To add a comment, you need the 'Add Comments' permission which is assigned by a space administrator. See Space permissions or contact a space administrator for more information.

To add a new comment:

1. Choose Add > Comment from the top of the page, or click in the box next to your profile picture below the last comment.
2. Type in your comment.
3. Click Preview to see how your comment will appear.
4. By default, Watch this page is ticked. This means that you will start receiving notifications about this page. Remove the tick if you do not want to watch the page.
5. Click Save.

To respond to a comment:

1. Click Reply located below the text of a comment.
2. Type in your response.
3. Click Save.

Editing a comment

To add a comment, you need the 'Add Comments' permission which is assigned by a space administrator. See Space permissions or contact a space administrator for more information. Space administrators can edit all comments within their space. The date on a comment always indicates the time the comment was last edited.

To edit a comment:

1. Go to the comment and click Edit.
2. Make changes to the comment just as if you were adding a comment.
3. Click Save when you are finished.

Deleting a comment

To delete a comment from a page, you need the 'Remove Comments' permission which is assigned by a space administrator. See Space permissions or contact a space administrator for more information.

- It is not possible to delete all comments for a page simultaneously.
• **Note:** Deleted comments cannot be restored.

**To delete a comment:**

1. Go to the page that contains the comment.
2. Click **Remove** at the bottom of the comments box. This is only displayed if you have permission to remove comments for this page.

**Notes**

- You can choose **Tools > Watch** to receive an email notification whenever anyone edits the page or adds a comment to the page.
- Your **profile picture** will appear next to each comment that you have added. (This is true if your space uses the Confluence Default theme.)
- On blog posts only, an ‘Author’ lozenge will appear on any comments made by the original author of the post.
- Comments are not auto-saved. See feature request: [CONF-12978 - Authenticate](#) to see issue details

**Linking to Comments**

You can add a link to a comment by making use of the PermaLink associated with each comment.

---

**On this page:**

- To link to a comment from within Confluence
- To link to a comment from outside Confluence
- Related Topics

---

**To link to a comment from within Confluence**

1. Right-click on the Permalink icon located at the lower right of the comments box.
2. Select **Copy Link Location** from the pop-up menu.
3. Edit the page from which you want to link to the comment.
4. Click **Link** in the toolbar, and select the **Web Link** tab.
5. Paste the PermaLink into the address field.
6. Provide link text if required.

**To link to a comment from outside Confluence**

1. Right-click on the Permalink icon located at the lower right of the comments box.
2. Select **Copy Link Location** from the pop-up menu.
3. Use this URL to link to the comment from your web page.

Alternately, click on the Permalink icon and copy the URL displayed in the address bar of your browser.

---

ℹ️ The older method of linking to comments (used in Confluence 3.5.x and older) using just the commentid has been removed. If you would like to see it reinstated, please [visit this JIRA issue](#).

Printing Confluence Pages

You can print one or more Confluence pages:

- To print a single page, use your browser's 'Print' option.
- Confluence allows you to export a single page, a part of a space, or an entire space into a single PDF file. See [Exporting Confluence Pages and Spaces to PDF](#).

Managing Changes and Notifications and Tasks

Confluence provides several ways in which you can watch for changes to single pages, entire spaces, and all spaces on the site. You can also follow the updates made by specific people. You can only track updates to content that you have permission to see.

Personal tasks appear in the task-and-notification dialog, and you can assign team tasks via a task list on a page.

Making yourself a watcher of pages or spaces

You can 'watch' a page, blog post or space that you have permission to view. Confluence will then send you an email notification whenever someone adds or updates content on, or adds a comment to, that page or space. See:

- [Watching a Page or Blog Post](#)
- [Watching a Space](#)

If you have space administrator permissions, you can [manage watchers of pages and spaces](#).

Requesting other notifications

You can configure Confluence to send you various digest reports via email. See [Subscribing to Email Notifications of Updates to Confluence Content](#).

On this page:

- [Making yourself a watcher of pages or spaces](#)
- [Requesting other notifications](#)
- [Tracking updates by specific people](#)
- [Managing your notifications and tasks](#)
- [Using Confluence RSS feeds](#)

Related pages:

- [Page History and Page Comparison Views](#)

- [Contributors Macro](#)
- [Confluence User's Guide](#)
Tracking updates by specific people

You can also follow the activity of people who interest you (see Network Overview) and receive a notification when someone follows you (see Subscribing to Email Notifications of Updates to Confluence Content).

Managing your notifications and tasks

There are a few ways to manage notifications and tasks in Confluence:

- You can manage your email notification settings via the options in your user profile. See Subscribing to Email Notifications of Updates to Confluence Content.
- The Confluence workbox displays all notifications collected from Confluence page watches, shares and mentions. See Managing Notifications in Confluence.
- You can manage your personal tasks in the Confluence workbox, and also create a list of tasks on a page. See Managing Tasks in Confluence.

Using Confluence RSS feeds

You can build RSS feeds to monitor content changes in Confluence.

- Create a customised RSS feed using the RSS Feed Builder.
- Subscribe to one of the pre-specified feeds generated by Confluence.

Watching a Page or Blog Post

You can 'watch' a Confluence page, blog post or space. Confluence will then send you a notification by email whenever anyone updates the watched content.

You will receive email notifications for:

- Edits (unless the user clears the Notify watchers check box).
- Deletions.
- Attachments, including new versions or deletions of an existing attachment.
- Comments, including new comments, edits of existing comments or deletions of existing comments.

By default, Confluence will assign you as a watcher of any page or blog post that you create or edit. This behaviour is called ‘autowatch’. You can control autowatch.

There is no daily digest for email notifications. You will receive an email notification every time someone makes a change.

You will not receive email notifications for content changes due to the output of a macro, because the page content itself has not been edited.

You need 'View' permission for the page, blog post or space to receive notifications.

On this page:

- Watching a Page or Blog Post
- Setting Autowatch and Other Notification Options
- Watching an Entire Space
- Watching for New Blog Posts
- Managing Watches from your User Profile
- Managing Watches from the Email Message
- Related Topics

Watching a Page or Blog Post

To start watching a page or blog post:
1. Go to the page or blog post.
2. Choose **Tools > Watch.**

**To stop watching a page or blog post:**

1. Go to the page or blog post.
2. Choose **Tools > Stop watching.**

**Setting Autowatch and Other Notification Options**

By default, Confluence will assign you as a watcher of any page or blog post that you create or edit. This behaviour is called 'autowatch'. You can turn autowatch on or off, and set other notification options, in the email settings section of your user profile. See [Setting User Settings](#).

**Watching an Entire Space**

You can choose to watch all the pages and blog posts in a given space. See [Watching a Space](#).

**Watching for New Blog Posts**

You can choose to watch for:

- New blog posts in a given space. See [Watching a Space](#).
- All new blog posts in the Confluence site. See [Subscribing to Email Notifications of Updates to Confluence Content](#).

**Managing Watches from your User Profile**

The 'Watches' page in your user profile displays a list of all pages and spaces you are currently watching.

**To manage your watches:**

1. Go to the 'Watches' view for your user profile, as follows:
   - Go to your name (the 'user' menu) at the top of the page and choose **Watches.**
2. Click the envelope icon next any unwanted watches to turn them off.

**Managing Watches from the Email Message**

The email notifications that you receive from Confluence have some useful links at the bottom of the email message. The links in each message vary, depending on the context. In general, the links allow you to view the page online, reply to a comment, and so on. In particular with respect to setting your notification preferences, you will see one or more of the following links:

- **Stop watching page** – Click this link to stop watching the page that triggered the email notification.
- **Stop watching space** – Click this link to stop watching the space that triggered the email notification.
- **Stop following this user** – Click this link to stop following the user whose update triggered the email notification.
- **Manage Notifications** – Click this link to go to the email settings page in your user profile.

*Screenshot: Email notification footer showing links*

Managing Changes and Notifications and Tasks
Updating Email Address

Take me back to Confluence User's Guide

Watching a Space

You can 'watch' a Confluence page, blog post or space. Confluence will then send you a notification by email whenever anyone updates the watched content.

You will receive email notifications for:

- Edits (unless the user clears the Notify watchers check box).
- Deletions.
- Attachments, including new versions or deletions of an existing attachment.
- Comments, including new comments, edits of existing comments or deletions of existing comments.

By default, Confluence will assign you as a watcher of any page or blog post that you create or edit. This behaviour is called 'autowatch'. You can control autowatch.

There is no daily digest for email notifications. You will receive an email notification every time someone makes a change.

You will not receive email notifications for content changes due to the output of a macro, because the page content itself has not been edited.

You need 'View' permission for the page, blog post or space to receive notifications.

On this page:

- Watching an Entire Space
- Watching for New Blog Posts in a Space
- Watching all Spaces on the Site
- Managing Watches from your User Profile
- Managing Watches from the Email Message
- Related Topics

Watching an Entire Space

Watch a space if you want to receive notifications of updates to any content in the space.

To start watching a space:

1. Go to a page in the space and choose Browse > Advanced.
2. In the left-hand panel, click Start watching this space (or Start watching all content).

To stop watching a space:
1. Go to a page in the space and choose Browse > Advanced.
2. In the left-hand panel, click Stop watching this space.

Watching for New Blog Posts in a Space

You can choose to receive a notification whenever someone adds a blog post in the space. You will not receive notification of updates to or deletions of blog posts, nor of comments on the blog posts.

Hint: By default, the option is labelled Start watching space blogs. If you are already watching the entire space, the wording will change to Only watch space blogs. If you choose that option, you will no longer be watching the entire space.

To start watching for new blog posts in a space:
1. Go to a page in the space and choose Browse > Advanced.
2. In the left-hand panel, click Start watching space blogs (or Only watch space blogs).

To stop watching for new blog posts in a space:
1. Go to a page in the space and choose Browse > Advanced.
2. In the left-hand panel, click Stop watching space blogs.

Watching all Spaces on the Site

You can receive notifications about changes to the content of pages, blog posts and comments from across all spaces on a Confluence site.

To start watching for content changes across the whole site:
1. Go to your name (the 'User' menu) at the top of the page and choose Settings.
2. Click Email in the left-hand panel.
3. Click Edit and select Subscribe to daily updates.
4. Click Submit.

Managing Watches from your User Profile

The 'Watches' page in your user profile displays a list of all pages and spaces you are currently watching.

To manage your watches:
1. Go to the 'Watches' view for your user profile, as follows:
   - Go to your name (the 'user' menu) at the top of the page and choose Watches.
2. Click the envelope icon next any unwanted watches to turn them off.

Managing Watches from the Email Message

The email notifications that you receive from Confluence have some useful links at the bottom of the email message. The links in each message vary, depending on the context. In general, the links allow you to view the page online, reply to a comment, and so on. In particular with respect to setting your notification preferences, you will see one or more of the following links:

- Stop watching page – Click this link to stop watching the page that triggered the email notification.
- Stop watching space – Click this link to stop watching the space that triggered the email notification.
- **Stop following this user** – Click this link to stop following the user whose update triggered the email notification.
- **Manage Notifications** – Click this link to go to the email settings page in your user profile.

**Managing Watchers**

If you are a space administrator for a space, you can manage the watchers for all pages and blog posts in that space. This means that you can:

- View a list of the watchers of a page/blog post.
- View a list of the watchers of the space for that page/blog post.
- Add users as watchers of the page/blog post.
- Remove existing watchers of the page/blog post.

ℹ️ *It is not possible to remove watchers of the space.*

**To manage your watchers for a page/blog post:**

1. Navigate to the page or blog post for which you want to manage the watchers. Note, you must be a space administrator for the space that the page is in.
2. Choose **Tools > Manage Watchers**. The 'Manage Watchers' screen will be displayed (see screenshot below). The left-hand column of the 'Manage Watchers' screen will contain the users watching the page/blog post, the right-hand column will contain the users watching the space.
   - To remove an existing page watcher, click the icon (trash can) next to the user's name.
   - To add a user as a watcher of the page, type in the box and choose the user's name from the list.
3. Click **Done** to save your changes.

**Screenshot: Managing Watchers**
Subscribing to Email Notifications of Updates to Confluence Content

You can 'watch' a page, blog post or space. Confluence will then send you a notification by email whenever anyone adds or updates content on that page or space. You can also subscribe to daily email reports and other notifications of various updates, as described below.

You will only receive notifications for content that you have permission to view. Users that have been disabled by an administrator will not receive email notifications.

Subscribing to email notifications

You can subscribe to the following email summary reports:

- A daily report of updates to all spaces that you have permission to view.
- An immediate report of all blog posts added or changed, in all spaces that you have permission to view.
- An immediate report of all updates made by the people you are following, in all spaces that you have permission to view.
- An immediate report when someone follows you.
- A daily or weekly report of recommended updates, in all spaces that you have permission to view.

To edit your email notification settings:

1. Go to your name (the 'User' menu) at the top of the page and choose Settings.
2. Click Email in the left-hand panel.
3. Click Edit.
Below is an explanation of all the email settings is explained below.

<table>

• This affects all subscriptions set. | (Not applicable) |
| **Show changed content** | **Option:** Do you want your notifications to include details of the changes made to the content?  
• If you do not select this option, your notifications will include the full content of the page.  
• If you do select this option, your notifications will include the full content of the page as well as a list of the differences between the current and previous versions of the page. See Page History and Page Comparison Views. | • Edits to pages and blog posts. | (Not applicable) |
| Subscribe to recommended updates | Receive an email message showing the top content that is relevant to you. How do you set the frequency of the mail message? A link in the email message allows you to choose daily or weekly notifications. How do you enable and disable the notification? You can turn off the notification by clicking a link in the email message. You can also turn the notification on or off by setting the ‘Subscribe to recommended updates’ option in your user profile. | Confluence chooses the content to display, based on:  
- Pages and blog posts that people have recently liked.  
- Pages and blog posts that people have recently commented on.  
- Pages and blog posts that have recently been created.  
‘Recent’ means any activity that occurred since the last recommended updates message was sent to you. The activities are listed in order of popularity, with the most popular at the top. Likes, comments and content creations are scored equally. Activity that involves people in your network ranks higher than activity not involving your network. Content in your favourite spaces also ranks higher than content in other spaces. The recommended updates summary does not include any content that you created yourself, and it gives a lower ranking to content that you have participated in, for example by adding a comment or updating the page. If there is no activity to report, Confluence will not send the email message. | Daily (weekdays at 1pm) or weekly |

**Notes for administrators**  
- To enable Confluence to send email notifications, a System Administrator must configure an email server. See [Configuring a Server for Outgoing Mail](#).  
- Confluence Administrators can set the default options for the recommended updates notification. Choose...
Subscribing to RSS Feeds within Confluence

RSS feeds allow you to track updates to content within Confluence. You will need an RSS newsreader to subscribe to them.

On this page:
- Confluence RSS Feeds
- RSS Newsreaders
- Removing an RSS Feed
- Related Topics

Confluence RSS Feeds

You can create a customised RSS feed using the RSS Feed Builder or subscribe to one of the pre-specified feeds generated by Confluence.

What would you like to do?
- Create and subscribe to customised RSS feeds using the RSS Feed Builder — create a customised RSS feed (e.g. filter your feed using a label; specify the number of items and days to include in your feed; etc.)
- Subscribe to pre-specified RSS feeds — generate an RSS feed automatically in a minimal number of steps.
- Subscribe to a feed of any Confluence user's network to track the activities of users they are following in their network.

RSS Newsreaders

The following are some popular RSS newsreader programs for various operating systems. You can find a more comprehensive list on Google's open directory.

Windows
- SharpReader
- NewsGator
- Syndirella
- FeedDemon
- NewzCrawler

Mac OS X
- Safari
- NetNewsWire
- NewsFire
- Shrook

Multi-Platform
- NewsMonster (Runs in the Mozilla web browser)
- Radio Userland (Windows and MacOS)
- AmphetaDesk (Windows, Unix, Mac OS X)

Removing an RSS Feed
There is no need to try to delete or remove an RSS feed built by the Confluence RSS feed builder.

Explanation: The feeds generated by the RSS Feed Builder are dynamically generated via the parameters included in the feed URL (address). For example, take a look at the following feed URL:

```
http://confluence.atlassian.com/createrssfeed.action?types=page&sort=modified&showContent=true...
```

The above feed URL will generate a list of pages ('types=page'), sorted by the modification date and showing the page content. The feed is generated at the time when the URL is fetched and there is no RSS feed information stored on the database. For that reason, there is no need to remove anything.

RSS Feed Macro

Using pre-specified RSS feeds

If you want to customise your Confluence RSS feed (e.g. use a label to filter your feed), use the RSS Feed builder instead.

To subscribe to RSS feeds generated by Confluence, for a particular space:

1. Choose Browse > Advanced from the dropdown list. The 'Advanced' screen will appear.
2. Click on RSS Feeds in the left-hand column.
3. Copy and paste the link for one of the following feeds into your RSS newsreader:
   - Pages
   - News
   - Mail
   - Comments
   - Attachments
   - All content

To subscribe to RSS feeds generated by Confluence, for a particular page (where available):

1. Locate the following icon, which is available in the top-right corner of certain pages:
2. Copy and paste the icon's link into your RSS newsreader.

RSS Feed Macro

Using the RSS Feed Builder
Using the RSS feed builder, you can create customised RSS feeds to subscribe to changes within Confluence.

Wondering what an RSS feed is? See more information about RSS Feeds.
Building an RSS Feed

Follow the steps below to build your feed, choosing the type of content and the time period you want to monitor.

To create a customised RSS feed:

1. Choose Browse > Feed Builder.
2. Select the content types you want in your feed. Check Mail if you want to know when the email archive is updated. (See the overview of mail archives in Confluence.)
3. Select one or more spaces from the list.
4. Click Advanced Options to set the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feed Name</td>
<td>The default name is based on the name of your Confluence installation, e.g. 'Extranet RSS Feed'</td>
</tr>
<tr>
<td>With these labels</td>
<td>Enter one or more labels separated by spaces or commas. Confluence returns all content (of the selected types) that matches one or more of the labels. See the hint below about using labels to customise your feeds.</td>
</tr>
<tr>
<td>Exclude these spaces</td>
<td>Exclude specific spaces from those already selected.</td>
</tr>
<tr>
<td>Sorted by</td>
<td>Sort content by either the date or creation or the date they were last updated.</td>
</tr>
<tr>
<td>Limit to</td>
<td>Specify the number of items returned in your feed.</td>
</tr>
<tr>
<td>Within the last</td>
<td>Specify how old items returned can be.</td>
</tr>
<tr>
<td>Include content for pages</td>
<td>Specify whether the entire page is displayed in the feed.</td>
</tr>
</tbody>
</table>

5. Click Create RSS Feed to create your feed.
6. Drag or copy the link into your RSS reader.

Tip: Try building separate feeds, one for pages only and one that includes comments as well. This allows you to monitor only pages if you are short of time, and to read the comments when you have more time.

Hint: Using Labels to Customise your Feed

You can use the RSS feed builder to track updates to labelled pages and comments on those pages. Here is an idea for customising your RSS feed by using your own personal label(s). This is useful if you want to track updates to specific pages or blog posts, and you do not want to deal with emails. You can use this method as an
alternative to watching pages.

- Build an RSS feed that returns pages, blog posts and comments labelled with a personal label, such as 'my:feed'.
- Each time you want to 'watch' a page, just label it with 'my:feed'.
- All updates and comments will automatically come through your RSS feed.

**Notes**

- **Removing an RSS feed**: You need only delete the RSS feed link built by the Confluence RSS feed builder to remove an RSS feed from your page. This is because the feed is dynamically generated using the parameters in the feed URL.

- **Feed authentication options**: Confluence can offer you the option of an anonymous feed or a feed that requires authentication.
  - An **anonymous** feed will show only the content that is visible to anonymous users. The feed URL does not contain the &os_authType parameter mentioned below. This feed is useful only if your Confluence site allows anonymous access. If a feed is anonymous, you only get anonymously-viewable content in the feed regardless of whether you are a Confluence user or not.
  - An **authenticated** feed requires you to log in to Confluence before you can retrieve the content. The feed URL contains the following parameter: &os_authType=basic.
  - The option to choose between an anonymous and an authenticated feed is currently not available on the feed builder screen. The feed builder offers only authenticated feeds. See [CONF-21601](#) for details and a workaround.

Take me back to [Confluence User's Guide](#)

**Working with RSS Feeds**

An RSS feed is a format for delivering summaries of regularly changing web content. Subscribing to an RSS feed allows you to stay informed of the latest content from sites that you are interested in.

RSS isn't designed to be read in a regular web browser. Specialised RSS newsreader programs can check RSS files every so often, and tell you what's new on a site. Your reader may be on a website, an addon to your browser, part of your email program, or a stand-alone program.

Confluence works with RSS in two ways:

- Confluence generates its own RSS feeds for tracking updates to content within Confluence. You will need an RSS reader which can grab the RSS feeds from Confluence and display them for you.
- Confluence's [RSS macro](#) allows you to display the contents of RSS feeds on a Confluence page. The feeds may come from a Confluence feed generator or from external sites. In this way, Confluence can act as an RSS reader.

For a technical description of RSS, read [Mark Pilgrim's "What is RSS?" article](#) on XML.com.

- [Displaying content from RSS feeds on a Confluence page](#)
- [Managing Changes and Notifications and Tasks](#)

Take me back to [Confluence User's Guide](#)

**RSS Readers Compatibility**
Due to some users having problems with Confluence RSS Feeds, some research was done with several RSS Feed Readers. RSS Feeds have been created through the feed builder and tested on a Windows machine. For each feed reader they have been tested with both authentication and public access, checking for the visibility of content, icons and images. The results are in the tables below:

**Feeds with authentication**

<table>
<thead>
<tr>
<th>RSS Feed Reader</th>
<th>Content</th>
<th>Icons</th>
<th>Images</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>RssReader 1.0.880</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>

| Google Reader             | ✓       | ✓     | ✓      | • Simple online feed reader  
|                           |         |       |        | • Shows the entire page                                             |
| Yahoo                     | ❌       | ❌     | ❌      | • Error message: Invalid URL format                                |
Managing Notifications in Confluence

This page is about the notification-and-task dialog, known as the Confluence ‘workbox’, which drops down when you choose the icon in the Confluence page header.

Do you want to manage your notification email messages instead? See Subscribing to Email Notifications of Updates to Confluence Content.

Managing your notifications in the Confluence workbox

The workbox displays all notifications collected from Confluence page watches, shares and mentions. You can view your notifications and convert them to personal tasks. Use the inline actions to reply to comments, like a comment or page, or watch a page. Follow the links in a notification to open the relevant page or blog post.

The workbox displays your notifications and your personal tasks in separate tabs.

To manage your notifications:

1. Choose the notification-and-task icon in the Confluence page header.
   - You can use the keyboard shortcut: Type g then n. (When in the Confluence editor, click outside the editor pane before pressing the keyboard shortcut keys.)
   - The icon above shows that you have 3 unread notifications.

2. Choose the notifications icon:

3. Choose a notification from the list, to see the notification details. Now you can do the following:
   - Choose a link or Open to open the related page, blog post, or comment. The page will open in a new tab in your browser.
   - Choose Like or Unlike to let people know that you like, or have stopped liking, a page, blog post, or comment.
   - Choose Watch or Stop Watching to receive notifications, or stop receiving notifications, about a page or blog post.
   - Choose Reply to respond to a comment inline, within the workbox.
   - Choose the ‘add task’ icon to flag a notification as a task. The notification will remain in the notification list too.
Which notifications are included?

The workbox displays a notification when someone does one of the following in Confluence:

- Shares a page or blog post with you.
- Mentions you in a page, blog post or comment.
- Comments on a page or blog post that you are watching.
- Likes a page or blog post that you are watching.

The workbox does not show notifications triggered because you are watching a space. Only watches on pages and blog posts are relevant here.

Keyboard shortcuts
### Key

<table>
<thead>
<tr>
<th>Key</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>g</strong> then <strong>n</strong></td>
<td>Open the Confluence workbox.</td>
</tr>
<tr>
<td><strong>j</strong></td>
<td>Move down to the next entry in the notification list.</td>
</tr>
<tr>
<td><strong>k</strong></td>
<td>Move up to the previous entry in the notification list.</td>
</tr>
<tr>
<td><strong>n</strong></td>
<td>Move down to the next notification for a particular page or blog post.</td>
</tr>
<tr>
<td><strong>p</strong></td>
<td>Move up to the previous notification for a particular page or blog post.</td>
</tr>
<tr>
<td>Enter</td>
<td>Open the selected notification.</td>
</tr>
<tr>
<td><strong>u</strong></td>
<td>Return to the notification list after opening a particular notification.</td>
</tr>
</tbody>
</table>

**Note:** The keyboard shortcuts are available for notifications only, not for tasks, inside the Confluence workbox.

### Managing notifications with Confluence mobile

You can view and respond to your notifications on your phone or other mobile device too. See [Using Confluence on a Mobile Device](#) for more about mobile platforms.

![Confluence Mobile](image)

**Notes**

- Read notifications are automatically deleted after 2 weeks.
- Unread notifications are automatically deleted after 4 weeks.
- You cannot delete your notifications yourself.

- The notification-and-task dialog is not available in clustered environments. The plugin will be installed and enabled, but it will detect that the site is in clustered mode and will not display the dialog.
- The notification-and-task dialog is provided by a set of plugins. To remove the personal notifications and tasks functionality from your site, you can disable the following plugins. See [Disabling or Enabling a Plugin](#) for instructions. Disabling these plugins will disable the entire notification-and-task dialog. It is not possible to disable only tasks or only notifications:
  - Notifications and Tasks - Common Plugin
  - Notifications and Tasks - Host Plugin
  - Notifications and Tasks - Confluence Provider Plugin
- If you want to re-enable the plugins, do so in the following order: Common Plugin, Host Plugin,
There is no option to disable the notification-and-task dialog for an individual user.

Managing Tasks in Confluence

You can manage your personal tasks in the notification-and-task dialog, known as the Confluence 'workbox', which drops down when you choose the icon 📝 in the Confluence page header.

You can also create a list of tasks on a page, and assign them to your colleagues via @mention. Changes made in the workbox are reflected in the task list on the page, and changes made on the page are reflected in the workbox too.

Creating personal tasks and having tasks assigned to you

There are a few ways that you and other people can assign tasks to you:

- You can add a personal task via the workbox.
- You can add a notification to your task list, via the notification workbox. This is useful if you want to get back to it later.
- Someone can assign you a task from a task list on a Confluence page.
- Other Confluence actions may create a task for you. For example, your Confluence site may be running a plugin that creates and assigns tasks.

Managing your personal tasks in the workbox

The workbox displays your notifications and your personal tasks in separate tabs. The task tab shows the tasks assigned to you. When you update a task that originated in a task list on a page, the update is reflected in the task list too.

Screenshot: Your personal tasks in the workbox
To manage your tasks:

1. Choose the notification-and-task icon in the Confluence page header.
   - You can use the keyboard shortcut: Type `g` then `n`. (When in the Confluence editor, click outside the editor pane before pressing the keyboard shortcut keys.)
   - The icon above shows that you have 3 unread notifications.

2. Choose the personal tasks icon:

3. To add a task and assign it to yourself, type the task summary in the text box and choose Add task.

4. To prioritise tasks, drag and drop them into your chosen order. (Click a task, hold down your mouse button to drag the task into position, then release the mouse button.)

5. To complete a task, or mark it as incomplete, choose the check box next to the task.

6. To add notes to a task and see further information (for example, a related page) choose the task item.
   The task details dialog will open.

Adding your notifications to your task list

You can flag a notification as a task. This is useful if you want to take action on the notification later.

To add a notification to your task list:

1. Choose the task and notification icon in the Confluence page header.
   - You can use the keyboard shortcut: Type `g` then `n`. (When in the Confluence editor, click outside the editor pane before pressing the keyboard shortcut keys.)
   - The icon above shows that you have 3 unread notifications.
2. Choose the notifications icon:

3. Choose the notification that you want to add to your task list. The notification details dialog will open.

4. Choose the 'add task' icon to add this notification to your tasks. The notification will remain in the notification list too.

See Managing Notifications in Confluence for a full description of notifications.

Creating task lists and managing tasks on a page

Task lists on a page are useful for assigning and managing tasks in a team.

To add a task list on a page:

1. Edit the page.

2. Choose the task-list icon in the editor toolbar, or press [ and then ] on your keyboard.

3. Type the description of the task.

4. If you want to assign a task to someone, type '@' and the person's name in the task description. (For more information about @mentions, see Using Mentions.) That person will receive a notification, and the task will appear in their personal task list in the workbox. If you @mention yourself, the task will appear in your personal task list.

5. To end the list, press Enter twice.

Managing tasks on a page:

- When viewing a page, you and other viewers can mark tasks as complete or incomplete. Updates to a task on the page will be transferred to the workbox too. (See above.)
- To be able to update a task list when in view mode, you need permission to edit the page:
  - You need the 'Create page' permission in the space. See Space Permissions Overview.
  - There must not be any page restrictions that prevent you from editing the page. See Page Restrictions.

What if the update fails?

This section describes what you should do if Confluence displays an error message saying that your change to a task list could not be saved. The cause is probably one of the following:

- Your session has expired. Resolution: Log in and update the task list again.
- You do not have permission to update the task list. **Resolution:** Check your permissions. You need 'Create page' permission in the space. Please check also that there are no page restrictions that prevent you from editing the page.
- The network is down. **Resolution:** Please try again when the network is available.

**Screenshot: A task list on a page**

Managing tasks with Confluence mobile

You can view and manage your tasks on your phone or other mobile device too. See [Using Confluence on a Mobile Device](#) for more about mobile platforms.

1. Open the flyout menu
2. Choose "Tasks"
3. Add a task
4. Select a task
5. Add notes or complete a task

**Notes**

- The notification-and-task dialog is not available in clustered environments. The plugin will be installed and enabled, but it will detect that the site is in clustered mode and will not display the dialog.
- The notification-and-task dialog is provided by a set of plugins. To remove the personal notifications and tasks functionality from your site, you can disable the following plugins. See [Disabling or Enabling a Plugin](#) for instructions. Disabling these plugins will disable the entire notification-and-task dialog. It is not possible to disable only tasks or only notifications:
  - Notifications and Tasks - Common Plugin
  - Notifications and Tasks - Host Plugin
  - Notifications and Tasks - Confluence Provider Plugin
- If you want to re-enable the plugins, do so in the following order: Common Plugin, Host Plugin,
Confluence Provider Plugin.

- There is no option to disable the notification-and-task dialog for an individual user.
- Completed tasks in the workbox are automatically deleted after 7 days.
- You cannot disable the functionality that provides task lists on a page.

**Searching Confluence**

Quick guide to searching in Confluence:

1. Use the search box at the top right of your Confluence screen. It offers you a quick navigation aid as well as a full site search.

   ![Search Box](image)

2. You can search Confluence directly from your browser's search box. Just add your Confluence site as a search provider using the dropdown menu in your browser's search box.

3. While editing a page or a blog post, you can find and replace text on the page. See [Using the Editor](#).

---

**Using the Quick Navigation Aid**

The quick navigation aid automatically offers a dropdown list of pages and other items, matched by title to your search query. You can select one of the offered items or ignore them altogether.

**To use the quick navigation aid:**

1. Start typing your query into the search box located at the top right-hand corner of every screen.
   Confluence matches titles as you type, showing a quickly-adjusting dropdown list of pages, blog posts, personal profiles, attachments and so on.
   🔄 Press the Enter key if you want to bypass the quick navigation aid and perform a full search, as described [below](#).
2. To see the space to which an item belongs, let your mouse pointer hover over the item in the dropdown list.
3. Use the up- and down-arrows on your keyboard to move up and down the list of matching titles and select an item.
4. Press the Enter key to open the selected item.
5. If you do not find what you are looking for, click **Search for** at the bottom of the list to do a full search.
   This has the same effect as pressing Enter immediately after typing your search query. The full search is described [below](#).

   **Screenshot:** The quick navigation aid showing titles matching the query 'con'
Here is more information about how the quick navigation feature works:

- Confluence will truncate any titles that are too long to be displayed.
- The matching items are grouped by content type so that you can quickly find the type you want. Confluence shows a maximum of 6 pages and/or blog posts, 2 attachments, 3 people and 2 spaces. If no matches are found in a particular category, then that category does not appear in the list.
- Items are ordered with the most recent updates first.
- When the matching item is a person's name, their profile picture appears next to their name in the list.
- The part of the title that is matched by the search query is highlighted in bold text.
- Your Confluence Administrator can enable or disable the quick navigation feature using the Confluence Administration Console.

Performing a Full Search

When you perform a full search, Confluence will search all content in all spaces (global and personal), mail, personal profiles, attachments and the space description. The results will appear on a new screen.

For the developers

The rendering of search results in Confluence is pluggable. If you are a developer, you may wish to write your own search result renderer to change how the search results are displayed. For more information, please refer to the following developer document: Writing a search result renderer.

To use the full search:

1. Type your query into the search box located at the top right-hand corner of every screen (or type it into the text box at the top of the Search screen).
2. Press the Enter key. (This means that you will ignore the dropdown list of titles offered by Confluence’s quick navigation aid, described above.)
3. The Search screen appears, as shown below. If any Confluence pages or items match your search query, the Search screen shows a list of the matching items.
4. Click an item’s title to open the Confluence page or other item.
On the left of the screen you will see a text block for each item that matched the search criteria, with the following information for each item:

- An icon representing the content type (user profile, space, page, blog post, etc). See [Icons Used in Confluence](#).
- The title or name of the content item.
- For attachments: The size and type of file, with a link to download or view the attachment where relevant. See information on [viewing Office attachments](#) below.
- For image files: A thumbnail of the image will display to the right of the file name.
- The most relevant few lines of content from within the item. Any words that match your search query are highlighted within the content.
- For personal profile items: The email address.
- The space to which the item belongs, displayed on the last line of the item's text block.
- The date when the content item was last modified.

You will see only search results which you have permission to view.

On the right of the screen are further options which allow you to tailor or filter your search results. See [below](#).

**Viewing Attached Office Documents**

When the search results include an attached Office document, you will see a View link as shown in the screen snippet below.

*Screenshot: Search results include an attached Office document with 'View' link*
Click the View link to view the content of the Office document within Confluence. If you have an Office application installed, you will also be able to launch your Office editor from within Confluence. See Displaying Office Files in Confluence and Working with the Office Connector.

Accepting 'Did you mean' Suggestions from Confluence

When you perform a full Confluence search, as described above, Confluence may offer you an alternative spelling of your search query. The alternative spelling will appear next to the words 'Did you mean', as shown in the example below.

To accept an alternative spelling suggestion:

1. Type your query into the search box.
2. Press the Enter key.
3. Confluence will analyse the wiki content, to determine whether an alternative spelling of your search query occurs more often in the wiki content. If this is the case, the words 'Did you mean' will appear on the screen, along with an alternative spelling for your search query.
4. If you want to try the alternative spelling, click the word showing the suggested spelling. In the example below, you would click confluence.

Screenshot: The Search screen with 'Did you mean' offering a corrected spelling
Here is more information about how the 'Did you mean' feature works:

- Confluence uses both a dictionary (bundled with Confluence) and words mined from the content on your system to work out the best alternative spellings of your search terms. Practically, this means that Confluence can provide spelling corrections for specialised jargon that may not appear in a standard dictionary. In general, when deciding between alternative spellings, Confluence will favour words that appear more often in your content.
- In some cases, the 'Did you mean' suggestion may appear even when there are Confluence pages, etc, which match your search query. In other cases, there will be no items which match your search criteria. In both cases, Confluence will offer a 'Did you mean' suggestion if there is a word which will help you find more relevant content.
- The 'Did you mean' feature may offer more than one suggestion.
- The 'Did you mean' suggestion may even offer an incorrect spelling. This would happen if the incorrect spelling occurs many times within your Confluence site. This is intentional, because the aim of the 'Did you mean' feature is to help you find content, not to correct your spelling.
- Your Confluence Administrator can enable or disable the 'Did you mean' feature using the Confluence Administration Console.

Filtering your Search Results

The Search screen, pictured above, appears when you do your first search. By default, Confluence will search all content across your Confluence site, including all spaces, mail archives, attachments and all other content types.

On the right of the screen are options which allow you to tailor or filter the search results.

Enter your filter criteria as described below, then click Filter.

- **Where** — Restrict your search results to a particular space, or to your favourite spaces, global spaces or personal spaces.
- **What** — Restrict your search results to a particular content type (pages, blog posts, mail, etc).
- **When** — Restrict your search results to content modified within a particular period of time (today, yesterday, within the last week or within the last month).
- **Who** — Restrict your search results to content last modified by a particular user. You can start typing the person's username or part of their name into the text box as follows:
  - Type the username (e.g. 'jsmith').
  - Or start typing the person's first name (e.g. 'john')
  - Or their last name (e.g. 'smith').
  - Or another part of their name, such as a middle name.
Confluence will offer you a list of possible matches. Use your mouse to select the person you want, then press the Enter key to filter the search results.
More information about the user-matching filter:

- The user-matching filter is **not** case sensitive. You can enter upper or lower case letters and will receive the same results.
- When looking for users to match the name you entered, Confluence divides a person's name into logical units corresponding to first name, middle name (one or more) and last name. It matches the letters of each unit in the name you entered against the letters of each unit in the user directory. For example, you can enter 'jo sm' to look for John Smith. The search is triggered after you have entered at least two letters.
- For each part of the name, you need to enter at least two letters. For example, if you enter just 'john s', the filter will look for users called 'john' and will ignore the 's'. Similarly, if you enter 'j smith' you will see everyone with the name 'smith' even if their first name does not start with a 'j'.
- You are not forced to use the auto-complete list. You can just type 'jsmith' or 'jo sm' and filter on that without choosing a match from the dropdown list. Confluence will warn you if there is more than one user corresponding to the name you have entered.

Click **Clear Filter** if you want to remove all your filters and perform the same search again but without the filter.

### Search Options When Using the Documentation Theme

When using the Documentation theme, the Confluence search offers a few options as described below.

#### Using the search box at the top right of the page:

- By default, the main Confluence search is configured to search the entire Confluence site.
  - You will see the words **Search Confluence** in the search box at top right of the page.
  - The Confluence search will look for matches in the entire Confluence site. This is the default behaviour for other themes too.
- A space administrator can configure the Documentation theme to restrict the search to the current space.
  - You will see the words **Search this space** in the search box at top right of the page.
  - The search will return results from the current space only.
  - You can override the search restriction. Enter `all:` and your search term to search the entire site. For example, enter the following into the search box at top right of the page to search the entire site for 'technical writing':

```
all: technical writing
```

#### Using the search box in the left-hand panel:

- By default, the Documentation theme's left-hand panel includes a search box. Enter your search term there, to restrict the search to the current space. Specifically, this will search only the pages that are
children of the space's home page.

- If your administrator has restricted the main search to the current space, there will not be a search box in the left-hand panel.

For screenshots and a full description, see Using the Documentation Theme.

**Advanced Search Syntax**

See Confluence Search Syntax for more ways to refine the text you enter into the search box.

Additionally, see Confluence Search Fields for special parameters you can use in the search box to search on various metadata.

**Browsing Related Labels**

Also on the right of the Search screen, Confluence will offer a list of labels which are related to your search query. See the screenshot above.

You can click a label to see all pages and blog posts tagged with that label. See Viewing Labels and Labelled Content.

**Searching the Content of Attachments**

When you search Confluence, by default the search will include the content of the following types of attachments:

- Word
- Text
- PowerPoint
- Excel
- PDF
- HTML

To search the content of other attachment types, you will need to use an attachment content extractor plugin. For more information, take a look at the following:

- Existing extractor plugins which you can install on your Confluence site.
- Guidelines on developing your own attachment content extractor plugin.

**Searching Confluence from your Browser's Search Box**

If you are using Firefox or Internet Explorer 7 or later, you can add your Confluence site as a search provider, using the dropdown menu next to the browser's search box.

The example below shows the 'Extranet' Confluence site offered for inclusion as a search engine in the browser's search box.

*Screenshot: Adding your Confluence site to your browser's search box*
Information about OpenSearch:

- Confluence supports the autodiscovery part of the OpenSearch standard, by supplying an OpenSearch description document. This is an XML file that describes the web interface provided by Confluence's search function.
- Any client applications that support OpenSearch will be able to add Confluence to their list of search engines.
- Your Confluence Administrator can enable or disable the Open Search feature using the Confluence Administration Console.

Text Tokenisation and Filtering

When searching for content based on search terms entered by the user, Confluence splits the text of the content into tokens, and then filters and modifies those tokens according to the following rules.

Tokenisation

Confluence uses Lucene’s Standard Tokenizer. This splits the text into tokens as follows:

- Splits words at punctuation characters, removing punctuation. However, a dot that's not followed by white space is considered part of a token.
- Splits words at hyphens, unless there's a number in the token, in which case the whole token is interpreted as a product number and is not split.
- Recognises email addresses and internet host names as one token.

An example: The string 'foo-bar5' won't be split into 'foo' and 'bar5', so a search for 'bar5' or 'bar*' will not find any results.

Filtering
Confluence then:

- Removes "s" from the ends of words.
- Removes the dots from acronyms, e.g. I.B.M. becomes IBM.
- Converts everything to lower case.
- Removes common words like 'the' and 'or' are removed.
- Converts words to their stems. For example, 'fishing' and 'fishes' both become 'fish'.

Related Topics

Searching Confluence

Searching the People Directory

The people directory displays a list of people who use your Confluence site.

The people directory includes anybody who has logged into Confluence or who has had a user account created for them in Confluence. The people directory does not include users who can log into Confluence using external user management if they have never yet logged in.

Viewing the People Directory

Choose Browse > People Directory.

The Confluence administrator can hide the people directory. If it is hidden, you will not see the People Directory link in the Browse menu.

Screenshot: The People Directory

Searching for People

To search for a particular person, type their first name and/or last name into the search box and click Search.

- To search everyone who uses your Confluence site, click All People.
• To search just those people who have set up a personal space, click People with Personal Spaces.

**Following People’s Activities**

Confluence’s network features allow you to 'follow' (that is, keep track of) other people’s activities throughout a Confluence site. For more information, please refer to Network Overview. Using the hover profile feature, the people directory is a convenient area from which you can start following other people throughout your Confluence site.

• To start following another person’s activities, move your mouse over a user’s name or profile picture and in their hover profile popup, click Follow.
• To stop following another person’s activities, move your mouse over a user’s name or profile picture and in their hover profile popup, click Stop Following.

Once you start following another person, their activities will start appearing in your network view.

**People Directory provides hCard microformat**

The people directory uses the hCard microformat for simple integration with a variety of microformat-enabled tools. hCard is an open data format for representing people, companies, organisations, and places. Read more about microformats and hCard.

**Confluence Search Syntax**

Here’s how you can refine your search. Confluence will ignore common words like "the" unless you place your query within quotes.

**Exact phrase search**

To search for content that contains the exact phrase "chalk and cheese"

"chalk and cheese"

Confluence will ignore common words (stop words) like "and" above. This is the default list of stop words used by lucene. Please cast your vote towards this improvement request.

For eg:

1. Searching for "The One" returns all pages containing "One" because "The" is a stop word.
2. Searching for "Cheese One" would only return pages in which "One" appears as the first word (other than stop words) after "Cheese". So it would return "Cheese for One" or "Cheese to One" or "Cheese One". It would not match "One Cheese" or "Cheese Flamingo One"

**Or Search**

To search for content that contains one of the terms, "chalk" OR "cheese"
chalk OR cheese

Please note that the operator OR must be typed in capitals.

And Search
To search for content that contains both the terms "chalk" AND "cheese"

chalk AND cheese

Please note that the operator AND must be typed in capitals.

Not search
To search for content that contains "chalk" but NOT "cheese"

chalk NOT cheese

Please note that the operator NOT must be typed in capitals.

Excluded Term search
Similar to the NOT search, to search for content that contains "chalk" and "butter" but NOT "cheese"

chalk butter -cheese

Grouping Search
To search for content that MUST contain "chalk" but CAN contain either "cheese" or "butter" use the search:

(cheese OR butter) AND chalk

Title Search
To search for content with "chalk" in its title, where title is the field keyword.

title:chalk

Wild card searches
Single character
To search for "butter" or "batter" you can use the search:

`b?tt?r`

To search for "chicken" or "chickpea" you can use the search:

`chick*`

Wildcards can be used anywhere within a word, except at the very beginning.

For example:

`*chick`

is an invalid search term.

**Multiple characters**

To search for "chick" or "chickpea":

`c*c*`

You can also combine search characters to get the exact word. For example the search term below will return "chick" yet not "chickpea":

`c*c?`

---

**Case Sensitivity in wildcard searches**

Since the fix for [CONF-13846](#) Confluence is case sensitive for wildcard searches.

You should note that all the example searches given previously search across the default set of fields which are stored as lower case and therefore all searches of that style should be given lower case search terms (as shown in the examples).

However, if you were to search one of the case sensitive fields, such as 'content-name-untokenized' the case of your search term would need to match the document you are searching for.

**Proximity searches**

This search ensure that the two words specified must be within a certain number of words of each other to be included.
will return "Octagon blog post".

is an invalid search term.

Range search

Searches for names that fall alphabetically within the specified range.

\[\text{[adam TO ben]}\]

Note: You can't use the AND keyword inside this statement and that TO must be written in capitals to form a valid search.

Fuzzy search

This search looks for words spelled similarly.

To search for octagon, if unsure about spelling:

\[\text{octogan~}\]

will correctly return "octagon"

Combined search

You can also combine various search terms together:

\[\text{o?tag* AND past~ AND ("blog" AND "post")}\]

Search for macros

You can search Confluence content for anywhere a macro is used. To do this, just add macroName: to your search and append the macro name after the column. For example, search for all excerpt-include macros:

\[\text{macroName:excerpt-include*}\]

For more information about macroName and other search fields, see Confluence Search Fields.
Confluence Search Fields

Purpose of this document

This page is intended for developers and advanced users of Confluence. It gives an overview of the Apache Lucene search fields used in Confluence.

On this page:

- Searching for Content in Specific Fields
- Confluence Search Fields
  - Personal Information
  - Pages
  - Blog
  - Attachments
  - Mail Items
- Related Topics

Searching for Content in Specific Fields

Confluence data is stored in fields which can be specified in the search. To search a specific field, type the name of the field followed by a colon ':' and then the term you are looking for.

Examples:

```
title:"Some Title"
labelText:chalk
```

The field specification applies only to the term directly preceding the colon. For example, the query below will look for "Some" in the title field and will search for "Heading" in the default fields.

```
title:Some Heading
```

Confluence Search Fields

Below are the fields which can be searched, listed by content type.

When you perform a search in Confluence, it is likely that there will be many pages or other content items that match your search terms. Confluence will rank the matching items by evaluating their relevance. This should mean that the items most relevant to you will appear at the top of the search results list, so that you can quickly select the item you need.

Below is an overview of the method Confluence uses to determine the relevance of the items returned by the search, i.e. to rank the search results.

**Philosophy behind the Ranking**

Confluence gives highest priority to personal information i.e. documents which take you to a user's profile when you click on them. Collaboration is a primary function of a wiki, so Confluence makes it easy to find people.

For example, if you search for 'John Smith', the first results you see will be for John Smith's user profile and personal space. There may also be other content (wiki pages, email messages, etc) which contain the words 'John Smith'. These other content types may even have 'John Smith' as the page title and repeated multiple times in the content, but they will still appear lower down in the list of search results.

Matching terms found in the title of a page, or in the title of any content type, are considered a strong match. So are matches found in labels, because when someone applies a label it means that they think the content is particularly relevant to the labelled term.
Matches found in the content body are of average importance. If the matched term appears more than once, the document will be given a proportionately higher ranking.

We also assume that information created recently is slightly more relevant than older information.

**Summary of the Ranking Method**

When displaying the results of a search, Confluence applies a weighting to each of the content items returned.

To determine the weighting:

1. For each content item, Confluence first applies three weightings based on the following:
   a. The content type of the item returned — user profile, page, blog post, attachment, etc. (More details below.)
   b. The type of field in which the search term was found — title, name, label, or content body. (More details below.)
   c. The age of the item returned. (More details below.)
2. Confluence then combines the three weightings to arrive at a single weighting for the content item.

The item with the heaviest weighting will appear at the top of the list of search results, and the other items will appear below in descending order of weighting.

**Weighting of Content Types**

<table>
<thead>
<tr>
<th>Content Type</th>
<th>Weighting</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Profile</td>
<td>9</td>
</tr>
<tr>
<td>Page</td>
<td>8</td>
</tr>
<tr>
<td>Blog</td>
<td>7</td>
</tr>
<tr>
<td>Attachment</td>
<td>6</td>
</tr>
<tr>
<td>Comment</td>
<td>5</td>
</tr>
<tr>
<td>Mail</td>
<td>0.5</td>
</tr>
<tr>
<td>Space Description</td>
<td>0.4</td>
</tr>
</tbody>
</table>

**Simple example**

If the search returns 7 matching items, and each item is one of the above types, then the items will be presented in the above order on the results screen. (This example assumes that the search term is found in the same field in each item — see more about fields below.)

**Weighting of Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Weighting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>9</td>
</tr>
</tbody>
</table>
Note that 'content' above could be the content of a page, or the content of a comment, or the body of any other content type. See more about content types above.

**Simple example**

A match for a search term in the title of a document is 1.8 times (9/5) more important than a match in the content.

### Weighting Based on Age

This weighting is based on the age of the item returned in the search results. The age of the item is calculated from the creation date of the item. The age intervals are quite coarse-grained, as shown in the table below.

<table>
<thead>
<tr>
<th>When the Item was Created</th>
<th>Weighting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Today</td>
<td>1.5</td>
</tr>
<tr>
<td>Yesterday</td>
<td>1.3</td>
</tr>
<tr>
<td>Up to 1 week ago</td>
<td>1.25</td>
</tr>
<tr>
<td>Up to 1 month ago</td>
<td>1.2</td>
</tr>
<tr>
<td>Up to 3 months ago</td>
<td>1.15</td>
</tr>
<tr>
<td>Up to 6 months ago</td>
<td>1.10</td>
</tr>
<tr>
<td>Up to 1 year ago</td>
<td>1.05</td>
</tr>
<tr>
<td>Beyond a year</td>
<td>1</td>
</tr>
</tbody>
</table>

The weighting is fairly small, so will not have a large effect. When an item is more than a year old, the age weighting is just '1' i.e. it has no effect.

**Simple example**

- If two documents match in all other ways then the newer one will be presented first.
- If the two documents being compared are both older than a year then their relative age does not matter.

### Simplified Example

Let's assume you search for a single term.

Confluence finds a match in the title of an email message created today:
<table>
<thead>
<tr>
<th>Weighting for the content type (email)</th>
<th>0.5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weighting for field (title)</td>
<td>9</td>
</tr>
<tr>
<td>Weighting for age (today)</td>
<td>1.5</td>
</tr>
<tr>
<td><strong>Total weighting</strong></td>
<td>6.75</td>
</tr>
</tbody>
</table>

Confluence also finds a match in the content of a comment created three weeks ago:

<table>
<thead>
<tr>
<th>Weighting for the content type (comment)</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weighting for field (content)</td>
<td>5</td>
</tr>
<tr>
<td>Weighting for age (up to 1 month ago)</td>
<td>1.2</td>
</tr>
<tr>
<td><strong>Total weighting</strong></td>
<td>30</td>
</tr>
</tbody>
</table>

**Result:** The comment (weighting 30) will be appear higher in the search results than the e-mail (6.75).

Confluence uses the [Apache Lucene](https://lucene.apache.org) search engine library. Lucene's score calculation has a number of additional terms, not mentioned in the above example. We have simplified above, for purposes of illustration. If you are interested, you can see more information in the [Lucene documentation](https://lucene.apache.org).

**Organising Content**

Confluence provides a number of ways for organising and structuring content in the wiki:

- **Spaces** allow you to group content according to major categories.
- **Pages** are used for discrete topics, and can be structured into page trees to show the relation between them.
- **Favourites** are particular pages or spaces that have been bookmarked by a user, to make them easy to find again.
- **Labels** are user-defined tags that are added to related pages in order to categorise them in some way.
- **Attachments** to a page can include images, multimedia, Office and PDF files, and provide a way to include other forms of content in the wiki.
- **Email** can be collected and archived within each space individually, to manage all mail related to a project.
Working with Pages

Pages are the primary means of storing and sharing information in Confluence. Pages are contained within **spaces**.

- Use **spaces** to organise your wiki content into your primary logical groups. For example, you could have a space per team, per product, or per department.
- Use **pages** to organise your content into lower-level groups. For example, you could have a page for a particular team activity, or for a feature in a product, or for a chapter in a book. Add more child pages to contain lower-level details if necessary.

Things you can do with pages in Confluence:

- Create a new page from anywhere within the site.
- Write content using the editor.
- Rename a page.
- Copy an existing page.
- Organise pages hierarchically via parent-child relationships.
- Move pages while editing a page or while viewing the space’s Tree view.
- Navigate within and between spaces through flexible linking.
- Collaborate via comments on a page.
- Control access through page security restrictions.
- Monitor page updates and other activity through page notifications.
- View page history and link to older versions.
- Search page content, including attachments.
- Export pages to PDF, WORD, HTML or XML.
- Email page content.
- Like a page.

Moving a Page

This page describes how to move a page. You can move a page:

- to a different space, with a new parent
- to have a different parent page, within the same space
- to reorder sibling pages that are children of a common parent.

When you move a page, all of the page content such as attachments and comments will be moved with the page. Additionally, all child and descendant pages and their page content will also be moved.
You can also copy a page, and move an attachment.

On this page:
- Moving a Page to a Different Space
- Moving a Page within a Space
- Related Topics

Permissions

To move a page, you need the following permissions:

- 'Edit' permission on the page you are moving, and
- 'View' permission on the page's parent page. So if you are moving the page to a different parent, you need 'View' permission on the new parent.

To move a page into a different space, you will also need:

- 'Remove' permission on the space you are moving from, and
- 'Create' permission on the space you are moving to.

To move a page while keeping its page restrictions, you will also need:

- Space administrator permission on the space you are moving to. Alternatively, remove the page restrictions before performing the move.

Moving a Page to a Different Space

You can move a page, along with its child pages, to a different space. Any links to a moved page from the current space will automatically be renamed to point to the page in the new space.

To move a page to another space in your Confluence site:

1. Go to the page and choose Tools > Move.
2. Use the tabs on the left to help you find the new space and parent page for your page, that is, the location where you want to move your page. The 'Current location' and 'New location' breadcrumb trails at the bottom of the dialog indicate the current parent page and new parent page.
3. If you want to move a page to a different position amongst the child pages, check Reorder to see a list of sibling pages when you click Move.
4. Click Move.
5. If you are reordering the child pages, click in the list to set the new position for the page and click Reorder.

Moving a Page within a Space

You can move a page to a different position in the page tree. This allows you to:

- Move a single page, or a family of pages, to have a different parent within the space.
- Reorder sibling pages that are children of a common parent.

Any links to the page are maintained. When a page that is itself a parent (that is, it has one or more child pages) is moved, the entire hierarchy of child pages of the moved page (including comments and attachments) is maintained.

To move a page using the space's 'Tree' view:

1. From any page, choose Browse > Pages.
2. Click Tree.
3. Find the page you want to move.
4. Drag the page up or down the tree.
5. While dragging the page, you see one of the following:
   - A thin line between existing pages — this indicates the potential new position for the page.
     Release the mouse button when the page is where you want it.
   - A wide highlight over one or more existing pages — this indicates that you can drop the page into a
     page family. Release the mouse button to add the page to the family. The page will appear either
     in alphabetical sequence or as the last page in the family, depending on the family's sequential
     order.

⚠️ The new position of the page is saved as soon as you release the mouse button.
💡 To cancel the move while still holding down the mouse button, press the 'Esc' key.

**Related Topics**

- Moving an Attachment

- Deleting a Page
- Sequential Order of Pages
- Overview of Pages

Take me back to the Confluence User's Guide.

**Copying a Page**

You can copy a page, to create a duplicate of the page content. You will need to rename the page, because a
page name must be unique within a space.

You need 'Create Pages' permission, which is assigned by a space administrator from the Space Administration
screens. See space permissions or contact a space administrator for more information.

**To copy a page:**

1. Go to a page in the space and choose **Tools > Copy**.
   Confluence will open a copy of the page in edit mode. By default, Confluence will name the page 'Copy of
   <<original page name>>'.
2. Rename the page and make any other changes required in the body of the page.
3. If you need to move the new page to a different space or a different parent, you can edit the **Location**.
   Refer to the instructions on moving a page.
4. Click **Save**.

**Notes**

- Copying a page will duplicate all of the original page's attachments and labels, but will not copy comments
  from the original page.
- This method of copying a page does not copy the child pages. Please add your vote to issue CONF-2814
  if you'd like to see this improvement.
- You can copy an entire space, including all pages in the space (parents and children) — refer to these
  instructions on copying a space.
- Consider using WebDAV to move or copy a page hierarchy from one space to another, provided that
  none of the page names already exist in the target space.
To rename a page:

1. Go to a page in the space, and click **Edit** at the top to view the page in ‘Edit’ mode.
2. Change the page title as required.
3. Click **Save**.

**Notes**

- Confluence will automatically update all internal links to point to your new page title. This only works for page links that use the relative link syntax, for example [Renaming a Page].
- In macros, page links will not be updated. You need to update these manually.
* Links from external sites will be broken, unless they use the page's permanent URL.

### Deleting a Page

To delete a page, you need the 'Remove Pages' permission. See Space Permissions or contact a space administrator for more information. If someone has applied page restrictions to the page, the restrictions may prevent you from deleting the page too.

#### To delete a page:

Go to the page and choose **Tools > Remove**. Confirm the action as prompted.

**Note:** The 'Remove' option will only appear if you have permission to remove this page.

#### Related pages:

- Restoring a Deleted Page
- Purging Deleted Pages

- Editing or Deleting a Page That Won't Render
- Confluence User's Guide

### Deleting a page and all its children

If the page you are deleting has any child pages, they will be moved to the root of the space. The child pages will not be deleted.

**Hint:** If you need to remove a parent page and a large number of child pages:

- Create a temporary new space.
- Move the parent page to the new space. The child pages will move too.
- Remove the space.

**Notes**

- When you delete a page, Confluence moves it to the trash. Space administrators can recover pages from the trash.
- Purge the trash to remove the page permanently.
- Attachments attached to a deleted page will remain in the database (allowing potential retrieval) until the trash is purged. When the trash is purged, all attachments on that page are permanently removed.

#### Purging Deleted Pages

When a user deletes a page from a Confluence space, the page is not permanently removed. Instead, Confluence places the deleted page into the 'Trash'. The page will remain in 'Trash' until a space administrator purges the page.

Purging deleted pages permanently clears them from 'Trash'.

You need to be a space administrator to purge deleted pages for a space.

#### To purge deleted pages:

1. Choose Browse > Space Admin.
1. Choose **Browse > Space Admin**.
   *Note: ‘Space Admin’ is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).*
2. Click **Trash** from the left panel. A list of deleted pages and emails for the space is displayed.
3. Click the **Purge** link beside a page or else click **Purge All** to permanently clear all deleted pages and news items.

   When the trash is purged, all attachments on purged pages are permanently removed as well.

**Related Topics**

**Restoring a Deleted Page**

When you restore a page, you are retrieving it from ‘Trash’ to the root of the space where it existed before it was deleted.

You need to be a **space administrator** to restore deleted pages.

**To restore a deleted page:**

1. Choose **Browse > Space Admin**.
   *Note: ‘Space Admin’ is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).*
2. Click **Trash** from the left panel. A list of deleted pages and emails for the space is displayed.
3. Click **Restore** beside the page you want to restore.

**Note**

If a new page has already been created in that space with the same name as the deleted page, you will be given an option to rename the page before it is restored.

Sequential Order of Pages

Confluence allows you to present your pages in any order (sequence) you choose. The position of a page is reflected in the following places:

- The Tree tab on the space's 'Pages' view
- Exporting pages to PDF, HTML and XML
- The Pagetree macro
- The Children macro

Alphabetical versus Manual Order

By default, Confluence will present your pages in alphabetical order. When you move a page to a different position, the order becomes manual for the affected page family.

When ordering pages alphabetically, Confluence actually applies a more sophisticated 'natural' order rather than a straight alphabetical order. The natural order handles numeric values correctly when doing string comparisons.

Now let's consider what happens when you add a page to a page family, by creating a new page or by moving or copying a page into the family:

- If the page family's order is alphabetical, the new page will appear in alphabetical order too.
- If the page family's order is manual, the new page will appear at the bottom of the list of pages in the
Changing the Page Order

You can change the order of the pages by moving pages within the page tree — see Moving a Page.

You can also change the order of a page-family from manual to alphabetical (see the 'Setting Page Order to Alphabetical' section on Setting a Page Family to Alphabetical Order).

- The Pagetree macro
- The Children macro

Alphabetical versus Manual Order

By default, Confluence will present your pages in alphabetical order. When you move a page to a different position, the order becomes manual for the affected page family.

When ordering pages alphabetically, Confluence actually applies a more sophisticated 'natural' order rather than a straight alphabetical order. The natural order handles numeric values correctly when doing string comparisons.

Now let's consider what happens when you add a page to a page family, by creating a new page or by moving or copying a page into the family:
- If the page family's order is alphabetical, the new page will appear in alphabetical order too.
- If the page family's order is manual, the new page will appear at the bottom of the list of pages in the family.

Changing the Page Order

You can change the order of the pages by moving pages within the page tree — see Moving a Page.

You can also change the order of a page-family from manual to alphabetical (see the 'Setting Page Order to Alphabetical' section on Setting a Page Family to Alphabetical Order).
Setting Page Order to Alphabetical

If the pages in a page family have been ordered manually, you can reset the page order to alphabetical as described below.

A page family is a set of pages under a single parent page. In this section, when we say 'page family' we mean the immediate children of the parent page, not including the grand-children.

The screenshot below shows a family of pages in non-alphabetical order under the parent ‘Sample Page’. Notice the icon next to the parent ‘Sample Page’, giving you the option to order the pages alphabetically.

Screenshot: A family of pages in non-alphabetical order with 'Sort Alphabetically' icon

To set a page family to alphabetical order:

1. Go to a page in the space and choose Browse > Pages.
2. Go to the Tree tab.
3. Expand the branches of the tree to find the page family you want.
4. If the page family is in non-alphabetical (manual) order, the 'Sort Alphabetically' icon will appear next to the parent page as shown in the screenshot above. Click the icon.
5. The child pages will shuffle into alphabetical order and the icon will change to the 'Undo Sorting' icon as shown in the screenshot below.

Only the immediate children of the parent page will be affected. The grand-children will not be re-ordered. (If you want to re-order the grand-children, you need to click the 'Sort Alphabetically' icon next to the parent of those pages i.e. re-ordering happens for one node at a time.)

Screenshot: A family of pages in alphabetical order with 'Undo Sorting' icon
If you change your mind, you can click the 'Undo Sorting' icon to undo the alphabetical sort. This option is only available while you remain on the Tree tab and provided that you have not performed any other action on the page family. Once you move away from this screen or do something else with the page family, such as moving children in or out of the family, the undo option is no longer available.

Managing Orphaned Pages

An orphaned page is a page without any incoming links. What this means is that unless you know that this page exists, you are not likely to come across it in the space during the natural course of navigation.

When you are working in a large space with a number of pages, it is difficult to keep track of all of them. An orphaned page may be redundant or need to be referred to from another page. Confluence allows you to view all the orphaned pages in a space so you can "tidy up" the space by either deleting pages or by reorganising them.

To view the orphaned pages in a space:

1. Choose Browse Space > Advanced.
2. Click on Orphaned Pages in the left panel.

You can:

- delete an orphaned page by clicking on the 'trash' icon beside it.
- give an orphaned page a parent — see Moving a Page.

Screenshot: Managing Orphaned Pages

Managing Undefined Pages

In Confluence, you can create links to pages that you intend to create later. These are links to "undefined pages". This is useful because it allows you to create links first and enter content for those pages later.

For example, this link to new page is a link to a non-existent page, also called an undefined page. The link is shown in dark red. If someone clicks the link, Confluence will create a new page called 'link to new page'.

The 'Undefined Pages' view gives a consolidated report of all undefined pages so that you can manage your space better. The undefined page links are badged with this icon to remind you that those pages need to be created.

To view a list of the undefined links in a space:

1. Choose Browse > Advanced.
2. Choose Undefined Pages in the left-hand panel. This will display a list of all the undefined pages in the space.

You can click the link for an undefined page to create the page and add content to it.

Using the Documentation Theme

The Documentation theme is one of the themes bundled with Confluence. It provides an inbuilt table of contents for your wiki space, a configurable header and footer, and text styles suited to documentation. You can also configure it to restrict the search results to the current space, rather than searching the entire Confluence site.

This page tells you how to view pages in your Confluence space when your space uses the Documentation theme. For the full list of features and instructions on applying the theme to a space, see the guide to configuring the Documentation theme.

Quick guide to using the Documentation theme

- The left-hand panel contains a page tree. This is a table of contents that shows the pages in the space.
- Click the plus signs in the page tree to see the child pages.
- Drag the thick vertical bar to change the width of the panels.
- Show/hide the left-hand panel: Click the sidebar icon at top right, next to the search box, to remove the left-hand panel altogether. Click the icon again to restore the panel.
- Alternatively, press 'T' on your keyboard to show/hide the left-hand panel.
- Overriding a space-restricted search: If your theme is configured to restrict the search to the current space, you can enter 'all:' and your search term to search the entire site.

The rest of this page gives more details of the above guidelines.
Using the Documentation Theme

By default, the left-hand panel contains a search box and a table of contents (page tree) showing all the pages in your space. Specifically, it shows the pages that are children of the space’s home page.

A space administrator can customise the Documentation theme as follows:

- Change the content in the left-hand panel and add a header and footer to the page. This means that your own pages may look different from the screenshot above.
- Restrict the search so that it will show results from the current space only, not from the entire Confluence site.

Here is a summary of the things you can do on a page that uses the Documentation theme:

- Click the plus signs to open and close the branches of the page tree (table of contents) in the left-hand panel.
- Drag the thick bar between the left-hand panel and the content, to increase or decrease the width of the panel.
- Click the sidebar icon at top right, next to the search box, to remove the left-hand panel. This will remove the panel for you only. Other people will still see it.
- Click the sidebar icon again to restore the left-hand panel.
- Alternatively, press '[' on your keyboard to show/hide the left-hand panel.
- Use the scroll bars to scroll the left-hand and right-hand panels independently of each other.
- Search the content of the space or the site. See below.

Searching the Space or the Site

When using the Documentation theme, the Confluence search offers a few options as described below.

Using the search box at the top right of the page:

- By default, the main Confluence search is configured to search the entire Confluence site.
  - You will see the words ‘Search Confluence’ in the search box at top right of the page.
  - The Confluence search will look for matches in the entire Confluence site. This is the default behaviour for other themes too.
- A space administrator can configure the Documentation theme to restrict the search to the current space.
  - You will see the words ‘Search this space’ in the search box at top right of the page.
• The search will return results from the current space only.
• You can override the search restriction. Enter 'all:' and your search term to search the entire site. For example, enter the following into the search box at top right of the page to search the entire site for 'technical writing':

```
all: technical writing
```

Using the search box in the left-hand panel:

• By default, the Documentation theme's left-hand panel includes a search box. Enter your search term there, to restrict the search to the current space. Specifically, this will search only the pages that are children of the space's home page.
• If your administrator has restricted the main search to the current space, there will not be a search box in the left-hand panel.

Hints and Tips

Below are some hints that you may find useful when using the Documentation theme. Where can I see a working example of the Documentation theme?

The Confluence documentation uses the Documentation theme. If you are reading this documentation online on the Atlassian documentation wiki, you are seeing a working version of the Documentation theme.

Which pages will appear in the Documentation theme's table of contents?

The theme constructs the page tree in the left-hand panel from all pages that are child pages of the space’s home page. Each space has a single page designated as the 'Home' page. You can specify the home page in the space administration section.

Help, my pages do not appear in the Documentation theme table of contents

Cause 1: Your pages are not under the space’s home page. The most probable reason why your pages do not appear in the page tree in the left-hand panel is this: The theme constructs that table of contents from all pages that are child pages of the space’s home page. If your pages are above the home page in the page tree, they will not appear in the left-hand panel.

There are two ways to fix the problem:

• You can change the designated space home page in the space administration section.
• Or you can drag and drop all your pages to make them children of the current home page. You can drag and drop pages in the 'Pages' section of the space 'Browse' screen. See Moving a Page.

Cause 2: Problem with upgrade from Confluence 3.1, with Documentation theme as plugin, to Confluence 3.2 or later with Documentation theme bundled. If your existing Confluence installation already has the Documentation theme plugin installed, you may find that after upgrading to Confluence 3.2 the left-hand navigation bar is empty in the spaces that use the theme. The fix is to enable all modules of the Documentation theme plugin. See the knowledge base article.

Help, my left-hand panel has disappeared

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
If your entire left-hand panel has disappeared when using the Documentation theme, this is probably because you have clicked the sidebar icon at top right, next to the search box. Click the icon again to restore the panel.

**Viewing Page Information**

The 'Information View' for a page shows you various bits of useful information about the page.

**To see the Information View for a page:**

1. View the page.
2. Choose **Tools > Info** to go to the 'Information' view for the page.

The 'Information View' displays the following information:

1. **Page Details:** Title, author, date of creation, date of last modification and the tiny link of the page.
2. **Page Hierarchy:** Parent-child relationships of the page.
3. **Page Permissions:** Displays page-level security restrictions that apply to the page (if present).
4. **Recent Changes:** Links to the five most recent versions of the page along with the name of the editor and the date of modification.
5. **View page history:** A link to the page history, which displays all the versions of the page in reverse chronological order and allows you to compare versions or to restore a previous version.
6. **Hot Referrers:** The external website pages which send the most viewers to the page.

**Screenshot: A page’s Information View**

**Working with Pages**

Take me back to Confluence User's Guide

**Viewing Recently Visited Content**

Confluence keeps track of pages you have recently visited in Confluence. This history is available from the Recently Viewed screen. You can also use this screen to go back to Confluence pages you have recently visited.
To view the list of recently visited pages and go back to one of them:

1. Go to the 'Recently Viewed' content view. To do this:
   - Go to your name (the 'User' menu) at the top of the page and choose Recently Viewed.
2. Choose the title of the page you wish to revisit.

Screenshot: Recently viewed content

---

**Notes**

- The list of recently-viewed pages records up to the last 20 pages visited.
- The list is cleared when you log out of Confluence or your Confluence session terminates.

**Related Topics**

- Working with Pages
- Confluence User's Guide

**Page History and Page Comparison Views**

Confluence tracks histories of changes to pages by maintaining a version of the page each time it is modified. It is easy to view changes between different versions and to restore a previous version if required.

---

**Accessing the Page History View**

To view the history of a page:
• Go to the page and choose **Tools > Page History**.

You can click a version number to view that version. To get back to the page history view, click **View Page History**.

**Screenshot: Page History View**

<table>
<thead>
<tr>
<th>Version</th>
<th>Date</th>
<th>Changed By</th>
<th>Operations</th>
</tr>
</thead>

</tr>
</tbody>
</table>

**Viewing Changes in a Page History**

The page history view and **page information view** allow you to view recent changes made to a page or to compare the differences between any two versions of a page.

**Viewing Recent Changes**

To view recent changes made to a page:

1. Click **view change** at the top of the page below the page title. The page comparison view is displayed, showing the differences between the current version and the previous version.
   Or:
2. Choose **Tools > Info** to go to the ‘Information’ view for the page.
3. In the section titled ‘Recent Changes’ you will see the most recent versions of the page, along with the date of their modification and the name of the modifying author.
4. Click **view changes** beside the desired version. The page comparison view is displayed, showing the differences between the selected and previous versions.

**Comparing Two Different Versions of a Page**

To compare two different versions of a page:

1. Go to the page and choose **Tools > Page History**.
2. Select the versions you want to compare by selecting the check boxes beside them.
3. Click **Compare selected versions**. The page comparison view is displayed, showing the text differences between the selected versions.
Page Comparison View

The page comparison view shows the differences between selected page versions.

Key

On the page comparison view, the following key indicates the differences between the selected page versions:

</tbody>
</table>

Interactive views

When a page comparison view is first displayed, all large sections of unchanged text are hidden and reduced to an ellipsis . . .

You can view page changes between versions which are adjacent to your current page comparison view. Click the link containing:

- << to view the page comparison with the earlier adjacent version
- >> to view the page comparison with the more recent adjacent version.

For example, if your page comparison view is between v. 30 and v. 34 of a page, you can view changes between:

- v. 29 and v. 30 by clicking << Changes from 29 to 30
- v. 34 and v. 35 by clicking Changes from 34 to 35 >>

Other Page History View Features

You can also use the page history view to:

- View an older version of a page
- Restore an older version of a page
- View change comments

Related Topics

Restoring an Older Version of a Page

To restore an older version of a page:

1. Go to the page and choose **Tools > Page History**.
2. Click **Restore this version** beside the version to restore.
3. Change the default comment if desired and click **OK**.

**Notes**

- All page history is retained. Restoring an older version creates a copy of that version. For example, in the screenshot below, if you selected v.39 and clicked **Restore this version**, a copy of v.39 would be created. This copy would be v.42 and would become the current version.
- You can click a version number's link to view the contents of that page version.
- Select the check boxes of two different versions and click **Compare selected versions** to view the changes made between them.
- If you are viewing a specific page version, you can restore that version of the page by clicking **Restore this Version** on that page.
- To get back to the page history view, click **View Page History**.

**Screenshot: Restoring an Older Version of a Page**

Viewing an Older Version of a Page

Confluence keeps a *history of all page changes*. You can see what any of the previous versions of the page looked like, as well as link to them.

There are two ways that you can view an older version of a page.

- **Using the 'View Change' link** — this allows you to quickly check the most recent change to a page and the most recent version of the page, prior to the current version.
- **Using the Page History** — this allows you to look for a specific version of the page.

**On this page:**

- Viewing an Older Version of a Page using the 'View Change' Link
- Viewing an Older Version of a Page using the Page History
- Related Topics

Viewing an Older Version of a Page using the 'View Change' Link

To view an older version of a page using the 'View Change' link:
1. Go to the page and click **view change** (displayed under the page title).
2. Click the **Version ###** link in the top left-hand box to show the page content of the previous version.

**Notes**

- If you want to view an earlier version of the page, click the < link at the top left.
- If you want to send this page version to someone, simply copy and paste the URL from your browser. The link will look something like this: http://confluence.atlassian.com/pages/viewpage.action?pageId=12345.

**Viewing an Older Version of a Page using the Page History**

**To view an older version of a page using the page history:**

1. Go to the page and choose **Tools > Page History**. The 'Page History' view will open. Read more about viewing the page history on [Page History and Page Comparison Views](#).
2. Click a version number’s link to view the contents of that page version. The following header will display across the top of the old version of the page:

    ![Header of an older version of a page](image)

    **When you are viewing a specific version of the page, the following functions are available:**

    | Function               | Description                                      |
    |------------------------|--------------------------------------------------|
    | current version        | View the latest version of the page.             |
    | Compare with Current   | Compare the differences between the version of the page you are viewing and the current version. |
    | Restore this Version   | Restore the page version you are viewing to be the current version. |
    | View Page History      | Return to the list of page versions.            |
    | << Previous or Next >> | View the previous or next page version, respectively. |

If you want to send this page version to someone, simply copy and paste the URL from your browser. The link will look something like this: http://confluence.atlassian.com/pages/viewpage.action?pageId=12345.

**Using a WebDAV Client to Work with Pages**

You can access Confluence content via a WebDAV client, such as 'My Network Places' in Microsoft Windows. Provided that you have permission, you will be able to read and write to spaces, pages and attachments in Confluence. You will be asked to log in and the standard Confluence content access permissions will apply to the equivalent content available through the WebDAV client.

Please refer to the page on [configuring and setting up a WebDAV client](#).
Working with Blog Posts

You can publish a blog post from any space in Confluence, provided you have permission. Blog posts may be announcements, journal entries, status reports, or any other timely information.

You can view the blog posts for a space by choosing Browse > Blog. Confluence catalogues the blog posts chronologically and allows you to browse blog posts for the space by navigating a calendar.

Creating and editing a blog post is just as easy as creating and editing any other page in Confluence. You can also let people know you care by liking a blog post.

Creating and editing a blog post is just as easy as creating and editing any other page in Confluence. You can also let people know you care by liking a blog post.

What would you like to do?

View blog posts
Add blog posts
Edit blog posts
Link to blog posts
Delete blog posts

Deleting Blog Posts

To delete blog posts, you require ‘Remove Blog’ permission which is assigned by a space administrator. See Space Permissions or contact a space administrator for more information.

To delete a blog post:

- Go to the blog post and choose Tools > Remove.
  - The Remove option is only displayed if you have permission to remove this blog post.

Handy Hint

Deleted blog posts are stored in the trash and can be recovered by a space administrator.

Take me back to Confluence User's Guide

Editing Blog Posts

To edit a blog post, you require the ‘Create Blog’ permission which is assigned by a space administrator. See Space Permissions or contact a space administrator for more information.

To edit a blog post:

1. Navigate to the space that has the blog post and choose Browse > Blog. A list of the most recent blog posts within the space is presented. A calendar allows you to browse earlier blog posts.
2. Locate the blog post and click Edit.
3. Make changes to the blog post.
4. *(optional)* Add a comment, in the text box below the editing pane, to describe your changes.
5. Preview your changes if desired, and click Save.

Editing a blog post is similar to editing any other page in Confluence. However, there are a few things to keep in mind:

- You cannot change the date of an existing blog post. You can only backdate when adding a blog post.
- You cannot move a blog post to another space.
- A blog post has no parent.

Working with Spaces

In Confluence, content is organised into spaces. There are two types of space:

- **Global** spaces are areas on your site into which you can group content items (pages, attachments, news, etc) based on any subject or topic of your choice. For example, you may want separate areas on your site for each team or project within your organisation.
- **Personal** spaces belong to specific users. They can be kept private, or opened up so the whole world can view and edit them, just like global spaces. These spaces are listed in the People Directory. They are not listed on the 'All' tab on the dashboard.

What is a Space?

A space is an area within Confluence, containing your wiki pages. You can think of each space as a sub-site, or mini-site, each with its own home page.

Each space:

- Has its own pages, blog posts, comments, RSS feeds and mail (mail applies to global spaces only).
- Has its own access control settings. You can set different levels of access for different spaces.
- Can be separately exported to PDF, HTML or XML.

There is no limit to the number of global spaces you can create in Confluence.

On this page:

- What is a Space?
- Viewing the spaces in a Confluence site
- Guidelines for dividing content into spaces and pages
- Example: Favourite spaces as shown on the dashboard
- Notes

- Archiving a Space
- Deleting a Space
- Viewing Space Activity
- Using Labels to Categorise Spaces
- Administering a Space
- Confluence User's Guide

Viewing the spaces in a Confluence site

Confluence displays a list of spaces in the following locations:

- The **dashboard** displays a list of all the spaces in the Confluence site that you have permission to see. You can make a space a favourite, or categorise the space, to get easy access to the content that is most relevant to you. See Customising your Personal Dashboard.
- The **space directory** displays a list of all the global and personal spaces in the Confluence site that you have permission to see. You can choose to see all spaces, the spaces you have marked as favourite, or the spaces in a given space category. You can further restrict the number of spaces displayed, by entering a word or words in the Filter box. Confluence will display only the spaces that have the matching words in the space name or description. See Viewing All Confluence Spaces.
- The **people directory** displays a list of all Confluence users, including those who have personal spaces. See Searching the People Directory.
Guidelines for dividing content into spaces and pages

To ensure maintainable and logical spaces, consider the following points when allocating your content to pages and spaces:

- Group the content by topic, subject, project or team.
- Evaluate permissions across the wiki content. If members require conflicting access, for example John must access content on topics A and B, while Jane must access content for topics B and C, then the topics should be separated into three spaces.

Useful notes about spaces and pages:

- Spaces cannot be nested. You cannot have parent and child spaces, but you can have parent and child pages within a space.
- Page permissions can prevent users from accessing a specific page, even though they have permission to access the space.
- Page permissions alone cannot keep the existence of a page secret. The page should be in a restricted space instead.
- Pages can be moved between spaces.
- You can group related spaces, using space categories.

Example: Favourite spaces as shown on the dashboard

The screenshot below shows the area of the Confluence dashboard that displays the spaces that you have marked as favourite:

![Spaces dashboard](Image)

Notes

A space key is a short, unique identifier for a space. For example, you might give your documentation space a key of "DOC". To find the key of an existing space, look at the Confluence URL for a page in the space. The standard Confluence URL has this format:

```
http://my.confluence.site.com/display/SPACEKEY/Page+Name
```
Viewing All Confluence Spaces

Quick guide to viewing spaces

- The **dashboard** displays a list of all the spaces in the Confluence site that you have permission to see. You can make a space a **favourite**, or **categorise the space**, to get easy access to the content that is most relevant to you. See [Customising your Personal Dashboard](#).

- The **space directory** displays a list of all the global and personal spaces in the Confluence site that you have permission to see. You can choose to see all spaces, the spaces you have marked as favourite, or the spaces in a given space category. You can further restrict the number of spaces displayed, by entering a word or words in the **Filter** box. Confluence will display only the spaces that have the matching words in the space name or description. See [Viewing All Confluence Spaces](#).

- The **people directory** displays a list of all Confluence users, including those who have personal spaces. See [Searching the People Directory](#).

On this page:

- Quick guide to viewing spaces
- Viewing spaces on the dashboard
- Viewing spaces in the space directory
- Viewing personal spaces in the people directory
- Notes

Related pages:

- [Working with Spaces](#)

**Viewing spaces on the dashboard**

The Confluence dashboard displays a list of spaces that you have permission to view. Remember to log in, so that you can see the complete list of spaces based on your username's permissions.

The **Spaces** tab displays all the global spaces on the site that you have permission to view, and the spaces you have marked as your **favourites**.

**To see the spaces on the dashboard:**

1. Choose **Dashboard** at the top left of your Confluence screen.
2. Scroll down and choose the **Spaces** tab.

**Screenshot: Viewing spaces on the dashboard**
Viewing spaces in the space directory

The space directory displays a list of global and personal spaces that you have permission to view. Remember to log in, so that you can see the complete list of spaces based on your username's permissions. The order of spaces is random.

Categorising the spaces: The spaces are displayed on a number of tabs, each showing a different set of spaces, as follows:

- **All Spaces** – Shows all the global and personal spaces on the site. The list excludes spaces that you do not have permission to view, and spaces that have been archived.
- **Global Spaces** – Excludes personal spaces.
- **Personal Spaces** – Shows only personal spaces.
- **Favourite Spaces** – Shows the spaces that you have marked as your favourites.
- **Various categories** – You will see a number of tabs showing spaces categorised by label. You can add any space category you like. See Using Labels to Categorise Spaces.
- **Archived Spaces** – Shows all the global and personal spaces on the site that have been archived, and that you have permission to view.

Filtering the list of spaces: To restrict the number of spaces displayed, enter a word or words in the Filter box. Confluence will display only the spaces that have the matching words in the space name or description.

To see the spaces in the space directory:

2. Click one of the tabs to see the spaces you want.
3. If you want to restrict the number of spaces shown, entering a word or words in the Filter box.

Screenshot: Viewing favourite spaces in the space directory
Viewing personal spaces in the people directory

The people directory displays a list of Confluence users, including those who have personal spaces. See Search the People Directory. It excludes spaces that have been archived.

To see the personal spaces in the people directory:

2. Choose People with Personal Spaces.

Notes

- If you do not log in, you will be treated as an 'anonymous user’. Confluence will display only those spaces that an anonymous user has permission to see.
- Permission to access a space is granted by a space administrator. See the overview of space permissions.
- You can use the Spaces List macro to display a list of spaces on a Confluence page.
Setting up a New Global Space

To set up a new global space, you need the 'Create Space' permission. 'Create Space' is one of the global permissions that can be assigned by a Confluence administrator.

To create a new global space:

1. Click Add Space located above the list of global spaces on the dashboard, or at the top right of the dashboard, or at the top right of the space directory. The 'Create Space' dialog appears.
2. Enter the following information about your new space:
   - **Space name**: A name for the space. Space names do not have to be unique.
   - **Space key**: A simple key to identify your space (A-Z, a-z, 0-9). This key is a shorthand name for the space, used when linking content between spaces, for web URLs and for reports. For example, a 'Development Space' might have a space key of ‘DEV’. The space key must be unique within the entire Confluence site.
   - **Make this space private**: A private space will be visible only to the person who created it. If you do not make it private, the space will have the default space permissions. The creator will have space administrator permissions on the new space, and can change the permissions at any time after creating the space.
3. Click Create. The home page for your new space is displayed. Note that the home page will automatically contain any default space content as defined by your Confluence administrator.

Next, you can choose a theme and start adding pages to your space.

Screenshot: Adding a global space to Confluence

Create a space for your team or project:

- **Space name**: Chocolate
- **Space key**: CHOC
  - Used in the space's URL: http://localhost:8090/display/CHOC
  - Make this space private

Create Cancel

Notes

A space administrator can change the permissions at any time after creating the space.
Setting Up your Personal Space

Your personal space is a place where you can publish your own pages and blog posts. Once you have set up your personal space, Confluence users can reach it by clicking your name in the People Directory. You can get to it by clicking your name at the top of the page and choosing 'Personal Space'.

Creating your personal space

To set up your personal space, you need the 'Personal Space' permission which is assigned by a Confluence administrator. See Giving People Access to Content and Global Permissions Overview.

To create your personal space:

1. Click your name at the top of the page. (This is the 'user' menu.)
2. Choose Add Personal Space from the dropdown list. The 'Add your personal space' dialog will open.
3. Indicate whether your space should be private or not. A private space will be visible only to you. If you do not make it private, the space will have the default space permissions. Note that you can change these settings again later. You will have space administrator permissions on your space.
4. Click Create.
5. The home page of your new space will appear. Your home page will contain any default space content as defined by your Confluence administrator. You can change this content at any time.

On this page:

- Creating your personal space
- Adding and changing content in your space
- Changing the look and feel of your space
- Granting access to your space
- Watching updates made in your space

Related pages:

- Working with Spaces
- User Profile Overview
- Linking to Personal Spaces and User Profiles
- Confluence User's Guide

Adding and changing content in your space

Now you can start adding pages to your personal space. You may also want to upload your photo.
Changing the look and feel of your space

If you like, you can apply a different theme to your personal space, or modify its colour scheme.

Granting access to your space

When you created the space, you set the option to make your space private, or to allow other people to view and contribute content to your space. You can change the permissions on your space at any time.

Watching updates made in your space

By default, Confluence assigns you as a watcher of your space. This means that you will receive an email notification each time someone adds or updates content in your space. You can stop watching the space (see Watching a Space) and change your notification settings at any time.

Administering a Space

This page gives an overview of the administration functions available in global and personal spaces. You need to be a space administrator to perform space administration functions.

Administering a global space

To view the space administration menu:

1. Go to a page in the space you wish to manage.
2. Choose Browse > Space Admin.
   Note: 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
3. Choose a link from the options available in the left-hand panel.

For global spaces, the options available are divided the following categories:

- **Space Operations**
  - Space Details – See Editing Space Details.
  - Space Labels – See Using Labels to Categorise Spaces.
  - Remove Space – See Deleting a Space.
  - Trash – See Purging Deleted Pages and Restoring a Deleted Page.
- **Security**
  - Permissions – See Assigning Space Permissions.
  - Restricted Pages – See Viewing Restricted Pages.
- **Mail**
  - Mail Accounts – See Archiving Mail Overview.
  - Mailbox Import – See Importing Mail.
- **Look and Feel**
  - Themes – See Applying a Theme to a Space.
  - Colour Scheme – See Editing a Space's Colour Scheme.
  - Layout – See Customising Space Layouts.
  - Stylesheet – See Styling Confluence with CSS.
  - PDF Layout – See Customising Exports to PDF.
  - PDF Stylesheet – See Customising Exports to PDF.
Administrating a personal space

To view the space administration menu:

1. Go to a page in the personal space that you wish to manage.
2. Choose Browse > Space Admin.
   Note: 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
3. Choose a link from the options available in the left-hand panel.

For personal spaces, the options are divided into the following categories:

- **Space Operations**
  - Space Details – See Editing Space Details.
  - Space Labels – See Using Labels to Categorise Spaces.
  - Remove Space – See Deleting a Space.
  - Trash – See Purging Deleted Pages and Restoring a Deleted Page.

- **Security**
  - View or set space permissions
  - View restricted pages

- **Look and Feel**
  - Themes – See Applying a Theme to a Space.
  - Colour Scheme – See Editing a Space's Colour Scheme.
  - Layout – See Customising Space Layouts.
  - Stylesheet – See Styling Confluence with CSS.
  - PDF Layout – See Customising Exports to PDF.
  - PDF Stylesheet – See Customising Exports to PDF.

### Editing Space Details

You need to be a space administrator for the space, to edit the details of that space.

To edit the details of a space:

1. Go to a page in the space you wish to archive.
2. Choose Browse > Space Admin.
   Note: 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
3. The 'Edit Space Details' screen appears. You can:
   - Change the name of the space.
   - Change the description of the space.
   - Change the status of the space from 'Current' to 'Archived' or back again. See Archiving a Space.
   - Select a new home page for the space. The home page is the default page to which users are directed when they click the link to the space from the Dashboard.  
     Note: If you set this field to blank (no selection) then the default home page will be the 'Pages' tab of the 'Browse Space' screen for that space.
4. Choose Save.

#### Related pages:

- Working with Spaces
- Archiving a Space
- Confluence User's Guide

### Notes

- You cannot edit the key or the space creator's name.
The **Edit Space Details** fields do not accept wiki markup. Any wiki markup entered in these fields will be displayed as plain text.

## Deleting a Space
Deleting a space permanently removes the space and all of its contents. You need to be the [space administrator](#) of a space to delete that space space.

**Note:** Deleting a space is permanent. Always create an XML backup of the space before proceeding. Once you have deleted the space, there is no way to restore it unless you have made an XML space backup.

### Related pages:
- [Working with Spaces](#)
- [Archiving a Space](#)
- [Copying or Renaming a Space](#)
- [Confluence User's Guide](#)

### To delete a space:
1. Go to a page in the space you wish to delete.
2. Choose **Browse > Space Admin.**
   - **Note:** 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the `confluence-administrators` group).
3. Choose **Remove Space** in the left-hand panel.
4. Choose **OK.**

**Notes**

There is a problem in some versions of Confluence, where space deletion does not work. See issue **CONF-26122** - [Authenticate](#) to see issue details. If you like, you can watch that issue to be informed of progress.

### Backing Up and Restoring a Space
Confluence can back up all the content, comments and attachments for a space. The process involves converting the data in the space into XML format. The end product is a zip file that contains XML file(s) that define the content of the space, and optionally a folder containing the attachments in the space. To transfer this data to another Confluence site, you can upload the zip file.

#### Creating a space backup

See [Exporting Confluence Pages and Spaces to XML](#).

#### Restoring (importing) a space backup

See [Restoring a Space](#).

### Archiving a Space

You can archive a space, so that its content is less visible but still available on your Confluence site. You need to be a [space administrator](#) to archive a space. You can change a space's status from archived to current at any time.

#### The effect of archiving a space

If a space is archived:

- The pages and other content do not appear in the Confluence quick navigation aid, which drops down when you enter text in the search box.
- By default, the pages and other content do not appear in the Confluence search results. If a Confluence site contains any archived spaces, the search screen will provide an option to include them in the search
results.

- The space and its pages do not appear on the dashboard.
- Updates to the space's content do not appear in activity streams, such as the recent updates section of the dashboard.
- The space does not appear in space-selection dropdown menus. Similarly, its pages and other content do not appear in any dropdown menus in the Confluence user interface.
- In the space directory, the archived space will no longer appear in the general space lists. Archived spaces will appear on the 'archived spaces' tab. They will also appear on the category tabs, as determined by their labels.

These functions remain available for archived spaces:

- People can view the content as usual, by following a link or typing in a URL belonging to the archived space.
- People can edit the content as usual, as determined by the space permissions.
- RSS feeds, watches and notifications remain active.

Archiving a space

To archive a space:

1. Go to a page in the space you wish to archive.
2. Choose Browse > Space Admin.  
   Note: 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
3. The 'Edit Space Details' screen appears. Select Archived in the Status dropdown menu.
4. Choose Save.

Notes

Archiving a space has no effect on search results of external search engines. For example, the space will still appear in Google search results.

Screenshot: An archived space
Viewing Space Activity

Note that the space activity information is disabled by default. See notes below.

If enabled, the space activity screen displays statistics on the activity in each space. These include:

- How many pages and blog posts have been viewed, added or updated over a given period.
- Which content is the most popular (most frequently viewed).
- Which content is the most active (most frequently edited).
- Which people are the most active contributors/editors of content.

To view the activity in a space:

1. Navigate to any page in the space and choose Browse > Space Admin.
2. Go to the Activity tab.

Confluence will show a graphic display of the number of pages and blog posts that have been viewed, added and edited, showing trends over a period of time. For example:
Activity for week starting 31 December 2006

Viewing

This graph shows how many times pages and blog posts have been viewed over the current time period.

Screenshot 1: Number of viewed pages and blog posts in a week

The top ten most popular and most active pages and/or blog posts will be listed, with a link to each.

Most popular content (Views)

1. Confluence Documentation Home (2262)
2. Set JAVA_HOME variable in Windows (1180)
3. Confluence Installation Guide (607)
4. Remote API Specification (467)
5. User Macros (436)
6. installing Confluence Standalone (385)
7. JIRA Issue Macro (370)
8. Administrators Guide (353)
9. Dynamic Tasklist Macro (335)
10. Frequently Asked Questions (320)

Screenshot 2: Popular content

Notes

- The Confluence Usage Stats plugin, which provides the 'Space Activity' screen, is known to cause performance problems on large installations. This plugin is disabled by default. A status report on the progress of the performance issues with this plugin is available in this issue: USGTRK-15.
- Your Confluence system administrator can enable the plugin, but please be aware of the possible impact upon your site's performance.
- The plugin is sometimes called 'Confluence Usage Tracking'.
- If your Confluence site is clustered, the space activity information will not be available.

Related Topics
Viewing Recently Updated Content

The 'Recently Updated' view is a useful way of keeping track of the changes being made in a space. It displays links to the most recently added or modified content within the space including pages, blog posts, mail messages and comments.

To view the recently updated content in a space:

1. Choose Browse > Pages.
2. Choose Recently Updated. A list of the most recently added or modified content in the space is displayed. Choose a link to open the corresponding document.

Archiving Mail Overview

Confluence Mail Archiving is an optional feature. This means that the Mail elements will not appear in the Confluence user interface by default. Mail archiving features are contained in a bundled plugin. To activate mail archiving features in Confluence, activate the plugin from Confluence Admin > Plugins > Show System Plugins > Confluence Mail Archiving Plugin.

Confluence allows you to collect and archive mail within each space individually. This is a useful facility that allows you to archive all emails pertaining to a particular project on Confluence alongside it in the same space.

You can download mail from one or more pop-accounts. You can also import mail from mbox files either on your local system or on the Confluence server.

⚠️ The information on this page does not apply to Confluence OnDemand.

Choose Browse > Mail to see archived mail.

(If you are not a space administrator for the target space, contact your Confluence administrator to request Space Admin permission.)

From here, you can navigate mail easily and also use the Quick Search to search mail and the attachments it contains.

What would you like to do?

- Add a Mail Account
- Manage Mail accounts
- Import Mail
- View Mail
- Fetch Mail
- Delete Mail
- Restore Mail
The ability to archive mail applies only to global spaces, not personal spaces. Please see Working with Spaces for information about the differences between global spaces and personal spaces.

**Related Topics**

Take me back to the Confluence User's Guide.

**Adding a Mail Account**

**Confluence Mail Archiving is an optional feature.** This means that the Mail elements will not appear in the Confluence user interface by default. Mail archiving features are contained in a bundled plugin. To activate mail archiving features in Confluence, activate the plugin from Confluence Admin > Plugins > Show System Plugins > Confluence Mail Archiving Plugin.

When you add a mail account, you are configuring Confluence to download mail from that account and archive the mail within the space. Since Confluence removes emails from an email account as it is added to the Mail Archive, Confluence must be set up to poll a clone email account rather than the actual account. For example, to archive the actual account sales@company.com to your Confluence Sales space, you must first create a clone account such as conf-sales@company.com that contains the same email content.

---

**Stage 1 - Creating A Clone Email Account**

1. Add a new email account on the mail server with the clone email address.
2. Copy all existing emails from the actual account to the clone account.
3. Set up the actual account to bcc sent emails to the clone account.
4. Set up the actual account to forward received emails to the clone account.

**Stage 2 - Archive Clone Account To Mail Archive**

1. If you are not a space administrator for the target space, contact your Confluence administrator to request Space Admin permission. You need to be a space administrator before you can add a mail account to the space.
2. Go to Browse > Mail.
3. Click on Mail Accounts under the heading 'Mail' in the left panel to show the list of existing mail accounts.
4. Click Add mail account located at the top of the page.
5. Enter configuration details for the account. The protocol may be POP/S or IMAP/S. Click Create when finished.

- **Account Name:** Enter a name for this account by which it will be known in Confluence.
- **Description:** Provide a description for this account (Optional).
- **Protocol:** Choose from POP, IMAP, POPS or IMAPS
- **Hostname:** Enter the account mail server host name.
- **Port:** The mail server's port number will be displayed by default. Do not edit this field.
- **Username:** Enter a username for this account.
- **Password:** The account's password.

**Important:** Configured accounts will have their mail downloaded and removed from the server, so make sure you are downloading from a clone account.

---

Note: The ability to import mail applies only to global spaces, so the 'Import' section does not appear in the 'Space Admin' tab for personal spaces. Please see Working with Spaces for information about the differences...
between global spaces and personal spaces.

Deleting Mail

To delete mail for a space, you require 'Remove Mail' permission which is assigned by a space administrator from the Space Administration screens. See Space Permissions.

Only a space administrator can delete all email messages for the space simultaneously.

⚠️ The information on this page does not apply to Confluence OnDemand.

To delete mail for a space:

1. Go to Browse > Mail.
2. Go to the Mail tab. A list of messages in the space is displayed in reverse chronological order.
3. Delete an individual email by clicking the trash  icon beside it. Deleted mail is stored under Trash and can be restored by a space administrator from the Space Admin tab. If you are a space administrator, you can delete all email messages within a space at once by clicking on the Delete All link at the top of the mail view.

Notes

- Email messages deleted using the Delete All option cannot be restored.
- Confluence Mail Archiving is an optional feature. This means that the Mail elements will not appear in the Confluence user interface by default. Mail archiving features are contained in a bundled plugin. To activate mail archiving features in Confluence, activate the plugin from Confluence Admin > Plugins > Show System Plugins > Confluence Mail Archiving Plugin.

Fetching Mail

Confluence Mail Archiving is an optional feature. This means that the Mail elements will not appear in the Confluence user interface by default. Mail archiving features are contained in a bundled plugin. To activate mail archiving features in Confluence, activate the plugin from Confluence Admin > Plugins > Show System Plugins > Confluence Mail Archiving Plugin.

Confluence fetches mail from the server once every 30 minutes.

You need to be a space administrator to manually retrieve new mail from mail accounts.
The information on this page does not apply to Confluence OnDemand.

To manually retrieve mail:

1. Go to Browse > Mail.
2. Go to the Mail tab. A list of messages for the space is displayed in reverse chronological order.
3. Click on the Fetch new mail link located above the list of messages. Any new messages will be displayed in order of most recent first.

Note

Once mail is fetched, it will be removed from the server.

Importing Mail

Confluence Mail Archiving is an optional feature. This means that the Mail elements will not appear in the Confluence user interface by default. Mail archiving features are contained in a bundled plugin. To activate mail archiving features in Confluence, activate the plugin from Confluence Admin > Plugins > Show System Plugins > Confluence Mail Archiving Plugin.

Confluence allows you to import mail from mbox files located either on your local system or on the Confluence server and archive it within the space.

You need to be a space administrator to import mail for a space.

The information on this page does not apply to Confluence OnDemand.

To import mail from mbox files:

1. Go to Browse > Mail.
2. Click on Mail Import under the heading 'Mail' in the left panel.
   - To import from a Local system, click Browse to select the mbox file. Then click Import.
   - To import from the Server, enter the location of the mbox file on the server in the Server text field and click Import.

The ability to import mail applies only to global spaces, so the 'Import' section in the above screenshot does not appear in the 'Space Admin' tab for personal spaces. Please see Working with Spaces for information about the differences between global spaces and personal spaces.

Restoring Mail

Take me back to the Confluence User's Guide.

Restoring Mail

Deleted email messages are stored under 'Trash' and can be restored by a space administrator from the Space Administration screens.

You can only restore an email message from trash if it was deleted individually and not using the 'Remove All' operation.

To restore mail:

1. Navigate to any page in the space and choose Browse > Space Admin.
Choose Trash in the left-hand panel. A list of pages and email messages deleted from the space is displayed.

Choose Restore beside the email you want to restore.

To view the restored email message, choose Browse > Mail.

Notes

Confluence Mail Archiving is an optional feature. This means that the Mail elements will not appear in the Confluence user interface by default. Mail archiving features are contained in a bundled plugin. To activate mail archiving features in Confluence, activate the plugin from Confluence Admin > Plugins > Show System Plugins > Confluence Mail Archiving Plugin.

Viewing Mail

Confluence Mail Archiving is an optional feature. This means that the Mail elements will not appear in the Confluence user interface by default. Mail archiving features are contained in a bundled plugin. To activate mail archiving features in Confluence, activate the plugin from Confluence Admin > Plugins > Show System Plugins > Confluence Mail Archiving Plugin.

In Confluence, each global space can be set up to archive mail.

To view mail messages archived within a particular space:

1. Navigate to any page in the space and choose Browse > Space Admin.
2. Click on the Mail tab. The mail is displayed in reverse chronological order with a default of 30 mails per page. You can move between pages by clicking the << Previous and Next >> links or by selecting a particular page number.
3. Click on a mail message to view its contents.

The information on this page does not apply to Confluence OnDemand.

If you are a space administrator, or have been given permission to delete mail messages, you can also delete emails from here.

Navigating Mail:

Find More These links links at the top of an email message let you search for other emails from the same author or on the same subject.

Attachments This link located below the email body allows you to view mail attachments. The link is only displayed if any attachments exist.

Entire Thread This link allows you to view the mail's thread, if one exists.

The 'Mail Operations' panel is located to the right of the mail view and displays links to:

- Entire Thread: View the thread that this mail belongs to. This option is only available when the mail belongs to a thread.
- Next By Date: Navigate to the next message.
- Previous By Date: Navigate to the previous message.
- Remove Mail: Remove the current mail from the space.
- Mail Archive: Go to the mail archive view for this space.

Working with Confluence Labels

Labels are key words or tags that you can add to pages, blog posts, attachments and spaces. You can define your own labels and use them to categorise, identify or bookmark content in Confluence.

For example, you could assign the label 'accounting' to all accounts-related pages on the site. You can then browse all pages with that label in a single space or across the site, or display a list of pages with that label. You can search based on the label, or use it to filter items when you subscribe to a Confluence RSS feed.

Because labels are user-defined, you can add any word that helps you identify the content in the site.

You can add or remove labels without affecting the page content.

Content labels

You can add labels to pages, blog posts and attachments. Any user with permission to view the page can also view its labels. See Adding Labels.
Space labels and space categories

You can also apply labels to spaces and use them to categorise your spaces. See Using Labels to Categorise Spaces.

Advantages of labels

Here are some of the advantages of using labels:

- Labels are user-defined which means that you decide what information is relevant to you and how you are going to label it.
- You can group pages and spaces without having to restructure the site.
- Labels are easy to add and edit, and do not affect the content of the page.
- You can add as many labels as you like to a page or space.

Using labels

- Adding Labels
- Using Labels to Categorise Spaces
- Removing Labels
- Using Label Macros to Categorise Wiki Content
- Viewing Labels and Labelled Content

Notes

Note: Personal labels are deprecated: Earlier versions of Confluence recognised a special type of label called a 'personal' label. A personal label starts with 'my:' and is only visible to the user who created it. We are removing personal labels from Confluence, as announced in the Confluence 4.1 Upgrade Notes. The functionality for personal labels is still in Confluence, but we recommend that you stop using them. In a future release, we plan to remove the functionality altogether.

Adding Labels

Labels are key words or tags that you can add to pages, blog posts, attachments and spaces. You can define your own labels and use them to categorise, identify or bookmark content.

Labelling a page or blog post

Any user with permission to edit a page can add a label to a page.
To add a label to a page or blog post:

1. Go to the page. If the page already has labels, these will be listed at the bottom of the page, below the page content.
2. Click the edit icon 🖌 beside the list of labels, or press L on your keyboard.
3. Type in a new label. Existing labels are suggested as you type.
4. Click Add.

On this page:
- Labelling a page or blog post
- Labelling an attachment
- Notes

Related pages:
- Removing Labels
- Viewing Labels and Labelled Content
- Using Label Macros to Categorise Wiki Content
- Using Labels to Categorise Spaces
- Confluence User's Guide

Screenshot 1: Labels as they are displayed on a page

Screenshot 2: Adding a label to a page or blog post

Labelling an attachment

Any user who has permission to view or edit the page that contains the attachment can add a label to the attachment.

To add a label to an attachment:

1. Go to the page that contains the attachment. Choose Tools > Attachments.
2. Alternatively, go to the attachments view of the space:
   Go to a page in the space and choose Browse > Attachments.
3. You will see a list of attachments, with columns for attachment name and other details. If the attachment already has labels, these will be listed in the Labels column.
4. Click the edit icon 🖌 beside the list of labels.
5. Type in a new label. Existing labels are suggested as you type.
6. Click **Add**.

You can also add labels in a list of attachments displayed by the **Attachments macro**, by clicking the edit icon beside each label as described above.

**Screenshot 2: Adding a label to an attachment**

---

**Notes**

- **Note: Personal labels are deprecated**: Earlier versions of Confluence recognised a special type of label called a 'personal' label. A personal label starts with 'my:' and is only visible to the user who created it. We are removing personal labels from Confluence, as announced in the **Confluence 4.1 Upgrade Notes**. The functionality for personal labels is still in Confluence, but we recommend that you stop using them. In a future release, we plan to remove the functionality altogether.
- If you add a label to a template, that label will be copied to the page when someone adds a page based on that template. See **Adding a Template**.

**Using Labels to Categorise Spaces**

Confluence provides the following types of space label:

- **Space labels**. A space label can be used to group related spaces for display by the Content by Label macro, and for ranking search results. You use space labels in a similar way to global labels.
- **Space categories**. A 'space category' is a special type of space label that Confluence uses to group spaces in the space directory, and in the recent activity area of the dashboard. The rest of this page describes space categories.

Note that you can only set up space categories if you are a space administrator for that space, or you are a Confluence system administrator.

**Using Space Categories**

Here is an example of using space categories. Let's assume that you have one or more spaces that your Sales team may be interested in. You can use the category 'sales' to group those spaces together.

1. First add the 'sales' category to the relevant spaces, as described below.
2. Then, in the space directory, you can click the relevant tab to see only the spaces with the chosen label. See **Viewing All Confluence Spaces**.
3. And, you can see updated content in those spaces by choosing the 'sales' category under the Space Categories tab in the recent activity area of the dashboard. See **Customising your Personal Dashboard**.
Categorising a Space

When you categorise a space, you add a 'space category' to the space. A category cannot exist if there are no spaces labelled with that category.

To categorise a space:

1. Navigate to the space you wish to categorize.
2. Choose Browse > Space Admin.
   *Note:* 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
3. Click Space Labels in the left-hand panel.
4. Under 'Space Categories', enter your category name and click Add.
   Alternatively, click a category in the list of 'Suggested Space Categories' displayed on the screen.

Removing a Space from a Category

Removing a space from a category is the same thing as removing the category from the space.

To remove a space from category:

1. Navigate to the space you wish to remove the category from.
2. Choose Browse > Space Admin.
   *Note:* 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
3. Click Space Labels in the left-hand panel.
4. Click the x next to the space category.

Removing an Entire Space Category

To remove a whole space category from Confluence, just remove that category from all spaces, as described above. A category cannot exist if there are no spaces labelled with that category. The space category will disappear from the dashboard and space directory.

To remove an entire space category from Confluence:

2. Click the tab corresponding to the space category that you want to remove.
3. You will see a list of all spaces in that category. Click the spaces one by one, and remove the category from each space, as described above.
Removing Labels

Labels are key words or tags that you can add to pages, blog posts and attachments. You can define your own labels and use them to categorise, identify or bookmark content in Confluence. You can see the existing labels, and the pages which contain the labels, by viewing labels and labelled content.

Removing labels in Confluence

To remove a label from a page or blog post:

1. Go to the page that contains the label. You will see the labels at the bottom of the page below the page content.
2. Choose the edit icon beside the list of labels, or press L on your keyboard.
3. In the 'Labels' dialog, choose the X next to a label to remove that label.
4. Choose Close.
To remove a label from an attachment:

1. Go to the page that contains the attachment. Choose **Tools > Attachments**.
2. Alternatively, go to the attachments view of the space:
   Go to a page in the space and choose **Browse > Attachments**.
3. You will see a list of attachments, with columns for the attachment name and other details. If the attachment already has labels, these will be listed in the **Labels** column.
4. Choose the edit icon beside the list of labels.
5. In the 'Labels' dialog, choose the **X** next to a label to remove that label.
6. Choose **Close**.

When you have removed the label from all content, the label will disappear from the labels view in the space too.

**Notes**

- **Deleted pages containing labels**: If you have deleted pages that contain a label, you may need to **purge** the deleted pages from the space's trash to ensure that the label disappears too.
- **Bulk removal of labels**: There is no way to remove a number of labels at once, via the Confluence user interface. Instead, we suggest that you use the **Confluence Command Line Interface**. See the 'removeLabels' action described in the **CLI documentation**. For an introduction to the CLI, see this blog post: **Confluence CLI for bulk actions like deleting or publishing pages**.

---

**Using Label Macros to Categorise Wiki Content**

Using labels, you can categorise pages and refer to content across multiple categories, pages and even spaces.

**Example**

For the purpose of this example, imagine we have a space with pages of content on various type of vehicles. Pages are shown in **bold** text, while the labels are in **blue**.

- **Cars** vehicle-type
  - Toyota Prius vehicle car
  - Honda Civic vehicle car
  - Porsche Carrera vehicle car

- **Motorbikes** vehicle-type
  - Harley Davidson Sportster vehicle motorbike
  - Suzuki GSX-R vehicle motorbike

This page hierarchy can then be categorised using labels, with pages referenced using the **Content by Label Macro**.

<table>
<thead>
<tr>
<th>If you want to list...</th>
<th>You would use this label:</th>
<th>These would be the pages that you would get:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vehicle types</td>
<td>vehicle-type</td>
<td>Cars, Motorbikes</td>
</tr>
</tbody>
</table>
All vehicles

<table>
<thead>
<tr>
<th>vehicle</th>
</tr>
</thead>
<tbody>
<tr>
<td>Toyota Prius, Honda Civic, Porsche Carrera, Harley Davidson Sportster, Suzuki GSX-R</td>
</tr>
</tbody>
</table>

All cars

<table>
<thead>
<tr>
<th>car</th>
</tr>
</thead>
<tbody>
<tr>
<td>Toyota Prius, Honda Civic, Porsche Carrera</td>
</tr>
</tbody>
</table>

Navmap Macro

The Navigation Map Macro renders the list of pages associated with a specified label as a navigation map.

Related Labels Macro

The Related Labels Macro lists labels commonly associated with the current page's labels.

Content by Label Macro

The Content by Label Macro displays a list of content marked with specified labels.

Labels List Macro

The Labels List Macro lists all labels of a space, grouped alphabetically.

Recently Used Labels Macro

The Recently Used Labels Macro lists labels most recently used in a specified scope (global, space, or personal).

Popular Labels Macro

The Popular Labels Macro displays popular labels in a list or in a heatmap (also called a cloud).

Viewing Labels and Labelled Content

Labels are key words or tags that you can add to pages, blog posts, attachments and spaces. You can define your own labels and use them to categorise, identify or bookmark content in Confluence. This page describes a few ways of viewing labels and labelled content. The focus of this page is global labels. You may also be interested in viewing personal labels.

Finding the labels view

If you see a label on a page, blog post or attachment, click it to go to the labels view. Global labels are visible to all users with 'view' permission on the page, and personal labels are visible only to the person who added them.

- Any page or blog post that has labels will have them listed together in a block at the bottom of the page.
- You will also see labels in the 'Attachments' view or in a listing of attachments provided by the Attachments macro. (See Displaying a List of Attachments.)

To find the labels view by clicking a label:

If you are in a page that has labels, click a label.
If it is a **personal** label (starts with 'my:') you will go to the personal labels page in your user profile. See [Viewing Personal Labels](#).

If it is a global label, you will go to the 'Labels' tab of the space. You will see all labels for that space.

**Screenshot 1: Labels as they are displayed on a page**

![Label example](image)

**To find the labels view from the menu:**

Go to a page in the space and choose **Browse > Labels**.

**On this page:**

- Finding the labels view
- Using the labels view
- Searching for labels
- Navigating pages by URL and label

**Related pages:**

- Viewing Personal Labels
- Searching Confluence
- Confluence User's Guide

**Using the labels view**

The labels view in a space offers the following options:

- **Popular Labels**: Click this option to see a list of the most frequently used labels in that space. From here, you can also view the most popular labels across the site. The bigger the font size, the more popular the label.

- **All Labels**: View all labels in the space. From this view, you can click on a link to view an alphabetical listing of all labels across the site. Clicking on a label will list all content in the space with that label. It will also display any related labels if they exist. **Related labels** are labels that frequently appear on pages together. For example, if pages labelled with 'sales' also tend to have the label 'marketing', these will be displayed as related labels.

- **See content from all spaces**: Expand the list of labels to include pages and other labelled content from all spaces.

**Screenshot 2: The labels view of the space**
Searching for labels

A quick way to find labelled content is to search for it. If there is a label matching your query, you will see it in the panel titled Browse Labels in the search results. Click the label to see all content in the site with that label.

Screenshot 3: Searching for labelled content

Advanced label searching

Use the 'labelText:' prefix to search specifically for page labels. The table below gives examples of search terms that you can enter into Confluence's search box, and the search results that you can expect.

<table>
<thead>
<tr>
<th>Searching for ...</th>
<th>Returns content that ...</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Navigating pages by URL and label

This section describes how to move around your Confluence pages by adding and subtracting labels from the list of labels that you want to match. You can search for matching labels by entering a URL. You can also add and subtract labels from the search.

To search labelled pages by typing a URL:

1. Open a new web browser window.
2. In the address bar of your web browser, type an URL such as:
   
   http://CONFLUENCE_HOSTNAME/label/foo+bar

3. Press Enter.

4. The 'View Labels' page will load, showing search results for pages with the labels 'foo' and 'bar'.

Adding a label to your results:

- Click a label from the Related Labels list (at the top left).
- A new page loads, showing pages that contain all of the labels selected so far. You can continue to add labels to the results in this way.

Subtracting a label from your search results:

Once two labels are in use, links to subtract a label from the search appear at the end of the labels list. These are easily identified because these links have a preceding minus sign, like this:

- education

Screenshot 4: Labels view with links for subtracting labels

Viewing Personal Labels

Any page that has labels (global or personal) will have them listed at the bottom of the page. Personal labels start with 'my:', and are only visible to the user that created them.
Note: Personal labels are deprecated: We are removing personal labels from Confluence, as announced in the Confluence 4.1 Upgrade Notes. The functionality for personal labels is still in Confluence, but we recommend that you stop using them. In a future release, we plan to remove the functionality altogether.

To view your personal labels:

- If you are on a page that has personal labels, click one of those labels to get to the screen showing all your personal labels.
- Alternatively, visit the URL: `<your Confluence site>/users/viewmylabels.action`. For example: [http://confluence.atlassian.com/users/viewmylabels.action](http://confluence.atlassian.com/users/viewmylabels.action)

You will see a list of your personal labels along with the pages that contain the label, as shown in the screenshot below.

- Confluence User's Guide

What do you want to do?

Adding Favourites
Viewing Favourites
Removing Favourites

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Adding Favourites

To add a page as a favourite:

1. Go to the page.
2. Choose Tools > Favourite.
   This will change to ⭐ Favourite (when you next open the Tools menu) to indicate that you have added this page as a favourite.

To add a global space as a favourite:

1. Go to the Dashboard.
2. Click the Spaces tab.
3. Click the star icon ⭐ located beside the space name in the list of global spaces.
   This will change to ⭐ to indicate that you have added this global space as a favourite.

To add a personal space as a favourite:

2. Click on a person's name or profile picture to view their personal space.
3. Go to a page in the space and choose Browse > Advanced.
4. Click on Add Space to Favourites in the left-hand panel.
   This will change to Remove Space from Favourites to indicate that you have added that person's personal space as a favourite.

Once you have added a personal space to your list of favourites, that personal space will be added to your list of favourite spaces, which can be accessed from the dashboard or your profile.

For more information about global spaces and personal spaces, see Working with Spaces.

Working with Attachments

An attachment is any file that is included with your page. Examples of attachments are screenshots, photographs, other images, Word documents, presentations, PDF documents, videos and sound files. Attachments are useful when you want to share information that exists in another file format. You can attach files to any page or blog post, provided you have permission to do so.

When a page you are viewing contains attachments, a small paperclip icon appears next to the page byline, under the page name. Clicking the paperclip will take you to the 'Attachments' view, where you will see the full list of attachments.

On this page:

- A quick guide to attachments
- Working with attachments
- Notes

Related pages:

- Configuring Attachment Size
- Configuring your Attachment Storage
- Confluence User’s Guide

A quick guide to attachments

Choose Tools > Attachments to view and attach files to a Confluence page. (See Attaching Files to a Page.) If you attach a file with the same name as an existing attachment, Confluence will create a new version of the existing attachment.

Once you have attached the relevant files, you can display attached images and multimedia content on the page. If the attachment is an Office document, use the View File macro to display the content of the document on the Confluence page. If you have an Office application installed, you will also be able to launch your Office editor from within Confluence. See Displaying Office Files in Confluence and Working with the Office Connector.
Your page can display a list of attachments – these may be the files that are attached to the page or to any page in the space. You can also display a link to an attachment. When a user clicks the link, the attachment will open, provided that the user has the software application needed to open the attachment.

You can label an attachment, and then use labels to categorise your content.

Working with attachments

- Using Drag-and-Drop in Confluence
- Attaching Files to a Page
- Attachment Versions
- Deleting an Attachment

- Viewing Attachment Details

Notes

If you want an attachment to be displayed on more than one page, you may wish to consider creating a special page to hold such attachments. This special page could be part of an ‘inclusions library’.

Using Drag-and-Drop in Confluence

This page describes the drag-and-drop functionality in Confluence, and the browser configurations needed to support that functionality.

Overview of the drag-and-drop features

Confluence supports these forms of drag-and-drop:

- **Drag-and-drop within the editor.** Working inside the editor panel, you can drag an image or a macro and drop it into a different location on the page.

- **Drag-and-drop for external images and files.** You can drag a file from a location outside Confluence, and drop it directly into the editor. For example, try it with images, video files, audio files, Office documents, and PDF files. The contents of the file will be embedded into the page or blog post.

Drag-and-drop within the editor

Working within the editor panel, you can drag an image or a macro from one location on the page and drop it into a different location on the page. Hover your cursor over the image or the macro placeholder. The cursor changes to a drag-and-drop icon and you can click the image or macro and drag it to a new location.

If you want to abandon the drag-and-drop action, press Escape. The image/macro will return to its original position.

Requirements for internal drag-and-drop

For the drag-and-drop of images and macros in the editor, Confluence supports the following browsers: Chrome, Firefox, and Internet Explorer 9. (Drag and drop in the editor does not work in Internet Explorer 8.)
Drag-and-drop for external images and files

You can drag files from your computer or file system onto your browser and attach them to your Confluence pages or blog posts. You can drag and drop:

- multiple files at once.
- image, multimedia and PDF files, and Office documents.

When you drag and drop files onto the different Confluence views, you get the following results:

<table>
<thead>
<tr>
<th>Confluence View</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachments</td>
<td>Files are attached</td>
</tr>
<tr>
<td>Page</td>
<td>Files are attached</td>
</tr>
<tr>
<td>Edit</td>
<td>Files are attached, and embedded at the cursor position</td>
</tr>
</tbody>
</table>

**Requirements for external drag-and-drop**

- Your browser must support the drag-and-drop functionality of HTML5.
- Some browsers, such as Internet Explorer 9, Firefox 3.5 and Safari 4 do not support the drag-and-drop functionality of HTML5. For these browsers, Confluence will attempt to use the drag-and-drop functionality provided by Google Gears.

  - The first time you try to drag and drop a file into one of these browsers, Confluence will prompt you to install Google Gears into your browser. Refer to the prompt below for more information. For more details on the installation requirements for Google Gears, refer to Google's own How to install instructions.
  - Please check the Google Gears website for the most up-to-date browser support details.

  - To check if Google Gears is already installed on your computer, refer to Google's own How to check if Gears is installed instructions.

**Note about supported web browsers:** Please ensure that you are using one of the web browsers...
supported by Confluence. If you are using an unsupported browser or browser version, some features may not work correctly. You can find the list of supported web browsers and browser versions on this page: Supported Platforms.

- Some older Confluence themes do not support Confluence’s drag-and-drop feature.

  - **Supported themes**: Confluence Default theme, Documentation theme, Easy Reader theme.
  - **Themes that are not supported**: Left Navigation theme, Clickr theme. You cannot drag and drop attachments into spaces that use these themes.

**Prompt to install Google Gears**

If you are using a browser that does not support the drag-and-drop feature, and Google Gears has not yet been installed:

- When you attempt to drag and drop a file into Confluence (but not the editor), you will see the following message:

  **Screenshot: Generic Confluence prompt to install Google Gears**

  ![Generic Confluence prompt to install Google Gears](image)

  Click **OK** to install Google Gears.

- When you attempt to drag and drop a file into the editor, you will be prompted with the following message:

  **Screenshot: Confluence prompt to install Google Gears**

  ![Confluence prompt to install Google Gears](image)

  **Note**: **Save any drafted content** before continuing with the installation of Google Gears. The installation process will replace your current Confluence page and you will need to restart your browser after the Google Gears installation has completed.

  Click **Proceed with Installation** to install Google Gears.
Initial use with Google Gears

When adding an attachment to a page or blog post in your Confluence site for the first time after Google Gears has been installed, you will be prompted to allow Google Gears to trust your Confluence site. If this warning message appears, choose *I trust this site. Allow it to use Gears* and then choose *Allow*.

*Screenshot: Google Gears security prompt*

![Gears Security Warning](image)

**Note:** Google Gears is not supported on Safari. See [CONF-20032](https://confluence.atlassian.com/doc/CONF-20032) for updates.

Disabling drag-and-drop for external files

- If you wish to disable the drag-and-drop feature, you can disable the entire *Confluence Drag and Drop Plugin*. See [Disabling or Enabling a Plugin](https://confluence.atlassian.com/doc/Disabling_or_Enabling_a_Plugin).
- You can also disable the drop zone that appears on the 'Attachments' view or the image dialog box, by disabling the *View Attachments Drop Zone* or *Image Dialog Drop Zone* modules of the above plugin. This will remove these drop zones while retaining Confluence's drag-and-drop functionality.

Attaching Files to a Page

An attachment is any file that is included with your page. Examples of attachments are screenshots, photographs, other images, Word documents, presentations, PDF documents, videos and sound files. Attachments are useful when you want to share information that exists in another file format. Read more in [Working with Attachments](https://confluence.atlassian.com/doc/Working_with_Attachments).

When you attach a file to a page, Confluence makes a copy of the file and stores it on the Confluence server. Page attachments in Confluence are managed using the 'Attachments' view of the page.

To attach a file, you need the 'Create Attachments' permission. See [Space Permissions](https://confluence.atlassian.com/doc/Space_Permissions).

When a page you are viewing contains attachments, a small paperclip icon ![paperclip](image) appears next to the page byline, under the page name. Clicking the paperclip will take you to the 'Attachments' view, where you will see the full list of attachments.
On this page:

- Attaching files
- Attachment versions

- Confluence User's Guide

**Attaching files**

This page describes the following ways of attaching files to a Confluence page:

- Drag and drop files on to a Confluence page.
- Browse to, and upload files from, your computer or network.

**To attach a file to a page using drag-and-drop:**

1. View the page to which you want to attach files.
2. Drag one or more files from your computer onto the page. The ‘Attach File(s)’ message box appears, indicating the upload status of the files being attached to your page.

You can drag and drop more than one file at a time onto a page. You cannot drag a folder of files onto a page.

Expand this section to see other ways to drag-and-drop a file on to a page...

You can also drag and drop files:

- directly onto the 'Attachments' view for the page.
- directly onto the editor view of the page.
- onto any tab of the 'Insert Link' or 'Insert Image' dialogs, which are available from the **Insert** menu while editing.

**To attach a file to a page from the computer's (or network's) file system:**

1. Choose **Tools > Attachments**.
2. Choose **Browse** and navigate to the file.
3. Select the file and click **Open**.
4. Add a descriptive comment for the file (optional).
5. Choose **Attach more files** if required.
6. Choose **Attach**.

You can attach than one file at a time. You cannot attach a folder of files.

Expand this section to see other ways to upload a file to a page...
You can also browse for, and upload, a file from:

- the 'Attachments' tab of the 'Insert Link' dialog. (While editing the page, choose Insert > Link.)
- the 'Attached Images' tab of the 'Insert Image' dialog. (While editing the page, choose Insert > Image.)

**Attachment versions**

If you upload a file with the same name as an existing attachment, Confluence will rename the old file and keep it as a previous version. Read more about Attachment Versions and Viewing Attachment Details.

**Notes**

- **Reusing attachments:** If you want to display the same file on more than one page, the best way is to put the attachment on a page (say, page A) and then use the Include Page Macro to include page A into page B, page C, and all the pages where you want the diagram, presentation, or other file. Alternatively, you can display an image that is attached to another page.
- **Updating the original file:** Any changes you make to the source file do not affect the copy that was uploaded to Confluence. To update the Confluence copy, you need to upload the new version of the file.

**Attachment Versions**

An attachment is any file that is included with your page. Examples of attachments are screenshots, photographs, other images, Word documents, presentations, PDF documents, videos and sound files. Attachments are useful when you want to share information that exists in another file format.

When viewing a list of attachments, you can add a new version of an existing attachment by uploading an attachment with the same file name, as displayed on the attachment view. Existing files will be kept with the name 'Version x', where the value of 'x' increments with each upload of an attachment with the same file name.

To see all versions of an attachment: Choose the arrow next to an attachment name.

**Related pages:**

- Attaching Files to a Page
- Deleting an Attachment
- Moving an Attachment
- Viewing Attachment Details
- Working with Attachments
- Confluence User's Guide

---

**Screenshot: Attachment versions**

---

**Notes**
You cannot revert to a previous version of an attachment. See feature request CONF-1943.

Confluence does not track the history of attachments in the same way as it does for pages. See feature request CONF-13943.

By default, attachments and their versions are stored in the `<confluence_home>/attachments` directory. (See Attachment Storage Configuration.)

There is no limit to the number of attachments or attachment versions, provided that there is enough disk space.

Deleting an Attachment

An attachment is any file that is included with your page. Examples of attachments are screenshots, photographs, other images, Word documents, presentations, PDF documents, videos and sound files. Attachments are useful when you want to share information that exists in another file format.

By default, when you remove an attachment, this will delete all versions of the attachment. To do that, you need the 'Remove Attachments' permission. See Space permissions.

If you want to delete a specific version of an attachment, you need to be a space administrator.

Related pages:
- Working with Attachments
- Displaying Images
- Confluence User's Guide

To delete all versions of an attachment:

1. Go to the page that contains the attachment.
3. Choose Remove next to the attachment you want to delete.
4. Choose Remove to confirm your action.

To delete a specific version of an attachment:

1. Go to the page that contains the attachment.
3. Choose the arrow on the left next to the attachment you want to manage. A list of attachment versions will appear.
4. Choose Remove next to the version you want to delete.
5. Choose Remove to confirm your action.

Screenshot: Attachments and attachment versions

Displaying a List of Attachments

An attachment is any file that is included with your page. Examples of attachments are screenshots,
photographs, other images, Word documents, presentations, PDF documents, videos and sound files. Attachments are useful when you want to share information that exists in another file format.

You can display a list of attachments on your page – these may be the files that are attached to the page or to any page in the space. Use the Attachments macro to show a list of the attachments on the current page. Use the Space Attachments macro to show a list of the attachments in the current space. Both these macros generate a table of attachments which is clickable.

**Using the macros**

**To add the Attachments or Space Attachments macro to a page:**

1. In the Confluence editor, choose Insert > Other Macros.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{ and the beginning of the macro name, to see a list of suggested macros. Details are in Using Autocomplete.

**To edit an existing macro:** Click the macro placeholder and choose Edit. A macro dialog window will open, where you can edit the parameters of the macro.

---

**Parameters of the Attachments macro**

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>

---

**Related pages:**

- Attaching Files to a Page
- Working with Attachments
- Working with Macros
- Confluence Wiki Markup for Macros
- Confluence Storage Format for Macros
- Confluence User's Guide
| **Filename Patterns** | all | A comma-separated list of regular expressions, used to filter the attachments by file name. Note that the parameter values must be regular expressions. For example:
- To match a file suffix of ‘.jpg’, use `.*jpg` (not `.*.jpg`).
- To match file names ending in ‘.jpg’ or ‘.png’, use `.*jpg, .*png`.

Here is a [tutorial on regular expressions](#).

| **Attachment Labels** | (none) | A list of labels, used to filter the attachments to display. If you wish to enter more than one label, separate the labels with commas. Confluence will show only attachments that have **all** the labels specified. (The match is an **AND**, not an **OR**.) For information on labelling the attachments, see [Adding Labels](#).

| **Include Old Attachment Versions** | false | A value of **true** will include previous attachment versions in the list.

| **Sort By** | date | The sort order for attachments. Note that people viewing the page can change the sort order by clicking the column headings. Valid values are:
- **date** – sorts by reverse chronological order (newest first)
- **size** – sorts largest to smallest
- **name** – sorts alphabetically

| **Sort Order** | ascending | Used in combination with the **Sort By** parameter, to sort the attachments in ascending or descending order.

| **Allow Upload** | true | If selected, the list of attachments will include options allowing users to browse for, and attach, new files.
Page Title | (none) |
---|---|
Used to display attachments from another page. If you do not enter a page title, the macro will display the files attached to the current page.

**Viewing files and changing file properties from the Attachments macro**

The list of files displayed by the Attachments macro includes options for viewing the files and other actions, provided the user has the relevant permissions.

- If you have specified the 'Allow Upload' parameter, users will be able to upload attachments directly from the list.
- Users can remove attachments. Note that they can only remove the entire attachment, including all versions of the attachment. To remove a specific version of an attachment, they must go to the 'Attachments' view. See [Deleting an Attachment](#).
- Users can edit attachment properties and labels. If an attachment is an Office or PDF file, they will see the appropriate options for Office Connector files.

**Screenshot 1: The Attachments macro**

![Screenshot of the Attachments macro](image)

**Parameters of the Space Attachments macro**

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space</td>
<td>(none)</td>
<td>Selects the Confluence space to display all attachments for. If no space is specified, the current space will be used.</td>
</tr>
<tr>
<td>Attachment Labels</td>
<td>(none)</td>
<td>Filters the attachments to display, based on a list of labels. If you wish to enter more than one label, separate the labels with commas. For information on labelling the attachments, see <a href="#">Adding Labels</a>.</td>
</tr>
</tbody>
</table>
Show Filter Controls | true | Determines whether or not the filter panel is shown. The filter panel allows you to filter the list of attachments by file type (extension).

---

**Downloading Attachments**

An attachment is any file that is included with your page. Examples of attachments are screenshots, photographs, other images, Word documents, presentations, PDF documents, videos and sound files. Attachments are useful when you want to share information that exists in another file format.

**To download a single attachment from a page:**

1. View the page.
2. Choose **Tools > Attachments**.
3. Right-click the link on the attachment name, and select **Save Link As**, **Save Target As** or a similar option provided by your browser. This will open a 'Save' dialog.
4. Select the location into which you want to download the file and choose **Save**.

**Related pages:**
- Attaching Files to a Page
- Working with Attachments
- Confluence User's Guide

**To download all the attachments from a page:**

1. View the page.
2. Choose **Tools > Attachments**.
3. Choose the **Download All** button at the end of the page to download a zipped file of all the page’s attachments.

**Notes**

- There is no permission that controls the downloading of attachments. See an article in our knowledge base about [disabling the download of attachments](mailto:).  
- Confluence does not supply an option to download all attachments from a space. See the closed feature request: [CONF-5669 - Authenticate](mailto:) to see issue details.
Editing Attachment Properties

An attachment is any file that is included with your page. Examples of attachments are screenshots, photographs, other images, Word documents, presentations, PDF documents, videos and sound files. Attachments are useful when you want to share information that exists in another file format.

To edit an attachment's properties, you need the 'Create Attachments' permission. See Space Permissions.

To edit the properties of an attachment:

1. View the page that contains the attachment.
2. Choose Tools > Attachments.
3. Choose Properties next to the attachment. The 'Properties' screen will appear.
4. Make your changes:
   - File Name — Rename or modify the name of the attachment.
   - New Comment — Update the existing comment or enter a new comment.
   - New Content Type — Change the content type of the attachment by entering a valid MIME type.
   - Page — Move the attachment to another page.
5. Choose Save.

Related pages:
- Attaching Files to a Page
- Moving an Attachment
- Viewing Attachment Details
- Working with Attachments
- Confluence User's Guide

Embedding Multimedia Content

Using multimedia files you can display movies, animations and videos, and embed audio files on your Confluence page.

There are several methods for attaching files to a page. Once you have attached the multimedia file to a Confluence page, you then edit the page to set where the multimedia content should appear.

In the example below, we display a Flash file that is attached to this page.

Confluence supports the following multimedia formats:
1. Adobe Flash (.swf)
2. Apple QuickTime (.mov)
3. Windows Media (.wma, .wmv)
4. Real Media (.rm, .ram)
5. MP3 and MP4 files (.mp3, .mp4)
6. MPEG files (.mpeg, .mpg)
7. AVI files (.avi) You may need to enable an avi decoder within your browser.

**Displaying a multimedia file attached to the page**

Once you have attached a multimedia file to a page, there are different methods for choosing where on the page the multimedia content should appear:

**Inserting the Multimedia macro yourself**

You can add the Multimedia macro to the page yourself using the Macro Browser. This allows you to display a multimedia file that is attached to either the current page or to another page in the Confluence site.

**To insert the Multimedia macro on the page at the current cursor position:**

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find and select the required macro.

**Speeding up macro entry with autocomplete:** Type `{ and the beginning of the macro name, to see a list of suggested macros. Details are in [Using Autocomplete](#).**

**To edit an existing macro:** Click the macro placeholder and choose **Edit**. A macro dialog window will open, where you can edit the parameters of the macro.

**Using autocomplete**

Once a multimedia file is attached to the page, you can use **autocomplete**, while editing the page, to choose where the multimedia content should appear.

**To position an attached multimedia file on the page using autocomplete:**

1. While editing the page, position the cursor where you want to place the multimedia content.
2. Trigger the autocomplete function by typing `!`.
3. Choose the multimedia file from the list that appears.
4. If necessary, click on the Multimedia macro placeholder and choose Edit to set various options such as the width, height or autoplay.

Using drag-and-drop

Depending on the browser you are using, you can attach and position a multimedia file in one step using drag-and-drop.

To attach and position multimedia content using drag-and-drop:

1. While you are editing a page, simply drag-and-drop the multimedia file on to the page. Confluence will attach the file to the page and insert the Multimedia macro at the current cursor position for you.
2. If necessary, click on the Multimedia macro placeholder and choose Edit to set various options such as the width, height or autoplay.

Multimedia macro parameters

Parameters are options that you can set to control the content or format of the macro output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page Name</td>
<td>Current page</td>
<td>Name of the page to which the multimedia file is attached. If you are using the Macro Browser, just start typing the name of the page and then select it from the dropdown list that appears. The page can be in the same space or another space.</td>
</tr>
<tr>
<td>Attachment</td>
<td>None</td>
<td>File name of the multimedia file.</td>
</tr>
<tr>
<td>Width</td>
<td>If not specified, the browser will determine the width based on the file type.</td>
<td>Width of the movie window to be displayed on the page. By default, this value is specified in pixels. You can also choose to specify a percentage of the window's width, or any other value accepted by HTML.</td>
</tr>
<tr>
<td>Height</td>
<td>If not specified, the browser will determine the height based on the file type.</td>
<td>Height of the movie window to be displayed on the page. By default, this value is specified in pixels. You can also choose to specify a percentage of the window's height, or any other value accepted by HTML.</td>
</tr>
</tbody>
</table>
Autoplay | False | If this option is checked (that is, if the parameter is set to 'true') then the video or audio file will start playing as soon as the page is loaded. If this option is not checked (set to 'false') then the file will not play until the user clicks the icon or image on the page. See the note about autoplay below.

Notes

- The multimedia file must be attached to a Confluence page. For security reasons, files located on remote servers are not permitted. See the Widget Connector for displaying live content from external sites.

- You will need the relevant multimedia plugin for your browser. Your browser (Firefox, Internet Explorer, Safari and others) needs a plugin to play the video or audio file on a Confluence page. For example, to play a Flash movie you need the Flash plugin. Many plugins are shipped with the major browsers by default. If a user does not have the required plugin installed and enabled in their browser, they will not be able to view the multimedia files on the page.

- Autoplay may not always work as expected. You can set autoplay on, so that your video or audio file should start playing as soon as the page is loaded into the browser. (See parameters.) However, this setting may not always work as expected. Confluence will send an instruction to the browser plugin that plays the multimedia file. Different browsers and different media plugins behave in different ways, and not all of them respect such instructions.

- Use the Office Connector to display Office documents. Take a look at the Office Connector for embedding Word documents, presentations and other Office documents onto your Confluence page.

- If you get the error, 'Unable to embed content of type application/octet-stream', this means the MIME type is not recognised.

- Advanced users can try styling via CSS. By default, each embedded object is wrapped in a div tag. If you wish to style the div and its contents, override the embeddedObject CSS class. Specifying an ID as a property also allows you to style different embedded objects differently. CSS class names in the format embeddedObject-ID are used.

Embedding PowerPoint Presentations in a Page

Below are some ideas on how your wiki page can include information from a Microsoft PowerPoint presentation.

On this page:
- Option 1 — Office Connector for Confluence
- Option 2 — Gallery or Slide Show of JPEG or PNG Images
- Option 3 — Convert PowerPoint to HTML
- Related Topics
**Option 1 — Office Connector for Confluence**

The Office Connector provides the most straightforward way to display PowerPoint slides.

**To attach and display a PowerPoint presentation in Confluence:**

1. Attach the presentation to a Confluence page:
   - View the Confluence page where you want to display your presentation.
   - Open the 'Tools' menu and select 'Attachments'.
   - Browse for your PowerPoint presentation and upload it to the Confluence page.
   - You will find detailed instructions in [Attaching Files to a Page](#).
2. Now you can display the document embedded into the Confluence page, using the View File macro. Refer to the detailed instructions for the [View File macro](#).

   ![The Office Connector is shipped with Confluence 2.10 and later. The Office Connector plugin is supported for Confluence versions 2.8.0 and later.](#)

**Option 2 — Gallery or Slide Show of JPEG or PNG Images**

1. Convert your PowerPoint pages into JPEG or PNG images, using 'save as' from PowerPoint (slide1.jpg, slide2.jpg...).
2. Upload the image files as attachments to your Confluence page. To upload in bulk, use the [WebDAV plugin](#).
3. Use the [Gallery macro](#) or the [Slideshow plugin](#) to render the images as a slide show in Confluence.

   ![Optionally, you could create a page template or a user macro that uses the Slideshow plugin, so that you do not have to code this into the wiki page each time you create a new show.](#)

**Option 3 — Convert PowerPoint to HTML**

You can convert the PowerPoint file to web page format and embed the page inside your Confluence document.

**If you accept page edits or comments from untrustworthy users, you should not attempt this process, due to a risk of malicious user attacks via the html-include macro.**

1. Review the risks associated with enabling the html-include macro [here](#).
2. If you decide to proceed, follow the instructions to enable embedded HTML pages using the macro.
3. Select an PowerPoint converter. There are at least two applications that can convert PPT to HTML:
   - [Producer for PowerPoint](#).
   - If you do not have the PowerPoint application on your machine, you can use the [Internet Assistant for PowerPoint](#) instead.
4. Download and install your chosen converter.
5. Follow the converter documentation to perform the HTML conversion. An Internet Assistant conversion guide can be found [here](#). The conversion process will create a small collection of HTML pages. Each slide will have its own page, plus an index page with buttons to let you switch between slide pages.
6. If you wish, you can test the HTML presentation now by loading the index page in your browser.
7. Place the HTML files into their own directory, named uniquely by the title of your presentation.
8. Find a suitable location to host these files within your web server. Confluence hosts all files within the `<my-install-directory>/confluence/distribution users is to go to <my-install-directory>/confluence/pages/powerpoint/<my-presentation-name>` containing index.html, slide01.html... or similar.
10. Edit or create the page where you wish to embed the PowerPoint presentation. Add the HTML Include macro pointing to the index page of your slides. Remember that URLs are case sensitive.
11. Save the page. The index page to your slides should now appear.

Moving an Attachment

You can move an attachment from its current location to any page within the site.

To move an attachment, you need the following permissions:

- Edit page permission on the page where the attachment currently exists.
- Create attachment permission on the space into which you are moving the attachment.

Space permissions are assigned by a space administrator from the Space Administration screens. See Space permissions or contact a space administrator for more information.

To move an attachment:

1. Go to the page that contains the attachment.
2. Choose Tools > Attachments.
3. Click the Properties link beside the attachment. This will display a new screen, where you can edit the properties of an attachment.
4. Select the page where you want to move the attachment by either:
   - Entering the page's title into the Page field
   - Clicking the Choose a Page icon and using the 'Choose a Page' pop-up window to choose a page within the site.
5. Click OK.

Screenshot: Moving an attachment

Moving a Page

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Choose a Page

The 'Choose a Page' window allows you to locate a page in your Confluence site. The window appears when you are moving an attachment.

To choose a page:

1. Click the page picker icon to display the 'Choose a Page' window. You will see the following tabs:
   - **Search**: Allows you to search for your page in all Confluence spaces.
   - **History**: Displays a list of pages recently visited by you.
   - **Recently Modified**: Displays pages most recently modified by you.
   - **Referring Pages**: Displays a list of all pages that refer to the current page.

2. Select the required page from the list of pages in one of the tabs.

Moving an Attachment

Viewing Attachment Details

An attachment is any file that is included with your page. Examples of attachments are screenshots, photographs, other images, Word documents, presentations, PDF documents, videos and sound files. Attachments are useful when you want to share information that exists in another file format.

You can view attachment details in the following places:

- The list of attachments in a space — this will show all files attached to all pages in the space. See below.
- The list of attachments for a specific page. See below.
- A list of attachments created by a macro and displayed on a page. See Displaying a List of Attachments.

On this page:

- Viewing attachments in a space
- Viewing attachments on a page
- Attachment details

Related pages:

- Working with Attachments
- Displaying a List of Attachments
- Confluence User's Guide

Viewing attachments in a space

To view the attachments associated with a space:

1. Go to a page in the space and choose **Browse > Attachments**.
   
   You will see a list of all the attachments in the space, along with their details and the pages they are attached to.

2. To see only files of a particular type:
   - Type the last part of the file name in the **Filter By File Extension** box. For example, enter ‘.gif’ to see only image files of the GIF format.
   - Click **Filter**.

3. To see only files that have a particular label or labels:
   - Type the label or labels in the **Filter by Label** box. If you enter more than one label, separate the
labels with commas or spaces. Confluence will show only attachments that have **all** the labels specified. (The match is an AND, not an OR.)

- Click **Filter**.

**Screenshot 1: List of attachments for a space**

![List of attachments for a space](image)

**Viewing attachments on a page**

When a page you are viewing contains attachments, a small paperclip icon 📄 appears next to the page byline, under the page name. Clicking the paperclip will take you to the 'Attachments' view, where you will see the full list of attachments.

**To view the attachments associated with a page:**

1. Go to the page.
2. Choose **Tools > Attachments**. You will see a list of the attachments in the page along with their details.
3. To see all versions of an attachment, choose the arrow on the left of the attachment name.

The list of attachments includes options for viewing the files, and other actions, provided the user has the relevant permissions. If you have specified the 'Allow Upload' parameter, users will be able to **upload attachments** directly from the list too. Users can also **remove attachments** or **edit attachment properties** and **labels**. If an attachment is an Office or PDF file, you will see the appropriate options for **Office Connector** files.

**Screenshot 2: List of attachments for a page**

![List of attachments for a page](image)

**Attachment details**

Note that the page view shows a different subset of fields from the space view.

- **Name** is the name of the attached file.
• **Size** tells you how much space the attachment takes up. You can sort by size by clicking the column title.
• **Creator** is the person who attached the file. Clicking on the link takes you to the person's' user profile.
• **Creation Date** is the date the file was attached. You can sort by date by clicking the column title.
• **Labels** are keywords, or tags, that you can enter to categorise the attachments. See how to [add labels](#).
• **Last Mod. Date** (in the space view) is the date the file was last modified.
• **Attached To** (in the space view) tells you which page contains the attachment.
• **Comment** (in the page view) is a short description of the attachment.
• The **Properties** link (in the page view) lets you edit the attachment details. See how to [edit attachment properties](#).
• The **Remove** link (in the page view) lets you delete the attachment, or a specific version of the attachment.
• The **Edit in Office** link (in the page view) appears next to Office files only, and lets you edit that attachment.
• The **Attach File** option lets you add another attachment or another version of an existing attachment. See how to [upload attachments](#).

### Customising Confluence

You can customise or configure many aspects of Confluence:

- The **look and feel** of any Confluence space.
- **Personal aspects**, including your personal profile and homepage.
- Setting up your [user profile](#).
- **User access**, including permissions and page restrictions.
- Add-ons such as gadgets and macros.
- Customisations for specific uses of Confluence.

#### Related pages:

### User Profile Overview

Each Confluence user has a User Profile area, where numerous account management features can be accessed.

#### Finding your User Profile

Go to your [name](#) (the 'User' menu) at the top of the page and choose [Profile](#).

The profile view is divided into tabs, each of which is described in a separate section below.
On this page:

- Finding your User Profile
- Profile
- Network
- Status Updates
- Labels
- Watches
- Drafts
- Settings

Screenshot: User profile

Profile

- View and edit your personal details, such as your name and email address details and optionally, your photograph and other personal information. Note that as a security precaution, in order to change your email address, you will be required to re-enter your password.
- Upload a profile picture (optional).
- Change your password.

Network

- View the recent activity of users that you are following via the Network view.
- Follow other users from this view.

The 'Administer User' link is visible to Confluence administrators only. The administrator can click this link to go directly to the user management screen in the Administration Console.
Status Updates
- View your history of status updates.

Labels
- View your personal labels.

Watches
- View a list of the pages and spaces you are currently watching.

Drafts
- Retrieve any pages you were in the process of editing. See Working with Drafts.

Settings
- Edit your General Settings (homepage, language and timezone).
- Subscribe to email notifications.
- View and revoke your OAuth access tokens.

Updating Email Address
Email Address Privacy

Take me back to the Confluence User's Guide.

Editing User Settings

You can set various Confluence preferences that affect your personal session:

- General preferences such as home page, language and time zone, as described below.
- Editor settings, as described below.
- Email settings for subscriptions to email reports. See Subscribing to Email Notifications of Updates to Confluence Content.
- OAuth access tokens that you have granted from your Confluence user account. See Viewing and Revoking OAuth Access Tokens.

General User Preferences

To edit your general user settings:

1. Go to your name (the 'User' menu) at the top of the page and choose Settings.
2. Click **Edit** and update the settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Site Homepage</td>
<td>Select the page that you would like to see whenever you log into Confluence.</td>
</tr>
<tr>
<td>Language</td>
<td>Select your language. See <a href="#">below</a>.</td>
</tr>
<tr>
<td>Time zone</td>
<td>Select your time zone.</td>
</tr>
<tr>
<td>Use Keyboard Shortcuts</td>
<td>Enable <a href="#">keyboard shortcuts</a>, other than for the editor.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**On this page:**
- [General User Preferences](#)
- [More about Language](#)
- [Editor Preferences](#)

- [Confluence User's Guide](#)

**Screenshot: Editing your user profile settings**

More about Language

Setting your language preference in your user profile is described in the section above. This section gives more information about that setting and other settings that affect the language Confluence will use.

Individual users can choose the language that Confluence will use to display screen text and messages. Note that the list of supported languages depends on the language packs installed on your Confluence site.

The language used for your session will depend on the settings below, in the following order of priority from
highest to lowest:

- The language preference defined in your user profile. Note that you need to be logged in for this setting to take effect.
- The language that you choose by clicking an option at the bottom of the Confluence login screen. Confluence stores this value in a cookie. When the cookie expires, the setting will expire too.
- The language set in your browser.
  - Note that your Confluence administrator can disable this option by setting a system property.
  - The browser sends a header with a prioritised list of languages. Confluence will use the first supported language in that list.
- The default language for your site, as defined by your Confluence site administrator.

Editor Preferences

You can set some options that determine the way the Confluence editor works. Note that these settings affect only you. Other people using Confluence can enable or disable the settings on their user profiles independently.

To change your editor preferences:

1. Go to your name (the ‘User’ menu) at the top of the page and choose Settings.
2. Click Editor under ‘Your Settings’ in the left-hand panel.
3. Click Edit.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable Autocomplete</td>
<td>Select to disable autocompletion when you press one of the trigger characters.</td>
</tr>
<tr>
<td>Disable Autoformatting</td>
<td>Select to disable autoformatting when you type wiki markup in the editor. Click ? on the editor toolbar to learn more.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Screenshot: User settings for the editor

Editing Your User Profile

Your user profile contains basic information about you. If you do not have a personal space, your user profile will be displayed when anyone clicks your name in the People Directory.

To edit your user profile:
1. Go to your name (the 'User' menu) at the top of the page and choose Profile.
2. On your Profile view, click Edit in the Personal details section.
3. Enter details about yourself in the form displayed.
4. Click Save.

<table>
<thead>
<tr>
<th>Detail</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Full Name</td>
<td>Your name as you would like it to appear in your profile.</td>
</tr>
<tr>
<td>Email</td>
<td>Your email address which will be used to send you mail notifications.</td>
</tr>
<tr>
<td>Phone</td>
<td>Your phone number.</td>
</tr>
<tr>
<td>IM</td>
<td>Your Instant Messenger (IM) details. To suit a variety of IM applications, this option accepts any string value. For example, you can enter IM details in the form of an email address, such as ' or a user ID, like '123456789'.</td>
</tr>
<tr>
<td>Website</td>
<td>Your website's URL.</td>
</tr>
<tr>
<td>Position</td>
<td>The title of your position within your organisation.</td>
</tr>
<tr>
<td>Department</td>
<td>The name of your department within your organisation.</td>
</tr>
<tr>
<td>Location</td>
<td>Your location. This could be a town, city, region or country.</td>
</tr>
<tr>
<td>About me</td>
<td>Information about yourself that other users can view (such as your professional information, hobbies, and other interests). You can use Confluence wiki markup in this field. Note that your Username cannot be changed.</td>
</tr>
</tbody>
</table>

Screenshot: Edit profile
Handy Hint

Confluence administrators can configure Confluence to mask email addresses (e.g. 'example at atlassian dot com'), protecting your email address from search engine spiders and the like.

Related Topics

- Viewing User Profile
- Choosing a Profile Picture
- Setting Up your Personal Space
- Email Address Privacy

Email Address Privacy

Confluence can mask the email addresses of users to protect them from mail spammers.

This is done by a Confluence administrator and is configured through the Administration Console. The Confluence administrator has three options for email address privacy:
- **Public**: email addresses are displayed publicly.
- **Masked**: email addresses are still displayed publicly, but masked in such a way to make it harder for spam-bots to harvest them.
- **Private**: only Confluence administrators can see the email addresses.

For more information on setting these options, which are configured using the Administration Console, refer to [User Email Visibility](#).

### Related Topics

- [Editing Your User Profile](#)

- [User Email Visibility](#)

Take me back to the [Confluence User's Guide](#).

### Updating Email Address

The email address you specify in your profile settings is used for your mail notifications and is also displayed in your profile description.

**To update your email address:**

1. Go to your name (the 'User' menu) at the top of the page and choose **Profile**.
2. Click **Edit** in the 'Personal' section.
3. In the **Email** field, specify your new email address which will be used when sending you mail notifications.
4. Click **Save**.

### Related Topics

- [Changing Password](#)
- [Editing Your User Profile](#)

Take me back to the [Confluence User's Guide](#).

### Choosing a Profile Picture

Your profile picture is used as the icon for your personal space, to represent you in the People Directory, and to illustrate your comments. It also appears in various other places next to your name, such as in the list of recent updates on the dashboard.

You can upload your own profile picture or use one of the images provided by Confluence. If you upload your own profile picture, you will have an opportunity to crop (trim) the picture.

**To choose a profile picture:**

1. Go to your name (the 'User' menu) at the top of the page and choose **Profile**.
2. Click **Picture** on the left.
3. Choose one of the following two options:
   - Upload a new picture: Click **Browse** to locate your picture, then click **Upload** to upload it from your computer or file server.
   - Or select one of the default icons provided.
4. Click **Set Profile Picture**.

*Screenshot: Choosing a profile picture*
If you upload a profile picture that is larger than 48x48 pixels, the 'Edit My Profile Picture' screen will appear. You can select part of the picture or the entire picture, to be used as the final image for your profile. Note that the size of the final image will always be scaled down to 48x48 pixels.

To edit your profile picture:

1. Click and drag the centre of the superimposed square to select the centre of the new image.
2. Click the corners of the square to resize the area for your new image.
3. Click **Save**.
4. The image from your selected area will be cropped, resized to 48x48 pixels and saved.

*Screenshot: Trimming a profile picture*
Deleting a Profile Picture

You can delete the profile picture images that you have uploaded to Confluence.

To delete a profile picture:

1. Go to your name (the 'User' menu) at the top of the page and choose Profile.
2. Click Picture on the left.
3. Locate and select the picture file you wish to delete, then click Delete.
   - Note that you can only delete images that you have uploaded to Confluence. The standard icons cannot be deleted.
4. Click Delete to confirm the action. The picture is permanently removed from the server.

Screenshot: Deleting a Profile Picture

Editing Your User Profile

Take me back to the Confluence User's Guide.

Viewing and Revoking OAuth Access Tokens

This page describes the purpose of OAuth access tokens which have been issued on behalf of your Confluence user account and provides instructions on how to revoke them.

On this page:

- OAuth Access Tokens
- Viewing your OAuth Access Tokens
  - OAuth Access Token Details
- Revoking your OAuth Access Tokens
OAuth Access Tokens

OAuth access tokens allow you to use a Confluence gadget on an external web application or website (also known as the 'consumer') and grant this gadget access to Confluence data which is restricted or privy to your Confluence user account.

OAuth access tokens will only appear in your user profile if the following conditions have been met:

1. Your Confluence Administrator has established an OAuth relationship between your Confluence site and the consumer. Confluence Administrators should refer to Configuring OAuth for more information about establishing these OAuth relationships.
2. You have accessed a Confluence gadget on the consumer and have conducted the following tasks:
   a. Logged in to your Confluence user account via the gadget and then,
   b. Clicked the 'Approve Access' button to allow the gadget access to data that is privy to your Confluence user account.

Confluence will then send the consumer an OAuth 'access token', which is specific to this gadget. You can view the details of this access token from your Confluence site's user account.

An OAuth access token acts as a type of 'key'. As long as the consumer is in possession of this access token, the Confluence gadget on the consumer will be able to access Confluence data that is both publicly available and privy to your Confluence user account. As a Confluence user, you can revoke this access token at any time. Furthermore, all access tokens expire after seven days. Once the access token is revoked or has expired, the Confluence gadget will only have access to publicly available Confluence data.

Viewing your OAuth Access Tokens

To view all of your Confluence user account's OAuth access tokens:

1. Go to your name (the 'User' menu) at the top of the page and choose Settings.
2. Click View OAuth Access Tokens. A view similar to screenshot below is displayed. Refer to OAuth Access Token Details below for information on interpreting this table.

If no access tokens have been set, then 'None specified' is shown.

Screenshot: Viewing your OAuth Access Tokens

<table>
<thead>
<tr>
<th>OAuth Access Tokens</th>
</tr>
</thead>
<tbody>
<tr>
<td>Profile</td>
</tr>
</tbody>
</table>

Your list of OAuth access tokens is presented in a tabular format, with each access token presented in separate rows and each property of these tokens presented in a separate columns:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Consumer</td>
<td>Consumer Description</td>
</tr>
</tbody>
</table>
### Consumer

The name of the Confluence gadget that was added on the consumer.

### Consumer Description

A description of this consumer application. This information would have been obtained from the consumer's own OAuth settings when an OAuth relationship was established between Confluence and that consumer.

If the consumer is another Atlassian application, this information is obtained from the Consumer Info tab's 'Description' field of the OAuth Administration settings. The application's administrator can customise this Consumer Info detail.

### Issued On

The date on which the OAuth access token was issued to the consumer by Confluence. This would have occurred immediately after you approved this gadget access to your Confluence data (privy to your Confluence user account).

### Expires On

The date when the OAuth access token expires. This is seven days after the 'Issued On' date. When this date is reached, the access token will be automatically removed from this list.

### Actions

The functionality for revoking the access token.

---

**Revoking your OAuth Access Tokens**

**To revoke one of your OAuth access tokens:**

1. View your Confluence user account's OAuth access tokens (described above).
2. Locate the Confluence gadget whose OAuth access token you wish to revoke and click Revoke OAuth Access Token next to it.
   The gadget's access token is revoked and the Confluence gadget on the consumer will only have access to publicly available Confluence data.

**Choosing your Homepage**

By default, all users are directed to the dashboard after logging in. However, you can choose to be redirected to the home page of any space on the Confluence site after logging in.

**To set the home page:**

1. Click on your name (the 'user' menu) at the top of the page and choose Settings.
2. Click Edit.
3. Use the Site Homepage list to select a space. Note that only the list of spaces to which you have 'view' access is displayed here. You will be directed to the home page of the selected space when you next log in.
4. Click Submit.

*Screenshot: General Preferences Settings*

User Profile Overview

Take me back to Confluence User's Guide

Customising your Personal Dashboard

You can customise the Confluence dashboard to provide access to the content on the site that is most relevant to you. The options described on this page will change your own personal dashboard, but will not affect the dashboard that other people see.

If you are a Confluence Administrator, you can change the global dashboard, as seen by all Confluence users. See the administrator's guide to customising the dashboard.

On this page:
- Displaying your Favourite Spaces
- Categorising your Spaces
- Displaying your Favourite Pages
- Related Topics

Displaying your Favourite Spaces

Mark some spaces as favourites. You can now click the Spaces tab on the dashboard to see a list of your favourite spaces. You can also click the Favourite Spaces tab at the top right of the dashboard to see recently updated content from just your favourite spaces.

Categorising your Spaces

To help keep Confluence spaces organised, you can label spaces with different space categories. See Using Labels to Categorise Spaces. Space categories are used to group related spaces.

For example, you might want to group spaces on your Confluence site by applying the following space categories to the relevant spaces:

- 'design' (for spaces relevant to a design team), and
- 'development' (for spaces relevant to a development team).

If a subset of these spaces is relevant to both teams, apply both the 'design' and 'development' categories to each of these spaces to make the spaces appear in both groups.

Once you have added space categories, you can click the Space Categories tab at the top right of the dashboard and select a category from the drop-down menu to display only spaces belonging to that category.

Displaying your Favourite Pages
Mark some pages as **favourites**. You can now click the **Pages** tab on the dashboard to see a list of your favourite pages.

**Screenshot: The dashboard, showing favourite pages and space categories**

Confluence combines powerful online authoring capabilities, deep Office integration and an extensive plugin catalogue to help people work better together and share information effortlessly. Get started by adding a new space to create content in. Add a few users to try out Confluence with you.

If you want to display a different message here, you can easily change the welcome message.

### Applying a Theme to a Space

Themes allow you to personalise the 'look and feel' of Confluence. You can apply a theme to your entire Confluence site and to individual spaces. Choose a specific theme if you want to add new functionality or...
Confluence comes with a selection of themes. In addition, a site administrator can install new themes as plugins via the Confluence Administration Console. Provided that the theme is installed into your Confluence site, any space administrator can apply a theme to a space.

By default when you create a new space, the space will have the Confluence default theme.

**To apply a theme to a space:**

1. Choose Browse > Space Admin.
   
   *Note:* 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
2. Click Themes in the left-hand panel under 'Look and Feel'.
3. Select a theme option.
4. Click Confirm.

Applying a Theme to a Site  
Editing a Space's Colour Scheme  
Customising the Look and Feel of a Confluence Space

Configuring the Documentation Theme  

The Documentation theme is one of the themes bundled with Confluence. (See availability below.) The theme is designed for spaces containing technical documentation, but you may find it useful for other types of content too. It provides an inbuilt table of contents for your wiki space, a configurable header and footer, and text styles suited to documentation. (See features below.)
Quick guide to applying and customising the Documentation theme

- Go to Space Admin and click Themes.
- Select Documentation Theme and click Confirm.
- If you want to customise the theme, click Configure theme.
  - Select or deselect the default page tree.
  - Select or deselect the space-restricted search.
  - Enter the text and wiki markup for your custom left-hand panel header and footer.
  - Click Save.

The rest of this page gives more details of the above procedure.

On this page:

- Applying the Documentation Theme to your Space
- Applying the Documentation Theme to your Site
- Customising the Documentation Theme
- Features of the Documentation Theme
- Availability of the Theme
- Hints and Tips
- Related Topics

Screenshot: A wiki page using the Documentation theme

Applying the Documentation Theme to your Space

You need space administrator permissions to apply a theme to a space.
Follow the steps below to apply the 'Documentation Theme' to your space. All pages in the space will start using the theme immediately.

**To apply a theme to a space:**

1. Choose **Browse > Space Admin.**  
   *Note:* 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the `confluence-administrators` group).
2. Click **Themes** in the left-hand panel under 'Look and Feel'.
3. Select a theme option.
4. Click **Confirm**.

**Screenshot: Applying a theme**

[![Screenshot: Applying a theme](image-url)](image-url)

### Applying the Documentation Theme to your Site

If you have **site administrator** permissions, you can apply the theme at site level. It will then be the default theme for all spaces in the site. See the administrator's guide to [applying a theme](#).

### Customising the Documentation Theme

The theme works well without any customisation. If necessary, you can restrict the search to just one space, change the content of the left-hand navigation panel and add your own header and footer.

**To customise the Documentation theme:**

1. Choose **Browse > Space Admin.**  
   *Note:* 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the `confluence-administrators` group).
2. Click **Themes** in the left-hand panel under the heading 'Look and Feel'.
3. If the space is not yet using the Documentation theme, apply the theme as described above.
4. Click **Configure theme** in the yellow area of the 'Current Theme' section at the top of the page. See **screenshot below**. The 'Documentation Theme Configuration' screen appears. See **screenshot below**.
5. Select or deselect the **Page Tree** check box. This determines whether your space will display the default
search box and table of contents (page tree) in the left-hand panel.

6. Select or deselect the **Limit search results to the current space** check box.
   - If you select the check box:
     - The Confluence search will look for matches only in the current space by default. Users can override this restriction when entering their search term. See [Using the Documentation Theme](#).
     - The default page tree in the left-hand panel will not include a search box.
   - If you do not select the check box:
     - The Confluence search will look for matches in the entire Confluence site. This is the default behaviour for other themes too.
     - The default page tree in the left-hand panel will include a search box, which restricts search results to the current space.

7. Enter text, images, macros and other wiki markup into any or all of the three text boxes.
   - You can use the `Include` or `Excerpt Include` to include re-usable content into your footer. See hint below.

   - 'Navigation' – This text box contains content for the left-hand panel.
     - If the **Page Tree** check box is selected, the navigation panel contains the default search box and page tree. Any content you enter into the ‘Navigation’ text box will appear above the page tree and search box.
     - You can include your own content *underneath* the page tree as well as above. See hint below.
   - In summary: Deselect the **Page Tree** check box. Insert your own page tree using the **Page Tree** macro, then add your own content under the macro.
   - 'Header' – This text box contains content for a page header that will appear above the page title on all pages in the space. See example screenshot below.
   - 'Footer' – This text box contains content for a page footer that will appear after the comments and above the site footer, on all pages in the space. See example screenshot below.

8. Click **Save**.

**Screenshot: The ‘Configure theme’ option**

```
Current Theme
The current theme controls the layout and colours of this space.

**Documentation Theme**
Featuring a page tree or a custom navigation, the documentation theme makes it easy to navigate through your Confluence site. The theme is optimised for Firefox, Safari and Internet Explorer 7+.  

**Configure theme** - further customise this theme’s options
```

**Screenshot: Customising the Documentation theme**
Customising the Theme at Site Level

If you have site administrator permissions, you can apply and customise the theme at site level. The customisation options are the same as the space level options, as described above.

Features of the Documentation Theme

Screenshot: A customised header, footer and left-hand panel
The above screenshot shows a wiki space with a customised left-hand panel, header and footer.

Here is a summary of the features that the Documentation theme provides:

- By default, the left-hand panel contains a search box and a table of contents (page tree) showing all the pages in your space. Specifically, it shows the pages that are children of the space’s home page.
- The left-hand panel is fully customisable. You can choose to include or exclude the search box and page tree. You can enter your own text, images and wiki markup.
- People viewing the page can drag the thick bar between the left-hand panel and the content, to increase or decrease the width of the panel. They can also remove the panel altogether, by clicking the sidebar icon at top right, next to the search box.
- The left-hand and right-hand panels scroll independently of each other.
- The page title is neatly above the page content, and not uncomfortably above the navigation panel as tends to happen when you insert the navigation panel yourself.
- Because the left-hand panel is part of the theme, it will be upgraded whenever Confluence is upgraded. There is no need to remove and then re-apply your customisations on each upgrade, as you would do if you added your own left-hand navigation bar.
- The theme also provides a customisable header and footer, which will appear at the top and bottom of every page.
- The text and heading styles are designed to enhance the content typically found in a documentation space.
- You can use the Space Jump macro to link from a page in one wiki space to a page with the same name in another space, without knowing the name of the page when you create the link.
- You can limit the Confluence search results to the current space. If you choose this option, the
Confluence search will look for matches only in the current space by default. Users can override the restriction. See Using the Documentation Theme.

Availability of the Theme

Confluence Versions

The Documentation theme is bundled with Confluence 3.2 and later. If you have Confluence 3.1, your Confluence Administrator can download the theme from the Atlassian Plugin Exchange and install it as a plugin.

The theme is not available for versions of Confluence earlier than Confluence 3.1.

Hints and Tips

Below are some hints that you may find useful when using the Documentation theme. Where can I see a working example of the Documentation theme?

The Confluence documentation uses the Documentation theme. If you are reading this documentation online on the Atlassian documentation wiki, you are seeing a working version of the Documentation theme.

Which pages will appear in the Documentation theme's table of contents?

The theme constructs the page tree in the left-hand panel from all pages that are child pages of the space’s home page. Each space has a single page designated as the ‘Home’ page. You can specify the home page in the space administration section.

Help, my pages do not appear in the Documentation theme table of contents

Cause 1: Your pages are not under the space’s home page. The most probable reason why your pages do not appear in the page tree in the left-hand panel is this: The theme constructs that table of contents from all pages that are child pages of the space’s home page. If your pages are above the home page in the page tree, they will not appear in the left-hand panel.

There are two ways to fix the problem:

- You can change the designated space home page in the space administration section.
- Or you can drag and drop all your pages to make them children of the current home page. You can drag and drop pages in the ‘Pages’ section of the space ‘Browse’ screen. See Moving a Page.

Cause 2: Problem with upgrade from Confluence 3.1, with Documentation theme as plugin, to Confluence 3.2 or later with Documentation theme bundled. If your existing Confluence installation already has the Documentation theme plugin installed, you may find that after upgrading to Confluence 3.2 the left-hand navigation bar is empty in the spaces that use the theme. The fix is to enable all modules of the Documentation theme plugin. See the knowledge base article.

Help, my left-hand panel has disappeared

If your entire left-hand panel has disappeared when using the Documentation theme, this is probably because you have clicked the sidebar icon at top right, next to the search box. Click the icon again to restore the panel.
Hiding pages from the left-hand table of contents

You can 'hide' pages by putting them at the same level as or higher than the space home page.

Each space has a single page designated as the 'Home' page. You can specify the home page in the space administration section.

The theme constructs the page tree in the left-hand panel from all pages that are child pages of the space's home page.

If your documentation pages are at the same level as the space home page, they will not appear in the left-hand navigation bar. So you can 'hide' pages by putting them at the same level as or higher than the space home page. The pages will show up in the search results and people can see the content if they open the page, but the pages will not appear in the left-hand panel.

More detail: The theme uses the Pagetree macro to produce the table of contents. When entering the Pagetree macro, you can choose the top page in the page tree. The Documentation theme chooses the space home page as the top page.

Using reusable content in your header, footer or left-hand panel

You can use any text or wiki markup in your theme header, footer or left-hand panel. One useful hint is to use the Include or Excerpt Include to include re-usable content into your footer.

The screenshot above shows the theme customisation options, with examples of the macros used to include content from other pages. And the example screenshot also above shows the resulting header, footer and left-hand panel.

Adding content below the page tree in your left-hand panel

If you want to include your own content underneath the page tree, you can deselect the 'Page Tree' check box, add your own page tree using the Pagetree macro in the 'Navigation' text box, and then add your own content under the macro.

The screenshot above shows the theme customisation options, with the default page tree deselected and a custom page tree inserted, along with additional content in the left-hand panel. The example screenshot also above shows the resulting left-hand panel.

Adding underlines to your links

By default, the Documentation theme does not underline hyperlinks. If you prefer to have your links underlined, you can edit the CSS stylesheet for your space and add the following CSS code:

```
.wiki-content a:link, .wiki-content a:visited, .wiki-content a:active {
    text-decoration: underline;
}
```

To edit a space's CSS style sheets:
1. Choose **Browse > Space Admin**.
   
   *Note:* 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the **confluence-administrators** group).

2. Click **Stylesheet** in the left-hand panel under the heading 'Look and Feel'.

3. Click **Edit**.

4. Paste your custom CSS into the text field.

5. Click **Save**. The new CSS will be visible on all content pages in the space.

Notes:

- You need **system administrator** permissions to edit the CSS for a space or for the site.
- This function is turned off by default. To turn it on, go to **Confluence Admin > Security Configuration** and choose **Custom Stylesheets for Spaces**.

### Jumping to the same page in another space

The **(spacejump)** macro is provided along with the Documentation theme. You can use space jumping to link from a page in one wiki space to a page with the same name in another space, without knowing the name of the page when you create the link. When a reader is viewing a page and clicks the link provided by the macro, they will go to a page with the same name, but in the space specified in the macro. See [more about the Space Jump macro](https://confluence.atlassian.com/doc/using-the-spacejump-macro-1313738536.html).

### Hiding the left-hand panel completely

It's not possible to remove the left-hand panel entirely, using the user interface supplied by the theme. There is an improvement request here: [CONF-25923](https://confluence.atlassian.com/browse/CONF-25923) - **Authenticate** to see issue details. If you like, you can comment on and/or vote for that request. In the meantime, **Atlassian Answers** is a good place to ask the question and see if other people can help you with custom code to remove the panel.

### Configuring the Easy Reader Theme

The Easy Reader theme is one of the themes bundled with Confluence. This is a fixed-width variation of the default Confluence theme. Its larger fonts, smooth gradient background and comfortable line length make it ideal for displaying and reading longer documents.

**Quick guide to applying the Easy Reader theme**

1. Choose **Space Admin > Themes**.
2. Select **Easy Reader Theme**.
3. Click **Confirm**.

The rest of this page gives more details of the above procedure.

**On this page:**

- **Applying the Easy Reader Theme to your Space**
- **Customising the Look and Feel of the Easy Reader Theme**
- **Hints and Tips**

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
You need space administrator permissions to apply a theme to a space.

Applying the Easy Reader Theme to your Space

Follow the steps below to apply the 'Easy Reader Theme' to your space. All pages in the space will start using the theme immediately.

To apply a theme to a space:

1. Choose Browse > Space Admin.
   
   Note: 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
2. Click Themes in the left-hand panel under 'Look and Feel'.
3. Select a theme option.
4. Click Confirm.

Screenshot: Applying a theme
Applying the theme to your entire Confluence site

If you have site administrator permissions, you can apply the theme at site level. It will then be the default theme for all spaces in the site. See the administrator's guide to applying a theme.

Customising the Look and Feel of the Easy Reader Theme

You can customise the space CSS style sheets to change the colours, background image and other styles in the theme. See the guide to using CSS to customise the Easy Reader theme.

Hints and Tips

If a page has content that is very wide, it will either:

- cause a scroll bar to appear, or
- break out, i.e. the content will extend over the right-hand border of the page.

Changing a Space's Logo

In Confluence, you can replace the default logo for a space with a logo of your own choice.

You need to be a space administrator to replace a space's logo.

The instructions below refer to global spaces. For your personal space, your profile picture is used as the space icon.
To change a space’s logo:

1. Choose **Browse > Space Admin.**  
   *Note:* 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
2. Click **Change Space Logo** in the left panel under the heading 'Look and Feel'. See the screenshot below.
3. Use the browse option to locate the new logo and click **Upload**.

**Hint:** A space logo looks best if the height and width of the image are of the same or similar length. In other words, the area occupied by the image, including white space, should be square rather than rectangular.

**Screenshot: Changing a space’s logo**

---

**Change the logo for this space.**

- **Image**
  
  [Image]

  - **Upload Logo**
  - **Current**
    (default)

- **Image Data**
  
  - **H:** 30
  - **W:** 42
  - **GIF**

---

**Changing the Confluence Browser Icon, aka favicon**

- **Document status as of 26-Aug-2012**
  
  These changes work in Confluence 4.2.x however some may not be needed. We’re confirming which ones are redundant at the moment, however in the meantime please make all the changes listed below to ensure it works. Backing up the old files is strongly recommended.

The Confluence logo is displayed in the user’s browser to identify the Confluence browser tab. To use a custom image for your Confluence site:

1. Obtain or create an image in PNG file format. To maximise browser compatibility, it should be 32x32 pixels in size, 71x71 DPI (dots per inch) and have an 8 bit colour depth.
2. In your Confluence installation, find the `...\confluence\images\icons` directory.
3. Back up the file `favicon.png`.
4. Replace the `favicon.png` file with your custom PNG image.
   
   **You may also need to back up and replace the following images in your Confluence installation:**
   
   - `...\confluence\images\icons\favicon.ico`
   - `...\confluence\favicon.ico`
   - `...\confluence\images\logo\confluence_16.png` (Reduce this image to 16x16 pixels.)
   - `...\confluence\images\logo\confluence_16_white.png`
   - `...\confluence\images\logo\confluence_16_trans.png`
5. Restart your application server.

⚠️ The information on this page does not apply to Confluence OnDemand.

Users may need to clear their browser cache before they will see the new image.

ℹ️ Converting a PNG to an icon

To create an ICO out of your PNG image, you can use the freeware tool png2ico or the the online tool at http://converticon.com/.

Customising the Look and Feel of a Confluence Space

Customising Space Layouts

You can modify Confluence’s look and feel by editing the 'decorator' (layout) files. This page tells you how to customise the layout files for a space.

Confluence system administrators can also customise the layout of their entire Confluence site as a whole. For more information, please refer to Customising Site and Space Layouts. Site layout customisations modify the default layout of all spaces in the Confluence site. However, any space layout customisations will override the equivalent site customisations.

A note about permissions: To perform these customisations, you will require space administrator permissions for that space. For security reasons, you must also have Confluence system administrator permissions to modify any space layout throughout your Confluence site.

⚠️ If you modify the look and feel of Confluence by following these instructions, you will need to update your customisations when upgrading Confluence. The more dramatic the customisations are, the harder it will be to reapply your changes when upgrading. Please take this into account before proceeding with any customisations. For more information on updating your customisations, please refer to Upgrading Customised Site and Space Layouts.

Confluence is built on top of the Open Source SiteMesh library, a web-page layout system that provides a consistent look and feel across a site. SiteMesh works through ‘decorators’ that define a page’s layout and structure.

To edit the layout of Confluence, you will need to modify these decorator files. A decorator file is a .vmd file and is written in a very simple programming language called Velocity. Learn more about Velocity. Once you become familiar with Velocity, you can edit the decorator files to personalise the appearance of Confluence.

The decorator files in Confluence are grouped into the following categories:

- **Site layouts**: These are used to define the controls that surround each page in the site. For example, if you want to make changes to the header and the footer, you will need to modify these layouts.

- **Content layouts**: These control the appearance of content such as pages and blog posts. They do not change the way the pages themselves are displayed, but they allow you to alter the way the surrounding comments or attachments are shown.

- **Export layouts**: These control the appearance of spaces and pages when they are exported to HTML. If you are using Confluence to generate a static website, for example, you will need to modify these layouts.
Learn more about using decorators.

To edit a decorator file:

1. Choose Browse > Space Admin.
   
   Note: 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).

2. Click the Layout link in the left-hand panel, under Look and Feel. You will see a list of the layouts for the space.
   
   (Layout is displayed only if you are a Confluence system administrator.)

   - Click View Default to view the vmd file.
   - Click Create Custom to edit the default vmd file. This will open up the vmd file in edit mode.

   Make changes and click Update.

   Customising the Look and Feel of a Confluence Space

   Applying a Theme to a Space

   Administrator’s Guide - Design and Layout

   Take me back to the Confluence User’s Guide.

   Editing a Space’s Colour Scheme

   Confluence allows you to customise the colour scheme of a space. By default, a space’s colour scheme is based on global settings configured from the Administration Console.

   You need to be a space administrator to edit a space’s colour scheme.

   To change the colour scheme for a space:

   1. Choose Browse > Space Admin.

   Note: 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).

   2. Click Colour Scheme in the left-hand panel under the heading Look and Feel.

   3. Click Select next to a colour scheme under Custom Colour Scheme (if not already selected).
4. Click the Edit link. This will bring up a new screen. See screenshot below.

5. Enter standard HTML/CSS2 colour codes, or use the colour-picker to choose a new colour from the palette provided. Any changes you make will immediately be reflected in this space.

The colour scheme applies to the following UI elements:

- **Top Bar** - the bar across the top of the page that contains the breadcrumbs
- **Tab Navigation Background** - the background colour of the tab navigation menus
- **Tab Navigation Text** - the text of the tab navigation menus
- **Breadcrumbs Text** - the breadcrumbs text in the top bar of the page
- **Space Name Text** - the text of the current space name located above the page title
- **Heading Text** - all heading tags throughout the space
- **Links** - all links throughout the space
- **Borders and Dividers** - table borders and dividing lines
- **Tab Navigation Background Highlight** - the background colour of the tab navigation menu when highlighted
- **Tab Navigation Text Highlight** - the text of the tab navigation menu when highlighted
- **Top Bar Menu Selected Background** - the background colour of the top bar drop down menu when selected
- **Top Bar Menu Item** - the text colour of the menu items in the top bar drop down menu
- **Page Menu Selected Background** - the background colour of the drop down page menu when selected
- **Page Menu Item Text** - the text of the menu items in the drop down page menu
- **Menu Item Selected Background** - the background colour of the menu item when selected (applies to both the top bar and page drop down menus)
- **Menu Item Selected Text** - the text colour of the menu item when selected (applies to both the top bar and page drop down menus)

Please note that some UI elements are specific to the default theme and may not take affect for other themes.

*Screenshot: Editing a space's colour scheme*
Handy Hint

If you mess things up, just click the **Reset** button and then try again.

**Styling Confluence with CSS**

This page explains the facility for changing the look and feel of Confluence with CSS.

**On this page:**

- Introduction
- Considerations for Using Custom CSS
- Getting Started
- CSS Resources
- Related Pages

**Introduction**

Cascading Style Sheets (CSS) are an industry-standard way of styling a web page. The content of a page is rendered with HTML, and its look and feel is determined by CSS files. You can upload a CSS text file, or simply
type in a stylesheet, and apply it to a space or even a whole Confluence site.

Notes:
- You need system administrator permissions to edit the CSS for a space or for the site.
- This function is turned off by default. To turn it on, go to Confluence Admin > Security Configuration and choose Custom Stylesheets for Spaces.

Creating CSS styles that work seamlessly across different browsers is a delicate task for basic web sites, and reasonably challenging when customising web applications like Confluence. It is important to test each change that you make and ensure it works as expected in all areas of Confluence – for example, on the Confluence dashboard as well as on regular pages.

In order to get you started, we have compiled this introduction, a basic styling tutorial and a more advanced tutorial.

Considerations for Using Custom CSS

CSS Knowledge is Required

If you are not familiar with CSS, see the links in the CSS Resources section below. You should spend some time to become confident with Cascading Style Sheets before you start editing your Confluence style sheets.

Security

Custom CSS can be used to inject scripts into a page, opening the risk of cross-site scripting (XSS) attacks. With this feature enabled, space administrators could upload styles that steal other users' login credentials, trick their browsers into performing actions on the wiki without their knowledge, or even obtain global administration privileges. As such, this feature is disabled by default. Confluence administrators should only enable custom CSS if they are comfortable with the risks listed in this paragraph.

Scaling

Each page needs to scale. Depending on the resolution of the user's screen, the content should render intelligently. Your designs needs to degrade gracefully. Try resizing each page that exists in Confluence. There are quite a few pages in the browse-space-section, like drafts, labels, page hierarchy, and so on. Your style has to work everywhere, not just in the first page you happen to be looking at.

Features Cannot Be Disabled

It is easy to turn off certain links, headers, or even menu items by simply setting their style to 'hidden'. This can help you to roll out Confluence to users that may not be very Wiki-savvy yet. The simpler the UI, the easier it may be for them to use. However, please remember that removing the link to a part of the application does not mean that the functionality is not available. Every user can still change their style from within their browsers, or access the URL directly. Don't rely on CSS to disable parts of Confluence.

Features Should Not Be Disabled

Users familiar with Confluence will expect to find the same controls that they are accustomed to. Removing buttons or controls from the interface is not advised as it may frustrate your users and cause them to circumvent your design by using direct URL access, as mentioned above.

Confluence Version Compatibility

Be aware of any plans to upgrade your Confluence instance. Future versions of Confluence may not be compatible with your custom CSS — this may cause your CSS to break, requiring maintenance when Confluence is upgraded. Ask your Confluence administrator for more information.
Test on Different Web Browsers

As a rule you should test your modifications on different web browsers. Internet Explorer, Firefox, Opera and Safari (on Mac OS X) are some of the more popular browsers.

Note about supported web browsers: Please ensure that you are using one of the web browsers supported by Confluence. If you are using an unsupported browser or browser version, some features may not work correctly. You can find the list of supported web browsers and browser versions on this page: Supported Platforms.

CSS Customisation is Not Supported

As creating custom CSS has potentially limitless possibilities, Atlassian will not support issues that are caused by or related to CSS customisation.

Getting Started

Editing the CSS

To edit a space's CSS style sheets:
1. Choose Browse > Space Admin. 
   Note: 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
2. Click Stylesheet in the left-hand panel under the heading 'Look and Feel'.
3. Click Edit.
4. Paste your custom CSS into the text field.
5. Click Save. The new CSS will be visible on all content pages in the space.

Follow the Tutorial

Follow the examples in the Basic Styling Tutorial or the more advanced Styling Tabs in Confluence to get started.

Basic Styling Tutorial

This page contains instructions on how to get started with custom CSS styling in Confluence.

On this page:

- CSS Editing Quick-Start
- Tutorial: Changing the Header Background
- CSS Editing Tips
  - Begin With a Space Stylesheet
  - Use the Right Tools
  - Edit Simple Elements First
CSS Editing Quick-Start

To edit a space's CSS style sheets:
1. Choose **Browse > Space Admin**.  
   *Note:* 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
2. Click **Stylesheet** in the left-hand panel under the heading 'Look and Feel'.
3. Click **Edit**.
4. Paste your custom CSS into the text field.
5. Click **Save**. The new CSS will be visible on all content pages in the space.

Tutorial: Changing the Header Background

The header is the menu area at the top of a default Confluence page where the Breadcrumb Links, Browse menu, User menu and the Quick Search box reside. In this example, we are going to change the background of the header to include a custom graphic.

1. Create a custom graphic. For this example, we created a custom header graphic of 1046 x 61 pixels.
2. Upload the custom graphic to a page in the space that you are customising.
3. Note the page ID of the page where you uploaded the new graphic. (in this example, the page ID was ‘658833839’).
4. Compose your custom CSS for the header. The example below loads the new graphic (called ‘header.png’) from a specific page (denoted by page ID ‘658833839’) in the same space.

```css
#header {
  background-image: url('..download/attachments/658833839/header.png');
  background-repeat: no-repeat;
}
```

5. Log in as the Space Administrator.
6. Open the Space Admin page.
7. Click **Stylesheet**.
8. Click **Edit** to change the code in the text field.
9. Paste your custom CSS into the text field.
10. Click **Save** and then reload the page (you may have to shift-reload). The background of the header will change.
11. The custom header will be visible on all content pages in the space. To revert your change, simple delete the custom code from the 'Stylesheet' page and click **Save**.

CSS Editing Tips

**Begin With a Space Stylesheet**

A space stylesheet is a good starting point for CSS customisation, as it already includes all of the elements that can be changed. When you work on the space stylesheet it styles all content pages in the space. Build and test it at space-level, before considering applying the new stylesheet to your entire site. Once you are satisfied with your space design, test it thoroughly until you are confident that it has no problems. Then, you can look into advanced customisation of the Confluence CSS such as adjusting the Search page, the Dashboard and other integral pages.

**Use the Right Tools**
As the Confluence CSS is reasonably sophisticated, web development applications will help you to understand how the page styles have been created. In particular, you will need to view the existing source for the pages you’re starting to work on. If you don’t already have some, tools such as the following free applications will allow you to do this.

1. **Firebug**
   Firebug, a plugin for the Firefox web browser, allows you to take a look at the style of each element on your page. This is very useful to see what styles are currently applied, for example styles applied to the header only.

2. **Web Developer**
   The Web Developer plugin for Firefox allows you to edit CSS inline and create new page designs.

3. **CSS Edit**
   CSS Edit is a stand-alone CSS editor for Macintosh that extracts all existing styles from a given page and allows you to overwrite these.

### Edit Simple Elements First

Begin by editing simple elements and checking that they work. By making changes, then checking that each one worked, you can easily isolate any CSS code that is causing problems. Be aware that some page elements are more suited to customisation than others. For example, adding a gradient to the toolbar is less likely to ‘break’ the page than changing the page width. Editing reasonably static elements such as background graphics will render more predictably than designs which attempt to completely change the user interface or the Javascript-powered drop-down menus (which we don’t recommend editing).

**Related Topics**

- Styling Confluence with CSS
- Styling Tabs in Confluence
- Including Cascading Stylesheets in Themes
- Styling Fonts in Confluence

Confluence provides the ability to adjust its visual style via Cascading Style Sheets (CSS). With this feature, it is very easy to change the look and feel of Confluence.

This tutorial shows you to change the fonts of a normal Confluence page. We will show how to change the font and font sizes with a few lines of CSS.

**Screenshot 1: Default Font in a Confluence Page**

**Screenshot 2: Custom Font in a Confluence Page**
At the bottom of this page you can find the code for the custom font. Simply copy and paste it into the Space Stylesheet form within the Space Administration section.

**Changing the fonts**

In order to customise the fonts in Confluence, you first need to set the body font to the font you want. Second, you may want to adjust the font size to account for the fact that different fonts have different relative sizes.

The relevant CSS is shown below, and can be configured in Space Admin > Stylesheets. These styles change Confluence’s font from its default of Helvetica/Arial – sans serif fonts – to Times/Times New Roman – serif fonts.

To adjust for the fact that Times is a bit smaller than Helvetica, we increase the font size to 14 pixels.

```css
body {
  font-family: Times, "Times New Roman", serif;
  font-size: 14px;
}
.wiki-content,
.wiki-content p,
.wiki-content table,
.wiki-content tr,
.wiki-content td,
.wiki-content th,
.wiki-content ol,
.wiki-content ul,
.wiki-content li {
  font-size: 14px;
}
```

The many styles which include 'wiki-content' are necessary to change the font-size for all the tags in the wiki content.

**Styling Tabs in Confluence**

Confluence provides the ability to adjust its visual style via Cascading Style Sheets (CSS). With this feature, it is very easy to change the look and feel of Confluence.
This tutorial shows you how to change the look and feel of Confluence. We will address the Confluence tabs in this tutorial and how we can change their look completely with a few lines of CSS.

Let's take a look at what we are trying to achieve. Notice the dark blue tabs in Screenshot 1? Our goal is to blend them into the background and change the text style as in Screenshot 2.

**Screenshot 1: Default Confluence Tabs in Admin Screen**

At the bottom of this page you can find the code for the custom tabs. Simply copy and paste it into the Space Stylesheet form within the Space Administration section. Let's discuss each selector in detail:

### Container Style

```css
#navigation, #tab-navigation{
    border-bottom: 1px solid #CCC;
    background-color: transparent;
    margin: 1em 0 2em -5px;
}
```

Let's start with the container around the tabs. We don't want a `background-color` for the tabs and the container, therefore we will set the color to be transparent. With the `border-bottom` attribute we will create a thin grey line at the bottom to separate the navigation from the rest of the page. Lastly we adjust the margins of the container to create some space around the tabs.

### Tab Style
Then we style each link within the tab. We set the font-weight to normal, to make the tabs less dominant and change the color to a dark grey. We also have to specify the border and background-color attributes explicitly to overwrite the default styles in Confluence. If we don’t specify the background color for example, the blue color of the default style will be applied.

**Hover Style**

```css
.tab-navigation .tab a:hover {
  font-weight: normal;
  color: #0088CC;
  background-color: transparent;
  border: none;
}
```

Now we want to specify the hover attributes of the links. Note that we have to overwrite the background-color and the border attributes again, otherwise the default styles will be applied. We also change the color of the text for the hover effect of the link.

**Currently Selected Element Style**

```css
ul.tab-navigation .current a:hover, ul.tab-navigation .current a {
  color:#000000;
  background-color: transparent;
  border:none;
}
```

The last selector we will need to customise is the element with the class current. Note that we use a more specific selector this time. The reason we are doing this is because these specific selectors are used in the default CSS stylesheet. If we were to use more general selectors, like we did above (ignoring the ul), the default style would still be applied since more specific selectors are rendered with a higher priority. We want to keep the general style of the other links but simply change the color of the text to black.

**Complete CSS Style**

Simply copy and paste the code below to change the look of the tabs in Confluence.
/* @group Tab Styles */

.tab-navigation .tab a {
  font-weight: normal;
  color: #999999;
  background-color: transparent;
  border: none;
}

.tab-navigation .tab a:hover {
  font-weight: normal;
  color: #0088CC;
  background-color: transparent;
  border: none;
}

#navigation, #tab-navigation{
  border-bottom-color:#CCC;
  margin: 1em 0 2em -10px;
  background-color: transparent;
}

ul.tab-navigation .current a:hover, ul.tab-navigation .current a {
  background-color: transparent;
  border:none;
  color:#000000;
}

/*@end*/

Using CSS to Customise the Easy Reader Theme

This page gives some hints on using the space CSS style sheets to customise the Easy Reader theme.

You can customise the Easy Reader theme using CSS at space or site level. A common modification is to change or remove the background image.

⚠️ CSS elements are specific to each theme

You will need to match your theme choice and custom CSS. If you want to use the CSS on this page, you will need to apply it to a space that is using the Easy Reader theme. If you apply the CSS at site level, then your entire site must use the Easy Reader theme.

Editing the CSS

To edit a space's CSS style sheets:
1. Choose Browse > Space Admin.
   Note: 'Space Admin' is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
2. Click **Stylesheet** in the left-hand panel under the heading 'Look and Feel'.
3. Click **Edit**.
4. Paste your custom CSS into the text field.
5. Click **Save**. The new CSS will be visible on all content pages in the space.

### Simple CSS Customisations for Easy Reader Theme

#### To change the background image:

```css
body { background: #ccc url("path/to/your/background.gif") 50% 0 repeat-y; }
```

Remember to set an appropriate background colour to extend past the left and right edges of the image. In the example we use colour code `#ccc`. This colour should match the last pixel on the left and right of your background image.

- **Upload your background image as a page attachment**
  
  You can upload your background as a page attachment. Make sure that you restrict editing (but not viewing) of that page to yourself or the space/site administrators.

#### To replace the theme's gradient image with your choice of background colour:

```css
body { background: #ccc; }
```

#### To add a border to the left and right of the content area, using a specific colour (in the example we use colour code `#ccc`):

```css
#full-height-container { border-left: 1px solid #ccc; border-right: 1px solid #ccc; }
```

### Giving People Access to Content

Confluence gives you the choice to make the site as open or as closed as you wish. Here are some points to consider:

- As a tool for communication and collaboration, Confluence is at its best when all your users can participate fully.
- So it is advisable not to restrict users unless you have a good reason for doing so.
- Confluence keeps a history of all changes to pages and other content. So it is easy to see who has changed what, and to reverse any edits if required.

### Levels of permission
There are three levels of permissions in Confluence.

**Global permissions**

**Global permissions** are site-wide permissions, and are assigned by administrators. Confluence allows two levels of administrator permissions:

- **System Administrator** - Users with this permission can perform all the Confluence administrative functions.
- **Confluence Administrator** - Users with this permission can perform most of the Confluence administrative functions, but excluding those functions which could compromise the security of the Confluence system.

Users with 'System Administrator' or 'Confluence Administrator' permission can assign permissions to other users. For full details, please refer to the [overview of global permissions](#) in the *Administrator's Guide*.

**Space permissions**

The permission to create a new space or to administer one is granted by a *Confluence Administrator* from the global *Administration Console*.

Every space has its own independent set of permissions. These permissions determine the access settings for different users of the space. In order to assign these permissions to other users, a user must be a space administrator i.e. must have the 'Admin' permission for that space.

See [Users and Groups](#) to learn how these permissions are assigned.

**Note:** If you misconfigure a space so that nobody has access to administer it any more, someone in the 'confluence-administrators' group will need to fix the permissions for you.

**Page restrictions**

You can set [page-level restrictions](#), if you have the 'Restrict Pages' permission within the space concerned.

Page restrictions allow you to control who can view or edit individual pages. To set page restrictions, edit the page and use the page restriction options below the text-entry box.

---

**On this page:**

---

**More information**
How do space permissions and page restrictions work together?

Example: In the HR (Human Resources) space, everyone in the organisation has the ‘View’ space permission, but only the HR team has the ‘Pages --> Create’ space permission (i.e. the ability to create and edit pages in the space). A member of the HR team starts to create a new page called 'Annual Leave Policy'. Because the page is not yet finished, she sets the 'Viewing' page restriction so that only the HR team can view the page. When the page is finished, she will remove the 'Viewing' restriction so that everyone in the company can see the page.

How do space permissions and page restrictions affect links?

Space permissions and page restrictions affect how links between pages are displayed to a visitor:

- if the link points to a page in a space to which the visitor does not have 'View' space permission, the link will not be rendered at all.
- if the visitor has 'View' space permission, but page restrictions prohibit her from viewing the page, the link will be rendered but an 'Access Denied' message will be displayed when she clicks the link.
- if the visitor has 'View' space permission, and is not restricted from viewing the page, the link will display and behave as normal.

Links to attachments are also affected: If the visitor does not have permission to view the page to which the attachment is attached, the link will not be rendered.

Page Restrictions

Page restrictions allow you to control who can view or edit individual pages. You set the page restrictions using the Page Restrictions dialog, either directly by choosing Tools > Restrictions, or when editing a page.

For instructions on using the Page Restrictions dialog, refer to Setting a Page's Restrictions.

When a page you are viewing has restrictions applied, a small padlock icon appears next to the page byline. Clicking the padlock will open the Page Restrictions dialog, where full details on the page restrictions are displayed.

The Confluence Permissions and Page Restrictions Hierarchy

Permissions and page restrictions in Confluence work within a hierarchical manner. For example, users who can access and modify global permissions (for instance, Confluence Administrators) can define which users can access and modify space level permissions (that is, space administrators). Space administrators can then define which users have access to create and modify pages. These users in turn can then apply viewing and editing restrictions to a page. By inheritance, these restrictions will also be applied to any child or descendant pages which are then added to that page.

See the diagram below for an illustration.

*Diagram: Confluence Restrictions Hierarchy*
Requirements for Setting Restrictions

In order to set or modify page restrictions, you need to have both:

- 'Restrict Pages' permission in the space to which the page belongs (since page restrictions operate within the bounds of space permissions).
- Permission to edit the page itself. That is, if a user is prevented from editing a page through page restrictions, they are also prevented from changing the restrictions themselves.

Page Security Rules

Users can only view page or space content for which they (or a group they are in) have 'View' permission. Pages that a user does not have 'View' access to are referred to as 'inaccessible' pages. Visit Inaccessible Page to see how Confluence deals with pages a user cannot view:

- Anonymous users are directed to the login page.
- Logged-in users are shown a permissions error page.
It is not possible to conceal the existence of pages, though you can restrict 'View' access to page content. Users will still be able to find the page if they know its URL. But they will not be able to view the content if they don't have the correct permissions.

**Inherited Restrictions and Child Pages**

If a page has its 'View' restriction set, that restriction will be inherited by all its children (and their children, and so on). If a 'View' restriction is added to a page that has already inherited page restrictions from its parent, users must satisfy both restrictions in order to see the page.

'EEdit' restrictions are not inherited from the parent page, only from the space. In a space, the 'Add Pages' permission governs both the creation and the editing of pages. See [Space Permissions Overview](#).

**Example of Child Page Restrictions**

Consider the page 'Documents', with a child page 'Executive', which itself has a child page 'Payroll'. To begin with, anyone who can view the space to which these pages belong can see all three pages.

For security reasons, 'View' restrictions are set on the 'Executive' page, restricting it to the 'mycompany-management group'. At this point, anyone can still see the 'Documents' page, but you must be in the 'mycompany-management group' in order to view either 'Executive' or 'Payroll'.

Since 'Payroll' information is considered particularly private, the 'Payroll' page then has its page restrictions set to only allow members of the 'mycompany-financial' group to view it. At this point, anyone can see the 'Documents' page, only members of 'mycompany-management' can see 'Executive', and only users who are members of both the 'mycompany-management' and 'mycompany-financial' groups can view 'Payroll'.

**How to Open Part of a Space**

If designing a large site implementation with this strategy, consult [Page Restrictions](#) and [Performance Considerations](#).

Often there are cases for which a section of a space should be opened to a group or set of users (for this example, we'll call them group B), but the rest of the space should not be visible to your main users (for this example, we'll call them group A). In this case:

1. Add 'view' permission for both groups A and B in [space permissions](#).
2. Move the page to be opened to the root of the space. When browsing the pages in the space, your normal space home page and this page should both be at the root level.
3. Add a page restriction to allow Group A and B to see this page.
4. Add a page restriction to your main landing page for Group A, thereby excluding this set of pages from Group B.

You can repeat this with any page hierarchy.

**Administrators**

- Space administrators are responsible for the management of a space and its contents. They therefore have the ability to remove all restrictions from a page (as described in 'Viewing Restricted Pages'). This means that space administrators can view and edit all content in the space.
- Users who are members of the 'confluence-administrators' group ('super-users') cannot immediately see pages from which they are excluded by page restrictions. Also, to be able to edit the page, you will need to remove the restriction from it first – go to [Space Administration > Restricted Pages](#).
You cannot exclude yourself

As creator or editor of a page, you cannot use page restrictions to deny yourself access to the page. Confluence will automatically add your username into the list of users/groups allowed to view/edit the page. If you remove your username, Confluence will put it back again.

Working with Pages

Take me back to the Confluence User's Guide.

Setting a Page's Restrictions

Page restrictions control who may view or edit a specific page, within the bounds of the space permissions:

- View restrictions make the page invisible to everyone except the chosen users and groups.
- Edit restrictions prevent everyone except the chosen users and groups from editing the page.

You can restrict the page to as many users and groups as you like.

In order to set or modify page restrictions, you need to have the 'Restrict Pages' permission in the space to which the page belongs, as well as permission to edit the page itself.

Setting Page Restrictions

To set restrictions on a page:

1. Choose Tools > Restrictions. The Page Restrictions dialog opens. You can also click the padlock icon in the page's byline (if available), or click either Unrestricted or Restricted when editing the page.
2. Select the restriction option required.
3. Choose the users and groups who you want to be able to view or edit the page:
   - To choose just yourself, click Me.
   - To choose a particular user or group, type the user's username (or their full name), or the group name, into the Enter ... name box, and click Restrict. You can enter multiple user and group names, when separated by commas.
   - To search for a user or group (if you are unsure of the name), click Person... or Group... (You can read more about searching for users.)
4. Click Save.

Screenshot: The Confluence Page Restrictions dialog
Removing Page Restrictions

To remove restrictions on a page:

1. Choose Tools > Restrictions. The Page Restrictions dialog opens. You can also click the padlock icon in the page's byline (if available), or click either Unrestricted or Restricted when editing the page.
2. Click Remove restriction next to the appropriate users or groups.
3. Click Save.

You can both set and remove restrictions for different users or groups when using the Page Restrictions dialog.

Notes

When a page you are viewing has restrictions applied, a small padlock icon appears next to the page byline. Clicking the padlock will open the Page Restrictions dialog, where full details on the page restrictions are displayed.

View and edit restrictions apply to all users including space administrators. However, space administrators can remove any restriction on a page. See Viewing Restricted Pages.

Site Administrators and their Permissions

All site administrative functions are performed from the Administration Console. You need ‘System Administrator’ or ‘Confluence Administrator’ permissions to access the Administration Console.

The Confluence permission scheme allows the following levels of site administrator permissions, with the most powerful at the top of the list:

- **Super user** – A ‘super user’ belongs to the `confluence-administrators` group, has full administrative access to Confluence, and can see all the content.
- **System Administrator** – A person with ‘System Administrator’ permission has full administrative access to Confluence.
- **Confluence Administrator** – A person with ‘Confluence Administrator’ permission has access to most of the Confluence administrative functions.

⚠️ Some functionality described on this page is restricted in Confluence OnDemand.

Please refer to the overview of global permissions for full details.

Contacting Confluence Administrators

If you receive an error message from Confluence, the error page may offer you a link to click in order to contact the administrators of the Confluence site.

When you click the link to contact the Confluence administrators, you will see an administrator contact page with the title ‘Contact Site Administrators’. By default, the administrator contact page looks like the screenshot below.

**Screenshot: The administrator contact screen**

The screen may look different

In certain configurations of Confluence, you will not be able to use the form shown in the screenshot above. Instead, you will see a message telling you about one of the following conditions:
• If your Confluence administrator has not configured a mail server for Confluence, this means that Confluence will not be able to send an email message to the administrators.
• If none of the Confluence administrators has an email address, Confluence will not be able to send an email message to them.
• If there are no Confluence administrators defined to Confluence, Confluence will not be able to send an email message to them.
• The Confluence administrator can disable the form and specify a different message to be displayed on the above screen instead of the default message and form. See the administrator’s guide.

Configuring the Administrator Contact Page

Space Administrators and their Permissions

A space administrator is a user with the ‘Space Admin’ permission for a space. This permission itself is assigned from the Space Administration screens by a space administrator.

Who is a space administrator?

The person who creates a space is automatically the administrator of that space. That person can then assign other space administrators as required.

Confluence administrators are not necessarily space administrators.

• A user who has the ‘Administer Confluence’ permission is not automatically a space administrator for a particular space. In order for them to be a space administrator, they must belong to a group which has space administration rights on the space, or their username must be specifically granted space administration rights on the space.
• Users who are members of the 'confluence-administrators' group do automatically have space administration permissions for all spaces.

Refer to the Administrator’s Guide for more details about Confluence administrator permissions.

What can a space administrator do?

A space administrator has permission to do anything in the space regardless of any other setting. Space administrators are responsible for the management of a space and its contents. Note that page permissions affect space administrators differently from other users.

Space administrators can:

• view all content in the space. If there are page permissions that restrict the viewing of a page to a single user, or to a group to which the space administrator doesn’t belong, a space administrator can still view the page by removing the restriction.
• edit all content on any page in the space.
• remove restrictions from any page in the space (using the Space Administration interface).
• manage the watchers for any page in the space (but not watchers of the space).
• grant themselves any other space permissions (e.g. permission to set restrictions on a particular page).

All space administration functions, with the exception of managing watchers, are performed from the 'Space Admin' tab (choose Browse > Space Admin). You need to be a space administrator to access the Space Administration screens.

Related Topics

Space Permissions Overview

Take me back to Confluence User's Guide
Space Permissions Overview
Every space has its own independent set of permissions. Space permissions can only be granted by a space administrator. A space administrator has permission to do anything in the space regardless of any other setting.

Permissions can be assigned to any group, to any individual user in the Confluence-User group, and to users in the Anonymous group.

These are the permissions that can be assigned at the space level:

- **View**: user can view this space's content, including the space's details, and its pages and news items (blog posts)
- **Pages**:
  - Add – user may create and edit pages in this space.
  - Export – user may export pages in this space.
  - Restrict – user may apply page-level restrictions.
  - Remove – user may remove pages in this space.
- **Blog**:
  - Add – user may add and edit blog posts in this space.
  - Remove – user may remove blog posts in this space.
- **Comments**:
  - Add – user may make comments in this space.
  - Remove – user may remove comments from this space.
- **Attachments**:
  - Add – user may add attachments in this space.
  - Remove – user may remove attachments from this space.
- **Mail**:
  - Remove – user may delete individual mail items.
- **Space**:
  - Export – user may export content from this space.
  - Admin – user has administrative permissions over this space.

- Page Restrictions
- Confluence User's Guide

Notes

**Warning**: If you deny all administrative access to a space by mistake, so that nobody has access to administer the space any more, you will need to ask someone in the confluence-administrators group to fix the permissions for you.

Assigning Space Permissions
You can assign space permissions to groups or to individual users. You need to be a space administrator to assign space permissions. In addition, Confluence administrators can set the default permissions that will be applied to new spaces as described below.

To access the permissions for a space:

1. Go to the ‘Space Permissions’ view. To do this:
   a. Go to a page in the space where you want to view or assign permissions.
   b. Choose Browse > Space Admin.
      (You will see the ‘Space Admin’ option only if you are a space administrator of the current space.)
c. Click **Permissions** in the 'Security' section of the left-hand panel.

2. Click **Edit Permissions**.

The 'Edit Space Permissions' screen appears. It has the following sections:

- Groups – a list of groups which already have permissions to access the site.
- Individual Users – a list of users who already have permissions to access the site.
- Anonymous Access – the space permissions granted to all anonymous users of the site.

**On this page:**

- Assigning space permissions to groups
- Assigning space permissions to users
- Assigning space permissions to anonymous users
- Setting default space permissions

**Related pages:**

- Space Permissions Overview
- Users and Groups
- Confluence User's Guide

**Screenshot: Editing space permissions**

Assigning space permissions to groups

- To assign a permission, check the box next to the relevant group.
- To deny a permission, uncheck the relevant box.
To add a new group to the list, type the group name into the text box in the 'Groups' section and click **Add**. The group will appear in the list of groups. You can then assign the permissions.

To search for a group:
- Click the **icon**.
- The **Group Search** window opens. Enter all or part of the group name. You can use an asterisk "*" as a wild card.
- Check the boxes to select the required group(s).
- Click **Select Groups**. The group name(s) will appear in the text box in the 'Groups' section.
- Click **Add**.

To bulk assign or revoke group member permissions, choose either **Select All** or **Deselect All** from the **Actions** dropdown list.

Click **Save All** to apply the changes.

**Assigning space permissions to users**

- To assign a permission, check the box next to the relevant user.
- To deny a permission, uncheck the relevant box.
- To add a new user to the list, type the username into the text box in the 'Individual Users' section and click **Add**. The user will appear in the list of users, with 'View' permission assigned. You can then add more permissions if necessary.
- To search for a user:
  - Click the **icon**.
  - The **User Search** window opens. You can read more about searching for users.
  - Check the boxes to select the required user(s).
  - Click **Select User(s)**. The username(s) will appear in the text box in the 'Individual Users' section.
  - Click **Add**.

To bulk assign or revoke individual user permissions, choose either **Select All** or **Deselect All** from the **Actions** dropdown list.

Click **Save All** to apply the changes.

**Assigning space permissions to anonymous users**

- To assign a permission, check the box for the required permission.
- To deny a permission, uncheck the relevant box.
- To bulk assign or revoke anonymous user permissions, choose either **Select All** or **Deselect All** from the **Actions** dropdown list.

Click **Save All** to apply the changes.

**Note**: You cannot grant space administration rights or page restriction rights to anonymous users.

**Setting default space permissions**

If you have **Confluence Administrator** permission, you can set the default permissions that will be applied to new spaces. The default permissions are configurable for groups only, not for individual users or anonymous users.

**To set the default space permissions:**

1. Choose **Browse > Confluence Admin**.
2. Choose **Space Permissions** in the left-hand column.
3. Choose **Edit Permissions**.

**Screenshot: Default space permissions**
Users and Groups

A 'user' is the account for an individual who accesses Confluence.

New users are created by a Confluence administrator via the Administration Console. See Searching For and Administering Users for more information.

A Confluence administrator can also group users together into user groups for more convenient administration. This means that any permissions you assign at the site, space and page levels can be assigned to a whole group. A user in one of these groups will automatically be granted all permissions granted to the group.

There are two special groups in Confluence:

- **Confluence-Administrators** - This is a 'super-group' and a user from this group has permission to do anything in the site regardless of any other setting.
- **Confluence-Users** - This is the default group into which all new users are assigned. Permissions you assign to this group will be assigned to all newly signed-up users of Confluence.

Anonymous Users

Confluence treats all users who do not log in when they access Confluence as being 'Anonymous'. Administrators can assign permissions to this group separately.

Overlapping group and user permissions

When a user is assigned more than one permission, the most powerful permission will prevail.

Further explanation:

- A user may be assigned a permission specifically to their username. They may also be assigned a permission by belonging to a group, or even several groups.
- The user will then be able to perform all functions assigned to them.
- So if a user is allowed to do something over and above what the group can do, the user will be able to do it. And if the group is allowed to do something over and above the specific permissions granted to the user, the user will still be able to do it.
Managing Confluence Users

Confluence User's Guide

Searching for Users

This page describes how to use the 'User Search' window, which appears when you click Choose Users or a user search icon on a Confluence page.

On this page:

- Accessing the User Search
- Using the Simple User Search
- Using the Advanced User Search
- Searching for Users in One or More Groups
- Selecting One or More Users
- Notes
- Related Topics

Accessing the User Search

To access the 'User Search' window:

1. Click the user search link or icon when you are performing one of the following actions:
   - When assigning space permissions, click the icon in the users section.
   - When adding members to a group, click the icon.
2. The simple 'User Search' window will appear, as shown below.

Using the Simple User Search

To search via the simple user search:

1. Select the User tab on the 'User Search' screen. (See above for instructions on accessing the screen.)
2. If the Simple link is showing, click it. (If you see the Advanced link instead, then you're fine. The simple search is already active.)
3. The simple user search screen will appear, as shown below.
4. Type some information about the user into the 'Search' box. You can type all or part of their username, full name or email address.
5. Click Search.
6. Confluence will return a list of matching users. See below for instructions on selecting one or more users.

Screenshot: Simple user search

Using the Advanced User Search

To search via the advanced user search:

1. Select the Advanced tab on the 'User Search' screen. (See above for instructions on accessing the screen.)
2. If the Advanced link is showing, click it. (If you see the Simple link instead, then you're fine. The advanced search is already active.)
3. The advanced user search screen will appear, as shown below.
4. Type some information about the user into the 'Search' box. You can type all or part of their username, full name or email address.
5. Click Search.
6. Confluence will return a list of matching users. See below for instructions on selecting one or more users.
The advanced user search allows you to specify the field in which your search term appears, i.e. username, full name or email address. You may find this useful if you need to limit the number of users appearing in the search results.

To search via the advanced user search:

1. Select the User tab on the 'User Search' screen. (See above for instructions on accessing the screen.)
2. If the Advanced link is showing, click it. (If you see the Simple link instead, then you’re fine. The advanced search is already active.)
3. The advanced user search screen will appear, as shown below.
4. Complete one or more of the following fields:
   - **User Name** — Enter all or part of the person's username i.e. their login id, e.g. 'joe', or 'bloggs'.
   - **Full Name** — Enter all or part of the person's name, e.g. 'joe bloggs', or 'bloggs', or 'joe'.
   - **E-Mail** — Enter all or part of the person's email address, e.g. 'acme'
5. Click Search.
6. Confluence will return a list of matching users. See below for instructions on selecting one or more users.

Screenshot: Advanced user search

Searching for Users in One or More Groups

You can also list the users who appear in a particular group or in a set of groups.

To search for users in a particular group:

1. Select the Membership tab on the 'User Search' screen. (See above for instructions on accessing the screen.)
2. The 'Group Membership' search screen will appear, as shown below.
3. Type all or part of a group name into the 'Search' box.
4. Click Search.
5. Confluence will return a list of users belonging to any groups which match your search term.
6. Now you can select one or more users, as described below.

Screenshot: Searching for users in a group
Selecting One or More Users

After searching for users and receiving a list of names from Confluence, as described above, you can now select the user(s) you need.

To select one or more users:

1. Click the box next to the username(s) to select or unselect one or more users. You can click Check All to select or unselect all users.
2. Click Select User(s).
3. The 'User Search' window will close and the selected users will appear on the screen which you were using before you accessed the user search.
Notes

- **Case sensitivity**: The search is not case sensitive. You can enter either upper- or lower-case text, and it will make no difference to the search results.
- **Wild cards**: The search allows the asterisk as a wild card, but you do not need to use it. The search results will be the same whether you use a wild card or not. The wildcard functionality remains available for compatibility with older versions of Confluence.
- **Multiple user directories**: You may define multiple user directories in Confluence, so that Confluence looks in more than one place for its users and groups. For example, you may use the default Confluence **internal directory** and also connect to an **LDAP directory server**. In such cases, you can define the **directory order** to determine where Confluence looks first when processing users and groups. Here is a summary of how the directory order affects the processing:
  - The order of the directories is the order in which they will be searched for users and groups.
  - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

See [Managing Multiple Directories](#).

- **Crowd and the user search**: If you are using Atlassian's **Crowd** for user management, you will need [Crowd 1.5.1 or later](#) to use the ‘Simple’ option in the user search. If your version of Crowd does not support the simple user search, you will see only the ‘Advanced’ search form.

Using Confluence on a Mobile Device

When you view a Confluence page on a mobile device, such as an iPhone or an iPad, Confluence will display an optimised version of the page. This is Confluence mobile.

On your phone or other supported mobile device, you can:

- View the Confluence dashboard, pages, blog posts, and user profiles.
- Add a comment to a page or blog post.
- Like a page, blog post or comment.
- Manage your personal tasks and notifications.

You cannot add or edit pages or blog posts, or edit existing comments, using the mobile interface.

See [Supported Platforms](#) for details of supported mobile devices.

The dashboard – the first thing you see

*Screenshot: The dashboard in Confluence mobile*
Choose a tab to see:

- Popular content – what people like in your wiki.
- Recent blogs – the latest blog posts.
- Network – updates by people in your network.

Tap the links to view the full content of a page, blog post or comment.

**Searching for content and people**

Tap the menu icon to open the menu panel on the left of the page. Then type text or a person's name in the Search box. The mobile interface offers the quick navigation search, which returns matches on page title only. (See Searching Confluence.) To use the full search, switch to desktop mode.

**Screenshot: The menu panel in Confluence mobile**

Viewing pages, blog posts and comments

Tap a link on the dashboard or on any other page. Confluence will display the linked page, blog post or comment.

You can:
- View the content, tap a link to move to another page, and interact with the page using the standard functionality supported by mobile browsers.
- Like or unlike a page, blog post or comment.
- Add a comment. Confluence mobile supports plain-text comments only.

*Screenshot: A page with a 'Like' button and a comment box*

### Chocolate

**By Sarah Maddox**

![Save button](image)

### Viewing people's profiles

Search for a person's name, then view that person's user profile. Tap the options to phone, SMS or email a colleague directly from your mobile device.

*Screenshot: A user profile on Confluence mobile*

### Following up on notifications

You can view and respond to your notifications on your phone or other mobile device. Tap the menu icon

---

*Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.*
to open the menu panel on the left of the page. Choose Notifications, and tap a notification to see its details. You can reply, watch or like via the inline actions. Tap Open to open the page or blog post in a new page. For full details, see Managing Notifications in Confluence.

Screenshot: Notifications in Confluence mobile

Managing tasks

You can view and manage your tasks on your phone or other mobile device too. Tap the menu icon to open the menu panel on the left of the page. Choose Tasks, and tap the plus sign to add a new task. Tap a task to see its details. You can add notes, complete a task, and tap a link to open the related page. For full details, see Managing Tasks in Confluence.

Screenshot: Tasks in Confluence mobile

Notes about Confluence Mobile

When you view a Confluence page on a mobile device, such as an iPhone or an iPad, Confluence will display an optimised version of the page. This is Confluence mobile.

For a summary of mobile features, see Using Confluence on a Mobile Device. Below are additional notes that you will find useful.

On this page:

- Some macros may not work
- You can swap from mobile to standard Confluence and back again
- Confluence chooses the mobile or desktop interface based on your device
- Administrators can disable Confluence mobile on your site
- Confluence mobile is a web interface, not a native app
- Related pages

Some macros may not work

Confluence macros are not yet fully supported in Confluence mobile. If you view a page that contains an unsupported macro, you will see a message inviting you to click through to the desktop version of the page.

Screenshot: Macro not rendered in Confluence mobile
You can swap from mobile to standard Confluence and back again

You can swap from the mobile view to the standard view of a page at any time. Choose the menu icon then choose **Switch to desktop version**.

*Screenshot: The menu panel in Confluence mobile*

You can also swap from the desktop view to the mobile view, if you are on a mobile device. Choose the option **Switch to Confluence Mobile** at the top of the window.

*Screenshot: Option to switch to Confluence mobile*

Confluence chooses the mobile or desktop interface based on your device

Confluence mobile supports iOS and Android devices. For specific versions, see [Supported Platforms](#).

**Administrators can disable Confluence mobile on your site**

The mobile functionality is provided by a plugin called the 'Confluence Mobile Plugin'. To remove the functionality from your site, you can disable the plugin. See [Disabling or Enabling a Plugin](#).

**Confluence mobile is a web interface, not a native app**

Atlassian does not supply a native mobile application that you can download and install onto your mobile device. Confluence mobile is a web-based user interface that the Confluence server displays when it detects a mobile client.

Setting up a knowledge base
A support engineer's guide to using Confluence as a knowledge base – see Developing a Knowledge Base on Confluence Wiki.

Setting up an intranet
A quick guide to setting up an intranet wiki – see Developing an Intranet on Confluence Wiki.

Working with Confluence Markup
This section describes two types of markup found in Confluence:

- **Confluence storage format.** Confluence stores the content of pages and blog posts in an XHTML-based format. Advanced users can view the storage format of a page and even edit it, provided their Confluence site is configured to allow that. See Confluence Storage Format for a description of the core elements of the storage format. For details of the elements used to define a macro, see Confluence Storage Format for Macros.

- **Wiki markup.** Confluence allows data entry via a shorthand code called wiki markup. Some parts of the Confluence administration interface also accept wiki markup for defining content. For a description of the wiki markup syntax, see Confluence Wiki Markup. For details of the wiki markup used to define Confluence macros, see Confluence Wiki Markup for Macros.

A request from the Atlassian technical writers about comments and feedback: When adding comments to this page, please restrict your comments to constructive feedback on the documentation itself: Things we’ve missed in the documentation, and things that will be useful to other readers. If you have other feedback about the editor, wiki markup, the XML storage format, and Confluence 4 in general, please add your comments in the section titled Confluence 4 Editor - Customer Feedback, and its child pages. Our reason for this request: When a page attracts a large number of comments, it makes it difficult for everyone to read the page, and to add or respond to comments about the documentation. Thanks.

Confluence Storage Format

This page describes the XHTML-based format that Confluence uses to store the content of pages, page templates, blog posts and comments. This information is intended for advanced users who need to interpret and edit the underlying markup of a Confluence page.

We refer to the Confluence storage format as 'XHTML-based'. To be correct, we should call it XML, because the Confluence storage format does not comply with the XHTML definition. In particular, Confluence includes custom elements for macros and more. We're using the term 'XHTML-based' to indicate that there is a large proportion of HTML in the storage format.

Notes:

- You can view the Confluence storage format for a given page by choosing Tools > View Storage Format. This option is only available if one of the following is true:
  - You are a Confluence administrator.
  - Your Confluence site has the Confluence Source Editor plugin installed and you have permission to use the source editor.

- If you would like to edit the storage format for a page, your Confluence system administrator will need to install the Confluence Source Editor plugin.
- Clarification of terminology: If you choose Tools > View Source, you will see the format used within the editor panel, not the storage format of the page.

- A request from the Atlassian technical writers about comments and feedback: When adding comments to this page, please restrict your comments to constructive feedback on the documentation itself: Things we’ve missed in the documentation, and things that will be useful to other readers. If you have other feedback about the editor, wiki markup, the XML storage format, and Confluence 4 in general, please add your comments in the section titled Confluence 4 Editor - Customer Feedback, and its child pages. Our reason for this request: When a page attracts a large number of comments, it makes it difficult for everyone to read the page, and to add or respond to comments about the documentation. Thanks.

</tr>
</tbody>
</table>
A note about link bodies

All links received from the editor will be stored as plain text by default, unless they are detected to contain the limited set of mark up that we allow in link bodies. Here are some examples of markup we support in link bodies.

For rich content like images, you need to use ac:link-body to wrap the contents.

<table>
<thead>
<tr>
<th>Link with an embedded image for the body</th>
<th><img src="http://confluence.atlassian.com/images/logo/confluence_48_trans.png" alt="google.png" /></th>
</tr>
</thead>
</table>

For rich content like images, you need to use ac:link-body to wrap the contents.
An example of different link bodies

```xml
<ac:link>
  <!-- Any resource identifier -->
  <ri:page ri:content-title="Home" ri:space-key="SANDBOX" />
  <ac:link-body>Some <strong>Rich</strong> Text</ac:link-body>
</ac:link>

<ac:link>
  <ri:page ri:content-title="Plugin developer tutorial stuff" ri:space-key="TECHWRITING" />
  <ac:plain-text-link-body><![CDATA[A plain <text> link body]]></ac:plain-text-link-body>
</ac:link>

<ac:link>
  <ri:page ri:content-title="Plugin developer tutorial stuff" ri:space-key="TECHWRITING" />
  <!-- A link body isn't necessary. Auto-generated from the resource identifier for display. -->
</ac:link>
```

The markup tags permitted within the `<ac:link-body>` are `<b>`, `<strong>`, `<em>`, `<i>`, `<code>`, `<tt>`, `<sub>`, `<sup>`, `<br>` and `<span>`.

**Images**

<table>
<thead>
<tr>
<th>Format type</th>
<th>In Confluence 3.5 and earlier</th>
<th>In Confluence 4.0 and later</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attached image</td>
<td><img src="attachment" alt="atlassian_log o.gif!" /></td>
<td><img src="attachment" alt="attachment" /></td>
<td><img src="attachment" alt="attachment" /></td>
</tr>
</tbody>
</table>

Supported image attributes (some of these attributes mirror the equivalent HTML 4 IMG element):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ac:align</td>
<td>image alignment</td>
</tr>
<tr>
<td>ac:border</td>
<td>Set to &quot;true&quot; to set a border</td>
</tr>
<tr>
<td>ac:class</td>
<td>css class attribute.</td>
</tr>
<tr>
<td>ac:title</td>
<td>image tool tip.</td>
</tr>
<tr>
<td>ac:style</td>
<td>css style</td>
</tr>
<tr>
<td>ac:thumbnail</td>
<td>Set to &quot;true&quot; to designate this image as a thumbnail.</td>
</tr>
<tr>
<td>ac:alt</td>
<td>alt text</td>
</tr>
<tr>
<td>ac:height</td>
<td>image height</td>
</tr>
<tr>
<td>ac:width</td>
<td>image width</td>
</tr>
<tr>
<td>ac:vspace</td>
<td>the white space on the top and bottom of an image</td>
</tr>
<tr>
<td>ac:hspace</td>
<td>the white space on the left and right of an image</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Format type</th>
<th>In Confluence 3.5 and earlier</th>

</thead>
<tbody>
<tr>
<td>Merge Cell</td>
<td>Normal Cell 1</td>
</tr>
<tr>
<td>Normal Cell 1</td>
<td>Normal Cell 2</td>
</tr>
</tbody>
</table>

```html
<table>
  <tbody>
    <tr>
      <th>Table Heading Cell 1</th>
      <th>Table Heading Cell 2</th>
    </tr>
    <tr>
      <td rowspan="2">Merged Cell</td>
      <td>Normal Cell 1</td>
    </tr>
    <tr>
      <td>Normal Cell 2</td>
    </tr>
  </tbody>
</table>
```
**Page layouts**

Confluence supports page layouts directly, as an alternative to macro-based layouts such as those using the section and column macros. This section documents the storage format XML created when these layouts are used in a page.

**Notes:**

- Page layouts were introduced in Confluence 4.2, and are not available in earlier versions of Confluence.
- The word `{content}` in the layouts below indicates where further XHTML or Confluence storage format block content would be entered, such as `<p>` or `<table>` tags.

<table>
<thead>
<tr>
<th>Layout Type</th>
<th>In Confluence 4.2 and later</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Two columns</strong></td>
<td></td>
</tr>
</tbody>
</table>

```xml
<div class="contentLayout" data-atlassian-layout="{"name":"pagelayout-two-simple","columns":[]}">
  <div class="columnLayout twoColumns">
    <div class="cell">
      <div class="innerCell">
        {content}
      </div>
    </div>
    <div class="cell">
      <div class="innerCell">
        {content}
      </div>
    </div>
  </div>
</div>
```
Three columns

```html
<div class="contentLayout" data-atlassian-layout="{"name": "pagelayout-three-simple", "columns": ["", ""]}">
  <div class="columnLayout threeColumns">
    <div class="cell">
      <div class="innerCell">{content}</div>
    </div>
    <div class="cell">
      <div class="innerCell">{content}</div>
    </div>
    <div class="cell">
      <div class="innerCell">{content}</div>
    </div>
  </div>
</div>
```
Two columns with header and footer

```html
<div class="contentLayout"
    data-atlassian-layout="{"name":"pagelayout-two","columns":[$""],"header":true,"footer":true}">
  <div class="header">
    <div class="innerCell">
      {content}
    </div>
  </div>
  <div class="columnLayout twoColumns">
    <div class="cell ">
      <div class="innerCell">
        {content}
      </div>
    </div>
    <div class="cell ">
      <div class="innerCell">
        {content}
      </div>
    </div>
  </div>
  <div class="footer">
    <div class="innerCell">
      {content}
    </div>
  </div>
</div>
```
Left sidebar with header and footer

```html
<div class="contentLayout"
data-atlassian-layout="{"name":"pagelayout-two-left","columns":["aside","large"],"header":true,"footer":true}">
  <div class="header">
    <div class="innerCell">
      {content}
    </div>
  </div>
  <div class="columnLayout twoColumns">
    <div class="cell aside">
      <div class="innerCell">
        {content}
      </div>
    </div>
    <div class="cell large">
      <div class="innerCell">
        {content}
      </div>
    </div>
  </div>
  <div class="footer">
    <div class="innerCell">
      {content}
    </div>
  </div>
</div>
```
<div class="contentLayout"
data-atlassian-layout="{"name":"pagelayout-two-right","columns":{"large","aside"},"header":true,"footer":true}">
  <div class="header">
    <div class="innerCell">
      {content}
    </div>
  </div>
  <div class="columnLayout twoColumns">
    <div class="cell large">
      <div class="innerCell">
        {content}
      </div>
    </div>
    <div class="cell aside">
      <div class="innerCell">
        {content}
      </div>
    </div>
  </div>
  <div class="footer">
    <div class="innerCell">
      {content}
    </div>
  </div>
</div>
Three columns with header and footer

```html
<div class="contentLayout"
    data-atlassian-layout="{"name":"pagelayout-three","columns":["","",""],"header":true,"footer":true}"
>
    <div class="header">
        <div class="innerCell">
            {content}
        </div>
    </div>

    <div class="columnLayout threeColumns">
        <div class="cell">
            <div class="innerCell">
                {content}
            </div>
        </div>
        <div class="cell">
            <div class="innerCell">
                {content}
            </div>
        </div>
        <div class="cell">
            <div class="innerCell">
                {content}
            </div>
        </div>
    </div>

    <div class="footer">
        <div class="innerCell">
            {content}
        </div>
    </div>
</div>
```
### Left and right sidebar with header and footer

```html
<div class="contentLayout"
data-atlassian-layout="{&quot;name&quot;:&quot;pagelayout-three-sidebars&quot;,&quot;columns&quot;:[&quot;sidebars&quot;,&quot;large&quot;,&quot;sidebars&quot;],&quot;header&quot;:true,&quot;footer&quot;:true}">
  <div class="header">
    <div class="innerCell">
      {content}
    </div>
  </div>
  <div class="columnLayout threeColumns">
    <div class="cell sidebars">
      <div class="innerCell">
        {content}
      </div>
    </div>
    <div class="cell large">
      <div class="innerCell">
        {content}
      </div>
    </div>
    <div class="cell sidebars">
      <div class="innerCell">
        {content}
      </div>
    </div>
  </div>
  <div class="footer">
    <div class="innerCell">
      {content}
    </div>
  </div>
</div>
```

### Emoticons

<table>

</tr>
</tbody>
</table>
Resource identifiers

Resource identifiers are used to describe "links" or "references" to resources in the storage format. Examples of resources include pages, blog posts, comments, shortcuts, images and so forth.

<table>
<thead>
<tr>
<th><strong>Resource</strong></th>
<th><strong>Resource identifier format</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Page</td>
<td><code>&lt;ri:page ri:space-key=&quot;FOO&quot; ri:content-title=&quot;Test Page&quot;/&gt;</code></td>
</tr>
</tbody>
</table>

**Notes:**
- `ri:space-key:` (optional) denotes the space key. This can be omitted to create a relative reference.
- `ri:content-title:` (required) denotes the title of the page.
### Blog Post

```xml
<ri:blog-post ri:space-key="FOO"
  ri:content-title="First Post"
  ri:posting-day="2012/01/30" />
```

**Notes:**
- `ri:space-key:` *(optional)* denotes the space key. This can be omitted to create a relative reference.
- `ri:content-title:` *(required)* denotes the title of the page.
- `ri:posting-day:` *(required)* denotes the posting day. The format is YYYY/MM/DD.

### Attachment

```xml
<ri:attachment ri:filename="...">
  ... resource identifier for the container of the attachment ...
</ri:attachment>
```

**Notes:**
- `ri:filename:` *(required)* denotes the name of the attachment.
- the body of the `ri:attachment` element should be a resource identifier denoting the container of the attachment. This can be omitted to create a relative attachment reference (similar to [foo.png] in wiki markup).

**Examples:**

#### Relative Attachment Reference

```xml
<ri:attachment ri:filename="happy.gif" />
```

#### Absolute Attachment Reference

```xml
<ri:attachment ri:filename="happy.gif">
  <ri:page ri:space-key="TST"
    ri:content-title="Test Page"/>
</ri:attachment>
```
<table>
<thead>
<tr>
<th>Table Title</th>
<th>Example Code</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td><code>&lt;ri:url ri:value=&quot;http://example.org/sample.gif&quot;/&gt;</code></td>
<td>- <strong>ri:value</strong>: (required) denotes the actual URL value.</td>
</tr>
</tbody>
</table>
| Shortcut    | `<ri:shortcut ri:key="jira" ri:parameter="ABC-123">` | - **ri:key**: (required) represents the key of the Confluence shortcut.  
  - **ri:parameter**: (required) represents the parameter to pass into the Confluence shortcut.  
  - The example above is equivalent to `[ABC-123@jira]` in wiki markup. |
| User        | `<ri:user ri:username="fred"/>` | - **ri:username**: (required) denotes the name of the user. |
| Space       | `<ri:space ri:space-key="TST"/>` | - **ri:space-key**: (required) denotes the key of the space. |
| Content Entity | `<ri:content-entity ri:content-id="123"/>` | - **ri:content-id**: (required) denotes the id of the content. |

**Template variables**
This screenshot shows a simple template:

A single-line text variable: $MyText
A multi-line text variable: $MyMulti
A selection list: $MyList

The template contains the following variables:

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Type</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>$MyText</td>
<td>Single-line text</td>
<td></td>
</tr>
<tr>
<td>$MyMulti</td>
<td>Multi-line text</td>
<td>Size: 5 x 100</td>
</tr>
<tr>
<td>$MyList</td>
<td>List</td>
<td>List items: Apples, Pears, Peaches</td>
</tr>
</tbody>
</table>

The XML export produces the following code for the template:

```xml
<at:declarations>
  <at:string at:name="MyText" />
  <at:textarea at:columns="100" at:name="MyMulti" at:rows="5" />
  <at:list at:name="MyList">
    <at:option at:value="Apples">Apples</at:option>
    <at:option at:value="Pears">Pears</at:option>
    <at:option at:value="Peaches">Peaches</at:option>
  </at:list>
</at:declarations>
<p>This is Sarah's template</p>
<p>A single-line text variable: $MyText</p>
<p>A multi-line text variable: $MyMulti</p>
<p>A selection list: $MyList</p>
<p>End of page.</p>
```

Confluence Storage Format for Macros
This page is an extension of the page about the Confluence storage format. This page describes the XML used to define specific Confluence macros – those that are shipped with Confluence. For each macro, we define the macro name, parameter names, and accepted parameter values.

This information is intended for advanced users who need to interpret and edit the underlying markup for a Confluence page.

**Anchor macro**

Allows you to link to a specific part of a page.

**Macro name:** anchor

**Macro body:** None.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-parameter</td>
<td>Yes</td>
<td>(None)</td>
<td>The name of the anchor.</td>
</tr>
<tr>
<td>(Unnamed in wiki markup)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

```xml
<ac:macro ac:name="anchor">
  <ac:default-parameter>here</ac:default-parameter>
</ac:macro>
```
On this page:
- Anchor macro
- Attachments macro
- Blog Posts macro
- Change-History macro
- Chart macro
- Cheese macro
- Children Display macro
- Code Block macro
- Column macro
- Content by Label macro
- Content by User macro
- Contributors macro
- Contributors Summary macro
- Expand macro
- Info macro
- Section macro
- Table of Contents macro
- Macro format notes
  - Macro bodies
  - Plain text bodies
- Other notes

Related pages:
- Confluence Storage Format
- Working with Confluence Markup
- Working with Macros
- Confluence User's Guide

**Attachments macro**

Displays a list of attachments on a given page.

**Macro name:** attachments

**Macro body:** None.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>old</td>
<td>No</td>
<td>false</td>
<td>Available values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• false - Displays only the latest version of each attachment.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• true – Displays all versions of each attachment, including the old versions.</td>
</tr>
</tbody>
</table>
| **patterns** | No | (None) | A comma-separated list of regular expressions, used to filter the attachments by filename. Note that the parameter values must be regular expressions. For example:
  - To match a file suffix of 'jpg', use `.*jpg` (not `.*.jpg`).
  - To match file names ending in 'jpg' or 'png', use `.*jpg,.*png`.
  Here is a [tutorial on regular expressions](https://confluence-docs.atlassian.com/tutorials/regular-expressions). |
| **sortBy** | No | date | Available values:
  - date
  - size
  - name |
| **page** | No | The page on which the macro exists. | Page name, used to display attachments from another page. |
| **sortOrder** | No | The default sort order is determined by the sortBy type:
  - Reverse chronological for 'date'.
  - Largest to smallest for 'size'.
  - Alphabetical for 'name'. | Available values:
  - ascending
  - descending |
| **labels** | No | (None) | A comma-separated list of labels. Confluence will show only attachments that have all the labels specified. (The match is an AND, not an OR.) |
| **upload** | No | false | Determines whether the list of attachments will include options allowing users to browse for, and attach, new files. |
Blog Posts macro

Lists the most recent news items in the space.

**Macro name:** blog-posts

**Macro body:** None.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>No</td>
<td>entire</td>
<td>Available values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>entire</strong> – Display the whole content of each blog post.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>excerpts</strong> – Display a short extract from each blog post. If the post contains an Excerpt macro, the Blog Posts macro will display the content defined in the Excerpt macro. If the post does not contain an Excerpt macro, the Blog Posts macro will display the first few sentences of the post.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>titles</strong> – Display a list of blog posts, showing titles only.</td>
</tr>
<tr>
<td>spaces</td>
<td>No</td>
<td>@self</td>
<td>One or more space keys, separated by a comma or a space.</td>
</tr>
</tbody>
</table>
- To exclude content in a specific space, put a minus sign (-) immediately in front of that space key. For example: If you specify a space key of `-BAD SPACE` you will get only content which is not in the BADSPACE.
- To indicate that the results must come from a specific space, put a plus sign (+) immediately in front of that space key. For example: If you specify a space key of `+GOODSPACE` you will get only content in GOODSPACE. (Note that this is not particularly useful, because each content item belongs to one space only. If you put a plus sign next to one space key and list other space keys too, the other space keys will be ignored.)

Special values:
<table>
<thead>
<tr>
<th><strong>Author</strong></th>
<th><strong>No</strong></th>
<th><strong>(None)</strong></th>
<th><strong>One or more usernames, separated by commas.</strong></th>
</tr>
</thead>
</table>
| **Time**   | **No** | **(None)** | **Available values:**
|            |        |            | • m — Minutes
|            |        |            | • h — Hours
|            |        |            | • d — Days
|            |        |            | • w — Weeks
|            |        |            | **For example,**
|            |        |            | • `time=12h` — Display blog posts created in the last twelve hours.
|            |        |            | • `time=7d` — Display blog posts created in the last seven days. |
| **Reverse**| **No** | **false**  | **A value of true changes the sort order.** |

When specifying a personal space, remember to use the tilde (`~`) sign in front of the username, such as `~jbloggs` or `~jbloggs@example.com`. 
<table>
<thead>
<tr>
<th>sort</th>
<th>No</th>
<th>creation</th>
<th>Available values:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>title</td>
<td>• title — Sort alphabetically by title.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>creation</td>
<td>• creation — Sort by the date on which the content was added.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>modified</td>
<td>• modified — Sort by the date on which the content was last updated.</td>
</tr>
</tbody>
</table>

| max    | No                      | 15       | The maximum number of results to be displayed. |
| label  | No                      | (None)   | One or more label values, separated by a comma or a space. |
|        |                         |          | • To exclude content which matches a given label, put a minus sign (-) immediately in front of that label value. For example: If you specify a label value of -badpage you will get only content which is not labelled with 'badpage'. |
|        |                         |          | • To indicate that the results **must** match a given label value, put a plus sign (+) immediately in front of that label value. For example: If you specify a label value of +superpage,+goodpage you will get only content which has at least two labels, being 'superpage' and 'goodpage'. |

**Example:**
Change-History macro

Displays a history of updates made to a page.

**Macro name:** change-history

**Macro body:** None.

**Parameters:** None

**Example:**

```xml
<ac:macro ac:name="change-history"/>
```

Chart macro

Displays a chart based on tabular data.

**Macro name:** chart

**Macro body:** Accepts rich text, consisting of tables that hold the chart's data.

This macro recognises a large number of parameters, listed here by type for convenience.

**Chart type parameters**

These parameters determine the type of chart to display and how the chart looks.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Required</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>----------</td>
<td>---------</td>
<td>---------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| type              | No       | pie     | The type of chart to display. XY charts have numerical x- and y-axes. The x values may optionally be time-based. See the `timeSeries` parameter. Available values:  
|                   |          |         | • Standard charts – pie, bar, line, area  
|                   |          |         | • XY plots – xyArea, xyBar, xyLine, xyStep, xyStepArea, scatter, timeSeries  
|                   |          |         | • Other charts – gantt (beta)                                                                   |
| orientation       | No       | vertical| The display orientation. Applies to area, bar and line charts. Available values:  
|                   |          |         | • vertical – y-axis is vertical  
|                   |          |         | • horizontal – x-axis is vertical                                                              |
| 3D                | No       | false   | Show in three dimensions. Applies to area, bar and line charts.                                  |
| stacked           | No       | false   | Stacked values. Applies to area and bar charts.                                                  |
| showShapes        | No       | true    | Applies to line charts. Shapes are shown at each data point.                                     |
| opacity           | No       |         | • 75 percent for 3D charts  
|                   |          |         | • 50 percent for non-stacked area charts  
<p>|                   |          |         | • 100 percent for all other charts                                                               |
|                   |          |         | A percentage value between 0 (transparent) and 100 (opaque) that determines how opaque the foreground areas and bars are. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>title</td>
<td>No</td>
<td>(None)</td>
<td>The title of the chart.</td>
</tr>
<tr>
<td>subTitle</td>
<td>No</td>
<td>(None)</td>
<td>A subtitle for the chart.</td>
</tr>
<tr>
<td>xLabel</td>
<td>No</td>
<td>(None)</td>
<td>The label for the x-axis (domain).</td>
</tr>
<tr>
<td>yLabel</td>
<td>No</td>
<td>(None)</td>
<td>The label for the y-axis (range).</td>
</tr>
<tr>
<td>legend</td>
<td>No</td>
<td>false</td>
<td>Determines whether to show a legend (key) for the chart.</td>
</tr>
</tbody>
</table>

**Chart data parameters**

The data for the chart is taken from tables found in the macro body. The parameters below control how this data is interpreted. By default, numeric and date values are interpreted according to the Confluence global default language (locale) formats. If conversion fails, other languages defined in Confluence will be tried. You can specify additional conversion options using the parameters below.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>---</td>
<td>---</td>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>tables</td>
<td>No</td>
<td>All first level tables</td>
<td>You can supply a comma-separated list of table IDs and/or table numbers (starting at 1) contained within the body of the macro that will be used as the data for the chart. If data tables are embedded in other tables, then table selection will be required. This occurs when more complex formatting is done (for example using section and column macros).</td>
</tr>
<tr>
<td>columns</td>
<td>No</td>
<td>All columns</td>
<td>You can supply a comma-separated list of column labels and/or column titles and/or column numbers for tables used for chart data. This applies to all tables processed. Columns are enumerated starting at 1. Column label is the text for the column in the header row. Column title is the HTML title attribute for the column in the header row.</td>
</tr>
</tbody>
</table>
| dataOrientation | No | horizontal | The content orientation. By default, the data tables will be interpreted as columns (horizontally) representing domain and x values. Available values:  

- **vertical** – data table columns will be interpreted as series.  
- **horizontal** – data tables rows will be interpreted as series. |
<p>| timeSeries | No | false | If 'true', the x values in an XY plot will be treated as time series data and so will be converted according date formats. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dateFormat</code></td>
<td>No</td>
<td>Confluence language defined date formats</td>
<td>For time series data, the date format allows for additional customisation of the conversion of data to date values. If a <code>date Format</code> is specified, it will be the first format used to interpret date values. Specify a format that matches the time series data. See simple date format.</td>
</tr>
<tr>
<td><code>timePeriod</code></td>
<td>No</td>
<td>day</td>
<td>The time period for time series data. Defines the granularity of how the data is interpreted. Available values: millisecond, second, minute, hour, day, week, month, quarter, year</td>

</table>
### Pie chart Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| pieSectionLabel    | No       | Show only the pie section key value | Format of pie section labels. The format uses a string with special replacement variables:  
   • `%0%` is replaced by the pie section key.  
   • `%1%` is replaced by the pie section numeric value.  
   • `%2%` is replaced by the pie section percent value.  

**Example 1:** To display something like 'Independent = 20':

```
%0% = %1%
```

**Example 2:** To display something like 'Independent (20%)':

```
%0% (%2%)
```
pieSectionExplode | No | No exploded sections | A comma-separated list of pie keys that are to be shown exploded. Note: requires jFreeChart version 1.0.3 or higher.

Chart attachment parameters

These are advanced options that can be used for chart versioning, to enable automation and to improve performance. Use these options carefully! Normally, the chart image is regenerated each time the page is displayed. These options allow for the generated image to be saved as an attachment and have subsequent access to re-use the attachment. This can be useful especially when combined with the Cache plugin to improve performance. Depending on the options chosen, chart images can be versioned for historical purposes.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachment</td>
<td>No</td>
<td>(None)</td>
<td>The name and location where the chart image will be saved as an attachment. The user must be authorised to add attachments to the page specified. Available syntax for this parameter:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• ^attachmentName.png — the chart is saved as an attachment to the current page.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• page name^attachmentName.png — the chart is saved as an attachment to the page name provided.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• spacekey:pageTitle^attachmentName.png — the chart is saved as an attachment to the page name provided in the space indicated.</td>
</tr>
</tbody>
</table>
| attachmentVersion | No       | new    | Defines the versioning mechanism for saved charts. Available values:  
|                   |          |        | - **new** — creates new version of the attachment.  
|                   |          |        | - **replace** — replaces all previous versions of the chart. To replace an existing attachment, the user must be authorised to remove attachments for the page specified.  
|                   |          |        | - **keep** — only saves a new attachment if an existing export of the same name does not exist. An existing attachment will not be changed or updated.  
| attachmentComment | No       | (None) | Comment used for a saved chart attachment.  
| thumbnail         | No       | false  | If true, the chart image attachment will be shown as a thumbnail (small, expandable) image.  

**Example:**

Below is a simple example of a pie chart. See more examples in [Storage Format Examples for Chart Macro](#).
<ac:macro ac:name="chart">
<ac:parameter ac:name="title">Fish Sold</ac:parameter>
<ac:parameter ac:name="type">pie</ac:parameter>
<ac:rich-text-body>
<table>
<tbody>
<tr>
<th><p>Fish Type</p></th>
<th><p>2004</p></th>
<th><p>2005</p></th>
</tr>
<tr>
<th><p>Herring</p></th>
<td><p>9,500</p></td>
<td><p>8,300</p></td>
</tr>
<tr>
<th><p>Salmon</p></th>
<td><p>2,900</p></td>
<td><p>4,200</p></td>
</tr>
<tr>
<th><p>Tuna</p></th>
<td><p>1,500</p></td>
<td><p>1,500</p></td>
</tr>
</tbody>
</table>
</ac:rich-text-body>
</ac:macro>

**Cheese macro**
Displays the words "I like cheese!"
Macro name: cheese

Macro body: None.

Parameters: None

Example:

```latex
<ac:macro ac:name="cheese"/>
```

Children Display macro

Displays the children and descendants of the current page.

Macro name: children

Macro body: None.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>reverse</td>
<td>No</td>
<td>false</td>
<td>Reverses the sort order in the list of child pages. Use this parameter in conjunction with the sort parameter described below. A value of true will change the sort order from ascending to descending.</td>
</tr>
</tbody>
</table>
| sort           | No       | Manual if the pages have been manually reordered, otherwise alphabetical by page title | Determines the sort order of the list of child pages. Available values:  
  - creation – Sort by the date on which the page was created.  
  - title – Sort alphabetically by page name.  
  - modified – Sort by the date on which the page was last updated. |
<p>| style          | No       | Bullet list | A heading style to be applied to the list of child pages. Available values: h1 (heading level 1) through to h6 (heading level 6). |</p>
<table>
<thead>
<tr>
<th><strong>Parameter</strong></th>
<th><strong>Default</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>page</td>
<td>No</td>
<td>The page that contains the macro. The name of the parent page. The macro will display the children of the specified page. To specify a page in a different space, use a space key followed by a colon. For example: MYSPACE:My page. If the value of this parameter is a forward slash (/) the macro will list the pages at the root of the current space. In other words, the pages without parents.</td>
</tr>
<tr>
<td>excerpt</td>
<td>No</td>
<td>false</td>
</tr>
<tr>
<td>first</td>
<td>No</td>
<td>(None)</td>
</tr>
<tr>
<td>depth</td>
<td>No</td>
<td>(None)</td>
</tr>
<tr>
<td>all</td>
<td>No</td>
<td>false</td>
</tr>
</tbody>
</table>

**Example:**

...
**Code Block macro**

Displays code in your document with the appropriate syntax highlighting.

**Macro name:** code

**Macro body:** Accepts plain text.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>title</td>
<td>No</td>
<td>(None)</td>
<td>Adds a title to the code macro box.</td>
</tr>
<tr>
<td>theme</td>
<td>No</td>
<td>Confluence</td>
<td>Specifies the colour scheme used for displaying your code. Many of these themes are based on the default colour schemes of popular integrated development environments (IDEs). The default theme is Confluence (also known as Default), which is typically black and coloured text on a blank background. Available themes:</td>
</tr>
</tbody>
</table>

- Django
- Emacs
- FadeToGrey
- Midnight
- RDark
- Eclipse
- Confluence (same as default)
<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>linenumbers</td>
<td>No</td>
<td>If true, a line number will be shown to the left of each line of code. Numbering is incremented by 1. If false, no line numbers are shown.</td>
</tr>
</tbody>
</table>
| language    | java  | Specifies the language (or environment) for syntax highlighting. 
- (none) — that is, no syntax highlighting
- actionscript3
- bash
- csharp — that is, C#
- coldfusion
- cpp — that is, C++
- css
- delphi
- diff
- erlang
- groovy
- java
- javafx
- javascript
- perl
- php
- powershell
- python
- ruby
- scala
- sql
- vb — that is, Visual Basic
- html/xml |
| firstline   | 1     | When linenumbers is true, this value defines the number of the first line of code. |
| collapse    | false | If true, the code macro's content will be collapsed upon visiting or refreshing the Confluence page. Clicking the 'expand source' link allows you to view the content. If false, the code macro's content is always displayed in full. |
Example:

The following example shows all parameters and a body:

```xml
<ac:macro ac:name="code">
  <ac:parameter ac:name="title">This is my title</ac:parameter>
  <ac:parameter ac:name="theme">FadeToGrey</ac:parameter>
  <ac:parameter ac:name="linenumbers">true</ac:parameter>
  <ac:parameter ac:name="language">html/xml</ac:parameter>
  <ac:parameter ac:name="firstline">0001</ac:parameter>
  <ac:parameter ac:name="collapse">true</ac:parameter>
  <ac:plain-text-body><![CDATA[<b>This is my code</b>]]></ac:plain-text-body>
</ac:macro>
```

Below are three examples of the Code Block macro with various optional parameters used.

<table>
<thead>
<tr>
<th>Description</th>
<th>Markup</th>
<th>What you will get</th>
</tr>
</thead>
</table>
| Code block macro with a body and no optional parameters | `<ac:macro ac:name="code">
  <ac:plain-text-body><![CDATA[this is my code]]></ac:plain-text-body>
</ac:macro>` | this is my code |
| Code block macro with a body and the optional `language` parameter defined | `<ac:macro ac:name="code">
  <ac:parameter ac:name="language">html/xml</ac:parameter>
  <ac:plain-text-body><![CDATA[this is my code]]></ac:plain-text-body>
</ac:macro>` | this is my code |
Code block macro with a body and optional title, line numbers and language parameters defined

```xml
<ac:macro ac:name="code">
  <ac:parameter ac:name="title">This is my title</ac:parameter>
  <ac:parameter ac:name="linenumbers">true</ac:parameter>
  <ac:parameter ac:name="language">html/xml</ac:parameter>
  <ac:plain-text-body><![CDATA[this is my code]]></ac:plain-text-body>
</ac:macro>
```

This is my title
this is my code

---

**Column macro**

Used with the Section macro to define columns on a page. See [Working with page layouts and columns and sections](#).

**Macro name:** column

**Macro body:** Accepts rich text.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>No</td>
<td>100% of the page width, divided equally by the number of columns in the section.</td>
<td>The width of the column. Can be specified either in pixels (for example, 400px) or as a percentage of the available page width (for example, 50%).</td>
</tr>
</tbody>
</table>

**Example:**

```xml
<ac:macro ac:name="column">
  <ac:parameter ac:name="width">100px</ac:parameter>
  <ac:rich-text-body>
    <p>This is the content of <strong>column 1</strong>.</p>
  </ac:rich-text-body>
</ac:macro>
```

---

**Content by Label macro**
Displays a list of content associated with specific labels.

**Macro name:** contentbylabel

**Macro body:** None.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
</table>
| spaces         | No       | @all    | Filters the results by space. The macro will display only the pages and other content types which belong to the space(s) you specify here. You can specify one or more space keys, separated by a comma or a space.

- To exclude content in a specific space, put a minus sign (-) immediately in front of that space key. For example: If you specify a space key of -BADS PACE you will get only content which is not in the BADSPACE.

- To indicate that the results **must** come from a specific space, put a plus sign (+) immediately in front of that space key. For example: If you specify a space key of +GOOD SPACE you will get only content in GOODSPACE. (Note that this is not particularly useful, because each content item belongs to one space only. If you put a plus sign next to one space key and list other space keys too, the other space keys will be ignored.)

Special values:
- **@self** — The current space.
- **@personal** — All personal spaces.
- **@global** — All global spaces.
- **@favorite** — The spaces you have marked as favourite.
- **@favourite** — The same as @favorite above.
- **@all** — All spaces in your Confluence site.
- **@** — The same as @all above.

When specifying a personal space, remember to use the tilde (~) sign in front of the username, such as ~jbloggs or ~jbloggs@example.com.

<table>
<thead>
<tr>
<th>Filter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>author</td>
<td>No</td>
<td>(None)</td>
<td>Filters the results by author. The macro will display only the pages and other content types which are written or updated by the author(s) you specify here. You can specify one or more authors, separated by a comma.</td>
</tr>
<tr>
<td>title</td>
<td>No</td>
<td>(None)</td>
<td>Adds a heading to the list.</td>
</tr>
<tr>
<td>showLabels</td>
<td>No</td>
<td>true</td>
<td>Determines whether to display the matching labels in the list of results.</td>
</tr>
<tr>
<td>reverse</td>
<td>No</td>
<td>false</td>
<td>Use this parameter in conjunction with the sort parameter. Set reverse=true to change the sort from ascending to descending. This parameter is ignored if the sort parameter is not specified.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Default</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------</td>
<td>-------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| **sort**  | No      | modified | Determines how the results are sorted. To change the sort order from ascending to descending, use the `reverse` parameter described above. If this parameter is not specified, the sort order defaults to descending order based on the last modification date. Values:  
  - **title** — Sort alphabetically by title.
  - **creation** — Sort by the date on which the content was added.
  - **modified** — Sort by the date on which the content was last updated. |
| **max**   | No      | 15    | Determines the maximum number of results to be displayed. Note that the results are sorted first, and then the maximum parameter is applied. |
| **excerpt** | No      | false | If this parameter is set to `true`, the macro displays an excerpt from each page listed in the results. Note that you must define the excerpts on each of those pages, by adding the `Excerpt macro` to each page. If a particular page does not have an excerpt defined, then the Content by Label macro will not attempt to show an excerpt for that page. The Content by Label macro will show only the first few lines of the excerpt for each page. |
| labels     | Yes     | (None)   | Use this parameter to filter the results by label. The macro will display only the pages and other content types which are tagged with the label(s) you specify here. See also the `operator` parameter.

You can specify one or more label values, separated by a comma or a space.

- To exclude content which matches a given label, put a minus sign `-` immediately in front of that label value. For example: If you specify a label value of `-badpage` you will get only content which is not labelled with `badpage`.
- To indicate that the results must match a given label value, put a plus sign `+` immediately in front of that label value. For example: If you specify a label value of `+superpage,+goodpage` you will get only content which has at least two labels, being `superpage` and `goodpage`.

<p>| showSpace | No      | true     | Determines whether to display the spaces in the list of results. |</p>
<table>
<thead>
<tr>
<th>type</th>
<th>No</th>
<th>All</th>
</tr>
</thead>
</table>

Filters the results by content type. The macro will display only the content of the type you specify here.

You can specify one or more types, separated by a comma or a space.

To exclude content of a given content type, put a minus sign (-) immediately in front of that content type. For example: If you specify a content type of `-blogpost` you will get pages and all other content except for blog posts.

Available values:
- `page` — *pages*.
- `blogpost` or `news` — blog posts, also known as *news* items.
- `attachment` — *attachments*.
<table>
<thead>
<tr>
<th>operator</th>
<th>No</th>
<th>OR</th>
</tr>
</thead>
</table>
|          |    | The operator to apply to the supplied lists of labels. By default, a page with any of the non-prefixed labels (that is, labels without a plus (+) or minus (-) sign immediately preceding it) will be listed. If you specify a value of AND, only pages with all of the supplied non-prefixed labels will be listed.

Note that this parameter only modifies the behaviour of the 'Label(s)' parameter and only affects label values without a plus (+) or minus (-) sign prefix. To avoid confusion or unexpected results, we recommend that you do not use the operator parameter in conjunction with any label values prefixed with '+' or '-' signs.

Example:

```xml
<ac:macro ac:name="contentbylabel">
  <ac:parameter ac:name="spaces">@personal,@self</ac:parameter>
  <ac:parameter ac:name="author">admin,smaddox</ac:parameter>
  <ac:parameter ac:name="title">My labelled pages</ac:parameter>
  <ac:parameter ac:name="showLabels">false</ac:parameter>
  <ac:parameter ac:name="reverse">true</ac:parameter>
  <ac:parameter ac:name="sort">creation</ac:parameter>
  <ac:parameter ac:name="max">10</ac:parameter>
  <ac:parameter ac:name="labels">chocolate,cake</ac:parameter>
  <ac:parameter ac:name="showSpace">false</ac:parameter>
  <ac:parameter ac:name="type">page</ac:parameter>
  <ac:parameter ac:name="operator">AND</ac:parameter>
</ac:macro>
```

**Content by User macro**

Displays a list of the content items that have been created by a specified Confluence user.

**Macro name:** content-by-user

**Macro body:** None.
<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-parameter</td>
<td>Yes</td>
<td>(None)</td>
<td>The Confluence username for the person whose content you wish to display</td>
</tr>
<tr>
<td>(Unnamed in wiki markup)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

```html
<ac:macro ac:name="content-by-user">
  <ac:default-parameter>jsmith</ac:default-parameter>
</ac:macro>
```

**Contributors macro**

Displays a list of Confluence users who have made a contribution of some type to a page.

**Macro name:** contributors

**Macro body:** None.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>No</td>
<td>(None)</td>
<td>Limits the number of contributors displayed in the list.</td>
</tr>
<tr>
<td>spaces</td>
<td>No</td>
<td>Current space</td>
<td>Specifies the space key of the Confluence space to search. Space keys are case sensitive.</td>
</tr>
</tbody>
</table>

Special values:
- @global — All global spaces.
- @personal — All personal spaces.
- @all — All spaces in the Confluence site.

You can specify one or more space keys or special values, separated by commas.

If no page and labels are specified, all pages from the specified set of spaces are included.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reverse</td>
<td>No</td>
<td>false</td>
<td>Reverses the order of contributors in the list. Must be used in conjunction with the order parameter.</td>
</tr>
</tbody>
</table>
| scope     | No       | The specified page only | Specifies additional pages to include when generating the list of contributors. Available values:  
- children – only the child pages of the specified page.  
- descendants – all descendants of the specified page. |
| labels    | No       | (None) | Limits the list of contributors to those who created the specified labels on a page. You can specify one or more labels, separated by commas. |
| showPages | No       | false | If the value is true, the macro will display a list of the pages used to generate the list of contributors. |
| noneFoundMessage | No | "No contributors found for:" (and a summary of selected parameter values) | Any message given here will override the default message that is displayed when no contributors are found. |
| showCount | No       | false | Determines whether the macro will show the number of times each person made a contribution. |
| **contentType** | **No** | **Both pages and blog posts** | Restricts the content type that the macro will use when generating the list of contributors. Available values:  
- *pages* - pages  
- *blogposts* - blog posts. |
| **include** | **No** | **authors** | Filters by either the type of contribution made to a page (and optionally its descendant pages), or the watches on the page. Contribution types are:  
- *authors* - includes people who created or have edited the page(s)  
- *comments* - includes people who have added comments to the page(s)  
- *labels* - includes people who have added labels to the page(s)  
- *watches* - includes people who are watching the page(s). You can specify one or more contribution types, separated by commas. |
| **mode** | **No** | **inline** | Determines how the list of contributors is formatted:  
- *inline* — a comma-separated list  
- *list* — a bullet list. |
| **showAnonymous** | **No** | **false** | Determines whether to include those who contributed anonymously to a page. |
| order | No | count | Specifies the criteria used to sort contributors. Sort criteria are:
|       |    |       | - **count** – sorts the names based on the total number of contributions to the page(s)
|       |    |       | - **name** – sorts the names into alphabetical order
|       |    |       | - **update** – sorts the names by the date of their last contribution to the page(s).

| page | No | The current page | Specifies the page to use when generating the list of contributors. If page and spaces are left blank, the current page is assumed.

| showLastTime | No | false | Determines whether to show the last time each person made a contribution.

| publishDate | No | (None) | Specifies the publication date for a blog post. The date format required is: YYYY/MM/DD.

**Example:**

This example specifies a content type of blog posts:
Contributors Summary macro

Displays a table of contribution-based statistics for a set of pages.

**Macro name:** contributors-summary

**Macro body:** None.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
</table>

This example specifies a content type of pages:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>No</td>
<td>(None)</td>
<td>Limits the number of contributors or pages displayed in the table.</td>
</tr>
</tbody>
</table>
| spaces      | No       | Current space | Specifies the space key of the Confluence space to search. Space keys are case sensitive. Special values:  
|             |          |         | - `@global` — All global spaces.  
|             |          |         | - `@personal` — All personal spaces.  
|             |          |         | - `@all` — All spaces in the Confluence site.  
|             |          |         | You can specify one or more space keys or special values, separated by commas.  
|             |          |         | If no page and labels are specified, all pages from the specified set of spaces are included. |
| reverse     | No       | false   | Reverses the order of items in the table. Must be used in conjunction with the order parameter. |
| showAnonymous | No   | false   | Determines whether to include those who contributed anonymously to a page. |
| scope       | No       | The specified page only | Specifies additional pages to include when generating the list of contributors.  
|             |          |         | Available values:  
|             |          |         | - `children` — only the child pages of the specified page.  
<p>|             |          |         | - <code>descendants</code> — all descendants of the specified page. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| **order** | No | **edits** | Sets the criterion used for sorting items in the table.  
Available values:  
- *edits* - sorts items in the table based on the total number of edits made, either by a contributor or to a page.  
- *name* - sorts items in the table in alphabetical order, either by contributor or page name.  
- *editTime* - sorts items in the table based on when the contributor last edited a page (or a specified set of pages) or when the page was last edited.  
- *update* - sorts items in the table based on when the contributor last made any contribution to a page (or a specified set of pages) or when the page last had any contribution made to it. |
| **page** | No | **The current page** | A page title. Specifies the page to use when generating the list of contributors. If *page* and *spaces* are left blank, the current page is assumed. |
| **labels** | No | **(None)** | Limits contribution-based statistics to the specified labels only. You can specify one or more labels, separated by commas. |
| **columns** | No | **edits, comments, labels** | Determines the columns that should appear in the table. The statistics or type of information presented depends on the *groupby* parameter. |
Available values:

- **edits** – the number of times each contributor has edited the page(s) or the number of edits made to each page.
- **edited** – a list of the pages edited by each contributor or a list of contributors who have edited each page.
- **comments** – the number of times each contributor has added comments to the page(s) or the number of comments on each page.
- **commented** – a list of pages to which each contributor has added comments or a list of contributors who have commented on each page.
- **labels** – the number of times each contributor has added labels to the page(s) or the number of labels on each page.
- **labeled** – a list of pages to which each contributor has added labels or a list of contributors who have added a label to each page.
- **labellist** – a list of labels either added by each contributor or on each page.
- **watches** – the number of pages being watched by each contributor/person or the number of contributors/people watching each page.
- **watching** – a list of pages being watched by each contributor/person or a list of contributors/people watching each page.
- **lastupdate** – the last time each contributor made an update or when each page was last updated. Valid updates can include edits, comments or label modifications to a page.

You can specify one or more columns, separated by commas.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>

</tbody>
</table>
This example specifies a content type of blog posts:

```xml
<ac:macro ac:name="contributors-summary">
    <ac:parameter ac:name="limit">10</ac:parameter>
    <ac:parameter ac:name="spaces">ds,@personal</ac:parameter>
    <ac:parameter ac:name="reverse">true</ac:parameter>
    <ac:parameter ac:name="showAnonymous">true</ac:parameter>
    <ac:parameter ac:name="order">update</ac:parameter>
    <ac:parameter ac:name="labels">chocolate,cake</ac:parameter>
    <ac:parameter ac:name="columns">edits,comments,labels,lastupdate</ac:parameter>
    <ac:parameter ac:name="contentType">blogposts</ac:parameter>
    <ac:parameter ac:name="showZeroCounts">true</ac:parameter>
    <ac:parameter ac:name="publishDate">2012/06/07</ac:parameter>
</ac:macro>
```

This example specifies a content type of pages:

```xml
<ac:macro ac:name="contributors-summary">
    <ac:parameter ac:name="limit">10</ac:parameter>
    <ac:parameter ac:name="spaces">ds,@personal</ac:parameter>
    <ac:parameter ac:name="reverse">true</ac:parameter>
    <ac:parameter ac:name="showAnonymous">true</ac:parameter>
    <ac:parameter ac:name="scope">descendants</ac:parameter>
    <ac:parameter ac:name="order">update</ac:parameter>
    <ac:parameter ac:name="page">ds:Advanced Topics</ac:parameter>
    <ac:parameter ac:name="labels">chocolate,cake</ac:parameter>
    <ac:parameter ac:name="columns">edits,comments,labels,lastupdate</ac:parameter>
    <ac:parameter ac:name="contentType">pages</ac:parameter>
    <ac:parameter ac:name="showZeroCounts">true</ac:parameter>
</ac:macro>
```

**Expand macro**

Displays an expandable/collapsible section of text.

**Macro name:** expand

**Macro body:** Accepts rich text.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-parameter</td>
<td>No</td>
<td>Click here to expand...</td>
<td>Text that will be displayed on the line that people can click to expand the hidden text.</td>
</tr>
<tr>
<td>(Unnamed in wiki markup)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Example:**
Info macro

Displays a block of text in a blue highlight box.

Macro name: info

Macro body: Accepts rich text.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>icon</td>
<td>No</td>
<td>true</td>
<td>Determines whether to display the icon in the title bar of the information box.</td>
</tr>
<tr>
<td>title</td>
<td>No</td>
<td>(None)</td>
<td>The title of the information box. If specified, the title text will be displayed in bold next to the icon.</td>
</tr>
</tbody>
</table>

Example:

The following example shows all parameters and a body:

```xml
<ac:macro ac:name="info">
  <ac:parameter ac:name="icon">false</ac:parameter>
  <ac:parameter ac:name="title">This is my title</ac:parameter>
  <ac:rich-text-body>
    <p>This is <em>important</em> information.</p>
  </ac:rich-text-body>
</ac:macro>
```

Below are some examples of the Info macro with various optional parameters used.

<table>
<thead>
<tr>
<th>Description</th>
<th>Markup</th>
<th>What you will get</th>
</tr>
</thead>
</table>

Info macro with a body and optional Title and Icon parameters defined

```
<ac:macro ac:name="info">
    <ac:parameter ac:name="icon">false</ac:parameter>
    <ac:parameter ac:name="title">This is my title</ac:parameter>
    <ac:rich-text-body>
        <p>
            <span>This is important information.</span>
        </p>
    </ac:rich-text-body>
</ac:macro>
```

**Section macro**

Used with the Column macro to define columns on a page. See [Working with page layouts and columns and sections](#).

**Macro name:** section

**Macro body:** Rich text, consisting of one or more Column macros.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>border</td>
<td>No</td>
<td>False</td>
<td>If the value is true, the columns in this section will have a dashed border.</td>
</tr>
</tbody>
</table>

**Example:**
**Table of Contents macro**

Displays a table of contents from your page headings.

**Macro name:** toc

**Macro body:** None.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>printable</td>
<td>No</td>
<td>true</td>
<td>If you set this parameter to <code>false</code>, the table of contents will not be visible when you print the page.</td>
</tr>
<tr>
<td>style</td>
<td>No</td>
<td>none</td>
<td></td>
</tr>
<tr>
<td>-------</td>
<td>----</td>
<td>------</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The style of bullet point for each list item. You can use any valid CSS style. For example:

- none – No list style is displayed.
- circle – The list style is a circle.
- disc – The list style is a filled circle. This is the typical bullet list, and is the one we are using in this example list.
- square — The list style is a square.
- decimal — The list is numbered (1, 2, 3, 4, 5).
- lower-alpha — The list style is lower case, alphabetised (a, b, c, d, e).
- lower-roman — The list style is lower-case roman numerals (i, ii, iii, iv, v, vi).
- upper-roman — The list style is upper-case roman numerals (I, II, III, IV, V, VI).

<table>
<thead>
<tr>
<th>maxLevel</th>
<th>No</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Maximum heading level. Use this parameter to select the highest heading level to include. For example, a value of 2 will list h1 and h2 levels, but will not include h3 and below.
| **indent** | No | (None) | This parameter applies to vertical lists only (type = list).

Use this parameter to indent the list items according to CSS quantities. For example, a value of 10px will successively indent list heading groups by 10 pixels. Level 1 headings will be indented 10px, and level 2 headings by an additional 10px, and so on. |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>minLevel</strong></td>
<td>No</td>
<td>1</td>
<td>Minimum heading level. The heading level at which the table of contents will start. For example, a value of 2 will list h2, h3, and h4 headings, but will not include h1 headings.</td>
</tr>
<tr>
<td><strong>class</strong></td>
<td>No</td>
<td>(None)</td>
<td>A CSS class name. If you have a custom style sheet, you can use this parameter to output the table of contents with the specified class attribute.</td>
</tr>
</tbody>
</table>
| **exclude** | No | (None) | Specifies the headings to exclude by pattern matching. The value must be a regular expression. If this parameter is specified, the table of contents will include only the headings that match the regular expression. Example: .*
\.[1/2]  
See Sun's Regex documentation for examples of constructing regular expression strings. |
| **type** | No | **list** | Defines the overall format of the table of contents.  
Available values:  
- list – displays the table of contents in a vertical list.  
- flat – displays a horizontal series of links. For example: [Heading 1] [Heading 2] [Heading 3]. |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>outline</strong></td>
<td>No</td>
<td><strong>false</strong></td>
<td>A value of true will apply outline numbering to the headings as displayed in the table of contents. For example: 1.1, 1.2, 1.3.</td>
</tr>
</tbody>
</table>
| **separator** | No | **brackets** | This parameter applies to flat lists only (type = flat). Use this parameter to style the display of a flat list.  
Available values:  
- brackets – Each item is enclosed by square brackets: [ ].  
- braces – Each item is enclosed by braces: { }.  
- parens – Each item is enclosed by parentheses: ( ).  
- pipe – The items are separated by a pipe: |  
- anything – The items are separated by the value you enter. You can enter any text as a separator, for example ***. If using a custom separator, be aware that text displays exactly as entered, with no additional white space to further separate the characters. |
include | No | (None) | Specifies the headings to include by pattern matching. The value must be a regular expression. If this parameter is specified, the table of contents will ignore any headings that do not match the regular expression. Example: \.* \.. [1//2] 

See Sun's Regex documentation for examples of constructing regular expression strings.

Example:

This example shows a list-type table of contents.

```xml
<ac:macro ac:name="toc">
  <ac:parameter ac:name="printable">true</ac:parameter>
  <ac:parameter ac:name="style">square</ac:parameter>
  <ac:parameter ac:name="maxLevel">2</ac:parameter>
  <ac:parameter ac:name="indent">5px</ac:parameter>
  <ac:parameter ac:name="minLevel">2</ac:parameter>
  <ac:parameter ac:name="class">bigpink</ac:parameter>
  <ac:parameter ac:name="exclude">[1//2]</ac:parameter>
  <ac:parameter ac:name="type">list</ac:parameter>
  <ac:parameter ac:name="outline">true</ac:parameter>
  <ac:parameter ac:name="include">.*</ac:parameter>
</ac:macro>
```

This example shows a flat table of contents.

```xml
<ac:macro ac:name="toc">
  <ac:parameter ac:name="printable">true</ac:parameter>
  <ac:parameter ac:name="maxLevel">2</ac:parameter>
  <ac:parameter ac:name="minLevel">2</ac:parameter>
  <ac:parameter ac:name="class">bigpink</ac:parameter>
  <ac:parameter ac:name="exclude">[1//2]</ac:parameter>
  <ac:parameter ac:name="type">flat</ac:parameter>
  <ac:parameter ac:name="outline">true</ac:parameter>
  <ac:parameter ac:name="separator">pipe</ac:parameter>
  <ac:parameter ac:name="include">.*</ac:parameter>
</ac:macro>
```

*Macro format notes*
Macro bodies

Some macros accept a body as well as parameters.

- The Info macro and Expand macro are examples of macros that accept a rich text body.
- The Code Block macro is a good example of a macro that accepts a plain text body.

Plain text bodies

The body of a plain text macro must be inside a CDATA block. So the following is not sufficient:

```html
<ac:plain-text-body>text</ac:plain-text-body>
```

The correct usage is:

```html
<ac:plain-text-body><![CDATA[text]]></ac:plain-text-body>
```

Other notes

- The 'Required' column indicates whether the parameter is required on data entry. If the parameter is not supplied, Confluence will insert default values as indicated in the 'Default' column.

  A request from the Atlassian technical writers about comments and feedback: When adding comments to this page, please restrict your comments to constructive feedback on the documentation itself: Things we've missed in the documentation, and things that will be useful to other readers. If you have other feedback about the editor, wiki markup, the XML storage format, and Confluence 4 in general, please add your comments in the section titled Confluence 4 Editor - Customer Feedback, and its child pages. Our reason for this request: When a page attracts a large number of comments, it makes it difficult for everyone to read the page, and to add or respond to comments about the documentation. Thanks.

Confluence Storage Format Examples for Chart Macro

This page is an extension of Confluence Storage Format for Macros, which contains storage format examples for all Confluence macros. The Chart macro is a special case, because it offers so many options via parameters and chart types. This page offers additional examples for the Chart macro.

Pie chart

Here is a simple example of a pie chart.

Storage format
<ac:macro ac:name="chart">
  <ac:parameter ac:name="title">Fish Sold</ac:parameter>
  <ac:parameter ac:name="type">pie</ac:parameter>
  <ac:rich-text-body>
    <table>
      <tbody>
        <tr>
          <th>Fish Type</th>
          <th>2004</th>
          <th>2005</th>
        </tr>
        <tr>
          <td>Herring</td>
          <td>9,500</td>
          <td>8,300</td>
        </tr>
        <tr>
          <td>Salmon</td>
          <td>2,900</td>
          <td>4,200</td>
        </tr>
        <tr>
          <td>Tuna</td>
          <td>1,500</td>
          <td>1,500</td>
        </tr>
      </tbody>
    </table>
  </ac:rich-text-body>
</ac:macro>

Resulting chart
Fish Sold

2004 (1,500 - 50%)  2005 (1,500 - 50%)

Bar chart

Here is a simple example of a bar chart.

Storage format
<ac:macro ac:name="chart">
  <ac:parameter ac:name="title">Fish Sold</ac:parameter>
  <ac:parameter ac:name="type">bar</ac:parameter>
  <ac:rich-text-body>
    <table>
      <tbody>
        <tr>
          <th>Fish Type</th>
          <th>2004</th>
          <th>2005</th>
        </tr>
        <tr>
          <td>Herring</td>
          <td>9,500</td>
          <td>8,300</td>
        </tr>
        <tr>
          <td>Salmon</td>
          <td>2,900</td>
          <td>4,200</td>
        </tr>
        <tr>
          <td>Tuna</td>
          <td>1,500</td>
          <td>1,500</td>
        </tr>
      </tbody>
    </table>
  </ac:rich-text-body>
</ac:macro>

Resulting chart
Time series chart

Here is an example of a time series chart.

**Storage format**

```xml
<ac:macro ac:name="chart">
  <ac:parameter ac:name="timePeriod">Month</ac:parameter>
  <ac:parameter ac:name="dataOrientation">vertical</ac:parameter>
  <ac:parameter ac:name="rangeAxisLowerBound">0</ac:parameter>
  <ac:parameter ac:name="dateFormat">MM/yyyy</ac:parameter>
  <ac:parameter ac:name="type">timeSeries</ac:parameter>
  <ac:parameter ac:name="domainaxisrotateticklabel">true</ac:parameter>
  <ac:rich-text-body>
    <table>
      <tbody>
        <tr>
          <th>Month</th>
          <th>Revenue</th>
        </tr>
        <tr>
          <td><p>1/2005</p></td>
          <td><p>31.8</p></td>
        </tr>
        <tr>
          <td><p>2/2005</p></td>
          <td><p>41.8</p></td>
        </tr>
      </tbody>
    </table>
  </ac:rich-text-body>
</ac:macro>
```
<table>

    &lt;p&gt;12&lt;/p&gt;
  </td>
</tr>
</tbody>
Confluence Wiki Markup

This page describes the wiki markup used on some administration screens in Confluence. Another page describes the wiki markup for macros.

Wiki markup is useful when you want to do one of the following:

- Configure the [Documentation theme](#).
- Type wiki markup directly into the editor. Confluence will convert it to the rich text editor format as you type.
- Create links using the Advanced tab of the Links Browser.
- Insert a block of wiki markup into the Confluence editor. (Choose Insert > Wiki Markup.)

**Note:** You cannot edit content in wiki markup. Confluence does not store page content in wiki markup. Although you can enter wiki markup into the editor, Confluence will convert it to the rich text editor format immediately. You will not be able to edit the wiki markup after initial entry.

**A request from the Atlassian technical writers about comments and feedback:** When adding comments to this page, please restrict your comments to constructive feedback on the documentation itself: Things we've missed in the documentation, and things that will be useful to other readers. If you have other feedback about the editor, wiki markup, the XML storage format, and Confluence 4 in general, please add your comments in the section titled [Confluence 4 Editor - Customer Feedback](#), and its child pages. Our reason for this request: When a

<table>
<thead>
<tr>
<th>Satisfaction</th>
<th>2002</th>
<th>2003</th>
<th>2004</th>
</tr>
</thead>
<tbody>
<tr>
<td>Very satisfied</td>
<td>12</td>
<td>23</td>
<td>31</td>
</tr>
<tr>
<td>Satisfied</td>
<td>1</td>
<td>34</td>
<td>36</td>
</tr>
<tr>
<td>Dissatisfied</td>
<td>4</td>
<td>6</td>
<td>22</td>
</tr>
<tr>
<td>Very dissatisfied</td>
<td>2</td>
<td>7</td>
<td>12</td>
</tr>
</tbody>
</table>
page attracts a large number of comments, it makes it difficult for everyone to read the page, and to add or respond to comments about the documentation. Thanks. 😊

Headings

To format a line as a heading, type "hn." at the start of your line, where n can be a number from 1 to 6.

<table>
<thead>
<tr>
<th>What you need to type</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td>h1. Biggest heading</td>
<td>Biggest heading</td>
</tr>
<tr>
<td>h3. Big heading</td>
<td>Big heading</td>
</tr>
<tr>
<td>h5. Small heading</td>
<td>Small heading</td>
</tr>
</tbody>
</table>

Lists

Wiki markup allows you to create bulleted or numbered lists, and is flexible enough to allow a combination of the two list types.

ℹ️ If you need to separate the text within lists using line breaks, make sure you do so using a double slash (/!). Empty lines may disrupt the list.

Simple lists

Use the hyphen (-) to create simple lists.
Make sure there is a space between the hyphen and your text.

<table>
<thead>
<tr>
<th>What you need to type</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td>- some</td>
<td>• some</td>
</tr>
<tr>
<td>- bullet</td>
<td>• bullet</td>
</tr>
<tr>
<td>- points</td>
<td>• points</td>
</tr>
</tbody>
</table>

Bulleted lists

Use the asterisk (*) to create bullets. For each subsequent level, add an extra asterisk.
Make sure there is a space between the asterisk and your text.

<table>
<thead>
<tr>
<th>What you need to type</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td>* some</td>
<td>• some</td>
</tr>
<tr>
<td>* bullet</td>
<td>• bullet</td>
</tr>
<tr>
<td>** indented</td>
<td>• indented</td>
</tr>
<tr>
<td>** bullets</td>
<td>• bullets</td>
</tr>
<tr>
<td>* points</td>
<td>• points</td>
</tr>
</tbody>
</table>

**Numbered lists**

Use the hash (#) to create numbered lists.
Make sure there is a space between the hash and your text.

<table>
<thead>
<tr>
<th>What you need to type</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td># a</td>
<td>1. a</td>
</tr>
<tr>
<td># numbered</td>
<td>2. numbered</td>
</tr>
<tr>
<td># list</td>
<td>3. list</td>
</tr>
</tbody>
</table>

A second level of hashes will produce a sub-list, such as the **alphabetical** sub-list shown below.

<table>
<thead>
<tr>
<th>What you need to type</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td># Here's a sentence.</td>
<td>1. Here’s a sentence.</td>
</tr>
<tr>
<td>## This is a sub-list point.</td>
<td>a. This is a sub-list point.</td>
</tr>
<tr>
<td>## And a second sub-list point.</td>
<td>b. And a second sub-list point.</td>
</tr>
<tr>
<td># Here's another sentence.</td>
<td>2. Here’s another sentence.</td>
</tr>
</tbody>
</table>

You can use a third level of hashes to produce a sub-sub-list.

<table>
<thead>
<tr>
<th>What you need to type</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td># Here's a sentence.</td>
<td>1. Here’s a sentence.</td>
</tr>
<tr>
<td>## This is a sub-list point.</td>
<td>a. This is a sub-list point.</td>
</tr>
<tr>
<td>### Third list level.</td>
<td>i. Third list level.</td>
</tr>
<tr>
<td>## Another point at the third level.</td>
<td>ii. Another point at the third level.</td>
</tr>
<tr>
<td>## And a second sub-list point.</td>
<td>b. And a second sub-list point.</td>
</tr>
<tr>
<td># Here's another sentence.</td>
<td>2. Here’s another sentence.</td>
</tr>
</tbody>
</table>

**Note:** In numbered lists as described above, the format of the ‘number’ displayed at each list level may be different, depending upon your browser and the style sheets installed on your Confluence instance. So in some
cases, you may see letters (A, B, C, etc; or a, b, c, etc) or Roman numerals (i, ii, iii, etc) at different list levels.

Mixed lists

<table>
<thead>
<tr>
<th>What you need to type</th>
<th>What you will get</th>
</tr>
</thead>
</table>
| # Here                | 1. Here
| #* is                |   • is
| #* an                |   • an
| # example             | 2. example
| #* of                |   • of
| #* a                 |   • a
| # mixed              | 3. mixed
| # list               | 4. list

Tables

You can create two types of tables.

Table Type 1

Allows you to create a simple table with an optional header row. You cannot set the width of the columns in this table.

Use double bars for a table heading row.

What you need to type:

<table>
<thead>
<tr>
<th>heading 1</th>
<th>heading 2</th>
<th>heading 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>cell A1</td>
<td>cell A2</td>
<td>cell A3</td>
</tr>
<tr>
<td>cell B1</td>
<td>cell B2</td>
<td>cell B3</td>
</tr>
</tbody>
</table>

What you will get:

<table>
<thead>
<tr>
<th>heading 1</th>
<th>heading 2</th>
<th>heading 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>cell A1</td>
<td>cell A2</td>
<td>cell A3</td>
</tr>
<tr>
<td>cell B1</td>
<td>cell B2</td>
<td>cell B3</td>
</tr>
</tbody>
</table>

You can also use a vertical header.

What you need to type:

<table>
<thead>
<tr>
<th>heading 1</th>
<th>col A1</th>
<th>col A2</th>
<th>col A3</th>
</tr>
</thead>
<tbody>
<tr>
<td>heading 2</td>
<td>col B1</td>
<td>col B2</td>
<td>col B3</td>
</tr>
</tbody>
</table>

What you will get:
### Table Type 2

This method allows you to specify the width of the columns in the table.

#### What you need to type

```
{section:border=true}
{column:width=30%}
Text for this column goes here. This is the smaller column with a width of only 30%.
{column}
{column:width=70%}
Text for this column goes here. This is the larger column with a width of 70%.
{section}
```

#### What you will get

| Text for this column goes here. This is the smaller column with a width of only 30%.
| Text for this column goes here. This is the larger column with a width of 70%.

For more details please see the Column Macro and the Section Macro.

### Advanced Formatting

#### Colour and Other Formatting

To add colour and other formatting to your tables, you can use the Panel Macro within columns. More table-formatting options may be available if your Confluence administrator has installed additional macros.

### Lists

Here’s an example of how to embed lists in a table:

#### What you need to type

```
||Heading 1||Heading 2||
|* Item 1|
|* Item 2|
|* Item 3|# Item 1|
|# Item 2|
|# Item 3|
```

#### What you will get

<table>
<thead>
<tr>
<th>Heading 1</th>
<th>Heading 2</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Text Effects

Use the markup shown in the examples below to format text.

<table>
<thead>
<tr>
<th>What you need to type</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>strong</strong></td>
<td>strong</td>
</tr>
<tr>
<td><em>bold text</em></td>
<td>bold text</td>
</tr>
<tr>
<td><em>emphasis</em></td>
<td>emphasis</td>
</tr>
<tr>
<td><strong>italics</strong></td>
<td>italics</td>
</tr>
</tbody>
</table>
|                       | *Hint*: To italicise parts of a word, add braces (curly brackets) around the underscore. For example, Thing(_x_)
gives you this: Thingx |
| ??citation??          | citation          |
| -deleted-             | deleted           |
| +inserted+            | inserted          |
| Text with*superscript^ | Text with superscript |
|                       | *Hint*: There are two ways to make superscripts work, when used directly after another word or character: |
|                       | _Add a space before the superscript. For example, k_g/m^3^ gives you this: kg/m^3_ |
|                       | _Add braces (curly brackets) around the superscript markup. For example, kg/m(^3^) gives you this: kg/m^3_ |
| Text with~subscript~  | Text with subscript |
| {{monospaced}}       | monospaced        |

bq. Here's how you make a paragraph appear as a block quotation. Here's how you make a paragraph appear as a block quotation.
**Text Breaks**

**Paragraph Break**

In wiki markup, a paragraph is a continuous line of text ending in two carriage returns. This is equivalent to a continuous line of text followed by a blank line.

When rendered into HTML, the result is a line of text wrapped in a set of `<p></p>` tags.

**Line Break**

Confluence provides two options for forcing a line break within a paragraph of text:

- Implicitly, by entering a single carriage return at its end.
- Explicitly, by entering two consecutive backslashes: `\`

When rendered into HTML, the result is a paragraph of text that is split into separate lines by `<br>` tags, wherever a forced line break appears.

> For most purposes, explicit line breaks are not required because a single carriage return is enough.

The examples below show how to use explicit line breaks.

<table>
<thead>
<tr>
<th>What you need to type</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td>here is some text</td>
<td>here is some text</td>
</tr>
<tr>
<td>\</td>
<td>divided</td>
</tr>
<tr>
<td>\</td>
<td>using line</td>
</tr>
<tr>
<td>\</td>
<td>breaks</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>This is a short list:</td>
<td>This is a short list:</td>
</tr>
<tr>
<td>* Point 1</td>
<td>* Point 1</td>
</tr>
<tr>
<td>Text to go with point 1</td>
<td>Text to go with point 1</td>
</tr>
<tr>
<td>* Point 2</td>
<td>* Point 2</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Text to go with point 2with a break</td>
<td>Text to go with point 2 with a break</td>
</tr>
</tbody>
</table>

If you wish to use multiple consecutive line breaks, each should be separated by a space character. For example, use this for two consecutive line breaks:

\ \ \ \ 

**Horizontal Rule**

Use four dashes (----) then press Enter, to create a horizontal rule. (It does not work if you press space.)

Make sure that the dashes are on a separate line from the rest of the text.
here is some text

---

divided by a horizontal rule

---

**Links**

You can use wiki markup to add hyperlinks to your text.

<table>
<thead>
<tr>
<th>What you need to type</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td>[#anchor]</td>
<td>A link to an anchor on the same page.</td>
</tr>
<tr>
<td>[Confluence Wiki Markup^attachment.ext]</td>
<td>A link to a file attached to the page.</td>
</tr>
<tr>
<td>[pagetitle]</td>
<td>A link to a page.</td>
</tr>
<tr>
<td>[pagetitle#anchor]</td>
<td>A link to an anchor on another page.</td>
</tr>
<tr>
<td>[pagetitle^attachment.ext]</td>
<td>A link to a file attached to another page.</td>
</tr>
<tr>
<td>[spacekey:pagetitle]</td>
<td>A link to a page in another space.</td>
</tr>
<tr>
<td>[spacekey:pagetitle#anchor]</td>
<td>A link to an anchor on a page in another space.</td>
</tr>
<tr>
<td>[spacekey:pagetitle^attachment.ext]</td>
<td>A link to a file attached to a page in another space.</td>
</tr>
<tr>
<td>[/2004/01/12/blogposttitle]</td>
<td>A link to a blog post.</td>
</tr>
<tr>
<td>[spacekey:/2004/01/12/blogposttitle]</td>
<td>A link to a blog post in another space.</td>
</tr>
<tr>
<td>[/2004/01/12]</td>
<td>A link to a whole day's blog posts.</td>
</tr>
<tr>
<td>[spacekey:/2004/01/12]</td>
<td>A link to a whole day's blog posts in another space.</td>
</tr>
<tr>
<td>[spacekey:]</td>
<td>A link to the space homepage (or the space summary page of the space.</td>
</tr>
<tr>
<td>[~username]</td>
<td>A link to the user profile page of a particular user.</td>
</tr>
<tr>
<td>[phrase@shortcut]</td>
<td>A shortcut link to the specified shortcut site. Shortcuts are configured by the site administrator.</td>
</tr>
<tr>
<td>[<a href="mailto:legendaryservice@atlassian.com">mailto:legendaryservice@atlassian.com</a>]</td>
<td>A link to an email address.</td>
</tr>
<tr>
<td>[file://z:/file/on/network/share.txt]</td>
<td>A link to a file on your computer or on a network share that you have mapped to a drive. <em>This only works on Internet Explorer.</em></td>
</tr>
</tbody>
</table>
Note that Confluence treats headings as anchors, so you can link to headings using this pattern: [spacekey:pagename#headingname], where headingname is case-sensitive and must be entered without spaces.

For each of these link forms:

- You can prepend a link alias, so that alternate text is displayed on the page. Example: [link alias|pagetitle#anchor]
- You can append a link tip, which appears as a tooltip. Example: [pagetitle#anchor|link tip]

**Images**

You can display images from attached files or remote sources.

<table>
<thead>
<tr>
<th>What you need to type</th>
<th>What you will get</th>
</tr>
</thead>
<tbody>
<tr>
<td>!<a href="http://www.host.com/image.gif">http://www.host.com/image.gif</a>!</td>
<td>An image from a remote source is displayed on the page. Uses a fully qualified URL.</td>
</tr>
<tr>
<td>!attached-image.gif!</td>
<td>An image file attached to the page is displayed.</td>
</tr>
<tr>
<td>!pageTitle^image.gif!</td>
<td>An image file attached to a different page is displayed.</td>
</tr>
<tr>
<td>!spaceKey:pageTitle^image.gif!</td>
<td>An image file attached to a page in a different space is displayed.</td>
</tr>
<tr>
<td>!/2010/05/23/My Blog Post^image.gif!</td>
<td>An image file attached to a blog post is displayed.</td>
</tr>
<tr>
<td>!image.jpg^thumbnail!</td>
<td>The image is displayed as a thumbnail on the page (only works with images that are attached to the page). Users can click on the thumbnail to see the full-sized image. Thumbnails must be enabled by the site administrator for this to work.</td>
</tr>
<tr>
<td>!image.gif^align=right, vspace=4!</td>
<td>For any image, you can specify attributes of the HTML image tag as a comma separated list of name=value pairs.</td>
</tr>
</tbody>
</table>

Available HTML image tags include:

<table>
<thead>
<tr>
<th>Image tag</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>align</td>
<td>Available values are 'left', 'right', 'bottom', 'center', 'top'.</td>
</tr>
<tr>
<td>border</td>
<td>Specifies the width of the border (in pixels).</td>
</tr>
<tr>
<td>bordercolor</td>
<td>Use with the 'border' tag. Specify colours by name or hex value.</td>
</tr>
<tr>
<td>hspace</td>
<td>Specifies the amount of whitespace to be inserted to the left and right of the image (in pixels).</td>
</tr>
<tr>
<td><strong>vspace</strong></td>
<td>Specifies the amount of whitespace to be inserted above and below the image (in pixels).</td>
</tr>
<tr>
<td><strong>width</strong></td>
<td>Specifies the width of the image (in pixels). This will override the natural width of the image.</td>
</tr>
<tr>
<td><strong>height</strong></td>
<td>Specifies the height of the image (in pixels). This will override the natural height of the image.</td>
</tr>
<tr>
<td><strong>title</strong></td>
<td>Specifies alternate text for the image, which is displayed when the pointer hovers over the image.</td>
</tr>
<tr>
<td><strong>alt</strong></td>
<td>Specifies alternate text for the image. This text is retrievable via search, and contributes to accessibility of the page for text-only viewing.</td>
</tr>
</tbody>
</table>

**Page Layouts**

There is no wiki markup representation for page layouts.

**Useful Information**

- A **space key** is a short, unique identifier for a space. For example, you might give your documentation space a key of "DOC". To find the key of an existing space, look at the Confluence URL for a page in the space. The standard Confluence URL has this format:

  http://my.confluence.site.com/display/SPACEKEY/Page+Name

- If you would like to edit the XML source of a page, your Confluence system administrator will need to install the Confluence Source Editor plugin. See more about the Confluence Source Editor Confluence Storage Format.

- Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

**Confluence Wiki Markup for Macros**

- Work in progress
  
  We are adding the details for each macro in turn. They are not all here yet. See CONF-24972 - Authenticate to see issue details. In the meantime, please refer to the Confluence 3.5 macro documentation.

This page is an extension of Confluence Wiki Markup. It describes the wiki markup used to define specific Confluence macros – the macros that are shipped with Confluence. For each macro, we define the macro name, parameter names, and accepted parameter values.

Wiki markup is useful when you want to do one of the following:
- Configure the Documentation theme.
- Type wiki markup directly into the editor. Confluence will convert it to the rich text editor format as you type.
- Create links using the Advanced tab of the Links Browser.
• Insert a block of wiki markup into the Confluence editor. (Choose Insert > Wiki Markup.)

Note: You cannot edit content in wiki markup. Confluence does not store page content in wiki markup. Although you can enter wiki markup into the editor, Confluence will convert it to the rich text editor format immediately. You will not be able to edit the wiki markup after initial entry.

Anchor macro

Allows you to link to a specific part of a page.

Macro name: anchor

Macro body: None.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-parameter</td>
<td>Yes</td>
<td>(None)</td>
<td>The name of the anchor.</td>
</tr>
<tr>
<td>(Unnamed in wiki markup)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example:

{anchor:here}

On this page:

- Anchor macro
- Attachments macro
- Blog Posts macro
- Change-History macro
- Chart macro
- Cheese macro
- Children Display macro
- Code Block macro
- Column macro
- Content by Label macro
- Content by User macro
- Contributors macro
- Contributors Summary macro
- Expand macro
- Info macro
- Section macro
- Table of Contents macro
- Notes

Related pages:

- Confluence Wiki Markup

**Attachments macro**

Displays a list of attachments on a given page.

**Macro name:** attachments

**Macro body:** None.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>old</td>
<td>No</td>
<td>false</td>
<td>Available values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• false - Displays only the latest version of each attachment.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• true – Displays all versions of each attachment, including the old versions.</td>
</tr>
<tr>
<td>patterns</td>
<td>No</td>
<td>(None)</td>
<td>A comma-separated list of regular expressions, used to filter the attachments by file name. Note that the parameter values must be regular expressions. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• To match a file suffix of 'jpg', use .'jpg (not *.jpg).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• To match file names ending in 'jpg' or 'png', use .*jpg,.*png</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Here is a tutorial on regular expressions.</td>
</tr>
<tr>
<td>sortBy</td>
<td>No</td>
<td>date</td>
<td>Available values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• date</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• size</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• name</td>
</tr>
<tr>
<td>page</td>
<td>No</td>
<td>The page on which the macro exists.</td>
<td>Page name, used to display attachments from another page.</td>
</tr>
</tbody>
</table>
### sortOrder

| No |

The default sort order is determined by the `sortBy` type:
- Reverse chronological for 'date'.
- Largest to smallest for 'size'.
- Alphabetical for 'name'.

**Available values:**
- ascending
- descending

### labels

| No |

A comma-separated list of labels. Confluence will show only attachments that have **all** the labels specified. (The match is an AND, not an OR.)

### upload

| No |

Determines whether the list of attachments will include options allowing users to browse for, and attach, new files.

**Example:**

```plaintext
{attachments:old=false|patterns=.*png,.*jpg|sortby=name|page=My page about chocolate|sortorder=descending|labels=chocolate,cookies|upload=false}
```

---

**Blog Posts macro**

Lists the most recent news items in the space.

**Macro name:** blog-posts

**Macro body:** None.
<table>
<thead>
<tr>
<th>content</th>
<th>No</th>
<th>entire</th>
</tr>
</thead>
</table>

Available values:
- **entire** – Display the whole content of each blog post.
- **excerpts** – Display a short extract from each blog post. If the post contains an Excerpt macro, the Blog Posts macro will display the content defined in the Excerpt macro. If the post does not contain an Excerpt macro, the Blog Posts macro will display the first few sentences of the post.
- **titles** – Display a list of blog posts, showing titles only.

<table>
<thead>
<tr>
<th>spaces</th>
<th>No</th>
<th>@self</th>
</tr>
</thead>
</table>

One or more space keys, separated by a comma or a space.
To exclude content in a specific space, put a minus sign (-) immediately in front of that space key. For example: If you specify a space key of -BADSPACE you will get only content which is not in the BADSPACE.

To indicate that the results must come from a specific space, put a plus sign (+) immediately in front of that space key. For example: If you specify a space key of +GOODSPACE you will get only content in GOODSPACE. (Note that this is not particularly useful, because each content item belongs to one space only. If you put a plus sign next to one space key and list other space keys too, the other space keys will be ignored.)

Special values:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>author</strong></td>
<td>No</td>
<td>(None)</td>
<td>One or more usernames, separated by commas.</td>
</tr>
</tbody>
</table>
| **time** | No | (None) | Available values:  
- **m** — Minutes  
- **h** — Hours  
- **d** — Days  
- **w** — Weeks  
For example,  
- **time=12h** — Display blog posts created in the last twelve hours.  
- **time=7d** — Display blog posts created in the last seven days. |
<p>| <strong>reverse</strong> | No | false | A value of <code>true</code> changes the sort order. |</p>
<table>
<thead>
<tr>
<th><strong>sort</strong></th>
<th><strong>No</strong></th>
<th><strong>creation</strong></th>
<th><strong>Available values:</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>title</strong> — Sort alphabetically by title.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>creation</strong> — Sort by the date on which the content was added.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <strong>modified</strong> — Sort by the date on which the content was last updated.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>max</strong></th>
<th><strong>No</strong></th>
<th><strong>15</strong></th>
<th><strong>The maximum number of results to be displayed.</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>label</strong></td>
<td><strong>No</strong></td>
<td><strong>(None)</strong></td>
<td><strong>One or more label values, separated by a comma or a space.</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• To exclude content which matches a given label, put a minus sign (-) immediately in front of that label value. For example: If you specify a label value of <code>badpage</code> you will get only content which is not labelled with 'badpage'.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• To indicate that the results <strong>must</strong> match a given label value, put a plus sign (+) immediately in front of that label value. For example: If you specify a label value of <code>superpage,goodpage</code> you will get only content which has at least two labels, being 'superpage' and 'goodpage'.</td>
</tr>
</tbody>
</table>

**Example:**

```
{blog-posts:content=titles|spaces=@self,ds|author=jsmith|time=4w|reverse=true|sort=creation|max=10|label=chocolate,cookies}
```

*Change-History macro*
Displays a history of updates made to a page.

**Macro name:** change-history

**Macro body:** None.

**Parameters:** None

**Example:**

```
{change-history}
```

---

**Chart macro**

Displays a chart based on tabular data.

**Macro name:** chart

**Macro body:** Accepts rich text, consisting of tables that hold the chart’s data.

This macro recognises a large number of parameters, listed here by type for convenience.

**Chart type parameters**

These parameters determine the type of chart to display and how the chart looks.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| type      | No       | pie     | The type of chart to display. XY charts have numerical x- and y-axes. The x values may optionally be time-based. See the `timeSeries` parameter. Available values:  
- *Standard charts* – pie, bar, line, area  
- *XY plots* – xyArea, xyBar, xyLine, xyStep, xyStepArea, scatter, timeSeries  
- *Other charts* – gantt (beta) |

---
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| orientation | No       | vertical | The display orientation. Applies to area, bar and line charts.
|            |          |         | Available values:
|            |          |         | • vertical – y-axis is vertical
|            |          |         | • horizontal – x-axis is vertical |
| 3D         | No       | false   | Show in three dimensions. Applies to area, bar and line charts. |
| stacked    | No       | false   | Stacked values. Applies to area and bar charts. |
| showShapes | No       | true    | Applies to line charts. Shapes are shown at each data point. |
| opacity    | No       |         | A percentage value between 0 (transparent) and 100 (opaque) that determines how opaque the foreground areas and bars are. |

**Chart display parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>No</td>
<td>300</td>
<td>The width of the chart in pixels.</td>
</tr>
<tr>
<td>height</td>
<td>No</td>
<td>300</td>
<td>The height of the chart in pixels.</td>
</tr>
<tr>
<td>dataDisplay</td>
<td>No</td>
<td>false</td>
<td>Determines whether to display the body of the macro, consisting of the data table. By default, the chart data table is not displayed.</td>
</tr>
</tbody>
</table>
|            |          |         | Available values:
|            |          |         | • false – the data is not displayed. |
|            |          |         | • true or after – the data is displayed after the chart. |
|            |          |         | • before – the data is displayed before the chart. |
imageFormat | No | png | The image format to be used for the chart.

Available values:
- png
- jpg

Chart title and label parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>title</td>
<td>No</td>
<td>(None)</td>
<td>The title of the chart.</td>
</tr>
<tr>
<td>subTitle</td>
<td>No</td>
<td>(None)</td>
<td>A subtitle for the chart.</td>
</tr>
<tr>
<td>xLabel</td>
<td>No</td>
<td>(None)</td>
<td>The label for the x-axis (domain).</td>
</tr>
<tr>
<td>yLabel</td>
<td>No</td>
<td>(None)</td>
<td>The label for the y-axis (range).</td>
</tr>
<tr>
<td>legend</td>
<td>No</td>
<td>false</td>
<td>Determines whether to show a legend (key) for the chart.</td>
</tr>
</tbody>
</table>

Chart data parameters

The data for the chart is taken from tables found in the macro body. The parameters below control how this data is interpreted. By default, numeric and date values are interpreted according to the Confluence global default language (locale) formats. If conversion fails, other languages defined in Confluence will be tried. You can specify additional conversion options using the parameters below.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tables</td>
<td>No</td>
<td>All first level tables</td>
<td>You can supply a comma-separated list of table IDs and/or table numbers (starting at 1) contained within the body of the macro that will be used as the data for the chart. If data tables are embedded in other tables, then table selection will be required. This occurs when more complex formatting is done (for example using section and column macros).</td>
</tr>
<tr>
<td><strong>columns</strong></td>
<td>No</td>
<td>All columns</td>
<td>You can supply a comma-separated list of column labels and/or column titles and/or column numbers for tables used for chart data. This applies to all tables processed. Columns are enumerated starting at 1. Column label is the text for the column in the header row. Column title is the HTML title attribute for the column in the header row.</td>
</tr>
</tbody>
</table>
| **dataOrientation** | No | horizontal | The content orientation. By default, the data tables will be interpreted as columns (horizontally) representing domain and x values. Available values:  
- **vertical** – data table columns will be interpreted as series.  
- **horizontal** – data tables rows will be interpreted as series. |
<p>| <strong>timeSeries</strong> | No | false | If 'true', the x values in an XY plot will be treated as time series data and so will be converted according date formats. |
| <strong>dateFormat</strong> | No | Confluence language defined date formats | For time series data, the date format allows for additional customisation of the conversion of data to date values. If a date format is specified, it will be the first format used to interpret date values. Specify a format that matches the time series data. See <a href="#">simple date format</a>. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timePeriod</td>
<td>No</td>
<td>day</td>
<td>The time period for time series data. Defines the granularity of how the data is interpreted. Available values: millisecond, second, minute, hour, day, week, month, quarter, year.</td>
</tr>
<tr>
<td>language</td>
<td>No</td>
<td>(None)</td>
<td>Use in combination with the country parameter to form a locale. These additional number and date formats will be used for data conversion before the default languages. Available values are the two-character ISO 639-1 alpha-2 codes.</td>
</tr>
<tr>
<td>country</td>
<td>No</td>
<td>(None)</td>
<td>Use in combination with the language parameter to form a locale. Valid values are the two-character ISO 3166 codes.</td>
</tr>
</tbody>
</table>
| forgive     | No       | true    | Determines whether the macro will forgive (allow) some data formatting errors. Available values: 
- **true** — the macro tries to convert numeric and date values that do not totally match any of the default or user-specified formats. 
- **false** — the macro enforces strict data formatting. If there are data format errors, the chart will not be produced. |

**Chart colour parameters**

Colours are specified using hexadecimal notation or HTML colour names.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bgColor</td>
<td>No</td>
<td>White</td>
<td>Background colour of the chart.</td>
</tr>
<tr>
<td>borderColor</td>
<td>No</td>
<td>No border</td>
<td>Colour of the border around the chart.</td>
</tr>
<tr>
<td>colors</td>
<td>No</td>
<td></td>
<td>A comma-separated list of colours used to customise the colours of categories, sections, and series.</td>
</tr>
</tbody>
</table>

**Chart axis parameters**

Depending on the chart type, the range and domain axis may be customised. These values are automatically generated based on the data but can be overridden by specifying one or more more of these parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rangeAxisLowerBound</td>
<td>No</td>
<td>(None)</td>
<td>Minimum value for the range axis.</td>
</tr>
<tr>
<td>rangeAxisUpperBound</td>
<td>No</td>
<td>(None)</td>
<td>Maximum value for the range axis.</td>
</tr>
<tr>
<td>rangeAxisTickUnit</td>
<td>No</td>
<td>(None)</td>
<td>Range axis units between axis tick marks.</td>
</tr>
<tr>
<td>rangeAxisLabelAngle</td>
<td>No</td>
<td>(None)</td>
<td>Angle for the range axis label in degrees.</td>
</tr>
<tr>
<td>domainAxisLowerBound</td>
<td>No</td>
<td>(None)</td>
<td>Only applies to XY plots. Domain axis lower bound. For a date axis, this value must be expressed in the date format specified by the dateFormat parameter.</td>
</tr>
<tr>
<td>domainAxisUpperBound</td>
<td>No</td>
<td>(None)</td>
<td>Only applies to XY plots. Domain axis upper bound. For a date axis, this value must be expressed in the date format specified by the dateFormat parameter.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Required</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>----------</td>
<td>----------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>domainAxisTickUnit</td>
<td>No</td>
<td>(None)</td>
<td>Only applies to XY plots. Domain axis units between axis tick marks. For a date axis, this value represents a count of the units specified in the <code>timePeriod</code> parameter. The <code>timePeriod</code> unit can be overridden by specifying a trailing character: <code>y</code> (years), <code>M</code> (months), <code>d</code> (days), <code>h</code> (hours), <code>m</code> (minutes), <code>s</code> (seconds), <code>ms</code> (milliseconds).</td>
</tr>
<tr>
<td>domainAxisLabelAngle</td>
<td>No</td>
<td>(None)</td>
<td>Only applies to XY plots. The angle for the domain axis label, in degrees.</td>
</tr>
<tr>
<td>categoryLabelPosition</td>
<td>No</td>
<td>(None)</td>
<td>Placement of the axis label text for categories.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Available values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <code>up45</code> — 45 degrees going upward</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <code>up90</code> — 90 degrees going upward</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <code>down45</code> — 45 degrees going downward</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <code>down90</code> — 90 degrees going downward</td>
</tr>
<tr>
<td>dateTickMarkPosition</td>
<td>No</td>
<td><code>start</code></td>
<td>Placement of the date tick mark.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Available values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <code>start</code> — tick mark is at the start of the date period.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <code>middle</code> — tick mark is in the middle of the date period.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <code>end</code> — tick mark is at the end of the date period.</td>
</tr>
</tbody>
</table>

**Pie chart Parameters**
### pieSectionLabel

<table>
<thead>
<tr>
<th></th>
<th>No</th>
<th>Show only the pie section key value</th>
</tr>
</thead>
</table>

Format of pie section labels. The format uses a string with special replacement variables:
- `%0%` is replaced by the pie section key.
- `%1%` is replaced by the pie section numeric value.
- `%2%` is replaced by the pie section percent value.

**Example 1:** To display something like 'Independent = 20':

```
%0% = %1%
```

**Example 2:** To display something like 'Independent (20%)':

```
%0% (%2%)
```

### pieSectionExplode

<table>
<thead>
<tr>
<th></th>
<th>No</th>
<th>No exploded sections</th>
<th>A comma-separated list of pie keys that are to be shown exploded. Note: requires jFreeChart version 1.0.3 or higher.</th>
</tr>
</thead>
</table>

**Chart attachment parameters**

These are advanced options that can be used for chart versioning, to enable automation and to improve performance. Use these options carefully! Normally, the chart image is regenerated each time the page is displayed. These options allow for the generated image to be saved as an attachment and have subsequent access to re-use the attachment. This can be useful especially when combined with the Cache plugin to improve performance. Depending on the options chosen, chart images can be versioned for historical purposes.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Parameter</td>
<td>Default</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>-------------------------</td>
<td>---------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
<td></td>
</tr>
</tbody>
</table>
| attachment              | No      | The name and location where the chart image will be saved as an attachment. The user must be authorised to add attachments to the page specified. Available syntax for this parameter:  
  - `^attachmentName.png` — the chart is saved as an attachment to the current page.  
  - `page name^attachmentName.png` — the chart is saved as an attachment to the page name provided.  
  - `spacekey:page name^attachmentName.png` — the chart is saved as an attachment to the page name provided in the space indicated. |
| attachmentVersion       | No      | Defines the the versioning mechanism for saved charts. Available values:  
  - `new` — creates new version of the attachment.  
  - `replace` — replaces all previous versions of the chart. To replace an existing attachment, the user must be authorised to remove attachments for the page specified.  
  - `keep` — only saves a new attachment if an existing export of the same name does not exist. An existing attachment will not be changed or updated. |
| attachmentComment       | No      | Comment used for a saved chart attachment. (None) |
Example:

Below is a simple example of a pie chart. See more examples in Wiki Markup Examples for Chart Macro.

{chart:type=pie\title=Fish Sold}

<table>
<thead>
<tr>
<th>Fish Type</th>
<th>2004</th>
<th>2005</th>
</tr>
</thead>
<tbody>
<tr>
<td>Herring</td>
<td>9,500</td>
<td>8,300</td>
</tr>
<tr>
<td>Salmon</td>
<td>2,900</td>
<td>4,200</td>
</tr>
<tr>
<td>Tuna</td>
<td>1,500</td>
<td>1,500</td>
</tr>
</tbody>
</table>

{chart}

Cheese macro

Displays the words "I like cheese!"

Macro name: cheese

Macro body: None.

Parameters: None

Example:

{cheese}

Children Display macro

Displays the children and descendants of the current page.

Macro name: children

Macro body: None.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>reverse</td>
<td>No</td>
<td>false</td>
<td>Reverses the sort order in the list of child pages. Use this parameter in conjunction with the sort parameter described below. A value of true will change the sort order from ascending to descending.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Default</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>-----------</td>
<td>---------</td>
<td>-------------</td>
<td></td>
</tr>
<tr>
<td>sort</td>
<td>No</td>
<td>Manual if the pages have been manually reordered, otherwise alphabetical by page title. Determines the sort order of the list of child pages. Available values: - <code>creation</code> – Sort by the date on which the page was created. - <code>title</code> – Sort alphabetically by page name. - <code>modified</code> – Sort by the date on which the page was last updated.</td>
<td></td>
</tr>
<tr>
<td>style</td>
<td>No</td>
<td>Bullet list. A heading style to be applied to the list of child pages. Available values: <code>h1</code> (heading level 1) through to <code>h6</code> (heading level 6).</td>
<td></td>
</tr>
</tbody>
</table>
| page      | No      | The page that contains the macro. The name of the parent page. The macro will display the children of the specified page. To specify a page in a different space, use a space key followed by a colon. For example: `MYSPACE:My page`.
If the value of this parameter is a forward slash (`/`) the macro will list the pages at the root of the current space. In other words, the pages without parents. |
<p>| excerpt   | No      | false. If <code>true</code>, Confluence will display any excerpts that are defined on the child pages. The excerpts must be defined via an Excerpt macro. |</p>
<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>first</td>
<td>No</td>
<td>(None)</td>
<td>The maximum number of child pages to be displayed (at the top level). For example, if the value of this parameter is 99, the macro will display the first 99 pages at the top level. It will also display their children, as determined by the depth and all parameters.</td>
</tr>
<tr>
<td>depth</td>
<td>No</td>
<td>(None)</td>
<td>The number of levels of child pages to display. For example, if the value is 2, the macro will display 2 levels of child pages.</td>
</tr>
<tr>
<td>all</td>
<td>No</td>
<td>false</td>
<td>If true, Confluence will display all levels of child pages. This setting will override the depth setting.</td>
</tr>
</tbody>
</table>

Example:

```
{children:reverse=true|sort=creation|style=h4|page=Home|excerpt=true|first=99|depth=2|all=true}
```

**Code Block macro**

Displays code in your document with the appropriate syntax highlighting.

**Macro name:** code

**Macro body:** Accepts plain text.
| theme     | No | Confluence | Specifies the colour scheme used for displaying your code. Many of these themes are based on the default colour schemes of popular integrated development environments (IDEs). The default theme is Confluence (also known as Default), which is typically black and coloured text on a blank background. Available themes:
- Django
- Emacs
- FadeToGrey
- Midnight
- RDark
- Eclipse
- Confluence (same as default) |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>linenumbers</td>
<td>No</td>
<td>false</td>
<td>If true, a line number will be shown to the left of each line of code. Numbering is incremented by 1. If false, no line numbers are shown.</td>
</tr>
</tbody>
</table>
| language | No | java | Specifies the language (or environment) for syntax highlighting.  
|---|---|---|---|
| | | | - (none) — that is, no syntax highlighting  
| | | | - actionscript3  
| | | | - bash  
| | | | - csharp — that is, C#  
| | | | - coldfusion  
| | | | - cpp — that is, C++  
| | | | - css  
| | | | - delphi  
| | | | - diff  
| | | | - erlang  
| | | | - groovy  
| | | | - java  
| | | | - javafx  
| | | | - javascript  
| | | | - perl  
| | | | - php  
| | | | - powershell  
| | | | - python  
| | | | - ruby  
| | | | - scala  
| | | | - sql  
| | | | - vb — that is, Visual Basic  
| | | | - html/xml  
| firstline | No | 1 | When linenumbers is true, this value defines the number of the first line of code.  
| collapse | No | false | If true, the code macro’s content will be collapsed upon visiting or refreshing the Confluence page. Clicking the ‘expand source’ link allows you to view the content.  
| | | | If false, the code macro’s content is always displayed in full.  

Example:
Column macro

Used with the Section macro to define columns on a page. See Working with page layouts and columns and sections.

Macro name: column

Macro body: Accepts rich text.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>No</td>
<td>100% of the page width, divided equally by the number of columns in the section.</td>
<td>The width of the column. Can be specified either in pixels (for example, 400px) or as a percentage of the available page width (for example, 50%).</td>
</tr>
</tbody>
</table>

Example:

```
{column:width=100px}
This is the content of *column 1*.
{column}
```

Content by Label macro

Displays a list of content associated with specific labels.

Macro name: contentbylabel

Macro body: None.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>spaces</td>
<td>No</td>
<td>@all</td>
<td></td>
</tr>
</tbody>
</table>
Filters the results by space. The macro will display only the pages and other content types which belong to the space(s) you specify here.

You can specify one or more space keys, separated by a comma or a space.

- To exclude content in a specific space, put a minus sign (-) immediately in front of that space key. For example: If you specify a space key of -BADSPACE you will get only content which is not in the BADSPACE.
- To indicate that the results must come from a specific space, put a plus sign (+) immediately in front of that space key. For example: If you specify a space key of +GOODSPACE you will get only content in GOODSPACE. (Note that this is not particularly useful, because each content item belongs to one space only. If you put a plus sign next to one space key and list other space keys too, the other space keys will be ignored.)

Special values:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>@self</td>
<td></td>
<td>The current space.</td>
</tr>
<tr>
<td>@personal</td>
<td></td>
<td>All personal spaces.</td>
</tr>
<tr>
<td>@global</td>
<td></td>
<td>All global spaces.</td>
</tr>
<tr>
<td>@favorite</td>
<td></td>
<td>The spaces you have marked as favourite.</td>
</tr>
<tr>
<td>@favourite</td>
<td></td>
<td>The same as @favorite above.</td>
</tr>
<tr>
<td>@all</td>
<td></td>
<td>All spaces in your Confluence site.</td>
</tr>
<tr>
<td>*</td>
<td></td>
<td>The same as @all above.</td>
</tr>
</tbody>
</table>

When specifying a personal space, remember to use the tilde (~) sign in front of the username, such as ~jbloggs or ~jbloggs@example.com.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>author</td>
<td>No</td>
<td>(None) Filters the results by author. The macro will display only the pages and other content types which are written or updated by the author(s) you specify here. You can specify one or more authors, separated by a comma.</td>
</tr>
<tr>
<td>title</td>
<td>No</td>
<td>(None) Adds a heading to the list.</td>
</tr>
<tr>
<td>showLabels</td>
<td>No</td>
<td>true Determines whether to display the matching labels in the list of results.</td>
</tr>
<tr>
<td>reverse</td>
<td>No</td>
<td>false Use this parameter in conjunction with the sort parameter. Set reverse=true to change the sort from ascending to descending. This parameter is ignored if the sort parameter is not specified.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Required</td>
<td>Value</td>
</tr>
<tr>
<td>-----------</td>
<td>----------</td>
<td>-------</td>
</tr>
</tbody>
</table>
| sort      | No       | modified | Determines how the results are sorted. To change the sort order from ascending to descending, use the reverse parameter described above. If this parameter is not specified, the sort order defaults to descending order based on the last modification date. Values:  
  - title — Sort alphabetically by title.  
  - creation — Sort by the date on which the content was added.  
  - modified — Sort by the date on which the content was last updated. |
<p>| max       | No       | 15    | Determines the maximum number of results to be displayed. Note that the results are sorted first, and then the maximum parameter is applied. |
| excerpt   | No       | false | If this parameter is set to true, the macro displays an excerpt from each page listed in the results. Note that you must define the excerpts on each of those pages, by adding the Excerpt macro to each page. If a particular page does not have an excerpt defined, then the Content by Label macro will not attempt to show an excerpt for that page. The Content by Label macro will show only the first few lines of the excerpt for each page. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>labels</strong></td>
<td>Yes</td>
<td>(None) Use this parameter to filter the results by label. The macro will display only the pages and other content types which are tagged with the label(s) you specify here. See also the <code>operator</code> parameter. You can specify one or more label values, separated by a comma or a space. <strong>•</strong> To exclude content which matches a given label, put a minus sign (-) immediately in front of that label value. For example: If you specify a label value of <code>-badpage</code> you will get only content which is not labelled with 'badpage'. <strong>•</strong> To indicate that the results <strong>must</strong> match a given label value, put a plus sign (+) immediately in front of that label value. For example: If you specify a label value of <code>+superpage,+goodpage</code> you will get only content which has at least two labels, being 'superpage' and 'goodpage'.</td>
</tr>
<tr>
<td><strong>showSpace</strong></td>
<td>No</td>
<td>true Determines whether to display the spaces in the list of results.</td>
</tr>
</tbody>
</table>
| type       | No | All | Filters the results by content type. The macro will display only the content of the type you specify here.

You can specify one or more types, separated by a comma or a space.

To exclude content of a given content type, put a minus sign (-) immediately in front of that content type. For example: If you specify a content type of `-blogpost` you will get pages and all other content except for blog posts.

Available values:
- `page` — pages.
- `blogpost` or `news` — blog posts, also known as news items.
- `attachment` — attachments. |
The operator to apply to the supplied lists of labels. By default, a page with any of the non-prefixed labels (that is, labels without a plus (+) or minus (-) sign immediately preceding it) will be listed. If you specify a value of AND, only pages with all of the supplied non-prefixed labels will be listed.

Note that this parameter only modifies the behaviour of the 'Label(s)' parameter and only affects label values without a plus (+) or minus (-) sign prefix. To avoid confusion or unexpected results, we recommend that you do not use the operator parameter in conjunction with any label values prefixed with '+' or '-' signs.

Example:

```
{contentbylabel:spaces=@personal,@self|author=admin,smaddox|title=My labelled pages|showLabels=false|reverse=true|sort=creation|max=10|excerpt=true|labels=chocolate,cake|showSpace=false|type=page|operator=AND}
```

**Content by User macro**

Displays a list of the content items that have been created by a specified Confluence user.

**Macro name:** content-by-user

**Macro body:** None.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-parameter</td>
<td>Yes</td>
<td>(None)</td>
<td>The Confluence username for the person whose content you wish to display</td>
</tr>
<tr>
<td>(Unnamed in wiki markup)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example:
**Contributors macro**

Displays a list of Confluence users who have made a contribution of some type to a page.

**Macro name:** contributors

**Macro body:** None.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>No</td>
<td>(None)</td>
<td>Limits the number of contributors displayed in the list.</td>
</tr>
</tbody>
</table>
| spaces         | No       | Current space | Specifies the space key of the Confluence space to search. Space keys are case sensitive. Special values:  
- @global — All global spaces.  
- @personal — All personal spaces.  
- @all — All spaces in the Confluence site.  
You can specify one or more space keys or special values, separated by commas.  
If no page and labels are specified, all pages from the specified set of spaces are included. |
<p>| reverse        | No       | false   | Reverses the order of contributors in the list. Must be used in conjunction with the order parameter. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| scope           | No      | Specifies additional pages to include when generating the list of contributors. Available values:  
|                 |         | - children – only the child pages of the specified page.  
|                 |         | - descendants – all descendants of the specified page.  
| labels          | No      | Limits the list of contributors to those who created the specified labels on a page. You can specify one or more labels, separated by commas.  
| showPages       | No      | false  
| noneFoundMessage| No      | "No contributors found for:" (and a summary of selected parameter values)  
| showCount       | No      | false  
| contentType     | No      | Both pages and blog posts  
|                 |         | Restricts the content type that the macro will use when generating the list of contributors. Available values:  
|                 |         | - pages  
|                 |         | - blogposts – blog posts.  

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
| include | No | authors | Filters by either the type of contribution made to a page (and optionally its descendant pages), or the watches on the page. Contribution types are:
- **authors** - includes people who created or have edited the page(s)
- **comments** - includes people who have added comments to the page(s)
- **labels** - includes people who have added labels to the page(s)
- **watches** - includes people who are watching the page(s).
You can specify one or more contribution types, separated by commas. |
| mode | No | inline | Determines how the list of contributors is formatted:
- **inline** — a comma-separated list
- **list** — a bullet list. |
| showAnonymous | No | false | Determines whether to include those who contributed anonymously to a page. |
| order | No | count | Specifies the criteria used to sort contributors. Sort criteria are:
- **count** — sorts the names based on the total number of contributions to the page(s)
- **name** — sorts the names into alphabetical order
- **update** — sorts the names by the date of their last contribution to the page(s). |
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Required</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>page</td>
<td>No</td>
<td>The current page</td>
<td>Specifies the page to use when generating the list of contributors. If page and spaces are left blank, the current page is assumed.</td>
</tr>
<tr>
<td>showLastTime</td>
<td>No</td>
<td>false</td>
<td>Determines whether to show the last time each person made a contribution.</td>
</tr>
<tr>
<td>publishDate</td>
<td>No</td>
<td>(None)</td>
<td>Specifies the publication date for a blog post. The date format required is: YYYY/MM/DD.</td>
</tr>
</tbody>
</table>

**Example:**

This example specifies a content type of blog posts:

```
{contributors:limit=10|spaces=ds,@personal|reverse=true|labels=chocolate,cake|showPages=true|noneFoundMessage=Oh dear, no contributors found|showCount=true|contentType=blogposts|include=authors,comments,labels,watches|mode=list|showAnonymous=true|order=update|showLastTime=true|publishDate=2012/06/30}
```

This example specifies a content type of pages:

```
{contributors:limit=10|spaces=ds,@personal|reverse=true|scope=descendants|labels=chocolate,cake|showPages=true|noneFoundMessage=Oh dear, no contributors found|showCount=true|contentType=pages|include=authors,comments,labels,watches|mode=list|showAnonymous=true|order=update|page=ds:Advanced Topics|showLastTime=true}
```

**Contributors Summary macro**

Displays a table of contribution-based statistics for a set of pages.

**Macro name:** contributors-summary

**Macro body:** None.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>No</td>
<td>(None)</td>
<td>Limits the number of contributors or pages displayed in the table.</td>
</tr>
</tbody>
</table>
| spaces    | No       | Current space | Specifies the space key of the Confluence space to search. Space keys are case sensitive. Special values:  
- `@global` — All global spaces.  
- `@personal` — All personal spaces.  
- `@all` — All spaces in the Confluence site. You can specify one or more space keys or special values, separated by commas. If no page and labels are specified, all pages from the specified set of spaces are included. |
| reverse   | No       | false         | Reverses the order of items in the table. Must be used in conjunction with the `order` parameter. |
| showAnonymous | No       | false         | Determines whether to include those who contributed anonymously to a page. |
| scope     | No       | The specified page only | Specifies additional pages to include when generating the list of contributors. Available values:  
- `children` — only the child pages of the specified page.  
- `descendants` — all descendants of the specified page. |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| order     | No       | edits | Sets the criterion used for sorting items in the table. Available values:  
- **edit** - sorts items in the table based on the total number of edits made, either by a contributor or to a page.  
- **name** - sorts items in the table in alphabetical order, either by contributor or page name.  
- **editTime** - sorts items in the table based on when the contributor last edited a page (or a specified set of pages) or when the page was last edited.  
- **update** - sorts items in the table based on when the contributor last made any contribution to a page (or a specified set of pages) or when the page last had any contribution made to it. |
| page      | No       | The current page | A page title. Specifies the page to use when generating the list of contributors. If **page** and **spaces** are left blank, the current page is assumed. |
| labels    | No       | (None) | Limits contribution-based statistics to the specified labels only. You can specify one or more labels, separated by commas. |
| columns   | No       | edits, comments, labels | Determines the columns that should appear in the table. The statistics or type of information presented depends on the **groupby** parameter. |
Available values:

- **edits** – the number of times each contributor has edited the page(s) or the number of edits made to each page.
- **edited** – a list of the pages edited by each contributor or a list of contributors who have edited each page.
- **comments** – the number of times each contributor has added comments to the page(s) or the number of comments on each page.
- **commented** – a list of pages to which each contributor has added comments or a list of contributors who have commented on each page.
- **labels** – the number of times each contributor has added labels to the page(s) or the number of labels on each page.
- **labeled** – a list of pages to which each contributor has added labels or a list of contributors who have added a label to each page.
- **labellist** – a list of labels either added by each contributor or on each page.
- **watches** – the number of pages being watched by each contributor/person or the number of contributors/people watching each page.
**watching** – a list of pages being watched by each contributor/person or a list of contributors/people watching each page.

**lastupdate** – the last time each contributor made an update or when each page was last updated. Valid updates can include edits, comments or label modifications to a page.

You can specify one or more columns, separated by commas.

<table>
<thead>
<tr>
<th>groupby</th>
<th>No</th>

<th>(None)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the publication date for a blog post. The date format required is: YYYY/MM/DD.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Example:**
This example specifies a content type of blog posts:

```
{contributors-summary:limit=10|spaces=ds,@personal|reverse=true|showAnonymous=true|order=update|labels=chocolate,cake|columns=edits,comments,labels,lastupdate|groupBy=pages|contentType=blogposts|showZeroCounts=true|publishDate=2012/06/07}
```

This example specifies a content type of pages:

```
{contributors-summary:limit=10|spaces=ds,@personal|reverse=true|showAnonymous=true|scope=descendants|order=update|page=ds:Advanced Topics|labels=chocolate,cake|columns=edits,comments,labels,lastupdate|groupBy=pages|contentType=pages|showZeroCounts=true}
```

**Expand macro**

Displays an expandable/collapsible section of text.

**Macro name:** expand

**Macro body:** Accepts rich text.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-parameter</td>
<td>No</td>
<td>Click here to expand...</td>
<td>Text that will be displayed on the line that people can click to expand the hidden text.</td>
</tr>
<tr>
<td>(Unnamed in wiki markup)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

```
{expand:This is my message}
This text is _hidden_ until you expand it.
{expand}
```

**Info macro**

Displays a block of text in a blue highlight box.

**Macro name:** info

**Macro body:** Accepts rich text.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter name</td>
<td>Required</td>
<td>Default</td>
<td>Parameter description and accepted values</td>
</tr>
<tr>
<td>----------------</td>
<td>----------</td>
<td>---------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>icon</td>
<td>No</td>
<td>true</td>
<td>Determines whether to display the icon in the title bar of the information box.</td>
</tr>
<tr>
<td>title</td>
<td>No</td>
<td>(None)</td>
<td>The title of the information box. If specified, the title text will be displayed in bold next to the icon.</td>
</tr>
</tbody>
</table>

Example:

```
{info:title=This is my title|icon=false}
This is _important_ information.
{info}
```

Section macro

Used with the Column macro to define columns on a page. See Working with page layouts and columns and sections.

Macro name: section

Macro body: Rich text, consisting of one or more Column macros.

Example:

```
{section:border=true}
{column:width=100px}
This is the content of *column 1*.
{column}
{column}
This is the content of *column 2*.
{column}
{section}
```

Table of Contents macro

Displays a table of contents from your page headings.

Macro name: toc

Macro body: None.
<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Required</th>
<th>Default</th>
<th>Parameter description and accepted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>printable</td>
<td>No</td>
<td>true</td>
<td>If you set this parameter to false, the table of contents will not be visible when you print the page.</td>
</tr>
<tr>
<td>style</td>
<td>No</td>
<td>none</td>
<td>The style of bullet point for each list item. You can use any valid CSS style. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• none — No list style is displayed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• circle — The list style is a circle.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• disc — The list style is a filled circle. This is the typical bullet list, and is the one we are using in this example list.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• square — The list style is a square.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• decimal — The list is numbered (1, 2, 3, 4, 5).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• lower-alpha — The list style is lower case, alphabetised (a, b, c, d, e).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• lower-roman — The list style is lower-case roman numerals (i, ii, iii, iv, v, vi).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• upper-roman — The list style is upper-case roman numerals (I, II, III, IV, V, VI).</td>
</tr>
<tr>
<td>maxLevel</td>
<td>No</td>
<td>7</td>
<td>Maximum heading level. Use this parameter to select the highest heading level to include. For example, a value of 2 will list h1 and h2 levels, but will not include h3 and below.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Required</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>----------</td>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>indent</td>
<td>No</td>
<td>(None)</td>
<td>This parameter applies to vertical lists only (<code>type = list</code>). Use this parameter to indent the list items according to CSS quantities. For example, a value of 10px will successively indent list heading groups by 10 pixels. Level 1 headings will be indented 10px, and level 2 headings by an additional 10px, and so on.</td>
</tr>
<tr>
<td>minLevel</td>
<td>No</td>
<td>1</td>
<td>Minimum heading level. The heading level at which the table of contents will start. For example, a value of 2 will list h2, h3, and h4 headings, but will not include h1 headings.</td>
</tr>
<tr>
<td>class</td>
<td>No</td>
<td>(None)</td>
<td>A CSS class name. If you have a custom style sheet, you can use this parameter to output the table of contents with the specified class attribute.</td>
</tr>
<tr>
<td>exclude</td>
<td>No</td>
<td>(None)</td>
<td>Specifies the headings to exclude by pattern matching. The value must be a regular expression. If this parameter is specified, the table of contents will include only the headings that match the regular expression. Example: .*/.[1/2] See <a href="https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html">Sun's Regex documentation</a> for examples of constructing regular expression strings.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Required</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>----------</td>
<td>-------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| **type**    | No       | list  | Defines the overall format of the table of contents. Available values:  
list – displays the table of contents in a vertical list.  
flat – displays a horizontal series of links. For example: [Heading 1] [Heading 2] [Heading 3]. |
| **outline** | No       | false | A value of true will apply outline numbering to the headings as displayed in the table of contents. For example: 1.1, 1.2, 1.3. |
| **separator** | No       | brackets | This parameter applies to flat lists only (type = flat). Use this parameter to style the display of a flat list. Available values:  
brackets – Each item is enclosed by square brackets: [ ].  
braces – Each item is enclosed by braces: { }.  
parens – Each item is enclosed by parentheses: ( ).  
pipe – The items are separated by a pipe: | anything – The items are separated by the value you enter. You can enter any text as a separator, for example ***. If using a custom separator, be aware that text displays exactly as entered, with no additional white space to further separate the characters. |
**include**  
**No**  
(No)  
Specifies the headings to include by pattern matching. The value must be a regular expression. If this parameter is specified, the table of contents will ignore any headings that do not match the regular expression. Example: .* \\.[1//2]  
See Sun's Regex documentation for examples of constructing regular expression strings.

**Example:**

This example shows a list-type table of contents.

```markdown
{toc:printable=true|style=square|maxLevel=2|indent=5px|minLevel=2|class=bigpink|exclude=[1//2]|type=list|outline=true|include=.*}
```

This example shows a flat table of contents.

```markdown
{toc:printable=true|maxLevel=2|minLevel=2|class=bigpink|exclude=[1//2]|type=flat|outline=true|separator=pipe|include=.*}
```

**Notes**

- The 'Required' column indicates whether the parameter is required on data entry. If the parameter is not supplied, Confluence will insert default values as indicated in the 'Default' column.
- Wiki markup is not case sensitive. For example, you can specify a parameter name of sortBy or sortby.
- For a few macros in wiki markup, the default parameter may be unnamed. The examples on this page show the macros concerned. In such cases, the unnamed parameter is always the first parameter specified.
- **A request from the Atlassian technical writers about comments and feedback:** We would like to distinguish between the documentation of the current solution (this page) and any discussion of the solution and possible changes to Confluence wiki markup and/or the XHTML-based storage format. If you have a suggestion for, or correction of, this documentation, please add your suggestion to this page. If you have feedback on the Confluence markup, storage format and related functionality, please add your suggestion to the page titled Confluence 4 Editor - Customer Feedback. Thanks😊

**Wiki Markup Examples for Chart Macro**

This page is an extension of Confluence Wiki Markup for Macros, which contains wiki markup examples for all Confluence macros. The Chart macro is a special case, because it offers so many options via parameters and chart types. This page offers additional examples for the Chart macro.

**Pie chart**
Here is a simple example of a pie chart.

Wiki markup

```
{chart:type=pie|title=Fish Sold}
|| Fish Type || 2004 || 2005 ||
|| Herring | 9,500 | 8,300 |
|| Salmon | 2,900 | 4,200 |
|| Tuna | 1,500 | 1,500 |
{chart}
```

Resulting chart

**Fish Sold**

- 2004 (1,500 - 50%)
- 2005 (1,500 - 50%)

Bar chart

Here is a simple example of a bar chart.

Wiki markup

```
{chart:type=bar|title=Fish Sold}
|| Fish Type || 2004 || 2005 ||
|| Herring | 9,500 | 8,300 |
|| Salmon | 2,900 | 4,200 |
|| Tuna | 1,500 | 1,500 |
{chart}
```

Resulting chart
Time series chart

Here is an example of a time series chart.

Wiki markup

```{chart:type=timeSeries|dateFormat=MM/yyyy|timePeriod=Month|
dataOrientation=vertical|rangeAxisLowerBound=0|domainaxisrotateticklabel=true}|| Month || Revenue ||
| 1/2005 | 31.8 |
| 2/2005 | 41.8 |
| 3/2005 | 51.3 |
| 4/2005 | 33.8 |
| 5/2005 | 27.6 |
| 6/2005 | 49.8 |
| 7/2005 | 51.8 |
| 8/2005 | 77.3 |
| 9/2005 | 73.8 |
| 10/2005 | 97.6 |
| 11/2005 | 101.2 |
| 12/2005 | 113.7 |

|| Month || Expenses ||
| 1/2005 | 41.1 |
| 2/2005 | 43.8 |
| 3/2005 | 45.3 |
| 4/2005 | 45.0 |
| 5/2005 | 44.6 |
| 6/2005 | 43.8 |
| 7/2005 | 51.8 |
| 8/2005 | 52.3 |
| 9/2005 | 53.8 |
| 10/2005 | 55.6 |
| 11/2005 | 61.2 |
| 12/2005 | 63.7 |
{chart}```

Resulting chart
Here is an example of an XY line chart.

Wiki markup

```
{chart:type=xyline}
<table>
<thead>
<tr>
<th></th>
<th></th>
<th>12</th>
<th>14</th>
<th>23</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revenue</td>
<td>41.1</td>
<td>31.8</td>
<td>12.4</td>
<td></td>
</tr>
<tr>
<td>Expense</td>
<td>31.1</td>
<td>41.8</td>
<td>43.6</td>
<td></td>
</tr>
</tbody>
</table>
{chart}
```

Resulting chart

Here is an example of an XY bar chart.

Wiki markup
Here is an example of an XY area chart.

Wiki markup

```wiki
{chart:type=xyarea}

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Revenue</td>
<td>41.1</td>
<td>31.8</td>
</tr>
<tr>
<td>Expense</td>
<td>31.1</td>
<td>41.8</td>
</tr>
</tbody>
</table>
{chart}
```

Resulting chart
Here are two examples of area charts.

**Wiki markup for area chart 1**

```
{chart:type=area|dataDisplay=true|legend=true|width=300|height=300|opacity=50}
|| Satisfaction || 2002 || 2003 || 2004 ||
| Very satisfied | 20 | 23 | 34 |
| Satisfied | 40 | 34 | 23 |
| Disatisfied | 25 | 26 | 25 |
| Very disatisfied | 15 | 17 | 18 |
{chart}
```

**Resulting area chart 1**
Working with Confluence Gadgets

This section introduces the concept of gadgets in Confluence and provides an outline on how to use gadgets in Confluence and other web applications.

On this page:
Introduction to Gadgets in Confluence

A gadget is a small object (i.e. a piece of functionality) offering dynamic content that can be placed into the page of:

- An Atlassian application's website, such as a Confluence page or blog post or a JIRA 4.0+ dashboard.
- A third-party application's website, such as iGoogle or Gmail. (But see the limitations on using Confluence gadgets in other applications.)

Gadgets allow interactions between Confluence and other compatible websites. Confluence interacts with gadgets that support the OpenSocial specification.

For more information about Atlassian gadgets, please refer to the introduction to Atlassian gadgets and the big list of Atlassian gadgets.

Using Gadgets in Confluence

You can place any gadget that complies with the OpenSocial specification from an external source, such as iGoogle or other Atlassian applications such as JIRA 4.0+, onto a Confluence page or blog post. To add a gadget to a page, use the Confluence macro browser to add a Gadget macro.

See the page on adding JIRA gadgets to a Confluence page.

Adding Confluence Gadgets in Other Applications

You can add a Confluence gadget to a JIRA dashboard or another Confluence site. In principle, you can also put a Confluence gadget on any other OpenSocial-compliant website such as iGoogle or Gmail. See the limitations on using Confluence gadgets in other applications.

Adding a Confluence Gadget to JIRA

See Adding a Confluence Gadget to a JIRA Dashboard.

Adding a Confluence Gadget to Non-Atlassian Web Applications

For instructions on how to add Confluence gadgets in another compatible non-Atlassian web application or container, refer to Configuring Confluence Gadgets for Use in Other Applications.

Confluence Gadgets

The Confluence Gadgets topic explains the purpose of the 'Confluence Gadgets' window and provides information about the gadgets which are bundled with Confluence.

Configuring Confluence Gadgets for Use in Other Applications
Adding a Confluence Gadget to a JIRA Dashboard
Adding a Confluence Gadget to a JIRA Dashboard

JIRA 4.0 is the first major Atlassian application that can incorporate OpenSocial-compliant gadgets, such as Confluence gadgets onto its dashboard. This page explains how to add a Confluence gadget to the dashboard of a JIRA 4.0+ installation.

To add a Confluence gadget to a JIRA dashboard, complete the sections below in order.

On this page:

- Create an Application Link Between Confluence and JIRA
- Finding a Confluence Gadget's URL
- Adding a Confluence Gadget to a JIRA server's Gadgets Directory
- Adding a Confluence Gadget to the JIRA Dashboard
- Related Topics

Create an Application Link Between Confluence and JIRA

If your Confluence gadgets need to access user-restricted Confluence data, then your Confluence administrator must first establish an Application Link between your Confluence site and the JIRA site. For more information about configuring an Application Link between Confluence and other web applications, refer to Configuring OAuth Authentication for an Application Link.

If you only need to access anonymously accessible Confluence data, then you can proceed to Finding a Confluence Gadget's URL, below.

Finding a Confluence Gadget's URL

The Confluence gadget’s URL is the gadget’s XML specification file. These URLs look something like this:

```
http://example.com/my-gadget-location/my-gadget.xml
```

To find a Confluence gadget’s URL:

1. Choose Browse > Confluence Gadgets. The ‘Confluence Gadgets’ window will open. The ‘Confluence Gadgets’ window displays a list of available Confluence gadgets in your Confluence installation, as shown in the screenshot below. By default, Confluence only includes a few gadgets. However, if your Confluence administrator has installed more Confluence gadgets (typically as Confluence plugins), these will also appear in this list. If a scrollbar is available, use it to find the gadget you want.
2. After finding your gadget, use the Gadget URL link to copy the gadget's URL to your clipboard. Many operating systems and browsers allow you to do this by right-clicking the Gadget URL link and copying it using the context menu.

Screenshot: Finding a gadget's URL
Adding a Confluence Gadget to a JIRA server’s Gadgets Directory

To add a Confluence Gadget to the Gadgets Directory in JIRA:

1. Go to the dashboard by clicking Dashboard at the top left of the screen.
2. The dashboard will appear. Click Add Gadget.
3. The 'Add Gadget' screen appears, showing the list of gadgets in your directory. See screenshot 1 below. Click Add Gadget to Directory.
   - You will only see this button if you have administrator permissions for your dashboard.
4. The 'Add Gadget to Directory' screen appears. See screenshot 2 below. Paste the gadget URL (which you copied to your clipboard above) into the text box.
5. Click Add Gadget.
6. The gadget appears in your gadget directory. (It will be highlighted for a short time, so that you can see it easily.)

Screenshot 1: Gadget directory with 'Add Gadget to Directory' button

Screenshot 2: Add Gadget to Directory screen
In the procedure below, 'your Atlassian dashboard' and 'your Atlassian application' refers to the JIRA Dashboard and application, respectively.

You can add a gadget from the directory of gadgets that are available to your Atlassian application.

To add a gadget to your Atlassian dashboard,
1. Go to the dashboard by clicking the ‘Dashboard’ link or the ‘Home’ link at the top left of the screen.
2. The dashboard will appear, looking something like screenshot 1 below. Click ‘Add Gadget’.
3. The ‘Add Gadget’ screen will display a list of available gadgets in your gadget directory, as shown in screenshot 2 below. Find the gadget you want, using one or more of the following tools:
   - Use the scroll bar on the right to move up and down the list of gadgets.
   - Select a category in the left-hand panel to display only gadgets in that category.
   - Start typing a key word for your gadget in the ‘Search’ textbox. The list of gadgets will change as you type, showing only gadgets that match your search term.
4. When you have found the gadget you want, click the ‘Add it Now’ button to add the gadget to your dashboard.

Screenshot 1: An Atlassian dashboard
Adding a Gadget to the Directory of Available Gadgets

You need to have administrator privileges to add a gadget to the list of available gadgets. If you have permission to add gadgets to and remove gadgets from the directory itself, you will see the 'Add Gadget to Directory' and 'Remove' buttons on the 'Add Gadget' screen. Please refer to the Gadgets and Dashboards Administration Guide.

Configuring Confluence Gadgets for Use in Other Applications

This page tells you how to add a Confluence gadget to another (external) application. The instructions and examples given in this topic focus on adding and using Confluence Gadgets in other web applications.

Atlassian support does not cover gadgets on external sites like iGoogle and Gmail

In principle, you should be able to add Atlassian gadgets to iGoogle, Gmail and other external sites that support OpenSocial gadgets. However, these external integrations are experimental at this stage and we have encountered problems with them. Please do have fun playing around with them, but be aware that Atlassian does not support the use of Atlassian gadgets on iGoogle, Gmail or other external web sites. See the detailed section on gadget limitations.

Gadgets that display information from Atlassian applications, such as Confluence, should be able to run on iGoogle, Gmail and other web applications that provide OpenSocial containers. Below are specific instructions for iGoogle and Gmail. You can experiment by adding a Confluence gadget to other web sites and applications, such as a Ning community like The Content Wrangler.

On this page:

- Overview of Adding a Confluence Gadget to Another Web Application
- Finding a Confluence Gadget's URL
Overview of Adding a Confluence Gadget to Another Web Application

The exact procedure for adding a Confluence gadget depends on the application where you want to add the gadget. The basic steps are the same:

1. Find the Confluence gadget's URL, i.e. the URL for the gadget's XML specification file.
2. Ensure one of the following two mandatory (typically one-off) procedures have been conducted:
   - An OAuth relationship between Confluence (as the 'service provider') and the other web application (as the 'consumer') has been established. Refer to Configuring OAuth for more information about OAuth and instructions on establishing these relationships.
   - A Trusted Applications relationship between Confluence and JIRA has been established. Refer to Configuring Trusted Applications in the JIRA documentation for more information about establishing these relationships.
3. Follow the procedure provided by the external web application where you want to add the Confluence gadget.

Finding a Confluence Gadget's URL

The Confluence gadget's URL is the gadget's XML specification file. These URLs look something like this:

```
http://example.com/my-gadget-location/my-gadget.xml
```

To find a Confluence gadget's URL:

1. Choose Browse > Confluence Gadgets. The 'Confluence Gadgets' window will open. The 'Confluence Gadgets' window displays a list of available Confluence gadgets in your Confluence installation, as shown in the screenshot below. By default, Confluence only includes a few gadgets. However, if your Confluence administrator has installed more Confluence gadgets (typically as Confluence plugins), these will also appear in this list. If a scrollbar is available, use it to find the gadget you want.
2. After finding your gadget, use the Gadget URL link to copy the gadget's URL to your clipboard. Many operating systems and browsers allow you to do this by right-clicking the Gadget URL link and copying it using the context menu.

Screenshot: Finding a gadget's URL
Adding an Atlassian Gadget to iGoogle

You can customise your iGoogle home page by adding gadgets and moving them around on the page.

To add an Atlassian gadget to your iGoogle page:

1. First find the gadget's URL as described above.
2. Go to iGoogle and log in if you have a username and password.
3. Click Add stuff near the top right of the iGoogle page.
4. The Google gadget directory will appear, showing a list of available gadgets. Click Add feed or gadget in the right-hand panel.
5. A text box will open, as shown above. Enter or paste the gadget's URL from your clipboard into the textbox and click Add.
6. Go back to your iGoogle home page. The gadget will appear on your iGoogle page.

Adding an Atlassian Gadget to Gmail

You can add gadgets to the left-hand panel of your Gmail page.

To add an Atlassian gadget to your Gmail page:

1. First find the gadget's URL as described above.
2. Log in to Gmail.
3. Click Settings near the top right of the Gmail page. The Gmail settings page will appear.
4. Click the Labs tab. The Gmail Labs page will appear. This is a laboratory area or testing ground where Google allows you to use experimental features in Gmail.
5. Scroll down to find the feature called 'Add any gadget by URL'.
6. Select the Enable option, as shown here:
7. Click **Save Changes**.

8. A new **Gadgets** tab will appear on your 'Settings' page. Click the **Gadgets** tab. The 'Gadgets' page will appear, as shown in the screenshot below.

9. Enter or paste your gadget's URL into the **Add a gadget by its URL** box, then click **Add**.

10. The gadget will appear in the left-hand panel of your Gmail page, as shown in the screenshot below.

**Screenshot: Adding a gadget to Gmail**

**Activity Stream Gadget**

The activity stream gadget is similar to the **recently updated macro** and shows a list of the most recently changed content within your Confluence site.

For instructions on how to use Confluence gadgets in your applications, please see [Confluence Gadgets](#).

In addition to showing a list of most recently changed content, the activity stream gadget also provides the following features:

- The ability to add comments to pages and blog posts, by clicking the 'add comment' icon at the top-right of an added or edited page or blog post in the activity stream.
- The ability to reply to a comment by clicking the 'add comment' icon at the top-right of a comment in the activity stream.
- Activities are grouped by separate date.
- An RSS feed link to its content in the top-right corner of the gadget.

**Screenshot: Adding a Comment in the Activity Stream Gadget**
Activity Stream Gadget Properties

Properties are settings for Confluence gadgets that allow the user to control the content or presentation of data retrieved by the gadget. These are similar to a Confluence macro's parameters. The table below lists relevant properties for this gadget.

<table>
<thead>
<tr>
<th>Property</th>
<th>Required?</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Yes</td>
<td>None</td>
<td>Adds a title to the top of the Activity Stream.</td>
</tr>
<tr>
<td>Projects</td>
<td>No</td>
<td>None specified (i.e. display content in all spaces)</td>
<td>Filters the content by space. This gadget will display only the pages etc. which belong to the space(s) you specify here.</td>
</tr>
<tr>
<td>Username</td>
<td>No</td>
<td>None specified (i.e. display content by all users)</td>
<td>Filters the results by user. The macro will display only the pages etc. which were last modified by the user(s) you specify here.</td>
</tr>
<tr>
<td>Number of Entries</td>
<td>No</td>
<td>10</td>
<td>Specify the maximum number of results to be displayed. A maximum of 10 results will be displayed by default. The maximum value that this property can accept is 100.</td>
</tr>
</tbody>
</table>
Confluence: News Gadget Properties

Properties are settings for Confluence gadgets that allow the user to control the content or presentation of data retrieved by the gadget. These are similar to a Confluence macro's parameters. The table below lists relevant properties for this gadget.

<table>
<thead>
<tr>
<th>Property</th>
<th>Required?</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show News?</td>
<td>No</td>
<td>True</td>
<td>Shows a short list of the most recent Confluence Product Blogs.</td>
</tr>
</tbody>
</table>
Confluence Page Gadget

The Confluence page gadget allows you to show content from a page on your Confluence site in a gadget. You can optionally configure the gadget to display links to view and/or edit the page on your Confluence site. The page gadget can also be displayed in canvas view, so that it takes up all of the space provided by your dashboard.

For instructions on how to use Confluence gadgets in your applications, please see Confluence Gadgets.

**Macros that work with the page gadget**

Please note, not all macros work with the page gadget. Please refer to the Working Macros section below for more information.

**Confluence QuickNav Gadget Properties**
This gadget has no properties and cannot be customised.

**Adding JIRA Gadgets to a Confluence Page**

This is a summary of the steps required to add a JIRA gadget to a Confluence page:

- If your JIRA site does not allow anonymous access, your JIRA administrator will need to configure JIRA to trust Confluence via Application Links. See the [JIRA administrator's guide](#).
- Your Confluence administrator will need to add the JIRA gadget URL to the list of authorised external gadgets in Confluence. See the [Confluence administrator's guide](#).
- Now you can add the gadget to a wiki page in Confluence using the Macro Browser. See the Confluence user's guide to the [Gadget macro](#).

Note that the Confluence Gadget macro is a specific type of macro which is used to display a gadget in a Confluence page - so once you have configured external gadgets in the Confluence Administration Console, they will appear in the Macro Browser.

**Creating your Technical Documentation Space**

This guide is for people who want to develop and publish technical documentation on Confluence wiki. You will find it useful if you want to write a technical manual such as a user's guide, administrator's guide, installation guide, and so on. This page is a quick-start guide to creating a wiki space for technical documentation.
Quick guide to creating a technical documentation space

- Add a space and select the Documentation theme.
- Set the space permissions.
- Change the title and content of the space home page.
- Customise the Documentation theme.
- Create an inclusions library to manage your re-usable content.
- Create the table of contents for your manual or manuals, by adding top-level pages for all the usual sections (user's guide, administrator's guide, and so on).
- Customise your PDF layout and stylesheet, if required.
- Hint: Now that you have a good skeleton for a documentation space, save the space as a template space.

The rest of this page gives more details of the above procedure.

On this page:

- Step 1. Add your Space
- Step 2. Set the Space Permissions
  - A Bit More about Permissions
- Step 3. Customise the Title and Content of the Home Page
- Step 4. Customise the Documentation Theme
  - Example of a Customised Footer
- Step 5. Create an Inclusions Library
  - Examples of Inclusions Libraries
- Step 6. Create the Table of Contents
- Step 7. (Optional) Customise the PDF Layout and Stylesheet
- Step 8. Save your New Space as a Template Space

Step 1. Add your Space

Below is a quick guide to adding a space. See Setting up a New Global Space for a full description.
1. Go to the Confluence dashboard and click the 'Add Space' link located above the list of spaces.

![Add Space](image)

**Add Space**

- Feed Builder
- People Directory

Spaces: Favourite New (1) Global

Demonstration Space

An example of a Confluence space with a tutorial and sample content.

*Hint:* If you cannot see the 'Add Space' link, this means that you do not have permission to add spaces. Please contact your Confluence administrator.

2. The 'Create Space' screen appears. Enter a **space name** and a short, unique **space key**.

3. Leave the **permission** settings as default, or choose to allow only yourself to view or contribute content to this space. You can change these settings later and with more flexible options.

4. Select the 'Documentation Theme'.

5. Click 'OK'.

The home page of your new space will appear. Because you created the space, you are the space administrator. Now you can do some basic configuration, as described in the sections below.

**Step 2. Set the Space Permissions**

Define the space permissions to determine who can do what in your new space.
1. Open the 'Browse' menu and select 'Space Admin'.

2. Click 'Permissions' in the left-hand panel.
3. Confirm your administrator access as prompted.
4. Click 'Edit Permissions'.
5. Set the permissions to suit your needs then click 'Save All'.
   - You can add groups and/or individual users to the list, then select the permissions for each group or user.
   - You can also set the permissions for anonymous users – these are people who have not logged in to the wiki. Anonymous access is available only if enabled for the entire Confluence site.
   - Note that you can change these permissions at any time. You may want to restrict the permissions to specific groups now, and later open the space to more people.

A Bit More about Permissions

Confluence has a robust and granular permissions scheme that you can use to determine who can view, comment on and even update the documentation. There are three levels of permissions in Confluence:

- Global permissions apply across the entire site.
- Space permissions apply to a space.
- Page restrictions allow you to restrict the editing and/or viewing of a specific page. Below we discuss a way of using these in the draft, review and publishing workflow.

Space permissions in Confluence are simple yet granular enough to be useful for technical documentation. You can:

- Use the permission levels to control who can create pages in the space, delete pages, create comments, delete comments, administer the space, and so on.
- Grant a permission level to one or more users, and/or to one or more groups, and/or to anonymous users.

Terminology:

- 'Anonymous' means people who have not logged in to the wiki.
- The 'confluence-users' group is the default group into which all new users are assigned. Everyone who can log in to Confluence is a member of this group.
For example, you might allow your team full edit and administration rights while others can only add comments. Or you might grant the general public access to your documentation, while only staff members can update it.

For detailed information, see the documentation on:

- Global permissions
- Space permissions
- Page restrictions
- Users and groups

**Step 3. Customise the Title and Content of the Home Page**

When you created your space, Confluence created a home page with default content and a default title, 'Home'. You will want to change the title and content.
1. Go back to your space home page, by clicking the space name in the breadcrumbs at the top of the screen. In the example below, the space name is ‘MyProduct Documentation’:

   [Image of breadcrumbs]

   View Space Permissions

2. The space home page appears. By default, the page title is ‘Home’.

   [Image of home page]

   Added by Administrator, last edited by Administrator on Nov 04, 2010

3. Click ‘Edit’.

4. The page opens in edit mode. Change the title to suit your needs.

   [Image of edit mode]

5. Update the content to suit your needs.

   Hint: If you do not know what to add yet, just add a short description. You can refine the content of the page later. Take a look at an example of a home page.

6. Click ‘Save’.

**Step 4. Customise the Documentation Theme**

When you added the space you chose the Documentation theme, which provides a left-hand navigation bar and a good look and feel for technical documentation. If necessary, you can configure the Documentation theme to add your own page header and footer or to customise the default left-hand navigation bar. These customisations affect the online look and feel of your documentation. See Configuring the Documentation Theme for the full description.
1. Open the 'Browse' menu and select 'Space Admin'.
2. Click 'Themes' in the left-hand panel.
3. If the space is not yet using the Documentation theme, apply the theme now.
4. Click 'Configure theme' in the yellow area of the 'Current Theme' section at the top of the page.

**Current Theme**

The current theme controls the layout and colours of this space.

**Documentation Theme**

This theme is well suited for structured content, such as documentation. It features a table of contents (page tree) on the left, making it easier to see the structure of a space and move from page to page. You can customise the left-hand panel, page header and page footer. This theme supports Firefox, Safari and Internet Explorer 7+.

**Configure theme** - further customise this theme's options

5. The 'Documentation Theme Configuration' screen appears. Customise the left-hand navigation bar, header and footer to suit your needs. Details are in the documentation. Here are some hints:
   - The 'Page Tree' check box determines whether your space will display the default search box and table of contents (page tree) in the left-hand panel.
   - The 'Limit search results to the current space' check box determines whether Confluence will search only the current space or the whole Confluence site. This setting affects the default search. Viewers can override it each time they do a search.
   - Enter text, images, macros and other wiki markup into any or all of the three text boxes for the left-hand navigation bar, header and footer. You can use the Include macro and the Excerpt Include macro to include re-usable content.
   - Any content you add to the navigation panel will appear above the default page tree.
   - If you like, you can remove the default page tree (by unticking the box) and add your own, customised version of the Pagetree macro instead.

6. Click 'Save'.

Example of a Customised Footer

Take a look at the footer of a page in the Crowd documentation space.

To produce the above footer, we have the following content in the footer panel in the Documentation theme configuration screen:
Step 5. Create an Inclusions Library

Using Confluence, you can dynamically include content from one page into another page. You can include a whole page into another one, using the Include macro. You can also define an ‘excerpt’ on a page, and then include that excerpted text into another page using the Excerpt Include macro.

To organise your re-usable content, we recommend that you create a set of pages called an ‘inclusions library’.

1. Open the ‘Browse’ menu and select ‘Pages’.
2. The ‘List Pages’ screen will appear. Open the ‘Add’ menu and select ‘Page’. This will add a page at the root of the space, at the same level as the home page.
3. Enter a suitable title. We use ‘_InclusionsLibrary’. The unusual format of the title helps to let people know this page is special.
4. Enter some content on the page. We enter text explaining the purpose of the inclusions library and how to re-use the content. You can copy our text by clicking through to one of the example pages listed below.
5. Add child pages containing your re-usable content. See the examples of our own inclusions libraries listed below.

Some notes about inclusions libraries:

- The inclusions library is not a specific feature of Confluence. The pages in the inclusions library are just
like any other Confluence page.

- The pages are located at the root of the wiki space, not under the home page. This means that they will not appear in the table of contents on the left and they will not be picked up by the search in the left-hand navigation bar either.
- The pages will be picked up by other searches, because they are just normal wiki pages.
- We have decided to start the page name with an underscore. For example, `_My Page Name`. This indicates that the page is slightly unusual, and will help prevent people from changing the page name or updating the content without realising that the content is re-used in various pages.

**Examples of Inclusions Libraries**

Here are some examples in our documentation:

- [Crowd inclusions library](#)
- [Confluence inclusions library](#)

**Step 6. Create the Table of Contents**

Create the table of contents for your documentation, by adding the top-level pages for all the usual sections:

- User’s guide
- Administrator’s guide
- Installation guide
- Configuration guide
- Release notes
- FAQ
- Whatever else you need

1. Go back to your space home page, by clicking the space name in the breadcrumbs at the top of the screen.
2. Open the 'Add' menu and select 'Page'. This will add the page as a child of the home page.
3. Enter the page title, 'User's Guide'.
4. Enter the content of the page.
   **Hint:** If you do not know what to add yet, just add a short description then refine the content of the page later. If you like, you can add the [Children macro](#). That will act as a table of contents on the page once you have added child pages.
5. Click 'Save'.

Now do the same for all the sections of your technical document.

**Step 7. (Optional) Customise the PDF Layout and Stylesheet**

If you are planning to provide PDF versions of your documentation, you may want to customise the PDF layout and styles for your space. You can skip this step for now and do it later, if you prefer. The instructions are in a separate section of this guide, dedicated to PDF. See [Providing PDF Versions of your Technical Documentation](#).

**Step 8. Save your New Space as a Template Space**

This is a useful suggestion. Once you have set up your first documentation space and are more-or-less happy with it, use the [Copy Space plugin](#) (see notes below) to copy the space while it still has very little content. From this point on, you can copy it each time you want to create a new documentation space.
1. Open the 'Browse' menu and select 'Space Admin'.
2. Click 'Copy Space' in the left-hand panel.

Hint: If you cannot see the 'Copy Space' option, this means that the plugin is not installed on your Confluence site. Refer to the documentation on installing plugins.
3. The 'Copy Space' screen will appear. Enter the details as prompted, to copy your space to another new space.

   ![Copy Space Screen](image)

4. Click 'Save'.

You now have a template space. From this point on, you can use the Copy Space plugin to copy the template space each time you want to create a new documentation space.

Notes:

- The Copy Space plugin is not covered by Atlassian support. However, the Atlassian technical writers use it for all our documentation. If you like, you can vote for an comment on the request for Atlassian support to cover this plugin: CONF-14198.
- Your site administrator will need to install the Copy Space plugin into Confluence. Refer to the documentation on installing plugins.

Next Steps

You now have the basic structure and configuration for your technical documentation space. You have also created a handy template to use next time you need a space. What next? Take a look at Using Templates in Technical Documentation.

Using Templates in Technical Documentation

This page is part of the guide to developing technical documentation on Confluence Wiki. We have already
shown you how to create your technical documentation space. Now we offer an introduction to the templates that Confluence provides.

Quick guide to templates in Confluence
- A template is a page with predefined content that can be used as a prototype when creating other pages.
- Templates are available across the Confluence site (global templates) or per space (space templates).
- Both 'global templates' and 'space templates', as described on this page, define the content of a page. They do not define the content of an entire space.
- You can import predefined templates, including those shipped with Confluence and additional templates from the Atlassian Plugin Exchange.
- To create a template for an entire space, see our guide to creating your documentation space.

On this page:
- Deciding Where to Put Your Templates
- Creating a Global Template
- Creating a Space Template
- Importing Templates
- Using a Template to Create a Page

Deciding Where to Put Your Templates

In Confluence, there are two places to store your page templates:
- **Space templates:** These page templates are available in a specific space only. People who have space administrator permission can define templates via the space administration screen.
- **Global templates:** These page templates are available in every space on the site. People who have Confluence Administrator permission can define the global templates via the Confluence Administration Console.

Decide whether your template is useful across more than one space.
- If yes, create a global template. You will need Confluence administrator permissions.
- If no, create a space template.
  - You will need space administrator permissions for the relevant space(s).
  - You may have already saved your documentation space as a template, as described in our guide to creating your documentation space. In that case, it may be useful to save your template page in your template space. When you later copy the space, the template pages will be copied too.

Creating a Global Template

1. Choose Browse > Confluence Admin.
2. Enter your password if prompted.
3. Choose Global Templates in the left-hand panel.

See Global Templates for more information.

Creating a Space Template

1. From any page in the space, choose Browse > Templates.
2. Choose Add New Space Template.

See Adding a Template for more information.
Importing Templates

Confluence ships with a number of templates, including the 'Charts', 'Document List' and 'Meeting Notes' templates. These templates are not available for use by default. However, if you have the appropriate permissions to access the Administration Console, you can import any of these templates to be used globally or within a specific space. In addition, you can find more template bundles on the [Atlassian Plugin Exchange](https://plugins.atlassian.com).

1. Go to the Confluence Administration Console and choose **Import Templates**.
2. Select the templates that you want to import.
3. Select the space to import the templates to, or choose to import them as global templates.
4. Choose **Import**.

Using a Template to Create a Page

When people add a page on your Confluence site, they can choose to base their new page on a template.

Go to the page that will be the parent of your new page, and choose **Add > Page from template**. (This link is only displayed if there are templates already defined.)

See [Creating a Page using a Template](#) for more information.

Next Steps

You now have a good idea of how Confluence templates work. What next? Take a look at [Re-using Content in Technical Documentation](#).

Re-using Content in Technical Documentation

This page is part of the guide to [developing technical documentation on Confluence Wiki](https://confluence.atlassian.com/display/DOC/Developing+Technical+Documentation). In the page about creating your technical documentation space, we showed you how to set up an 'inclusions library' to contain content that you can re-use on more than one page. Now we offer further guidelines on re-using content in your documentation space.

Your documentation may be about using a software application, or it may be a technical manual for your product range. On this page, we use the term 'widget' to describe the things that you are documenting, such as the screen, form, document, product or object.
Quick guide to re-using content

- Create an 'inclusions library' to manage your re-usable content. See our guide to creating your technical documentation space.
- Use the **excerpt** macro to define a re-usable section ('excerpt') on a page, or just decide to re-use the entire content of the page.
- Use the **excerpt-include** macro to include the excerpt from one page onto another page.
- Use the **include** macro to include the entire content of a page onto another page.
- Consider installing the Multi Excerpt plugin if you need to define multiple excerpts per page.

The rest of this page gives an overview and more details of the above procedures.

On this page:
- **Reasons for Re-Using Content**
- **Defining an Inclusions Library**
- **Working with Excerpts and Inclusions**
  - Using the Include Page Macro
  - Using the Excerpt Include Macro
  - Using the Multi Excerpt Plugin
- **An Example of Content Re-Use: A Glossary**
  - Creating a One-Page Glossary
  - Creating a Glossary with Child Pages
  - Referring to Glossary Terms
- **Further Reading**

Reasons for Re-Using Content

A golden rule for technical documentation is to write the content only once but allow that content to be used in many places and in many forms.

For example, you may have the following types of content:

- A technical manual that describes each widget in detail.
- Tips and tricks on how to get the most out of the widget.
- A step-by-step user guide for first-time users on how to use the most common widgets.
- A training manual with exercises or videos that people can follow in their own time.
- A one-page cheat sheet for users to stick up on their workstation.
- Text for a sales brochure that is sent out to a print house for production.

Each of these types of content will share common information, such as a glossary entry, a technical or marketing description of the widget, or a step-by-step guide on how to use the widget.

Some initial planning of your technical documentation will allow you to re-use any or all of the content you write, so there is only ever one place to update the content, and those changes flow through to all of your other documentation.

Defining an Inclusions Library

We recommend that you create an 'inclusions library' to manage your re-usable content. If you have not already done this when creating your documentation space, see our guide to creating your technical documentation space.

Working with Excerpts and Inclusions
Excerpts and inclusions (sometimes called 'includes') are very useful for re-using content:

- Use the Excerpt macro (**excerpt**) to define a re-usable section ('excerpt') on a page.
- Use the Excerpt Include macro (**excerpt-include**) to include the excerpt on another page.
- Use the Include Page macro (**include**) to include the entire content of a page onto another page.

A simple example of an inclusion is a note or warning that is used in many places in your documentation. Here is an example:

```
⚠️ Example note -- "Draft in progress"

This document is still in draft status. Please treat the content with caution.
```

**Tip:** Keep your re-usable pages short and sweet. Do not worry if you find that you need hundreds of pages to hold your inclusions. It helps to keep things separate and organised.

### Using the Include Page Macro

In this example, we use the Include Page macro to create a note that you can re-use on your documentation pages. The Include Page macro will include the entire content of one page into another page. (See the 'Excerpt' macro below for including parts of a page.)

1. Create a page in your inclusions library called **_Draft Note**.
2. Add the content of the page. In this example, we use the Note macro with some text in the title and body:

```
{note:title=Draft in progress}This document is still in draft status. Please treat the content with caution.{note}
```

3. Use the Include Page macro to include that note in any page in your documentation. For example:

```
{include:_Draft Note|nopanel=true}
```

See the documentation on the [Include Page macro](#) for more details.

### Using the Excerpt Include Macro

An excerpt is a section of a page that you can include into another page.
1. Use the `excerpt` macro to define any content in your page that you want to be able to use elsewhere. This content can be as short as a word or as long as the entire page. For example, let's assume we have a page called 'My Short Poem':

```
I really love this poem:
(excerpt)
Mary had a little lamb
Its fleece was white as snow
(excerpt)
And I'm going to use it all over the place.
```

2. Use the Excerpt Include macro to include the excerpt into another page. For example:

```
(excerpt-include:My Short Poem|nopanel=true)
```

You can only define one `excerpt` on a page. See the documentation on the Excerpt Include macro for more details.

To have multiple excerpts on a page, see the 'Multi Excerpt plugin' below.

Using the Multi Excerpt Plugin

The Multi Excerpt plugin provides additional macros that enable you to have multiple excerpts on a page. A good example of where you would find this useful is in the glossary page discussed below. If you want to include a single glossary entry or a subset of the glossary entries in another page, then the named excerpts allowed by the Multi Excerpt plugin are very useful.

Notes:

- The Multi Excerpt plugin is a commercial plugin and is not free.
- Your Confluence administrator will need to download and install the plugin into your Confluence site before you can use the macros described below. Refer to the documentation on installing plugins.
- Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support. Please refer to the Multi Excerpt plugin page for support details.
1. Use the following code on the base page containing the content you want to use elsewhere:

```markdown
{multi-excerpt:name=ExcerptName1}
Excerpt text 1
{multi-excerpt}
Any other text
{multi-excerpt:name=ExcerptName2}
Excerpt text 2
{multi-excerpt}
```

2. Use the following code on the page where you want to include the named excerpt:

```markdown
{multi-excerpt-include:pageTitle=PageName|name=ExcerptName1|nopanel=true}
```

3. You can also include excerpts from other spaces using the following syntax:

```markdown
{multi-excerpt-include:spaceKey:pageName|name=excerptName|nopanel=true}
```

See the [Multi Excerpt plugin page](https://confluence.atlassian.com/pages/with-plugins/multi-excerpt-plugin) for more details.

**An Example of Content Re-Use: A Glossary**

A glossary is something that most technical documentation will require. There are a few ways to set up glossaries in Confluence. These are the most popular:

- All glossary entries on one page.
- Each glossary entry on separate child pages with a main page showing excerpts of the glossary.

Once you have defined the glossary entry, you can refer to it from the main pages of your technical documentation.

**Creating a One-Page Glossary**

This style of glossary is useful if the glossary entries tend to be short and there are not too many of them.
1. Create a page named **Glossary**.

2. Add an alphabetical index at the top of the page and a heading for each letter of the alphabet:

   ![Index Example]

   ```
   {anchor:A}
   h2. A
   {anchor:B}
   h2. B
   {anchor:C}
   h2. C ...
   ```

3. Enter each glossary entry under the relevant alphabetical heading. Each glossary entry (term) should include:
   - An anchor tag, so that you can link to it from other pages.
   - The term itself.
   - A definition of the term.
   - A link to the page in your technical documentation that explains the term in greater detail, where relevant.

   ```
   {anchor:MyGlossaryTerm}
   h4. MyGlossaryTerm
   This is the definition of MyGlossaryTerm. See [Page Name] for more information.
   ```

4. Optionally, include a horizontal line between the terms. This depends on how long each entry is. If your glossary tends to have short entries, it may look too cluttered with horizontal lines.

---

See the glossary in the [Confluence documentation](#) for an example of this style of glossary (without the alphabetical index).

**Creating a Glossary with Child Pages**

This style of glossary is useful if the glossary entries tend to be quite long or have additional information over and above the definition of the term.
1. Create a page named **Glossary**.
2. Create a child page for each glossary entry (term). Each child page should contain:
   - The term as the title of the page.
   - The definition of the term in the body of the page.
   - Excerpt tags (`{excerpt}`) tags surrounding the definition.
   - Any additional information after the `excerpt` tags.

   ```
   {excerpt}
   This is the definition of MyGlossaryTerm
   {excerpt}
   More information to describe MyGlossaryTerm
   ```

3. On the 'Glossary' page, use the `children` macro to show the excerpts from each child page in a list, with the page name displayed in 'h4' style.

   ```
   {children:excerpt=true|style=h4}
   ```

See the glossary in the [Crowd documentation](https://confluence.atlassian.com/crowd) for an example of this style of glossary.

**Referring to Glossary Terms**

In the main pages of your technical documentation, create a link to the glossary page for each glossary term.

```
_[MyGlossary Term|Glossary#MyGlossaryTerm]_
```

Note that this is a standard page link with an anchor. We have formatted the link as italics, because it helps to have the glossary links looking different to other page links. Readers can just skip over the glossary link if they are already familiar with the term.

**Further Reading**

- A blog post about content re-use: [Technical Writing in a Wiki - Content Re-use and Structure](https://confluence.atlassian.com/crowd) (November 2010).

**Next Steps**

You now have a good idea of how to re-use content in a Confluence documentation space. What next? Take a look at [Managing the Life Cycle of your Technical Documentation](https://confluence.atlassian.com/crowd).

**Managing the Life Cycle of your Technical Documentation**

This page is part of the guide to [developing technical documentation on Confluence Wiki](https://confluence.atlassian.com/crowd). We have already shown you how to [create your technical documentation space](https://confluence.atlassian.com/crowd), including how to set permissions for your space. Now we offer a quick-start guide to managing the life cycle of your technical documentation in Confluence. The life cycle includes drafting, reviewing and publishing a document, as well as managing documentation that is release-specific.
Quick guide to managing the technical documentation life cycle

- Create draft pages with restricted permissions, to hide them until they are ready for publication.
- Set the permissions to allow reviewers to comment on and/or update the pages.
- When ready, publish the page by removing the permission restrictions.
- Monitor updates to your draft and published pages by watching your space and/or subscribing to RSS feeds.
- Use spaces as a mechanism for matching your documentation version to product releases: one space per major release number.
- Consider installing plugins for extended workflow and publication management.

The rest of this page gives more details of the above procedures.

On this page:

- Using the Built-In Confluence Functionality to Manage Workflow and Release Cycle
  - Drafting, Reviewing and Publishing a Page
  - Keeping Track of Documentation Updates
    - Viewing the History of a Page
    - Receiving Email Notification of Updates
    - Monitoring Updates via RSS Feeds
  - Release Management
    - Space Keys
    - The Release Management Process
  - Other Scenarios using the Built-In Confluence Functionality
  - Using Add-Ons for Extended Workflow, Publication and Concurrent Version Management
  - Notes

Using the Built-In Confluence Functionality to Manage Workflow and Release Cycle

This section describes how to use the built-in Confluence functionality to manage your workflow (draft, review, publish) and to align your documentation version control to the product release cycle.

In this scenario we also assume that you want a live space that always has the same space key and always contains the latest version of your documentation. This scenario suits the requirements of an organisation that wants their technical documentation to be 'live'. Various groups of people can refine the content as and when required. People can also subscribe to the space, knowing that they will always get the latest version of the documentation and comments.

This is the way we manage our documentation at Atlassian. The content of the wiki is dynamic, continuously updated, commented on, subscribed to and watched by thousands of people all over the world.

Drafting, Reviewing and Publishing a Page

The workflow is simple.
### 1. Create a page with restricted permissions.

For example, you might restrict viewing to a group of people such as your team. On a public wiki, you might restrict viewing to staff members, so that the general public cannot see the page.

### 2. Write the page content.

### 3. Ask other people to review the page.

They can add comments to the page or simply edit the page content directly.

### 4. Publish the page when ready, by doing the following:

- Delete the comments on the page.
- Remove the permission restrictions on the page. The page has now been published.

The space permissions and site permissions now determine who can see and/or update the page.

---

The screenshot below shows a page under review. Notice the lock icon at top left, indicating that restricted permissions apply to this page.

---

### Keeping Track of Documentation Updates

On a wiki, it is quite usual for a number of different people to update a single page. Technical writers need to know what happens to our documents, both during review and after publication.

#### Viewing the History of a Page

Confluence creates a new version of the page every time someone edits the page. The page history shows all the versions, with date, author, and any comments made on the update.

Go to the page and choose **Tools > Page History.**

<table>
<thead>
<tr>
<th>Version</th>
<th>Date</th>
<th>Changed By</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>CURRENT (v. 41)</td>
<td>Jul 07, 2009 11:33</td>
<td>Gilies Gaskell [Atlassian Technical Writer]</td>
<td></td>
</tr>
<tr>
<td>v. 40</td>
<td>Jun 18, 2007 11:08</td>
<td>Rosie Jameson [Atlassian Technical Writer]</td>
<td>Restore this version</td>
</tr>
</tbody>
</table>

On the page history view, you can:
View the content of a specific version of the page.
Revert to (restore) a specific version.
Select any two versions and ask for a comparison, to see what has changed between those two versions.

See Page History and Page Comparison Views for detailed information.

It is all very well to go to a specific page and see what has happened to it, but how do you know when to go and look at the page? You need a notification of any changes made to your documentation space.

In Confluence, you can monitor updates to your documentation via email notifications and via RSS feeds.

**Receiving Email Notification of Updates**

You can ‘watch’ a page or an entire space. Whenever anyone updates the page or space, you will receive an email notification.

To watch a page:

1. Open the ‘Tools’ menu and select ‘Watch’.

To watch a space:

1. Go to a page in the space and choose Browse > Advanced.
2. In the left-hand panel, click ‘Start watching this space’.

See Subscribing to Email Notifications of Updates to Confluence Content for details of the various notifications Confluence will send, and how to configure your notification settings.

**Monitoring Updates via RSS Feeds**

RSS feeds provide another way to keep track of updates. The simplest way to build an RSS feed is to use Confluence’s feed builder, accessible from the dashboard. This will give you a URL that you can ping to get the latest updates.

Below we describe how to set up a useful feed for your technical documentation space. Remember that you can adjust the settings to suit your own needs.

1. Choose Browse > Feed Builder. The RSS feed builder form appears.
2. Check the boxes to select all the content types. (Even if you are not expecting comments, blog posts or mail in your documentation space, it does no harm to receive notifications if they do arrive.):
   - Pages and the comments and attachments on pages.
   - Blog posts and their comments and attachments.
   - Mail.
3. Select your documentation space from the list. Press Ctrl and click to select multiple spaces.
4. Click the Create RSS Feed button to create your feed.
5. This will take you to a new screen. Drag or copy the link into your RSS reader. The feed URL is linked to the words Drag or copy this link to your RSS reader.

Now that you have set up your RSS feed, you need to decide how to read it. There are various options to choose from. For example:

- Use an RSS reader, such as the Sage add-on for Firefox.
- Use an email client, such as Thunderbird.

See Subscribing to RSS Feeds within Confluence for details.
Let’s assume that your product goes through a regular release cycle, and that you need to retain separate documentation for each major version of the product.

At Atlassian, we use spaces as our version-control mechanism.

- **Archive spaces.** At each release, we create a new archive space to house the previous version of the documentation.
- **The live space.** The documentation for the latest version of the product resides in the live space. The live space always retains the same space key and is always available for viewing and updating.

**Space Keys**

The live space has just the product name as its space key. For example, for the Crowd product the space key is ‘CROWD’. (See the Crowd documentation space.)

For the archived versions, we use a combination of the product name plus version number as the space key. For example, we use ‘CROWD020’ for the Crowd 2.0 documentation, ‘CROWD016’ for the Crowd 1.6 documentation, and so on.

**The Release Management Process**

Here is an overview of the process we follow at Atlassian.

1. **Leading up to release date.** Work with hidden draft pages in the live space. A ‘hidden draft’ is simply a page that has restricted permissions applied:
   - For each new feature, create a new page with restricted permissions.
   - If you need to update existing pages, create a hidden copy of the existing page and apply the updates to the copy.
   - Follow the usual draft and review procedure for each page.
2. **A few days before release date.** Use the Copy Space plugin to copy the live space to a new space. This creates a snapshot of the current documentation, and will act as an archive for the current release which is soon to become the previous release. (We described the use of the Copy Space plugin in the earlier section of this guide: Creating your Technical Documentation Space.)
3. **On release date.** Publish the updated documentation for the new version of the product:
   - Rebrand the live documentation space to reflect the new release number. In other words, change the space name and any other descriptions that include the product release number.
   - Unhide all the new pages, by removing the permission restrictions on each hidden page.
   - Copy the content of the updated pages to the proper pages, then delete the copies.
   - Export the newly updated space to PDF, HTML and XML, for those customers who prefer offline versions of the documentation.

Note that the above process is applicable to major releases of the product. For minor bug-fix releases, we simply update the documentation in the live space. We do not create archive spaces for every minor release.

The example below shows an extract from the dashboard of our documentation wiki, listing the spaces for different versions of the Crowd documentation. (Crowd is one of our products.) Each space holds the documentation for a specific major release of Crowd.
Other Scenarios using the Built-In Confluence Functionality

It is easy to design other ways of managing your documentation spaces using the built-in Confluence functionality. For example, the simplest scenario is to publish a new space for every new release of your product, using the same Copy Space plugin as described above.

Using Add-Ons for Extended Workflow, Publication and Concurrent Version Management

For advanced workflow features, consider installing the Ad Hoc Workflows add-on onto your Confluence site.

For advanced publication and concurrent version management consider using the Scroll Versions add-on. Scroll Versions enables you to set up and manage concurrent versions of your documentation in a single space. Multiple versions of software, different product variants, and even multiple languages of documentation can be managed. Changes to pages are scheduled for a specified version and then published all at once.

1. Install the Scroll Versions add-on from the Marketplace or using Confluenes Universal Plugin Manager.
2. Create a space for your documentation or activate Scroll Versions on your existing documentation.
3. Add the version numbers that you want to work with, via the version management screen.
4. When a version is ready to publish go to ‘Browse’ > ‘Scroll Versions’ > ‘Manage Versions’ and publish your documentation within the same space or to another space.

See the documentation of Scroll Versions for further information.
Similarly, consider using the Content Publishing add-on to publish content from a master space to a published space. In this scenario, you will create a master space that contains your drafts in progress and new releases. The master space is visible only to the authors and reviewers. You will periodically publish the master space to a published space. This suits the requirements of an organisation that needs a 'published' or 'official' set of documentation, published only when a new version of the product is released. There is no requirement for continual updating of the documentation.

1. Install the Content Publishing plugin.
2. Create a space for your master content.
3. Create a space for your published content.
4. When the content in the master space is ready to publish, go to the ‘Advanced’ tab in the ‘Space Admin’ section of the master space.
5. Click ‘Publish Space’ to configure the settings and then publish your space. See the plugin documentation to choose the options best for your needs.
6. Click ‘Publish’.

**Notes**

- **Installing plugins.** If you decide to use additional plugins, your site administrator will need to install the plugins into your Confluence site. Refer to the documentation on installing plugins.

- **Plugin support.** Before installing a plugin into your Confluence site, please check the plugin’s information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

**Next Steps**

Now you know about managing your workflow and documentation release process on Confluence. What next? Take a look at Providing PDF Versions of your Technical Documentation.

**Providing PDF Versions of your Technical Documentation**

This page is part of the guide on Developing Technical Documentation on Confluence Wiki.

Confluence is a platform for publishing online documentation. It also provides an export to PDF feature for producing PDF versions of your documentation, allowing you to print it, or to provide a copy to customers who are unable to access the online version. This guide describes how to export your technical documentation to PDF using Confluence’s built-in PDF export, and introduces a third-party plugin that provides additional PDF layout and style functionality.

**Quick guide to PDF exports**

- Customise the PDF layout (title page, header and footer) and style, for use each time you export your documentation.
- Export a single page to PDF.
- Export a selection of pages or an entire space to PDF.
- Consider installing a third-party plugin for advanced PDF export functionality.

The rest of this page gives more details of the above procedures.
Customising the PDF Layout and Style

If you plan to create PDF versions of your documentation, you may want to customise the PDF layout and styles for your space. These customisations will be applied every time you export documentation to PDF.

Under PDF layout you can add HTML to customise the PDF title page, and page headers and footers. Under PDF stylesheet, you can adjust the appearance of the PDF pages.

Editing the PDF Layout

Setting a global PDF layout
1. Open the Confluence Admin screen.
2. Select Look and Feel > PDF Layout. The following screens allows you to enter HTML and CSS that will be rendered on the PDF title page, as well as page headers and footers.

Setting the PDF layout at space level
1. Choose Browse > Space Admin.
   Note: ‘Space Admin’ is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
2. Click PDF Layout in the 'Look and Feel' section of the left-hand panel.
3. Click Edit, and customise the HTML that generates the following areas in the exported PDF document:
   - PDF Space Export Title Page – title page.
   - PDF Space Export Header – page headers.
   - PDF Space Export Footer – page footers.
4. Enter your customisations into each text box as required. The PDF layout section accepts HTML code. You can include inline CSS in the HTML too. Save your work.

Editing the PDF Stylesheet
Setting a global PDF Stylesheet

1. Open the Confluence Admin screen.
2. Click Look and Feel > PDF Stylesheet. The following screen allows you to enter and save CSS code that will render content on each page.

Setting a space-level PDF stylesheet

1. Choose Browse > Space Admin.
   Note: ‘Space Admin’ is displayed only if you are a space administrator for that space, or you are a super user (a member of the confluence-administrators group).
2. Click PDF Stylesheet in the left-hand panel. The ‘PDF Export Stylesheet’ section appears, showing the current contents of your PDF stylesheet. It contains all CSS rule customisations applied to the pages in the space.
3. Click Edit and enter your customisations into the text box as required. The PDF stylesheet section accepts Cascading Style Sheets (CSS) rules. Save your work.

Examples of PDF Customisation

Below are typical customisations you may want to make for your technical documentation. For more examples, see Customising Exports to PDF.

Adding a Title Page

You can create a title or cover page to your PDF document using HTML. Use the PDF Space Export Title Page section of the PDF layout to do this. Adding a New Title Page

The following example uses HTML with an inline CSS rule to generate a title page.

```html
<div class="fsTitlePage"
    style="margin-left:auto;margin-top:75mm;margin-right:auto;page-break-after:always">
    <img src="/download/attachments/12345/titlepage.png"/>
</div>
```

Including Content Above Table of Contents in Default Title Page

The following example includes content above the automatically-generated table of contents that appears on the default title page, so that your title page includes your own content plus the table of contents.

```html
<div class="fsTitlePage"
    style="margin-left:auto;margin-top:75mm;margin-right:auto;">
    <img src="/download/attachments/12345/titlepage.png"/>
</div>
```

Adding an Image to your Title Page

In the examples above, the title page includes an image called ‘titlepage.png’, centred in the middle of the page. The image is attached to a Confluence page and is referenced via its relative URL (that is, we use only the last part of the URL, excluding the Confluence site’s base URL).

Follow these instructions to include an image on your title page:
1. Attach the image to a Confluence page.
2. View the list of attachments on that page.
3. Right-click the image and copy its location.
4. Paste the link into the appropriate src="" attribute within your PDF stylesheet, as shown above.
5. Remove the first part of the URL before /download/....

Adding Headers and Footers

You can add headers and footers to your PDF pages using HTML. Use the 'PDF Space Export Header' and 'PDF Space Export Footer' sections of the PDF layout to do this. For simple headers and footers, plain text is enough. The following example adds a simple copyright notice.

Copyright © 2010, Atlassian Pty Ltd.

Adding Page Numbering to a Header or Footer

To add page numbering, you need to combine customised HTML in the PDF Layout with customised CSS in the PDF Stylesheet.

1. PDF Layout HTML: In the Footer section (or the Header section), use an empty span element with a unique ID, for example pageNum, to act as a place holder for the page number.

   HTML - PDF Layout: Footer Section
   ```html
   <span id="pageNum"/>
   ```

2. PDF Stylesheet CSS: Create the following CSS selector rule for the empty span:

   CSS - PDF Stylesheet
   ```css
   #pageNum:before
   {
   content: counter(page);
   }
   ```

Analysing the above CSS selector rule in more detail:

- The #pageNum rule selects the HTML element with the specified ID of "pageNum", which is the span element we created for the header or footer.
- The :before part of the selector is a pseudo class that allows the insertion of content before the span element is processed.
- The counter(page) is a function that returns the current page number as its content.
- The content property tells the CSS processor that dynamic content (that is, an incrementing page number) is to be inserted at the span tag.

Exporting to PDF

You can use the built-in Confluence PDF export to export a single page, a selection of pages or an entire space to a single PDF file.

Exporting a Single Page to PDF

You can export a Confluence page to PDF. This option exports a single page and is available to all users who have permission to view the page.
- Go to a page in the space and choose **Tools > Export to PDF**. Follow the prompts to export the page.

**Exporting a Selection of Pages or a Space to PDF**

1. Go to a page in the space and choose **Browse > Advanced**.
2. Click **PDF Export** in the left-hand panel. This option will only be visible if you have the ‘Export Space’ permission.
3. Select the pages you want to export.
   - You have the option to **Select All** or **Deselect All** pages.
   - When you select a page, all its child pages will also be selected. Similarly, when you deselect a page all its child pages will also be deselected.
4. Click **Export**.
5. When the export process has finished, download and save the PDF file as prompted.

**Using the Scroll PDF Exporter Plugin to Export to PDF**

The Scroll PDF Exporter provides flexible themes for configuring PDF layout and styles. You can select one of Scroll PDF Exporter’s built-in themes and configure your table of contents, header and title pages. For even more flexibility, see the section **HowTos** in the Scroll PDF Exporter documentation.

For this advanced PDF export functionality, you will need to install the **Scroll PDF Exporter** plugin to your Confluence site.

**Notes**

- **Permissions required to export a space**: To use the space export functionality, you need ‘Export Space’ permission. See the guide to **space permissions** or contact a **space administrator** for more information.

- **Installing plugins**: If you decide to use additional plugins, your site administrator will need to install the plugins to your Confluence site. Refer to the documentation on **installing plugins**.
• **Plugin support:** Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

### Next Steps

Now you know all about providing PDF versions of your documentation. What next? See other ways of exporting and printing technical documentation.

### Exporting and Printing Technical Documentation

This page is part of the guide to developing technical documentation on Confluence Wiki. Confluence is a great tool for writing and maintaining technical documentation. There are times when we need to export the content out of Confluence into other forms, such as PDF, HTML, Microsoft Word and paper.

Confluence itself provides an export to both PDF and HTML. Plugins provide additional functionality. Below are guidelines on exporting your technical documentation to various formats, including printed output.

---

**Quick guide to printing and exporting content**

- Use the browser's print option to print a single page.
- To print more than one page and for more advanced printing options, export your documentation to PDF.
- Confluence can export your pages to PDF, HTML, Confluence-specific XML and Word.
- Consider installing plugins to export your pages to PDF (enhanced functionality). Word (enhanced functionality), DocBook XML, Eclipse Help and JavaHelp.
- Make your exports available to your customers for download by attaching the exported file to a Confluence page.

---

The rest of this page gives more details of the above procedures.

---

### On this page:

- Exporting to Microsoft Word via a Plugin
- Exporting to Eclipse Help via a Plugin
- Exporting to EPUB via a Plugin
- Exporting to HTML via a Plugin
- Making the PDF and Other Exported Files Available to your Readers
- Notes
- Further Reading

---

*Printing*
To print a single Confluence page, just use the browser's print option. This option is available to all users who have permission to view the page.

To print more than one page and for more advanced printing options, export your documentation to PDF. See Providing PDF Versions of your Technical Documentation.

**Exporting to PDF**

Because this is such an important topic, we have a section of this guide dedicated to PDF. See Providing PDF Versions of your Technical Documentation.

**Exporting to HTML**

Using the built-in Confluence HTML export, you can export a single page, a selection of pages or an entire space to HTML. Confluence supplies the HTML and associated files in a zip file.

1. Go to a page in the space and choose **Browse > Advanced**.
2. Click **HTML Export** in the left-hand panel.
   
   This option will only be visible if you have 'Export Space' permission.
3. Select the **Include Comments** check box if you want to include comments for the pages you are exporting.
4. Select the pages you want to export by selecting the check boxes in the tree view of pages displayed. By default, all pages are selected. You have the option to **Select All** or **Deselect All** pages.
   
   If you select the check box of a page that contains one or more child or descendant pages, all of these child and descendant pages will also be selected. Similarly, if you clear the check box of such a page, all of its child and descendant pages will also be cleared. This provides a convenient method of exporting subtrees, for example, chapters or sections within a document.
5. Click **Export**. This will create a zipped archive of HTML files.
6. When the export process has finished, download the zipped archive as prompted and extract the files into a folder.
Exporting to Confluence-Specific XML

Confluence provides an XML export. The XML produced is a proprietary format and is intended for backups or for transferring a space from one Confluence instance to another. If you write your documentation on Confluence and your customers have Confluence too, then you can export your manuals to XML and customers can upload them onto their own Confluence site.

Exporting to DocBook XML via a Plugin

Scroll DocBook Exporter converts Confluence pages to DocBook XML. Your Confluence system administrator will need install the plugin onto your Confluence site.

Exporting to Microsoft Word

Confluence can export a page to Word. (Select 'Export to Word' from the 'Tools' menu.) This option performs a basic conversion of wiki content to HTML and applies some Word CSS stylesheets. It processes just one page at a time.

Exporting to Microsoft Word via a Plugin

Scroll Office is a Confluence plugin. Once installed, Scroll Office replaces Confluence's built-in 'Export to Word' functionality. You can export a single page or a hierarchy of pages.

You can define your templates in Word in the usual way, and upload them to Confluence as global templates or space templates. When you export your Confluence pages to Word, Scroll Office will use those templates to build native Word documents from the wiki pages.

Scroll Office provides additional features such as enforcing page-breaks, setting the page orientation to landscape or portrait, and ignoring content. The latest version offers a REST-style API for automated export.

Exporting to Eclipse Help via a Plugin

Scroll EclipseHelp Exporter provides an export to Eclipse Help format.

You can produce embeddable online help for Eclipse-based applications. Scroll EclipseHelp Exporter converts the Confluence content into EclipseHelp-compatible JAR files to create a standalone online help or a context-sensitive help.

A hint about the Eclipse Help platform: You can use a cut-down version of the Eclipse Help platform to provide online documentation for any system. It doesn't have to be an Eclipse tool that you are documenting. For some ideas, take a look at a couple of articles about documenting your project using the Eclipse help system.

Exporting to EPUB via a Plugin

The Scroll EPUB Exporter outputs an ebook in the common EPUB format that can be read on iPads, iPhones and any other ebook reader.

Exporting to HTML via a Plugin

The Scroll HTML Exporter enables the delivery of Confluence content from a web server. It converts the pages into static HTML pages that can be uploaded to a web server. The output of the Scroll HTML exporter can also be used as an input to produce other HTML-based help formats such as WinHelp and HTML Help.

Making the PDF and Other Exported Files Available to your Readers

There are a number of ways to make your exported files available to your readers, such as putting the files on a disc and shipping them with your product.
One of the simplest ways is to attach the files to a Confluence page. (See [Attaching Files to a Page](#).)

For example, Atlassian uses the out-of-the-box Confluence export functionality to provide PDF, HTML and XML versions of our documentation. People can download the files from our [documentation wiki](#). For example, here are the [JIRA documentation downloads](#) and the [Confluence documentation downloads](#).

For those people who would like to use the XML files to recreate the documentation on their own Confluence sites, we provide instructions on [setting up your own local documentation](#).

**Notes**

- **Permissions required to export a space.** To use the space export functionality, you need 'Export Space' permission. See the guide to [space permissions](#) or contact a space administrator for more information.

- **Installing plugins.** If you decide to use additional plugins, your site administrator will need to install the plugins into your Confluence site. Refer to the documentation on [installing plugins](#).

- **Plugin support.** Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on [plugin support](#).

**Further Reading**

- A blog post about exporting and importing content from/to Confluence: [Technical Writing in a Wiki - Single Source Publishing](#) (November 2010).

- A good overview of the Scroll Office features in this [blog post](#) (August 2010) and the [followup post](#) (November 2010).

**Next Steps**

Now you know about a number of ways to get your technical documentation out of Confluence into various formats, for printing or for input into another system or process flow. What next? Take a look at [Essential Confluence Features for Technical Documentation](#).

**Essential Confluence Features for Technical Documentation**

This page is part of the guide to developing technical documentation on Confluence. In this section we highlight the built-in Confluence macros that are most useful in technical documentation. For more information about Confluence macros, see [Working with Macros](#).

---

### On this page:

- Auto-Generating a Table of Contents for Page Content
- Drawing Attention to Elements of a Page
- Putting Content inside Customisable Panels
- Inserting Anchor Links on Pages
- Structuring Content using Sections and Columns
- Making your Documentation more Engaging by Embedding Videos

---

**Auto-Generating a Table of Contents for Page Content**

It is important to make it easy for viewers to jump to the section of a Confluence page that they are most interested in. The Table of Contents macro helps you navigate lengthy pages by summarising the content structure and providing links to headings used on the page.

**Click here to see a common example >>**

2. Each feature in the release is a heading on the page.
3. You can generate a list of hyperlinks to each of the features in the release notes by inserting the Table of Contents macro:

![Image of Table of Contents macro](image)

4. The image below shows the Table of Contents macro inserted at the top of the 'Release Notes' page. Note that we have excluded the 'Highlights of Confluence 4.0' heading from the table of contents by modifying the macro's parameters.
5. The image below shows the macro parameters specified in the macro browser. Note the 'Minimum Heading Level' and 'Maximum Heading Level' parameters.

Return to top of page

Drawing Attention to Elements of a Page

Often when creating documentation there are elements of a page that you want to highlight, or draw the the viewers attention to. Confluence ships with the following macros that help you focus a viewer's attention to a note, information, tip or warning.

Click here to see common examples >>

**Note Macro**

<table>
<thead>
<tr>
<th>What is it?</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Note macro allows you to highlight a note on a Confluence page.</td>
<td><img src="https://example.com/draft-in-progress.png" alt="" /> Draft in progress</td>
</tr>
<tr>
<td>It creates a yellow coloured box surrounding your text, as shown to the right.</td>
<td>This document is a draft and is under development.</td>
</tr>
</tbody>
</table>

See [Note Macro](#) for more examples and instructions.

**Info Macro**

<table>
<thead>
<tr>
<th>What is it?</th>
<th>Example</th>
</tr>
</thead>
</table>

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
The Info macro allows you to highlight helpful information on a Confluence page.

It creates a blue coloured box surrounding your text, as shown to the right.

See [Info Macro](#) for more examples and instructions.

### Tip Macro

<table>
<thead>
<tr>
<th>What is it?</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Tip macro allows you to highlight a helpful tip on a Confluence page.</td>
<td><img src="#" alt="Learn more" /> Check out this blog post: <a href="#">Techni cal Writing in a Wiki: Technical Communicators Explain How &amp; Why?</a></td>
</tr>
<tr>
<td>It creates a green coloured box surrounding your text, as shown to the right.</td>
<td></td>
</tr>
</tbody>
</table>

See [Tip Macro](#) for more examples and instructions.

### Warning Macro

<table>
<thead>
<tr>
<th>What is it?</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Warning macro allows you to highlight a warning note on a Confluence page.</td>
<td><img src="#" alt="Draft" /> This page is a draft in progress and visible to Atlassian staff only.</td>
</tr>
<tr>
<td>It creates a red coloured box surrounding your text, as shown to the right.</td>
<td></td>
</tr>
</tbody>
</table>

See [Warning Macro](#) for more examples and instructions.

[Return to top of page](#)

**Putting Content inside Customisable Panels**

The [Panel macro](#) allows you to place content inside a customisable coloured panel. This is particularly useful when you want to clearly separate elements on a page.

*Click here to see a common example*
1. You are documenting a procedure which involves a number of steps.
2. You want to call out the steps of the procedure from the rest of the page by placing it inside a coloured box, or panel.
3. You can create a coloured panel using the Panel macro.
4. The image below shows the parameters set for the panel using the macro browser.

Return to top of page

Inserting Anchor Links on Pages

Anchor links can be especially useful when navigating between sections of a long document or when you want to link to a segment of a page from another page. The Anchor macro allows you to link to specific parts of a page.

Click here to see a common example >>

1. You are documenting part of a user guide.
2. The page is split into multiple sections.
3. After each section you want to provide a link for viewers to click, taking them back to the top of the page.
4. To achieve this you first must create an anchor at the top of the page using the Anchor macro. You can give the anchor any name you like. In the image below, the anchor at the top of the page will be named 'top'.

5. The anchor placeholder will appear to indicate where your anchor link is located on the page:
6. Create a link to the anchor, anywhere on the page, using the [Link Browser](#). The image below shows a link to the anchor called 'top' by using the hash '#' followed by the name of the anchor you created earlier, with an alias of 'Return to Top'.

See [Working with Anchors](#) for more examples and instructions.

**Structuring Content using Sections and Columns**

Sometimes it is necessary to structure content into sections and columns. The details are in [Working with Page Layouts and Columns and Sections](#).

- Page layouts offer a set of predefined columns and sections.
- The Section and Column macros allow more flexibility. You can set the width of the columns, and put the sections and columns in any part of the page.
- You can create any number of sections on a Confluence page using the Section macro.
- Each section can contain any number of columns, created using the Column macro.
- Columns can either have a fixed width, specified in pixels, or a dynamic width, specified as a percentage of the page width.
- Note: A `column` must be created inside a `section`.

**Click here to see a common example >>**

The images below show part of a Confluence page with two sections (outlined in red), each with two columns (blue) of different widths.
1. Section 1:

   1. Put a name to your face
   2. Learn how content is organised
   3. Get familiar with the Confluence screens
   4. Start creating content
   5. Add a panel to your page

   Put a face to your name
   Your profile picture is used to identify you across Confluence. Upload your own picture via your Profile.
   Learn More >>

   Upload
Making your Documentation more Engaging by Embedding Videos

Pictures can be worth a thousand words. The same can be said for videos. Often, it's easy to explain a concept or demonstrate a procedure using a video. The Widget macro allows you to embed web content, including YouTube, Episodic and Vimeo videos, in a Confluence page.

Click here to see a common example >>

1. You release a new version of your product.
3. The marketing team creates a video demonstrating the new features of the release and uploads it to YouTube.
4. You can embed the video in your Release Notes using the Widget macro, for playback on your Confluence page.
   a. Select 'Other Macros' from the 'Insert' menu in the Rich Text Editor toolbar.

   ![Image of Rich Text Editor toolbar with 'Other Macros' highlighted]

   b. Search for the 'Widget Connector' in the macro browser.

   ![Image of Select Macro dialog with 'Widget Connector' highlighted]
c. Insert the URL of your YouTube video into the ‘Web Sites Widget URL’ field.

![Web Sites Widget URL](https://example.com)

d. Click ‘Insert’ and save your page.

![Confluence 4.0 Release Notes](https://example.com)

See [Widget Connector Macro](https://example.com) for information on the supported services and for more usage examples.

**Return to top of page**

**Next Steps**

Take a look at [Confluence Plugins for Technical Documentation](https://example.com).

**Confluence Plugins for Technical Documentation**

This page is part of the guide to developing technical documentation on Confluence. In this section we highlight some of the Confluence plugins that are useful for technical writers in designing and developing documentation.

A plugin is an extension module that you can add to your Confluence site, to extend the wiki’s core functionality. It is similar to an add-on for your browser. Confluence plugins may be developed by Atlassian or by third parties.
To find the plugins featured on this page, and other plugins too, visit the Atlassian Plugin Exchange.

This page features plugins that provide the following extended capabilities:

- **Extended Wiki Markup Features**
  - Quick Overview of Macros
  - Composition Plugin
  - Using the Composition Plugin to Outline Text Blocks
  - Using the Composition Plugin to Add Tabs to a Page
  - Using the Composition Plugin to Flow your Text around Images
  - Scaffolding Plugin

- **Extended Version Control**
  - Scroll Versions
  - Attachment Checkout Plugin

- **Drawing Tools**
  - Gliffy Plugin
    - Notes
    - Further Reading

---

Quick guide to the plugins featured below

- **Scroll Versions** – Adds functionality for sophisticated version management, enhanced content reuse, support for context-sensitive help, permalinks, and duplicate page titles. This is a commercial plugin.

- **Composition plugin** – Provides macros which allow finer control over the layout (composition) of a page. For example, outline text; add tabs to your page; flow your text around diagrams. This plugin is free.

- **Scaffolding plugin** – Provides macros for creating ‘permanent templates’ and editable forms. Commercial.

- **Attachment Checkout plugin** – Adds check-out/check-in functionality for Confluence attachments. Free.

- **Gliffy plugin** – Provides an embedded diagram editor. Commercial.
Extended Wiki Markup Features

All wiki markup extensions are provided by macros in Confluence. Some macros are built in to Confluence. Other macros are supplied by plugins.

Quick Overview of Macros

Before looking at plugins, let's take a quick look at macros in general. There are two ways to add a macro to your page:

- Use the macro browser. This is the simplest and recommended way.
- Or insert the macro's name in curly brackets into the text of your page and specify the parameters.

Click here to see an example of a macro >>
The following code uses the `{include}` macro to insert the text from the page called 'My Page'. The text will appear on the page where the macro is used:

```
Page text...
{include:My Page}
page text...
```

The resulting page will look like this:

```
Page text...
<text from the 'My Page' page>
page text...
```

A number of macros are shipped with your Confluence installation by default. See Working with Macros. Below we describe some plugins that provide additional useful macros for Confluence:

Composition Plugin

The **Composition plugin** adds some formatting features to compose a page in a more flexible way. Using the macros provided by the Composition plugin, you can:

- Outline your text blocks.
- Add tabs to a page.
- Flow your text around the images or diagrams on the page.

**Using the Composition Plugin to Outline Text Blocks**

Use the `{cloak}` macro to outline a text block.

**Usage:** The following code creates a text block named 'SeeAlso' for the outlined 'See Also' section within a page. The text block with id=’SeeAlso’ will be hidden after the 'See Also' title:

```
{composition-setup}
  h2. {toggle-cloak:id=SeeAlso} See Also
  {cloak:id=SeeAlso}
  h3. Working With Macros:
    [Link 1]
    [Link 2]
  h3. Working with Rich Text Editor:
    [Link 3]
    [Link 4]
  {cloak}
```

**Alternatives:** You can also use the `{expand}` macro available in Confluence by default, but this macro can outline only text of the same level and cannot hide headings within the text. The `{expand}` macro does not require parameters and just hides the text placed between the `{expand}` tags.

**Note:** If you need to outline a text block containing nested headings, consider the text structure. Maybe the block is too big. You could create a child page from this block to decompose the whole text. Then you can include and outline the text block using the `{include}` macro within `{expand}`.

**Using the Composition Plugin to Add Tabs to a Page**

Use the `{deck}` and `{card}` macros to separate content between tabs on the same page.
Usage: The following code creates two tabs with client information:

```
{composition-setup}

h1. Client Name
{deck:id=ClientName}
{card:label=Basic}

Client Company Name: Company
[Client Web Site|http://url.com]
Our projects: [Project1|Project1 Home]
{card}
{card:label=Contacts}
Company CEO: John Brown, e_mail: brown@company.com
{card}
{deck}
```

The tabs on a page will look like this:

![Client Name](image)

Using the Composition Plugin to Flow your Text around Images

Use the `{float}` macro to make your text flow around images or diagrams.

Usage: The following code demonstrates how a picture can be surrounded by the description, as often shown in printed publications:

```
{composition-setup}
{float:left}
!shakespeare.jpg!
{float}

William Shakespeare (baptised 26 April 1564; died 23 April 1616) was an English poet and playwright, widely regarded as the greatest writer in the English language and the world's pre-eminent dramatist.
```

The page will look like this:
William Shakespeare (baptized 26 April 1564; died 23 April 1616) was an English poet and playwright, widely regarded as the greatest writer in the English language and the world's pre-eminent dramatist. He is often called England's national poet and the "Bard of Avon". His surviving works, including some collaborations, consist of about 39 plays, 164 sonnets, two long narrative poems, and several other poems. His plays have been translated into every major living language and are performed more often than those of any other playwright.

Shakespeare was born and raised in Stratford-upon-Avon. At the age of 18, he married Anne Hathaway, with whom he had three children: Susanna, and twins Hamnet and Judith. Between 1586 and 1592, he began a successful career in London as an actor, writer, and part owner of a playing company called the Lord Chamberlain's Men, later known as the King's Men. He appears to have retired to Stratford around 1613, where he died three years later. Few records of Shakespeare's private life survive, and there has been considerable speculation about such matters as his physical appearance, sexuality, religious beliefs, and whether the works attributed to him were written by others.

Shakespeare produced most of his known work between 1592 and 1613. His early plays were mainly comedies and histories, genres he raised to the peak of sophistication and artistry by the end of the 16th century. He then wrote mainly tragedies until about 1608; including Hamlet, King Lear, and Macbeth, considered some of the finest works in the English language. In his last phase, he wrote tragicomedies, also known as romances, and collaborated with other playwrights.

For more macros, see the Composition plugin page.

Scaffolding Plugin

The Scaffolding plugin allows you to create sophisticated page templates in order to add content easily and fast. Scaffolding templates are suitable for dynamically-filled data and allow people to create pages by completing form fields and selecting values from drop-down lists.

The Scaffolding templates are useful for creating pages with a well-determined structure, such as:

- API methods or property descriptions.
- Constant list.
- Feature description.
- Software requirement specifications.

Example: The following Scaffolding template creates a description of an API method:
h3. Method Name
{text-data:methodName|required=true}{text-data}

h3. Method Description
{text-data:methodDescription|type=area|required=true|width=100%}description{text-data}

h3. Parameters
{table-data:parameters}
|| Name || Type || Mandatory || Description ||
| {text-data:paramName}ParamName{text-data} |
{list-data:paramType}{list-option:Number}Number{list-option}{list-option:String}String{list-option}{list-option:DateTime}DateTime{list-option:MACaddress}MACaddress{list-option}{list-option:IPaddress}IPaddress{list-option}{list-data} |
{list-data:paramMandatory}{list-option:Required}Required{list-option}{list-option:Optional}Optional{list-option}{list-data} |
{text-data:paramDescription|type=area}param description{text-data} |
{table-data}

h3. Return Value
The returned value is an XML structure of the following format:
\{code:xml\}
\(\text{code}\)\nWhere elements mean:
{table-data:returnValues}
|| Name || Type || Description ||
| {text-data:paramName}ParamName{text-data} |
{list-data:paramType}{list-option:Number}Number{list-option}{list-option:String}String{list-option}{list-option:DateTime}DateTime{list-option:MACaddress}MACaddress{list-option}{list-option:IPaddress}IPaddress{list-option}{list-data} |
{text-data:paramDescription|type=area}param description{text-data} |
{table-data}

h3. Remarks
{text-data:remarks}remarks{text-data}

h3. See Also

This template will look like this:
For more information on how to create templates in Confluence, see Adding a Template.

Alternatives: Confluence includes built-in templates which as useful for static data and simple text. For more information, see Working with Templates.

Notes: The Scaffolding (and any) template changes will affect only new pages created from the modified template. In order to change the existing pages, you need to edit each individual page and add or modify the formatting manually.

For more information on Scaffolding, see the Scaffolding plugin page.

Extended Version Control

Scroll Versions

Scroll Versions enables you to set up and manage concurrent versions of your documentation in a single space. Multiple versions of software, different product variants, and even multiple translations of documentation can be managed. Changes to pages are scheduled for a specified version and then published all at once. See the Scroll Versions documentation for an overview of the key features.

Video: Scroll Versions - Version Management for Confluence (4:20)

Attachment Checkout Plugin

The Attachment Checkout plugin adds check-out/check-in functionality for Confluence attachments. It allows you to control the versions of the documents attached to a page with the same file name.
Attachment checkout allows Confluence to warn contributors that the document is being edited by someone else. Note that there are no merge features for attachments.

**Example:** To store and control the versions of Project Vision documentation received from a customer on the Confluence page:

<table>
<thead>
<tr>
<th>Name</th>
<th>Size</th>
<th>Creator (Last Modifier)</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client1_Project1_Vision.doc</td>
<td>30 kB</td>
<td>Ekaterina Stepalinga</td>
<td>Checkout</td>
</tr>
<tr>
<td>Version 2</td>
<td>30 kB</td>
<td>Ekaterina Stepalinga</td>
<td>Nov 8, 2010</td>
</tr>
<tr>
<td>Version 1</td>
<td>30 kB</td>
<td>Ekaterina Stepalinga</td>
<td>Nov 8, 2010</td>
</tr>
</tbody>
</table>

For information on working with attachments, see [Working with Attachments](#). For information on attachment versioning, see [Attachment Versions](#).

### Drawing Tools

**Gliffy Plugin**

The [Gliffy plugin](http://www.gliffy.com/) provides an embedded diagram editor. Gliffy allows you to create and edit diagrams directly from a Confluence page. It supports various [diagram types](#) (UML, business process, and so on).

**Alternatives:** As an alternative you can use the standalone version of Gliffy available at [http://www.gliffy.com/](http://www.gliffy.com/). Gliffy online has a free basic version.

For more information, see the [Gliffy plugin page](#).

### Notes

- **Installing plugins.** If you decide to use additional plugins, your site administrator will need to install the plugins into your Confluence site. Refer to the documentation on [installing plugins](#).
- **Plugin support.** Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on [plugin support](#).

Developing a Knowledge Base on Confluence Wiki

Welcome! This is a guide to using Confluence as a knowledge base. You will find this guide useful if you want to produce a knowledge base with a survey, content curation, intelligent search and standardized templates.

In these pages, we'll show you how to use Confluence to achieve a high-functioning knowledge base, including these features:

- Using Templates
- Subscriptions (RSS or Email)
- Exporting articles (PDF or Word)
- Organizing content (hierarchically or by label)
- Involving Customers (using comments)
- Populating data
- Scripts to update content programatically
- A “Was This Helpful?” survey
- Intelligent searching algorithms (higher ranked articles are promoted in search results)
- Targeted searching across specified Confluence spaces and content types
- How to show related content
- Extensive metrics and reporting
- Maintenance

PAGES IN THE GUIDE
- Creating Your Knowledge Base Space
- Using Templates and Formatting Macros in a Knowledge Base
- Proactive Communications in a Knowledge Base
- Additional Plugins for a Knowledge Base

- Confluence Administrator's Guide

Creating Your Knowledge Base Space

This guide is for people who want to develop and publish a knowledge base using Confluence. You'll find Confluence useful because it combines professional web publishing features with the ease-of-use and flexibility of a wiki - requiring a low barrier to entry, but high quality output for all your team members. Confluence provides all of the collaborative features for your reports (such as automatic versioning, granular enterprise security, email and RSS subscriptions, and JIRA integration). This page is a quick-start guide to creating a wiki space for a knowledge base.
Quick guide to creating a knowledge base space

- Add a Space and Select the Documentation Theme
- Set the Space Permissions
- Customise the Title and Content of the Homepage
- Customise the Documentation Theme
- Create an Inclusions Library to Manage Reusable Content
- Create the Table of Contents
- Make your Knowledge Base Proactive with a Subscribable RSS Feed
- Insert Google Analytics Code into Confluence's Custom HTML
- Set up Atlassian's Content Survey and Reporting Plugin

The rest of this page gives more details of the above procedure.

### On this page:

- **Step 1. Add a Space and Select the Documentation Theme**
- **Step 2. Set the Space Permissions**
- **Step 3. Customise the Title and Content of the Homepage**
- **Step 4. Customise the Documentation Theme**
- **Step 5. Create an Inclusions Library to Manage Reusable Content**
- **Step 6. Create the Table of Contents**
- **Step 7. Make your Knowledge Base Proactive with a Subscribable RSS Feed**
- **Step 8. Insert Google Analytics Code into Confluence's Custom HTML**
- **Step 9. Set up Atlassian's Content Survey and Reporting Plugin**
- **Note about Plugin Support**

#### Step 1. Add a Space and Select the Documentation Theme

Below is a quick guide to adding a space. See [Setting up a New Global Space](#) for a full description.

1. Go to the Confluence dashboard and click **Add Space** located on the 'Spaces' tab.
   
   *Hint: If you cannot see the Add Space link, this means that you do not have permission to add spaces. Please contact your Confluence administrator.*

2. In the 'Create Space' screen, enter a **space name** and a short, unique **space key**.

3. Leave the **permission** settings as default, or choose to allow only yourself to view or contribute content to this space. You can change these settings later and with more flexible options.

4. Select the **Documentation Theme**.

5. Click **OK**.

The homepage of your new space will appear. Because you created the space, you are the space administrator. Now you can do some basic configuration, as described in the sections below.

#### Step 2. Set the Space Permissions

Define the space permissions to determine who can do what in your new space.
1. Choose **Browse > Space Admin**.
2. Click **Permissions** in the left-hand panel.
3. Confirm your administrator access as prompted.
4. Click **Edit Permissions**.
5. Set the permissions to suit your needs then click **Save All**.
   - You can add **groups** and/or individual **users** to the list, then select the permissions for each group or user.
   - You can also set the permissions for **anonymous** users – these are people who have not logged in to the wiki. Anonymous access is available only if enabled for the entire Confluence site. We recommend this setting if you are using this space for Technical Documentation or for a Knowledge Base.
   - Note that you can change these permissions at any time. You may want to restrict the permissions to specific groups now, and later open the space to more people.

A Bit More about Permissions

Confluence has a robust and granular permissions scheme that you can use to determine who can view, comment on and even update the documentation. There are three levels of permissions in Confluence:

- Global permissions apply across the entire site.
- Space permissions apply to a space.
- Page restrictions allow you to restrict the editing and/or viewing of a specific page. Below we discuss a way of using these in the draft, review and publishing workflow.

Space permissions in Confluence are simple yet granular enough to be useful for technical documentation. You can:

- Use the permission levels to control who can create pages in the space, delete pages, create comments, delete comments, administer the space, and so on.
- Grant a permission level to one or more users, and/or to one or more groups, and/or to anonymous users.

Terminology:

- 'Anonymous' means people who have not logged in to the wiki. These are users that won't affect your the number permitted by your license.
- The 'confluence-users' group is the default group into which all new users are assigned. Everyone who can log in to Confluence is a member of this group.

For example, you might allow 'Anonymous' users specific view and content creation rights so that they can access and engage with your knowledge base while your team lead (Bill) maintains full Space Administration rights.
Step 3. Customise the Title and Content of the Homepage

When you created your space, Confluence created a homepage with default content and a default title, 'Home'. You will want to change the title and content.
1. Go back to your space homepage, by clicking the space name in the breadcrumbs at the top of the screen. In the example below, the space name is 'My Knowledge Base':

   Dashboard › My Knowledge Base › Space Administration › View Space Permissions

2. The space homepage appears. By default, the page title is 'Home'.

   Dashboard › My Knowledge Base › Home

3. Click **Edit**.

4. Change the title to suit your needs.

5. Update the content to suit your needs.

   *Hint:* If you do not know what to add yet, just add a short description. You can refine the content of the page later. Take a look at an [example of a homepage](#).

6. Click **Save**.

**Step 4. Customise the Documentation Theme**

When you added this space you chose the Documentation theme, which provides a left-hand navigation bar and a good look and feel for a knowledge base. If necessary, you can configure the Documentation theme to add your own page header and footer or to customise the default left-hand navigation bar. These customisations affect the online look and feel of your knowledge base. See [Configuring the Documentation Theme](#) for the full description in our product documentation.
1. Choose **Browse > Space Admin**.
2. Click **Themes** in the left-hand panel.
3. If the space is not yet using the Documentation theme, apply the theme now.
4. Click **Configure theme** in the yellow area of the ‘Current Theme’ section at the top of the page.

**Current Theme**

The current theme controls the layout and colours of this space.

**Documentation Theme**

This theme is well suited for structured content, such as documentation. It features a table of contents (page tree) on the left, making it easier to see the structure of a space and move from page to page. You can customise the left-hand panel, page header and page footer. This theme supports Firefox, Safari and Internet Explorer 7+.

**Configure theme** - further customise this theme's options

5. The ‘Documentation Theme Configuration’ screen appears. Customise the left-hand navigation bar, header and footer to suit your needs. Details are in the documentation. Here are some hints:
   - The **Page Tree** check box determines whether your space will display the default search box and table of contents (page tree) in the left-hand panel.
   - The **Limit search results to the current space** check box determines whether Confluence will search only the current space or the whole Confluence site. This setting affects the default search. Viewers can override it each time they do a search.
   - Enter text, images, macros and other wiki markup into any or all of the three text boxes for the left-hand navigation bar, header and footer. You can use the **Include macro** and the **Excerpt Include macro** to include re-usable content.
   - Any content you add to the navigation panel will appear above the default page tree.
   - If you like, you can remove the default page tree (by unticking the box) and add your own, customised version of the **Pagetree** macro instead.

6. Click **Save**.

**Example of a Customised Footer**

Take a look at the footer of a page in the Crowd documentation space.

To produce the above footer, we have the following content in the footer panel in the Documentation theme configuration screen:

---

Except where otherwise noted, content in this space is licensed under a Creative Commons Attribution 2.5 Australia License.
Here it is in text form:

{include:_Documentation Footer|nopanel=true}
{include:ALLDOC:_Copyright Notice|nopanel=true}

The above content consists of two Include macros.

- The first macro includes a page called _Documentation Footer. This page contains the big blue buttons and hyperlinked text.
- The second macro includes a page from a different space, the ALLDOC space, called _Copyright Notice. This page includes our standard copyright notice, used in all our documentation spaces.
- In each include macro, the content has been drawn from an inclusions library, a hidden content repository, from which you can store frequently and re-usable content throughout your knowledge base space.

**Step 5. Create an Inclusions Library to Manage Reusable Content**

Using Confluence, you can dynamically include content from one page into another page. You can include a whole page into another one, using the Include macro. You can also define an 'excerpt' on a page, and then include that excerpted text into another page using the Excerpt Include macro.

To organise your re-usable content, we recommend that you create a set of pages called an 'inclusions library'.

1. Choose Browse > Pages.
2. Choose Add > Page. This will add a page at the root of the space, at the same level as the homepage.
3. Enter a suitable title. We use '_InclusionsLibrary'. The unusual format of the title helps to let people know this page is special.
4. Enter some content on the page. We enter text explaining the purpose of the inclusions library and how to re-use the content. You can copy our text by clicking through to one of the example pages listed below.
5. Add child pages containing your re-usable content. See the examples of our own inclusions libraries listed below.

Some notes about inclusions libraries:

- The inclusions library is not a specific feature of Confluence. The pages in the inclusions library are just like any other Confluence page.
- The pages are located at the root of the wiki space, not under the homepage. This means that they will not appear in the table of contents on the left and they will not be picked up by the search in the left-hand navigation bar either.
- The pages will be picked up by other global searches, because they are just normal wiki pages.
- We have decided to start the page name with an underscore. For example, '_InclusionLibrary'. This indicates that the page is slightly unusual, and will help prevent people from changing the page name or updating the content without realising that the content is re-used in various pages.

**Examples of Inclusions Libraries**

Here are some examples in our documentation:
Step 6. Create the Table of Contents

Create the table of contents for your knowledge base, by adding the top-level pages for all the usual sections. For instance, our Technical Support Team designed the following pages in the Confluence Knowledge Base on our public wiki:

- Browse Articles by Label
- Browse Articles by Top Ranked Content
- Browse Articles by Page Tree Hierarchy
- Browse Articles by Version
- Subscribe to Proactive Announcements

1. Go back to your space homepage, by clicking the space name in the breadcrumbs at the top of the screen.
2. Choose Add > Page. This will add the page as a child of the homepage.
3. Enter the page title, for instance: ‘Browse Articles by Label’.
4. Enter the content of the page.
   - Hint: If you do not know what to add yet, just add a short description then refine the content of the page later. If you like, you can follow a similar outline as the Confluence Knowledge Base and add the Label List macro. This displays a hyperlinked alphabetical index of all labels within the current space. As you create content in this space and apply appropriate labels, the macro will update this page automatically.

Browse Content by Label

Click on one of the labels below to find related content:

Below are the 181 labels used in Confluence Knowledge Base listed alphabetically. Click a label to see its associated content.

A-B: apache, applinks, appserver, attachments, backup, bamboo, build
C: cache, calendar, camelcase, camel_case, captcha, case_sensitivity,
D: dashboard, database, db2, deadlock, directory, doc_import, documentation_theme, dynamic_tasklist

5. Click Save.

Now do the same for all the sections of your Knowledge Base that you wish to appear in the left-navigation bar of the Documentation theme. Below is what the Table of Contents looks like for our Confluence Knowledge Base:
Step 7. Make your Knowledge Base Proactive with a Subscribable RSS Feed

Let's populate the knowledge base homepage with content by creating an RSS feed that your coworkers and customers can subscribe to and receive important updates on your knowledge base and technical alerts on your products.

This is a strategy that Atlassian's Technical Support Team uses to create a proactive knowledge base that provides technical alerts to customers and coworkers and helps solve support issues before they're even created.

By following the quick guide below, you'll create a homepage similar to the one Atlassian's Technical Support Team has created for the Confluence Knowledge Base on our public wiki and turn your knowledge base from reactive to proactive.

Technical Announcements

Copy the RSS feed into your favourite RSS reader:

<table>
<thead>
<tr>
<th>Important Technical Announcements for Confluence</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blog Posts</td>
</tr>
<tr>
<td><img src="image" alt="End of Support and New Support Announcements for Confluence 3.5 and Confluence 4.0" /> created by Sarah Maddox [Atlassian Technical Writer] Confluence Knowledge Base Jan 06</td>
</tr>
<tr>
<td><img src="image" alt="Welcome to the Confluence Technical Announcements Blog" /> created by Jeremy Largman [Atlassian] Confluence Knowledge Base Dec 22</td>
</tr>
<tr>
<td><img src="image" alt="Technical Alert for Confluence 3.4 - Login Errors when Delegating to Crowd" /> created by Adam Laskowski [Atlassian] Confluence Knowledge Base Oct 14</td>
</tr>
</tbody>
</table>

View more recent blog posts
### Creating your RSS Feed

Confluence can filter spaces by content type. To filter your knowledge base for 'blog post' content, do the following:

1. Choose **Browse > Blog Posts**.
2. Copy this URL to your clipboard.
3. Create an RSS feed for the URL of your knowledge base space.

Now your RSS feed will consist of any blog posts created in the knowledge base space.

### Highlighting Your Technical Announcement RSS Feed

1. Go to your space homepage by clicking the appropriate breadcrumb in the top-left of your screen.
2. Click **Edit**.
3. Insert an 'h2' heading, such as 'Important Technical Announcements'.
4. Insert bold text that reads something like, 'Copy the RSS feed into your favourite RSS reader:'.
5. Choose **Insert > Other Macros** to open the Macro Browser.
6. Select the 'Panel' macro in the Macro Browser and specify your desired macro preferences. We recommend that you change the **Panel Title**, **Border Style**, and **Background Color** to further highlight the panel on the page.
7. Click **Insert**.

### Insert a Blog Posts Macro

1. Click in the Panel macro placeholder and choose **Insert > Other Macros** to open the Macro Browser again.
2. Select the 'Blog Posts' macro in the Macro Browser and specify the following preferences:

   - **Content Type to Display**: Title
   - **Restrict to These Spaces**: Your knowledge base Spacekey
   - **Maximum Number of News Items**: 5
   - **Sort By**: Creation
   - **Reverse Sort**: Tick the box

3. Click **Insert** to insert the Blog Posts macro onto the page inside your Panel macro.

Now your panel will display the last 5 blog posts created in your knowledge base space.
## Inserting your RSS Feed into your 'Technical Announcement' Panel

First, let's create a link so that your coworkers and customers can view all of the blog posts in your knowledge base space. See [Working with Links](#) for a full description in our product documentation.

1. Place your cursor after/below the Blog Posts macro in the Panel macro placeholder.
2. Type: 'View more recent blog posts'.
3. Highlight this text and click **Link** on the editor toolbar.

### Insert Link

<table>
<thead>
<tr>
<th>Search</th>
<th>URL:</th>
<th>http://</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recently Viewed</td>
<td>Link Text:</td>
<td>View more recent blog posts</td>
</tr>
<tr>
<td>Attachments</td>
<td>Web Link</td>
<td></td>
</tr>
</tbody>
</table>

4. Select 'Web Link' and paste the link you copied to create your RSS Feed.
5. Click **Insert**.

Now, let's insert your RSS Feed into your panel by linking an image. See [Linking an Image](#) for a full description in our product documentation.

1. Attach an RSS Icon ![RSS 2.0](RSS.png) to the page by dragging and dropping it into the editor (preferably below the link you just created). See [Drag-and-Drop](#) for a full description in our product documentation.
2. Click the RSS Icon image and then click the 'Align right' button on the editor toolbar.
3. Click **Border** in the image properties panel.
4. Link the RSS Icon by selecting the image and then clicking **Link** on the editor toolbar.
5. Click the 'Web Link' tab and insert the RSS Feed URL you created.
6. Click **Insert** to link your RSS Feed to the RSS Icon image.
7. Click **Save** to save your page and test your RSS Icon.

Congratulations! You have successfully created a proactive knowledge base.

**Step 8. Insert Google Analytics Code into Confluence's Custom HTML**

Now that you have a strong foundation for a knowledge base, it's critical to assess how effectively it services your customers. Google Analytics is a tool that gives you rich insights into your website traffic and marketing effectiveness. You are going to want to understand how your customers are accessing the resources in your knowledge base. This is a quick guide to inserting Google Analytics HTML code into Confluence so you can measure your knowledge base traffic.
If you don’t have one already, create a Google Account and then create a Google Analytics Account using your Confluence instance’s URL. Copy the Google Analytics code to your clipboard.

Log into Confluence as a System Administrator or Confluence Administrator. Go to the Confluence ‘Administration Console’. To do this:

a. Choose Browse > Confluence Admin.

b. Enter your password and click Confirm. You’ll be temporarily logged into a secure session to access the ‘Administrator Console’.

Click Custom HTML under ‘Look and Feel’. Click Edit to insert custom HTML into your Confluence instance.

1. Insert Custom HTML

   - At end of the HEAD
   - At beginning of the BODY
   - At end of the BODY

7. Paste your Analytics code you have saved to your clipboard into the table labeled At end of the BODY.

8. Click Save.

You can now monitor the activity and traffic for every page you create in your Confluence instance and Knowledge Base.

Hint: If your knowledge base only represents a space within your greater Confluence instance, you can search Google Analytics for activity in the specific space by exclusively filtering for the space key.

Read David Simpson’s blog post about Tracking Confluence Usage with Google Analytics for more information.

**Step 9. Set up Atlassian’s Content Survey and Reporting Plugin**

Now that you can monitor the traffic and activity of your knowledge base, let’s measure its effectiveness. When the Content Survey and Reporting Plugin is activated for a space, it will generate a report that includes:

- Direct feedback from customers about article quality
- Amalgamated "composite score" results
- Answers to secondary questions, such as "Was the info complete?" or "Was the article well-written?".

Lastly, the Content Survey and Reporting Plugin will institute 'intelligent searching' which means that based on the results of the surveys, higher ranked pages are promoted in search results, so your best and most popular pages are found easiest. This is a quick guide for how to set up the Content Survey and Reporting Plugin.
This plugin only functions properly if the Documentation Theme is applied to the space.

Let's install the Content Survey and Reporting Plugin using Confluence's Universal Plugin Manager.

### Installing the Content Survey and Reporting Plugin

1. Log into Confluence as a System Administrator or Confluence Administrator.
2. Go to the Confluence 'Administration Console'. To do this:
   a. Choose **Browse > Confluence Admin**.
   b. Enter your password and click **Confirm**. You'll be temporarily logged into a secure session to access the 'Administrator Console'.
3. Click **Plugins** under 'Configuration'
4. Click the **Install** tab of the UPM and search for the 'Content Survey and Reporting Plugin'.
5. Click **Install**

Now that you've installed the Content Survey and Reporting Plugin, let's configure a survey:

### Configuring a Survey

1. Go to your space homepage by clicking the appropriate breadcrumb in the top-left of your screen.
2. Choose **Browse > Space Admin**.
3. Click **Configure Survey** under 'Knowledge Base Survey'. Here you can:
   - Add a question
   - Edit a question's text
   - Activate or deactivate a question
   - Edit the response text
4. Configure a 'Primary Question' for the survey

   **Primary Question:**
   - **Was this helpful?**
   - Add an Additional Question:
   - Edit Survey Completed Response (anonymous):
   - Edit Survey Completed Response (user):

5. Click **Save**.

Now that you've added a primary question, let's test out the plugin by adding it to the footer of the
Documentation theme so that every page within your Knowledge Base space includes your survey.

**Invoking the Content Survey and Reporting Macro**

1. Go to your space homepage by clicking the appropriate breadcrumb in the top-left of your screen.
2. Choose **Browse > Space Admin**.
3. Click **Themes** under 'Look and Feel'.
4. Click **Configure theme** in the yellow area of the 'Current Theme' section at the top of the page.
5. Visit the 'Footer' section of the 'Documentation Theme Configuration' page and insert this recommended markup to achieve a nice layout of the Content Survey and Reporting Plugin:

   ```
   {section}
   {column:width=5%}
   {column}
   {column:width=90%}
   {panel}
   {kbsurvey}
   {panel}
   {column}
   {column:width=5%}
   {column}
   {section}
   ```

6. Click **Save** and go to your space homepage to view your Content Survey and Reporting Plugin in the footer of the page.

With the Content Survey and Reporting Plugin you can dramatically improve the quality of your knowledge base and the efficiency with which your team creates and maintains it. Here is an example of how our Technical Support Team uses the Content Survey and Reporting Plugin in the Confluence Knowledge Base:

**Help us improve!**

<table>
<thead>
<tr>
<th>Is this article helpful?</th>
<th>Yes</th>
<th>No</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is the content complete?</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Is it well written?</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Content Survey and Reporting Plugin Results:**

Survey results are viewable by Space Administrators only. The plugin develops three results:

- **Pages with Results** - Determine page-by-page, which are you most effective knowledge base articles and which ones need improvement.
As you can see, the plugin develops a 'Composite Score' which ranks articles in search, so your highest scoring (best) content can be found most easily. The score is based on the last 32 votes cast, using the global search configuration. See Confluence Content Survey and Reporting Plugin for a full description on how Global Search boosting works.

- **Pages without Results** - These are the pages in your knowledge base without survey results.
- **Rollup Report** - This is the summary of all survey results. The report can be used to determine how effective your overall knowledge base content is.

<table>

</tr>
</tbody>
</table>

Searching Multiple Spaces from your Knowledge Base

As mentioned, the Content Survey and Reporting Plugin generates a composite score that ranks pages and articles within your knowledge base to make the highest (most well regarded) pages more retrievable by visitors. The plugin also improves Confluence search by allowing users to search multiple spaces without ever leaving your knowledge base space. This is really helpful for users that are unfamiliar with Confluence because they can keep the knowledge base as a point of reference within the greater instance of Confluence.

At Atlassian, our product knowledge bases and product documentation exist in the same Confluence instance so that we can make both available to 'Anonymous' users. Our Technical Support team uses the Content Survey and Reporting Plugin to allow visiting users to search for Confluence resources in the product documentation space from the Confluence Knowledge Base space. This provides the visitor twice the chances of finding an answer to their question.

In the image below, you can see the space specific search used in the left-navigation bar to find content related to Confluence in both the 'Documentation' and 'Knowledge Base' spaces. Pages in the 'Documentation' space are listed first and pages in the 'Knowledge Base' space are listed second.
If a user doesn’t choose one of the recommendations from the quick search drop-down menu, the plugin will display a search results page inside the Knowledge Base space rather than directing them to the Confluence global search page. By keeping the visitor in the same space, it will help new users find the information they need and only navigate to pages they intend to, minimising confusion and the number of times a user has to hit the ‘Back’ button in their browser.

**Note about Plugin Support**

Before installing a plugin into your Confluence site, please check the plugin’s information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

**Next Steps**
Using Templates and Formatting Macros in a Knowledge Base

This page is part of the guide to developing a knowledge base on Confluence Wiki. We have already shown you how to create your knowledge base space. Now we offer an introduction to the templates that Confluence provides.

Quick guide to templates in Confluence

- A template is a page with predefined content that can be used as a prototype when creating other pages.
- Templates are available across the Confluence site (global templates) or per space (space templates).
- Both 'global templates' and 'space templates', as described on this page, define the content of a page. They do not define the content of an entire space.
- You can import predefined templates, including those shipped with Confluence and additional templates from the Atlassian Plugin Exchange.
- To create a template for an entire space, see our guide to creating your documentation space.

Space Information Design

One question that comes up is whether a knowledge base should be implemented as a decision matrix, with a multi-select or other list. We knew that most of our users visit our documentation directly from search engines. Early on, we learned that at least for us, Google Analytics was showing that most traffic was coming from search engines, not from within our site. See Metrics for a discussion on that. So, we knew to focus on optimising page titles and tags rather than focus on a decision matrix.

Confluence's Built-in Feature Set

Page Templates

Confluence’s Page Templates are an easy place to start. Begin by choosing how you want your templates to look. Here’s how we made our page template:

```
  h3. Symptoms
  FILL IN SYMPTOMS HERE

  h3. Cause
  FILL IN CAUSE HERE

  h3. Resolution
  FILL IN RESOLUTION HERE

  {htmlcomment}
  ENTER SUPPORT TICKET LINKS
  {htmlcomment}
```

You might consider the scaffolding plugin or Form Field Markup for filling out forms. Our support engineers are quite used to using wiki markup (we live and breathe Confluence!), so we left this template as is.

Construct a Home Page: Section, Panels, RSS, and Notifications
Check out the Confluence Knowledge Base Home. The colored content in the middle of the page is an amalgamation of panel, rss and attachment macros. Go to Tools >> Wiki Markup to see.

Wondering how we just made Tools >> Wiki Markup in a different font in the sentence above? Use the {{ }} notation to get the courier font, which you can use for breaking out text. And this would be, of course, a tip. Remember, you can visit Tools >> Wiki Markup on this page as well!

The wiki markup there is a little confusing, but it breaks down like this:

1. A Section macro, defining the top and bottom of the page
2. Column macros, dividing the panels into three
3. Panel macros, with hot, hot, hot html colours
4. Content By Label Macros
5. An RSS Icon, embedded as an attachment, with a link to the RSS feed. Notice the magic on this one:

```
[[rss20.gif|align=right!|http://confluence.atlassian.com/createrssfeed.action?types=pages&sort=created&showContent=true&spaces=CONFKB&labelString=conf32&rssType=rss1&maxResults=50&timeSpan=120&publicFeed=true&title=Confluence+3.2+Knowledge+Base+Articles&showDiff=false]
```

That's a link, with the attachment as the alias, an alignment parameter, and the URL to the RSS feed. Cool, right?

**Exporting Pages**

These are built-in Confluence features. Check Page Exports. You can learn how to customise the PDF export as well.

**Content Macros**

Besides the ones listed above, some favourite macros for formatting content around the site are the Tip, Info, Warning, and Note Macros, ad the Code macro. They make things look great. We also use Adaptavist’s Content Formatting Macros when we really want to bring our A-game.

Every once in a while we get mileage out of the {nomarkup} user macro, when we want to discuss using a macro itself. I suppose that’s because Confluence is one of the products we support! It might be useful for other reasons...

**JIRA Issues Macro**

Using JIRA for bug tracking? You can’t expect your users to necessarily have exactly the right JQL filters to show the appropriate topics. We have some nice JIRA Issues Macros on display. One of my favourites is in the JIRA KB’s Causes for OutOfMemory Errors:

```
{jiraissues:url=http://jira.atlassian.com/sr/jira.issueviews:searchrequest-xml/tem/SearchRequest.xml?jqlQuery=project+%3D+JRA+AND+issuetype+in+%28Bug%2C+Improvement%2C+subTaskIssueTypes%28%22+AND+component+%3D+%22Performance+-+Memory+leaks%22+ORDER+BY+key+DESC&tempMax=200|columns=fixversion;summary;status;key|anonymous=true}
```

Notice the JQL there including components and sorting, plus the specific columns.
Labels

Sometimes, an article needs to be cross listed. For that we label our articles. Some great macros to use for this are \{contentbylabel\}, \{listlabels\} and the \{dynamiccontentbylabels\} macro in the Content Survey Plugin.

Next Steps

You now have a good idea of how Confluence templates work. What next? Take a look at Proactive Communications in a Knowledge Base.

Proactive Communications in a Knowledge Base

This page is part of the guide to developing a knowledge base on Confluence Wiki. We have already shown you how to create your knowledge base space and how to use templates and formatting macros. We touched a bit on creating proactive communications in Creating your Knowledge Base Space, and discuss a bit further here.

Quick guide to proactive communications

- A template is a page with predefined content that can be used as a prototype when creating other pages.
- Confluence can either produce or consume rss feeds
- Both the rss and blog-posts macro are a good way to show summaries

Proactive Alerts

Sending technical alerts to customers is a great way to keep customers and staff informed, and good way to reduce support load. At Atlassian we use the Knowledge Base both to consume and produce proactive content for which customers can opt in. This page describes how to achieve that.

Using Confluence as a producer

- The Working with Blog Posts describes how to produce blog posts from Confluence.
- Emailing a Page is a great way to send mass emails to users or an email distribution list.

Using Confluence as a consumer

Even if your Confluence instance isn't producing your proactive content, it can consume and display it in a prominent way:

- The RSS Feed Macro can consume content from any RSS feed on the Internet.
- We use the Blog Posts Macro for it looks especially handsome in a panel, accentuated by an RSS image in a link. Here's the wiki markup:

```markdown
h4. Technical Alerts
{panel:title=Important Technical Alerts for Confluence| borderStyle=solid| borderColor=#ccc| titleBGColor=#f93| bgColor=#fc9}
{blog-posts:content|title|max=5|sort=modified|spaces=CONFKB|time=30d}*
*[View more recent blog posts](http://confluence.atlassian.com/pages/viewrecentblogposts.action?key=CONFKB)*

![CONFKB:Confluence Knowledge Base Home^rss20.gif](http://confluence.atlassian.com/createrssfeed.action?types=blogpost&blogpostSubTypes=comment&blogpostSubTypes=attachment&spaces=CONFKB&title=Confluence+KB+-+Technical+Alerts&labelString=techalert&xcludedSpaceKeys%3D&sort=modified&maxResults=10&timeSpan=30&showContent=true&showDiff=true&confirm=Create+RSS+Feed|showTitleOnly=true)}
```
Next Steps

You now have a good idea of how to do proactive communications. Next up, consider Additional Plugins for a Knowledge Base in more detail.

Additional Plugins for a Knowledge Base

This page is part of the guide to developing a knowledge base on Confluence Wiki. This page includes additional plugins that might expand your usage.

Useful Plugins for a Knowledge Base

These are some great plugins for Confluence as a Knowledge Base:

- The Content Survey and Reporting Plugin gives a good report on popular and unpopular content.
- The Archiving Plugin flags old content.
- The Ad Hoc Workflows Plugin or Content Publishing Plugin, which manages workflows and a review process.

Note about Plugin Support

Before installing a plugin into your Confluence site, please check the plugin's information page to see whether it is supported by Atlassian, by another vendor, or not at all. See our guidelines on plugin support.

Bye

Hope you enjoyed the tutorial! Have a chocolate, and please share with us your experiences. You can comment directly on this page or email us at .

Developing an Intranet on Confluence Wiki

This guide is for people who are using Confluence as a platform for an intranet. You will find this guide useful if you want to create a space where your team can collaborate and share information.

Quick guide to creating an intranet space

- Add a space.
- Set the space permissions.
- Customise the title and content of the home page.
- Subscribe to email notifications for any updates made to the space.
- Manage your existing Office documents.
- Import page templates.
- Set up your personal space.
- Publish a blog post.

The rest of this page gives more details of the above procedures.

Step 1. Add a Space

Below is a quick guide to adding a space for your team.
1. Go to the Confluence dashboard and click the ‘Add Space’ link.
2. The ‘Create Space’ screen appears. Enter a space name and a short, unique space key.
3. Leave the permission settings as default, or choose to allow only yourself to view or contribute content to this space. You can change these settings later and with more flexible options.
4. Select a theme. We recommend the 'Global Look and Feel' theme for an intranet.
5. Click ‘OK’ to add the space to your Confluence site.

The home page of your new space will appear. Because you created the space, you are the space administrator. Now you can do some basic configuration, as described in the sections below.

Step 2. Set the Space Permissions

Define the space permissions to determine who can do what in your new space.
1. Open the ‘Browse’ menu and select ‘Space Admin’.

2. Click ‘Permissions’ in the left-hand navigation panel.
3. Confirm your administrator access as prompted.
4. Click ‘Edit Permissions’.
5. Set the permissions to suit your needs then click ‘Save All’.
   - You can add groups and/or individual users to the list, then select the permissions for each group or user.
   - You can also set the permissions for anonymous users – these are people who have not logged in to the wiki and will not count towards the number allocated by your license. Anonymous access is available only if enabled for the entire Confluence site. However, it is unlikely you will need anonymous users for your intranet.
   - Note that you can change these permissions at any time. You may want to restrict the permissions to specific groups now, and later open the space to more people.

More about Permissions

Confluence has a robust and granular permissions scheme that you can use to determine who can view, create content and comment within your intranet. There are three levels of permissions in Confluence:

- Global permissions apply across the entire site.
- Space permissions apply to a space.
- Page restrictions allow you to restrict the editing and/or viewing of a specific page.

Space permissions in Confluence are simple yet granular enough to be useful for an intranet. You can:
- Use the permission levels to control who can create pages, delete pages, create comments, delete comments, administer the space, and so on.
- Grant a permission level to one or more users, and/or to one or more groups, and/or to anonymous users. A space administrator has complete control.

Terminology:

- 'Anonymous' means people who have not logged in to the wiki.
- The 'confluence-users' group is the default group into which all new users are assigned. Everyone who can log in to Confluence is a member of this group.

For example, you might allow the 'confluence-users' group permission to create and edit comments, but reserve full editing rights for your team members. Let's assume your team members are all members of the 'dev-team' group. The example below shows that members of the 'dev-team' group have all permissions except space administration, but 'Ryan Reynolds' only has a few editing rights.

For detailed information, see the documentation on:

- Global permissions
- Space permissions
- Page restrictions
- Users and groups

Step 3. Customise the Title and Content of the Home Page

When you created your space, Confluence created a home page with default content and a default title, 'Home'. You will want to change the title and content to suit your team.
1. Go back to your space home page, by clicking the space name in the breadcrumbs at the top of the screen. In the example below, the space name is 'Development Team Space':

```
Dashboard › Development Team › Space Administration › View Space Permissions
```

![View Space Permissions](image)

2. The space home page appears. By default, the page title is 'Home'.

```
Dashboard › Development Team › Home
```

![Home](image)

3. Click 'Edit'.
4. The page opens in edit mode. Change the title to suit your needs.

```
Dashboard › Development Team › Home › Edit Page
```

![Edit Page](image)

```
This is the home of the Development Team space.
```

5. Update the content to suit your needs.
   
   *Hint:* If you do not know what to add yet, just add a short description. You can refine the content of the page at any time.

6. Click 'Save' to save your home page.

**Step 4. Subscribe to Email Notifications for Updates Made to the Space**

You can configure your email notifications to suit your needs: Subscribe to all blog posts from Confluence, subscribe to your network, or stay informed about any changes in a specific space. Below is a quick guide to monitoring a space's content. See [Watching a Space](#) for a full description.
1. Open the ‘Browse’ menu and select ‘Advanced’.

2. Click ‘Start watching this space’ in the bottom section of the left-hand navigation panel.

If at any time you wish to stop watching the space, just click ‘Stop watching this space’.

**Example of an Email Notification**

Here is an example of the email notification you will receive when someone adds a comment to a page:

⭐ [Confluence@atlassian.com](mailto:Confluence@atlassian.com) to me

**Spend 5 minutes. Save a heck of a lot more.**

Blog post comment added by [Ryan Reynolds](mailto:Ryan.Reynolds@atlassian.com)

Required Reading. Auto-complete rocks. Nice video!

[View Online](#) | [Reply To This](#)

"Reply" | "Forward"

**More about Notifications**

You can specify the notifications you want to receive on a global, space and page level. The quick guide above demonstrated how to set up notifications for a space. Now we will show you how to configure your notifications on the global and page levels.

**Global Notifications**

Global notification settings determine the overall behaviour of the notifications you receive from Confluence.
1. Open the 'User' menu (Your name) and select 'Settings'

2. Click 'Email' in the left-hand navigation panel.
3. Click 'Edit'.
4. Change the default settings to suit your needs. You can alter these email settings at any time.
5. Click 'Submit' to save your changes.

**Page and Blog Post Notifications**

Follow the quick guide below to receive notifications from Confluence about changes to and comments on a specific page or blog post. See [Watching a Page or Blog Post](#) for a full description.

You can watch any given page or blog post that you have permission to view. We will use your space's home page as an example.
1. Open the home page of your space.
2. Open the 'Tools' menu and select 'Watch'.

You are now watching the current page and Confluence will notify you about any updates made or comments added.

Note that Confluence will not notify you about content changes that are due to the output of a macro. For example: The output of the Children macro will change if someone adds a child page. The page containing the Children macro will show the new child page. But the page content itself has not been edited, so no notifications will be sent.

You can stop watching a page or blog post at any time. Just open the page, go to the 'Tools' menu and click 'Stop Watching'.

Step 5. Attach or Import Office Documents if Applicable

Below are some guidelines on managing your existing Office documents in Confluence. You can choose to attach them to a Confluence page, so that team members can view and access them in Confluence. Or you can import the documents into Confluence, converting the content to wiki format.

**Attaching Office Documents to a Page**

You can use Confluence as a central repository for your team's the Microsoft Office documents. This means that you can share your Office documents without having to email them to your teammates. People can view the Office documents even if they do not have Office installed on their computers.
1. Go to your space home page, by clicking the space name in the breadcrumbs at the top of the screen.
2. Hovering over the 'Tools' menu and click 'Attachments'.
3. Choose one of the following methods for attaching files to the page:
   - Use the 'Attachments' view's 'browse and attach' feature to attach one or more file(s):
     a. Click the 'Browse' button.
     b. Browse through your files and select the file that you would like to attach to the page.
     c. Enter a description for the attachment in the 'Comment' text field (optional).
     d. Click 'Attach more files' if required. More attachment entry fields will appear, allowing you to attach more files.
     e. Click the 'Attach' button.

   Alternatively, use the drag-and-drop feature to attach one or more file(s): Drag one or more file(s) accessible from your computer and drop them onto the 'Attachments' view. The 'Attach File(s)' message box appears, indicating the upload status of the file(s) being attached to your page.

**Importing Existing Word Documents into Confluence**

You can also import content from Microsoft Word into Confluence, so that it becomes a wiki page. See Importing.
a Word Document into Confluence for a full description.

1. Go to your space home page, by clicking the space name in the breadcrumbs at the top of the screen.
2. Open the 'Tools' menu and select 'Import Word Document'. The Office Connector import screen will appear.
3. Click the 'Browse' button and find the Office document on your local drive or network.
4. Click the 'Open' or 'Upload' button provided by your browser. The path and file name of the document will now appear in the text box on the Office Connector import screen.
5. Click the 'Next' button. The import document options screen will display.

6. Enter the following information:
   - 'Root page title' – The title of the wiki page that will contain the information from your imported document.
   - 'Import as a new page in the current space' – A new wiki page will be created with the page title specified above.
   - Choose what you want the importer to do if there are page title conflicts, by selecting one of the following options:
     - 'Rename imported pages if page name already exists' – Confluence will assign new names to any new page which would otherwise have a duplicate name. The content of existing pages will remain unchanged.
     - 'Split by heading' – Use this field to split your document into multiple wiki pages. If you do not want to split your document into multiple wiki pages, leave the default 'Don't split' option selected.
6. Click 'Import' to import your document.

When the upload has finished, the content of the Office document will have been transformed into Confluence page content. You can now view and edit this page in the normal way, using the Confluence Rich Text Editor or Wiki Markup. There is no connection between the original Office document and this wiki page.

Step 6. Import Page Templates

In order for an intranet to be effective, people need to use it. One way to spur new user adoption is to provide your team mates with templates so that they can focus more on content creation and less on page format. Confluence offers a number of templates, including a template for 'Meeting Notes' and a 'Three-Column Layout',
to help your team get started populating your intranet and improving its productivity. See Importing Templates for a full description.

1. Log in to Confluence as an administrator and go to the Confluence 'Administration Console'.
2. Click 'Import Templates' in the left-hand navigation panel. The 'Import Templates' screen will appear, listing the template packages deployed to your Confluence instance (for example, 'Default Templates Package') and the templates included in each package.

   ![Import Templates](image)

   - Security
     - Security Configuration
     - Manage Users
     - Manage Groups
     - Global Permissions
     - User Directories
   - Configuration
     - General Configuration
     - Daily Backup Admin
     - Manage Referrers
     - Plugins
     - Languages
     - Shortcut Links
     - External Gadgets
     - Global Templates

   The following template package plugins were found. To import templates, tick the checkboxes for the desired templates, select to import the templates to, and click the Import button.

   - Default Templates Package (8) Check All Uncheck All
     - Charts
     - Document List
     - Meeting Notes
     - Multimedia Content
     - RSS News Feed
     - Tasklist
     - Three-Column Layout
     - Two-Column Layout

   Import To: Global Templates

3. Select the templates you want by ticking the check boxes next to the template names.
   Note: You can view a preview of the template by clicking the template name.
4. Select the import destination for the templates in the 'Import To' dropdown. If you want the templates to be available to a specific space only, select the name of the space, otherwise select 'Global Templates' to make the templates available to all spaces.
5. Click the 'Import' button to import the selected templates.

How Users will Find Templates

Now that you have made Confluence's templates available to your site or space, other Confluence users will be able to choose a template when they want to create a page.

Choosing a Template from the Dashboard

When you add a page from the Confluence dashboard, you will be able to select the template and space for the
new page at the same time.

1. Go to the Confluence Dashboard by clicking 'Dashboard' from the breadcrumbs at the top left of your screen.
2. Click the 'Add Page' button. The 'Add Page' dialog appears.

3. Select the space where you want to add the page.
4. Select the template you want to use to populate your page.

5. Click 'Next' to create the page.

Choosing a Template from within the Editor

Often you will add a page from within a space, or as a child of another page. This guide shows you how to choose a template from within the Confluence editor.

1. Go to your space home page, by clicking the space name in the breadcrumbs at the top of the screen.
2. Hover over the 'Add' menu and click 'Page'. This will launch the Confluence editor.
3. To populate the editor from a template, click the ‘Select a page template to start from’ link below the ‘Title’ field. This will launch the ‘Page Template Wizard’.
4. Choose a page template from those available in the list.

**Page Template Wizard**

**Step 1: Choose a page template**

Please choose a template from below:

<table>
<thead>
<tr>
<th>Name</th>
<th>Scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>Charts</td>
<td>Global</td>
</tr>
<tr>
<td>Document List</td>
<td>Global</td>
</tr>
<tr>
<td>Meeting Notes</td>
<td>Global</td>
</tr>
<tr>
<td>Multimedia Content</td>
<td>Global</td>
</tr>
<tr>
<td>RSS News Feed</td>
<td>Global</td>
</tr>
<tr>
<td>Tasklist</td>
<td>Global</td>
</tr>
<tr>
<td>Three-Column Layout</td>
<td>Global</td>
</tr>
<tr>
<td>Two-Column Layout</td>
<td>Global</td>
</tr>
</tbody>
</table>

Back  Next >>

5. Click 'Next' to populate the editor with the selected template.

**Step 7. Set Up your Personal Space**

Now that you have created a space for your team, let's create your **personal space**. This is a place where you can publish your own pages and blog posts. Once you have created it, Confluence users can reach your personal space by clicking your name in the People Directory or by searching for your name via the quick navigation search box.
1. Go to your name at the top of the page and select ‘Create Personal Space’ from the dropdown list.

2. Enter a few details about your space:
   - Choose who can view content.
   - Choose who can contribute (create and edit) content.
   - Choose the ‘Global Look and Feel’ for your personal space.

3. Click the ‘Create’ button.

4. The ‘Home’ page for your new space is displayed.

**Step 8. Publish a Blog Post**

Blog posts are a good way of letting your team mates and the company know your news. People can blog about product and strategic ideas, team updates, and things they want to get ideas about. New employees can write blog posts introducing themselves. People write about getting married or the birth of a child. Blog posts are a great way for people to share their visions, get to know their co-workers and start lively discussions.

Remember to set your email notifications to alert you about the blog posts published within Confluence, as described in an earlier step.

See [Working with Blog Posts](#) for a full description of adding, editing, viewing and linking to blog posts.

1. Go to a page in your space.
2. Hover over the ‘Add’ menu and select ‘Blog Post’.
3. Change the title to suit your needs.
4. Update the content to suit your needs.
5. Click ‘Save’ to publish your blog post.

How to Get Support

Managing Confluence Users

A Confluence user is a person who can read or update a Confluence site. You can choose whether your Confluence site is accessible to anonymous users (people who have not logged in) or only to logged-in users. See Setting up Public Access.

Confluence user management

You can add users to Confluence, and then assign them permissions that determine their access to the content and administrative functions in your Confluence site. You can also collect users into groups, and assign the permissions to groups for easier management. See the following topics:
Adding and Inviting Users
Removing or Deactivating Users
Searching For and Administering Users
Managing Site-Wide Permissions and Groups

By default, Confluence stores its users and groups in the Confluence database. This is called the internal
directory. You can choose to connect Confluence to an external userbase instead, such as Microsoft Active
Directory or another LDAP server. You can also use Atlassian Crowd and JIRA as directory managers. When
you add a user or group to Confluence, it will be added to the external directory too, based on your configuration
options. See Configuring User Directories.

On this page:
- Confluence user management
- Authentication
  - Seraph
  - XML-RPC and SOAP authentication
  - Password authentication

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If
you are using Confluence-only OnDemand, the information does apply.

Authentication

Seraph

Almost all authentication in Confluence (and JIRA) is performed through Seraph, Atlassian's open source web
authentication framework. The goal of Seraph is to provide a simple, extensible authentication system that we
can use on any application server.

Seraph is implemented as a servlet filter. Its sole job is, given a web request, to associate that request with a
particular user (or no user if the request is anonymous). It supports several methods of authentication, including
HTTP Basic Authentication, form-based authentication, and looking up credentials already stored in the user's
session.

Seraph itself performs no user management functions. It merely checks the credentials of the incoming request
and delegates any user management functions (looking up a user, checking a user's password) to Confluence's
user management system.

If you want to integrate Confluence with your own single sign-on (SSO) infrastructure, you would do so by
installing Atlassian Crowd or by writing a custom Seraph authenticator. See our developer documentation on HT
TP authentication with Seraph.

XML-RPC and SOAP authentication

Normally, requests for Confluence's remote API will include an authentication token as the first argument. With
this method of authentication, XML-RPC and SOAP authentication requests are checked directly against the
user management framework, and tokens are assigned directly by the remote API subsystem. These requests
do not pass through Seraph authenticators.
However, if the token argument is blank, Seraph will be used as a fallback authentication method for remote API requests. So, to use a custom Seraph authenticator with XML-RPC or SOAP requests, ensure that you pass an empty string as the authentication token to remote API methods.

**Password authentication**

By default, password authentication is delegated from Seraph to the user management system. This is not necessary, however. Single sign-on systems may have no password authentication at all, and get all the necessary credentials from the SSO provider.

**Earlier user management frameworks**

- **Atlassian-User – now behind the scenes.** Atlassian-User is a user and group management framework developed by Atlassian. It provides user, group and profile management services to Confluence. In earlier versions of Confluence, you needed to configure your user directories by editing the `atlassian-user.xml` file directly. In Confluence 3.5 and later this is no longer necessary, nor is it possible. Please refer to the documentation for Confluence 3.4 or earlier, if you need details of this framework. Refer to the Confluence 3.5 Upgrade Notes for details of the automatic migration that will occur during the upgrade process.

- **OSUser – obsolete.** OpenSymphony User was Confluence’s core user management framework before Atlassian-User. Please refer to the documentation for Confluence 3.4 or earlier, if you need details of this framework.

**Adding and Inviting Users**

There are a number of ways to add users to Confluence:

- **By user signup:** If user signup is enabled on your Confluence site, people can add themselves as users of the site. See below.

- **Via an invitation link:** You can invite people to sign up, by sending them an invitation link. You can copy and paste the link, or prompt Confluence to send the link in an email message. See below.

- **By adding users manually:** Administrators with Confluence Administrator or System Administrator permissions can add new users. See below.

- **Via an external user directory:** See Configuring User Directories.

**Allowing user signup**

If you enable user signup, a ‘Sign Up’ option will appear on the Confluence screens. The option will be on the login screen, and also in the header on public sites. People can choose the option to create their own usernames on Confluence.

You can restrict the signup to people whose email addresses are within a given domain or domains. This is useful if you want to ensure that only people within your organisation can add their own usernames.

You will still be able to add or invite users manually, whether user signup is enabled or not.

You need Confluence Administrator or System Administrator permissions to change the signup options.

**To set the user signup options:**

1. Choose **Invite Users** on the dashboard, then choose **User Signup Options**.
   Or take the longer route: Choose **Browse > Confluence Admin**. Then choose **Users > User Signup Options**.
2. Choose **Allow people to sign up to create their account**.
3. Choose one of the following options:
   - **Restricted by domain(s)** – Note: You need to set up a mail server for Confluence before you can configure domain restricted signup. When you choose this option, a text box will appear. Enter one or more domains, separated by commas. People will only be able to sign up if their email address belongs to one of the domains specified here. Confluence will send the person an email message, asking them to click a link to confirm their email address.
   For example: mydomain.com, mydomain.net
• No restrictions – Anyone will be able to sign up to Confluence. Confluence will not send any email message requesting confirmation.

4. Choose Notify administrators by email when an account is created if you want Confluence to send an email message to all administrators (people with Confluence Administrator or System Administrator permissions) every time someone signs up to Confluence.

On this page:

• Allowing user signup
• Enabling and disabling notifications about user signup
• Inviting people to sign up
• Resetting the invitation link
• Adding users manually
• Notes

Related pages:

• Managing Confluence Users
• Configuring a Server for Outgoing Mail
• Confluence Administrator’s Guide

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Enabling and disabling notifications about user signup

By default, Confluence will send an email notification to all Confluence administrators whenever someone signs up to the Confluence site. The administrators (people with Confluence Administrator or System Administrator permissions) will receive this message when someone signs up either by clicking the 'Sign Up' link or by clicking the invitation URL sent by an administrator.

To disable this notification:

1. Choose Invite Users on the dashboard, then choose User Signup Options.
   Or take the longer route: Choose Browse > Confluence Admin. Then choose Users > User Signup Options.
2. Remove the tick from Notify administrators by email when an account is created.
3. Choose Save.

Screenshot: User signup options
Inviting people to sign up

You can invite new users to the site by sending them a signup URL, called an 'invitation link'. You can copy the invitation link and paste it onto a page or into an email message, or you can prompt Confluence to send an email message containing the same link.

The option to send invitations is independent of the signup options. You can send invitations if signup is open to all, restricted by domain, or disabled entirely. Even if signup is disabled, a person who has received an invitation will be able to sign up.

When someone visits the invitation link in a browser, a Confluence signup screen will appear.

To invite people to sign up:

1. Choose Invite Users on the dashboard.
2. Copy the Invitation Link and paste it into an email message, or onto a page on your intranet, for example.
3. Alternatively, prompt Confluence to send an email message for you:
   - Enter one or more email addresses in the field labelled Email To. Separate the addresses with commas. For example: john@example.com, sarah@example.com
   - Optional: Change the Message if you want to.
   - Choose Send.

Resetting the invitation link

The invitation link includes a security token, like this:
This security token is a shared token – individual invitations do not have unique tokens. Anyone who obtains this token will be able to sign up to Confluence.

You can change the token at any time, by choosing **Reset**. The previous invitation link will become unusable. People will no longer be able to use the previous link to sign up. If they try, they will see an error message that the signup token has expired.

**Screenshot: Inviting users**

Adding users manually

**To add a new user:**

1. Choose **Invite Users** on the dashboard, then choose **Add Users**.
   
   Or take the longer route: Choose **Browse > Confluence Admin**. Then choose **Users > Add Users**.

2. Enter the user's details: username, name, password, and email address.

3. Choose whether Confluence should send an **email** message informing the person of their new username.

   The email message will contain a link that the person can use to reset their password.

4. Choose **Create**.

**Screenshot: Adding users**
Notes

- **Multiple directories.** You may define multiple user directories in Confluence, so that Confluence looks in more than one place for its users and groups. For example, you may use the default Confluence internal directory and also connect to an LDAP directory server. In such cases, you can define the directory order to determine where Confluence looks first when processing users and groups. Here is a summary of how the directory order affects the processing:
  - The order of the directories is the order in which they will be searched for users and groups.
  - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

See [Managing Multiple Directories](#).

- **Email server required for domain restricted signup and for invitations.** You need to set up a mail server for Confluence, before you can configure domain restricted signup or send email invitations to users.

- **Are the user management options not visible?** If you have external user management turned on, internal user management is disabled. To configure external user management, go to Browse > Confluence > Security Configuration. See [Disabling the Built-In User Management](#).

Removing or Deactivating Users

If you are a [Confluence Administrator](#), you can remove and deactivate users.

You can **remove** a user from Confluence if they have not yet added or edited any content on the site. Such content includes pages and blog posts, and edits and comments on existing pages.

You can **deactivate**, or disable, a user, including one who has contributed content.

- Deactivated users can no longer log in to Confluence.
- Deactivating a user will not remove the content created by them.
- Deactivated users do not count towards your license count. (See the notes below.)

**Related pages:**
- [Managing Confluence Users](#)
- [Configuring User Directories](#)
To remove a user:

1. Go to the user's profile and choose Administer User.
2. Choose Remove.

To deactivate a user:

1. Go to the user's profile and choose Administer User.
2. Choose Disable.

</tr>
</tbody>
</table>

Notes

- The Administer User link is only visible if you are logged in as an administrator.
- You can also remove or disable users using the Administration Console.
- You can edit the groups that a user belongs to, to change their permissions without completely preventing their access to Confluence.
- Multiple user directories: You may define multiple user directories in Confluence, so that Confluence looks in more than one place for its users and groups. For example, you may use the default Confluence internal directory and also connect to an LDAP directory server. In such cases, you can define the directory order to determine where Confluence looks first when processing users and groups. Here is a summary of how the directory order affects the processing:
  - The order of the directories is the order in which they will be searched for users and groups.
  - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

See Managing Multiple Directories.

- Number of users and your license: The Confluence 'License Details' screen tells you how many users
your Confluence instance is licensed to support, and how many are currently registered. See Viewing and Editing License Details. The number of registered users includes only users who have the 'Can Use' global permission. Deactivated users, as described above, are not included.

**Searching For and Administering Users**

If you have Confluence Administrator permissions, you can view users, edit their user details, reset their passwords, and assign them to groups.

**Accessing the user management screen**

There are two ways to do this.

Option 1: Administer a known user:

- Go to a user's profile
- Choose Administer User.

Option 2: Find the user first:

- Choose Browse > Confluence Admin.
- Choose Users in the left-hand panel.
- The 'Users' screen appears. You can now list all users or search for a specific user.

**Listing all users**

To list all users:

1. Choose Show all users. All members of the confluence-users group are listed in alphabetical order, by username. If there are more users than can fit on one page, the results will be divided into multiple pages.
2. To move to another page of results, choose the numbered links, Next or Previous near the top or bottom of the page.
3. To specify how many results should be shown per page, choose a number 10, 20, 50 or 100 near the top of the page.

---

**On this page:**

- Accessing the user management screen
- Listing all users
- Using the simple user search
- Using the advanced user search
- Notes

**Related pages:**

- Adding and Inviting Users
- Giving People Access to Content
- Confluence Administrator's Guide

⚠ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

---

**Using the simple user search**

To search for a user via the simple user search:

1. If the Simple link is showing, choose it. (If you see the 'Advanced' link and no 'Simple' link, then the
simple search is already active.)

2. Type some information about the user into the ‘Find User’ text box. You can type all or part of their username, full name or email address.

3. Choose Search.

4. Confluence will display a list of matching users. Click the link on a username to see and edit the details for that user.

Using the advanced user search

The advanced user search allows you to specify the field in which your search term appears: username, full name or email address. This is useful if you need to limit the number of users appearing in the search results.

To search via the advanced user search:

1. If the Advanced link is showing, choose it. (If you see the ‘Simple’ link and no ‘Advanced’ link, then the advanced search is already active.)

2. Complete one or more of the following fields:
   - **Username** — Enter all or part of the person's username. This is their login ID, such as 'joe', or 'bloggs'.
   - **Full Name** — Enter all or part of the person's name. For example, 'joe bloggs', or 'bloggs', or 'joe'.
   - **Email** — Enter all or part of the person's email address. For example, 'acme'.

3. Choose Search.

4. Confluence will display a list of matching users. Click the link on a username to see and edit the details for that user.

Notes

- **Multiple user directories**: You may define multiple user directories in Confluence, so that Confluence looks in more than one place for its users and groups. For example, you may use the default Confluence *internal directory* and also connect to an *LDAP* directory server. In such cases, you can define the *directory order* to determine where Confluence looks first when processing users and groups. Here is a summary of how the directory order affects the processing:
  - The order of the directories is the order in which they will be searched for users and groups.
  - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

See [Managing Multiple Directories](#).

- **Crowd and the user search**: If you are using Atlassian's *Crowd* for user management, you will need *Crowd* 1.5.1 or later to use the ‘Simple’ option in the user search. If your version of Crowd does not support the simple user search, you will see only the ‘Advanced’ search form.

Screenshot: The user management screen
**Editing User Details**

To update a user's details:

1. First, go to the user management screen for the user concerned. There are two ways to do this:
   - Either, go to the user's **Profile** and click the 'Administer User' link on the user's profile screen.
   - Or, choose **Browse > Confluence Admin**.
     - Select the link 'Manage Users' in the left-hand panel.
     - Locate the user by doing a search on the username or the groups to which they belong.
     - Click the user link.

2. Now you should be able to see the user's current details and links allowing you to edit them.
   - **View Profile** — View the user's profile.
   - **Edit Groups** — Add or remove this user from a group.
   - **Edit Details** — Change details such as the user's name, email address, contact details and team or department information.
     - Changing a user's username is not supported. See **Changing Usernames** for information.
   - **Set Password** — Edit the user’s password details.
   - **Remove** — You can remove a user permanently if the user has not added or edited any content on the site.
   - **Disable** — You can disable (i.e. deactivate) access for a user who has already added or edited any content on the site.

⚠️ The information on this page *does not apply* to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

**Notes**

- **Multiple user directories**: You may define multiple user directories in Confluence, so that Confluence looks in more than one place for its users and groups. For example, you may use the default Confluence internal directory and also connect to an LDAP directory server. In such cases, you can define the directory order to determine where Confluence looks first when processing users and groups. Here is a summary of how the directory order affects the processing:
  - The order of the directories is the order in which they will be searched for users and groups.
Changes to users and groups will be made only in the first directory where the application has permission to make changes.

See [Managing Multiple Directories](#).

### Resetting the Login Count for a User

Confluence records the number of failed logins attempts made against each user account. When the login attempts exceed a preset number (see [Configuring Captcha for Failed Logins](#)), the user will prompted to authenticate using CAPTCHA until they successfully log in.

If you are a [Confluence Administrator](#), you can manually reset the failed login count for a user.

---

The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

---

To reset the failed login count for a user,

1. Choose **Browse > Confluence Admin**.
2. Select 'Manage Users' in the left-hand panel. The 'Manage Users' screen appears, as shown below.
3. Search for the desired user and click the user in the search results. The 'View User' screen will be displayed.
4. Click the 'Reset Failed Login Count' for the user. The 'Current Failed Login Count' will be reset to 0.

---

---

### Changing Usernames

A **username** is the name used to log into Confluence, eg. `jsmith`.

Currently, there is no straightforward method for changing a username and its associated content, to that of another user. The only practicable method currently available is to execute direct SQL queries on your database. There is a [feature request to facilitate this process via a web interface](#) and you can vote for it to improve its chances of being implemented. Be aware, however, that no matter what method you use to change usernames in Confluence, there is no support provided for this process. The instructions below provide suggested guidelines on how to change a username via SQL queries, although this may vary depending on your database.
**Instructions For Changing Usernames**

- This document is for use with 3.5 or later. If using an earlier version, please see the [3.4 version](#) of the page.

  The following SQL commands are only tested for MySQL and PostgreSQL Databases. If you have any other database please contact your DBA to determine the equivalent queries.

Usernames can only be changed through direct update to the Confluence database.

1. If you have a database administrator, request that they approve the database-related steps described below.
2. If you are using JIRA user management, [Revert from JIRA To Internal User Management](#).
3. [Backup Confluence](#).
4. If you are using MySQL, make sure you are not running in safe updates mode:

   ```sql
   set sql_safe_updates=0;
   ```

5. Create a `usermigration` table:

   ```sql
   create table usermigration
   (
   oldusername varchar(255),
   newusername varchar(255)
   )
   ```

6. Usernames that will be changed must be placed in the `usermigration` table with their current and planned user names:

   ```sql
   insert into usermigration (oldusername, newusername)
   values ('oldusername', 'newusername');
   ```

7. Run the following SQL commands:
   - If you have command line access to your database, download the scripts for PostgreSQL or MySQL, then run them against your database:
     - **PostgreSQL**
       ```bash
       $ psql -f PostgreSQLChangeUsernames.sql your_database_name
       ```
     - **MySQL**
       ```bash
       $ mysql your_database_name < MySQLChangeUsernames.sql
       ```
b. Otherwise, run the following:
   i. If your DB administration tool does not support multiple SQL queries, these must be entered individually:

   **PostgreSQL**

   ```sql
   update attachments
   set creator = newusername from usermigration u
   where creator = u.oldusername;

   update attachments
   set lastmodifier = newusername from usermigration u
   where lastmodifier = u.oldusername;

   update content
   set creator = newusername from usermigration u
   where creator = u.oldusername;

   update content
   set lastmodifier = newusername from usermigration u
   where lastmodifier = u.oldusername;

   update content
   set username = newusername from usermigration u
   where username = u.oldusername;

   update content_label
   set owner = newusername from usermigration u
   where owner = u.oldusername;

   update content_perm
   set creator = newusername from usermigration u
   where creator = u.oldusername;

   update content_perm
   set lastmodifier = newusername from usermigration u
   where lastmodifier = u.oldusername;

   update content_perm
   set username = newusername from usermigration u
   where username = u.oldusername;

   update cwd_user
   set lower_user_name = lower(newusername) from usermigration u
   where lower_user_name = lower(u.oldusername);

   update cwd_user
   set user_name = newusername from usermigration u
   where user_name = u.oldusername;

   update extrlnks
   set creator = newusername from usermigration u
   where creator = u.oldusername;

   update extrlnks
   set lastmodifier = newusername from usermigration u
   where lastmodifier = u.oldusername;

   update follow_connections
   set followee = newusername from usermigration u
   where followee = u.oldusername;
   ```
update follow_connections
set follower = newusername from usermigration u
where follower = u.oldusername;

update label
set owner = newusername from usermigration u
where owner = u.oldusername;

update links
set creator = newusername from usermigration u
where creator = u.oldusername;

where a.creator = u.oldusername;

update CONTENT a, usermigration u
set a.lastmodifier = u.newusername
where a.lastmodifier = u.oldusername;

update CONTENT a, usermigration u
set a.username = u.newusername
where a.username = u.oldusername;

update CONTENT_LABEL a, usermigration u
set a.owner = u.newusername
where a.owner = u.oldusername;

update CONTENT_PERM a, usermigration u
set a.creator = u.newusername
where a.creator = u.oldusername;

update CONTENT_PERM a, usermigration u
set a.lastmodifier = u.newusername
where a.lastmodifier = u.oldusername;

update CONTENT_PERM a, usermigration u
set a.username = u.newusername
where a.username = u.oldusername;

update CWD_USER a, usermigration u
set a.lower_user_name = LOWER(u.newusername)
where a.lower_user_name = LOWER(u.oldusername);

update CWD_USER a, usermigration u
set a.user_name = u.newusername
where a.user_name = u.oldusername;

update EXTRNLNKS a, usermigration u
set a.creator = u.newusername
where a.creator = u.oldusername;

update EXTRNLNKS a, usermigration u
set a.lastmodifier = u.newusername
where a.lastmodifier = u.oldusername;

update FOLLOW_CONNECTIONS a, usermigration u
set a.followee = u.newusername
set a.followee = u.newusername
where a.followee = u.oldusername;

update FOLLOW_CONNECTIONS a, usermigration u
set a.follower = u.newusername
where a.follower = u.oldusername;

update LABEL a, usermigration u
set a.owner = u.newusername
where a.owner = u.oldusername;

update LINKS a, usermigration u
set a.creator = u.newusername
where a.creator = u.oldusername;

update LINKS a, usermigration u
set a.lastmodifier = u.newusername
where a.lastmodifier = u.oldusername;

update NOTIFICATIONS a, usermigration u
set a.creator = u.newusername
where a.creator = u.oldusername;

update NOTIFICATIONS a, usermigration u
set a.lastmodifier = u.newusername
where a.lastmodifier = u.oldusername;

update NOTIFICATIONS a, usermigration u
set a.username = u.newusername
where a.username = u.oldusername;

update PAGETEMPLATES a, usermigration u
set a.creator = u.newusername
where a.creator = u.oldusername;

update PAGETEMPLATES a, usermigration u
set a.lastmodifier = u.newusername
where a.lastmodifier = u.oldusername;

update REMEMBERMETOKEN a, usermigration u
set a.username = u.newusername
where a.username = u.oldusername;

update SPACEGROUPS a, usermigration u
set a.creator = u.newusername
where a.creator = u.oldusername;

update SPACEGROUPS a, usermigration u
set a.lastmodifier = u.newusername
where a.lastmodifier = u.oldusername;

update SPACEPERMISSIONS a, usermigration u
set a.creator = u.newusername
where a.creator = u.oldusername;

update SPACEPERMISSIONS a, usermigration u
set a.lastmodifier = u.newusername
where a.lastmodifier = u.oldusername;

update SPACEPERMISSIONS a, usermigration u
set a.permusername = u.newusername
where a.permusername = u.oldusername;

update SPACES a, usermigration u
set a.creator = u.newusername
where a.creator = u.oldusername;

update SPACES a, usermigration u
set a.lastmodifier = u.newusername
where a.lastmodifier = u.oldusername;

update TRACKBACKLINKS a, usermigration u
set a.creator = u.newusername
where a.creator = u.oldusername;
ii. Reassign user preferences in the OS_PROPERTYENTRY table. Usernames in the OS_PROPERTYENTRY table need to be prefixed with 'CWD_'.

**PostgreSQL**

```
update os_propertyentry
set entity_name = 'CWD_' || newusername from usermigration u
where entity_name = 'CWD_' || u.oldusername;
```

**MySQL**

```
update OS_PROPERTYENTRY a, usermigration u
set a.entity_name = concat('CWD_', u.newusername)
where a.entity_name = concat('CWD_', u.oldusername);
```

iii. Reassign personal spaces and settings associated with the old username to the new username. The tilda (~) is required as it is prepended to the space key of all personal spaces:

**PostgreSQL**

```
update spaces
set spacekey = '~' || newusername from usermigration u
where spacekey = '~' || u.oldusername;

update bandana
set bandanacontext = '~' || newusername from usermigration u
where bandanacontext = '~' || u.oldusername;
```

**MySQL**

```
update SPACES a, usermigration u
set a.spacekey = concat('~', u.newusername)
where a.spacekey = concat('~', u.oldusername);

update BANDANA a, usermigration u
set a.bandanacontext = concat('~', u.newusername)
where a.bandanacontext = concat('~', u.oldusername);
```

8. Each username is associated with a full name. For example, username 'jsmith' may have a full name of 'John M Smith'. If this fullname needs to be changed, modify the first_name, lower_first_name, last_name and lower_last_name in the cwd_user table. Ensure the lower_columns are merely copies of their normal counterparts but with all letters in lower case. Then modify the display_name and lower_display_name columns so that they are the first_name and last_name columns or the lower_first_name and lower_last_name columns put together but separated by a space.
Rebuild the Indexes

After all the updates, it's necessary to Rebuild the Indexes from Scratch.

All old usernames in Confluence should now be replaced with the new usernames from the `usrmigration` table.

Restoring Passwords To Recover Admin User Rights

Use this document if you are unable to log in to Confluence as administrator. The most common reason for using these instructions is if you have lost the administration password for your Confluence site.

Before you Start

Please note the following before you start:

- The following instructions include example SQL that should work on MySQL and PostgreSQL. You may need to customise the queries for other databases or for your installation.
- We strongly recommend testing the queries on a test database before modifying your production database.

New user management in Confluence 3.5 and later

- Confluence now uses the `CWD_USER` table in the database to store and refer to its users.
- When you imported your backup on upgrade from Confluence 3.4.9 or earlier, the upgrade process copied the users from the `OS_USER` table (for upgrades from versions older than 2.7) or the `USERS` table (for versions 2.7 to 3.4) into the `CWD_USER` table.
- The new user management framework also introduced user directories. Making modifications to users in the database will only fully work for users in Confluence's Internal Directory. The instructions below include extra steps for instances in which the user management has been delegated to external sources (via LDAP, Crowd or JIRA).

Please refer to the older documentation if you are still using `OSUser` or `AtlassianUser`.

Using Crowd for SSO

- If Confluence is configured for SSO through Crowd, you will only be able to authenticate as users from the Crowd server.
- This document covers how to recover administration rights from the local 'Confluence Internal Directory' only. However, you will not be able to authenticate as a local Confluence administrator while Crowd SSO is enabled. Please refer to Integrating Crowd with Atlassian Confluence for details on how to configure or disable Crowd SSO.

On this page:

- Before you Start
- Step 0. Get access to the database
- Step 1. Identify Administrator
- Step 2. Replace Administrator Password
- Step 3. Put the Internal Directory in First Position
- Step 4. Clean Up
- Notes
The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Step 0. Get access to the database

If you are using the embedded HSQL database, you can find the files containing your database in <confluence-home-directory>/database. When you shut down Confluence, the SQL will be written to a '.script' or '.log' file in that directory to which you can append the SQL described below.

If you are using a proper production database, connect to the database with your normal tools. You will need to have permission to run queries and update data in the database.

Step 1. Identify Administrator

To find out which usernames have admin privileges, connect to your database using a database admin tool such as DBVisualiser. Please download a database admin tool now if you do not have one installed already. Then connect to your database and retrieve the list of administrator usernames and IDs with:

```
select u.id, u.user_name from cwd_user u
join cwd_membership m on u.id=m.child_user_id join cwd_group g on
m.parent_id=g.id join cwd_directory d on d.id=g.directory_id
where g.group_name='confluence-administrators' and d.directory_name='Confluence Internal Directory';
```

If there are multiple results, choose one ID/username combination to use for the following steps. If there are no results, skip down to 'If No Local Users Exist' in Step 2.

Step 2. Replace Administrator Password

Confluence does not store passwords in plain text in the database, but uses hashes computed from the original password. You will need to insert a hash, rather than the plain password, over the existing password in the database. Below is the hash for the password admin:

```
x61Ey612Kl2gpFL56FT9weDnpSo4AV8j8+qx2AuTHdRyY036xxzTTrw10Wq3+4qQyB+XURPWx1ONxp3Y3pB37A==
```

For an External Database

To change the password to admin for a given username:

1. Shut down Confluence.
2. Connect to your database.
3. Run the following SQL:

```
update cwd_user set credential =
'x61Ey612Kl2gpFL56FT9weDnpSo4AV8j8+qx2AuTHdRyY036xxzTTrw10Wq3+4qQyB+XURPWx1ONxp3Y3pB37A=='
where id=<id from Stage 1>;
```

For the Evaluation Embedded HSQL Database

1. Shut down Confluence.
2. Connect to your database.
3. Run the following SQL:

```
update cwd_user set credential =
'x61Ey612Kl2gpFL56FT9weDnpSo4AV8j8+qx2AuTHdRyY036xxzTTrw10Wq3+4qQyB+XURPWx1ONxp3Y3pB37A=='
where id=<id from Stage 1>;
```
To change the password to admin for a given username:

1. Shut down Confluence.
2. Open `<confluence-home>/database/confluencedb.script`, or `confluencedb.log` if the .script file looks empty.
3. Search for:

```
INSERT INTO CWD_USER VALUES(
```

4. Keep searching until you find the appropriate user, then replace their password with the hash value above.
5. Save the file.

If No Local Users Exist

There may be no administrators in your Internal Directory. If this is the case, you need to add one:

1. Add a new admin user by running:

```
insert into cwd_user(id, user_name, lower_user_name, active, created_date,
updated_date, first_name, lower_first_name, last_name, lower_last_name,
display_name, lower_display_name, email_address, lower_email_address,
directory_id, credential) values (1212121, 'admin', 'admin', 'T',
'Ministrator', 'ministrator', 'A. D. Ministrator', 'a. d. ministrator',
'admin@example.com', 'admin@example.com', (select id from cwd_directory
where directory_name='Confluence Internal Directory'),
'x61Ey612K12gpFL56FT9weDnps04AV8j8qX2AuThdRy036xxzTrw10Wq3+4g2yB+XURPWx1
ONxp3Y3pB37A==');
```

2. Add new groups by running:

```
insert into cwd_group(id, group_name, lower_group_name, active, local,
created_date, updated_date, description, group_type, directory_id)
values ( 
'888888','confluence-administrators','confluence-administrators','T','F','2
011-03-21 12:20:29','2011-03-21 12:20:29',NULL,'GROUP',(select id from
cwd_directory where directory_name='Confluence Internal Directory'));
insert into cwd_group(id, group_name, lower_group_name, active, local,
created_date, updated_date, description, group_type, directory_id)
values ( '999999','confluence-users','confluence-users','T','F','2011-03-21
12:20:29','2011-03-21 12:20:29',NULL,'GROUP',(select id from cwd_directory
where directory_name='Confluence Internal Directory'));
```

3. Add group memberships into cwd_membership:
```sql
insert into cwd_membership (id, parent_id, child_user_id) values (888888, (select id from cwd_group where group_name='confluence-users' and directory_id=(select id from cwd_directory where directory_name='Confluence Internal Directory')), 1212121);
insert into cwd_membership (id, parent_id, child_user_id) values (999999, (select id from cwd_group where group_name='confluence-administrators' and directory_id=(select id from cwd_directory where directory_name='Confluence Internal Directory')), 1212121);
```

⚠️ If using an Oracle database, use `sysdate` instead of a string for the `created_date` column.

**Step 3. Put the Internal Directory in First Position**

Start Confluence, and try logging in with the username of the user you updated/created and the password 'admin'. If this works, skip to Step 4. Otherwise, your Internal Directory does not have high enough priority.

**To put your Internal Directory in first position:**

1. Find the directory names and their order:
   ```sql
   select d.id, d.directory_name, m.list_index from cwd_directory d join cwd_app_dir_mapping m on d.id=m.directory_id;
   ```

2. Take note of the ID with list_index 0, and the list_index and ID of the Confluence Internal Directory.

3. Switch the order of the directories:
   ```sql
   update cwd_app_dir_mapping set list_index = 0 where directory_id = <Internal Directory id>
   update cwd_app_dir_mapping set list_index = <Noted Internal Directory list_index> where directory_id = <Directory id that had list_index 0>;
   ```

4. Check to see if the directory is active (the 'active' column should be set to 'T'):
   ```sql
   select id, directory_name, active from cwd_directory where id = <Internal Directory id>;
   ```

5. If necessary, activate the directory:
   ```sql
   update cwd_directory set active = 'T' where id = <Internal Directory id>;
   ```

**Step 4. Clean Up**

To tidy up:

1. Start Confluence.
2. Log in with your modified/created username and use password `admin`.
3. Change your password. **Do not leave your password as admin, or your instance will not be secure.**
4. If you created a new user in Stage 2, create a new admin via the UI and delete the admin you created in Stage 2.
5. If you followed Stage Three, go to Confluence Administration > User Directories and rearrange your directories so they are correctly configured again.

Notes
- Learn more about the [password hash algorithm Confluence is using](https://confluence.apache.org/display/CONFLUENCE/Managing+Security+and+Access+Control).

**Managing Site-Wide Permissions and Groups**

Permissions determine what people can do on your Confluence site. Confluence recognises permissions at site level and at space level, as well as page-level restrictions.

You can create groups and allocate people to them, so that you can assign permissions to a number of people at once. For example, it is quicker to give group 'X' access to Confluence, rather than giving every team member access individually. You can also set the access levels for anonymous users.

**Related pages:**
- [Confluence Security](https://confluence.apache.org/display/CONFLUENCE/Managing+Security+and+Access+Control)
- [Confluence Administrator's Guide](https://confluence.apache.org/display/CONFLUENCE/Managing+Security+and+Access+Control)

**Global Groups Overview**

A group is a collection of users. Administrators create groups so that the administrator can assign permissions to a number of people at once. For example, it is quicker to give group 'X' access to Confluence, rather than giving every team member access individually. You need **Confluence Administrator permissions** to view and update groups.

Groups are available at the space and page levels to allow for flexible access control. A user in a group will automatically be granted all permissions granted to the group.

**Special groups**

There are two special default groups in Confluence:

1. **confluence-administrators**: This is a group of ‘super-users’ who can access the Confluence administration screens (‘administration console’) and perform site-wide administration. Members of this group can also see all spaces in the Confluence site. Any user who is a member of this group has site-wide administration powers, regardless of any other setting. The settings on the global permissions screen do **not** affect the powers allowed to members of this group.
2. **confluence-users**: This is the default group for all new users. Permissions you assign to this group will be assigned to all newly signed-up users of Confluence.

**The Confluence Administrator permission and the ‘confluence-administrators’ group are not related.** Going by the names, you would think the ‘confluence-administrators’ group and the ‘Confluence Administrator’ permission are related – but they are not. Granting a user or a group ‘Confluence Administrator’ permission is not the same as granting them membership of the ‘confluence-administrators’ group. Granting the ‘Confluence Administrator’ permission enables access to only a subset of the administrative functions. Granting membership to the ‘confluence-administrators’ group gives complete access.
Anonymous users

Confluence treats all users who do not log in when they access Confluence as being ‘anonymous’. You can grant anonymous ‘Use Confluence’ permission via the Global Permissions screen. See Setting up Public Access. This will allow non-registered users to access pages and spaces in Confluence. A space administrator can further control anonymous access per space via the space permissions.

Updating groups

To add a new group:

1. Choose Browse > Confluence Admin.
2. Choose Manage Groups in the left-hand panel.
3. Choose Add Group.
4. Enter a name for your group and choose Save.

You are now ready to start adding users to the group.

To remove a group:

1. Choose Browse > Confluence Admin.
2. Choose Manage Groups in the left-hand panel. You will see a list of all existing groups along with links to remove them.
3. Choose Remove beside the group you want to remove.

Notes

- Multiple user directories: You may define multiple user directories in Confluence, so that Confluence looks in more than one place for its users and groups. For example, you may use the default Confluence internal directory and also connect to an LDAP directory server. In such cases, you can define the directory order to determine where Confluence looks first when processing users and groups. Here is a summary of how the directory order affects the processing:
  - The order of the directories is the order in which they will be searched for users and groups.
  - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

See Managing Multiple Directories.

Adding or Removing Users in Groups

If you are a Confluence Administrator, you can add users and groups, and assign users to groups in order to
determine their permissions.

This page tells you how to add a user to a group or remove a user from a group. For an overview of users and groups, please refer to Users and Groups and Managing Confluence Users.

You can edit group membership in two places:

- From the group management screen.
- From the user management screen for a particular user.

Both methods are described below.

On this page:
- Adding and Removing Members via the Group Management Screen
- Editing Group Membership from the User Management Screen
- Notes

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Adding and Removing Members via the Group Management Screen

This is the recommended method, available in Confluence 2.10 and later. It allows you to manage the group membership for a number of users at the same time.

To add members to a group:

1. Choose Browse > Confluence Admin.
2. Select ‘Manage Groups’ in the left-hand panel.
3. The ‘Manage Groups’ screen appears, showing a list of groups. Select the group to which you want to add users.
4. The ‘Group Members’ screen appears, showing the users who belong to the selected group. (See screenshot below.) Click the ‘Add Members’ link.
5. The ‘Add Members’ screen appears, as shown below. Type in the usernames of the people you want to add to the group. You can also search for and select users by clicking the magnifying glass icon, as described in Searching for Users.
6. When you have added the required username(s), click the ‘Add’ button to add the member(s) to the group.

To remove members from a group:

1. Choose Browse > Confluence Admin.
2. Select ‘Manage Groups’ in the left-hand panel.
3. The ‘Manage Groups’ screen appears, showing a list of groups. Select the group from which you want to remove the user.
4. The ‘Group Members’ screen appears, showing the users who belong to the selected group. (See screenshot below.) Click the ‘Remove user from group’ icon next to the user whose group membership you want to remove.
1. Go to the user management screen for the user concerned. There are two ways to do this:
   - Either,
     - Go to the user's Profile and click the 'Administer User' link on the user's profile screen. (This link is available in Confluence 2.8.2 and later.)
     - Or, Choose Browse > Confluence Admin.
       - Select 'Manage Users' in the left-hand panel.
       - The 'Manage Users' screen appears, as shown below. You can now choose to 'Show all users' or you can search for a specific user by entering all or part of the person's username, full name or email address. (For more details about the user search, see Searching For and Administering Users.)
       - Click the link on the username you want to edit.
   2. Now you should be able to see the user's current details, with links allowing you to edit the user's details and groups. See the screenshot showing a user's details below.
   3. Click 'Edit Groups'. This will display two lists of groups, as shown in the screenshot below. Update the user's group membership as follows:
      - 'Not a member of groups' — This box shows all groups to which the user does not belong. To add the user to a group, select a group and click 'Join'. Hold the Ctrl key down and click to select more than one group.
      - 'Member of groups' — This box shows all groups to which the user belongs. Select a group and click 'Leave' to remove the user from the group.
Multiple user directories: You may define multiple user directories in Confluence, so that Confluence looks in more than one place for its users and groups. For example, you may use the default Confluence internal directory and also connect to an LDAP directory server. In such cases, you can define the directory order to determine where Confluence looks first when processing users and groups. Here is a summary of how the directory order affects the processing:

- The order of the directories is the order in which they will be searched for users and groups.
- Changes to users and groups will be made only in the first directory where the application has permission to make changes.

See Managing Multiple Directories.

RELATED TOPICS
Global Permissions Overview

Permissions determine the actions which a user is allowed to perform within Confluence. Global permissions are one of the levels of permission provided by Confluence.

In order to assign these permissions, you must already have the global 'Confluence Administrator' or 'System Administrator' permission (described below). You can then assign global permissions to groups, individual users and anonymous users. Further permissions are granted from the space administration screens.

The Confluence permission scheme allows the following levels of site administrator permissions, with the most powerful at the top of the list:

- **Super user** – A 'super user' belongs to the confluence-administrators group, has full administrative access to Confluence, and can see all the content.
- **System Administrator** – A person with 'System Administrator' permission has full administrative access to Confluence.
- **Confluence Administrator** – A person with 'Confluence Administrator' permission has access to most of the Confluence administrative functions.

**Note:** The first system administrator and super-user is defined during initial setup. During the initial configuration of Confluence, the Setup Wizard asks for the username of the System Administrator. This user will have the 'System Administrator' permission and will be a member of the 'confluence-administrators' group.

---

⚠️ Some functionality described on this page is restricted in Confluence OnDemand.

**Overview of the global permissions**

Global permissions control access across the whole Confluence site. Here is a list:

<table>
<thead>
<tr>
<th>Global Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Use</td>
<td>This is the most basic permission that allows users to access the site. Users with this permission count towards the number of users allowed by your license. See the information on removing/deactivating users.</td>
</tr>
<tr>
<td>Permission</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Attach Files to User Profile</td>
<td>This allows the user to upload files to be stored in their user profile. This feature was made obsolete by the introduction of personal spaces in Confluence 2.2. Hence, this permission is no longer relevant. Attachments can be accessed from a user profile view (for example, an image within the 'About Me' field of a profile view) by attaching these files to a page within that user's personal space and referencing them using appropriate wiki markup code.</td>
</tr>
<tr>
<td>Update User Status</td>
<td>This allows the user to update their user status, which can be seen on the user's profile, pages in their personal space and on various activity streams accessible to other Confluence users.</td>
</tr>
<tr>
<td>Personal Space</td>
<td>This permission allows the user to create a personal space.</td>
</tr>
<tr>
<td>Create Space(s)</td>
<td>This permission allows users to create new spaces within your Confluence site. When a space is created, the creator automatically has the 'Admin' permission for that space and can perform space-wide administrative functions.</td>
</tr>
<tr>
<td>Confluence Administrator</td>
<td>This permission allows users to access the 'Administration Console' that controls site-wide administrative functions. Users with this permission can perform most, but not all, of the Confluence administrative functions. See the comparison of 'System Administrator' and 'Confluence Administrator' below.</td>
</tr>
<tr>
<td>System Administrator</td>
<td>This permission allows users to access the 'Administration Console' that controls site-wide administrative functions. Users with this permission can perform all the Confluence administrative functions, including the ones which the 'Confluence Administrator' permission does not allow. See the comparison of 'System Administrator' and 'Confluence Administrator' below. Refer also to the note about the 'confluence-administrators' group below.</td>
</tr>
</tbody>
</table>

**Comparing the System Administrator permission with the Confluence Administrator permission**

Confluence recognises two levels of administrator:

- **System Administrator** – Users with this permission can perform all the Confluence administrative functions, including the ones which the 'Confluence Administrator' permission does not allow.
- **Confluence Administrator** – Users with this permission can perform most, but not all, of the Confluence administrative functions.
The two-tier administration is useful when you want to delegate some administrator privileges to project managers or team leaders. You can give 'Confluence Administrator' permission to users who should be able to perform most administrative functions, but should not be able to perform functions that can compromise the security of the Confluence system.

The following functions are granted to the 'System Administrator' permission but excluded from the 'Confluence Administrator' permission:

<table>
<thead>
<tr>
<th>Administration Screen</th>
<th>Excluded from Confluence Administrator permission</th>
</tr>
</thead>
<tbody>
<tr>
<td>General Configuration</td>
<td>The following functionality is disallowed:</td>
</tr>
<tr>
<td></td>
<td>• Server Base URL</td>
</tr>
<tr>
<td></td>
<td>• Remote API plugin</td>
</tr>
<tr>
<td></td>
<td>• Public Signup</td>
</tr>
<tr>
<td></td>
<td>• Connection Timeouts</td>
</tr>
<tr>
<td>Security Configuration</td>
<td>The following functionality is disallowed:</td>
</tr>
<tr>
<td></td>
<td>• External user management</td>
</tr>
<tr>
<td></td>
<td>• Append wildcards to user and group searches</td>
</tr>
<tr>
<td></td>
<td>• Anti XSS Mode</td>
</tr>
<tr>
<td></td>
<td>• Enable Custom Stylesheets for Spaces</td>
</tr>
<tr>
<td></td>
<td>• Show system information on the 500 page</td>
</tr>
<tr>
<td></td>
<td>• Maximum RSS Items</td>
</tr>
<tr>
<td></td>
<td>• XSRF Protection</td>
</tr>
<tr>
<td>Plugins</td>
<td>The following functionality is disallowed:</td>
</tr>
<tr>
<td></td>
<td>• Upgrade</td>
</tr>
<tr>
<td></td>
<td>• Install</td>
</tr>
<tr>
<td></td>
<td>• Confluence Upgrade Check</td>
</tr>
<tr>
<td>Daily Backup Admin</td>
<td>This function is disallowed entirely.</td>
</tr>
<tr>
<td>Mail Servers</td>
<td>This function is disallowed entirely.</td>
</tr>
<tr>
<td>User Macros</td>
<td>This function is disallowed entirely.</td>
</tr>
<tr>
<td>Attachment Storage</td>
<td>This function is disallowed entirely.</td>
</tr>
<tr>
<td>Layouts</td>
<td>This function is disallowed entirely.</td>
</tr>
<tr>
<td>Custom HTML</td>
<td>This function is disallowed entirely.</td>
</tr>
<tr>
<td>Backup &amp; Restore</td>
<td>This function is disallowed entirely.</td>
</tr>
<tr>

<td>This function is disallowed entirely.</td>
</tr>
<tr>
<td>Cluster Configuration</td>
<td>This function is disallowed entirely.</td>
</tr>
<tr>
<td>Scheduled Jobs</td>
<td>This function is disallowed entirely.</td>
</tr>
</tbody>
</table>
Comparing the confluence-administrators group with the administrator permissions

The 'confluence-administrators' group defines a set of 'super-users' who can access the Confluence administration console and perform site-wide administration. Members of this group can also see the content of all pages and spaces in the Confluence instance, regardless of space permissions. They cannot immediately see the pages that exclude them via page restrictions without knowing the direct URL to the page. They can remove the page restrictions via the Space Administration screen if need be. For example, they will not see restricted pages displayed by the children macro. But they are able to access restricted pages directly using the page URL.

The settings on the 'Global Permissions' screen do not affect the powers allowed to members of the 'confluence-administrators' group.

Granting the 'System Administrator' or 'Confluence Administrator' permission to a user will not automatically grant the user access to all spaces in the site. These permissions will only give access to the administration console.

Be aware, however, that users with 'System Administrator' can add themselves to the 'confluence-administrators' group and become a super-user.

The Confluence Administrator permission and the 'confluence-administrators' group are not related. Going by the names, you would think the 'confluence-administrators' group and the 'Confluence Administrator' permission are related – but they are not. Granting a user or a group 'Confluence Administrator' permission is not the same as granting them membership of the 'confluence-administrators' group. Granting the 'Confluence Administrator' permission enables access to only a subset of the administrative functions. Granting membership to the 'confluence-administrators' group gives complete access.

Updating global permissions

To view the global permissions for a group or user:

1. Choose Browse > Confluence Admin.
2. Choose Global Permissions in the left-hand panel. The 'View Global Permissions' screen appears.

Add or edit group and user permissions as follows:

To add permissions for a group:

1. First add the group to Confluence, if you have not already done so.
2. Choose Edit Permissions. The 'Edit Global Permissions' screen appears.
3. Enter the group name in the Grant browse permission to box in the 'Groups' section. You can search for the group name.
4. Choose Add.
5. The group will appear in the list and you can now edit its permissions.

To add permissions for a specific user:
(Consider adding the user to a group and then assigning the permissions to the group, as described above, instead of assigning permissions to the specific user.)

1. First add the user to Confluence, if you have not already done so.
2. Choose Edit Permissions. The 'Edit Global Permissions' screen appears.
3. Enter the username in the Grant browse permission to box in the 'Individual Users' section. You can search for the username.
4. Choose Add.
5. The username will appear in the list and you can now edit its permissions.
To add or edit the permissions for a user or group:

1. Select, or clear, the check box under the relevant permission in the row for the relevant user/group. A selected check box indicates that the permission is granted.
2. To allow anonymous access to your Confluence site, select the 'Use Confluence' and 'View User Profile' options in the 'Anonymous Access' section. For more information about these permissions, refer to Setting up Public Access.
3. Choose Save All to save your changes.

</tbody>
</table>

Grant browse permission to [Add]

Anonymous Access

When a user is using Confluence while not logged in, they are using it anonymously. For example, Enabling anonymous 'USE' permission, allows non-logged-in users to browse pages and spaces in Confluence.

<table>
<thead>
<tr>
<th>Anonymous</th>
<th>Use Confluence</th>
<th>View User Profiles</th>
<th>Save All</th>
<th>Cancel</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>can use</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Error messages you may see

Confluence will let you know if there is a problem with some permissions. In rare situations, you may see the following error messages below a permission:

- 'User/Group not found' — This message may appear if your LDAP repository is unavailable, or if the user/group has been deleted after the permission was created.
- 'Case incorrect. Correct case is: xxxxxx' — This message may appear if the upper/lower case in the permission does not match the case of the username or group name. If you see a number of occurrences of this message, you should consider running the routine supplied to fix the problem.

Setting Up Public Access

You can enable anonymous access (also known as public access) to your Confluence site by granting the 'Use Confluence' permission to 'anonymous' users. An 'anonymous' user is someone who has not logged in to the Confluence site. The 'Use Confluence' permission is also called 'can use'.

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
This user category gives you an easy way to administer users who have not logged into the site. Permissions assigned to this category apply to all anonymous users of the site.

**Enabling anonymous access to the site**

If you want to make your site visible to everyone, including people who have not logged in, you must enable anonymous access at site level.

**To enable anonymous access to your site:**

1. Choose **Browse > Confluence Admin**.
2. Choose **Global Permissions** in the left-hand panel.
3. Choose **Edit Permissions**.
4. In the 'Anonymous Access' section, select the **can use** check box to enable anonymous access to the content on your site.
5. If you want to allow anonymous users to see **user profiles**, select the check box in the **View User Profiles** section.
   
   **Note:** You must grant the 'can use' permission as well, if you want to grant the 'View User Profiles' permission.
6. Choose **Save All**.

---

**Disabling anonymous access to the site**

To disable anonymous access to your site, deselect the **can use** check box, then choose **Save All**. People will not be able to see the content on the site until they have logged in.

**Granting public access to a space**

To enable public access to a Confluence space, you must grant the following permissions to anonymous users:

- The site-wide 'can use' permission, as described above.
- The relevant **space permissions**. If you want a space to be publicly accessible, the anonymous user must have at least the 'View Space' permission. To set space permissions, choose **Browse > Space Admin > Permissions**.

**Notes**

- **We severely warn against** giving anonymous users any administrative privileges, either within a space, or especially over the Confluence site. Giving administrative privileges to untrusted users may lead to a serious security compromise of your site.
- You can allow people to sign up for usernames themselves, and choose other options for user signup and
Configuring User Directories

A user directory is a place where you store information about users and groups. User information includes the person's full name, username, password, email address and other personal information. Group information includes the name of the group, the users that belong to the group, and possibly groups that belong to other groups.

The **internal** directory stores user and group information in the Confluence database. You can also connect to **external** user directories, and to Atlassian **Crowd** and **JIRA** as directory managers.

### On this page:
- Configuring User Directories in Confluence
- Connecting to a Directory
- Updating Directories

⚠️ The information on this page does not apply to Confluence OnDemand.

### Configuring User Directories in Confluence

To configure your Confluence user directories:

1. Choose **Browse > Confluence Admin**.
2. Click ‘**User Directories**’ in the left-hand panel.

### Connecting to a Directory

You can add the following types of directory servers and directory managers:

- Confluence's internal directory. See Configuring the Internal Directory.
- Various other LDAP directory servers. See Connecting to an LDAP Directory.
- An LDAP directory for delegated authentication. See Connecting to an Internal Directory with LDAP Authentication.
- Atlassian Crowd. See Connecting to Crowd or JIRA for User Management.
- Atlassian JIRA 4.3 or later. See Connecting Confluence to JIRA for User Management.
- Atlassian JIRA 4.2 or earlier, using the legacy database connection. See Connecting to JIRA 4.2 or Earlier for User Management.

You can add as many external user directories as you need. Note that you can define the **order** of the directories. This determines which directory Confluence will search first, when looking for user and group information. See Managing Multiple Directories.

### Updating Directories

#### Limitations when Editing Directories

You cannot edit, disable or remove the directory your user belongs to. This precaution is designed to prevent administrators from locking themselves out of the application by changing the directory configuration in a way that prevents them logging in or removes their administration permissions.

This limitation applies to all directory types. For example:

- You cannot disable the internal directory if your user is an internal user.
- You cannot disable or remove an LDAP or a Crowd directory if your user comes from that directory.
In some situations, reordering the directories will change the directory that the current user comes from, if a user with the same username happens to exist in both. This behaviour can be used in some cases to create a copy of the existing configuration, move it to the top, then remove the old one. Note, however, that duplicate usernames are not a supported configuration.

You cannot remove the internal directory. This precaution aligns with the recommendation below that you always keep an administrator account active in the internal directory.

**Recommendations**

The recommended way to edit directory configurations is to log in as an internal user when making changes to external directory configuration.

⚠️ We recommend that you keep either an administrator or system administrator user active in your internal directory for troubleshooting problems with your user directories.

**Enabling, Disabling and Removing Directories**

You can enable or disable a directory at any time. If you disable a directory, your configuration details will remain but the application will not recognise the users and groups in that directory.

You have to disable a directory before you can remove it. Removing a directory will remove the details from the database.

Configuring the Internal Directory

The internal directory stores user and group information in the Confluence database.

Overview

The internal directory is enabled by default at installation. When you create the first administrator during the setup procedure, that administrator's username and other details are stored in the internal directory.

If needed, you can configure one or more additional user directories. This is useful if you want to grant access to users and groups that are stored in a corporate directory or other directory server.

Connecting to an LDAP Directory

You can connect your Confluence application to an LDAP directory for authentication, user and group management.

Overview

An LDAP directory is a collection of data about users and groups. LDAP (Lightweight Directory Access Protocol) is an Internet protocol that web applications can use to look up information about those users and groups from the LDAP server.

We provide built-in connectors for the most popular LDAP directory servers:

- Microsoft Active Directory
- Apache Directory Server (ApacheDS)
- Apple Open Directory
- Fedora Directory Server
- Novell eDirectory
- OpenDS
- OpenLDAP
- OpenLDAP Using Posix Schema
- Posix Schema for LDAP
- Sun Directory Server Enterprise Edition (DSEE)
- A generic LDAP directory server

When to use this option: Connecting to an LDAP directory server is useful if your users and groups are stored in a corporate directory. When configuring the directory, you can choose to make it read only, read only with local groups, or read/write. If you choose read/write, any changes made to user and group information in the application will also update the LDAP directory.

Connecting to an LDAP Directory in Confluence

To connect Confluence to an LDAP directory:

1. Choose Browse > Confluence Admin.
2. Click User Directories in the left-hand panel.
3. Add a directory and select one of these types:
   - Microsoft Active Directory – This option provides a quick way to select AD, because it is the most popular LDAP directory type.
   - LDAP – You will be able to choose a specific LDAP directory type on the next screen.
4. Enter the values for the settings, as described below.
5. Save the directory settings.
6. Define the directory order by clicking the blue up- and down-arrows next to each directory on the 'User Directories' screen. Here is a summary of how the directory order affects the processing:
   - The order of the directories is the order in which they will be searched for users and groups.
   - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

For details see Managing Multiple Directories.

<tr>
<td></td>
<td>• ou=Users</td>
</tr>
</tbody>
</table>
### Additional Group DN

This value is used in addition to the base DN when searching and loading groups. If no value is supplied, the subtree search will start from the base DN.

Example:
- `ou=Groups`

### Permission Settings

**Note:** You can only assign LDAP users to local groups when 'External Management User Management' is not selected.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read Only</td>
<td>LDAP users, groups and memberships are retrieved from your directory server and can only be modified via your directory server. You cannot modify LDAP users, groups or memberships via the application administration screens.</td>
</tr>
<tr>
<td>Read Only, with Local Groups</td>
<td>LDAP users, groups and memberships are retrieved from your directory server and can only be modified via your directory server. You cannot modify LDAP users, groups or memberships via the application administration screens. However, you can add groups to the internal directory and add LDAP users to those groups.</td>
</tr>
<tr>
<td>Read/Write</td>
<td>LDAP users, groups and memberships are retrieved from your directory server. When you modify a user, group or membership via the application administration screens, the changes will be applied directly to your LDAP directory server. Please ensure that the LDAP user specified for the application has modification permissions on your LDAP directory server.</td>
</tr>
</tbody>
</table>

### Adding Users to Groups Automatically

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
**Default Group Memberships**

*Option available in Confluence 3.5 and later, and JIRA 4.3.3 and later.* This field appears if you select the 'Read Only, with Local Groups' permission. If you would like users to be automatically added to a group or groups, enter the group name(s) here. To specify more than one group, separate the group names with commas.

*In Confluence 3.5 to Confluence 3.5.1:* Each time a user logs in, their group memberships will be checked. If the user does not belong to the specified group(s), their username will be added to the group(s). If a group does not yet exist, it will be added locally.

*In Confluence 3.5.2 and later, and JIRA 4.3.3 and later:* The first time a user logs in, their group memberships will be checked. If the user does not belong to the specified group(s), their username will be added to the group(s). If a group does not yet exist, it will be added locally. On subsequent logins, the username will not be added automatically to any groups. This change in behaviour allows users to be removed from automatically-added groups. In Confluence 3.5 and 3.5.1, they would be re-added upon next login.

Please note that there is no validation of the group names. If you mis-type the group name, authorisation failures will result – users will not be able to access the applications or functionality based on the intended group name.

**Examples:**
- confluence-users
- confluence-users,jira-users,jira-developers

### Advanced Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Nested Groups</td>
<td>Enable or disable support for nested groups. Some directory servers allow you to define a group as a member of another group. Groups in such a structure are called 'nested groups'. If you are using groups to manage permissions, you can create nested groups to allow inheritance of permissions from one group to its sub-groups.</td>
</tr>
<tr>
<td>Setting</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Use Paged Results</td>
<td>Enable or disable the use of the LDAP control extension for simple paging of search results. If paging is enabled, the search will retrieve sets of data rather than all of the search results at once. Enter the desired page size – that is, the maximum number of search results to be returned per page when paged results are enabled. The default is 1000 results.</td>
</tr>
<tr>
<td>Follow Referrals</td>
<td>Choose whether to allow the directory server to redirect requests to other servers. This option uses the node referral (JNDI lookup <code>java.naming.referral</code>) configuration setting. It is generally needed for Active Directory servers configured without proper DNS, to prevent a <code>javax.naming.PartialResultException: Unprocessed Continuation Reference(s)</code> error.</td>
</tr>
</tbody>
</table>
| Naive DN Matching               | If your directory server will always return a consistent string representation of a DN, you can enable naive DN matching. Using naive DN matching will result in a significant performance improvement, so we recommend enabling it where possible. This setting determines how your application will compare DNs to determine if they are equal.  
  
  - If this check box is ticked, the application will do a direct, case-insensitive, string comparison. This is the default and recommended setting for Active Directory, because Active Directory guarantees the format of DNs.  
  - If this check box is not ticked, the application will parse the DN and then check the parsed version. |
| Enable Incremental Synchronisation | Enable incremental synchronisation if you only want changes since the last synchronisation to be queried when synchronising a directory.  
  
  **WARNING**: Please be aware that when using this option, the user account configured for synchronisation must have read access to:  
  
  - The `uSNChanged` attribute of all users and groups in the directory that need to be synchronised.  
  - The objects and attributes in the Active Directory deleted objects container (see Microsoft's Knowledge Base Article No. 892806 for details).  
  
  If at least one of these conditions is not met, you may end up with users who are added to (or deleted from) the Active Directory not being respectively added (or deleted) in JIRA. |
### Synchronisation Interval (minutes)
Synchronisation is the process by which the application updates its internal store of user data to agree with the data on the directory server. The application will send a request to your directory server every x minutes, where ‘x’ is the number specified here. The default value is 60 minutes.

### Read Timeout (seconds)
The time, in seconds, to wait for a response to be received. If there is no response within the specified time period, the read attempt will be aborted. A value of 0 (zero) means there is no limit. The default value is 120 seconds.

### Search Timeout (seconds)
The time, in seconds, to wait for a response from a search operation. A value of 0 (zero) means there is no limit. The default value is 60 seconds.

### Connection Timeout (seconds)
This setting affects two actions. The default value is 0.
- The time to wait when getting a connection from the connection pool. A value of 0 (zero) means there is no limit, so wait indefinitely.
- The time, in seconds, to wait when opening new server connections. A value of 0 (zero) means that the TCP network timeout will be used, which may be several minutes.

### User Schema Settings

<table>
<thead>

</tbody>
</table>

*Diagrams of Some Possible Configurations*
Diagram above: Confluence connecting to an LDAP directory.

Diagram above: Confluence connecting to an LDAP directory with permissions set to read only and local groups.

Notes
Currently there is a bug which causes a system error if the username and password are not correct. This also happens if you are accessing anonymously, but the directory server does not support anonymous access. If you get a system error message, try checking the username and password credentials. You can watch this issue to see updates on this bug: [CONF-25961 - Authenticate](#) to see issue details

**Configuring the LDAP Connection Pool**

When connection pooling is enabled, the LDAP directory server maintains a pool of connections and assigns them as needed. When a connection is closed, the directory server returns the connection to the pool for future use. This can improve performance significantly.

**To configure your LDAP connection pool:**

1. Choose *Browse > Confluence Admin*.
2. Click *User Directories* in the left-hand panel.
3. Click *LDAP Connection Pool Configuration* in the 'Additional Configuration' section.

---

The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initial Pool Size</td>
<td>The number of LDAP connections created when initially connecting to the pool.</td>
<td>1</td>
</tr>
<tr>
<td>Preferred Pool Size</td>
<td>The optimal pool size. LDAP will remove idle connections when the number of connections grows larger than this value. A value of 0 (zero) means that there is no preferred size, so the number of idle connections is unlimited.</td>
<td>10</td>
</tr>
<tr>
<td>Maximum Pool Size</td>
<td>The maximum number of connections. When the number of connections reaches this value, LDAP will refuse further connections. As a result, requests made by an application to the LDAP directory server will be blocked. A value of 0 (zero) means that the number of connections is unlimited.</td>
<td>0</td>
</tr>
<tr>
<td>Pool Timeout (seconds)</td>
<td>The length of time, in seconds, that a connection may remain idle before being removed from the pool. When the application is finished with a pooled connection, the connection is marked as idle, waiting to be reused. A value of 0 (zero) means that the idle time is unlimited, so connections will never be timed out.</td>
<td>30</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
<td>----</td>
</tr>
</tbody>
</table>
| Pool Protocol         | Only these protocol types will be allowed to connect to the LDAP directory server. If you want to allow multiple protocols, enter the values separated by a space. Valid values are: | plain ssl  
(Both plain and ssl) |
|                       | • plain  
• ssl |
| Pool Authentication   | Only these authentication types will be allowed to connect to the LDAP directory server. If you want to allow multiple authentication types, enter the values separated by a space. See [RFC 2829](https://tools.ietf.org/html/rfc2829) for details of LDAP authentication methods. Valid values are: | simple |
|                       | • none  
• simple  
• DIGEST-MD5 |

Notes:

- The connection pool settings are system wide and will be used to create a new connection pool for every configured LDAP directory server.
- You must restart your application server for these settings to take effect.

**RELATED TOPICS**

- [Connecting to an LDAP Directory](#)
- [Configuring User Directories](#)
- [Configuring an SSL Connection to Active Directory](#)

If you want to configure a read/write connection with Microsoft Active Directory, you will need to install an SSL certificate, generated by your Active Directory server, onto your Confluence server and then install the certificate into your JVM keystore.
On this page:

- Prerequisites
- Step 1. Install the Active Directory Certificate Services
- Step 2. Obtain the Server Certificate
- Step 3. Import the Server Certificate

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Updating user, group, and membership details in Active Directory requires that your Atlassian application be running in a JVM that trusts the AD server. To do this, we generate a certificate on the Active Directory server, then import it into Java’s keystore.

Prerequisites

To generate a certificate, you need the following components installed on the Windows Domain Controller to which you’re connecting.

<table>
<thead>
<tr>
<th>Required Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internet Information Services (IIS)</td>
<td>This is required before you can install Windows Certificate Services.</td>
</tr>
<tr>
<td>Windows Certificate Services</td>
<td>This installs a certification authority (CA) which is used to issue certificates. Step 1, below, explains this process.</td>
</tr>
</tbody>
</table>

Step 1. Install the Active Directory Certificate Services

If Certificate Services are already installed, skip to step 2, below. The screenshots below are from Server 2008, but the process is similar for Server 2000 and 2003.

1. Log in to your Active Directory server as an administrator.
2. Click **Start**, point to **Administrative Tools**, and then click **Server Manager**.
3. In the **Roles Summary** section, click **Add Roles**.

5. On the Select Role Services page, select the Certification Authority check box, and then click Next.
6. On the **Specify Setup Type** page, click **Enterprise**, and then click **Next**.

7. On the **Specify CA Type** page, click **Root CA**, and then click **Next**.
8. On the **Set Up Private Key** and **Configure Cryptography for CA** pages, you can configure optional configuration settings, including cryptographic service providers. However, the default values should be fine. Click **Next** twice.

9. In the **Common name for this CA** box, type the common name of the CA, and then click **Next**.
10. On the **Set Validity Period** page, accept the default values or specify other storage locations for the certificate database and the certificate database log, and then click **Next**.
11. After verifying the information on the Confirm Installation Selections page, click Install.
12. Review the information on the results screen to verify that the installation was successful.

---

Step 2. Obtain the Server Certificate
The steps above describe how to install the certification authority (CA) on your Microsoft Active Directory server. Next, you will need to add the Microsoft Active Directory server’s SSL certificate to the list of accepted certificates used by the JDK that runs your application server.

The Active Directory certificate is automatically generated and placed in root of the C:\ drive, matching a file format similar to the tree structure of your Active Directory server. For example: c:\ad2008.ad01.atlassian.com_ad01.crt.

You can also export the certificate by executing this command on the Active Directory server:

```
certutil -ca.cert client.crt
```

Step 3. Import the Server Certificate

For an application server to trust your directory's certificate, the certificate must be imported into your Java runtime environment. The JDK stores trusted certificates in a file called a keystore. The default keystore file is called cacerts and it lives in the jre\lib\security sub-directory of your Java installation.

In the following examples, we use server-certificate.crt to represent the certificate file exported by your directory server. You will need to alter the instructions below to match the name actually generated.

Windows

1. Navigate to the directory in which Java is installed. It's probably called something like C:\Program Files\Java\jdk1.5.0_12.
2. Run the command below, where server-certificate.crt is the name of the file from your directory server:

```
keytool -import -keystore .\jre\lib\security\cacerts -file server-certificate.crt
```

3. keytool will prompt you for a password. The default keystore password is changeit.
4. When prompted Trust this certificate? [no]: enter yes to confirm the key import:

```
Enter keystore password: changeit
Owner: CN=ad01, C=US
Issuer: CN=ad01, C=US
Serial number: 15563d6677a4e9e4582d8a84be683f9
Valid from: Tue Aug 21 01:10:46 ACT 2007 until: Tue Aug 21 01:13:59
ACT 2012
Certificate fingerprints:
Trust this certificate? [no]: yes
Certificate was added to keystore
```

You may now use the 'Secure SSL' option when connecting your application to your directory server.

UNIX

1. Navigate to the directory in which Java is installed. cd $JAVA_HOME will usually get you there.
2. Run the command below, where `server-certificate.crt` is the name of the file from your directory server:

```
sudo keytool -import -keystore ./jre/lib/security/cacerts -file server-certificate.crt
```

3. `keytool` will prompt you for a password. The default keystore password is `changeit`.

4. When prompted Trust this certificate? [no]: enter yes to confirm the key import:

```
Password:
Enter keystore password: changeit
Owner: CN=ad01, C=US
Issuer: CN=ad01, C=US
Serial number: 15563d6677a4e9e4582d8a84be683f9
Certificate fingerprints:
  SHA1:
Trust this certificate? [no]: yes
Certificate was added to keystore
```

You may now use the 'Secure SSL' option when connecting your application to your directory server.

**Mac OS X**

1. Navigate to the directory in which Java is installed. This is usually `/Library/Java/Home`.
2. Run the command below, where `server-certificate.crt` is the name of the file from your directory server:

```
sudo keytool -import -keystore ./jre/lib/security/cacerts -file server-certificate.crt
```

3. `keytool` will prompt you for a password. The default keystore password is `changeit`.

4. When prompted Trust this certificate? [no]: enter yes to confirm the key import:
Password:
Enter keystore password: changeit
Owner: CN=ad01, C=US
Issuer: CN=ad01, C=US
Serial number: 15563d6677a4e9e4582d8a84be683f9
Valid from: Tue Aug 21 01:10:46 ACT 2007 until: Tue Aug 21 01:13:59
ACT 2012
Certificate fingerprints:
   SHA1:
Trust this certificate? [no]:  yes
Certificate was added to keystore

You may now use the ‘Secure SSL’ option when connecting your application to your directory server.

RELATED TOPICS

Connecting to an LDAP Directory
Configuring User Directories

Connecting to an Internal Directory with LDAP Authentication
You can connect your Confluence application to an LDAP directory for delegated authentication. This means that Confluence will have an internal directory that uses LDAP for authentication only. There is an option to create users in the internal directory automatically when they attempt to log in, as described in the settings section.

Overview
An internal directory with LDAP authentication offers the features of an internal directory while allowing you to store and check users' passwords in LDAP only. Note that the 'internal directory with LDAP authentication' is separate from the default 'internal directory'. On LDAP, all that the application does is to check the password. The LDAP connection is read only. Every user in the internal directory with LDAP authentication must map to a user on LDAP, otherwise they cannot log in.

When to use this option: Choose this option if you want to set up a user and group configuration within your application that suits your needs, while checking your users' passwords against the corporate LDAP directory. This option also helps to avoid the performance issues that may result from downloading large numbers of groups from LDAP.
Connecting Confluence to an Internal Directory with LDAP Authentication

To connect to an internal directory but check logins via LDAP:

1. Choose Browse > Confluence Admin.
2. Click 'User Directories' in the left-hand panel.
3. Add a directory and select type 'Internal with LDAP Authentication'.
4. Enter the values for the settings, as described below.
5. Save the directory settings.
6. If you want LDAP users to be used in place of existing internal users, move the 'Internal with LDAP Authentication' directory to the top of the list. You can define the directory order by clicking the blue up- and down-arrows next to each directory on the ‘User Directories’ screen. Here is a summary of how the directory order affects the processing:
   - The order of the directories is the order in which they will be searched for users and groups.
   - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

   For details see Managing Multiple Directories.
7. Add your users and groups in Confluence. See Adding and Inviting Users and Managing Site-Wide Permissions and Groups.

Server Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name that will help you to identify the directory. Examples:</td>
</tr>
<tr>
<td></td>
<td>• Internal directory with LDAP Authentication</td>
</tr>
<tr>
<td></td>
<td>• Corporate LDAP for Authentication Only</td>
</tr>
</tbody>
</table>
| Directory Type | Select the type of LDAP directory that you will connect to. If you are adding a new LDAP connection, the value you select here will determine the default values for some of the options on the rest of screen. Examples:  
| | • Microsoft Active Directory  
| | • OpenDS  
| | • And more.  
| Hostname | The host name of your directory server. Examples:  
| | • ad.example.com  
| | • ldap.example.com  
| | • opens.example.com  
| Port | The port on which your directory server is listening. Examples:  
| | • 389  
| | • 10389  
| | • 636 (for example, for SSL)  
| Use SSL | Select this check box if the connection to the directory server is an SSL (Secure Sockets Layer) connection. Note that you will need to configure an SSL certificate in order to use this setting.  
| Username | The distinguished name of the user that the application will use when connecting to the directory server. Examples:  
| | • cn=administrator,cn=users,dc=ad,dc=example,dc=com  
| | • cn=user,dc=domain,dc=name  
| | • user@domain.name  
| Password | The password of the user specified above.  
| Copying Users on Login |  
| Setting | Description |
| **Copy User on Login** | This option affects what will happen when a user attempts to log in. If this check box is selected, the user will be created automatically in the internal directory that is using LDAP for authentication when the user first logs in and their details will be synchronised on each subsequent log in. If this check box is not selected, the user’s login will fail.

If you select this check box the following additional fields will appear on the screen, which are described in more detail below:

- Default Group Memberships
- Synchronise Group Memberships
- User Schema Settings (described in a separate section below) |

| **Default Group Memberships** | This field appears if you select the **Copy User on Login** check box. If you would like users to be automatically added to a group or groups, enter the group name(s) here. To specify more than one group, separate the group names with commas. Each time a user logs in, their group memberships will be checked. If the user does not belong to the specified group(s), their username will be added to the group(s). If a group does not yet exist, it will be added to the internal directory that is using LDAP for authentication.

Please note that there is no validation of the group names. If you mis-type the group name, authorisation failures will result – users will not be able to access the applications or functionality based on the intended group name.

Examples:

- confluence-users
- confluence-users,jira-users,jira-developers |

| **Synchronise Group Memberships** | This field appears if you select the **Copy User on Login** check box. If this check box is selected, group memberships specified on your LDAP server will be synchronised with Confluence each time the user logs in.

If you select this check box the following additional fields will appear on the screen, both described in more detail below:

- Group Schema Settings (described in a separate section below)
- Membership Schema Settings (described in a separate section below) |

**Schema Settings**
Setting | Description
--- | ---
**Base DN** | The root distinguished name (DN) to use when running queries against the directory server. Examples:
- `o=example,c=com`
- `cn=users,dc=ad,dc=example,dc=com`
- For Microsoft Active Directory, specify the base DN in the following format: `dc=domain1,dc=local`. You will need to replace the `domain1` and `local` for your specific configuration. Microsoft Server provides a tool called `ldp.exe` which is useful for finding out and configuring the the LDAP structure of your server.

**User Name Attribute** | The attribute field to use when loading the username. Examples:
- `cn`
- `sAMAccountName`

### Advanced Settings

<table>

<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use Paged Results</td>
<td>Enable or disable the use of the LDAP control extension for simple paging of search results. If paging is enabled, the search will retrieve sets of data rather than all of the search results at once. Enter the desired page size – that is, the maximum number of search results to be returned per page when paged results are enabled. The default is 1000 results.</td>
</tr>
<tr>
<td>Follow Referrals</td>
<td>Choose whether to allow the directory server to redirect requests to other servers. This option uses the node referral (JNDI lookup <code>java.naming.referral</code>) configuration setting. It is generally needed for Active Directory servers configured without proper DNS, to prevent a <code>javax.naming.PartialResultException: Unprocessed Continuation Reference(s)</code> error.</td>
</tr>
</tbody>
</table>

### User Schema Settings

Note: this section is only visible when **Copy User on Login** is enabled.
### Additional User DN
This value is used in addition to the base DN when searching and loading users. If no value is supplied, the subtree search will start from the base DN.

Example:
- `ou=Users`

### User Object Class
This is the name of the class used for the LDAP user object. Example:
- `user`

### User Object Filter
The filter to use when searching user objects.

Example:
- `(&(objectCategory=Person)(sAMAccountName=*))`

### User Name RDN Attribute
The RDN (relative distinguished name) to use when loading the username. The DN for each LDAP entry is composed of two parts: the RDN and the location within the LDAP directory where the record resides. The RDN is the portion of your DN that is not related to the directory tree structure. Example:
- `cn`

### User First Name Attribute
The attribute field to use when loading the user's first name. Example:
- `givenName`

### User Last Name Attribute
The attribute field to use when loading the user's last name. Example:
- `sn`

### User Display Name Attribute
The attribute field to use when loading the user's full name. Example:
- `displayName`

### User Email Attribute
The attribute field to use when loading the user's email address. Example:
- `mail`

### Group Schema Settings

Note: this section is only visible when both **Copy User on Login** and **Synchronise Group Memberships** are enabled.

![The information on this page does not apply to Confluence OnDemand.]

Connecting Confluence to Crowd for User Management

Atlassian Crowd is an application security framework that handles authentication and authorisation for your web-based applications. With Crowd you can integrate multiple web applications and user directories, with support for single sign-on (SSO) and centralised identity management. The Crowd Administration Console provides a web interface for managing directories, users and their permissions. See the Crowd Administration Guide.

When to use this option: Connect to Crowd if you want to use the full Crowd functionality to manage your directories, users and groups. You can connect your Crowd server to a number of directories of all types that Crowd supports, including custom directory connectors.

To connect Confluence to Crowd:

1. Go to your Crowd Administration Console and define the Confluence application to Crowd. See the Crowd documentation: Adding an Application.
2. Choose Browse > Confluence Admin.
3. Click ‘User Directories’ in the left-hand panel.
4. Add a directory and select type ‘Atlassian Crowd’. Enter the settings as described below.
5. Save the directory settings.
6. Define the directory order by clicking the blue up- and down-arrows next to each directory on the ‘User Directories’ screen. Here is a summary of how the directory order affects the processing:
   - The order of the directories is the order in which they will be searched for users and groups.
   - Changes to users and groups will be made only in the first directory where the application has permission to make changes.
   - For details see Managing Multiple Directories.
7. If required, configure Confluence to use Crowd for single sign-on (SSO) too. See the Crowd documentation: Integrating Crowd with Atlassian Confluence.
### Crowd Settings in Confluence

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| Name          | A meaningful name that will help you to identify this Crowd server amongst your list of directory servers. Examples:  
  - Crowd Server
  - Example Company Crowd |
| Server URL    | The web address of your Crowd console server. Examples:  
  - http://www.example.com:8095/crowd/  
  - http://crowd.example.com |
| Application Name | The name of your application, as recognised by your Crowd server. Note that you will need to define the application in Crowd too, using the Crowd administration Console. See the Crowd documentation on [adding an application](http://crowd.example.com). |
| Application Password | The password which the application will use when it authenticates against the Crowd framework as a client. This must be the same as the password you have registered in Crowd for this application. See the Crowd documentation on [adding an application](http://crowd.example.com). |

#### Crowd Permissions

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read Only</td>
<td>The users, groups and memberships in this directory are retrieved from Crowd and can only be modified via Crowd. You cannot modify Crowd users, groups or memberships via the application administration screens.</td>
</tr>
<tr>
<td>Read/Write</td>
<td>The users, groups and memberships in this directory are retrieved from Crowd. When you modify a user, group or membership via the application administration screens, the changes will be applied directly to Crowd. Please ensure that the application has modification permissions for the relevant directories in Crowd. See the Crowd documentation: <a href="http://crowd.example.com">Specifying an Application’s Directory Permissions</a>.</td>
</tr>
</tbody>
</table>

#### Advanced Crowd Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
### Enable Nested Groups

Enable or disable support for nested groups. Before enabling nested groups, please check to see if the user directory or directories in Crowd support nested groups. When nested groups are enabled, you can define a group as a member of another group. If you are using groups to manage permissions, you can create nested groups to allow inheritance of permissions from one group to its sub-groups.

### Synchronisation Interval (minutes)

Synchronisation is the process by which the application updates its internal store of user data to agree with the data on the directory server. The application will send a request to your directory server every x minutes, where x is the number specified here. The default value is 60 minutes.

---

**Connecting Confluence to JIRA for User Management**

Note that the license tiers for JIRA and Confluence do not need to match to use this feature. For example, you can manage a Confluence 50 user license with JIRA, even if JIRA only has a 25 user license.

Subject to certain limitations, you can connect a number of Atlassian web applications to a single JIRA server for centralised user management.

**When to use this option:** You can only connect to a server running JIRA 4.3 or later. Choose this option as an alternative to Atlassian Crowd, for simple configurations with a limited number of users.

**If you are running JIRA 4.2 or earlier, please see [Connecting to JIRA 4.2 or Earlier for User Management](#).**

**To connect Confluence to JIRA 4.3 or later:**

1. Go to your JIRA administration screen and define the Confluence application to JIRA:
   - For JIRA 4.3.x, select 'Other Applications' from the 'Users, Groups & Roles' section of the 'Administration' menu.
   - For JIRA 4.4 or later, select 'Users' > 'JIRA User Server' in Administration mode.
   - Click 'Add Application'.
   - Enter the **application name** and **password** that Confluence will use when accessing JIRA.
   - Enter the **IP address** or addresses of your Confluence server. Valid values are:
     - A full IP address, e.g. 192.168.10.12.
     - A wildcard IP range, using CIDR notation, e.g. 192.168.10.1/16. For more information, see the introduction to [CIDR notation on Wikipedia](https://en.wikipedia.org/wiki/CIDR_notation) and [RFC 4632](https://tools.ietf.org/html/rfc4632).
   - **Save** the new application.
2. Set up the JIRA user directory in Confluence:
   - Choose **Browse > Confluence Admin**.
   - Click 'User Directories' in the left-hand panel.
   - **Add** a directory and select type 'Atlassian JIRA'.
   - Enter the settings as described below. When asked for the **application name** and **password**, enter the values that you defined for your Confluence application in the settings on JIRA.
   - **Save** the directory settings.
   - Define the **directory order** by clicking the blue up- and down-arrows next to each directory on the 'User Directories' screen. Here is a summary of how the directory order affects the processing:
     - The order of the directories is the order in which they will be searched for users and groups.
• Changes to users and groups will be made only in the first directory where the application has permission to make changes.

For details see Managing Multiple Directories.

3. In order to use Confluence, users must be a member of the confluence-users group or have Confluence 'can use' permission. Follow these steps to configure your Confluence groups in JIRA:
   a. Add the confluence-users and confluence-administrators groups in JIRA.
   b. Add your own username as a member of both of the above groups.
   c. Choose one of the following methods to give your existing JIRA users access to Confluence:
      • Option 1: In JIRA, find the groups that the relevant users belong to. Add the groups as members of one or both of the above Confluence groups.
      • Option 2: Log in to Confluence using your JIRA account and go to the Confluence Administration Console. Click ‘Global Permissions’ and assign the ‘can use’ permission to the relevant JIRA groups.

### JIRA Settings in Confluence

Diagram above: Confluence connecting to JIRA for user management, with JIRA in turn connecting to LDAP.

**RELATED TOPICS**

- Configuring User Directories
  - Configuring the Internal Directory
Reverting from Crowd or JIRA to Internal User Management

If your Confluence site currently uses JIRA or Crowd for user management, you can revert to internal user management as described below. If your Confluence instance has only a few users, it is easier to recreate the users and groups in Confluence manually. If you have a large number of users and groups, it is more efficient to migrate the relevant users and groups into the Confluence Internal directory.

Both options provided below will reset the affected users’ passwords. When done, be sure to notify them to use the ‘Reset My Password’ link on the Confluence log in page before they attempt to log in.

On this page:
- Option 1 – Manually Recreate Users and Groups in Confluence
- Option 2 – Transfer Crowd/JIRA Users and Groups to the Confluence Database

The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Option 1 – Manually Recreate Users and Groups in Confluence

Use this option if you have only a few users and groups.

1. Log in to Confluence as a Confluence system administrator.
2. Go to the user directories administration screen and move the internal directory to the top of the list of directories, by clicking the arrows in the 'Order' column.
3. Make sure that you have at least one user from the internal directory in each of the confluence-users and confluence-administrators groups.
4. Make sure that you have a username in the internal directory with Confluence system administrator permissions.
   - If you do not have such a user, add a new one now, and log out of Confluence.
   - Log back in as the user you just added, and go back to the user directories administration screen.
5. Disable the 'Atlassian Crowd' directory.
6. Manually add the required users and groups in Confluence. They will be added to the internal directory, because you have moved it to the top of the list of directories.
   - If you have assigned Confluence permissions to a group which exists in JIRA, you must create a group in Confluence with the same name.
   - If a user who exists in JIRA has created content or has had permissions assigned to them in Confluence, you must also create that user in Confluence.
7. Add the users to the required groups.

Option 2 – Transfer Crowd/JIRA Users and Groups to the Confluence Database
Use this option to migrate External Application (Crowd or JIRA) users into the Confluence database. You need a knowledge of SQL to perform this task.

The SQL commands given below are tailored for MySQL. If you are using a database other than MySQL, you will need to modify the SQL to work in your database.

**Step 1. Create Backups**

Creating backups is the only way to restore your data if something goes wrong.

1. From Confluence, create a full XML site backup including attachments.
2. Stop Confluence.
3. Make a backup copy of the Confluence home and installation directories.
4. Repeat the above steps for your External Application.
5. From your MySQL administration tool, create a database backup for the Crowd/JIRA and Confluence databases.

**Step 2. Replace Confluence User Management**

Use the SQL below to move groups and users from your External Application to Confluence by transferring table content. The SQL provided is specific to MySQL and must be modified for other databases.

**Find the IDs for your Directories**

1. Run the following command and take note of the resulting number. It will be referenced throughout the following instructions as <Confluence Internal ID>.

```
select id from cwd_directory where directory_name='Confluence Internal Directory';
```

2. From the User Directories administration page, find the name of the directory who's users/groups you want to move. Run the following command and take note of the resulting number. It will be referenced throughout the following instructions as <External Application ID>.

```
select id from cwd_directory where directory_name='<External Directory Name>';
```

**Move Groups to Confluence**

1. It is possible that you have several groups in your Internal Directory that have the same name as groups in your External Application. To find these, run:

```
select distinct a.id, a.directory_id, a.group_name, d.directory_name from cwd_group a join cwd_group b on a.group_name=b.group_name join cwd_directory d on d.id=a.directory_id where a.directory_id != b.directory_id;
```

   a. If you have results from the previous query, for each of the group names that have duplicates, find the id for the group in the Confluence Internal Directory (<internal group id>) and the External Application (<external group id>). Run the following:
update cwd_group_attribute set group_id=<internal group id>,
directory_id=<Confluence Internal Id> where group_id=<external group id>
update cwd_membership set child_group_id=<internal group id> where
child_group_id=<external group id>
update cwd_membership set parent_id=<internal group id> where
parent_id=<external group id>
delete from cwd_group where id=<external group id>

2. Move all the groups in the External Application to the Confluence Internal Directory.

update cwd_group set directory_id=<Confluence Internal ID> where
directory_id=<External Application ID>

Move Users to Confluence

1. It is possible that you have several users in your Internal Directory that have the same name as users in your External Application. To find these, run:

select distinct a.id, a.directory_id, a.user_name, d.directory_name from
cwd_user a join cwd_user b on a.user_name=b.user_name join cwd_directory d
on d.id=a.directory_id where a.directory_id != b.directory_id;

a. If you have results from the previous query, for each of the user names that have duplicates, find the id for the user in the Confluence Internal Directory (<internal user id>) and the External Application (<external user id>). Run the following:

update cwd_membership set child_user_id=<internal user id> where
child_user_id=<external user id>
update cwd_user_credential_record set user_id=<internal user id>
where user_id=<external user id>
update cwd_user_attribute set user_id=<internal user id>,
directory_id=<Confluence Internal ID> where user_id=<external user id>
delete from cwd_user where id=<external user id>

update cwd_user set directory_id=<Confluence Internal ID> where
directory_id=<External Application ID>

Delete the External Application directory

1. You need to change the order of your directories so that the Internal directory is at the top, and active.

a. If you have only two directories - the Internal and the External Application directory you are deleting, then do the following:
b. If you have more than two directories, you need to rearrange them so the Internal Directory is at the top (list_index 0) and the External Application directory you are deleting is at the bottom.
   • List the directories and their order using

   ```
   select d.id, d.directory_name, m.list_index from cwd_directory d 
   join cwd_app_dir_mapping m on d.id=m.directory_id order by 
   m.list_index;
   ```

   • Change the list indexes so that they are in the order you want. Directory order can be rearranged using

   ```
   update cwd_app_dir_mapping set list_index = <position> where 
   directory_id = <directory id>;
   ```

c. Check that the internal directory is enabled.
   • List the internal directory. An enabled directory will have its ‘active’ column set to ‘T’

   ```
   select id, directory_name, active from cwd_directory where id = 
   <Internal Directory id>;
   ```

   • If the internal directory is not active, activate it by

   ```
   update cwd_directory set active = 'T' where id = <Internal 
   Directory id>;
   ```

2. When the directories are ordered correctly, delete the External Application directory from the directory order:

   ```
   delete from cwd_app_dir_operation where app_dir_mapping_id = (select id 
   from cwd_app_dir_mapping where directory_id = <External Application ID>); 
   delete from cwd_app_dir_mapping where directory_id = <External Application ID>;
   ```

3. The External Application directory is referenced in several other tables in the database. You need to remove the remaining references to it:
delete from cwd_directory_attribute where directory_id=<External Application ID>
delete from cwd_directory_operation where directory_id=<External Application ID>

4. All references to the External Directory should now have been removed. Delete the directory using:

delete from cwd_directory where id = <External Application ID>

Reset passwords

1. All users who were in the External Directory you deleted, including admins, will be unable to log in. Their passwords need to be reset by choosing the "Forgot your password?" link on the login page. Alternatively, use the instructions at Restoring Passwords To Recover Admin User Rights to reset the administrator password, then set the users' passwords for them via the Manage Users page in the administration screen.

RELATED TOPICS

Configuring User Directories

Connecting to JIRA 4.2 or Earlier for User Management

Atlassian JIRA is an issue and project tracking tool. Like Confluence, JIRA offers the ability to store its users and groups in its database. You can configure Confluence to look for its users and groups in the JIRA database. This page describes the legacy JIRA database connector, which provides a direct connection to the JIRA database.

When to use this option: Choose the legacy JIRA database connector if your JIRA server is JIRA 4.2 or earlier, for backwards compatibility with the already-existing option for Confluence to use JIRA for user management.

If you are using JIRA 4.3 or later, you cannot use the legacy JIRA database connector. Instead, choose the 'Atlassian JIRA' directory type.

On this page:
- Connecting Confluence to JIRA
- JIRA Settings in Confluence

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Connecting Confluence to JIRA

To connect Confluence to JIRA 4.2 or earlier:

1. Edit the Confluence server.xml file, to construct the datasource location, as described below.
2. Restart Confluence.
3. Choose Browse > Confluence Admin.
4. Click User Directories in the left-hand panel.
5. Add a directory and select type Legacy Atlassian JIRA (4.2 and earlier). Enter the settings as described below.
6. Save the directory settings.
7. Define the directory order by clicking the blue up- and down-arrows next to each directory on the 'User Directories' screen. Here is a summary of how the directory order affects the processing:
   - The order of the directories is the order in which they will be searched for users and groups.
   - Changes to users and groups will be made only in the first directory where the application has permission to make changes.
   For details see Managing Multiple Directories.
8. In order to use Confluence, users must be a member of the confluence-users group or have Confluence 'can use' permission. Follow these steps to configure your Confluence groups in JIRA:
   a. Add the confluence-users and confluence-administrators groups in JIRA.
   b. Add your own username as a member of both of the above groups.
   c. Choose one of the following methods to give your existing JIRA users access to Confluence:
      - Option 1: In JIRA, find the groups that the relevant users belong to. Add the groups as members of one or both of the above Confluence groups.
      - Option 2: Log in to Confluence using your JIRA account and go to the Confluence Administra
      ration Console. Click 'Global Permissions' and assign the 'can use' permission to the relevant JIRA groups.

### JIRA Settings in Confluence

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A meaningful name that will help you to identify this JIRA server amongst your list of directory servers. Examples:</td>
</tr>
<tr>
<td></td>
<td>• JIRA</td>
</tr>
<tr>
<td></td>
<td>• Example Company JIRA</td>
</tr>
</tbody>
</table>
### Datasource Location

The JNDI name of the JIRA datasource configured in your application server. Example: `java:comp/env/jdbc/YourJiraDatasource`

In JIRA standalone distributions (using the default application server, Tomcat 6) you can construct the datasource location as follows:

1. Open your `<jira_install>/conf/server.xml` file in a text editor.
2. Look for the database setup section in that file. It looks something like this:

```xml
<Resource auth="Container"
    driverClassName="com.mysql.jdbc.Driver"
    maxActive="20"
    name="*jdbc/JiraDS*"
    password="jirauser"
    type="javax.sql.DataSource"
    url="jdbc:mysql://localhost/jiradb?useUnicode=true&characterEncoding=UTF8"
    username="jirauser"
    validationQuery="select 1"/>
```

3. Copy the above lines (the 'Resource' section) and paste it to your Confluence's `server.xml` file (located at `<confluence_install>/conf/server.xml`), under the Context path. This will then expose the value of the name attribute as the JNDI resource locator.
4. Copy the JNDI name from the `name` parameter. In this example, the datasource location is: `java:comp/env/jdbc/JiraDS`

Managing Multiple Directories

This page describes what happens when you have defined more than one user directory in Confluence. For example, you may have an internal directory and you may also connect to an LDAP directory server and/or other types of user directories. When you connect to a new directory server, you also need to define the directory order.

Duplicate usernames across directories are not supported. If you are connecting to more than one user directory, please ensure that the usernames are unique to one directory. For example, if you have a user `j smith` in both 'Directory1' and 'Directory2', that is an unsupported configuration.

Overview

Here is a summary of how the directory order affects the processing:

- The order of the directories is the order in which they will be searched for users and groups.
- Changes to users and groups will be made only in the first directory where the application has permission to make changes.

On this page:

- Overview
- Configuring the Directory Order
- Effect of Directory Order
  - Login
  - Permissions
  - Updating Users and groups

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Configuring the Directory Order

You can change the order of your directories as defined to Confluence. Select 'User Directories' from the Confluence Administration Console and click the blue up- and down-arrows next to each directory.

Notes:

- Please read the rest of this page to understand what effect the directory order will have on authentication (login) and permissions in Confluence, and what happens when you update users and groups in Confluence.

Effect of Directory Order

This section summarises the effect the order of the directories will have on login and permissions, and on the updating of users and groups.

Login

The directory order is significant during the authentication of the user, in cases where the same user exists in multiple directories. When a user attempts to log in, the application will search the directories in the order specified, and will use the credentials (password) of the first occurrence of the user to validate the login attempt.

Permissions
The directory order is significant when granting the user permissions based on group membership. If the same username exists in more than one directory, the application will look for group membership only in the first directory where the username appears, based on the directory order.

Example:

- You have connected two directories: The Customers directory and the Partners directory.
- The Customers directory is first in the directory order.
- A username jsmith exists in both the Customers directory and the Partners directory.
- The user jsmith is a member of group G1 in the Customers directory and group G2 in the Partners directory.
- The user jsmith will have permissions based on membership of G1 only, not G2.

Updating Users and groups

If you update a user or group via the application's administration screens, the update will be made in the first directory where the application has write permissions.

Example 1:

- You have connected two directories: The Customers directory and the Partners directory.
- The application has permission to update both directories.
- The Customers directory is first in the directory order.
- A username jsmith exists in both the Customers directory and the Partners directory.
- You update the email address of user jsmith via the application's administration screens.
- The email address will be updated in the Customers directory only, not the Partners directory.

Example 2:

- You have connected two directories: A read/write LDAP directory and the internal directory.
- The LDAP directory is first in the directory order.
- All new users will be added to the LDAP directory. It is not possible to add a new user to the internal directory.

Managing Nested Groups

Some directory servers allow you to define a group as a member of another group. Groups in such a structure are called ‘nested groups’. If you are using groups to manage permissions, you can create nested groups to allow inheritance of permissions from one group to its sub-groups.

This page describes how Confluence handles nested groups that exist in one or more of your directory servers.
Enabling Nested Groups

You can enable or disable support for nested groups on each directory individually. Go to the 'User Directories' section of the Confluence Administration Console, edit the directory and select 'Enable Nested Groups'. See Configuring User Directories.

Notes:

- Before enabling nested groups for a specific directory type in Confluence, please make sure that your directory server supports nested groups.
- Please read the rest of this page to understand what effect nested groups will have on authentication (login) and permissions in Confluence, and what happens when you update users and groups in Confluence.

On this page:
- Enabling Nested Groups
- Effect of Nested Groups
  - Login
  - Permissions
  - Viewing Lists of Group Members
  - Adding and Updating Group Memberships
- Examples
  - Example 1: User is Member of Sub-Group
  - Example 2: Sub-Groups as Members of the 'jira-developers' group
  - Example 3: Sub-Groups as Members of the 'confluence-users' group
- Notes

⚠️ The information on this page does not apply to Confluence OnDemand.

Effect of Nested Groups

This section summarises the effect nested groups will have on login and permissions, and on the viewing and updating of users and groups.

Login

When a user logs in, they will be allowed access to the application if they belong to an authorised group or any of its sub-groups.

Permissions

The user will be allowed access to a function if they belong to a group that has the necessary permissions, or if they belong to any of its sub-groups.

Viewing Lists of Group Members

If you ask to view the members of a group, you will see all users who are members of the group and all users belonging its sub-groups, consolidated into one list. We call this a 'flattened' list.

You cannot view or edit the nested groups themselves. You will not be able to see that one group is a member of another group.

Adding and Updating Group Memberships

If you add a user to a group, the user is added to the named group and not to any other groups.
If you try to remove a user from a flattened list, the following will happen:

- If the user is a member of the top group in the hierarchy (tree) of groups contained in the flattened list, the user will be removed from the group.
- Otherwise, you will see an error message stating that the user is not a direct member of the group.

**Examples**

**Example 1: User is Member of Sub-Group**

Let's assume that the following two groups exist in your directory server:

- staff
- marketing

Memberships:

- The *marketing* group is a member of the *staff* group.
- User *jsmith* is a member of *marketing*.

You will see that *jsmith* is a member of both *marketing* and *staff*. You will not see that the two groups are nested. If you assign permissions to the *staff* group, then *jsmith* will get those permissions.

**Example 2: Sub-Groups as Members of the 'jira-developers' group**

In an LDAP directory server, we have groups *'engineering-group'* and *'techwriters-group'* We want to grant both groups developer-level access to our JIRA site.

- Add a group called *'jira-developers'*.
- Add the *'engineering-group'* as a sub-group of *'jira-developers'*. 
- Add the *'techwriters-group'* as a sub-group of *'jira-developers'*. 

Group memberships are now:

- *jira-developers* — sub-groups: *engineering-group*, *techwriters-group*
- *engineering-group* — sub-groups: *dev-a*, *dev-b*; users: *pblack*
- *dev-a* — users: *jsmith*, *sbrown*
- *dev-b* — users: *jsmith*, *dblue*
- *techwriters-group* — users: *rgreen*

When JIRA requests a list of users in the *'jira-developers'* group, it will receive the following list:

- *pblack*
- *jsmith*
- *sbrown*
- *dblue*
- *rgreen*

*Diagram: Sub-groups as members of the 'jira-developers' group*
Example 3: Sub-Groups as Members of the ‘confluence-users’ group

In an LDAP directory server, we have groups ‘engineering-group’ and ‘payroll-group’. We want to grant both groups access to our Confluence site.

- Add a group called ‘confluence-users’.
- Add the ‘engineering-group’ as a sub-group of ‘confluence-users’.
- Add the ‘payroll-group’ as a sub-group of ‘confluence-users’.

Group memberships are now:

- confluence-users — sub-groups: engineering-group, payroll-group
- engineering-group — sub-groups: dev-a, dev-b; users: pblack
- dev-a — users: jsmith, sbrown
- dev-b — users: jsmith, dblue
- payroll-group — users: rgreen

When Confluence requests a list of users in the ‘confluence-users’ group, it will receive the following list:

- pblack
- jsmith
- sbrown
- dblue
- rgreen

Diagram: Sub-groups as members of the 'confluence-users' group
**Notes**

- **Possible impact on performance.** Enabling nested groups may result in slower user searches.

- **Definition of nested groups in LDAP.** In an LDAP directory, a nested group is defined as a child group entry whose DN (Distinguished Name) is referenced by an attribute contained within a parent group entry. For example, a parent group 'Group One' might have an `objectClass=group` attribute and one or more `member=DN` attributes, where the DN can be that of a user or that of a group elsewhere in the LDAP tree:

  ```
  member=CN=John Smith,OU=Users,OU=OrgUnitA,DC=sub,DC=domain
  member=CN=Group Two,OU=OrgUnitBGroups,OU=OrgUnitB,DC=sub,DC=domain
  ```

- Managing Nested Groups
- Synchronising Data from External Directories
Synchronising Data from External Directories

For certain directory types, Confluence stores a cache of directory information (users and groups) in the application database, to ensure fast recurrent access to user and group data. A synchronisation task runs periodically to update the internal cache with changes from the external directory.

On this page:
- Affected Directory Types
- How it Works
- Finding the Time Taken to Synchronise
- Manually Synchronising the Cache
- Configuring the Synchronisation Interval

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Affected Directory Types

Data caching and synchronisation apply to the following user directory types:
- LDAP (Microsoft Active Directory and all supported LDAP directories) where permissions are set to read only.
- LDAP (Microsoft Active Directory and all supported LDAP directories) where permissions are set to read only, with local groups.
- LDAP (Microsoft Active Directory and all supported LDAP directories) where permissions are set to read/write.
- Atlassian Crowd.
- Atlassian JIRA.

Data caching and synchronisation do not occur for the following user directory types:
- LDAP (Microsoft Active Directory and all supported LDAP directories) where permissions are set to authentication only, with local groups.
- Internal Directory with LDAP Authentication.
- Internal Directory.

How it Works

Here is a summary of the caching functionality:
- The caches are held in the application database.
- When you connect a new external user directory to the application, a synchronisation task will start running in the background to copy all the required users, groups and membership information from the external directory to the application database. This task may take a while to complete, depending on the size and complexity of your user base.
- Note that a user will not be able to log in until the synchronisation task has copied that user’s details into the cache.
- A periodic synchronisation task will run to update the database with any changes made to the external directory. The default synchronisation interval, or polling interval, is one hour (60 minutes). You can change the synchronisation interval on the directory configuration screen.
You can manually synchronise the cache if necessary.
If the external directory permissions are set to read/write: Whenever an update is made to the users, groups or membership information via the application, the update will also be applied to the cache and the external directory immediately.
All authentication happens via calls to the external directory. When caching information from an external directory, the application database does not store user passwords.
All other queries run against the internal cache.

Finding the Time Taken to Synchronise

The ‘User Directories’ screen shows information about the last synchronisation operation, including the length of time it took.

Manually Synchronising the Cache

You can manually synchronise the cache by clicking ‘Synchronise’ on the ‘User Directories’ screen. If a synchronisation operation is already in progress, you cannot start another until the first has finished.

Configuring the Synchronisation Interval

Note: The option to configure the synchronisation interval for Crowd and JIRA directories is available in Confluence 3.5.3 and later. Earlier versions of Confluence allow you to configure the interval for LDAP directories only.

You can set the ‘Synchronisation Interval’ on the directory configuration screen. The synchronisation interval is the period of time to wait between requests for updates from the directory server.

The length you choose for your synchronisation interval depends on:

- The length of time you can tolerate stale data.
- The amount of load you want to put on the application and the directory server.
- The size of your user base.

If you synchronise more frequently, then your data will be more up to date. The downside of synchronising more frequently is that you may overload your server with requests.

If you are not sure what to do, we recommend that you start with an interval of 60 minutes (this is the default setting) and reduce the value incrementally. You will need to experiment with your setup.

Diagrams of Possible Configurations for User Management
The aim of these diagrams is to help people understand each directory type at a glance. We have kept the diagrams simple and conceptual, with just enough information to be correct.

Some things that we do not attempt to show:

- In most cases, we do not attempt to show that you can have multiple directory types mapped to Confluence at the same time. We illustrate that fact in just the first two LDAP diagrams.
- We have not included a diagram for Confluence’s legacy connection to JIRA database.
- We do not attempt to show all of the possible configurations and layered connections that are available now that you can use JIRA as a directory manager.

On this page:

- Confluence Internal Directory
- Confluence with Read/Write Connection to LDAP
- Confluence with Read-Only Connection to LDAP, with Local Groups
- Confluence Internal Directory with LDAP Authentication
- Confluence with LDAP Authentication, Copy Users on First Login
- Confluence Connecting to JIRA
- Confluence Connecting to JIRA and JIRA Connecting to LDAP
- Confluence and JIRA Connecting to Crowd

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

User Management Limitations and Recommendations
This page describes the optimal configurations and limitations that apply to user management in Confluence.

On this page:

- General Recommendations
- Recommendations for Connecting to LDAP
  - Optimal Number of Users and Groups in your LDAP Directory
  - Redundant LDAP is Not Supported
  - Specific Notes for Connecting to Active Directory
- Recommendations for Connecting to JIRA for User Management
  - Single Sign-On Across Multiple Applications is Not Supported
  - Custom Application Connectors are Not Supported
  - Custom Directories are Not Supported
  - Optimal Number of Users and Applications
  - Recommendations

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

**General Recommendations**

- **Duplicate usernames across directories are not supported.** If you are connecting to more than one user directory, please ensure that the usernames are unique to one directory. For example, if you have a user jsmith in both 'Directory1' and 'Directory2', that is an unsupported configuration.

- **Be careful when deleting users in remote directories.** If you are connecting to an LDAP directory, a Crowd directory or a JIRA directory, please take care when deleting users from the remote directory. If you delete a user that is associated with data in Confluence, this will cause problems in Confluence.

**Recommendations for Connecting to LDAP**

Please consider the following limitations and recommendations when connecting to an LDAP user directory.

**Optimal Number of Users and Groups in your LDAP Directory**

The connection to your LDAP directory provides powerful and flexible support for connecting to, configuring and managing LDAP directory servers. To achieve optimal performance, a background synchronisation task loads the required users and groups from the LDAP server into the application's database, and periodically fetches updates from the LDAP server to keep the data in step. The amount of time needed to copy the users and groups rises with the number of users, groups, and group memberships. For that reason, we recommended a maximum number of users and groups as described below.

This recommendation affects connections to LDAP directories:

- Microsoft Active Directory
- All other LDAP directory servers

The following LDAP configurations are not affected:

- Internal directories with LDAP authentication
- LDAP directories configured for 'Authentication Only, Copy User On First Login'

Please choose one of the following solutions, depending on the number of users, groups and memberships in your LDAP directory.

<table>
<thead>
<tr>
<th>Your environment</th>
<th>Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Our Test Results

We performed internal testing of synchronisation with an AD server on our local network consisting of 10 000 users, 1000 groups and 200 000 memberships.

We found that the initial synchronisation took about 5 minutes. Subsequent synchronisations with 100 modifications on the AD server took a couple of seconds to complete.

Please keep in mind that a number of factors come into play when trying to tune the performance of the synchronisation process, including:

- **Size of userbase.** Use LDAP filters to keep this to the minimum that suits your requirements.
- **Type of LDAP server.** We currently support change detection in AD, so subsequent synchronisations are much faster for AD than for other LDAP servers.
- **Network topology.** The further away your LDAP server is from your application server, the more latent LDAP queries will be.
- **Database performance.** As the synchronisation process caches data in the database, the performance of your database will affect the performance of the synchronisation.
- **JVM heap size.** If your heap size is too small for your userbase, you may experience heavy garbage collection during the synchronisation process which could in turn slow down the synchronisation.

Redundant LDAP is Not Supported

The LDAP connections do not support the configuration of two or more LDAP servers for redundancy (automated failover if one of the servers goes down).

**Specific Notes for Connecting to Active Directory**

When the application synchronises with Active Directory (AD), the synchronisation task requests only the changes from the LDAP server rather than the entire user base. This optimises the synchronisation process and gives much faster performance on the second and subsequent requests.

On the other hand, this synchronisation method results in a few limitations:

1. **Externally moving objects out of scope or renaming objects causes problems in AD.** If you move objects out of scope in AD, this will result in an inconsistent cache. We recommend that you do not use the external LDAP directory interface to move objects out of the scope of the sub-tree, as defined on the application's directory configuration screen. If you do need to make structural changes to your LDAP directory, manually synchronise the directory cache after you have made the changes to ensure cache consistency.

2. **Synchronising between AD servers is not supported.** Microsoft Active Directory does not replicate the uSNChanged attribute across instances. For that reason, we do not support connecting to different AD servers for synchronisation. (You can of course define multiple different directories, each pointing to its own respective AD server.)

3. **Synchronising with AD servers behind a load balancer is not supported.** As with synchronising between two different AD servers, Microsoft Active Directory does not replicate the uSNChanged attribute
across instances. For that reason, we do not support connecting to different AD servers even when they are load balanced. You will need to select one server (preferably one that is local) to synchronise with instead of using the load balancer.

4. **You must restart the application after restoring AD from backup.** On restoring from backup of an AD server, the uSNChanget timestamps are reverted to the backup time. To avoid the resulting confusion, you will need to flush the directory cache after a Active Directory restore operation.

5. **Obtaining AD object deletions requires administrator access.** Active Directory stores deleted objects in a special container called cn=Deleted Objects. By default, to access this container you need to connect as an administrator and so, for the synchronisation task to be aware of deletions, you must use administrator credentials. Alternatively, it is possible to change the permissions on the cn=Deleted Objects container. If you wish to do so, please see [this Microsoft KB Article](#).

6. **The User DN used to connect to AD must be able to see the uSNChanged attribute.** The synchronisation task relies on the uSNChanged attribute to detect changes, and so must be in the appropriate AD security groups to see this attribute for all LDAP objects in the subtree.

**Recommendations for Connecting to JIRA for User Management**

Please consider the following limitations and recommendations when connecting to a JIRA server for user management.

**Single Sign-On Across Multiple Applications is Not Supported**

When you connect to JIRA for user management, you will not have single sign-on across the applications connected in this way. JIRA, when acting as a directory manager, does not support SSO.

**Custom Application Connectors are Not Supported**

JIRA, Confluence, FishEye, Crucible and Bamboo can connect to a JIRA server for user management. Custom application connectors will need to use the new REST API.

**Custom Directories are Not Supported**

Earlier versions of JIRA supported OSUser Providers. It was therefore possible write a special provider to obtain user information from any external user directory. This is no longer the case.

**Optimal Number of Users and Applications**

Please consider the following limitations when connecting to a JIRA server for user management:

- Maximum 500 users.
- Maximum 5 connected applications.

**Recommendations**

<table>
<thead>
<tr>
<th>Your environment</th>
<th>Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
If **all** the following are true:

- You have fewer than 500 users.
- You want to share user and group management across just a few applications, such as one JIRA server and one Confluence server, or two JIRA servers.
- You do not need single sign-on (SSO) between JIRA and Confluence, or between two JIRA servers.
- You do not have custom application connectors. Or, if you do have them, you are happy to convert them to use the new REST API.
- You are happy to shut down all your servers when you need to upgrade JIRA.

Your environment meets the optimal requirements for using JIRA for user management.

If **one or more** of the following are true:

- You have more than 500 users.
- You want to share user and group management across more than 5 applications.
- You need single sign-on (SSO) across multiple applications.
- You have custom applications integrated via the Crowd SOAP API, and you cannot convert them to use the new REST API.
- You are not happy to shut down all your servers when you need to upgrade JIRA.

We recommend that you install [Atlassian Crowd](https://www.atlassian.com/software/crowd) for user management and SSO.

If you are considering creating a custom directory connector to define your own storage for users and groups...

Please see if one of the following solutions will work for you:

- If you have written a custom provider to support a specific LDAP schema, please check the supported LDAP schemas to see if you can use one of them instead.
- If you have written a custom provider to support nested groups, please consider enabling nested groups in the supported directory connectors instead.
- If you have written a custom provider to connect to your own database, please consider loading the data into the application's database instead.
- If you need to keep the custom directory connection, please consider whether [Atlassian Crowd](https://www.atlassian.com/software/crowd) meets your requirements. See the documentation on [Creating a Custom Directory Connector](https://confluence-docs.atlassian.com/display/DOC/Creating+a+Custom+Directory+Connector).

**RELATED TOPICS**

- [Connecting to Crowd or JIRA for User Management](https://confluence-docs.atlassian.com/display/DOC/Connecting+to+Crowd+or+JIRA+for+User+Management)
- [Configuring User Directories](https://confluence-docs.atlassian.com/display/DOC/Configuring+User+Directories)
- [Requesting Support for External User Management](https://confluence-docs.atlassian.com/display/DOC/Requesting+Support+for+External+User+Management)
This page gives guidelines on how to request help from the Atlassian support team if you are having problems with external user management. External user management includes connections to Active Directory, other LDAP servers, Atlassian Crowd or Atlassian JIRA for user management. The information on this page is provided in addition to the more general page on Troubleshooting Problems and Requesting Technical Support.

The cause of such problems may be:

- The LDAP server is not responding.
- The application password is incorrectly configured, causing the LDAP server or other directory to return an authentication error.
- Other LDAP settings are incorrectly configured.

On this page:

- Troubleshooting the Connection to your External User Directory
- Problems During Initial Setup
- Complex Authentication or Performance Problems

⚠️ The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

Troubleshooting the Connection to your External User Directory

The configuration screen for external directories in Confluence has a 'Test Settings' button. This will help you to diagnose problems with user management in Active Directory and other LDAP servers.

To test your directory connection:

1. Choose Browse > Confluence Admin.
2. Click 'User Directories' in the left-hand panel.
3. Edit the relevant directory.
4. Click 'Test Settings'.
5. The results of the test will appear at the top of the screen.

Please refer to our knowledge base articles for troubleshooting user management and login issues.

If the above resources do not help, continue below.

Problems During Initial Setup

Raise a support request and include the following information.

- Download an LDAP browser to make sure you have the right settings in your LDAP directory. Atlassian recommends LDAP Studio. Include screenshots of your user and group DNs.
- If you can start up Confluence and access the Administration Console, review your directory settings. See Connecting to an LDAP Directory. Attach screenshots of all your settings.

Complex Authentication or Performance Problems

Raise a support request and include the following information.

Confluence Server

Log in to Confluence and access the Administration Console.

- Take a screenshot of the 'System Information' screen, or save the page as HTML.
- Take a screenshot of the 'Global Permissions' screen, if people are having problems with logging in.
- Go to 'Space Admin' for the relevant space and take a screenshot of the 'Permissions' page, if you are having problems with space or page permissions.
**Confluence Configuration Files**

- If you have implemented a custom authenticator or in any way modified `seraph-config.xml` or `seraph-h-paths.xml`, please provide the modified file.

**User Management System**

- Include the name and version of your LDAP server.
- Does your LDAP server use dynamic or static groups?
- Review your directory settings. See [Connecting to an LDAP Directory](#). Attach screenshots of all your settings.

**Diagnostics**

- Enable profiling. See [Performance Tuning](#).
- Enable detailed user management logging, by editing `confluence/WEB-INF/classes/log4j.properties`. Change this section:

```
###
# Atlassian User
###
#log4j.logger.com.atlassian.user=DEBUG
#log4j.logger.com.atlassian.confluence.user=DEBUG
#log4j.logger.bucket.user=DEBUG
#log4j.logger.com.atlassian.seraph=DEBUG
#log4j.logger.com.opensymphony.user=DEBUG
```

Remove the `#` signs at the beginning of the lines, so that it looks like this:

```
###
# Atlassian User
###
log4j.logger.com.atlassian.user=DEBUG
log4j.logger.com.atlassian.confluence.user=DEBUG
log4j.logger.bucket.user=DEBUG
log4j.logger.com.atlassian.seraph=DEBUG
log4j.logger.com.opensymphony.user=DEBUG
```

- After enabling both the above, please attempt a Confluence LDAP account login and attach a copy of the log files that are produced when the problem occurs. To do this, locate your install directory or exploded WAR directory, then zip the full `/logs` subdirectory into a single file for us to examine. The logs subdirectory is located in your Confluence Home directory.

**RELATED TOPICS**

[Configuring User Directories](#)

- [Configuring the Internal Directory](#)
- [Connecting to an LDAP Directory](#)
- [Connecting to an Internal Directory with LDAP Authentication](#)
- [Connecting to Crowd or JIRA for User Management](#)
- [Connecting to JIRA 4.2 or Earlier for User Management](#)
- [Managing Multiple Directories](#)
- [Managing Nested Groups](#)
**Disabling the Built-In User Management**

By selecting the 'External user management' option in Confluence, you can disable the group and user management screens in Confluence. You need **system administrator permissions** to set this option.

You will find it useful to select external user management under the following circumstances:

- When Crowd's directory permissions are configured so that Confluence cannot update the Crowd directories, then Confluence's external user management setting must be turned on. Otherwise, a 'System Error' will occur when Confluence attempts to write data into Crowd. For more information about integrating Crowd with Confluence, see [Connecting to Crowd or JIRA for User Management](#).
- If you are using JIRA for user management, we recommend that you turn on Confluence's external user management setting. This centralises user management in JIRA. See [Connecting to Crowd or JIRA for User Management](#) and [Connecting to JIRA 4.2 or Earlier for User Management](#).

---

The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.

To disable management of users and groups within Confluence:

1. Choose **Browse > Confluence Admin**.
2. Click 'Security Configuration' in the left-hand panel.
3. The 'Edit Security Configuration' screen will appear. Click 'Edit'.
4. Tick the 'External user management' check box.
5. Click 'Save'.

**Notes**

- Please refer to the following bugs and improvement requests:
  - CONF-16709 – When the External User Management check box is ticked, the group and user management screens are still functional.
  - CONF-21158 – Enabling both public signup and external user management renders a blank screen during signup.
  - CONF-9830 – This is a request to rename this feature to better reflect its functionality.

**Installing Plugins and Macros**

A **plugin** is an add-on to the core Confluence code, which can extend the Confluence functionality. Some plugins are shipped with Confluence, others are available for you to install yourself.

A **macro** allows a developer to perform programmatic functions within a page, and gives the Confluence user...
access to more complex content structures. Many macros are made available by plugins.

You need **System Administrator** permissions in order to install and configure plugins.

### Installing and configuring plugins and macros

### Installing and Configuring Plugins using the Universal Plugin Manager

This page provides information about the Universal Plugin Manager (UPM) in Confluence and links to topics on how to install and configure plugins using the UPM. You need **System Administrator** permissions in order to install and configure plugins.

**A note about plugin safety:** Plugins are very powerful: they can change the behaviour of almost any part of the Confluence server. It is **very important** that you trust a plugin before you install it. Always be aware of where (and who) a plugin comes from.

### Overview of the Universal Plugin Manager

The Universal Plugin Manager (UPM) provides a set of functions for managing your plugins. The UPM is itself a system plugin. It allows you to perform common tasks such as:

- Enabling and disabling plugins and their plugin modules.
- Installing new plugins.
- Configuring advanced plugin options.
- Finding out-of-date plugins and updating them.
- Checking the compatibility of your installed plugins against newer versions of the application.

Through the UPM you can interact with the [Atlassian Plugin Exchange](https://plugins.atlassian.com). You can use the UPM to browse available plugins for your application, and try or buy any of these plugins without ever leaving your application.
Managing your plugins

- Checking Plugin Compatibility for Confluence Upgrades
- Configuring a Plugin
- Disabling or Enabling a Plugin
- Installing a Plugin
- Uninstalling a Plugin
- Upgrading your Existing Plugins
- Viewing the Plugin Audit Log
- Viewing your Installed Plugins

Notes

Having problems with the Universal Plugin Manager? Try the Universal Plugin Manager FAQ. (This will redirect you to the Universal Plugin Manager documentation. Use the back button on your browser to return the Confluence documentation.)

Checking Plugin Compatibility for Confluence Upgrades

The Application Upgrade Check in the Universal Plugin Manager (UPM) helps you to check whether your plugins will still work with Confluence after a Confluence upgrade.

For example, if you were thinking of upgrading from Confluence 4.1 to Confluence 4.2, the Application Upgrade Check can tell you the following:

- Installed plugins that are compatible with Confluence 4.1 and Confluence 4.2.
- Installed plugins that are not compatible with Confluence 4.2, but will be compatible with Confluence 4.2 if you upgrade them.
- Installed plugins that are not compatible with Confluence 4.2, even if you upgrade them to their latest version.

To access the Universal Plugin Manager in Confluence:
1. Choose Browse > Confluence Admin.
2. Click the Plugins link in the Configuration section of the left-hand menu. The Universal Plugin Manager will appear.

To check compatibility of your plugins against different Confluence versions:
1. Click the Upgrade Check tab.
2. In the Check compatibility for dropdown menu, select the version of your application to check the plugins against.
3. Click the Check button.
4. The page display any of your installed plugins that are not compatible with the selected application version. The compatibility checker will also check the compatibility of the latest available version of each plugin.
plugin (if not already upgraded). You can click on the name of any of the plugins to view more information about the plugin.

The plugins are grouped into sections under the following headings:

- **Incompatible** – The installed versions of these plugins are not compatible with the selected application version. There are currently no plugin upgrades available that are compatible with the selected application version.
- **Compatible, if upgraded** – The installed versions of these plugins are not compatible with the selected application version. However, the plugins will be compatible if you upgrade them. There are buttons allowing you to upgrade these plugins.
- **Compatible if both <the application> and the plugin are upgraded** – The installed versions of these plugins are not compatible with the selected application version. There is a plugin compatible with the newer application version, but it is not compatible with the application version you are currently running. You must upgrade the application and then upgrade the plugin. There are buttons allowing you to disable these plugins before proceeding with the upgrade.
- **Compatible** – The currently installed versions of these plugins are compatible with the selected application version.
- **Unknown** – These plugins may or may not be compatible with the selected application version. If a plugin is not registered with the Atlassian Plugin Exchange, the Universal Plugin Manager cannot check its compatibility with different application versions.

Screenshot: Checking plugin compatibility against different Confluence versions

Configuring a Plugin

A number of Confluence plugins have advanced configuration options. If you have one of these plugins installed on your Confluence site, you can view and update these configuration options via the Universal Plugin Manager (UPM).

If you would like to disable or enable a plugin, please refer to **Disabling or Enabling a Plugin**.

To access the Universal Plugin Manager in Confluence:
1. Choose Browse > Confluence Admin.
2. Click the Plugins link in the Configuration section of the left-hand menu. The Universal Plugin Manager will appear.

To configure a plugin in Confluence:

1. Click the Manage Existing tab.
2. Locate the plugin that you want to configure and click its title. The plugin details section expands.
3. Click the Configure button for that plugin. The advanced configuration options appear.

   **Warning:** If the plugin is disabled, you cannot configure it and so the Configure button does not appear. If there are no advanced configuration options for the plugin, there is no Configure button.

4. Update the configuration settings as desired and save your changes.
   **Note:** The plugin itself provides advanced configuration options. If you encounter any problems after you click the Configure button, the plugin is responsible for the issue, not the UPM.

**Screenshot: Configuring a plugin**

**Screenshot: Example of plugin configuration options – WebDAV configuration**

**Disabling or Enabling a Plugin**

Using the **Universal Plugin Manager (UPM)**, you can disable a plugin on your Confluence site without permanently removing the plugin. You can also enable any plugins that have been previously disabled. In some cases, you may want to disable or enable a specific module in a plugin.
You can also disable all user installed plugins in your application, by enabling **safe mode**. This may help you to diagnose a plugin-related problem more easily.

If you want to add or remove a plugin from your Confluence site, please refer to Installing a Plugin or Uninstalling a Plugin.

On this page:
- Disabling a plugin
- Enabling a plugin
- Disabling/Enabling a module within a plugin
- Disabling/Enabling all user-installed plugins (safe mode)

Related pages:
- Installing Plugins and Macros

**Disabling a plugin**

To access the Universal Plugin Manager in Confluence:
1. Choose Browse > Confluence Admin.
2. Click the Plugins link in the Configuration section of the left-hand menu. The Universal Plugin Manager will appear.

To disable a plugin:
1. Click the Manage my plugins tab. You will see a list of the plugins installed in your application.
2. Locate the plugin that you want to disable and click the title to expand the plugin details section.
3. Click the Disable button.
4. Once a plugin has been disabled, you may need to restart your application for your change to take effect. If so, you will see a message for the plugin.
   Once the plugin is fully disabled, you will see an Enable link for the plugin.

**Screenshot: Disabling a plugin**

**Enabling a plugin**

To access the Universal Plugin Manager in Confluence:
1. Choose Browse > Confluence Admin.
2. Click the Plugins link in the Configuration section of the left-hand menu. The Universal Plugin Manager will appear.

To enable a plugin:
1. Click the Manage Existing tab. You will see a list of the plugins installed in your application.
2. Locate the plugin that you want to enable and click the title to expand the plugin details section.
3. Click the Enable button.
4. Once a plugin has been enabled, you may need to restart your application for your change to take effect.
If so, you will see a message for the plugin: 'Enabled, requires restart'. Once the plugin is fully disabled, you will see a **Disable** link for the plugin.

**Screenshot: Enabling a plugin**

![WebDAV Plugin](image)

**Disabling/Enabling a module within a plugin**

In some cases, you may want to turn part of a plugin's functionality off or on, by disabling or enabling a specific module of the plugin.

**Note:** Be careful when disabling a module within a plugin. This can have unexpected effects on other parts of your Confluence functionality.

**To access the Universal Plugin Manager in Confluence:**

1. Choose **Browse > Confluence Admin.**
2. Click the **Plugins** link in the **Configuration** section of the left-hand menu. The Universal Plugin Manager will appear.

**To disable or enable a module within a plugin:**

1. Click the **Manage my plugins** tab. You will see a list of the plugins installed in your application.
2. Locate the plugin that contains the module you are interested in, and click the plugin title to expand the plugin details section.
3. Click **Manage plugin modules**.
4. Move your cursor over the module that you are interested in. If the module is enabled, a **Disable** option will appear. If the module is disabled, an **Enable** option will appear. Choose the option you want.

**Disabling/Enabling all user-installed plugins (safe mode)**

Running your application in safe mode disables all user installed plugins at once. All plugins that were disabled when you entered safe mode will be re-enabled when you exit safe mode.

**To access the Universal Plugin Manager in Confluence:**

1. Choose **Browse > Confluence Admin.**
2. Click the **Plugins** link in the **Configuration** section of the left-hand menu. The Universal Plugin Manager will appear.

**To enable safe mode:**

1. Click the **Manage my plugins** tab.
   The system displays a list the installed plugins.
2. Click the **Enable Safe Mode** link.
3. Click the **Continue** button in the confirmation window.
   All user installed plugins will be disabled and your application will now be running in safe mode.
4. Make changes to your installed plugins as desired.
   For example, you may want to enable/disable specific plugins or plugin modules.
5. Exit safe mode by clicking one of the links in the Safe Mode banner:
- Click **Exit Safe Mode and restore the previous configuration** to restore your plugin configuration to its state before you entered Safe Mode.
- Click **Exit Safe Mode and keep the current configuration** to keep all changes made to your plugin configuration during Safe Mode.

_Screenshot: Running Confluence in safe mode_

---

**Installing a Plugin**

This page describes how to install a plugin into Confluence using the Universal Plugin Manager (UPM). Plugins can be used to customise and extend the functionality available in Confluence.

You can search for plugins in the UPM, or upload your own. The UPM searches the plugins in the [Atlassian Plugin Exchange](https://addons.atlassian.com).

---

**On this page:**
- Adding a plugin from the Atlassian Plugin Exchange
- Uploading your own plugin
- Notes

---

⚠️ The information on this page _does not apply_ to Confluence OnDemand.

---

**Adding a plugin from the Atlassian Plugin Exchange**

To access the Universal Plugin Manager in Confluence:

1. Choose **Browse > Confluence Admin**.
2. Click the **Plugins** link in the **Configuration** section of the left-hand menu. The Universal Plugin Manager will appear.

To find and add a plugin from the Atlassian Plugin Exchange:

1. Click the **Install** tab in the UPM. You will see a list of featured plugins.
2. Search for your plugin as follows:
   - Enter some keywords that describe the plugin in the **Search the Plugin Exchange** search box and press Enter.
   - Alternatively, browse to the desired plugin in the list. You can choose **Featured, Popular, Support (by Atlassian)** or **All available** from the **Plugins to show** dropdown to see a different list of plugins.
3. Click the **Install** button for the desired plugin to add it to your application. A confirmation message and the plugin details will appear when the plugin is installed successfully.
**Note:** You may need to restart your application for your change to take effect. The Universal Plugin Manager will inform you if this is the case.

**Note:** Not all plugins can be automatically installed. Some required manual installation. These plugins will have a **Download** button instead of an **Install** button. In these cases, you should read and follow the plugin's installation instructions.

Screenshot: Finding a new plugin from the Atlassian Plugin Exchange

---

**Uploading your own plugin**

To access the Universal Plugin Manager in Confluence:

1. Choose **Browse > Confluence Admin**.
2. Click the **Plugins** link in the **Configuration** section of the left-hand menu. The Universal Plugin Manager will appear.

To upload your own plugin to Confluence:

1. Click the **Install** tab in the UPM. The system displays a list of featured plugins.
2. Click the **Upload Plugin** link. The system displays the **Upload Plugin** window.
3. Specify the location of your plugin:
   - If the plugin you want to install is on your computer, use the **Browse** dialogue to choose the plugin JAR file.
   - If you want to install a plugin from a remote location, enter the URL of the plugin JAR file in the **From this URL** text box.
4. Click the **Upload** button to upload and enable your plugin. A confirmation message will appear when the plugin is successfully installed.

**Note:** You may need to restart your application for your change to take effect. The Universal Plugin Manager will inform you if this is the case.

Screenshot: Uploading a new plugin
Uninstalling a Plugin

If you wish to remove a plugin from Confluence altogether, you can uninstall it via the Universal Plugin Manager (UPM). If you only want to temporarily remove it, you may wish to disable your plugin instead.

To access the Universal Plugin Manager in Confluence:
1. Choose Browse > Confluence Admin.
2. Click the Plugins link in the Configuration section of the left-hand menu. The Universal Plugin Manager will appear.

To uninstall a plugin from Confluence:
1. Click the Manage Existing tab.
   The systems lists the plugins installed in your application.
2. Click the name of the plugin that you wish to uninstall.
   The system displays the plugin details.
3. Click the Uninstall button.
   The information summary displays an Uninstalling message and uninstalls the plugin from your application.

Notes

- In Confluence, you can install and uninstall both version 1 and version 2 plugins using the Universal Plugin Manager.
- Some entries that you find listed in the Universal Plugin Manager are not actually plugins. These entries will show a 'Download' button which allows you to download the application to your desktop and run it following the instructions given by that application.

The information on this page does not apply to Confluence OnDemand.
Upgrading your Existing Plugins

Plugins are often developed separately from Confluence. You may wish to upgrade your plugins to more recent versions to allow them to work with your Confluence version or simply to take advantage of new features in a plugin version. The Universal Plugin Manager (UPM) provides you with a list of plugins that have available upgrades and allows you to upgrade each plugin individually or in bulk.

Tip: If you are considering upgrading Confluence, you can use the Universal Plugin Manager to check the compatibility of your plugins with your desired Confluence version. See Checking Plugin Compatibility for Confluence Upgrades.

On this page:
- Upgrading a plugin
- Upgrading all plugins

⚠ The information on this page does not apply to Confluence OnDemand.

Upgrading a plugin

To access the Universal Plugin Manager in Confluence:
1. Choose Browse > Confluence Admin.
2. Click the Plugins link in the Configuration section of the left-hand menu. The Universal Plugin Manager will appear.

To upgrade a plugin in Confluence:
1. Click the Manage my plugins tab. You will see a list of plugins that are available for upgrading, under the heading 'Available Updates'.
   - If there is a later version of a plugin that you have already installed, this page will show the latest compatible version of the plugin.
   - You can click the plugin name to expand the row and see more information about the plugin.
   - You can filter your list by entering keywords in the Filter visible plugins text box.
2. Click the name of the plugin that you want to upgrade, to see more information about the plugin.
3. Click the Update button next to the plugin to update it to the version shown.

Upgrading all plugins

To access the Universal Plugin Manager in Confluence:
1. Choose Browse > Confluence Admin.
2. Click the Plugins link in the Configuration section of the left-hand menu. The Universal Plugin Manager will appear.

To upgrade all available plugins in Confluence:
1. Click the **Manage my plugins** tab. You will see a list of plugins that are available for upgrading, under the heading ‘Available Updates’:
   - If there is a later version of a plugin that you have already installed, this page will show the latest compatible version of the plugin.
   - You can click the plugin name to expand the row and see more information about the plugin.
   - You can filter your list by entering keywords in the **Filter visible plugins** text box.

2. Click the **Update All** button to upgrade every plugin to the plugin versions shown.

**Note:** Not all plugins can be installed or upgraded via the Universal Plugin Manager. There are some plugins that you must manually install and upgrade.

### Screenshot: Upgrading plugins

The Universal Plugin Manager (UPM) keeps a log of all plugin activity in your Confluence instance. For example, adding plugins, and enabling plugins. You can configure the audit log to adjust the period of time for which log entries should be kept.

### Viewing the Plugin Audit Log

The Universal Plugin Manager (UPM) keeps a log of all plugin activity in your Confluence instance. For example, adding plugins, and enabling plugins. You can configure the audit log to adjust the period of time for which log entries should be kept.

#### Viewing the plugin audit log

To access the Universal Plugin Manager in Confluence:

1. Choose **Browse** > **Confluence Admin**.
2. Click the **Plugins** link in the **Configuration** section of the left-hand menu. The Universal Plugin Manager will appear.

To view the plugin audit log:

1. Click the **Audit Log** tab.
   - The plugin audit log appears with a list of the 25 most recent entries.
2. Use the arrows if you want to view older entries.
3. Click the orange RSS icon if you want to receive the audit log activity in an RSS feed.

On this page:

- Viewing the plugin audit log
- Configuring the plugin audit log

Screenshot: Viewing the plugin audit log

Configuring the plugin audit log

To access the Universal Plugin Manager in Confluence:
1. Choose Browse > Confluence Admin.
2. Click the Plugins link in the Configuration section of the left-hand menu. The Universal Plugin Manager will appear.

To configure the amount of time log entries are kept:

1. Click the Audit Log tab.
   The plugin audit log appears.
2. Click the Configure purge policy link.
3. Specify how many days to keep the logs before purging in the Purge audit log after field.
4. Click the Confirm button.

Screenshot: Configuring the audit log’s purge policy

Viewing your Installed Plugins

The Universal Plugin Manager (UPM) allows you to easily view the plugins installed on your Confluence instance. This includes plugins that are bundled with Confluence as well as any third party plugins that you have installed. Both enabled and disabled plugins are displayed.

On this page:
Viewing your Installed Plugins

To view your installed plugins,

1. Click the 'Manage Existing' tab. The plugins installed on your application will be displayed.
   - The plugins will be grouped into 'User-installed Plugins' and 'System Plugins'.
   - You can filter your list by entering keywords in the 'Filter visible plugins' text box.
   - The list of 'System Plugins' will be hidden by default. Click the 'Show System Plugins' link, if you want to view them.
   - Enabled plugins will be listed with an icon. Disabled plugins will be listed with an icon.
   - Click the name of a plugin to view the plugin's details.
   - Click 'Enable Safe Mode' to run your application in safe mode. Read 'Disabling or Enabling a Plugin' (see Related Topics below) for more information on Safe Mode.

What is the difference between a 'System Plugin' and a 'User Installed Plugin'?  

- **System plugins** are those that shipped with the product when you downloaded it from Atlassian. These plugins are integral to the functioning of the system, and although you can disable some of them, you should not do so unless instructed by an Atlassian Support engineer. Note, not every system plugin can be disabled and you will not be able to uninstall any system plugins at all.
- **User-installed plugins** are those which have been installed in the product after it was set up: either by uploading a plugin jar file, or by placing it in the applications plugin directories. These plugins can be uninstalled.

Screenshot: Viewing Installed Plugins (Confluence)
Viewing a Plugin's Details

You can view the details for a plugin when you click the name of a plugin in the installed plugins list (as described above). The summary contains a short description of the plugin as well as buttons/links for plugin operations and related information.

Screenshot: Viewing a Plugin's Details (Confluence)

- **Plugin key** — This field shows the unique key that identifies each plugin in the system.
- **Developer** — This field lists the name of the plugin developer and a link to the developer's homepage, if provided by the plugin developer.
- **Plugin version** — This field lists the version of the plugin currently installed.
- **Manage plugin modules** — Click this link to display the modules below the plugin summary. This link will only display if the plugin has modules, e.g. the Confluence Advanced Macros plugin. If you want to enable or disable a plugin module, hover your mouse over the module and click the 'Enable'/'Disable' button that
displays.

- **Configure** — Click this link to display the configuration settings for the plugin in the Universal Plugin Manager. This link will be disabled if the plugin is disabled. Please note that not all plugins have settings that can be configured through the Universal Plugin Manager. Refer to 'Configuring a Plugin' (see Related Topics below) for more information.

- **Disable** — Click this button to disable the plugin in your application. This button will only display if the plugin is enabled. Refer to 'Disabling or Enabling a Plugin' (see Related Topics below) for more information.

- **Enable** — Click this button to enable the plugin in your application. This button will only display if the plugin is disabled.

- **Uninstall** — Click this button to uninstall the plugin from your application. This button will only display if the plugin is a user-installed plugin. Refer to 'Uninstalling a Plugin' (see Related Topics below) for more information.

**Plugin loading strategies in Confluence**

**The categories**

Confluence plugins have different behaviour based on how they are loaded by Confluence. The plugins themselves are the same, but based on how they are loaded, they may or may not be upgraded, or may not be disabled, or may not be uninstalled. This chart should explain how plugins can be loaded by Confluence, and the ramifications for each choice.

The category any particular plugin is in can vary with Confluence version or circumstance. The examples mentioned here describe the way particular plugins are loaded by default in Confluence 2.8.

⚠️ The information on this page does not apply to Confluence OnDemand.

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Static</td>
<td>cannot be installed or upgraded without a Confluence restart</td>
<td></td>
</tr>
<tr>
<td><strong>Core</strong></td>
<td>Included with Confluence and cannot be uninstalled. The classes and plugin.xml are not bundled into plugin jars, but mixed in with Confluence source on the main classpath. Additionally, the plugin.xml definitions are not called &quot;atlassian-plugin.xml&quot; as they are everywhere else, but are named for the plugin e.g., &quot;basic-macros.xml&quot;. We would like to separate some of them out and turn them into Bundled plugins.</td>
<td><strong>WEB-INF/lib</strong></td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>the opposite of static, these can be installed/upgraded while Confluence is running</td>
<td><strong>Admin Sections</strong></td>
</tr>
</tbody>
</table>
### Bundled

Bundled plugins can be administered from the Plugins console from Administration >> Plugins. You can upload or disable them there.

*Bundled* plugins are included in a zip of jars called `atlassian-bundled-plugins.zip` which is on the main Confluence classpath, in a resources directory: `<confluence-install>/confluence/WEB-INF/classes/com/atlassian/confluence/setup`. At Confluence startup, they are extracted and copied into the `$CONFLUENCE_HOME/bundled-plugins` directory, from whence they are loaded. To remove a bundled plugin (you shouldn’t normally have to do this), remove the plugin from the `atlassian-bundled-plugins.zip` file and the `bundled-plugins` directory, otherwise Confluence will just put it back in place on the next startup. In versions later than 2.6, you'll have to recreate the `.jar` file (if the jar file is from the `lib` folder) or recreate the `zip` folder (if its in the `classes` folder). Bundled plugins can be upgraded or disabled.

### Uploaded

Installed by the user via the plugin repository or the Plugin Manager page. These plugins are stored in the database and then copied to the `$CONFLUENCE_HOME/plugins-cache` folder on each Confluence node.

could be anything

<table>
<thead>
<tr>
<th>Bundled</th>
<th>Office Connector</th>
</tr>
</thead>
</table>

To summarise the relationships of categories in the table, all plugins are either *Static* or *Dynamic*. *Static* plugins can be further categorised into *Core* or `WEB-INF/lib`. *Dynamic* plugins are divided into *Bundled* and *Uploaded*.

**Use of the categories in Confluence**

Within Confluence, the *Core* and `WEB-INF/lib` categories are not actually named as such, and they don't map neatly to other names (though they do map, as will be explained). They are used here because of the logical distinction they provide.

In Confluence, some of the *Core* plugins are called "System". Plugins can be designated as "System" by adding a flag to the plugin manifest file. To do this, `system=true` should be added to the top-level `atlassian-plugin` element of the manifest file. The manifest file is generally called `atlassian-plugin.xml`, but it could have another name; the *Core* plugins' files do.
All of the Core plugins once were labeled as "System", but it seems the practice has faded over time. If a plugin is designated as "System", then it will not show up in the Plugin Manager page in Confluence and thus cannot be enabled/disabled. However, it will show up in the Plugin Repository Client, where it can be disabled; allowing disabling there is probably incorrect behavior.

Static plugins that are not marked as "System" (any remaining Core and WEB-INF/lib plugins), are simply called Static in Confluence. There is no way to tell the WEB-INF/lib and Core plugins apart from within Confluence. You just have to figure out where the classes are.

Members of the other specific categories - Bundled and Uploaded - can be determined. We can tell which plugins are Bundled and which plugins are Uploaded, so we know which plugins are Uploaded though this specific term is never used in the Confluence UI. Instead, they are called Dynamic.

**Upgrading plugins**

- Core plugins cannot be upgraded.
- WEB-INF/lib plugins can be upgraded by replacing the JAR in WEB-INF/lib and restarting Confluence.
- Bundled plugins can be upgraded using the Plugin Manager or the Plugin Repository Client. A new plugin jar is uploaded and stored as an Uploaded plugin. Confluence compares the version number with the Bundled plugin and uses the newer.
- Uploaded plugins are upgradable using the Plugin Manager or the Plugin Repository Client. When a new plugin jar is uploaded, the previous version is discarded from the database and the $CONFLUENCE_HOME/plugin-cache.

**RELATED TOPICS**

Removing Malfunctioning Plugins

**Removing Malfunctioning Plugins**

Confluence goes to some lengths to prevent itself being unusable due to a problematic plugin. However, sometimes a plugin will manage to do this anyway. This page describes what to do if a plugin cannot be disabled or deleted from the Administration console (from Administration >> Plugins).

⚠️ The information on this page does not apply to Confluence OnDemand.

**Plugin Loading Strategies**

1. Read through Plugin loading strategies in Confluence.
2. Determine where your plugin is loaded. The usual options are:
   a. The PLUGINDATA table on the database
   b. The <confluence-home>/bundled-plugins folder
   c. The <confluence-home>/plugin-cache folder
   d. The <confluence-home>/plugins-osgi-cache folder
   e. The <confluence-home>/plugins-temp folder
   f. The <confluence-install>/confluence/WEB-INF/lib folder (deprecated approach)

Check these locations when troubleshooting plugin loading issues.

✅ Check the How to display classpath utility for tips on what’s loading, and the Knowledge Base Article on plugin malfunctioning.

**Deleting a plugin from the Database**

To remove a plugin from Confluence when Confluence is not running,
1. Connect to the Confluence database.
2. Run the following SQL statement in your database:
   
   ```sql
   select plugindataid, pluginkey, filename, lastmoddate from plugindata;
   ```

3. After you have found the plugindataid for the offending plugin, please run the following:
   
   ```sql
   delete from plugindata where plugindataid='XXXXXX';
   ```

   where XXXXXX is the plugindataid value.

4. Restart Confluence.

**Disabling a plugin from the database**

**To disable in the database,**

Run the following query on your Confluence database:

```sql
select BANDANAVALUE from BANDANA where BANDANAKEY = 'plugin.manager.state.Map'
```

This will return a value like:

```xml
<map>
  <entry>
    <string>com.atlassian.confluence.ext.usage</string>
    <boolean>true</boolean>
  </entry>
</map>
```

Edit the value `boolean` to have `false`:

```xml
<map>
  <entry>
    <string>com.atlassian.confluence.ext.usage</string>
    <boolean>false</boolean>
  </entry>
</map>
```

**Deleting a Bundled Plugin**

Bundled plugins can be administered from the Plugins console from Administration >> Plugins. You can upload or disable them there.
Bundled plugins are included in a zip of jars called `atlassian-bundled-plugins.zip` which is on the main Confluence classpath, in a resources directory - `<confluence-install>/confluence/WEB-INF/classes/com/atlassian/confluence/setup`. At Confluence startup, they are extracted and copied into the `$CONFLUENCE_HOME/bundled-plugins` directory, from whence they are loaded. To remove a bundled plugin (you shouldn't normally have to do this), remove the plugin from the atlassian-bundled-plugins.zip file and the bundled-plugins directory, otherwise Confluence will just put it back in place on the next startup. In versions later than 2.6, you'll have to recreate the jar file (if the jar file is from the lib folder) or recreate the zip folder (if it's in the classes folder). Bundled plugins can be upgraded or disabled.

If you need to remove a bundled plugin, check to see if you have duplicates in the `<confluence-home>/bundled-plugins` or `<confluence-home>/plugin-cache` directory.

Usually, the problem is that an old plugin is getting loaded along with the properly bundled one, but if you need to remove a bundled plugin, check Plugin loading strategies in Confluence.

Enabling and Configuring Macros

Macros allow you to perform programmatic functions within a page, and can be used for generating more complex content structures.

Generally speaking, a macro is simply a command wrapped inside curly braces {...}. To learn how to write your own macro, or use macros written by other people, read the Confluence Plugin Guide.

⚠️ The information on this page does not apply to Confluence OnDemand.

Related Topics:

Configuring a URL Whitelist for Macros

This page tells you how to restrict some Confluence macros so that they can get information from authorised sources (URLs) only.

Whitelisting URLs for the RSS and HTML Include macros

The RSS and HTML Include macros are used to include content dynamically from other websites onto a Confluence page. The included content may possibly be malicious or harmful to your Confluence instance.

Confluence administrators can set up a list of trusted URLs, thus limiting the locations from which the RSS macro and the HTML Include macro can draw their content.

The form below allows you to define specific URLs and/or URL patterns which are trusted, or to allow inclusion from all URLs without restriction.

To configure the URL whitelist:

1. Choose Browse > Confluence Admin.
2. Select Configure Whitelist in the left-hand panel. The 'Configure Whitelist' screen will appear, as shown in the screenshot below.
3. Select one of the options as follows:
   - Allow all domains — There will be no restrictions to the content which can be included onto your
Confluence pages.

- **Restrict to listed domains** — Confluence will allow content from trusted URLs only. When you select this option, a textbox will open allowing you to enter specific URLs and/or URL patterns. Enter one or more URLs, each on its own line. You can enter the full URL, or use the pattern matching rules described below.

4. Click **Save**.

**On this page:**

- [Whitelisting URLs for the RSS and HTML Include macros](#)
- [URL Pattern-Matching Rules](#)
- [Notes](#)
- [What Happens to a Page Containing a Disallowed URL?](#)

**Related pages:**

- [Enabling HTML macros](#)
- [RSS Feed Macro](#)
- [HTML Include Macro](#)
- [Configuring a URL Whitelist for Gadgets](#)
- [Confluence Administrator's Guide](#)

⚠️ The information on this page does not apply to Confluence OnDemand.

**Screenshot: Configuring a URL whitelist for RSS and HTML Include macros**

- **Enable Whitelist**
  - ![on] Allow all domains
  - ![off] Restrict to listed domains

- **Whitelist Rules**
  
  http://*.atlassian.com

**URL Pattern-Matching Rules**

Enter one URL or URL pattern per line. You can enter a full URL or use pattern-matching as described below:

- If the rule starts with an equals sign (=), only the exact URL following the ‘=’ will be allowed.
- If the rule starts with a slash (/) then the whole rule will be treated as a regular expression.
- Otherwise, any asterisk (*) will be treated as a wildcard to match one or more characters.

**Notes**

---

*Created in 2012 by Atlassian. Licensed under a [Creative Commons Attribution 2.5 Australia License](https://creativecommons.org/licenses/by/2.5/au/).*
Some things to be aware of:

- By default, the RSS and HTML Include macros are disabled in Confluence. A System Administrator can enable them on the 'Plugins' screen of the Confluence Administration Console.
- A user who has the ‘Confluence Administrator’ permission, but not necessarily the ‘System Administrator’ permission, can configure the URL whitelist for the HTML Include and RSS macros.

**What Happens to a Page Containing a Disallowed URL?**

A user can add the RSS Feed macro or the HTML-include macro to a Confluence page. The macro code includes a URL from which the content is drawn. When the page is displayed, Confluence will check the URL against the whitelist. If the URL is not allowed, Confluence will display an error message on the page.

The error message says that Confluence "could not access the content at the URL because it is not from an allowed source" and displays the offending URL. If the person viewing the page is a Confluence Administrator, they will also see a link to the Administration page where they can configure the URL whitelist.

Here is an example of the error message, including the link shown only to Confluence Administrators:

```
Could not access the content at the URL because it is not from an allowed source.
http://feathers.wordpress.com
Configure whitelist >>
```

Here is an example of the error message, but without the link.

```
Could not access the content at the URL because it is not from an allowed source.
http://feathers.wordpress.com
You may contact your site administrator and request that this URL be added to the list of allowed sources.
```

**Configuring the User List Macro**

The User List macro has an optional Display Online parameter. If the User Listener plugin is configured to allow this feature, then the page author can select Display Online to show a list of all online users.

ℹ️ You need to have System Administrator permissions in order to perform this function.

**To enable the Display Online filter in the User List macro:**

1. Choose Browse > Confluence Admin.
2. Select Plugins in the left-hand panel. This will list the currently installed plugins.
3. Scroll down and click User Listener. The User Listener plugin panel will appear at the top of the screen.
4. Enable the User Log In Listener module by clicking Enable on its right.
5. Restart Confluence.

⚠️ The information on this page does not apply to Confluence OnDemand.
List of online users can be misleading

When the Display Online parameter is used, Confluence uses a context listener to generate the list of online users. A context listener is a J2EE term for something that listens for events in the application server. We listen for session open and close events, so a user is 'online' if they have a session on the application server. Some application servers don’t correctly despatch close events for sessions – in these cases, the list of online users may be misleading.

Enabling HTML macros

The \{html\} macro allows you to use HTML code within a Confluence page.

The \{html-include\} macro allows you to include the contents of an HTML file in a Confluence page.

CAUTION: Including unknown HTML inside a web page is dangerous. Because HTML can contain active scripting components, it would be possible for a malicious attacker to present a user of your site with script that their web browser would believe came from you. Such code could be used, for example, to steal a user’s authentication cookie and give the attacker their Confluence login password.

By default, the HTML macros are disabled. You should only turn on these macros if you trust all your users not to attempt to exploit them.

You need System Administrator permissions in order to perform this function.

Related pages:

- Working with Macros
- Confluence Administrator's Guide

The information on this page does not apply to Confluence OnDemand.
To enable the HTML macros:

1. Choose Browse > Confluence Admin.
2. Choose Plugins in the left-hand panel. This will display the installed plugins active for this Confluence installation.
3. Choose Show System Plugins to display bundled plugins.
4. Choose Confluence HTML macros, then choose Enable.
5. Choose Manage plugin modules to see the list of modules in the plugin.
6. Ensure that the html (html-xhtml) module is enabled.

Enabling the html-include Macro

The \{html-include\} macro allows you to include the content of an HTML file in a Confluence page. This page tells you how to enable the macro, so that it is available on your Confluence site. For help on using the macro, see HTML Include Macro.

⚠️ CAUTION: Including unknown HTML inside a web page is dangerous.

Because HTML can contain active scripting components, it would be possible for a malicious attacker to present a user of your site with script that their web browser would believe came from you. Such code could be used, for example, to steal a user’s authentication cookie and give the attacker their Confluence login password.

⚠️ The information on this page does not apply to Confluence OnDemand.

Enabling the HTML Macros

By default, the HTML macros are disabled. You should only turn on these macros if you trust all your users not to attempt to exploit them.

ℹ️ You need to have System Administrator permissions in order to perform this function.

To enable the HTML macros,

1. Choose Browse > Confluence Admin.
2. Select ‘Plugins’ in the left-hand panel. This will display the installed plugins active for this Confluence installation.
3. Click ‘HTML macros’, then click ‘Enable Plugin’.

To embed an external page,

Use the following syntax:

```
{html-include:url=http://www.example.com}
```

To include HTML inline,
Use the following syntax:

```html
<b>I like cheese</b>
```

**Adding, Editing and Removing User Macros**

User macros are short pieces of code that perform an often-used function or add some custom formatting to a page. People can call the macro into action by adding the macro keyword to their Confluence pages. You can write a 'user macro' by adding code on a screen in the Confluence Administration Console.

Notes:

- You need System Administrator permissions in order to perform this function.
- See Shared User Macros for a list of community-donated macros.
- Be careful when installing user macros from unknown authors.
- If you remove a user macro that is in use on Confluence pages, you will need to remove the macro from the pages manually. When you remove the user macro, the usage of the macro on the page will become invalid. Hint: Use the Confluence search to find all occurrences of the macro on pages and blog posts.
To add a user macro:

1. Choose Browse > Confluence Admin.
2. Click User Macros in the left-hand panel.
3. Click Create a User Macro at the top of the list of macros.
4. Enter the macro details as explained in the guide to writing user macros.
5. Click Add.

To edit a user macro:

1. Choose Browse > Confluence Admin.
2. Select User Macros in the left-hand panel. This will list the currently configured user macros.
3. Click Edit next to the relevant macro.
4. Update the macro details as explained in the guide to writing user macros.
5. Click Save.

To remove a user macro:

1. Choose Browse > Confluence Admin.
2. Select User Macros in the left-hand panel. This will list the currently configured user macros.
3. Click Remove next to the relevant macro.

Best Practices for Writing User Macros

Examples of User Macros

Writing User Macros

User macros are short pieces of code that perform an often-used function or add some custom formatting to a page. People can add the macro to a page by choosing it from the Macro Browser when editing a Confluence page. The macro is run when the page is loaded by the browser. You can write a user macro by adding code on a screen in the Confluence Administration Console.

You need to have System Administrator permissions in order to create user macros.

Do you need a plugin instead?

If you want to distribute your user macro as a plugin, please refer to the developer's guide to the User Macro plugin module. If you want to create more complex, programmatic macros in Confluence, you may need to write a Macro plugin.

On this page:

- Creating a User Macro
- Examples and Best Practices
- Related Topics
Creating a User Macro

To create a user macro:

1. Go to the Confluence Administration Console and click User Macros in the left-hand panel.
2. Click Create a User Macro.
3. Supply the information in the input fields as explained below, then click Add.

The sections below tell you about each of the input fields.

Macro Name

Enter the text that people will see when looking for the macro in the Macro Browser.

Visibility

Set the visibility options to specify who can see this macro when they are searching using the Macro Browser or Autocomplete.

User macros must have parameters defined in order to appear in the Confluence 4.0 Macro Browser.

The options are as follows:

<table>
<thead>
<tr>
<th>Visibility Option</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visible to all users</td>
<td>All users will see this macro when searching for a macro using the Macro Browser or Autocomplete.</td>
</tr>
</tbody>
</table>
Visible only to system administrators

Choose this option if you want the macro to be 'hidden' from most users when the users are looking for a macro to add to a page. Note that this does not completely hide the macro. Instead, it is useful if you want to avoid cluttering the Macro Browser and Autocomplete with unnecessary macros. Specifically, if you are:

- **Editing a page and inserting a macro using the Macro Browser:** Only system administrators will see this macro in the Macro Browser. For other users, the macro will not show up in the Macro Browser when the user searches for a macro to add to a page.
- **Editing a page and inserting a macro using Autocomplete:** Only system administrators will see this macro in Autocomplete. For other users, the macro will not show up in the Autocomplete list when the user searches for a macro to add to a page.
- **Viewing the page:** The macro output will be visible to all users who have permission to see the page.
- **Editing a page that already contains the macro:** Provided a user has permission to edit the page, the macro will be visible to all users when editing the page, and all users who have permission to edit the page will also be able to edit or remove the macro.

Please note that all the macro information will also be discoverable, including the macro title, description, parameter names and other metadata. Do not include confidential data anywhere in the definition of a user macro, even if it is marked as visible only to system administrators.

**Macro Title**

Enter the text that should appear in the Macro Browser and in Autocomplete, to identify this macro when people are looking for it to insert onto a page.

**Description**

Enter the text that should appear in the Macro Browser describing this macro. Note that the Macro Browser's search will pick up matches in the description as well as in the title.

**Categories**

Select one or more categories for your macro. To select more than one category, hold down the 'Ctrl' key while selecting. These are the categories that appear in the Macro Browser, helping users to choose a macro from a logical set.

**Icon URL**

If you would like the Macro Browser to display an icon for your macro, enter the URL here. You can enter an absolute URL or a path relative to the Confluence base URL. For example:

- Absolute URL:
What is the macro body?

The macro body is the content that is displayed on the wiki page. If the macro allows a body, users will be able to enter body content when configuring the macro in the Macro Browser.

How can I use the macro body?

If you specify that your macro has a body, you will be able to pass text to the macro when you invoke it from within a page.

If your macro has a body, any body content that the user enters will be available to the macro in the $body variable. See the section about the template below. In addition, the options below allow you to tell Confluence to pre-process the body before it is placed in the macro output.

What are the options for macro body?

<table>
<thead>
<tr>
<th>Body Processing Option</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>No macro body</td>
<td>Select this option if your macro does not need a body.</td>
</tr>
<tr>
<td>Escaped</td>
<td>If your macro has a body, and you make use of the body as $body in your template, Confluence will add escape characters to the HTML markup in the macro body. You could use this if you want to show the HTML markup in the rendered page. For example, if the body is:</td>
</tr>
<tr>
<td>---------</td>
<td>-----------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td><code>&lt;b&gt;Hello World&lt;/b&gt;</code></td>
</tr>
<tr>
<td></td>
<td>Then value of $body will be:</td>
</tr>
<tr>
<td></td>
<td><code>&amp;lt;b&amp;gt;Hello World&amp;lt;/b&amp;gt;</code></td>
</tr>
<tr>
<td></td>
<td>This will render as:</td>
</tr>
<tr>
<td></td>
<td><code>&lt;b&gt;Hello World&lt;/b&gt;</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Unrendered</th>
<th>If your macro has a body, and you make use of the body as $body in your template, HTML in the body will be processed within the template before being output. Ensure that HTML is ultimately output by the template.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rendered</td>
<td>If your macro has a body, and you make use of the body as $body in your template, Confluence will recognise HTML in the macro body. For example, if the body is:</td>
</tr>
<tr>
<td></td>
<td><code>&lt;b&gt;Hello World&lt;/b&gt;</code></td>
</tr>
<tr>
<td></td>
<td>Then value of $body will be:</td>
</tr>
<tr>
<td></td>
<td><code>&lt;b&gt;Hello World&lt;/b&gt;</code></td>
</tr>
<tr>
<td></td>
<td>This will render as: <code>Hello World</code></td>
</tr>
</tbody>
</table>

**Template**

Enter code to specify what the macro will do. For example, to add a macro inside the macro you are writing, you would write:
Quick guide:

- Use HTML and Confluence-specific XML elements in the macro template. Details of Confluence's storage format are in Confluence Storage Format.
- You can use the Velocity templating language. Here is more information on the Velocity project.
- If your macro has a body, your template can refer to the macro body text by specifying 'body'.
- Each parameter variable you use must have a matching metadata definition. Use @param to define metadata for your macro parameters.
- When using the information passed using parameters, refer to your parameters as $paramXXX where 'XXX' is the parameter name that you specified in the @param metadata definition.
- Use @noparams if your macro does not accept parameters. Note that this will prevent your macro appearing in the macro browser.

See our detailed guide to writing a user macro template.

Be careful when installing user macros. Ideally use only macros from authors and sources that are well known to you.

Best Practices for Writing User Macros

This section contains tips and suggestions for best practice in macro coding. To see how to write a user macro and add it to your Confluence site, take a look at our guide to writing user macros.

The information on this page does not apply to Confluence OnDemand.

Add a Descriptive Header to your Macro Template

We recommend that you include a short description of your macro via comments at the top of the Template field as shown below. You can see an excellent example in the 'Image rollover' user macro.
## Macro title: My macro name
## Macro has a body: Y or N
## Body processing: Selected body processing option
## Output: Selected output option

## Developed by: My Name
## Date created: dd/mm/yyyy
## Installed by: My Name

## Short description of what the macro does

### Expose your Parameters in the Macro Browser

Confluence offers great options for making your macro look good in the macro browser. You can specify the macro category, link to an icon, define the parameters that the macro browser will use to prompt the user for information, and more.

In particular, read the documentation on defining the macro parameters to be displayed in the macro browser.

### Supply Default Values for Macro Parameters

You cannot guarantee that a user will supply parameters, so one of the first things to do in the macro is check that you have received some value if you expect to rely on it later on in the macro code.

In the example below, the macro expects three parameters. It substitutes sensible defaults if they are not supplied:

```plaintext
#set($spacekey= $paramspacekey)
#set($numthreads= $paramnumthreads)
#set($numchars= $paramnumchars)

## Check for valid space key, otherwise use current
#if (!$spacekey)
   #set ($spacekey=$space.key)
#end

## Check for valid number of threads, otherwise use default of 5
#if (!$numthreads)
   #set ($numthreads=5)
#end

## Check for valid excerpt size, otherwise use default of 35
#if (!$numchars)
   #set ($numchars=35)
#end
```

**Writing User Macros**

**Examples of User Macros**

Below are some sample user macros. To see how to write a user macro and add it to your Confluence site, take a look at our guide to writing user macros.

Example 1: A macro that displays 'Hello World'
Take a look at an example of a 'Hello World' macro.

Example 2: The 'Error' macro that creates a red box

Let's write a simple macro that creates a red box (using an existing Confluence style) around some text. See Error Box Macro - Example of a User Macro.

Example 3: A macro that demonstrates the use of parameters

See Colour and Size Macro - Example of a User Macro.

Example 4: A macro that prevents text from being printed

See NoPrint Example of a User Macro.

On this page:

- Example 1: A macro that displays 'Hello World'
- Example 2: The 'Error' macro that creates a red box
- Example 3: A macro that demonstrates the use of parameters
- Example 4: A macro that prevents text from being printed
- Example 5: A macro that creates a preformatted panel
- Example 6: A macro that creates a preformatted table
- Community-contributed user macros

The information on this page does not apply to Confluence OnDemand.

Example 5: A macro that creates a preformatted panel

This user macro creates a panel preformatted with specific colours. See Preformatted Table - Example of a User Macro.

Example 6: A macro that creates a preformatted table

This user macro creates a table with predefined headings. See Panel Preformatted with Specific Colours - Example of a User Macro.

Community-contributed user macros

You may want to take a look at the library of shared user macros.

Be careful when installing user macros from unknown authors.

Hello World Example of User Macro

This page tells you how to create a user macro that displays the text 'Hello World!' and any text that the user places in the body of the macro. For full details about creating a user macro, see the guide to writing user macros.

Defining the 'Hello World' user macro

To create the 'Hello World' user macro:

1. Choose Browse > Confluence Admin.
2. Choose **User Macros** in the left-hand panel.
3. Choose **Create a User Macro** at the bottom of the list of macros.
4. Enter the macro attributes as follows:
   - **Macro Name**: helloworld
   - **Visibility**: Visible to all users in the Macro Browser
   - **Macro Title**: Hello World
   - **Description**: Displays "Hello World" and the macro body.
   - **Categories**: Confluence Content
   - **Icon URL**: You can leave this field empty.
   - **Documentation URL**: You can leave this field empty.
   - **Macro Body Processing**: Rendered
   - **Template**:

```
## @noparams
Hello World!
$body
```
5. Choose **Save**.

**Related pages:**
- [Writing User Macros](#)
- [Guide to User Macro Templates](#)
- [Examples of User Macros](#)

⚠️ **The information on this page does not apply** to Confluence OnDemand.

**Screenshot: Defining the 'Hello World' user macro**
Create User Macro

Macro Name: helloworld

Macro Browser Information

Visibility: Visible to all users in the Macro Browser

Macro Title: Hello World

Description: Displays "Hello World" and the macro body.

Definition of User Macro

Macro Body Processing:
- No macro body
- Escaped
- Unrendered
- Rendered

Template:

```
@{noparams}
Hello World!
$body
```

Using the 'Hello World' macro on a page

Now you can add the macro to your Confluence page using the Macro Browser:
The result is:

![Testing the Hello World macro]

You can also use autocomplete to add the macro onto your page: start typing '{hello' in the editor, and select the 'Hello World' macro from the list of suggestions that appears.

**Error Box Macro - Example of a User Macro**

Let's write a simple macro that creates a red box (using an existing Confluence style) around some text. This may be useful for writing about error conditions, for example. For full details about creating a user macro, see the guide to [writing user macros](#).

**Defining the 'Error' user macro**

**To create the 'Error' user macro:**

1. Choose **Browse > Confluence Admin**.
2. Choose **User Macros** in the left-hand panel.
3. Choose **Create a User Macro** at the bottom of the list of macros.
4. Enter the macro attributes as follows:
   - **Macro Name**: error
   - **Visibility**: Visible to all users in the Macro Browser
   - **Macro Title**: Error
   - **Description**: Displays a red box around some text
   - **Categories**: Confluence Content
   - **Icon URL**: You can leave this field empty.
Using the 'Error' macro on a page

To add the macro to a page, edit the page and choose Insert > Other Macros and find the 'Error' macro. (Or use autocomplete: start typing '{err' in the editor, and select the 'Error' macro from the list of suggestions that appears.)

Your page will display an error box, like this:

(Write your error message here.)

Colour and Size Macro - Example of a User Macro

This example demonstrates how you can pass parameters into your macro. Let's say you want to write your own font colour macro, with a parameter allowing the user to specify the colour. Then perhaps you want to add another parameter, that allows the user to specify the font size.

For full details about creating a user macro, see the guide to writing user macros.

Defining the 'Colour' user macro

This example uses a single parameter.

To create the 'Colour' user macro:

1. Choose Browse > Confluence Admin.
2. Choose User Macros in the left-hand panel.
3. Choose Create a User Macro at the bottom of the list of macros.
4. Enter the macro attributes as follows:
   - Macro Name: colour
   - Visibility: Visible to all users in the Macro Browser
   - Macro Title: Colour
   - Description: Colours a block of text
   - Categories: Confluence Content
   - Icon URL: You can leave this field empty.
   - Documentation URL: You can leave this field empty.
   - Macro Body Processing: Rendered
   - Template:
5. Choose **Save**.

### Related pages:
- [Writing User Macros](#)
- [Guide to User Macro Templates](#)
- [Examples of User Macros](#)

> The information on this page does not apply to Confluence OnDemand.

### Using the 'Colour' macro on a page

To add the macro to a page, edit the page and choose **Insert > Other Macros** and find the 'Colour' macro. (Or use autocomplete: start typing '{colo' in the editor, and select the 'Colour' macro from the list of suggestions that appears.)

#### Defining the 'Stylish' user macro

If your macro requires more than one parameter, you can use variables $param0 to $param9 to represent them. Let's say that you want to add a parameter that allows the user to specify the size of the text.

Enter the macro attributes as follows:

- **Macro Name**: stylish
- **Visibility**: Visible to all users in the Macro Browser
- **Macro Title**: Stylish
- **Description**: Applies colour and size to text
- **Categories**: Confluence Content
- **Icon URL**: You can leave this field empty.
- **Documentation URL**: You can leave this field empty.
- **Macro Body Processing**: Rendered
- **Template**:

  ```html
  ## @param 0:title=colour|type=string
  ## @param 1:title=size|type=string
  <span style="color: $param0; font-size: $param1">$body</span>
  ```

#### Naming your parameters

Alternatively, you can also use explicitly-named parameters in your macro. These macro parameters will appear as variables with the name $param<x> where <x> is the name of your parameter.

```html
## @param Colour:title=colour|type=string
## @param Size:title=size|type=string
<span style="color: $paramColour; font-size: $paramSize">$body</span>
```
NoPrint Example of a User Macro

This page gives an example of a user macro, the 'NoPrint' macro, that you can use to prevent text from being printed. For full details about creating a user macro, see the guide to writing user macros.

Defining the 'NoPrint' user macro

To create the 'NoPrint' user macro:

1. Choose Browse > Confluence Admin.
2. Choose User Macros in the left-hand panel.
3. Choose Create a User Macro at the bottom of the list of macros.
4. Enter the macro attributes as follows:
   - Macro Name: noprint
   - Visibility: Visible to all users in the Macro Browser
   - Macro Title: NoPrint
   - Description: Hides text from printed output.
   - Categories: Confluence Content
   - Icon URL: You can leave this field empty.
   - Documentation URL: You can leave this field empty.
   - Macro Body Processing: Rendered
   - Template:

```
## @noparams
<div class="noprint">$body</div>
```

5. Choose Save.

Related pages:
- Writing User Macros
- Guide to User Macro Templates
- Examples of User Macros

The information on this page does not apply to Confluence OnDemand.

Using the 'NoPrint' Macro on a page

Now you can add the macro to your Confluence page using the Macro Browser. Text entered into the body of the macro placeholder will not be printed, but will appear when the page is viewed online.

Making the PDF export recognise the NoPrint macro

See Advanced PDF Export Customisations.

Panel Preformatted with Specific Colours - Example of a User Macro

This user macro creates a panel pre-formatted to specific colours. It will create a panel that looks like this:
Defining the 'Formatted Panel' user macro

1. Choose Browse > Confluence Admin.
2. Choose User Macros in the left-hand panel.
3. Choose Create a User Macro at the bottom of the list of macros.
4. Enter the macro attributes as follows:
   - Macro Name: formpanel
   - Visibility: Visible to all users in the Macro Browser
   - Macro Title: Formatted Panel
   - Description: Creates a panel preformatted with specific colours
   - Categories: Formatting
   - Icon URL: You can leave this field empty.
   - Documentation URL: You can leave this field empty.
   - Macro Body Processing: Escaped
   - Template:

```
## @param Title:title=Title|type=string|desc=Title
<ac:macro ac:name="panel">
  <ac:parameter ac:name="titleBGColor">#ccc</ac:parameter>
  <ac:parameter ac:name="borderStyle">solid</ac:parameter>
  <ac:parameter ac:name="borderColor">#6699CC</ac:parameter>
  <ac:parameter ac:name="borderWidth">2</ac:parameter>
  <ac:parameter ac:name="titleColor">#000000</ac:parameter>
  <ac:parameter ac:name="title">$!paramTitle</ac:parameter>
  <ac:rich-text-body>$body</ac:rich-text-body>
</ac:macro>
```

5. Choose Save.

Explanation of the code in the macro template

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>@param Title:title=Title</td>
<td>Description</td>
</tr>
<tr>
<td>&lt;ac:macro ac:name=&quot;panel&quot;&gt;</td>
<td></td>
</tr>
<tr>
<td>&lt;ac:parameter ac:name=&quot;titleBGColor&quot;&gt;#ccc&lt;/ac:parameter&gt;</td>
<td></td>
</tr>
<tr>
<td>&lt;ac:parameter ac:name=&quot;borderStyle&quot;&gt;solid&lt;/ac:parameter&gt;</td>
<td></td>
</tr>
<tr>
<td>&lt;ac:parameter ac:name=&quot;borderColor&quot;&gt;#6699CC&lt;/ac:parameter&gt;</td>
<td></td>
</tr>
<tr>
<td>&lt;ac:parameter ac:name=&quot;borderWidth&quot;&gt;2&lt;/ac:parameter&gt;</td>
<td></td>
</tr>
<tr>
<td>&lt;ac:parameter ac:name=&quot;titleColor&quot;&gt;#000000&lt;/ac:parameter&gt;</td>
<td></td>
</tr>
<tr>
<td>&lt;ac:parameter ac:name=&quot;title&quot;&gt;$!paramTitle&lt;/ac:parameter&gt;</td>
<td></td>
</tr>
<tr>
<td><a href="">ac:rich-text-body</a>$body&lt;/ac:rich-text-body&gt;</td>
<td></td>
</tr>
</tbody>
</table>

Note: The panel's title will be empty if the user does not give a value for the title parameter.

Related pages:
- Writing User Macros
- Guide to User Macro Templates
- Examples of User Macros

⚠️ The information on this page does not apply to Confluence OnDemand.
### @param

Title:title=Title|type=string|desc=Title

@param defines the metadata for your macro parameters. When users select this macro, the macro will contain a parameter called "Title" where they can enter data. A macro dialog window appears when the user selects this macro using **Insert > Other Macros** or when a user clicks the macro placeholder and chooses **Edit**. The macro will, later on, use the data stored in this parameter to enter data in the title section of the Panel macro.

@param Title

This parameter is called "Title".

title=Title

defines the parameter title that will appear in the macro dialog window as "Title".

type=string

defines the field type for the parameter as a text field.

desc=Title

defines the description of the parameter.

```xml
<ac:macro ac:name="panel">
```

This command activates the Confluence **Panel** macro.

Hint: To discover the code name of a Confluence macro, see **Confluence Storage Format for Macros**. If the macro you want is not documented there, follow these steps:

1. Create and save a page containing a Confluence macro you want to investigate.
2. Choose **Tools > View Storage Format**. This option is available to Confluence administrators only, and shows the XML source code for the page. (See **Confluence Storage Format**.)
3. A Confluence macro starts with the following string: `<ac: macro ac:name=```
Sets the parameters for the macro: the background colour, border style, border colour, border width and title colour.

Hint: To discover the names of the parameters for a Confluence macro, see Confluence Storage Format for Macros. If the macro you want is not documented there, follow these steps:

1. Create and save a page containing a Confluence macro you want to investigate.
2. Choose Tools > View Storage Format. This option is available to Confluence administrators only, and shows the XML source code for the page. (See Confluence Storage Format.)
3. The macro parameters start with the following string: <ac:parameter ac:name="paramName"

Enters the value stored in the 'Title' parameter into the title section of the macro.

The ! tells the macro to leave the title blank, when there is no data in the "Title" parameter.

Users can enter data that is stored in the body of the macro. This line enables the macro to access and store the body content passed to your macro.

This command marks the end of the macro.

Preformatted Table - Example of a User Macro

This user macro creates a 2 x 2 table, with the headings defined as 'Parameter' and 'Description'. It will create a table that looks like this:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note: As the macro is written, the user cannot amend the heading titles when using the macro on a Confluence page.

Related pages:
- Writing User Macros
- Guide to User Macro Templates
- Examples of User Macros

⚠️ The information on this page does not apply to Confluence OnDemand.

Defining the 'Formatted Table' user macro

1. Choose Browse > Confluence Admin.
2. Choose User Macros in the left-hand panel.
3. Choose Create a User Macro at the bottom of the list of macros.
4. Enter the macro attributes as follows:
- Macro Name: formtable
- Visibility: Visible to all users in the Macro Browser
- Macro Title: Formatted Table
- Description: Creates a simple 2 x 2 table with the column headings filled in
- Categories: Formatting
- Icon URL: You can leave this field empty.
- Documentation URL: You can leave this field empty.
- Macro Body Processing: Escaped
- Template:

```
## @param Head1:type=string|desc=Heading
## @param Head2:type=string|desc=Heading
## @param Cell1:type=string|desc=cell
## @param Cell2:type=string|desc=cell
#set ($paramHead1 ="Parameter")
#set ($paramHead2 ="Description")

<div id="preformattedtable">
<table>
<tr>
<th>$paramHead1</th>
<th>$paramHead2</th>
</tr>
<tr>
<td>$!paramCell1</td>
<td>$!paramCell2</td>
</tr>
</table>
</div>
```

5. Choose **Save**.

*Using the macro on a Confluence page*

**To add the macro to a page:**

1. In the Confluence editor, choose **Insert > Other Macros**.
2. Find and select the ‘Formatted Table’ macro.
3. Enter the cell contents into the form.
4. Choose **Insert**.

**Amending the contents of the table**

To change the content in the cells of the table:

1. Edit the page.
2. Click the macro placeholder for the ‘Formatted Table’ macro, to see the properties panel.
3. Choose **Edit**.
4. Enter the cell contents into the form.
5. Choose **Save**

*Note:* Content entered into the body of the ‘Formatted Table’ macro will not appear on the page.

*Guide to User Macro Templates*

You write a user macro in a screen in the Confluence Administration Console. The ‘template’ is one of the fields
that you define when writing a user macro. (See the rest of the guide to writing user macros.) This page gives you guidelines about the code you can enter in a user macro template.

Quick guide to user macro templates:

- Use HTML and Confluence-specific XML elements in the macro template. Details of Confluence's storage format are in Confluence Storage Format.
- You can use the Velocity templating language. Here is more information on the Velocity project.
- If your macro has a body, your template can refer to the macro body text by specifying "$body".
- Each parameter variable you use must have a matching metadata definition. Use @param to define metadata for your macro parameters.
- When using the information passed using parameters, refer to your parameters as $paramXXX where 'XXX' is the parameter name that you specified in the @param metadata definition.
- Use @noparams if your macro does not accept parameters. Note that this will prevent your macro appearing in the macro browser.

On this page:

- Accessing your Macro's Body
- Using Parameters in your User Macro
- Objects Available to your Macro
- Controlling Parameter Appearance in the Editor Placeholder
- Related Topics

⚠️ The information on this page does not apply to Confluence OnDemand.

Accessing your Macro's Body

Use the $body object within your user macro template to access the content passed to your macro in the macro body.

The $body object is available if you have specified that your macro has a body (in other words, if you have not selected No macro body).

Example: Let's assume your macro is called helloworld.

Enter the following code in your template:

```
Hello World: $body
```

A user, when editing a Confluence page, chooses your macro in the Macro Browser and then enters the following in the macro placeholder that is displayed in the edit view:

```
From Matthew
```

The wiki page will display the following:

```
| Hello World: From Matthew |
```

Using Parameters in your User Macro

You can specify parameters for your macro, so that users can pass it information to determine its behaviour on a
How your Macro's Parameters are Used on a Confluence Page

When adding a macro to a Confluence page, the Macro Browser will display an input field for each of your macro's parameters. The field type is determined by the parameter type you specify for each parameter.

Defining the Parameters

Briefly, a parameter definition in the template contains:

- @param
- The parameter name
- A number of attributes (optional)

Format:

```
## @param MYNAME:title=MY TITLE|type=MY TYPE|desc=MY DESCRIPTION|required=true|multiple=true|default=MY DEFAULT VALUE
```

Additional notes:

- The order of the parameters in the template determines the order in which the Macro Browser displays the parameters.
- We recommend that you define the parameters at the top of the template.
- There may be additional attributes, depending on the parameter type you specify.

The sections below describe each of the attributes in detail.

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Description</th>
<th>Required / Recommended / Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>(an unnamed, first attribute)</td>
<td>A unique name for the parameter. The parameter name is the first attribute in the list. The name attribute itself does not have a name. See the section on name below.</td>
<td>Required</td>
</tr>
<tr>
<td>title</td>
<td>The parameter title will appear in the Macro Browser. If you do not specify a title, Confluence will use the parameter name.</td>
<td>Recommended</td>
</tr>
<tr>
<td>type</td>
<td>The field type for the parameter. See the section on type below.</td>
<td>Recommended</td>
</tr>
<tr>
<td>desc</td>
<td>The parameter description will appear in the Macro Browser.</td>
<td>Optional</td>
</tr>
<tr>
<td>required</td>
<td>Specifies whether the user must enter information for this parameter. Defaults to 'false'.</td>
<td>Optional</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td></td>
</tr>
<tr>
<td>multiple</td>
<td>Specifies whether the parameter accepts multiple values. Defaults to ‘false’.</td>
<td></td>
</tr>
<tr>
<td>default</td>
<td>The default value for the parameter.</td>
<td></td>
</tr>
</tbody>
</table>

### Parameter Name

The parameter name is the first attribute in the list. The name attribute itself does not have a name.

**Example:** The following code defines 2 parameters, named ‘foo’ and ‘bar’:

```markdown
## @param foo
## @param bar
```

### Parameter Type

The field type for the parameter. If you do not specify a type, the default is string.

<table>
<thead>
<tr>
<th>Parameter Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Displays a checkbox to the user and passes the value ‘true’ or ‘false’ to the macro as a string.</td>
</tr>
</tbody>
</table>
| enum           | Offers a list of values for selection. You can specify the values to appear in a dropdown in the Macro Browser. Example of specifying the enum values:

```markdown
## @param
colour:title=Colour|type=enum
|enumValues=Grey,Red,Yellow,Green
```

*Note about i18n:* Confluence does not support internationalisation of the enum values. The value the user sees is the one passed to the macro as the parameter value, with the capitalisation given. In this case ‘Grey’, ‘Red’, etc.
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A text field. This is the default type. Example with a required field:</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td></td>
<td>## @param status:title=Status</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td>confluence-content</td>
<td>Offers a control allowing the user to search for a page or blog post. Example:</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td></td>
<td>## @param page:title=Page</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td>username</td>
<td>Search for user.</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td></td>
<td>## @param user:title=Username</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td>spacekey</td>
<td>Offers a list of spaces for selection. Passes the space key to the macro.</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td></td>
<td>## @param space:title=Space</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td>date</td>
<td>Confluence accepts this type, but currently treats it in the same way as 'string'. Example:</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td></td>
<td>## @param fromDate:title=From Date</td>
</tr>
<tr>
<td></td>
<td>Note about dates: A user can enter a date in any format, you should validate the date format in your user macro.</td>
</tr>
</tbody>
</table>
### int

Confluence accepts this type, but currently treats it in the same way as 'string'. Example with a default value:

```markdown
## @param
numPosts:title=Number of Posts|type=int|default=15|desc=Number of posts to display
```

### percentage

Confluence accepts this type, but currently treats it in the same way as 'string'. Example:

```markdown
## @param
pcent:title=Percentage|type=percentage|desc=Number of posts to display
```

---

**Using the Parameters in your Macro Code**

The parameters are available in your template as `$paramfoo`, `$parambar` for parameters named "foo" and "bar".

Normally, a parameter like `$paramfoo` that is missing will appear as '$paramfoo' in the output. To display nothing when a parameter is not set, use an exclamation mark after the dollar sign like this: `$!paramfoo`

**Using No Parameters**

If your macro does not accept parameters, you should use `@noparams` in your template. That will let Confluence know that it need not display a parameter input field in the Macro Browser.

If the user macro contains no parameters and does not specify `@noparams`, then the Macro Browser will display a free-format text box allowing users to enter undefined parameters. This can be confusing, especially if the macro does not accept parameters.

**Example:** Add the following line at the top of your template:

```markdown
## @noparams
```

---

**Objects Available to your Macro**

Including the macro body and parameters, the following Confluence objects are available to the macro:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Class Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>$body</td>
<td>The body of the macro (if the macro has a body)</td>
<td>String</td>
</tr>
</tbody>
</table>
$paramfoo, $parambar, ... $param<name> Named parameters ("foo", "bar") passed to your macro. String

$config The BootstrapManager object, useful for retrieving Confluence properties. BootstrapManager

$renderContext The PageContext object, useful for (among other things) checking $renderContext.outputType PageContext

$space The Space object that this content object (page, blog post, etc) is located in (if relevant). Space

$content The current ContentEntity object that this macro is a included in (if available). ContentEntityObject

Macros can also access objects available in the default Velocity context, as described in the developer documentation.

Controlling Parameter Appearance in the Editor Placeholder

A macro developer (or author of a user macro) can control which fields of the macro should appear in the placeholder in the Confluence Editor.

Plugin Macro Metadata

The macro metadata for a plugin macro now has parameter options as shown in the following example:

```xml
<macro name="panel" documentation-url="help.panel.macro">
  <category name="formatting"/>
  <parameters>
    <parameter name="title" type="string">
      <option key="showNameInPlaceholder" value="false" />  
      <option key="showValueInPlaceholder" value="true" />
    </parameter>
    <parameter name="borderStyle" type="string"/>
    <parameter name="borderColor" type="color"/>
  </parameters>
</macro>
```

The option showNameInPlaceholder specifies that in the above example the 'title' parameters name should not be shown.

The option showValueInPlaceholder specifies that the user entered value for this parameter should be shown.

So, for the above example, the macro placeholder could show something like 'panel | my panel title'. If showNameInPlaceholder was true instead of false it would show something like 'panel | title = my panel title'.

If a macro has neither option on any of it's parameters then the default behaviour is to show all parameters: full title and value. If one or more parameters has either option set then all parameters without the options set will default to false (i.e. will not be shown).

User Macro Metadata
The behaviour for a user macro is as described above, however the method of configuration is within the @param entry in the template. So, the example from above would look something like:

```html
## @param
title:type=string|option-showNameInPlaceholder=false|option-showValueInPlaceholder=true
```

### Configuring the Office Connector

The Office Connector is a Confluence plugin that allows Confluence users to interact with Microsoft Office and Open Office in various ways. You can display content from Office documents on a wiki page and import content from an Office document into Confluence. Please refer to the User Guide for details of these interactions.

A **System Administrator** can enable or disable parts of the Office Connector and can configure options as described below.

<table>
<thead>
<tr>
<th>On this page:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Enabling and Disabling the Office Connector and its Modules</strong></td>
</tr>
<tr>
<td><strong>Configuring the Office Connector Options</strong></td>
</tr>
<tr>
<td><strong>Related Topics</strong></td>
</tr>
</tbody>
</table>

⚠️ *The information on this page does not apply to Atlassian OnDemand sites with multiple apps. If you are using Confluence-only OnDemand, the information does apply.*

#### Enabling and Disabling the Office Connector and its Modules

The Office Connector is bundled with Confluence 2.10 and later, so you should not need to install it. But you may wish to enable or disable some of its modules.

A **System Administrator** can install, enable or disable plugins and plugin modules. You can read a general overview in *Installing Plugins and Macros*.

To enable or disable the Office Connector and its modules:

1. Select **Plugins**, under 'Configuration' in the left-hand panel of the Confluence Administration Console.
2. Click **Show system plugins** under 'System Plugins'.
3. Search the page for **Office Connector plugin** and select the link.
4. The 'Office Connector plugin' panel will appear near the top centre of the page, as shown in the screenshot below.
5. Now you can do one of the following:
   - **Configure plugin** – This will take you to the separate plugin configuration screen described below.
   - **Disable plugin** – Click this link if you want to disable all modules of the plugin, but leave the plugin installed on your Confluence site.
   - **Uninstall plugin** – Click this link if you want to remove the Office Connector permanently from your Confluence site. To restore it at a later date, you will need to re-install it from the Confluence Plugin Repository.
   - **Manage plugin modules** – You can also enable or disable one or more of the Office Connector modules, as described in the table below.
**Screenshot: Enabling the Office Connector plugin and its modules**

![Office Connector plugin](image)

This is the `com.atlassian.confluence.plugins.jira-office-connector` plugin for Atlassian Confluence.

**Module Description**

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>

<td>This module supplies the 'View' link which appears next to attachments displayed in search results, where the attachment is an Office document.</td>
</tr>
<tr>
<td>Link for previewing an attachment</td>
<td>This module supplies the 'View' link which appears next to attachments displayed on the 'Attachments' view of a page, where the attachment is an Office document.</td>
</tr>
<tr>
<td>viewfile</td>
<td>This module supplies the {viewfile} macro. See View File Macro.</td>
</tr>
<tr>
<td>viewdoc</td>
<td>This module supplies the Word document component of the {viewfile} macro.</td>
</tr>
<tr>
<td>viewxls</td>
<td>This module supplies the Excel document component of the {viewfile} macro.</td>
</tr>
<tr>
<td>viewppt</td>
<td>This module supplies the PowerPoint document component of the {viewfile} macro.</td>
</tr>
<tr>
<td>viewpdf</td>
<td>This module supplies the PDF document component of the {viewfile} macro.</td>
</tr>
<tr>
<td>editgrid</td>
<td>This module is used to migrate editgrid users to the Office Connector.</td>
</tr>
<tr>
<td>Import Word UI on page tabs</td>
<td>This module supplies a 'Doc Import' tab which appears in older versions of Confluence, next to the 'View', 'Edit', 'Attachments' and 'Info' tabs. Not relevant to Confluence 2.10 or later, except for custom themes.</td>
</tr>
<tr>
<td>Import Word UI on drop down menu</td>
<td>This module supplies the 'Doc Import' link which appears in the Confluence 'Tools' dropdown menu.</td>
</tr>
<tr>
<td>Edit in Office javascript resource</td>
<td>This module contains the javascript resources for launching the desktop applications for editing Office documents.</td>
</tr>
<tr>
<td>Office Connector Servlet</td>
<td>This module allows Confluence users to edit their Confluence pages in Microsoft Word. It performs the conversion to and from Word.</td>
</tr>
<tr>
<td>Office Authenticator Filter</td>
<td>This module authenticates HTTP requests from Office applications.</td>
</tr>
<tr>
<td>PPT slide web service</td>
<td>This module allows Confluence users to view a PowerPoint presentation on a wiki page. It provides the slide images to the Flash control which displays the slides on the wiki page.</td>
</tr>
</tbody>
</table>
DOC and XLS image cache web service

This module is required if Confluence users want to view a Word document or an Excel spreadsheet on a wiki page. It allows images to be stored in a cache on the server, so that they can be retrieved when the browser renders the HTML page.

Office Connector Actions

This module must be enabled if the Office Connector is used.

Configuring the Office Connector Options

A Confluence administrator can set the options described below, to determine the behaviour of the Office Connector on your Confluence site.

To set the configuration options for the Office Connector:

1. Select Office Connector under 'Configuration' in the left-hand panel of the 'Confluence Administration Console'. The 'Configure Office Connector plugin' screen will appear.
2. Set the configuration options as described in the table below.

**Screenshot: Configuring the Office Connector options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit in word button location</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Warnings:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Advanced Formatting Options:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Authentication:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Temporary storage for wvfile macro</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Maximum file space for cache(MB)</td>
<td>500</td>
<td></td>
</tr>
<tr>
<td>Number of Conversion Queues</td>
<td>6</td>
<td></td>
</tr>
</tbody>
</table>

The configuration options are described in the table below:
<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Warnings: Show a warning before allowing a user to perform an import</td>
<td>Disabled</td>
<td>If this option is enabled, the user will receive a warning when importing a Word document. The warning will tell the user when they are about to overwrite existing content.</td>
</tr>
<tr>
<td>Advanced Formatting Options: Use the footnote macro for Word footnotes</td>
<td>Disabled</td>
<td>If this option is enabled, a Confluence page created from an imported Word document will use the (footnote) macro from Adaptavist to render any footnotes contained in the document. Note that you will need to install the Footnotes plugin onto your Confluence site. For more information about this plugin and macro, please refer to the Footnotes plugin.</td>
</tr>
<tr>
<td>Authentication: Allow authentication tokens in the URL path</td>
<td>Disabled</td>
<td>If this option is enabled, the Office Connector will use authentication tokens in the URL.</td>
</tr>
</tbody>
</table>
| Temporary storage for viewfile macro          | The Confluence Home directory. | The `{viewfile}` macro will cache data temporarily. This option allows you to set the location of the cache. Available settings are:  
  - **Confluence home directory** – The temporary file will be stored in your Confluence Home directory.  
  - **A directory specified in the directories.properties file** – You can specify a location by editing the Office Connector’s `directories.properties` file:  
    1. Go to the bundled-plugins directory in your Confluence Home directory.  
    2. Copy the Office Connector JAR file to a temporary location: `OfficeConnector-x.xx.jar`, where ‘x.xx’ is the version number. |
3. Unzip the JAR file and find the `directories.properties` file in the `resources` directory. The content of the file looks like this:

```properties
# Complete the following line to set a custom cache directory.
# If resetting to blank, don't delete anything before or including the '='
com.benhyan.confluence.word.edit.cacheDir=
```
4. Edit the last line, adding the path to your required temporary location directly after the '=' character. For example:

- On Windows:

```bash
com\be\nry\an\con\flu\ence\e.word\edit\cach\edir=c:\mypath\`
```

- On Linux:

```bash
com\be\nry\an\con\flu\ence\e.word\edit\cach\edir=/home/myusername/mypath
```
5. Save the file, recreate the JAR and put it in the bundled-plugins directory in your Confluence Home directory, overwriting the original JAR.

- Cache in-memory – The temporary file will be held in memory. We recommend this option if you are running in a clustered environment.

<table>
<thead>
<tr>
<th>Maximum file space for cache (MB)</th>
<th>500</th>
<th>This is the maximum size of the cache used by the {viewfile} macro. (See above.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of Conversion Queues</td>
<td>6</td>
<td>This is the maximum number of threads used to convert PowerPoint or PDF slide shows. You can use this setting to manage Confluence performance, by limiting the number of threads so that the Office Connector does not consume too many resources. Click Manage Queues to view attachments that are still pending conversion.</td>
</tr>
</tbody>
</table>

Viewing and Editing License Details

When you upgrade or renew your Confluence license, you will receive a new license key. You will need to update your Confluence installation with the new license key.

You can access your existing license key, or generate an evaluation license key, at [http://my.atlassian.com](http://my.atlassian.com).

Updating your license details in Confluence

To update your Confluence license:

1. If you do not already have a license key, get your existing license key, or generate an evaluation license key, at [http://my.atlassian.com](http://my.atlassian.com).
2. Log in to Confluence as a user with Confluence Administrator or System Administrator permissions.
3. Choose **Browse > Confluence Admin**.
4. Choose **License Details** in the left-hand panel.
5. Enter your new license details into the **License** field.
6. Choose **Save**.

If you are running a Confluence cluster, you will need to:

- Update each server's Confluence license separately.
- Ensure that the new license has enough nodes to cover all servers that are currently running in your cluster. To check the number of active servers in your cluster, see the [Cluster Administration page](#).

Screenshot: License details

This page shows your current licensing information. You can use the form below to update the license Confluence is running with.

<table>
<thead>
<tr>
<th>Organisation</th>
<th>Atlassian</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date Purchased</td>
<td>Feb 11, 2007</td>
</tr>
<tr>
<td>License Type</td>
<td>Confluence: Commercial Server</td>
</tr>
<tr>
<td>Licensed Users</td>
<td>500 (0 signed up currently)</td>
</tr>
<tr>
<td>Support Period</td>
<td>Your commercial Confluence support and updates are available until Feb 12, 2008.</td>
</tr>
<tr>
<td>Server ID</td>
<td>AACK-COIS-AACK-COIS (Atlassian sales or support may ask you to provide this ID)</td>
</tr>
</tbody>
</table>

Viewing your license details

To view the details of your Confluence license:

1. Log in to Confluence as a user with Confluence Administrator or System Administrator permissions.
2. Choose Browse > Confluence Admin.
3. Choose License Details in the left-hand panel.

The 'License Details' screen tells you:

- What type of license you have (for example: Commercial, Academic, Community, or Evaluation).
- How many users your Confluence site is licensed to support, and how many are currently registered (‘signed up currently’). See below for more about the user count. Choose Refresh button to make sure you see the latest count.
- How much time remains in your one-year support and upgrades period (for full licenses) or 30-day trial (for trial licenses).
- Your server ID, which:
  - is generated when you install Confluence for the first time
  - exists for the life of the Confluence installation
  - survives an upgrade
  - is held in the database
  - is not bound to a specific license
  - is the same for all servers in a cluster.

Understanding the user count for your Confluence license

The number of registered users allowed on your Confluence site may be limited, depending on your license type. See the licensing and pricing overview on the Atlassian website. If you have an 'unlimited' license, then the number of registered users is not significant.

The number of registered users is also called the 'user count' or the number of users 'signed up currently'. It is
Reducing the User Count for your Confluence License

This page tells you how to reduce the number of users that count towards your Confluence license. You may want to reduce your user count in Confluence if you have exceeded your license limit, or if you want to change to a lower-tier license to reduce costs.

Understanding the user count for your Confluence license

The number of registered users allowed on your Confluence site may be limited, depending on your license type. See the licensing and pricing overview on the Atlassian website. If you have an 'unlimited' license, then the number of registered users is not significant.

The number of registered users is also called the 'user count' or the number of users 'signed up currently'. It is determined as follows:

- It includes only those users who have the 'can use' global permission for the Confluence site. (See Global Permissions Overview for more about the 'can use' permission.)
- It does not include anonymous users, who may access your Confluence site if you have allowed anonymous access. (See Setting Up Public Access for more about allowing anonymous access.)
- It does not include deactivated users.

On this page:

- Understanding the user count for your Confluence license
- Reducing the user count

Reducing the user count

The recommended method for reducing your user count is to remove or deactivate the users. You can remove users who do not require access to Confluence and have never created content in Confluence. You can deactivate users who have created content but no longer require access to Confluence. See Removing or Deactivating Users.
Alternatively, if you have connected Confluence to an LDAP directory, you may want configure Confluence to synchronise a subset of users from LDAP rather than all users. This is described in the following knowledge base article: Changing the Number of Users Synchronized from LDAP to Confluence. This can be a complicated procedure and we recommend that you do not use this method unless necessary.

**Cache Statistics**

Confluence provides statistics about its internal caches that allow you to track the size and hit ratio of each cache and tune it for better performance (if necessary). See Performance Tuning for more information.

**Configurable Caches**

System administrators can change the sizes of Confluence's internal caches through the Administration Console and these changes will take effect without the need to first shut down and then restart Confluence. The maximum number of units for any of the defined cache regions can be adjusted individually.

Note that larger cache sizes will require more memory at runtime, so you should review the memory allocation of the Confluence Java process and the physical memory available on your server.

The information on this page does not apply to Confluence OnDemand.

**Viewing Cache Statistics and Modifying Cache Sizes**

To view the cache statistics:

1. Choose **Browse > Confluence Admin**.
2. Click **Cache Statistics** in the left-hand panel. There you will find a list of all objects cached within Confluence.
3. Click the **Advanced** tab for more detail. Below is an example for one of the most frequently used caches, the 'Content Object' cache.

<table>
<thead>
<tr>
<th>Name</th>
<th>Percent Used</th>
<th>Effectiveness</th>
<th>Objects / Size</th>
<th>Hit / Miss / Expiry</th>
<th>Adjust Size</th>
<th>Flush</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content Object</td>
<td>80%</td>
<td>73%</td>
<td>4023 / 5000</td>
<td>374550 / 140460 / 55044</td>
<td>Adjust Size</td>
<td>Flush</td>
</tr>
</tbody>
</table>

About the generated numbers:

- **Percent Used**: 
  
  \[ \text{Percent Used} = \frac{\text{Objects}}{\text{Size}} \]

- **Effectiveness**: 
  
  \[ \text{Effectiveness} = \frac{\text{Hits}}{\text{Hits + Misses}} \]

- **Objects / Size**: 
  
  The number of entries in the cache / the number of total possible entries allowed (configurable).

- **Hit / Miss / Expiry**: 
  
  The number of reads accessing cache where required content was found / the number of reads accessing cache where required content was not found / the number of objects evicted from the cache.

- **Adjust Size**: 
  
  Use this option to specify a different maximum cache size. Enter a new cache size and click the **Adjust Size** button to set it.
Flush:

Flushes the cache.

For instance, to calculate **Percent Used**:

\[
\text{Percent Used} = \frac{\text{Objects}}{\text{Size}}
\]

\[
\text{Percent Used} = \frac{4023}{5000} = 80\%
\]

To calculate **Effectiveness**:

\[
\text{Effectiveness} = \frac{\text{Hits}}{\text{Hits} + \text{Misses}}
\]

\[
\text{Effectiveness} = \frac{374550}{374550 + 140460} = 73\%
\]

⚠️ The clustered versions of Confluence use distributed cache called Tangosol Coherence.

Watching the Cache Contents

To see the specific items in the caches, view the cache statistics at `<baseUrl>/admin/cachecontents.jsp`.

Additional Notes about Configurable Caches

Changes to cache size configurations persist across Confluence restarts as they are saved in the `<confluence-home>/config/ehcache.xml` file (or `<confluence-home>/config/confluence-coherence-cache-config-clustered.xml` for a clustered instance). In most cases, a Confluence administrator will never need to know about these files. However, if it is necessary to tune cache options other than the maximum cache size, this can be done by manually editing these files. See **Cache Performance Tuning** for details.

⚠️ Important note about clustered Confluence installations

The cache configuration file is stored in a home directory of each cluster node. When a Confluence administrator changes a cache size, all running cluster nodes will automatically update their own configuration files in their respective home directories. However, if a cluster node is not running when an administrator adjusts a cache size, the `/config/confluence-coherence-cache-config-clustered.xml` file in its home directory will not be updated. Since cluster caches are configured by the first node to start, if a node with an outdated cache configuration is the first to start up, the whole cluster would end up using the configuration of that node. However, copying this file from one node to another would resolve this issue.

Performance Tuning

If you need to tune your application when under high usage, you may like to review [this document](#) for suggestions.

Confluence Data Directory Configuration

Here is a link listing important Confluence files.

The home directory defines the location of the directory where Confluence will store its data, including attachments, indexes and backups. Administrators can set this location by defining a value for the file <MY-INST ALL>/confluence/WEB-INF/classes/confluence-init.properties. To find what your home directory is currently set to, open this file and check the confluence.home property. It is unset on new installations.

⚠️ The information on this page does not apply to Confluence OnDemand.

Windows Configuration

On Windows, this path:

```
C:\confluence\data
```

will be written like so:

```
confluence.home=C:/confluence/data
```

Note that all backslashes (\) are written as forward slashes (/).

Linux/Solaris Configuration

On any Linux-based system, the property is defined using the normal directory syntax:

```
confluence.home=/var/confluence/
```

Symbolic links

If your confluence.home directory contains a symbolic link, you must define the absolute path.

⚠️ Please note that there can be no symbolic links within the confluence.home directory. If disk space is an issue, place the entire confluence.home directory on a disk partition where there is enough space.

The absolute path of generated files (such as exports) is compared with the absolute path of the confluence.home directory when constructing URLs. When a sub-directory has a different path, the URL will be incorrect, and you may receive "Page not found" errors. These measures are in place to prevent "directory traversal" attacks.

Fixing the Confluence Configuration

The Confluence configuration file: confluence-cfg.xml inside the home directory may contain references to the original location of your Confluence home. You will need to edit this file to update these references to also
point to the new location. The two properties in this file that need to change are:

- `daily.backup.dir` if you have not configured your backups to be placed elsewhere already
- `hibernate.connection.url` if you are using the embedded HSQL database.

**Content Index Administration**

The content indexes power Confluence's search functionality. They are also used for a number of related functions such as building email threads in the mail archive, the `space activity` feature and lists of recently-updated content. The [Gliffy plugin](https://confluence.atlassian.com/display/DOC/Gliffy+plugin) also uses them for some of its functionality.

For reasons of efficiency, Confluence does not immediately add content to the index. New and modified Confluence content is first placed in a queue and the queue is processed once every minute (by default).

**On this page:**

- Viewing the Content Index Summary
- Rebuilding the Content Indexes
- Slow Reindexing
- Viewing the Index Browser
- More Hints and Tips

⚠️ The information on this page does not apply to Confluence OnDemand.

**Viewing the Content Index Summary**

To see information about your Confluence instance's content indexing,

1. Choose Browse > Confluence Admin.
2. Click 'Content Indexing' under the heading 'Administration' in the left-hand panel.

*Screenshot: Index summary*
Rebuilding the Content Indexes

The content indexes are maintained automatically, but you may need to rebuild one or both of them manually under circumstances such as these:

- Your searching and mail threading are malfunctioning. (Rebuild the Search Index.)
- The Did You Mean feature is malfunctioning. (Rebuild the Did You Mean Index.)
- After an upgrade. If a content re-index is required after an upgrade, it will be noted in an upgrade subsection of the relevant Confluence Release Notes.

In new Confluence installations, the 'Did You Mean' feature is not initially activated. To activate it, you first need to build its index by clicking its 'Build' button on this page.

To rebuild either of the content indexes,

1. Choose Browse > Confluence Admin.
2. Click 'Content Indexing' under the heading 'Administration' in the left-hand panel.
3. Click the 'Rebuild' button in either the 'Search Index' or 'Did You Mean Index' sections on this page, depending on the particular index you want to rebuild.

- If one of these indexes has not yet been built, its button will indicate 'Build' instead of 'Rebuild).
- As shown in the image below, only one index can be (re)built at a time.

Screenshot: Content Indexing
Slow Reindexing

Does the reindexing take a long time to complete? The length of time depends on the following factors:

- Number of pages in your Confluence instance.
- Number, type and size of attachments.
- Amount of memory allocated to Confluence.

It may help to increase the heap memory allocation of Confluence by following the instructions in the JIRA documentation.

If you are running an older version of Confluence and find that the index rebuild is not progressing, you may need to shut down Confluence, and restart it with the following Java system property set: `bucket.indexing.threads.fixed=1`. This will cause the re-indexing to happen in a single thread and be much more stable (but slower).

Viewing the Index Browser

Confluence uses a search engine called Lucene. If you need to see more details of the indexed pages in your Confluence site, you can download and run Luke. Luke is a development and diagnostic tool that accesses existing Lucene indexes and allows you to display and modify their content in several ways.

Start Luke and use it to open the `index` directory, located in your Confluence Home directory. For example: `c:\confluence\data\confluence-home\index`.

More Hints and Tips

- If you are still experiencing problems after performing the above rebuild, the next step might be to remove the index and rebuild it from scratch.
  - The space activity feature uses the index to store data. If you remove the index file, the existing activity data will disappear.
  - A tip for the development community: If you have the Confluence source, you can look for references to the SmartListManager to find the screens and lists that rely on the content index.
Finding Unused Spaces

Sometimes, you want to know what is not being used. It's great to know what's getting most attention, but what about stagnant pages, or even entire spaces that are no longer active?

While viewing space activity can provide hints, it doesn't always provide enough detail. The simple way is to go directly to the database. We recommend DbVisualizer, and have basic instructions for connecting it to HSQLDB.

The following query identifies the last date on which content was modified in each space within a single Confluence instance:

```
SELECT spaces.spacename, MAX(content.lastmoddate)
FROM content, spaces
WHERE content.spaceid = spaces.spaceid
GROUP BY spaces.spacename;
```

It returns a list of spacenames, and the last date and time at which any content was added or changed.

The information on this page does not apply to Confluence OnDemand.

Alternatively, this one simply identifies spaces whose content hasn't changed since a specified date:

```
SELECT spaces.spacename
FROM content, spaces
WHERE content.spaceid = spaces.spaceid
GROUP BY spaces.spacename
HAVING MAX(content.lastmoddate) < '2006-10-10';
```

The result is a simple list of space names.

It's also possible to present the information in a wiki page, using the SQL plugin, which can be installed using the Plugin Exchange. You'll also need to define a database resource in conf/server.xml and confluence/WEB-INF/web.xml, as described here. Having done so, you can use wiki markup code like the following, replacing confluenceDS with the name of your own local datasource:

```
{sql: dataSource=confluenceDS|output=wiki}
SELECT spaces.spacename AS Space, MAX(content.lastmoddate) AS LastModified
FROM content, spaces
WHERE content.spaceid = spaces.spaceid
GROUP BY Space;
{sql}
```
The result will be something like this:

<table>
<thead>
<tr>
<th>space</th>
<th>lastmodified</th>
</tr>
</thead>
<tbody>
<tr>
<td>Private Space</td>
<td>2007-10-11 11:34:04.914</td>
</tr>
</tbody>
</table>

You can try the Chart plugin in combination with the SQL plugin to give more visually attractive results.

**Important Directories and Files**

**The Installation Directory**

The 'Confluence Installation directory' is the directory into which the Confluence application files and libraries have been unpacked (unzipped) when Confluence was installed. Confluence does not modify or store any data in this directory. This directory is also sometimes called the 'Confluence Install directory'.

**Important Files and Directories**

- **confluence/WEB-INF/classes/confluence-init.properties**: This file tells Confluence where to find the Confluence Home Directory. This file is modified by the administrator when installing Confluence.
- **confluence/WEB-INF/classes/osuser.xml**: This file is modified when connecting Confluence to an external user management system such as an LDAP server or JIRA instance in Confluence 2.0 and earlier. For more information, refer to Managing Confluence Users.
- **confluence/WEB-INF/classes/atlassian-user.xml**: This file is modified when connecting Confluence to an external user management system such as an LDAP server or Crowd. For more information, refer to Managing Confluence Users.
- **confluence/WEB-INF/lib/**: This directory is used when deploying plugins, especially those plugins that cannot automatically be loaded through the Administration Console.
- **confluence/WEB-INF/classes/log4j.properties**: Confluence's logging configuration file. See Working with Confluence Logs.
- **confluence/WEB-INF/classes/ehcache.xml**: This is where you can configure the size of Confluence's internal caches
- **confluence/WEB-INF/classes/styles/site-css.vm**: Confluence's main stylesheet, modify at your own risk
- **conf/server.xml**: SSL configuration.

**Memory Settings**

The file used to edit JAVA_OPTS memory settings will depend on the method used to install Confluence, as well as the operating system used for your installation.

- **Windows Users**
  - Confluence — bin/setenv.bat
  - Confluence Installer — wrapperwin32.conf
- **Mac/Linux Users**
  - Confluence — bin/setenv.sh
  - Confluence Installer — wrapperosx.conf

⚠️ The information on this page does not apply to Confluence OnDemand.

**The Temp Directory**
The temp directory is configured in the Java runtime and some Confluence components write temporary files or lockfiles into this directory.

For EAR/WAR installations typically, this directory is /tmp on Linux systems, or C:\Temp on Windows.

For Standalone installations the temp directory is located in the installation directory as /temp.

To change the location of this directory, start the Java Virtual Machine in which confluence is running with the argument:

-Djava.io.tmpdir=/path/to/your/own/temp/directory.

**The Confluence Home Directory**

The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

Tip: Another term for 'Home directory' would be 'data directory'.

Administrators can expect the Confluence Home Directory to grow quite large in a busy site.

The location of this directory is configured by the system administrator during installation (see confluence-init.properties above).

**Important Files and Directories**

- **confluence.cfg.xml**: Confluence's core configuration file; includes the configuration for connecting to its database.
- **default-formatting.properties**: Some auxiliary configuration data concerning default number and date formats.
- **attachments/**: All file attachments in the Confluence site are stored under this directory. This is the only place Confluence keeps attachment files.
- **backups/**: If Confluence is configured to produce daily backups, these are kept in this directory. Administrators should occasionally delete old or unwanted backups from this directory to prevent it from growing too large.
- **config/**: Miscellaneous global and per-space configuration files are kept in this directory.
- **database/**: If Confluence is being run from the embedded HSQL database, the database files will be kept in this directory.
- **index/**: The full-text search index is kept in this directory. Removing or modifying files in this directory may cause search to no longer function. Rebuilding the search index from Confluence's global administration screen will completely regenerate the contents of this directory.
- **plugins/**: Dynamically uploaded plugins are stored in this directory. Administrators can install new plugins by copying them into this directory and triggering a scan from the plugin management page.
- **temp/**: Confluence stores temporary files in this directory, especially during backups and exports. A daily job within Confluence deletes files that are no longer needed.
- **thumbnails/**: Stores temporary files for image thumbnails. The contents of this directory can be safely deleted, as Confluence will regenerate thumbnails as required.
- **velocity/**: Storage for customised page layouts, globally and per-space.

**Database**

All other data — page contents, links, archived mail and so on — is kept in the database. If you have configured Confluence to use the embedded HSQL database, the database will store its files under database/ in the Confluence Home Directory. Otherwise, the database management system you are connecting to is responsible for where and how your remaining data is stored.
Tip

All of Confluence's persistent data is stored either in the Confluence Home Directory, or the database. If you have backup copies of both of these, taken at the same time, you will be able to restore Confluence from them (see Restoring Data from other Backups).

Confluence Installation Directory
The Embedded HSQLDB Database
Database Configuration

Confluence Home Directory

Often in the documentation, you'll see a reference to the 'Confluence Home directory'.

What is the Confluence Home Directory?
The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

Tip: Another term for 'Home directory' would be 'data directory'.

⚠️ The information on this page does not apply to Confluence OnDemand.

Finding the Confluence Home Directory

The location of the Confluence Home directory is defined when you install Confluence. This location is stored in a configuration file called confluence-init.properties, which is located inside the confluence/WEB-INF/classes directory in your Confluence Installation directory.

When Confluence first starts up, it reads the confluence-init.properties file to determine where to look for the Home directory.

Once Confluence is running you can find the Confluence Home directory via the Administration console, under Administration > System Information > Confluence Information - Confluence Home.

Content of the Confluence Home Directory

The Confluence home directory contains some of the configuration data used by Confluence. Other data is stored in the database. This section outlines the purpose of the files and directories in the Confluence home directory.

confluence.cfg.xml

This file contains all of the information necessary for Confluence to start up, such as:

- Product license
- Context path
- Database details, such as location and connection pool settings
- Paths to important directories

attachments

This directory contains every version of each attachment stored in Confluence. This directory is not used when
Confluence is configured to store attachments in the database. Attachments are always stored in the database in clustered instances of Confluence.

Paths within this directory have the following structure:

```
/attachments/PAGE_ID/ATTACHMENT_ID/VERSION
```

You can specify an alternative directory for attachment storage by setting the `attachments.dir` property in `confluence.cfg.xml`.

**backups**

Confluence will place its daily backup archives in this directory, as well as any manually generated backups. Backup files in this directory take the following form:

```
daily-backup-YYYY_MM_DD.zip
```

You can specify an alternative directory for backups by setting the `daily.backup.dir` property in `confluence.cfg.xml`.

**bundled-plugins**

Confluence ships with a set of bundled plugins. These are plugins written by the Atlassian and the Confluence community that we think provide useful and broadly applicable functionality in Confluence. The `bundled-plugins` directory is where Confluence will unpack its bundled plugins when it starts up. This directory is refreshed on every restart, so removing a plugin from this directory will not uninstall the plugin. It will simply be replaced the next time Confluence starts up.

**database**

This is where Confluence stores its database when configured to run with the HSQL embedded database. In such cases this directory contains all Confluence runtime data. Installations configured to run using an external database such as MySQL will not use this directory.

**index**

This is where Confluence stores its indexes for rapid retrieval of often used data. The Confluence index is used heavily by the application for content searching and recently updated lists and as such is critical for a running Confluence instance. It is important to note however that should the data in this directory be lost or corrupted, it can be restored by running a full reindex from within Confluence. This can take a long time depending on how much data is stored Confluence’s database.

An alternative directory may be specified for the index by setting the `lucene.index.dir` property in `confluence.cfg.xml`. As this is the most heavily accessed directory in the Confluence home directory you might want to consider hosting it on the fastest disk available. It would also be useful if the disk holding the Confluence index was not heavily used by any other application to reduce access contention.

**plugin-cache**

All Confluence plugins are stored in the Confluence database. To allow for quicker access to classes contained within the plugin JARs, Confluence will cache these plugins in the `plugin-cache` directory. This directory is updated as plugins are installed and uninstalled from the system and is completely repopulated from the database every time Confluence is restarted. Removing plugins from this directory does not uninstall them.
resources

The `resources` directory stores any space logos used in your Confluence instance. For each space with a space logo, there is a directory within `resources` named after the space's key. That directory contains the space's logo.

temp

The `temp` directory is used for various runtime functions such as exporting, importing, file upload and indexing. As the name suggests, and file in this directory is of temporary importance and is only used during runtime. This directory can be safely emptied when Confluence is offline.

An alternative directory may be specified for temporary data by setting the `webwork.multipart.saveDir` property in `confluence.cfg.xml`.

thumbnails

When Confluence generates a thumbnail of an image (for example when the `gallery` macro is used), the resulting thumbnail is stored in this directory for quicker retrieval on subsequent accesses. This directory is essentially a thumbnail cache, and deleting files from this directory simply means the thumbnail will have to be regenerated on the next access.

Installing a Language Pack

Confluence ships with a number of bundled language packs. These languages appear as options on the 'Language Configuration' screen in the Administration Console when choosing a default language and as 'Language' options for users in their user settings. You can make additional languages available for selection by installing language packs. Please note, you must be a Confluence administrator to install a language pack.

Language packs are plugins. The process of installing a language pack is the same as installing a new plugin.

⚠️ The information on this page does not apply to Confluence OnDemand.

Installing a Language Pack using the Plugin Manager

To install a language pack using the plugin manager:

1. Click 'Plugins' in the Confluence Administration Console.
2. Click 'Install'.
3. Locate the language pack and install it via the plugin manager interface.

**Installing a Language Pack Manually**

To install a language pack manually, you will need to upload the language pack plugin as described below. The language pack plugin will be enabled by default once you have installed it.

Plugins are distributed as a jar file. To install a plugin:
1. In the 'Administration' section of Confluence, click **Plugins**.
2. Use **Browse** to find the plugin jar you wish to install from your hard drive or network location, and select it.
3. Click **Upload**.
4. The plugin will be uploaded to Confluence and will be automatically installed.
5. Check the 'Plugin Administration' screen to ensure that the plugin is available.
6. Enable the plugin if necessary. (Some plugins will be enabled by default when they are installed. Others will have to be manually enabled from the 'Plugin Administration' screen.)

**Finding more Language Packs**

- You can download official language packs from the [Atlassian Plugin Exchange](https://plugins.atlassian.com). You can also download language packs developed by the Confluence user community from the [Language Pack Translations page](https://translations.atlassian.com).

**Showing User Interface Key Names for Translation**

For those customers working on creating translations of the Confluence user interface, from 4.1 onwards there is a feature that will help. After opening the Confluence dashboard, you can simply add this text to the end of your Confluence URL, like so:

```
?i18ntranslate=on
```

Then press Enter.

This will then cause each element of the user interface to display its special **key name** while Confluence is still in an interactive mode. This makes it easier to find the essential context for each key, which can then be searched on [http://translations.atlassian.com](http://translations.atlassian.com) where you can enter an appropriate translation for your custom language pack.

The key names are displayed with a "lightning bolt" graphic between elements of the names. For example, the buttons will show up with elements shown like so:

```
Dashboard\title, dashboard
```

For example, for the **Browse** button, the associated key **system.space.menu** can be found on [http://translations.atlassian.com](http://translations.atlassian.com), allowing you to write a better translation for the term **Browse**, being able to see the full context of where the UI element belongs and what it means to the user.

To turn off the translation view, add this code to the end of the Confluence URL:

Installing a Plugin

Site Backup and Restore

Atlassian suggests establishing a backup strategy using a native database tool for a production instance of Confluence.

By default, Confluence backs up all data and attachments once a day to a backup file. These files are called XML site backups, and are stored in the backups directory of Confluence home. You can also create XML site backups manually. This mechanism is intended for small to medium-sized deployments of Confluence. It is not intended for use with large deployments with lots of pages and attachments (see below).

- Restore your site from an XML site backup
- Manually create an XML site backup
- Configuring Backups
- User Submitted Backup & Restore Scripts

XML site backups are fine for most small to medium-sized instances of Confluence, containing a few thousand pages and attachments. However, large instances of Confluence may find that backups become slow to create and use large amounts of disk space.

The information on this page does not apply to Confluence OnDemand.

Backups For Large Instances

XML site backups are unsuitable for instances of Confluence that contain thousands of pages, as XML backups take progressively longer to complete as the amount of text increases. Another issue with XML site backups is that Confluence instances with gigabytes of attachments will consume disk space rapidly. This is because each site backup contains all content needed for a site restore. For example, if a 1 GB instance of Confluence is backed up daily, it will create 30 GB of backups per month if left unattended. When administering a large instance, you can reduce disk space by setting XML site backups to exclude attachments, then manually scheduling a backup of your attachments from the Confluence home directory or database. The backup manager can save space by saving changed files instead of all content.

<table>
<thead>
<tr>
<th>Creation Delay</th>
<th>Disk Usage</th>
<th>Recommended Backup Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acceptable</td>
<td>Acceptable</td>
<td>XML site backup with attachments</td>
</tr>
<tr>
<td>Acceptable</td>
<td>Unacceptable</td>
<td>XML site backup minus attachments, plus manual backup of attachments</td>
</tr>
<tr>
<td>Unacceptable</td>
<td>Unacceptable</td>
<td>Manual backup of database and attachments</td>
</tr>
</tbody>
</table>
**Creation Delay** is the time it takes to create an XML site backup *minus attachments*. **Disk Usage** can be estimated by multiplying the frequency of your XML site backups by their current size.

**Manual Backups**

Confluence's [Attachment Storage Configuration](https://confluencelassian.readthedocs.io/) can be set to store attachments in the Confluence home directory, or in the database.

**Database Backup**

Use your Database Administration Tool to create a backup of your Confluence database. If your database is storing your attachments, importing this later will restore all content. For instances with big attachments, please note that currently Confluence migrate attachments in a single transaction: [CONF-9888](https://confluencelassian.readthedocs.io/).

**Attachment Backup**

If stored on the filesystem, attachments are placed under the `attachments` directory of your Confluence home directory. Copy this directory to create a backup of all attachments.

To restore from these backups, please refer to [Restoring Data from other Backups](https://confluencelassian.readthedocs.io/).

**Related Topics**

- [Production Backup Strategy](https://confluencelassian.readthedocs.io/)
- [Backup FAQ](https://confluencelassian.readthedocs.io/)

**Production Backup Strategy**

Confluence automatic daily XML backup is suitable if you:

- are evaluating Confluence
- do not have database administration familiarity, and your Confluence installation is small

Once your Confluence installation reaches more than a few thousand pages, the XML backup facility can be inefficient compared to your database's own backup tools. The built in backup functionality requires a lot of memory to run and is less reliable when restoring data.

**Related pages:**

- [Site Backup and Restore](https://confluencelassian.readthedocs.io/)
- [Backup FAQ](https://confluencelassian.readthedocs.io/)

---

**Establishing a production system backup solution**

Atlassian recommends establishing an alternative database backup strategy:

- Create a backup or dump of your database using tools provided by your database
- Create a file system backup of your Confluence home directory

Once this is in place, disable the daily backups through the scheduled jobs feature via 'Administration Console > Administration > Scheduled Jobs'.

We want to stress that creating these two backups is better than having a Confluence XML backup. It is more robust and far more reliable for large production instances. You will be able to restore your whole site, including all data, attachments and configuration information intact with these two backups. See [Restoring Data from other Backups](https://confluencelassian.readthedocs.io/).

Which files need to be backed up?

Back up the whole home directory is the safest option, however most files and directories are populated on...
startup and can be ignored. At minimum, these files/directories must be backed up:

- attachments – but If you store your attachments in the database then you can ignore the attachments directory
- confluence-cfg.xml

The rest of the directories will be auto-populated on start up. You may also like to backup these directories:

- config – if you have modified your ehcache.xml file.
- index – if your site is large or reindexing takes a long time – this will avoid the need for a full reindex when restoring.

How do I restore?

Take a look a the Migrating Confluence Between Servers document for instructions on restoring a backup using this technique.

Other processes

XML backups are described and used for other processes in Confluence, like upgrading and moving servers. Using the backup strategy described above will work for those processes too.

- Our upgrade guide does not require the use of an XML backup (although the earlier Confluence upgrade procedure, and the JIRA upgrade guide, do use XML backups).
- Our migrate server procedure – used to set up a test server – can use a SQL dump as well.
- The database migration procedure uses the XML backup for small data sets. Large data sets will require third party database migration tools.

Note: The XML export built into Confluence is not suited for the backup or migration of large data sets. There are a number of third party tools that may be able to assist you with the data migration. If you would like help in selecting the right tool, or help with the migration itself, we can put you in touch with one of the Atlassian Experts.

Configuring Backups

Confluence backs up your data regularly into a zipped XML file. By default, this backup is performed at 2.00 a.m. each day and the backup files are stored in the backups folder under the Confluence Home directory. The default naming convention for the backup files is 'backup-yyyy_MM_dd'. Confluence can write backups to both local and mapped network drives.

From the Backup Administration section of Confluence's administration console, you can:

- Include or exclude attachments in backups.
- Configure a different path to store backup files. (By default, this option is not available. See below for information about enabling the configuration option.)
- Change the naming format used for the files.

You can also change the schedule of this backup using Confluence's scheduled jobs feature.

You need to have System Administrator permissions in order to configure these options.

On this page:
- Configuring Confluence Backups
- Enabling Backup Path Configuration
- Notes

The information on this page does not apply to Confluence OnDemand.
To configure Confluence backups:

1. Choose Browse > Confluence Admin.
2. Click 'Backup Administration' in the 'Configuration' section.
3. Click the 'Edit' button on the 'Backup Administration' screen.
4. Now you can do the following:
   - To specify an alternate path to store backup files — Select 'Custom' and then enter the path. The directory must be on either a local drive or a mounted network drive.
   - By default, this option is not available. See below for information about enabling the configuration option.
   - Please ensure the mapped drive is on a physical server, not a Virtual Machine image.
   - To exclude attachments from backups — Select 'Off' beside 'Backup Attachments'. By default, this feature is 'On'.
   - To use a different naming prefix format — Enter the new format in the 'Backup File Prefix' input field.
   - To use a different date format — Enter the date format in the 'Backup File Date Pattern' input field using the syntax described in this document from Sun.
5. 'Save' your changes.

You can disable Confluence backups through the scheduled jobs feature.

Enabling Backup Path Configuration

By default, it is not possible to specify a backup path via the Confluence Administration Console. This feature is disabled by default for security reasons. Administrators can restore this functionality by updating the relevant configuration property as described below. However, we recommend that you turn the feature off in production environments. For production environments, please review our Production Backup Strategy.

To enable the configuration option:

1. Edit the confluence.cfg.xml file found in the Confluence Home Directory.
2. Set the value of property admin.ui.allow.daily.backup.custom.location to 'true' (without the quotation marks).
3. Restart Confluence.

If the value of the above configuration property is 'true', it will be possible to specify a backup path via the Confluence Administration Console. If the value of this property is 'false' or the property is not present in the configuration file, the backup path is not configurable.

Notes

*Time is derived from the Confluence server*
The time zone is taken from the server on which Confluence is running.

To check the time according to the server, do the following:

1. Choose **Browse > Confluence Admin**.
2. Click 'System Information' in the left-hand panel and look at the 'System Time'.

**Backup strategy for large Confluence sites**

Consider using the **production backup strategy** if your Confluence site is large or you are encountering problems with your automated backup.

**RELATED TOPICS**

**User Submitted Backup & Restore Scripts**

These scripts are user-submitted and should be used with caution as they are not covered by Atlassian technical support. If you have questions on how to use or modify these scripts, please post them to Atlassian Answers. Feel free to submit new scripts or post updates by logging in and adding them to the page as a comment.

⚠️ The information on this page does not apply to Confluence OnDemand.

**Delete Old Backups - Wscript Script On Windows**

This script examines backup filename and deletes them if necessary, it may need to be edited.

```
'If you want 3 day old files to be deleted then insert 3 next to Date = "your number here"
'This script will search out and delete files with this string in them ".2005-12-04-" This of course depends on the number you enter. 
'You can always do a wscript.echo strYesterday or strFileName to see what the script thinks you are searching for.

dtmYesterday = Date - 3
strYear = Year(dtmYesterday)
strMonth = Month(dtmYesterday)
If Len(strMonth) = 1 Then
    strMonth = "0" & strMonth
End If
strDay = Day(dtmYesterday)
If Len(strDay) = 1 Then
    strDay = "0" & strDay
End If
strYesterday = strYear & "-" & strMonth & "-" & strDay
strFileName = "C:\test*." & strYesterday &"-"*
Set objFSO = CreateObject("Scripting.FileSystemObject")
objFSO.DeleteFile(strFileName)
```
Delete Old Backups - Basic Bash Script For Linux

Old XML backups can be deleted automatically by inserting a nightly or weekly automation script or cron similar to the following:

```
ls -t <path to your backup dir>/* | tail -n +6 | xargs -i rm {}
```

Or, using the older form of the `tail` command if your system does not support the standard form:

```
ls -t <path to your backup dir>/* | tail +6 | xargs -i rm {}
```

Delete Old Backups - Advanced Bash Script For Linux

Old XML backups can be deleted automatically by inserting a nightly or weekly automation script or cron similar to the following. Set the `BACKUP_DIR` and `DAYS_TO_RETAIN` variables to appropriate values for your site. Between runs, more files than `DAYS_TO_RETAIN` builds up.

```bash
#!/bin/sh
# Script to remove the older Confluence backup files.
# Currently we retain at least the last two weeks worth
# of backup files in order to restore if needed.
BACKUP_DIR="/data/web/confluence/backups"
DAYS_TO_RETAIN=14
find $BACKUP_DIR -maxdepth 1 -type f -ctime +$DAYS_TO_RETAIN -delete
```

Manual Database & Home Backup - Bash Script For Linux

This backs up a mySQL database and the Confluence home directory.

```bash
#!/bin/bash
CNFL=/var/confluence
CNFL_BACKUP=/backup/cnflBackup/`date +%Y%m%d-%H%M%S`
rm -rf $CNFL/temp/*
mkdir $CNFL_BACKUP
mysqldump -uroot -p<password> confluence|gzip > $CNFL_BACKUP/confluence.mysql.data.gz
tar -cjvf $CNFL_BACKUP/data.bzip $CNFL > $CNFL_BACKUP/homedir.status
```

Backup by Date - Postgres

```bash
export d=`date +%u`
mkdir -p /home/backup/postgres/$d
sudo -u postgres pg_dumpall | bzip2 > /home/backup/postgres/$d/sql.bz2
```
Manually Backing Up the Site

Confluence is configured to back up its data automatically. You can also manually perform this backup from the Administration Console.

You need to have System Administrator permissions in order to perform this function.

Note: Atlassian recommends that you follow the Production backup strategy if your Confluence site is large or you are encountering problems with your automated backup.

Creating the site backup

To manually back up your site:

1. Choose Browse > Confluence Admin.
2. Choose Backup & Restore in the left-hand panel.
3. Choose Archive to backups folder to store a copy of the backup in the same folder as Confluence’s backups.
   If you do not archive the backup it will be made available for you to download, and then deleted from the server after 24 hours.
4. Choose Backup attachments to include attachments in your backup.
5. Choose Backup.
   The process will take a few minutes.

Retrieving the Backup File

Confluence stores the backup as a zipped XML file in the 'backups' directory under the Confluence Home directory on your Confluence server. To find your Confluence Home directory, see the documentation. You will need access to the Confluence server in order to retrieve this file.

Enabling the download of the backup file via the administration console

By default, it is not possible to retrieve the backup file via the Confluence Administration Console. This feature is disabled for security reasons.

Administrators can enable this functionality by updating the relevant configuration property as described below. If this functionality is enabled, Confluence will prompt you to download the backup file when the backup process finished. However, we recommend that you turn the feature off in production environments.

To enable download of the backup file from the Administration Console:

1. Edit the confluence.cfg.xml file found in the Confluence Home Directory.
2. Set the value of property admin.ui.allow.manual.backup.download to 'true' (without the quotation marks).
3. Restart Confluence.
If the value of the above configuration property is 'true', it will be possible to download the backup file after manually backing up the site via the Confluence Administration Console. If the value of this property is 'false' or the property is not present in the configuration file, you will need to retrieve the backup file from the file system on the Confluence server. By default, the value is 'false'.

Notes

If you experience timeout errors, please consider bypassing Apache and creating the export directly from Tomcat. This will speed up the process and prevent timeouts. For example, your URL might be something like http://<domain>.com. To bypass this and access Tomcat directly, use this URL: http://localhost:8080/confluence/admin/backup.action.

Restoring a Site

⚠️ CAUTION: Restoring a backup of an entire confluence site will:

- Wipe out all Confluence content in the database. Please ensure that your database is backed up before you start.
- Log you out after the restoration process. Please make sure you know the login details contained in the data that you are about to restore.

This page describes how to restore data from an XML backup file into an existing Confluence installation. If you want to restore data into a new site, follow the instructions on Restoring from Backup During Setup.

You need System Administrator permissions in order to perform this function.

Notes before you start:

- All content replaced. Restoring a site from backup will replace all your content, as described in the warning above.
- Selective space restoration not possible. You cannot select a single space to restore from the entire site backup when the backup contains more than one space.
- Backward version compatibility. Confluence supports backward compatibility for site backups (but not space backups). You can successfully restore backups of a site from an older version of Confluence to a newer version of Confluence. You cannot restore backups from a newer version to an older version. For example, if you create a site backup in Confluence 2.4.3, it cannot be restored into a Confluence 2.2.2 site. It can however, be restored into 2.4.5 or 2.5.x, because 2.4.5 and 2.5.x are newer versions of Confluence.

Related pages:

- Production Backup Strategy

⚠️ The information on this page does not apply to Confluence OnDemand.

Restoring data from an XML backup

You can restore data from an XML backup file located somewhere on your local computer or a shared drive, or you can copy the XML file into the Confluence installation and restore it from there. The second option is recommended for large backup files. Both options are described below.

To restore data from an XML backup located outside Confluence:
1. Choose **Browse > Confluence Admin**.
2. Choose **Backup and Restore** in the left-hand panel.
3. Choose **Choose File** and browse for the backup file.
4. Uncheck **Build Index** if you want to create the index at a later stage.
5. Choose **Upload and Restore**.

### To restore data from an XML backup located in your Confluence installation:

1. Copy your XML backup zip file into the `restore` directory in your Confluence home directory. For example:
   - On UNIX: `/opt/java/src/confluence/deployments/conf.atlassian.com/home/restore`
   - On Windows: `C:\Program Files\Atlassian\Application Data\Confluence x.x\restore`
2. Choose **Browse > Confluence Admin**.
3. Choose **Backup and Restore** in the left-hand panel.
4. The zip file that you copied in step 1 will appear in the list of files under the heading **Restore a backup from the Confluence Home Directory** on your Confluence Administration Console. Select the zip file.
5. Uncheck **Build Index** if you want to create the index at a later stage.
6. Choose **Restore**.

### Notes

- **Production backup strategy preferred.** Atlassian recommends that you follow the [Production Backup Strategy](#) for your production Confluence site, because Confluence XML backups are not recommended for non-evaluation sites.

- **Restoring from other backups.** If your daily backup zip files cannot be restored for some reason, but you have backups of both your database and your Confluence home directory, then it is still possible to [restore from these backups](#).

### Restoring a Space

This page tells you how to import the contents of a Confluence space into another Confluence site, via an XML backup file.

You can **export the content of a space**, including pages, comments and attachments. The process involves converting the data in the space into XML format. The end product is a zip file that contains XML file(s) and optionally, all the attachments in the space. To transfer this data to another Confluence site, you simply restore this zip file as described below.

Confluence will only allow you to restore a space if there is not already a space by that name on the site. If you already have a space with the identical name, you will need to delete or rename the existing space before restoring the new one.

---

⚠️ **The information on this page does not apply to Confluence OnDemand.**
**Cannot restore to a different major Confluence release**

Confluence only supports forward and backward compatibility for space import and export when executed within the **same major version** of Confluence.

Clarifying our terminology: By **major version**, we mean the version defined in the first two sections of the release number. For example, Confluence 2.2 and Confluence 2.3 are different major versions. Confluence 2.2.1 and Confluence 2.2.6 are the same major version.

**Restoration Data Must Share the Same Major Version Number**

This means that a space export created in one major version of Confluence cannot be imported into a different major version of Confluence. For example, if you create a space export in Confluence 2.2.5, it cannot be imported into a Confluence 2.2.2 site. It can be however imported into 2.3.6. Similarly, a space export created in 2.2.2 can not be imported into 2.3.5. However, it can be restored into a Confluence 2.2.6 site.

If you try to carry out such an operation, an error message similar to the one below will be displayed and the import action will be stopped.

**Screenshot: Major Version Clash on Space Restore**

The following error(s) occurred:

- Restore denied. You can only restore space backups exported from the same major version (e.g. 2.2.x or 2.3.x).

**Workaround for restoring Spaces between Major Releases**

You'll need to set up a test server, **download** and install the same version of confluence as the version you exported the space from, then import the space into this test server. Next **update Confluence** on your test installation to the right major version so that you can perform the export and import this space into your production confluence successfully. Otherwise, you can try to **Change the version of the space export**, but please try this on a test site as well.

---

**You need to have System Administrator permissions in order to perform this function.**

### To restore a space,

1. Choose **Browse > Confluence Admin**.
2. Select **Backup and Restore** in the ‘Administration’ section of the left-hand panel.

You can restore data in one of two ways:

1. **Upload a zipped backup to Confluence**:
   - Browse for the backup file.
   - Uncheck **Build Index** if you want to create the index at a later stage.
   - Click **Upload and Restore**.

2. **Restore a backup from the file system**:
   - Select the backup file from the form field displayed. If you do not see your backup file, make sure that it has been copied into the `/opt/java/src/confluence/deployments/conf.atlassian.com/home/restore` directory.
   - Uncheck **Build Index** if you want to create the index at a later stage.
   - Click **Restore**.
Changing the version of a space backup

Confluence prevents the import of space backups which aren’t from the same major version. The reason for this is that any schema change between the export and imported version of Confluence will cause the import to fail, leaving you with an incomplete import. Even worse, the failure can be database-dependent, so it may work fine on one particular database but your backup will fail to import later.

Do not import a modified space backup on a production server. Import the modified space backup on a test server, then export from the test server to create a pristine space backup for the new version.

To change the version of a space backup, do the following:

- extract the space backup ZIP file
- edit `exportDescriptor.properties` in a text editor
- change the `buildNumber` to the `buildNumber` of the Confluence version you wish to import into
- zip up the modified contents of the backup into a ZIP file again.

This will allow you to import a backup into a test instance of Confluence. After checking the imported space for errors, export it cleanly from the test server and import the fresh backup into your production server.

If your import fails on the test server due to Hibernate errors, this indicates a schema incompatibility and cannot be worked around. You will need to restore your entire site on an old version of Confluence, and export the space from there. See the last section of Restoring a Space for details.

Restoring a Test Instance from Production

See Migrating Confluence Between Servers for a more comprehensive explanation.

Many Confluence administrators will have a production instance running the "live" version of Confluence, as well as a test instance for testing upgrades and so on. In this situation, it’s quite common that the two instances are running different versions of Confluence. This document describes how to copy the data from a production instance to a test instance, where the production version may be different to the test version.

Before proceeding with this guide, ensure you have read and understood the normal procedure for upgrading Confluence.

Upgrading a test Confluence instance with production data

Essentially, we are copying both the production home directory and database to the test instance. We then update the database details on the test instance to point to the test database, leaving all other instance metadata (most importantly the Confluence `build number`) the same as production.

1. Shut down your test instance.
2. Restore the production database to the test database server.
3. Create a backup of the `confluence.cfg.xml` file found in the home directory of the test instance.
4. Copy the production confluence-home directory to the test application server.
5. Open the `confluence.cfg.xml` which has been copied in a text editor. Change the database settings...
to match the test database server. **Ensure you do not point to your production database.** (You can compare with the backup you made in Step 3 if you need to get the database settings. Don’t just copy this file – you need the build number unchanged from production to indicate the database is from an older version of Confluence.)

Before starting your test instance, you need to do the following steps to ensure no contact with production systems.

**Ensuring no contact with production systems**

To ensure no contact with external systems, you will need to disable both inbound and outbound mail services.

1. Disable global outbound mail by running the following database query:

   ```sql
   SELECT * FROM BANDANA WHERE BANDANAKEY = 'atlassian.confluence.smtp.mail.accounts';
   ```

2. Disable space-level mail archiving by running the following database query:

   ```sql
   SELECT * FROM BANDANA WHERE BANDANAKEY = 'atlassian.confluence.space.mailaccounts';
   ```

   Change the ‘SELECT *’ to a ‘DELETE’ in the above queries once you are sure you want to remove the specified accounts.

   Once this is done, you can start your test instance without any mails being sent or retrieved. Think carefully about other plugins which may access production systems (SQL macro, etc.). These should be disabled promptly after starting the test instance.

   You can create a developer license for this server and update the License Details after starting up.

   **See also**

   - Upgrading Confluence
   - Migrating Confluence Between Servers
   - Restoring to a Test Instance of Confluence from Production

**Restoring Data from other Backups**

Typically, Confluence data is restored from the Administration Console or from the Confluence Setup Wizard.

If you are experiencing problems restoring from an zipped XML backup file, it is still possible to restore provided you have:

1. A backup of your home directory.
2. A backup of your database (if you’re using an external database).

Instructions for this method of restoring differ depending on whether you are using the embedded database or an external database (like Oracle, MS SQL Server, MySQL or Postgres).

⚠️ **The information on this page does not apply to Confluence OnDemand.**

**Embedded Database**
If you are running against the embedded database, the database is located inside the database folder of your Confluence Home Directory. Hence, all you need to do is:

1. Retrieve the most recent backup of your home directory.
2. Unpack the Confluence distribution and point the confluence-init.properties file to this directory.

---

**External Database**

If you’re using an external database, you need to do the following.

1. Prepare backups of your home directory and database (preferably backups that are dated the same). That is, make sure the home directory is accessible on the filesystem and the database available to be connected to.
2. If this database happens to have a different name, or is on a different server, you need to modify the jdbc url in the confluence.cfg.xml file inside the Confluence Home Directory. The value of this property is specified as hibernate.connection.url.
3. Unpack the Confluence distribution and point the confluence-init.properties file to the home directory.

---

**Retrieve file attachments from a backup**

File attachments on pages can be retrieved from a backup without needing to import the backup into Confluence. This is useful for recovering attachments that have been deleted by users.

Both automated and manual backups allow this, as long as the 'Include attachments' property was set. Users wanting to restore pages, spaces or sites should check out the Confluence Administrator’s Guide instead.

Before following the instructions for recovering attachments, please review how backups store file and page information.

⚠️ The information on this page does not apply to Confluence OnDemand.

---

**How Backups Store File and Page Information**

The backup zip file contains entities.xml, an XML file containing the Confluence content, and a directory for storing attachments.

**Backup Zip File Structure**

Page attachments are stored under the attachments directory by page and attachment id. Here is an example listing:
Inside the attachment directory, each numbered directory inside is one page, and the numbered file inside is one attachment. The directory number is the page id, and the file number is the attachment id. For example, the file \attachments\98\10001 is an attachment with page id 98 and attachment id 10001. You can read entities.xml to link those numbers to the original filename. Entities.xml also links each page id to the page title.

**Entities.xml Attachment Object**

Inside the entities.xml is an Attachment object written in XML. In this example, the page id is 98, the attachment id is 10001 and the filename is *myimportantfile.doc*. The rest of the XML can be ignored:

```
<object class="Attachment" package="com.atlassian.confluence.pages">
  <id name="id">98</id>
  <property name="fileName">
    <![CDATA[myimportantfile.doc]]>
  </property>
  ...
  <property name="content" class="Page" package="com.atlassian.confluence.pages">
    <id name="id">10001</id>
  </property>
  ...
</object>
```

**Entities.xml Page Object**

This XML describes a page. In this example, the page id is 98 and the title is *Editing Your Files*. The rest of the XML can be ignored:

```
<object class="Page" package="com.atlassian.confluence.pages">
  <id name="id">98</id>
  <property name="title">
    <![CDATA[Editing Your Files]]>
  </property>
  ...
</object>
```

**Instructions for Recovering Attachments**

Each file must be individually renamed and re-uploaded back into Confluence by following the instructions below. Choose one of the three methods:

**Choice A - Recover Attachments By Filename**

Best if you know each filename you need to restore, especially if you want just a few files:

1. Unzip the backup directory and open entities.xml.
2. Search entities.xml for the filename and find the attachment object with that filename. Locate its page and attachment id.
3. Using the page and attachment id from entities.xml, go to the attachments directory and open that directory with that page id. Locate the file with the attachment id.
4. Rename the file to the original filename and test it.
5. Repeat for each file.
6. To import each file back into Confluence, upload to the original page by attaching the file from within Confluence.

**Choice B - Restore Files By Page**

Best if you only want to restore attachments for certain pages:

1. Unzip the backup directory and open entities.xml.
2. Search entities.xml for the page title and find the page object with that title. Locate its page id.
3. Go to the attachments directory and open that directory with that page id. Each of the files in the directory is an attachment that must be renamed.
4. Search entities.xml for attachment objects with that page id. Every attachment object for the page will have an attachment id and filename.
5. Rename the file with that attachment id to the original filename and test it.
6. Repeat for each page.
7. To import each file back into Confluence, upload to the original page by attaching the file from within Confluence.

**Choice C - Restore All Files**

Best if you have a small backup but want to restore many or all the attachments inside:

⚠️ Following process is applicable to space export only. Site xml backups do not require page id to be updated manually due to the nature of persistent page_id's.

1. Unzip the backup directory and open entities.xml.
2. Go to the attachments directory and open any directory. The directory name is a page id. Each of the files in the directory is an attachment that must be renamed.
3. Search entities.xml for attachment objects with that page id. When one is found, locate the attachment id and filename.
4. Rename the file with that attachment id to the original filename and test it.
5. Find the next attachment id and rename it. Repeat for each file in the directory.
6. Once all files in the current directory are renamed to their original filenames, search entities.xml for the page id, eg directory name. Find the page object with that page id and locate its page title.
7. Rename the directory to the page title and move on to the next directory. Repeat for each un-renamed directory in the attachments directory.
8. To import each file back into Confluence, upload to the original page by attaching the file from within Confluence.

⚠️ To obtain detailed information about lost attachments, location, name and type of the attachments, you may use the findattachments script

**Troubleshooting failed XML site backups**

⚠️ XML site backups are only necessary for migrating to a new database. Setting up a test server or Establishing a reliable backup strategy is better done with an SQL dump.

Exception while importing backup

| Follow [Troubleshooting XML backups that fail on restore](#) instead |

⚠️ The information on this page *does not apply* to Confluence OnDemand.

### Resolve Errors With Creating An XML Backup

The errors may be caused by a slightly corrupt database. If you're seeing errors such as *'Couldn’t backup database data'* in your logs, this guide will help you correct the error on your own. We strongly recommend that you backup your database and your Confluence home directory beforehand, so that you can [restore your site from those](#) if required. If you are unfamiliar with SQL, we suggest you contact your database administrator for assistance.

**Preferable solution**

The [Production Backup Strategy](#) is a very reliable and more efficient way to do backups. If you are running into problems with XML backups - whether memory related or because of problems like the one described here - use the native backup tool as an alternate solution.

**To Identify And Correct The Problem**

To work out where the data corruption or problems are, increase the status information reported during backup, then edit the invalid database entry:

1. Stop Confluence.
2. If you have an external database, use a database administration tool to create a manual database backup.
3. Backup your Confluence home directory. You will be able to [restore your whole site](#) using this and the database backup.
4. Open the `my_confluence_install/confluence/WEB-INF/classes/log4j.properties` and add this to the bottom and save:

   ```
   log4j.logger.com.atlassian.confluence.importexport.impl.XMLDatabinder=DEBUG
   log4j.additivity.com.atlassian.confluence.importexport.impl.XMLDatabinder=false
   
   log4j.logger.com.atlassian.confluence.importexport.impl.XMLDatabinder=DEBUG
   log4j.additivity.com.atlassian.confluence.importexport.impl.XMLDatabinder=false
   ```

5. Find your `atlassian-confluence.log`. Move or delete all existing Confluence logs to make it easier to find the relevant logging output.
6. Restart Confluence and login.
7. Begin a backup so that the error reoccurs.
8. You must now check your log files to find out what object could not be converted into XML format. Open `confluence-home/logs/atlassian-confluence.log`. Scroll to the bottom of the file.
9. Do a search for *'ObjectNotFoundException'*. You should see an error similar to this:
10. Open a DBA tool such as DbVisualizer and connect to your database instance. Scan the table names in the schema. You will have to modify a row in one of these tables.
11. To work out which table, open catalina.out, check the first line of the exception. This says there was an error writing the ContentPermission object with id 5 into XML. This translates as the row with primary key 5 in the CONTENTLOCK tablened needs fixing. To work out what table an object maps to in the database, here's a rough guide:
   - Pages, blogposts, comments --> CONTENT table
   - attachments --> ATTACHMENTS table
   - More information can be found in the schema documentation

12. Now you must find the primary key of the incorrect row in this table. In this case, you can check the first line and see that the row has a primary key of 5.

13. Each property is written to a column, so the last property that was being written has the incorrect value. The row being written to when the exception was thrown was CONTENT (line 5) with a value of 2535 (line 6). Now you know the column and value. This value 2535 is the id of an entry that no longer exists.

14. Using a database administrative tool, login ot the Confluence database. Locate the row in the relevant table and correct the entry. Check other rows in the table for the default column value, which may be null, 0 or blank. Overwrite the invalid row value with the default.

15. Restart Confluence.

16. Attempt the backup again. If the backup fails and you are stuck, please lodge a support request with your latest logs.

Troubleshooting “Duplicate Key” related problems

If you are encountering an error message such as:

could not insert:
[bucket.user.propertyset.BucketPropertySetItem#bucket.user.propertyset.BucketPropertySetItem@a70067d3]; SQL []; Violation of PRIMARY KEY constraint 'PK_OS_PROPERTYENTRY314D4EA8'. Cannot insert duplicate key in object 'OS_PROPERTYENTRY'.; nested exception is java.sql.SQLException: Violation of PRIMARY KEY constraint 'PKOS_PROPERTYENTRY_314D4EA8'. Cannot insert duplicate key in object 'OS_PROPERTYENTRY'.

this indicates that the Primary Key constraint 'PK_OS_PROPERTYENTRY_314D4EA8' has duplicate entries in table 'OS_PROPERTYENTRY'.

You can locate the constraint key referring to 'PK_OS_PROPERTYENTRY_314D4EA8' in your table 'OS_PROPERTYENTRY' and locate any duplicate values in it and remove them, to ensure the "PRIMARY KEY" remains unique. An example query to list duplicate entries in the 'OS_PROPERTYENTRY' table is:

SELECT ENTITY_NAME,ENTITY_ID,ENTITY_KEY,COUNT(*) FROM OS_PROPERTYENTRY
GROUP BY ENTITY_NAME,ENTITY_ID,ENTITY_KEY HAVING COUNT(*)>1

To Help Prevent This Issue From Reoccuring

1. If you are using the embedded database, be aware that it is bundled for evaluation purposes and does not offer full transactional integrity in the event of sudden power loss, which is why an external database is recommended for production use. You should migrate to an external database.

2. If you are using an older version of Confluence than the latest, you should consider upgrading at this point.

Resolve Errors When Attempting To Restore An XML Backup

The errors may be caused by a slightly corrupt database. You will need to find the XML backup file entry that is violating the DB rules, modify the entry and recreate the XML backup:

1. On the instance being restored, follow the instructions to disable batched updates (for simpler debugging), log SQL queries and log SQL queries with parameters at Enabling Detailed SQL Logging.
2. Once all three changes have been made, restart Confluence.
3. Attempt another restore.
4. Once the restore fails, check your log files to find out what object could not be converted into XML format. For Confluence distribution users, check your Confluence install directory under the /logs/ and check both atlassian-confluence.log and catalina.out file. The correct file will contain SQL debug output.
5. Scroll to the bottom of the file and identify the last error relating to a violation of the database constraint. For example:

```
2006-07-13 09:32:33,372 ERROR
[confluence.importexport.impl.ReverseDatabinder] endElement
net.sf.hibernate.exception.ConstraintViolationException:
    could not insert: [com.atlassian.confluence.pages.Attachment#38]
net.sf.hibernate.exception.ConstraintViolationException: could not
insert: [com.atlassian.confluence.pages.Attachment#38]
...
Caused by: java.sql.SQLException: ORA-01400: cannot insert NULL
into ("CONFUSER"."ATTACHMENTS"."TITLE")
at oracle.jdbc.driver.DatabaseError.throwSqlException(DatabaseError.java:112)
at oracle.jdbc.driver.T4CTTIoer.processError(T4CTTIoer.java:331)
at oracle.jdbc.driver.T4CTTIoer.processError(T4CTTIoer.java:288)
```
This example indicates a row in your attachment table with ID = 38 that has a null title.

6. Go to the server that the backup was created on. You must have a copy of the database from which the backup was created. If you do not have this, use a DBA tool to restore a manual backup of the database.

7. Open a DBA tool and connect to the original database instance and scan the table names in the schema. You will have to modify a row in one of these tables.

8. To work out which table, open catalina.out, check the first line of the exception. To work out what table an object maps to in the database, here’s a rough guide:
   - Pages, blogposts, comments --> CONTENT table.
   - attachments --> ATTACHMENTS table.

9. To correct the example error, go to the attachment table and find that attachment object with id 38. This will have a a null title. Give a title using the other attachments titles as a guide. You may have a different error and should modify the database accordingly.

10. Once the entry has been corrected, create the XML backup again.

11. Import the backup into the new version.

12. If the import succeeds, revert the changes made in your SQL logging to re-enable disable batched updates and turn off log SQL queries and log SQL queries with parameters.

Troubleshooting “Duplicate Entry” for key "cp_" or "cps_

If you are encountering an error message such as:

```
com.atlassian.confluence.importexport.ImportExportException: Unable to complete import because the data does not match the constraints in the Confluence schema. Cause: MySQLIntegrityConstraintViolationException: Duplicate entry '1475804-Edit' for key 'cps_unique_type'
```

This indicates that the XML export came from a version of Confluence with a corrupt permissions database, caused by some 3rd party plugin. This is an issue that was fixed when CONF-22123 was implemented in Confluence 3.5.2. The simplest workaround is to export the space again after upgrading the instance to 3.5.2 or above. If that is not an option, then either the export will need to be edited manually to remove the duplicate permission entries or the source instance will need to have the offending entries removed. The following SQL queries can be used to look for such entries:
SELECT * FROM CONTENT_PERM WHERE USERNAME IS NULL AND GROUPNAME IS NULL;

SELECT cp.ID, cp.CP_TYPE, cp.USERNAME, cp.GROUPNAME, cp.CPS_ID, cp.CREATOR, cp.CREATIONDATE, cp.LASTMODIFIER, cp.LASTMODDATE
FROM CONTENT_PERM cp
WHERE cp.USERNAME IS NOT NULL AND cp.GROUPNAME IS NOT NULL;

SELECT cps1.ID, cps1.CONTENT_ID, cps1.CONT_PERM_TYPE FROM CONTENT_PERM_SET cps1,
CONTENT_PERM_SET cps2
WHERE cps1.ID <> cps2.ID AND
cps1.CONTENT_ID = cps2.CONTENT_ID AND
cps1.CONT_PERM_TYPE = cps2.CONT_PERM_TYPE
ORDER BY cps1.CONTENT_ID, cps1.CONT_PERM_TYPE, cps1.CREATIONDATE ASC;

SELECT cp.ID, cp.CP_TYPE, cps.CONTENT_ID,
(SELECT scps.ID FROM CONTENT_PERM_SET scps WHERE scps.CONTENT_ID = cps.CONTENT_ID AND scps.CONT_PERM_TYPE = cp.CP_TYPE) AS suggested_cps_id
FROM CONTENT_PERM cp, CONTENT_PERM_SET cps
WHERE cp.CPS_ID = cps.ID AND
cp.CP_TYPE <> cps.CONT_PERM_TYPE;

SELECT DISTINCT cp1.ID, cp1.CP_TYPE, cp1.USERNAME, cp1.GROUPNAME, cp1.CPS_ID, cp1.CREATOR, cp1.CREATIONDATE, cp1.LASTMODIFIER, cp1.LASTMODDATE
FROM CONTENT_PERM cp1, CONTENT_PERM_SET cps1, CONTENT_PERM cp2, CONTENT_PERM_SET cps2
WHERE
cp1.CPS_ID = cps1.ID AND
cp2.CPS_ID = cps2.ID AND
cp1.ID <> cp2.ID AND
cps1.CONTENT_ID = cps2.CONTENT_ID AND
cp1.CP_TYPE = cp2.CP_TYPE AND
cp1.USERNAME = cp2.USERNAME
ORDER BY cp1.CPS_ID, cp1.CP_TYPE, cp1.USERNAME, cp1.CREATIONDATE;

SELECT DISTINCT cp1.ID, cp1.CP_TYPE, cp1.USERNAME, cp1.GROUPNAME, cp1.CPS_ID, cp1.CREATOR, cp1.CREATIONDATE, cp1.LASTMODIFIER, cp1.LASTMODDATE
FROM CONTENT_PERM cp1, CONTENT_PERM_SET cps1, CONTENT_PERM cp2, CONTENT_PERM_SET cps2
WHERE
cp1.CPS_ID = cps1.ID AND
cp2.CPS_ID = cps2.ID AND
cp1.ID <> cp2.ID AND
cps1.CONTENT_ID = cps2.CONTENT_ID AND
cp1.CP_TYPE = cp2.CP_TYPE AND
cp1.GROUPNAME = cp2.GROUPNAME
ORDER BY cp1.CPS_ID, cp1.CP_TYPE, cp1.GROUPNAME, cp1.CREATIONDATE;

SELECT * FROM CONTENT_PERM_SET
WHERE ID NOT IN (SELECT DISTINCT CPS_ID FROM CONTENT_PERM);

Remove all matching entries and perform the export again.

Troubleshooting “Duplicate Key” related problems

If you are encountering an error message such as:
could not insert: [bucket.user.propertyset.BucketPropertysetItem#bucket.user.propertyset.BucketPropertysetItem@a70067d3]; SQL []; Violation of PRIMARY KEY constraint 'PK_OS_PROPERTYENTRY314D4EA8'. Cannot insert duplicate key in object 'OS_PROPERTYENTRY'; nested exception is java.sql.SQLException: Violation of PRIMARY KEY constraint 'PKOS_PROPERTYENTRY_314D4EA8'. Cannot insert duplicate key in object 'OS_PROPERTYENTRY'.

This indicates that the Primary Key constraint 'PK_OS_PROPERTYENTRY_314D4EA8' has duplicate entries in table 'OS_PROPERTYENTRY'.

You can locate the constraint key referring to 'PK_OS_PROPERTYENTRY_314D4EA8' in your table 'OS_PROPERTYENTRY' and locate any duplicate values in it and remove them, to ensure the "PRIMARY KEY" remains unique. An example query to list duplicate entries in the 'OS_PROPERTYENTRY' table is:

```sql
SELECT ENTITY_NAME, ENTITY_ID, ENTITY_KEY, COUNT(*) FROM OS_PROPERTYENTRY GROUP BY ENTITY_NAME, ENTITY_ID, ENTITY_KEY HAVING COUNT(*)>1
```

Troubleshooting "net.sf.hibernate.PropertyValueException: not-null" related problems

If you're receiving a message like:

```
ERROR [Importing data task] [confluence.importexport.impl.ReverseDatabinder] endElement net.sf.hibernate.PropertyValueException: not-null property references a null or transient value: com.atlassian.user.impl.hibernate.DefaultHibernateUser.name
```

This means there's an unexpected null value in a table. In the above example, the error is in the name column in the USERS table. We've also seen them in the ATTACHMENTS table.

Remove the row with the null value, redo the xml export, and reimport.

To Help Prevent this Issue from Recurring

1. If you are using the embedded database, be aware that it is bundled for evaluation purposes and does not offer full transactional integrity in the event of sudden power loss, which is why an external database is recommended for production use. You should migrate to an external database.
2. If you are using an older version of Confluence than the latest, you should consider upgrading at this point.

The problem with different settings for case sensitivity varies between databases. The case sensitivity of the database is usually set through the collation that it uses. Please vote on the existing issue.

Troubleshooting failed XML site backups
Confluence Administrator's Guide
Migrating from HSQLDB to MySQL
If you've gone through Migrate to Another Database and cannot migrate because of a failed xml backup, this page might help.

**Disclaimer**

MySQL Migration Toolkit is released by the makers of MySQL and as such, problems with the software should be directed to them. Atlassian Support does not offer support for the Migration Toolkit, nor do we provide support for this migration path. These instructions are offered for strictly informational purposes, and your mileage may vary.

**Backup Reminder**

Please backup your database and your home folder before attempting this.

**The information on this page does not apply to Confluence OnDemand.**

**Resources needed**

- Empty MySQL DB with appropriate credentials to allow creation, deletion, and insertion of tables and rows.
- A Windows machine that can both communicate to the Confluence server and the destination DB.
- MySQL Migration Toolkit
- HSQL Database Engine

**Preparation for migrating to MySQL from HSQLDB**

1. Shutdown Confluence
2. Make a copy of the confluence home folder for backup purposes
3. Install the Migration Toolkit
4. Unzip the hsqldb package.
5. Copy the hsqldb.jar from hsqldb/lib into C:\Program Files\MySQL\MySQL Tools for 5.0\java\lib
6. Start the MySQL Migration Toolkit

**Running the Migration Toolkit**

You should be presented with the following screen.

Choose Direct Migration
Source Database

Select the source database you want to migrate from.

- **Database System:** Generic JDBC
  - **Connection String:**
    - `jdbc:hsqldb:file:PATHTODATABASEFOLDER\confluencedb`
  - **Username:** sa
  - **Password:** No password. Leave this field blank
Destination Database

Please make sure that the computer that is running MySQL Toolkit is able to access the MySQL server and that the user listed has the ability to create, drop, insert, and update tables.

If your MySQL user has a $ character in the password (such as 'pa$sword'), please change the password or create a temporary account with full permissions. If you do not, the toolkit will throw an "Illegal group reference" error and you will not be able to proceed with the migration.

Target Database
Select the destination database.

Target Database Connection
Select a RDBMS from the list of supported systems

Connection Parameters
Please enter the connection parameters to connect to the database.

Target Connection Parameter
Choose from the list of available drivers for this RDBMS

Connection String: [ ]
Job Connection String: [ ]

Connecting to Servers
Connecting to Servers
Establishing database connections.

<table>
<thead>
<tr>
<th>Connection Progress</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Tasks to execute:</strong></td>
</tr>
<tr>
<td>The following tasks will now be executed. Please monitor the execution progress. Press [Advanced &gt;&gt;] to see the log.</td>
</tr>
<tr>
<td>✔ Connecting to source database system</td>
</tr>
<tr>
<td>✔ Retrieve schema information from source database system</td>
</tr>
<tr>
<td>✔ Test connection to target database system</td>
</tr>
</tbody>
</table>

**Execution completed successfully.**

You should see the toolkit trying to connect. If you have problems, please click on the advanced options and sql will show you debugging information. Click Advanced to see the log. If you see "Java Heap Space: Out of Memory", you can start the *MySQL Migration Toolkit* with a -Xmx flag to allocate more memory to the JVM.

After this screen you should come to reverse engineering. Click next.

**Source Schemata Selection**

You should see 2 databases, **INFORMATION_SCHEMA** and **PUBLIC**. Choose **PUBLIC**

**Object Type Selection**
Object Type Mapping

Object Creation Options

- Database Object Creation Parameters
  - Select the desired options for the object creation. Click Next > to start the creation process.
  - Create Objects Online
  - Create Script File for Create Statements

Click **Show Details** on both sections. For **Migration Method for Type Schema**, choose **Multilanguage**. For **Migration Method for Type Table**, choose **Data Consistancy/Multilanguage**.

Click **Advanced**. Check **Enabled Detailed Mappings in Next Step**

Detailed Object Mapping

Click to rename the **destination database** to be the one set aside to migrate to.

From this point on, you should be able to click next all the way through to finish the migration.

**Rebuilding the Ancestor Table**

In Confluence, the ancestor table defines what pages are ancestors or descendants of other pages (which can be used by search restrictions with the ancestorids restriction). Occasionally, the ancestor table will become out of sync. When this happens, you can rebuild the table to restore everything to normal.

- Live Monitoring Using the JMX Interface
- Tracking Customisations Made to your Confluence Installation

---

**Live Monitoring Using the JMX Interface**

With the JMX interface (introduced in Confluence 2.8), you can monitor the status of your Confluence instance in real time. This will provide you with useful data such as the resource usage of your instance and its database latency, allowing you to diagnose problems or performance issues. To read the JMX data, you will need to use a JMX client.

**Disable JMX**

If you experience any problems during Confluence startup that are related to JMX, it is possible to disable the JMX registration process. Please place jmxContext.xml in your <confluence-install>/confluence/WEB-INF/classes folder to do so.
What is JMX?

JMX (Java Management eXtensions) is a technology for monitoring and managing Java applications. JMX uses objects called MBeans (Managed Beans) to expose data and resources from your application.

1. Enabling JMX Remote with Tomcat

By default, Confluence uses the Apache Tomcat web server. To use JMX, you must enable it on your Tomcat server, by carrying out the steps under the Apache Tomcat documentation, entitled Enabling JMX Remote. With those steps completed, restart your Tomcat server.

For the stand-alone, add the startup parameter -Dcom.sun.management.jmxremote to setenv.sh or setenv.bat. See instructions for the Windows Service - enter it in the same place as PermGen Memory.

2. Selecting your JMX Client

You need to use a JMX client in order to view the JMX output from Confluence. JConsole is a readily available JMX client that is included with the supported Java Developer Kit (version 5 onwards). The full name is the 'Java Monitoring and Management Console', but we will refer to it as JConsole for the purposes of this document.

3. Adding the JMX Client to your Path

You must add the location of the JConsole binary file to your path environment variable. As JConsole resides in the 'bin' (binaries) folder under your Java directory, the path should resemble something like this:

```
JDK_HOME/bin/
```

In this example, replace 'JDK_HOME' with the full system path to your Java directory.

4. Configuring JConsole

To configure JConsole:

1. Run the JConsole application.
2. You will be prompted to create a new connection. Choose remote process and enter the hostname of your Confluence instance and a port of your choosing.

```
To connect easily, add the startup parameters to setenv.bat or setenv.sh:
-Dcom.sun.management.jmxremote -Dcom.sun.management.jmxremote.port=8086
-Dcom.sun.management.jmxremote.authenticate=false
Port 8086 is unlikely to be used. Then, connect remotely using port 8086.
```

```
JConsole, or any JMX client, will not see applications which are not owned by the same user. For example under Windows, if an application is started as a service, it is the System User which owns the process, and not the Current User.
```

3. Click Connect.

Note: Other JMX clients besides JConsole can read JMX information from Confluence.

What can I monitor with JMX?
The JMX interface allows you to see live internal information from your Confluence instance, via the following MBeans:

**IndexingStatistics**

This MBean shows information related to search indexing.

<table>
<thead>
<tr>
<th>Property name</th>
<th>Function</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flushing</td>
<td>Shows state of cache (i.e. flushing, or not).</td>
<td>True/False</td>
</tr>
<tr>
<td>LastElapsedTimeMilliseconds</td>
<td>Time taken during last indexing.</td>
<td>Milliseconds</td>
</tr>
<tr>
<td>LastElapsedTimeReindexing</td>
<td>Time taken during last re-indexing.</td>
<td>Milliseconds</td>
</tr>
<tr>
<td>TaskQueueLength</td>
<td>Shows number of tasks in the queue.</td>
<td>Integer</td>
</tr>
</tbody>
</table>

**SystemInformation**

This MBean shows information related to database latency. It also contains most of the information presented on the [System Information page](#).

<table>
<thead>
<tr>
<th>Property name</th>
<th>Function</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>DatabaseExampleLatency</td>
<td>Shows the latency of an example query performed against the database.</td>
<td>Milliseconds</td>
</tr>
</tbody>
</table>

**RequestMetrics**

This MBean shows information related to system load and error pages served.

<table>
<thead>
<tr>
<th>Property name</th>
<th>Function</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>AverageExecutionTimeForLastTenRequests</td>
<td>Average execution time for the last ten requests.</td>
<td>Milliseconds</td>
</tr>
<tr>
<td>CurrentNumberOfRequestsBeingServed</td>
<td>Number of requests being served at this instant.</td>
<td>Integer</td>
</tr>
<tr>
<td>ErrorCount</td>
<td>Number of times the Confluence error page was served.</td>
<td>Integer</td>
</tr>
<tr>
<td>NumberOfRequestsInLastTenSeconds</td>
<td>Obviously, the Number Of Requests In the Last Ten Seconds.</td>
<td>Integer</td>
</tr>
</tbody>
</table>

**MailServer-SMTPServer**

This MBean shows information related to email dispatch attempts and failures. There will be an MBean for every SMTP Mailserver that has been configured in the Confluence instance.
### Property name | Function | Values
--- | --- | ---
EmailsAttempted | The number of email messages Confluence has tried to send. | Integer
EmailsSent | The number of email messages sent successfully. | Integer

**MailTaskQueue**

This MBean shows information related to the email workload.

<table>
<thead>
<tr>
<th>Property name</th>
<th>Function</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>ErrorQueueSize</td>
<td>Number of errors in the queue.</td>
<td>Integer</td>
</tr>
<tr>
<td>Flushing</td>
<td>Shows state (i.e. flushing, or not)</td>
<td>True/False</td>
</tr>
<tr>
<td>FlushStarted</td>
<td>Time that operation began.</td>
<td>Time</td>
</tr>
<tr>
<td>RetryCount</td>
<td>The number of retries that were performed.</td>
<td>Integer</td>
</tr>
<tr>
<td>TaskSize</td>
<td>Number of email messages queued for dispatch.</td>
<td>Integer</td>
</tr>
</tbody>
</table>

**SchedulingStatistics**

This MBean shows information related to current jobs, scheduled tasks and the time that they were last run.

**High CPU consuming threads**

For Java 1.6, add the Top Threads Plugin to monitor whether CPU is spiking. Download it to a directory and run JConsole like this:

```
JConsole -pluginpath /pathto/topthreads.jar
```

This works only with JDK 1.6, but that can be on the remote machine if the server is running a lower version.

Please note, adding live monitoring to a production instance may itself have an impact on performance.

**Tracking Customisations Made to your Confluence Installation**

The 'Modification' section of the Confluence 'System Information' screen lists the files that have been changed since your Confluence application was installed. You will find this information particularly useful when upgrading Confluence to a new version, because you will need to re-apply all customisations after the upgrade.
To see the modifications made to files in your Confluence installation,

1. Choose Browse > Confluence Admin.
2. Select ‘System Information’ in the ‘Administration’ section of the left-hand panel.
3. Scroll down to the section titled ‘Modification’.

Screenshot: Modifications tracker on the Confluence System Information screen

<table>
<thead>
<tr>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified: decorators/main.vmfd, pages/page-breadcrumbs.vmfd, template/includes/macros.vmfd, decorators/mail.vmfd, decorators/spaces.vmfd, template/includes/personal-sidebar.vmfd</td>
</tr>
<tr>
<td>Removed: No files removed</td>
</tr>
</tbody>
</table>

**Notes**
- The modification tracker does not detect changes to class files from the `confluence.jar` or other JAR files. If you modify classes, the Confluence modification detection does not report the modification. See issue CONF-20993.

**RELATED TOPICS**

**Viewing Site Statistics**
Note that the site activity information is **disabled by default**. See notes [below](#).

If enabled, the global activity screen displays statistics on the activity in your Confluence site. These include:

- How many pages and blog posts have been viewed, added or updated over a given period.
- Which spaces are the most popular (most frequently viewed).
- Which spaces are the most active (most frequently edited).
- Which people are the most active contributors/editors of content.

When viewing activity:

- **Viewed Pages**: Shows all pages and blog posts that have been viewed, added or updated.
- **Popular Spaces**: Shows which spaces are the most popular (most frequently viewed).
- **Active Spaces**: Shows which spaces are the most active (most frequently edited).
- **Active Users**: Shows which people are the most active contributors/editors of content.

**Screenshots**: Global Activity, Modifications tracker

---

*The information on this page does not apply to Confluence OnDemand.*
The top ten most popular and most active pages and/or blog posts will be listed, with a link to each.

**Notes**

- The [Confluence Usage Stats plugin](#), which provides the 'Global Activity' screen, is known to cause performance problems on large installations. This plugin is **disabled by default**. A status report on the progress of the performance issues with this plugin is available in this issue: [USGTRK-15](#).
- Your Confluence system administrator can enable the plugin, but please be aware of the possible impact upon your site's performance.
- The plugin is sometimes called 'Confluence Usage Tracking'.
- If your Confluence site is **clustered**, the global activity information will not be available.

Viewing System Properties

After adding memory, setting a proxy or changing other Java options, it can be difficult to diagnose whether the system has picked them up. This page tells you how to view the system properties that your Confluence site is using.
In Confluence 3.0.2 and Later

You can see the expanded system properties on the 'System Information' screen of the Confluence Administration Console.

To see the system properties recognised by your Confluence installation:

1. Choose Browse > Confluence Admin.
2. Select System Information in the 'Administration' section of the left-hand panel.
3. Scroll down to the section titled 'System Properties'.

In Confluence Versions Earlier than 3.0.2

To find out more about what properties are being picked up, download the file `systemproperties.jsp` (attached to this page). Place it in your `<confluence-install>/confluence/admin` directory. Access the following URL:

```
http://<yourbaseurl>/admin/systemproperties.jsp
```

No restart of Confluence is required.

Installing Patched Class Files

Atlassian support or the Atlassian bug-fixing team may occasionally provide patches for critical issues that have been resolved but have not yet made it into a release. Those patches will be class files which are attached to the relevant issue in our JIRA bug-tracking system.

Installation Instructions for the Confluence Distribution

Follow these steps to install a patched class file:

1. Shut down your confluence instance.
2. Copy the supplied class files to `<installation-directory>/confluence/WEB-INF/classes/<subdirectories>`, where:
   - `<installation-directory>` must be replaced with your Confluence Installation directory. (If you need more information, read about the Confluence Installation Directory.)
   - `<subdirectories>` must be replaced by the value specified in the relevant JIRA issue. This value will be different for different issues. In some cases, the subdirectories will not exist and you will need to create them before copying the class files. Some issues will contain the patch in the form of a ZIP file which will contain the desired directory structure.
3. Restart your Confluence instance for the changes to become effective.

Class files in the `WEB-INF/classes` directory of a web application will be loaded before classes located in JAR files in the `WEB-INF/lib` directory. Therefore, classes in the first directory will effectively replace classes of the same name and package which would otherwise be loaded from the JAR files.

Finding Your Confluence Support Entitlement Number (SEN)

There are three ways to find your Support Entitlement Number (SEN):

- **Method 1:** Check in the Confluence Administration Interface
  Select Administration >> License Details. The SEN is shown:

- **Method 2:**
  Log into my.atlassian.com as the Account Holder or Technical Contact

- **Method 3:** Atlassian Invoice
  Your Support Entitlement Number (SEN) appears on the third page of your Atlassian Invoice.

See Finding Your Support Entitlement Number in the support space for more general information about how Atlassian Support uses this number.

⚠️ The information on this page does not apply to Confluence OnDemand.

Site Configuration
Configuring the Site Home Page

You can configure Confluence to send users to any of the space home pages on the site when they log in, rather than to the dashboard.

To configure the site-wide home page:

1. Go to the 'Administration Console' and click 'General Configuration' in the left-hand panel.
2. Click 'Edit' next to the 'Site Configuration' panel.
3. Select a space from the 'Site Homepage' dropdown menu. When users log in, Confluence will open the home page of the space you choose here.
   a. The spaces available to set as the site home page will depend on the access permissions of the space and the site.
   i. The site home page must be accessible to the 'confluence-users' group
   ii. If the site allows anonymous access, the site home page must also be accessible to anonymous users, that is, people who have not logged in to Confluence.
4. Ensure that the 'View Space Goes to Browse Space' option is set to 'Off' if you want users to be sent to the space home page and not the space summary page.
5. Click the 'Save' button at the bottom of the screen.

Notes

- The user's personal settings will override the global setting.

The Default Administrator Contact Message

By default, the 'contact administrators message' looks much like the highlighted area in the screenshot below, starting with 'Please enter information...'.

**Screenshot: The default 'Contact Site Administrators' message**

To restore the message to its default simply remove the custom message you entered when following the instructions above, so that the 'Custom Contact Administrators Message' field is empty.

**Customisation Examples**

When entering the 'Custom Contact Administrators Message', you can use text and Confluence wiki markup. This is similar to entering your own text and markup for the 'Site Welcome Message'. For examples of the kind of customisations possible, take a look at the guide to editing the site welcome message.

**Disabling the Administrator Contact Form**

If you prefer to disable the ability for users to send an email message to the site administrators, you can disable the form portion of this screen. You can only disable the form if you first provide a 'Custom Contact Administrators Message' as described above.

To enable or disable the administrator contact form:

1. Go to the 'Administration Console' and click **General Configuration** in the left-hand panel.
2. Click **Edit** at the top of the 'Site Configuration' section.
3. Select **on** or **off** for the 'Contact Administrators Form'.
4. Click **Save**.

**Configuring Spam Prevention**

You can configure Confluence to use Captcha to help prevent spam, including the spamming of Confluence administrators. The administrator contact form is covered by the site-wide Captcha settings as documented in Configuring Captcha for Spam Prevention.

**Related Topics**
Contacting Confluence Administrators
Configuring Captcha for Spam Prevention

Editing the Site Title

The site title appears in your browser's title bar. By default, it is set to 'Confluence'.

To change the title of your Confluence site:

1. Go to the 'Administration Console' and click 'General Configuration' in the left-hand panel.
2. Click 'Edit' at the top of the 'Site Configuration' screen.
3. Enter a new title for your site in the input field next to 'Site Title'.
4. Click 'Save'.

Related Topics

No content found for label(s) site-configuration.

Editing the Global Logo

By default, the global logo appears beside the page title on all pages in the site. You can disable the logo or replace it with one of your own.

You need to be a Confluence Administrator to configure the global logo.

To configure the global logo:

1. Choose Browse > Confluence Admin.
2. Click Global Logo, under 'Look and Feel' in the left panel.
3. Click Off to disable the current logo, or click Browse to upload a new logo.

Related Topics

No content found for label(s) site-configuration.

Configuring the Server Base URL

The Server Base URL is the URL via which users access Confluence. The base URL must be set to the same URL by which browsers will be viewing your Confluence site.

Confluence will automatically detect the base URL during setup, but you may need to set it manually if your site's URL changes or if you set up Confluence from a different URL to the one that will be used to access it publicly.

You need to have System Administrator permissions in order to perform this function.

The information on this page does not apply to Confluence OnDemand.

To configure the Server Base URL:

1. In Confluence, open the 'Browse' menu and select 'Confluence Admin'. The 'Administration Console' will open.
2. Click 'General Configuration' in the left-hand panel.
3. Click the 'Edit' button next to 'Site Configuration'.
4. Enter the new URL in the 'Server Base URL' text box.
5. 'Save' your changes.

Example

If Confluence is installed to run in a non-root context path (that is, it has a context path), then the server base URL should include this context path. For example, if Confluence is running at:

http://www.foobar.com/confluence

then the server base URL should be:

http://www.foobar.com/confluence

Notes

• **Using different URLs.** If you configure a different base URL or if visitors use some other URL to access Confluence, it is possible that you may encounter errors while viewing some pages.

• **Changing the context path.** If you change the context path of your base URL, you may also need to edit the web server's server.xml file to reflect the new path:
  1. Stop the Confluence server.
  2. Go to your Confluence 'destination directory'. This is the directory where the Confluence installation files are stored. For example, C:\Program Files\Atlassian\Confluence. Let's call this directory '{CONFLUENCE_INSTALLATION}'.
  3. Edit the configuration file at {CONFLUENCE_INSTALLATION}\conf\server.xml.
  4. Change the value of the path attribute in the Context element to reflect the context path. For example, if Confluence is running at http://www.foobar.com/confluence, then your path attribute should look like this:

```xml
<Context path="/confluence" docBase="../confluence" debug="0" reloadable="false" useHttpOnly="true"/>
```

  5. Save the file.

Customising Default Space Content

**Confluence Administrators** can define default content for a space home page. This content will appear on the home page whenever someone adds a new space. You can define different content for global spaces and for personal spaces.

The default content will appear only for new spaces that are created after you have defined the content. Content in existing home pages will not be changed.

To define default content for home pages in global spaces:

1. Choose **Browse > Confluence Admin**.
2. Click **Default Space Content** under 'Configuration' in the left-hand panel.
3. The **Space Home Pages** tab will open on the 'Default Space Content' page.
4. Click **Customise**. (This step is necessary only if the content is still set to the default. If it has already been customised, the 'Customise' option will not appear.)
5. Enter the content that you want to appear on the home page for new global spaces. You can use special characters within the content as variables (place holders). Confluence will replace the curly brackets and digits with the corresponding information as shown below:
   - \{0\} — The space name.

6. Click Save.

**To define default content for home pages in personal spaces:**

1. Choose **Browse > Confluence Admin**.
2. Click **Default Space Content** under 'Configuration' in the left-hand panel.
3. The 'Default Space Content' screen will open. Click the **Personal Space Home Pages** tab.
4. Click **Customise**. (This step is necessary only if the content is still set to the default. If it has already been customised, the 'Customise' option will not appear.)
5. Enter the content which you want to appear on the home page for new personal spaces. You can use special characters within the content as variables (place holders). Confluence will replace the curly brackets and digits with the corresponding information as shown below:
   - \{0\} — The space owner's full name.
   - \{1\} — The space owner's e-mail address.
   - \{2\} — Any personal information the space owner has entered on their user profile in the 'Information about me' section.
6. Click the 'Save' button.

You can also undo all customisations of the default home page content, and go back to the default content as originally supplied with Confluence.

**To restore the original default content:**

1. Choose **Browse > Confluence Admin**.
2. Click **Default Space Content** under 'Configuration' in the left-hand panel.
3. Choose either the **Space Home Pages** tab or the **Personal Space Home Pages** tab, as required.
4. Click **Revert**. (This option appears only if the content has been customised. If the content is still set to the default, the 'Revert' option is not present.)

*Screenshot: Defining default space content*
Configuring the Destination of View Space Links

By default, when you click a space link in order to view the space, you are taken to the space’s home page. If you wish, you can configure Confluence to redirect all space links on the site to the ‘Browse Space’ view of the space instead.

To direct the space link to the ‘browse space’ view:

1. Go to the ‘Administration Console’ and click ‘General Configuration’ in the left-hand panel.
2. Click ‘Edit’ at the top of the ‘Site Configuration’ screen.
3. Select ‘On’ next to ‘View Space goes to Browse Space’.
4. Click ‘Save’.

Editing the Site Welcome Message

The site welcome message appears at the top left of the Confluence dashboard, between the site logo and the list of spaces. You can use it to display an introduction to the site or a message of the day.

To edit the site welcome message:

1. Go to the Administration Console and click General Configuration in the left-hand panel.
2. Click Edit at the top of the Site Configuration section.
3. Type into the Site Welcome Message box. You can enter text or Confluence wiki markup.
4. Click Save.
The Default Site Welcome Message

By default, the site welcome message looks more or less like the screenshot below, starting with the words Welcome to Confluence and ending above the list of spaces.

To restore the default site welcome message and remove your customised message, just delete the text in the Site Welcome Message text box. Provided that you have not customised Confluence, your Confluence users will see the default message if there is no text in the Site Welcome Message text box in your Administration Console.

Example 1. Adding a Simple Welcome Message

Let's say you want to display a simple message like this at the top of your dashboard:

Welcome to the MyCompany Wiki

New to MyCompany? Find out about your induction

Otherwise, have fun, because you can't always work!
To produce the above welcome message, follow the step-by-step instructions above and add the following wiki markup into the **Site Welcome Message** text box:

```
{panel}
h2. Welcome to the MyCompany Wiki

New to MyCompany? [Find out about your induction|DS:Company Induction].
Otherwise, [have fun|DS:Have Fun], because you can't always work!
```

**Example 2: Formatting your Welcome Message**

Now let's say you want to put the words into a panel and add some spacing, so that your dashboard looks like this:

```
{panel}
h2. Welcome to the MyCompany Wiki

New to MyCompany? Find out about your induction.
Otherwise, have fun, because you can't always work!

Welcome to the MyCompany Wiki

New to MyCompany? Find out about your induction.
Otherwise, have fun, because you can't always work!
```

**Example 3: Including Content from Another Page**

It may be easier to write your welcome message on a normal Confluence page and include the page into the **Site Welcome Message** text box:

```
{panel}
h2. Welcome to the MyCompany Wiki

New to MyCompany? [Find out about your induction|DS:Company Induction].
Otherwise, [have fun|DS:Have Fun], because you can't always work!
```

```
{panel}
```

```
[panel]
```
**Welcome Message** text box. Using a normal page means that you can:

- Write the message using the editor rather than wiki markup.
- Preview the content of the welcome message before saving it, using the page editor's preview feature.
- Allow other people, who are not Confluence administrators, to edit the welcome message.

To include content from another page:

1. Create a Confluence page as usual and add your welcome message as the page content. Remember to limit the size of the content, because it must fit nicely onto the dashboard. For this example, let's assume you put your page in the 'DS' space and the title of your page is 'Dashboard Welcome Message'.
2. Add page permissions or space permissions to suit your requirements. You may want to restrict the editing of the page to a group of people, or you may want to allow any employee to edit the page. This will determine who can update the welcome message on the dashboard.
3. Follow the step-by-step instructions above and add the following wiki markup into the Site Welcome Message text box:

   ```{include:DS:Dashboard Welcome Message}
   ```

   In the above example we use the {{include}} macro to display the content from the given page. See the guide to the include macro. In our example, the space key 'DS' and the page name 'Dashboard Welcome Message' are variables. You can use any space and page you like.
4. Save the site welcome message. The dashboard will display the content of the page immediately. Similarly, if you or anyone else edits the page, the welcome message on the dashboard will change as soon as you save the page.

**Example 4. Adding Blog Posts Filtered by Labels to your Welcome Message**

Looking for more advanced ideas?

This video shows you how to display a list of blog posts on your dashboard and how to choose the blog posts by labelling them.

Video title: *Bring "Must Read" Content to the Dashboard*

Summary of the procedure shown in the video:

1. Create a page containing the {{blog-posts}} macro. Choose to display only the blog posts that are labelled with 'dashboard-blog'. (This is just an example of a label. You can choose any label text you like.) See the guide to the Blog Posts macro.
2. Add the label to a blog post. (In the video, we just add the label to one blog post. You will probably want to add it to a number of posts.)
3. Edit your site welcome message to include the above page, using the include macro.

**How We Use the Site Welcome Message at Atlassian**

Atlassian makes great use of the welcome message on our internal Confluence wiki. Here is an example of the dashboard as it appeared on a certain day:
The welcome message itself contains just an \{include\} macro:

```
{include:STAFF:Extranet Homepage}
```

The \include\ macro allows you to include the content an entire page onto another page. This particular page lives in the STAFF space, where anyone can edit it. It usually shows some amusing picture or company-wide notice. The featured photo generally changes once a week or so – whenever someone feels like changing it. The page itself has over 600 edits by many different people.

The page also includes an edit link, for quick access to change the welcome message. We have the Compositio\n plugin installed which allows you to use the \{float\} macro.

Our wiki markup in the 'Extranet Homepage' page looks something like this:
This is the content that goes on the Extranet homepage, above the spaces list.

NOTE: KEEP YOUR PICTURES SMALL (<80KB) -- USE JPG FOR PICTURES, WIDTH 400

h4. Experimental blogroll: All posts labelled "extranet-dashboard"

If you want to promote a good post to stand out from the eac white noise, just add the label *extranet-dashboard*. To avoid inflation please use the label carefully.

Configuring the What's New Dialog

The 'What's New' dialog automatically displays when a user first logs in after a major Confluence upgrade (e.g. upgrading to Confluence 4.0). The dialog displays a summary of the new features for the release, sourced from our website (by default).

Confluence administrators can configure the behaviour of the 'What's New' dialog, as follows:

- Change the URL that the 'What's New' dialog retrieves information from.
- Disable the dialog.

On this page:

- [Changing the 'What's New' Dialog URL](#)
- [Disabling the 'What's New' Dialog](#)
- [Notes](#)
Changing the 'What's New' Dialog URL

The 'What's New' dialog URL is stored in your Confluence help-paths.properties file. This URL is a concatenation of the help.prefix property with the help.whats.new.iframe.link.

Before you begin:

- The help.prefix property also defines the base URL for Confluence help links, i.e. help links in the Confluence application.

To change the 'What's New' Dialog URL:
Follow the instructions in the 'Changing the Links for Individual Help Pages' section on Local Confluence Documentation. You will need to update the 'help.prefix' and 'help.whats.new.iframe.link' properties, as desired.

For example, you may have installed your Confluence documentation behind a firewall at http://www.example.com/ and created a page http://www.example.com/whatsnew that you use for change management. In this case, you would do the following:

- Set help.prefix to http://www.example.com/
- Set help.whats.new.iframe.link to whatsnew

There is an additional property 'help.whats.new.full.link'. This is only used if the content pointed to by the updated URL isn't loaded in 10 seconds, in which case a 'timeout' screen is displayed with a link to the full 'What's New' content. For locally-hosted pages you can just set this property to the same value as help.whats.new.iframe.link.

Disabling the 'What's New' Dialog

The 'What's New' dialogue is enabled via a plugin. To disable the 'What's New' dialogue, you need to disable the Confluence What's New plugin in Confluence.

To disable the 'Confluence What's New' plugin:
Follow the instructions on Disabling or Enabling a Plugin. Please note, the 'Confluence What's New' plugin is a 'System Plugin'. Click 'Show System Plugins' on the Plugins administration page to display the system plugins.

Configuring Encoding

Confluence allows the configuration of which character encoding is used to deliver pages.

⚠️ While different character encodings are supported, we strongly recommend that **UTF-8** is used. Confluence is heavily tested on UTF-8, and users are likely to have less problems with this encoding than others.

⚠️ **Mac Users**

Mac Users please note that **MacRoman** encoding is compatible with UTF-8. You do not need to change your encoding settings if you are already using MacRoman.

To avoid problems with character encoding, make sure the encoding used across the different components of your system are the same:

- [Configuring Database Character Encoding](#)
- [Application Server URL encoding](#)
- [Confluence Character Encoding](#)

If you are having problems with the character encoding in Confluence, please see the [Troubleshooting Character Encodings](#) page.

⚠️ The information on this page does not apply to Confluence OnDemand.

Character encodings in Confluence

Character encoding advice

In general, **always set all character encodings to UTF-8**. That includes database, JDBC drivers, application server, filesystem and Confluence.

In certain isolated cases (e.g. Microsoft Windows), it might not be possible to use a fully Unicode filesystem (that is, a default Windows install doesn't support Unicode filenames properly). If so, stick with UTF-8 for the other two and be aware that your operating system might have limitations around international attachments (pre-2.2), backup and restore of international data, etc.

The remainder of the document explains the encoding settings that are applicable in Confluence and how they relate to application behaviour.

⚠️ The information on this page does not apply to Confluence OnDemand.

Where character encoding is used

There are three places that character encoding matters to Confluence:

1. **Database encoding** - usually the most important; it is where almost all user data is stored.
2. **Filesystem encoding** - important for attachment storage (pre-2.2), reading Velocity templates and writing
exported files.

3. **HTTP request and response encoding** - important for form parsing, correct rendering by the browser and browser interpretation of encoded URLs.

Problems generally arise when Confluence thinks one of the above encoding is different to what it actually is. For example, Confluence might believe the database is using ISO-8859-1 encoding, when in fact it is UTF-8 encoded.

**Java character encoding**

Java *always uses the multibyte UTF-16 character encoding for all String data*. This means that each of the encodings above defines how, at that particular point, characters are converted to and from Java's native UTF-16 format into some other format that the browser, filesystem or database might understand.

So when a request comes in to Confluence, we convert it from the request encoding to UTF-16. Then we store that data into the database, converting from UTF-16 to the database's encoding. Retrieving information from the database and sending it back to the browser is the same process in the opposite direction.

*A char represents single Unicode code point from the Base Multilingual Plane (BMP), encoded as UTF-16. Multiple chars are used as surrogate pairs for characters beyond U+FFFF.*

**Problems with character encodings**

If Confluence has the wrong idea about encoding for one of the above, it manifests itself in different ways:

1. Incorrect database encoding - user data is corrupted between saving and restoring from the database. This often happens after a delay, as we cache data as it is written to the database and only later retrieve the corrupted copy from the database.
2. Incorrect/non-Unicode filesystem encoding - international filenames break attachment download/upload/removal (pre-2.2); exports break with international content or attachments.
3. Incorrect HTTP encoding - incorrect encoding selected by browser, resulting in incorrect rendering of characters. Changing browser encoding causes page to render properly. Broken URLs when linking to pages or attachments with non-ASCII characters.

**Configuration of character encodings**

The *Confluence character encoding* is a configuration setting found in *Administration > General Configuration*, and at runtime available in Settings.defaultEncoding. It is subsequently used in the following parts of the system:

- **ConfluenceWebWorkConfiguration** sets *webwork.i18n.encoding* to the this encoding, which WebWork uses in the response Content-Type header.
- **AbstractEncodingFilter** sets the HTTP request encoding to this encoding. This seems unnecessary, since the Content-Type header from the client should include the encoding used. This affects form submissions and file uploads.
- **VelocityUtils** reads in Velocity templates using this encoding when reading templates from disk.
- **AbstractXmlExporter** creates its output using this encoding.
- **GeneralUtil** uses this encoding when doing URLEncode and URLDecode. Different browsers have different support for character sets in URLs, so it's uncertain how much benefit this provides.

In summary, changing the Confluence character encoding will change your **HTTP request and response encoding** and your **Filesystem encoding** as used by exports and velocity templates.

The *database encoding* is the responsibility of your JDBC drivers. The drivers are responsible for reading and writing from the database in its native encoding and translating this data to and from Java Strings (which are UTF-16). For some drivers, such as **MySQL**, you must set Unicode encoding explicitly in the JDBC URL. For others, the driver is smart enough to determine the database encoding automatically.

Ideally, your database itself should be in a Unicode encoding (and we recommend [doing this](#) for the simplest...
configuration), but that is not necessary as long as:

- the database encoding supports all the characters you want to store in Confluence
- your JDBC drivers can properly convert from the database encoding to UTF-16 and vice-versa.

The **filesystem encoding** is mostly ignored by Confluence, except for the cases where the above configuration setting above plays a part (exports, velocity). When attachments are uploaded, they are written as a stream of bytes directly to the filesystem. It is the same when they are downloaded: the bytes from the file InputStream are written directly to the HTTP response.

In some places in Confluence, we use the *default filesystem encoding* as determined by the JVM and stored in the `file.encoding` system property (it can be overridden by setting this property at startup). This encoding is used by the Java `InputStreamReader` and `InputSteamWriter` classes by default. This encoding should probably never be used; for consistent results across all filesystem access we should be using the encoding set in the General Configuration.

In certain cases we explicitly hard-code the encoding used to read or write data to the filesystem. Two important examples are:

- importing Mbox mailboxes which are known to be ISO-8859-1
- Confluence Bandana config files are always stored as UTF-8.

Some application servers, Tomcat for example, have an encoding setting that modifies Confluence URLs before they reach the application. This can prevent access to international pages and attachments (really anything with international characters in the URL). See configuring your Application Server URL encoding.

**RELATED TOPICS:**
- Configuring Database Character Encoding
- Troubleshooting Character Encodings

**Troubleshooting Character Encodings**

Often users may have problems with certain characters in a Confluence instance. Symptoms may include:

- Non-ASCII characters appearing as question marks (?)
- Page links with non-ASCII characters not working
- Single characters being displayed as two characters
- Garbled text appearing

In most cases, it is due to a mis-configuration in one of the components that Confluence uses.

> The information on this page does not apply to Confluence OnDemand.

Follow these steps to diagnose the problem:

1. **Run the encoding test**

Confluence includes an encoding test that can reveal problems with your configuration.

To perform the test, access the Encoding Test page via the `<confluence base-url>/admin/encodingtest.action` page on your Confluence instance. You will be required to copy and paste a line of text and submit a form. The test will take the text and pass it through Confluence, the application server and the database, and return the results.

You should also test pasting some sample text (Japanese for example) if you are experiencing problems with a specific language.

Example:
A successful test looks like the following:

The encoding test has now been run. Below, you can compare the raw text delivered from Confluence back to you, as a round-trip through the database. All the test results should appear identical.

<table>
<thead>
<tr>
<th>Internacionalização</th>
<th>This image is how all of the test results below should appear. This page, and all of your System Information.</th>
</tr>
</thead>
</table>

**Test 1: Raw text**

This is the test string generated in Confluence.

**Internationalização**

**Test 2: Form submission**

This is the test string pasted by you into the web form and submitted back to Confluence.

**Internationalização**

**Test 3: Database round-trip (select as LOWER)**

This is the string from Test 2 after being stored in the database and then retrieved.

**internationalização**

Expected result: (converting Java string to lowercase)

**internationalização**

**Test 4: Database round-trip (select as UPPER)**

This is the string from Test 2 after being stored in the database and then retrieved.

**INTERNATIONALIZAÇÃO**

Expected result: (converting Java string to uppercase)

**INTERNATIONALIZAÇÃO**

⚠️ **MySQL 3.x**

MySQL 3.x is known to have some problems with the upper- and lower-casing of some characters, and may fail the last two tests. For more information, see [MySQL 3.x Character Encoding Problems](http://confluence.atlassian.com/admin/encodingtest.action).
2. Ensure the same encoding is used across all components

As mentioned in the Configuring Encoding document, the same character encoding should be used across the database, application server and web application (Confluence).

- To change the character encoding used in Confluence, see Configuring Character Encoding.
- To change the character encoding used in the application server, please ensure you set the Application Server URL encoding and view your application server's documentation on any other settings required to enable your encoding.
- To change the character encoding used in the database, see Configuring Database Character Encoding.

3. Requesting support

If there are still problems with character encoding after following the above steps, create a support request, and our support staff will aid in solving your problem.

Entering in the following details will help us to identify your problem:

- Attach screenshots of the problem
- Attach the results of the encoding test (above)
- Select which application server (and version) you are using
- Select which database (and version) you are using
- Copy the contents of the System Information page into the ‘Description’ field

"€“ Euro character not displaying properly

The € (euro) symbol is a three byte character, with byte values in file (UTF-8) of 0xE2, 0x82, 0xAC.

Sometimes, if the character encoding is not set consistently among all participating entities of the system, Confluence, server and the database, one may experience strange behaviour.

```
... I write a page with a Euro sign in it (€). All is well, the Euro sign shows up in the wiki markup text-box, and the preview, and the display of the saved page.
One day later, the Euro sign has changed into a question mark upside down!
... What is going on? Why does the Euro sign mysteriously change? How do I prevent it?
```

Interestingly enough the character encoding test passes with no problems, demonstrating that Confluence and the connected Database both recognise the € symbol.

⚠️ The information on this page does not apply to Confluence OnDemand.

There are two potential reasons for this behaviour:

**Database and Confluence is using utf-8 encoding. The connection is not.**

When data transferred to it via the connection which does not use utf-8 encoding gets encoded incorrectly. Hence, updating the connection encoding may resolve this problem from now on, yet it probably would not affect already existing data.

**Database is not using utf-8. Confluence and your connection are.**

If your Database encoding is not set to UTF-8, yet is using some other encoding such as latin1, it could be one of the potential reasons why you lose the "€“ characters at some stage. It could be occurring due to caching.
When Confluence saves data to the database, it may also keep a local cached copy. If the database encoding is set incorrectly, the Euro character may not be correctly recorded in the database, but Confluence will continue to use its cached copy of that data (which is encoded correctly). The encoding error will only be noticed when the cache expires, and the incorrectly encoded data is fetched from the database.

For instance the latin1 encoding would store and display all 2-byte UTF8 characters correctly except for the euro character which is replaced by ‘?’ before being stored. As Confluence’s encoding was set to UTF-8, the 2-byte UTF-8 characters were stored in latin1 database assuming that they were two latin1 different characters, instead of one utf8 character. Nevertheless, this is not the case for 3-byte utf8 characters, such as the Euro symbol.

Please ensure that you set the character encoding to UTF-8 for all the entities of your system as advised in this guide.

MySQL 3.x Character Encoding Problems
MySQL 3.x is known to have some problems upper- and lower-casing certain (non-ASCII) characters.

Diagnosing the problem
1. Follow the instructions for Troubleshooting Character Encodings.
2. If the upper- and lower-cased strings displayed on the Encoding Test are different, then your database is probably affected.

An example (faulty) output of the Encoding Test is shown below:

⚠️ The information on this page does not apply to Confluence OnDemand.

Screenshot: Encoding Test Output
Solution

Upgrade to a newer version of MySQL. (4.1 is confirmed to work.)

Configuring Mail

- Configuring a Server for Outgoing Mail
- Setting Up a Mail Session for the Confluence Distribution
- Configuring the Recommended Updates Email Notification
- The Mail Queue

Customising the eMail Templates

⚠️ The information on this page does not apply to Confluence OnDemand.

Configuring a Server for Outgoing Mail

Configuring your Confluence server to send email messages allows your Confluence users to:

- Receive emailed notifications and daily reports of updates.
- Send a page via email.
You can personalise email notifications by configuring the ‘From’ field to include the name and email address of the Confluence user who made the change.

You need System Administrator permissions in order to configure Confluence's email server settings.

On this page:
- Configuring Confluence to send email messages
- Testing the email settings
- Troubleshooting

Related pages:
- The Mail Queue
- Setting Up a Mail Session for the Confluence Distribution

The information on this page does not apply to Confluence OnDemand.

Configuring Confluence to send email messages

To configure Confluence to send outgoing mail:

1. Choose Browse > Confluence Admin.
2. Select Mail Servers under Configuration in the left-hand panel. This will list all currently configured SMTP servers.
3. Click Add New SMTP Server (or edit an existing server).
4. Edit the following fields as required:
   - **Name**: By default, this is simply 'SMTP Server'.
   - **From Address**: Enter the email address that will be displayed in the 'from' field for email messages originating from this server. This field is mandatory. You will not be able to complete the Confluence mail server configuration until this field has been specified.
   - **From Name**: Enter the name that will be displayed in the 'from' field for email messages originating from this server. This is the text which appears before the user's registered email address (in angled brackets). This field accepts the following variables, which reference specific details defined in the relevant Confluence user's profile:
     - **Variable** | **Description**
       - ${fullname} | The user's full name.
       - ${email} | The user's email address.
       - ${email.hostname} | The domain/host name component of the user's email address.
       - ${fullname} (Confluence) | Hence, if Joe Bloggs made a change to a page he was watching and the Confluence site's 'From Address' was set to confluence-administrator@example-company.com, then the 'From' field in his email notification would be: Joe Bloggs (Confluence) <confluence-administrator@example-company.com>.
   - **Subject Prefix**: Enter some text to appear at the beginning of the subject line.
5. Manually enter your Host Address, User Name and Password details (recommended)
OR

Specify the JNDI location of a mail session configured in your application server.

Testing the email settings

A Confluence administrator can test the email server as follows:

1. Set up a mail server at Confluence Admin > Mail Servers, as described above
2. Click Send Test Email to check that the server is working. Check that you get the test email in your inbox.
3. You can flush the email queue to send the email message immediately. Go to Confluence Admin > Mail Queue, and click Flush Mail Queue. See The Mail Queue.

A user can test that notifications are working as follows:

1. Go to your user profile (using the Settings link) and edit your email preferences. See Subscribing to Email Notifications of Updates to Confluence Content.
2. Enable Notify On My Actions. (By default, Confluence does not send you notifications for your own changes.)
3. Go to a page you wish to get notifications about.
4. Choose Tools > Watch. See Watching a Page or Blog Post.
5. Edit the page, make a change, and save the page.
6. Check your email inbox. You may need to wait a while for the email message to arrive.

Troubleshooting

If you experience problems with these configurations, please check that your <Confluence-Install>/confluence/WEB-INF/lib contains only one copy of the following JAR files:

1. activation-x.x.x.jar
2. mail-x.x.x.jar

Ideally, these should be:

- activation-1.0.2.jar
- mail-1.3.2.jar (or later)

You will then need to move these into the proper directory: Please move (not copy) the two jar files from the <confluence-install>/confluence/WEB-INF/lib directory to <confluence-install>/lib and restart Confluence.

Setting Up a Mail Session for the Confluence Distribution

Set up a mail session for the Confluence distribution to use Gmail as follows:

1. Stop Confluence.
2. Move (don't copy) activation-1.0.2.jar and mail-1.4.1.jar from <confluence-install>/confluence/WEB-INF/lib to <confluence-install>/lib.
3. Add the following to your server.xml file found in <confluence-install>/conf/ (add it just before the </Context> tag):
4. Restart Confluence.
5. Go to Browse > Confluence Admin and click on Mail Servers. Choose either Edit an existing configuration, or Add a new SMTP mail server.
6. Edit the server settings as necessary, and set the JNDI Location as:

```
java:comp/env/mail/GmailSMTPServer
```

Note that the JNDI Location is case sensitive and must match the resource name specified in server.xml.

7. Submit, and send a test email.

**Configuring the Recommended Updates Email Notification**

Confluence sends a regular email report to subscribers, containing the top content that is relevant to the person receiving the message. This is called the 'Recommended Updates' notification.

If you have Confluence Administrator or System Administrator permissions, you can configure the default settings that determine how often the Recommended Updates notification is sent. When new users are added to Confluence, the default settings will be applied to their user profiles.

Confluence users can choose their personal settings, which will override the defaults. See Subscribing to Email Notifications of Updates to Confluence Content.

**Initial settings of the defaults**

When you install Confluence, the initial values of the default settings are as follows:

- The default frequency is weekly.
- If your Confluence site has public signup enabled, the Recommended Updates notification is disabled by default. If public signup is not enabled, the notification is enabled by default.

You can change the above settings, specifying a different default value for the site.

**Notes:**

- The Recommended Updates notification is sent only to people who have a user profile in Confluence. If your Confluence site uses external user management, such as LDAP, then people will receive the report only after they have logged in for the first time. (The first login creates their user profile.)
- The daily email message is sent at 1 p.m. in the user's configured time zone.
- The weekly email message is sent at 1 p.m. on Thursdays in the user's configured time zone.
Configuring the Recommended Updates notification

You can set the default send option (send / do not send) and the default schedule (daily or weekly).

To configure the Recommended Updates email notification:

1. Choose Browse > Confluence Admin.
2. Click Recommended Updates Email in the left-hand panel.

Disabling the Recommended Updates notification for the entire site

You can also turn off the recommended updates notification for the entire site, by disabling the 'Confluence daily summary email' plugin. See Disabling or Enabling a Plugin.

The Mail Queue

Email messages waiting to be sent are queued in a mail queue and periodically flushed from Confluence once a minute. A Confluence administrator can also manually flush messages from the mail queue.

If there is an error sending messages, the failed email messages are sent to an error queue from which you can either try to resend them or delete them.

To view the mail queue:

1. Choose Browse > Confluence Admin.
2. Choose Mail Queue in the left-hand panel. This will display the email messages currently in the queue.
3. Choose Flush Mail Queue to send all email messages immediately.
4. Choose Error Queue to view failed email messages. You can try to Resend the messages, which will flush the mails back to the mail queue, or you can Delete them from here.

Attachment Storage Configuration

Confluence allows you to store attachments in one of three places:

- Filesystem - locally in the Confluence home directory
- Database - in Confluence's configured database
- WebDAV - remotely on a WebDAV server (*deprecated*)

A System Administrator can configure Confluence's attachment storage via the 'Attachment Storage' option on the 'Administration Console'.

ℹ️ You need to have System Administrator permissions in order to perform this function.

⚠️ The information on this page **does not apply** to Confluence OnDemand.

---

**Attachment Storage Options**

**Local File System**

By default, Confluence stores attachments in the attachments directory within the configured Confluence home folder. If you are looking to run Confluence Clustered, attachments must be stored in the database.

**Database**

Confluence gives administrators the option to store attachments in the database that Confluence is configured to use.

Here are some reasons why, as an administrator, you may want to choose this storage system:

- Ease of backup.
- Avoiding issues with certain characters in attachment file names.

⚠️ While storing attachments in the database can offer some advantages, please be aware that the amount of space used by the database will increase because of the greater storage requirements.

**WebDAV**
Confluence also allows administrators to set an external WebDAV repository as the location for attachment storage.

⚠️ **WebDAV attachment manager deprecated**

The option to store Confluence attachments on a WebDAV server has never worked in a useful fashion, and has not been maintained for many versions.

- The WebDAV attachment manager will be **deprecated** from Confluence 2.7, and will be removed from a later version of Confluence.
- If you store attachments on external WebDAV servers, we recommend that you migrate to file-system or database-backed attachment storage as soon as possible. Refer to CONF-9313 and CONF-2887.
- This DOES NOT affect the operation of the WebDAV plugin.

### Migration between Attachment Storage Systems

You can 'migrate' your attachments from one storage system to another. All existing attachments will be moved over to the new attachment storage system.

- When the migration occurs, all other users will be locked out of the Confluence instance. This is to prevent modification of attachments while the migration occurs. Access will be restored as soon as the migration is complete.

- When migrating attachments from your database to a filesystem, the attachments are removed from the database after migration. However, when migrating attachments from a filesystem to your database, the attachments remain on the filesystem after migration. If you wish to change this function's behaviour from 'copy' to 'move', please see CONF-14802 and cast your vote.

### To perform a migration, follow the steps below:

1. Choose **Browse > Confluence Admin**.
2. Click 'Attachment Storage' in the left-hand panel. The current configuration will be displayed.
3. Click the 'Edit' button to modify the configuration.
4. Select the storage system you desire.
Edit attachment storage

5. Click the 'Save' button to save the changes.
6. A screen will appear, asking you to confirm your changes. Clicking 'Migrate' will take you to a screen that displays the progress of the migration.

Migration warning

Troubleshooting

To enable debug logging for WebDAV attachment storage, add the following to the bottom of WEB-INF/classes/log4j.properties and restart Confluence:

```
log4j.logger.com.atlassian.confluence.pages.persistence.dao=DEBUG,confluentelog
log4j.additivity.com.atlassian.confluence.pages.persistence.dao=false

log4j.logger.org.apache.webdav=DEBUG,confluentelog
log4j.additivity.org.apache.webdav=false
```

For more about log file configuration, see Working with Confluence Logs.

Hierarchical File System Attachment Storage

For Confluence version 3.0, the structure of attachments stored on the filesystem was changed. In versions of Confluence prior to 3.0, attachments were stored in directories corresponding to the id of the content to which they belong. The more content in Confluence with attachments, the more directories you would have immediately beneath your configured attachments directory. This directory structure has been changed in Confluence 3.0 and since the default configuration of Confluence is to store attachments in the filesystem, this change is likely to have relevance to administrators of most existing Confluence installations.

If you are installing Confluence for the first time, there will be no consequences as a result of this change. If you are upgrading from a previous version of Confluence, the migration to this new filesystem structure should happen automatically during the upgrade.

The reason for introducing this change was to address the issue CONF-13004. Certain file systems have a limit on the number of files that can be stored in a directory and large Confluence installations were reaching this...
limit. In addition, storing too many files at a single directory level can cause performance degradation in some circumstances. This new attachment storage strategy ensures this will no longer be the case.

⚠️ The information on this page does not apply to Confluence OnDemand.

⚠️ Backup Confluence Home

Before upgrading to Confluence 3.0, as with any upgrade you must ensure you have a backup of your Confluence home directory before you proceed.

The New Directory Layout

The attachment storage layout was chosen to fulfil the following main requirements:

1. Limit the number of entries at any single level in a directory structure.
2. Partition attachments per space making it possible for a system admin to selectively back up attachments from particular spaces (see the JIRA issue for more details).

An attachment in Confluence can be thought of as having a number of identifying attributes: id, space id and content id. That is to say, the attachment logically belongs to a piece of content which logically belongs in a space (not all content belongs to a space). For attachments within a space in Confluence, the directory structure is typically 8 levels, with the name of each directory level based on the following algorithm:

<table>
<thead>
<tr>
<th>level</th>
<th>Derived From</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 (top)</td>
<td>Always 'ver003' indicating the Confluence version 3 storage format</td>
</tr>
<tr>
<td>2</td>
<td>The least significant 3 digits of the space id, modulo 250</td>
</tr>
<tr>
<td>3</td>
<td>The next 3 least significant digits of the space id, modulo 250</td>
</tr>
<tr>
<td>4</td>
<td>The full space id</td>
</tr>
<tr>
<td>5</td>
<td>The least significant 3 digits of the content id, modulo 250</td>
</tr>
<tr>
<td>6</td>
<td>The next 3 least significant digits of the content id, modulo 250</td>
</tr>
<tr>
<td>7</td>
<td>The full content id</td>
</tr>
<tr>
<td>8</td>
<td>The full attachment id</td>
</tr>
</tbody>
</table>

Within the 8th level will be a file for each version of that attachment, named to match the version number e.g. 1

An example:
To find the directory where attachments for a particular space are stored, you can use the JSP findspaceattachments.jsp at the location <confluence url>/admin/findspaceattachments.jsp. This JSP requires a space key and returns the directory on the file system where attachments for that space are stored.

Attachment D in the above diagram is stored in a slightly different structure. Attachments that are not conceptually within a space replace the level 2 - 4 directories with a single directory called 'nonspaced'. Examples of such attachments are the global site logo and also attachments on draft content.

**Upgrading to the new attachment storage structure**
As mentioned previously, this upgrade is only necessary if you have Confluence configured to store attachments on the file system.

If migration is not necessary due to a different storage configuration (for example, because attachments are stored in the database), then no migration will occur during upgrade and the Confluence log will simply show the following messages -

```
INFO [main] [AbstractUpgradeManager] upgradeStarted Starting automatic upgrade of Confluence
INFO [main] [UpgradeTask] isUpgradeNeeded The configured attachmentDataDao does not store attachment data on the file system so the HierarchicalFileSystemAttachmentUpgradeTask is not necessary.
INFO [main] [AbstractUpgradeManager] upgradeFinished Upgrade completed successfully
```

Should migration be required, it will occur automatically during upgrade and the log will show output similar to this -

```
INFO [main] [UpgradeTask] doUpgrade Beginning HierarchicalFileSystemAttachmentUpgradeTask. Depending on the size of the attachment data this may take some time.
INFO [main] [UpgradeTask] run 4023 pages may have attachments to be moved to a new hierarchical structure.
INFO [main] [UpgradeTask] run 0 of 4023 pages have had their attachments moved to the new structure.
INFO [main] [UpgradeTask] run 500 of 4023 pages have had their attachments moved to the new structure.
INFO [main] [UpgradeTask] run 1000 of 4023 pages have had their attachments moved to the new structure.
INFO [main] [UpgradeTask] run 1500 of 4023 pages have had their attachments moved to the new structure.
INFO [main] [UpgradeTask] run 2000 of 4023 pages have had their attachments moved to the new structure.
INFO [main] [UpgradeTask] run 2500 of 4023 pages have had their attachments moved to the new structure.
INFO [main] [UpgradeTask] run 3000 of 4023 pages have had their attachments moved to the new structure.
INFO [main] [UpgradeTask] run 3500 of 4023 pages have had their attachments moved to the new structure.
INFO [main] [UpgradeTask] run 4000 of 4023 pages have had their attachments moved to the new structure.
INFO [main] [UpgradeTask] run Successfully moved the attachments for all 4023 pages to the new hierarchical structure.
INFO [main] [UpgradeTask] doUpgrade Completed HierarchicalFileSystemAttachmentUpgradeTask.
INFO [main] [AbstractUpgradeManager] upgradeFinished Upgrade completed successfully.
```
It should be noted that for most implementations of Java, the migration to the new data structure involves moving the files (not copying them). Hence, there should not be a need to have additional disk space available. It also means that the migration should be relatively fast.

**Have you previously applied the CONF-8298 patch?**

The patch or workaround on the [CONF-8298](#) issue changed the structure of attachment storage but not to the most efficient possible structure. So during the Confluence 3.0 upgrade process this intermediate [CONF-8298](#) structure will be detected and automatically upgraded.

**Troubleshooting the upgrade**

⚠ It should be noted that in the event of a failure, your attachment directory may be in an inconsistent state and your first step in troubleshooting should be to restore the backup of your home directory.

There are a number of reasons the migration could fail. This will be shown in the log with a message similar to "Failed to move the attachments for all pages to the new hierarchical structure."

Immediately preceding this message in the log will be entries for each page whose attachments could not be moved. The following table shows examples of these messages and offers some possible explanations.

<table>
<thead>
<tr>
<th>Example Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The configured attachment directory <code>&lt;directory name&gt;</code> could not be found or was not a directory.</td>
<td>The configured Confluence attachment directory is not accessible. Check confluence home for the attachment directory and ensure the permissions are correct to allow reading and writing for this directory.</td>
</tr>
<tr>
<td>It is not possible to migrate the attachments to the new structure since files already exist which the attachment process may need to create.</td>
<td>Your attachments directory contains files or directories which the upgrade task wants to create. That is, a top level directory called ver003 containing directories or files with names containing up to 3 digits (e.g. 1, 213). This could be due to a previous failed attempt to migrate the attachments. You should restore a previous good copy of your attachments directory and remove any files or directories with this naming pattern before retrying.</td>
</tr>
<tr>
<td>Couldn't find current Confluence content for the id <code>&lt;content Id&gt;</code>. The attachment is a non-spaced attachment (e.g. global logo, draft attachment, etc) and will be migrated to the nonspaced directory.</td>
<td>This is a normal message indicating that the attachment being migrated does not belong to a space e.g. global logo.</td>
</tr>
<tr>
<td>Problem while accessing the database for content id <code>&lt;content Id&gt;</code> so its attachments will not be migrated.</td>
<td>It was not possible to access the database at this point during the migration. You will need restore your Confluence attachment directory from the backup and attempt the upgrade again, once the database is accessible again.</td>
</tr>
</tbody>
</table>
Could not create the new attachment directory directory.
The upgrade task could not create the new directory to contain the attachment being moved. Does the server user have sufficient permission to perform this operation in the indicated directory? Is there sufficient disk space?

Failed to move the current attachment directory <some path> to the new location of <some other path>.
The upgrade task could not move the directory. Does the server user have sufficient permission to perform this operation in the indicated directory?

Configuring a WebDAV client for Confluence
WebDAV allows users to access Confluence content via a WebDAV client, such as 'My Network Places' in Microsoft Windows. Provided that the user has permission, they will be able to read and write to spaces, pages and attachments in Confluence. Users will be asked to log in and the standard Confluence content access permissions will apply to the equivalent content available through the WebDAV client.

Introduction to Confluence’s WebDAV Client Integration
By default, all WebDAV clients have permission to write to Confluence. Write permissions include the ability for a WebDAV client to create, edit, move or delete content associated with spaces, pages and attachments in a Confluence installation.

On the ‘WebDAV Configuration’ screen in the Confluence Administration Console, you can:

- Deny a WebDAV client write permissions to a Confluence installation using a regular expression (regex).
- Disable or enable strict path checking.
- Enable or disable access to specific virtual files/folders.

Note:

- The 'WebDav Configuration' page is only be available if the WebDAV plugin has been enabled. Refer to Installing Plugins and Macros for more information on enabling Confluence plugins. Note that this plugin is installing Plugins and Macros
- The settings on the 'WebDav Configuration' page do not apply to external attachment storage configuration.

On this page:

- Introduction to Confluence's WebDAV Client Integration
- Restricting WebDAV Client Write Access to Confluence
- Disabling Strict Path Checking
- Virtual Files and Folders
- Using a WebDAV Client to Work with Pages
- Known Issues

Restricting WebDAV Client Write Access to Confluence
In earlier versions of the WebDAV plugin, separate options for restricting a WebDAV client's write permissions (that is, create/move, edit and delete actions), were available. However, in the current version of this plugin, they have been simplified and combined into a general write permission restriction that covers all of these actions.

WebDAV clients are now denied write permission to your Confluence installation by setting a regex that matches specific content within the WebDAV client's user agent header. Upon setting a regex, it will be added to a list of restricted WebDAV clients. Any WebDAV clients whose user agent header matches a regex in this list will be denied write permission to your Confluence installation.
Example: A PROPFIND method header generated by a Microsoft Web Folder WebDAV client, showing the user agent header field:

```
PROPFIND /plugins/servlet/confluence/default HTTP/1.1
Content-Language: en-us
Accept-Language: en-us
Content-Type: text/xml
Translate: f
Depth: 1
Content-Length: 489
User-Agent: Microsoft Data Access Internet Publishing Provider DAV
Host: 127.0.0.1:8082
Connection: Keep-Alive
```

Unlike earlier versions of the WebDAV plugin which could only restrict write permissions for all WebDAV clients, the current version of this plugin allows you to restrict write permissions to specific WebDAV clients selectively.

To restrict a WebDAV client’s write access permissions to your Confluence installation,

1. Choose **Browse > Confluence Admin**.
2. Click **WebDav Configuration** under ‘Configuration’ in the left panel. The ‘WebDAV Configuration’ page is displayed.
3. Enter a regex that matches a specific component of the user agent header sent by the WebDAV client you want to restrict.
4. Click the **Add new regex** button. The regex is added to the list of restricted WebDAV clients.
   - You can repeat steps 3 and 4 to add a regex for each additional WebDAV client you want to restrict.
5. Click the **Save** button to save the configuration changes.

To restore one or more restricted WebDAV client’s write access permissions to your Confluence installation,

1. Choose **Browse > Confluence Admin**.
2. Click **WebDav Configuration** under ‘Configuration’ in the left panel. The ‘WebDAV Configuration’ page is displayed.
3. Select the regex(es) from the list that match(es) the user agent header sent by the restricted WebDAV client(s) you want to restore.
4. Click the **Remove selected regexes** button. The regexes you had selected are removed from the list of restricted WebDAV clients.
5. Click the **Save** button to save the configuration changes.

Screenshot: WebDAV configuration
Disabling Strict Path Checking

If you observe any idiosyncrasies with your WebDAV client, such as a folder that does exist on your Confluence site but is missing from the client, you can disable the WebDAV plugin's strict path checking option, which may minimise these problems.

To disable the WebDAV plugin’s strict path checking option,

1. Choose Browse > Confluence Admin.
2. Click ‘WebDav Configuration’ under ‘Configuration’ in the left panel. The ‘WebDAV Configuration’ page is displayed.
3. Clear the ‘Disable strict path check’ check box.
4. You can re-enable this option at a later point in time by simply selecting this check box.
5. Click the ‘Save’ button to save this configuration change.

Virtual Files and Folders

In the unlikely event that you observe any problems with the WebDAV client's performance or stability, you can enable access to automatically generated (that is, virtual) files and folders.

By default, these options are hidden on the 'WebDAV Configuration' page. To make them visible, you must append the parameter hiddenOptionsEnabled=true to the end of your URL and reload the page. For example:

`<Confluence base URL>/admin/plugins/webdav/config.action?hiddenOptionsEnabled=true`
To enable or disable access to virtual files and folders,

1. Choose **Browse > Confluence Admin**.
2. Click **WebDav Configuration** under 'Configuration' in the left panel. The 'WebDav Configuration' page is displayed.
3. Amend your URL as described in the note above and reload the 'WebDav Configuration' page.
4. Select or clear the check box options in the 'Virtual Files and Folders' section as required.
5. Click the 'Save' button to save the configuration changes.

**Using a WebDAV Client to Work with Pages**

The following sections tell you how to set up a WebDAV client natively for a range of different operating systems. WebDAV clients typically appear as drives in your operating system's file browser application, such as Windows Explorer in Microsoft Windows, or Konqueror in Linux.

**Setting Up a WebDAV Client in Microsoft Windows**

This section covers the two methods for configuring a WebDAV client natively in Microsoft Windows:

- As a network drive
- As a web folder

If possible, use the network drive method as this will enable more comprehensive WebDAV client interaction with Confluence than that provided by a web folder. However, your Confluence instance must meet several environmental constraints if you use this method. If you cannot configure your instance to meet these requirements, then use the web folder method or third-party WebDAV client software.

If you run into any problems with the procedures in this section, please refer to the Troubleshooting WebDAV page.

**Windows Network Drive**

To map a Confluence WebDAV client network drive, your Confluence instance must be configured so that all of the following criteria is met:

- Uses HTTP (not HTTPS)
- Listens on port 80 (not 8080, which is the default port value used by the popular application server Apache Tomcat that runs many Confluence EAR / WAR installations, or 8090, the default for Confluence distributions)
- Has no context root
- There is an issue (WBDV-208) that can prevent Network Drives from being mapped. Please use the Network Folders steps below as a workaround.

The reason for these restrictions results from limitations in Microsoft's Mini-Redirector component. For more information, please refer to Microsoft's server discovery issue.
To map a Confluence WebDAV client network drive in Microsoft Windows,

1. In Windows XP, go to **My Computer** –> **Tools menu** –> **Map Network Drive**. In Windows Vista, go to **Computer** –> **Map Network Drive**. The 'Map Network Drive' dialog box opens.
2. Specify the following input to map the WebDAV client as a network drive:
   - **Drive**: `<Any drive letter>` (for example, `Z:`)
   - **Folder**: `\<hostname>\webdav` (for example, `\localhost\webdav`)
3. Click 'Finish'.
   - When prompted for login credentials, specify your Confluence username and password.

**Windows Web Folder**

To map a Confluence WebDAV client web folder in Windows XP,

1. Go to **My Network Places** and choose 'Add a network place'. The 'Add Network Place Wizard' opens.
2. Click 'Next', ensure that 'Choose another network location' is selected and then click 'Next' again.
3. In the 'Internet or network address' field, enter the URL for the Confluence WebDAV location (for example, `http://<confluence server url>/confluence/plugins/servlet/confluence/default` or `http://<confluence server url>/plugins/servlet/confluence/default`) and then click 'Next'.
   - When prompted for login credentials, specify your Confluence username and password.
4. Provide a meaningful name for your web folder and proceed with the remainder of the wizard.
5. Click 'Finish'.

**Screenshot: A Confluence WebDAV Client Web Folder in Windows XP**

To map a Confluence WebDAV client web folder in Windows Vista,

- This procedure is very similar to the one for Windows XP. However, the following procedure includes the slight interface differences that are specific to Windows Vista.
1. Open the 'Map Network Drive' dialog box (refer to first step of the procedure above for mapping a network drive) and choose 'Connect to a Web site that you can use to store your documents and pictures'. The 'Add Network Location' wizard opens.

2. Click 'Next', ensure that 'Choose a custom network location' is selected and then click 'Next' again.

3. In the 'Internet or network address' field, enter the URL for the Confluence WebDAV location (for example, http://<confluence server url>/confluence/plugins/servlet/confluence/default or http://<confluence server url>/plugins/servlet/confluence/default) and then click 'Next'.

   When prompted for login credentials, specify your Confluence username and password.

4. Provide a meaningful name for your network location/web folder and proceed with the remainder of the wizard.

5. Click 'Finish'.

**Setting up a WebDAV client in Linux or Solaris**

There are many tools and mechanisms available for configuring WebDAV clients in these operating systems. Therefore, we have chosen to demonstrate this using the file manager **Konqueror**, which is part of the Linux **K Desktop Environment**.

**To set up a Confluence WebDAV client in Konqueror,**

1. Open Konqueror.

2. In the 'Location' field, enter the URL for the Confluence WebDAV location using the 'protocol' webdavs (for example, webdavs://<confluence server url>/confluence/plugins/servlet/confluence/default or webdavs://<confluence server url>/plugins/servlet/confluence/default) and press Enter.

   If prompted for login credentials, specify your Confluence username and password.

   You should be able to click to load many, but not all files. In practice, you would normally save a modified file locally, then drag it to the Konqueror window to upload it to Confluence.

**Known Issues**

Please refer to the **WebDAV plugin documentation** for a description of the known issues and suggested workarounds.

**RELATED TOPICS**

No content found for label(s) data-storage,webdav.

**Configuring Quick Navigation**

When a user is searching Confluence (see **Using the Quick Navigation Aid**) the quick navigation aid automatically offers a dropdown list of pages and other items, matched by title to the search query. By default, this feature is enabled, with the maximum number of simultaneous quick navigation requests set to 40. However, these options can be modified as described below.

The maximum number of simultaneous quick navigation requests defines the maximum number of individuals who can use this feature simultaneously on the same Confluence server. If your Confluence server serves a large number of individuals who use this feature regularly, some of whom are being denied access to it, you may wish to increase this value.
To modify the quick navigation feature's options,

1. Choose **Browse > Confluence Admin**.
2. Select '**General Configuration**' in the left-hand panel.
3. In the '**General Configuration**' screen, click '**Edit**'.
4. To disable this feature, select '**Off**' beside '**Quick Navigation**'.
5. To modify the maximum number of simultaneous quick navigation requests, enter the appropriate number in the field beside '**Max Simultaneous Requests**'.
6. Click '**Save**'.

The following screenshot demonstrates the user interface of the quick navigation aid.

**Screenshot: The quick navigation aid showing titles matching the query 'mark'**

**RELATED TOPICS**

**Searching Confluence**

**Enabling OpenSearch**

With OpenSearch autodiscovery, you can add Confluence search to your Firefox or IE7 search box (see **Searching Confluence from your Browser's Search Box**). By default, OpenSearch autodiscovery is enabled. This feature can be enabled or disabled as described below.

**To enable or disable OpenSearch autodiscovery,**
1. Choose Browse > Confluence Admin.
2. Select 'General Configuration' in the left-hand panel.
3. In the 'General Configuration' screen, click 'Edit'.
4. Select 'On' beside 'Open Search' to enable this feature, or 'Off' to disable it.
5. Click 'Save'.

**Searching Confluence**

Enabling the Did You Mean Feature

When you perform a full Confluence search, Confluence may offer you an alternative spelling of your search query. The alternative spelling will appear next to the words 'Did you mean'. By default, this feature is disabled. You can enable it as described below.

**To enable the 'Did You Mean' feature,**

1. Choose Browse > Confluence Admin.
2. Select 'General Configuration' in the left-hand panel.
3. In the 'General Configuration' screen, click 'Edit'.
4. Select 'On' beside 'Did You Mean'.
   - If you have no 'Did you mean' feature index or you have not yet created it, this option will not be available. To create this index, click 'build the did-you-mean index' and on the subsequent page, click 'Build' in the 'Did You Mean Index' section. Then return to the 'General Configuration' screen in Edit mode.
5. Click 'Save'.

**Languages and Locales**

The 'Did You Mean' feature supports only the English language. In addition, the 'Did You Mean' index requires the built-in UK-English locale (en_UK). If your Confluence site uses a different language pack, such as English (US), the 'Did You Mean' feature will not work. You will see an error message like this:

> For Did You Mean both the indexing language and the global default language must be set to English.

For more information about how the 'Did You Mean' feature works, please refer to the user guide.

You can track the request to support other languages by watching issue CONF-14768.

**RELATED TOPICS**

**Enabling the Remote API**

Confluence provides XML-RPC and SOAP remote APIs (application programming interfaces). You need to enable the APIs from the Administration Console before you can access Confluence remotely.

You need System Administrator permissions in order to perform this function.

**To enable the remote API:**
1. Choose **Browse > Confluence Admin.**
2. Click **General Configuration** in the left-hand panel.
3. Click **Edit.**
4. Click the check box next to **Remote API (XML-RPC & SOAP).**
5. Click **Save.**

**Related pages:**

[Confluence Remote API Reference](#)

---

**Enabling Threaded Comments**

Comments on pages or blog posts are displayed in one of two views:

- **Threaded:** Shows the comments in a hierarchy of responses. Each reply to a comment is indented to indicate the relationships between the comments.
- **Flat:** Displays all the comments in one single list and does not indicate the relationships between comments.

By default, comments are displayed in **threaded** mode. A Confluence Administrator (see **Global Permissions Overview**) can enable or disable the threaded view for the entire Confluence site.

To enable or disable the threaded view:

1. Choose **Browse > Confluence Admin.**
2. Select **General Configuration** in the left-hand panel.
3. Click **Edit.**
4. Check **Threaded Comments** to enable threaded mode. Clear the check box to disable threaded mode and display all comments in flat mode.
5. Click **Save.**

**Related pages:**

---

**Enabling Trackback**

When Trackback is enabled, any time you link to an external webpage that supports Trackback Autodiscovery, Confluence will send a trackback ping to that page to inform it that it has been linked to.

Confluence pages also support Trackback Autodiscovery and when Trackback is enabled, can receive trackback pings sent by other sites.

To enable trackback,

1. Choose **Browse > Confluence Admin.**
2. Select ‘**General Configuration**’ in the left panel.
3. In the ‘**Feature Settings**’ screen, click ‘**Edit**’.
4. Select ‘**On**’ beside ‘**Trackback**’ and click ‘**Save**’.

Other Settings

- Configuring Attachment Size
- Configuring Character Encoding
- Configuring HTTP Timeout Settings
- Configuring Indexing Language
- Configuring Number Formats
- Configuring Shortcut Links
- Configuring Time and Date Formats
- Known Issues with Enterprise or Webhosting environments

Configuring Attachment Size

Confluence gives you the option of limiting the maximum size of a single file attachment. Confluence administrators should keep in mind that the amount of disk space used by Confluence is directly proportional to the number and size of attachments put into the system.

To configure the maximum size allowed for an attachment:

1. Go to the ‘Administration Console’ and click ‘General Configuration’ in the left-hand panel.
2. Click ‘Edit’ on the ‘General Configuration’ screen.
3. Enter the maximum size next to ‘Attachment Maximum Size’. The default is 10 MB.
4. ‘Save’ your changes.

To configure the maximum 'index-able size of attachments':

By default, large attachment is defined as greater than 1 MB. The threshold for attachments that won't get excerpts can be modified using the system property atlassian.indexing.contentbody.maxsize, which takes a size in bytes.

Example

To specify 250 kb you would use the following JVM parameter:
-J-Datlassian.indexing.contentbody.maxsize=256000

Outcomes of Limiting Attachment Indexing Size

Limiting the size of attachment indexing has the following effects:

- Decreases the size of the index when large attachments are present.
- Decreases the memory used in indexing large attachments.
- Prevent excerpts of large attachments being displayed in search results.

For more details, please refer to the following JIRA issue.

Related Topics

No content found for label(s) other-settings.
Configuring Character Encoding

Confluence uses UTF-8 character encoding to deliver its pages.

⚠️ While it is possible to change the character encoding, unless you are certain of what you are doing, we recommend that you leave this as it is.

To change the character encoding:

1. Go to the ‘Administration Console’ and click on ‘General Configuration’ in the left panel.

2. Click ‘Edit’ at the bottom of the ‘Formatting and International Settings’ screen. For Confluence version earlier than 2.6.2, look for the ‘Options and Settings’ screen.

4. ‘Save’ your changes.

Related Topics

No content found for label(s) other-settings.

Configuring HTTP Timeout Settings

When macros such as the RSS Macro make HTTP requests to servers which are down, a long timeout value is used. You can set this timeout value through a system parameter to avoid this.

To configure the HTTP Timeout Settings:

1. Choose Browse > Confluence Admin.

2. Select ‘General Configuration’ under the ‘Configuration’ heading in the left-hand panel.

3. Find the ‘Connection Timeouts’ section in the lower portion of the screen.

4. Click ‘Edit’ to adjust the settings:
   - **Adjust External connections enabled**: This setting allows system administrators to disable external connections so macros like the RSS Macro won’t be allowed to make connections to an external server. It’s provides protection against external servers providing insecure HTML, timing out or causing performance problems. The default setting is ‘true’.
   - **Connection Timeout (milliseconds)**: Sets the maximum time for a connection to be established. A value of zero means the timeout is not used. The default setting is ten seconds (10000).
   - **Socket Timeout (milliseconds)**: Sets the default socket timeout (SO_TIMEOUT) in milliseconds, which is the maximum time Confluence will wait for data. A timeout value of zero is interpreted as an infinite timeout. The default setting is ten seconds (10000).

Configuring Indexing Language

Changing the indexing language defined in Confluence may improve the accuracy of Confluence search results, if the majority of the content of your site is in some language other than English. Confluence supports content indexing in English (default), German, Russian, Chinese, CJK, Custom Japanese, French, Brazilian, Czech and Greek.

To configure a different indexing language:
1. Go to the ‘Administration Console’ and click ‘General Configuration’ in the left-hand panel.
2. Click any of the ‘Edit’ links.
3. Select the ‘Indexing Language’ from the dropdown list in the ‘Formatting and International Settings’ section.
4. Click ‘Save’.

Choosing a Default Language
Installing a Language Pack
Content Index Administration
Rebuild the Content Indices from Scratch
Creating a Lowercase Page Title Index

Configuring Number Formats

To change the number formats:
1. Go to the ‘Administration Console’ and click on ‘General Configuration’ in the left panel.
2. Click ‘Edit’ at the bottom of the ‘Options and Settings’ screen.
   - There are two number format settings:
     - Long Number Format
     - Decimal Number Format
3. Change the formats using the guidelines in this document.
4. ‘Save’ your changes.

Related Topics

No content found for label(s) other-settings.

Configuring Shortcut Links

Shortcut links provide a quick way of linking to resources that are frequently referenced from Confluence. When you create a shortcut link, you assign a key to an URL so that, when editing, a user can type just the key instead of the complete URL.

Here is an example:

Most Google searches look like this: http://www.google.com/search?q=. If you create a shortcut for this search with the key ‘google’, every time a user needs to use http://www.google.com/search?q=sear

searchterms, they can just type [searchterms@google] instead.

Here is a screenshot showing the shortcuts currently defined on http://confluence.atlassian.com:

<table>
<thead>
<tr>
<th>Key</th>
<th>Expanded Value</th>
<th>Default Alias</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>cache</td>
<td><a href="http://www.google.com/search?q=cache">http://www.google.com/search?q=cache</a>;</td>
<td></td>
<td>Remove</td>
</tr>
<tr>
<td>imdb</td>
<td><a href="http://us.imdb.com?Title">http://us.imdb.com?Title</a>?</td>
<td></td>
<td>Remove</td>
</tr>
<tr>
<td>jira</td>
<td><a href="http://jira.atlassian.com/secure/QuickSearch.jspa?searchString=">http://jira.atlassian.com/secure/QuickSearch.jspa?searchString=</a></td>
<td>JIRA Issue %s</td>
<td>Remove</td>
</tr>
<tr>
<td>google/groups</td>
<td><a href="http://groups.google.com/groups?q=">http://groups.google.com/groups?q=</a></td>
<td></td>
<td>Remove</td>
</tr>
<tr>
<td>google</td>
<td><a href="http://www.google.com/search?q=">http://www.google.com/search?q=</a></td>
<td></td>
<td>Remove</td>
</tr>
<tr>
<td>dictionary</td>
<td><a href="http://www.dict.org/bin/Dict?Database=%25&amp;Form=Dict&amp;Strategy=%25&amp;Query=">http://www.dict.org/bin/Dict?Database=%&amp;Form=Dict&amp;Strategy=%&amp;Query=</a></td>
<td></td>
<td>Remove</td>
</tr>
</tbody>
</table>
Shortcut links are added and maintained by Confluence administrators from the Administration Console.

Creating Shortcut Links

To create a shortcut link:

1. Go to the Administration Console and click Shortcut Links in the left panel.
2. Enter a Key for your shortcut. This is the shortcut name a user will use to reference the URL.
3. Enter the Expanded Value. This is the URL for the link. You can use ‘%s’ in the URL to specify where the user's input is inserted. If there is no ‘%s’ in the URL, the user's input will be put at the end.
4. (Optional. Available in Confluence version 2.3 and later.) Enter a Default Alias. This is the text of the link which will be displayed on the page where the shortcut is used, with the user's text being substituted for ‘%s’.
5. Click Save.

Using Shortcut Links

Enter a shortcut link on the Advanced tab of the Insert Link dialog. See Linking to Pages for details.

Specify in the link what should be appended to the end of the shortcut URL, followed by an at-sign (@) and the key of the shortcut. Shortcut names are case-insensitive. So, for example, using the keys shown in the above screenshot:

<table>
<thead>
<tr>
<th>To link to...</th>
<th>Type this</th>
<th>Resulting URL</th>
<th>Demonstration</th>
</tr>
</thead>
<tbody>
<tr>
<td>a JIRA issue</td>
<td>CONF-1000@JIRA</td>
<td><a href="http://jira.atlassian.com/secure/QuickSearch.jspa?searchString=CONF-1000">http://jira.atlassian.com/secure/QuickSearch.jspa?searchString=CONF-1000</a></td>
<td>CONF-1000</td>
</tr>
<tr>
<td>a Google search</td>
<td>Atlassian Confluence@Google</td>
<td><a href="http://www.google.com/search?q=Atlassian+Confluence">http://www.google.com/search?q=Atlassian+Confluence</a></td>
<td>Atlassian Confluence@Google</td>
</tr>
</tbody>
</table>

Deleting Shortcut Links

Shortcut links are listed on the Shortcut Links tab of the Administration Console. Click Remove to delete the shortcut.

Related Topics

Configuring Time and Date Formats

Confluence allows you to localise the formats used to display dates and times within the web interface. The settings use the syntax of Java’s SimpleDateFormat class (described below).

To change the time and date formats:

1. Go to the ‘Administration Console’ and click on ‘General Configuration’ in the left panel.
2. Click ‘Edit’ at the bottom of the ‘Options and Settings’ screen.
   - There are three time and date format settings:
     - Time Format: displaying only the time of day (for example, when each news item is posted)
     - Date Time Format: displaying both the date and the time of day (for example, in historical versions of pages)
• Date Format: displaying only the date (for example, the creation and most recent modification dates of pages)

3. Change the formats using the guidelines in this document.

4. ‘Save’ your changes.

Known Issues with Enterprise or Webhosting environments

When you attempt to run Confluence, you may get the following error:

```
java.security.AccessControlException: access denied (java.lang.RuntimePermission accessDeclaredMembers)
    at java.security.AccessControlContext.checkPermission(AccessControlContext.java(Compiled Code))
    at java.security.AccessController.checkPermission(AccessController.java(Compiled Code))
    at java.lang.SecurityManager.checkPermission(SecurityManager.java(Compiled Code))
```

Some of the libraries Confluence relies on to function make use of features of the Java language that may be restricted by Java security policies. This does not normally cause any problems: the default security configuration of most application servers will happily run Confluence. However, in some shared-hosting or enterprise environments, security settings may be such that Confluence can not function.

The permissions required by Confluence to run are detailed in the sample policy file below. You may need to give this information to your systems administrator so that they can be deployed with the Confluence application.

```
grant codeBase "file:${catalina.home}/webapps/confluence/-" {
    permission java.security.AllPermission;
};

grant {
    permission java.lang.RuntimePermission "accessDeclaredMembers";
    permission java.lang.reflect.ReflectPermission "suppressAccessChecks";
    permission java.lang.RuntimePermission "defineCGLIBClassInJavaPackage";
};
```

Configuring System Properties
This page describes how to set Java properties and options on startup for Confluence Stand-alone and EAR/WAR versions.
See [How to Fix Out of Memory Errors by Increasing Available Memory](#) for specific instructions for OutOfMemory Errors.

---

### Linux

**To Configure System Properties in Linux Installations,**

1. From `<confluence-install>/bin` (Stand-alone) or `<Tomcat-home>/bin` (EAR-WAR installation), open `setenv.sh`.
2. Find the section `JAVA_OPTS=`
3. Refer to the list of parameters **below**.

- Add all parameters in a space-separated list, inside the quotations.

### Windows (starting from .bat file)

**To Configure System Properties in Windows Installations When Starting from the .bat File,**

1. From `<confluence-install>/bin` (Stand-alone) or `<Tomcat-home>/bin` (EAR-WAR installation), open `setenv.bat`.
2. Find the section `set JAVA_OPTS=%JAVA_OPTS%`
3. Refer to the list of parameters **below**.

- Add all parameters in a space-separated list. Make sure to keep the string `%JAVA_OPTS%` in place.

### Windows Service

There are two ways to configure system properties when you [Start Confluence Automatically on Windows as a Service](#), either via **command line** or in the **Windows Registry**

---

**Setting Properties for Windows Services via Command Line**
### Setting Properties for Windows Services via Command Line

1. Identify the name of the service that Confluence is installed as in Windows (Control Panel > Administrative Tools > Services):

   ![Confluence Service](image)

   In the above example, the **SERVICENAME** is: JIRA030908110721. Find the Confluence equivalent.

2. Open the command window from Start >> Run >> type in 'cmd' >> Enter

3. `cd` to the bin directory of your Confluence instance, or the bin directory of your Tomcat installation if your are running Confluence EAR/WAR.

4. Run:

   ```
   tomcat6w \ES\%SERVICENAME%
   ```

   In the above example, it would be `tomcat6w \ES\JIRA030908110721`

5. Click on the Java tab to see the list of current start-up options:

   ![Java Tab](image)

6. Append any new option on its own new line by adding to the end of the existing Java Options. Refer to the list of parameters below.

---

### Setting Properties for Windows Services via the Windows Registry

In some versions of Windows, there is no option to add Java variables to the service. In these cases, you must add the properties by viewing the option list in the registry.
To Set Properties for Windows Services via the Windows Registry,

1. Go to {{Start >> Run, and run "regedit32.exe".}

2. Find the Services entry:
   - **32-bit**: HKEY_LOCAL_MACHINE >> SOFTWARE >> Apache Software Foundation >> Procrun 2.0 >> Confluence
   - **64-bit**: HKEY_LOCAL_MACHINE >> SOFTWARE >> Wow6432Node >> Apache Software Foundation >> Procrun 2.0 >> Confluence

3. To change existing properties, especially increasing Xmx memory, double-click the appropriate value.

4. To change additional properties, double-click options.

5. Refer to the list of parameters [below](#). Enter each on a separate line.

### Verifying Your Settings

To see what Confluence is using, check [Viewing System Properties](#).

<td>3.3</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Sets the number of threads to be used for the reindex job. The value has to be in the range of 1 to 10 (inclusive), i.e. at least one thread but no more than 10 threads will be used. There is no default value, i.e.

- If you don't set `index.queue.thread.count`, the number of threads to be used are calculated based on the number of objects that need to be reindexed and the number of processors available (a maximum of 10 threads will be used).
- If you set `index.queue.thread.count=2`, then two threads will be used to reindex the content (regardless of the number of objects to be reindexed or the number of processors available)
- If you set `index.queue.thread.count=200`, then ten threads (the maximum allowed) will be used to reindex the content.
<table>

**Recognised System Properties**

Confluence supports some configuration and debugging settings that can be enabled through Java system properties. System properties are usually set by passing the `-D` flag to the Java virtual machine in which Confluence is running. See the full instructions: [Configuring System Properties](#).

⚠️ The information on this page does not apply to Confluence OnDemand.

**RELATED TOPICS**

**Configuring System Properties**

**Application Server Configuration**

The following pages contain information about configuring your application server for Confluence:

- Application Server URL encoding
- Managing Application Server Memory Settings
- Switching to Apache Tomcat

**Application Server URL encoding**

Application servers may have different settings for character encodings. We strongly suggest setting this to UTF-8 where possible.

Information on setting the character encoding is available at:

- Configuring Tomcat's URI Encoding

**Configuring Tomcat's URI encoding**

By default, Tomcat uses ISO-8859-1 character encoding when decoding URLs received from a browser. This can cause problems when Confluence's encoding is UTF-8, and you are using international characters in attachment or page names.

1. Edit `conf/server.xml` and find the line where the Coyote HTTP Connector is defined. It will look something like this, possibly with more parameters:

   ```xml
   <Connector port="8090"/>
   ```

2. Add a `URIEncoding="UTF-8"` property to the connector:
3. Restart Tomcat

If you are using mod_jk

You should apply the same URIEncoding parameter as above to the AJP connector if you are using mod_jk, and add the following option to your Apache mod_jk configuration:

```xml
<Connector port="8090" URIEncoding="UTF-8"/>
```

```
JkOptions +ForwardURICompatUnparsed
```

More information using Apache with Tomcat

For comprehensive examples of how to use Tomcat and Apache with Confluence, see Running Confluence behind Apache.

Managing Application Server Memory Settings

The minimum and maximum JVM heap space allocated to the application server affects performance. Confluence administrators may wish to modify this value from the defaults depending on their server load. This document only provides guidelines rather than rules, so administrators optimising for performance should use this document as a starting point only.

⚠️ For a comprehensive overview of memory management, and memory tuning in Confluence under Sun JRE, please read Garbage Collector Performance Issues

Testing For Optimum Memory Settings

In the general case, both JIRA & Confluence users will benefit from setting the minimum and maximum values identical. In larger installations, there is benefit to memory tuning, if there is a perceived performance issue. If you are experiencing Out of Memory Heap errors, try doubling the -Xmx and -Xms values for your installation to see if this resolves or helps resolve your issue. If not, please lodge a support ticket as there may be other factors contributing.

Memory usage is most likely to be maximised under peak load, and when creating a site XML backup. In many cases, the backup can be the cause of the OOM, so increase -Xmx values and verify if a backup was occurring at the time of OOM. A quick rule of thumb for gauging the success of a memory adjustment is using simple anecdotal evidence from users. Is it snappier? The same? How does it handle while a backup is occurring?

⚠️ Atlassian recommends in normal use, to disable the XML backup and use a Production Backup Strategy.

- If you normally perform manual XML site backups on your server, test your maximum memory requirements by performing a site XML backup while the server is under maximum load
- If you do not create manual XML site backups, simply monitor the server while under maximum load
Applying Memory Settings

**Switching to Apache Tomcat**

Apache Tomcat is the only application server supported for Confluence. To move Confluence from an application server (e.g. WebSphere) to Tomcat using the same database, follow the instructions below.

Please note, you cannot simply copy the WAR file or expanded WAR directory from an old Confluence EAR/WAR version in the old application server to Tomcat. **This will not work.**

Follow these instructions:

1. **Before You Start**
2. **Backing Up**
3. **Switching Application Servers**
4. **Applying Customisations**
   - Confluence Server
   - Plugins
   - Look and Feel
   - Performance
   - Advanced Customisations
5. **Testing Confluence**

**1. Before You Start**

1. The following instructions will only work if you are running the same major version of Confluence on both application servers. If you are running different major versions of Confluence, you will need to upgrade Confluence before you can switch to Tomcat.
2. Note that you need current software maintenance, as the process for changing application servers involves installing Confluence or Confluence EAR-WAR.
3. If the environment (e.g. the database system, the operating system and so on) that you are running Confluence in has changed, please ensure it still complies with the Confluence [System Requirements](#).
4. If you are using an external database, familiarise yourself with all known issues for your specific database. Also make sure the Confluence database connector principal (the database user login) has sufficient permissions to modify the database schema.
5. Note any customisations that you have made to Confluence, e.g. enabled/installed plugins, modified layouts, custom themes, etc. You will need to reapply these after you have switched to Tomcat. You can view the list of customisations in the Reapplying Customisations section below.
6. We recommend that you **do not** run any other applications in your Tomcat application server that is running Confluence, to prevent performance issues.

**2. Backing Up**

Before you switching to Tomcat, you must back up the following:

1. **Back up your Confluence Home directory.** The Confluence Home directory is the folder where Confluence stores its configuration information, search indexes and page attachments. If you are using
1. **Back up your database.** Perform a manual backup of your external database before proceeding with the upgrade and check that the backup was created properly. If you are not a database expert or unfamiliar with the backup-restore facilities of your database, you should try to restore the backup to a different system to ensure that the backup worked before proceeding. This recommendation is not specific to Confluence usage, but it is good practice to ensure that your database backup is not broken.

   The 'embedded database' is the HSQLDB database supplied with Confluence for evaluation purposes, you don't need to back it up since it is stored in the home directory. But you should not use this database for production systems anyway, so if you happen to accidentally still use HSQLDB in a production system, please **migrate to a proper database before** the upgrade.

2. **Switching Application Servers**

   1. Install Confluence on your new application server. We recommend that you **install Confluence** (from the zip file) as it is preconfigured with Tomcat. If you want more control over the installation process, you can **install Confluence EAR-WAR on Tomcat** however this requires more manual configuration.

      Regardless of which method you choose, as part of the installation process:
      - If you are connecting to your database via a standard JDBC connection, enter the URL, username and password for your existing database.
      - If you are connecting to your database via datasource, use the settings for your existing database when you configure the JDBC datasource in your new server. Refer to the appropriate guide below:
          - [Configuring a MySQL Datasource in Apache Tomcat](#)
          - [Configuring a SQL Server Datasource in Apache Tomcat](#)
          - [Configuring a PostgreSQL Datasource in Apache Tomcat](#)

   2. Copy the following files from your old Confluence installation to your new one:

      - `{CONFLUENCE_INSTALL}\confluence\WEB-INF\classes\confluence-init.properties`
      - `{CONFLUENCE_INSTALL}\confluence\WEB-INF\classes\atlassian-user.xml`
      - `{CONFLUENCE_INSTALL}\confluence\WEB-INF\classes\osuser.xml` (*copy this over if you are using JIRA user management*)
      - `{CONFLUENCE_INSTALL}\confluence\WEB-INF\classes\seraph-config.xml` (*copy this over if you using custom SSO*)
      - `{CONFLUENCE_INSTALL}\confluence\WEB-INF\web.xml` (*copy this over if you have previously modified it, e.g. to configure a datasource*)

   3. Make sure you shutdown the old server before you startup the new one.

   4. If you are running the new application server on a different machine to the old one, carry out the following actions as soon as you start the new server:
      - **Re-index your data.**
      - Make sure that the **attachments location** is valid for the new server.

   5. If you have applied special settings to their Confluence server and/or Confluence look and feel, you will need to reapply these customisations as described in **below.**

4. **Applying Customisations**

   - the embedded HSQLDB database supplied for evaluation purposes, the database files are also stored in this directory.

   - **Tip:** Another term for 'Home directory' would be 'data directory'. The location of the Home directory is stored in a configuration file called `confluence-init.properties`, which is located inside the `confluence/WEB-INF/classes` directory in your Confluence Installation directory.
After switching to Tomcat, you need to review any customisations and other special configurations you previously used for your Confluence instance, and re-apply if necessary. This section also contains some Tomcat-specific customisations that you may wish to considering applying, if you haven’t used Confluence with Tomcat before.

⚠️ Before you apply customisations

Please ensure that your Confluence installation works correctly on Tomcat without any customisations before you apply any of customisations listed below. This will make it easier to identify problems, if you run into trouble during the switch to Tomcat.

**Confluence Server**

- For long-term use, we recommend that you configure Confluence to start automatically when the operating system restarts. For Windows servers, this means configuring Confluence to run as a Windows service.
- If you are using the Confluence edition and you have previously defined a **CATALINA_HOME environment variable**, please check that it points to the correct path for the new Confluence Tomcat server.
- If you were previously running **Confluence on a non-standard port**, edit your new `<Installation-DIrectory>\conf\server.xml` file as described in [Change listen port for Confluence](#).

**Plugins**

- If you were previously using any **plugins**, install the latest compatible version and disable any plugins that are incompatible with your new instance of Confluence. The easiest way to do this is to use the [Plugin Repository](#) in the Confluence Administration Console.

**Look and Feel**

- If you are using any **customised themes**, please check that they are displaying as expected. Some further customisation may be required to ensure compatibility with your new version of Confluence.
- If you had previously customised the **default site or space layouts**, you will need to reapply your changes to the new defaults as described here. Please do not just copy your VM (velocity) files across. Ensure that Confluence works without your custom layouts then apply the layout via the Confluence Administration console.

**Performance**

- If the load on your Confluence instance is high, you may need more simultaneous connections to the database. Read more about this in the [Performance Tuning](#) guide.
- If you had previously modified the **memory flags** (`Xms` and `Xmx`) in either the `<Installation-Directory>\bin\setenv.sh` or the `<Installation-Directory>\bin\setenv.bat` file, you may want to make the modifications in your new installation. The parameters are specified in the `JAVA_OPTS` variable. See [How to Fix Out of Memory Errors by Increasing Available Memory](#) for more information.

**Advanced Customisations**

- If you were previously running **Confluence over SSL**, you will need to reapply your configuration as described in [Running Confluence Over SSL or HTTPS](#).
- If you were using a custom SSO authenticator, change `seraph-config.xml` to the correct authenticator.
- If you had changed the **Confluence interface text**, you will need to copy over the `ConfluenceActionSupport.properties` file.
- If you had previously modified the Confluence **source code**, you will need to reapply your changes to the new version.

5. Testing Confluence

Make sure you test **Confluence on the new server** before deploying it in production.

The [Working with Confluence Logs](#) document contains the locations for the application logs, if you need to refer
Database Configuration

This document provides information on configuring an external database.

The embedded HSQL database for evaluation purposes

The Confluence installation includes an embedded HSQLDB database, supplied for the purpose of evaluating Confluence.

If you are using the embedded database, the database files are stored in the `database` folder under your Confluence Home directory. See also Important Directories and Files.

![Embedded Database is Not Suitable for Production Instances of Confluence](image)

Production instances of Confluence should use an external database. When using the default HSQLDB database, you run the risk of unrecoverable data loss due to not being transaction safe.

- Corruption is occasionally encountered after sudden power loss and can usually be corrected using this data recovery procedure.
- HSQLDB is still suitable for evaluation purposes, but the risk can only be eliminated by switching databases. External databases may also provide superior speed and scalability.

Selecting an external database

**Note:** Take time to choose your database wisely. The XML backup built into Confluence is not suited for migration or backup of large data sets. If you need to migrate later, you will need to use a third party database migration tool.

Below is more information on selecting and migrating to an external database:

Configuring Database Character Encoding

The database used with Confluence should be configured to use the same character encoding as Confluence. The recommended encoding is Unicode UTF-8 (the equivalent for Oracle databases is AL32UTF8).

There are two places where character encoding may need to be configured:

- when creating the database
- when connecting to the database (JDBC connection URL or properties).

The configuration details for each type of database are different. Some examples are below.

On this page:

- JDBC connection settings
- Creating a UTF-8 database
- Updating existing database to UTF-8

⚠️ The information on this page does not apply to Confluence OnDemand.

JDBC connection settings

MySQL

Append "useUnicode=true to your JDBC URL:

```text
jdbc:mysql://hostname:port/database?useUnicode=true&characterEncoding=utf8
```

Created in 2012 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
If you are modifying `confluence.cfg.xml` directly rather than via the Confluence Installation GUI, you'll need to escape out the & in the URL string as this is a reserved XML token and will break the syntax when the XML is parsed. An effective URL could be similar to:

```xml
<property
    name="hibernate.connection.url">jdbc:mysql://hostname:port
/database?useUnicode=true&amp;characterEncoding=utf8</property>
```

### Creating a UTF-8 database

**MySQL**

1. Create a UTF-8 database with binary UTF-8 collation.
   - Binary UTF-8 provides case-sensitive collation.

   ```sql
   CREATE DATABASE confluence CHARACTER SET utf8 COLLATE utf8_bin;
   ```

2. You will also need to set the Server Characterset to utf8. This can be done by adding the following in `my.ini` for Windows or `my.cnf` for other OS. It has to be declared in the Server section, which is the section after `[mysqld]`:

   ```ini
   [mysqld]
   default-character-set=utf8
   ```

   If the above option does not work, try using `character_set_server=utf8` in lieu of `default-character-set=utf8`.

3. Use the `status` command to verify database character encoding information.
3. In some cases, the individual tables collation and character encoding may differ from the one that the database as a whole has been configured to use. Please use the command below to ensure all tables within your Confluence database are correctly configured to use UTF-8 character encoding and binary UTF-8 collation:

```
use confluence;
show table status;
```

Check for the value listed under the **Collation** column, to ensure it has been set to **utf8_bin** (that is, case-sensitive) collation for all tables. If not, then this can be changed by the following command, executed for each table in the Confluence database:

```
ALTER TABLE tablename CONVERT TO CHARACTER SET utf8 COLLATE utf8_bin;
```

Please substitute the `<tablename>` above, with each table within the confluence database.

Relevant MySQL manual for more detailed explanation:

- [Specifying Character Sets and Collations documentation](https://dev.mysql.com/doc/refman/5.0/en/collation-specification.html)
- [Connection Character Sets and Collations](https://dev.mysql.com/doc/refman/5.0/en/charset-connection.html)
- [SHOW TABLE STATUS Syntax](https://dev.mysql.com/doc/refman/5.0/en/show-table-status.html)
- [ALTER TABLE Syntax](https://dev.mysql.com/doc/refman/5.0/en/alter-table.html)

---

**PostgreSQL**
CREATE DATABASE confluence WITH ENCODING 'UNICODE';

Or from the command-line:

$ createdb -E UNICODE confluence

For more information see the PostgreSQL documentation.

For PostgreSQL running under Windows

Please note that international characters sets are only fully supported and functional when using PostgreSQL 8.1 and above under Microsoft Windows.

For PostgreSQL running under Linux

Please make sure you check the following to ensure proper handling of international characters in your database

When PostgreSQL creates an initial database cluster, it sets certain important configuration options based on the host environment. The command responsible for creating the PostgreSQL environment `initdb` will check environment variables such as `LC_CTYPE` and `LC_COLLATE` (or the more general `LC_ALL`) for settings to use as database defaults related to international string handling. As such it is important to make sure that your PostgreSQL environment is configured correctly before you install Confluence.

To do this, connect to your PostgreSQL instance using `psql` and issue the following command:

```
SHOW LC_CTYPE;
```

If `LC_CTYPE` is set to either "C" or "POSIX" then certain string functions such as converting to and from upper and lower case will not work correctly with international characters. Correct settings for this value take the form `<LOCAL>.<ENCODING>` (for example `en_AU.UTF8`).

If your `LC_CTYPE` is incorrect please check the PostgreSQL documentation for information on configuring database localisation. It is not easy to change these settings with a database that already contains data.

Updating existing database to UTF-8

MySQL database with existing data

For an existing database

If you're using a existing database, confirm the Character Encoding by executing the query:

```
SHOW VARIABLES LIKE 'character%';
```

```
SHOW VARIABLES LIKE 'collation%';
```

The results should be UTF-8.

Before proceeding with the following changes, please backup your database.

This example shows how to change your database from latin1 to utf8.
1. Dump the database to a text file using `mysqldump` tool from the command-line:
   
   ```
   mysqldump -p --default-character-set=latin1 -u <username> --skip-set-charset confluence > confluence_database.sql
   ```

2. Copy `confluence_database.sql` to `confluence_utf8.sql`.

3. Open `confluence_utf8.sql` in a text editor and change all character sets from 'latin1' to 'utf8'.

4. Encode all the latin1 characters as UTF-8:
   
   ```
   recode latin1=utf8 confluence_utf8.sql (the recode utility is described at http://directory.fsf.org/recode.html; it can actually be downloaded from http://recode.progiciels-bpi.ca/, and is available for Ubuntu via apt-get)
   ```

In MySQL:

1. DROP DATABASE confluence;

2. CREATE DATABASE confluence CHARACTER SET utf8 COLLATE utf8_bin;

Finally, reimport the UTF-8 text file:

1. ```
   mysql -u <username> -p --default-character-set=utf8 --max_allowed_packet=64M confluence < /home/confluence/confluence_utf8.sql
   ```

To support large imports, the parameter '--max_allowed_packet=64M' used above sets the maximum size of an SQL statement to be very large. In some circumstances, you may need to increase it further, especially if attachments are stored in the database.

**Testing database encoding**

See Troubleshooting Character Encodings for a number of tests you can run to ensure your database encoding is correct.

**RELATED TOPICS:**

  - Database Setup For MySQL

**Database JDBC drivers**

The JDBC drivers for all databases currently supported for Confluence are linked below. You will need to make the driver available to your application server, as described in the appropriate setup guide.

ℹ️ Please note, we bundle a number of JDBC drivers with Confluence, as shown below. You do not have to download or install the drivers for the relevant databases, if you are using a direct JDBC connection. If you are connecting via a datasource, you will still need to download and install the drivers manually.

**JDBC Driver Download Links**

<table>

**Database Setup for Oracle**

This guide covers deploying the Confluence or Confluence WAR distributions with an Oracle database.

⚠️ **This database can only be set up by an Oracle database administrator (DBA)**

If you are not a DBA, you should not attempt to set up this database.

Oracle has a history of being extremely difficult to set up. If you do not have access to an experienced Oracle DBA in your organisation, you are recommended to select any free, scalable and easy-to-install alternative rather than proceeding with Oracle. Users evaluating Confluence are recommended to start with an alternative database and only consider migrating to Oracle after approval from their DBA. Atlassian's technical support for Oracle setup difficulties will also reflect the high minimum skill requirements for attempting an Oracle setup.

**Database Setup Information**

This setup guide must be used in conjunction with the list of Known Issues For Oracle. Please review that page before continuing.

**Schema Requirements**

Confluence can be deployed to a schema in any Oracle instance.

**Database Compatibility**

Please refer to Supported Platforms for information about supported database versions. If your version of Oracle is not supported, please upgrade to a supported version before installing Confluence.

Check your database drivers, to see if you need an update.

- For Oracle 11.1, use the 10.2.0.4 or 11.1.0.7.0 driver (Java 6 ojdbc6.jar).
- For Oracle 11.2, use the 11.2.0.1.0 driver (Java 6 ojdbc6.jar).

Tip: search for the jar filename on the download site.

Check that your version of Oracle does not have any known issues:
### Database Preparation

Tailor these instructions to your particular database version:

1. Perform any necessary database or driver upgrades. Download the latest compatible database drivers. See the Oracle JDBC driver FAQ.
2. Create a Confluence user and grant the connect and resource permissions only to the user:

   ```sql
   create user <user> identified by <password>;
   grant connect, resource to <user>;
   ```

3. Add a local "all_objects" view to the user's schema, so that there is no possibility that a table with the same name as one of the Confluence tables in another schema will cause any conflicts. This is a workaround for the bug CONF-3613:

   ```sql
   create view <user>.all_objects as
   select *
   from sys.all_objects
   where owner = upper('<user>');
   ```

   **⚠️** Do not grant the database user the select any table permission, or it can cause problems with other schemas, as per the same bug CONF-3613.

### Determining Your JDBC URL

The JDBC thin driver for Oracle use three different styles of URL:

<table>
<thead>
<tr>
<th>New Style</th>
<th>Old Style</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>jdbc:oracle:thin:@//[HOST][:PORT]/SERVICE</code></td>
<td><code>jdbc:oracle:thin:@[HOST][:PORT]:SID</code></td>
</tr>
</tbody>
</table>

You may be also interested in the relevant JIRA documentation to check the compatibility of your Oracle server and driver.

**Deploying Confluence with Oracle**

Complete the instructions for installing Confluence, then return to this document instead of proceeding to the Confluence Setup Guide.
The tnsnames style is required for connecting to an Oracle RAC cluster. This example has been broken up over multiple lines for clarity, but it should be compacted into a single line. These may need more analysis than documented below, so you should seek the assistance of an experienced DBA.

If you use the new style URL, then SERVICE can be either an SID or Service Name, but if you use the old style URL, it can only be the SID.

You should be able to determine the host, port, service name, and/or SID by getting a DBA to run the following command as the user running oracle (by default "oracle"):

```bash
lsnrctl status
```

For reference, here is a sample output:

tnsnames

```sql
jdbc:oracle:thin:@(DESCRIPTION=
  (SDU=32768)
  (enable=broken)
  (LOAD_BALANCE=yes)
  (FAILOVER=yes)
  (ADDRESS=
    (PROTOCOL=TCP)
    (HOST=dbserver1.example.com)
    (PORT=1525))
  (ADDRESS=
    (PROTOCOL=TCP)
    (HOST=dbserver2.example.com)
    (PORT=1525))
  (CONNECT_DATA=
    (SERVICE_NAME=CONFDB)))
```
SNRCTL for Linux: Version 11.2.0.2.0 - Beta on 29-JUN-2012 15:20:59

Alias                     LISTENER
Version                   TNSLSNR for Linux: Version 11.2.0.2.0 - Beta
Start Date                06-JUN-2012 08:36:34
Uptime                    23 days 6 hr. 44 min. 25 sec
Trace Level               off
Security                  ON: Local OS Authentication
SNMP                      OFF
Default Service           XE
Listener Parameter File   /u01/app/oracle/product/11.2.0/xe/network/admin/listener.ora
Listener Log File         /u01/app/oracle diag/tnslsnr/<HOSTNAME>/listener/alert/log.xml
Listening Endpoints Summary...
    (DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(KEY=EXTPROC_FOR_XE)))
    (DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=<HOSTNAME>)(PORT=1521)))

    (DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=<HOSTNAME>)(PORT=8080))(Presentation=HTTP))

Services Summary...
Service "PLSExtProc" has 1 instance(s).
    Instance "PLSExtProc", status UNKNOWN, has 1 handler(s) for this service...
Service "XE" has 1 instance(s).
    Instance "XE", status READY, has 1 handler(s) for this service...
Service "XEXDB" has 1 instance(s).
    Instance "XE", status READY, has 1 handler(s) for this service...
The command completed successfully

1. The host and port is determined by the line containing PROTOCOL=tcp, **without** Presentation=HTTP.
2. Under services summary, each service which has an instance with READY status is a connectable service. The name following Service is a service name for connecting to the database name following Instance on the next line.
3. The SID is the name of the database instance, as defined by the $ORACLE_SID variable when you have sourced the Oracle environment to your shell.

For example, assuming that you are running Confluence on the same server as the Oracle database, with the above lsnrctl status output, you would use one of the following URLs:

```
jdbc:oracle:thin:@localhost:1521/XE
jdbc:oracle:thin:@//localhost:1521/XE
```

The URL can be used in either a direct JDBC connection or using a Tomcat datasource. If you want to use a datasource, please follow the instructions of the next two sections Adding a Datasource to Tomcat and Configuring Confluence Datasource Access, or if you'd prefer to just use a direct JDBC URL, skip to Running the Confluence Setup Wizard.

For further information on Oracle JDBC URLs, see [this page](#).

*Adding a Datasource to Tomcat*
1. Open `<INSTALL>/conf/server.xml` for editing.
2. Locate the section Host -> Context

   ```xml
   <Host name="localhost" debug="0" appBase="webapps" unpackWARs="true"
   autoDeploy="false">
   <Context path="" docBase="./confluence" debug="0" reloadable="true">
   <!-- Logger is deprecated in Tomcat 5.5. Logging configuration for
   Confluence is specified in confluence/WEB-INF/classes/log4j.properties -->
   <Manager pathname="" />
   </Context>
   </Host>
   
   Paste in the Resource section provided, before Manager as shown:

   ```xml
   <Host name="localhost" debug="0" appBase="webapps" unpackWARs="true"
   autoDeploy="false">
   <Context path="" docBase="./confluence" debug="0" reloadable="true">
   <!-- Logger is deprecated in Tomcat 5.5. Logging configuration for
   Confluence is specified in confluence/WEB-INF/classes/log4j.properties -->
   <Resource
   name="jdbc/confluence"
   auth="Container"
   type="javax.sql.DataSource"
   driverClassName="oracle.jdbc.OracleDriver"
   url="jdbc:oracle:thin:@hostname:port:sid"
   username="<username>"
   password="<password>"
   connectionProperties="SetBigStringTryClob=true"
   maxActive="25"
   maxIdle="5"
   maxWait="10000"
   />
   </Context>
   </Host>
   
3. Change the `username` and `password` to match the Oracle login.
4. Change `url` to match what you determined in Determining the JDBC URL. For example:
   
   ```
   jdbc:oracle:thin:@example.atlassian.com:1521:confluencedb
   ```
5. If required, choose different `maxActive` and `maxIdle` values. These set how many total database
   connections will be allowed at one time, and how many will be kept open even when there is no database
   activity.

   **Configuring Confluence Datasource Access**

   Configure Confluence to use this datasource:

   1. Edit the file `<INSTALL>/confluence/WEB-INF/web.xml`
   2. Go to the end of the file and just before `</web-app>`, insert the following:
<resource-ref>
<description>Connection Pool</description>
<res-ref-name>jdbc/confluence</res-ref-name>
<res-type>javax.sql.DataSource</res-type>
<res-auth>Container</res-auth>
</resource-ref>

**Running the Confluence Setup Wizard**

Now Confluence is ready to attempt to connect to Oracle:

1. Download the Oracle JDBC database drivers for your JDK version via the [Database JDBC drivers](#) page. We recommend using the thin drivers only. Copy the JAR file into `<confluence install>/WEB-INF/lib`. This directory path is potentially `<INSTALL>/lib` if Confluence is running off Apache Tomcat version 6 or above.

2. Startup Confluence using `<INSTALL>/bin/startup.bat` or `<INSTALL>/bin/startup.sh`

3. Insert your licence and select **External Database**.

4. If you are using a Datasource:
   a. Select **Datasource Connection** using your Oracle version.
   b. Enter `java:comp/env/jdbc/confluence` for the name of the datasource.

5. If you are using a Direct JDBC URL:
   a. Select **Direct JDBC URL** using your Oracle version.
   b. Enter your JDBC URL to match what you determined in [Determining the JDBC URL](#)

Confluence should now deploy using the Oracle database specified. Please read this [comment](#) on Oracle database optimisation.

**Oracle Configuration Tips**

**24-hour time format with Oracle 8i**

We have received a report from a user that when an Oracle 8i database is configured to use 24-hour time as the default format, an exception like this may occur:
One symptom of this problem is that Confluence may refuse to start after midday.

The workaround is to go to 'General Configuration' and set the default time format to "HH:mm".

**RELATED TOPICS**

[Known Issues For Oracle](#)

**Database Setup for SQL Server**

Use this guide in conjunction with the more general [Database Setup Guide for Any Database](#). These instructions add some reference notes specific to SQL Server.

1. Review the [known issues for SQL Server](#).
2. Identify which character encoding to use. To do this, check the encoding currently used by your application server and Confluence. All three must use compatible encoding. For example, the default SQL Server encoding of USC-2 is compatible with UTF-8.
3. Create a new database (as an SQL administrator). If you set your application server and Confluence to use an encoding incompatible with USC-2, specify that character encoding for the database.
4. Set the default collation for the database to be 'SQL_Latin1_General_CP1_CS_AS' (case sensitive). You can do this by issuing the following SQL query:

```
ALTER DATABASE <database_name> COLLATE SQL_Latin1_General_CP1_CS_AS
```

NB: if you receive an error at this point stating "The database could not be exclusively locked to perform the operation", you may need to prevent other connections by setting the mode to single user for the transaction:

```
ALTER DATABASE <database_name> SET SINGLE_USER WITH ROLLBACK IMMEDIATE;
<your ALTER DATABASE query>
ALTER DATABASE <database_name> SET MULTI_USER;
```

5. Configure the database to use the isolation level, Read Committed with Row Versioning. You can do this by issuing the following SQL query:

```
Determine if READ_COMMITTED_SNAPSHOT is enabled

SELECT is_read_committed_snapshot_on FROM sys.databases WHERE name= 'YourDatabase'
```

Return value:

1 = READ_COMMITTED_SNAPSHOT option is ON. Read operations under the read-committed isolation level are based on snapshot scans and do not acquire locks.

0 = READ_COMMITTED_SNAPSHOT option is OFF (default). Read operations under the read-committed isolation level use share locks.

```
ALTER DATABASE <database_name>
SET READ_COMMITTED_SNAPSHOT ON
WITH ROLLBACK IMMEDIATE;
```

6. Create a new SQL user account for Confluence (as an SQL administrator). Provide full create, read and write permissions for the database tables. Please note, Confluence must be able to create its own schema.

7. Install the database drivers, if needed:

**SQL Server JDBC Drivers bundled with Confluence**

The JDBC drivers for this database are bundled with Confluence. You do not have to download or install any JDBC drivers to use this database with Confluence, if you are using a direct JDBC connection. If you are connecting via a datasource, you will still need to download and install the drivers manually. See [Database JDBC drivers](#) for more information on the bundled JDBC drivers.

- If you're not sure which connection you're using, it's most likely JDBC. A JNDI resource must be configured manually, as described in [Configuring a MySQL Datasource in Apache Tomcat](#).
If you are configuring a datasource to connect to your MS SQL server database, you will need to place the jar file in `<confluence install>/WEB-INF/lib` (for Confluence 2.10 onwards) or `<confluence install>/common/lib` (for earlier versions). Information and links to the appropriate database drivers are available on Database JDBC drivers. You may also find this page helpful: http://jtds.sourceforge.net/faq.html

8. Start Confluence and visit the home URL (e.g. http://localhost:8090) to start the Confluence Setup Wizard and select a Custom Install, insert the relevant connection information.

- When prompted for a driver class name in the database setup step enter:

  ```
  net.sourceforge.jtds.jdbc.Driver
  ```

- When prompted for the jdbc url, the format to use is:

  ```
  jdbc:jtds:sqlserver://<server>:<port>/<database>
  ```

### Configuring a SQL Server Datasource in Apache Tomcat

This page contains instructions on how to set up an SQL Server datasource connection for Confluence or Confluence EAR/WAR.

**On this page:**

- 1. Install the Driver
- 2. Shut down Tomcat
- 3. Configure Tomcat
- 4. Configure the Confluence web application
- 5. Configure Confluence

#### 1. Install the Driver

2. After unpacking the file you have downloaded, you'll find a file called something like `jtds-1.2.5.jar` (whatever is the latest version).
3. Copy this file into the common/lib directory of your Tomcat installation. Be aware that this directory may be just lib for Tomcat version 6 and beyond (i.e. `<tomcat-install>/lib` rather than `<tomcat-install>/common/lib`).

  - Alternatively you can get the driver from `/confluence/WEB-INF/lib/jtds-1.2.2.jar` and move it into the common/lib directory of your Tomcat installation.

#### 2. Shut down Tomcat

1. Run `bin/shutdown.sh` or `bin/shutdown.bat` to bring Tomcat down while you are making these changes.

  - Make a backup of your `<CONFLUENCE_HOME>/confluence.cfg.xml` file and your `<CONFLUENCE_INSTALL>/conf/server.xml` file so you can easily revert should there be a problem.

#### 3. Configure Tomcat

1. Firstly, you need to edit `<confluence install>/conf/server.xml` and find the following lines:
1. Within the Context tags, directly after the opening <Context/> line, insert the DataSource Resource tag:

```xml
<Resource name="jdbc/confluence" auth="Container"
  type="javax.sql.DataSource"
  username="yourDatabaseUser"
  password="yourDatabasePassword"
  driverClassName="net.sourceforge.jtds.jdbc.Driver"
  url="jdbc:jtds:sqlserver://localhost:1433/yourDatabaseName"
  maxActive="20"
  maxIdle="10"
  validationQuery="select 1" />
```

- Replace the username and password parameters with the correct values for your database.
- In the url parameter, replace the word 'yourDatabaseName' with the name of the database your confluence data will be stored in.

2. Why is the validationQuery element needed?

   When a database server reboots, or there is a network failure, all the connections in the connection pool are broken and this normally requires a Application Server reboot.

   However, the Commons DBCP (Database Connection Pool) which is used by the Tomcat application server can validate connections before issuing them by running a simple SQL query, and if a broken connection is detected, a new one is created to replace it. To do this, you will need to set the "validationQuery" option on the database connection pool.

   If switching from a direct JDBC connection to datasource, you can find the above details in your <CONFLUENCE_HOME>/confluence.cfg.xml file.

3. The configuration properties for Tomcat's standard data source resource factory (org.apache.tomcat.dbcp.dbcp.BasicDataSourceFactory) are as follows:

   - driverClassName — Fully qualified Java class name of the JDBC driver to be used.
   - maxActive — The maximum number of active instances that can be allocated from this pool at the same time.
   - maxIdle — The maximum number of connections that can sit idle in this pool at the same time.
   - maxWait — The maximum number of milliseconds that the pool will wait (when there are no available connections) for a connection to be returned before throwing an exception.
   - password — Database password to be passed to our JDBC driver.
   - url — Connection URL to be passed to our JDBC driver. (For backwards compatibility, the property driverName is also recognized.)
   - user — Database username to be passed to our JDBC driver.
   - validationQuery — SQL query that can be used by the pool to validate connections before they are returned to the application. If specified, this query MUST be an SQL SELECT statement that returns at least one row.
4. **Configure the Confluence web application**

1. Edit `/confluence/WEB-INF/web.xml` in your confluence installation
2. Go to the end of the file and just before `</web-app>`, insert the following:

```xml
<resource-ref>
  <description>Connection Pool</description>
  <res-ref-name>jdbc/confluence</res-ref-name>
  <res-type>javax.sql.DataSource</res-type>
  <res-auth>Container</res-auth>
</resource-ref>
```

5. **Configure Confluence**

- **If you have not yet set up Confluence**
  1. Follow the steps in the [Confluence Setup Guide](#)
  2. In the Database Setup section, choose the “Datasource Connection” option.
  3. Set the JNDI name to `java:comp/env/jdbc/confluence`
  4. Set the Database dialect to SQL Server.

- **If you are changing an existing Confluence installation over to using a Tomcat datasource**
  1. Edit the `<confluence home>/confluence.cfg.xml` file
  2. Delete any line that contains a property that begins with hibernate.
  3. Insert the following at the start of the `<properties>` section.

```xml
<property name="hibernate.setup">true</property>
<property name="hibernate.dialect">net.sf.hibernate.dialect.SQLServerIntlDialect</property>
<property name="hibernate.connection.datasource">java:comp/env/jdbc/confluence</property>
```

4. Restart Confluence.

**RELATED TOPICS**

- [Configuring a MySQL Datasource in Apache Tomcat](#)
- [Database Setup For Any External Database](#)

If you are using Confluence in a production environment, data should be stored in an external database. The embedded database is bundled for evaluation purposes and does not offer full transactional integrity in the event of sudden power loss.

This document provides instructions for setting up Confluence for use with a production-ready database. It covers both migration from an evaluation installation of Confluence and installation of an empty database during initial setup. The following specific database guides have additional information:

- [PostgreSQL Guide](#)
- [MySQL Guide](#)
- [Oracle Guide](#)
- [SQL Server](#)

**Preparation**

Install the following on the Confluence server:
- Database administration tool, for example DBVisualizer
- JDBC database drivers
- The database server (unless accessed remotely)

The instructions refer to two particular directories:

- The `<Confluence Installation Directory>` is the directory where you unpacked the Confluence download.
- The `<Confluence Home Directory>` is the directory where Confluence stores its data, which you set by editing the `confluence-init.properties` file in `Confluence Installation Directory/WEB-INF/classes`.

### Database Setup

Create the schema and setup permissions:

1. Visit the [Database Configuration](#) page to review any known issues and database setup for your database.
2. Create a new schema using the [correct database encoding](#).
3. Create a user with full read/write access to the Confluence schema, including the ability to create tables.
4. If the database only permits users to log in from approved hosts (e.g. localhost), grant database access permission for the Confluence server.
5. If the database is hosted remotely to the Confluence server, set up any firewall permissions.
6. Test the connection by using the database administration tool installed on the Confluence server to log in to the database.

### Migration From an Evaluation Instance of Confluence

Continue here if you are migrating from an evaluation instance with the built-in database. If you are installing Confluence for the first time, continue below.

### Create Backups

To keep any existing Confluence content:

1. If you are already using an external database, use your database administration tool to create a full database backup.
2. Manually create an XML backup of Confluence under `Administration` -> `Backup & Restore`. If you have less than 100MB of attachments, check `Backup attachments` when creating the backup. If you have over 100MB of attachments, you should not check the 'Backup attachments' and instead you should manually copy the `/attachments` directory in your Confluence home to a backup location. This attachments directory will later be copied into the new home directory.
3. Download the backup file to a backup location.

### Database Connection Setup

Set up Confluence's database connection:

1. Stop Confluence if it is already running.
2. The JDBC database drivers for your database must be available to the application server. You can skip this step if the drivers are already loaded.
   a. Copy the database driver JAR file into the `lib` directory. In Confluence this directory is `/confluence/WEB-INF/lib`. Other application servers will use a different path.
   b. If the application server does not support dynamic library loading, stop your application server.
3. Create a new Confluence home directory.
4. Open the `WEB-INF/classes/confluence-init.properties` file in your Confluence installation and change the `confluence.home` property to point to this new Confluence home directory.
5. Start up Confluence. Refer to the platform-specific installation instructions to learn how. You should be presented with the Confluence setup wizard. Enter your license information.
6. Select 'Custom install'.
7. Select a database from the drop down list.
8. Select Direct JDBC and then enter the username, password and database driver of the new database.
9. If you created a Confluence backup earlier and wish to restore it, import it into Confluence now.
10. Once the wizard is complete, if you did not check the 'Backup attachments', copy the backed up /attach ments directory into the new Confluence home.

RELATED TOPICS

Troubleshooting External Database Connections

Database Setup for PostgreSQL

This document provides instructions for setting up Confluence for use with a PostgreSQL database. Please check the Known Issues for PostgreSQL before you start.

On this page:

- **1. Install PostgreSQL**
- **2. Create a User and a Database**
- **3. Configure Confluence to use the PostgreSQL Database**
- **Troubleshooting**

1. Install PostgreSQL

To install PostgreSQL,

1. Download the database software and installer from the PostgreSQL download site and save it to your desktop. Choose the package that matches your operating system. Where available, choose the One Click Installer. These instructions assume you will use the One Click Installer. For example:
   - PostgreSQL One Click Installer for Windows.
   - PostgreSQL One Click Installer for Linux.
   - PostgreSQL One Click Installer for Mac OS X.
2. Run the installer. Please note the following information when installing PostgreSQL:
   - The password that you are prompted to provide during the installation process is for the 'postgres' account, which is the db root level account.
   - The default port for PostgreSQL is 5432. If you decide to change the default port, please ensure that your new port number does not conflict with any services running on that port. You will also need to remember to update all further mentions of db port.
   - Choose the locale that best fits your geographic location, when prompted to enter a locale.
   - Do not launch Stack Builder at the completion of the installer.
3. PostgreSQL is now installed on your machine.

2. Create a User and a Database

All screenshots below are taken from a PostgreSQL configuration on a Windows machine.

To create a PostgreSQL user and database,
1. Start the ‘pgAdmin III’ administration tool on your machine. The pgAdmin III administration console will display. The database user and database that will be used by Confluence are created via the ‘pgAdmin III’ tool.

2. Connect to the PostgreSQL server (e.g. double-click on the server name in the object browser). Enter a ‘postgres’ password when prompted.

3. Create a new user, i.e. login role (e.g. right-click ‘Login Roles’ in the object browser and select ‘New Login Role...’):
   - Enter a name and password for the new user.
   - Do not select any role privileges.

4. Create a database (e.g. right-click ‘Databases’ and select ‘New Database...’):
   - Enter a name for the new database.
   - Set the owner of the database to the user you created in the previous step.
   - Select ‘UTF8’ for ‘Encoding’.
Creating a User and Database via Linux command-line

If you are on Linux and do not have the above pgAdmin III administration tool, you can use the command line interface instead. Assuming that you are using the default installation directory of /opt/PostgreSQL/8.3/bin/, enter the following commands:

```
sudo -s -H -u postgres
# Create the Confluence user:
/opt/PostgreSQL/8.3/bin/createuser -S -d -r -P -E confuser
# Create the Confluence database:
/opt/PostgreSQL/8.3/bin/createdb -O confuser confluence
exit
```

3. Configure Confluence to use the PostgreSQL Database

Once you have installed and set up PostgreSQL, you will need to configure Confluence to use the PostgreSQL database.

**To configure Confluence to use PostgreSQL,**
1. **Install Confluence**, if you haven’t done so already. Ensure that you download the Confluence distribution, not the evaluation installer.
2. Ensure that Confluence is stopped (for example, by ensuring that the application server or service which is running Confluence has been stopped or terminated).
3. Install the database drivers, if needed:

   **PostgreSQL JDBC Drivers bundled with Confluence**
   The JDBC drivers for this database are bundled with Confluence. You do not have to download or install any JDBC drivers to use this database with Confluence, if you are using a direct JDBC connection. If you are connecting via a datasource, you will still need to download and install the drivers manually. See Database JDBC drivers for more information on the bundled JDBC drivers.
   - If you’re not sure which connection you’re using, it’s most likely JDBC. A JNDI resource must be configured manually, as described in Configuring a MySQL Datasource in Apache Tomcat.

   Note: Confluence only bundles the JDBC 3 driver which will work under the 1.6 JVM. However, if you are using Java 6 and want to use the JDBC 4 driver, you can download it via Database JDBC drivers and install it as described below. You will need to remove the existing PostgreSQL JDBC 3 driver (e.g. postgresql-8.4-701.jdbc3), if you do want to use the JDBC 4 driver.

   - If you are configuring a datasource to connect to your PostgreSQL database, you will need to place the jar file in `<confluence install>/WEB-INF/lib` (for Confluence 2.10 onwards) or `<confluence install>/common/lib` (for earlier versions). Information and links to the appropriate database drivers are available on Database JDBC drivers.

   Windows renames .jar extensions to .zip! Just rename it back to .jar. You’ll have to set your folder options to view hidden file extensions if you can’t rename it without changing the file type (Tools >> Folder Options >> View >> Uncheck “Hide Extensions for known file types.”

4. Start Confluence and after entering your license code on the 'Confluence Setup Wizard' page, click ‘Custom Installation’. The ‘Choose a Database Configuration’ page will display.
5. Select ‘PostgreSQL’ and click ‘External Database’. The ‘Configure Database’ page will display.
6. Choose your desired database connection method (please note that if you choose to connect via datasource, you will need to install the appropriate database drivers as described in the previous step).
7. Enter your PostgreSQL database setup details (as defined in the previous step above):

   **Connecting to an SSL Database**
   Simply add ssl=true parameter in the Database URL, for example:

   ```
   jdbc:postgresql://localhost:5432/confluence?ssl=true
   ```
If the server that is hosting the PostgreSQL database is not the same server as Confluence, then please ensure that the confluence server can contact the database server and also refer to the PostgreSQL documentation on how to set up `pg_hba.conf`. If the pg_hba.conf file is not set properly, remote communication to the PostgreSQL server will fail.

**Running SQL Queries**

For ongoing maintenance of your server, you can continue to use PGAdmin as your SQL browser.

**Troubleshooting**

- **Known Issues for PostgreSQL** contains common issues encountered when setting up your PostgreSQL database to work with Confluence.
- If you are unable to connect to the database from Confluence and they are on different machines, most likely you have a firewall in between the two machines or your `pg_hba.conf` file is misconfigured. Verify that your firewall is set to allow connections through 5432 or double check your `hba configuration`.
- If Confluence is complaining that it's missing a class file, you might have forgotten to place the jdbc driver in the WEB-INF/lib folder or possibly have placed it in the wrong folder.
- If none of the above describes your issue, please create a support ticket at [http://support.atlassian.com](http://support.atlassian.com) and be sure to include your logs (found in confluence-install/logs and confluence-data/logs).

---

**Configuring a PostgreSQL Datasource in Apache Tomcat**

This page contains instructions on how to set up an PostgreSQL datasource connection for Confluence or Confluence EAR/WAR.

**On this page:**

- 1. **Install the Driver**
- 2. **Shut down Tomcat**
- 3. **Configure Tomcat**
- 4. **Configure the Confluence web application**
- 5. **Configure Confluence**

**1. Install the Driver**

2. Copy this file into the `common/lib` directory of your Tomcat installation. Be aware that this directory may be just `lib` for Tomcat version 6 and beyond (i.e. `<tomcat-install>/lib` rather than `<tomcat-install>/common/lib`).

If you are using Confluence 3.2.0 or later you can get the driver from `/confluence/WEB-INF/lib/postgresql-8.4-701.jdbc3.jar` and move it into the `common/lib directory` of your Tomcat installation.
2. Shut down Tomcat

1. Run `bin/shutdown.sh` or `bin/shutdown.bat` to bring Tomcat down while you are making these changes.

   Make a backup of your `<CONFLUENCE_HOME>/confluence.cfg.xml` file and your `<CONF
   LUENCE_INSTALL>/conf/server.xml` file so you can easily revert should there be a problem.

3. Configure Tomcat

1. Firstly, you need to edit `<confluence install>/conf/server.xml` and find the following lines:

   ```xml
   <Context path="" docBase="/confluence" debug="0" reloadable="true">
     <!-- Logger is deprecated in Tomcat 5.5. Logging configuration for Confluence is specified in confluence/WEB-INF/classes/log4j.properties -->
   </Context>
   ```

2. Within the Context tags, directly after the opening `<Context.../>` line, insert the DataSource Resource tag:

   ```xml
   <Resource name="jdbc/confluence" auth="Container" type="javax.sql.DataSource">
     username="postgres"
     password="postgres"
     driverClassName="org.postgresql.Driver"
     url="jdbc:postgresql://localhost:5432/yourDatabaseName"
     maxActive="20"
     maxIdle="10"
     validationQuery="select 1" />
   ```

   - Replace the `username` and `password` parameters with the correct values for your database.
   - In the `url` parameter, replace the word 'yourDatabaseName' with the name of the database your confluence data will be stored in.

   **Why is the validationQuery element needed?**

   When a database server reboots, or there is a network failure, all the connections in the connection pool are broken and this normally requires a Application Server reboot.

   However, the Commons DBCP (Database Connection Pool) which is used by the Tomcat application server can validate connections before issuing them by running a simple SQL query, and if a broken connection is detected, a new one is created to replace it. To do this, you will need to set the "validationQuery" option on the database connection pool.

   **If switching from a direct JDBC connection to datasource, you can find the above details in your `<CONFLUENCE_HOME>/confluence.cfg.xml` file.**
The configuration properties for Tomcat's standard data source resource factory (org.apache.tomcat.dbcp.dbcp.BasicDataSourceFactory) are as follows:

- **driverClassName** — Fully qualified Java class name of the JDBC driver to be used.
- **maxActive** — The maximum number of active instances that can be allocated from this pool at the same time.
- **maxIdle** — The maximum number of connections that can sit idle in this pool at the same time.
- **maxWait** — The maximum number of milliseconds that the pool will wait (when there are no available connections) for a connection to be returned before throwing an exception.
- **password** — Database password to be passed to our JDBC driver.
- **url** — Connection URL to be passed to our JDBC driver. (For backwards compatibility, the property driverName is also recognized.)
- **user** — Database username to be passed to our JDBC driver.
- **validationQuery** — SQL query that can be used by the pool to validate connections before they are returned to the application. If specified, this query MUST be an SQL SELECT statement that returns at least one row.

4. Configure the Confluence web application

1. Edit /confluence/WEB-INF/web.xml in your confluence installation
2. Go to the end of the file and just before </web-app>, insert the following:

```xml
<resource-ref>
  <description>Connection Pool</description>
  <res-ref-name>jdbc/confluence</res-ref-name>
  <res-type>javax.sql.Datasource</res-type>
  <res-auth>Container</res-auth>
</resource-ref>
```

5. Configure Confluence

- **If you have not yet set up Confluence**
  1. Follow the steps in the Confluence Setup Guide
  2. In the Database Setup section, choose the "Datasource Connection" option.
  3. Set the JNDI name to java:comp/env/jdbc/confluence
  4. Set the Database dialect to Postgres.

- **If you are changing an existing Confluence installation over to using a Tomcat datasource**
  1. Edit the <confluence home>/confluence.cfg.xml file
  2. Delete any line that contains a property that begins with hibernate.
  3. Insert the following at the start of the <properties> section.

```xml
<property name="hibernate.setup"><![CDATA[true]]></property>
<property name="hibernate.dialect"><![CDATA[net.sf.hibernate.dialect.PostgreSQLDialect]]></property>
<property name="hibernate.connection.datasource"><![CDATA[java:comp/env/jdbc/confluence]]></property>
```

4. Restart Confluence.

**Database Setup For MySQL**

This page provides instructions for installing Confluence and the open-source MySQL database on Microsoft Windows, as well as how to set up and configure MySQL to work with Confluence. Additional instructions are also provided for migrating across any existing Confluence database content. Use this guide in conjunction with the more general Database Setup Guide for Any Database. These instructions add some important reference notes specific to MySQL.

Please note the following points:

- Throughout the instructions below, the Confluence Installation Directory refers to the directory where you extracted the Confluence zipped installer.
- The MySQL Database Setup procedure below will make modifications to your default MySQL Server settings. These modifications result in:
  1. The default collation (localisation) option being changed to utf8_bin (that is, case-sensitive binary UTF8), such that by default, all new database tables will be created with this type of case-sensitive collation.
  2. The default MySQL database storage engine being changed to 'InnoDB'.

On this page:

- **1. Install Confluence**
- **2. Install MySQL Server**
- **3. Set up your MySQL Database and User**
- **(Optional) 4. Back Up Confluence Data**
- **5. Set Up your Database Connection**
- **Troubleshooting**
- **Related Documents**

1. **Install Confluence**

   Install Confluence if you have not done so already. Ensure that you download Confluence, not the evaluation installer.

2. **Install MySQL Server**

   To install MySQL Server,

   1. If you do not have an operational MySQL database server instance available, install 'MySQL Community Server' database server (version 5.0). The installation package can be downloaded from the MySQL download page or from the version 5.0 download page. Instructions for installing the MySQL 5.0 database server on Windows can be found on the 'Installing MySQL on Windows' page of the MySQL web site.
2. Run the 'MySQL Server Instance Config Wizard':
   a. At the start of the Config Wizard (or after having chosen Reconfigure Instance), choose Detailed Configuration.
   b. Choose the type of MySQL Server that best suits your hardware requirements. This will affect the MySQL Server's usage of memory, disk and CPU resources. Refer to the relevant MySQL documentation for further information.
   c. Choose 'Transactional Database Only' for the database usage step. This ensures that your MySQL database will use InnoDB as its default storage engine.
   
   It is highly recommended that you only use the InnoDB storage engine with Confluence. Avoid using the MyISAM storage engine as this can lead to data corruption.
   d. Set the InnoDB Tablespace settings to your requirements. (The default settings are acceptable).
   e. Set the approximate number of concurrent connections permitted that best suits your Confluence usage requirements. You can use one of the presets if desired or enter a number manually. Refer to the relevant MySQL documentation for further information.
   f. For the networking options, ensure the 'Enable TCP/IP Networking' and 'Enable Strict Mode' options are selected (default). Refer to the MySQL documentation on setting the networking and server SQL modes for further information.
   g. For the MySQL server instance's default character set option, choose 'Best Support For Multilingualism' (i.e. UTF-8).
   h. For the Windows configuration option, choose whether or not to install the MySQL Server as a Windows Service. If your hardware is going to be used as a dedicated MySQL Server, you may wish to choose the 'Install As Windows Service' and Launch the MySQL Server automatically) options. Refer to the relevant MySQL documentation for further information.
   i. Finally, select the 'Modify Security Settings' option to enter and set your MySQL Server (root) access password.

3. Install the database drivers, if needed:

MySQL JDBC Drivers bundled with Confluence
The JDBC drivers for this database are bundled with Confluence. You do not have to download or install any JDBC drivers to use this database with Confluence, if you are using a direct JDBC connection. If you are connecting via a datasource, you will still need to download and install the drivers manually. See Database JDBC drivers for more information on the bundled JDBC drivers.

- If you're not sure which connection you're using, it's most likely JDBC. A JNDI resource must be configured manually, as described in Configuring a MySQL Datasource in Apache Tomcat.

- If you are configuring a datasource to connect to your MySQL database, you will need to place the jar file i.e. mysql-connector-java-5.x.y-bin.jar where x.y depends on the driver version) in <confluence install>/WEB-INF/lib (for Confluence 2.10 onwards) or <confluence install>/common/lib (for earlier versions). Information and links to the appropriate database drivers are available on Database JDBC drivers.
4. Configure your MySQL server’s settings by editing MySQL’s `my.cnf` file (often named `my.ini` on Windows operating systems). Locate the `[mysqld]` section in the file and modify the following parameters:
   - Specify the default character set to be UTF-8:
     - MySQL 4.1.3 and above
       ```
       [mysqld]
       ...
       character-set-server=utf8
       collation-server=utf8_bin
       ...
     ```
     - MySQL 4.1.2 and below
       ```
       [mysqld]
       ...
       default-character-set=utf8
       default-collation=utf8_bin
       ...
     ```
   - Set the default storage engine to InnoDB:
     ```
     [mysqld]
     ...
     default-storage-engine=INNODB
     ...
     ```
   - Specify/increase the value of `max_allowed_packet` to be at least 32M:
     ```
     [mysqld]
     ...
     max_allowed_packet=32M
     ...
     ```

(Refer to MySQL Option Files for detailed instructions on editing `my.cnf` and `my.ini`.)

5. Restart your MySQL server for the changes to take effect:
   - On Windows, use the Service Manager to restart the service
   - On Linux, depending on your setup you will need to run either `"/etc/init.d/mysqld stop"` or `"/etc/init.d/mysql stop"` or `"service mysqld stop"` followed by the same command with "stop" replaced with "start"
   - On Mac OS X, run `"sudo /Library/StartupItems/MySQLCOM/MySQLCOM restart"

3. Set up your MySQL Database and User

To create the database and user privileges,
1. Run the "mysql" command as a MySQL super user. The default is "root" with a blank password.
2. Create an empty Confluence database schema by running
   
   ```sql
   CREATE DATABASE confluence;
   ```

3. Create the Confluence database user by running
   
   ```sql
   GRANT ALL PRIVILEGES ON confluence.* TO 'confluenceuser'@'localhost' IDENTIFIED BY 'confluencepass';
   ```

Replace "confluenceuser" and "confluencepass" with a username and password of your choice. If Confluence is not running on the same server as your MySQL database server, replace "localhost" with the hostname or IP address of the Confluence server.

To support international languages in Confluence, you should verify that the newly created database is using UTF-8 encoding and re-examine the JDBC URL settings (configured in Stage 3).

For an existing database

If you're using a existing database, confirm the Character Encoding by executing the query:

   ```sql
   SHOW VARIABLES LIKE 'character%';
   SHOW VARIABLES LIKE 'collation%';
   ```

The results should be UTF-8.

(Optional) 4. Back Up Confluence Data

This stage is only required if you have existing Confluence content you wish to transfer.

To back up your Confluence data,

1. Manually create an XML backup of Confluence under Administration -> Backup & Restore. If you have less than 100MB of attachments, check 'Backup attachments' when creating the backup. If you have over 100MB of attachments, you should not check the 'Backup attachments' and instead you should manually copy the /attachments directory in your Confluence home to another location. This attachments directory can then be copied into the new home directory as described later.
2. Download the backup file to a backups folder.

5. Set Up your Database Connection

To set up your Confluence MySQL database connection or to switch to using this external database,
1. Ensure that Confluence is stopped (for example, by ensuring that the application server or service which is running Confluence has been stopped or terminated).

2. If you haven't started Confluence yet, you can skip this step. If you have set up Confluence with the built-in (HSQLDB) database, edit Confluence Installation Directory_/confluence/WEB-INF/classes/confluence-init.properties and change the confluence.home property to point to a new directory. e.g. if you had

   confluence.home=c:/confluencedata

   You could change it to:

   confluence.home=c:/confluencedata_mysql

   This is your new Confluence Home Directory. (The name doesn't have to end in _mysql – that's just an example)

3. Start Confluence and set up the new configuration.
   a. Enter your license key and click the 'Custom Installation' button.
   b. Under the 'External Database' heading, select 'MySQL' from the dropdown list and click 'External Database'.
   c. On the next page, click 'Direct JDBC'.
   d. Enter confluenceuser in the User Name field, and the password you chose earlier in the Password field
   e. Click the Next button. If you get the error message Could not successfully test your database: : Server connection failure during transaction. Due to underlying exception: 'java.sql.SQLException: Access denied for user 'confluenceuser'@'localhost' (using password: YES)' verify that you have properly given the confluenceuser user all the right permissions when connecting from localhost.
   f. (optional) If you previously backed up your Confluence data, you can choose to restore it at the 'Load Content' page. Choose 'Restore From Backup', browse for the backup you created and restore it. Otherwise choose either the example or empty site as you wish.

Troubleshooting

- Known Issues for MySQL contains common issues encountered when setting up your MySQL database to work with Confluence.
- If Confluence is complaining that it's missing a class file, you might have forgotten to place the jdbc driver in the WEB-INF/lib folder or possibly have placed it in the wrong folder.
- If none of the above describes your issue, please create a support ticket at http://support.atlassian.com and be sure to include your logs (found in confluence-install/logs and confluence-data/logs).

- Configuring Database Character Encoding
- Known Issues for MySQL

Configuring a MySQL Datasource in Apache Tomcat

This page tells you how to set up a MySQL datasource connection for Confluence or Confluence EAR/WAR.
1. Shut down Tomcat

1. Run bin/shutdown.sh or bin/shutdown.bat to bring Tomcat down while you are making these changes.
2. Make a backup of your <CONFLUENCE_HOME>/confluence.cfg.xml file and your <CONFLUENCE_INSTALL>/conf/server.xml file so that you can easily revert if you have a problem.

2. Install the Drivers

2. After unpacking the file you have downloaded, you will find a file called something like mysql-connector-java-3.0.10-stable-bin.jar.
3. Copy this file into the common/lib directory of your Tomcat installation. Be aware that this directory may be just lib for Tomcat version 6 and beyond (i.e. <tomcat-install>/lib rather than <tomcat-install>/common/lib).

3. Configure Tomcat

1. If you are using the Confluence distribution, edit the conf/server.xml file in your Tomcat installation. If you are running your own Tomcat instance, edit the XML file where you declared the Confluence Context descriptor.
2. If editing conf/server.xml, find the following lines:

```xml
<Context path="" docBase="../confluence" debug="0" reloadable="true">
   <!-- Logger is deprecated in Tomcat 5.5. Logging configuration for Confluence is specified in confluence/WEB-INF/classes/log4j.properties -->
</Context>
```

3. Within the Context tags, directly after the opening <Context.../> line, insert the DataSource Resource tag:

```xml
<Resource name="jdbc/confluence" auth="Container"
type="javax.sql.DataSource"
   username="yourusername"
   password="yourpassword"
   driverClassName="com.mysql.jdbc.Driver"
   url="jdbc:mysql://localhost:3306/confluence?useUnicode=true&characterEncoding=utf8"
   maxActive="15"
   maxIdle="7"
   defaultTransactionIsolation="READ_COMMITTED"
   validationQuery="Select 1" />
```

- Replace the username and password parameters with the correct values for your database.
- In the url parameter, replace the word 'confluence' with the name of the database your Confluence data will be stored in.
If you plan to use non-Latin characters, you will also need to add "&useUnicode=true&characterEncoding=utf8" on the end of the above URL. These options are not required for any database other than MySQL.

Notes

- If switching from a direct JDBC connection to datasource, you can find the above details in your <CONFLUENCE_HOME>/confluence.cfg.xml file.

- Why is the validationQuery element needed? When a database server reboots, or there is a network failure, all the connections in the connection pool are broken and this normally requires an application server reboot.

However, the Commons DBCP (Database Connection Pool) which is used by the Tomcat application server can validate connections before issuing them by running a simple SQL query, and if a broken connection is detected, a new one is created to replace it. To do this, you will need to set the "validationQuery" option on the database connection pool.

- The configuration properties for Tomcat's standard data source resource factory (org.apache.tomcat.dbcp.dbcp.BasicDataSourceFactory) are as follows:
  - driverClassName – Fully qualified Java class name of the JDBC driver to be used.
  - maxActive – The maximum number of active instances that can be allocated from this pool at the same time.
  - maxIdle – The maximum number of connections that can sit idle in this pool at the same time.
  - maxWait – The maximum number of milliseconds that the pool will wait (when there are no available connections) for a connection to be returned before throwing an exception.
  - password – Database password to be passed to our JDBC driver.
  - url – Connection URL to be passed to our JDBC driver. (For backwards compatibility, the property driverName is also recognized.)
  - user – Database username to be passed to our JDBC driver.
  - validationQuery – SQL query that can be used by the pool to validate connections before they are returned to the application. If specified, this query MUST be an SQL SELECT statement that returns at least one row.

4. Configure the Confluence Web Application

1. Edit confluence/WEB-INF/web.xml in your Confluence installation.
2. Go to the end of the file and insert the following element just before </web-app>:

   <resource-ref>
     <description>Connection Pool</description>
     <res-ref-name>jdbc/confluence</res-ref-name>
     <res-type>javax.sql.DataSource</res-type>
     <res-auth>Container</res-auth>
   </resource-ref>

5. Configure Confluence

If you have not yet set up Confluence:

1. Follow the steps in the Confluence Setup Guide
2. In the Database Setup section, choose the "Datasource Connection" option.
3. Set the JNDI name to java:comp/env/jdbc/confluence
4. Set the Database dialect to MySQL.

If you are changing an existing Confluence installation over to using a Tomcat datasource:

1. Find your ConfluenceHome directory (see: Confluence Home Directory if you don't know where it is).
2. Edit the confluence.cfg.xml file
3. Delete any line that contains a property that begins with `hibernate`.
4. Insert the following at the start of the `<properties>` section.

```xml
<property name="hibernate.setup"><![CDATA[true]]></property>
<property name="hibernate.dialect"><![CDATA[net.sf.hibernate.dialect.MySQLDialect]]></property>
<property name="hibernate.connection.datasource"><![CDATA[java:comp/env/jdbc/confluence]]></property>
```

6. Restart Confluence

Run `bin/startup.sh` or `bin/startup.bat` to start Tomcat with the new settings.

### RELATED TOPICS

- **Database Setup For MySQL**
- **Creating Database Schema Manually**
- **Database Schema Creation**

This document provides information on how to find the SQL for database table creation.

Often, DBAs will require that table creation be done manually. To find the required SQL statements, you can use the script generated from our evaluation version's HSQLDB database.

- Install Confluence with no external database.
- Shut down Confluence.
- Find the file located in `<confluence-home>/database/confluencedb.script`

The `confluence-home` directory is not your installation directory, its the directory specified in `confluence-init.properties`. For more information, see [Confluence Home Directory](#) and [Confluence Installation Directory](#).

To see some example SQL statements, click 'Tools' and select 'Attachments' on this wiki page.

To get Confluence to run against this established schema, configure the database with the normal procedure, then modify the hibernate.connection.url, username and password from `confluence-home/confluence.cfg.xml` or `server.xml`, depending on whether it's a direct jdbc or resource connection. This is described in [Migrating Confluence Between Servers](#).

### RELATED TOPICS

- **Database Configuration**
- **Migrate to Another Database**

This document outlines how to migrate your data from your existing database to another database. It is designed for migrating from an evaluation to a production database. Large data sets will require third party database migration tools. You should use this method when moving from the embedded database to an external database. Provided your dataset is not large, you may use this method to move from one type of external database to another – for example, from Oracle to PostgreSQL.

**Note:** If you are simply moving your database from one server to another you can just change the JDBC URL in `<confluence.home>/confluence.cfg.xml` (if you are using a direct JDBC connection) or in the definition
of your datasource (if you are connecting via a datasource).

**Limitations of database migration**

**Note:** The XML export built into Confluence is not suited for the backup or migration of large data sets. There are a number of third party tools that may be able to assist you with the data migration. If you would like help in selecting the right tool, or help with the migration itself, we can put you in touch with one of the Atlassian Experts.

**Database migration**

There are two ways you can perform the migration:

1. Method one is the standard procedure.
2. For large installations of Confluence: If the total size of attachments on your installation exceeds 500MB, use method two.

**On this page:**

- **Method one – standard procedure**
  - **Step One: Backing up your data**
  - **Step Two: Configuring the Confluence Home Directory**
  - **Step Three: Setting up the new database**
  - **Step Four: Setting up Confluence with the new database**

- **Method two – for large installations**
  - **Step One: Backing up your data**
  - **Step Two: Configuring the Confluence Home Directory**
  - **Step Three: Moving your attachments**
  - **Step Four: Setting up new database**
  - **Step Five: Setting up Confluence with the new database**

- **A note about case sensitivity in your database**
- **Troubleshooting**

**Method one – standard procedure**

**Step One: Backing up your data**

1. Note which plugins are currently installed/enabled, so that you can reinstate them later.
2. Create a backup of your existing data. This is done from the Administration Console. Instructions on how to create a backup can be found here.
4. If you are already using an external database, please make a backup of it using the utilities that were installed with it.

**Step Two: Configuring the Confluence Home Directory**

1. Create a new Confluence Home Directory. You can place this directory anywhere you like and give it a name of your choice.
2. Open WEB-INF/classes/confluence-init.properties file in your Confluence installation and change the confluence.home property to point to this new Confluence Home Directory.

**Step Three: Setting up the new database**

Perform the database setup instructions for your database.

**Step Four: Setting up Confluence with the new database**

If your databases are not already configured for Confluence, refer to Database Configuration to setup your database access.
1. Make sure that the JDBC drivers for your database are available to the application server. If you don't already have the JDBC driver, please download one from here.
2. Make sure that your database is using a case-sensitive collation. Please refer to the section on case sensitivity below and see this issue for more details: CONF-7917.
3. If you are running the Confluence distribution, copy your JDBC database driver (a .jar file), into the <confluence-install>/lib folder.
4. Start up Confluence. You will see the Confluence Setup Wizard.
5. Select 'Custom Install'.
6. Select your database from the drop down list.
7. Select 'Direct JDBC' and then enter the details of the new database you want to migrate to. 
   ☀️ Read the documentation on the Setup Wizard for more detailed explanation.
8. When prompted, restore the contents of the backup you made in Step One into the new Confluence site.

Your old Confluence data will now be imported to your new database.

**Method two – for large installations**

**Step One: Backing up your data**

1. Before proceeding with these instructions please check that:
   - you are upgrading from at least Confluence version 2.2 and
   - your attachments are stored in the file system, and not in your database. (To migrate between attachment storage systems, please see Attachment Storage Configuration)
   ☢️ These instructions will not work if either of the above is not true.
2. From Confluence, go to Administration -> Backup & Restore and create a manual backup that excludes attachments.
3. Shut down and back up the Confluence Home Directory.
4. If you are already using an external database, please make a backup of it using the utilities that were installed with it.

**Step Two: Configuring the Confluence Home Directory**

1. Create a new Confluence Home Directory. You can place this directory anywhere you like and give it a name of your choice.
2. Open WEB-INF/classes/confluence-init.properties file in your Confluence installation and change the confluence.home property to point to this new Confluence Home Directory.

**Step Three: Moving your attachments**

Move the contents of your attachments directory from your old Confluence Home to your new Confluence Home.

**Step Four: Setting up new database**

Perform the database setup instructions for your database.

**Step Five: Setting up Confluence with the new database**

If your databases are not already configured for Confluence, refer to Database Configuration to setup your database access.

1. Make sure that the JDBC drivers for your database are available to the application server. If you don't already have the JDBC driver, please download one from here.
2. Make sure that your database is using a case-sensitive collation. Please refer to the section on case sensitivity below and see this issue for more details: CONF-7917.
3. If you are running the Confluence distribution, copy your JDBC database driver (a .jar file), into the <confluence-install>/lib folder.
4. Start up Confluence. You will see the Confluence Setup Wizard.
5. Select 'Custom Install'.
6. Select your database from the drop down list.
7. Select 'Direct JDBC' and then enter the details of the new database you want to migrate to.
A note about case sensitivity in your database

'Collation' refers to a set of rules that determine how data is sorted and compared. Case sensitivity is one aspect of collation. Other aspects include sensitivity to kana (Japanese script) and to width (single versus double byte characters).

Case sensitive or case insensitive collation – how should you create your Confluence database? What about when you are migrating your existing Confluence instance from one database to another?

Setting up a New Confluence Instance

For new Confluence instances, we recommend using case sensitive collation for your Confluence database. This is the default collation type used by many database systems.

Note: Even if the database is configured for case sensitive collation, Confluence reduces all usernames to lower case characters before storing them in the database. For example, this means that 'joebloggs', 'joeBloggs' and 'JoeBloggs' will be treated as the same username.

Migrating an Existing Confluence Instance to a Different Database

The default Confluence configuration uses case sensitive database collation. This is typical of databases created under default conditions. If you are migrating from this type of configuration to a new database, we recommend that the new database uses case sensitive collation. If you use case insensitive collation, you may encounter data integrity problems after migration (for example, via an XML import) if data stored within your original Confluence site required case sensitive distinctions.

Troubleshooting

If you are unable to restore your XML backup, consult our Troubleshooting Guide.

The Embedded HSQLDB Database

The Confluence installation includes an embedded HSQLDB database, supplied for the purpose of evaluating Confluence.

If you are using the embedded database, the database files are stored in the \database folder under your Confluence Home directory. See also Important Directories and Files.

Embedded Database is Not Suitable for Production Instances of Confluence

Production instances of Confluence should use an external database. When using the default HSQLDB database, you run the risk of unrecoverable data loss due to not being transaction safe.

- Corruption is occasionally encountered after sudden power loss and can usually be corrected using this data recovery procedure.
- HSQLDB is still suitable for evaluation purposes, but the risk can only be eliminated by switching databases. External databases may also provide superior speed and scalability.

RELATED TOPICS
**Important Directories and Files**

**Database Configuration**

**Troubleshooting the Embedded Database (HSQL DB)**

*java.sql.SQLException: User not found: SA*

HSQLDB periodically must update its files to represent changes made in the database. In doing so, it must delete the current confluencedb.data file on the filesystem (beneath conf.home/database) and replace it with a new one.

If an administrator issues a shutdown on Confluence in this period, data can be lost, and is typically noticed by the error message, when starting Confluence up again, of 'User not found: SA'.

Users encountering this problem should seek to restore backups, contained in the backup directory beneath confluence.home. If daily backups have been turned off, and no other copy of data remains, the data is lost.

**Hibernate logging**

It can be useful to [enable detailed Hibernate logging](http://hsqldb.sourceforge.net/doc/guide/ch01.html#N101C2) when debugging problems with HSQL.

**Connecting to the Embedded Database**

Connecting to the Embedded HSQL Database can be quite difficult. You may need to connect to the database to retrieve information, or for troubleshooting purposes.

Please follow the instructions on how to connect to the embedded HSQL Database using the Database Administration tool [DBVisualizer](http://dbvisualizer.org/).

**Connecting to HSQLDB using DBVisualizer**

The purpose of this guide is to walk you through connecting to Confluence’s embedded Hypersonic SQL Database using the Database Administration tool [DBVisualizer](http://dbvisualizer.org/).

Below are step by step instructions on how to Configure DBVisualizer and connect it to HSQLDB.

**Prerequisites**

1. Download and install the latest copy of [DBVisualizer](http://dbvisualizer.org/).
2. You will also need to download a copy (preferably the latest version) of [HSQLDB](http://hsqldb.sourceforge.net/).
3. Extract the contents of the HSQLDB archive.
4. Ensure that Confluence is not running.

**Connection Procedure**

Please ensure that you read and follow the instructions below carefully.

⚠️ **Remember to backup your `<confluence-home>/database` folder before attempting any modifications**

**1. Enter Connection Name**
1. Click on the icon highlighted in Red
2. Enter an identifiable name for the connection. e.g. conf2.5.4-std

2. Select JDBC Driver

1. From the drop down list select HSQLDB Embedded
2. Click on Load Driver Files
3. Browse to directory where the HSQLDB.jar file is located. Confluence bundles this and it can be found at <confluence-installation>/confluence/WEB-INF/lib/hsqldb-*.jar.

3. Select Database Path
   1. Browse to your <Confluence-Home> directory
   2. Open the Database folder
   3. Select the confluencedb.properties file

4. Enter Connection Details
1. Remove the ".properties" from the end of confluencedb
2. Type in sa for the username
3. Leave the password field blank

*refer to the example screenshot above if you are unsure*

### 5. Connect to embedded Database

1. Click on Test Connection to verify that the details are correct.
2. Click on "**Finish**" to complete the setup.
3. Select the connection from the list on the left hand side.
4. You can now click on "**Connect**" to connect to the embedded database.

*HSQL database manager*
Alternatively, you can use HSQLDB’s database manager. Just copy the value of hibernate.connection.url in confluence.cfg.xml as the URL and you’re good to go.

Database Tables Reference

Below is a diagram of the Table References in Confluence (2.5.4).

This may be useful for Database Administrators that need to manually create the Database tables.

Right Click and Select Save Link As here to download this image.

Troubleshooting External Database Connections

A common administration issue when configuring Confluence is identifying database connectivity problems. This page tells you about a helper utility, in the form of a JSP page, that can help you to isolate database connectivity issues. It checks whether you can connect to a database with your application server. If your application server cannot connect to the database, Confluence will not be able to connect to the database either.

Introduction to the Atlassian Database Check Utility

You can use this utility to:

- Check that your application server can successfully query your database, either via immediate JDBC connectivity or a datasource in the context of your application server.
- Pinpoint problems in your configuration which may occur if the above is failing.

This is what the utility does:

- Check that a JDBC driver can be loaded into memory and view what is already loaded.
- Connect to a JDBC URL and do a ‘select 1’ from the database.
- Find a DataSource in the JNDI environment and do the above.
- View the System classpath (to ensure that the JDBC JAR file is there).

Using the Utility

If you have already set up Confluence completely
1. Download the attached testdatabase.jsp to your <confluence-install>/confluence directory.
2. Restart Confluence.
4. Check that your database driver is loaded into memory. If not, check the system classpath for the JDBC driver file, and that the driver is in the <confluence-install>/lib directory (for Confluence version 2.10 onwards) or <confluence-install>/common/lib (for earlier versions). Here are some instructions.
5. Enter the DB settings Confluence is using and test the database. If an error appears, check that the db service is running, the location matches, and that any users specified actually exist with the right login and permissions. You may be able to find a workaround by Googling the error.

If you cannot set up Confluence because of an error in 'Configuring Database'

1. Record the DB settings you are using for your direct JDBC or datasource connection in the 'Configure Database' step of your setup.
2. Download the attached testdatabase.jsp to your <confluence-install>/confluence directory.
3. Rename your <confluence-install>/confluence/WEB-INF/web.xml file to backup web.xml. This disables redirection.
4. Restart Confluence.
6. Check that your database driver is loaded into memory. If not, check the system classpath for the JDBC driver file, and that the driver is in the <confluence-install>/common/lib directory as described in these instructions.
7. Enter the DB settings you recorded and test the database. If an error appears, check that the db service is running, the location matches, and that any users specified actually exist with the right login and permissions. You may be able to find a workaround by Googling the error.
8. After correcting the error, rename <confluence-install>/confluence/WEB-INF/backup web.xml back to web.xml.

Notes

If you use this utility, please let us know ways in which we could improve it or leave helpful hints for others here.

For a comprehensive set of database instructions that might be helpful for troubleshooting, please refer to the following links:

- PostgreSQL
- MySQL

Requesting Technical Support

If you are still stuck after attempting the suggestions above, lodge a free technical support request with information on your database setup.

Configuring database query timeout

If database queries are taking too long to perform, and your application is becoming unresponsive, you can configure a timeout for database queries. There is no default timeout in Confluence.

To configure a database query timeout, do the following on your test server:

1. Shut down Confluence.
2. Extract databaseSubsystemContext.xml from the confluence-x.x.x.jar that is in confluence/WEB-INF/lib/, and put a copy in confluence/WEB-INF/classes/.
3. Edit confluence/WEB-INF/classes/databaseSubsystemContext.xml to add the defaultTimeout property to the "transactionManager" bean:
<bean id="transactionManager" class="org.springframework.orm.hibernate.HibernateTransactionManager">
  <property name="sessionFactory">
    <ref bean="sessionFactory"/>
  </property>
  <property name="defaultTimeout" value="120"/>
</bean>

The timeout is measured in seconds and will forcibly abort queries that take longer than this. In some cases, these errors are not handled gracefully by Confluence and will result in the user seeing the Confluence error page.

4. Start Confluence.

Once the timeout is working properly in your test environment, migration the configuration change to Confluence.

⚠️ You will need to reapply these changes when upgrading Confluence, as the original databaseSubsystemContext.xml file changes from version to version.

### Improving Database Performance

**Diagnosis**

Use native database tools to assess the impact of your database. If you'd like to check what Confluence is doing from it's side, you can enable sql logging. If you analyze thread dumps, as this is done in general Troubleshooting Confluence Hanging or Crashing guide, you may find the kinds of threads like this:

```
"http-8080-Processor150" daemon prio=1 tid=0x08543368 nid=0x11aa in Object.wait() [0x665a4000..0x665a51b0]
at java.lang.Object.wait(Native Method)
  - waiting on <0x83140488> (a com.mchange.v2.resourcepool.BasicResourcePool)
  - locked <0x83140488> (a com.mchange.v2.resourcepool.BasicResourcePool)
```

These threads are waiting for a database connection. It could be that the database is not performing optimally, or it may just need tuning for allowing more connection threads. Both are discussed below.

**Upgrade your Database and Drivers**

SQL Server 2000, Oracle 9i, and MySQL with 3.1 drivers are among some of the issues with database performance. Ensure you are using updated versions of databases and their drivers.

**Upgrade your hardware**

Atlassian does not offer specific recommendations on hardware for database performance. Use good judgment and native OS and database tools for your assessment.
Confluence 4.3 Documentation

Ensure you have the Latest Database Indices

Confluence has improved database performance over time. You’ll want to make sure you have all the latest, if you’re getting hung threads waiting for db connections.

Confluence 2.10 or Manual .ddl Indices

With 2.10 and later, Confluence includes database indices bundled. Confluence 2.10 automatically creates the necessary database indexes when you upgrade. If you are not on 2.10, you may have run the .ddl manually during the upgrade process. To check, you can look against these.

Additional Indices not Included in 2.10

- One import db index is the lower case page title index. Prior to Confluence 3.0, querying for a page by title and space key can take a long time due to table scans necessary on a lowercase where clause. On most databases it is possible to add a lowercase index on these columns that helps with performance. See Creating a Lowercase Page Title Index for instructions on how to do this. Prior to 2.10, apply lowercase title indexes (all Confluence versions).
- The compound database index for the ATTACHMENTDATA table is described in CONF-13819.
- A composite index on some of the columns in SpacePermissions table is described in CONF-14488.

Tuning the Database Connection Pool

This is described in the knowledge base article Confluence Slows and Times out During Periods of High Load due to DB Connection Pool.

Configure a Database Query Timeout

If a database is getting overloaded, you can prevent it from crashing Confluence by Configuring a Database Query Timeout.

Related Articles

Troubleshooting Database Issues.

Creating a Lowercase Page Title Index

**Diagnosis**

Confluence sometimes has performance problems retrieving pages by title because the query uses the lower() function. For example, the query looks something like this:

```
select * from CONTENT where lower(TITLE) = :title and SPACEID = :spaceid
```

Database profiling might show a query like the following taking a long time to execute (emphasis added):

```
select ... from CONTENT page0_, SPACES space1_
where page0_.CONTENTTYPE='PAGE'
and (lower(space1_.SPACEKEY)= @P0 and page0_.SPACEID=space1_.SPACEID)
and(lower(page0_.TITLE)= @P1)
and(page0_.PREVVER is null )and(page0_.CONTENT_STATUS='current' ))
```

Typically, databases don't use indexes when you use a function in a where clause; they do a table scan instead. This makes the performance of this query not ideal (CONF-11577).

**Generic solution**

On many databases (e.g. Oracle, PostgreSQL, DB2 for z/OS), it is possible to create the index using the normal "create index" syntax, just using the function instead of the column name.
CREATE INDEX CONFTITLE_LOWER ON CONTENT(lower(TITLE));

Sources:
- [http://www.postgresql.org/docs/current/static/sql-createindex.html](http://www.postgresql.org/docs/current/static/sql-createindex.html)
- [http://asktom.oracle.com/tkyte/article1/](http://asktom.oracle.com/tkyte/article1/)

**SQL Server**

On SQL Server, you can add a computed column to the database table and then add an index on this column.

```
ALTER TABLE CONTENT ADD TITLE_LOWER AS lower(TITLE);
CREATE INDEX CONFTITLE_LOWER ON CONTENT(TITLE_LOWER);
```

Sources:

**MySQL**

It is not currently possible to create a lowercase index on MySQL. Confluence 3.0 includes some caching improvements which should alleviate this performance problem on this database.

Source:

**Workaround for MySQL databases, using a case-insensitive collation:**

Please check whether your MySQL database has been set to use case-sensitive or case-insensitive collation. The queries to check whether your database is set to case-insensitive collation are:

```
SHOW FULL COLUMNS FROM CONTENT WHERE FIELD = 'title';
SHOW FULL COLUMNS FROM SPACES WHERE FIELD = 'spacekey';
```

If the `collation_name` is returned as `<encoding>_ci`, the `ci` indicates case-insensitive collation.

If the database has been set to use case-insensitive collation, you can try removing `lower` from the following queries, in your `ContentEntityObject.hbm.xml` file residing in your `<Confluence-Install>`/confluence/WEB-INF/lib/confluence-2.x.x.jar/com/atlassian/confluence/core/:
DB2 for Linux or Windows

DB2 supports indexes on generated columns which are used for queries with a matching predicate. You can implement it like this:

```sql
ALTER TABLE CONTENT ADD COLUMN TITLE_LOWER GENERATED ALWAYS AS (LOWER(TITLE));
CREATE INDEX CONFTITLE_LOWER ON CONTENT(TITLE_LOWER)
```

- CONF-10030: Queries that use 'lower' do not use index because of case sensitivity

Surviving Database Connection Closures

When a database server reboots or a network failure has occurred, all connections in the database connection pool are broken. To overcome this issue, Confluence would normally need restarting (or for Confluence WAR distributions, the application server running Confluence would need restarting).

However, database connections in the database connection pool can be validated by running a simple SQL query. If a broken database connection is detected in the pool, a new one is created to replace it.

To do this, you can specify an optional validation query for your database connection. Depending on whether you are using a direct JDBC URL, or a data source, this is configured differently.

Determining the validation query SQL for your database type

Different database types have slightly different SQL syntax requirements for their validation query. The validation query should be as simple as possible, as this is run every time a connection is retrieved from the pool.

The following validation queries are recommended for the following types of databases:

<table>
<thead>
<tr>
<th>Database Type</th>
<th>Validation Query</th>
</tr>
</thead>
<tbody>
<tr>
<td>MySQL</td>
<td>select 1</td>
</tr>
</tbody>
</table>
Microsoft SQL Server | select 1  
Oracle | select 1 from dual  
PostgreSQL | select 1  

**Enabling validation query using direct JDBC**

**To ensure Confluence validates database connections in the database connection pool:**

1. Shut down Confluence
2. Edit the `confluence.cfg.xml` file at the root of your Confluence Home Directory
3. Add the property "hibernate.c3p0.validate" and set it to "true", and add the property "hibernate.c3p0.preferredTestQuery" and set it to the value of the query you determined above for your database type. See this excerpt of the file with the two added properties for details:

```
<property name="hibernate.c3p0.validate">true</property>
<property name="hibernate.c3p0.preferredTestQuery">select 1</property>
```

4. Save `confluence.cfg.xml`
5. Restart Confluence

**Ensuring validation query using a data source**

**To ensure Confluence validates database connections in the database connection pool:**

1. Shut down Confluence (or the Tomcat installation running Confluence).
2. Edit the `conf/server.xml` file in your Confluence Install Directory, or in the Tomcat installation's CATALINA_HOME directory.
3. Find the Resource element for your data source, and add the "validationQuery" field, with the value of the query you determined above for your database type. See this excerpt of the file with this added for details:
server.xml (excerpt)

```xml
...<Resource name="jdbc/confluence" auth="Container"
type="javax.sql.DataSource"
    username="postgres"
    password="postgres"
    driverClassName="org.postgresql.Driver"
    url="jdbc:postgresql://localhost:5432/yourDatabaseName"
    maxActive="20"
    maxIdle="10"
    validationQuery="select 1" />
...```

4. Save `conf/server.xml`

5. Restart Confluence (or the Tomcat installation running Confluence).

**Results and Considerations**

You should now be able to recover from a complete loss of all connections in the database connection pool without the need to restart Confluence or the application server running Confluence.

⚠️ **Performance Considerations:**

- Setting this option has a performance impact. The overall decrease in performance should be minimal, as the query itself is quick to run. In addition, the query will only execute when you make a connection. Thus, if the connection is kept for the duration of a request, the query will only occur once per request.

- If you are running a large Confluence installation, you may wish to assess the performance impact of this change before implementing it.

**Webserver Configuration**

- [Configuring Web Proxy Support for Confluence](#)
- [Running Confluence behind Apache](#)
  - [General Apache Configuration Notes](#)
  - [Using Apache with mod_proxy](#)
  - [Using Apache with virtual hosts and mod_proxy](#)
  - [Using Apache with mod_jk](#)
  - [Using mod_rewrite to Modify Confluence URLs](#)
  - [Configuring Apache to Cache Static Content via mod_disk_cache](#)

**Configuring Web Proxy Support for Confluence**

Some of Confluence’s macros, such as `{rss}` and `{jiraissues}` need to make web requests to remote servers in order to retrieve data. If Confluence is deployed within a data centre or DMZ, it may not be able to access the Internet directly to make these requests. If you find that the `{rss}` macro does not work, ask your network administrator if Confluence needs to access the Internet through a web proxy.

**Configuring an outbound HTTP proxy in Confluence**

Proxy support is configured by passing certain system properties to the Java Virtual Machine on startup. These properties follow the conventions defined by Oracle:

- `http.proxyHost`
- `http.proxyPort` (default: 80)
- `http.nonProxyHosts` (default: `<none>`)
At a minimum, you need to define `http.proxyHost` to configure an HTTP proxy. System property configuration is described in the [Configuring System Properties](#).

Properties `http.proxyHost` and `http.proxyPort` indicate the proxy server and port that the http protocol handler will use.

```bash
-Dhttp.proxyHost=proxy.example.org -Dhttp.proxyPort=8080
```

Property `http.nonProxyHosts` indicates the hosts which should be connected to directly and not through the proxy server. The value can be a list of hosts, each separated by a pipe character |. In addition, a wildcard character (asterisk) * can be used for matching. For example:

```bash
-Dhttp.nonProxyHosts=*.foo.com|localhost
```

Note: You may need to escape the pipe character | in some command-line environments.

If the `http.nonProxyHosts` property is not configured, all web requests will be sent to the proxy.

Please note that any command line parameters set are visible from the process list, and thus anyone who has the appropriate access to view the process list will see the proxy information in the clear. To avoid this, you can set these properties in the `catalina.properties` file, located in `confluence-install/conf/`. Add this to the end of the file:

```properties
http.proxyHost=yourProxyURL
http.proxyPort=yourProxyPort
http.proxyUser=yourUserName
http.proxyPassword=yourPassword
```

**Configuring HTTP proxy authentication**

Proxy authentication is also configured by providing `system properties` to Java in your application server’s configuration file. Specifically, the following two properties:

- `http.proxyUser` – username
- `http.proxyPassword` – secret

**HTTP proxy (Microsoft ISA) NTLM authentication**

Confluence supports NTLM authentication for outbound HTTP proxies when Confluence is running on a Windows server.

This means that the `{rss}` and `{jiraissues}` macro will be able to contact external websites if requests have to go through a proxy that requires Windows authentication. This support is not related to logging in Confluence users automatically with NTLM, for which there is a [user-contributed authenticator](#) available.

To configure NTLM authentication for your HTTP proxy, you need to define a domain `system property`, `http.auth.ntlm.domain`, in addition to the properties for host, port and username mentioned above:
-Dhttp.auth.ntlm.domain=MYDOMAIN

Configuring authentication order

Sometimes multiple authentication mechanisms are provided by an HTTP proxy. If you have proxy authentication failure messages, you should first check your username and password, then you can check for this problem by examining the HTTP headers in the proxy failure with a packet sniffer on the Confluence server. (Describing this is outside the scope of this document.)

To set the order for multiple authentication methods, you can set the system property http.proxyAuth to a comma-separated list of authentication methods. The available methods are: ntlm, digest and basic; this is also the default order for these methods.

For example, to attempt Basic authentication before NTLM authentication, and avoid Digest authentication entirely, you can set the http.proxyAuth property to this value:

- Dhttp.proxyAuth=basic,ntlm

Troubleshooting

1. There’s a diagnostic jsp file in CONF-9719 for assessing the connection parameters.
2. ‘Status Code [407]‘ errors are described in APR-160.
3. Autoproxies are not supported. See CONF-16941.

Running Confluence behind Apache

This page documents a configuration of Apache, rather than of Confluence itself. Atlassian will support Confluence with this configuration, but we cannot guarantee to help you debug problems with Apache. Please be aware that this material is provided for your information only, and that you use it at your own risk.

Introduction

For improved performance in high-load environments, you should run Confluence behind a web server. In general, web server caching and thread management is far superior to that provided by your application server’s HTTP interface.

To run Confluence behind the Apache httpd web server, there are two main configuration options: mod_jk or mod_proxy.

<table>
<thead>
<tr>
<th>Connection type</th>
<th>Features</th>
</tr>
</thead>
<tbody>
<tr>
<td>mod_proxy (also known as reverse proxy)</td>
<td>• recommended connection method</td>
</tr>
<tr>
<td></td>
<td>• simple HTTP proxy to application server</td>
</tr>
<tr>
<td></td>
<td>• works with all application servers</td>
</tr>
<tr>
<td></td>
<td>• if application paths are consistent, there is minimal load on the web server</td>
</tr>
</tbody>
</table>
mod_jk (also known as AJP) | • uses the AJP binary protocol
• provides failover (and load balancing, which Confluence supports only with a clustered license)
• only works with some application servers (typically Tomcat)
• if application paths are consistent, there is some load on the web server to translate requests to AJP

Features common to both mod_proxy and mod_jk
• application paths must be consistent to avoid complex and slow URL rewriting
• works with name-based virtual hosting, both on web server and app server
• web server keeps a pool of connections to application server

Using mod_proxy
• Using Apache with mod_proxy is the main documentation for this configuration.
• If you want to set up the common configuration of JIRA and Confluence virtual hosts, you can use Apache's virtual hosts with separate application servers.

Using mod_jk
• Using Apache with mod_jk is the main documentation for this configuration.
• You can follow a similar method to the mod_proxy documentation above for setting up virtual hosts in Apache and Tomcat, if required.

Mod_jk2 not supported
The misleadingly-named mod_jk2 is an older method of connecting to Tomcat from Apache. Since mod_jk2 is no longer supported by the Apache Foundation, we do not support this configuration, and are not updating our mod_jk2 documentation. Mod_jk2 also has unresolved problems with Unicode URLs; you need to use either mod_proxy or mod_jk for international characters to work correctly in Confluence.

Caching static content via mod_disk_cache
To improve performance of a large Confluence site, we recommend that you move the caching of static content from the JVM into Apache. This will prevent the JVM from having a number of long running threads serving up static content. See Configuring Apache to Cache Static Content via mod_disk_cache.

Other related documentation
• Configuring Tomcat's URI encoding
• Running Confluence Over SSL or HTTPS

General Apache Configuration Notes

On this page:
• Prefer Apache mod_deflate to Confluence's built-in gzip implementation
• Ensure keepalive is enabled
• Enable keepalive for recent MSIE user agents

Prefer Apache mod_deflate to Confluence's built-in gzip implementation
1. Disable gzip in confluence. See Compressing an HTTP Response within Confluence.
2. Enable gzip compression in Apache. For RedHat distributions this can be achieved by adding the following lines:
Ensure keepalive is enabled

```
KeepAlive On
```

Enable keepalive for recent MSIE user agents

The standard Apache SSL configuration is very conservative when it comes to MSIE and SSL. By default all keepalives are disabled when using HTTPS with MSIE. While MSIE will always be special, the issues with SSL and MSIE have been solved since Service Pack 2 for Windows XP, released over 4 years ago. For anyone using an XP machine SP2 or above, it is safe to allow keepalive for MSIE 6 and above.

Remove the following lines:

```
SetEnvIf User-Agent ".*MSIE.*" \
    nokeepalive ssl-unclean-shutdown \ 
    downgrade-1.0 force-response-1.0
```

Add these in their place:

```
BrowserMatch "MSIE [1-5]" nokeepalive ssl-unclean-shutdown downgrade-1.0 force-response-1.0
BrowserMatch "MSIE [6-9]" ssl-unclean-shutdown
```

RELATED TOPICS

- Running Confluence behind Apache
- Configuring Tomcat's URI encoding
- Running Confluence Over SSL or HTTPS
- Using Apache with mod_proxy

This page describes how to integrate Confluence into an Apache website using mod_proxy.

There are some common situations where you might use the configuration:

- You have an existing Apache-based website, and want to add Confluence to the mix (for example, http://
www.example.com/confluence).

- You have two or more Java applications, each running in their own application server on different ports, for example, http://example:8090/confluence and http://example:8080/jira. By setting up Apache with mod_proxy, you can have both available on the regular HTTP port (80) – for example, at http://www.example.com/confluence and http://www.example.com/jira. This allows each application to be restarted, managed and debugged separately.

**Note:** This page documents a configuration of Apache, rather than of Confluence itself. Atlassian will support Confluence with this configuration, but we cannot guarantee to help you debug problems with Apache. Please be aware that this material is provided for your information only, and that you use it at your own risk.

We describe two options:

- If you want a URL like http://www.example.com/confluence, go to the **simple configuration**.
- If you want a URL like http://confluence.example.com, go to the **complex configuration**.

**Simple configuration**

In these examples, we use the following:

- http://www.example.com/confluence - your intended URL
- http://example:8090 - the hostname and port Confluence is currently installed to
- /confluence - the intended context path (the part after hostname and port)

Please substitute the examples below with your intended URL's in your own server. Copy/pasting these suggestions will not work on your server.

**Set the context path**

Set your Confluence application path (the part after hostname and port). To do this in Tomcat (bundled with Confluence), edit conf/server.xml, locate the "Context" definition:

```
<Context path="" docBase="../confluence" debug="0" reloadable="true">
```

and change it to:

```
<Context path="/confluence" docBase="../confluence" debug="0" reloadable="true">
```

Then restart Confluence, and ensure you can access it at http://example:8090/confluence

**Set the URL for redirection**

Set the URL for redirection. In the same conf/server.xml file, locate this code segment:

```
<Connector port="8090" maxHttpHeaderSize="8192"
        maxThreads="150" minSpareThreads="25" maxSpareThreads="75"
        enableLookups="false" redirectPort="8443" acceptCount="100"
        connectionTimeout="20000" disableUploadTimeout="true" />
```

And append the last line:

```xml
<Connector port="8090" maxHttpHeaderSize="8192"
    maxThreads="150" minSpareThreads="25" maxSpareThreads="75"
    enableLookups="false" redirectPort="8443" acceptCount="100"
    connectionTimeout="20000" disableUploadTimeout="true"
    proxyName="www.example.com" proxyPort="80" />
```

If this isn't working for you, try adding a scheme attribute to your Connector tag: `scheme="https"`.

**Configure mod_proxy**

Now enable mod_proxy in Apache, and proxy requests to the application server by adding the example below to your Apache httpd.conf (note: the files may be different on your system; the [JIRA docs](https://confluence.atlassian.com/doc/enable-mod-proxy-in-apache/) describe the process for Ubuntu/Debian layout):

```xml
# Put this after the other LoadModule directives
LoadModule proxy_module /usr/lib/apache2/modules/mod_proxy.so
LoadModule proxy_http_module /usr/lib/apache2/modules/mod_proxy_http.so

# Put this in the main section of your configuration (or desired virtual host, if using Apache virtual hosts)
ProxyRequests Off
ProxyPreserveHost On

<Proxy *>
   Order deny,allow
   Allow from all
</Proxy>

ProxyPass /confluence http://www.example.com/confluence
ProxyPassReverse /confluence http://www.example.com/confluence
<Location /confluence>
   Order allow,deny
   Allow from all
</Location>
```

**Note to Windows Users**

It is recommended that you specify the absolute path to the `mod_proxy.so` and `mod_proxy_http.so` files.

**Restart your Apache server**

This is needed to pick up on the new configuration. This can be done by running the following on your command line/terminal/shell:

```bash
sudo apachectl graceful
```

**Set the Confluence Base URL**

The last stage is to set the Base URL to the address you're using within the proxy. In this example, it would be `http://www.example.com/confluence`

Complex configuration
Complex configuration involves using the mod_proxy_html filter to modify the proxied content en-route. This is required if the Confluence path differs between Apache and the application server. For example:

<table>
<thead>
<tr>
<th>Externally accessible (Apache) URL</th>
<th><a href="http://confluence.example.com/">http://confluence.example.com/</a></th>
</tr>
</thead>
<tbody>
<tr>
<td>Application server URL</td>
<td><a href="http://app-server.internal.example.com:8090/confluence/">http://app-server.internal.example.com:8090/confluence/</a></td>
</tr>
</tbody>
</table>

Notice that the application path in the URL is different in each. On Apache, the path is /, and on the application server the path is /confluence.

For this configuration, you need to install the mod_proxy_html module, which is not included in the standard Apache distribution. Alternative solutions are discussed below.

```xml
# Put this after the other LoadModule directives
LoadModule proxy_module modules/mod_proxy.so
LoadModule proxy_http_module modules/mod_proxy_http.so
LoadModule proxy_html_module modules/mod_proxy_html.so

<VirtualHost *>
  ServerName confluence.example.com

    # Put this in the main section of your configuration (or desired virtual host, if using Apache virtual hosts)
    ProxyRequests Off
    ProxyPreserveHost On

    <Proxy *>
      Order deny,allow
      Allow from all
    </Proxy>

    ProxyPass / http://app-server.internal.example.com:8090/confluence
    ProxyPassReverse / http://app-server.internal.example.com:8090/confluence

    ProxyHTMLURLMap / /confluence/

  <Location />
    Order allow,deny
    Allow from all
  </Location>

</VirtualHost>
```

The ProxyHTMLURLMap configuration can become more complex if you have multiple applications running under this configuration. The mapping should also be placed in a Location block if the web server URL is a subdirectory and not on a virtual host. The Apache Week tutorial has more information how to do this.

Adding SSL

If you're running Apache in front of Tomcat, it's a good idea to terminate your SSL configuration at Apache, then forward the requests to Tomcat over HTTP. You can set up Apache to terminate the SSL connection and use the ProxyPass and ProxyPassReverse directives to pass the connection through to Tomcat (or the appropriate application server) which is running Confluence.

1. Create a new SSL host by creating a virtual host on 443
2. The standard http connection on apache could be used to redirect to https if you want or it could just be firewalled.
3. Within the VirtualHost definition:
   a. define the SSL options (SSLEngin and SSLCertificateFile)
   b. define the ProxyPass and ProxyPassReverse directives to pass through to Tomcat.

Most of the relevant Apache Config:

```plaintext
Listen 443
NameVirtualHost *:443
<VirtualHost *:443>
   SSLEngine On
   SSLCertificateFile /etc/apache2/ssl/apache.pem
   ProxyPass / http://localhost:8090/
   ProxyPassReverse / http://localhost:8090/
</VirtualHost>
```

Apart from the Apache configuration there is a couple of things you will need to do before you get your server working:

1. You will have to change your base URL to point to https addresses. See the documentation on configuring the server base URL.
2. We need to set up the connector to use https. In your installation directory, edit the file server.xml and add this attributes to your connector:

   ```xml
   proxyName="proxy.example.com" proxyPort="443" scheme="https"
   ```

More information

- The mod_proxy_html site has documentation and examples on the use of this module in the complex configuration.
- Apache Week has a tutorial that deals with a complex situation involving two applications and ProxyHTMLURLMap.
- Using Apache with virtual hosts and mod_proxy shows how to configure the special case where you want JIRA and Confluence running on separate application servers on virtual host subdomains.

Alternatives

If Tomcat is your application server, you have two options:

- use mod_jk to send the requests to Tomcat
- use Tomcat's virtual hosts to make your Confluence application directory the same on the app server and the web server, removing the need for the URL mapping.

If your application server has an AJP connector, you can:

- use mod_jk to send the requests to your application server.

Using Apache with virtual hosts and mod_proxy

**Note:** This page documents a configuration of Apache, rather than of Confluence itself. Atlassian will support Confluence with this configuration, but we cannot guarantee to help you debug problems with Apache. Please be aware that this material is provided for your information only, and that you use it at your own risk.
The Apache web server is often used in front of an application server to improve performance in high-load environments. Mod_proxy simply redirects requests for certain URLs to another web server, so it typically requires no additional configuration on the application server.

This page documents a very common configuration request: configuring JIRA and Confluence on two Apache virtual hosts, running on different application servers. This is just a special case of mod_proxy configuration.

You can use virtual hosts in your application server if you want to run JIRA and Confluence on the same application server. There is a sample configuration for Tomcat you can use after configuring Apache.

**Apache configuration**

For this configuration to work properly, the application paths must be the same on both the application servers and the web server. For both JIRA and Confluence below, this is /.

<table>
<thead>
<tr>
<th>JIRA external URL</th>
<th><a href="http://jira.example.com/">http://jira.example.com/</a></th>
</tr>
</thead>
<tbody>
<tr>
<td>JIRA application server URL</td>
<td><a href="http://jira-app-server.internal.example.com:8080/">http://jira-app-server.internal.example.com:8080/</a></td>
</tr>
<tr>
<td>Confluence external URL</td>
<td><a href="http://confluence.example.com/">http://confluence.example.com/</a></td>
</tr>
<tr>
<td>Confluence application server URL</td>
<td><a href="http://confluence-app-server.internal.example.com:8090/">http://confluence-app-server.internal.example.com:8090/</a></td>
</tr>
</tbody>
</table>

Add the following to your Apache httpd.conf:
Points to note:

- ProxyPass and ProxyPassReverse directives send traffic from the web server to your application server.
- The application path is the same on the application server and on the web server (both are /).
- Because the above configuration uses name-based virtual hosting, you must configure your DNS server to point both names (jira.example.com, confluence.example.com) to your web server.

More information

For different ways to configure mod_proxy, see Using Apache with mod_proxy.

If you use Tomcat, mod_jk provides a different way of connecting Apache via AJP. You can also use the above configuration with just one application server if you use Tomcat's virtual hosts.

Using Apache with mod_jk

Note:

- The preferred configuration is Using Apache with mod_proxy. This works with any application server, and together with mod_proxy_html allows complex URL rewriting to deal with different application paths on
the web server and the application server.

- This page documents a configuration of Apache, rather than of Confluence itself. Atlassian will support Confluence with this configuration, but we cannot guarantee to help you debug problems with Apache. Please be aware that this material is provided for your information only, and that you use it at your own risk.

**Introduction**

The Apache web server is often used in front of an application server to improve performance in high-load environments. Mod_jk allows request forwarding to an application via a protocol called AJP. Configuration of this involves enabling mod_jk in Apache, configuring a AJP connector in your application server, and directing Apache to forward certain paths to the application server via mod_jk.

Mod_jk is sometimes preferred to mod_proxy because AJP is a binary protocol, and because some site administrators are more familiar with it than with mod_proxy.

The scope of this documentation is limited to configuring the AJP connector in Tomcat 5.x. Other application servers may support AJP connectors; please consult your application server documentation for instructions on how to configure it.

The configuration below assumes your Confluence instance is accessible on the same path on the application server and the web server. For example:

<table>
<thead>
<tr>
<th>Externally accessible (web server) URL</th>
<th><a href="http://www.example.com/confluence/">http://www.example.com/confluence/</a></th>
</tr>
</thead>
<tbody>
<tr>
<td>Application server URL (HTTP)</td>
<td><a href="http://app-server.internal.example.com:8090/confluence/">http://app-server.internal.example.com:8090/confluence/</a></td>
</tr>
</tbody>
</table>

The AJP connection of the application server is set to: app-server.internal.example.com:8009.

**Configuring mod_jk in Apache**

The standard distribution of Apache does not include mod_jk. You need to download it from the [JK homepage](https://httpd.apache.org/docs/2.4/mod/mod_jk.html) and put the mod_jk.so file in your Apache modules directory.

Next, add the following in `httpd.conf` directly or included from another file:

```sh
# Put this after the other LoadModule directives
LoadModule jk_module modules/mod_jk.so

# Put this in the main section of your configuration (or desired virtual host, if using Apache virtual hosts)
JkWorkersFile conf/workers.properties
JkLogLevel info

# JkMount /confluence worker1
# JkMount /confluence/* worker1
```

**Configuring workers.properties**

Create a new file called 'workers.properties', and put it in your Apache conf directory. (The path for workers.properties was one of the configuration settings above.)
worker.list=worker1
worker.worker1.host=app-server.internal.example.com
worker.worker1.port=8009
worker.worker1.type=ajp13

Tomcat 5.x configuration

In Tomcat 5, the AJP connector is enabled by default on port 8009. An absolutely minimal Tomcat server.xml is below for comparison. The relevant line is the Connector with port 8009 – make sure this is uncommented in your server.xml.

```xml
<Server port="8000" shutdown="SHUTDOWN">
  <Service name="Catalina">
    <!-- Define a HTTP/1.1 Connector on port 8090 -->
    <Connector port="8090" />
    <!-- Define an AJP 1.3 Connector on port 8009 -->
    <Connector port="8009" protocol="AJP/1.3" />
    <Engine name="Catalina" defaultHost="localhost">
      <Host name="localhost" appBase="webapps">
        <Context path="/confluence" docBase="/opt/webapps/confluence-2.2/confluence"/>
        <Logger className="org.apache.catalina.logger.FileLogger"/>
      </Host>
    </Engine>
  </Service>
</Server>
```

Points to note:

- the Connector on port 8009 has protocol of "AJP/1.3". This is critical.
- the Context path of the Confluence application is "/confluence". This must match the path used to access Confluence on the web server.
- we recommend keeping your application Contexts outside the server.xml in Tomcat 5.x. The above example includes them for demonstration only.

Improving the performance of the mod_jk connector

The most important setting in high-load environments is the number of processor threads used by the Tomcat AJP connector. By default, this is 200, but you should increase it to match Apache's maxThreads setting (256 by default):

```xml
<Connector port="8009" minSpareThreads="5" maxThreads="256" protocol="AJP/1.3" />
```

All the configuration parameters for the AJP connector are covered in the Tomcat documentation.

Ensuring UTF-8 compatibility

If you have problems downloading attachments with non-ASCII characters in the filename, add the following to your Apache configuration:
And specify UTF-8 as the URIEncoding in the AJP connector configuration:

```xml
<Connector port="8009" protocol="AJP/1.3" URIEncoding="UTF-8" />
```

These settings are discussed further on [Configuring Tomcat's URI encoding](#).

### Configuring Tomcat's URI encoding

The [Tomcat JK website](http://tomcat.apache.org/) has complete documentation on workers.properties and Apache configuration. You can also find information there on how to use mod_jk with IIS.

### Using mod_rewrite to Modify Confluence URLs

**Note**: This page documents a configuration of Apache, rather than of Confluence itself. Atlassian will support Confluence with this configuration, but we cannot guarantee to help you debug problems with Apache. Please be aware that this material is provided for your information only, and that you use it at your own risk.

Confluence requires URL rewriting for proper functionality, if Confluence is accessible via different domain names. If Confluence is configured for multiple domains without URL rewriting, you will experience an array of problems. See [Various Issues Caused when Server Base URL Does Not Match the URL Used to Access Confluence](#).

An example of why you may want to access Confluence from different domains:

- From an internal network:
  
  http://wiki

- The externally visible domain:
  
  http://wiki.domain.com

### Using URL rewriting to access Confluence over multiple domains

**To configure Confluence over multiple domains:**

1. Add a DNS entry mapping [http://wiki](http://wiki) to the externally visible IP address of the Confluence server.
2. Set Confluence’s [server base URL](http://wiki.domain.com).
3. Add Apache HTTP proxy, using the instructions from [Running Confluence behind Apache](#).
4. Add the mod_rewrite module to change the URL.

### Configuring Apache to Cache Static Content via mod_disk_cache

To improve performance of a large Confluence site, we recommend that you move the caching of static content from the JVM into Apache. This will prevent the JVM from having a number of long running threads serving up static content.

Static content in Confluence includes most JavaScript, CSS and image files which are included with the application or an installed plugin. This content will be cached by Apache in this configuration. User-provided content like space logos, attachments or embedded images are not considered static content and will not be
configured.

**Note:** This page documents a configuration of Apache, rather than of Confluence itself. Atlassian will support Confluence with this configuration, but we cannot guarantee to help you debug problems with Apache. Please be aware that this material is provided for your information only, and that you use it at your own risk.

### Configuring Apache mod_disk_cache

**To configure Apache to cache static Confluence content:**

1. **Add a mod_disk_cache stanza to the virtual host configuration:**

   ```
   <IfModule mod_disk_cache.c>
     # "s" is where Confluence serves "static" stuff. Instruct Apache
to cache it:
     CacheEnable disk /s
     CacheIgnoreHeaders Set-Cookie
     CacheRoot "/var/cache/mod_proxy"
   </IfModule>
   ```

2. **Configure Apache to load mod_disk_cache.** For example, in our server configuration this is done in `/etc/httpd/conf/httpd.conf`:

   ```
   LoadModule disk_cache_module modules/mod_disk_cache.so
   ```

3. **Restart Apache after both modifications are complete.**

### Notes

- Please refer to the Apache documentation for [mod_disk_cache](http://httpd.apache.org/docs/2.4/mod/mod_disk_cache.html).
- If you encounter problems where users are served stale content, you may need to purge the Apache cache directory (`/var/cache/mod_proxy` in the above configuration) after a Confluence or plugin upgrade. This is a simple 3 step process:
  - Shut down Apache.
  - Clear the cache directory. For example: `sudo rm -r /var/cache/mod_proxy/*`
  - Restart Apache.
- Ensure that you are running the `htcacheclean` daemon in order to prevent excessive use of disk space. In our situation we ran it like this:

  ```
  sudo htcacheclean -d30 -n -t -p /var/cache/mod_proxy -l 512M
  ```

  This will purge content once the cache reaches 512M every 30 minutes. See the Apache documentation for [htcacheclean](http://httpd.apache.org/docs/2.4/htcacheclean.html) for details of the options.

### Starting Confluence Automatically on System Startup

You can configure Confluence to start automatically on system startup, allowing it to recover automatically after a reboot.

---

No content found for label(s) auto-startup.

**Start Confluence Automatically on Linux**
On Linux/Solaris, the best practice is to install, configure and run each service (including Confluence) as a dedicated user with only the permissions they require.

To install, configure and run Confluence automatically on Linux/Solaris:

1. Create a `confluence` user for instance, using the following command:

   ```bash
   sudo useradd --create-home -c "Confluence role account" confluence
   ```

2. Create a directory to install Confluence into:

   ```bash
   sudo mkdir /usr/local/confluence
   sudo chown confluence: /usr/local/confluence
   ```

3. Log in as the `confluence` user to install Confluence:

   ```bash
   sudo su - confluence
   cd /usr/local/confluence/
   tar zxvf /tmp/confluence-3.0.1-std.tar.gz
   ln -s confluence-3.0.1-std/ current
   ```

4. Edit `<<CONFLUENCE_INSTALL_DIRECTORY>>/confluence/WEB-INF/classes/confluence-init.properties` file, and set `confluence.home=/usr/local/confluence/<Confluence_Data_Home>` (ensure you have removed the comment `#`)

5. Then back as root, create the file `/etc/init.d/confluence` (code shown below), which will be responsible for starting up Confluence after a reboot (or when manually invoked).

   ```bash
   #!/bin/sh
   # Confluence Init Script
   # $Id$
   # $Log$
   # This script is responsible for starting up the Confluence server.
   # In the future, you can disable Confluence by removing this file.

   confluence_home=/usr/local/confluence
   confluence_base_dir=$confluence_home/confluence
   confluence_classpath=confluence_home/WEB-INF/lib
   confluence_jar=confluence_home/WEB-INF/confluence.jar
   confluence_logdir=$confluence_home/logs

   # Start Confluence
   start() {
     if test -x $confluence_classpath/$confluence_jar; then
       java -Dconfluence_home=$confluence_home -Dconfluence_base_dir=$confluence_base_dir -Dconfluence_classpath=$confluence_classpath -Dconfluence_jar=$confluence_jar -Dconfluence_logdir=$confluence_logdir -Dconfluence_startfile=confluence-config.xml -jar $confluence_base_dir/confluence.jar
     fi
   }

   # Stop Confluence
   stop() {
     if ! confluence.base_dir=$confluence_home; then
       echo "Confluence is not running" 1>&2
       return
     fi

     echo "Stopping Confluence" 1>&2
     kill -INT confluence.base_dir/confluence.pid
     while ! test -e confluence.base_dir/confluence.pid; do
       sleep 1
     done
   }

   # Reload Confluence
   reload() {
     stop
     start
   }

   case "$1" in
     start)
       start
       start
     ;; stop)
       stop
       stop
     ;; reload)
       reload
       reload
     ;; *)
       echo "usage: confluence-init.sh start|stop|reload"
          exit 1
     esac

   # The following enables the script to be executed from anywhere
   # (the next line can be removed when you are satisfied)
   # chown root root init.d/confluence
   # chmod 755 init.d/confluence
   ```

   If you are running Ubuntu Jaunty (or later) do not perform this step. Please use the instructions further down this page.
#!/bin/sh -e
# Confluence startup script
#chkconfig: 2345 80 05
#description: Confluence

# Define some variables
# Name of app ( JIRA, Confluence, etc )
APP=confluence
# Name of the user to run as
USER=confluence
# Location of application's bin directory
CATALINA_HOME=/usr/local/confluence/current
# Location of Java JDK
export JAVA_HOME=/usr/lib/jvm/java-6-sun

case "$1" in
  # Start command
  start)
    echo "Starting $APP"
    /bin/su -m $USER -c "$CATALINA_HOME/bin/startup.sh &> /dev/null"
    ;;
  # Stop command
  stop)
    echo "Stopping $APP"
    /bin/su -m $USER -c "$CATALINA_HOME/bin/shutdown.sh &> /dev/null"
    echo "$APP stopped successfully"
    ;;
  # Restart command
  restart)
    $0 stop
    sleep 5
    $0 start
    ;;
  *)
    echo "Usage: /etc/init.d/$APP (start|restart|stop)"
    exit 1
    ;;
  esac

exit 0

6. Make this file executable:

    sudo chmod +x /etc/init.d/confluence

7. Set this file to run at the appropriate runlevel. For example, use sudo chkconfig --add confluence on Redhat-based systems, sudo update-rc.d confluence defaults or rcconf on Debian-based systems.

8. You should now be able to start Confluence with the init script. A successful startup output typically looks like this:
$ sudo /etc/init.d/confluence start
Starting Confluence:
If you encounter issues starting up Confluence, please see the Installation guide at http://confluence.atlassian.com/display/DOC/Confluence+Installation+Guide
Using CATALINA_BASE: /usr/local/confluence/current
Using CATALINA_HOME: /usr/local/confluence/current
Using CATALINA_TMPDIR: /usr/local/confluence/current/temp
Using JRE_HOME: /usr/lib/jvm/java-1.5.0-sun
done.

You should then see this running at http://<server>:8090/
The port for this will be whatever is defined in your Confluence server.xml file.

Adding Confluence as a service for Ubuntu Jaunty (or later)

To continue configuring Confluence to start automatically as a service on Ubuntu Jaunty (or later):

1. After logging in as the confluence user to install Confluence, create start and stop scripts in /usr/local/confluence:

Example start script:

```bash
#!/bin/bash
export JAVA_HOME=/usr/lib/jvm/java-6-sun-1.6.0.16/
export JDK_HOME=/usr/lib/jvm/java-6-sun-1.6.0.16/
cd /usr/local/confluence/current/bin
./startup.sh
```

Example stop script:

```bash
#!/bin/bash
export JAVA_HOME=/usr/lib/jvm/java-6-sun-1.6.0.16/
export JDK_HOME=/usr/lib/jvm/java-6-sun-1.6.0.16/
cd /usr/local/confluence/current/bin
./shutdown.sh
```

2. Make both of these scripts executable. For example, by issuing the command: sudo chmod a+x /usr/local/confluence/start /usr/local/confluence/stop.

3. Karmic and later: Create two text files in /etc/init/ called confluence-up.conf and confluence-down.conf:

```bash
confluence-up:
```

```bash
confluence-down:
```
start on runlevel [2345]

script

date >> /tmp/confluence-startup.out
exec sudo -u confluence /usr/local/confluence/start >>
/tmp/confluence-startup.out 2>&1

end script

confluence-down:

start on runlevel [16]

expect fork
responder

exec sudo -u confluence /usr/local/confluence/stop >>
/tmp/confluence-shutdown.out 2>&1

... and make them readable to all users:
sudo chmod a+r /etc/init/confluence-up.conf /etc/init/confluence-down.conf

1. Jaunty, Intrepid: Create two text files in /etc/event.d/ called confluence-up and confluence-down:

   confluence-up:

   start on runlevel 2
   start on runlevel 3
   start on runlevel 4
   start on runlevel 5

   exec sudo -u confluence /usr/local/confluence/start >>
   /tmp/confluence-startup.out 2>&1

   confluence-down:
start on runlevel 1
start on runlevel 6

exec sudo -u confluence /usr/local/confluence/stop >>
/tmp/confluence-shutdown.out 2>&1

... and make them readable to all users:
sudo chmod a+r /etc/event.d/confluence-up /etc/event.d/confluence-down

RELATED TOPICS

Starting Confluence Automatically on System Startup

Start Confluence Automatically on Windows as a Service

For long-term use, we recommend that you configure Confluence to start automatically when the operating system restarts. For Windows servers, this means configuring Confluence to run as a Windows service.

There are two ways to install the Confluence distribution as a service: using the Confluence installer or manually as described below.

On this page:

- Reasons for Starting Confluence as a Service
- Changing the User Running the Service
- Manually Installing the Confluence Distribution as a Service
- Managing Confluence as a Service
- Upgrading Confluence
- Troubleshooting Confluence while Running as a Windows Service
- Requesting Support

⚠️ Problem with 64-bit Windows

If you are running 64-bit Windows, please note that Apache Tomcat cannot run as a Windows service if you are using a 64-bit JDK. Please ensure that you are using a 32-bit JDK. Refer to our knowledge base article for more information.

Reasons for Starting Confluence as a Service

Installation as a Windows service offers these advantages:

- Reduced risk of shutting down Confluence by accident (If you start Confluence manually, a console window opens and there is a risk of someone accidentally shutting down Confluence by closing the window).
- Automated Confluence recovery after server restart.
- Improved troubleshooting through logging server output to file.

You can read more about Windows services in the Microsoft Developer Network.

Changing the User Running the Service

If you wish to run the service as a non-administrator user for security, or if you are using network drives for backups, attachments or indexes, you can run the service as another user. To change users, open the Apache
Tomcat Confluence properties, go to the 'Log On' tab and enter the required username and password. Go to your Windows Control Panel -> User Accounts and confirm that the user has write permissions for the %CATALINA_HOME%, index and database directories. Note that any network drives must be specified by UNC and not letter mappings (eg. \\backupserver\confluence not z:\confluence).

For more detail, see Creating a Dedicated User Account on the Operating System to Run Confluence.

**Manually Installing the Confluence Distribution as a Service**

From your Windows-based server:

1. Open a command prompt in the `<CONFLUENCE-INSTALL>/bin` directory.
2. Confirm that the JAVA_HOME variable is set to the JDK base directory with the command:
   
   ```
   echo %JAVA_HOME%
   ```
   
   Note that any directory in the path with spaces (eg. C:\Program Files must be converted to its eight-character equivalent (e.g. C:\Progra~1).

3. If you are installing Confluence on a Windows 2008 server, be sure to run the command prompt using 'run as administrator'. (Otherwise running 'service.bat', as described in the next step, will fail.)
4. Use the following command to install the service with default settings:
   
   ```
   service.bat install Confluence
   ```

5. Now, to have the service start automatically when the server starts, run:
   
   ```
   tomcat6 //US//Confluence --Startup auto
   ```

6. If you have a less than a 512 megabytes of memory, skip this step. For users with large Confluence installations, you can increase the maximum memory Confluence can use. (The default is 256MB). For example, you can set the maximum memory to 512 megs using:
   
   ```
   tomcat6 //US//Confluence --JvmMx 512
   ```

7. If you do not have any JVM parameters that you pass to your distribution of Confluence, you can skip this step. If you do, add them to the service using:
   
   ```
   tomcat6 //US//Confluence ++JvmOptions="-Djust.an.example=True"
   ```

8. For further configuration options, please refer to the Tomcat Windows Service How-To guide
9. Go to your Windows Control Panel -> Administrative Tools -> Services -> Apache Tomcat Confluence and right-click on Properties to verify the settings are correct.

Confluence is now installed as a service, but will not automatically start up until the next server reboot

10. Start the Confluence service with the command:
Managing Confluence as a Service

You can manage the Confluence service from the command prompt.

- Stop Confluence with:
  ```
  net stop Confluence
  ```

- Uninstall the Confluence service with:
  ```
  service.bat remove Confluence
  ```

Upgrading Confluence

After upgrading Confluence, you can either uninstall and reinstall the Windows service or change the StartPath parameter to your new folder. Refer to the Tomcat documentation for help.

Troubleshooting Confluence while Running as a Windows Service

- Check the Knowledge Base articles:
  No content found for label(s) windows_service.

- If none of the above solves your problem, please refer to the complete list of known issues in our Knowledge Base.

- When investigating memory issues or bugs, it may be useful to view information from Confluence's garbage collection. To turn on the verbose garbage collection, use the command:
  ```
  tomcat6 //US//Confluence
  ++JvmOptions="-Xloggc:<CONFLUENCE-INSTALL>\logs\atlassian-gc.log"
  ```

- The Confluence 2.9 installer does not work when installed as service, due to a missing semi-colon in service.bat. Please refer to reported issue CONF-12785.

- You can use a Sysinternals tool called Procmon.exe from the The Microsoft Windows Sysinternals Team, to check that the error occurred at the specific time when the Confluence service started. You need to match the time when Tomcat failed, as captured by this tool, against the time in the Windows Event Viewer.

⚠️ **Note**

We do not recommend that you run this tool for too long as it may disrupt other Atlassian applications. Once you have captured the required information you will need to press Ctrl + E to stop capturing.
**Requesting Support**

If, after following the troubleshooting guide above, you still cannot make Confluence run as a Windows Service or if there is an error when setting the JVM configuration for the service, you can create a support request.

Please provide the following information when creating your support request, because we will need it to assist you:

- Are you running a 32 bit or 64 bit Windows?
- Give us the result of running `java -version` from Windows command line console.
- A screen shot of your Windows Registry setting for Tomcat.
- If you have modified `service.bat`, please give us a copy of this file for review.
- What application server are you using? eg. Are you using the Confluence distribution?

**RELATED TOPICS**

Starting Confluence Automatically on System Startup  
How to Fix Out of Memory Errors by Increasing Available Memory

**Configuring a Large Confluence Installation**

Deploying any application to several thousand users requires care and planning, especially if those users are going to be relying on the application to get their work done.

⚠️ The information on this page does not apply to Confluence OnDemand.

**General Advice**

**Staged Rollout**

Do not try to deploy Confluence immediately to your whole organisation. Instead, roll it out department by department, or project by project.

How Confluence will scale given a particular software and hardware configuration depends very much on how Confluence is likely to be used in your organisation. Launching Confluence to everybody at once may seem like a neat idea, but it also means that any problems you might experience scaling the system up to your entire organisation will hit you all at once, annoy everyone and possibly hurt adoption.

Rolling Confluence out gradually will give you the chance to tune it as you go, resulting in a much more painless experience. There will also be organisational advantages: you can identify those teams or projects who are most likely to be successful 'early adopters', and those teams can experiment with how best a wiki might suit your organisation, and pass on their 'best wiki practices' as usage of Confluence expands.

**Plugin Governance**

Confluence plugins can add tremendous value. Before adding one, visit the plugin's page and explore its issues (available from the issue management link). Try the plugin in a test environment and make sure to note any adverse effects after adding it to a production environment. Test plugins independently when upgrading.

**Backup strategy**

Disable the XML backup and use the Production Backup Strategy.

**New Spaces Governance**

For both performance and good practice, put some modest governance in place around the creation of new spaces, such as a simple request that includes a check for duplicates and some strategy around how to best use
a space. Duplicates and unused spaces should be purged by a wiki gardener. Try to keep it to one space per group.

**Choosing User Management and Single Sign-On**

We recommend that you choose and configure your user management solution as soon as possible, rather than adding it to your Confluence installation at a later date.

It is possible to integrate with an LDAP repository, such as Microsoft Active Directory, or add a single sign-on solution later (especially with the addition of Crowd). But if possible it is best to configure your user management system up front. You can configure access for only a specific group or set of groups, thereby keeping the gradual rollout.

Please refer to our detailed guide to Configuring User Directories and examine the User Management Limitations and Recommendations.

**Configuring your Application Server, Web Server and Database**

Because Confluence can be deployed in so many server combinations, we do not currently have guides on the best tuning parameters for each individual server. We will be happy to provide support, however. If you have any tuning parameters that you find particularly useful for Confluence instances, feel free to share them with other Confluence users in the Confluence Community space.

**Best Practices**

**Troubleshooting possible memory leaks**

The Troubleshooting Confluence Hanging or Crashing guide is a good place to start. Some of the known causes listed there could result in performance issues short of a crash or hang. Many of the issues reported there are exacerbated with a large installation.

**Memory Usage**

The Java virtual machine is configured with a "maximum heap size" that limits the amount of memory it will consume. If Confluence fills up this maximum heap size it will run out of memory, and start behaving unpredictably. You can keep track of Confluence's memory usage from the System Information screen of the administration console:

<table>
<thead>
<tr>
<th>Java VM Memory Statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Memory</td>
</tr>
<tr>
<td>Free Memory</td>
</tr>
<tr>
<td>Used Memory</td>
</tr>
<tr>
<td>Memory Graph</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

This example shows that, at the time of writing, confluence.atlassian.com is using 173MB of an allocated 313MB of heap. (The JVM was configured with a maximum heap size of 450MB, but this information is not available in the graph. The 313MB figure shows that the full 450MB of heap has not yet been needed)

**Database Connection Pool**

Confluence will need a database connection for each simultaneous user connection to the server. It is also a good idea to have 5-10 connections spare for Confluence internal processes such as backups, re-indexing or daily notification jobs.

Running out of pooled connections will cause the server to slow down as more users are waiting for a connection to be freed before starting their own request, and will eventually cause visible system errors as Confluence times out waiting for a database connection.
If you are using Confluence's internal connection pool, you can increase the number of available connections by modifying the `hibernate.c3p0.max_size` property in `{confluence_home}/confluence-cfg.xml`, and restarting Confluence. **Make sure** you have also configured your database to be able to support that many simultaneous connections.

**Cache Sizes**

The [Performance Tuning](#) page includes some useful rules of thumb for configuring the sizes of Confluence's internal caches.

To improve performance of a large Confluence site, we recommend that you move the caching of static content from the JVM into Apache. This will prevent the JVM from having a number of long running threads serving up static content. See [Configuring Apache to Cache Static Content via mod_disk_cache](#).

- Confluence Administrator's Guide
- Configuring Confluence

**Configuring Logging**

We recommend that you configure Confluence's logging to your own requirements. You can change the log settings in two ways:

- Configure logging in Confluence Administration – Your changes will be in effect only until you next restart Confluence.
- Edit the properties file – Your changes will take effect next time you start Confluence, and for all subsequent sessions.

Both methods are described below. In some rare circumstances you may also need to configure Configuring Logging.

**Terminology:** In log4j, a 'logger' is a named entity. Logger names are case-sensitive and they follow a hierarchical naming standard. For example, the logger named `com.foo` is a parent of the logger named `com.foo.Bar`.

⚠️ *The information on this page does not apply to Confluence OnDemand.*

**Configure logging in Confluence Administration**

You can change some of Confluence's logging behaviour via the Administration Console while Confluence is running. Any changes made in this way will apply only to the currently-running Confluence lifetime. The changes are not written to the `log4j.properties` file and are therefore discarded when you next stop Confluence.

Not all logging behaviour can be changed via the Administration Console. For logging configuration not mentioned below, you will need to stop Confluence and then edit the logging properties file instead.

The 'Logging and Profiling' screen shows a list of all currently defined loggers. On this screen you can:

- Turn page profiling on or off.
- Turn detailed SQL logging on or off.
- Add a new logger for a class/package name.
- Remove a logger for a class/package name.
- Set the logging level (INFO, WARN, FATAL, ERROR or DEBUG) for each class or package name.
- Reset all logging levels to a predefined profile.

### Changing the logging configuration

1. Choose **Browse > Confluence Admin**.
2. Select 'Logging and Profiling' in the 'Administration' section of the left-hand panel.
   - You need to have **System Administrator** permissions in order to perform this function.
3. The 'Logging and Profiling' screen appears, as shown below. Use the following guidelines to change the logging behaviour while Confluence is running:
   - 'Performance Profiling' — See [Page Request Profiling](#).
   - 'SQL Logging' — Click the 'Enable SQL Logging' button to log the details of SQL requests made to the database.
     - If you need to enable logging of SQL parameter values, you will need to change the setting in the properties file. This option is not available via the Administration Console.
   - 'Log4j Logging' — Click one of the profile buttons to reset all your loggers to the predefined profiles:
     - The 'Production' profile is a fairly standard profile, recommended for normal production conditions.
     - The 'Diagnostic' profile gives more information, useful for troubleshooting and debugging. It results in slower performance and fills the log files more quickly.
   - 'Add New Entry' — Type a class or package name into the text box and click the 'Add Entry' button. The new logger will appear in the list of 'Existing Levels' in the lower part of the screen.
   - 'Existing Levels' - These are the loggers currently in action for your Confluence instance.
     - You can change the logging level by selecting a value from the 'New Level' dropdown list. Read the Apache documentation for a definition of each level.
     - Click the 'Remove' link to stop logging for the selected class/package name.
4. Click the 'Save' button to save any changes you have made in the 'Existing Levels' section.

</tbody>
</table>

Save
To configure the logging levels and other settings on a permanent basis, you need to stop Confluence and then change the settings in the `log4j.properties` file, described above.

The properties file contains a number of entries for different loggers that can be uncommented if you are interested in logging from particular components. Read more in the Apache log4j documentation.

See Working with Confluence Logs for some guidelines on specific configuration options you may find useful.

Configuring Levels for java.util.logging in `logging.properties`

A few libraries used by Confluence use java.util.logging rather than log4j or slf4j. These libraries include:

- com.sun.jersey
- org.apache.shindig
- net.sf.ehcache

Confluence’s `logging.properties` file is set to redirect java.util.logging at specific levels to log4j via slf4j.

To increase logging levels for these libraries you must first configure the `logging.properties` file in `<CONFLUENCE-INSTALL>/confluence/WEB-INF/classes/`. The logging levels are different from log4j and are listed here.

For example, to increase logging for shindig change the following line in the `logging.properties` file:

```
org.apache.shindig.level = INFO
```

to

```
org.apache.shindig.level = FINE
```

And then use one of the methods above as well to configure the log4j level.

Troubleshooting SQL Exceptions

If you get an exception similar to those shown below, it is a good idea to increase the logging levels of your Confluence instance. If you request Atlassian support, this additional logging will help us work out the cause of the error.

Increased logging levels will enable us to diagnose errors like these:

```
org.springframework.dao.DataIntegrityViolationException: (HibernateTemplate): data integrity violated by SQL ''; nested exception is java.sql.BatchUpdateException: Duplicate entry '1234' for key 1
at org.springframework.jdbc.support.SQLStateSQLExceptionTranslator.translate(SQLStateSQLExceptionTranslator.java:88)
caused by: java.sql.BatchUpdateException: Duplicate entry '1234' for key 1
```

or

```
org.springframework.dao.DataIntegrityViolationException: (HibernateTemplate): data integrity violated by SQL ''; nested exception is java.sql.BatchUpdateException: Duplicate entry '1234' for key 1
at org.springframework.jdbc.support.SQLStateSQLExceptionTranslator.translate(SQLStateSQLExceptionTranslator.java:88)
caused by: java.sql.BatchUpdateException: Duplicate entry '1234' for key 1
```
Confluence 4.3 Documentation

(HibernateTemplate): data integrity violated by SQL ''; nested exception is java.sql.BatchUpdateException: ORA-00001: unique constraint (CONFLUENCE.SYS_C0012345) violated

This document outlines the steps to take to increasing logging on your system.

### Changing the logging levels via the Administration Console

With Confluence 2.7 and later, you can adjust logging levels at runtime via the Administration Console — read the [instructions](#). Below we tell you how to edit the log4j files directly.

1. Open `confluence/WEB-INF/classes/log4j.properties` and uncomment the following lines. The double `##` lines are comments, leave them intact.

   ```properties
   ## log hibernate prepared statements/SQL queries (equivalent to setting 'hibernate.show_sql' to 'true')
   #log4j.logger.net.sf.hibernate.SQL=DEBUG
   ## log hibernate prepared statement parameter values
   #log4j.logger.net.sf.hibernate.type=DEBUG
   ```

   If you can not locate these lines in your log4j.properties file, please add them to the end of it.

2. Restart Confluence.
3. Redo the steps that led to the error.
4. Zip up your logs directory and attach it your support ticket.
5. If you are using Oracle and received a [constraint error](#), please ask your database administrator which table and column the constraint (that is, CONFLUENCE.SYS_C0012345) refers to and add that information to your support ticket.
6. Open `confluence/WEB-INF/classes/log4j.properties` again and remove the 4 lines you added in step 1. (The additional logging will impact performance and should be disabled once you have completed this procedure.)

### Registering External Gadgets

You can register gadgets from external web sites (such as [JIRA](#), [iGoogle](#) or [Gmail](#)) with your Confluence installation, so that the gadgets appear in the [macro browser](#) and people can add them to Confluence pages via a [gadget macro](#).

Choose one of the following ways to register the external gadgets on Confluence:

- **Subscribe to all of the external application’s gadgets**: You can add all the gadgets from your JIRA, Bamboo, FishEye or Crucible site – or from another Confluence site – to your Confluence gadget directory. People can then pick and choose the gadgets to add to their Confluence pages.
- **Register the external gadgets one by one**: If you cannot subscribe to an application’s gadgets, you will need to add the gadgets one by one. This is necessary for applications and websites that do not support gadget subscription, and for applications where you cannot establish a trusted relationship via Application Links.
Both methods are described below. First, consider whether you need to set up a trust relationship between Confluence and the other application.

**Setting up a trust relationship with the other application**

In addition to registering the external gadgets, we recommend that you set up an OAuth or Trusted Application relationship between the application that serves the gadget (the service provider) and Confluence (the consumer). The trust relationship is required for gadgets that access restricted data from the external web application.

See how to configure [OAuth](#) or [Trusted Applications Authentication](#), using Application Links.

If the external web application provides anonymous access to all the data you need in the gadgets, then you do not need a trust relationship.

For example, if your gadgets will retrieve data from [JIRA](#) and your JIRA server includes projects and issues that are restricted to logged-in users, then you will need a trust relationship between Confluence and JIRA. If you do not set up the trust relationship, then the gadgets will show only the information that JIRA makes visible to anonymous users.

**Subscribing to all of the application's gadgets**

You can add all the gadgets from your [JIRA](#), [Bamboo](#), [FishEye](#) or [Crucible](#) site – or from another Confluence site – to your Confluence gadget directory. People can then pick and choose the gadgets to add to their Confluence pages.

**To subscribe to another site’s gadgets:**

1. Choose **Browse** > **Confluence Admin**.
2. Click **External Gadgets** in the left-hand panel.
3. Click the **Gadget Feeds** tab.
4. Enter the base URL of the application you want to subscribe to, in the text box labelled **Gadget Feed URL**. For example, `http://example.com/jira` or `http://example.com/confluence`.
5. Click **Add**. Confluence will convert the URL to a gadget feed and place it in the list of ‘Added Gadget Feeds’.

---

On this page:

- Setting up a trust relationship with the other application
- Subscribing to all of the application's gadgets
- Registering individual gadgets

⚠️ *The information on this page does not apply to Confluence OnDemand.*

---

**Screenshot 1: Subscribing to a gadget feed**
Registering individual gadgets

If you cannot subscribe to an application's gadgets, you will need to register the gadgets one by one. This is necessary for applications and websites that do not support gadget subscription, and for applications where you cannot establish a trusted relationship via Application Links.

First you will need to obtain that gadget's URL and copy it to your clipboard.

Getting a gadget's URL from an Atlassian application

If your web application is another Atlassian application such as Confluence or JIRA:

A gadget's URL points to the gadget's XML specification file. In general, a gadget's URL looks something like this:

```
http://example.com/my-gadget-location/my-gadget.xml
```

If the gadget is supplied by a plugin, the URL will have this format:

http://my-app.my-server.com:port/rest/gadgets/1.0/g/my-plugin.key:my-gadget/my-path/my-gadget.xml

For example:

http://mycompany.com/jira/rest/gadgets/1.0/g/com.atlassian.streams.streams-jira-plugin:activitystream-gadget/gadgets/activitystream-gadget.xml

To find a gadget's URL in JIRA:

- Go to your dashboard by clicking the Dashboards link at the top left of the screen.
- Click Add Gadget to see the list of gadgets in the directory.
- Find the gadget you want, using one or more of the following tools:
  - Use the scroll bar on the right to move up and down the list of gadgets.
  - Select a category in the left-hand panel to display only gadgets in that category.
  - Start typing a key word for your gadget in the Search textbox. The list of gadgets will change as you type, showing only gadgets that match your search term.
  - Right-click the Gadget URL link for that gadget and copy the gadget's URL into your clipboard.

To find a gadget's URL in Confluence:

- Choose Browse > Confluence Gadgets to see the list of available Confluence gadgets.
- Find the gadget you want.
- Right-click the Gadget URL link for that gadget and copy the gadget's URL into your clipboard.
Getting a gadget's URL from another application

If the gadget comes from a non-Atlassian web application or web site, please consult the relevant documentation for that application to obtain the gadget's URL.

Registering the gadget for use in Confluence

Now that you have the gadget's URL, you can register it in Confluence, so that people can add it to their pages.

To register the gadget in Confluence:

1. Choose **Browse > Confluence Admin**.
2. Click **External Gadgets** under 'Configuration' in the left panel. The 'External Gadgets' page is displayed.
3. In the 'Add a new Gadget' section, paste your gadget's URL into the **Gadget Specification URL** field.
4. Click **Add**. Your gadget will be shown in the list of registered gadgets below and it will also become available in the [macro browser](#).

Screenshot 2: Registering external gadgets one by one

Removing access to external gadgets

To remove a single gadget from Confluence, click the **Remove** button next to the gadget URL.

If you have subscribed to an application's gadgets, you will need to remove the entire subscription. You cannot unregister a single gadget. Click the **Remove** button next to the gadget feed URL.

The gadget(s) will no longer be available in the macro browser, and people will not be able to add them using the Gadget macro. Any pages that already use the gadget will show a broken gadget link.

Configuring a URL Whitelist for Gadgets

For security reasons, you may wish to limit the URLs from which users can get content that is displayed on your Confluence site, such as the content displayed in a gadget. A whitelist is a list of URLs whose content you wish to make available to users of your site.

**Adding whitelist URLs for external gadgets**
By default, Confluence will block a gadget's access to third-party data sources. When you are using a gadget that draws content from a third-party data source, you will need to add the URL of that data source to the gadget whitelist.

To add a URL to the whitelist for gadgets:

1. Choose **Browse > Confluence Admin**.
2. Click **External Gadgets** in the left-hand panel.
3. Click the **Gadget Whitelist** tab.
4. Enter a URL for the **Host to Whitelist**. For example, http://jira.atlassian.com. You can also enter a URL pattern, as described below.
5. Click **Add**.

---

**On this page:**
- Adding whitelist URLs for external gadgets
- Rules for URL pattern-matching
- Notes

**Related pages:**
- Registering External Gadgets
- Configuring a URL Whitelist for Macros
- Confluence Administrator's Guide

---

**Rules for URL pattern-matching**

Enter one URL or URL pattern per line. You can enter a full URL or use pattern-matching as described below:

- If the rule starts with an equals sign (=), only the exact URL following the '=' will be allowed.
- If the rule starts with a slash (/) then the whole rule will be treated as a regular expression.
- Otherwise, any asterisk (*) will be treated as a wildcard to match one or more characters.

**Notes**

- URLs for which Application Links are configured are automatically whitelisted, so you do not need to add them to this list.

---

The information on this page does not apply to Confluence OnDemand.

---

Screenshot: Configuring a URL whitelist for external gadgets
When a gadget or subscription is removed from your site, the whitelist entry is not automatically removed.

Confluence Data Model

Content

The actual information that users are storing and sharing.

attachmentdata: stores the binary data for attached files.
Only used when Confluence is configured to store attachments in the database; otherwise, attachments are stored in the local filesystem.

```
Table "attachmentdata"
<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Modifiers</th>
</tr>
</thead>
<tbody>
<tr>

Clustering

clustersafety: normally, this table only contains one row. The value of the safetynumber is what Confluence uses to find out whether another instance is sharing its database without being part of the cluster.
Table "clustersafety"

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Modifiers</th>
</tr>
</thead>
<tbody>
<tr>
<td>clustersafetyid</td>
<td>bigint</td>
<td>not null</td>
</tr>
<tr>
<td>safetynumber</td>
<td>integer</td>
<td></td>
</tr>
</tbody>
</table>

Indexes:
"clustersafety_pkey" PRIMARY KEY, btree (clustersafetyid)

System information

`confversion` used by the upgrade system to determine what to expect from the database, so as to negotiate upgrades.

Table "confversion"

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Modifiers</th>
</tr>
</thead>
<tbody>
<tr>
<td>confversionid</td>
<td>bigint</td>
<td>not null</td>
</tr>
<tr>

Confluence Clustering Overview

It is possible to run Confluence in a clustered environment instead of on a single server. This means that you can run multiple copies of Confluence in a cluster, so that clients (such as a browser) can connect to any copy and see the same information.

⚠️ Consider your options carefully before deciding on a clustered installation

While we have tried to make clustering Confluence as easy and administrator-friendly as possible, it is a major architectural change and requires extra planning for deployment and upgrades. Please consider the information on the Cluster Checklist and then consult Atlassian support before making your final decision.
This page gives an overview and links to further pages with information on installing, configuring and administering a Confluence cluster.

⚠️ The information on this page does not apply to Confluence OnDemand.

Before Deciding to Run a Confluence Cluster

1. Read and consider the details on the Cluster Checklist.
2. Consider the difference between clustering for scalability and clustering for high availability (HA).
3. Contact Atlassian support for further information and advice.

Technical Overview

Confluence on Virtualised Environments

Atlassian officially supports non-clustered installations of Confluence 3.0 and later on VMware. Although possible, we do not recommend (nor support) running versions of Confluence prior to 3.0 on VMware, since Confluence 3.0 resolved many performance issues that were present in earlier versions. Be aware that we also do not support clustered installations of Confluence on VMware. Please comment or vote on the feature request at CONF-19559.

Read a technical overview of clustering in Confluence.

Server and Network Requirements

Installation and Upgrading

There are two methods of installing Confluence in a cluster, depending on whether you have existing data:

- Fresh installation
- Existing data

If you are upgrading an existing Confluence cluster to a new version of Confluence, refer to the cluster upgrade guide.

Technical Overview of Clustering in Confluence

Overview of clustering documentation
Refer to the overview of Confluence clustering in the Administrators’ Guide.

The information on this page does not apply to Confluence OnDemand.

Introduction

From version 2.3, Confluence has had the ability to configure and run multiple copies of itself in a cluster, so that clients can connect to any copy and see the same information. In effect, a Confluence cluster behaves as a single, powerful Confluence installation. While we have tried to make clustering Confluence as easy and administrator-friendly as possible, it is a major architectural change from earlier versions (or non-clustered installations) and consequently, requires extra planning for deployment and upgrades.

This document will give a technical overview of clustering in Confluence, primarily for those users and developers who will be installing and configuring Confluence in a cluster. A separate overview is available for Confluence plugin developers.

Cluster topology

A simple description of the cluster topology for Confluence would be multiple applications, shared data source. A cluster of Confluence consists of:

- multiple homogeneous installations of Confluence (called nodes below)
  - a Confluence home directory for each installation.
- a distributed Oracle Coherence cache (formerly known as Tangosol Coherence), which all nodes use via a multicast group - see network summary below
- a single database, which all nodes connect to

The user is responsible for configuring an appropriate HTTP load balancer in front of the clustered installations. Typically this means using mod_jk or another application server load-balancing technology. The load balancer must be configured to support session affinity.

Communication between clustered nodes is minimised by using a distributed cache which propagates updates to all other nodes automatically. Where necessary, Coherence provides a locking mechanism for synchronising jobs and a RMI interface for more complex communication.

LAN Clustering Only
Atlassian only supports clustering over a local area network. While it is theoretically possible to configure Confluence to cluster across a WAN, the latency involved is likely to kill performance of the cluster. We can’t stop you trying, of course, but you’re going to have to work out how to configure Coherence yourself, and we’re not going to support the resulting mess.

**Homogeneous Confluence installations**

All the Confluence installations must be running exactly the same application, down to the lowest level. Items that must be the same include:

- Confluence version
- Application server version
- JDK version
- Libraries and plugins in the Confluence classpath, WEB-INF/lib
- Libraries in the application server classpath

The installation section has more information how to ensure homogeneous node installations.

**Creating a Confluence cluster**

When installing Confluence in a clustered setup, you will be responsible for configuring your web server and load balancer to distribute traffic between each node. No additional software is required as Coherence is bundled with Confluence.

Here is an overview of the process:

1. Obtain a clustered licence key from Atlassian for each node
2. Upgrade a single node to the clustered licence
3. Start the cluster from that node’s administration menu, specifying a name and optionally a preferred network interface
4. Restart the single node and test it
5. Copy the Confluence application and Confluence home directory to the second node
6. Bring up the second node and it will automatically join the cluster.

Copying the Confluence application and home directory helps ensure that the installations are homogeneous.

An alternative to this method is to copy the Confluence web application, but not the Confluence home directory. In this case, the installation wizard will require your cluster name to connect to the other nodes, and it will automatically configure itself. You will need to rebuild the index manually after this installation, however.

There is now full documentation for a Confluence Cluster Installation.

**Upgrade process**

Another consequence of the homogeneous requirement is that upgrades must be done by following a strict process.

1. All cluster nodes are brought down
2. Upgrade a single node to the latest Confluence version
3. Start the single node so it can upgrade the database
4. Upgrade subsequent nodes and start them one-by-one.

This is the only safe method of upgrading a Confluence cluster.

**Single database**

The Confluence database in a cluster is shared by all nodes. This means that the database must be able to scale to service all the Confluence nodes, which will probably mean implementing some kind of database cluster and JDBC-level load balancing. We can not offer support with scaling or tuning your database, you will need to talk to your DBA or database vendor.
For obvious reasons, you must have an external database to run Massive - you can not cluster Confluence when using the embedded HSQL database.

The most important requirement for the cluster database is that it have sufficient connections available to support the expected number of application nodes. For example, if each Confluence instance has a connection pool of 20 connections and you expect to run a cluster with four nodes, your database server must allow at least 80 connections to the Confluence database. In practice, you may require more than the minimum for debugging or administrative purposes.

In a cluster, attachments must be stored in the database. Configuring a cluster in an existing installation will automatically migrate your attachments to the database. Non-clustered installations still have the option of using the Confluence home directory for storing attachments.

While attachments are stored in the database, they are temporarily written to the cluster node's local filesystem, designated `<confluence-home>/temp` folder, when being streamed to users (so Confluence doesn't have to hold open database connections unnecessarily). For this reason, Confluence will still need enough temporary disk space to hold any attachments currently in transit.

**Distributed cache**

In a normal configuration, Confluence uses many caches to reduce the number of database queries required for common operations. Viewing a page might require dozens of permissions checks, and it would be very slow if Confluence queried the database for this information with every page view. However, caches must be carefully maintained so they are consistent with the application data. If the page permissions change, the old invalid data needs to be removed from the cache so it can be replaced with a fresh correct copy.

To preserve consistent caches across a cluster, Confluence uses a distributed cache called Oracle Coherence, which manages replicating cache updates transparently across all nodes. The network requirements of the distributed cache are quite simple, but must be preserved if the cluster is to work properly.

To discover other nodes in the cluster, Confluence broadcasts a join request on a multicast network address. Confluence must be able to open a UDP port on this multicast address, or it will not be able to find the other cluster nodes.

Once the nodes are discovered, each responds with a unicast (normal) IP address and port where it can be contacted for cache updates. Confluence must be able to open a UDP port for regular communication with the other nodes.

Because the Coherence network requirements are different to those required by the Confluence database connection, the situation can arise where Confluence can use the database but not talk to the other nodes in the cluster via Coherence. When Confluence detects this, it will shut itself down in a cluster panic.

For more details on the network configuration of the distributed cache, see the [networking summary](#).

**Home directory**

Confluence’s home directory has a much-reduced role in a cluster. Because the application data must be shared between all nodes for consistency, the only information stored in the Confluence home directory is either node-specific, or needed to start Confluence. This includes information related to:

- database connection
- license
- cluster connection

The only application data stored in the Confluence home directory is the Lucene search index. Confluence synchronises this data itself by keeping track of indexing tasks in the database.

This is also why we recommend copying the Confluence home directory from the first node when setting up subsequent nodes. If you did not copy the Confluence home directory, you would need to rebuild the search
index from scratch on the subsequent nodes after installation.

**Event handling**

Broadcasting events to all nodes in a cluster is supported in Confluence, but not recommended. The cluster topology uses a shared data store so that application state does not need to be synchronised by events.

The event broadcasting is done only for certain events, like installing a plugin. When a plugin is installed in one node, Confluence puts the plugin data in the database, and notifies the other nodes that they need to load the plugin into memory.

**Indexing**

Confluence maintains a copy of its Lucene search index on each node of the cluster. This index is used for many things beside full-text searches, including RSS feeds and lists of recently updated content. Indexing in a cluster works like this:

1. Node 1 gets a request to save some page update
2. After saving the page in the database, Node 1 adds a "page-updated" index entry to the queue, which is in the database
3. Periodically, each node picks up the "latest entries" from the queue, where what is latest is determined from a timestamp on a file in the Confluence home directory which indicates when the queue was last inspected. This process is called "flushing the index queue".
4. Each node independently updates its local Lucene index. The "page-updated" index entry is internally changed into a delete-document task and an add-document task to apply the changes to Lucene.
5. Each node updates the timestamp on its index-queue-timestamp file to reflect the most recent processing or "flushing" of the index queue.

Because of step #3, if the timing of the nodes is not synchronised or changes sporadically (due to a virtualisation environment, typically), index changes will not be correctly synchronised in the cluster. This is the most common cause of index sync problems in clusters.

If a node is disconnected from the cluster for a short amount of time (less than three hours), it will be able to bring its copy of the index up-to-date when it rejoins the cluster. If a node is down for a long amount of time and its lucene index has become stale as a result, you may want to avoid the expensive operation of rebuilding the index. To do that, you must copy a "live" version of the Lucene index from an active node. Simply replace the contents of the Confluence Home]/index directory with those from an active node before bringing the stale node back up.

**Job synchronisation**

For tasks such as sending the daily report emails, it is important that only one node in the cluster does this. Otherwise you would get multiple emails from Confluence every day.

Confluence uses locks in the Coherence distributed cache to ensure only one node can be running certain jobs at a time. This ensures email notifications will only be sent once.

**Activity tracking**

*Activity tracking* does not work in a cluster, and will be disabled for clustered deployments. We're working on making the activity tracker clusterable in a future release. You can follow [this issue](https://confluence.atlassian.com/display/CONFLUENCE/Activity+tracking). You can try some [other options](https://confluence.atlassian.com/display/CONFLUENCE/Other+options) for tracking usage.

**Cluster panic**

In some situations, there can be a network issue or firewall that prevents the distributed cache from communicating but still allows Confluence to update the database. This is a dangerous situation because when the caches on the detached nodes become inconsistent, users on different nodes will see different information and updates can be lost.
Confluence can detect this problem by checking a database value against a cached value, and if they differ, all the clustered nodes will be shut down with a 'Cluster panic' message. This is considered a fatal error because the consequences can cause damage to your data. For those administrators that like to live on the edge, there is a system property to prevent cluster panic and allow data corruption. For more information, see Cluster safety mechanism.

If a cluster panic does occur, you need to ensure proper network connectivity between the clustered nodes. Most likely multicast traffic is being blocked or not routed correctly. See the networking summary below.

**Summary of network requirements**

In addition to normal connectivity with its database, all clustered Confluence instances require access to a multicast group and the ability to open a UDP unicast port.

By default, the multicast address is automatically generated from the cluster name you provide when starting the cluster and the multicast port is fixed. During cluster setup, Confluence will prompt for the unicast IP address to use if the server has multiple network interfaces, and by default the unicast port is fixed. The cluster multicast group will be joined on the same network interface as the bound unicast IP address.

For any settings which are not configurable through the Confluence web interface, they can be configured via an XML file in the Confluence home directory for more exotic networking requirements.

**Scaling Confluence On A Single Server**

Since the maximum addressable memory on a 32 bit JVM is 4GB, some large servers may scale Java applications by running JVM instances concurrently. This would be implemented as separate, clustered Confluence nodes running on a single server and communicating internally. Because each JVM replicates the cache entirely, it may be useful to test a single, massive instance running a 64 bit JVM as an alternative. This configuration may result in superior performance than an internal cluster.

**Geographically Distributed Clusters**

Collocating nodes is strongly recommended as high latency will almost certainly degrade performance due to the overhead of cache replication. Cluster nodes will provide the best performance if servers are physically adjacent. However, as long as all nodes share a LAN, users may wish to test alternative configurations to see how performance is affected.

**Cluster safety mechanism**

**Introduction**

A mechanism was added in Confluence 2.3 and above to ensure database consistency when running multiple cluster nodes against the same database. This is called the cluster safety mechanism, and is designed to ensure that your wiki cannot become inconsistent because updates by one user are not visible to another. A failure of this mechanism is a fatal error in Confluence and is called cluster panic.

Because the cluster safety mechanism helps prevents data inconsistency whenever any two copies of Confluence running against the same database, it is enabled in _all_ instances of Confluence, not just clusters.

*The information on this page does not apply to Confluence OnDemand.*
How cluster safety works

A scheduled task, ClusterSafetyJob, runs every 30 seconds in Confluence. In a cluster, this job is run only on one of the nodes. The scheduled task operates on a safety number – a randomly generated number that is stored both in the database and in the distributed cache used across a cluster. It does the following:

1. **Generate** a new random number
2. **Compare the existing safety numbers**, if there is already a safety number in both the database and the cache.
3. **If the numbers differ, publish a ClusterPanicEvent.** Currently in Confluence, this causes the following to happen:
   - disable all access to the application
   - disable all scheduled tasks
   - update the database safety number to a new value, which will cause all nodes accessing the database to fail.
4. If the numbers are the same or aren’t set yet, **update the safety numbers**:
   - set the safety number in the database to the new random number
   - set the safety number in the cache to the new random number.

How to fix it

See ['Database is being updated by an instance which is not part of the current cluster' Error Message](#)

Technical details

The cluster safety number in the database is stored in the CLUSTERSAFETY table. This table has just one row: the current safety number.

**Changing Datasources Manually in a Cluster**

The recommended way of changing database connections is to shut down the whole cluster, install Confluence into new and empty directories and use the Setup Wizard to configure all new database connection settings.

However, if you wish to manually change your settings, you may proceed as described below.

⚠️ It is **strongly recommended** that you test all of the following in a staging or test instance of Confluence before performing these steps in your production environment.

⚠️ The information on this page **does not apply** to Confluence OnDemand.

**Step 1: Prepare**

- Locate the confluence-cfg.xml file in the Confluence home directory.
- Make a backup copy of that file.
- Prepare the necessary changes to that file.

**Step 2: Shut Down Confluence**

You need to shut down all the nodes in the cluster, not just one.

**Step 3: Apply your Changes**

Apply your configuration changes to the required node.

**Step 4: Restart the Changed Node**

It is crucial that you bring up the node on which you applied the changes **first**. Otherwise you will get an error
message, and have to shut down all instances again.

**Step 5: Restart all Other Nodes**

Done.

Confluence cluster debugging tools

There is an umbrella issue opened for all cluster debugging tools [here](#).

It includes the tools listed below.

**Multicast**

- Which multicast address?

The multicast address and port used by Confluence can be found on the [Cluster Administration page](#) or in `confluence.cfg.xml` in the Confluence home directory.

- Multicast address generation.

Confluence uses a hashing algorithm to take the inputted name during setup and it is then turned into a multicast address stored in the config file. Thus, once the initial setup is completed, Confluence will use the address this is the reason why user can change the address if needed, without actually changing the name. Consequently the additional nodes using the same multicast address specified in the config file are able to join the cluster.

Each node has a multicast address configured in the `confluence-cfg.xml` file:

```xml
name="confluence.cluster.address">xxx.xx.x.x</property>
```

A warning message is displayed when an user changes the address from the one that Confluence has generated by the hashing of the name. There is no way of eliminating the message any other way other than by returning the address to the one that matches the cluster name. Purpose of the warning message is to remind the user that the address has been changed - as it is not the hashed version any longer - consequently the node can not join the cluster just by using the name. It is also necessary to provide the correct address as well.

**Mapping interface to IP address.**

To ensure that the interface name is mapped correctly, the following tool can be used. It shows the mapping of the interface name to the IP address.
C:\>java -jar list-interfaces.jar
interfaces.size() = 4
networkInterface[0] = name:lo (MS TCP Loopback interface) index: 1
 addresses:
 /127.0.0.1;

networkInterface[1] = name:eth0 (VMware Virtual Ethernet Adapter for VMnet8) index: 2 addresses:
 /192.168.133.1;

networkInterface[2] = name:eth1 (VMware Virtual Ethernet Adapter for VMnet1) index: 3 addresses:
 /192.168.68.1;

networkInterface[3] = name:eth2 (Broadcom NetXtreme 57xx Gigabit Controller - Packet Scheduler Miniport) index: 4 addresses:
 /192.168.0.101;

**Debugging tools**

Listed below are some debugging tools that help determine what the status of the multicast traffic is:

<table>
<thead>
<tr>
<th>Tool</th>
<th>Information provided</th>
</tr>
</thead>
<tbody>
<tr>
<td>netstat -gn</td>
<td>Lists multicast groups. Does not work on Mac OS X.</td>
</tr>
<tr>
<td>netstat -rn</td>
<td>Lists system routing table.</td>
</tr>
<tr>
<td><strong>Multicast Test</strong></td>
<td>Coherence tool for testing multicast traffic from one node to another.</td>
</tr>
<tr>
<td>tcpdump -i interface</td>
<td>Captures network traffic on the given interface. Most useful on an interface that only receives cluster traffic.</td>
</tr>
</tbody>
</table>

**Add multicast route**

Multicast networking requirements vary across operating systems. Some operating systems require little configuration, while some require the multicast address to be explicitly added to a network interface before Confluence can use it.

If the **Multicast Test** tool shows that multicast traffic can't be sent or received correctly, adding a route for multicast traffic on the correct interface will often fix the problem. The example below is for a Ubuntu Linux system:

```
rout add -net 224.0.0.0 netmask 240.0.0.0 dev eth0
```

To support multiple applications using multicast on different interfaces, you may need to specify a route specific to the **Confluence multicast address**.
Check firewall

Ensure your firewall allows UDP traffic on the multicast address and port used by Confluence.

Prefer IPv4

⚠️ There's a known issue with IPv6, especially on Linux.

The fix is to add -Djava.net.preferIPv4Stack=true to JAVA_OPTS. This tells the JVM to try binding an IPv4 address first, and resort to IPv6 only if that fails.
Note: A more radical approach is to add NETWORKING_IPV6=no to /etc/sysconfig/network, yet probably should be left for a later consideration on a production machine.

Change multicast interface

Confluence might have selected the incorrect interface for multicast traffic, which means it cannot connect to other nodes in the cluster. To override the interface used for multicast traffic after initial setup, edit confluence.cfg.xml in the Confluence home directory and add a property (or change the existing one) to select your desired network interface. For example to tell Confluence to use eth1:

```xml
<property name="confluence.cluster.interface">eth1</property>
```

Increase multicast TTL

The multicast time-to-live (TTL) specifies how many hops a multicast packet should be allowed to travel before it is discarded by a router. It should be set to the number of routers in between your clustered nodes: 0 if both are on the same machine, 1 if on two different machines linked by a switch or cable, 2 if on two different machines with one intermediate router, and so on.

Create a file in the Confluence home directory called tangosol-coherence-override.xml. Add the following to it, setting the TTL value appropriately (1 is the default):

```xml
<?xml version='1.0'?><coherence><cluster-config><multicast-listener><time-to-live system-property='tangosol.coherence.ttl'>1</time-to-live></multicast-listener></cluster-config></coherence>
```

Alternatively, simply start Confluence with the system property: -Dtangosol.coherence.ttl=1. Again, 1 is the default value, and you should change it to something appropriate to your network topology.

Check intermediate routers

Advanced switches and routers have the ability to understand multicast traffic, and route it appropriately. Unfortunately sometimes this functionality doesn't work correctly with the multicast management information (IGMP) published by the operating system running Confluence.

If multicast traffic is problematic, try disabling advanced multicast features on switches and routers in between the clustered nodes. These features can prevent multicast traffic being transmitted by certain operating systems.

For best results, use the simplest network topology possible for the cluster traffic between the nodes. For two
nodes, that means a single network cable. For larger numbers, try using a single high-quality switch.

**Advanced Tangosol configuration**

If the solution to your problem involves changes to the Tangosol configuration, these changes should **not** be made to the Confluence configuration in `confluence WEB-INF classes/`. Instead, to ensure your configuration survives upgrades, make your changes via:

- Tangosol system properties
- creating a `tangosol-coherence-override.xml` file in the Confluence home directory.

Examples of making these changes are shown in the increasing the TTL section.

Multicast Test

This page describes the Multicast Test, a Coherence tool for testing multicast traffic from one node to another. You may find this useful when troubleshooting a clustered installation of Confluence.

In order to run the Multicast test, you need to the Coherence file from Oracle. You will need to sign up for a free Oracle account and sign the license agreement, before downloading the file. The Multicast Test comes as a script called multicast-test, which you will find located in the bin folder in the above zip file.

Instructions on how to run this script file can be found in the Coherence documentation. You may like to go straight to the subheading called 'Example' in the guide, where there is an example on how to use the multicast-test script.

The Multicast Test will use the multicast address of 237.0.0.1:9000 by default. Confluence creates a unique address based on the cluster name that you enter during setup. As such, you should include the -group flag in your multicast testing to ensure your tests are broadcasting across the same address as your Confluence nodes.

The information on this page does not apply to Confluence OnDemand.

Confluence Clustering Overview

Clustering for Scalability vs Clustering for High Availability (HA)

People occasionally enquire about setting up High-Availability (HA) Confluence clusters. Confluence's clustering is designed to solve a different problem, that of scaling under high load. This page explains the difference.

What is High Availability (HA)?

HA means that your application will be available, without interruption. It's a very difficult thing to achieve, and is typically what people are talking about when they refer to five-nines availability.

In the context of application clustering, it means that any given node (or combination of nodes) can be shut down, blown up, or simply disconnected from the network unexpectedly, and the rest of the cluster will continue operating cleanly as long as at least one node remains. It requires that nodes can be upgraded individually while the rest of the cluster operates, and that no disruption will result when a node rejoins the cluster. It typically also requires that nodes be installed in geographically separate locations.

What does Confluence's clustering do, then?
Confluence's clustering system allows a single installation to serve a much greater number of concurrent requests than a single server. This is what we refer to as 'scaling under load'.

It does provide a certain amount of resilience, as the death of one node won't bring the other(s) down. However, it requires very low network latency, which rules out geographic separation of the servers, and upgrading can only be performed while the entire cluster is shut down. This doesn't mean that Confluence's clustering is buggy or broken. It simply reflects the difference between the two design aims.

On this page:

- What is High Availability (HA)?
- What does Confluence's clustering do, then?
- So what kind of resilience can I build into a Confluence installation?
- What's the difference between load balancing and failover?
- What do you mean by 'session affinity'?

So what kind of resilience can I build into a Confluence installation?

It's still entirely possible to build a resilient Confluence installation, using a 'cold-failover' approach in which two (or more) servers share a database and (normally) a network-mounted file system, where no more than one server is actually running at any given time.

Several different approaches are feasible, but the common elements are:

- a well-configured load balancer (session affinity is irrelevant in this case)
- a reliable monitoring system which can detect and shut down a misbehaving Confluence instance before starting the spare server
- startup scripts with added smarts to check for the presence of another running node before deciding whether to start up a server
- servers with the same view of both the database and the home directory.

It's vital to ensure that only one server is running at any one time, in this kind of setup. If a server starts while another is already running against the same database, the result will be a cluster panic that shuts down both servers.

A single database becomes the single point of failure in such a system. This can be alleviated by database clustering, or by replication from the 'active' database server to the standby server(s) if you wish to separate the failover systems while keeping database latency to a minimum.

In the same vein, the home directory can be hosted on a shared network system — SAN or NAS, preferably with its own replication/rapid recovery system — though there's a known issue to consider. Alternatively, to avoid the use of networked file systems, a utility such as rsync can be used to periodically bring the spare servers' home directories up to date, so long as you keep the period sufficiently short — probably between one and five minutes, depending on the rate of activity. This can be avoided altogether by keeping attachments in the database; it increases the demands on the bandwidth between the application and database servers, but guarantees that the system is in a consistent state at switchover. If the data is at all sensitive or confidential, it's advisable to run rsync over ssh, to minimise the opportunity for the data to be captured on its way across the network.
