Crowd Documentation

About
Crowd is a web-based single sign-on (SSO) tool that simplifies application provisioning and identity management.

Crowd is the perfect solution to:

- Give your users the convenience of single sign-on
- Manage any number of users, logins and passwords
- Centralise user management for applications such as JIRA, Confluence and Bamboo
- Connect to multiple LDAP servers, such as Microsoft Active Directory
- Integrate or import legacy user repositories
- Control access to selected applications by user and group
- Easily connect Crowd's application framework to new web applications

Resources
If you have a question about using Crowd, please contact our support team. You may also want to check out the mailing lists and forums:

Thank you for choosing Crowd. To help you get up and running quickly, we have compiled some quick-start instructions on configuring and using Crowd with your JIRA and Confluence applications.

This quick-start guide assumes that you have installed and set up JIRA and/or Confluence and now wish to set up Crowd for user management in one or both of them.

- If you want to use JIRA or Confluence but have not yet installed them, please follow the instructions in JIRA 101 and/or Confluence 101 before configuring Crowd.
- If you want to use Crowd with other applications but not JIRA or Confluence, please follow the detailed Crowd installation and setup guide rather than this 'Crowd 101' guide.

Getting Started

1. Installing Crowd

First things first. If you have not already got Crowd up and running, carry out the following steps:

For Windows: (click to expand)

1. Go to the Atlassian download centre.
2. Download the 'Standalone (ZIP archive)' file.
3. Unzip the zip archive into a directory of your choice, avoiding spaces in the directory name.
4. Tell Crowd where to find its Crowd Home directory, by editing the crowd-init.properties file as described in the installation guide.
5. Set up your database as described in the database configuration guide.

For Mac: (click to expand)

1. Go to the directory where you unzipped Crowd and running start_crowd.bat.
2. To access Crowd, go to your web browser and type this address: http://localhost:8095/crowd.
3. Follow the Setup Wizard. This will guide you through the process of setting up your Crowd server and creating an admin user.

For more help on the technical procedures in this section, please refer to the Crowd installation guide.

If you need assistance, please create a support ticket.
1. Go to the Atlassian download centre.
2. Click the ‘Mac OS X’ tab and download the ‘Standalone (TAR.GZ archive)’ file.
3. Unzip the archive into a directory of your choice, avoiding spaces in the directory name.
4. Tell Crowd where to find its Crowd Home directory, by editing the crowd-init.properties file as described in the installation guide.
5. Set up your database as described in the database configuration guide.

This quick-start page assumes that you have an existing JIRA or Confluence application. So we recommend that you connect Crowd to a production-ready database and not HSQLDB. But if you are evaluating Crowd, it is fine to use HSQLDB and then move to a different database later. In that case, you do not need to do anything in this step, because Crowd contains everything you need.

6. Start your Crowd server by going to the directory where you unzipped Crowd and double-clicking start_crowd.sh.
7. To access Crowd, go to your web browser and type this address: http://localhost:8095/crowd.
8. Follow the Setup Wizard. This will guide you through the process of setting up your Crowd server and creating an admin user.

For more help on the technical procedures in this section, please refer to the Crowd installation guide.

If you need assistance, please create a support ticket.

For Unix or Linux: (click to expand)

1. Go to the Atlassian download centre.
2. Click the ‘Linux’ tab and download the ‘Standalone (TAR.GZ Archive)’ file.
3. Unzip the archive into a directory of your choice, avoiding spaces in the directory name.
4. Tell Crowd where to find its Crowd Home directory, by editing the crowd-init.properties file as described in the installation guide.
5. Set up your database as described in the database configuration guide.

This quick-start page assumes that you have an existing JIRA or Confluence application. So we recommend that you connect Crowd to a production-ready database and not HSQLDB. But if you are evaluating Crowd, it is fine to use HSQLDB and then move to a different database later. In that case, you do not need to do anything in this step, because Crowd contains everything you need.

6. Start your Crowd server by going to the directory where you unzipped Crowd and double-clicking start_crowd.sh.
7. To access Crowd, go to your web browser and type this address: http://localhost:8095/crowd.
8. Follow the Setup Wizard. This will guide you through the process of setting up your Crowd server and creating an admin user.

For more help on the technical procedures in this section, please refer to the Crowd installation guide.

If you need assistance, please create a support ticket.

2. Adding Users and Groups

Crowd is designed to help you manage users and groups across multiple applications. Your next step is to configure a user directory in Crowd to contain your JIRA and/or Confluence users and groups.

If you are starting out from scratch with a new JIRA and a new Confluence site: (click to expand)

1. Add a Crowd directory — Add a Crowd Internal directory to contain all your JIRA and Confluence users.
2. Add the Confluence groups — Add the ‘confluence-users’ and ‘confluence-administrators’ groups to your new directory.
3. Add the JIRA groups — Add the ‘jira-users’, ‘jira-developers’ and ‘jira-administrators’ groups to your new directory.
4. Import your users from a CSV file or add them manually.
5. Add the users to the groups — Use Crowd’s bulk user management to add all the users to the ‘confluence-users’ and ‘jira-users’ groups. Also add any administrators to the administration groups and add the developers to the ‘jira-developers’ group. For more details about the permissions applicable to each group, refer to the Confluence and JIRA documentation.

If you have existing JIRA and Confluence sites, each currently managing its own set of users internally: (click to expand)

If your JIRA users are currently managed via JIRA’s internal management and your Confluence users are managed separately via Confluence’s internal management, you can use Crowd to simplify and centralise your user and group management:

1. Add a Crowd directory — Use the Crowd Administration Console to add a Crowd Internal directory to contain all your JIRA and Confluence users.
2. Import the users and groups from Confluence — Use the Crowd importer to copy your users and groups from Confluence into the new Crowd directory. This process will also copy the group memberships into Crowd.
3. Import the users and groups from JIRA — Use the Crowd importer to copy your users and groups from JIRA into the same Crowd directory as the Confluence users. This process will add any additional users and groups from JIRA and update the existing Confluence users with their JIRA group memberships.
4. Check your users and groups in Crowd — Use Crowd’s group browser to check that your users, groups and group memberships are available as expected in Crowd.
If you have existing JIRA and Confluence sites, with all users currently managed internally in JIRA: (click to expand)

If your JIRA and Confluence users are currently all managed via JIRA's internal management, you can use Crowd to simplify and centralise your user and group management:

1. **Add a Crowd directory** — Use the Crowd Administration Console to add a Crowd Internal directory to contain all your JIRA and Confluence users.
2. **Import the users and groups from JIRA** — Use the Crowd importer to copy your users and groups from JIRA into the new Crowd directory. This process will also copy the group memberships into Crowd.
3. **Check your users and groups in Crowd** — Use Crowd's group browser to check that your users, groups and group memberships are available as expected in Crowd.

If you have existing JIRA and Confluence sites, with all users currently managed in an LDAP directory: (click to expand)

If your users are in a corporate LDAP directory, you can choose whether you want to store your groups in LDAP or in Crowd.

- If you want to store your users and groups in LDAP:
  1. **Add a Crowd LDAP directory connector** — Choose the options for your specific version of LDAP, such as Microsoft Active Directory or Novell eDirectory. Crowd supports a number of LDAP flavours, as listed in the documentation.
  2. **Check your users and groups in Crowd** — Use Crowd's group browser to check that your users, groups and group memberships are available as expected in Crowd.
- If you want to store your users in LDAP and your groups in Crowd:
  1. **Add a Crowd Delegated Authentication directory** — Choose the options for your specific version of LDAP, such as Microsoft Active Directory or Novell eDirectory. Crowd supports a number of LDAP flavours, as listed in the documentation.
  2. **Add the Confluence groups** — Add the 'confluence-users' and 'confluence-administrators' groups to your new Crowd Delegated Authentication directory.
  3. **Add the JIRA groups** — Add the 'jira-users', 'jira-developers' and 'jira-administrators' groups to your new Crowd Delegated Authentication directory.
  4. **Add the users to the groups** — Use Crowd's bulk user management to add all the users to the 'confluence-users' and 'jira-users' groups. Also add any administrators to the administration groups and add the developers to the 'jira-developers' group. For more details about the permissions applicable to each group, refer to the Confluence and JIRA documentation.

If none of the above scenarios matches your requirements: (click to expand)

Take the following steps, choosing your directory and other options as indicated in the linked documentation:

1. **Add a Crowd directory** — Choose the directory type you need to contain all your JIRA and Confluence users.
2. **Add your users and groups either via Crowd's importer or manually**:
   - **Import your users and groups into Crowd.**
   - **Or do it manually**:
     a. **Add the users.**
     b. **Add the Confluence groups** — Add the 'confluence-users' and 'confluence-administrators' groups to your new directory.
     c. **Add the JIRA groups** — Add the 'jira-users', 'jira-developers' and 'jira-administrators' groups to your new directory.
     d. **Add the users to the groups** — Use Crowd's bulk user management to add all the users to the 'confluence-users' and 'jira-users' groups. Also add any administrators to the administration groups and add the developers to the 'jira-developers' group. For more details about the permissions applicable to each group, refer to the Confluence and JIRA documentation.

If you have Confluence or JIRA, but not both, pick the scenario above that best matches your requirements, then just skip the steps for the application that you do not need.

### 3. Connecting the Applications

Crowd manages your users' access to your applications and makes single sign-on (SSO) possible. (More about SSO below.) For this to happen, you need to tell Crowd about the applications and to copy some Crowd libraries into the applications' installation folders.
1. **Add Confluence** — Add the Confluence application to Crowd, following the instructions in the Add Application Wizard.
   - Choose 'Confluence' as the application type.
   - In the 'Directories' step, choose the user directory you added for Confluence.
   - In the 'Authorisation' step, allow all users to authenticate.

2. **Configure the Crowd libraries in Confluence** — Copy the Crowd client libraries into your Confluence folders and configure the properties files as described on the Confluence integration page.

3. **Now add JIRA** — Add the JIRA application to Crowd, following the instructions in the Add Application Wizard.
   - Choose 'JIRA' as the application type.
   - In the 'Directories' step, choose the user directory you added for JIRA.
   - In the 'Authorisation' step, allow all users to authenticate.

4. **Configure the Crowd libraries in JIRA** — Copy the Crowd client libraries into your JIRA folders and configure the properties files as described on the JIRA integration page.

We will call these your 'Crowd-connected applications'.

### Mastering the Basics

1. **Examining your Crowd Server Setup**

   Go to the **System Information** screen in Crowd's Administration Console to find useful information about your Crowd server, such as the location of your Crowd Home directory, information about your database and JVM, and your license server ID.

2. **Managing SSO**

   If you have configured single sign-on (SSO) when setting up your Crowd-connected applications (JIRA and Confluence) in step 3 above, your users will only need to log in or log out once, to Crowd or any Crowd-connected application. When they start another Crowd-connected application, they will be logged in automatically. Similarly, when they log out of Crowd or one of the Crowd-connected applications, they will be logged out of Crowd and the other application(s) at the same time.

   - **Overview of SSO** — An overview of Crowd's SSO capabilities, plus links to detailed information.
   - **Configuring Trusted Proxy Servers** — If you are running applications behind one or more proxy servers, you may find it useful to configure Crowd to trust the proxies' IP addresses.

### Managing your Users' Experience of Crowd

1. **Your users will need to access Crowd at** [http://<Crowd machine name>:8095/crowd](http://<Crowd machine name>:8095/crowd) (not http://localhost:8095/crowd).

2. **Testing a User's Login**

   **Why would I do this?** (click to expand)

   You may want to test a user's login to a specific application if the user has reported problems with logging in, or if you have just set up the first user to access a new application. The test verifies whether a user will be able to log in to a given application, based on the application, directory and group associations in Crowd.

   **How do I do this?** (click to expand)

   Go to the application's 'Authentication Test' tab in the Crowd Administration Console, as described in the documentation. The documentation also describes the possible error messages and the steps you can take to resolve any problems.

3. **Changing or Resetting a User’s Password**

   **Why would I do this?** (click to expand)

   You may need to change or reset someone's password, if they have forgotten their password or if someone else has come to know the password.

   **Crowd users can change or reset their own passwords too. See the user documentation. To allow this, you need to grant them Crowd user rights, as described below.**

   **How do I do this?** (click to expand)
Go to the ‘User Details’ screen in the Crowd Administration Console, as described in the documentation.

If you have configured an email server and a notification template, Crowd will send the user an email about their new password.

8. Setting Up User Aliases

Why would I do this? (click to expand)

Aliases are useful if the same person has different usernames in JIRA and Confluence. You can define the user just once in Crowd, and allocate one or more aliases for the different applications that the user can access.

How do I do this? (click to expand)
The documentation has the full details. In summary:

1. Make sure that aliasing is enabled for JIRA and Confluence, on the application's 'Options' screen.
2. Add the appropriate alias for each user, on the user's 'Applications' screen.

9. Granting Crowd User Rights to Someone

Why would I do this? (click to expand)

You can give your users access to Crowd's Self-Service Console, where they can edit their own profile, change their password and see the applications they are allowed to access. They can read the Crowd User Guide for guidance.

How do I do this? (click to expand)

Make sure that the person's username is in a user directory where all users are authorised to use Crowd. Please refer to the documentation for details.

10. Granting Crowd Administrator Rights to Someone

Why would I do this? (click to expand)

When you first set up Crowd, you will define a single Crowd administrator. It is advisable to give other people administration rights too, so that you do not run into problems when the single administrator is unavailable.

How do I do this? (click to expand)

Make sure that the person is a member of the ‘crowd-administrators’ group. Please refer to the documentation.

Important Next Steps

11. Setting Up your Applications' Host Names

When you set up your applications in step 3 above, you will have specified an IP address for each application. If JIRA, Confluence or any Crowd-connected application resides on a server that passes Crowd a host name instead of an IP address, you will need to tell Crowd the host name. Please refer to the documentation.

12. Connecting to an External Database

If you decided to use the default HSQLDB database when you set up Crowd, you need to switch to a production-ready database before using Crowd as a production system. HSQLDB is provided for evaluation purposes only. Please refer to the documentation.

13. Backing Up your Crowd Data

To back up your Crowd data and establish processes for regular backups, please refer to the documentation.

Thank you for choosing Crowd.

We are always happy to help. Feel free to email or call us with any questions you may have.
Crowd Administration Guide

Crowd is a web-based single sign-on (SSO) tool that simplifies application provisioning and identity management. The Crowd Administration Guide is for people who have Crowd administration rights.

    - Specifying which Groups can access an Application
Crowd is an application security framework that handles authentication and authorisation for your web-based applications. With Crowd you can quickly integrate multiple web applications into a single security architecture that supports single sign-on (SSO) and centralised identity management.

Crowd has the following components:

- **The Crowd Administration Console** is a clean and powerful web-interface for managing directories, users (known in Crowd as 'principals') and their security rights (permissions). Refer to the Crowd Administration Guide for details.
- **The Crowd Self-Service Console** allows authorised users to maintain their user profiles and passwords and to view their usernames, groups, roles and applications. Refer to the Crowd User Guide for details.
- **The Crowd Integration API** provides a platform-neutral way to integrate web applications into a single security architecture. With the integration API, applications can quickly access user information and perform security checks.
Designed for ease of use, Crowd can be deployed with your existing infrastructure. Crowd supports:

- Java, .NET and PHP applications.
- Popular directory servers such as Microsoft Active Directory, Sun ONE and OpenLDAP. Additionally, custom directory connectors may be developed using the Crowd integration API.

See the list of supported applications and directories.

**Architectural Overview**

Crowd is a middleware application that integrates web applications into a single security architecture, supporting single sign-on and centralised identity management. Crowd works by dispatching authentication and authorisation calls from configured applications to configured directories.

A typical deployment may be similar to the following:

When an application needs to validate a security or authentication request (e.g. when a user attempts to log in to the application) the application will make a simple API call to the Crowd framework, which will then forward the call to the appropriate directory.

**About Applications**

Crowd integrates and provisions applications. Once defined, an application is mapped to one or more directories, whose users are then granted access to the application. Note that an application can only communicate with Crowd when the application uses a known host address.

**About Directories**

Crowd supports an unlimited number of user directories. A directory can be one of the following types:

- Internal to Crowd.
- Connected to Crowd via an LDAP connector (e.g. for Active Directory), with all authentication and user/group/role management in LDAP.
- A Crowd internal directory for user/group/role management but with authentication delegated to LDAP (e.g. Active Directory).
- Connected via a custom directory connector (e.g. for a legacy database).

Once you have defined a directory in Crowd, you can map it to applications. Crowd will then pass authentication and authorisation requests to the directory, for all applications that are mapped to that directory. Modification of directory entities (users, groups and roles) can be done via the Crowd Administration Console or via the application, depending on the application's capabilities.

You can even map multiple directories to an application, providing the application with a single view of multiple directories in a specified order.

**Supported Applications and Directories**

Crowd integrates and provisions applications. Once defined, an application is mapped to one or more directories, whose users are then granted access to the application. This page lists the supported application and directory connectors.

**Application Connectors**
Atlassian JIRA
Atlassian Confluence
Atlassian Bamboo
Atlassian Fisheye
Atlassian Crucible
Google Apps
Apache
Subversion
Jive Forums
Atlassian CrowdID
Acegi
NTLM for JIRA — Third-party plugin not officially supported by Atlassian
NTLM for Confluence — Third-party plugin not officially supported by Atlassian

You can also add your own custom applications.

Directory Connectors

Connecting to LDAP directories:

- Apache Directory Server (ApacheDS)
- Apple Open Directory
- Fedora Directory Server
- Generic LDAP Directory
- Microsoft Active Directory
- Novell eDirectory
- OpenLDAP
- OpenLDAP using Posix Schema
- OpenDS
- Posix Schema for LDAP
- Sun Java System Directory Server Enterprise Edition (DSEE, previously called SunONE)

Using Crowd's internal directories:

- Internal Crowd Directory
- Delegated Authentication Directory, combining the features of an internal Crowd directory with delegated LDAP authentication.

You can also add a connector to your own custom directory.

Crowd Documentation

**About the Crowd Administration Console**

The Crowd Administration Console presents the full range of Crowd administration functionality to authorised Crowd administrators.

Authorised Crowd users who are not administrators can also access the Crowd Console. They will see a subset of functionality, which we call the ‘Self-Service Console’. Refer to the Crowd User Guide for details.

If you are a Crowd administrator, the Crowd Administration Console allows you to perform the following functions:

- Configure applications to access the Crowd framework.
- Create and manage users and adjust their group and role membership.
- Map directories to allow users to access integrated applications.
- Adjust server deployment properties, including those configured during the setup process.
- Back up and restore your Crowd data.
- View active sessions and manually expire sessions.
- View Crowd system information.
- Update your user profile and password and view the groups, roles and applications associated with your username. Refer to the Crowd User Guide for details.

To access the Crowd Administration Console,

The welcome screen will appear, looking something like this:
The Crowd Administration Console is a web application provisioned by Crowd — you can see it in the list of applications shown in the Application Browser.

Using the Directory Browser

About Directories

Crowd supports an unlimited number of user directories. A directory can be one of the following types:

- Internal to Crowd.
- Connected to Crowd via an LDAP connector (e.g. for Active Directory), with all authentication and user/group/role management in LDAP.
- A Crowd internal directory for user/group/role management but with authentication delegated to LDAP (e.g. Active Directory).
- Connected via a custom directory connector (e.g. for a legacy database).

Once you have defined a directory in Crowd, you can map it to applications. Crowd will then pass authentication and authorisation requests to the directory, for all applications that are mapped to that directory. Modification of directory entities (users, groups and roles) can be done via the Crowd Administration Console or via the application, depending on the application’s capabilities.

You can even map multiple directories to an application, providing the application with a single view of multiple directories in a specified order.

About the Directory Browser

The Directory Browser allows you to view and search for configured directories.

To use the Directory Browser,

1. Log in to the Crowd Administration Console.
2. Click the 'Directories' tab in the top navigation bar.
3. This will display the Directory Browser, showing all the directories that exist in your Crowd system. You can refine your search by specifying a 'Name' (note that this is case-sensitive), or 'Active'/Inactive' directories. An 'Inactive' directory cannot be used by any applications, regardless of whether or not they are mapped to it.
4. To view or edit a directory's details, click the 'View' link.

You created one default directory when you set up Crowd. To add more directories, see Adding a Directory

Crowd Documentation

Adding a Directory

Directories contain authentication and authorisation information about users, groups and roles. Crowd supports an unlimited number of directories. Administrators can use different directories to create silos of users. For example, you might store your customers in one directory and your employees in another.

Crowd supports the following types of directory:

- **Crowd Internal Directory**
  Internal directories use the Crowd database to store user, group and role information. Internal directories are stored in Crowd's database server.

- **Delegated Authentication Directory**
  A Delegated Authentication directory combines the features of an internal Crowd directory with delegated LDAP authentication. This means that you can have your users authenticated via an external LDAP directory while managing the users, groups and roles in Crowd. You can use Crowd's flexible and simple group management when the LDAP groups do not suit your requirements.

  For example, you can set up a simple group configuration in Crowd for use with [Confluence](https://confluence.atlassian.com) and other [Atlassian](https://www.atlassian.com) products, while authenticating your users against the corporate LDAP directory. You can also avoid the performance issues which might result from downloading large numbers of groups from LDAP.

- **LDAP Directory Connector**
  Crowd provides built-in connectors for the most popular LDAP directory servers, including Microsoft Active Directory, Sun DSEE, OpenLDAP, Apache DS, and others.

- **Custom Directory Connector**
  Custom directory connectors allow developers to connect Crowd to custom user-stores, such as existing databases or legacy systems.

You can add as many directories of each type as you need.

To add a directory,

1. Log in to the Crowd Administration Console.
2. Click the 'Directories' link in the top navigation bar.
3. This will display the Directory Browser. Click the 'Add Directory' link.
4. This will display the 'Select Directory Type' screen (see below). Click the button corresponding to the type of directory you want to add:
   - 'Internal' — see Configuring an Internal Directory
   - 'Delegated Authentication' — see Configuring a Delegated Authentication Directory
   - 'Connector' — see Configuring an LDAP Directory Connector (e.g. Microsoft Active Directory)
   - 'Custom' — see Configuring a Custom Directory Connector

Once a directory has been configured, you will need to specify permissions for its users. You can then map the directory to appropriate applications.

**Screenshot: 'Select Directory Type'**
Internal directories store authentication and authorization information in the Crowd database. To configure an internal directory,
1. Log in to the Crowd Administration Console.
2. Click the ‘Directories’ tab in the top navigation bar.
3. This will display the Directory Browser. Click ‘Add Directory’ in the left-hand menu.
4. Click the ‘Internal’ button.
5. Complete the fields as described in the table below.
6. Click the ‘Continue’ button to configure the directory’s permissions.

⚠️ Once you have configured the directory’s permissions, you will have finished configuring your new directory. You can then map the directory to appropriate applications.

**Create Internal Directory**

Crowd Documentation

**Configuring an LDAP Directory Connector**

Crowd provides built-in connectors for the most popular LDAP directory servers, including Microsoft Active Directory, Sun DSEE, OpenLDAP, Apache DS, and others. The full list is below.

**On this page:**

- Summary of Configuration Steps
- Configuring Directory Details
- Configuring Connector Details
- Configuring LDAP Object and Attribute Settings
  - User Configuration
  - Group Configuration
  - Role Configuration
- LDAP Object Structures
- Hint: An LDAP Browser
- Next Step

**Summary of Configuration Steps**
To configure an LDAP directory connector,

1. Log in to the Crowd Administration Console.
2. Click the 'Directories' link in the top navigation bar.
3. The Directory Browser will appear. Click the 'Add Directory' link.
4. The 'Select Directory Type' screen will appear. Click the 'Connector' button.
5. The 'Details' tab will appear. See screenshot 1 below. Enter the 'Name' and 'Description' (see table of fields below), then click the 'Continue' button.
6. The 'Connector' tab will appear. See screenshot 2 below. Select the relevant connector type and fill in the basic connection information for your directory server. For details, please see:
   - Apache Directory Server (ApacheDS)
   - Apple Open Directory
   - Fedora Directory Server
   - Generic LDAP Directories
   - Microsoft Active Directory
   - Novell eDirectory
   - OpenDS
   - OpenLDAP
   - OpenLDAP Using Posix Schema
   - Posix Schema for LDAP
   - Sun Directory Server Enterprise Edition (DSEE)
7. Click the 'Test Connection' button to verify that Crowd can successfully connect to the directory.
8. Click the 'Continue' button.
9. The 'Configuration' tab will appear. See the configuration screenshots below. Fill in the configuration details for your groups, roles and users, as described in the tables below the configuration screenshots. Also please see LDAP Object Structures (below).
10. Click the 'Test Search' button to verify that Crowd can successfully locate groups/roles/users within the directory.
11. Click the 'Continue' button to configure the directory's permissions.

**Configuring Directory Details**

*Screenshot 1: Directory details*

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>

<td>The connection URL to use when connecting to the directory server, e.g.: ldap://localhost:389, or port 636 for SSL.</td>
</tr>
<tr>
<td>Secure SSL</td>
<td>Specifies whether the connection to the directory server is an SSL connection.</td>
</tr>
<tr>
<td>Use Node Referrals</td>
<td>Use the JNDI lookup java.naming.referral option. Generally needed for Active Directory servers configured without proper DNS, to prevent referral exceptions. Uses the JNDI java.naming.referral lookup.</td>
</tr>
<tr>
<td>Use Nested Groups</td>
<td>Enable or disable support for nested groups on the LDAP user directory.</td>
</tr>
</tbody>
</table>

**Connector**

The directory connector to use when communicating with the directory server. Custom directory connectors can be configured if an out-of-box connector is not supplied. Documentation and examples are available from the Atlassian website.

**URL**

`ldap://localhost:389`

The connection URL to use when connecting to the directory server. For example `ldap://localhost:389` or port `636` for SSL.

**Secure SSL**

Tick the box to indicate that the connection to the directory server should be secured using SSL.

**Use Node Referrals**

Checked. Generally needed for Active Directory servers configured without proper DNS, to prevent referral exceptions. Uses the JNDI `java.naming.referral lookup`.

**Use Nested Groups**

Unchecked. This will enable nested group support for a directory.

**Use the User Membership Attribute**

Unchecked. An alternate way to list group members. Not supported by all directory providers.

**Use memberOf for group membership**

Unchecked. Use the `memberof` attribute with Active Directory when fetching the groups to which a user belongs.

**Use Paged Results**

Checked. Use the LDAP control extension for simple paged results option. Retrieves chunks of data rather than all of the results at once. This feature may be necessary when using Microsoft Active Directory if more than 999 results are returned for any given search.

**Paged Results Size**

The paging size to use when iterating over search results from your LDAP server.

**Use Relaxed DN Standardization**

Checked. If the directory server always returns DNs in a spaceless, comma-delimited format, it is possible to use a relaxed and efficient form of DN comparison resulting in a significant performance improvement.

**Enable Caching**

Unchecked. Use server-side, event-driven caching of the remote directory.

**Base DN**

Enter the root Distinguished Name (DN) to use when running queries versus the directory server. For example: `dc=atlassian,dc=com`.

**User DN**

Connect to the directory server using the supplied username.

**Password**

Connect to the directory server using the supplied password.
### Use the User Membership Attribute

Put a tick in the checkbox if your Active Directory supports the group membership attribute on the user. (By default, this is the `memberOf` attribute.)

- If this checkbox is ticked, Crowd will use the group membership attribute on the user when **retrieving the members of a given group**. This will result in a more efficient retrieval.
- If this checkbox is not ticked, Crowd will use the members attribute on the group (‘member’ by default) for the search.
- If the ‘Use Nested Groups’ checkbox is ticked, Crowd will ignore the ‘Use the User Membership Attribute’ option and will use the members attribute on the group for the search.

### Use 'memberOf' for Group Membership

Put a tick in the checkbox if your Active Directory supports the ‘memberOf’ attribute on the user.

- If this checkbox is ticked, Crowd will use the ‘memberOf’ attribute when **retrieving the list of groups to which a given user belongs**. This will result in a more efficient search.
- If this checkbox is not ticked, Crowd will use the members attribute on the group (‘member’ by default) for the search.

### Use Paged Results

Use the LDAP control extension for simple paging of search results. Retrieves chunks of data rather than all of the search results at once. This feature may be necessary when using Microsoft Active Directory if more than 999 results are returned for any given search.

#### Paged Results Size

Enter the desired page size i.e. the maximum number of search results to be returned per page, when paged results are enabled. Defaults to 999 results.

### Use Relaxed DN Standardisation

This setting determines how Crowd will compare DNs to determine if they are equal. See [Configuring Relaxed DN Standardisation](#).

- If this checkbox is ticked, Crowd will do a direct, case-insensitive, string comparison. This is the default and recommended setting for Active Directory, because Active Directory guarantees the format of DNs. Using relaxed DN standardisation will result in a significant performance improvement.
- If this checkbox is not ticked, Crowd will parse the DN and then check the parsed version.

### Enable Caching

Put a tick in the checkbox to enable directory caching. Directory caching can provide fast recurrent access to user, group and role data for a particular directory. This can provide significant performance improvements for applications such as JIRA, which require large amounts of user information. Please read the full instructions: [Configuring Caching for an LDAP Directory](#).

### Max Cache Elements in Memory

This checkbox appears if ‘Enable Caching’ is ticked. Specify the maximum number of cache elements to be held in memory before overflowing to disk. Please read the full instructions: [Configuring Caching for an LDAP Directory](#).

### Polling Interval

This checkbox appears if ‘Enable Caching’ is ticked. Crowd will send a request to Active Directory every x seconds, where ‘x’ is the number specified here. Please read the full instructions: [Configuring Caching for an LDAP Directory](#).

### Base DN

Enter the root distinguished name to use when running queries versus the directory server, e.g.: `o=acmecorp,c=com`.

### User DN

Distinguished name of the user that Crowd will use when connecting to the directory server.

### Password

The password that Crowd will use when connecting to the directory server.

---

We have shown the settings for Active Directory. For details about the settings for your specific directory server, please see:

### Configuring LDAP Object and Attribute Settings

Once you have selected a connector you can modify various LDAP object and attribute settings of the specific LDAP server for users, groups and roles as shown on the screenshots below. On first setup, Crowd will provide generic default settings based on the connector selected.

When configuring your LDAP connector, if you are using non-standard object types, you will need to adjust the default filter and object type...
configurations. If your connector is added successfully, but you are unable to see any data when browsing your LDAP directory, it is likely that your object and filters are configured incorrectly.

**User Configuration**

**Screenshot 3: User configuration**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User DN</td>
<td>This value is used in addition to the base DN (distinguished name) when searching and loading users. An example is ou=Users. If no value is supplied, the subtree search will start from the base DN.</td>
</tr>
<tr>
<td>User Object Class</td>
<td>This is the name of the class used for the LDAP user object. An example is user.</td>
</tr>
<tr>
<td>User Object Filter</td>
<td>The filter to use when searching user objects.</td>
</tr>
<tr>
<td>User Name Attribute</td>
<td>The attribute field to use when loading the username. Examples are cn and sAMAccountName.</td>
</tr>
<tr>
<td>User Name RDN Attribute</td>
<td>The RDN (relative distinguished name) to use when loading the username. An example is cn. The DN for each LDAP entry is composed of two parts: the RDN and the location within the LDAP directory where the record resides. The RDN is the portion of your DN that is not related to the directory tree structure.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User First Name Attribute</td>
<td>The attribute field to use when loading the user's first name. An example is <code>givenName</code>.</td>
</tr>
<tr>
<td>User Last Name Attribute</td>
<td>The attribute field to use when loading the user's last name. An example is <code>sn</code>.</td>
</tr>
<tr>
<td>User Display Name Attribute</td>
<td>The attribute field to use when loading the user's full name. An example is <code>displayName</code>.</td>
</tr>
<tr>
<td>User Email Attribute</td>
<td>The attribute field to use when loading the user's email address. An example is <code>mail</code>.</td>
</tr>
<tr>
<td>User Group Attribute</td>
<td>The attribute field to use when loading the user's groups. An example is <code>memberOf</code>. Please refer to the specific settings for group membership searches on the 'Connector' tab, as described above.</td>
</tr>
<tr>
<td>User Password Attribute</td>
<td>The attribute field to use when loading a user's password. An example is <code>unicodePwd</code>.</td>
</tr>
</tbody>
</table>

**Group Configuration**

**Screenshot 4: Group configuration**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group DN</td>
<td>This value is used in addition to the base DN when searching and loading groups, an example is ou=Groups. If no value is supplied, the subtree search will start from the base DN.</td>
</tr>
<tr>
<td>Group Object Class</td>
<td>This is the name of the class used for the LDAP group object. Examples are <code>groupOfUniqueNames</code> and <code>group</code>.</td>
</tr>
<tr>
<td>Group Object Filter</td>
<td>The filter to use when searching group objects. An example is <code>(objectCategory=Group)</code>.</td>
</tr>
<tr>
<td>Group Name Attribute</td>
<td>The attribute field to use when loading the group's name. An example is <code>cn</code>.</td>
</tr>
<tr>
<td>Group Description Attribute</td>
<td>The attribute field to use when loading the group's description. An example is <code>description</code>.</td>
</tr>
<tr>
<td>Group Members Attribute</td>
<td>The attribute field to use when loading the group's members. An example is <code>member</code>. Please refer to the specific settings for group membership searches on the 'Connector' tab, as described above.</td>
</tr>
</tbody>
</table>
### Role Configuration

**Screenshot 5: Role configuration**

#### Attribute Description

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
</table>
| Disable Roles           | When you create an LDAP directory connector, roles in Crowd will be disabled by default. To enable roles, remove the tick from the checkbox. You may need to click out of the checkbox (e.g. click the **Update** button) to see the role configuration fields. Then click the **Update** button again to apply the change.  

**Note:** If you have enabled caching for the directory, then you cannot enable roles for that directory. Caching does not work with roles in Crowd. |
| Role DN                 | This value is used in addition to the base DN when searching and loading roles. An example is `ou=Roles`. If no value is supplied, the subtree search will start from the base DN. |
| Role Object Class       | This is the name of the class used for the LDAP role object. An example is `group`.                                                        |
| Role Object Filter      | The filter to use when searching role objects. An example is `(objectclass=group)`.                                                      |
| Role Name Attribute     | The attribute field to use when loading the role's name. An example is `cn`.                                                             |
| Role Description Attribute | The attribute field to use when loading the role's description. An example is `description`.                                          |
| Role Members Attribute  | The attribute field to use when loading the role's members. An example is `member`.                                                      |
LDAP Object Structures

The Crowd LDAP connectors assume that all container objects (groups and roles) have the full DN to the associated member. Currently, the membership attributes on a User object are not used by Crowd; however, in the future these associations may be used to assist with performance when looking up memberships.

Supported Object Types

- groupOfUniqueNames
- inetorgperson
- posixGroup
- posixUser

Zimbra Mail Server

User objects have been tested and are known to work with the zimbraAccount LDAP object types.

Microsoft Active Directory

The Active Directory LDAP connector assumes that all LDAP object types are of the default structure. Any changes to the default object structure of the User and Group objects will require a custom connector to be coded.

Supported Attributes

Crowd's LDAP connectors support the adding and updating of the following user attributes when integrating with an LDAP server via an LDAP directory connector:

- surname
- given name
- email
- password

If you need support for additional LDAP attributes, the Crowd LDAP connector can be extended. With a license purchase, full source is available and the LDAP connectors can be modified to support any number of attributes.

Hint: An LDAP Browser

To help you identify your LDAP structure, you may find an LDAP browser useful. Take a look at our guide on using Apache Directory Studio.

Next Step

Specify the directory permissions, which allow you to restrict the way in which applications can use the directories. See Specifying Directory Permissions.

Once you have configured the directory's permissions, you have finished configuring your new directory. You can then map the directory to appropriate applications.

Using Apache Directory Studio for Crowd LDAP Configuration
Crowd Documentation

**Apache Directory Server (ApacheDS)**

This page provides configuration notes for Apache Directory Server. This page is related to [Configuring an LDAP Directory Connector](#).

---

**Known issues with ApacheDS and Crowd:**

1. ApacheDS 1.0.2 does not support password resets without a restart. This is an ApacheDS limitation.
2. ApacheDS does not support paged results. CWD-1109: Cannot browse users or groups if Use Paged Results is enabled. Again, this is an ApacheDS limitation.

*Screenshot: Connector — ApacheDS*
## Attribute Description

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connector</td>
<td>The directory connector to use when communicating with the directory server.</td>
</tr>
<tr>
<td>URL</td>
<td>The connection URL to use when connecting to the directory server, e.g.: <code>ldap://localhost:389</code>, or <code>port 639 for SSL</code>.</td>
</tr>
<tr>
<td>Secure SSL</td>
<td>Specifies if the connection to the directory server is a SSL connection.</td>
</tr>
<tr>

<td>Use the JNDI lookup <code>java.naming.referral</code> option. Generally needed for Active Directory servers configured without proper DNS, to prevent referral exceptions. Use the JNDI <code>java.naming.referral</code> lookup.</td>
</tr>
<tr>
<td>Use Nested Groups</td>
<td>Enable or disable support for <code>nested groups</code> on the LDAP user directory.</td>
</tr>
</tbody>
</table>

- **Connector**: The directory connector to use when communicating with the directory server. Custom directory connectors can be configured if an out-of-box connector is not supplied. Documentation and examples are available from the Atlassian website.
- **URL**: The connection URL to use when connecting to the directory server. For example `ldap://localhost:389`, or `port 639 for SSL`.
- **Secure SSL**: Specifies if the connection to the directory server should be secured using SSL.
- **Use Node Referrals**: Use the JNDI lookup `java.naming.referral` option. Generally needed for Active Directory servers configured without proper DNS, to prevent referral exceptions. Use the JNDI `java.naming.referral` lookup.
- **Use Nested Groups**: This will enable nested group support for a directory.
- **Use the User Membership Attribute**: An alternate way to find group members. Not supported by all directories. This option will be ignored if nested groups are enabled.
- **Use Paged Results**: Use the LDAP control extension for simple paged results option. Retrieves chunks of data rather than all of the results at once. This feature is may be necessary when using Microsoft Active Directory if more than 999 results are returned for any given search.
- **Use Relaxed DN Standardisation**: If the directory server always returns DNs in a spaceless, comma-delimited format, it is possible to use a relaxed and efficient form of DN comparison resulting in a significant performance improvement.
- **Enable Caching**: Use server-side, event-driven caching of the remote directory.
- **Base DN**: Enter the root Distinguished Name (DN) to use when running queries versus the directory server. For example: `cn=admcorp,ou=com`.
- **User DN**: Connect to the directory server using the supplied username.
- **Password**: Connect to the directory server using the supplied password.
Use the User Membership Attribute

Put a tick in the checkbox if your directory supports the group membership attribute on the user. (By default, this is the 'memberOf' attribute.) For instructions on enabling this feature in your directory, please refer to the OpenLDAP documentation.

- If this checkbox is ticked, Crowd will use the group membership attribute on the user when retrieving the members of a given group. This will result in a more efficient retrieval.
- If this checkbox is not ticked, Crowd will use the members attribute on the group ('member' by default) for the search.
- If the 'Use Nested Groups' checkbox is ticked, Crowd will ignore the 'Use the User Membership Attribute' option and will use the members attribute on the group for the search.

Use Paged Results

Use the LDAP control extension for simple paged results option. Retrieves chunks of data rather than all of the results at once. This feature may be necessary when using Microsoft Active Directory if more than 999 results are returned for any given search.

Use Relaxed DN Standardisation

This setting determines how Crowd will compare DNs to determine if they are equal. See Configuring Relaxed DN Standardisation.

- If this checkbox is not ticked, Crowd will parse the DN and then check the parsed version. This is the default and recommended setting for ApacheDS.
- If this checkbox is ticked, Crowd will do a direct, case-insensitive, string comparison, which will result in a significant performance improvement. This is only possible if the directory guarantees the format of DNs.

Enable Caching

This option is available for ApacheDS 1.5.0 and later. Put a tick in the checkbox to enable directory caching. Directory caching can provide fast recurrent access to user, group and role data for a particular directory. This can provide significant performance improvements for applications such as JIRA, which require large amounts of user information. Please read the instructions: Configuring Caching for an LDAP Directory.

Max Cache Elements in Memory

This checkbox appears if 'Enable Caching' is ticked. Specify the maximum number of cache elements to be held in memory before overflowing to disk. Please read the full instructions: Configuring Caching for an LDAP Directory.

Base DN

Enter the root distinguished name to use when running queries versus the directory server, e.g.: o=acmecorp,c=com.

User DN

The username that Crowd will use when connecting to the directory server.

Password

The password that Crowd will use when connecting to the directory server.

Apple Open Directory

This page provides configuration notes for Apple OS X Open Directory. This page is related to Configuring an LDAP Directory Connector.

Crowd supports read-only connections to Apple OS X Open Directory services.

Crowd’s Apple Open Directory support is read-only
Currently, you cannot add or update user details or group details in a Crowd-connected Apple OS X Open Directory server. Users will not be able to change their passwords from Crowd or from Crowd-connected applications.
**Attribute** | **Description**
---|---
Connector | The directory connector to use when communicating with the directory server.
URL | The connection URL to use when connecting to the directory server, e.g. ldap://localhost:389, or port 639 for SSL.
Secure SSL | Specifies whether the connection to the directory server is an SSL connection.
Use Node Referrals | Specifies whether to use the JNDI lookup java.naming.referral option.
Use the User Membership Attribute | Put a tick in the checkbox if your directory supports the group membership attribute on the user. (By default, this is the 'memberOf' attribute.) For instructions on enabling this feature in your directory, please refer to the OpenLDAP documentation.
  
  - If this checkbox is ticked, Crowd will use the group membership attribute on the user when retrieving the members of a given group. This will result in a more efficient retrieval.
  - If this checkbox is not ticked, Crowd will use the members attribute on the group ('member' by default) for the search.
Use Paged Results | Specifies whether to use the LDAP control extension for simple paged results option. Retrieves chunks of data rather than all of the results at once.
Use Relaxed DN Standardisation

This setting determines how Crowd will compare DNs to determine if they are equal. See Configuring Relaxed DN Standardisation.

- If this checkbox is ticked, Crowd will do a direct, case-insensitive, string comparison. This is the default and recommended setting for Apple Open Directory. Using relaxed DN standardisation will result in a significant performance improvement.
- If this checkbox is not ticked, Crowd will parse the DN and then check the parsed version.

Base DN
The root distinguished name to use when running queries against the directory server, e.g. o=acmecorp,c=com.

User DN
The distinguished name of the user that Crowd will use when connecting to the directory server.

Password
The password that Crowd will use when connecting to the directory server.

Group Relationships

Crowd will check both the gidNumber and the memberUid attributes to determine if a user is a member of a group. The name of the gidNumber attribute is not configurable — Crowd will always use this attribute to determine membership.

The RFC 2307 schema does not support nesting of groups, so Crowd does not support nested groups in Apple Open Directory.

Next Step
Go back to Configuring an LDAP Directory Connector.

Using Apache Directory Studio for Crowd LDAP Configuration
Crowd Documentation

Fedora Directory Server

This page provides configuration notes for Fedora Directory Server (Fedora DS). This page is related to Configuring an LDAP Directory Connector.

Crowd supports read-only connections to Fedora DS using the Posix/NIS schema RFC 2307.
Crowd’s Fedora DS support is read-only
Currently, you cannot add or update user details or group details in a Crowd-connected Fedora Directory server. Users will not be able to change their passwords from Crowd or from Crowd-connected applications.

<table>
<thead>
<tr>
<th>Attribute</th>

Screenshot: Connector — Fedora DS
Use the User Membership Attribute

Put a tick in the checkbox if your directory supports the group membership attribute on the user. (By default, this is the 'memberOf' attribute.) For instructions on enabling this feature in your directory, please refer to the OpenLDAP documentation.

- If this checkbox is ticked, Crowd will use the group membership attribute on the user when retrieving the members of a given group. This will result in a more efficient retrieval.
- If this checkbox is not ticked, Crowd will use the members attribute on the group ('member' by default) for the search.

Use Paged Results

Specifies whether to use the LDAP control extension for simple paged results option. Retrieves chunks of data rather than all of the results at once.

Use Relaxed DN Standardisation

This setting determines how Crowd will compare DNs to determine if they are equal. See Configuring Relaxed DN Standardisation.

- If this checkbox is ticked, Crowd will do a direct, case-insensitive, string comparison. This is the default and recommended setting for Fedora DS. Using relaxed DN standardisation will result in a significant performance improvement.
- If this checkbox is not ticked, Crowd will parse the DN and then check the parsed version.

Base DN

The root distinguished name to use when running queries against the directory server, e.g.: o=acmecorp,c=com.

User DN

The distinguished name of the user that Crowd will use when connecting to the directory server.

Password

The password that Crowd will use when connecting to the directory server.

Group Relationships

Crowd will check both the gidNumber and the memberUid attributes to determine if a user is a member of a group. The name of the gidNumber attribute is not configurable — Crowd will always use this attribute to determine membership.

The RFC 2307 schema does not support nesting of groups, so Crowd does not support nested groups in Fedora DS.

Configuring an SSL Certificate for Microsoft Active Directory

If you wish to use Crowd to add users or change passwords in Microsoft Active Directory, you will need to install an SSL certificate generated by your Active Directory server and then install the certificate into your JVM keystore. Please read the instructions: Configuring an SSL Certificate for Microsoft Active Directory.

Integrating Crowd with ADAM

We have not tested Crowd integration with Active Directory Application Mode (ADAM). However, ADAM and Active Directory share the same code base, LDAP interface and API. So ADAM should work with Crowd, following the same integration instructions as above. If you try it, we'd be interested to hear of your experiences.

Using Apache Directory Studio for Crowd LDAP Configuration

Crowd Documentation

Configuring an SSL Certificate for Microsoft Active Directory

You can configure Crowd to work with Microsoft Active Directory by setting up an LDAP connector in Crowd. If you wish to use Crowd to add users or change passwords in Active Directory, you will need to install an SSL certificate generated by your Active Directory server and then install the certificate into your JVM keystore.

On this page:

- Prerequisites
- Step 1. Install the Microsoft Certificate Services
- Step 2. Obtain the Server Certificate
- Step 3. Import the Server Certificate
  - Windows
  - Unix
  - Mac OS X
Prerequisites

Make sure that you have the following installed on your Windows server (domain controller):

<table>
<thead>
<tr>
<th>Required Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows 2000 Service Pack 2</td>
<td>Required if you are using Windows 2000</td>
</tr>
<tr>
<td>Internet Information Services (IIS)</td>
<td>This is required before you can install Windows Certificate Services.</td>
</tr>
<tr>
<td>Windows Certificate Services</td>
<td>This installs a certification authority (CA) which is used to issue certificates.</td>
</tr>
</tbody>
</table>

Step 1. Install the Microsoft Certificate Services

1. Using the Active Directory Control Panel – Add/Remove Programs administration tool:
   - Select ‘Add/Remove Windows Components’ to start the Windows Components Wizard.
   - Place check marks next to ‘Certificate Services’ and ‘Internet Information Services (IIS)’.
   - Click ‘Next’.

2. Select ‘Enterprise root CA’ Certificate Authority Type and click ‘Next’.
2. Enter a 'CA name' (server name) and click 'Next>'. On Windows Server 2003, this is the 'Common name for this CA'.

3. Leave the 'Data Storage Locations' as default and click 'Next>'.
The software installation process is complete. Click 'Finish'.

5. The software installation process is complete. Click 'Finish'.

6. Click 'OK' to restart IIS.
You will now need to restart your Microsoft Active Directory Server.

**Step 2. Obtain the Server Certificate**

The steps above describe how to install the certification authority (CA) on your Microsoft Active Directory server. Next, you will need to add the Microsoft Active Directory server’s SSL certificate to the list of accepted certificates used by the JDK that runs your Crowd server.

The Active Directory certificate is automatically generated and placed in root of the C:\ drive, matching a file format similar to the tree structure of your Active Directory server, e.g. `c:\crowd-ad2000.ad01.crowd.atlassian.com_ad01.crt`.

You can also export the certificate by executing this command on the Active Directory server:

```
certutil -ca.cert crowd-client.crt
```

**Step 3. Import the Server Certificate**

For a Crowd server to trust your directory’s certificate, the certificate must be imported into your Java runtime environment. The JDK stores trusted certificates in a file called a keystore. The default keystore file is called `cacerts` and it lives in the `lib\security` sub-directory of your Java installation.

In the following examples, we use `server-certificate.crt` to represent the certificate file exported by your Directory Server. You will need to alter the instructions below to match the name actually generated.

### Windows

1. Navigate to the directory in which Java is installed. It's probably called something like `C:\Program Files\Java\jdk1.5.0_12`.
2. Run the command below, where `server-certificate.crt` is the name of the file from your directory server:

   ```
   keytool -import -keystore .\lib\security\cacerts -file server-certificate.crt
   ```

   keytool will prompt you for a password. The default keystore password is `changeit`.

   4. When prompted Trust this certificate? [no]: enter yes to confirm the key import:

   ```
   Enter keystore password:  changeit
   Owner: CN=ad01, C=US
   Issuer: CN=ad01, C=US
   Serial number: 15563d6677a4e9e4582d8a84be683f9
   Certificate fingerprints:
   Trust this certificate? [no]:  yes
   Certificate was added to keystore
   ```

   You may now use the Secure SSL option when using Crowd to connect to your directory.

### Unix

1. Navigate to the directory in which Java is installed. `cd $JAVA_HOME` will usually get you there.
2. Run the command below, where `server-certificate.crt` is the name of the file from your directory server:

   ```
   sudo keytool -import -keystore ./lib/security/cacerts -file server-certificate.crt
   ```

   keytool will prompt you for a password. The default keystore password is `changeit`.

   4. When prompted Trust this certificate? [no]: enter yes to confirm the key import:

   ```
   Enter keystore password:  changeit
   Owner: CN=ad01, C=US
   Issuer: CN=ad01, C=US
   Serial number: 15563d6677a4e9e4582d8a84be683f9
   Certificate fingerprints:
   Trust this certificate? [no]:  yes
   Certificate was added to keystore
   ```
Password:
Enter keystore password: changeit
Owner: CN=ad01, C=US
Issuer: CN=ad01, C=US
Serial number: 15563d6677a4e9e4582d8a84be683f9
Certificate fingerprints:
Trust this certificate? [no]: yes
Certificate was added to keystore

You may now use the Secure SSL option when using Crowd to connect to your directory.

Mac OS X

1. Navigate to the directory in which Java is installed. This is usually /Library/Java/Home.
2. Run the command below, where server-certificate.crt is the name of the file from your directory server:

   sudo keytool -import -keystore ./lib/security/cacerts -file server-certificate.crt

3. keytool will prompt you for a password. The default keystore password is changeit.
4. When prompted Trust this certificate? [no]: enter yes to confirm the key import:

   Password:
Enter keystore password: changeit
Owner: CN=ad01, C=US
Issuer: CN=ad01, C=US
Serial number: 15563d6677a4e9e4582d8a84be683f9
Certificate fingerprints:
Trust this certificate? [no]: yes
Certificate was added to keystore

You may now use the Secure SSL option when using Crowd to connect to your directory.

<tr>
<td>Use Node Referrals</td>
<td>Use the JNDI lookup <code>java.naming.referral</code> option. Generally needed for Active Directory servers configured without proper DNS, to prevent referral exceptions. Uses the JNDI <code>java.naming.referral</code> lookup.</td>
</tr>
<tr>
<td>Use Nested Groups</td>
<td>Enable or disable support for nested groups on the LDAP user directory.</td>
</tr>
<tr>
<td>Use the User Membership Attribute</td>
<td>Put a tick in the checkbox if your directory supports the group membership attribute on the user. (By default, this is the 'memberOf' attribute.) For instructions on enabling this feature in your directory, please refer to the OpenLDAP documentation.</td>
</tr>
<tr>
<td></td>
<td>• If this checkbox is ticked, Crowd will use the group membership attribute on the user when retrieving the members of a given group. This will result in a more efficient retrieval.</td>
</tr>
<tr>
<td></td>
<td>• If this checkbox is not ticked, Crowd will use the members attribute on the group ('member' by default) for the search.</td>
</tr>
<tr>
<td></td>
<td>• If the 'Use Nested Groups' checkbox is ticked, Crowd will ignore the 'Use the User Membership Attribute' option and will use the members attribute on the group for the search.</td>
</tr>
</tbody>
</table>
Use Paged Results

Use the LDAP control extension for simple paging of search results. Retrieves chunks of data rather than all of the search results at once. This feature may be necessary when using Microsoft Active Directory if more than 999 results are returned for any given search.

Use Relaxed DN Standardisation

This setting determines how Crowd will compare DNs to determine if they are equal. See Configuring Relaxed DN Standardisation.

- If this checkbox is not ticked, Crowd will parse the DN and then check the parsed version. This is the default setting for Novell eDirectory.
- If this checkbox is ticked, Crowd will do a direct, case-insensitive, string comparison, which will result in a significant performance improvement. This is only possible if the directory guarantees the format of DNs.

Base DN

Enter the root distinguished name to use when running queries versus the directory server, e.g.:

```
o=acmecorp,c=com```

User DN

Distinguished name of the user that Crowd will use when connecting to the directory server.

Password

The password that Crowd will use when connecting to the directory server.

Using Apache Directory Studio for Crowd LDAP Configuration

Crowd Documentation

OpenDS

This page provides configuration notes for OpenDS. This page is related to Configuring an LDAP Directory Connector.

Screenshot: Connector — OpenDS
Attribute | Description
--- | ---
Connector | The directory connector to use when communicating with the directory server.
URL | The connection URL to use when connecting to the directory server, e.g.: `ldap://localhost:389` or `port 639 for SSL`.
Secure SSL | Specifies if the connection to the directory server is a SSL connection.
Use Node Referrals | Use the JNDI lookup `java.naming.referral` option. Generally needed for Active Directory servers configured without proper DNS, to prevent referral exceptions. Uses the JNDI `java.naming.referral` lookup.
Use Nested Groups | Enable or disable support for `nested groups` on the LDAP user directory.
**Use the User Membership Attribute**

Put a tick in the checkbox if your directory supports the group membership attribute on the user. (By default, this is the 'memberOf' attribute.) For instructions on enabling this feature in your directory, please refer to the [OpenLDAP documentation](https://www.openldap.org/).

- If this checkbox is ticked, Crowd will use the group membership attribute on the user when retrieving the members of a given group. This will result in a more efficient retrieval.
- If this checkbox is not ticked, Crowd will use the members attribute on the group ('member' by default) for the search.
- If the 'Use Nested Groups' checkbox is ticked, Crowd will ignore the 'Use the User Membership Attribute' option and will use the members attribute on the group for the search.

**Use Paged Results**

Use the LDAP control extension for simple paged results option. Retrieves chunks of data rather than all of the results at once. This feature may be necessary when using Microsoft Active Directory if more than 999 results are returned for any given search.

**Use Relaxed DN Standardisation**

This setting determines how Crowd will compare DNs to determine if they are equal. See [Configuring Relaxed DN Standardisation](https://www.crowd.atlassian.com/).  
- If this checkbox is not ticked, Crowd will parse the DN and then check the parsed version. This is the default setting for OpenDS.
- If this checkbox is ticked, Crowd will do a direct, case-insensitive, string comparison, which will result in a significant performance improvement. This is only possible if the directory guarantees the format of DNs.

**Base DN**

Enter the root distinguished name to use when running queries versus the directory server, e.g.: `dc=example,dc=com`.

**User DN**

Distinguished name of the user that Crowd will use when connecting to the directory server.

**Password**

The password that Crowd will use when connecting to the directory server.

Use Relaxed DN Standardisation

This setting determines how Crowd will compare DNs to determine if they are equal. See Configuring Relaxed DN Standardisation.

- If this checkbox is ticked, Crowd will do a direct, case-insensitive, string comparison. This is the default and recommended setting for OpenLDAP Posix. Using relaxed DN standardisation will result in a significant performance improvement.
- If this checkbox is not ticked, Crowd will parse the DN and then check the parsed version.

Password Encryption

Select the type of encryption that the directory uses.

Base DN

The root distinguished name to use when running queries against the directory server, e.g.: o=acmecorp,c=com.

User DN

The distinguished name of the user that Crowd will use when connecting to the directory server.

Password

The password that Crowd will use when connecting to the directory server.

Group Relationships

Crowd will check both the gidNumber and the memberUid attributes to determine if a user is a member of a group. The name of the gidNumber attribute is not configurable — Crowd will always use this attribute to determine membership.

The RFC 2307 schema does not support nesting of groups, so Crowd does not support nested groups in OpenLDAP based on the Posix/NIS schema.

Next Step

Go back to Configuring an LDAP Directory Connector.

Posix Schema for LDAP

This page provides notes for configuring an LDAP directory using the Posix/NIS schema RFC 2307. This page is related to Configuring an LDAP Directory Connector.
Crowd supports read-only connections to an LDAP directory using the Posix/NIS schema. This is useful if you have a Unix installation and want to integrate with an LDAP directory. The Posix/NIS schema allows integration between an LDAP directory and the Unix NIS (Network Information Service).

**Crowd’s Posix support is read-only**
Currently, Crowd supports read-only access to the directory based on the Posix schema. You cannot add or update user details.

**Screenshot: ‘Connector — LDAP using Posix schema’**

<table>
<thead>
<tr>

</tr>
<tr>
<td>Password</td>
<td>Connect to the directory server using the supplied password.</td>
</tr>
</tbody>
</table>

**Attribute**

- **Connector**
  - The directory connector to use when communicating with the directory server.

- **URL**
  - The connection URL to use when connecting to the directory server, e.g.: `ldap://localhost:389`, or `port 636 for SSL`.

- **Secure SSL**
  - Specifies if the connection to the directory server is a SSL connection.

- **Use Node Referrals**
  - Use the JNDI lookup `java.naming.referral` option. Generally needed for Active Directory servers configured without proper DNS, to prevent a `javax.naming.PartialResultException: Unprocessed Continuation Reference(s)` error.
| Use the User Membership Attribute | Put a tick in the checkbox if your directory supports the group membership attribute on the user. (By default, this is the 'memberOf' attribute.) For instructions on enabling this feature in your directory, please refer to the OpenLDAP documentation.

- If this checkbox is ticked, Crowd will use the group membership attribute on the user when retrieving the members of a given group. This will result in a more efficient retrieval.
- If this checkbox is not ticked, Crowd will use the members attribute on the group ('member' by default) for the search. |

| Use Paged Results | Use the LDAP control extension for simple paged results option. Retrieves chunks of data rather than all of the results at once. This feature may be necessary when using Microsoft Active Directory if more than 999 results are returned for any given search. |

| Use Relaxed DN Standardisation | This setting determines how Crowd will compare DNs to determine if they are equal. See Configuring Relaxed DN Standardisation.

- If this checkbox is ticked, Crowd will do a direct, case-insensitive, string comparison. This is the default and recommended setting for Posix schemas. Using relaxed DN standardisation will result in a significant performance improvement.
- If this checkbox is not ticked, Crowd will parse the DN and then check the parsed version. |

| Password Encryption | Select the type of encryption that the directory uses. |

| Base DN | Enter the root distinguished name to use when running queries versus the directory server, e.g.: o=acmecorp,c=com. |

| User DN | Distinguished name of the user that Crowd will use when connecting to the directory server. |

| Password | The password that Crowd will use when connecting to the directory server. |

**Group Relationships**

Crowd will check both the gidNumber and the memberUid attributes to determine if a user is a member of a group. The name of the gidNumber attribute is not configurable — Crowd will always use this attribute to determine membership.

The RFC 2307 schema does not support nesting of groups, so Crowd does not support nested groups in the Posix schema.

Sun Directory Server Enterprise Edition (DSEE)

This page provides configuration notes for Sun's Java System Directory Server Enterprise Edition (DSEE, previously called 'SunONE Directory Server'). This page is related to Configuring an LDAP Directory Connector.

Screenshot: Connector — Sun Directory Server Enterprise Edition (DSEE)

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connector</td>
<td>The directory connector to use when communicating with the directory server.</td>
</tr>
<tr>
<td>URL</td>
<td>The connection URL to use when connecting to the directory server, e.g.: ldap://localhost:389, or port 639 for SSL.</td>
</tr>
<tr>
<td>Secure SSL</td>
<td>Specifies if the connection to the directory server is a SSL connection.</td>
</tr>
</tbody>
</table>
Use Node Referrals

Use the JNDI lookup java.naming.referral option. Generally needed for Active Directory servers configured without proper DNS, to prevent a javax.naming.PartialResultException: Unprocessed Continuation Reference(s) error.

Use Nested Groups

Enable or disable support for nested groups on the LDAP user directory.

Use the User Membership Attribute

Put a tick in the checkbox if your directory supports the group membership attribute on the user. (By default, this is the 'memberOf' attribute.) For instructions on enabling this feature in your directory, please refer to the OpenLDAP documentation:

- If this checkbox is ticked, Crowd will use the group membership attribute on the user when retrieving the members of a given group. This will result in a more efficient retrieval.
- If this checkbox is not ticked, Crowd will use the members attribute on the group ('member' by default) for the search.
- If the 'Use Nested Groups' checkbox is ticked, Crowd will ignore the 'Use the User Membership Attribute' option and will use the members attribute on the group for the search.

Use Paged Results

Use the LDAP control extension for simple paged results option. Retrieves chunks of data rather than all of the results at once. This feature may be necessary when using Microsoft Active Directory if more than 999 results are returned for any given search.

Use Relaxed DN Standardisation

This setting determines how Crowd will compare DNs to determine if they are equal. See Configuring Relaxed DN Standardisation:

- If this checkbox is not ticked, Crowd will parse the DN and then check the parsed version. This is the default and recommended setting for Sun DSEE.
- If this checkbox is ticked, Crowd will do a direct, case-insensitive, string comparison, which will result in a significant performance improvement. This is only possible if the directory guarantees the format of DNs.

Base DN

Enter the root distinguished name to use when running queries versus the directory server, e.g.: o=acmecorp,c=com.

User DN

The username that Crowd will use when connecting to the directory server.

Password

The password that Crowd will use when connecting to the directory server.

Configuring a Custom Directory Connector

Custom directory connectors allow developers to connect Crowd to custom user-stores, such as existing databases or legacy systems.

First you need to create a custom directory connector. The simplest way to accomplish this is to add a JAR file with the necessary classes to the Crowd WEB-INF/lib folder. For details, please see Creating a Custom Directory Connector.

Once you have added your JAR file to the Crowd WEB-INF/lib folder, you are ready to configure a Custom Directory Connector, as described below.

To configure a Custom Directory Connector,

1. Log in to the Crowd Administration Console.
2. Click the 'Directories' link in the top navigation bar.
3. This will display the Directory Browser. Click the 'Add Directory' link.
4. Click the 'Custom' button.
5. Complete the fields as described in the table below.
6. Click the 'Continue' button to configure the directory's permissions.

Once you have configured the directory's permissions, you will have finished configuring your new directory. You can then map the directory to appropriate applications.

<table>
<thead>
<tr>
<th>Custom Directory Store Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name used to identify the directory within Crowd. This is useful when there are multiple directories configured, e.g. Chicago Employees or Web Customers.</td>
</tr>
<tr>
<td>Description</td>
<td>Details about this specific directory.</td>
</tr>
</tbody>
</table>
Active

Only deselect this if you wish to prevent all users within the directory from accessing all mapped applications.

Implementation Class

Crowd Documentation

Configuring a Delegated Authentication Directory

A Delegated Authentication directory combines the features of an internal Crowd directory with delegated LDAP authentication. This means that you can have your users authenticated via an external LDAP directory while managing the users, groups and roles in Crowd. You can use Crowd's flexible and simple group management when the LDAP groups do not suit your requirements.

For example, you can set up a simple group configuration in Crowd for use with Confluence and other Atlassian products, while authenticating your users against the corporate LDAP directory. You can also avoid the performance issues which might result from downloading large numbers of groups from LDAP.

The diagram below gives a conceptual overview of delegated LDAP authentication. This example assumes that you have:

- The Confluence application integrated with Crowd.
- A Crowd Delegated Authentication directory called 'Employees' which contains the group 'confluence-users'.
- An LDAP directory containing all your employees and their authentication details (e.g. username and password).
Summary of Configuration Steps

To configure a Delegated Authentication directory,
1. Log in to the Crowd Administration Console.
2. Click the 'Directories' link in the top navigation bar.
3. This will display the Directory Browser. Click the 'Add Directory' link.
4. This will display the 'Select Directory Type' screen. Click the 'Delegated Authentication' button.
5. This will display the 'Details' tab (see Screenshot 1 below). Enter the 'Name' and 'Description' fields, then click the 'Continue' button.
6. This will display the 'Connector' tab (see Screenshot 2 below). Select the relevant connector type, and fill in the basic connection information for your directory server. For details, please see:
   - Apache Directory Server (ApacheDS)
   - Apple Open Directory
   - Fedora Directory Server
   - Generic LDAP Directories
   - Microsoft Active Directory
   - Novell eDirectory
   - OpenDS
   - OpenLDAP
   - OpenLDAP Using Posix Schema
   - Posix Schema for LDAP
   - Sun Directory Server Enterprise Edition (DSEE)
7. Click the 'Test Connection' button to verify that Crowd can successfully connect to the directory.
8. Click the 'Continue' button.
9. This will display the 'Configuration' tab (see Screenshot 3 below). Fill in the configuration details for your users.
10. Click the 'Test Search' button to verify that Crowd can successfully locate groups/roles/users within the directory.
11. Click the 'Continue' button to configure the directory's permissions.

Configuring LDAP Object and Attribute Settings

Screenshot 3: Configuration
### Create Delegated Authentication Directory

#### User Configuration

**User DN:**
This value is used in addition to the base DN (distinguished name) when searching and loading users. An example is `ou=Users`. If no value is supplied, the subtree search will start from the base DN.

**User Object Class:**
The LDAP user object class type to use when loading users.

**User Object Filter:**
The filter to use when searching user objects.

**User Name Attribute:**
The attribute field to use when searching user objects. Examples are `cn` and `sAMAccountName`.

**User Name RDN Attribute:**
The RDN to use when loading the user's DN.

**User First Name Attribute:**
The attribute field to use when loading the user's first name.

**User Last Name Attribute:**
The attribute field to use when loading the user's last name.

**User Display Name Attribute:**
The attribute field to use when loading the user's full name.

**User Email Attribute:**
The attribute field to use when loading the user's email.

**User Group Attribute:**
The attribute field to use when loading the user's groups.

**User Password Attribute:**
The attribute field to use when manipulating a user password.

<td>User Password Attribute</td>
<td>The attribute field to use when loading a user's password. An example is \texttt{unicodePwd}.</td>
</tr>
</tbody>
</table>

Please refer to the notes on LDAP object structures in the page about LDAP connectors.

**Next Steps**

Once you have configured the directory's permissions, you have finished configuring your new directory.

Next steps will be:

1. Map the directory to the appropriate applications.
2. Consider how you would like to add your users to Crowd's Delegated Authentication directory. There are a few options:
   - Manually add the users to the Crowd directory.
   - Use Crowd's Directory importer to copy your LDAP users into your Delegated Authentication directory.
   - Let Crowd do it for you, at login time. If a user logs in successfully via LDAP authentication but does not yet exist in Crowd, Crowd will automatically add them to the Delegated Authentication directory. You will then need to add the user to any necessary groups, to allow them to access applications where group membership is required.

**Same username required in Crowd and LDAP**

The username must be the same in the Crowd Delegated Authentication directory and in the LDAP directory. Changing the username in LDAP will break the link to the Crowd Delegated Authentication directory.

**Configuring Caching for an LDAP Directory**

Directory caching can be used to enable fast recurrent access to user, group and role data for a particular directory.

This page describes caching that can be configured on the Crowd server, to store user and group information from a Crowd-connected LDAP directory. For an overview of the other types of caching offered by Crowd, please refer to Overview of Caching.

On this page:
Features of LDAP Caching in Crowd

Where the LDAP directory supports it, Crowd will keep an up-to-date cache of user, group and role information retrieved from the LDAP directory. Use of the cache should improve performance particularly in directories which are large, slow or off site.

Summary of the caching features:

- The cache uses lazy loading where possible, storing only the information that is required rather than loading the entire directory into the cache.
- Crowd ensures that the cache remains up to date by monitoring the LDAP directory for updates. When a change occurs, Crowd updates the server-side cache incrementally. The monitoring mechanism depends on the type of LDAP directory, as described in the list of supported directories below.
- The caches are held in memory on the Crowd server machine. They can become considerably large. When necessary, the cache will overflow to disk.

The diagram below gives a conceptual overview of the caches supported by Crowd, including the LDAP caching discussed on this page. For an overview of the other types of caching offered by Crowd, please refer to Overview of Caching.
Supported LDAP Directories

<table>
<thead>
<tr>
<th>Directory</th>
<th>Monitoring Mechanism</th>
</tr>
</thead>
<tbody>
<tr>
<td>ApacheDS version 1.5.0 and later</td>
<td>Listening, via 'persistent search'. See details below.</td>
</tr>
<tr>
<td>Microsoft Active Directory</td>
<td>Polling, via 'uSNChanged'. See details below.</td>
</tr>
</tbody>
</table>

**LDAP Persistent Search**

For supported LDAP directories, Crowd monitors changes via the LDAP change notification feature known as 'persistent search'. The word
'persistent' means that the search remains active forever, once initiated. Crowd performs the initial search on the LDAP directory and receives the results. From that point on, whenever an entry in the result set is updated, the LDAP directory sends Crowd a new copy of that entry.

**Microsoft Active Directory Change Notification**

Crowd sends a request to AD at regular intervals, asking to be notified of changes made since the last request, via the uSNChanged attribute. You can configure the time interval on Crowd’s Directory Connector screen for your Active Directory. Details are in MSDN.

**Configuring the Cache**

*Screen snippet: Cache Configuration for Microsoft Active Directory*

You can enable or disable the cache for each directory via the Crowd Directory Connector screen, provided that the directory supports LDAP caching. Below are descriptions of and guidelines for the configuration settings.

**Setting the Maximum Number of Elements in Memory**

When configuring the cache, you can set the ‘Max Cache Elements in Memory’. This number is proportional to the number of users/groups that can be stored in memory before overflowing to disk. If you have limited JVM memory constraints, you can set the number to a lower value. Note that loading from disk can be significantly slower than loading from memory.

Crowd uses Ehcache for its cache implementation. The maximum number of elements in memory is one of the configuration settings allowed by Ehcache. Each cached directory consists of about 20 internal caches. The maximum number of elements in memory corresponds to the maximum elements per internal cache.

The largest internal cache maps DNs to principals/groups/roles. Therefore the maximum number of elements in memory should approximate the sum of principals + groups + roles in the scope of your configured LDAP subtrees.

We recommend leaving this value at the default 50,000 unless you experience memory problems. This setting means that if the number of principals + groups + roles exceeds 50,000, then some of the entities will overflow to a disk-based cache.

We have tested with up to 8,000 users and 8,000 groups. We used 512 MB of JVM memory (-Xmx) and set the maximum number of elements in memory to 50,000.

**Setting the Polling Interval for Cache Updates**

When configuring the cache for Microsoft Active Directory, you can set the ‘Polling Interval’. This is the time interval (number of seconds) that Crowd will wait between its requests for updates from AD.

The length of your polling interval depends on the length of time you can tolerate stale data. If you poll more frequently, then your data will be more up to date. The downside of polling more frequently is that you may overload your AD server with requests.

A good value for the polling interval would take into account the performance of your AD server and the size of the pipe between the AD server and the Crowd server.

If in doubt, we recommend that you start with an interval of 5 or 10 minutes and reduce the value incrementally. You will need to experiment with your setup. You can use Crowd’s performance profiling feature to see the performance of your setup.

Very short and very long intervals:

- We have tested polling intervals as short as 15 seconds, when the AD server is on the local network. Any shorter would mean that the polling interval exceeds the time taken to perform the poll operation. Each poll consists of 6 operations: searching for created or updated principals/groups/roles (3), and searching for deleted principals/groups/roles (3).
- Alternatively, if you are confident that most of the AD updates will be done via Crowd and that there will be very few changes on the AD server that do not originate from Crowd, then you can set the polling interval to be something much larger, e.g. 2 hours. Note that in this case, any change made to the AD server outside of Crowd may take up to two hours to appear in Crowd.

**Inspecting and Flushing the Cache**
You can view directory information via the Directory Browser. The 'View Directory' screen allows you to:

- See basic cache information — View the number of users, groups, and roles cached and the date on which the cache was last updated.
- Flush the cache — Click the 'Flush Cache' button to remove all cached elements. Crowd will lazily reload data when the data is next requested by a client application.

### Screenshot: Inspecting and flushing the cache

![View Directory - Corporate Active Directory](image)

### Limitations

#### Limitations for All Directories

The following comments apply to all directory types, including Microsoft Active Directory.

1. **Only specified directories are supported.** — Crowd can only support caching for directories which provide a suitable mechanism. See the list of supported directories above.
2. **Memory usage is higher.** — Because of the memory requirements imposed by the caching, we recommend increasing the amount of heap allocated to Crowd to at least 512MB (`-Xmx512m`).
3. **Delegated Authentication directories are not supported.** — Delegated Authentication directories are not cached, because only the authentication is delegated to the directory, and authentication itself is not cached.
4. **Posix/NIS schema is not supported.** — LDAP directories using the Posix/NIS schema will not be cached, because the group memberships fetching scheme does not support caching.
5. **Externally moving objects out of scope causes problems.** — Do not use the external LDAP directory interface to move objects out of the scope of the sub-tree, as defined on Crowd's Directory Connector screen. This will result in an inconsistent cache. If you do need to make structural changes to your LDAP directory, flush the directory cache after you have made the changes to ensure cache consistency.
6. **Nested groups will cause a single large performance hit when finding a user's memberships.** — If you are using nested groups, you will notice a single (possibly huge) performance hit on the first call to find the memberships of user. This one-off hit will occur every time the cache is flushed, such as when Crowd is restarted or when you manually flush the cache.
7. **Unique entities are required, with respect to entity type and name.** — There can be only one entity with a specific entity name and type. For example, you cannot have two groups with the same name in the visible group tree.
8. **DN mapping must be unique.** — Directory entities must be mapped in such a way that their DN mapping is unique. For example, you cannot have an entity with DN that could correspond to a group and a role.
9. **Renaming objects is not supported.** — If the DN of an object is changed externally, the cache will be out of date until flushed.

#### Additional Limitations for Microsoft Active Directory

In addition to the general limitations listed above, please take note of these comments which apply specifically to Microsoft Active Directory (AD).

1. **Syncing between AD servers is not supported.** — Microsoft Active Directory does not replicate the `uSNC` attribute across instances. For that reason, Crowd does not support connecting to different AD servers for syncing. (You can of course define multiple different directories in Crowd, each pointing to its own respective AD server.)
2. **You must restart Crowd after restoring AD from backup.** — On restoring from backup of an AD server, the `uSNC` timestamps

---

*Additional information and troubleshooting tips can be found in the Crowd documentation.*
are reverted to the backup time. To avoid the resulting confusion, you will need to flush the directory cache after a Active Directory restore operation.

3. **Obtaining object deletions requires Administrator access.** — Active Directory stores deleted objects in a special container called cn=Deleted Objects. By default, to access this container you need to connect as an Administrator and so, for Crowd to be aware of deletions, you must use Administrator credentials. Alternatively, it’s possible to change the permissions on the cn=Deleted Objects container. If you wish to do so, please see this Microsoft KB Article.

**Error Handling**

If Crowd detects a connection timeout or an error, Crowd will automatically flush the caches and re-start the directory monitors. To manually flush the cache and re-start the monitors, use the "Flush Cache" button.

Crowd Documentation

**Configuring Relaxed DN Standardisation**

When configuring an LDAP directory connector in Crowd, you can set relaxed DN standardisation on or off. This page gives some background to the setting of this option.

Crowd needs to compare DNs (distinguished names) to check a number of things, such as whether a user is a member of a group. Some directories guarantee that DNs will always be in a standard format, and some return slight variants with changes such as extra whitespace. If we know that, in a specific directory, DNs are case insensitive and are always returned in a compact format (i.e. the separators are commas without spaces) then we can convert both the attribute names and values to lower case and just do a direct string comparison.

Using relaxed DN standardisation provides significant performance benefits, so we recommend enabling it where possible.

**Effect of Turning Relaxed DN Standardisation On or Off**

<table>
<thead>
<tr>
<th>Relaxed DN Standardisation in Crowd</th>
<th>Processing in Crowd</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>Crowd will perform the full DN parsing and compare the parsed version.</td>
<td>See below for default settings for each directory type.</td>
</tr>
<tr>
<td>On</td>
<td>Crowd will perform a toLower operation and then do a direct comparison of the two DN strings.</td>
<td>If this setting is 'off' by default for your directory type (see below) then you may be able to turn it on. Both of the following two statements need to be true: 1. The directory server always returns memberDNs in a compact format i.e. the separators are commas without spaces. For example: • Compact format: 'cn=bob,dc=example,dc=com' • Not compact: 'cn=bob, dc=example, dc=com' 2. The attribute names in the RDN are always lower case, or all searches for DNs and memberDN attributes are case insensitive.</td>
</tr>
</tbody>
</table>

**Default Settings in Crowd**

Crowd ships with the following default settings, as determined by the characteristics of each directory type.

<table>
<thead>
<tr>
<th>Directory Type</th>
<th>Relaxed DN Standardisation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ApacheDS 1.0.x</td>
<td>Off</td>
</tr>
<tr>
<td>ApacheDS 1.5.x</td>
<td>Off</td>
</tr>
<tr>
<td>Apple Open Directory</td>
<td>On</td>
</tr>
</tbody>
</table>
Directory permissions allow you to restrict the way in which directories can be used by mapped applications. Often, administrators need to limit applications to only being able to read — not modify — directory entity data, i.e. the users, groups and roles contained within the directory. You can achieve this by disabling the relevant directory permissions.

Directory permissions are defined at two levels:

1. **Directory-level permissions** are defined on the ‘Permissions’ tab of the ‘View Directory’ screen. These permissions apply to each application mapped to the directory, unless the application has its own application-level permissions.
2. **Application-level directory permissions** are defined on the ‘Permissions’ tab of the ‘View Application’ screen. If a permission is enabled at directory level, you can enable it for a specific application. For example, you could enable the ‘Add User’ permission on the ‘Customers’ directory in JIRA but disable the permission for Confluence.

Take a look at an example.

Disabling a directory-level permission will override any permissions enabled at application level. If a permission is enabled at application level and then subsequently disabled at directory level, the directory-level permission will apply. (The application-level permissions will be ‘remembered’ and will apply again if re-enabled at directory level.)

How do directory permissions affect the Crowd application (Crowd Administration Console)?

- If a particular permission is turned off at directory level, then no application can perform the related function - not even the Crowd application. So, for example, if you disable the ‘Remove User’ permission for a directory, then the Crowd Administration Console will not allow you to delete a user from that directory.
- The Crowd application is not bound by application-level permissions.

Below, we tell you about directory-level permissions. You can also read more about [application-level directory permissions](#).

### Directory-Level Permissions

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Group</td>
<td>Allows applications to add groups to the directory.</td>
</tr>
<tr>
<td>Add User</td>
<td>Allows applications to add users to the directory.</td>
</tr>
<tr>
<td>Add Role</td>
<td>Allows applications to add roles to the directory.</td>
</tr>
<tr>
<td>Modify Group</td>
<td>Allows applications to modify groups in the directory.</td>
</tr>
<tr>
<td>Modify User</td>
<td>Allows applications to modify users in the directory.</td>
</tr>
<tr>
<td>Role</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Modify Role</td>
<td>Allows applications to modify roles in the directory.</td>
</tr>
<tr>
<td>Remove Group</td>
<td>Allows applications to delete groups from the directory.</td>
</tr>
<tr>
<td>Remove User</td>
<td>Allows applications to delete users from the directory.</td>
</tr>
<tr>
<td></td>
<td><img src="https://example.com/warning.png" alt="Warning" /> Consider carefully whether you allow the deletion of users, as some applications contain historical data, e.g. documents that the user has created. Read more.</td>
</tr>
<tr>
<td>Remove Role</td>
<td>Allows applications to delete roles from the directory.</td>
</tr>
</tbody>
</table>

When you **add a new directory**, all of its permissions are enabled by default.

**To specify directory permissions,**

1. Configure a new directory as described in Adding a Directory or select an existing directory from the Directory Browser.
2. Click the 'Permissions' tab. This will display a list of permissions as shown in the screenshot below.
   - **To enable a directory permission**, select the corresponding checkbox.
   - **To disable a directory permission**, deselect the corresponding checkbox.

_Screenshot: Directory permissions_

![Screenshot](https://example.com/screenshot.png)

- **Add Group**: Allow groups to be added to the directory.
- **Add User**: Allow users to be added to the directory.
- **Add Role**: Allow roles to be added to the directory.
- **Modify Group**: Allow groups to be modified in the directory.
- **Modify User**: Allow users to be modified in the directory.
- **Modify Role**: Allow roles to be modified in the directory.
- **Remove Group**: Allow groups to be removed from the directory.
- **Remove User**: Allow users to be removed from the directory.
- **Remove Role**: Allow roles to be removed from the directory.
Need to grant users permission to access an application?
To control which users within a directory may access a mapped application, see Specifying which Groups can access an Application.

Crowd Documentation

Importing Users and Groups into a Directory

Once you have added a directory, you can import groups and users into it from external user-stores or from another directory defined in Crowd. This can reduce the number of user-stores within your organisation, and give you a consolidated, centralised point of user management. Once you have imported users into a Crowd directory, you can manage them via the Crowd Administration Console (assuming the directory's permissions allow this).

For example, your organisation might currently have user IDs for Atlassian JIRA users stored within JIRA's database, and user IDs for Jive Forums users stored within Jive's database. You could use Crowd to import all the user IDs from both places into Microsoft Active Directory.

You can import from different user-stores into a single Crowd directory, or into different Crowd directories, depending on your needs.

To import users into a directory,

1. Log in to the Crowd Administration Console.
2. Click the 'Users' link in the top navigation bar.
3. This will display the User Browser. Click the 'Import Users' link.
4. This will display the 'Import Type' screen (see below). Click the button corresponding to the type of user-store or file from which you want to import external users into Crowd:
   - 'Atlassian Importer' — see Importing Users from Atlassian Confluence, Importing Users from Atlassian JIRA and Importing Users from Atlassian Bamboo
   - 'Directory Importer' — see Importing Users from One Crowd Directory into Another
   - 'CSV Importer' — see Importing Users from CSV Files
   - 'JIVE' — see Importing Users from Jive Forums

Screenshot: 'Select Import Type'

**External User Importer**

<table>
<thead>
<tr>
<th>1. Import Type</th>
<th>2. Options</th>
<th>3. Results</th>
</tr>
</thead>
</table>

Where would you like to import users from?

Use the Atlassian Importer to import users from Atlassian products, e.g. JIRA, Confluence, Bamboo.

Import your users, groups and roles from another directory defined in Crowd.

Import your users and groups from a CSV file. You can supply one or two files, the first (mandatory) containing your users and another (optional) containing their group memberships (e.g., "smith", "administrators").

Import your users and groups from your Jive Forums installation.
Importing Users from Atlassian Confluence

If you have already been using Atlassian Confluence, and are now configuring Confluence as a Crowd application, you will probably want to import your existing Confluence users and groups into a Crowd directory.

It is recommended that you import your Confluence users into an Internal Directory that has its 'Password Encryption' set to 'ATLASSIAN-SHA1'. Otherwise, users' passwords will not be copied across to Crowd.

To import users and groups from Atlassian Confluence into a Crowd directory,
1. Ensure that the database driver for the Confluence database is on Crowd's classpath. To do this, simply copy the JDBC driver jar for your particular Confluence database across to apache-tomcat/common/lib in your Crowd installation directory. Then restart Crowd.

2. Log in to the Crowd Administration Console.

3. Click the 'Users' link in the top navigation bar.

4. This will display the User Browser. Click the 'Import Users' link.

5. This will display the 'Import Type' screen. Click the 'Atlassian Importer' button.

6. This will display the 'Options' screen. Complete the fields as follows:
   - 'Atlassian Product' — Select 'Confluence'.
   - 'Directory' — Select the directory that you have created for your Confluence users.
   - 'Import Passwords' — Select this checkbox if you wish to import the users' passwords from Confluence. You can only import passwords if the Crowd directory is using the 'Atlassian SHA1' encryption method.
   - 'Product Database URL' — Type the URL of your Confluence instance's database. The exact syntax will depend on which database you are using; see Database Configuration in the Confluence Configuration Guide.
   - 'Database Driver' — type the name of your Confluence instance's database JDBC driver (e.g. for MYSQL, type com.mysql.jdbc.Driver).
   - 'Username' — Type the username of the database user Crowd will use to login to your Confluence instance's database.
   - 'Password' — Type the password of the database user Crowd will use to login to your Confluence instance's database.

7. Click the 'Continue' button to import the users from your Confluence instance into your Crowd directory.

8. The 'Results' screen will be displayed, showing how many users and groups have been imported into your Crowd directory.

9. Click the 'Users' button to view and manage the imported users and groups via the Crowd Administration Console (assuming the directory's permissions allow this).

Screenshot: 'Import Confluence Users'

Next Step

To give the imported groups access to the Confluence application, see Specifying which Groups can access an Application.

Importing Users from Atlassian JIRA

If you have already been using Atlassian JIRA, and are now configuring JIRA as a Crowd application, you will probably want to import your existing JIRA users and groups into a Crowd directory.

It is recommended that you import your JIRA users into an Internal Directory that has its 'Password Encryption' set to 'ATLASSIAN-SHA1'. Otherwise, users' passwords will not be copied across to Crowd.

To import users and groups from Atlassian JIRA into a Crowd directory,

1. Ensure that the database drivers for the JIRA database are on Crowd's classpath. To do this, simply copy the JDBC driver jar for your particular JIRA database across to apache-tomcat/common/lib in your Crowd installation directory. Then restart Crowd.
2. Log in to the Crowd Administration Console.
3. Click the 'Users' link in the top navigation bar.
4. This will display the User Browser. Click the 'Import Users' link.
5. This will display the 'Import Type' screen. Click the 'Atlassian Importer' button.
6. This will display the 'Options' screen. Complete the fields as follows:
   - 'Atlassian Product' — Select 'JIRA'.
   - 'Directory' — Select the directory that you have created for your JIRA users.
   - 'Import Passwords' — Select this checkbox if you wish to import the users' passwords from JIRA. You can only import passwords if the Crowd directory is using the 'Atlassian SHA1' encryption method.
   - 'Product Database URL' — Type the URL of your JIRA instance's database. The exact syntax will depend on which database you are using; see Connecting JIRA to a Database in the JIRA Installation Guide.
   - 'Database Driver' — Type the name of your JIRA instance's database JDBC driver (e.g. for MYSQL, type com.mysql.jdbc.Driver).
   - 'Username' — Type the username of the database user that Crowd will use to log in to your JIRA instance's database.
   - 'Password' — Type the password of the database user Crowd will use to log in to your JIRA instance's database.

   The import process will log in to the database, not into JIRA.
7. Click the 'Continue' button to import the users from your JIRA instance into your Crowd directory.
8. The 'Results' screen will be displayed, showing how many users and groups have been imported into your Crowd directory.
9. Click the 'Users' button to view and manage the imported users and groups via the Crowd Administration Console (assuming the directory's permissions allow this).

Screenshot: 'Import JIRA Users'
Next Step

To give the imported groups access to the JIRA application, see Specifying which Groups can access an Application.

Crowd Documentation

Importing Users from Atlassian Bamboo
If you have already been using Atlassian Bamboo, and are now configuring Bamboo as a Crowd application, you will probably want to import your existing Bamboo users and groups into a Crowd directory.

We recommend that you import your Bamboo users into an internal Crowd directory that has its ‘Password Encryption’ set to ‘ATLASSIAN-SHA1’. Otherwise, users' passwords will not be copied across to Crowd.

To import users and groups from Atlassian Bamboo into a Crowd directory,

1. Ensure that the database drivers for the Bamboo database are on Crowd's classpath. To do this, simply copy the JDBC driver jar for your particular Bamboo database across to apache-tomcat/common/lib in your Crowd installation directory. Then restart Crowd.
2. Log in to the Crowd Administration Console.
3. Click the ‘Users’ link in the top navigation bar.
4. This will display the User Browser. Click the ‘Import Users’ link.
5. This will display the ‘Import Type’ screen. Click the ‘Atlassian Importer’ button.
6. This will display the ‘Options’ screen. Complete the fields as follows:
   - ‘Atlassian Product’ — Select ‘Bamboo’.
   - ‘Directory’ — Select the directory that you have created for your Bamboo users.
   - ‘Import Passwords’ — Select this checkbox if you wish to import the users' passwords from Bamboo. You can only import passwords if the Crowd directory is using the ‘Atlassian SHA1’ encryption method.
   - ‘Product Database URL’ — Type the URL of your Bamboo instance's database. The exact syntax will depend on which database you are using. See Database Configuration in the Bamboo Installation Guide.
   - ‘Database Driver’ — Type the name of your Bamboo instance's database JDBC driver (e.g. for MYSQL, type com.mysql.jdbc.Driver).
   - ‘Username’ — Type the username of the database user that Crowd will use to log in to your Bamboo instance's database.
   - ‘Password’ — Type the password of the database user Crowd will use to log in to your Bamboo instance's database.
7. The import process will log in to the database, not into Bamboo.
8. Click the ‘Continue’ button to import the users from your Bamboo instance into your Crowd directory.
9. The ‘Results’ screen will be displayed, showing how many users and groups have been imported into your Crowd directory.
10. Click the ‘Users’ button to view and manage the imported users and groups via the Crowd Administration Console (assuming the directory's permissions allow this).

Screenshot: ‘Import Bamboo Users’

Next Step

To give the imported groups access to the Bamboo application, see Specifying which Groups can access an Application.
Importing Users from Jive Forums

If you have already been using Jive Forums, and are now configuring Jive Forms as a Crowd application, you will probably want to import your existing Jive users and groups into a Crowd directory.

**Before you begin:**

The database drivers for the Jive Forums database will need to be on Crowd's classpath. To do this, simply copy the database driver JAR for your particular Jive database across to `CROWD/apache-tomcat/common/lib` and restart Crowd.

**Note:** the passwords for users in Jive will not be copied across to Crowd as they are stored as hashes in Jive's internal database.

To import users and groups from Jive Forums into a Crowd directory,

1. Login to the Crowd Administration Console.
2. Click the 'Users' link in the top navigation bar.
3. This will display the User Browser. Click the 'Import Users' link.
4. This will display the 'Import Type' screen. Click the 'JIVE' button.
5. This will display the 'Options' screen. Complete the fields as follows:
   - 'Directory' — select the directory that is mapped to the Jive Forums application.
   - 'DB URL' — type the URL of Jive's database.
   - 'DB Driver' — type the name of Jive's database JDBC driver.
   - 'Username' — type the username of the database user that Crowd will use to login to Jive's database.
   - 'Password' — type the password of the database user Crowd will use to login to Jive's database.

   The import process will log in to the database, not to Jive Forums.
6. Click the 'Continue' button to import the users from Jive Forums into your Crowd directory.
7. The 'Status' screen will be displayed, showing how many users and groups have been imported into your Crowd directory.
8. Click the 'Users' button to view and manage the imported users and groups via the Crowd Administration Console (assuming the directory's permissions allow this).
You can copy users from an external directory or user base into Crowd via a CSV (comma-separated values) file. There are two phases involved:

1. Export your existing users and their group memberships from your external directory into a CSV file or files.
2. Import the users, groups and group memberships into a Crowd directory from the CSV files.

   The CSV importer is available with Crowd 1.1.1 and later.

Preparing your CSV Files

You will need:

- a CSV file containing user information, and
- optionally, another CSV file containing group memberships.

Attached are simple examples of the CSV files:

- Example user CSV file
- Example group membership CSV file

The CSV Importer's 'File Mappings' screen allows you to match the CSV fields to Crowd's User and Group fields.

Formatting and location of the CSV files:

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location</td>
<td>The CSV files must be on the local drive (e.g. C:) of the Crowd server.</td>
</tr>
<tr>
<td>Supported attributes</td>
<td>The CSV Importer does not support custom attributes. The supported attributes are shown in the drop-down lists on the 'File Mappings' screen.</td>
</tr>
<tr>
<td>Header row</td>
<td>The first row in each CSV file must be a header row. The CSV Importer will not import the information in the first row. The information in the first row is displayed in the column labelled 'CSV Header Row' on the 'File Mappings' screen</td>
</tr>
<tr>
<td>Delimiter</td>
<td>The fields in the CSV file must be separated by a single-character delimiter. The CSV Importer's 'Configuration' screen lets you tell Crowd which delimiter you have used.</td>
</tr>
<tr>
<td>Passwords</td>
<td>You will need to decide whether to import your passwords into Crowd. And if you do import the passwords, you must choose to import them as either encrypted or clear text. Check the password encryption in the directory you are exporting users from, and compare it with the encryption method of the Crowd directory you want to import the users into. You can use Crowd's Directory Browser to view the directory's configuration details, including the encryption method. The CSV Importer's 'Configuration' screen lets you tell the CSV Importer whether to encrypt the passwords.</td>
</tr>
</tbody>
</table>

To export information from your user directory into a CSV file,

1. Export the users from your external user directory or database into a CSV file. Your directory or user base should have an option to allow you to do this.
2. If you want to copy your existing group memberships into Crowd, export the groups and group memberships into another CSV file.

Importing the CSV Files into Crowd

Once you have prepared your CSV file(s), you can import the users and groups into a Crowd directory.

To import users and groups from CSV files,

1. Log in to the Crowd Administration Console.
2. Click the 'Users' link in the top navigation bar.
3. This will display the User Browser. Click the 'Import Users' link.
4. This will display the 'Import Type' screen. Click the 'CSV Importer' button.
5. This will display the 'Configuration' tab of the 'CSV Importer'.
6. Enter the details of the CSV files as described in 'Configuring the CSV Importer'.

Crowd Documentation

Configuring the CSV Importer

Once you have started the CSV Importer, the 'Configuration' screen allows you to specify information about the Crowd directory and CSV file(s) involved in the import.

Refer to information on preparing your CSV files.

To configure the CSV importer,

1. Start the CSV Importer.
2. This will display the 'Configuration' screen. Complete the fields as follows:
   - 'Directory' — Select the Crowd user directory into which you want to import the users.
   - 'Are your passwords encrypted?' — Select 'Yes' if the passwords in your CSV file are already encrypted. Crowd will not re-encrypt the passwords during the import. Select 'No' if the passwords in your CSV file are not encrypted.
   - 'Group Membership File' — If you want to import groups and group memberships of your users, type the location of the CSV file containing the group membership information.
3. Click the 'Continue' button to map the CSV fields to the Crowd directory fields.

Mapping CSV Fields to Crowd Fields

Once you have entered details on the Configuration screen of the CSV Importer, the 'File Mappings' screen allows you to match the CSV fields to the User and Group fields in Crowd. Crowd will use these mappings to import the information from the CSV file(s) into your Crowd directory.

Refer to information on preparing your CSV files.

The 'File Mappings' screen has two main sections:

- **User Mappings** — Use this section to map the fields in your 'User' CSV file.
- **Group Mappings** — Use this section to map the fields in your 'Group Membership' CSV file, if you have one. This section will only appear if you have specified a 'Group Membership File' on the Configuration screen.

Each section has the following columns:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSV Header Row</td>
<td>This column shows the text from each field in the first row of your CSV file. The CSV Importer assumes that the first row is a header row.</td>
</tr>
<tr>
<td>Sample Row</td>
<td>This column shows the text from each field in the second row of your CSV file. This is done to help you with the mapping process.</td>
</tr>
<tr>
<td>Mapping</td>
<td>Each row in this column contains a drop-down list of the Crowd field names available for mapping. To map a Crowd field to a CSV field, select the appropriate Crowd field name from the drop-down list to match the CSV field shown in the 'CSV Header Row' column.</td>
</tr>
</tbody>
</table>

In the 'User Mappings' section, the 'Mapping' drop-down lists contain the following Crowd field names:

<table>
<thead>
<tr>
<th>Crowd field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Name</td>
<td>Required. One of the rows on the screen must map this value to the CSV field containing the users' first names.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Required. One of the rows on the screen must map this value to the CSV field containing the users' last names.</td>
</tr>
<tr>
<td>Email Address</td>
<td>Required. One of the rows on the screen must map this value to the CSV field containing the users' email addresses.</td>
</tr>
<tr>
<td>Username</td>
<td>Required. One of the rows on the screen must map this value to the CSV field containing the usernames.</td>
</tr>
<tr>
<td>Password</td>
<td>If your CSV file contains passwords, map this value to the CSV field containing the passwords.</td>
</tr>
<tr>
<td>None</td>
<td>Select 'None' if the CSV field displayed under 'CSV Header Row' is not to be mapped to any Crowd fields. These CSV fields will not be imported into Crowd.</td>
</tr>
</tbody>
</table>

In the 'Group Mappings' section (if present), the 'Mapping' drop-down lists contain the following Crowd field names:
<table>
<thead>
<tr>
<th>Crowd field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Name</td>
<td>Required. One of the rows on the screen must map this value to the CSV field containing the names of the groups.</td>
</tr>
<tr>
<td>Username</td>
<td>Required. One of the rows on the screen must map this value to the CSV field containing the usernames.</td>
</tr>
<tr>
<td>None</td>
<td>Select ‘None’ if the CSV field displayed under ‘CSV Header Row’ is not to be mapped to any Crowd fields. These CSV fields will not be imported into Crowd.</td>
</tr>
</tbody>
</table>

**To map the CSV fields to Crowd fields,**

1. Start the **CSV Importer**.
2. Complete the details on the ‘Configuration screen’ and click the ‘Continue’ button.
3. This will display the ‘File Mappings’ screen. Complete the mappings in the ‘User Mappings’ section as follows:
   - In the ‘CSV Header Row’ column, find the field which contains your users’ first names — select ‘First Name’ from the drop-down list in the ‘Mapping’ column.
   - In the ‘CSV Header Row’ column, find the field which contains your users’ last names — select ‘Last Name’ from the drop-down list in the ‘Mapping’ column.
   - In the ‘CSV Header Row’ column, find the field which contains your users’ email addresses — select ‘Email Address’ from the drop-down list in the ‘Mapping’ column.
   - In the ‘CSV Header Row’ column, find the field which contains the usernames — select ‘Username’ from the drop-down list in the ‘Mapping’ column.
   - In the ‘CSV Header Row’ column, find the field which contains your users’ passwords — select ‘Password’ from the drop-down list in the ‘Mapping’ column.
   - Select ‘None’ from the drop-down lists for all unmatched rows.
4. Complete the mappings in the ‘Group Mappings’ section (if present) as follows:
   - In the ‘CSV Header Row’ column, find the field which contains the group names — select ‘Group Name’ from the drop-down list in the ‘Mapping’ column.
   - In the ‘CSV Header Row’ column, find the field which contains the usernames — select ‘Username’ from the drop-down list in the ‘Mapping’ column.
   - Select ‘None’ from the drop-down lists for all unmatched rows.
5. Click the ‘Continue’ button to confirm the CSV configuration.

- Viewing the Results of the Import

**Crowd Documentation**

**Confirming the CSV Importer Configuration**

The 'Confirmation' screen allows you to review your configuration and mapping before performing the CSV import.

To confirm the CSV configuration and mapping,

1. Review the information shown on the 'Confirmation' screen.
2. Click the 'Continue' button to import the users from your CSV file into your Crowd directory.
3. Once the import is complete, Crowd will display the 'Results' screen.
The CSV Importer adds to the Crowd directory, but does not update or delete existing information:

- If the Username already exists in Crowd, the CSV Importer does not overwrite the information for that user even if the Username exists in the CSV file with different user information.
- The CSV Importer does not remove users from Crowd.
- If your 'Group Membership' CSV file contains additional group(s) for a user, the additional group(s) and group membership(s) will be imported.
- Existing group memberships will not be changed or removed.
- The 'Results' screen will show number of duplicate usernames in the CSV file which were ignored i.e. not imported.
- The 'Results' screen will show number of duplicate group names in the CSV file which were ignored i.e. not imported.

**Screenshot: 'CSV Importer - Results'**
Once you have added a directory, you can import users, groups and roles into it from an external system or from another directory defined in Crowd. To learn about importing from external systems, refer to Importing Users and Groups into a Directory. Below we tell you how to import from one Crowd directory to another.

You can copy users, groups, roles and memberships:

- From an LDAP directory to a Delegated Authentication directory.
- From one internal Crowd directory to another internal Crowd directory.

Things to be aware of:

- The 'Password Encryption' method must be the same in both directories, otherwise you will not be able to copy the users across.
- The directory importer does not support nested groups when importing users, groups and roles from LDAP into a delegated authentication directory. See CWD-1334.
- The 'source directory' is the directory you want to copy users, groups and roles from. The 'destination directory' is where you want to copy them to. Both directories must be defined in Crowd before you start the import process.

To import users, groups and roles from one Crowd directory into another,
1. Log in to the Crowd Administration Console.
2. If not already defined, add the source directory to Crowd.
3. If not already defined, add the destination directory to Crowd.
4. Click the 'Users' link in the top navigation bar.
5. This will display the User Browser. Click the 'Import Users' link.
6. This will display the 'Import Type' screen. Click the 'Directory Importer' button.
7. This will display the 'Options' screen, shown below. Complete the fields as follows:
   • 'Source Directory' — Select the directory that contains the users, groups and roles you want to copy.
   • 'Destination Directory' — Select the directory that you want to copy the users, groups and roles into.
   • 'Overwrite Destination Directory' — Tick the box if you want to delete and replace all the details and memberships for any user who exists in both source and destination directories:
      - If the checkbox is empty, Crowd will not update the user details for that username in the destination directory, but will add any new group or role memberships for that username.
      - If the checkbox is ticked, Crowd will remove all the details and memberships for that username from the destination directory and replace them with the details and memberships from the source directory.
8. Click the 'Continue' button.
9. The 'Confirmation' screen will be displayed. Check the details and click the 'Continue' button.
10. The 'Results' screen will be displayed, showing how many users, groups and roles have been imported into your Crowd directory.

If the import of any users, groups or roles failed, please check the log files to find out why.

Screenshot: 'Import users from one directory to another'

Next Steps

To allow the users to log in to the integrated application(s) via Crowd:

- Map the directory to the application(s), if not already done. See Mapping a Directory to an Application.
- Give the imported groups access to the application(s). See Specifying which Groups can access an Application.

  • Default Applications
  • Application Types

About the Application Browser
The Application Browser allows you to view and search for integrated applications.

To use the Application Browser,

1. Log in to the Crowd Administration Console.
2. Click the ‘Applications’ tab in the top navigation bar.
3. This will display the Application Browser, showing all the applications that exist in your Crowd system. You can refine your search by specifying a ‘Name’ (note that this is case sensitive), or ‘Active/Inactive’ applications.
4. To view or edit an application's details, click the application name or the ‘View’ link next to the specific application.

About Applications
Crowd integrates and provisions applications. Once defined, an application is mapped to a directory(s), whose users are then granted access to the application. Note that an application can only communicate with Crowd when the application uses a known host address.

Default Applications
When you first use the Application Browser, you will see a number of default applications, i.e. applications that are shipped with your Crowd
installation:

- **'crowd'** — This is the Crowd Administration Console. The Crowd Administration Console is itself a web application that is provisioned by Crowd. The 'crowd' application is mapped to the default directory which you defined during setup, and can be accessed by members of the crowd-administrators group.
- **'crowd-openid-server'** — This is the CrowdID application which you (optionally) configured during setup. It allows you to provide OpenID services to your users. For details please see the CrowdID Administration Guide and the CrowdID User Guide.
- **'demo'** — This is the 'demo' application which you (optionally) configured during setup. Its main purpose is to provide an example of how to integrate custom applications with Crowd.
- **'google-apps'** — This is the Crowd application connector which allows single sign-on (SSO) to Google Apps. To enable SSO between Crowd-connected applications and Google Apps, you will need to configure the Google Apps connector as described in Configuring the Google Apps Connector.

**Application Types**

Crowd supports the following application types, as indicated by the application-type icons on the Application Browser:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Crowd Icon" /></td>
<td>This icon marks the Crowd application.</td>
</tr>
<tr>
<td></td>
<td>- There will be one, and only one, application of this type.</td>
</tr>
<tr>
<td></td>
<td>- You cannot rename, deactivate or delete this application.</td>
</tr>
<tr>
<td><img src="image" alt="Bamboo Icon" /></td>
<td>This marks a Bamboo server connected to Crowd.</td>
</tr>
<tr>
<td><img src="image" alt="Confluence Icon" /></td>
<td>This marks a Confluence server connected to Crowd.</td>
</tr>
<tr>
<td><img src="image" alt="Crucible Icon" /></td>
<td>This marks a Crucible server connected to Crowd.</td>
</tr>
<tr>
<td><img src="image" alt="Fisheye Icon" /></td>
<td>This marks a Fisheye server connected to Crowd.</td>
</tr>
<tr>
<td><img src="image" alt="JIRA Icon" /></td>
<td>This marks a JIRA server connected to Crowd.</td>
</tr>
<tr>
<td><img src="image" alt="Remote Icon" /></td>
<td>These are the 'remote' applications, which you can add to Crowd as described in Adding an Application. This application type does not include plugin applications. You can rename, deactivate or delete remote applications.</td>
</tr>
<tr>
<td><img src="image" alt="Plugin Icon" /></td>
<td>The 'plugin' applications are implemented as plugins to Crowd.</td>
</tr>
<tr>
<td></td>
<td>- An example of a plugin application is the Google Apps connector, which is shipped with your Crowd installation. To activate the Google Apps connector, you need to configure it.</td>
</tr>
<tr>
<td></td>
<td>- In future, other plugin applications may become available. You will then be able to install them by copying the relevant jars to your Crowd installation. See Important Directories and Files.</td>
</tr>
<tr>
<td></td>
<td>- All installed plugin applications are created automatically when the Crowd server starts up, by loading them from the relevant folders in your Crowd Home directory.</td>
</tr>
<tr>
<td></td>
<td>- You cannot rename or delete plugin applications. You can deactivate them.</td>
</tr>
</tbody>
</table>

**Crowd Documentation**

**Adding an Application**
This page gives an overview of the process for adding an application to Crowd, and refers to the application-specific pages for detailed instructions.

**Overview**

There are two main steps to integrating an application with Crowd:

- **Step 1. Configure Crowd to talk to your application** — that is, set up a directory in Crowd containing your users and groups, and then add the application to Crowd using the ‘Add Application’ wizard, as described below. The application will now be allowed to authenticate against Crowd.
- **Step 2. Configure the application to talk to Crowd** — that is, install the Crowd client into the application and configure the application to forward users’ authentication and security requests to Crowd.

**Detailed Instructions**

Please refer to the details for your specific application:

- Integrating Crowd with Atlassian Bamboo
- Integrating Crowd with Atlassian Confluence
- Integrating Crowd with Atlassian CrowdID
- Integrating Crowd with Atlassian Crucible
- Integrating Crowd with Atlassian FishEye
- Integrating Crowd with Atlassian JIRA
- Integrating Crowd with Acegi Security
- Integrating Crowd with Apache
- Integrating Crowd with Jive Forums
- Integrating Crowd with Spring Security
- Integrating Crowd with Subversion
- Integrating Crowd with a Custom Application

**Using Crowd’s ‘Add Application’ Wizard**

1. Log in to the Crowd Administration Console.
2. Click the ‘Applications’ tab in the top navigation bar.
3. This will display the Application Browser. Click ‘Add Application’ in the left-hand menu.
4. This will display the first screen for the ‘Add Application’ wizard for Crowd. Complete the fields as described in the table below.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Type</td>
<td>This is used to define the type of application you are adding to Crowd. If you cannot see a matching application type, please choose the ‘Generic Application’ option.</td>
</tr>
</tbody>
</table>
4. The username which the application will use when it authenticates against the Crowd framework as a client. This value must be unique, i.e. it cannot be used by more than one application client.

5. A short description of the application. Note: A URL is often helpful.

6. The password which the application will use when it authenticates against the Crowd framework as a client.

7. Retype the same password as above, to confirm it.

After completing this form, click the 'Next' button to go to the 'Connection' step.

5. Enter the connection details for your application, as described in the table below.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>The URL of your application. For example this may be <a href="http://jira.atlassian.com">http://jira.atlassian.com</a>. After entering the URL for the application, you can click the 'Resolve IP Address' button. Crowd will attempt to resolve the IP address for your application.</td>
</tr>
<tr>
<td>Remote IP Address</td>
<td>This is the IP address of the server where your application exists. To help you work this out, you can click the 'Resolve IP Address' button once you have entered a URL.</td>
</tr>
</tbody>
</table>

After completing this form, click the 'Next' button to go to the 'Directories' step.

6. Now select the directories that this application can use for authentication and authorisation:

   Click the relevant checkbox(es) to select one or more directories.
   After completing this form, click the 'Next' button to go to the 'Authorisation' step.

7. In the 'Authorisation' step you will determine the users who are authorised to access the application.
For each directory, you should do one of the following:
- Either select 'Allow all users to authenticate', to grant application access to all users defined in the directory.
- Or select one or more groups you wish to have access, and click 'Add Group' to add each group to the list. The 'Add Group' button appears when you select a group.
- To remove a group from the list after adding it, click the 'remove' link that will appear next to the authorised groups' names.

After completing this form, click the 'Next' button to go to the 'Confirmation' step.

8. Now confirm the details for your application.

Check the details of your application.
- If you need to change anything, you can click the tabs to go back to one of the steps in the 'Add Application' wizard.
- When you are happy with the details, click the 'Add Application' button

You will now be on the 'View Application' page where you can adjust most of the options you have selected during the creation process.

9. After completing the 'Add Application' wizard, remember to configure the application as described in the detailed instructions:
- Integrating Crowd with Atlassian Bamboo
- Integrating Crowd with Atlassian Confluence
- Integrating Crowd with Atlassian CrowdID
- Integrating Crowd with Atlassian Crucible
- Integrating Crowd with Atlassian FishEye
- Integrating Crowd with Atlassian JIRA
- Integrating Crowd with Acegi Security

Crowd Documentation

Integrating Crowd with Atlassian Bamboo

This page tells you how to connect Atlassian's Bamboo integration server to one or more directory servers through Crowd.

Currently Crowd supports centralised authentication and single sign-on for Bamboo versions 1.2.2 and later.

Please check that this documentation applies to your version of Crowd

Please check the Crowd release number in this documentation against your version of Crowd. If you are using a different version of Crowd, you can find the appropriate documentation under ‘Previous Versions’ on the Crowd documentation homepage.

Prerequisites

Due to incompatible atlassian-user libraries, Bamboo releases prior to 1.2.2 are not compatible with latest version of Crowd. Please upgrade to the latest version of Bamboo before attempting to integrate Crowd.

1. Download and install Crowd. Refer to the Crowd installation guide for instructions. We will refer to the Crowd root folder as CROWD.
2. Download and install Bamboo (version 1.2.2 or later). Refer to the Bamboo Installation Guide for instructions. We will refer to the Bamboo root folder as BAMBOO. For the purposes of this document, we will assume that you have used the Standalone (ie. the easier) installation method of Bamboo. If you need to install Bamboo as an EAR/WAR, simply explode the EAR/WAR and make the necessary changes as described below, then repackage the EAR/WAR.
3. Run the Bamboo Setup Wizard, as described in the Bamboo documentation. During this setup process, you will define the Bamboo administrator's username and password. It is easier to do this before you integrate Bamboo with Crowd.
4. After you have installed and set up Bamboo, shut Bamboo down before you begin the integration process described below.

Step 1. Configuring Crowd to Talk to Bamboo

1.1 Prepare Crowd’s Directories/Groups/Users for Bamboo

1. Create a Crowd directory: The Bamboo application will need to authenticate users against a directory configured in Crowd. You will need to set up a directory in Crowd for Bamboo. For more information on how to do this, see Adding a Directory. We will assume that the directory is called Crowd Bamboo Directory for the rest of this document. It is possible to assign more than one directory for an application, but for the purposes of this example, we will use Crowd Bamboo Directory to house Bamboo users.

2. Add users and groups: You can either import them from your Bamboo deployment or add them manually.
   - Importing users and groups from Bamboo: If you have an existing Bamboo deployment and would like to import existing users and groups into Crowd, use the Bamboo Importer tool by navigating to Users > Import Users > Atlassian Importer. Select 'Bamboo' as the Atlassian Product and the Crowd Bamboo Directory as the directory into which Bamboo users will be
imported. For details please see Importing Users from Atlassian Bamboo. If you are going to import users into Crowd, you need to do this now, before you proceed any further.

- **Adding users and groups manually:** Bamboo needs an administrative group to exist in the directory in order to access the administration features. You can also create an optional additional group for other users. Create the groups in the Crowd Bamboo Directory:
  
  - `bamboo-admin`
  - `bamboo-user` *(optional)*

  See the documentation on Creating Groups for more information on how to define these groups.

  - Create at least one user in the Crowd Bamboo Directory and assign the user(s) to both the `bamboo-user` and the `bamboo-admin` groups. The Crowd documentation has more information on creating groups, creating users and assigning users to groups.

### 1.2 Define the Bamboo Application in Crowd

Crowd needs to be aware that the Bamboo application will be making authentication requests to Crowd. We need to add the Bamboo application to Crowd and map it to the Crowd Bamboo Directory:

1. Log in to the Crowd Administration Console and navigate to **Applications > Add Application**.

2. Complete the 'Add Application' wizard for the Bamboo application. See the instructions. The Name and Password values you specify in the 'Add Application' wizard must match the `application.name` and `application.password` that you will set in the Bamboo/webapp/WEB-INF/classes/crowd.properties file. (See Step 2 below.)

### 1.3 Specify which Users can Log In to Bamboo

Once Crowd is aware of the Bamboo application, Crowd needs to know which users can authenticate (log in) to Bamboo via Crowd. As part of the 'Add Application' wizard, you will set up your directories and group authorisations for the application. If necessary, you can adjust these settings after completing the wizard. Below are some examples.

You can either allow entire directories to authenticate, or just particular groups within the directories. In our example, we will allow the `bamboo-user` and `bamboo-admin` groups within the Crowd Bamboo Directory to authenticate:

<table>
<thead>
<tr>
<th>Directory – Group</th>
<th>Status</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bamboo Directory – <code>bamboo-admin</code></td>
<td>Active</td>
<td>Remove</td>
</tr>
<tr>
<td>Bamboo Directory – <code>bamboo-user</code></td>
<td>Active</td>
<td>Remove</td>
</tr>
</tbody>
</table>

If you are not using a `bamboo-user` group as a security restriction, you will need to set 'Allow all to authenticate' to 'true' when mapping the directory, otherwise only `bamboo-admin` group members will be able to log in to Bamboo.

### 1.4 Specify the Address from which Bamboo can Log In to Crowd

As part of the 'Add Application' wizard, you will set up Bamboo's IP address. This is the address which Bamboo will use to authenticate to Crowd. If necessary you can add a hostname, in addition to the IP address, after completing the wizard. See Specifying an Application's Address or Hostname.

#### Step 2. Configuring Bamboo to Talk to Crowd

⚠️ If your Bamboo version is earlier than 1.2.2, please upgrade to the latest stable version of Bamboo.

### 2.1 Install the Crowd Client Libraries into Bamboo

Bamboo needs Crowd's client libraries in order to be able to delegate user authentication to the Crowd application. In some cases, you will need to modify the Bamboo application, which is stored in BAMBOO/webapp.

1. Please check your versions of Crowd and Bamboo:
• If you are using Bamboo 1.2.2 to 1.2.4, you will need to update the Bamboo libraries as described in this step below.

• If you are using Bamboo 2.0 or later, the Crowd client libraries and crowd.properties file are included in the Bamboo 2.0 installation download. Please check if your version of Crowd is the same version as the Crowd client library included in the Bamboo 2.x.x installation download (e.g. Bamboo 2.0 currently includes the client library for Crowd 1.3).
  • If the Crowd library versions are different, you will need to update the Bamboo libraries as described in this step below.
  • If the Crowd library versions are the same, you can skip this step.

• Remove any existing versions of crowd-integration-client-X.X.X.jar from your BAMBOO/webapp/WEB-INF/lib directory. For example, remove crowd-integration-client-1.3.jar and replace it with the client jar provided in your crowd installation.

• Copy the Crowd client libraries and configuration files to Bamboo:

<table>
<thead>
<tr>
<th>Copy From</th>
<th>Copy To</th>
</tr>
</thead>
<tbody>
<tr>
<td>CROWD/client/crowd-integration-client-X.X.X.jar</td>
<td>BAMBOO/webapp/WEB-INF/lib</td>
</tr>
<tr>
<td>CROWD/client/conf/crowd.properties</td>
<td>BAMBOO/webapp/WEB-INF/classes</td>
</tr>
<tr>
<td>CROWD/client/conf/crowd-ehcache.xml</td>
<td>BAMBOO/webapp/WEB-INF/classes</td>
</tr>
</tbody>
</table>

2. For all versions of Bamboo: Add an explicit configuration for the Crowd cache settings as described below.
   After copying the CROWD/client/conf/crowd-ehcache.xml file to [BAMBOO/webapp/WEB-INF/classes], we highly recommend that you edit the Crowd cache settings to tune the cache behaviour as described below. Bamboo and Crowd will start work without this step, but Bamboo's users and groups will be cached for ever (until Bamboo is restarted), and any changes made in the Crowd-connected user directory will not be reflected in Bamboo until Bamboo is restarted.
   • Edit the crowd-ehcache.xml file, which is located in BAMBOO/webapp/WEB-INF/classes directory.
   • Add explicit settings for the following caches:
     - com.atlassian.crowd.integration-user
     - com.atlassian.crowd.integration-group
     - com.atlassian.crowd.integration-parentgroup
     - com.atlassian.crowd.integration-group-membership
     - com.atlassian.crowd.integration-all-memberships
     - com.atlassian.crowd.integration-all-group-members

3. For Bamboo 1.2.4 only: You will need to remove the seraph-0.7.23.jar file from Bamboo's WEB-INF/lib/ directory and replace it with the following file:
   http://repository.atlassian.com/maven2/com/atlassian/seraph/atlassian-seraph/0.10/atlassian-seraph-0.10.jar
   (Note: the 0.10 version of the Seraph JAR is newer than 0.7.23.)

2.2 Edit Bamboo's crowd.properties file

Configure the Bamboo application's properties to determine how Crowd will interact with Bamboo.

1. Edit BAMBOO/webapp/WEB-INF/classes/crowd.properties. Change the following properties:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>application.name</td>
<td>bamboo</td>
</tr>
<tr>
<td>application.password</td>
<td>set a password</td>
</tr>
<tr>
<td>crowd.server.url</td>
<td><a href="http://localhost:8095/crowd/services/">http://localhost:8095/crowd/services/</a></td>
</tr>
<tr>
<td>session.validationinterval</td>
<td>Set to 0, if you want authentication checks to occur on each request. Otherwise set to the number of minutes between requests to validate if the user is logged in or out of the Crowd SSO server. Setting this value to 1 or higher will increase the performance of Crowd's integration.</td>
</tr>
</tbody>
</table>

If your Crowd server's port is configured differently from the default (8095), set it accordingly.

You can read more about the crowd.properties file.

2.3 Configure Bamboo to use Crowd's Authenticator

Now that the Crowd client libraries exist, we need to configure Bamboo to use them.

1. Edit the Bamboo/webapp/WEB-INF/classes/atlassian-user.xml file so that the contents of the file is:
2. At this stage, Bamboo is set up for **centralised authentication**. If you wish to enable **single sign-on (SSO)** to Bamboo, refer to section 2.5 of this document.

### 2.4 Configure External User Management in Bamboo

For Bamboo to integrate successfully with Crowd, Bamboo's **External User Management** option needs to be:

- **Checked** if you are using an LDAP directory with Crowd and you don't have write-access in LDAP.
- **Unchecked** if you are using internal Crowd directories, or Crowd with LDAP where you do have write-access.
- **Unchecked** if you are using a **Delegated Authentication** directory.

More information:

- Please ignore the wording on some versions of the Bamboo screens, which may imply that you should check this option.
- In later versions of Bamboo, the option will be called **Read-Only External User Management**.
- Refer to the Bamboo documentation for full details of Bamboo's external management configuration.

### Security and Permission

You can change the following security and permission related settings for Bamboo.

#### Change Global Security and Permission Properties

- **Enable External User Management?**
  Enable this option if you are delegating your user management to another user management system (e.g. Crowd).
- **Enable Signup?**
  This will allow users to sign up for an account on Bamboo.
- **Enable contact details to be displayed?**
  This will allow Bamboo users contact details to be visible. Disabling this option will hide the email address, IM address, and the group the user is in.

#### 2.5 (Optional) Enable Single Sign-On

**SSO is optional**

Single sign-on (SSO) is optional when integrating Bamboo and other Atlassian products with Crowd. To use centralised authentication **without** SSO, skip the steps below.

To enable single sign-on (SSO), you will configure Bamboo's authentication and access request calls to use Seraph. To configure Seraph-based authentication:

1. **Edit the** `\BAMBOO\webapp\WEB-INF\classes\seraph-config.xml`
2. **Comment out the** `authenticator` node:

   ```xml
   <!--<authenticator class="com.atlassian.bamboo.user.authentication.BambooAuthenticator"/>-->
   ```

   and add a new one:

   ```xml
   <authenticator class="com.atlassian.crowd.integration.seraph.BambooAuthenticator"/>
   ```
Bamboo’s authentication and access request calls will now be performed using Seraph.

2.6 (Optional) Tune the Cache

When using the atlassian-user and Crowd framework together with Bamboo, it is highly recommended that caching be enabled. Multiple redundant calls to the atlassian-user framework are made on any given request. These results can be stored locally between calls by enabling caching via the Crowd Options menu. (Note that this caching in the Crowd application is enabled by default.)

Bamboo will obtain all necessary information for the period specified by the cache configuration - see Configuring Caching for an Application. If a change or addition occurs in Crowd to users, groups and roles, these changes will not be visible in Bamboo until the cache expires for that specific item (i.e. for the particular user, group or role).

The default value for the application cache is 5 minutes (300 seconds). To increase the performance of your application, consider changing the cache value to one or two hours (3600 or 7200 seconds).

See Crowd in Action

Welcome to Bamboo with Crowd!

- Users belonging to the bamboo-user group should now be able to log in to Bamboo. Try adding a user to the group using Crowd — you should be able to log in to Bamboo using this newly created user. That’s centralised authentication in action!
- If you have enabled SSO, you can try adding the Crowd Bamboo Directory and bamboo-admin group to the crowd application (see Mapping a Directory to an Application and Specifying which Groups can access an Application). This will allow Bamboo administrators to log in to the Crowd Administrative Console. Try logging in to Crowd as a Bamboo administrator, and then point your browser at Bamboo. You should be logged in as the same user in Bamboo. That’s single sign-on in action!

Crowd Documentation

Integrating Crowd with Atlassian Confluence

Atlassian’s popular Confluence wiki can quickly be configured to use the atlassian-user libraries to link single or multiple directory servers through Crowd.
Compatibility of Confluence and Crowd Versions

For best performance and support, please ensure that your Crowd and Confluence versions are compatible:

- Crowd versions 1.2 and later support Confluence 2.6.2 and later.
- This version of Crowd does not support Confluence 2.6.1 or earlier.
- If you are using Confluence 2.8 or later, please upgrade to Crowd 1.3.2 or later.
  Explanation: With Confluence 2.8 the atlassian-user interface has changed, and Crowd 1.3.2 provides the required update to Crowd's atlassian-user integration module.

Prerequisites

1. Download and install Crowd. Refer to the Crowd installation guide for instructions. We will refer to the Crowd root folder as CROWD.
2. Download and install Confluence (version 2.6.2 or later). Refer to the Confluence installation guide for instructions. We will refer to the Confluence root folder as CONFLUENCE.
3. Run the Confluence Setup Wizard, as described in the Confluence documentation. During this setup process, you will define the Confluence administrator's username and password. It is easier to do this before you integrate Confluence with Crowd.
4. After setting up Confluence, shut down Confluence before you begin the integration process described below.

Step 1. Configuring Crowd to Talk to Confluence

1.1 Prepare Crowd's Directories/Groups/Users for Confluence

The Confluence application will need to authenticate users against a directory configured in Crowd. You will need to set up a directory in Crowd for Confluence. For more information on how to do this, see Adding a Directory. We will assume that the directory is called Confluence Directory for the rest of this document. It is possible to assign more than one directory for an application, but for the purposes of this example, we will use Confluence Directory to house Confluence users.

Confluence also requires particular groups to exist in the directory in order to authenticate users. You will need to create two groups in the Confluence Directory:

1. confluence-users
2. confluence-administrators

See the documentation on Creating Groups for more information on how to define these groups.

You also need to ensure that the Confluence Directory contains at least one user who is a member of both groups. Choose one of the two options below:

- If you have an existing Confluence deployment and would like to import existing users and groups into Crowd, use the Confluence Importer tool by navigating to Users > Import Users > Atlassian Importer. Select Confluence as the Atlassian product, and the Confluence Directory as the directory into which Confluence users will be imported. For details please see Importing Users from Atlassian.
- If you don't wish to import your Confluence users, make sure you use Crowd to create at least one user in the confluence-users and the confluence-administrators group. The Crowd documentation has more information on creating groups, creating users and assigning users to groups.

1.2 Define the Confluence Application in Crowd

Crowd needs to be aware that the Confluence application will be making authentication requests to Crowd. We need to add the Confluence application to Crowd and map it to the Confluence Directory:

1. Log in to the Crowd Administration Console and navigate to Applications > Add Application.

2. Complete the 'Add Application' wizard for the Confluence application. See the instructions. The Name and Password values you specify in the 'Add Application' wizard must match the application.name and application.password that you will set in the CONFLUENCE/confluence/WEB-INF/classes/crowd.properties file. (See Step 2 below.)

1.3 Specify which Users can Log In to Confluence
Once Crowd is aware of the Confluence application, Crowd needs to know which users can authenticate (log in) to Confluence via Crowd. As part of the 'Add Application' wizard, you will set up your directories and group authorisations for the application. If necessary, you can adjust these settings after completing the wizard. Below are some examples.

You can either allow entire directories to authenticate, or just particular groups within the directories. In our example, we will allow the confluence-users and confluence-administrators groups within the Confluence Directory to authenticate:

![Confluence Groups Configuration](image)

For details please see Specifying which Groups can access an Application.

1.4 Specify the Address from which Confluence can Log In to Crowd

As part of the 'Add Application' wizard, you will set up Confluence's IP address. This is the address which Confluence will use to authenticate to Crowd. If necessary you can add a hostname, in addition to the IP address, after completing the wizard. See Specifying an Application's Address or Hostname.

Step 2. Configuring Confluence to Talk to Crowd

2.1 Install the Crowd Client Library into Confluence

Confluence needs Crowd's client library and configuration file in order to be able to delegate user authentication to the Crowd application. As stated earlier, we will modify the Confluence application by editing the standalone application, which is an exploded WAR stored in CONFLUENCE/confluence.

1. Copy the Crowd client library and configuration file to Confluence:

<table>
<thead>
<tr>
<th>Copy From</th>
<th>Copy To</th>
</tr>
</thead>
<tbody>
<tr>
<td>CROWD/client/crowd-integration-client-X.X.X.jar</td>
<td>CONFLUENCE/confluence/WEB-INF/lib</td>
</tr>
<tr>
<td>CROWD/client/conf/crowd.properties</td>
<td>CONFLUENCE/confluence/WEB-INF/classes</td>
</tr>
</tbody>
</table>

There is no need to copy across anything from CROWD/client/lib. All the required libraries from that directory already exist in Confluence versions 2.3 and later.

A note about older Confluence versions

Confluence 2.5.6 to 2.6.1 are not compatible with Crowd 1.2 and later. We recommend that you upgrade to Confluence 2.6.2 or later.

If you can not upgrade your Confluence instance, you will need to remove the seraph-X.X.X.jar file from Confluence's `<CONFLUENCE-INSTALLATION>/confluence/WEB-INF/lib/seraph-X.X.X.jar` and replace it with the following file:

http://repository.atlassian.com/maven2/com/atlassian/seraph/atlassian-seraph/0.10/atlassian-seraph-0.10.jar

2. Replace Confluence's cache configuration file:

<table>
<thead>
<tr>
<th>Copy From</th>
<th>Replace File</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
3. Edit `CONFLUENCE/confluence/WEB-INF/classes/crowd.properties`. Change the following properties:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>application.name</td>
<td>confluence</td>
</tr>
<tr>
<td>application.password</td>
<td>Set a password.</td>
</tr>
<tr>
<td>crowd.server.url</td>
<td><a href="http://localhost:8095/crowd/services/">http://localhost:8095/crowd/services/</a></td>
</tr>
<tr>
<td>session.validationinterval</td>
<td>This is the number of minutes between validation requests, when Crowd validates whether the user is logged in to or out of the Crowd SSO server. Set this value to 0 if you want authentication checks to occur on each request. Otherwise set to the required number of minutes between validation requests. Setting this value to 1 or higher will increase the performance of Crowd's integration.</td>
</tr>
</tbody>
</table>

If your Crowd server's port is configured differently from the default (i.e. 8095), set it accordingly. The `application.name` and `application.password` must match the `Name` and `Password` that you specified when defining the application in Crowd (see Step 1 above). Confluence does not use any of the other attributes of the `crowd.properties` file.

You can read more about the `crowd.properties` file.

### 2.2 Configure Confluence to use Crowd's Authenticator

Now that the Crowd client libraries exist, we need to configure Confluence to use them.

1. Edit the `CONFLUENCE/confluence/WEB-INF/classes/atlassian-user.xml` file so that the contents of the file is:

   ```xml
   <atlassian-user>
       <repositories>
           <crowd key="crowd" name="Crowd Repository"/>
       </repositories>
   </atlassian-user>
   ```

2. At this stage, Confluence is set up for **centralised authentication**. If you wish, you can now enable **single sign-on (SSO)** to Confluence. Skip this step if you are using the Confluence NTLM plugin to enable SSO. Instead, follow the instructions on configuring Confluence for NTLM SSO.

   Edit `CONFLUENCE/confluence/WEB-INF/classes/seraph-config.xml`. Comment out the `authenticator` node:

   ```xml
   <!--<authenticator class="com.atlassian.confluence.user.ConfluenceAuthenticator"/>-->
   ```

   and add a new one:

   ```xml
   <authenticator class="com.atlassian.crowd.integration.seraph.ConfluenceAuthenticator"/>
   ```

   Confluence's authentication and access request calls will now be performed using Seraph.

### 2.3 Enable Confluence's External User Management

Once the setup is complete, you may optionally wish to enable a Confluence feature known as 'External User Management' in Confluence, to prevent Confluence administrators from creating/modifying users. For more information please see the Confluence documentation regarding External User Management.
If you are using Confluence 2.6.2 or earlier, this step is required i.e. you must turn on external user management in Confluence.

If you have imported Confluence users into Crowd, you may want to delay turning on 'External User Management' for a week or two, to give users time to reset their passwords. (Because users' passwords are encrypted in Confluence's database, they will not be copied across to Crowd.)

2.4 (Optional) Tune the Cache

Enabling caching on the Crowd server: When using the Atlassian-User and Crowd framework together with Confluence, it is highly recommended that caching be enabled on the Crowd server. Multiple redundant calls to the Atlassian-User framework are made on any given request. These results can be stored locally between calls by enabling caching via the Crowd Options menu. Note that this caching on the Crowd server is enabled by default.

Enabling application caching for Confluence: If application caching is enabled for Confluence, Confluence will obtain all necessary information for the period specified by the cache configuration. See Configuring Caching for an Application. If a change or addition occurs to Crowd users, groups and roles, these changes will not be visible in Confluence until the cache expires for that specific item, i.e. for the particular user, group or role.

The default period for the application cache is 5 minutes (300 seconds). To increase the performance of your application, consider changing the cache value to one or two hours (3600 or 7200 seconds).

See Crowd in Action

- Users belonging to the confluence-users group should now be able to log in to Confluence.
- Try adding a user to the confluence-users group using Crowd — you should be able to log in to Confluence using this newly created user. That's centralised authentication in action!
- If you have enabled SSO, you can try adding the Confluence Directory and confluence-administrators group to the crowd application (see Mapping a Directory to an Application and Specifying which Groups can access an Application). This will allow Confluence administrators to log in to the Crowd Administration Console. Try logging in to Crowd as a Confluence administrator, and then point your browser at Confluence. You should be logged in as the same user in Confluence. That's single sign-on in action!

Configuring Confluence for NTLM SSO

Confluence NTLM plugin not officially supported by Atlassian

The Confluence NTLM plugin was written by a third party. Atlassian does not officially support the plugin. The Atlassian Crowd team will do our best to advise on any Crowd integration problems. Please refer to the plugin documentation for installation instructions and further support.

Out of the box, Confluence does not support Single Sign On (SSO) functionality. This page describes how to set up Confluence with NTLM SSO functionality using the Confluence NTLM plugin, Crowd, and Active Directory (AD) as your LDAP user repository.

Summary

The Confluence NTLM plugin enables the following authentication scenario:

- A user in a Windows domain logs into the Windows network, using their Active Directory username/password.
- Then, when they open Confluence in an Internet Explorer browser, they are seamlessly logged into Confluence.

The Crowd component then allows you to manage all users and groups in Active Directory. Crowd automatically ensures that users and groups are synchronised between AD and Confluence. For example, if a user/group is added/deleted from AD it will be automatically added/deleted from Confluence.

Components

<table>
<thead>
<tr>
<th>Confluence NTLM plugin</th>
<th>NTLM is the protocol used by Windows for authentication. The Confluence NTLM plugin takes care of the Windows domain / Active Directory login to Confluence. You must be running a Windows Domain Controller with accounts set up in AD in order to use this plugin. If NTLM authentication is not available, the plugin allows standard form-based login to Confluence. Note: This plugin is not officially supported by Atlassian.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Crowd</td>
<td>Crowd takes care of the synchronisation of users/groups between Active Directory and Confluence.</td>
</tr>
<tr>
<td></td>
<td>You will need to create an SSL connection between Crowd and the AD server if you would like to create users through Crowd. AD will not allow Crowd to add users or change their passwords unless the communication occurs over a secure connection.</td>
</tr>
<tr>
<td>Active Directory (AD) on Windows 2003 Server</td>
<td>Active Directory (AD) on Windows 2003 Server — you must already have an AD instance set up and running with a domain controller.</td>
</tr>
<tr>
<td>Confluence</td>
<td>The machine running Confluence must be part of the Windows domain or installed on the same box as the domain controller.</td>
</tr>
</tbody>
</table>

Steps

1. Back up your Confluence installation files and data:
   - Confluence Home directory. (See Confluence's Important Directories and Files for how to locate this).
   - Confluence installation directory (if you are using Confluence Standalone) or your Confluence webapp (if you are using Confluence EAR-WAR).
   - Your database (if you are not using the embedded database).
2. Download the Confluence NTLM plugin.
3. Install the plugin, following the instructions on the plugin documentation page.
4. In the ldaputil.properties file, insert the appropriate LDAP and Domain Controller information along with other parameters.
5. Install and configure Crowd.
6. Create a directory in Crowd for the AD LDAP server.
7. Create the Confluence application in Crowd and configure Crowd and Confluence to talk to each other, as described in Integrating Crowd with Atlassian Confluence.

When following the above instructions, **do not** change the seraph-config.xml file to enable Crowd's SSO functionality. (I.e. don't change the authenticator node to read `<authenticator class="com.atlassian.crowd.integration.seraph.ConfluenceAuthenticator"/>`. Instead of Crowd's SSO authentication, we'll be using the Confluence NTLM plugin.

8. In AD, create the groups **confluence-users** and **confluence-administrators**. They should then appear in Crowd.
9. In AD, create an admin user and make them a member of the above groups in AD.
10. Create any additional groups that you would like in AD.
11. Log in to the Windows domain using your desktop login and then open Confluence in an Internet Explorer browser. You should be logged in automatically.

Additional Crowd Performance Tips

- Change the default cache setting timeout in the file `<CONFLUENCE>\WEB-INF\classes\crowd-ehcache.xml`. For performance reasons, increase the object caching to 7,200 seconds (2 hours):
  
  ```
  timeToIdleSeconds="7200" timeToLiveSeconds="7200".
  ```

  This reduces the frequency of the requests from Crowd to the LDAP server when changes to LDAP objects (such as a group name or user attribute) are made, thus reducing the performance overhead.

- Turn on the ‘Use Paged Results’ option in the directory connector tab for the directory you’ve set up in Crowd.

Integrating Crowd with Atlassian CrowdID

Atlassian CrowdID is a free add-on to Crowd. It gives administrators a secure way to provide OpenID accounts for their users.

When installing Crowd 1.1+ the Crowd Setup Wizard allows you to install CrowdID with Crowd. If you chose to install CrowdID as part of the Setup Wizard, there is no need for further configuration. The CrowdID server will be up and running at http://localhost:8095/openidserver

If you have not already installed CrowdID, follow the instructions below to install it now.

Prerequisites

1. Download and install Crowd. Refer to the Crowd installation guide for detailed information on how to do this. We will refer to the Crowd root folder as CROWD.
2. This guide assumes that CrowdID was NOT installed with the installation of Crowd. If CrowdID was installed using the Crowd Setup Wizard, there is no need for further configuration.

Step 1. Configuring Crowd to Talk to CrowdID

1.1 Prepare Crowd’s Directories/Groups/Users for CrowdID

The CrowdID application will need to locate users from a directory configured in Crowd. You will need to set up a directory in Crowd for CrowdID. For information on how to do this, see Adding a Directory. We will assume that the directory is called CrowdID Directory for the rest of this document. It is possible to assign more than one directory for an application, but for the purposes of this example, we will use CrowdID Directory to house CrowdID users.

CrowdID also requires an administrator group to exist in the directory. You need to ensure that a crowd-administrators groups exist in the CrowdID Directory. Any user in this group will have CrowdID administrator access.

The Crowd documentation has more information on creating groups, creating users and assigning users to groups.

1.2 Define the CrowdID Application in Crowd

Crowd needs to be aware that the CrowdID application will be making authentication requests to Crowd. We need to add the CrowdID application to Crowd and map it to the CrowdID Directory.

1. Log in to the Crowd Administration Console and navigate to Applications > Add Application.

2. Complete the 'Add Application' wizard for the CrowdID application. See the instructions. The Name and Password values you specify in the 'Add Application' wizard must match the application.name and application.password that you will set in the CROWD/crowd-openidserver-webapp/WEB-INF/classes/crowd.properties file. (See Step 2 below.)

1.3 Specify which Users can Log In to CrowdID

Once Crowd is aware of the CrowdID application, Crowd needs to know which users can authenticate (log in) to CrowdID via Crowd. As part of the 'Add Application' wizard, you will set up your directories and group authorizations for the application. If necessary, you can adjust these settings after completing the wizard. Below are some examples.

You can either allow entire directories to authenticate, or just particular groups within the directories. In our example, we will allow the entire CrowdID Directory to authenticate:
### 1.4 Specify the Address from which CrowdID can Log In to Crowd

As part of the 'Add Application' wizard, you will set up CrowdID's IP address. This is the address which CrowdID will use to authenticate to Crowd.

If necessary you can add a hostname, in addition to the IP address, after completing the wizard. See Specifying an Application's Address or Hostname.

#### Step 2. Configuring CrowdID to Talk to Crowd

Edit `CROWD/crowd-openidserver-webapp/WEB-INF/classes/crowd.properties`. Change the following properties:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>application.name</td>
<td>crowd-openid-server</td>
</tr>
<tr>
<td>application.password</td>
<td>Set a password.</td>
</tr>
<tr>
<td>application.login.url</td>
<td><a href="http://localhost:8095/openidserver">http://localhost:8095/openidserver</a></td>
</tr>
<tr>
<td>crowd.server.url</td>
<td><a href="http://localhost:8095/crowd/services/">http://localhost:8095/crowd/services/</a></td>
</tr>
<tr>
<td>session.validationinterval</td>
<td>This is the number of minutes between validation requests, when Crowd validates whether the user is logged in to or out of the Crowd SSO server. Set this value to 0 if you want authentication checks to occur on each request. Otherwise set to the required number of minutes between validation requests. Setting this value to 1 or higher will increase the performance of Crowd's integration.</td>
</tr>
</tbody>
</table>

If your Crowd server's port is configured differently from the default (i.e. 8095), set it accordingly. The `application.name` and `application.password` must match the Name and Password that you specified when you defined the application in Crowd (see Step 1 above). The `application.login.url` should point to the correct host and port of the CrowdID application.

You can read more about the `crowd.properties` file.

#### See CrowdID in Action

- Go to http://localhost:8095/openidserver and log in with any user in the CrowdID Directory.

Integrating Crowd with Atlassian Crucible

You can use Crowd to provide external authentication and authorisation for Atlassian's Crucible code review tool.

**Crucible and FishEye**

When you purchase and install Crucible, you may also purchase Atlassian's FishEye source-repository viewer. If you have both FishEye and Crucible, they will share a common authentication mechanism and integration with Crowd. Crucible and FishEye will authenticate to Crowd using the same application name and password. See Integrating Crowd with Atlassian FishEye. If you have Crucible only (available from Crucible 1.6), you will need to set up the Crowd directory and application in the same way, following the instructions in Integrating Crowd with Atlassian FishEye.

**Prerequisites**

1. Download and install Crowd. Refer to the Crowd installation guide for detailed information on how to do this. We will refer to the Crowd root folder as CROWD.
2. Download and install Crucible. Refer to the Crucible Installation Guide for detailed information on how to do this.
3. Follow the instructions on integrating Crowd with FishEye.
   For Crucible versions 1.2.x and later, refer to the instructions for FishEye 1.4. For Crucible 1.1.x and earlier, refer to the instructions for FishEye 1.3.

**Configure Authorisation in Crucible Projects (If Required)**

Optionally, you can now use the Crowd users and/or groups in the permission schemes for your Crucible projects. If you have created groups in the Crowd directory which is mapped to your FishEye application (see Integrating Crowd with Atlassian FishEye), the Crowd groups can be seen in Crucible.

Please refer to the Crucible documentation for instructions on:

- Creating projects in Crucible (here).
- Creating permission schemes and assigning them to users and/or groups (here).
- Linking the permission scheme to a Crucible project (here).

- Overview of SSO
Integrating Crowd with Atlassian FishEye

You can use Crowd to provide external authentication and authorisation for Atlassian's FishEye source-repository viewer.

Crowd supports centralised authentication and single sign-on (SSO) for FishEye versions 1.3.1 and later.

**Crucible and FishEye**

If you are using Atlassian's Crucible code review tool, you will need to follow the instructions below on integrating Crowd with FishEye. If you have the standalone version of Crucible without FishEye (available from Crucible 1.6), please follow the instructions below to set up the Crowd directory and application for Crucible instead of FishEye. If preferred, you can change the name of your Crowd application and directory to 'Crucible' rather than 'FishEye'. Then follow the further instructions to integrate Crowd with Crucible.

**On this page:**
- Prerequisites
- Step 1. Configuring Crowd to Talk to FishEye
  - 1.1 Prepare Crowd's Directories/Groups/Users for FishEye
  - 1.2 Define the FishEye Application in Crowd
  - 1.3 Specify which Users can Log In to FishEye
  - 1.4 Specify the Address from which FishEye can Log In to Crowd
- Step 2. Configuring FishEye to Talk to Crowd
  - 2.1 Change the Details of your Existing FishEye Users
  - 2.2 Configure FishEye to use Crowd's Authenticator
  - 2.3 Configure Group Authorisation in FishEye (If Required)
- Next Step for Crucible Users

**Prerequisites**

1. Download and install Crowd. Refer to the Crowd installation guide for detailed information on how to do this. We will refer to the Crowd root folder as `CROWD`.
2. Download and install FishEye. Refer to the FishEye Installation Guide for detailed information on how to do this. We will refer to the FishEye root folder as `FISHEYE`.
   
   If you have the standalone version of Crucible (available from Crucible 1.6), there is no need to download or install FishEye.
3. After FishEye is set up, make sure FishEye is not running when you begin the integration process described below.

**Step 1. Configuring Crowd to Talk to FishEye**

**1.1 Prepare Crowd's Directories/Groups/Users for FishEye**

The FishEye application will need to authenticate users against a directory configured in Crowd. You will need to set up a directory in Crowd for FishEye. For more information on how to do this, see Adding a Directory. We will assume that the directory is called FishEye Directory for the rest of this document. It is possible to assign more than one directory for an application, but for the purposes of this example, we will use FishEye Directory to house FishEye users.

If you wish to use Crowd groups to control access to your FishEye repositories, you should set up your groups in Crowd. See the documentation on Creating Groups for more information on how to define these groups.

Use Crowd to create at least one user in the FishEye Directory. If you are using groups, assign your user(s) to the appropriate groups. The Crowd documentation has more information on creating users and assigning users to groups.

**1.2 Define the FishEye Application in Crowd**

Crowd needs to be aware that the FishEye application will be making authentication requests to Crowd. We need to add the FishEye application to Crowd and map it to the FishEye Directory:

1. Log in to the Crowd Administration Console and navigate to Applications > Add Application.

2. Complete the 'Add Application' wizard for the FishEye application. See the instructions. The Name and Password values you specify in the 'Add Application' wizard must match the 'Application name' and 'Application password' that you will set in FishEye's 'Crowd Authentication Settings' screen. (See Step 2 below.)

**1.3 Specify which Users can Log In to FishEye**

Crowd Authentication Settings
Once Crowd is aware of the FishEye application, Crowd needs to know which users can authenticate (log in) to FishEye via Crowd. As part of the 'Add Application' wizard, you will set up your directories and group authorisations for the application. If necessary, you can adjust these settings after completing the wizard. Below are some examples.

You can either allow entire directories to authenticate, or just particular groups within the directories. In our example, we will allow the entire FishEye Directory to authenticate:

### fmsesy

<table>
<thead>
<tr>
<th>Directory</th>
<th>Allow All to Authenticate</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>FishEye Directory</td>
<td>True</td>
<td>Remove</td>
</tr>
</tbody>
</table>

If you wish to authorise specific groups only, please see Mapping a Directory to an Application and Specifying which Groups can access an Application.

1.4 Specify the Address from which FishEye can Log In to Crowd

As part of the 'Add Application' wizard, you will set up FishEye's IP address. This is the address which FishEye will use to authenticate to Crowd. If necessary you can add a hostname, in addition to the IP address, after completing the wizard. See Specifying an Application's Address or Hostname.

**Step 2. Configuring FishEye to Talk to Crowd**

⚠️ The instructions below are for FishEye 1.4.x and later. If you are using FishEye 1.3.x, please follow the guide for earlier versions of FishEye.

2.1 Change the Details of your Existing FishEye Users

If you have an existing FishEye installation with existing built-in users, please do the following for each username in FishEye:

- Change the account type from 'built-in' to 'crowd'. This is required for the new authorisation through Crowd to work properly. For details please see the FishEye documentation.
- Ensure that the username in FishEye is the same as in Crowd. If necessary, rename the user in FishEye. See the FishEye documentation for details.

2.2 Configure FishEye to use Crowd's Authenticator

1. Log in to the FishEye Administration screens and navigate to 'Security'.
2. Select 'Setup Crowd authentication'.

FishEye allows only one authentication method to be configured at any one time. If you have already configured a different authentication source, click the 'Remove' link to remove that authentication method. You will then be presented with the options for different authentication methods – one will be the option to set up Crowd authentication.

3. The 'Crowd Authentication Settings' screen will appear, as shown below. Enter the following information:
   - **Application name** – The name for the FishEye application you specified in Step 1 above.
   - **Application password** – The password you specified in Step 1 above.
   - **Crowd URL** – `http://localhost:8095/crowd/services/`
     - The trailing slash is required.
   - **Auto-add** – Select 'Create a FishEye user on successful login' (default) to ensure that your Crowd users will be automatically enrolled into FishEye when they first log in via Crowd.
   - **Single sign on (SSO)** — Controls whether FishEye should attempt to participate in a single sign on (SSO) environment.

   - This SSO option is available only with FishEye 1.5.1 and later.
     - Select Enabled (default) if you want FishEye to use Crowd’s SSO capability.
     - Select Disabled if you want FishEye to use Crowd to check username/passwords and group membership, without participating in SSO. In this mode, FishEye will not read or set crowd.token cookies. This is useful in environments where you want FishEye to ignore crowd.token cookies set by other Crowd-enabled applications.
2.3 Configure Group Authorisation in FishEye (If Required)

If you have created groups in the Crowd directory which is mapped to your FishEye application (see Step 1 above), the Crowd groups can be seen in FishEye. Now you can set up group authorisation for your FishEye repositories.

Allow the groups to access your FishEye repositories as follows:

1. In the FishEye Administration menu, select 'Security' under 'Global Settings'.
2. This will display the 'Authentication Settings' screen. In the 'Permissions Summary' section, click 'Edit' next to the required repository name under 'Per-repository'.
3. The 'Edit Security' screen will appear. Select the group name(s) and click the 'Join' button. Click 'Update'. The group(s) will appear in the 'Built-in Groups' section of the 'Authentication Settings' screen.

For more information, please see the FishEye documentation on configuring external authentication sources.
Next Step for Crucible Users

If you are using Atlassian's Crucible code review tool, please take a look at the further instructions on integrating Crowd with Crucible.

Crowd Documentation

Configuring FishEye 1.3.x to talk to Crowd

This page forms part of the guide on Integrating Crowd with Atlassian FishEye and Crucible.

⚠️ Use the instructions below if you are integrating Crowd with FishEye version 1.3.x. If you are using FishEye 1.4.x or later, refer to the instructions for later versions of FishEye.

**Step 1. Configuring Crowd to talk to FishEye**

**Step 2. Configuring FishEye to talk to Crowd**

**Before you begin**

For any usernames that are already configured through the FishEye Administration console, you will need to change the account type from 'built-in' to 'custom'. This is required for the new authorisation through Crowd to work properly.

For details please see the FishEye documentation.

2.1 Install the Crowd Client Libraries into FishEye

Copy the Crowd integration libraries and configuration files as described in Integrating Crowd with a Custom Application. This involves copying all client library JARs to the library folder of FishEye:

⚠️ The version numbers have been omitted. Select the JAR which matches the name. This listing has been verified with FishEye 1.3.1.
<table>
<thead>
<tr>
<th>Files to Copy</th>
<th>Destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>CROWD/client/crowd-integration-client-X.X.X.jar</td>
<td>$FISHEYE_INST/lib</td>
</tr>
<tr>
<td>CROWD/client/lib/commons-codec-1.3.jar</td>
<td>$FISHEYE_INST/lib</td>
</tr>
<tr>
<td>CROWD/client/lib/commons-httpclient-3.0.jar</td>
<td>$FISHEYE_INST/lib</td>
</tr>
<tr>
<td>CROWD/client/lib/commons-lang-2.3.jar</td>
<td>$FISHEYE_INST/lib</td>
</tr>
<tr>
<td>CROWD/client/lib/jdom-1.0.jar</td>
<td>$FISHEYE_INST/lib</td>
</tr>
<tr>
<td>CROWD/client/lib/stax-api-1.0.1.jar</td>
<td>$FISHEYE_INST/lib</td>
</tr>
<tr>
<td>CROWD/client/lib/wsdl4j-1.6.1.jar</td>
<td>$FISHEYE_INST/lib</td>
</tr>
<tr>
<td>CROWD/client/lib/wstx-asl-3.2.0.jar</td>
<td>$FISHEYE_INST/lib</td>
</tr>
<tr>
<td>CROWD/client/lib/xfire-core-1.2.6.jar</td>
<td>$FISHEYE_INST/lib</td>
</tr>
</tbody>
</table>

2.2 Configure FishEye to use Crowd's Authenticator

1. Log in as an administrator to FishEye and navigate to 'Users/Security'. Select 'Setup Custom authentication'.
   - Enter the following 'Classname' for the authenticator:

     ```java
     com.atlassian.crowd.integration.fisheye.FisheyeAuthenticator
     ```

     Leave the cache and auto-add settings at their default values. This will mean authentication calls to Crowd will be cached (improves performance) and that users will be automatically enrolled into FishEye after their initial login to FishEye via Crowd.

   - Fisheye requires you to pass in the configuration attributes for Crowd. Add the following information in the 'Properties' text box, replacing the information with your own configuration data – match the values set in Step 1.

     ```properties
     application.name            fisheye
     application.password        password
     application.login.url       http://localhost:8080/
     crowd.server.url            http://localhost:8095/crowd/services/
     session.isauthenticated     session.isauthenticated
     session.tokenkey            session.tokenkey
     session.validationinterval  0
     session.lastvalidation      session.lastvalidation
     ```
Refer to the FishEye documentation for further details on using the FishEye setup screens.

2.3 Configure Groups for FishEye Source Repositories (If Required)

If you are using any FishEye groups to control access to particular source repositories, you will need to create the groups in Crowd and then configure FishEye as follows:

1. In the FishEye Administration menu, select 'Global Settings', then 'Users/Security'.
2. This will display the 'Authentication Settings' screen. In the 'Permissions Summary' section, edit the 'Per-repository' field and enter the group names (separated by commas) in the 'Custom restriction' field.

**Screenshot 1: 'Authentication Settings'**

<table>
<thead>
<tr>
<th>Permissions Summary</th>
<th>Allow anon access</th>
<th>Custom Restriction</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global:</td>
<td>NO (Yes)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Repository Default:</td>
<td>NO</td>
<td>not set</td>
<td></td>
</tr>
<tr>
<td>Per-repository:</td>
<td></td>
<td>default</td>
<td></td>
</tr>
<tr>
<td>private:</td>
<td>NO</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Screenshot 2: 'Custom Restriction'**

Edit Security

<table>
<thead>
<tr>
<th>Allow anonymous access:</th>
<th>NO</th>
</tr>
</thead>
<tbody>
<tr>
<td>Custom restriction:</td>
<td>staff, customers</td>
</tr>
</tbody>
</table>
Integrating Crowd with Atlassian JIRA

Atlassian's popular JIRA issue management system takes advantage of the OSUser framework and can quickly be configured to use OSUser to link in single or multiple directory servers through Crowd. Crowd provides integration libraries for the OpenSymphony OSUser module, which has a simple-to-use API for user management that allows pluggable implementations. You can read more about the OSUser API at [http://www.opensymphony.com/osuser/](http://www.opensymphony.com/osuser/).

Currently Crowd supports centralised authentication and single sign-on for JIRA versions 3.7.4 and later.

**Prerequisites**

1. Download and install Crowd. Refer to the [Crowd installation guide](#) for instructions. We will refer to the Crowd root folder as CROWD.
2. Download and install JIRA (version 3.7.4 or later). Refer to the [JIRA installation guide](#) for instructions. We will refer to the JIRA root folder as JIRA. For the purposes of this document, we will assume that you have used the 'Standalone' (i.e. the easier and recommended) installation method of JIRA. If you need to install JIRA as an EAR/WAR, simply explode the EAR/WAR and make the necessary changes as described below, then repackage the EAR/WAR.
3. Run the JIRA Setup Wizard, as described in the [JIRA documentation](#). During this setup process, you will define the JIRA administrator's username and password. It is easier to do this before you integrate JIRA with Crowd.
4. After setting up JIRA, shut down JIRA before you begin the integration process described below.

**Step 1. Configuring Crowd to talk to JIRA**

1.1 Prepare Crowd's Directories/Groups/Users for JIRA

1. The JIRA application will need to locate users from a directory configured in Crowd. You will need to set up a directory in Crowd for JIRA. This directory may be any Crowd-configured directory, such as an LDAP directory hooked up to Crowd or a Crowd internal directory. For information on how to do this, see Adding a Directory.

   We will assume that the directory is called JIRA Directory in Crowd for the rest of this document. It is possible to assign more than one directory for an application, but for the purposes of this example, we will use JIRA Directory in Crowd to house JIRA users.

2. JIRA also requires particular groups to exist in the directory in order to authenticate users. You need to ensure that these three groups exist in the JIRA Directory in Crowd:
   - jira-users
   - jira-developers
   - jira-administrators

3. You also need to ensure that the JIRA Directory in Crowd contains at least one user who is a member of all three groups. You can either:
   - If you have an existing JIRA deployment and would like to import existing groups and users into Crowd, use the JIRA Importer tool by navigating to Users > Import Users > Atlassian Importer. Select ‘JIRA’ as the Atlassian Product and the JIRA Directory in Crowd as the directory into which JIRA users will be imported. For details please see [Importing Users from Atlassian JIRA](#).
   - If you are going to import users into Crowd, you need to do this now before you proceed any further.

OR:

- If you don't wish to import your JIRA users, use the Crowd Administration Console to create the three groups, then create at least one user in the JIRA Directory in Crowd and add them to the three JIRA-specific groups (above). The Crowd documentation has more information on [creating groups](#), [creating users](#) and [assigning users to groups](#).

**Error will occur in JIRA if the required groups do not exist**

JIRA expects that the group names mentioned above will exist. If you need to use different group names, you may want to remove the above pre-existing groups from JIRA's Global Permissions. If the above groups do not exist somewhere in Crowd, you will receive an error when you try to remove the groups from JIRA's Global Permissions.
1.2 Define the JIRA Application in Crowd

Crowd needs to be aware that the JIRA application will be making authentication requests to Crowd. We need to add the JIRA application to Crowd and map it to the JIRA Directory in Crowd.

1. Log in to the Crowd Administration Console and navigate to Applications > Add Application.

2. Complete the 'Add Application' wizard for the JIRA application. See the instructions. The Name and Password values you specify in the 'Add Application' wizard must match the application.name and application.password that you will set in the JIRA/atlassian-jira/WEB-INF/classes/crowd.properties file. (See Step 2 below.)

1.3 Specify which users can log in to JIRA

Once Crowd is aware of the JIRA application, Crowd needs to know which users can authenticate (log in) to JIRA via Crowd. As part of the 'Add Application' wizard, you will set up your directories and group authorisations for the application. If necessary, you can adjust these settings after completing the wizard. Below are some examples.

You can either allow entire directories to authenticate, or just particular groups within the directories. In our example, we will allow the jira-users, jira-developers and jira-administrators groups within the JIRA Directory in Crowd to authenticate:

![Directory - Group](image)

With this example, only users who are members of the jira-users, jira-developers and jira-administrators groups will be able to authenticate against JIRA.

For details please see Specifying which Groups can access an Application.

1.4 Specify the address from which JIRA can log in to Crowd

As part of the 'Add Application' wizard, you will set up JIRA's IP address. This is the address which JIRA will use to authenticate to Crowd. If necessary you can add a hostname, in addition to the IP address, after completing the wizard. See Specifying an Application's Address or Hostname.

Step 2. Configuring JIRA to talk to Crowd

2.1 Install the Crowd Client Libraries into JIRA

JIRA needs Crowd's client libraries in order to be able to delegate user authentication to the Crowd application. As stated earlier, we are going to be modifying the JIRA application by editing the standalone application, which is an exploded WAR stored in JIRA/atlassian-jira.

1. Copy the Crowd client libraries and configuration files to JIRA:

<table>
<thead>
<tr>
<th>Copy From</th>
<th>Copy To</th>
</tr>
</thead>
<tbody>
<tr>
<td>CROWD/client/crowd-integration-client-X.X.X.jar</td>
<td>JIRA/atlassian-jira/WEB-INF/lib</td>
</tr>
<tr>
<td>CROWD/client/conf/crowd.properties</td>
<td>JIRA/atlassian-jira/WEB-INF/classes</td>
</tr>
</tbody>
</table>
Duplicate Crowd Client libraries in your classpath

You need to delete the existing crowd-integration-clien-X.X.X.jar file from JIRA's WEB-INF/lib directory and replace it with CROWD/client/crowd-integration-client-X.X.X.jar instead of just copying it over. Also, renaming the existing crowd-integration-client jar will not work as JIRA will start with duplicate Crowd Client libraries in its classpath.

2. If you are using JIRA 3.11 or earlier, you will need to remove the seraph-0.7.12.jar file from JIRA's WEB-INF/lib/ directory and replace it with the following file:
   http://repository.atlassian.com/maven2/com/atlassian/seraph/atlassian-seraph/0.10/atlassian-seraph-0.10.jar

3. If you are using JIRA 3.12.2 or earlier, you will need to update JIRA's xfire libraries:
   - Remove the xfire-all-1.2.1.jar file from JIRA's WEB-INF/lib/ directory.
   - Copy the following two files from Crowd's client/lib/ directory to JIRA's WEB-INF/lib/ directory:
     - xfire-aegis-1.2.6.jar
     - xfire-core-1.2.6.jar

4. Replace JIRA's cache configuration file:

<table>
<thead>
<tr>
<th>Copy From</th>
<th>Replace File</th>
</tr>
</thead>
<tbody>
<tr>
<td>CROWD/client/conf/crowd-ehcache.xml</td>
<td>JIRA/atlassian-jira/WEB-INF/classes/crowd-ehcache.xml</td>
</tr>
</tbody>
</table>

5. Edit JIRA/atlassian-jira/WEB-INF/classes/crowd.properties. Change the following properties:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>application.name</td>
<td>jira</td>
</tr>
<tr>
<td></td>
<td>The application name must match the name that you specified when you defined the application in Crowd (see Step 1 above).</td>
</tr>
<tr>
<td>application.password</td>
<td>set a password</td>
</tr>
<tr>
<td></td>
<td>The password must match the one that you specified when you defined the application in Crowd (see Step 1 above).</td>
</tr>
<tr>
<td>crowd.server.url</td>
<td><a href="http://localhost:8095/crowd/services/If">http://localhost:8095/crowd/services/If</a> your Crowd server's port is configured differently from the default (i.e. 8095), set it accordingly.</td>
</tr>
<tr>
<td>session.validationinterval</td>
<td>Set to 0, if you want authentication checks to occur on each request. Otherwise set to the number of minutes between request to validate if the user is logged in or out of the Crowd SSO server. Setting this value to 1 or higher will increase the performance of Crowd's integration.</td>
</tr>
</tbody>
</table>

You can read more about the crowd.properties file.

2.2 Configure JIRA to use Crowd's Authenticator

Now that the Crowd client libraries exist, we need to configure JIRA to use them.

1. Edit the JIRA config file JIRA/atlassian-jira/WEB-INF/classes/osuser.xml. Comment out any existing authentication providers and uncomment/insert the Crowd providers:
2. View JIRA/atlassian-jira/WEB-INF/classes/propertyset.xml. If there is no entry for the CrowdPropertySet, add the following <propertyset> item at the end of the file as the last <propertyset> item:

```xml
<propertyset name="crowd" class="com.atlassian.crowd.integration.osuser.CrowdPropertySet"/>
```

3. At this stage, JIRA is set up for centralised authentication. If you wish, you can now enable single sign-on (SSO) to JIRA.

   
   ![image]

   `View the JIRA Administrator's Guide for details.`

   ![image]

   `If you turn external user management on, the following functions can no longer be performed from within the JIRA administration interface: adding users, adding groups, editing users, editing groups.`

   
   **2.3 Enable JIRA's 'External User Management'**

   ![image]

   `Once the setup is complete, you can configure JIRA to allow external user management. Go to the JIRA Administration Console. In the General Configuration section, turn 'External user management' and 'External password management' on or off. (See the JIRA Administrator's Guide for details).`

   ![image]

   `JIRA with external user management ON:`

   ![image]

   `This is recommended, because it allows you to use Crowd's powerful cross-directory user administration features.`

   ![image]

   `If you turn external user management on, the following functions can no longer be performed from within the JIRA administration interface: adding users, adding groups, editing users, editing groups.`
If you are using Crowd 1.1.1 or earlier, you must turn external user management on in JIRA.

JIRA with external user management OFF:

This means that you can allow signup via JIRA, and you can manage your users within JIRA. Changes will flow through to Crowd.

JIRA has an automatic group membership feature. This means that any new user added through JIRA will automatically be a member of all groups which have the JIRA Users permission. In this way, you can ensure that a new user is automatically added to several groups when they sign up with JIRA.

Any group or user changes will cascade to all directories assigned to the JIRA application in Crowd. For example, if user 'jbloggs' registers in JIRA, 'jbloggs' will be added to every Crowd directory linked with the JIRA application.

2.4 (Optional) Tune the Cache

Enabling caching on the Crowd server: When using the Atlassian-User and Crowd framework together with JIRA, it is highly recommended that caching be enabled on the Crowd server. Multiple redundant calls to the Atlassian-User framework are made on any given request. These results can be stored locally between calls by enabling caching via the Crowd Options menu. Note that this caching on the Crowd server is enabled by default.

Enabling application caching for JIRA: If application caching is enabled for JIRA, JIRA will obtain all necessary information for the period specified by the cache configuration. See Configuring Caching for an Application. If a change or addition occurs to Crowd users, groups and roles, these changes will not be visible in JIRA until the cache expires for that specific item, i.e. for the particular user, group or role.

From JIRA 3.13, the default cache is two hours. In earlier versions, the default value for the application cache is 5 minutes (300 seconds) — increasing this to one or two hours (3600 or 7200 seconds) will improve the performance of your JIRA site.

2.5 (Optional) Disable the Auto-Complete Function in JIRA’s User Picker

To improve performance on page-loading in JIRA, we recommend that you disable the auto-complete function in JIRA’s 'User Picker' popup screens. Follow the instructions in the JIRA documentation.

More information: In our experience, disabling this feature in JIRA helps performance for customers with extremely large user bases. If you leave this feature enabled and have adequate performance results in JIRA, feel free to leave it enabled.

See Crowd in Action

- You should now be able to login using users belonging to the jira-users group. Try adding a user to the group using Crowd — you should be able to login to JIRA using this newly created user. That's centralised authentication in action!
- If you have enabled SSO, you can try adding the JIRA Directory in Crowd and jira-administrators group to the crowd application (see Mapping a Directory to an Application and Specifying which Groups can access an Application). This will allow JIRA administrators to log in to the Crowd Administration Console. Try logging in to Crowd as a JIRA administrator, and then point your browser at JIRA. You should be logged in as the same user in JIRA. That's single sign-on in action!

Known Limitations

A problem occurs in JIRA if a user is removed after that user has participated in an issue i.e. if JIRA refers to the user. If the user is internally managed by JIRA, JIRA will prevent the removal of the user but if the user is managed by an external system such as Crowd, JIRA will throw a `DataAccessException`

The current workaround for this is to deactivate the user's account (by removing them from the jira-users group). This issue can be tracked here: http://jira.atlassian.com/browse/CWD-202

Crowd Documentation

Configuring JIRA for NTLM SSO

JIRA NTLM plugin not officially supported by Atlassian

The JIRA NTLM plugin was written by a third party. Atlassian does not officially support this SSO plugin. Crowd implements SSO itself, but does not natively support the NTLM protocol without this plugin. Therefore, NTLM is not a pre-requisite for the use of Crowd. The Atlassian Crowd team will do our best to advise on any Crowd integration problems. Please refer to the plugin documentation for installation instructions and further support.

Out of the box, JIRA does not support Single Sign On (SSO) functionality. This page describes how to set up JIRA with NTLM SSO functionality using the JIRA NTLM plugin, Crowd, and Active Directory (AD) as your LDAP user repository.

Summary

The JIRA NTLM plugin enables the following authentication scenario:

- A user in a Windows domain logs into the Windows network, using their Active Directory username/password.
- Then, when they open JIRA in an Internet Explorer browser, they are seamlessly logged into JIRA.

The Crowd component then allows you to manage all users and groups in Active Directory. Crowd automatically ensures that users and groups are synchronised between AD and JIRA. For example, if a user/group is added/deleted from AD it will be automatically added/deleted from JIRA.

Components

| JIRA NTLM plugin | NTLM is the protocol used by Windows for authentication. The JIRA NTLM plugin takes care of the Windows domain / Active Directory login to JIRA. You must be running a Windows Domain Controller with accounts set up in AD in order to use this plugin. If NTLM authentication is not available, the plugin allows standard form-based login to JIRA.
| Note: This plugin is not officially supported by Atlassian. |
| Crowd | Crowd takes care of the synchronisation of users/groups between Active Directory and JIRA. You will need to create an SSL connection between Crowd and the AD server if you would like to create users through Crowd. AD will not allow Crowd to add users or change their passwords unless the communication occurs over a secure connection. |
| Active Directory (AD) on Windows 2003 Server | Active Directory (AD) on Windows 2003 Server — you must already have an AD instance set up and running with a domain controller. |
| JIRA | The machine running JIRA must be part of the Windows domain or installed on the same box as the domain controller. |

Steps

1. Back up your entire JIRA installation directory and run an XML backup of your data.
2. Download the JIRA NTLM plugin.
3. Read the README file included in the plugin zip file, and then follow the instructions in the INSTALL file to install the plugin.
4. In the ntlm_ldap.properties file, insert the appropriate LDAP and Domain Controller information along with other parameters.
5. Install and configure Crowd.
6. Create a directory in Crowd for the AD LDAP server.
7. Create the JIRA application in Crowd and configure Crowd and JIRA to talk to each other, as described in Integrating Crowd with Atlassian JIRA.

```
When following the above instructions, do not change the seraph-config.xml file to enable Crowd's SSO functionality. (i.e. don't change the authenticator node to read <authenticator class="com.atlassian.crowd.integration.seraph.JIRAAuthenticator"/>). Instead of Crowd's SSO authentication, we'll be using the JIRA NTLM plugin.
```

8. In AD, create the groups jira-users, jira-developers, and jira-administrators. They should then appear in Crowd.
9. In AD, create an admin user and make them a member of the above three groups in AD.
10. Create any additional groups that you would like in AD.
11. Log into the Windows domain using your desktop login and then open JIRA in an Internet Explorer browser. You should be logged in automatically.

**Additional Crowd Performance Tips**

- Change the default cache setting timeout in the file `<JIRA>/WEB-INF/classes/crowd-ehcache.xml`. For performance reasons, increase the object caching to 7,200 seconds (2 hours):
  
  ```
timeToIdleSeconds="7200" timeToLiveSeconds="7200"
  ```

  This reduces the frequency of the requests from Crowd to the LDAP server when changes to LDAP objects (such as a group name or user attribute) are made, thus reducing the performance overhead.

- Turn on the 'Use Paged Results' option in the directory connector tab for the directory you've set up in Crowd.

**Integrating Crowd with Acegi Security**

Crowd provides centralised authentication and single sign-on connectors for the web security framework Acegi. Acegi provides a modular and highly configurable approach to authentication and authorisation for J2EE applications.

If your web application already makes use of the Acegi framework for authentication and authorisation, you can use the Crowd Acegi connector to allow your application to easily delegate authentication and authorisation requests to Crowd.

The connectors are available with Crowd 1.2 and later and have been developed and tested with Acegi 1.0.5.

Please consult the Acegi quick start guide or reference guide for a thorough insight into the Acegi framework. You might also find useful information in our Crowd-Acegi integration tutorial.

```
This guide assumes developer-level knowledge and an Acegi-based web application
This guide is for developers rather than administrators. This guide assumes you have Crowd 1.5.1 or later installed and that you want to integrate your Acegi-based web application with Crowd's security server. The documentation below describes how to integrate Crowd with your own application that uses the Acegi framework. It assumes you already use Acegi in your application. If you need help integrating the Acegi framework with your web application, have look at some of the Acegi documentation.
```

```
Spring Security 2
If you're working with Spring Security, we have a separate tutorial.
```

**Prerequisites**

1. Download and configure Crowd. Refer to the Crowd Installation Guide for detailed information on how to do this. We will refer to the Crowd root folder as CROWD.
2. Have your Acegi-based custom application ready for tweaking. We will refer to your custom application as 'AcegiApp'.

**Step 1. Configuring Crowd to Talk to your Acegi Application**

Crowd needs to be aware that AcegiApp will be making authentication requests to Crowd. In brief, you will need to do the following:

1. Add the AcegiApp application to Crowd.
2. Add and configure the directories visible to AcegiApp.
3. Add and map the groups which are allowed to authenticate with AcegiApp.

Please see Adding an Application for a detailed guide.
Step 2. Installing the Crowd Acegi Connector

2.1 Adding the Crowd Acegi Connector to your Acegi Application

You will need to add the Crowd Acegi connector library and its associated dependencies to your Acegi application. You can do this manually by copying over the JAR files to your Acegi application or, if your Acegi application is a Maven project, you can add the Crowd Acegi connector as a project dependency. Both methods are described below.

2.1.1 Manually Adding the Crowd Acegi Connector Libraries

Follow either 2.1.1 or 2.1.2 (not both).

Copy the Crowd integration libraries and configuration files. This is described in the Client Configuration documentation. You will need to copy at least the following file to your Acegi application:

<table>
<thead>
<tr>
<th>Copy From</th>
<th>Copy To</th>
</tr>
</thead>
<tbody>
<tr>
<td>CROWD/client/crowd-integration-client-X.X.X.jar</td>
<td>AcegiApp/WEB-INF/lib</td>
</tr>
<tr>
<td>CROWD/client/lib*.jar</td>
<td>AcegiApp/WEB-INF/lib</td>
</tr>
</tbody>
</table>

2.1.2 Adding the Crowd Acegi Connector as a Maven Dependency

Follow either 2.1.1 or 2.1.2 (not both).

To integrate Crowd with your Maven 2 project, you will need to include the following dependency in your pom.xml:

```
<dependency>
  <groupId>com.atlassian.crowd</groupId>
  <artifactId>crowd-integration-client</artifactId>
  <version>X.X</version>
  <type>pom</type>
</dependency>
```

Because the Crowd libraries are not published to the standard Maven repository, you will need to add Atlassian's public repository:

```
<repositories>
  <repository>
    <id>central</id>
    <url>https://m2proxy.atlassian.com/repository/public</url>
    <snapshots>
      <enabled>true</enabled>
      <updatePolicy>always</updatePolicy>
    </snapshots>
    <releases>
      <enabled>true</enabled>
    </releases>
  </repository>
</repositories>
```

See more information on Maven 2 integration.

2.2 Adding the Cache Configuration File

Copy the following file into your application's classpath:

<table>
<thead>
<tr>
<th>Copy From</th>
<th>Copy To</th>
</tr>
</thead>
<tbody>
<tr>
<td>CROWD/client/conf/crowd-ehcache.xml</td>
<td>AcegiApp/WEB-INF/classes/crowd-ehcache.xml</td>
</tr>
</tbody>
</table>

This file can be tweaked to change the cache behaviour.

2.3 Configuring the Crowd Acegi Connector Properties
The Crowd Acegi connector needs to be configured with the details of the Crowd server.

1. Copy the default `crowd.properties` file to the classpath of your Acegi application:

<table>
<thead>
<tr>
<th>Copy From</th>
<th>Copy To</th>
</tr>
</thead>
<tbody>
<tr>
<td>CROWD/client/conf/crowd.properties</td>
<td>AcegiApp/WEB-INF/classes</td>
</tr>
</tbody>
</table>

2. Edit the `crowd.properties` and populate the following fields appropriately:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>application.name</td>
<td>Same as application name defined when adding the application to Crowd in Step 1.</td>
</tr>
<tr>
<td>application.password</td>
<td>Same as application password defined when adding the application to Crowd in Step 1.</td>
</tr>
<tr>
<td>crowd.server.url</td>
<td><a href="http://localhost:8095/crowd/services/">http://localhost:8095/crowd/services/</a></td>
</tr>
<tr>
<td>session.validationinterval</td>
<td>This is the time interval between requests which validate whether the user is logged in or out of the Crowd SSO server. Set to 0, if you want authentication checks to occur on each request. Otherwise set to the number of minutes you wish to wait between requests. Setting this value to 1 or higher will increase the performance of Crowd's integration.</td>
</tr>
</tbody>
</table>

You can read more about the `crowd.properties` file.

**Step 3. Configuring your Acegi Application to Use the Crowd Acegi Connector**

There are two ways you can integrate your application with Crowd:

- **Centralised user management**: The user repository available to your application will be the user repository allocated to your application via Crowd. This means that your application will use the centralised user repository for retrieving user details as well as performing authentication.
- **Single sign-on**: In addition to centralised authentication, SSO will be available to your application. If any other SSO-enabled applications (such as JIRA, Confluence, or your own custom applications) are integrated with Crowd, then SSO behaviour will be established across these applications. If you sign in to one application, you are signed in to all applications. If you sign out of one application, you are signed out of all applications.

First, you will need to add the Crowd client application context to wire up the Crowd beans that manage the communication to Crowd. You can do this by including the `applicationContext-CrowdClient.xml` Spring configuration file, found in `crowd-integration-client.jar`. For example, if you are configuring Spring using a context listener, you can add the following parameter in your your Acegi application's `WEB-INF/web.xml`:

```xml
<context-param>
  <param-name>contextConfigLocation</param-name>
  <param-value>
    ... classpath:/applicationContext-CrowdClient.xml ...
  </param-value>
</context-param>
```

Next, open the `applicationContext.xml` file relevant to your application, which contains the Acegi configuration. This is the file in your application that defines the Acegi beans. You are likely to have a bean configuration similar to this snippet:

```xml
<bean id="filterChainProxy" class="org.acegisecurity.util.FilterChainProxy">
  <property name="filterInvocationDefinitionSource">
    <value>
      CONVERT_URL_TO_LOWERCASE_BEFORE_COMPARISON
      PATTERN_TYPE_APACHE_ANT
      /images/**=#NONE#
      /scripts/**=#NONE#
      /styles/**=#NONE#
      /**=httpSessionContextIntegrationFilter,logoutFilter,authenticationProcessingFilter,securityContextHolderAwareRequestFilter,rememberMeProcessingFilter,anonymousProcessingFilter,exceptionTranslationFilter,filterInvocationInterceptor
    </value>
  </property>
</bean>
```
3.1 Configuring Centralised User Management

Perform the following updates to your Acegi Spring configuration:

1. Add the definition of the CrowdUserDetailsService:

   ```xml
   <bean id="crowdUserDetailsService" class="com.atlassian.crowd.integration.acegi.user.CrowdUserDetailsServiceImpl">
       <property name="authenticationManager" ref="crowdAuthenticationManager"/>
       <property name="groupMembershipManager" ref="crowdGroupMembershipManager"/>
       <property name="userManager" ref="crowdUserManager"/>
       <property name="authorityPrefix" value="ROLE_"/>
   </bean>
   ```

2. Add the definition of the RemoteCrowdAuthenticationProvider:

   ```xml
   <bean id="crowdAuthenticationProvider" class="com.atlassian.crowd.integration.acegi.RemoteCrowdAuthenticationProvider">
       <constructor-arg ref="crowdAuthenticationManager"/>
       <constructor-arg ref="httpAuthenticator"/>
       <constructor-arg ref="crowdUserDetailsService"/>
   </bean>
   ```

3. Update the definition of your AuthenticationManager / ProviderManager to use the CrowdAuthenticationProvider. If you need multiple authentication providers, you can append the CrowdAuthenticationProvider to your list.

   ```xml
   <bean id="authenticationManager" class="org.acegisecurity.providers.ProviderManager">
       <property name="providers">
           <list>
               <ref local="crowdAuthenticationProvider"/>
               ....
           </list>
       </property>
   </bean>
   ```

Further extensions

- If you have an existing user data model, then you can extend or wrap the CrowdDetailsService to cater for user objects within your application domain.
- If you require users within Crowd to be created in your application's persistence model so that you can store application-specific user data, you can extend the CrowdAuthenticationProvider to create records for successfully authenticated Crowd users.

Crowd’s remote API

We recommend that applications do not store the Crowd users locally. Rather, applications should query users via Crowd’s remote API.

3.2 Configuring Single Sign-On (SSO)

SSO is optional and requires centralised user management

Single sign-on is optional. If you wish to configure SSO you must first configure centralised user management as described in step 3.1 above.
1. Update the definition of the AuthenticationProcessingFilter to use the CrowdAuthenticationProcessingFilter:

   `<bean id="authenticationProcessingFilter" class="com.atlassian.crowd.integration.acegi.CrowdSSOAuthenticationProcessingFilter">
       <property name="httpAuthenticator" ref="httpAuthenticator"/>
       <property name="authenticationManager" ref="authenticationManager"/>
       <property name="filterProcessesUrl" value="/console/j_security_check"/>
       <property name="authenticationFailureUrl" value="/login.jsp?error=true"/>
       <property name="defaultTargetUrl" value="/"/>
       ...
   </bean>`

2. Add the definition of the CrowdLogoutHandler:

   `<bean id="crowdLogoutHandler" class="com.atlassian.crowd.integration.acegi.CrowdLogoutHandler">
       <property name="httpAuthenticator" ref="httpAuthenticator"/>
   </bean>`

3. Update the definition of the LogoutFilter to use the CrowdLogoutHandler:

   `<bean id="logoutFilter" class="org.acegisecurity.ui.logout.LogoutFilter">
       <constructor-arg value="/index.jsp"/>
       <list>
         ...
         <ref bean="crowdLogoutHandler"/>
         <bean class="org.acegisecurity.ui.logout.SecurityContextLogoutHandler"/>
       </list>
   </constructor-arg>
   </bean>`

   `<property name="filterProcessesUrl" value="/logout.jsp"/>

Step 4. Restarting your Acegi Application

Bounce your application. You should now have centralised authentication and single sign-on with Crowd.

**Authorisation**

For the purposes of Crowd integration with Acegi, you should map Acegi's roles to Crowd's groups. To put it another way: in order to use Acegi's authorisation features, users in Crowd will have their Acegi roles specified by their group names.

For example if user ‘admin’ is in the ‘crowd-admin’ group, then the user ‘admin’ will be authorised to view pages restricted to the ‘crowd-admin’ role in Acegi.
<!-- authorisation -->

```xml
<bean id="filterInvocationInterceptor" class="org.acegisecurity.intercept.web.FilterSecurityInterceptor">
    <property name="authenticationManager" ref="authenticationManager"/>
    <property name="accessDecisionManager" ref="accessDecisionManager"/>
    <property name="objectDefinitionSource">
        <value>
            CONVERT_URL_TO_LOWER_CASE_BEFORE_COMPARISON
            PATTERN_TYPE_APACHE_ANT
            /console/secure/**=ROLE_crowd-admin
            /console/user/**=IS_AUTHENTICATED_FULLY
        </value>
    </property>
</bean>

<bean id="accessDecisionManager" class="org.acegisecurity.vote.AffirmativeBased">
    <property name="allowIfAllAbstainDecisions" value="false"/>
    <property name="decisionVoters">
        <list>
            <bean class="org.acegisecurity.vote.RoleVoter"/>
            <bean class="org.acegisecurity.vote.AuthenticatedVoter"/>
        </list>
    </property>
</bean>
```

Crowd Documentation

**Integrating AppFuse - a Crowd-Acegi Integration Tutorial**

**AppFuse** provides a sweet starting point for developing web applications. You choose the frameworks, AppFuse generates the skeleton application.

At its core, the web security of AppFuse 2.0.1 and earlier applications relies on the modular and extensible **Acegi** authentication framework. In this tutorial, we look at a basic integration of Crowd with Acegi, using an application generated by AppFuse.

**Step 1. Get AppFuse**

In this tutorial, we will be using the Struts2-basic archetype to create the project, but the other types should be similar. For more information,
consult the AppFuse quickstart guide. In particular, it outlines the database requirements for AppFuse.

1. Create the project.

   ```
   mvn archetype:create -DarchetypeGroupId=org.appfuse.archetypes 
   -DarchetypeArtifactId=appfuse-basic-struts 
   -DRemoteRepositories=http://static.appfuse.org/releases -DarchetypeVersion=2.0 
   -DgroupId=com.mycompany.app -DartifactId=myproject
   ```

2. Since we will be editing the core Acegi configuration, we will need the full source code of the application.

   ```
   cd myproject
   mvn appfuse:full-source
   ```

3. Build it.

   ```
   mvn clean install
   ```

4. Run it.

   ```
   mvn jetty:run-war -Dmaven.test.skip
   ```

5. Play with it.

   ```
   http://localhost:8080/
   ```

6. Shut it down.

   ```
   ctrl+c
   ```

**Step 2. Let Crowd Know about AppFuse**

Add appfuse as an application via the Crowd Console. See Adding an Application for more information.

**Step 3. Add the Crowd Acegi Connector to AppFuse**

Open up the pom.xml and add the Crowd client libraries as a project dependency:

```xml
<dependencies>
  <dependency>
    <groupId>com.atlassian.crowd</groupId>
    <artifactId>crowd-integration-client</artifactId>
    <version>1.5.1</version>
  </dependency>
  ...
</dependencies>
```

You will also need to create the file `myproject/src/main/resources/crowd.properties`: 
In particular, the application name and password must match the values defined for the application added in Step 2.

Finally, copy the `STANDALONE/client/conf/crowd-ehcache.xml` to `myproject/src/main/resources/crowd-ehcache.xml`. This file defines the cache properties, such as cache timeouts, used when accessing data from the Crowd server.

**Step 4. Hook Up Centralised Authentication**

Before modifying the security configuration, you will need to add the Spring configuration file to wire up the Crowd client beans. Add the `applicationContext-CrowdClient.xml` configuration file to the list of `contextConfigLocations` in `WEB-INF/web.xml`:

```xml
<context-param>
    <param-name>contextConfigLocation</param-name>
    <param-value>
        classpath:/applicationContext-resources.xml
        classpath:/applicationContext-dao.xml
        classpath:/applicationContext-service.xml
        classpath*:/*applicationContext.xml
        WEB-INF/applicationContext*.xml
        WEB-INF/xfire-servlet.xml
        WEB-INF/security.xml
    </param-value>
</context-param>
```

AppFuse neatly stores all the Acegi configuration in `myproject/src/main/webapp/WEB-INF/security.xml`. In order to get centralised authentication, we will need to set up Acegi to use the wrapped authenticator class we just created. Edit the Acegi beans in `security.xml`:

1. Add the definition of the CrowdUserDetailsService:

```xml
<bean id="crowdUserDetailsService" class="com.atlassian.crowd.integration.acegi.user.CrowdUserDetailsServiceImpl">
    <property name="authenticationManager" ref="crowdAuthenticationManager"/>
    <property name="groupMembershipManager" ref="crowdGroupMembershipManager"/>
    <property name="userManager" ref="crowdUserManager"/>
    <property name="authorityPrefix" value="ROLE_"/>
</bean>
```

2. Add the definition of the RemoteCrowdAuthenticationProvider which will delegate Acegi's authentication requests to Crowd:

```xml
<bean id="crowdAuthenticationProvider" class="com.atlassian.crowd.integration.acegi.RemoteCrowdAuthenticationProvider">
    <constructor-arg ref="crowdAuthenticationManager"/>
    <constructor-arg ref="httpAuthenticator"/>
    <constructor-arg ref="crowdUserDetailsService"/>
</bean>
```

3. Replace the DaoAuthenticationProvider with our authenticator in the authentication manager:
3. `<bean id="authenticationManager" class="org.acegisecurity.providers.ProviderManager">
   <property name="providers">
     <list>
       <ref local="crowdAuthenticationProvider"/>
       <ref local="daoAuthenticationProvider"/>
       <ref local="anonymousAuthenticationProvider"/>
       <ref local="rememberMeAuthenticationProvider"/>
     </list>
   </property>
</bean>`

4. Now do a:

   
   ```
   mvn jetty:run-war -Dmaven.test.skip
   ```

   You should now be able to authenticate the users in your Crowd repository that meet all of the following conditions:
   - They are in a Crowd directory assigned to the AppFuse application in Crowd. See more information.
   - They are in Crowd groups named `USER` and `ADMIN`. You will need to add these groups and assign the user as a member of the groups. These Crowd group names map to the Acegi authorisation roles defined in the AppFuse application.
   - They are allowed to authenticate with the AppFuse application because EITHER they are in a group allowed to authenticate with Crowd see more OR their container directory allows all users to authenticate see more.

Congratulations. You have centralised authentication 😊

Application-level centralised user management

One quirk you may notice is that you can't view the profile details of users who exist in Crowd, but did not exist in AppFuse prior to the Crowd integration. Although it's possible to authenticate a Crowd user 'dude' and still run AppFuse as 'dude', 'dude' will not be in AppFuse's local database. AppFuse makes use of a database-backed user management system. In order to achieve application-level centralised user management, AppFuse will need to delegate its calls to create, retrieve, update and delete users to Crowd via Crowd's remote API. This will prevent data redundancy and eliminate the hassle of data synchronisation. This is beyond the scope of this short tutorial.

Step 5. Hook Up Single Sign-On

Enabling single sign-on (SSO) requires a little more tweaking of the `security.xml`:

1. Change the default processing filter to Crowd's SSO filter:

   ```
   <bean id="authenticationProcessingFilter" class="com.atlassian.crowd.integration.acegi.CrowdSSOAuthenticationProcessingFilter">
     <property name="httpAuthenticator" ref="httpAuthenticator"/>
     <property name="authenticationManager" ref="authenticationManager"/>
     <property name="authenticationFailureUrl" value="/login.jsp?error=true"/>
     <property name="defaultTargetUrl" value="/"/>
     <property name="filterProcessesUrl" value="/j_security_check"/>
     <property name="rememberMeServices" ref="rememberMeServices"/>
   </bean>
   ```

2. Add the definition of the CrowdLogoutHandler:
3. Update the definition of the LogoutFilter to use the CrowdLogoutHandler. You may need to uncomment the logout filter.

```xml
<bean id="logoutFilter" class="org.acegisecurity.ui.logout.LogoutFilter">
    <constructor-arg value="/index.jsp"/>
    <constructor-arg>
        <list>
            <ref bean="rememberMeServices"/>
            <ref bean="crowdLogoutHandler"/>
            <bean class="org.acegisecurity.ui.logout.SecurityContextLogoutHandler"/>
        </list>
    </constructor-arg>
    <property name="filterProcessesUrl" value="/logout.jsp"/>
</bean>
```

4. If the logout filter is not defined in the filter invocation list, you will need to add it:

```xml
<bean id="filterChainProxy" class="org.acegisecurity.util.FilterChainProxy">
    <property name="filterInvocationDefinitionSource">
        /**=httpSessionContextIntegrationFilter,logoutFilter,authenticationProcessingFilter,securityContextHolderAwareRequestFilter,rememberMeProcessingFilter,anonymousProcessingFilter,exceptionTranslationFilter,filterInvocationInterceptor
    </property>
</bean>
```

5. Now repeat:

```
mvn jetty:run-war -Dmaven.test.skip=true
```

SSO will only work for users that are able to authenticate with both applications and are authorised to use both applications. Try out the following:

- Log in to Crowd – you should be logged in to AppFuse.
- Log out of AppFuse – you should be logged out of Crowd.
- Log in to AppFuse; log out of Crowd; log in to Crowd as another user; refresh AppFuse – you should be logged in as the new user.

Congratulations, you have SSO 😊

**Integrating Crowd with Apache**

Crowd provides a number of modules that allow you to configure Crowd to authenticate HTTP Authentication requests made to an Apache web server.

The following features are provided:

- Use Crowd to password-protect resources on your website.
- Configure website locations to restrict access to specific Crowd groups or users.

**Note:** These instructions assume some Unix system and Apache configuration knowledge.
**Prerequisites**

- Apache web server version 2.0 or above with the mod_perl module installed and configured.
- The following third-party Perl modules:
  - SOAP::Lite (v0.69 or greater required)
  - Digest::SHA1
  - Error
  - Cache::Cache

**Installation and Configuration**

The following instructions are for Unix systems. If you're running Apache on Windows, see the notes below.

**Installing the Third-Party Perl Modules**

Download the required Perl modules from CPAN using the links above and install them as follows:

```
tar xvzf Cache-Cache-1.05.tar.gz
cd Cache-Cache-1.05
perl Makefile.PL
make
make install
```

See [http://search.cpan.org/~jhi/perl-5.8.0/pod/perlmodinstall.pod](http://search.cpan.org/~jhi/perl-5.8.0/pod/perlmodinstall.pod) for a detailed description of the various ways of installing Perl modules on your system.

**Installing the Crowd Perl Modules**

1. Download the three Crowd module files attached to this page:

<table>
<thead>
<tr>
<th>Attached file</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Crowd-Apache-Connector-1.2.3.zip</td>
<td>Crowd authentication, authorisation and perl module for Apache 2</td>
</tr>
</tbody>
</table>

2. Extract the Crowd-Apache-Connection archive file and install the three modules using the same procedure as for the third party modules.

```
unzip Crowd-Apache-Connector-1.2.3.zip
cd Atlassian-Crowd-1.2.3/
perl Makefile.PL
make
make install
cd ../Apache-CrowdAuth-1.2.3/
perl Makefile.PL
make
make install
cd ../Apache-CrowdAuthz-1.2.3/
perl Makefile.PL
make
make install
```
Configuring Apache

Ensure that mod_perl is enabled. Your Apache config file should contain a line like the following:

```
LoadModule perl_module modules/mod_perl.so
```

Many common distributions of Apache come with mod_perl preconfigured.

Configuring Authentication

To tell Apache to use Crowd to authenticate requests for a particular location, edit the Apache config file to add the following commands to a `<Location>` or `<Directory>` section:

```
Alias /crowd/ "/var/crowd/
<Directory "/var/crowd/"

  AuthName crowd
  AuthType Basic

  PerlAuthenHandler Apache::CrowdAuth
  PerlSetVar CrowdAppName appname
  PerlSetVar CrowdAppPassword apppassword
  PerlSetVar CrowdSOAPURL http://localhost:8095/crowd/services/SecurityServer
  PerlSetVar CrowdCacheEnabled on
  PerlSetVar CrowdCacheLocation /tmp/CrowdAuth
  PerlSetVar CrowdCacheExpiry 300

  require valid-user

</Directory>
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>AuthName crowd</td>
<td>Defines the realm of the authentication. This information is typically provided to the user in the dialogue box popped up by their browser</td>
</tr>
<tr>
<td>AuthType Basic</td>
<td>Tells Apache to use basic authentication. Digest authentication is not currently supported.</td>
</tr>
<tr>
<td>PerlAuthenHandler</td>
<td>Tells Apache to delegate authentication to the CrowdAuth module</td>
</tr>
<tr>
<td>Apache::CrowdAuth</td>
<td>Set the Application Apache should authenticate as</td>
</tr>
<tr>
<td>PerlSetVar CrowdAppPassword</td>
<td>Set the password for the Application</td>
</tr>
<tr>
<td>PerlSetVar CrowdSOAPURL</td>
<td>The URL of the Crowd SOAP service</td>
</tr>
<tr>
<td>PerlSetVar CrowdCacheEnabled</td>
<td>[optional] Controls whether CrowdAuth caches authentications locally to improve performance. Set to &quot;on&quot; or &quot;off&quot;. Caching is &quot;on&quot; by default</td>
</tr>
<tr>
<td>PerlSetVar CrowdCacheLocation</td>
<td>[optional] The directory in which CrowdAuth's local cache is stored. Defaults to /tmp/FileCache if not set</td>
</tr>
<tr>
<td>PerlSetVar CrowdCacheExpiry</td>
<td>[optional] The time (in seconds) before cached authentications in CrowdAuth's local cache expire. Defaults to 300 seconds (5 minutes)</td>
</tr>
<tr>
<td>require valid-user</td>
<td>Tells Apache that clients must provide a valid username/password to access the location</td>
</tr>
</tbody>
</table>

Configuring Authorisation

If you want to restrict access to a certain Directory or Location in your Apache configuration to a subset of Crowd users and/or groups, add the following lines to your configuration:
<Location>
  
  PerlAuthzHandler Apache::CrowdAuthz
  
  PerlSetVar CrowdAllowedUsers johnh,kevinr
  PerlSetVar CrowdAllowedGroups developers,crowd-administrators,customers:r
  
  
</Location>

<table>
<thead>
<tr>
<th>Command</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>PerlAuthzHandler Apache::CrowdAuthz</td>
<td>Tells Apache to use the Apache::CrowdAuthz module for authorisation</td>
</tr>
<tr>
<td>PerlSetVar CrowdAllowedUsers johnh,kevinr</td>
<td>Allow only the users johnh or kevinr to access the location</td>
</tr>
<tr>
<td>PerlSetVar CrowdAllowedGroups developers,crowd-administrators,customers:r</td>
<td>Allow only members of the developers or crowd-administrators groups to access the location. You can indicate that a group has read-only access to the location by appending &quot;:r&quot; to the group name. This is mainly useful for giving a group read-only access to a Subversion repository. Read-write access is the default privilege if &quot;:r&quot; is not specified.</td>
</tr>
</tbody>
</table>

Note:
- Typically, only one of the CrowdAllowedUsers or CrowdAllowedGroups would be needed for a particular location. You can define both. If you do, then access is granted if either is satisfied.
- If the CrowdCacheEnabled setting is on, then authorisation checks are cached in order to increase performance. This means that changes to group membership in Crowd may not be reflected immediately in user access.
- If you're using the CrowdAllowedGroups setting and your group names contain spaces, then surround the group names with quotes, for example:

  PerlSetVar CrowdAllowedGroups "Admin Staff,developers"

- Although the Apache Connector does not support Digest Authentication, the connection with Crowd can still be secured by using https to make the SOAP connections.

  PerlSetVar CrowdSOAPURL https://localhost:8095/crowd/services/SecurityServer

  For information on how to secure Crowd connections, refer to the documentation on configuring Crowd to work with SSL.

**Troubleshooting**

The CrowdAuth module logs detailed output if the Apache LogLevel parameter is set to info or debug. This can be useful in diagnosing problems.

<table>
<thead>
<tr>
<th>Apache Log Error Message</th>
<th>Possible Cause and Next Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>CrowdAppName or CrowdAppPassword is not defined</td>
<td>One or both of the CrowdAppName or CrowdAppPassword parameters is missing from the Apache config file.</td>
</tr>
<tr>
<td>Failed to authenticate application</td>
<td>The attempt to authenticate the application with Crowd failed. Check the values of the CrowdAppName or CrowdAppPassword parameters.</td>
</tr>
<tr>
<td>Failed to authenticate principal</td>
<td>Failed to authenticate a username/password pair provided by the client. This may just mean that the username or password supplied is incorrect. Note that CrowdAuth won't log successful authentications unless the LogLevel is info or above.</td>
</tr>
<tr>
<td>User token not found in SOAP response for user &lt;user&gt;</td>
<td>Internal SOAP protocol error.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>error 500...at CrowdAuth.pm..</td>
<td>Indicates that Apache can't connect to the Crowd SOAP service.</td>
</tr>
<tr>
<td>error 404...at CrowdAuth.pm...</td>
<td>Indicates that the URL used to connect to the Crowd SOAP service is incorrect. Check the value of the <code>crowdSOAPURL</code> parameter.</td>
</tr>
<tr>
<td>failed to resolve handler 'Apache::CrowdAuth': Can't locate Apache/CrowdAuth.pm ...</td>
<td>The <code>CrowdAuth.pm</code> file isn't located on the Perl include path (or it has incorrect permissions).</td>
</tr>
<tr>
<td>failed to resolve handler 'Apache::CrowdAuth': Can't locate SOAP/Lite.pm...</td>
<td>The <code>SOAP::Lite</code> module hasn't been installed.</td>
</tr>
<tr>
<td>Can't locate object method &quot;call&quot; via package &quot;SOAP::SOM&quot; at ...</td>
<td>This message indicates a missing or old installation of SOAP::Lite. Try installing (or reinstalling) version 0.69 SOAP::Lite. On Windows, you will get this error if you haven't manually upgraded the SOAP::Lite ppm (see below).</td>
</tr>
<tr>
<td>Can't use string (&quot;1&quot;) as an ARRAY ref while &quot;strict refs&quot; in use at (re_eval 116) line 1...</td>
<td>This message is a result of using Perl 5.10 with SOAP::Lite 0.69. Upgrading SOAP::Lite to version 0.71 or greater should correct the problem.</td>
</tr>
</tbody>
</table>

**Installing Perl, mod_perl and Perl Modules on Windows**

Setting up CrowdAuth on an Apache instance running on Windows requires that some things be done differently. The following instructions assume you are using ActivePerl as your Perl environment.

- If you don't already have a Perl interpreter installed, you'll need one. The following instructions assume an install of ActiveState's ActivePerl. We strongly recommend running version 5.8.8 (codename 8XX) of ActivePerl rather than any newer version.
- Windows installations of Apache are less likely to come with mod_perl pre-installed. A Win32 version of mod_perl in PPM format is available here.
- The `.tar.gz` format used to distribute CrowdAuth (and other modules) is supported by most modern Windows archiving utilities (WinZip, for example).
- The `make` utility used to build the Perl modules is not part of a Windows. `nmake`, Microsoft's equivalent, is available as a self-extracting archive here.

**Installing Perl Modules on Windows**

The required modules (Digest::SHA1, Error, Cache::FileCache, SOAP::Lite) are available through the Perl Package Manager utility.

CrowdAuth needs a newer version of SOAP::Lite than is supplied with ActivePerl (0.69 vs 0.55). A prebuilt ppm of the correct version can be installed from the University of Winnipeg's repository using the following command:

```
C:\>ppm install http://theoryx5.uwinnipeg.ca/ppms/SOAP-Lite.ppd
```

**Installing Apache::CrowdAuth on Windows**

```
unzip Crowd-Apache-Connector-1.2.3.zip using Winzip or equivalent...
cd Atlassian-Crowd-1.2.3/
perl Makefile.PL
nmake
nmake install
cd ../Apache-CrowdAuth-1.2.3/
perl Makefile.PL
nmake
nmake install
cd ../Apache-CrowdAuthz-1.2.3/
perl Makefile.PL
nmake
nmake install
```

When editing the `httpd.conf` file and adding the `mod_perl.so` module to Apache, you may need to add the following line above the `LoadModule` line:

```
LoadFile "C:/Perl/bin/perl58.dll"
LoadModule perl_module modules/mod_perl.so
```
This LoadFile line points to the perl58.dll in your Perl install directory.

Crowd Documentation

Integrating Crowd with Jive Forums

Jive Forums allows you to specify an implementation that provides authentication and authorisation external to the application. This document outlines how to integrate Crowd's authenticator with Jive Forums.

⚠️ Support for Jive Forums version 5.5.13 only
Crowd provides centralised authentication and single sign-on (SSO) for Jive Forums version 5.5.13 only. Jive have announced that Jive Forums has evolved into a new product, Jive Social Business Software (SBS). We have no plans to update Crowd to support later versions of Jive Forums.

Prerequisites

1. Download and configure Crowd. Refer to the Crowd installation guide for detailed information on how to do this. We will refer to the Crowd root folder as CROWD.
2. Install/configure Jive Forums. Refer to the relevant Jive Forums documentation for information regarding this installation process. The documentation is usually supplied with the software distribution. Do not attempt to use Crowd as the authentication system during the installation process (use the default authentication system for the installation process).

Step 1. Tell Crowd about Jive Forums

1.1 Prepare Crowd’s Directory/Users for Jive Forums

The Jive Forums application will need to locate users from a directory configured in Crowd. You will need to set up a directory in Crowd for Jive. For more information on how to do this, see Adding a Directory. We will assume that the directory is called Jive Forum Directory for the rest of this document. It is possible to assign more than one directory for an application, but for the purposes of this example, we will use Jive Forum Directory to house Jive Forum users.

If you have an existing Jive Forums deployment and would like to import existing users into Crowd, use the Jive Importer tool by navigating Users.
> **Import Users > JIVE.** Select the Jive Forum Directory as the directory into which Jive Forum users will be imported. For details please see Importing Users from Jive Forums. If you are going to import users into Crowd, you need to do this now before you proceed any further.

### 1.2 Define the Jive Forums Application in Crowd

Crowd needs to be aware that the Jive Forums application will be making authentication requests to Crowd. We need to add the Jive Forums application to Crowd and map it to the Jive Forums Directory:

1. Log in to the Crowd Administration Console and navigate to Applications > Add Application.

2. Complete the 'Add Application' wizard for the Jive Forums application. See the instructions. The Name and Password values you specify in the 'Add Application' wizard must match the application.name and application.password that you will set in the JIVEFORUMS/WEB-INF/classes/crowd.properties file. (See Step 2 below.)

### 1.3 Specify which Users can Log In to Jive Forums

Once Crowd is aware of the Jive Forums application, Crowd needs to know which users can authenticate (log in) to Jive Forums via Crowd. As part of the 'Add Application' wizard, you will set up your directories and group authorisations for the application. If necessary, you can adjust these settings after completing the wizard. Below are some examples.

You can either configure entire directories to authenticate or allow particular groups. In our example, we can simply allow the entire directory to authenticate:

![Directory Configuration](image)

Alternatively, we can use the **Groups** tab to restrict the application to only authenticate particular groups of users. For details please see Specifying which Groups can access an Application.

### 1.4 Specify the Address from which Jive Forums can Log In to Crowd

As part of the 'Add Application' wizard, you will set up Jive Forums's IP address. This is the address which Jive Forums will use to authenticate to Crowd. If necessary you can add a hostname, in addition to the IP address, after completing the wizard. See Specifying an Application's Address or Hostname.

### Step 2. Tell Jive Forums about Crowd

#### 2.1 Install the Crowd Client Libraries into the Jive Forums WebApp

Jive Forums may be deployed on an application server as a single WAR file or an exploded WAR folder. For the rest of the installation process, we will assume that Jive Forums has been set up as an exploded war file. If you need Jive Forums to be installed as a single WAR file, simply expand the WAR to a directory, make the changes as described below, and zip up the directory to form the WAR file. We will refer to the root folder of the Jive Forums web-app as **JIVEFORUMS**.

1. Copy the Crowd integration libraries and configuration files (this is described in the Client Configuration documentation). This is summarised below:

<table>
<thead>
<tr>
<th>Copy From</th>
<th>Copy To</th>
</tr>
</thead>
<tbody>
<tr>
<td>CROWD/client/crowd-integration-client-X.X.X.jar</td>
<td>JIVEFORUMS/WEB-INF/lib</td>
</tr>
<tr>
<td>CROWD/client/lib/log4j-1.2.8.jar</td>
<td>JIVEFORUMS/WEB-INF/lib/</td>
</tr>
<tr>
<td>CROWD/client/lib/ehcache-1.2.3.jar</td>
<td>JIVEFORUMS/WEB-INF/lib/</td>
</tr>
<tr>
<td>CROWD/client/conf/crowd.properties</td>
<td>JIVEFORUMS/WEB-INF/classes/</td>
</tr>
</tbody>
</table>
2. Replace the XFire libraries in your Jive Forums installation with the later version shipped with Crowd:
   - Remove all xfire*.jar files from your JIVEFORUMS/WEB-INF/lib folder.
   - Copy the XFire libraries from Crowd:

<table>
<thead>
<tr>
<th>Copy From</th>
<th>Copy To</th>
</tr>
</thead>
<tbody>
<tr>
<td>CROWD/client/xfire*.jar</td>
<td>JIVEFORUMS/WEB-INF/lib/</td>
</tr>
</tbody>
</table>

3. Examine the JIVEFORUMS/WEB-INF/lib folder and delete any duplicate JARs. Duplicate JARs represent common libraries used by both the Crowd client and Jive Forums.

4. Edit JIVEFORUMS/WEB-INF/classes/crowd.properties. Change the following properties:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>application.name</td>
<td>jiveforums</td>
</tr>
<tr>
<td>application.password</td>
<td>set a password</td>
</tr>
</tbody>
</table>

   The name and password values must match those set when defining the application in Crowd (see Step 1 above).

You can read more about the crowd.properties file.

2.2 Configure Jive Forums to use Crowd’s Authenticator

Crowd is now set up to provide authentication services to Jive. Now Jive needs to be set up to use Crowd’s authenticator. There are a few ways of doing this. The most user-friendly method is outlined below:

1. In your jiveHome directory, edit a file named jive-startup.xml. Modify the <setup> node to be false:

   ```xml
   <jive>
   <!-- When setup is false, you can access the setup tool. -->
   <setup>false</setup>
   ...
   <!-- Allow SSO login for admins -->
   <admin>
   <tryAlternativeLogin>true</tryAlternativeLogin>
   </admin>
   </jive>
   ```

   As the XML comment states, this lets us re-run Jive's setup.

2. Restart Jive Forums so that it picks up the changes.
3. View the Jive Forums site with a web browser - usually under the /jiveforums context-root. Jive will run the “Jive Forums Setup”.
4. In the ‘Install Checklist’ screen, click ‘Continue’ to navigate through the setup process.
5. In the ‘Datasource Settings’ screen, re-enter your database configuration details and click ‘Continue’.
6. In the ‘User System’ screen, select ‘Custom’ authentication system and click ‘Continue’.
7. You should be at the 'Custom User System' screen. Enter the following details which specify Crowd as the custom authenticator:

**UserManager implementation:**

```java
com.atlassian.crowd.integration.jive.CrowdUserManager
```

**GroupManager implementation:**

If you would like Crowd to manage your user groups, add the following group manager:

```java
com.atlassian.crowd.integration.jive.CrowdGroupManager
```

You can safely leave this field empty if you do not want Crowd to manage your groups.

**AuthFactory implementation:**

```java
com.atlassian.crowd.integration.jive.CrowdAuthFactory
```
Click ‘Continue’.
If you have any errors at this stage, it is very likely that there is a classpath issue (e.g., the Crowd client libraries aren’t being properly loaded by Jive). Please read the documentation regarding Crowd Client Libraries for help identifying the problem.

8. In the ‘Email Settings’ screen, re-enter your email configuration details and click ‘Continue’.
9. In the ‘Admin Account Setup’ screen, do not enter any details. Click ‘Skip this step’.

Warning
The default administrator for Jive Forums is the user admin. This user will need to exist in your mapped directory (i.e. the Jive Forums Directory) in Crowd. Without this user, you will not be able to access the administration console of Jive Forums.

10. Bounce the server and test that Crowd is authenticating users for Jive. You can do this by creating users (users) via the Crowd Administration Console and verifying that they are able to log in to Jive Forums.

Jive Forums Documentation
For further information regarding Jive Forums Authentication Integration, check out the Jive Forums Documentation at http://www.jivesoftware.com/builds/docs/latest/documentation/developer-guide.html#userintegration

Check out the Jive SSO page for more details on Jive SSO Integration and corresponding use cases.

Crowd Documentation

Jive SSO

This page details the nuts and bolts of Jive SSO. If you are having issues with Jive SSO, this page should be able to give you a better idea of what's going on behind the scenes and help you diagnose any common problems.

For Crowd-Jive integration, the incoming request must:

1. be authenticated with Crowd (have a Crowd SSO token in session or as a cookie)
2. be authenticated with Jive (have a CrowdAuthToken stored in HttpSession for Jive)
To authenticate with Crowd: simply log in to Crowd via any Crowd-SSO enabled application. This includes Jive's login page.

To authenticate with Jive: you need to be authenticated with Crowd as a user "allowed to be authenticated" by Jive. This means, the user must belong to a group or directory which Jive is authorised to authenticate. This user also needs to NOT be on any user/IP ban lists within the Jive application. The Crowd integration will honour the ban list. See note below.

**Enumeration of Use Cases**

User views Jive Forums and:

1. request is not authenticated with Crowd -> appears as guest user in Jive.
2. request is authenticated with Crowd, but user is not in directory/group allowed to authenticate with Jive -> appears as guest user in Jive.
3. request is authenticated with Crowd, user allowed to authenticate with Jive, user not on any ban list -> appears as logged-in user in Jive.
4. authenticated Jive user clicks logout from Jive -> user is logged out of Jive and Crowd.
5. authenticated Jive user logs out of Crowd using another SSO app -> user eventually times out of Jive.
6. request is authenticated with Crowd, user banned from logging into Crowd -> user appears as guest in Jive.
7. admin authenticated with Crowd and attempts to access Jive admin console -> admin appears logged in to Jive admin console.
8. authenticated Jive admin attempts to log out from Jive's admin console -> **admin is still logged in** (support issue filed with Jive Forums).
9. authenticated Jive admin attempts to log out from Jive Forums -> admin is logged out of Jive and Crowd.
10. request is authenticated with Crowd but user is banned from Jive Forums -> user is still authenticated with Crowd, but not allowed to log in to Jive Forums.

**Special Cases**

- It is known that the "remember me" functionality of Jive will cease to function. This has been intentionally disabled. Jive's "remember me" functionality will need to be replaced by a more general "remember me" from within Crowd. Once this is implemented in Crowd, the Jive integration libraries can utilise Crowd's "remember me", so that "remember me" is centralised.

- It is recommended that admins do not use ban lists. Rather, you should manage access control based on Crowd's groups. So it's best to disable Ban Users from within Ban Settings inside the Jive admin console. There is nothing wrong with using ban lists, as they will be honoured by the Crowd-Jive integration libraries. So they will make it hard for a banned user to switch to a non-banned user. The only way a banned Jive user, authenticated with Crowd for Jive, will be able to switch to a different user that Jive will pick up, is when the Jive's Crowd authentication cache clears, so that Jive recognises a new user is signing in. This is because there is no way to log out a banned user from Jive, as they will always appear to be "guest". So basically, if you have users with multiple identities, if one is banned and attempts to log in, the user will have to wait until the client cache is cleared before he/she can log in with a different identity. Note: it's easy for non-banned users to switch identities as the client authentication cache is cleared when they click "logout" from within Jive.

Integrating Crowd with Spring Security

Crowd provides centralised authentication and single sign-on connectors for the web security framework Spring Security. Spring Security provides a modular and highly configurable approach to authentication and authorisation for J2EE applications.

Spring Security was formerly known as Acegi
There is a separate tutorial for integrating Acegi with Crowd.

If your web application already makes use of the Spring Security framework for authentication and authorisation, you can use the Crowd Spring Security connector to allow your application to easily delegate authentication and authorisation requests to Crowd.

The connector is available with Crowd 1.6 and later and has been developed and tested with Spring Security 2.0.4.

Please consult the Spring Security suggested steps or reference guide for a thorough insight into the Spring Security framework. You might also find useful information in our Appfuse integration tutorial.

This guide assumes developer-level knowledge and a Spring Security-based web application
This guide is for developers rather than administrators. This guide assumes you have Crowd 1.6 or later installed and that you want to integrate your Spring Security-based web application with Crowd's security server. The documentation below describes how to integrate Crowd with your own application that uses the Spring Security framework. It assumes you already use Spring Security in your application. If you need help integrating the Spring Security framework with your web application, have look at some of the Spring Security documentation.

Prerequisites

1. Download and configure Crowd. Refer to the Crowd Installation Guide for detailed information on how to do this. We will refer to the Crowd root folder as CROWD.
2. Have your Spring Security-based custom application ready for tweaking. We will refer to your custom application as 'SpringSecApp'.

Step 1. Configuring Crowd to Talk to your Spring Security Application

Crowd needs to be aware that SpringSecApp will be making authentication requests to Crowd. In brief, you will need to do the following:

1. Add the SpringSecApp application to Crowd.
2. Add and configure the directories visible to SpringSecApp.
3. Add and map the groups which are allowed to authenticate with SpringSecApp.

Please see Adding an Application for a detailed guide.

Step 2. Installing the Crowd Spring Security Connector

2.1 Adding the Crowd Spring Security Connector to your Spring Security Application

You will need to add the Crowd Spring Security connector library and its associated dependencies to your Spring Security application. You can do this manually by copying over the JAR files to your Spring Security application or, if your Spring Security application is a Maven project, you can add the Crowd Spring Security connector as a project dependency. Both methods are described below.

2.1.1 Manually Adding the Crowd Spring Security Connector Libraries

Follow either 2.1.1 or 2.1.2 (not both).

Copy the Crowd integration libraries and configuration files. This is described in the Client Configuration documentation. You will need to copy at least the following file to your Spring Security application:

<table>
<thead>
<tr>
<th>Copy From</th>
<th>Copy To</th>
</tr>
</thead>
<tbody>
<tr>
<td>CROWD/client/crowd-integration-client-X.X.X.jar</td>
<td>SpringSecApp/WEB-INF/lib</td>
</tr>
<tr>
<td>CROWD/client/lib/*.jar</td>
<td>SpringSecApp/WEB-INF/lib</td>
</tr>
</tbody>
</table>

2.1.2 Adding the Crowd Spring Security Connector as a Maven Dependency

Follow either 2.1.1 or 2.1.2 (not both).
To integrate Crowd with your Maven 2 project, you will need to include the following dependency in your pom.xml:

```xml
<dependency>
  <groupId>com.atlassian.crowd</groupId>
  <artifactId>crowd-integration-client</artifactId>
  <version>X.X</version>
  <type>pom</type>
</dependency>
```

Because the Crowd libraries are not published to the standard Maven repository, you will need to add Atlassian's public repository:

```xml
<repositories>
  <repository>
    <id>central</id>
    <url>https://m2proxy.atlassian.com/repository/public</url>
    <snapshots>
      <enabled>true</enabled>
      <updatePolicy>always</updatePolicy>
    </snapshots>
    <releases>
      <enabled>true</enabled>
    </releases>
  </repository>
</repositories>
```

See more information on Maven 2 integration.

### 2.2 Adding the Cache Configuration File

Copy the following file into your application's classpath:

<table>
<thead>
<tr>
<th>Copy From</th>
<th>Copy To</th>
</tr>
</thead>
<tbody>
<tr>
<td>CROWD/client/conf/crowd-ehcache.xml</td>
<td>SpringSecApp/WEB-INF/classes/crowd-ehcache.xml</td>
</tr>
</tbody>
</table>

This file can be tweaked to change the cache behaviour.

### 2.3 Configuring the Crowd Spring Security Connector Properties

The Crowd Spring Security connector needs to be configured with the details of the Crowd server.

1. Copy the default crowd.properties file to the classpath of your Spring Security application:

<table>
<thead>
<tr>
<th>Copy From</th>
<th>Copy To</th>
</tr>
</thead>
<tbody>
<tr>
<td>CROWD/client/conf/crowd.properties</td>
<td>SpringSecApp/WEB-INF/classes</td>
</tr>
</tbody>
</table>

2. Edit the crowd.properties and populate the following fields appropriately:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>application.name</td>
<td>Same as application name defined when adding the application to Crowd in Step 1.</td>
</tr>
<tr>
<td>application.password</td>
<td>Same as application password defined when adding the application to Crowd in Step 1.</td>
</tr>
<tr>
<td>crowd.server.url</td>
<td><a href="http://localhost:8095/crowd/services/">http://localhost:8095/crowd/services/</a></td>
</tr>
<tr>
<td>session.validationinterval</td>
<td>This is the time interval between requests which validate whether the user is logged in or out of the Crowd SSO server. Set to 0, if you want authentication checks to occur on each request. Otherwise set to the number of minutes you wish to wait between requests. Setting this value to 1 or higher will increase the performance of Crowd's integration.</td>
</tr>
</tbody>
</table>

You can read more about the crowd.properties file.

### Step 3. Configuring your Spring Security Application to Use the Crowd Spring Security Connector
There are two ways you can integrate your application with Crowd:

- **Centralised user management**: The user repository available to your application will be the user repository allocated to your application via Crowd. This means that your application will use the centralised user repository for retrieving user details as well as performing authentication.

- **Single sign-on**: In addition to centralised authentication, SSO will be available to your application. If any other SSO-enabled applications (such as JIRA, Confluence, or your own custom applications) are integrated with Crowd, then SSO behaviour will be established across these applications. If you sign in to one application, you are signed in to all applications. If you sign out of one application, you are signed out of all applications.

First, you will need to add the Crowd client application context to wire up the Crowd beans that manage the communication to Crowd. You can do this by including the `applicationContext-CrowdClient.xml` Spring configuration file, found in `crowd-integration-client.jar`. For example, if you are configuring Spring using a context listener, you can add the following parameter in your Spring Security application's `WEB-INF/web.xml`:

```xml
<context-param>
    <param-name>contextConfigLocation</param-name>
    <param-value>
        ...
        classpath:/applicationContext-CrowdClient.xml
        ...
    </param-value>
</context-param>
```

### 3.1 Configuring Centralised User Management

The following sections assume that you have the Spring Security schema mapped to the `security` namespace. Perform the following updates to your Spring Security configuration:

1. **Add the definition of the CrowdUserDetailsService**:

   ```xml
   <bean id="crowdUserDetailsService" class="com.atlassian.crowd.integration.springsecurity.user.CrowdUserDetailsServiceImpl">
       <property name="authenticationManager" ref="crowdAuthenticationManager"/>
       <property name="groupMembershipManager" ref="crowdGroupMembershipManager"/>
       <property name="userManager" ref="crowdUserManager"/>
       <property name="authorityPrefix" value="ROLE_"/>
   </bean>
   ```

2. **Add the definition of the RemoteCrowdAuthenticationProvider**:

   ```xml
   <bean id="crowdAuthenticationProvider" class="com.atlassian.crowd.integration.springsecurity.RemoteCrowdAuthenticationProvider">
       <security:custom-authentication-provider />
       <constructor-arg ref="crowdAuthenticationManager"/>
       <constructor-arg ref="httpAuthenticator"/>
       <constructor-arg ref="crowdUserDetailsService"/>
   </bean>
   ```

#### Further extensions

- If you have an existing user data model, then you can extend or wrap the CrowdDetailsService to cater for user objects within your application domain.
- If you require users within Crowd to be created in your application's persistence model so that you can store application-specific user data, you can extend the CrowdAuthenticationProvider to create records for successfully authenticated Crowd users.
Crowd's remote API

We recommend that applications do not store the Crowd users locally. Rather, applications should query users via Crowd's remote API.

3.2 Configuring Single Sign-On (SSO)

SSO is optional and requires centralised user management

Single sign-on is optional. If you wish to configure SSO you must first configure centralised user management as described in step 3.1 above.

Perform the following additional updates to your Spring Security configuration:

1. Remove defaults from the <http/> element:
   a. Remove the auto-config attribute and add an
      entry-point-ref="crowdAuthenticationProcessingFilterEntryPoint" attribute to the http element.
   b. Remove the <form-login> element.
      You should end up with a http element similar to this:

```
<http lowercase-comparisons="false" entry-point-ref="crowdAuthenticationProcessingFilterEntryPoint">
  <!-- note: no auto-config attribute! -->
  <!--intercept-url pattern="/images/*" filters="none"/>
  <intercept-url pattern="/styles/**" filters="none"/>
  <intercept-url pattern="/scripts/**" filters="none"/>
  <intercept-url pattern="/admin/**" access="ROLE_ADMIN"/>
  <intercept-url pattern="/passwordHint.html*" access="ROLE_ANONYMOUS,ROLE_ADMIN,ROLE_USER"/>
  <intercept-url pattern="/signup.html*" access="ROLE_ANONYMOUS,ROLE_ADMIN,ROLE_USER"/>
  <intercept-url pattern="/a4j.res/*.html*" access="ROLE_ANONYMOUS,ROLE_ADMIN,ROLE_USER"/>
  <!-- APF-737, OK to remove line below if you're not using JSF -->
  <intercept-url pattern="/**/*.html*" access="ROLE_ADMIN,ROLE_USER"/>
</http>
```

1. Change the default processing filter to Crowd's SSO filter by adding the following bean definitions:

```
<authentication-manager alias="authenticationManager"/>

<beans:bean id="crowdAuthenticationProcessingFilterEntryPoint" class="org.springframework.security.ui.webapp.AuthenticationProcessingFilterEntryPoint">
    <beans:property name="loginFormUrl" value="/login.jsp"/>
</beans:bean>

<beans:bean id="crowdAuthenticationProcessingFilter" class="com.atlassian.crowd.integration.springsecurity.CrowdSSOAuthenticationProcessingFilter">
    <custom-filter position="AUTHENTICATION_PROCESSING_FILTER"/>
    <beans:property name="httpAuthenticator" ref="httpAuthenticator"/>
    <beans:property name="authenticationManager" ref="authenticationManager"/>
    <beans:property name="authenticationFailureUrl" value="/login.jsp?error=true"/>
    <beans:property name="defaultTargetUrl" value="/"/>
    <beans:property name="filterProcessesUrl" value="/j_security_check"/>
</beans:bean>
```

2. Add the definition of the CrowdLogoutHandler:
1. Add the definition of the CrowdLogoutHandler and add in a LogoutFilter that references it:

```xml
<bean id="crowdLogoutHandler" class="com.atlassian.crowd.integration.springsecurity.CrowdLogoutHandler">
    <property name="httpAuthenticator" ref="httpAuthenticator"/>
</bean>

<beans:bean id="logoutFilter" class="org.springframework.security.ui.logout.LogoutFilter">
    <custom-filter position="LOGOUT_FILTER"/>
    <beans:constructor-arg value="/index.jsp"/>
    <beans:list>
        <beans:ref bean="crowdLogoutHandler"/>
        <beans:bean class="org.springframework.security.ui.logout.SecurityContextLogoutHandler"/>
    </beans:list>
    <beans:property name="filterProcessesUrl" value="/logout.jsp"/>
</beans:bean>
```

**Step 4. Restarting your Spring Security Application**

Bounce your application. You should now have centralised authentication and single sign-on with Crowd.

**Authorisation**

For the purposes of Crowd integration with Spring Security, you should map Spring Security’s roles to Crowd’s groups. To put it another way: in order to use Spring Security's authorisation features, users in Crowd will have their Spring Security roles specified by their group names.

For example if user ‘admin’ is in the ‘crowd-admin’ group, then the user ‘admin’ will be authorised to view pages restricted to the ‘crowd-admin’ role in Spring Security.
<bean id="filterInvocationInterceptor" class="org.springframework.security.intercept.web.FilterSecurityInterceptor">
  <property name="authenticationManager" ref="authenticationManager"/>
  <property name="accessDecisionManager" ref="accessDecisionManager"/>
  <property name="objectDefinitionSource"/>
  <value>
    CONVERT_URL_TO_LOWERCASE_BEFORE_COMPARISON
    PATTERN_TYPE_APACHE_ANT
    /console/secure/**=ROLE_crowd-admin
    /console/user/**=IS_AUTHENTICATED_FULLY
  </value>
</bean>

<bean id="accessDecisionManager" class="org.springframework.security.vote.AffirmativeBased">
  <property name="allowIfAllAbstainDecisions" value="false"/>
  <property name="decisionVoters">
    <list>
      <bean class="org.springframework.security.vote.RoleVoter"/>
      <bean class="org.springframework.security.vote.AuthenticatedVoter"/>
    </list>
  </property>
</bean>

Crowd Documentation

**Integrating AppFuse - a Crowd-Spring Security Integration Tutorial**

AppFuse provides a sweet starting point for developing web applications. You choose the frameworks, AppFuse generates the skeleton application.

At its core, the web security of AppFuse 2.0.2+ applications relies on the modular and extensible Spring Security authentication framework. In this tutorial, we look at a basic integration of Crowd with Spring Security, using an application generated by AppFuse.

---

**Spring Security was formerly known as Acegi**

- The Acegi security framework changed its name to Spring Security with its 2.0 release.
- AppFuse 2.0.2 changed from Acegi to Spring Security for authentication. Earlier versions of AppFuse use Acegi.
- If you are working with Acegi in an earlier version of AppFuse, we have a [separate tutorial](#).
- Crowd 1.6 and above provide support for both Spring Security and Acegi. Earlier versions of Crowd only supported Acegi.
- We recommend all new projects use Spring Security as it is being actively maintained.
Prerequisites
This tutorial assumes you have installed Crowd 1.6 or later and are using Appfuse 2.0.2 or later.

Step 1. Get AppFuse

In this tutorial, we will be using the Struts2-basic archetype to create the project, but the other types should be similar. For more information, consult the AppFuse quickstart guide. In particular, it outlines the database requirements for AppFuse.

1. Create the project.

   ```
   mvn archetype:create -DarchetypeGroupId=org.appfuse.archetypes -DarchetypeArtifactId=appfuse-basic-struts -DgroupId=com.mycompany.app -DartifactId=myproject
   ```

2. Since we will be editing the core Spring Security configuration, we will need the full source code of the application.

   ```
   cd myproject
   mvn appfuse:full-source
   ```

3. Build it.

   ```
   mvn clean install
   ```

4. Run it.

   ```
   mvn jetty:run-war -Dmaven.test.skip
   ```

5. Play with it.

   ```
   http://localhost:8080/
   ```

6. Shut it down.

   ```
   ctrl+c
   ```

Step 2. Let Crowd Know about AppFuse

Add appfuse as an application via the Crowd Console. See Adding an Application for more information.

Step 3. Add the Crowd Spring Security Connector to AppFuse

Open up the pom.xml and add the Crowd client libraries as a project dependency:
You will also need to create the file `myproject/src/main/resources/crowd.properties`:

```java
application.name                        appfuse
application.password                    password
application.login.url                   http://localhost:8095/crowd/
crowd.server.url                        http://localhost:8095/crowd/services/
session.isauthenticated                 session.isauthenticated
session.tokenkey                        session.tokenkey
session.validationinterval              0
session.lastvalidation                  session.lastvalidation
```

In particular, the application name and password must match the values defined for the application added in Step 2.

Finally, copy the `STANDALONE/client/conf/crowd-ehcache.xml` to `myproject/src/main/resources/crowd-ehcache.xml`. This file defines the cache properties, such as cache timeouts, used when accessing data from the Crowd server.

### Step 4. Hook Up Centralised Authentication

Before modifying the security configuration, you will need to add the Spring configuration file to wire up the Crowd client beans. Add the `applicationContext-CrowdClient.xml` configuration file to the list of `contextConfigLocations` in `myproject/src/main/webapp/WEB-INF/web.xml`:

```xml
<context-param>
  <param-name>contextConfigLocation</param-name>
  <param-value>
    classpath:/applicationContext-resources.xml
    classpath:/applicationContext-dao.xml
    classpath:/applicationContext-service.xml
    classpath*:/*applicationContext.xml
    classpath:/applicationContext-CrowdClient.xml
    /WEB-INF/applicationContext*.xml
    /WEB-INF/xfire-servlet.xml
    /WEB-INF/security.xml
  </param-value>
</context-param>
```

AppFuse neatly stores all the Spring Security configuration in `myproject/src/main/webapp/WEB-INF/security.xml`. In order to get centralised authentication, we will need to set up Spring Security to use Crowd components for user information. Edit the beans in `security.xml`:

1. Add the definition of the `CrowdUserDetailsService`:

   ```xml
   <beans:bean id="crowdUserDetailsService" class="com.atlassian.crowd.integration.springsecurity.user.CrowdUserDetailsServiceImpl">
     <beans:property name="authenticationManager" ref="crowdAuthenticationManager"/>
     <beans:property name="groupMembershipManager" ref="crowdGroupMembershipManager"/>
     <beans:property name="userManager" ref="crowdUserManager"/>
     <beans:property name="authorityPrefix" value="ROLE_"/>
   </beans:bean>
   ```

2. Add the definition of the `RemoteCrowdAuthenticationProvider` that delegates Spring Security authentication requests to Crowd:
3. Comment out the default authentication provider, as we’ve replaced it with Crowd:

```xml
<!--
<authentication-provider user-service-ref="userDao">
  <password-encoder ref="passwordEncoder"/>
</authentication-provider>
-->
```

4. Now do a:

```
mvn clean install
```

This will pick up the configuration changes and add the Crowd client library into your app. Then run:

```
mvn jetty:run-war -Dmaven.test.skip
```

5. Head over to http://localhost:8080/. You should now be able to authenticate the users in your Crowd repository that meet all of the following conditions:

- They are in a Crowd directory assigned to the AppFuse application in Crowd. See more information.
- They are in Crowd groups named USER and ADMIN. You will need to add these groups and assign the user as a member of the groups. These Crowd group names map to the Spring Security authorisation roles defined in the AppFuse application.
- They are allowed to authenticate with the AppFuse application because EITHER they are in a group allowed to authenticate with Crowd (click for details) OR their container directory allows all users to authenticate (click for details).

Congratulations. You have **centralised authentication** 😊

---

**Application-level centralised user management**

One quirk you may notice is that you can't view the profile details of users who exist in Crowd, but did not exist in AppFuse prior to the Crowd integration. Although it's possible to authenticate a Crowd user 'dude' and still run AppFuse as 'dude', 'dude' will not be in AppFuse's local database. AppFuse makes use of a database-backed user management system. In order to achieve application-level **centralised user management**, AppFuse will need to delegate its calls to create, retrieve, update and delete users to Crowd via Crowd's remote API. This will prevent data redundancy and eliminate the hassle of data synchronisation. This is beyond the scope of this short tutorial.

---

**Step 5. Hook Up Single Sign-On**

Enabling single sign-on (SSO) requires quite a bit more tweaking of the **security.xml**:

1. Remove defaults from the `<http/>` element:
   a. Remove the `auto-config` attribute and add an `entry-point-ref="crowdAuthenticationProcessingFilterEntryPoints"` attribute to the `http` element.
   b. Remove the `<form-login>` element.

   You should end up with an `http` element similar to this:
2. Change the default processing filter to Crowd's SSO filter by adding the following bean definitions:

```xml
<authentication-manager alias="authenticationManager"/>

<beans:bean id="crowdAuthenticationProcessingFilterEntryPoint" class="org.springframework.security.ui.webapp.AuthenticationProcessingFilterEntryPoint">
    <beans:property name="loginFormUrl" value="/login.jsp"/>
</beans:bean>

<beans:bean id="crowdAuthenticationProcessingFilter" class="com.atlassian.crowd.integration.springsecurity.CrowdSSOAuthenticationProcessingFilter">
    <custom-filter position="AUTHENTICATION_PROCESSING_FILTER"/>
    <beans:property name="httpAuthenticator" ref="httpAuthenticator"/>
    <beans:property name="authenticationManager" ref="authenticationManager"/>
    <beans:property name="authenticationFailureUrl" value="/login.jsp?error=true"/>
    <beans:property name="defaultTargetUrl" value=""/>
    <beans:property name="filterProcessesUrl" value="/j_security_check"/>
</beans:bean>
```

3. Add the definition of the CrowdLogoutHandler and add in a LogoutFilter that references it:

```xml
<beans:bean id="crowdLogoutHandler" class="com.atlassian.crowd.integration.springsecurity.CrowdLogoutHandler">
    <beans:property name="httpAuthenticator" ref="httpAuthenticator"/>
</beans:bean>

<beans:bean id="logoutFilter" class="org.springframework.security.ui.logout.LogoutFilter">
    <custom-filter position="LOGOUT_FILTER"/>
    <beans:constructor-arg value="/index.jsp"/>
    <beans:constructor-arg>
        <beans:list>
            <beans:ref bean="crowdLogoutHandler"/>
            <beans:bean class="org.springframework.security.ui.logout.SecurityContextLogoutHandler"/>
        </beans:list>
    </beans:constructor-arg>
    <beans:property name="filterProcessesUrl" value="/logout.jsp"/>
</beans:bean>
```

4. Now repeat:
SSO will only work for users that are able to authenticate with both applications and are authorised to use both applications. Try out the following:

- Log in to Crowd – you should be logged in to AppFuse.
- Log out of AppFuse – you should be logged out of Crowd.
- Log in to AppFuse; log out of Crowd; log in to Crowd as another user; refresh AppFuse – you should be logged in as the new user.

Congratulations, you have SSO 😊

Integrating Crowd with Subversion

Install the Crowd Apache connector first
To use the Subversion connector, you will need to have the Crowd Apache Connector already installed.

Crowd's Subversion connector allows you to password-protect a Subversion repository and provide fine grained access by group or user.

**Prerequisites**

- Crowd Apache Connector.

**Configuring Crowd Authentication for Subversion**

If you are using Apache to manage access to a Subversion repository (instructions), and are using Crowd to manage the Apache authentication, then you can use the same configuration method to delegate Subversion's user authentication to Crowd.

Example:

```xml
<Location /svn>
  # Uncomment this to enable the repository
  DAV svn
  # Set this to the path to your repository
  SVNPath /var/lib/svn

  AuthName crowd
  AuthType Basic

  PerlAuthenHandler Apache::CrowdAuth
  PerlSetVar CrowdAppName subversion
  PerlSetVar CrowdAppPassword svn
  PerlSetVar CrowdSOAPURL http://localhost:8095/crowd/services/SecurityServer

  require valid-user

  # The following three lines allow anonymous read, but make
  # committers authenticate themselves.
  <LimitExcept GET PROPFIND OPTIONS REPORT>
    Require valid-user
  </LimitExcept>
</Location>
```

Note that you will need to restart Apache before any changes to its configuration files will take effect.

**Configuring Crowd Authorisation for Subversion**

To restrict Subversion repository access to certain groups and/or users, you can add the Apache::CrowdAuthz module and the
CrowdAllowedGroups and CrowdAllowedUsers directives (described [here](#)).

For more fine-grained access, Crowd provides the CrowdAuthzSVNAccessFile directive which allows you to define path-based access rules. Add the following lines (modifying the file location to fit your configuration) to the example above to enable the CrowdAuthzSVNAccessFile directive.

```perl
PerlAuthzHandler Apache::CrowdAuthz
PerlSetVar CrowdAuthzSVNAccessFile /etc/apache2/dav_svn.authz
```

The CrowdAuthzSVNAccessFile setting lets you define a file where you can configure group and user access at directory level. The format of the file is the same as that used by Subversion's own authorisation module, mod_authz SVN. Here is a small example:

```plaintext
# Everyone has read access to the repository
[/]
* = r

# Members of the bazdevelopers group can
# read and write to the BazWord project
[/BazWord]
@bazdevelopers = rw

# Members of the foodevelopers group can read and write
# to the FooCalc project
[/FooCalc]
@foodevelopers = rw

# Members of foodevelopers can read the branches
# directory but only user juliag (the release manager)
# can write to this path
[/FooCalc/branches]
juliag = rw
@foodevelopers = r

# peterc is a contractor, so he's denied all access to the statistics
# module (which is full of trade secrets).
[/FooCalc/trunk/statistics]
peterc =
```

Some notes:

- The format is a series of one or more repository paths (minus the leading URL) followed by one or more group or user directives for each path.
- You don't have to include every single path. If an exact path match is not found, the settings for the nearest parent directory are used.
- Access for the user or group can be set to one of:
  - `rw`: read and write access.
  - `r`: read-only access.
  - `<blank>`: no access.
- Group names are indicated by a leading `@` character.
- Lines starting with a `#` are comments.
- Note that the `groups` section of the file described in the Subversion documentation is ignored by Apache::CrowdAuthz, because group memberships come from Crowd.
- Do not prefix the paths in the file with the repository name (e.g. `[calc:/foo]`). (See note on SVNParentPath below.)
- If you specify a CrowdAuthzSVNAccessFile as well as one or both of CrowdAllowedGroups and CrowdAllowedUsers, only the CrowdAuthzSVNAccessFile is used for authorisation.

⚠️ **SVNParentPath Not Supported with CrowdAuthzSVNAccessFile**

Subversion provides the SVNParentPath directive, which allows multiple repositories in the same directory to use the same URL. The Crowd Apache integration modules do not support the use of SVNParentPath if you are using the CrowdAuthzSVNAccessFile directive to define permissions. (Using SVNParentPath without the CrowdAuthzSVNAccessFile directive works fine.)

**Mixing Authenticated and Anonymous Access**

A common requirement for Subversion access is to have a combination of anonymous (where a username and password is not required) and...
authenticated access. For example, many administrators want to allow anonymous users to read certain repository directories, but want only authenticated users to read (or write) more sensitive areas. To enable anonymous access, add the following lines to the Apache configuration file:

```
PerlAccessHandler Apache::CrowdAuthz->access_handler
PerlAuthzHandler Apache::CrowdAuthz
PerlSetVar CrowdAuthzSVNAccessFile /etc/apache2/dav_svn.authz
Satisfy Any
```

When anonymous access is enabled as shown above, Apache will not require a password for any part of the repository that matches the "" user in the CrowdAuthzSVNAccessFile file. For example, if you wanted to allow anonymous read access to most of a repository but require authentication for a private section, the CrowdAuthzSVNAccessFile file would look like this:

```
# login not required to read, only members of the 'developers' group can check in changes
[/]
* = r
@developers = rw

# anonymous access denied to /private directory
[/private]
@developers = rw
```

See also this example in the Subversion documentation.

For a detailed description of the AuthzSVNAccessFile file format, see the Subversion documentation.

Crowd Documentation

**Integrating Crowd with a Custom Application**

Crowd ships with out-of-the-box support for a number of applications. You can also integrate Crowd with other applications as follows:

**Step 1. Configuring Crowd to talk to your Application**
Please see Adding an Application.

Step 2. Configuring your Application to talk to Crowd

2.1 Developing a Crowd Client

If your application is not listed in Supported Applications and Directories then you will need to create your own Crowd Client for your application, using the Crowd SOAP API.

For assistance, please see Creating a Crowd Client for your Custom Application.

2.2 Configuring your Application

The integration libraries and configuration files are included in the Crowd download, in the client folder. You will find the Crowd integration library, and the client libraries on which the framework depends, in the lib folder. An example client properties file crowd.properties is located in the conf folder.

To configure your application, perform the following:

1. Copy the Crowd Client and supporting libraries to your application classpath, typically WEB-INF/lib.
   - These files will be in the client folder similar to crowd-integration-client-X.X.X.jar and all supporting jars in the client/lib folder.
2. Copy the client properties file crowd.properties to your application's deployment directory, typically WEB-INF/classes.
3. Edit the crowd.properties file to reflect the values of your deployment parameters. Refer to the description of the attributes in the crowd.properties file.

### Passing crowd.properties as an environment variable

You can pass the location of a client application's crowd.properties file to the client application as an environment variable when starting the client application. This means that you can choose a suitable location for the crowd.properties file, instead of putting it in the client application's WEB-INF/classes directory.

This applies to the Crowd Administration Console's crowd.properties file too. You may find this particularly useful when integrating with a WAR deployment of an integrated application.

Example:

```
-Dcrowd.properties={FILE-PATH}/crowd.properties
```

Configuring the Google Apps Connector

The Google Apps connector is shipped with your Crowd installation. This is a Crowd application connector which allows single sign-on (SSO) to Google Apps. If you wish to activate SSO between Crowd-connected applications and Google Apps, you will need to configure the Google Apps connector as described below.

Using the Google Apps Connector with Java 6
If you want to integrate Crowd with Google Apps in a JDK 1.6 environment, you will need to download two extra files. Please refer to CWD-1388.

On this page:
- Step 1. Configuring the Crowd Application, Directory and Group Details
- Step 2. Generating your SSO Keys
- Step 3. Configuring Google Apps to Recognise Crowd
- Step 4. Verifying that a User can Log in to Google Apps
- More Information about the Google Apps Connector
  - Deleting the Keys
  - The Ins and Outs of SSO with Google Apps
  - Usernames must be the Same in Google Apps and Crowd
- An Example of Google Apps SSO in Action

Step 1. Configuring the Crowd Application, Directory and Group Details

In this step, you will enter the application details for the Google Apps application connector in Crowd. You will manage access to Google Apps by associating Crowd directories and/or groups with the Google Apps application.

To define the Google Apps application details in Crowd,

1. Log in to the Crowd Administration Console.
2. Click the 'Applications' tab in the top navigation bar.
3. The Application Browser will appear. Click the link on the 'google-apps' application name.
4. The application 'Details' screen will appear, as shown below. If you wish, you can change the 'Description'. Please ensure that the 'Active' checkbox remains ticked.
5. Click the 'Directories' tab and select one or more user directories which contain the users who should have access to Google Apps.
6. To choose which users within the directory may authenticate against the application, either:
   - On the 'Directories' tab, change 'Allow all to authenticate' to 'True'. This will allow all users in that directory to log in to Google Apps. (The default is 'False'.)
   OR
   - Click the 'Groups' tab and select one or more groups of users, clicking the 'Add' button to add each group you need.
7. Click the 'Permissions' tab and set the directory permissions for the application.
8. If you wish, you can change the application options on the 'Options' tab:
   - 'Lower Case Output' — See Enforcing Lower-Case Usernames, Groups and Roles for an Application.
   - 'Enable Aliasing' — See Specifying a User's Aliases.
9. Click the 'Configuration' tab and generate your SSO keys as described in Step 2 below.

Screenshot: Google Apps application details in Crowd
Step 2. Generating your SSO Keys

Now you will ask Crowd to generate a public and a private key for use in authenticating Crowd to Google Apps. (Google Apps calls the public key a 'verification certificate'.)

To generate your SSO keys,

1. Still in the Crowd Application Browser as described in Step 1 above, click the 'Configuration' tab for the Google Apps application.
2. The 'Configuration' screen will appear, as shown below. Click the 'Generate New Keys' button.
3. Crowd will generate a public key and a private key, placing them in the plugin-data\crowd-saml-plugin directory of your Crowd Home. (For more information about Crowd Home, see Important Directories and Files.) When the keys have been generated, you will see a message 'DSA keys successfully generated and stored to disk.'

Screenshot: Configuring the Google Apps connector in Crowd

Step 3. Configuring Google Apps to Recognise Crowd

In this step, you will log in to Google Apps as an administrator and enter the information required for Crowd to authenticate to Google Apps. This information consists of some Crowd URLs and the public key which you generated from Crowd.

To configure Google Apps to recognise Crowd,
1. Log in to your Google Apps Dashboard as a Google Apps administrator.
2. In Google Apps, go to the 'Advanced tools' tab.
3. Click the 'Set up single sign-on (SSO)' link.
4. The 'Set up single sign-on (SSO)' screen will appear, as shown below.
5. Copy the URLs from the Crowd configuration screen (see above) and paste them into the Google Apps screen.
6. Now you will upload the public key which Crowd generated for you in Step 2 above:
   - Still in Google Apps, click the 'Browse' button under the heading 'Verification certificate'.
   - Navigate to the plugin-data\crowd-saml-plugin directory of your Crowd Home.
   - Select the public key certificate (file name DSAPublic.key) and upload it to Google Apps.
7. If necessary for your network configuration, set the 'Use a domain specific issuer' checkbox and the 'Network masks' in Google Apps. Please refer to the Google Apps documentation for guidance on these settings.
8. Save your changes in Google Apps.

**Screenshot: Setting up SSO in Google Apps**

**Step 4. Verifying that a User can Log in to Google Apps**

It is a good idea now to check your users can log in to Google Apps.
To test a user's authentication to Google Apps,

1. Still in the Crowd Application Browser as described in Step 2 above, click the 'Authentication Test' tab for the Google Apps application.
2. Enter a user's login details and verify the login. For more details, you can refer to Testing a User's Login to an Application.

Congratulations! You have now configured Crowd for SSO with Google Apps.

More Information about the Google Apps Connector

Deleting the Keys

Once you have generated the keys, a 'Delete Keys' button will appear on Crowd's configuration screen. Click this button to remove the keys from the Crowd Home directory. This will disable SSO with Google Apps.

The Ins and Outs of SSO with Google Apps

- Single sign-on (SSO) applies only to the applications within Google Apps. The Google Apps administration section (control panel) does not support SSO.
- When you sign out of Google Apps, you will also be signed out of Crowd and all Crowd-connected applications. This is the usual SSO behaviour.
- But when you sign out of Crowd, you will remain logged in to Google Apps even though you will be logged out of other Crowd-connected applications. (Reason: Google does not rely on a cookie, so there is no easy way for Crowd to tell Google you have signed out.)
  - It would take some additional development to support single sign-out from Google Apps. If you would like to see this work undertaken, please vote for issue CWD-1238.
- If you go directly to a Google Apps application without logging in to Crowd, Google Apps direct you to a Crowd login screen.
- The Crowd login screen for Google Apps will not offer a 'Forgotten your password' link. You cannot change your Crowd password via Google Apps. Instead, if you need to change your password please log in to Crowd directly, by going to this URL:
  http://YOUR-CROWD-LOCATION:8095/crowd/

Usernames must be the Same in Google Apps and Crowd

Usernames must exist in Google Apps as well as Crowd and a person's username must be the same in both Google Apps and Crowd. The Crowd Google Apps connector does not support the automatic adding of users. If a user exists in Crowd but not in Google Apps, then the user will not be able to log in to Google Apps.

An Example of Google Apps SSO in Action

Here's one example of how it might work:

- John raises an issue in JIRA. In the issue description, he adds a link to a Google Apps document containing more details.
- He assigns the issue to Sarah.
- Sarah clicks the link and opens the document directly in Google Apps. No need to log in again, no need to remember a different password.
Mapping a Directory to an Application

Mapping a directory to an application defines the user-base for an application. Sometimes known as 'application provisioning', directory mappings determine which user stores will be used when authenticating and authorising a user's access request. Read more about users, groups and roles.

When you defined an application, you choose a default directory for that application to use. Crowd also allows you to map multiple directories to each application. This allows each of your applications to view multiple user directories as a single repository.

To map a directory to an application,
1. Log in to the Crowd Administration Console.
2. Click the ‘Applications’ tab in the top navigation bar.
3. This will display the Application Browser. Click the ‘View’ link that corresponds to the application you wish to map.
4. This will display the ‘View Application’ screen. Click the ‘Directories’ tab.
5. This will display a list of directories that are currently mapped to the application. Select the new directory from the drop-down list and click the ‘Add’ button.
6. The new directory will be added to the bottom of the list of mapped directories. You can use the blue up-arrow or down-arrow to move a directory higher or lower in the order:

   ![Up and Down Arrows]

   Why directory order is important
7. You now need to choose which users within the directory may authenticate against the application. You have two choices:
   - To allow all users within the directory to authenticate against the application, change ‘Allow all to Authenticate’ to ‘True’, then click the ‘Update’ button.
   - To allow only specific groups of users within the directory to authenticate against the application, see Specifying which Groups can access an Application.
8. Next, you should define the application’s ability to add/update users in the directory. Click the ‘Permissions’ tab and set the directory permissions for the application.

   ![Screenshot: ‘Application — Map Directories’]

   Map your user directories to the application. When a user accesses the application, Crowd searches the mapped directories to authenticate the user and determine their group/pole membership. To access the application, the user must belong to a directory that allows all to authenticate, or to a group that is mapped to the application.

Specifying the Directory Order for an Application

When you map multiple directories to an application, you also need to define the directory order.

The directory order is important during the authentication of the user, in cases where the same user exists in multiple directories. When a user attempts to log in to an application, Crowd will search the directories in the order you specified, and will use the credentials (password, etc) of the first occurrence of the user to validate the login attempt. See diagram below.

The directory order is not significant when granting the user access to an application based on group membership. In the case of multiple directories, Crowd amalgamates the group memberships in the directories. See below.

On this page:

- Specifying the Directory Order
- How Authentication Works
- How Authorisation via Group Membership Works

Specifying the Directory Order

To specify the directory order,

1. Log in to the Crowd Administration Console.
2. Click the 'Applications' tab in the top navigation bar.
3. This will display the Application Browser. Click the 'View' link that corresponds to the application you wish to map.
4. This will display the 'View Application' screen. Click the 'Directories' tab.
5. This will display a list of directories that are currently mapped to the application. Use the blue up-arrow or down-arrow to move a directory higher or lower in the order.

Screenshot: 'Application---Mapped Directories'

How Authentication Works

The directory order is important during the authentication of the user.

Let's assume that JIRA has been set up as a Crowd application, and has been mapped to two directories, 'Partners' and 'Customers', in that order.

Here is what happens when a user attempts to log in to JIRA:
How Authorisation via Group Membership Works

The directory order is not significant when granting the user access to an application based on group membership.

If the same username exists in more than one directory assigned to an application, Crowd treats these usernames as the same user. Crowd searches all the assigned directories for the user, and amalgamates the group and role memberships.

For example, let's assume you have a user 'jsmith' who exists in both directories 'Customers' and 'Partners', and is a member of group 'G1' in 'Customers' and 'G2' in 'Partners'. Crowd will grant access to the user based on membership of both 'G1' and 'G2'.

Crowd Documentation

Specifying an Application's Directory Permissions

When you map a directory to an application, you can also define the application's ability to add/update/delete users, groups and roles in the directory. To do this, use the 'Permissions' tab in the 'View Application' screen.

Directory permissions are defined at two levels:

1. **Directory-level permissions** are defined on the 'Permissions' tab of the 'View Directory' screen. These permissions apply to each application mapped to the directory, unless the application has its own application-level permissions.

2. **Application-level directory permissions** are defined on the 'Permissions' tab of the 'View Application' screen. If a permission is enabled at directory level, you can enable it for a specific application. For example, you could enable the 'Add User' permission on the 'Customers' directory in JIRA but disable the permission for Confluence.

Take a look at an example.

Disabling a directory-level permission will override any permissions enabled at application level. If a permission is enabled at application level and then subsequently disabled at directory level, the directory-level permission will apply. (The application-level permissions will be 'remembered' and will apply again if re-enabled at directory level.)

---

**How do directory permissions affect the Crowd application (Crowd Administration Console)?**

- If a particular permission is turned off at directory level, then no application can perform the related function - not even the Crowd application. So, for example, if you disable the 'Remove User' permission for a directory, then the Crowd Administration Console will not allow you to delete a user from that directory.
- The Crowd application is not bound by application-level permissions.

For details on directory-level permissions, refer to the instructions on specifying directory permissions. Below are instructions on setting the application-level directory permissions.

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Group</td>
<td>Allows the application to add groups to the selected directory.</td>
</tr>
<tr>
<td>Add User</td>
<td>Allows the application to add users to the selected directory.</td>
</tr>
<tr>
<td>Add Role</td>
<td>Allows the application to add roles to the selected directory.</td>
</tr>
<tr>
<td>Modify Group</td>
<td>Allows the application to modify groups in the selected directory.</td>
</tr>
<tr>
<td>Modify User</td>
<td>Allows the application to modify users in the selected directory.</td>
</tr>
<tr>
<td>Modify Role</td>
<td>Allows the application to modify roles in the selected directory.</td>
</tr>
<tr>
<td>Remove Group</td>
<td>Allows the application to delete groups from the selected directory.</td>
</tr>
<tr>
<td>Remove User</td>
<td>Allows the application to delete users from the selected directory.</td>
</tr>
<tr>
<td></td>
<td>Consider carefully whether you allow the deletion of users, as some applications contain historical data, e.g. documents that the user has created. Read more.</td>
</tr>
<tr>
<td>Remove Role</td>
<td>Allows the application to delete roles from the selected directory.</td>
</tr>
</tbody>
</table>

When you initially map a directory to an application, all of the application's permissions are enabled by default. But note that disabling a directory-level permission will override any permissions enabled at application level.

To set the directory permissions for an application,
1. Log in to the Crowd Administration Console.
2. Click the 'Applications' tab in the top navigation bar.
3. This will display the Application Browser. Click the 'View' link next to the application you wish to update.
4. This will display the 'View Application' screen. Click the 'Permissions' tab.
5. This will display a list of directories that are currently mapped to the application, and a set of permission check-boxes.
6. Select a directory from the list on the left.
7. The 'Permissions' check-boxes will change to show the application's existing permissions for that directory.
   - To enable a directory permission, select the corresponding check-box.
   - To disable a directory permission, deselect the corresponding check-box.

Screenshot: Setting directory permissions for an application

On the application permissions screen, the words '(disabled globally)' will appear next to any permission that is disabled at directory level.

Example of Directory Permissions

Let's assume that you want to:

- Allow self-registration (automatic signup) of new users in your 'Customers' directory via JIRA, and
- Disable self-registration via Confluence.

Here's how you would set the directory-level and application-level permissions in Crowd.

1. At directory level, enable the 'Add User' permission (and any other permissions you want):
   a. In the Crowd Administration Console, click the 'Directories' tab in the top navigation bar.
   b. Select the 'Customers' directory.
   c. Click the 'Permissions' tab.
   d. Select the 'Add User' check-box.

2. At application level, make sure the 'Add User' permission is enabled for the JIRA application:
   a. Click the 'Applications' tab in the top navigation bar.
   b. Click the 'View' link next to the JIRA application.
   c. In the 'View Application' screen, click the 'Permissions' tab.
   d. Select the 'Customers' directory.
   e. Select the 'Add User' check-box.
3. At application level, disable the 'Add User' permission the Confluence application:
   a. Click the 'Applications' tab in the top navigation bar.
   b. Click the 'View' link next to the Confluence application.
   c. Click the 'Permissions' tab.
   d. Select the 'Customers' directory.
   e. Deselect the 'Add User' check-box.

In summary:
With the above application permissions, a person will be able to sign up for a user account via JIRA and this user will be created in the 'Customers' directory, but they will not be able to sign up for an account via Confluence.

Crowd Documentation

Specifying which Groups can access an Application

You can specify which users are allowed to authenticate against each application. For each mapped directory, you can either allow all users within the directory to authenticate with the application, or just particular groups within the directory. You can then assign group membership to each user.

For example, the default group crowd-administrators, which is automatically created in the default directory that you specified during setup, is allowed to access the Crowd Administration Console. This means that users who belong to the group crowd-administrators are allowed to log in to the Crowd Administration Console (assuming they supply a valid password).

To allow a group to access an application,
1. Log in to the Crowd Administration Console.
2. Click the 'Applications' tab in the top navigation bar.
3. This will display the Application Browser. Click the 'View' link that corresponds to the application you wish to map.
4. This will display the 'View Application' screen. Click the 'Groups' tab.
5. This will display a list of groups that currently have access to the application. Click the drop-down arrow next to the 'Add' button.
6. This will display a list of all the groups that exist within each directory. Select the new group from the drop-down list and click the 'Add' button.

Alternatively, you can allow all users from a particular directory to authenticate against the application. See Mapping a Directory to an Application.

Configuring Options for an Application

Viewing Users in Directories Mapped to an Application

The application 'Users' tab shows all the users in all the directories mapped to the selected application. You will also see basic information for each user, including the user's full name, username and email address. If the user has an alias for the selected application, the alias will appear too.

**Group authorisation is not taken into account**

Note the application 'Users' tab displays all users in the directory/directories mapped to the application, even if the application only allows specific groups within the directory/directories. There is an open feature request to limit the user search to only the users allowed to authenticate with the application: CWD-1348.

To see the users visible to an application,

1. Log in to the Crowd Administration Console.
2. Click the 'Applications' tab in the top navigation bar.
3. This will display the Application Browser. Click the link on the name of the application you wish to view.
4. The 'View Application' screen will appear. Click the 'Users' tab.
5. Enter your search criteria in the 'Search' textbox. You can enter all or part of the user's name, email address or username. Leave the search box empty to match all users.
6. Click the 'Search' button.

Screenshot: Viewing users for an application
Specifying an Application’s Address or Hostname

To ensure that your Crowd server can be used by legitimate applications only, Crowd will allow applications to log in only from known addresses. This means that you need to specify the IP address(es) and/or hostname(s) of each application.

When you add a new application, you will specify the application's IP address. After adding the application, you can update the IP address if necessary, as described below. In some cases, you may need to add the applicable host name as well as the IP address.

IP address and/or host name?
You should always specify the application's IP address. In addition, you may need to give a host name as well as the IP address. Some application servers may pass the host name to Crowd, instead of the IP address. If this happens, Crowd will not grant the application's authorisation request unless Crowd recognises the host name.

To specify an application's IP address or hostname,

1. Log in to the Crowd Administration Console.
2. Click the 'Applications' tab in the top navigation bar.
3. The Application Browser will appear. Click the link on the name of the application you wish to update.
4. The 'View Application' screen will appear. Click the 'Remote Addresses' tab.
5. You will see a list of IP addresses and hostnames that are currently mapped to the application. Type the new IP address or hostname into the 'Address' field and click the 'Add' button. Possible values are:
   - A full IP address, e.g. 192.168.10.12.
   - A wildcard IP range, using CIDR notation, e.g. 192.168.10.1/16. For more information, see the introduction to CIDR notation on Wikipedia and RFC 4632.
   - A host name, e.g. myhost.com.
6. The new address will be added to the bottom of the list.

A common problem: Application not connecting with Crowd
For an application to be able to use Crowd, the application's address must be valid and active. Ensure the 'Status' field is set to 'True'.
Testing a User’s Login to an Application

You can use an application's 'Authentication Test' tab to verify that a user will be able to log in to a given application, based on the user, directory and group associations in Crowd.

Performing the Test

The test works like this:

1. You enter the username and password of the user you wish to verify has access to a given application.
2. Crowd searches for the user with that username in the application’s mapped directories, and verifies the password.
3. If the user is not found or the password is invalid, the authentication fails the test.
4. Crowd checks whether the directory is set to allow all to authenticate.
5. If all can authenticate, the test passes.
6. Else, Crowd checks the group(s) to which the user belongs and verifies whether those groups have access to the application.
7. If the user belongs to an allowed group, the test passes, otherwise it fails.

To test a user’s login to an application,

1. Log in to the Crow Administration Console.
2. Click the 'Applications' link in the top navigation bar.
3. This will display the Application Browser. Click the 'View' link that corresponds to the application you wish to verify.
4. This will display the 'View Application' screen. Click the 'Authentication Test' tab.
5. Enter the 'Username' and 'Password' that you wish to verify.
6. Click the 'Update' button.
7. A message appears above the 'Username', displaying one of the following:
   - 'Successful verification' – The authentication has passed the test.
   - 'Invalid verification' – The authentication has failed the test.

Below are some suggestions for the next steps you can take in each case.
Successful Verification

If this test is successful, but the user is having trouble authenticating to an application, then the problem is caused by the connection between the application and Crowd rather than by user authentication.

Next step: Check the ‘Application Sessions’ tab in the Session Browser to see if the application is connected to Crowd.

Failed Verification

If the test declares the login to be invalid, this means that the configuration is incorrect within Crowd.

Next steps:
Check the following - all must be true to allow successful verification.

- The user must belong to a directory which is mapped to this application.
- The password you used must be valid. In particular, check that the password is the one specified in the first directory in which the user appears. (If the user belongs to more than one directory, Crowd uses the first directory in which the user appears, as determined by the directory order.)
- Either:
  - The directory must be set to allow all to authenticate.
  - The user must belong to a group which has access to the application.

Enforcing Lower-Case Usernames, Groups and Roles for an Application

In some cases you may wish to convert usernames, group names and role names to lower case when passing them to an application. You can set an option for each application, as described below. When the option is set, Crowd will convert upper-case and mixed-case information obtained from your user directory to lower case before passing the information to the application. The conversion is applied to the following information:

- Usernames
- Group names
- Role names
- Group and role memberships

If you set this option for an application, the conversion will apply to all directories mapped to the application.

This option is useful in the following situations:

1. First situation: Existing application-to-directory integration:
   - You have previously integrated an application that enforces lower-case usernames (e.g. jsmith) with a corporate directory which allows mixed-case usernames (e.g. JSmith). Examples of such applications are JIRA and Confluence.
   - You have existing usernames in the application, which are therefore all lower case.
   - Now you want to integrate the application with Crowd.
2. Second situation: You have a custom application which demands lower-case usernames and cannot do the conversion itself.

Check your options carefully
You should only enforce lower-case conversion if you are in a situation as described above. There is no need to enforce lower-case conversion if you are starting out afresh with a Crowd-to-JIRA or Crowd-to-Confluence integration. When lower-case conversion is not enforced, Crowd's behaviour is case-insensitive but case-preserving — it will ignore case when comparing usernames etc ('JSmith' = 'jsmith') and it will preserve case when passing information between applications and directories ('JSmith' remains 'JSmith'). This results in the expected behaviour in the Crowd-integrated directories as well as the Crowd-integrated applications such as JIRA and Confluence.

To enforce lower-case conversion for an application,

1. Log in to the Crowd Administration Console.
2. Click the ‘Applications’ tab in the top navigation bar.
3. The Application Browser will appear. Click the link on the name of the application you wish to configure.
4. The ‘View Application’ screen will appear. Click the ‘Options’ tab.
5. Put a tick in the checkbox labelled ‘Lower Case Output’.
6. Click the ‘Update’ button.

Screenshot: Application Options
Managing an Application's Session

Crowd allows you to see a list of all applications currently logged in to the Crowd framework. This is effectively a list of the applications which currently have users logged in to them, since an application will only ever log in to the Crowd framework when it needs to authenticate a user.

You can also force any session to expire, that is, you can log the application out of Crowd.

To see which applications are currently logged in to Crowd,

1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. Click 'Current Sessions' in the left-hand menu.
4. This will display the 'Application Sessions' screen, showing a list of all applications which are currently logged in to the Crowd framework. For example, the screenshot below shows that the crowd application (i.e. the Crowd Administration Console) is currently logged in to the Crowd framework.

You can refine your search by specifying an application's 'Name'. (Note that this is case sensitive.)

To force an application to log out of Crowd,

1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. Click 'Current Sessions' in the left-hand menu.
4. This will display the 'Application Sessions' screen, showing a list of all applications which are currently logged in to the Crowd framework. Click the application's 'Expire' link.

If you want to permanently prevent an application from logging in to Crowd, please see Deleting or Deactivating an Application.

Deleting or Deactivating an Application

Deactivating an application prevents users from logging in to the application. You might do this if you are making changes to an application and need to temporarily keep users out of it.

Deleting an application removes the application's details and its directory mappings. You would typically only do this if the application is no longer required.

To deactivate an application,

1. Log in to the Crowd Administration Console.
2. Click the 'Applications' tab in the top navigation bar.
3. This will display the Application Browser. Click the 'View' link that corresponds to the application you wish to deactivate.
4. This will display the 'Application Details' screen. Deselect the 'Active' check-box, then click the 'Update' button. No users will now be able to log in to the application.

Tips: To reactivate the application, follow the same steps but select the 'Active' check-box.

To delete an application,

1. Log in to the Crowd Administration Console.
2. Click the 'Applications' tab in the top navigation bar.
3. This will display the Application Browser. Click the 'View' link that corresponds to the application you wish to deactivate.
4. This will display the 'Application Details' screen. Click 'Remove Application' in the left-hand menu.

The application will be removed from Crowd and will no longer appear in the Application Browser.
You cannot delete or deactivate the ‘crowd’ application (i.e. the Crowd Administration Console).

Configuring Caching for an Application

Caching is used to store run-time authentication and authorisation rules, which can be expensive to calculate.

This page describes the cache that can be configured in each of the Crowd-connected applications, such as JIRA, Confluence and Bamboo. For an overview of the other types of caching offered by Crowd, please refer to Overview of Caching.

Crowd application caching is also referred to as ‘client caching’.

On this page:

- Explanation of Crowd Application Caching
- Enabling Application Caching
- Extract from the ehcache.xml file
- Basic Cache Attributes
- Important Client Caches

Explanation of Crowd Application Caching

Crowd-integrated applications can store user, group and role data in a local cache. This helps improve the performance of Crowd since these applications do not have to repeatedly request information from Crowd. Generally, it is not necessary to configure application caching, although this depends on the size of your application deployments.

Enabling Application Caching

To enable application caching,

- Edit the crowd-ehcache.xml file, which is located in the WEB-INF/classes directory of your application's Crowd client.
  The two main properties are:
  - diskStore: If you have enabled disk persistence (diskPersistent="true") this is the location on the file system where Ehcache will store its caching information. By default it uses java.io.tmpdir which is Java's default temporary file location.
  - defaultCache: This property has many configurable options. Please read the documentation provided by Ehcache to fully understand the implications and possibilities with this property. Some basic features are described below.

Some applications may enable/disable caching based on the Crowd server setting

The Crowd API allows an application to query whether caching is enabled on the Crowd server (isCacheEnabled). The Crowd Java client does not make use of this API feature, because it makes more sense to have application caching configured entirely on the application side. If you have a Crowd-integrated custom application which does make use of this API call, then the setting on the Crowd server will affect your application-side caching as well.

Extract from the ehcache.xml file

Below is a small snippet of the crowd-ehcache.xml file.

```xml
<ehcache>
  <diskStore path="java.io.tmpdir"/>
  <defaultCache
    maxElementsInMemory="50000"
    eternal="false"
    overflowToDisk="false"
    timeToIdleSeconds="300"
    timeToLiveSeconds="300"
    diskPersistent="false"
    diskExpireThreadIntervalSeconds="120"/>
</ehcache>
```
Basic Cache Attributes

- **eternal**: This indicates that all elements in the cache will live for ever and that any time-outs will be ignored. It is strongly recommended that you set this to false.
- **timeToIdleSeconds**: This sets the maximum amount of time between an element being accessed and its expiry. If you set this value to 0, the element will idle indefinitely.
- **timeToLiveSeconds**: This sets the maximum time between creation time of an element and its expiry. If you set this value to 0 it will live indefinitely.
- **maxElementsInMemory**: Sets the maximum number of elements that can be stored in the cache’s memory. If this limit is reached, the default caching strategy LRU (Least Recently Used) will be invoked and those elements will be removed.

An element is anything stored in Crowd’s cache: a user, a group, a list of users, a list of groups, a list of user memberships, a list of group memberships.

Hint: If you want to store everything in memory, try this value to start with:

\[(\text{Number of users } \times 2) + (\text{number of groups } \times 2)\]

Important Client Caches

The default maxElementsInMemory value of 50000 should be sufficient for most Crowd-integrated applications. However, for larger installations please ensure that the maxElementsInMemory matches the recommended size calculation listed below:

<table>
<thead>
<tr>
<th>Name of Cache</th>
<th>Size Calculation</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.atlassian.crowd.integration-user</td>
<td>The number of users in your system.</td>
</tr>
<tr>
<td>com.atlassian.crowd.integration-group</td>
<td>The number of groups in your system.</td>
</tr>
<tr>
<td>com.atlassian.crowd.integration-parentgroup</td>
<td>The number of groups in your system.</td>
</tr>
<tr>
<td>com.atlassian.crowd.integration-group-membership</td>
<td>The number of users multiplied by the number of groups ((\text{users } \times \text{groups})). This total could be quite large, so you can optimise it by setting it to the number of users that are likely to be active at any one time. The algorithm will fall back to using the com.atlassian.crowd.integration-all-group-members cache (see below) before hitting the server to check.</td>
</tr>
<tr>
<td>com.atlassian.crowd.integration-all-memberships</td>
<td>The number of users in your system.</td>
</tr>
<tr>
<td>com.atlassian.crowd.integration-all-group-members</td>

Crowd Documentation

Overview of SSO

Crowd provides single sign-on (SSO) across a number of applications. This means that users can log in just once, then access the applications without having to log in to each one individually. The SSO functionality is available for applications within a single domain, such as JIRA, Confluence and others. You can also extend SSO to beyond-the-firewall applications using CrowdID for OpenID and Crowd’s Google Apps connector.
This page gives an overview of Crowd’s SSO capabilities, plus links to detailed information on configuring Crowd and the applications concerned.

On this page:

- SSO within a Single Domain
- How It Works
- Configuring Crowd for SSO
- Configuring the Applications for SSO
- Troubleshooting SSO
- SSO Beyond the Firewall
- Using CrowdID as an OpenID Provider
- Using SSO with Google Apps

SSO within a Single Domain

The core Crowd functionality supports SSO across applications within a single domain, such as *.mydomain.com. Crowd uses a browser cookie to manage SSO. Because your browser limits cookie access to hosts in the same domain, this means that all applications participating in SSO must be in the same domain.

Example 1: If you wish to have single sign-on (SSO) support for *.mydomain.com, you will need to configure the SSO domain in Crowd as *.mydomain.com — including the full stop (‘.’) at the beginning. All your Crowd-connected applications must be in the same domain. For example:

<table>
<thead>
<tr>
<th>Application</th>
<th>Domain</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Crowd</td>
<td>crowd.mydomain.com</td>
<td>🔄</td>
</tr>
<tr>
<td>JIRA</td>
<td>jira.mydomain.com</td>
<td>🔄</td>
</tr>
<tr>
<td>Confluence</td>
<td>confluence.mydomain.com</td>
<td>🔄</td>
</tr>
<tr>
<td>FishEye</td>
<td>fisheye.mydomain.com</td>
<td>🔄</td>
</tr>
<tr>
<td>FishEye in different domain</td>
<td>fisheye.example.com</td>
<td>✗</td>
</tr>
</tbody>
</table>

Example 2: If you wish to have single sign-on (SSO) support for mydomain.com/*, you will need to configure the SSO domain in Crowd as mydomain.com. All your Crowd-connected applications must be in the same domain. For example:

<table>
<thead>
<tr>
<th>Application</th>
<th>Domain</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Crowd</td>
<td>mydomain.com/crowd</td>
<td>🔄</td>
</tr>
<tr>
<td>JIRA</td>
<td>mydomain.com/jira</td>
<td>🔄</td>
</tr>
<tr>
<td>Confluence</td>
<td>mydomain.com/confluence</td>
<td>🔄</td>
</tr>
<tr>
<td>FishEye</td>
<td>mydomain.com/fisheye</td>
<td>🔄</td>
</tr>
<tr>
<td>FishEye in different domain</td>
<td>example.com/fisheye</td>
<td>✗</td>
</tr>
</tbody>
</table>

You can find information the comparison of host name strings in RFC 2965 (pages 2 and 3).

You can configure the SSO domain via the Crowd Administration Console, as described in the documentation.

How It Works

The diagram below gives a conceptual overview of an HTTP request passing through an SSO filter and moving directly through the application business logic to create the response. (Click the link below the diagram to see a larger version.)

The diagram shows the ‘happy path’ only, assuming that:

- The user has already logged in to an application that is configured to participate in SSO. If the user has already logged in to one application, they will not need to log in again when accessing another application in the same domain.
- The request passes all authentication and authorisation checks.
The diagram illustrates the following steps:

Step 1: The HTTP request with an SSO cookie.
- The user has already logged in to an application that is part of the SSO environment.
- The user accesses a new application within the SSO environment, or performs some other action on the website.
- The browser creates an HTTP request, bundles all the cookies for the domain and sends the request to the web application. This includes the SSO cookie, since the user has already logged in.
- The request is trapped by the SSO filter in the web application's security framework. This filter may be provided by Atlassian Seraph, by Spring Security, by another framework or via custom code.
- (If the user has not logged in, the filter re-directs the user to the login screen at this point. But we're assuming the user has logged in.)
- The Crowd authenticator finds the SSO cookie, extracts the SSO token and passes the token to Crowd. The Crowd authenticator is a plugin to the security framework (Atlassian Seraph, Spring Security, or others).

Step 2: Validation of the SSO token.
- Crowd validates the session token. If another application in the same domain has already authenticated the user, Crowd will validate the existing authentication.
- If the session has expired, Crowd re-directs the user to the login screen and re-authenticates the user.
- Crowd checks that the user is authorised to access the application.
- If the user does not have the required permissions, Crowd re-directs the user to the login screen.
- Once validation is successful, Crowd passes the validated token back to the application's SSO filter.
- If the session is still valid, the user will not need to log in again even if accessing a different application. The authentication and authorisation will be transparent to the user.

Step 3: Processing of the HTTP request.
- The application's SSO filter passes the request to the business logic handler. (In a Java application, this is the servlet.)
- The business logic handler processes the request and builds the response.

Step 4: The HTTP response.
- The application sends the response back to the browser.

Here is a an overview of servlet filters from Sun and a useful tutorial from O'Reilly.

The SSO filter may be provided by a security framework or by custom code as follows:

<table>
<thead>
<tr>
<th>Security Framework or Custom Code</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Framework: Atlassian Seraph</td>
<td>Most of the Atlassian applications use Seraph. The Crowd documentation tells you how to integrate SSO into Confluence, JIRA, Bamboo, etc. If you are integrating a custom application with Crowd, you may also decide to use Seraph as your security framework.</td>
</tr>
<tr>
<td>Framework: Spring Security</td>
<td>You may have a web application that uses the Spring Security framework and that you are now integrating with Crowd. The Crowd documentation tells you how to integrate SSO into a Spring Security-based application. A point of interest: Crowd uses the Spring Security framework, and so does the Crowd 'demo' application.</td>
</tr>
</tbody>
</table>
You may have a web application that uses the Acegi Security framework and that you are now integrating with Crowd. The Crowd documentation tells you how to integrate SSO into an Acegi-based application. Note that Acegi Security is an earlier version of Spring Security.

Crowd provides a custom integration with FishEye and/or Crucible, including SSO. See the Crowd documentation.

When integrating your own web application with Crowd, you can use the Crowd API to implement SSO. We recommend that you use the SOAP API for long-term compatibility. If you have a Java application, you can use the Java client libraries shipped with Crowd, but please be aware that they may change between releases. You may need to re-compile your source and possibly change a package name.

There are a number of third-party language bindings and application connectors developed by Crowd users. You can see them in the Crowd Extension space.

### Configuring Crowd for SSO

Below are the configuration settings which affect SSO:

<table>
<thead>
<tr>
<th>Short Description</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set your SSO domain</td>
<td>Set the domain via the Crowd Administration Console, as described in the documentation.</td>
</tr>
<tr>
<td>Optional: Configure Trusted Proxy Servers</td>
<td>Configure Crowd to trust a proxy's IP address, if you are running applications behind one or more proxy servers. See the <a href="#">documentation</a></td>
</tr>
<tr>
<td>Optional: Enforce a secure connection, such as SSL, for all SSO requests</td>
<td>You can specify that the 'secure' flag is set on the SSO cookie, as described in the documentation. Unsecured connections will be rejected, including the Crowd Administration Console if not accessed via SSL.</td>
</tr>
</tbody>
</table>

### Configuring the Applications for SSO

When integrating an application with Crowd, you will configure the application to use Crowd as a centralised authentication repository. For most applications, **but not all**, you can also choose to configure SSO. This is described in detail for each application:

- Integrating Crowd with Atlassian Bamboo
- Integrating Crowd with Atlassian Confluence
- Integrating Crowd with Atlassian CrowdID
- Integrating Crowd with Atlassian Crucible
- Integrating Crowd with Atlassian FishEye
- Integrating Crowd with Atlassian JIRA
- Integrating Crowd with Acegi Security
- Integrating Crowd with Apache
- Integrating Crowd with Jive Forums
- Integrating Crowd with Spring Security
- Integrating Crowd with Subversion
- Integrating Crowd with a Custom Application

### Troubleshooting SSO

See [Troubleshooting SSO with Crowd](#).

### SSO Beyond the Firewall

Crowd allows you to extend SSO to beyond-the-firewall applications using CrowdID and Crowd's Google Apps connector.

**Using CrowdID as an OpenID Provider**

Crowd allows you to host an OpenID provider, called CrowdID, so that your users have a single point of authentication for all OpenID-enabled websites. Refer to the [CrowdID Administration Guide](#) and [CrowdID User Guide](#).

OpenID is an open, free protocol which allows a user to have a single identifier for logging in to any OpenID-enabled website. The website will communicate with a specific OpenID provider (in this case, your CrowdID server) when attempting to verify the user's login. For example, if your team uses 37signals' CRM tool Highrise, using Crowd's OpenID provider means you can get SSO between Highrise and your behind-the-firewall applications for all your team.

**Using SSO with Google Apps**
Crowd offers SSO with Google Apps via the Google Apps connector shipped with your Crowd installation. This means that your users can log in just once and then move between Google Apps and other applications like JIRA, Confluence, etc.

### Managing Users, Groups and Roles

In Crowd, users are referred to as *user entity objects* or just *users*.

Groups and roles are known as *permission container objects*. Groups are particularly important in Crowd, as they are often used to control access to applications. Note also that the *crowd-administrators* group confers Crowd administration rights to its members.

Roles are used less frequently, depending on the requirements of individual applications.

**Crowd’s role-based access control could be enhanced**

At present, the implementation of roles in Crowd is identical to the implementation of groups. Additional development work would be needed to differentiate the functionality of roles from groups. If you would like to help us to design better role-based access control, please add a comment to the improvement request CWD-931, letting us know how you would like to see it work.

This section describes how to add/edit users, groups and roles via the Crowd Administration Console. Note that the ability to do this depends on the permissions of the directory which contains the users, groups and roles.

Using the User Browser

In Crowd, users are referred to as *user entity objects* or just *users*.

The User Browser allows you to search, view, add and edit users within a specified directory.

To use the User Browser,

1. Log in to the Crowd Administration Console.
2. Click the 'Users' tab in the top navigation bar.
3. The User Browser will appear. Select the directory in which you are interested.
4. Enter your search criteria in the 'Search' textbox. You can enter all or part of the user's name, email address or username. Leave the search box empty to retrieve all users.
5. You can refine your search by choosing 'Active' or 'Inactive' users. (An 'Inactive' user is typically someone who has left your organisation.)
6. Click the 'Search' button. Crowd will list all the users in the selected directory who match your search criteria.
   • A maximum of 100 users will appear on a page.
   • If there are more than 100 users that match the search, the 'Next' and 'Previous' links will appear at the bottom of the page, so that you can move from one page to the next.
7. If you want to display fewer users, you can change the search criteria and click 'Search' again.
8. To view or edit a user's details, click the link on the user's name.

*Screenshot: 'User Browser'*
Adding a User

In Crowd, users are referred to as *user entity objects* or just *users*. You can either import users into Crowd in bulk (see Importing Users and Groups into a Directory), or add them individually as described below.

To add a user,
1. Log in to the Crowd Administration Console.
2. Click the 'Users' tab in the top navigation bar.
3. This will display the User Browser. Click 'Add User' in the left-hand menu.
4. Complete the following fields:
   - **Email** — The email address of the user. Email addresses must follow the RFC2822 format.
   - **Active** — Only deselect this if you wish to deny the user access to the Crowd-integrated applications.
   - **Username** — The user's login name. Within a given directory, the username must be unique. Note that you cannot change the username once the user has been created.
   - **Password** — The user's password.
     ☸ If you have configured an email server and a notification template, Crowd will send the user an email notification about their new password.
   - **Confirm Password** — Enter the same password again, to ensure that you have typed it correctly.
   - **First Name** — The user's first name.
   - **Last Name** — The user's last name.
   - **Directory** — The directory to which the user will be added. Note that the user cannot be moved to a different directory once the user has been created.

5. Click the 'Create' button to add the user.
6. After creating the user, you will be able to specify the user's attributes and group/role membership. If you wish, you can also verify that the user can log in to appropriate applications.

Crowd Documentation

Deleting or Deactivating a User

Deactivating a user prevents the user from logging in to any applications that use the Crowd framework and also excludes the user from the license count. You would typically do this when a user leaves your organisation.

Deleting a user removes the user completely from the relevant directory.

Deactivating instead of Deleting

We recommend that you deactivate a user rather than delete them, in case some applications contain historical data, such as documents that the user has created. Read more.

⚠️ Deactivating a user that resides in LDAP

For applications that need users to exist for historical data (such as JIRA), you should recreate the user and mark it inactive in a Crowd Internal Directory before deleting from your LDAP directory.

Deactivating a User

To deactivate a user,

1. Log in to the Crowd Administration Console.
2. Click the 'Users' link in the top navigation bar.
3. This will display the User Browser. Select the relevant directory, search for the user you wish to deactivate, and click the link on the user's name.
4. This will display the 'User Details' screen. Deselect the 'Active' checkbox, then click the 'Update' button.

The user will now be unable to log in to any applications that use the Crowd framework.

Screenshot: Deactivating a user
Deleting a User

To delete a user,

1. Log in to the Crowd Administration Console.
2. Click the ‘Users’ link in the top navigation bar.
3. This will display the User Browser. Select the relevant directory, search for the user you wish to delete, and click the link on the user's name.
4. This will display the ‘User Details’ screen. Click ‘Remove User’ in the left-hand menu. Confirm the deletion when prompted.

The user will be removed from the relevant directory and will no longer appear in the User Browser.

Screenshot: Deleting a user

RELATED TOPICS

• Using the User Browser
Managing a User's Session

For any given directory, Crowd allows you to see which users are currently logged in to one or more applications that use the Crowd framework.

You can also force any session to expire, that is, you can log the user out of Crowd.

To see which users are currently logged in to Crowd,

1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. Click 'Current Sessions' in the left-hand menu.
4. This will display the 'Session Browser'. Click the 'User Sessions' tab.
5. Select the directory containing the users in which you are interested, and click the 'Search' button.
6. This will display a list of all users, within your chosen directory, who are currently logged in to the Crowd framework.
   - You can refine your search by specifying a user's 'Name' (note that this is case-sensitive).

To log a user out of Crowd,

1. Login to the Crowd Administration Console.
2. Click the 'Administration' link in the top navigation bar.
3. Click 'Current Sessions' in the left-hand menu.
4. Click the 'User Sessions' tab.
5. This will display a list of all users which are currently logged in to the Crowd framework. Click the user's 'Expire' link.

If you want to permanently prevent a user from logging in to Crowd, please see Deleting or Deactivating a User.
## Editing a User's Details and Password

In Crowd, users are referred to as *user entity objects* or just *users*.

**To edit a user’s details,**

1. Log in to the *Crowd Administration Console*.
2. Click the 'Users' tab in the top navigation bar.
3. This will display the *User Browser*. Select the relevant directory, search for the user you want to update, and click the link on the user’s name.
4. This will display the *User Details* screen. Edit the details as required, then click the ‘Update’ button.

**To change a user’s password,**

1. Log in to the *Crowd Administration Console*.
2. Click the ‘Users’ tab in the top navigation bar.
3. This will display the *User Browser*. Select the relevant directory, search for the user you want to update, and click the link on the user’s name.
4. This will display the *User Details* screen. You can *either*:
   - Enter the new password, then click the ‘Update’ button.
   - Click ‘Reset Password’ in the left-hand menu. This will generate a new password (i.e. one which you do not know) and email it to the user.

**Warning:** If you have configured an *Email Server* and a *Notification Template*, Crowd will send the user an email notification about their new password.

*Screenshot: 'User Details'*
Users can update their own profiles
Authorised Crowd users can log in to the Self Service Console and update their own user profiles, as described in the Crowd User Guide.

Crowd Documentation

Specifying a User's Attributes

In Crowd, users are referred to as user entity objects or just users.
A user's default attributes are specific to the directory to which the user belongs. You can add other attributes (e.g. address, phone number, date of birth) manually as required.
Cannot add attributes to LDAP directories

You cannot add new attributes to directories connected via Crowd's LDAP connector, although you can update the existing supported attributes as described in our LDAP connector documentation. Any new attributes added via the Crowd Administration Console will simply not appear in the directory.

To edit a user's attributes,

1. Log in to the Crowd Administration Console.
2. Click the 'Users' link in the top navigation bar.
3. The User Browser will appear. Select the relevant directory, search for the user you want to update, and click the link on the user's name.
4. The 'User Details' screen will appear. Click the 'Attributes' tab.

   - To add a new attribute,
     1. Enter the name of the new attribute (e.g. phone) in the 'Attribute' field at the bottom of the screen.
     2. Enter the value of the new attribute (e.g. 0123456789) in the 'Value' field at the bottom of the screen.
     3. Click the 'Add' button.

   - To edit an existing attribute, edit the corresponding field in the 'Values' column, then click the 'Update' button.
   - To delete an attribute, click the corresponding 'Remove' link in the 'Action' column.

Note that some attributes may correspond to particular fields on the User Details screen. However, attributes are optional whereas the 'Details' fields are all required.

Enabling User Aliasing for an Application

You can choose to enable or disable aliasing for each application. By default, user aliasing is disabled.

User aliasing can reduce the performance of your user directory, especially on user searches.

To enable user aliasing for an application,

1. Log in to the Crowd Administration Console.
2. Click the ‘Applications’ tab in the top navigation bar.
3. The Application Browser will appear. Click the link on the name of the application you wish to configure.
4. The ‘View Application’ screen will appear. Click the ‘Options’ tab.
5. Put a tick in the checkbox labelled ‘Enable Aliasing’.
6. Click the ‘Update’ button.

Screenshot: Application options

Specifying a User’s Aliases

You can add and remove aliases via the user management screens in the Crowd Administration Console.

To edit a user’s aliases,

1. Log in to the Crowd Administration Console.
2. Click the ‘Users’ link in the top navigation bar.
3. This will display the User Browser. Select the relevant directory, find the user in that you want to update, then click the link on the user’s name.
4. The ‘User Details’ screen will appear. Click the ‘Applications’ tab.

- To add an alias for the user,
  1. Scroll down until you find the application to which the alias applies.
  2. Type the value of the new alias (e.g. ‘arthur’) into the ‘Alias’ field next to the application.
  3. Click the ‘Update’ button.

- To edit an existing alias, update the corresponding field in the ‘Alias’ column, then click the ‘Update’ button.
- To remove an alias, click the corresponding ‘Remove Alias’ link in the ‘Action’ column.
Examples and Use Cases

An example: Arthur Dent might have username 'dent@example.com' in your JIRA issue tracker, 'arthur' in your internal Confluence wiki and 'adent' in your public-facing Confluence wiki.

- Using Crowd, you can link a number of usernames as aliases of Arthur's primary login ID.
- Arthur can log in just once, to any Crowd-connected application. He will be automatically logged into the other applications via single sign-on (SSO).
- When logging in to a specific application (e.g. Confluence), Arthur must use the specific username (alias) for that application, e.g. 'arthur'.
- When logging in to Crowd, Arthur must use his primary login i.e. the one in the directory, e.g. 'adent'.

Here are some cases where Crowd's user aliasing may be useful:

- Aliasing allows you to work around the problem that occurs when you want to implement a single user base for a number of existing systems, where users may have different usernames in each system.
- When someone gets married or changes their name, you may wish to rename a user in your LDAP directory, such as Microsoft Active Directory. To avoid problems in applications which do not allow user renaming, you can now link the new LDAP username to an alias in Crowd.
- Some systems may use email addresses as usernames, while in others this may expose users to email spambots. Using Crowd aliasing, you can use different username formats to suit your application requirements.

Granting Crowd Administration Rights to a User

Members of the ‘crowd-administrators’ group have administration privileges — that is, they can:

- Access the Crowd Administration Console and perform the functions described in the Crowd Administration Guide.
- Access the CrowdID ‘Administration’ menu and perform the functions described in the CrowdID Administration Guide.
The ‘crowd-administrators’ group is automatically created in your default directory when you install Crowd. (See Running the Setup Wizard.) If you need to grant Crowd administration rights to users in other directories, you can create a ‘crowd-administrators’ group in any or all of your other directories and map the directories to the ‘crowd’ application.

To grant administration privileges to a user,

1. Log in to the Crowd Administration Console.
2. Click the ‘Users’ tab in the top navigation bar.
3. The User Browser will appear. Select the relevant directory, search for the user you want to update, and click the link on the user’s name.
4. The ‘User Details’ screen will appear. Click the ‘Groups’ tab.
5. A list of the user’s current groups (if any) will appear. Select the ‘crowd-administrators’ group from the dropdown box below the list, then click the ‘Add’ button.

If you wish, you can use a different or additional group to contain your Crowd administrators. To do this, map your chosen group(s) to the ‘crowd’ application as described in Specifying which Groups can access an Application. Note that CrowdID administrators, however, must always belong to the ‘crowd-administrators’ groups.

Crowd Documentation

**Granting Crowd User Rights to a User**

This page tells you how to authorise users to access Crowd, without giving them Crowd administration rights. Only Crowd administrators can authorise other users to access Crowd.

**Administrators and Non-Administrators**

The Crowd Administration Console presents the full range of Crowd administration functionality to authorised Crowd administrators.

Authorised Crowd users who are not administrators can also access the Crowd Console. They will see a subset of functionality, which we call the
Non-administrators cannot affect other users or the Crowd installation
Granting Crowd user rights will give your users the power to update their own profiles and passwords and view their authorisation details. But they will not be able to view or update other user profiles, nor perform any Crowd administration functions.

Authorising Non-Administrators to Use the Crowd Self-Service Console

To authorise a non-administrator to use Crowd, you should ensure that both of the following are true:

- The person's username is in a user directory where all users are authorised to use Crowd. See the instructions below.
- The person is not a member of a group mapped to the 'crowd' application. (Group members will have Crowd administration rights.)

To grant an entire directory access to Crowd,

1. Log in to the Crowd Administration Console.
2. Map your chosen user directory to the 'crowd' application.
3. On the 'Directories' tab, set the 'Allow All to Authenticate' option to 'True'.
4. Add the user(s) to the directory, if not already added.

Managing Groups and Roles

This page introduces you to groups and roles in Crowd.

About Groups and Roles

Groups and roles are known as permission container objects. Groups are particularly important in Crowd, as they are often used to control access to applications. Note also that the crowd-administrators group confers Crowd administration rights to its members.

Roles are used less frequently, depending on the requirements of individual applications.
Crowd’s role-based access control could be enhanced
At present, the implementation of roles in Crowd is identical to the implementation of groups. Additional development work would be needed to differentiate the functionality of roles from groups. If you would like to help us to design better role-based access control, please add a comment to the improvement request CWD-931, letting us know how you would like to see it work.

About nested groups
Some user directories allow you to define a group as a member of another group. Groups in such a structure are called ‘nested groups’. In Crowd, you can map any group to an application, including a group which contains other groups. Crowd supports nested groups for LDAP directory connectors, Crowd internal directories, Delegated Authentication directories and custom directories. You can enable or disable support for nested groups on each directory individually. For more information, refer to the documentation on configuring a directory.

For more details about nested groups, refer to Nested Groups in Crowd.

About the Group Browser and the Role Browser
The Group Browser and the Role Browser are very similar. They allow you to search, view, add and edit the various groups and roles stored within a specified directory.

To use the Group Browser,

1. Log in to the Crowd Administration Console.
2. Click the 'Groups' tab in the top navigation bar.
3. The Group Browser will appear. Select the directory in which you are interested, then click the 'Search' button to list all the groups that exist in that directory.
   You can refine your search by specifying a 'Name' or by choosing 'Active' or 'Inactive' groups.
4. To view or edit a group's details, click the link on the group name.
5. Click the 'Direct Members' tab to view the immediate members of the group, including users and other groups.
6. Click the 'Nested Members' tab to view all users who are included in the group and in its sub-groups
7. You can read more about group members in Managing Group Members.

Deactivating or Deactivating a Group

Deactivating a group prevents its members from logging in to any applications that use the Crowd framework. Deleting a group removes it completely from the relevant directory.

To deactivate a group,

1. Log in to the Crowd Administration Console.
2. Click the 'Groups' tab in the top navigation bar.
3. This will display the Group Browser. Select the relevant directory, locate the group you wish to deactivate, and click the 'View' link that corresponds to the group.
4. This will display the Group Details screen. Deselect the 'Active' check-box, then click the 'Update' button.

To delete a group,

1. Log in to the Crowd Administration Console.
2. Click the 'Groups' tab in the top navigation bar.
3. This will display the Group Browser. Select the relevant directory, locate the group you wish to deactivate, and click the 'View' link that corresponds to the group.
4. This will display the Group Details screen. Click 'Remove Group' in the left-hand menu.

Managing Group Members

Groups are known as permission container objects. Groups are particularly important in Crowd, as they are often used to control access to applications. Note also that the 'crowd-administrators' group confers Crowd administration rights to its members.

This page tells you how to view the members of a group in Crowd. The list of group members may take a while to load, depending upon the size of your user base.

Other things you can do from the group browser:

- Add users to a group
- Remove users from a group
- Add sub-groups (nested groups)
- Remove sub-groups (nested groups)
About nested groups

Some user directories allow you to define a group as a member of another group. Groups in such a structure are called 'nested groups'. In Crowd, you can map any group to an application, including a group which contains other groups. Crowd supports nested groups for LDAP directory connectors, Crowd internal directories, Delegated Authentication directories and custom directories. You can enable or disable support for nested groups on each directory individually. For more information, refer to the documentation on configuring a directory.

For more details about nested groups, refer to Nested Groups in Crowd.

To view the members of a group,

1. Log in to the Crowd Administration Console.
2. Click the 'Groups' tab in the top navigation bar.
3. The Group Browser will appear, as shown in screenshot 1 below. Select the directory in which you are interested, then click the 'Search' button to list all the groups that exist in that directory. You can refine your search by specifying a 'Name' or by choosing 'Active' or 'Inactive' groups.
4. Click the link on a specific group name to view the group's details.
5. The 'View Group — Details' screen will appear. Click the 'Direct Members' tab to view the immediate members of the group, as shown in screenshot 2 below.
   - If your user directory allows nested groups, users and other groups may be members of the selected group. The 'Direct Members' tab shows all the immediate members of the group, including users and other groups.
   - If the group you are viewing does not contain other groups as members, the 'Direct Members' tab will show only users.
6. Click the 'Nested Members' tab (if present) to view all users who are included in the group and in its sub-groups, as shown in screenshot 3 below.

Screenshot 1: Group Browser

<table>

Managing Groups and Roles
Crowd Documentation

**Automatically Assigning New Users to Groups**

You can configure Crowd to assign new users to specific groups automatically. In summary:

- You can define default groups for each directory, as shown below.
Every new user automatically becomes a member of these groups, whether the user is added via the Crowd Administration Console or via a Crowd-connected application.

Note that the automatic group membership does not work when importing users and groups via Crowd's external user importer.

To add new default groups for a directory,

1. Log in to the Crowd Administration Console.
2. Click the 'Directories' link in the top navigation bar.
3. The Directory Browser will appear. Search for the directory you wish to update, and click the link on the directory name.
4. The directory 'Details' screen will appear. Click the 'Options' tab.
5. The 'Options' screen will appear, as shown below. Click the 'Add Groups' button.
6. The 'Add Groups' popup screen will appear, as shown below. Enter your search criteria in the 'Search' textbox. You can enter all or part of the group name. Leave the search box empty to match all group names.
7. You can refine your search by choosing 'Active' or 'Inactive' groups.
8. You can also set the 'Maximum Results', i.e. the number of groups to be retrieved.
9. Click the 'Search' button. Crowd will list the groups in the selected directory that match your search criteria, but excluding groups that are already defined as default groups for the selected directory.
10. Select the groups by putting a tick in the checkbox next to one or more group names. To select all groups, you can put a tick in the checkbox at the top of the table.
11. Click the 'Add Selected groups' button to add the selected groups to the list of default groups for the directory.

To remove a group from the list of default groups for a directory,

1. Find the group in the list on the 'Options' tab.
2. Click the 'remove' link next to the group name.

After you have removed the group from the list, new users will not be added automatically into the group. Existing users will remain members of the group.

View Directory - Atlassian Crowd

Default Group Memberships

When a user is created in this directory, they will be automatically added to the following groups:

- crowd-administrators
- jira-administrators
- jira-developers
Adding Users to a Group

When you add a user to a group, that user will be authorised to use any applications that use this group to control access.

You can add users to a group in two places:

- The group management screen for a specific group — Here you can add many users at once to the selected group.
- The user management screen for a specific user — Here you can add the selected user to one or more groups at a time.

Both methods are described below.

On this page:

- Adding Users via Group Management
- Adding Users via User Management
- Same Username in Multiple Directories

Adding Users via Group Management

Using the group management screen for a specific group, you can add many users at once to the selected group.

To add one or more users to a group via the group management screen,
1. Log in to the Crowd Administration Console.
2. Click the 'Groups' link in the top navigation bar.
3. The Group Browser screen will appear. Select the relevant directory, locate the group you are interested in, and click the link on the group name.
4. The 'Group Details' screen will appear. Click the 'Direct Members' tab.
5. This will display a list of the selected group's members, both the groups and the users that are direct members of the group. See the screenshot below. Click the 'Add Users' button.
6. The 'Add Users' popup screen will appear, as shown below. Enter your search criteria in the 'Search' textbox. You can enter all or part of the user's email address or username. Leave the search box empty to match all usernames and email addresses.
7. You can refine your search by choosing 'Active' or 'Inactive' users. (An 'Inactive' user is typically someone who has left your organisation.)
8. You can also set the 'Maximum Results', i.e. the number of users to be retrieved.
9. Click the 'Search' button. Crowd will list the users in the selected directory who match your search criteria, but excluding users who are already members of the selected group.
   - Crowd will display a maximum number of users as specified in the 'Maximum Results' field. If too many users match the search, you can change the search criteria and click 'Search' again. (There is no way to move to the next page of matching users.)
10. Select the users by putting a tick in the checkbox next to one or more users. To select all users, you can put a tick in the checkbox at the top of the table.
11. Click the 'Add Selected Users' button to add the selected users to the group.

### Adding Users via User Management

Using the user management screen for a specific user, you can add the selected user to one or more groups at a time.

**To add a user to a one or more groups,**

1. Log in to the Crowd Administration Console.
2. Click the ‘Users’ link in the top navigation bar.
3. The User Browser will appear. Select the relevant directory, locate the user you wish to add, and click the link on the user’s name.
4. The ‘User Details’ screen will appear. Click the ‘Groups’ tab.
5. A list of the user’s current groups (if any) will appear, as shown below. Click the ‘Add Groups’ button.
6. The ‘Add Groups’ popup screen will appear, as shown below. Enter all or part of the group name in the ‘Search’ textbox. Leave the search box empty to match all groups.
7. You can refine your search by choosing ‘Active’ or ‘Inactive’ groups.
8. You can also set the ‘Maximum Results’, i.e. the number of groups to be retrieved.
9. Click the ‘Search’ button. Crowd will list the groups in the selected directory that match your search criteria, but excluding groups that the user already belongs to.
10. Crowd will display a maximum number of groups as specified in the ‘Maximum Results’ field. If too many groups match the search, you can change the search criteria and click ‘Search’ again. (There is no way to move to the next page of matching groups.)
11. Select the groups by putting a tick in the checkbox next to one or more groups. To select all groups, you can put a tick in the checkbox at the top of the table.
12. Click the ‘Add Selected groups’ button to add the user to the selected groups.

**Screenshot: The groups that a user belongs to**
Same Username in Multiple Directories

If the same username exists in more than one directory assigned to an application, Crowd treats these usernames as the same user. Crowd searches all the assigned directories for the user, and amalgamates the group and role memberships.

For example, let's assume you have a user 'jsmith' who exists in both directories 'Customers' and 'Partners', and is a member of group 'G1' in 'Customers' and 'G2' in 'Partners'. Crowd will grant access to the user based on membership of both 'G1' and 'G2'.

Removing Users from a Group

If you remove a user from a group, the user will no longer be able to log in to any applications that use this group to control access.

Removing a user from a group does not delete the user from the directory. See Deleting or Deactivating a User.

You can remove users from a group in two places:

- The group management screen for a specific group — Here you can remove many users at once from the selected group.
- The user management screen for a specific user — Here you can remove the selected user from one or more groups at a time.

Both methods are described below.

On this page:

- Removing Users via Group Management
- Removing Users via User Management

Removing Users via Group Management

Using the group management screen for a specific group, you can remove many users at once from the selected group.

To remove one or more users from a group via the group management screen,

1. Log in to the Crowd Administration Console.
2. Click the 'Groups' link in the top navigation bar.
3. The Group Browser screen will appear. Select the relevant directory, locate the group you are interested in, and click the link on the group name.
4. The 'Group Details' screen will appear. Click the 'Direct Members' tab.
5. This will display a list of the selected group's members, both the groups and the users that are direct members of the group. See the screenshot below. Click the 'Remove Users' button.
6. The 'Remove Users' popup screen will appear, as shown below. Enter your search criteria in the 'Search' textbox. You can enter all or part of the user's email address or username. Leave the search box empty to match all usernames and email addresses.
7. You can refine your search by choosing 'Active' or 'Inactive' users. (An 'Inactive' user is typically someone who has left your organisation.)
8. You can also set the 'Maximum Results', i.e. the number of users to be retrieved.
9. Click the 'Search' button. Crowd will list the users in the selected directory who match your search criteria and are members of the selected group.
10. Select the users by putting a tick in the checkbox next to one or more names. To select all users, you can put a tick in the checkbox at the top of the table.
11. Click the 'Remove Selected Users' button to remove the selected users from the group.

Screenshot: Direct members of a group
Removing Users via User Management

Using the user management screen, you can remove a specific user from the groups that that user belongs to.

To remove a user from one or more groups,
1. Log in to the Crowd Administration Console.
2. Click the ‘Users’ link in the top navigation bar.
3. This will display the User Browser. Select the relevant directory, locate the user you wish to remove, and click the link on the user’s name.
4. This will display the ‘User Details’ screen. Click the ‘Groups’ tab.
5. A list of the user’s current groups (if any) will appear, as shown below. Click the ‘Remove Groups’ button.
6. The ‘Remove Groups’ popup screen will appear, as shown below. Enter all or part of the group name in the ‘Search’ textbox. Leave the search box empty to match all groups.
7. You can refine your search by choosing ‘Active’ or ‘Inactive’ groups.
8. You can also set the ‘Maximum Results’, i.e. the number of groups to be retrieved.
9. Click the ‘Search’ button. Crowd will list the groups that the user belongs to, matching your search criteria in the selected directory.
10. Crowd will display a maximum number of groups as specified in the ‘Maximum Results’ field. If too many groups match the search, you can change the search criteria and click ‘Search’ again. (There is no way to move to the next page of matching groups.)
11. Select the groups by putting a tick in the checkbox next to one or more groups. To select all groups, you can put a tick in the checkbox at the top of the table.
12. Click the ‘Remove Selected groups’ button to remove the user from the selected groups.

Nested Groups in Crowd

This page describes the way Crowd handles nested groups, i.e. groups which contain other groups as members and groups which are members of other groups.

On this page:
- Summary of Nested Groups in Crowd
- Definition of Nested Groups
- Supported Directory Types
- Group Management via the Crowd Administration Console
- Verifying a User’s Access to an Application
- Presenting Flattened Lists of Users to Integrated Applications
- User Management via Integrated Applications
- Further Notes on Crowd’s Processing

Summary of Nested Groups in Crowd

Some user directories allow you to define a group as a member of another group. Groups in such a structure are called ‘nested groups’. In Crowd, you can map any group to an application, including a group which contains other groups. Crowd supports nested groups for LDAP directory connectors, Crowd internal directories, Delegated Authentication directories and custom directories. You can enable or disable support for nested groups on each directory individually. For more information, refer to the documentation on configuring a directory.

Here’s the effect on authorisation and presentation of group members to integrated applications:

- When verifying a user's login to an integrated application, Crowd will search the mapped group plus all its sub-groups.
- When an integrated application requests a list of users, Crowd will present a flat list of users gathered from the requested group and its sub-groups.

The rest of this page describes the above functionality in more detail.

Definition of Nested Groups

A ‘nested group’ is a group which is a member of another group. If you are using groups to manage permissions, you can create nested groups to allow inheritance of permissions from one group to its sub-groups.

In an LDAP directory, a nested group is defined as a child group entry whose DN (Distinguished Name) is referenced by an attribute contained within a parent group entry.

For example, a parent group ‘Group One’ might have an objectClass=group attribute and one or more member=DN attributes, where the DN can be that of a user or that of a group elsewhere in the LDAP tree:

```
member=CN=John Smith,OU=Users,OU=OrgUnitA,DC=sub,DC=domain
member=CN=Group Two,OU=OrgUnitBGroups,OU=OrgUnitB,DC=sub,DC=domain
```

Supported Directory Types
Crowd supports nested groups for the following directory types:

- LDAP directory connectors
- Internal directories
- Delegated Authentication directories
- Custom directories, provided that the customisation meets the interface requirements of the RemoteDirectory API.

The directory importer does not support nested groups when importing users, groups and roles from LDAP into a delegated authentication directory. See CWD-1334.

**Group Management via the Crowd Administration Console**

The Crowd administrator can view group memberships, add a group as a member of another group, and remove a group's membership of another group.

**Verifying a User's Access to an Application**

When verifying a user's login to an integrated application, Crowd will search the groups mapped to the application, plus all their sub-groups. If the username exists in one of the groups, Crowd will allow the user access to the application.

**Presenting Flattened Lists of Users to Integrated Applications**

Integrated applications may ask Crowd for a list of members in a group. Crowd will present all users who are members of the group and all users belonging its sub-groups, consolidated into one list. We call this list a 'flattened' group. This is necessary because many integrated applications do not understand the concept of nested groups. For that reason, Crowd makes the nesting transparent to integrated applications.

✅ Use Case: Confluence Requests a List of Users in 'confluence-users' group

A Crowd-integrated Confluence instance will see users in sub-groups as members of the parent group, allowing administrators to use nested groups to manage permissions. (This will not affect Confluence instances that are not Crowd-enabled.)

For example:

- In LDAP we have groups 'engineering-group' and 'payroll-group'. We want to grant both groups access to our Confluence site.
  1. Using Crowd, we add a group called 'confluence-users' in the LDAP directory.
  2. Add the 'engineering-group' as a sub-group of 'confluence-users'.
  3. Add the 'payroll-group' as a sub-group of 'confluence-users'.

- Group memberships are now:
  - confluence-users — sub-groups: engineering-group, payroll-group
  - engineering-group — sub-groups: dev-a, dev-b; users: pblack
  - dev-a — users: jsmith, sbrown
  - dev-b — users: jsmith, dblue
  - payroll-group — users: rgreen

- When Confluence requests a list of users in the 'confluence-users' group, Crowd will present the following list:
  - pblack
  - jsmith
  - sbrown
  - dblue
  - rgreen
User Management via Integrated Applications

Recommendation: Enable External User Management
If you have JIRA, Confluence, Bamboo, FishEye or Crucible connected to Crowd, and you have nested groups in your directory, we recommend that you turn on external user management, via the administration screen of the integrated application. This will avoid confusion in the user-management screens of the integrated application, since these applications do not understand the concept of nested groups.

Use Case: Application Adds a User to a Group
If an integrated application adds a user to a flattened group, the user is added to the named group and not to any of its sub-groups.

Use Case: Application Removes a User from a Group
If an integrated application attempts to remove a user from a flattened group, Crowd will do the following:
- If the user is a member of the top group in the hierarchy (tree) of groups contained in the flattened list (e.g. confluence-users), Crowd will remove the user.
- Otherwise, Crowd will return an error stating that the user is not a direct member of the group.

Further Notes on Crowd’s Processing
Crowd handles circular/cyclical references — For example, 'group1' is a member of 'group2', 'group2' is a member of 'group3', and 'group3' is in turn a member of 'group1'.

Crowd ignores members which are not users or groups — Group members might be computers, printers, etc.

Crowd gracefully handles unreachable groups — There may be references to groups or members that Crowd cannot enumerate. This might be because the referenced group no longer exists, or the LDAP group structure is not entirely consistent. Crowd will ignore such groups and print a warning to the log file.

Adding a Sub-Group
Removing a Sub-Group
Crowd Documentation

Adding a Sub-Group

If your directory supports nested groups, you can add a group as a member of another group. This page tells you how to add such a sub-group.

To add a sub-group,

1. Log in to the Crowd Administration Console.
2. Click the 'Groups' tab in the top navigation bar.
3. The Group Browser will appear. Select the directory in which you are interested, then click the 'Search' button to list all the groups that exist in that directory. You can refine your search by specifying a 'Name' or by choosing 'Active' or 'Inactive' groups.
4. If the sub-group does not yet exist in the directory, add it now:
   - Click 'Add Group' in the left-hand menu.
   - Complete the fields as described in Adding a Group or Role, then click the 'Create' button.
5. Now, you need to edit the parent group which will contain the sub-group:
   - If the parent group does not yet exist, add it now.
   - If the parent group already exists, find it in the list of groups and click the link on the group name to view the group details.
6. The 'View Group — Details' screen will appear. Click the 'Direct Members' tab.
7. This will display a list of the selected group's members, both the groups and the users that are direct members of the group. See the screenshot below. Click the 'Add Groups' button.
   - The 'Add Groups' button will not appear if nested groups are not enabled for your directory. You can enable nested groups via the directory configuration screen.
8. The 'Add Groups' popup screen will appear, as shown below. Enter your search criteria in the 'Search' textbox. You can enter all or part of the group name. Leave the search box empty to match all group names.
9. You can refine your search by choosing 'Active' or 'Inactive' groups.
10. You can also set the 'Maximum Results', i.e. the number of groups to be retrieved.
11. Click the 'Search' button. Crowd will list the groups in the selected directory that match your search criteria, but excluding groups that are already sub-groups of the selected group.
   - Crowd will display a maximum number of groups as specified in the 'Maximum Results' field. If too many groups match the search, you can change the search criteria and click 'Search' again. (There is no way to move to the next page of matching groups.)
12. Select the groups by putting a tick in the checkbox next to one or more group names. To select all groups, you can put a tick in the checkbox at the top of the table.
13. Click the 'Add Selected groups' button to add the selected groups to the group.

Screenshot: Direct members of a group
Removing a Sub-Group

If your directory supports nested groups, the directory may contain groups which are members of other groups. This page tells you how to remove a group's membership of another group. Note that removing a sub-group does not delete the group.
About nested groups

Some user directories allow you to define a group as a member of another group. Groups in such a structure are called 'nested groups'. In Crowd, you can map any group to an application, including a group which contains other groups. Crowd supports nested groups for LDAP directory connectors, Crowd internal directories, Delegated Authentication directories and custom directories. You can enable or disable support for nested groups on each directory individually. For more information, refer to the documentation on configuring a directory.

For more details about nested groups, refer to Nested Groups in Crowd.

To remove a sub-group,

1. Log in to the Crowd Administration Console.
2. Click the 'Groups' tab in the top navigation bar.
3. The Group Browser will appear. Select the directory in which you are interested, then click the 'Search' button to list all the groups that exist in that directory. You can refine your search by specifying a 'Name' or by choosing 'Active' or 'Inactive' groups.
4. Find the parent group in the list of groups and click the link on the group name to view the group details.
5. The 'View Group — Details' screen will appear. Click the 'Direct Members' tab.
6. This will display a list of the selected group's members, both the groups and the users that are direct members of the group. See the screenshot below. Click the 'Remove Groups' button.

    The 'Remove Groups' button will not appear if nested groups are not enabled for your directory. You can enable nested groups via the directory configuration screen.

7. The 'Remove Groups' popup screen will appear, as shown below. Enter your search criteria in the 'Search' textbox. You can enter all or part of the group name. Leave the search box empty to match all group names.
8. You can refine your search by choosing 'Active' or 'Inactive' groups.
9. You can also set the 'Maximum Results', i.e. the number of groups to be retrieved.
10. Click the 'Search' button. Crowd will list the groups in the selected directory that match your search criteria and are sub-groups of the selected group.

    Crowd will display a maximum number of groups as specified in the 'Maximum Results' field. If too many groups match the search, you can change the search criteria and click 'Search' again. (There is no way to move to the next page of matching groups.)

11. Select the groups by putting a tick in the checkbox next to one or more group names. To select all groups, you can put a tick in the checkbox at the top of the table.
12. Click the 'Remove Selected Groups' button to remove the selected sub-groups from the group.

Screenshot: Direct members of a group
This page summarises the way Crowd handles case sensitivity for usernames, group names and role names when storing, matching and searching data and when passing data between directories and applications.

Terminology:

- **Case insensitive** — Upper-case and lower-case letters are assumed to have the same meaning: JSmith is the same as jsmith.
- **Case preserving** — Upper and lower case are retained when passing or storing information: JSmith remains JSmith.
Outside Crowd

External to Crowd:

- Most LDAP directory schemas specify the user, group and role names as case insensitive for matching and searching, but case preserving when storing the data and passing it back to the requestor.
- Applications behave in different ways. Some, like JIRA and Confluence, insist on lower-case usernames, groups and roles and store all user-related data in lower case.

The Crowd Solution

Crowd's application caches and LDAP directory caches are case insensitive but case preserving. Crowd will ignore case when comparing usernames, etc (JSmith = jsmith) and it will preserve case when passing information between applications and directories (JSmith remains JSmith).

In addition, Crowd Internal and Delegated Authentication directories:

- Are case preserving, i.e. they store usernames, group and role names in mixed case.
- Support case-insensitive matching and searching.

Importing Users, Groups and Roles into Crowd Internal Directories

When you import user information into a Crowd Internal or Delegated Authentication directory, the case of usernames, group names and role names will be preserved.

Enforcing Lower-Case Usernames, Groups and Roles for an Application

In some cases you may wish to convert user, group and role names to lower case when passing them to an application. You can set an option for each application, as described in Enforcing Lower-Case Usernames, Groups and Roles for an Application. When the option is set, Crowd will convert upper-case and mixed-case information obtained from your user directory to lower case before passing the information to the application.

Crowd Documentation

Editing a User's Group and Role Membership

Within any given directory, you can choose the groups and roles to which each user belongs. Note that a user's group membership is particularly important, as groups are often used to control access to applications.

Groups

The Crowd Administration Console provides two ways of adding users to or removing users from a group:

- The group management screen for a specific group — Here you can add many users at once to the selected group.
- The user management screen for a specific user — Here you can add the selected user to one or more groups at a time.

Full instructions are in Adding Users to a Group and Removing Users from a Group.

Roles

Crowd's role-based access control could be enhanced

At present, the implementation of roles in Crowd is identical to the implementation of groups. Additional development work would be needed to differentiate the functionality of roles from groups. If you would like to help us to design better role-based access control, please add a comment to the improvement request CWD-931, letting us know how you would like to see it work.

To add a user to a role,
1. Log in to the Crowd Administration Console.
2. Click the 'Users' link in the top navigation bar.
3. This will display the User Browser. Select the relevant directory, locate the user you wish to add, and click the link on the user's name.
4. This will display the 'User Details' screen. Click the 'Roles' tab.
5. A list of the user's current roles (if any) will be displayed, as shown on the screenshot below. Select the relevant role from the drop-down box below the list, then click the 'Add' button.

Multiple Directories

If the same username exists in more than one directory assigned to an application, Crowd treats these usernames as the same user. Crowd searches all the assigned directories for the user, and amalgamates the group and role memberships.

For example, let's assume you have a user 'jsmith' who exists in both directories 'Customers' and 'Partners', and is a member of group 'G1' in 'Customers' and 'G2' in 'Partners'. Crowd will grant access to the user based on membership of both 'G1' and 'G2'.

  - Domain
Overview of Caching

Caching is used to store run-time authentication and authorisation rules, which can be expensive to calculate.

In Crowd, data caching occurs in three main areas:

- **Application caches in the applications that are connected to Crowd** — Applications such as JIRA, Confluence and Bamboo can store user, group and role data in a local cache. This helps improve the performance of Crowd, since these applications do not have to repeatedly request information from Crowd. Generally it is not necessary to configure application caching, although this depends on the size of your application deployments. You can set the options for application caching in the cache configuration file for that application. See Configuring Caching for an Application.

- **An authorisation cache on the Crowd server** — To improve performance, Crowd can store users’ authentication and per-application permissions in a local cache for a specified period. You can enable or disable this cache via an option on the ‘General Options’ screen in the Crowd Administration Console. See Authorisation Caching.

- **LDAP directory caches on the Crowd server** — Where the LDAP directory supports it, Crowd will keep an up-to-date cache of all user and group information from the directory. Crowd monitors changes from the remote directory and incrementally updates the cache. You can configure this cache on the Directory Connector screen. See Configuring Caching for an LDAP Directory.

This diagram gives a conceptual overview of the caches described above:

Crowd Documentation

Configuring Server Settings

You can alter the settings which were specified when your Crowd server was installed:

- SSO Cookie
When using Crowd for single sign-on (SSO), you can specify that the 'secure' flag is set on the SSO cookie. This will enforce a secured connection, such as SSL, for all SSO requests.

Unsecured connections will be rejected

If you set this flag, any applications not using a secure connection will not be able to participate in SSO and users will not be able to log in. Potentially, this may make it impossible to log in to Crowd, if your Crowd Administration Console application is not accessed via SSL.

To specify the secure flag on the SSO cookie,

1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. The 'General Options' screen will appear. Tick or untick the 'Secure SSO Cookie' checkbox as required:
   - Ticked — The 'secure' attribute will be included on the SSO cookie. A secured connection, such as SSL or TLS, is required for all SSO requests. Unsecured connections will be refused.
   - Not ticked — This is the default. The 'secure' attribute will not be included on the SSO cookie. This means that the SSO cookie may be transmitted over an unsecured connection.
4. Click the 'Update' button.
Deployment Title

The deployment title is a unique name for your Crowd instance. The deployment title is used by default in the subject line of email notifications.

To specify the deployment title,

1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. The 'General Options' screen will appear. Type the new name into the 'Deployment Title' field.
4. Click the 'Update' button.

Screenshot: 'General Options'
The SSO domain is used when setting HTTP authentication cookies in a user's browser. If this attribute is not correct, single sign-on (SSO) will not work when the user switches between applications.

The core Crowd functionality supports SSO across applications within a single domain, such as *.mydomain.com. Crowd uses a browser cookie to manage SSO. Because your browser limits cookie access to hosts in the same domain, this means that all applications participating in SSO must be in the same domain.

Example 1: If you wish to have single sign-on (SSO) support for *.mydomain.com, you will need to configure the SSO domain in Crowd as .mydomain.com — including the full stop (\) at the beginning. All your Crowd-connected applications must be in the same domain. For example:
Example 2: If you wish to have single sign-on (SSO) support for mydomain.com, you will need to configure the SSO domain in Crowd as mydomain.com/*.

All your Crowd-connected applications must be in the same domain. For example:

<table>
<thead>
<tr>
<th>Application</th>
<th>Domain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Crowd</td>
<td>mydomain.com/crowd</td>
</tr>
<tr>
<td>JIRA</td>
<td>mydomain.com/jira</td>
</tr>
<tr>
<td>Confluence</td>
<td>mydomain.com/confluence</td>
</tr>
<tr>
<td>FishEye</td>
<td>mydomain.com/fisheye</td>
</tr>
<tr>
<td>FishEye in different domain</td>
<td>example.com/fisheye</td>
</tr>
</tbody>
</table>

You can find information the comparison of host name strings in RFC 2965 (pages 2 and 3).

When developing on your local machine, you should set the domain to localhost.

To specify the domain,

1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. The 'General Options' screen will appear. Type the new domain into the 'SSO Domain' field.
4. Click the 'Update' button.

Token Seed

The token seed is a unique key for each site deployment of Crowd. This key is used when generating tokens for an authenticated application.
To specify the token seed,

1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. The 'General Options' screen will appear. Now you can either:
   • Type the new key into the 'Token Seed' field, then click the 'Update' button.
   OR
   • Click the 'Generate' button to create a random key automatically.

Screenshot: 'General Options'

**General Options**

- **Deployment Title**: Crowd
  The name of this Crowd instance.
- **SSO Domain**: The SSO domain for this Crowd deployment. Example: somecorp.com. If you want to support single sign-on across multiple hosts, be sure to put the period (.) in front of the domain. Leave this field empty if you want cookies to be set to the domain that requests are made to.
- **Secure SSO Cookie**: If checked, the “secure” flag is set on the cookie. This will break SSO for applications not accessed over SSUTLS (https://), potentially making logging into Crowd impossible.
- **Enable Authorisation Caching**: If checked, Crowd will cache a user's authentication and per-application permissions for a specified period. Recommended setting: Enabled, for vastly better performance. Disable only if you need immediate results when removing users or their permissions.
- **GZip Compression**: Tick the box to enable GZip compression of responses from the Crowd Security Server.
- **Token Seed**: Q4FRSSf
  A key used to generate authentication tokens in your Crowd deployment. The tokens are used when authenticating applications and users.

**Session Configuration**

This page tells you how to set the **timeout period for a session token** and how to enable/disable in-memory token storage.

**Session Timeout**
When a successful authentication occurs, for either an application or a user, a unique token is assigned. Tokens are valid for the period of time specified as the 'Session Timeout' attribute.

The session timeout determines how long a session will be considered valid during any period of inactivity. This value is specified in minutes and must be greater than 0.

To specify the session timeout,

1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. Click 'Session Config' in the left-hand menu.
4. The 'Session Config' screen will appear, as shown below. Type the new value into the 'Session Timeout' field, then click the 'Update' button.

Authentication Token Storage

Authentication tokens are used to validate application and user sessions. A token is stored for each active session. By default, they're kept in the Crowd database. Storing these tokens in memory can benefit performance, but with some significant drawbacks:

- Sessions will not be saved across Crowd restarts. If you restart Crowd, all your users will have to log in again.
- Clustering will not be possible. Atlassian does not officially support clustering Crowd, but a number of our customers are successfully using it in this manner. See this knowledge-base article.

Switching from database to in-memory token management does not require a restart of Crowd; nor will sessions be lost or validations failed. However, if you have lots of active sessions, and therefore lots of tokens, it can take some time to copy the token information. During this time, validation requests will be queued and Crowd will appear unresponsive to client applications.

As a guide, below are some benchmarks of time taken to switch from one form of token storage to the other. The measurements were taken on a quad-core Mac Pro, using a lightly-loaded PostgreSQL database:

<table>
<thead>
<tr>
<th>Number of Tokens:</th>
<th>100</th>
<th>500</th>
<th>1000</th>
<th>5000</th>
<th>10000</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database -&gt; Memory</td>
<td>0.1s</td>
<td>0.7s</td>
<td>1.2s</td>
<td>4.2s</td>
<td>8.2s</td>
</tr>
<tr>
<td>Memory -&gt; Database</td>
<td>1.2s</td>
<td>4.8s</td>
<td>9.2s</td>
<td>45s</td>
<td>90s</td>
</tr>
</tbody>
</table>

To switch the token storage location,

1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. Click 'Session Config' in the left-hand menu.
4. The 'Session Config' screen will appear, as shown below. Select one of the radio buttons next to Authentication Token Storage:
   - 'Database Cache' — This is the default option. Select it to store your tokens in the Crowd database. We recommend this option unless performance problems require in-memory storage.
   - 'Memory Cache' — Select this option to store your tokens in memory.
5. Click the 'Update' button.

Screenshot: 'Session Config'

**RELATED TOPICS**

- Managing an Application's Session
**Authorisation Caching**

Caching is used to store run-time authentication and authorisation rules, which can be expensive to calculate.

This page describes the cache that can be configured on the Crowd server, to store users’ authentication and per-application permissions for a specified period. For an overview of the other types of caching offered by Crowd, please refer to [Overview of Caching](#).

*Caching of Users’ Application Permissions on the Crowd Server — The Authorisation Cache*

Crowd can store users’ authentication and per-application permissions in a local cache for a specified period after retrieving the information from the directory and application data. The cached data will answer the following questions:

- For a particular user: Is the user authenticated?
- For a particular user and application: Does the user have access to the application?

You might call this the 'has access' cache, or the 'authorisation cache'.

Recommended setting: **Enabled**. For performance reasons, we recommend that the cache be enabled on the Crowd server. This is the default setting.

The effect of caching the data is that users will retain access to applications for a period after their username or permission has been removed, i.e. until the server-side cache expires. You should disable the cache only if you need immediate results when removing users or their permissions.

**To enable caching of user-to-application permissions on the Crowd server,**

1. Log in to the Crowd Administration Console.
2. Click the ‘Administration’ tab in the top navigation bar.
4. Click the ‘Update’ button.

*Screenshot: ‘Caching’*
Some applications may enable/disable caching based on the Crowd server setting

The Crowd API allows an application to query whether caching is enabled on the Crowd server (isCacheEnabled). The Crowd Java client does not make use of this API feature, because it makes more sense to have application caching configured entirely on the application side. If you have a Crowd-integrated custom application which does make use of this API call, then the setting on the Crowd server will affect your application-side caching as well.

Compression of Server Output

By default, Crowd compresses the output from the security server, using the Gzip compression format, before sending the data to the client over the network. Compression of server output is optional. You can turn it on or off via the Crowd Administration Console.

Here are some reasons why you may want to turn compression off:

- It may be easier to debug problems using uncompressed data.
- Some agents, such as older versions of Internet Explorer, have problems with the Gzip format.

If you're proxying Crowd behind Apache, check to see if you're using mod_deflate. You do not need to enable Gzip compression if Apache...
already provides it or you may encounter this issue: CWD-1398.

To enable/disable compression of server output,

1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. The 'General Options' screen will appear. Set the 'Gzip Compression' option as follows:
   - Put a tick in the checkbox to instruct the Crowd Security Server to use Gzip compression when sending responses.
   - Leave the checkbox empty to instruct Crowd to send uncompressed data.

**Screenshot: ‘Setting the Compression of Server Output’**

**Licensing**

Crowd licenses are based on the number of end-users who will log in to the applications that are integrated with Crowd.

You can obtain an evaluation license from the Atlassian website. When you obtain an evaluation license — or purchase, renew or upgrade your license — you will receive a license key via email or on the Atlassian website. You will need to enter your license key into your Crowd server as described below.

**On this page:**
Entering your License Key

To enter your license key,

1. Log in to the Crowd Administration Console.
2. Click the ‘Administration’ tab in the top navigation bar.
3. Click ‘Licensing’ in the left-hand menu.
4. Type (or paste) your license key into the ‘License Key’ field.
5. Click the ‘Update’ button.

Warning when Number of Users approaches License Limit

Whenever the number of users reaches 90% of the number allowed by the license, Crowd will send an email informing the administrator about the license limit and the current number of users. The email is sent to the email notification address, as defined on the ‘Mail Configuration’ screen in the Crowd Administration Console. (See Configuring your Mail Server.)

This warning should help the administrator to take action and avoid exceeding the license limit.

What to Do if the Number of Users Exceeds your License Limit

If the number of users who are allowed to log in to the Crowd framework exceeds the user license limit, no-one will be able to log in to any applications (other than the Crowd Administration Console). If this happens, you can obtain a temporary license from Atlassian.

Minimising your Licensing Cost

If you have more than one directory, ensure that the same user does not exist in multiple directories.
We recommend that you allow only particular groups to log in to each application, rather than entire directories.

Note that a mapped application can ‘see’ all users in a directory, even if not all of them can log in to the application. For example, a Human Resources application might be mapped to your entire Active Directory server, but only the HR group is allowed to log in to the application.

Recalculating your User Total

The Licensing screen shows the number of users who currently count towards your license. This total is updated automatically at regular intervals. If you have recently added or removed users, the total may not be up to date when you view the screen. You can update the count immediately, as described below.

To recalculate your user total,

1. Log in to the Crowd Administration Console.
2. Click the ‘Administration’ tab in the top navigation bar.
3. Click ‘Licensing’ in the left-hand menu.
4. Click the link labelled ‘Recalculate your user total’.

The recalculation may take a while, depending on the size of your user base.

Server ID and Support Entitlement Number

Your License Server ID is generated automatically, based on your license key.

The Support Entitlement Number will appear only on newer licenses. If your License Server ID starts with a 'B', you should also have a Support Entitlement Number. This number is not currently used, but will be used by Atlassian Support in the future.

Configuring your Mail Server

Once you have configured your mail server as described below, Crowd can send email notifications to users at specific events, such as when a user’s password is reset or a server event occurs.

To customise the password notification message, please see Creating an Email Notification Template.

On this page:

- Accessing the Mail Configuration Screen
- Mail Server Option 1: SMTP
- Mail Server Option 2: JNDI Location
  - Configuring the JNDI Resource
  - SMTP over SSL

Accessing the Mail Configuration Screen

To configure SMTP email,
1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. Click 'Mail Configuration' in the left-hand menu.
4. The 'Mail Configuration' screen allows you to choose between an SMTP and a JNDI mail server. Enter the details of your mail server as described below, then click the 'Update' button.

### Mail Server Option 1: SMTP

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notification Email Address</td>
<td>The email address which will receive notifications about server events. For example, Crowd will send an email warning to this address when the number of users approaches the license limit.</td>
</tr>
<tr>
<td>From Email Address</td>
<td>Crowd will add this email address as the 'sender' on the emails generated by Crowd and sent to users.</td>
</tr>
<tr>
<td>Subject Prefix</td>
<td>The prefix which will appear at the start of the email subject, for all emails generated by Crowd. This can be useful for email client programs that offer filtering rules.</td>
</tr>
<tr>
<td>Mail Server Type</td>
<td>Select the 'SMTP Server' radio button.</td>
</tr>
<tr>
<td>SMTP Host</td>
<td>The host address. For example: localhost or smtp.acme corp.com.</td>
</tr>
<tr>
<td>SMTP Port</td>
<td>The port on which the SMTP mail server listens. The default is '25'.</td>
</tr>
<tr>
<td>Username</td>
<td>The username to use when connecting to the mail server.</td>
</tr>
<tr>
<td>Password</td>
<td>The password to use when connecting to the mail server.</td>
</tr>
</tbody>
</table>

Enter the details as follows:

- **Notification Email Address** — The email address which will receive notifications about server events. For example, Crowd will send an email warning to this address when the number of users approaches the license limit.
- **From Email Address** — Crowd will add this email address as the 'sender' on the emails generated by Crowd and sent to users.
- **Subject Prefix** — The prefix which will appear at the start of the email subject, for all emails generated by Crowd. This can be useful for email client programs that offer filtering rules.
- **Mail Server Type** — Select the 'SMTP Server' radio button.
- **SMTP Host** — The hostname of the SMTP mail server, e.g. 'localhost' or 'smtp.acme corp.com'.
- **SMTP Port** — The port on which the SMTP mail server listens. The default is '25'.
- **Username** — The username that your Crowd server will use when it logs in to your mail server.
- **Password** — The password that your Crowd server will use when it logs in to your mail server.

### Mail Server Option 2: JNDI Location
Mail Configuration

Notification Email Address: 
Notification emails will be sent to this address regarding critical server messages, such as when a license is reaching its resource limits.

From Email Address: 
The sender (or FROM) email address to use when sending email notifications.

Subject Prefix: 
The subject prefix to use when sending email notifications. This is useful for mail client filtering rules. For example: [ACME CORP - Crowd].

Mail Server Details

Mail Server Type: 
Choose if you want to use SMTP or JNDI for your mail configuration.

JNDI Location

JNDI Location: 
The JNDI location of a javax.mail.Session object setup by your application server.

Select the 'JNDI Location' if you want to connect to a mail server via a datasource managed by your application server.

Enter the details as follows:

- **Notification Email Address** — The email address which will receive notifications about server events.
- **From Email Address** — Crowd will add this email address as the 'sender' on the emails generated by Crowd and sent to users.
- **Subject Prefix** — The prefix which will appear at the start of the email subject, for all emails generated by Crowd. This can be useful for email client programs that offer filtering rules.
- **Mail Server Type** — Select the 'JNDI Location' radio button.
- **JNDI Location** — The datasource name of a javax.mail.Session object which has been set up by your application server.

Configuring the JNDI Resource

For example, in Tomcat 5.5 (the default application server that is bundled with Crowd Standalone), your JNDI location would be `java:comp/env/mail/CrowdMailServer`, and you would add the following section in `conf/server.xml` or `conf/Catalina/localhost/crowd.xml`, inside the `<Context>` node:

```
<Context path="/crowd" docBase="/path/to/atlassian-crowd-war-directory" reloadable="false">
  <Resource name="mail/CrowdMailServer" auth="Container" type="javax.mail.Session">
    mail.smtp.host="yourmailserver.example.com"
    mail.smtp.port="25"
    mail.smtp.protocol="smtp"
    mail.smtp.auth="true"
    mail.smtp.user="your_userid"
    password="your_password"
  </Resource>
</Context>
```

If you have problems connecting, add a `mail.debug="true"` parameter, which will let you see SMTP-level details when testing the connection.

You will also need to ensure that the JavaMail classes and Java Beans Activation Framework are present in your application server's classpath.

If JavaMail is not present in your application server installation, you will receive the following error in your log file:

```
java.lang.NoClassDefFoundError: javax/mail/Authenticator
```

If the Activation Framework is not present in your application server installation, you will receive the following error in your log file:
SMTP over SSL

You can encrypt email communications between Crowd and your mail server via SSL, provided your mail server supports SSL.

To do this, edit your mail server connection properties and specify `starttls` and `SSLSocketFactory`, e.g.:

```xml
<Context path="/crowd" docBase="/path/to/atlassian-crowd-war-directory" reloadable="false">
  <Resource name="mail/CrowdMailServer" type="javax.mail.Session">
    <Parameter name="auth" value="Container"/>
    <Parameter name="mail.smtp.host" value="yourmailserver.example.com"/>
    <Parameter name="mail.smtp.port" value="465"/>
    <Parameter name="mail.smtp.protocol" value="smtp"/>
    <Parameter name="mail.smtp.auth" value="true"/>
    <Parameter name="mail.smtp.user" value="your_userid"/>
    <Parameter name="password" value="your_password"/>
    <Parameter name="mail.smtp.starttls.enable" value="true"/>
    <Parameter name="mail.smtp.socketFactory.class" value="javax.net.ssl.SSLSocketFactory"/>
  </Resource>
</Context>
```

Additionally, as you are connecting to an SSL service, you will need to import the SMTP server certificate into a Java keystore. The process is described in Configuring Crowd to Work with SSL.

**Creating an Email Notification Template**

The email template is used when sending a notification to a user, e.g. when resetting a user's password.

To set up your email template,
1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. Click 'Mail Template' in the left-hand menu.
4. Enter the text and macros that will be used to compose the body of the email message. The following macros are available:
   - $firstname — will be replaced by the user's first name.
   - $lastname — will be replaced by the user's last name.
   - $deploymenttitle — will be replaced by the title of your Crowd deployment, as defined in Deployment Title.
   - $date — will be replaced by the date/time of the message event.
   - $password — will be replaced by the user's new password.
5. Click the 'Update' button.

Screenshot: 'Mail Template'

Mail Template

Template:
Hello $firstname $lastname, Your password has been reset by a
$deploymenttitle administrator at $date. Your new password is:
$password $deploymenttitle

The email template used when resetting a users password. The supported macros are:
- $firstname (First Name)
- $lastname (Last Name)
- $deploymenttitle (Crowd deployment title)
- $date (Message date)
- $password (New password)

Crowd Documentation

Configuring Trusted Proxy Servers

If you are running applications behind one or more proxy servers, you may find it useful to configure Crowd to trust the proxies' IP addresses. When a proxy server forwards an HTTP request, Crowd will recognise the request as coming from the request's originator, not the proxy server. This is particularly useful if you want single sign-on amongst several applications running behind different proxy servers.
Configuring a trusted proxy server means that Crowd will use the rightmost IP address of the `X-Fowarded-For:` header when verifying the client's IP address.

Crowd allows a maximum of 15 proxy server IP addresses.

**To configure Crowd to trust a proxy server,**

1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. Click 'Trusted Proxy Servers' in the left-hand menu.
4. The 'Trusted Proxy Servers' screen appears. Type the IP address of the proxy server.
5. Click the 'Add' button.

Crowd Documentation

Back Up and Restoring Data

You can back up your Crowd data by exporting it to an XML file. The data includes:

- Your Crowd server configuration details, including connection details for all your directories and applications.
- Any internal directories that exist.

### Important Note about Crowd Backup Functionality

At present, Crowd does not allow you to schedule periodic backups. We do have an open feature request for this. Until this feature is added to Crowd, we recommend using alternative backup methods such as:

- A periodic backup or dump of your database using tools provided by your database.
- A backup of your Crowd Home directory using external backup tools.

We recommend that you back up your data regularly, especially after any significant configuration changes. You should also perform regular backups of your database.

### To back up your Crowd data,

1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. Click 'Backup' in the left-hand menu.
4. Select the 'Reset Domain' checkbox if the backup file will be restored onto a different server. Selecting 'Reset Domain' will reset the domain to blank. (After you restore the data, you can change the domain as described in Domain.)
5. Type an appropriate 'Backup File Path', including the name of the XML file.
6. Click the 'Submit' button.

### To restore your Crowd data,

**Before you begin:** If you created the XML backup file on a different server, edit the `crowd.properties` file and change the password to match the password of the server on which you created the XML backup file.

1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. Click 'Restore' in the left-hand menu.
4. In the 'Restore File Path' field, type the path to the backup file, including the name of the XML file.
5. Click the 'Submit' button.

Screenshot 1: 'Backup'
When troubleshooting problems with your Crowd installation, it is often useful to change the level of information provided by your Crowd server so that more information, messages and warnings are shown than usual. This page describes how to:

- Adjust the settings which affect Crowd's logging.
- Enable performance profiling.

With performance profiling turned on, your system output console will show a record of the time it takes (in milliseconds) to complete each Crowd action. This will help with diagnosing performance problems. The resulting output will be large, so you should not enable it for long periods.

You can see an example of performance profiling output [here](#).
Summary of the Logging Levels

Crowd uses Apache's log4j logging service. The amount of information written to the log file is determined by the logging 'level'. The type of message output at each level is as follows:

<table>
<thead>
<tr>
<th>Level</th>
<th>Type of Message Written to the Log</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEBUG</td>
<td>Fine-grained information that is useful for debugging only. These are low-level details that most people never need to know about.</td>
</tr>
<tr>
<td>INFO</td>
<td>Informational messages about what Crowd is doing. Usually not interesting.</td>
</tr>
<tr>
<td>WARN</td>
<td>Warnings that something may have gone wrong, or other messages a system administrator may wish to know. These are conditions that, while not errors in themselves, may indicate that the system is running sub-optimally.</td>
</tr>
<tr>
<td>ERROR</td>
<td>Indications that something has gone wrong in Crowd. The person responsible for configuring Crowd should be notified.</td>
</tr>
<tr>
<td>FATAL</td>
<td>Indications that something has gone wrong so badly that the system cannot recover.</td>
</tr>
<tr>
<td>ALL</td>
<td>All possible log messages.</td>
</tr>
</tbody>
</table>

Finding the Crowd Log File

Provided that you have not changed the log file location from the default, the Crowd log file is at the following location:

- For Standalone installations of Crowd: `{CROWD-STANDALONE-INSTALL}/atlassian-crowd.log`
- For WAR installations: The directory on your application server, from which the Crowd application was started.

Changing the Log Settings

You can change the log settings in two ways:

- Set the logging levels at runtime via the Administration Console, as described immediately below. Your changes will be in effect only until you next restart Crowd.
- Or edit the log configuration file, as described in the Advanced section below. Your changes will take effect next time you start Crowd, and for all subsequent sessions.

Configuring the Log Settings and Performance Profiling via the Administration Console

If necessary, you can edit the configuration file directly

If you change the log settings via the Administration Console, the changes are not written to the `log4j.properties` file and are therefore discarded when you next stop Crowd. Also, not all logging behaviour can be changed via the Administration Console. For logging configuration not mentioned below, or to change the log settings permanently, you will need to stop Crowd and then edit the log configuration file instead.

The 'Logging & Profiling' screen tells you whether performance profiling is currently on or off, and shows a list of all currently defined loggers. On this screen you can:

- Turn performance profiling on or off.
- Set the logging level for each class or package name, or reset all logging levels to the default setting.

With performance profiling turned on, your system output console will show a record of the time it takes (in milliseconds) to complete each Crowd action. This will help with diagnosing performance problems. The resulting output will be large, so you should not enable it for long periods.

You can see an example of performance profiling output here.
To configure profiling and logging,

1. Log in to the Crowd Administration Console.
2. Click the 'Administration' tab in the top navigation bar.
3. Click 'Logging & Profiling' in the left-hand menu.
4. The 'Logging and Profiling' screen appears, as shown below. The screen has the following sections:
   - 'Performance Profiling' — Click the 'Enable Profiling' button to turn profiling on, or 'Disable Profiling' to turn it off. (You will only see one of these buttons.)
   - 'Log4j Logging' — This section shows the loggers currently in action for your Crowd instance.
     - You can change the logging level by selecting a value from the 'New Level' dropdown list. Above is a definition of each level. You can also read the Apache documentation for more information.
     - You can click the 'Revert to Default' button if you want to reset the logging levels to the values shipped with your Crowd installation.
5. Click the 'Update Logging' button to save any changes you have made in the 'Log4j Logging' section.

Screenshot: Changing Log Levels and Profiling

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.atlassian.crowd</td>
<td>This is the parent of the crowd package loggers. Any children which do not have a level assigned to them will inherit the level from their parent.</td>
</tr>
<tr>
<td>com.atlassian.crowd....XFireFaultLoggingMethodHandler</td>
<td>Can be helpful if a Crowd SOAP service fault is thrown. It is best to enable DEBUG for all three XFire classes simultaneously when troubleshooting Crowd's SOAP service.</td>
</tr>
<tr>
<td>com.atlassian.crowd....XFireOutLoggingMethodHandler</td>
<td>The Crowd server outputs the incoming SOAP request method and parameters. This is useful when debugging your applications or monitoring the level of traffic for an integrated application.</td>
</tr>
<tr>
<td>com.atlassian.crowd....XFireInLoggingMethodHandler</td>
<td>The Crowd server outputs the outgoing SOAP request method and parameters. This is useful when debugging your applications or monitoring the level of traffic for an integrated application.</td>
</tr>
<tr>
<td>com.atlassian.crowd.license</td>
<td>Useful for troubleshooting certain licensing issues in Crowd.</td>
</tr>
</tbody>
</table>
Advanced Log Configuration

Terminology: In log4j, a ‘logger’ is a named entity. Logger names are case sensitive and follow a hierarchical naming standard. For example, the logger named `com.foo` is a parent of the logger named `com.foo.Bar`.

Finding the Log Configuration File

Crowd's logging behaviour is defined in the following properties file:

- For Standalone installations of Crowd: `{CROWD-STANDALONE-INSTALL}/crowd-webapp/WEB-INF/classes/log4j.properties`
- For WAR installations: `{CROWD-WAR-INSTALL}/WEB-INF/classes/log4j.properties`

This file is a standard log4j configuration file, as described in the Apache log4j documentation.

Editing the Log Configuration File

To configure the logging levels and other settings on a permanent basis:

1. Stop Crowd.
2. With a text editor, open the `log4j.properties` file in the location described above.
3. Adjust the output level to the required level of importance listed in the section on levels above.
4. Save the `log4j.properties` file.
5. Restart Crowd to have the new log settings take effect.

When diagnosing a server problem you need to adjust Crowd's package logging to:

`log4j.logger.com.atlassian.crowd=DEBUG`

Changing the Destination of the Crowd Log File

Terminology: In log4j, an output destination is called an ‘appender’.

To change the destination of the Crowd log file:

1. Stop Crowd.
2. With a text editor, open the `log4j.properties` file in the location described above.
3. Look for the `org.apache.log4j.RollingFileAppender` entry in the ‘Log File Locations’ section of the file. This appender controls the default logging destination described above.
4. Edit the following line, and replace `atlassian-crowd.log` with the full path and file name for the required logging destination:
   `log4j.appender.filelog.File=atlassian-crowd.log`
5. Save the `log4j.properties` file.
6. Restart Crowd to have the new log settings take effect.

Adjusting the Log Settings for CrowdID

The Crowd Administration Console does not give access to the CrowdID log settings. To adjust the logging levels of the CrowdID OpenID server, you will need to modify the configuration file at this location:

- For Standalone installations of CrowdID: `{CROWDID-STANDALONE-INSTALL}/crowd-openidsserver-webapp/WEB-INF/classes/log4j.properties`
- For WAR installations: `{CROWDID-WAR-INSTALL}/WEB-INF/classes/log4j.properties`

Performance Profiling

When troubleshooting problems with your Crowd installation, it is often useful to turn on performance profiling.

To enable profiling, go to the 'Logging & Profiling' tab under 'Administration' in the Crowd Administration Console. Full instructions are in the section on logging and profiling.

With performance profiling turned on, your system output console will show a record of the time it takes (in milliseconds) to complete each Crowd action. This will help with diagnosing performance problems. The resulting output will be large, so you should not enable it for long periods.

Here is an example of the performance profiling output, when search for and viewing a user via the Crowd Administration Console:

```
[15ms] - AOP: SecurityServer.findPrincipalByToken()
[15ms] - AOP: SecurityServer.isValidPrincipalToken()
[15ms] - AOP: SecurityServer.isValidPrincipalToken()
[15ms] - AOP: SOAPService.validateSOAPService()
[16ms] - AOP: SecurityServer.getDomain()
[16ms] - AOP: SOAPService.validateSOAPService()
```

Crowd Security Advisories and Fixes

This page has information on how to report any security bugs you might find in Crowd, and what we will do to fix the problem and announce the solution.

On this page:

- Finding and Reporting a Security Vulnerability
- Publication of Security Advisories
- Severity Levels
- Patches and Fixes
- Published Security Advisories
Finding and Reporting a Security Vulnerability

If you find a vulnerability in Crowd, please take the following steps to report it:

1. **Raise an issue on** [http://jira.atlassian.com](http://jira.atlassian.com):
   - Project — ‘Crowd’
   - Issue Type — ‘Bug’
   - Security Level — ‘Reporters and Developers’
   - Priority — ‘Blocker’
2. **Provide as much information as possible on how to reproduce the bug.**

Please conduct all communication about the vulnerability through JIRA, so that we can keep track of the issue and get a patch out as soon as possible.

Publication of Security Advisories

When a security issue is discovered in Crowd, we will resolve it as quickly as possible. Once we have a solution, we will let our customers know as follows:

- We will add a security advisory as a child of this page.
- We will post a copy of the advisory on the Crowd Announcements forum. The forum posts are also sent to our mailing list. You can subscribe via the Atlassian website.

Severity Levels

Atlassian security advisories include a severity level, rating the vulnerability as one of the following:

- Critical
- High
- Moderate
- Low

Below is a summary of the factors which we use to decide on the severity level, and the implications for your installation.

**Severity Level: Critical**

We classify a vulnerability as critical if most or all of the following are true:

- Exploitation of the vulnerability results in root-level compromise of servers or infrastructure devices.
- The information required in order to exploit the vulnerability, such as example code, is widely available to attackers.
- Exploitation is usually straightforward, in the sense that the attacker does not need any special authentication credentials or knowledge about individual victims, and does not need to persuade a target user, for example via social engineering, into performing any special functions.

**Severity Level: High**

We give a high severity level to those vulnerabilities which have the potential to become critical, but have one or more mitigating factors that make exploitation less attractive to attackers.

For example, given a vulnerability which has many characteristics of the critical severity level, we would give it a level of high if any of the following are true:

- The vulnerability is difficult to exploit.
- Exploitation does not result in elevated privileges.
- The pool of potential victims is very small.

Note: If the mitigating factor arises from a lack of technical details, the severity level would be elevated to critical if those details later became available. If your installation is mission-critical, you may want to treat this as a critical vulnerability.

**Severity Level: Moderate**

We give a moderate severity level to those vulnerabilities where the scales are slightly tipped in favour of the potential victim.

The following vulnerabilities are typically rated moderate:

- Denial of service vulnerabilities, since they do not result in compromise of a target.
- Exploits that require an attacker to reside on the same local network as the victim.
- Vulnerabilities that affect only nonstandard configurations or obscure applications.
- Vulnerabilities that require the attacker to manipulate individual victims via social engineering tactics.
- Vulnerabilities where exploitation provides only very limited access.
Severity Level: Low

We give a low severity level to those vulnerabilities which by themselves have typically very little impact on an organisation's infrastructure.

Exploitation of such vulnerabilities usually requires local or physical system access. Exploitation may result in client-side privacy or denial of service issues and leakage of information about organisational structure, system configuration and versions, or network topology.

Original ranking compiled by the SANS Institute

Our vulnerability ranking is based on a scale originally published by the SANS Institute.

Patches and Fixes

When a security issue has been resolved, we will make the solution available as follows:

- We will release a bug-fix version of Crowd as soon as possible.
- Where feasible, we will issue a patch for the current stable version of Crowd and for older versions of Crowd. Patches will be attached to the relevant JIRA issue.

Parameter Injection Vulnerability in Crowd

Severity

Atlassian rates this vulnerability as critical, according to the scale published in Crowd Security Advisories and Fixes. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a flaw which would allow a malicious user (hacker) to inject their own values into a Crowd request by adding parameters to the URL string. This would allow a hacker to bypass Crowd's security checks and perform actions that they are not authorised to perform.

Risk Mitigation

To address the issue, you should upgrade Crowd as soon as possible. Please follow the instructions in the 'Fix' section below. If you judge it necessary, you can block all untrusted IP addresses from accessing Crowd.

Vulnerability

A hacker can design a URL string containing parameters which perform specific actions on the Crowd server, bypassing Crowd's security checks. This is because Crowd does not adequately sanitise user input before applying it as an action on the server.

Exploiting this issue could allow an attacker to access or modify data and compromise the Crowd application.

The following Crowd versions are vulnerable: All versions from 1.0 to 1.5.0 inclusive.

Fix

Please download the relevant upgrade file for your version of Crowd from the download centre as follows:

- If you have Crowd 1.5.0 — upgrade to Crowd 1.5.1 (see the release notes and upgrade guide).
- If you have Crowd 1.4.x — upgrade to Crowd 1.4.7 (see the release notes and upgrade guide).
Crowd User Guide

About Crowd

Atlassian's Crowd is a software application installed by the system administrator. The administrator will also connect one or more of your organisation's applications to Crowd. When you log in to a Crowd-connected application, Crowd will verify your password and login permissions.

Using Crowd for single sign-on (SSO), each person needs only one username and password to access all web applications. You can host your own OpenID provider to include external applications.

- You only need to log in once, to Crowd or a Crowd-connected application. When you start another Crowd-connected application, you will be logged in automatically.
- When you log out of Crowd or one of the Crowd-connected applications, you will be logged out of Crowd and the other application(s) at the same time.

Crowd also manages the information held about you as a user of other software applications:

- Your login permissions to various applications.
- The password you use to log in to those applications.
- The groups and roles you belong to, which are used by the applications to decide which functions you can perform within the applications.
- The user directories which hold your information.

Search the User Guide

About the User Guide

The Crowd User Guide contains information for people who use Crowd to update their user profiles and passwords and to view their groups, roles and applications.

If you need information about installing Crowd, configuring your Crowd server or using the Crowd Administration Console, please visit the Crowd documentation home page.

If you have a question about using Crowd that hasn't been answered here, please let us know.

Download

You can download the Crowd documentation in PDF, HTML or XML formats.

Introduction to Crowd

This page gives a brief introduction to Crowd, for people who will view and update their login and user profile information in Crowd.

What is Crowd?

Atlassian's Crowd is a software application installed by the system administrator. The administrator will also connect one or more of your organisation's applications to Crowd. When you log in to a Crowd-connected application, Crowd will verify your password and login permissions.

Using Crowd for single sign-on (SSO), each person needs only one username and password to access all web applications. You can host your own OpenID provider to include external applications.

- You only need to log in once, to Crowd or a Crowd-connected application. When you start another Crowd-connected application, you will be logged in automatically.
- When you log out of Crowd or one of the Crowd-connected applications, you will be logged out of Crowd and the other application(s) at the same time.

Crowd also manages the information held about you as a user of other software applications:

- Your login permissions to various applications.
- The password you use to log in to those applications.
- The groups and roles you belong to, which are used by the applications to decide which functions you can perform within the applications.
- The user directories which hold your information.

Using Crowd

The Crowd administrator has access to Crowd's Administration Console, which provides the functions described in the Crowd Administration Guide.

Every authorised Crowd user has access to Crowd's Self-Service Console, where you can edit your user profile, change your password and view
other information about your Crowd username. The Crowd User Guide describes this functionality.

Some Terminology

Here is a list of all entries in the glossary, plus the first few lines of content. Click a link to see the full text for each entry.

- **Alias (Glossary Entry)** — Crowd allows you to have different usernames in different applications. These different usernames are called 'aliases'. Your Crowd administrator can manage your aliases for the applications you are authorised to access.
- **Authorisation to Use Crowd (Glossary Entry)** — If you are authorised to use Crowd, you can log in to Crowd's Self-Service Console to update your user profile and view other information about your username. The Crowd administrator can grant people access to the Self-Service Console, as described in the Crowd Administration Guide. Basically, the administrator should ensure that your username is in a user directory which is mapped to the Crowd application.
- **Crowd Administrator (Glossary Entry)** — A Crowd administrator is a user who has access to the Crowd Administration Console, which provides the functions described in the Crowd Administration Guide. The first administrator is defined during the installation of Crowd. A Crowd administrator can grant administration rights to other users, as described in the Crowd Administration Guide.
- **Crowd-Connected Application (Glossary Entry)** — A 'Crowd-connected application' is a software application which has been defined to and integrated with Crowd. These applications pass all login requests to Crowd for authentication. Depending on the integration level, the application may also make use of the groups and roles defined in Crowd for authorisation purposes, and allow single sign-on across the Crowd domain. The Crowd Administration Guide tells you how to connect an application to Crowd.
- **Directory (Glossary Entry)** — Crowd uses the term 'directory', or 'user directory', to refer to a store of information about a user. Typically, a directory will hold your username, name, password, email address, and so on. Your Crowd administrator can define one or more directories internally in Crowd or connect one or more external directories to Crowd. The external directory may be a corporate directory such as Microsoft's Active Directory. To learn more about Crowd's directory management, please refer to the Crowd Administration Guide.
- **Self-Service Console (Glossary Entry)** — Authorised Crowd users can access the Crowd Console, even if they are not Crowd administrators. Non-administrators will see a subset of the Crowd Console functionality, which we call the 'Self-Service Console'. The Crowd User Guide describes this functionality. The Crowd Administration Console presents the full range of Crowd administration functionality to authorised Crowd administrators.
- **Single Sign-On (Glossary Entry)** — Single sign-on (SSO) is a feature offered by Crowd. Your Crowd administrator can choose to enable this feature for the Crowd-connected applications. If SSO is enabled, you will only need to log in or log out once. Specifically:

**Related Topics**

Logging into Crowd

If you are authorised to use Crowd, you can log in to Crowd's Self-Service Console to update your user profile and view other information about your username. The Crowd administrator can grant people access to the Self-Service Console, as described in the Crowd Administration Guide. Basically, the administrator should ensure that your username is in a user directory which is mapped to the Crowd application.

If your administrator has configured Crowd to allow single sign-on (SSO), then you only need to log in once. When you start another Crowd-connected application, you will be logged in automatically.

**On this page:**

- How to Log In
- User Aliases
- SSO and Google Apps

**How to Log In**

To log in to Crowd,

1. Open Crowd in your web browser. In most cases, you will do this by typing an address like this one into the browser's address bar:

   http://YOUR-CROWD-LOCATION:8095/crowd/

   Replace 'YOUR-CROWD-LOCATION' with the address of your Crowd server. (Ask your Crowd administrator for this address.)

2. The Crowd login screen will appear, as shown in the screenshot below. Type in your username and password.
3. Click the 'Log In' button.

   [Screenshot: Crowd login screen]
If you have forgotten your password, you can click the ‘Forgotten your password’ link. Crowd will email you a new password. Read more about resetting your password.

User Aliases

Crowd allows you to have different usernames in different applications. These different usernames are called ‘aliases’. Your Crowd administrator can manage your aliases for the applications you are authorised to access.

- When you log in to Crowd itself, you must use your primary username i.e. the one registered in Crowd.
- If you choose to log in to another Crowd-connected application directly, such as Confluence or JIRA, instead of logging in via Crowd, then you must log in using the alias registered in that application (Confluence, JIRA, or whatever.)
- If SSO is enabled you will only need to log in or log out once, to Crowd or a Crowd-connected application. When you start another Crowd-connected application, you will be logged in automatically.

SSO and Google Apps

These notes are relevant if your Crowd administrator has enabled single sign-on between Crowd and Google Apps:

- Single sign-on (SSO) applies only to the applications within Google Apps. The Google Apps administration section (control panel) does not support SSO.
- When you sign out of Google Apps, you will also be signed out of Crowd and all Crowd-connected applications. This is the usual SSO behaviour.
- But when you sign out of Crowd, you will remain logged in to Google Apps even though you will be logged out of other Crowd-connected applications. (Reason: Google does not rely on a cookie, so there is no easy way for Crowd to tell Google you have signed out.)
  
  It would take some additional development to support single sign-out from Google Apps. If you would like to see this work undertaken, please vote for issue CWD-1238.
- If you go directly to a Google Apps application without logging in to Crowd, Google Apps direct you to a Crowd login screen.
- The Crowd login screen for Google Apps will not offer a ‘Forgotten your password’ link. You cannot change your Crowd password via Google Apps. Instead, if you need to change your password please log in to Crowd directly, by going to this URL: http://YOUR-CROWD-LOCATION:8095/crowd/

RELATED TOPICS

Logging out of Crowd
Resetting your Password
Crowd User Guide

Logging out of Crowd

Logging out of Crowd is easy — just click the ‘Log Out’ link at the top of the Crowd screen.

If your administrator has configured Crowd to allow single sign-on (SSO), then you will be automatically logged out of all Crowd-connected applications when you log out of Crowd.

This automatic logout will also happen if you log out of one of the other Crowd-connected applications — you will be logged out of Crowd and the other application(s) at the same time.
SSO and Google Apps

- Single sign-on (SSO) applies only to the applications within Google Apps. The Google Apps administration section (control panel) does not support SSO.
- When you sign out of Google Apps, you will also be signed out of Crowd and all Crowd-connected applications. This is the usual SSO behaviour.
- But when you sign out of Crowd, you will remain logged in to Google Apps even though you will be logged out of other Crowd-connected applications. (Reason: Google does not rely on a cookie, so there is no easy way for Crowd to tell Google you have signed out.)
- It would take some additional development to support single sign-out from Google Apps. If you would like to see this work undertaken, please vote for issue CWD-1238.
- If you go directly to a Google Apps application without logging in to Crowd, Google Apps direct you to a Crowd login screen.
- The Crowd login screen for Google Apps will not offer a 'Forgotten your password' link. You cannot change your Crowd password via Google Apps. Instead, if you need to change your password please log in to Crowd directly, by going to this URL: http://YOUR-CROWD-LOCATION:8095/crowd/

Changing or Resetting your Password

If you are authorised to use Crowd, you can log in to Crowd's Self-Service Console and change your password.

When attempting to log in to Crowd, you can also reset your password. This is useful if you have forgotten the old one.

Password change applies to one user directory only

In most cases, your username will be defined in one user directory only. But some organisations may have more than one user directory. For example, your username may be defined in Crowd for JIRA use, and also in another Crowd-connected directory (e.g. LDAP) for use in another application. If you change or reset your password, the new password will apply only in one directory — the directory mapped to the 'crowd' application and defined as first in the directory sequence. Your Crowd administrator can define the order of the directories, as described in the Crowd Administration Guide.

Changing your Password

If you are authorised to use Crowd, you can log in to Crowd's Self-Service Console and change your password.
To change your password,

1. Log in to Crowd.
2. If you are not a Crowd administrator, you can skip this step because you will go directly to the Crowd Self-Service Console.
   a. If you are a Crowd administrator, the Crowd Administration Console will open. Click the 'My Profile' link in the top navigation bar.
3. The Crowd Self-Service Console will open.
4. Click 'Change Password' in the left-hand menu.
5. The 'Change Password' screen will appear, as shown in the screenshot below. Enter the following information:
   a. Original Password — Your current password.
   b. New Password — Your new password.
   c. Confirm Password — Your new password again, to verify that you typed it correctly the first time.
6. Click the 'Update' button.
7. If the change is successful, a 'Password updated' message will appear on the screen.

Screenshot: Crowd's Change Password Screen

Password change applies to one user directory only

In most cases, your username will be defined in one user directory only. But some organisations may have more than one user directory. For example, your username may be defined in Crowd for JIRA use, and also in another Crowd-connected directory (e.g. LDAP) for use in another application. If you change or reset your password, the new password will apply only in one directory — the directory mapped to the 'crowd' application and defined as first in the directory sequence. Your Crowd administrator can define the order of the directories, as described in the Crowd Administration Guide.

Resetting your Password

The Crowd 'Login' screen allows you to reset your password. This is useful when you have forgotten the password.

To reset your password,

1. Open Crowd in your browser.
2. Click the 'Forgotten your password' link on the Crowd login screen.
3. The 'Reset Your Password' screen will appear, as shown in the screenshot below. Type in your Crowd username and click the 'Continue' button.
4. A message will appear: 'Your new password is on the way!' Click the 'Home' link at the top of the screen.
5. You will receive an email message with your new password. Copy the password.
6. Log in to Crowd using the new password.
7. Change your password to one you can remember easily.

Screenshot: Crowd's Reset Your Password screen
Password change applies to one user directory only

In most cases, your username will be defined in one user directory only. But some organisations may have more than one user directory. For example, your username may be defined in Crowd for JIRA use, and also in another Crowd-connected directory (e.g. LDAP) for use in another application. If you change or reset your password, the new password will apply only in one directory — the directory mapped to the 'crowd' application and defined as first in the directory sequence. Your Crowd administrator can define the order of the directories, as described in the Crowd Administration Guide.

Updating your User Profile

Provided that you are authorised to use Crowd, you can change the profile information for your username.

To update your user profile,

1. Log in to Crowd.
2. If you are not a Crowd administrator, you can skip this step because you will go directly to the Crowd Self-Service Console.
   • If you are a Crowd administrator, the Crowd Administration Console will open. Click the 'My Profile' link in the top navigation bar.
3. The My Profile screen will open, as shown in the screenshot below.
4. Update your profile information where necessary:
   • First Name — Your first name.
   • Last Name — Your last name or surname.
   • Email — Crowd will use this email address when sending you messages, such as a new password if you reset your password.

Screenshot: Crowd user profile
Which user directories are updated?

In most cases, your username will be defined in one user directory only. But some organisations may have more than one user directory. For example, your username may be defined in Crowd for JIRA use, and also in another Crowd-connected directory (e.g. LDAP) for use in another application. If you change your profile details, the change will be applied to all directories which the 'crowd' application has permission to update. Your Crowd administrator defines the application permissions, as described in the Crowd Administration Guide.

Viewing your Group Membership

Provided that you are authorised to use Crowd, you can see a list of the groups to which your username belongs.

To see which groups you belong to,

1. Log in to Crowd.
2. If you are not a Crowd administrator, you can skip this step because you will go directly to the Crowd Self-Service Console.
   - If you are a Crowd administrator, the Crowd Administration Console will open. Click the 'My Profile' link in the top navigation bar.
3. The Crowd Self-Service Console will open. Click 'Groups' in the left-hand menu.
4. The 'Groups' screen will appear, as shown in the screenshot below.

Screenshot: Groups

<table>
<thead>
<tr>
<th>My Profile</th>
<th>Change Password</th>
<th>Groups</th>
<th>Roles</th>
<th>Applications</th>
</tr>
</thead>
</table>

Groups

You are a member of the following groups:

- confluence-users
- payroll

Each group appears only once

Even if you are a member of the same group in more than one directory, the group name will appear only once on this screen. More explanation: In most cases, your username will be defined in one user directory only. But some organisations may have more than one user directory. For example, your username may be defined in Crowd as a Crowd administrator, and also in another Crowd-connected directory (e.g. LDAP). In addition, you may then be a member of the same group (e.g. 'confluence-users') in both directories. On the Crowd 'Groups' screen, the group 'confluence-users' will appear only once.

Crowd Release Summary

This page shows the highlights of the major Crowd releases.

Current Release

For information about the latest release, please go to the Crowd Release Notes.

Crowd 2.0 — 30 July 2009

- Introducing User Aliases
- Nested Groups in All Crowd Directories
- Automatic Group Membership for New Users
- Improved User and Group Management UI
- Improved Performance
- Improved Database Support
- New REST API
- Plugin Framework 2.2 and REST Module
- More in the Crowd 2.0 release notes

Crowd 1.6 — 17 December 2008

- Smarter Caching
- Quick Application Setup
- Connectors for OpenDS, Fedora DS and OpenLDAP (Posix)
- Spring Security 2
- More in the Crowd 1.6 release notes

Crowd 1.5 — 4 September 2008

- Single Sign-On to Google Apps
- Connector for Apple Open Directory
- Plugin Framework 2.0 and API
- More in the Crowd 1.5 release notes

Crowd 1.4 — 8 May 2008

- Nested Groups
- Self-Service Console
- Novell eDirectory Connector
- Posix Support for LDAP Directories
- Plugin Framework
- More in the release notes

Crowd 1.3 — 4 March 2008

- LDAP Authentication with Crowd Groups and Roles
- Cross-Directory User Importer
- Streamlined User Interface
- Simplified Installation, Setup and Integration
- Configuration of Logging and Profiling via Console
- Improved Performance and Efficiency
- Highlights for the Developers
- Plus Over 60 Improvements and Bug-Fixes
- More in the release notes

Crowd 1.2 — 27 November 2007
Directory Permissions per Application
Group and Role Membership Browser
Improved Browser for OpenID Login History
NTLM Support
Improved Integration with Jive Forums
Acegi Application Connector
Group-Based Authorization Added for Subversion
New Importer for Bamboo Users
More in the release notes

Crowd 1.1 — 20 June 2007

- OpenID
- More in the release notes

Crowd 1.0 — 5 March 2007

- UI improvements with new screen layouts.
- Import and Export process for XML.
- LDAP Fixes for OpenLDAP and Microsoft Active Directory.
- Improved error reporting.
- Apache / Subversion support
- More in the release notes

Crowd 2.0 Release Notes

30 July 2009

The Atlassian Crowd team is delighted to present the insanely fast, supremely nested Crowd 2.0.

Highlights of this release:

- Introducing User Aliases
- Nested Groups in All Crowd Directories
- Automatic Group Membership for New Users
- Improved User and Group Management UI
- Improved Performance
- Improved Database Support
- New REST API
- Plugin Framework 2.2 and REST Module
- Other Things Worth Mentioning
- Complete List of Improvements and Fixes

Upgrading to Crowd 2.0

You can download Crowd from the Atlassian website. If upgrading from a previous version, please read the Crowd 2.0 Upgrade Notes.

Highlights of Crowd 2.0

1

Introducing User Aliases
A single user can now have different usernames in different applications. For example, Arthur Dent might have username 'dent@example.com' in your JIRA issue tracker, ‘arthur’ in your internal Confluence wiki and ‘adent’ in your public-facing Confluence wiki.

- Using Crowd, Arthur can link a number of usernames as aliases of his main login ID.
- Arthur can log in just once, to any Crowd-connected application. He will be automatically logged into the other applications via single sign-on (SSO).
- Crowd's Administration Console makes it easy for a system administrator to track and manage the username, aliases and application authorisations for each user.
- Crowd's user aliasing allows you to work around the problem that occurs when you want to implement a single user base for a number of existing systems, where users may have different usernames in each system.
- When someone gets married or changes their name, you may wish to rename a user in your LDAP directory, such as Microsoft Active Directory. To avoid problems in applications which do not allow user renaming, you can now link the new LDAP username to an alias in Crowd.
- Some systems may use email addresses as usernames, while in others this may expose users to email spambots. Using Crowd aliasing, you can use different username formats to suit your application requirements.
- Our documentation has the details.
Nested Groups in All Crowd Directories

With Crowd 1.4, we introduced support for nested groups in Crowd-connected LDAP directories. This means that you can have a group as a member of another group. Now Crowd 2.0 supports nested groups for Crowd Internal and Delegated Authentication directories too. Your custom directories will also support nested groups, provided that they meet the interface requirements of the RemoteDirectory API.

- When verifying a user's login to a Crowd-connected application, Crowd will search the groups mapped to the application plus all their sub-groups.
- When an application requests a list of users in a group, Crowd will present a flat list of users gathered from the requested group and its sub-groups.

Automatic Group Membership for New Users

You can now configure Crowd to assign new users to specific groups automatically.

- You can define default groups for each directory.
- A new user automatically becomes a member of these groups, whether added via the Crowd Administration Console or via a Crowd-connected application.
- Note that the automatic group membership does not work when importing users and groups via Crowd's external user importer.
- You can read more in our documentation.
Improved User and Group Management UI

Looking to relieve the administrative pain that user and group management often entail, we have enhanced the management screens in the Crowd Administration Console and added bulk user and group administration for the first time in Crowd.

- You can add multiple users to a group at the same time.

On the user management side:

- You can add a user to multiple groups at the same time.
- When searching for a user, just enter all or part of a name, username or email address in a single search box to find the matching users.
- The user browser now shows every user's full name, as well as their usernames and email addresses.
Improved Performance

The Crowd team have done a lot of under-the-cover work in this release, chiefly on updating Crowd's database schema. This work will put us in good stead to provide shiny new features in later releases. For Crowd 2.0, the biggest gain is in the performance of Crowd Internal and Delegated Authentication directories. Comparisons of Crowd 2.0 with the previous release have generated the following statistics in our test environment, running on a Crowd Internal directory with 60000 users, 5000 groups and 240000 group memberships.

- Most operations are about twice as fast.
- Retrieving all users is a gigantic 15 times faster. This request is used when an application asks for all users at once, such as when JIRA's cache expires.
- Searching on fields such as name and email address is more than twice as fast.
- Authenticating a user is 60% faster.
We haven’t even tried to represent the searchPrincipals and findAllGroupRelationships requests graphically, because the performance improvement is off the charts:

🌟 MySQL is 15 times faster.
🌟 PostgreSQL is 100 to 1000 times faster.

**Improved Database Support**

The updated Crowd database schema provides some wins in the area of database support too.

- UTF-8 character encoding is now supported for MySQL databases. Before this release, Crowd required Latin 1 character encoding.
- The Crowd database schema uses case-insensitive table names, so for people who are using PostgreSQL, there is no longer any need for silly quotes in your SQL queries.
- Crowd’s mail template size is no longer limited to 255 characters.
New REST API

Crowd 2.0 exposes a new REST API that provides access to resources (data entities) via URI paths. This is useful for developers wanting to integrate Crowd into their application and for administrators needing to script interactions with the Crowd server.

- To use a REST API, your application will make an HTTP request and parse the response.
- You can request a response format of XML or JSON.
- Your methods will be the standard HTTP methods like GET, PUT, POST and DELETE.
- Because the REST API is based on open standards, you can use any web development language to access the API.
- Our documentation tells you more.

Plugin Framework 2.2 and REST Module

Crowd 2.0 supports version 2.2 of the Atlassian Plugin Framework, the latest plugin framework release to date. Crowd now also bundles the new REST plugin module type. We have used the REST plugin module type to develop the Crowd 2.0 REST APIs mentioned above.

- Developers can use the REST module type to create plugin points easily in Crowd by exposing services and data entities as REST APIs.
- The REST module type also makes it easier to develop cross-application plugins i.e. plugins which work in more than one application, because the module type helps developers to ensure consistency of REST APIs across Atlassian applications.
- There's more in our documentation.

Other Things Worth Mentioning

- You can now use wildcard IP ranges (CIDR notation) when specifying IP restrictions for an application.
- We now offer full support for Tomcat 6.
- We have enhanced the remote directory API to support finer-grained control in searches. The new API is type safe, supports ‘AND’ and ‘OR’ queries and allows you to make finer-grained requests based on primary or custom attributes. For example, you might search for users whose favourite colour is ‘pink’. The details are in the JavaDocs.

**Crowd 2.0 Beta Release Notes**

1 June 2009
Crowd 2.0 will be launched in June/July 2009. A beta release is currently undergoing internal testing and is also available to a limited number of customers for review. These release notes apply to Crowd 2.0 Beta. We'll publish the final release notes when we release the production-ready version of Crowd 2.0.

The beta release does not yet contain all the features that will be in the final Crowd 2.0 release.

If you would like to participate in testing the beta release, please contact Crowd Support.

---

**What's New in Crowd 2.0 Beta**

1. **Updated Database Schema**

   We have spent a lot of time refactoring the database layer of Crowd for 2.0. In particular, you should notice:
   - Improved speed and efficiency, especially when you are using an internal directory.
   - Support for case-insensitive searching. LDAP supports this feature natively, but now it is also available when you are using a Crowd internal directory.
   - UTF-8 character encoding for MySQL databases. Before this release, Crowd required Latin 1 character encoding.
   - Many other long-outstanding database issues in Crowd.

2. **Nested Groups in Internal Directories**

   Crowd now supports nested groups in internal directories, a feature that many people have requested.

3. **Easier Management of Group Memberships**

   We have improved Crowd's user interface for managing users and groups.
   - You can add many users to a group at the same time, via the group management screen.
   - With the new user picker, you can find the required user(s) quickly by entering all or part of the user's name, email address or username.

4. **Wildcard Support in Application IP Restrictions**

   Crowd now supports the use of netblocks for an application's remote address. This means you can specify a complete IP range for an application instead of individual addresses.
   - Use CIDR notation. For example: 192.168.10.1/16
   - Wikipedia has a good summary.

---

**Early Adopter’s Guide to Reviewing Crowd 2.0 Beta**

**Upgrading to Crowd 2.0 Beta**

Because of the database schema changes, you will need to:
- Export your existing Crowd database to XML: From the Administration Console, select ‘Administration’, ‘Backup’. See the instructions.
- Install Crowd 2.0 Beta, following the installation instructions. Please ensure that when starting up Crowd you point Crowd to a new crowd home directory, please do not use your current crowd home.
- Select 'Import data from an XML Backup' when running the Setup Wizard, as described in the setup instructions.

---

**Targets for your Testing**
We would love to have your feedback on this beta release, and in particular on the following aspects of the release:

- Support for nested groups in internal directories.
- The group and user pickers on the group management screen.
- Performance comparisons, particularly when using a Crowd internal directory.

Crowd 1.6.1 Release Notes

17 February 2009

The Atlassian Crowd team is delighted to present Crowd 1.6.1.
This release focuses on solving problems with case sensitivity. Crowd's internal directories, client caches and LDAP directory caches are now all case insensitive but case preserving. Crowd will ignore case when comparing usernames, etc ('JSmith' = 'jsmith') and it will preserve case when passing information between applications and directories ('JSmith' remains 'JSmith'). This results in the expected behaviour in the Crowd-connected directories as well as Crowd-connected applications such as JIRA and Confluence.

In addition, Crowd now allows you to enforce lower-case conversion of usernames, groups and roles for a specific application. Where is this useful? Let’s assume you have previously integrated JIRA with an LDAP directory that allows mixed-case usernames (e.g. ‘JSmith’). JIRA enforces lower-case usernames (e.g. ‘jsmith’), so you have existing lower-case usernames in JIRA. And now you want to integrate JIRA with Crowd. You can configure Crowd to convert all usernames, etc, to lower case before passing them to JIRA.

We have also fixed a few bugs, including a problem with finding group members in Posix directories and a problem with Gzip compression for SOAP requests.

Don’t have Crowd 1.6 yet?
Take a look at the new features and other highlights in the Crowd 1.6 Release Notes.

Crowd 1.6 Release Notes

18 December 2008

The Atlassian Crowd team is proud to present Crowd 1.6.

Crowd 1.6 introduces a new, more intelligent caching system that will improve performance of Crowd with LDAP, particularly for large and off-site directories.

This release also brings a quicker setup process for Atlassian applications. The Crowd Administration Console allows you to choose the application you want to integrate (JIRA, Confluence, Bamboo, FishEye or Crucible), prompts you for the necessary information and automatically adds the required directory and groups.

There are new directory connectors for OpenDS, Fedora Directory Server and OpenLDAP (based on the Posix:NIS schema).
You'll find a number of smaller improvements in this release too. More unusual characters are supported in the UI and in LDAP directories. Using Crowd's new authentication-related API events, you can create plugins that react when a user logs in, logs out, changes their password, and so on.

**Highlights of this release:**

- Smarter Caching
- Quick Application Setup
- Connectors for OpenDS, Fedora DS and OpenLDAP (Posix)
- Spring Security 2
- Other Good Things
- Complete List of Improvements and Fixes

**Responding to your feedback:**

---

### Upgrading to Crowd 1.6

You can download Crowd from the [Atlassian website](https://www.atlassian.com/software/crowd/downloads). If upgrading from a previous version, please read the [Crowd 1.6 Upgrade Notes](https://confluence.atlassian.com/crowd/crowd-16-upgrade-notes-790123026.html).

---

### Highlights of Crowd 1.6

#### Smarter Caching

Crowd 1.6 introduces a new, more intelligent caching system that will improve performance of Crowd with Microsoft Active Directory and ApacheDS. You should notice the improvement particularly in directories which are large, slow or off site.

- Crowd now keeps an up-to-date cache of user, group and role information retrieved from the LDAP directory.
- The cache uses lazy loading where possible, storing only the information that is required rather than loading the entire directory into the cache.
- Crowd ensures that the cache remains up to date by monitoring the LDAP directory for updates. When a change occurs, Crowd updates the server-side cache incrementally.
- Refer to our documentation for an overview of Crowd caching and details of the LDAP caching.
Quick Application Setup

Crowd 1.6 brings a quicker setup process for Atlassian applications. Crowd now supports specific application types for JIRA, Confluence, Bamboo, FishEye, and Crucible.

- The Crowd Administration Console allows you to choose the type of application you want to integrate and prompts you for the necessary information.
- Crowd automatically adds the required directory and groups. For example, if you are integrating Crowd with JIRA, Crowd will add the 'jira-users', 'jira-developers', and 'jira-administrators' groups for you.
- The setup process will prompt you to import the users from JIRA or the relevant application.
- Then you can move quickly to the next stage, configuring the application's libraries and other settings, which is still a manual process.
Connectors for OpenDS, Fedora DS and OpenLDAP (Posix)

Crowd 1.6 provides three new built-in directory connectors. The new connectors do not affect any directories already configured. They will make it easier to set up your directory if you are starting from scratch.

- OpenDS.
- Fedora Directory Server and OpenLDAP, based on the Posix/NIS schema.

Spring Security 2

- We've updated Crowd to use and support Spring Security 2. See our tutorials on how to set it up, or to use it with the latest version of Appfuse.

Other Good Things

- In Crowd 1.5, we introduced an early version of the Atlassian Plugin Framework 2. Crowd 1.6 now supports version 2.1 of the Atlassian Plugin Framework.
- Crowd now fires a number of API events related to authentication and change of password. This allows developers to create listener plugins that spring into action when a user logs in, logs out, changes their password, and so on.

### Crowd 1.5.2 Release Notes

**31 October 2008**  
The Atlassian Crowd team is delighted to present **Crowd 1.5.2**.

This release fixes the import of users from JIRA or other Atlassian products, which was broken in Crowd 1.5.1.

When configuring an LDAP directory connector, you can now enable or disable the use of the group membership attribute on the user, for group membership searches. By default, this option will be disabled. If your directory supports 'memberOf' or another group membership attribute on the user, then you should enable the option to speed up your group membership queries.

Don't have Crowd 1.5 yet?  
Take a look at the new features and other highlights in the **Crowd 1.5 Release Notes**.

### Crowd 1.5.1 Release Notes
14 October 2008
The Atlassian Crowd team is delighted to present Crowd 1.5.1.

Crowd 1.5.1 is a recommended upgrade which fixes a parameter injection vulnerability and other issues. Please refer to the security advisory for details of the security vulnerability, risk assessment and mitigation strategies.

When using Crowd for single sign-on (SSO), you can now specify that the ‘secure’ flag is set on the SSO cookie. This will enforce a secured connection, such as SSL, for all SSO requests. Note that if you set this flag, any applications not using a secure connection will not be able to participate in SSO. Potentially, this may make it impossible to log in to Crowd.

When generating session tokens, Crowd now includes a very large random number as part of the hash value. This makes it more difficult for a malicious third party to impersonate a legitimate Crowd user.

This release also brings a number of improvements to search functionality, particularly for LDAP directories and for Confluence instances integrated with Crowd.

Crowd 1.5 Release Notes

4 September 2008

The Atlassian Crowd team is proud to present Crowd 1.5.

Crowd now supports single sign-on (SSO) to Google Apps. Do you use Google Apps for your office documentation, calendar and collaboration tools? Using Crowd's SSO, your users can log in once then move seamlessly between Google Apps and other Crowd-integrated applications like JIRA, Confluence, Jive Forums and others.

Crowd 1.5 has a new directory connector, supporting read-only connections to Apple's OS X Open Directory server.

Developers will be interested in Atlassian's new Plugin Framework, now supported in Crowd 1.5. The new Google Apps connector, implemented as a plugin, provides a useful example for developers wanting to extend Crowd's functionality by building a Crowd plugin.

CrowdID has been updated to the latest OpenID 2.0 specification. CrowdID, shipped with Crowd, allows your corporation to act as OpenID provider for your employees.

This release brings many improvements and fixes, including much faster user imports and database imports, JNDI mail configuration and a cleaner upgrade process.

Highlights of this release:

- Single Sign-On to Google Apps
- Connector for Apple Open Directory
- Plugin Framework 2.0 and API
- Other Improvements and Bug-Fixes
- Complete List of Improvements and Fixes

Responding to your feedback:

🌟 45 votes satisfied

Keep logging your votes and issues. They help us decide what needs doing!

Upgrading to Crowd 1.5

You can download Crowd from the Atlassian website. If upgrading from a previous version, please read the Crowd 1.5 Upgrade Notes.

Highlights of Crowd 1.5
Single Sign-On to Google Apps

- Crowd now supports single sign-on (SSO) to Google Apps.
- Users can log in to Google Apps using their corporate username and password.
- An example of Google Apps SSO in action: A user clicks through from a link in a JIRA issue. The document opens directly in Google Apps. No need to log in again, no need to remember a different password.

Administrators can use Crowd's groups to authorise access to Google Apps.
Enjoy the security and convenience of managing all your users in one place.
Set up Google Apps SSO in two easy steps: Generate the keys in Crowd then enter the information in Google Apps.
Connector for Apple Open Directory

- Crowd 1.5 supports read-only connections to Apple OS X Open Directory server.
- Our documentation has the full details.

Plugin Framework 2.0 and API

- Crowd 1.5 comes with Atlassian’s new Plugin Framework, based on Spring Dynamic Modules using an embedded OSGi container.
- The new Google Apps connector is implemented as a plugin, using the new Plugin Framework. This provides a useful example for developers wanting to extend Crowd’s functionality by building a Crowd plugin.
The Plugin Framework is experimental at this stage. We’d be delighted to have your feedback via our JIRA project.

Take a look at our developer documentation, also currently under development.

Crowd now fires an API event when a create/update/delete operation is performed at directory level. Developers can create listener plugins which spring into action when a specific event occurs. For example, the plugin might do something when a user is created, or when a group is deleted, and so on.

Other Improvements and Bug-Fixes

- When configuring your mail server, you can now choose between SMTP and a JNDI location. This allows you to use an SSL connection to your mail server.
- Importing users into a Crowd directory from Atlassian applications or a CSV file is now much faster when dealing with large user bases.
- Importing Crowd data from an XML backup is also much faster, due to the use of JDBC batching.
- CrowdID has been updated to the latest OpenID 2.0 specification. CrowdID, shipped with Crowd, allows your corporation to act as an OpenID provider for your employees.
- We have moved the crowd.properties file for the Crowd Administration Console to the Crowd Home directory, so that upgrading Crowd will be cleaner and easier from now on.
- Crowd will respond to a ‘require password change’ attribute and force the user to change their password before logging in.

Crowd 1.4.7 Release Notes

14 October 2008
Crowd 1.4.7 is a recommended upgrade which fixes a parameter injection vulnerability, as described in the security advisory. Please refer to the advisory for details of the security vulnerability, risk assessment and mitigation strategies.

Don't have Crowd 1.5 yet?
Take a look at the new features and other highlights in the Crowd 1.5 Release Notes.

Crowd 1.4.4 Release Notes

1 July 2008
The Atlassian Crowd team is delighted to present Crowd 1.4.4.

You can now enable or disable support for nested groups on each LDAP user directory. If you upgrade your Crowd installation with existing LDAP directory connectors, nested group support will remain enabled for those directories. To configure nested group support for new or existing LDAP connectors, go to the connector configuration screen in your Administration Console.

When using Crowd for single sign-on (SSO), you can now specify the SSO cookie name for each application. Under the standard configuration, Crowd will use a single, default cookie name for all Crowd-connected applications. For more information, read about the crowd.properties file.

Crowd 1.4.3 Release Notes

5 June 2008
The Atlassian Crowd team is delighted to present Crowd 1.4.3, bringing significant performance improvements in JIRA when integrated with Crowd.

We have optimised the code and modified the caching behaviour in the Crowd client libraries. This will dramatically improve the performance of a JIRA-Crowd integration for large LDAP user directories.

Crowd 1.4.1 Release Notes

23 May 2008
The Atlassian Crowd team is delighted to present Crowd 1.4.1. This release includes a few bug fixes and a new feature — trusted proxy servers.

If you are running applications behind one or more proxy servers, you may find it useful to configure Crowd to trust the proxies' IP addresses.
When a proxy server forwards an HTTP request, Crowd will recognise the request as coming from the request's originator, not the proxy server.
This is particularly useful if you want single sign-on amongst several applications running behind different proxy servers. Our documentation tells you how to set this up.

**Crowd 1.4 Release Notes**

8 May 2008

The Atlassian Crowd team is proud to release **Crowd 1.4**.

Crowd 1.4 supports nested groups in LDAP directories. This means a group can now be a member of another group, making management of permissions much easier. For example, a Crowd-integrated Confluence or JIRA site will see users in sub-groups as members of the parent group.

The new Self-Service Console gives you the option to allow any authorised Crowd user to update their own user profile and password and to view their authorisation details.

There's a new directory connector for Novell eDirectory. Crowd also supports read-only connections to an LDAP directory using the Posix schema. This is useful if you have a Unix installation and want to integrate it with an LDAP directory.

For the development community, a new plugin framework supports customised event listeners and password encoders.

**Highlights of this release:**

- Nested Groups
- Self-Service Console
- Novell eDirectory Connector
- Posix Support for LDAP Directories
- Plugin Framework
- More than 30 Improvements and Bug-Fixes

**Responding to your feedback:**

- 4 new feature requests implemented
- 90 votes satisfied

Keep logging your votes and issues. They help us decide what needs doing!

**Upgrading to Crowd 1.4**

You can download Crowd from the Atlassian website. If upgrading from a previous version, please read the [Crowd 1.4 Upgrade Notes](#).

**Highlights of Crowd 1.4**

1

**Nested Groups**

- In your LDAP directory, you can assign a group as a member of another group.
- In Crowd, you can map any group to an application, including a group which contains other groups. Currently, nested groups are supported for LDAP directory connectors only.
- For example, you might have two LDAP groups: 'engineering-group' and 'payroll-group'. Now you want to allow all members of those groups to access your Confluence wiki. You can create a group called 'confluence-users', mapped to the Confluence application, with members 'engineering-group', 'payroll-group' and any other groups and users. Crowd will allow members of those groups and sub-groups...
to log in to Confluence. When Confluence requests a list of the users in the ‘confluence-users’ group, Crowd will present all users in the group plus all users in its sub-groups.

- Good news for our Confluence, JIRA and other Atlassian customers — this feature satisfies your requests for nested groups in those products too.
- Take a look at our documentation.

Self-Service Console

- Crowd users, including non-administrators, can log in to Crowd.
- Change or reset your own password.
- Update your user profile.
- View your group and role membership.
- See a list of the applications you can log in to.
- The new Crowd User Guide explains the ins and outs.
Novell eDirectory Connector

- Crowd 1.4 provides a built-in directory connector for Novell eDirectory.
- Take a look at our documentation.

Posix Support for LDAP Directories

- Crowd supports read-only connections to an LDAP directory using the Posix/NIS schema.
- Initially, our support is targeted at OpenLDAP directories.
- This is useful if you have a Unix installation and want to integrate with an LDAP directory.
- Here's our documentation on connecting your LDAP directory using the Posix/NIS schema.

Plugin Framework

- For our development community, the new plugin framework supports customised event listeners and password encoders.
- For example, you might decide to write your own event listener to audit failed Crowd authentication requests. Within Crowd itself, the reset password listener uses the new event framework.
- You can create your own plugin to use a specific password encryption algorithm that Crowd does not support out of the box. Crowd's own password encoders provide examples of such plugins.

Crowd 1.3.3 Release Notes

14 October 2008
Crowd 1.3.3 is a recommended upgrade which fixes a parameter injection vulnerability, as described in the security advisory. Please refer to the advisory for details of the security vulnerability, risk assessment and mitigation strategies.

⚠️ The latest version of Crowd, at the time of these release notes, is Crowd 1.5.1. We are supplying version 1.3.3 as an upgrade for versions 1.3.x, to fix the security vulnerability.

Don't have Crowd 1.5 yet?
Take a look at the new features and other highlights in the Crowd 1.5 Release Notes. And of course, Crowd 1.5.1 also includes the features of Crowd 1.4.

Download Latest Version

Crowd 1.3.2 Release Notes

3 April 2008
The Crowd development team presents Crowd 1.3.2. The main purpose of this release is to provide compatibility with the upcoming release of Confluence 2.8. We have updated Crowd's atlassian-user integration module to support an interface change in Confluence.

This release also fixes a problem occurring when an application attempts to add a user, where multiple directories are mapped to the application.

Don't have Crowd 1.3 yet?

Cheers,
The Atlassian Crowd Development Team
**Crowd 1.3 Release Notes**

4 March 2008

The Atlassian Crowd team is delighted to present Crowd 1.3. This release includes innovative solutions for LDAP group administration, cross-directory user imports and a streamlined management interface.

A new directory type allows you to combine the features of a Crowd directory with authentication delegated to an LDAP directory. This means that you can use Crowd's flexible group management when the LDAP groups do not suit your requirements. For example, set up a simple group configuration for use with Confluence, JIRA and other Atlassian products.

Our new Directory Importer allows you to copy your users from one directory into another — from and to any type of directory. For example, you can copy users, groups and roles from an LDAP directory to a Crowd directory, or vice versa.

The Crowd Administration Console has a new menu structure with an enhanced look and feel. It's easier to find the functions that you perform most often and interaction is more intuitive.

Installing and setting up Crowd is simpler and faster. Database configuration is now part of the Setup Wizard. When upgrading, you have the option to import your data from an XML backup or point Crowd at your existing database, and so bypass most of the Setup Wizard.

To speed up troubleshooting, you can configure your logging levels and enable performance profiling via the Administration Console. There's a bucketful of improvements in performance and efficiency, and many other fixes and enhancements.

**Highlights of this release:**

- LDAP Authentication with Crowd Groups and Roles
- Cross-Directory User Importer
- Streamlined User Interface
- Simplified Installation, Setup and Integration
- Configuration of Logging and Profiling via Console
- Improved Performance and Efficiency
- Highlights for the Developers
- Plus Over 60 Improvements and Bug-Fixes

**Responding to your feedback:**

🌟 6 new feature requests implemented
🌟 36 votes satisfied

Your votes and issues help us keep improving our products. Keep 'em coming!

You can download Crowd from the [Atlassian website](https://www.atlassian.com). If upgrading from a previous version, please read the [Crowd 1.3 Upgrade Notes](https://confluence.atlassian.com/display/CROWD/Crowd+1.3+Upgrade+Notes).

**Highlights of Crowd 1.3**

**LDAP Authentication with Crowd Groups and Roles**

- Crowd 1.3 provides a new directory type, Delegated Authentication, combining the features of a Crowd internal directory with delegated LDAP authentication.
- This allows you to have your users authenticated via an external LDAP directory while managing the groups and roles in Crowd.
- Use Crowd's flexible and simple group management when the LDAP groups do not suit your requirements. For example, you can set up a group configuration in Crowd for use with Confluence, JIRA and other Atlassian products.
- Avoid the performance issues which might result from downloading large numbers of groups from LDAP.
- Use the new Directory Importer, described below, to synchronise your LDAP users with your Crowd directory.
- When a user logs in for the first time, Crowd automatically adds them to the Crowd directory if not already present.
Cross-Directory User Importer

- Our new Directory Importer allows you to copy your users from one directory into another.
- Provided that the directory is defined in Crowd, you can copy from and to any directory type.
- For example, you might import users, groups, roles and memberships from an LDAP directory to a new Delegated Authentication directory (described above) so that you can manage the users, groups and roles in Crowd while allowing users to log in with their LDAP passwords.
- Read about the Directory Importer.
Streamlined User Interface

- The Crowd Administration Console has a new menu structure and an enhanced look and feel.
- A left-hand menu grants easy access to the functions you use most often, such as searching for a user or group.
- A single ‘Administration’ tab holds the configuration options, system information and backup/restore functions.
- In the interests of simplicity, we’ve changed the term ‘principal’ to ‘user’ throughout.
- When you click a ‘Help’ link, the relevant documentation page opens immediately.

Simplified Installation, Setup and Integration
• Database configuration is now part of the Setup Wizard, which will update the configuration files based on the options you select.
• You can choose between a JNDI datasource (i.e. server-managed) or a simpler JDBC configuration.
• When upgrading, you can import an XML backup of your Crowd database or connect to an existing database via the Setup Wizard. This means that you don't have to go through the whole Setup Wizard, nor do a manual backup and restore of your Crowd database files.
• When integrating an application with Crowd, you'll notice that there's just one single JAR file to copy.

5

Configuration of Logging and Profiling via Console

• Enable and disable performance profiling.
• Configure your logging levels via the Crowd Administration Console, for quick and simple runtime troubleshooting.
• Edit the log configuration file for more advanced settings.
• Read the documentation.

6

Improved Performance and Efficiency

• You'll notice faster search results on the Administration Console screens, such as the Application Browser and User Browser.
• That annoying 'POSTDATA has expired' message no longer appears when you click the 'Back' button.
• Search results returned to a Crowd application are now sorted alphabetically — such as the list of groups shown in a Confluence group picker.
• We've fixed the Hibernate StaleStateException error that was causing occasional performance degradation and authentication failures.
• You can choose to store the login session tokens in the Crowd database (as done prior to Crowd 1.3) or in memory (new option as from Crowd 1.3). Depending upon your installation, in-memory storage could greatly improve response times during authentication. Read about configuring token storage.
• Gzip compression of Crowd Security Server output is now optional. You can turn it on or off via the Crowd Administration Console. Some reasons why you may want to turn Gzip compression off:
  • It may be easier to debug problems using uncompressed data.
  • Some agents, such as older versions of Internet Explorer, have problems with the Gzip format.
Highlights for the Developers

- The Java client library API has been upgraded. Read more about the API changes and the upgrade notes.
- You can pass the crowd.properties file to a client application as an environment variable.

Plus Over 60 Improvements and Bug-Fixes

Resolved
CWD-799  When creating a Group/Role to a Principal in the Demo application, an exception is thrown.
Resolved
CWD-798  When adding a Group or Role via the Demo app, the description field is not being persisted.
Resolved
CWD-706  Fix logging on startup for the OpenID Server. Stop the logging of Hibernate INFO.
Resolved
CWD-570  First Name not being displayed from Apache DS
Resolved
CWD-453  Crowd core jar breaks in Grails, need a new slimmed-down client jar
Resolved
CWD-847  Error message is confusing when no directories are mapped to an application
Resolved
Known Issues in This Release

We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Crowd release, and report any problems so that we can fix them quickly. Here's a list of known issues which will be fixed in our next point release.

A big thank you to everyone who helps us ensure that Crowd keeps getting better and better.

Client API Changes

Crowd 1.3 brings a rework of the internals of the Crowd Client library — see CWD-622. This page gives a summary of the API changes.

Description of the changes

- The static implementations of HttpAuthenticator and SecurityServerClient have been removed. They have been replaced with instantiable objects.
- The GenericClient has been removed and its functions have been absorbed into the new SecurityServerClient and the ClientProperties objects.
- The relationships in the new class structure are represented below:

Why go to non-static?

- Makes it easier to unit test your applications. Simply mock out the SecurityServerClient or HttpAuthenticator interfaces to test business logic without being tied to the collaborators.
- Allows you to have multiple ‘applications’ in one classloader.

But I liked my static calls!

- SecurityServerClientFactory and HttpAuthenticatorFactory are provided to allow for a fast migration to the new API. The logical functionality of the client and authenticator are unchanged.
- So for example, instead of:

  ```java
  HttpAuthenticator isAuthenticated(request);
  ```

  you could use:

  ```java
  HttpAuthenticatorFactory.getHttpAuthenticator().isAuthenticated(request);
  ```

What are my options?
1. Use the supplied factory methods to manage singleton instances, OR
2. Externally manage singleton instances, e.g. via an IoC container like Spring.

Using the factories

The factories, `HttpAuthenticatorFactory` and `SecurityServerClientFactory`, provide quick access to implementations of the `HttpAuthenticator` and `SecurityServerClient`. They manage singleton instances of the beans. This means that if you do opt to use the factories, then you should never instantiate `HttpAuthenticatorImpl` or `SecurityServerClientImpl` directly.

The factories naturally assume that there is one application client per classloader, i.e. one `SecurityServerClient` and one `HttpAuthenticator`.

Using an IoC container

Managing the singleton implementations externally may be a convenient approach for applications that use an IoC container. For example, Spring could be used to manage the instances of `SecurityServerClientImpl` and `HttpAuthenticatorImpl`. In Crowd, internally, we use this approach.

If you would like to use the standard Spring configuration, which loads the client properties from `crowd.properties`, simply add the `applicationContext-CrowdClient.xml` from the classpath to your Spring configuration:

```xml
<context-param>
  <param-name>contextConfigLocation</param-name>
  <param-value>
    classpath:/applicationContext-CrowdClient.xml
  </param-value>
</context-param>
```

This file is located in the `crowd-integration-client.jar`.

If you would like to customise your own configuration, modify the bean configuration to suit your needs:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE beans PUBLIC "-//SPRING//DTD BEAN//EN" "http://www.springframework.org/dtd/spring-beans.dtd">
<beans>
  <bean id="propertyUtils" class="com.atlassian.crowd.util.PropertyUtils"/>
  <bean id="clientProperties" class="com.atlassian.crowd.integration.service.soap.client.ClientProperties">
    <constructor-arg ref="propertyUtils"/>
  </bean>
  <bean id="securityServerClient" class="com.atlassian.crowd.integration.service.soap.client.SecurityServerClientImpl">
    <constructor-arg ref="clientProperties"/>
  </bean>
  <bean id="httpAuthenticator" class="com.atlassian.crowd.integration.http.HttpAuthenticatorImpl">
    <constructor-arg ref="securityServerClient"/>
  </bean>
  <bean id="verifyTokenFilter" class="com.atlassian.crowd.integration.http.VerifyTokenFilter">
    <constructor-arg ref="httpAuthenticator"/>
  </bean>
  <bean id="crowdAuthenticationInterceptor" class="com.atlassian.crowd.integration.xwork.CrowdAuthenticationInterceptor">
    <constructor-arg ref="httpAuthenticator"/>
  </bean>
</beans>
```

Make sure that you do not use the factories (either directly or implicitly) when externally managing singletons.
If you would like to use the VerifyTokenFilter, you can use Spring to autowire the servlet filter by defining it in your web.xml:

```xml
<filter>
  <filter-name>verifyTokenFilter</filter-name>
  <filter-class>org.springframework.web.filter.DelegatingFilterProxy</filter-class>
</filter>

<filter-mapping>
  <filter-name>verifyTokenFilter</filter-name>
  <url-pattern>/secure/*</url-pattern>
</filter-mapping>
```

This will protect all resources matching the /secure/* pattern.

**Known Issues in Crowd 1.3**

We have an enthusiastic and dedicated group of testers and customers who jump in there, try out the new Crowd release, and report any problems so that we can fix them quickly. Below is a list of known issues. We’re working on them, and will have a point release out as soon as possible.

A big thank you to everyone who helps us ensure that Crowd keeps getting better and better.

While you're waiting, take a look at the great new features in Crowd 1.3.

You can also browse the Crowd project in our issue tracker to see what's fixed and what's not, for each release.

Crowd 1.3 Beta Release Notes

20 February 2008

Crowd 1.3 will be launched early in March 2008. A beta release is currently undergoing internal testing. These release notes apply to Crowd 1.3 beta. We'll publish the final release notes with the release of Crowd 1.3.0.

If you would like to participate in testing the beta release, please contact Crowd Support.

<table>
<thead>
<tr>
<th>Upgrading to Crowd 1.3 Beta</th>
</tr>
</thead>
<tbody>
<tr>
<td>If upgrading from a previous version, please read the Upgrade Notes.</td>
</tr>
</tbody>
</table>

What's Coming in Crowd 1.3

1 LDAP Authentication with Crowd Groups and Roles
   - Crowd 1.3 provides a new directory type, Delegated Authentication, combining the features of a Crowd internal directory with delegated LDAP authentication.
   - This allows you to have your users authenticated via an external LDAP directory while managing the groups and roles in Crowd.
   - Use Crowd's flexible and simple group management when the LDAP groups do not suit your requirements. For example, you can set up a group configuration in Crowd for use with Confluence and other Atlassian products.
   - Avoid the performance issues which might result from downloading large numbers of groups from LDAP.
   - Use the new Directory Importer, described below, to synchronise your LDAP users with your Crowd directory.
   - When a user logs in for the first time, Crowd automatically adds them to the Crowd directory if not already present.

2 Cross-Directory User Importer
   - Our new Directory Importer allows you to copy your users from one directory into another.
   - Provided that the directory is defined in Crowd, you can copy from and to any directory type.
   - For example, you might import users, groups, roles and memberships from an LDAP directory to a new Delegated Authentication directory (described above) so that you can manage the users, groups and roles in Crowd while allowing users to log in with their LDAP passwords.
   - Read about the Directory Importer.

3 Streamlined User Interface
   - The Crowd Administration Console has a new menu structure and an enhanced look-and-feel.
   - sed functions, so that an administrator has fewer steps to perform and interaction is more intuitive.
   - The 'Help' links on the Administration Console point directly to the relevant documentation pages.

4 Simplified Installation and Setup
   - Database configuration is now part of the Setup Wizard, which will update the configuration files based on the options you select.
   - You can choose between a JNDI datasource (i.e. server-managed) or a simpler JDBC configuration.
   - When upgrading, you can import an XML backup of your Crowd database or connect to an existing database via the Setup Wizard. This means that you don't have to go through the whole Setup Wizard, nor do a manual backup and restore of your Crowd database files.

5 Logging and Profiling Configuration via Console
   - Enable profiling and configure your logging levels via the Crowd Administration Console.

6 Improved Performance and Efficiency
   - You'll notice faster search results on the Administration Console screens, such as the Application Browser and User Browser, etc.
• That annoying 'POSTDATA has expired' message no longer appears when you click the 'Back' button.
• Search results returned to a Crowd application are now sorted alphabetically — such as the list of groups shown in a Confluence group picker.
• We've fixed the Hibernate StaleStateException error that was causing occasional performance degradation and authentication failures.
• You can choose to store the login session tokens in the Crowd database (as done prior to Crowd 1.3) or in memory (new option as from Crowd 1.3). Depending upon your installation, in-memory storage could greatly improve response times during authentication. Read about configuring token storage.
• Gzip compression of Crowd Security Server output is now optional. You can turn it on or off via the Crowd Administration Console. Some reasons why you may want to turn Gzip compression off:
  • It may be easier to debug problems using uncompressed data.
  • Some agents, such as older versions of Internet Explorer, have problems with the Gzip format.

7 Highlights for the Developers

• The Java client library API has been upgraded. Read more about the API changes and the upgrade notes.
• You can pass the crowd.properties file to a client application as an environment variable.

Crowd 1.2.4 Release Notes

14 October 2008
Crowd 1.2.4 is a recommended upgrade which fixes a parameter injection vulnerability, as described in the security advisory. Please refer to the advisory for details of the security vulnerability, risk assessment and mitigation strategies.

The latest version of Crowd, at the time of these release notes, is Crowd 1.5.1. The previous public release of Crowd 1.2.x was version 1.2.2. Version 1.2.3 was an internal release. We are supplying version 1.2.4 as an upgrade for versions 1.2.x, to fix the security vulnerability.

Don't have Crowd 1.5 yet?
Take a look at the new features and other highlights in the Crowd 1.5 Release Notes. And of course, Crowd 1.5.1 also includes the features of Crowd 1.3 and Crowd 1.4.

Download Latest Version

Crowd 1.2.2 Release Notes

16 January 2008: The Crowd development team has released Crowd 1.2.2.

Crowd 1.2.2 upgrades its packaged version of Apache Tomcat to version 5.5.25, to fix some reported Apache Tomcat vulnerabilities. Tomcat is supplied as the application server in the Crowd Standalone distribution.

This release also solves some problems with the Crowd build and resolves the incompatibility between Crowd single sign-on and the new JIRA/Confluence trusted application feature.

### Crowd 1.2.1 Release Notes

10 December 2007: The Crowd development team has released Crowd 1.2.1.

Crowd 1.2.1 fixes some installation problems. Other improvements include the sorting of groups by directory name then group name in the Application Browser.

Cheers,

The Atlassian Crowd Development Team

Crowd 1.2 Release Notes

The Atlassian Crowd team is delighted to present Crowd 1.2.

Crowd 1.2 is a major release that focuses on enhanced integration, security and usability. Crowd's directory permissions now allow finer-grained control, so that you can define the permissions per application. The Group and Role Browsers now display group/role membership. We have enhanced group management in the existing Jive Forums and Apache/Subversion connectors. Our NTLM plugin offers SSO (single sign-on) for JIRA and Confluence via NTLM desktop authentication. A new connector lets you integrate your Acegi security solution with Crowd. And you can import your Bamboo users directly into a Crowd directory.

We'd like to say a special thank you to CustomWare for their assistance with deployment and testing of the NTLM plugin.

⚠️ Stop Press — 27 February 2008: We got a little bit ahead of ourselves with our announcement of full NTLM support in Crowd 1.2. The NTLM plugins for JIRA and for Confluence are provided and supported by a third party, not by Atlassian.

Highlights of this release:

- Directory Permissions per Application
- Group and Role Membership Browser
- Improved Browser for OpenID Login History
- NTLM Support
- Improved Integration with Jive Forums
- Acegi Application Connector
- Group-Based Authorisation Added for Subversion
- New Importer for Bamboo Users
- Plus Over 70 Improvements and Bug-Fixes

Responding to your feedback:

🌟 8 new feature requests implemented
🌟 68 votes satisfied

Your votes and issues help us keep improving our products, and are much appreciated.

You can download Crowd from the Atlassian website. If upgrading from a previous version, please read the Upgrade Notes.

Upgrading to Crowd 1.2

Highlights of Crowd 1.2

1

Directory Permissions per Application

- Directory permissions determine whether groups, principals and roles can be added, modified or deleted.
- Before this release, permissions were set at directory level only. Permissions therefore applied across all applications associated with the directory.
- With Crowd 1.2, directory permissions can be set for each application. For example, you could enable the 'Add Principal' permission on the 'Employees' directory for JIRA but disable the permission for Confluence.
- See the screenshot below, and take a look at an example.
Group and Role Membership Browser

- A new ‘Principals’ tab in the Group Browser shows all principals belonging to a group.
- You can view membership in the Role Browser too.
- Read the documentation.

Improved Browser for OpenID Login History

- Instead of showing all login history on a single page, the Login History screen now divides the history into pages, for easier viewing.
- To move between pages, click ‘Next’, ‘Prev’ or a specific page number.
- In the ‘Action’ column, a new item ‘(Auto) Allow Always’ tells you which logins were allowed automatically because of a previous ‘Allow Always’ instruction.
NTLM Support

- NTLM is a Microsoft authentication protocol that allows you to access a website using your desktop login. The protocol utilises an integration between Microsoft Internet Explorer and Active Directory. When using this feature, users will only need to log in to their desktop to access NTLM-integrated applications.
- JIRA and Confluence NTLM connectors are now supported with Crowd 1.2.
- Read the instructions on setting up Confluence and JIRA NTLM support in Crowd.

Improved Integration with Jive Forums

- Crowd 1.2 provides support for group management in Jive Forums.
- Groups and group memberships are now pulled from Crowd.
- You can use the Jive Forums admin console to define application permissions associated with groups.
- This allows Crowd to manage Jive Forums groups and memberships and Jive Forums to handle the permissions associated with the groups.
- Read the documentation.

Acegi Application Connector

- Crowd 1.2 provides a built-in application connector for Acegi, a security solution with a particular emphasis on Spring Java/JEE applications.
- Read the documentation.
Group-Based Authorisation Added for Subversion

- Crowd allows you to password-protect your SVN repository running under Apache.
- You can now also configure fine-grained access by group as well as by user.
- Read more about the Crowd Subversion connector.

New Importer for Bamboo Users

- Our new Bamboo importer allows you to copy your Bamboo users into a Crowd directory.
- Read the documentation.

Plus Over 70 Improvements and Bug-Fixes

Crowd 1.1.2 Release Notes

The Crowd development team has released Crowd 1.1.2. Crowd 1.1.2 is a recommended upgrade from Crowd 1.1.1 since it provides improved integration with JIRA and Confluence, and tidier functionality for multiple directories.

For cross product compatibility, you must upgrade to the following versions of each product:

- Crowd 1.1.2 or later
- Bamboo 1.2.2 or later
- Confluence 2.5.6 or later
- JIRA 3.7.4 or later

Integration with JIRA user management

With Crowd 1.1.2, you can now turn external user management off in JIRA. This means that you can allow signup via JIRA, and you can manage your users within JIRA. Changes will flow through to Crowd.

JIRA has an automatic group membership feature. This means that any new user added through JIRA will automatically be a member of all groups which have the JIRA Users permission. In this way, you can ensure that a new user is automatically added to several groups when they sign up with JIRA.

RSS feeds

Crowd 1.1.2 fixes the problem experienced accessing RSS feeds from JIRA including retrieving JIRA issues via Confluence macros (e.g. the JIRA portlet macro).

Improved LDAP Performance
Crowd 1.1.2 now queries LDAP repositories in a more efficient manner that will give a dramatic performance increase for those with large numbers of LDAP groups.

**Other Fixes in Crowd 1.1.1**

Errors were reported by the JIRA trusted connection.

Cheers,
The Atlassian Crowd Development Team

**Crowd 1.1.1 Release Notes**

The Crowd development team has released Crowd 1.1.1.

This release is a **highly recommended upgrade** from Crowd 1.1.0 since it provides a security fix to XWork, the technology underlying the web framework **WebWork** which is used by Crowd.

This release also contains a new CSV importer as well as fixes for some issues found in 1.1.0.

**Importing Users and Groups from a CSV File**

You can now copy users from an external directory or user base into Crowd via a CSV (comma-separated values) file.

The new CSV Importer allows you to specify a file containing user information, and optionally another file containing the groups to which the users belong. You can then map the CSV fields to the Crowd directory fields. After performing the import, Crowd sums up the results.

*Screenshot: ‘CSV Importer - Configuration’*

**CSV Importer**

**Import your users and their group memberships**

- **Directory:** Atlassian
  - The directory to import your users and groups into.
- **Are your passwords encrypted?:**
  - Yes □ No □
  - if you are importing passwords, are they already encrypted?
- **Delimiter:**
  - The CSV file delimiter used in your file(s)
- **User File:** cliny-usersusers
  - The file containing your users information, i.e. “John”, “Swift”, “jimmy”, “john@atlassian.com”, “password”
- **Group Membership File:** cliny-usersgroups
  - The file containing your users group memberships, e.g. “jimmy”, “administrators”

**Other Fixes in Crowd 1.1.1**

Errors were reported by the JIRA trusted connection.

- APP_UNKNOWN; Unknown Application: {0}; ["confluence:4557196"]

CWD-438 Users shown twice in JIRA
CWD-437 JIRA's logout via SSO does not clear it's session
CWD-435 Exception using Seraph single-sign-on in Bamboo
CWD-434 Searching for a group spanning multiple directories by its name will not amalgamate the principals
CWD-425 Trim the application address when adding a valid application remote address.
CWD-419 displayName attribute is not used with the JIRA connector
CWD-414 The CSV Importer needs to display user results for duplicate entries i.e. users that have been ignored since they already exist in Crowd.
CWD-400 JIRA attach screenshot does not write file to the filesystem when Crowdified.
CWD-397 Document the CSV importer
CWD-385 Generated tokens have non-HTML escaped characters.
CWD-382 Create custom add successful page does not display directort connector page.
CWD-352 Configure the number of paged results for an LDAP connector
CWD-290 Upgrade webwork from 2.2.4 to 2.2.5
CWD-53 CSV importer
CWD-428 Change wording on the Atlassian importer
CWD-407 Textual changes to new CSV-importer screens

Cheers,
The Atlassian Crowd Development Team

**Crowd 1.1.0 Release Notes**

The Atlassian Crowd team is proud to announce the release of Crowd 1.1.

This release contains a whole host of new features targeted at implementing OpenID, along with core updates to the Crowd Administration Console.
OpenID-enable your organisation with CrowdID

OpenID enables you to use a centralised identity to login to any website that supports OpenID. It opens up the possibilities of massive scale cross-domain SSO.

Think about all the accounts you have online: blogs, wikis, to-do lists, photo galleries. The list is endless. Even simple tasks such as leaving comments on someone else's blog may require you to register an account with that particular blogging system. This leaves you, as an end user, to set up and manage numerous accounts on each of these sites. With OpenID, rather than managing all these disparate accounts individually, users can manage their identity in one place via an authentication server.

With the ever-increasing adoption of this open authentication framework, including names such as Microsoft, AOL, Sun, Verisign and Firefox, expect to see many applications enabled for OpenID authentication.

CrowdID offers OpenID to an organisation's user base, allowing users to manage their online identity. Everything from configuring different profiles, managing trusted sites to reviewing authentication activity, is accessible from CrowdID. Administrators can set up whitelists/blacklists so that only trusted hosts can request authentication and can set up secure communication via SSL. All of the users can be managed via Crowd's security server, utilizing LDAP services from products such as Microsoft Active Directory.

Included with CrowdID is a sample OpenID client application, providing a working example of an OpenID enabled application. This will help developers kick start OpenID-enabling their applications.

Using OpenID

Rather than registering and typing in your username and password on each site that you visit, OpenID allows you to type a URL similar to ‘openid.mycompany.com/users/jstepka’:

<table>
<thead>
<tr>
<th>My OpenID</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="https://openid.atlassian.com/users/jstepka" alt="OpenID Example" /></td>
</tr>
<tr>
<td>Use this URL to log in to websites that support OpenID.</td>
</tr>
</tbody>
</table>

The OpenID website that you are logging in to will redirect you to CrowdID, which will ask you if you would like to allow authentication with the requesting site.

You can even choose to 'Always' allow authentication with particular OpenID sites, which allows pass-through authentication if you are already logged into your CrowdID server. If you do this, then when you visit the site later, simply provide your URL (e.g. ‘openid.mycompany.com/users/jstepka’) and you are in.

Think of it as 'Remember Me' for the whole internet!
OpenID Verification

The following site:

http://wikitravel.org/en/

has requested that you confirm the following address as your personal identity:

https://openid.atlassian.com/users/jstepka

and is requesting the following information:

nickname email fullname language timezone

Select Profile

Use this profile: My Profile

Nickname jstepka
Full Name Justen Stepka
Email jstepka@atlassian.com
Country United States
Language English

'Blacklist' and 'Whitelist'

'Blacklists' and 'whitelists' allow administrators to lock down CrowdID their server so that, if necessary, it can only communicate with trusted hosts with which you have established relationships.

A blacklist will prevent specific hosts from communicating with the OpenID server. A whitelist will allow only specific hosts to communicate with the OpenID server.

Trust Relationships

Do you want to enable a black or white list?

Restriction Type: 🔘 None 🔘 Blacklist 🔘 Whitelist

A blacklist will restrict specific host from communicating with the OpenID server. A whitelist will only allow specific hosts to communicate with the OpenID server.

Whitelist mode: hosts that can login.

<table>
<thead>
<tr>
<th>Address</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>strategic-partner.com</td>
<td>Remove</td>
</tr>
</tbody>
</table>

OpenID Advanced Options

Some external sites implement security better than others. With CrowdID, you can pick how tough you want to be on OpenID sites that communicate with your Crowd OpenID server.
Crowd Console and Server Updates

Choose Your Encryption Type

Every administrator has their own password policies. When using a Crowd Internal Directory you can now select the level of encryption you need.

![Password Encryption Options]

Import Your JIRA and Confluence Passwords

Migration can be a pain. To ease your switch from existing Atlassian products, Crowd can now import your existing passwords!

![Import Passwords Options]

Faster Web-Services

Crowd web-services now support GZip compression, improving the performance when downloading large amounts of data such as the all the members of a large group or when performing large search.

Improved Apache and Subversion Integration

The Apache and Subversion library performance has been improved with the implementation of client-side caching of approved authentication requests.

Jive Forums 5.5 Support

The Jive Forums centralised authentication connector has been updated to support the new 5.5 major release of Jive Forums.

LDAP Configuration Tester
When setting up a Crowd LDAP connection you can now verify that your configuration connects as expected.

**JIRA Issue Tracker**

Errors were reported by the JIRA trusted connection.

**Crowd 1.0.5 Release Notes**

The Crowd development team has released Crowd 1.0.5.

If you are running Confluence version 2.4.4 or before, you will need to upgrade the `confluence/WEB-INF/lib/atlassian-user-XXXX-XX-XX.jar` Atlassian User library to version 2007-04-05. The original library file will need to be backed up, removed, and then replaced with the new version listed above.

This build is mix of bug fixes, documentation improvements, and feature enhancements:

You can now download Crowd from [http://www.atlassian.com/Crowd](http://www.atlassian.com/Crowd)

Errors were reported by the JIRA trusted connection.

Cheers,
The Atlassian Crowd Development Team

**Crowd 1.0.4 Release Notes**

> Crowd 2.0 has now been released — see the Crowd 2.0 Release Notes.

The Crowd development team has released Crowd 1.0.4.

This build focused on bug fixes:

- Import export process was failing with Oracle DB.
- Implemented updating known attribute types on an LDAP object.
- Importing JIRA users is fixed for MySQL on a Unix like filesystem.

You can now download Crowd from [http://www.atlassian.com/Crowd](http://www.atlassian.com/Crowd)

Errors were reported by the JIRA trusted connection.

Crowd 0.4.5 Beta Release Notes

Crowd 2.0 has now been released — see the Crowd 2.0 Release Notes.

The Crowd development team has released a new version of Crowd - 0.4.5.

This addresses bugs which can be viewed through our JIRA issue tracker:

http://jira.atlassian.com/secure/IssueNavigator.jspa?reset=true&pid=11291&fixfor=12652

• Improved Active Directory LDAP attribute filtering.
• UI improvements with new screen layouts.
• Spring TX management.

You can now download Crowd from http://www.atlassian.com/Crowd

Cheers,
The Atlassian Crowd Development Team

Crowd 0.4.4 Beta Release Notes

Crowd 2.0 has now been released — see the Crowd 2.0 Release Notes.

The Crowd development team has released a new version of Crowd - 0.4.4.

This addresses bugs which can be viewed through our JIRA issue tracker:
http://jira.atlassian.com/secure/IssueNavigator.jspa?reset=true&pid=11291&fixfor=12642

- Caching improvement for Confluence.
- Removed an additional attribute that was causing integration problems with SOAP services when using Active Directory.

You can now download Crowd from http://www.atlassian.com/Crowd

Cheers,
The Atlassian Crowd Development Team

Crowd 0.4.3 Beta Release Notes

Crowd 2.0 has now been released — see the Crowd 2.0 Release Notes.

The Crowd development team has released a new version of Crowd - 0.4.3.
This addresses bugs which can be viewed through our JIRA issue tracker:
http://jira.atlassian.com/secure/IssueNavigator.jspa?reset=true&pid=11291&fixfor=12267

- Support for AD when there are more than 999 records in a search result.
- Reduced the number of necessary libs for a client application.
- Improved the ‘build.properties’ file configuration.

You can now download Crowd from http://www.atlassian.com/Crowd

Cheers,
The Atlassian Crowd Development Team

Crowd 0.4.2 Beta Release Notes

Crowd 2.0 has now been released — see the Crowd 2.0 Release Notes.

The Crowd development team has released a new version of Crowd - 0.4.2.
This addresses bugs which can be viewed through our JIRA issue tracker:
http://jira.atlassian.com/secure/IssueNavigator.jspa?reset=true&pid=11291&fixfor=12623

You can now download Crowd from http://www.atlassian.com/Crowd

Cheers,
The Atlassian Crowd Development Team

Crowd 0.4.1 Beta Release Notes

Crowd 2.0 has now been released — see the Crowd 2.0 Release Notes.

The Crowd development team has released a new version of Crowd - 0.4.1.
This addresses bugs which can be viewed through our JIRA issue tracker:
http://jira.atlassian.com/secure/IssueNavigator.jspa?reset=true&pid=11291&fixfor=12600

You can now download Crowd from http://www.atlassian.com/Crowd

Cheers,
The Atlassian Crowd Development Team
Crowd 0.4 Beta Release Notes

Crowd 2.0 has now been released — see the Crowd 2.0 Release Notes.

The Crowd development team has released a new version of Crowd - 0.4.

This release addresses several critical issues:

- Seraph Logout code fails to logout the user in Confluence, Bamboo and JIRA.
- Unable to search for a Principal by email address.
- Accept header authentication factor unreliable with Mozilla based browsers.
- Default 'localhost' configuration not added valid IP address of 127.0.0.1.

New features include:

- Allow all to authenticate.
- New LDAP connectors build off Spring LDAP Template with better performance enhancements.
- Support for LDAP filters

**All Postgres DB will need to have the following command ran:**

```
alter table "APPLICATIONDIRECTORIES" add column "ALLOWALLTOAUTHENTICATE" boolean;
```

http://jira.atlassian.com/secure/IssueNavigator.jspa?reset=true&pid=11291&fixfor=12266

You can now download Crowd from http://www.atlassian.com/Crowd

Cheers,

The Atlassian Crowd Development Team

Crowd 0.3.3 Beta Release Notes

Crowd 2.0 has now been released — see the Crowd 2.0 Release Notes.

The Crowd development team has released a new version of Crowd - 0.3.3.

This release addresses the following:

- Upgrade from Webwork 1 to Webwork 2
- Workaround for Active Directory to support CN forwards.

**CRITICAL POSTGRES UPGRADE NOTES:** http://jira.atlassian.com/browse/CWD-71

We started testing on IE7 and have noticed the CSS bugs and will work to get this addressed for the next build.

http://jira.atlassian.com/secure/IssueNavigator.jspa?reset=true&pid=11291&fixfor=12544

You can now download Crowd from http://www.atlassian.com/Crowd

Cheers,

The Atlassian Crowd Development Team

Crowd 0.3.2 Beta Release Notes

Crowd 2.0 has now been released — see the Crowd 2.0 Release Notes.

The Crowd development team has released a new version of Crowd - 0.3.2.

This release addresses a Seraph SSO issue when integrating JIRA, Confluence and Bamboo.

http://jira.atlassian.com/secure/IssueNavigator.jspa?reset=true&pid=11291&fixfor=12540
You can now download Crowd from http://www.atlassian.com/Crowd

Cheers,
The Atlassian Crowd Development Team

Crowd 0.3 Beta Release Notes

ℹ️ Crowd 2.0 has now been released — see the Crowd 2.0 Release Notes.

Crowd 0.3

- Standalone version - Tomcat 5.5 with HSQL - .zip (65.3 Mbs)
- Standalone version - Tomcat 5.5 with HSQL - .tar.gz (64.7 Mbs)

Points of Interest

- The focus of this distribution is on performance for a large number of users and groups when integrating JIRA, Confluence and Bamboo integration.

Crowd 0.2 Beta Release Notes

ℹ️ Crowd 2.0 has now been released — see the Crowd 2.0 Release Notes.

Crowd 0.2

- Standalone version - Tomcat 5.5 with HSQL - .zip (59.5Mbs)
- Standalone version - Tomcat 5.5 with HSQL - .tar.gz (59.7Mbs)

Points of Interest

- There is an error when unzipping on the Windows platform, the archive integrity is fine and this will be fixed for the 0.3 release.
- The focus of this distribution is for JIRA and Confluence integration. Performance enhancements will be added for the 0.3 release which will allow large user-databases to be integrated.

Installing Crowd

Installing Crowd

You can download Crowd here.

⚠️ Warning: Some unzip programs cause errors

Some archive-extract programs cause errors when unzipping the Crowd archive file.

- Linux or Unix users can use any unzip program.
- Solaris users must use GNU Tar instead of Solaris Tar.
- Windows users should use a third-party unzip program like 7Zip or Winzip. If you do not have one, please download and install one before continuing:
  - 7Zip — Recommended. If in doubt, download the '32-bit .exe' version
  - Winzip

System Requirements
- Installing Crowd and CrowdID
- Running the Setup Wizard
System Requirements

This page describes the system requirements for Crowd and CrowdID.

On this page:

- Hardware Requirements
- Software Requirements
  - Supported Databases
  - Supported J2EE Servers
- Next Step

Hardware Requirements

The hardware required to run Crowd depends significantly on the number of applications and users that your installation will have, as well as the maximum number of concurrent requests that the system will experience during peak hours.

During evaluation Crowd will run well on any reasonably fast workstation computer (eg. 1.5+Ghz processor). Memory requirements depend on how many applications and users you will store, but 256MB is enough for most evaluation purposes.

Most users start by downloading Crowd, and running it on their local computer. It is easy to migrate Crowd to your enterprise infrastructure later.

We would appreciate if you let us know what hardware configuration works for you. Please create a support request in JIRA with your hardware specification and mention the number of applications and users in your Crowd installation.

While some of our customers run Crowd on SPARC-based hardware, Atlassian only officially supports Crowd running on x86 hardware and 64-bit derivatives of x86 hardware.

Software Requirements

1. Sun JDK 1.5 or higher. You can download the Java SE Development Kit (JDK) from the Sun website.
2. Note: Once the JDK is installed, you will need to set the JAVA_HOME environment variable, pointing to the root directory of the JDK. Some JDK installers set this automatically (check by typing 'echo %JAVA_HOME%' in a DOS prompt, or 'echo $JAVA_HOME' in a shell). If it is not set, please see Setting JAVA_HOME.
3. J2EE 1.4 application server or a Servlet 2.4 web container. NOTE: Crowd ships with Apache Tomcat (5.5.x).
4. JDBC-compliant database that is supported by Hibernate. NOTE: Crowd ships with a built-in HSQL database, which is fine for evaluation purposes. For production environments we recommend configuring Crowd to use an external database.
5. If you are deploying a WAR installation, ensure that the following JAR files are deployed in the shared lib folder on the application server:
   - JTA (Java Transaction API)

The JTA specifies standard Java interfaces between a transaction manager and the parties involved in a distributed transaction system: the resource manager, the application server, and the transactional applications. Refer to the Sun documentation for more information.

JavaMail classes
Java Beans Activation Framework (for those using Sun JDK 1.5.x only, this is included in JDK 1.6)

All of these JAR files are available in the Crowd Standalone Distribution zip file, available on the Crowd download centre — jta-1.0.1B.jar, mail-1.4.jar and activation-1.1.jar in CROWD\apache-tomcat-5.5.20\common\lib.

Supported Databases
The following database servers are supported by Hibernate:

- HypersonicSQL
- PostgreSQL
- Microsoft SQL Server
- MySQL
- Oracle 10g (tested on 10.2.0.1)

Of these, the following databases have been tested and are supported by Atlassian:

- HSQLDB
- MS SQL Server
- MySQL
- Oracle
- PostgreSQL

Supported J2EE Servers

The following J2EE servers are supported:

- JBoss (4.2.2 GA)
- Resin (3.0.x) — tested on 3.0.23. Resin versions 3.1.x and later are not compatible with Crowd. Please refer to CWD-1192.
- Tomcat 5.5.x (tested on 5.5.20) and Tomcat 6.

Next Step

Installing Crowd and CrowdID

Vote for more supported application servers

If you are interested in support for other application servers, please make your requests via our issue tracker. In particular, you can vote for the following existing requests:

- CWD-1192 — Provide support for versions of Resin newer than 3.0.26
- CWD-950 — Provide official support for Websphere

Setting JAVA_HOME

Once you have installed the JDK (see System Requirements), you need to set the JAVA_HOME environment variable.

To set the JAVA_HOME environment variable on Windows

1. Right click on the 'My Computer' icon on your desktop and select 'Properties'.
2. Click the 'Advanced' tab.
3. Click the 'Environment Variables' button.
4. Click 'New'.
5. In the 'Variable name' field, enter 'JAVA_HOME'.
6. In the 'Variable value' field, enter the directory (including its full path) where you installed the JDK.
7. Restart the computer.

To set the JAVA_HOME environment variable on 'nix based systems

There are many ways you can do it on 'nix based systems (including Mac OS X). Here are two:

For your current user,

1. Open up a shell / terminal window
2. vi ~/.profile (replace vi with your favourite text editor)
3. Add export JAVA_HOME=/path/to/java/home/dir on its own line at the end of the file
4. Add export PATH=$JAVA_HOME/bin:$PATH on its own line immediately after
5. Save, and restart your shell
6. Running java -version should give you the desired results

For all users in the system,

1. Open up a shell / terminal window
2. vi /etc/profile (replace vi with your favourite text editor)
3. Add export JAVA_HOME=/path/to/java/home/dir on its own line at the end of the file
4. Add export PATH=$JAVA_HOME/bin:$PATH on its own line immediately after
5. Save, and restart your shell
6. Running java -version should give you the desired results

If you are using a GUI, you may not need to open up the shell. Instead, you might be able to open the file directly in a graphical text editor.

Installing Crowd and CrowdID

The instructions below tell you how to install the standalone distribution of Crowd, which includes Apache Tomcat. If you wish to deploy a WAR distribution of Crowd or CrowdID on your own existing application server instead, read the instructions on the Crowd WAR distribution.

Crowd versions 1.1 and later include CrowdID. Installing Crowd, as described below, will also install CrowdID.

On this page:

1. Install Crowd (Standalone Distribution)
2. Optional Prepare your Database
3. Start Crowd and Complete the Setup Wizard

1. Install Crowd (Standalone Distribution)

1. Download Crowd.

2. Please check your unzip program before extracting the downloaded archive – see the note on the Crowd installation front page.

3. Unzip the download archive into a directory of your choice. Note: Do not specify directory names that contain spaces.

   ⚠ We’ll refer to this installation directory as {CROWD_INSTALL}.

4. Specify your Crowd Home directory by editing the configuration file at: {CROWD_INSTALL}/crowd-webapp/WEB-INF/classes/crowd-init.properties.

   The Crowd Home directory is where Crowd will store its configuration information. If you are using the embedded HSQL database, supplied for evaluation purposes, Crowd will also store its database in this directory. To specify the directory:

   - Open the crowd-init.properties file.
   - Choose the appropriate line in the file, depending upon your operating system (see below).
   - Remove the # at the beginning of the line.
   - Enter the name of the directory you want Crowd to use as its Home directory. For example,

     - On Windows:
       ```
       crowd.home=c:/data/crowd-home
       ```
   
     ⚠ Note: On Windows, make sure you use forward slashes as shown above, not backward slashes.

     - On Mac and Unix-based systems:
       ```
       crowd.home=/var/crowd-home
       ```

   - Save the crowd-init.properties file.

2. Optional Prepare your Database

   ⚠ Hint: If you are evaluating Crowd and are happy to use the database supplied, you can skip this step.

If you wish to set up Crowd and/or CrowdID with an external database, see:

- Connecting Crowd to a Database
- Connecting CrowdID to a Database
3. Start Crowd and Complete the Setup Wizard

1. Run the start-up script, found in your \{CROWD\_INSTALL\} directory:
   - \texttt{start\_crowd.bat} for Windows.
   - \texttt{start\_crowd.sh} for Mac and Unix-based systems.

2. Point a web browser at \url{http://localhost:8095/crowd} where you will see the Crowd Setup Wizard. Follow the instructions in the Wizard. You can also read more information about the Setup Wizard.

---

**Connecting Crowd to a Database**

You can configure your database connection as part of the Crowd Setup Wizard. It will make things easier if you have created the database and deployed the database driver before you start.

**HSQLDB database is supplied for evaluation purposes**

The Standalone distribution of Crowd is shipped with an embedded HSQLDB database. You can choose this embedded database during the Crowd setup process. The embedded database is fine for evaluation purposes, but for production installations you should connect Crowd to an enterprise database. This also lets you take advantage of existing database backup and recovery procedures.

Select the page corresponding to your database, for help on setting up an external database:

- HSQLDB
- MS SQL Server
- MySQL
- Oracle
- PostgreSQL

**RELATED TOPICS**

- System Requirements
- Installing Crowd and CrowdID
- Running the Setup Wizard
- Configuring Crowd
- Installing Crowd as a Windows Service

**HSQLDB**

The Standalone distribution of Crowd is shipped with an embedded HSQLDB database. When you run the Crowd Setup Wizard, you will be asked to choose a database. If you choose the embedded database, the data files will be stored in the Crowd Home directory, as configured during installation.

Also see \url{http://hsqldb.sourceforge.net/doc/guide/ch01.html#N101C2}.

**HSQLDB should not be used as a production database. It is included for evaluation purposes only.**

HSQLDB periodically must update its files to represent changes made in the database. In doing so, it must delete the current \texttt{crowddb.data} file on the file system (beneath the \texttt{/database} folder in your Crowd home directory) and replace it with a new one.

If an administrator issues a shutdown on Crowd while this update is happening, data can be lost and typically all configuration data for your Crowd server will be lost.

MS SQL Server

**Supported Versions**
Crowd supports MS SQL Server 2005 and 2008 versions.

When you run the **Crowd Setup Wizard**, you will be asked to choose a database and provide configuration settings for that database. It will make things easier if you have created the database and deployed the database driver before you start the Setup Wizard.

Follow the instructions below to set up MS SQL Server for Crowd.

1. **Configure SQL Server**
   1. Create a database user which Crowd will connect as (e.g. crowduser).
      
      ![Warning]
      In SQL Server, the database user (crowduser above) should not be the database owner, but should be in the db_owner role.

   2. Create a database for Crowd to store data in (e.g. crowddb).
   3. Ensure that the user has permission to connect to the database, and create and populate tables

2. **Copy the SQL Server driver to your application server**
   1. Download the SQL Server JDBC driver from JTDS (recommended), or I-net software (commercial).

      ![Warning]
      Microsoft have their own JDBC driver but we strongly recommend avoiding it after our JIRA customers have reported various connection errors (JRA-5760, JRA-6872), workflow problems (JRA-8443) and Chinese character problems (JRA-5054).

   2. Add the SQL Server JDBC driver jar (jtds-[version].jar) to the common/lib directory.

**Next Steps**
Complete the Crowd installation, then start Crowd and run the Setup Wizard as described in the Installation Guide.

**Configuring Unicode Support in MS SQL Server**
To configure Crowd to support Unicode in MS SQL Server 2005 and 2008, enter the following in the 'Hibernate Dialect' field on the Crowd Setup Wizard's Database Configuration screen:
com.atlassian.crowd.util.persistence.hibernate.SQLServerIntlDialect

**RELATED TOPICS**

MySQL

When you run the Crowd Setup Wizard, you will be asked to choose a database and provide configuration settings for that database. It will make things easier if you have created the database and deployed the database driver before you start the Setup Wizard.

Follow the instructions below to set up MySQL (5.0.37 and later) for Crowd.

1. **Configure MySQL**

   1. Create a database user which Crowd will connect as (e.g. *crowduser*).
   2. Create a Latin 1 encoded database for Crowd to store data in (e.g. *crowd*).

   ```sql
   create database crowd character set latin1;
   ```

   At present, Crowd does not support UTF-8 encoding for MySQL. If you would like MySQL UTF-8 support, please vote on [this issue](#).

   3. Ensure that the user has permission to connect to the database, and create and populate tables.
   4. Modify MySQL startup options in the configuration file `my.cnf`, so the transaction level is set to `transaction-isolation = READ-COMMITTED`. (Refer to [MySQL Option Files](#) for detailed instructions on editing `my.cnf`.)

   ```ini
   [mysqld]
   transaction-isolation = READ-COMMITTED
   ```

   The above configuration will prevent errors when you import directory information into Crowd. See [CWD-1505](#).

   5. Restart your MySQL server for the configuration change to take effect.

2. **Copy the MySQL driver to your application server**

   1. Download the MySQL Connector/J JDBC driver [driver](#). **Warning:** Avoid using version 5.1.x of the driver as it can lead to errors.
   2. Add the MySQL JDBC driver jar (`mysql-connector-java-3.x.x-bin.jar`) to the `apache-tomcat/common/lib/` directory. **NOTE:** Do not place the Debug Driver (`mysql-connector-java-3.x.x-bin-g.jar`) on the [CLASSPATH](#) as this can cause issues. ([JRA-8674](#)).

**Next Steps**

Complete the Crowd installation, then start Crowd and run the Setup Wizard as described in the [Installation Guide](#).

Oracle
When you run the Crowd Setup Wizard, you will be asked to choose a database and provide configuration settings for that database. It will make things easier if you have created the database and deployed the database driver before you start the Setup Wizard.

Follow the instructions below to set up Oracle for Crowd.

1. **Configure Oracle**
   1. Create a database user which Crowd will connect as (e.g. `crowduser`).
   2. Create a database for Crowd to store data in (e.g. `crowddb`).
   3. Ensure that the user has permission to connect to the database, and create and populate tables

2. **Copy the Oracle driver to your application server**
   2. Add the Oracle JDBC driver jar to the `apache-tomcat-X.X.XX/common/lib` directory.

**Next Steps**

Complete the Crowd installation, then start Crowd and run the Setup Wizard as described in the Installation Guide.

**PostgreSQL**

When you run the Crowd Setup Wizard, you will be asked to choose a database and provide configuration settings for that database. It will make things easier if you have created the database and deployed the database driver before you start the Setup Wizard.

Follow the instructions below to set up PostgreSQL for Crowd.

1. **Configure PostgreSQL**
   1. Create a database user which Crowd will connect as (e.g. `crowduser`).
   2. Create a database for Crowd to store data in (e.g. `crowddb`).
   3. Ensure that the user has permission to connect to the database, and create and populate tables

2. **Copy the PostgreSQL driver to your application server**
   2. Add the PostgreSQL JDBC driver jar to the `common/lib` directory.

  - Connecting CrowdID to a Database
Connecting CrowdID to a Database

CrowdID is a free add-on that ships with Crowd versions 1.1 and later.

By default, CrowdID in the Crowd ‘Standalone’ distribution is shipped preconfigured with HSQL. This is fine for evaluation purposes, but for production installations, you should connect CrowdID to an enterprise database. This also lets you take advantage of existing database backup and recovery procedures.

CrowdID database connection is not yet part of Setup Wizard

This page describes the procedure for connecting CrowdID to an external database. You’ll notice that the procedure for connecting Crowd itself to a database is simpler, because the Crowd database connection is configured by the Crowd Setup Wizard. The CrowdID database configuration cannot be done as part of the Setup Wizard. We hope to improve the CrowdID integration soon. In the meantime, please follow the steps below.

The following instructions will allow you to configure CrowdID to an external database:

- HSQLDB for CrowdID
- MS SQL Server for CrowdID
- MySQL for CrowdID
- Oracle for CrowdID
- PostgreSQL for CrowdID

Database Overview

CrowdID in the Crowd ‘Standalone’ distribution includes the Apache Tomcat application server and an in-memory HSQL database engine. This JNDI reference (CrowdIDDS) can be adjusted to use your custom database and driver by editing the crowd.xml deployment description.

HSQldb for CrowdID

The default version of CrowdID uses an embedded HSQLDB database.

Also see http://hsqldb.sourceforge.net/doc/guide/ch01.html#N101C2.

HSQldb periodically must update its files to represent changes made in the database. In doing so, it must delete the current crowddb.data file on the filesystem (beneath the /database folder) and replace it with a new one.

If an administrator issues a shutdown on CrowdID in this period, data can be lost, and typically all configuration data for your CrowdID server will be lost.

HSQldb should not be used as a production database. It is included for evaluation purposes only.

MS SQL Server for CrowdID

To connect CrowdID to MS SQL Server,

1. Configure SQL Server

   1. Create a database user which CrowdID will connect as (e.g. crowduser).

   ![Warning] In SQL Server, the database user (crowduser above) should not be the database owner, but should be in the db_owner role.

   2. Create a database for CrowdID to store data in (e.g. crowdiddb). ![Warning] This must be a different database to the one used by Crowd.
3. Ensure that the user has permission to connect to the database, and create and populate tables

2. **Copy the SQL Server driver to your application server**

1. Download the SQL Server JDBC driver from JTDS (recommended, assumed below), or I-net software (commercial).

   Microsoft have their own JDBC driver but we strongly recommend avoiding it after our JIRA customers have reported various connection errors (JRA-5760, JRA-6872)[http://jira.atlassian.com/browse/JRA-6872), workflow problems (JRA-8443) and Chinese character problems (JRA-5054).

2. Add the SQL Server JDBC driver jar (jtds-[version].jar) to the common/lib directory.

3. **Configure your application server to connect to SQL Server**

   1. Edit the conf/Catalina/localhost/crowd.xml and customise the `username`, `password`, `driverClassName` and `url` parameters for the Datasource.

   ```xml
   <Context path="/openidserver" docBase="../crowd-openidserver-webapp" debug="0">
     <Resource name="jdbc/CrowdIDDS" auth="Container" type="javax.sql.DataSource">
       <ResourceParameter name="username" value="[enter db username here]"/>
       <ResourceParameter name="password" value="[enter db password here]"/>
       <ResourceParameter name="driverClassName" value="net.sourceforge.jtds.jdbc.Driver"/>
       [ delete the minEvictableIdleTimeMillis, timeBetweenEvictionRunsMillis and maxActive params here ]
     </Resource>
   </Context>
   ```

   2. Delete the `minEvictableIdleTimeMillis`, `timeBetweenEvictionRunsMillis` and `maxActive` attributes (which are only needed for HSQL, and degrade performance otherwise).

4. **Configure CrowdID to use MS SQL Server**

   1. Edit the build.properties file (located in the root of the Standalone distribution) and modify the `hibernate.dialect` to the following:

   ```properties
   hibernate.dialect=org.hibernate.dialect.SQLServerDialect
   ```

   2. Then run the `./build.sh` or `build.bat`. This will configure CrowdID to use the MS SQL Server dialect. There is a problem with build.bat in Crowd version 1.2.0. To fix the problem, please apply the patch described in CWD-638.

   If you do not wish to edit this file and run the build script, you can edit the `jdbc.properties` (which the above script modifies) directly. The `jdbc.properties` file is located here: `crowd-openidserver-webapp\WEB-INF\classes\jdbc.properties`; modify the file to the following:

   ```properties
   # - Crowd Configuration Options
   hibernate.connection.datasource=java\:comp\:env/jdbc/CrowdIDDS
   hibernate.dialect=org.hibernate.dialect.SQLServerDialect
   hibernate.transaction.factory_class=org.hibernate.transaction.JDBCTransactionFactory
   ...```

*Next Steps*

You should now have an application server configured to connect to a database, and CrowdID configured to use the correct database. Now start up CrowdID and watch the logs for any errors.

MySQL for CrowdID

To connect CrowdID to MySQL,

1. **Configure MySQL.**
   1. Create a database user which CrowdID will connect as (e.g. crowduser).
   2. Create a latin1-encoded database for CrowdID to store data in (e.g. crowdiddb).⚠️ This must be a different database to the one used by Crowd.

   ```
   create database crowdiddb character set latin1;
   ```

   At present, CrowdID does not support utf-8 encoding for MySQL. For more information, please refer to issue CWD-990.
   3. Ensure that the user has permission to connect to the database, and create and populate tables.

2. **Copy the MySQL driver to your application server**
   1. Download the latest MySQL Connector/J JDBC driver.
   2. Add the MySQL JDBC driver jar (mysql-connector-java-3.x.x-bin.jar) to the common/lib/ directory. NOTE: Do not place the Debug Driver (mysql-connector-java-3.x.x-bin-g.jar) on the CLASSPATH as this can cause issues. (JRA-8674).

3. **Configure your application server to connect to MySQL**
   1. Edit the file apache-tomcat-X.X.XX/conf/Catalina/localhost/openidserver.xml and customise the username, password, driverClassName and url parameters for theDatasource.
1.

<Context path="/openidserver" docBase="../../crowd-openidserver-webapp" debug="0">

<Resource name="jdbc/CrowdIDDS" auth="Container" type="javax.sql.DataSource"
  username="[enter db username here]"
  password="[enter db password here]"
  driverClassName="com.mysql.jdbc.Driver"
  url="jdbc:mysql://localhost/crowdiddb?autoReconnect=true&amp;useUnicode=true&amp;characterEncoding=latin1"
  [ delete the minEvictableIdleTimeMillis, timeBetweenEvictionRunsMillis and maxActive params here ]
 />

<Manager className="org.apache.catalina.session.PersistentManager" saveOnRestart="false"/>
</Context>

The URL above assumes a LATIN-1 database — i.e. created with `create database crowdiddb character set latin1;`.

MySQL closes idle connections after 8 hours, so the `autoReconnect=true` is necessary to tell the driver to reconnect.

2. Delete the `minEvictableIdleTimeMillis`, `timeBetweenEvictionRunsMillis` and `maxActive` attributes (which are only needed for HSQL, and degrade performance otherwise).

4. Configure CrowdID to use MySQL

1. Edit the `build.properties` file (located in the root of the Standalone distribution) and modify the `hibernate.dialect` to the following. Please choose only one of the 3 available options depending on how you have configured your database server.

   *For MySQL set:*
   hibernate.dialect=org.hibernate.dialect.MySQLDialect

   *For MySQL with InnoDB set:*
   hibernate.dialect=org.hibernate.dialect.MySQLInnoDBDialect

   *For MySQL with MyISAM set:*
   hibernate.dialect=org.hibernate.dialect.MySQLMyISAMDialect

2. Then run `./build.sh` or `build.bat`. This will configure CrowdID to use the MySQL dialect.

If you do not wish to edit this file and run the build script, you can edit the `jdbc.properties` (which the above script modifies) directly. The `jdbc.properties` file is located here: `crowd-openidserver-webapp\WEB-INF\classes\jdbc.properties`. Modify the file to the following:

```properties
# - Crowd Configuration Options

hibernate.connection.datasource=java:comp/env/jdbc/CrowdIDDS
hibernate.dialect=org.hibernate.dialect.MySQLDialect
hibernate.transaction.factory_class=org.hibernate.transaction.JDBCTransactionFactory
...
```

Next steps

You should now have an application server configured to connect to a database, and CrowdID configured to use the correct database. Now start up CrowdID and watch the logs for any errors.

Oracle for CrowdID

Follow the steps below to connect CrowdID to Oracle.

1. **Configure Oracle**

   1. Create a database user which CrowdID will connect as (e.g. crowduser).
   2. Create a database for CrowdID to store data in (e.g. crowdiddb). This must be a different database to the one used by Crowd.
   3. Ensure that the user has permission to connect to the database, and create and populate tables.

2. **Copy the Oracle driver to your application server**

   2. Add the Oracle JDBC driver jar to the `common/lib` directory.

3. **Configure your application server to connect to Oracle**

   1. Edit the file `apache-tomcat-X.X.XX/conf/Catalina/localhost/openidserver.xml` and customise the `username`, `password`, `driverClassName` and `url` parameters for the Datasource.

   ```xml
   <Context path="/openidserver" docBase="../../../crowd-openidserver-webapp" debug="0">
       <Resource name="jdbc/CrowdIDDS" auth="Container" type="javax.sql.DataSource">
           <JdbcProperites>
               <username>[enter db username here]"</username>
               <password>[enter db password here]"</password>
               <driverClassName>[oracle.jdbc.driver.OracleDriver]"</driverClassName>
               <url>jdbc:oracle:thin:@localhost:1521:crowdiddb</url>
               [ delete the minEvictableIdleTimeMillis, timeBetweenEvictionRunsMillis and maxActive params here ]
           </JdbcProperites>
       </Resource>
   </Context>
   ``

   2. Delete the `minEvictableIdleTimeMillis`, `timeBetweenEvictionRunsMillis` and `maxActive` attributes (which are only needed for HSQL, and degrade performance otherwise).

4. **Configure CrowdID to use Oracle**

   1. Edit the `build.properties` file (located in the root of the standalone release) and modify the `hibernate.dialect` to the following
2. Then run `./build.sh` or `build.bat`. This will configure CrowdID to use the Oracle dialect. There is a problem with `build.bat` in Crowd version 1.2.0. To fix the problem, please apply the patch described in CWD-638.

If you do not wish to edit this file and run the build script, you can edit the `jdbc.properties` (which the above script modifies) directly. The `jdbc.properties` file is located here: `crowd-openidserver-webapp\WEB-INF\classes\jdbc.properties`. Modify the file to the following:

```properties
hibernate.dialect=org.hibernate.dialect.OracleDialect
```

**Next Steps**

You should now have an application server configured to connect to a database, and CrowdID configured to use the correct database. Now start up CrowdID and watch the logs for any errors.

**PostgreSQL for CrowdID**

To connect CrowdID to PostgreSQL,

1. **Configure PostgreSQL**
   1. Create a database user which CrowdID will connect as (e.g. `crowduser`).
   2. Create a database for CrowdID to store data in (e.g. `crowdiddb`). This must be a different database to the one used by Crowd.
   3. Ensure that the user has permission to connect to the database, and create and populate tables.
2. **Copy the PostgreSQL driver to your application server**

2. Add the PostgreSQL JDBC driver jar to the common/lib directory.

3. **Configure your application server to connect to PostgreSQL**

1. Edit the file `apache-tomcat-X.X.XX/conf/Catalina/localhost/openidserver.xml` and customise the `username`, `password`, `driverClassName` and `url` parameters for the Datasource.

```xml
<Context path="/openidserver" docBase="../../crowd-openidserver-webapp" debug="0">
  <Resource name="jdbc/CrowdIDDS" auth="Container" type="javax.sql.DataSource"
    username="[enter db username here]"
    password="[enter db password here]"
    driverClassName="org.postgresql.Driver"
    url="jdbc:postgresql://host:port/crowdiddb" [ see also http://jdbc.postgresql.org/doc.html ]
    [ delete the minEvictableIdleTimeMillis, timeBetweenEvictionRunsMillis and maxActive params here ] />
  <Manager className="org.apache.catalina.session.PersistentManager" saveOnRestart="false"/>
</Context>
```
2. Delete the `minEvictableIdleTimeMillis`, `timeBetweenEvictionRunsMillis` and `maxActive` attributes (which are only needed for HSQL, and degrade performance otherwise).

4. **Configure CrowdID to use PostgreSQL**

1. Edit the `build.properties` file located in the root of the standalone release and modify the `hibernate.dialect` to the following:

```properties
hibernate.dialect=org.hibernate.dialect.PostgreSQLDialect
```
2. Then run `./build.sh` or `build.bat`. This will configure crowd to use the PostgreSQL dialect. There is a problem with `build.bat` in Crowd version 1.2.0. To fix the problem, please apply the patch described in [CWD-638](http://jdbc.postgresql.org/doc.html).

If you do not wish to edit this file and run the build script, you can edit the `jdbc.properties` (which the above script modifies) directly. The `jdbc.properties` file is located here: `crowd-openidserver-webapp\WEB-INF\classes\jdbc.properties`. Modify the file to the following:

```properties
# - Crowd Configuration Options

hibernate.connection.datasource=java:comp/env/jdbc/CrowdIDDS
hibernate.dialect=org.hibernate.dialect.PostgreSQLDialect
hibernate.transaction.factory_class=org.hibernate.transaction.JDBCTransactionFactory
...```

**Next Steps**

You should now have an application server configured to connect to a database, and CrowdID configured to use the correct database. Now start up CrowdID and watch the logs for any errors.

Installing Crowd and CrowdID WAR Distribution

The Crowd and CrowdID WAR distributions are intended for deployment onto an existing J2EE application server. It is assumed that you already know how to deploy a web application onto your chosen application server. If not, please contact your system administrator to assist you, or consider installing the Crowd Standalone distribution instead.

The standard Crowd installation guide tells you how to install the Standalone distribution of Crowd, which includes Apache Tomcat. Instead, you may wish to deploy Crowd or CrowdID onto your own existing application server. For this purpose, we provide WAR (Webapp ARchive) distributions of the Crowd and CrowdID server applications.

Crowd supports all the application servers listed in System Requirements.

The procedures for connecting Crowd and CrowdID are slightly different. The Crowd setup process provides the option of JDBC or JNDI datasource connections via the Crowd Setup Wizard. CrowdID requires a JNDI datasource configuration. Detailed instructions are on the following pages:

• Installing Crowd WAR Distribution
• Installing CrowdID WAR Distribution

Installing Crowd WAR Distribution

The Crowd and CrowdID WAR distributions are intended for deployment onto an existing J2EE application server. It is assumed that you already know how to deploy a web application onto your chosen application server. If not, please contact your system administrator to assist you, or consider installing the Crowd Standalone distribution instead.

The standard Crowd installation guide tells you how to install the Standalone distribution of Crowd, which includes Apache Tomcat. Instead, you may wish to deploy Crowd or CrowdID onto your own existing application server. For this purpose, we provide WAR (Webapp ARchive) distributions of the Crowd and CrowdID server applications.

Crowd supports all the application servers listed in System Requirements.
Below is a generic overview of the steps required to install the Crowd WAR distribution. You will need to perform specific configuration steps depending upon your application server. As well as the generic instructions below, we also provide specific instructions on the following pages:

- Configuring Crowd & CrowdID on Tomcat 5.5.x
- Installing Crowd WAR on JBoss

**Step 1. Check the System Requirements**

⚠️ Please check that your database and server are supported, as outlined in System Requirements, and make sure that all dependencies are installed as described below, otherwise Crowd will not run properly.

1. Sun JDK 1.5 or higher. You can download the Java SE Development Kit (JDK) from the Sun website.
2. **Note:** Once the JDK is installed, you will need to set the JAVA_HOME environment variable, pointing to the root directory of the JDK. Some JDK installers set this automatically (check by typing 'echo %JAVA_HOME%' in a DOS prompt, or 'echo $JAVA_HOME' in a shell). If it is not set, please see Setting JAVA_HOME.
3. J2EE 1.4 application server or a Servlet 2.4 web container. NOTE: Crowd ships with Apache Tomcat (5.5.x).
4. JDBC-compliant database that is supported by Hibernate. NOTE: Crowd ships with a built-in HSQL database, which is fine for evaluation purposes. For production environments we recommend configuring Crowd to use an external database.
5. If you are deploying a WAR installation, ensure that the following JAR files are deployed in the shared lib folder on the application server:
   - JTA (Java Transaction API)

The JTA specifies standard Java interfaces between a transaction manager and the parties involved in a distributed transaction system: the resource manager, the application server, and the transactional applications. Refer to the Sun documentation for more information.

JavaMail classes
Java Beans Activation Framework (for those using Sun JDK 1.5.x only, this is included in JDK 1.6)

All of these JAR files are available in the Crowd Standalone Distribution zip file, available on the Crowd download centre — jta-1.0.1B.jar, mail-1.4.jar and activation-1.1.jar in CROWD\apache-tomcat-5.5.20\common\lib.

**Step 2. Install Crowd WAR**

Below is a summary of the Crowd WAR installation steps:

1. Download the Crowd WAR distribution from the Crowd download centre.
   - You will find the WAR archives for the Crowd and the CrowdID applications by clicking the 'Show all' link. You will need to deploy each application separately. For the rest of these instructions, we assume you are deploying Crowd WAR.
2. Please check your unzip program before extracting the downloaded archive, as some unzip programs can cause errors — see the note on the Crowd installation front page.
3. Unzip the download archive into a directory of your choice. We'll call it CROWD in the rest of these instructions.
4. Specify your Crowd Home directory by editing the configuration file at server/default/deploy/crowd.war/WEB-INF/classes/crowd-init.properties.

   The Crowd Home directory is where Crowd will store its configuration information. If you are using the embedded HSQL database, supplied for evaluation purposes, Crowd will also store its database in this directory. To specify the directory:

   - Open the crowd-init.properties file.
   - Choose the appropriate line in the file, depending upon your operating system (see below).
   - Remove the # at the beginning of the line.
   - Enter the name of the directory you want Crowd to use as its Home directory. For example:
     - On Windows:
       ```
crowd.home=c:/data/crowd-home
       ```
     - Note: On Windows, make sure you use forward slashes as shown above, not backward slashes.
     - On Mac and Unix-based systems:
crowd.home=/var/crowd-home

- Save the crowd-init.properties file.

5. Create a database in your chosen database server.

6. Copy the JDBC driver into your application server's classpath.

7. Depending upon your application server, you may need to zip up the WAR file again before deploying it. Place the CROWD directory or the WAR file into your application server's deployment directory. Please consult the server-specific documentation on how to do this. A few Atlassian best practice guides are listed here:
   - Configuring Crowd & CrowdID on Tomcat 5.5.x
   - Installing Crowd WAR on JBoss

8. Restart your application server.

9. Point a web browser at the IP address and port that your application server is running on (typically http://localhost:8080). The Crowd Setup Wizard will start.

RELATED TOPICS

- Installing Crowd and CrowdID
- Running the Setup Wizard
- Configuring Crowd
- Installing Crowd as a Windows Service

**Configuring Crowd & CrowdID on Tomcat 5.5.x**

The standard Crowd installation guide tells you how to install the Standalone distribution of Crowd, which includes Apache Tomcat. You may wish to deploy Crowd on your own existing application server instead. For this purpose, we provide WAR (Webapp ARchive) distributions of the Crowd and CrowdID server applications.

This page contains specific configuration steps for deploying Crowd or CrowdID on an existing Apache Tomcat server.

Please refer also to the generic WAR setup guide.

On this page:
- Configuring a Crowd 'context' in Tomcat
- Configuring a CrowdID 'context' in Tomcat
- Modifying Tomcat's server.xml to allow for Unicode Character Set

**Configuring a Crowd 'context' in Tomcat**

1. Create a file called crowd.xml that contains the following context:

   ```xml
   <Context path="/crowd" docBase="/path/to/atlassian-crowd-war-directory" reloadable="false"/>
   ```

2. Place the file in your Tomcat's conf/Catalina/localhost/ directory.

3. Modify the /path/to/atlassian-crowd-war-directory to reflect the actual path to your Crowd WAR distribution. To avoid problems with your deployment, this should NOT be Tomcat's webapps directory.
   If you are installing Crowd or CrowdID on Windows, make sure that the paths you specify for the location of the WAR file and database are full paths including drive letters.

**Configuring a CrowdID 'context' in Tomcat**

If you are deploying CrowdID, you will need to specify a JNDI datasource.

1. Create a file called openidserver.xml that resembles the following example for a MySQL database:
2. Place the file in your Tomcat's `conf/Catalina/localhost/` directory.

3. Modify the `/path/to/atlassian-crowd-openid-war-directory` to reflect the actual path to your CrowdID WAR distribution. To avoid problems with your deployment, this should **NOT** be Tomcat's `webapps` directory. If you are installing Crowd or CrowdID on Windows, make sure that the paths you specify for the location of the WAR file and database are full paths including drive letters.

4. Modify the content of the above file appropriately for your database (e.g. Oracle, Postgres, etc). In particular, please remember to update the `driveClassName`.

5. Copy the JDBC driver jar to your Tomcat's `common/lib/` directory.

### Modifying Tomcat's `server.xml` to allow for Unicode Character Set

If your user directory contains usernames or group names with Unicode characters, you need to modify your Tomcat distribution's `conf/server.xml` file. For example, you need to do this if your user directory allows for internationalised characters in usernames.

The additional setting described below will ensure that the HTTP query string is encoded in the same way as the body, instead of using the URI character encoding.

1. In your Tomcat distribution’s `conf/server.xml` file, find the connector definition for your HTTP protocol. The connector definition looks very much like this:

   ```xml
   <Connector port="8080" maxHttpHeaderSize="8192"
     maxThreads="150" minSpareThreads="25" maxSpareThreads="75"
     enableLookups="false" redirectPort="8443" acceptCount="100"
     connectionTimeout="20000" disableUploadTimeout="true"/>
   ```

2. Modify the block to include the `useBodyEncodingForURI` property with value set to 'true':

   ```xml
   <Connector port="8080" maxHttpHeaderSize="8192"
     maxThreads="150" minSpareThreads="25" maxSpareThreads="75"
     enableLookups="false" redirectPort="8443" acceptCount="100"
     connectionTimeout="20000" disableUploadTimeout="true" useBodyEncodingForURI="true"/>
   ```

   **This setting affects all web applications**

   Because you must define this property at the connector level, this setting will affect all web applications you have deployed under the connector. This should not adversely affect the other web applications, but please be aware of this fact. Crowd and CrowdID will run fine without this property set, but you will run into issues if a username or group contains internationalised characters. It is best to set this property to 'true'.

**RELATED TOPICS**

- System Requirements
- Installing Crowd and CrowdID
- Running the Setup Wizard
- Configuring Crowd
- Installing Crowd as a Windows Service

**Installing Crowd WAR on JBoss**
The standard Crowd installation guide tells you how to install the Standalone distribution of Crowd, which includes Apache Tomcat. You may wish to deploy Crowd on your own existing application server instead. For this purpose, we provide WAR (Webapp ARCHive) distributions of the Crowd and CrowdID server applications.

This page shows one example - use it as a basis for other installations

- This page tells you how to deploy Crowd onto a JBoss Application Server. For other application servers, refer to the generic WAR setup guide.
- On this page, we have used PostgreSQL as an example of a database connected via a JNDI datasource. Crowd supports all the databases listed in the System Requirements. Refer to Connecting Crowd to a Database for instructions on connecting Crowd to your enterprise database.

Step 1. Check the System Requirements

⚠ Please check that your database and server are supported, as outlined in System Requirements, and make sure that all dependencies are installed as described below, otherwise Crowd will not run properly.

1. Sun JDK 1.5 or higher. You can download the Java SE Development Kit (JDK) from the Sun website.
2. Note: Once the JDK is installed, you will need to set the JAVA_HOME environment variable, pointing to the root directory of the JDK. Some JDK installers set this automatically (check by typing 'echo %JAVA_HOME%' in a DOS prompt, or 'echo $JAVA_HOME' in a shell). If it is not set, please see Setting JAVA_HOME.
3. J2EE 1.4 application server or a Servlet 2.4 web container. NOTE: Crowd ships with Apache Tomcat (5.5.x).
4. JDBC-compliant database that is supported by Hibernate. NOTE: Crowd ships with a built-in HSQL database, which is fine for evaluation purposes. For production environments we recommend configuring Crowd to use an external database.
5. If you are deploying a WAR installation, ensure that the following JAR files are deployed in the shared lib folder on the application server:
   - JTA (Java Transaction API)

The JTA specifies standard Java interfaces between a transaction manager and the parties involved in a distributed transaction system: the resource manager, the application server, and the transactional applications. Refer to the Sun documentation for more information.

JavaMail classes
Java Beans Activation Framework (for those using Sun JDK 1.5.x only, this is included in JDK 1.6)

All of these JAR files are available in the Crowd Standalone Distribution zip file, available on the Crowd download centre — jta-1.0.1B.jar, mail-1.4.jar and activation-1.1.jar in CROWD\apache-tomcat-5.5.20\common\lib.

Step 2. Install Crowd WAR

Follow the steps below to install Crowd on JBoss 4.2.2 GA using a PostgreSQL database:

1. Download the WAR distribution from the Crowd download centre.
   - You will find the WAR archives for the Crowd and the CrowdID applications. You will need to deploy each application separately. For the rest of these instructions, we assume you are deploying Crowd WAR.
2. Please check your unzip program before extracting the downloaded archive, as some unzip programs can cause errors – see the note on the Crowd installation front page.
3. Unzip the download archive into a directory of your choice. We'll call it server/default/deploy/crowd.war in the rest of these instructions.
4. Specify your Crowd Home directory by editing the configuration file at server/default/deploy/crowd.war/WEB-INF/classes/crowd-init.properties.

The Crowd Home directory is where Crowd will store its configuration information. If you are using the embedded HSQL database, supplied for evaluation purposes, Crowd will also store its database in this directory. To specify the directory:

- Open the crowd-init.properties file.
- Choose the appropriate line in the file, depending upon your operating system (see below).
- Remove the # at the beginning of the line.
- Enter the name of the directory you want Crowd to use as its Home directory. For example,
  - On Windows:
crowd.home=c:/data/crowd-home

Note: On Windows, make sure you use forward slashes as shown above, not backward slashes.

- On Mac and Unix-based systems:
  crowd.home=/var/crowd-home

- Save the crowd-init.properties file.

5. Add file server/default/deploy/crowd.war/WEB-INF/jboss-web.xml, with the following contents:

```xml
<jboss-web>
  <resource-ref>
    <res-ref-name>jdbc/CrowdDS</res-ref-name>
    <res-type>javax.sql.DataSource</res-type>
    <jndi-name>java:CrowdDS</jndi-name>
  </resource-ref>
</jboss-web>
```

6. Create database crowd_db in PostgreSQL.

7. Add a datasource definition file server/default/deploy/postgres-ds.xml:

```xml
<datasources>
  <local-tx-datasource>
    <jndi-name>CrowdDS</jndi-name>
    <connection-url>jdbc:postgresql://localhost:5432/crowd_db</connection-url>
    <driver-class>org.postgresql.Driver</driver-class>
    <user-name>postgres</user-name>
    <password>postgres</password>
  </local-tx-datasource>
</datasources>
```

8. Modify file server/default/deploy/crowd.war/WEB-INF/classes/crowd.properties to point to the port of the JBoss server. 8080 is the default port number, and is shown in the example below:

```properties
crowd.server.url=http://localhost:8080/crowd/services/
crowd.application.login.url=http://localhost:8080/crowd/console/
```

9. Start JBoss with `run.sh` (Unix-based systems) or `run.bat` (Windows).

10. Point a web browser at `http://localhost:8080/` where you will see the Crowd Setup Wizard.

Installing CrowdID WAR Distribution

The Crowd and CrowdID WAR distributions are intended for deployment onto an existing J2EE application server. It is assumed that you already know how to deploy a web application onto your chosen application server. If not, please contact your system administrator to assist you, or consider installing the Crowd Standalone distribution instead.

The standard Crowd installation guide tells you how to install the Standalone distribution of Crowd, which includes Apache Tomcat. Instead, you may wish to deploy Crowd or CrowdID onto your own existing application server. For this purpose, we provide WAR (Webapp ARchive) distributions of the Crowd and CrowdID server applications.

Crowd supports all the application servers listed in System Requirements.

Below is a generic overview of the steps required to install the CrowdID WAR distribution. You will need to perform specific configuration steps, depending upon your application server. As well as the generic instructions below, we also provide server-specific instructions on the following pages:

- Configuring Crowd & CrowdID on Tomcat 5.5.x

Step 1. Check the System Requirements

⚠️ Please check that your database and server are supported, as outlined in System Requirements, and make sure that all dependencies are installed as described below, otherwise Crowd will not run properly.

1. Sun JDK 1.5 or higher. You can download the Java SE Development Kit (JDK) from the Sun website.
2. Note: Once the JDK is installed, you will need to set the JAVA_HOME environment variable, pointing to the root directory of the JDK. Some JDK installers set this automatically (check by typing 'echo %JAVA_HOME%' in a DOS prompt, or 'echo $JAVA_HOME' in a shell).
3. J2EE 1.4 application server or a Servlet 2.4 web container. NOTE: Crowd ships with Apache Tomcat (5.5.x).
4. JDBC-compliant database that is supported by Hibernate. NOTE: Crowd ships with a built-in HSQL database, which is fine for evaluation purposes. For production environments we recommend configuring Crowd to use an external database.
5. If you are deploying a WAR installation, ensure that the following JAR files are deployed in the shared lib folder on the application server:
   - JTA (Java Transaction API)

JavaMail classes
Java Beans Activation Framework (for those using Sun JDK 1.5.x only, this is included in JDK 1.6)

All of these JAR files are available in the Crowd Standalone Distribution zip file, available on the Crowd download centre — jta-1.0.1B.jar, mail-1.4.jar and activation-1.1.jar in CROWD\apache-tomcat-5.5.20\common\lib.

Step 2. Install CrowdID WAR

Below is a summary of the CrowdID WAR installation steps:

1. Download the CrowdID WAR distribution from the Crowd download centre.
   🔄 You will find the WAR archives for the Crowd and the CrowdID applications. You will need to deploy each application separately. For the rest of these instructions, we assume you are deploying CrowdID WAR.
2. Please check your unzip program before extracting the downloaded archive – see the note on the Crowd installation front page.
3. Unzip the download archive into a directory of your choice. We'll call it CROWDID in the rest of these instructions.
4. Create a database in your chosen database server and add the required datasource definition file to your application server.
5. Modify file CROWDID/WEB-INF/classes/jdbc.properties to use your chosen Hibernate database dialect, as explained in the previous step.
6. Modify file CROWDID/WEB-INF/classes/crowd.properties to point to the port of your application server. 8080 is the default, and is shown in the example below.
crowd.server.url=http://localhost:8080/crowd/services/
application.login.url=http://localhost:8080/crowd/console/

7. Depending upon your application server, you may need to zip up the WAR file again before deploying it. Place the CROWDID directory or the WAR file into your application server's deployment directory. Please consult the server-specific documentation on how to do this.
8. Restart your application server.
9. Point a web browser at the IP address and port that your application server is running on (typically http://localhost:8080). The Crowd Setup Wizard will start.

**RELATED TOPICS**
- System Requirements
- Installing Crowd and CrowdID
- Running the Setup Wizard
- Configuring Crowd
- Installing Crowd as a Windows Service

**Specifying your Crowd Home Directory**

The Crowd Home directory is where Crowd will store its configuration information. If you are using the embedded HSQL database, supplied for evaluation purposes, Crowd will also store its database in this directory. To specify the directory:

- Open the crowd-init.properties file.
- Choose the appropriate line in the file, depending upon your operating system (see below).
- Remove the # at the beginning of the line.
- Enter the name of the directory you want Crowd to use as its Home directory. For example,
  
  **On Windows:**
  
  crowd.home=c:/data/crowd-home

  **Note:** On Windows, make sure you use forward slashes as shown above, not backward slashes.

  **On Mac and Unix-based systems:**
  
  crowd.home=/var/crowd-home

- Save the crowd-init.properties file.

**Advanced Usage**

It is also possible to define the crowd.home property as a Java system or Servlet Context parameter.

**Java System Parameter**

Use the following format for your Java parameter:

-Dcrowd.home=/var/crowd-home

Where should you put this value?

You could add it to the setenv.sh or setenv.bat file supplied with the standalone release of Crowd.

**Servlet Context Parameter**

The following configuration XML can be added to the crowd-standalone-install/apache-tomcat/conf/Catalina/localhost/crowd.xml context file to set the crowd.home property:
Running the Setup Wizard

Before running the Setup Wizard described below, please follow the instructions on installing Crowd.

When you access the Crowd Administration Console for the first time, you will see the Crowd Setup Wizard. This is a series of screens which will prompt you to configure your database connection and to supply some default values (which you can change later if necessary).

On this page:

- Step 1. Starting the Setup Wizard
- Step 2. Licensing
- Step 3. Installation Type
- Step 4. Database Configuration
- Step 5. (Optional) Import Existing Crowd Data
- Step 6. Options
- Step 7. Mail Server
- Step 8. Default Directory
- Step 9. Default Administrator
- Step 10. Integrated Applications
- Step 11. Setup Complete

Do you need to restart the Setup Wizard from the beginning?
Read this hint in the Crowd Knowledge Base.

Step 1. Starting the Setup Wizard

Go to the following URL in your web browser: http://localhost:8095/crowd or http://localhost:8095/crowd/console.

- If there are no errors, you should see the 'License' screen described below.
- If there is an error in your configuration, you will see the 'Crowd Checklist' screen. Read more about troubleshooting your installation.

Step 2. Licensing

Crowd licenses are based on the number of end-users who will log in to the applications that are integrated with Crowd.

You can obtain an evaluation license from the Atlassian website. When you obtain an evaluation license — or purchase, renew or upgrade your license — you will receive a license key via email or on the Atlassian website.

Type or paste your license key into the 'License' field, shown on the screenshot above.
Step 3. Installation Type

In this step, you will choose whether to set up a new Crowd database or restore an existing database. Choose an option as follows:

- **New Installation** — Set up a new Crowd database.
  
  Hint: Choose this option if you are evaluating Crowd.

- **Import data from an XML Backup** — Import your Crowd data from an XML backup file, which has been exported from your existing Crowd installation.

Step 4. Database Configuration

The ‘Database Configuration’ screen allows you to choose the type of database connection, as described below.

- If in any doubt, choose the default ‘Embedded’ option for evaluation purposes.

When you click ‘Continue’ after choosing your database options, there may be a short wait while Crowd writes the information to the database tables. Please be patient.

Database Option 1: Embedded HSQLDB (For Evaluation Purposes Only)

Crowd ‘Standalone’ is shipped with an embedded HSQLDB database. If you choose the ‘Embedded’ option, the data files are stored in the Crowd Home directory, as configured on installation.

The HSQLDB database is fine for evaluation purposes, but for production installations you should connect Crowd to an enterprise database using the JDBC or JNDI datasource connections described below. This also lets you take advantage of your existing database backup and recovery procedures.

Database Option 2: JDBC Connection
Select the 'JDBC Connection' if you want to connect to an external database via a JDBC connection. (If you have not yet created your database for Crowd, follow the database setup instructions.)

Supply the details for your database:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database</td>
<td>Select your database server type.</td>
</tr>
<tr>
<td>Driver Class Name</td>
<td>Enter the class name for your database driver. Make sure that the class is in the class path on your application server. See guidelines on creating your specific database.</td>
</tr>
<tr>
<td>JDBC URL</td>
<td>Enter the URL at which Crowd can access the database JDBC connection.</td>
</tr>
<tr>
<td>Username</td>
<td>Enter the username which Crowd will use to access the database.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password corresponding to the above username.</td>
</tr>
<tr>
<td>Hibernate Dialect</td>
<td>This is the Hibernate configuration for the selected database type. The Crowd installation will supply a default dialect for the database type you have chosen. You should only alter this dialect if you need an alternative for the database type or are using an unsupported database type.</td>
</tr>
<tr>
<td>Overwrite Existing Data</td>
<td>Crowd will ask you to confirm that existing data should be overwritten, if both of the following are true:</td>
</tr>
</tbody>
</table>

- To configure Crowd to support Unicode in MS SQL Server 2005 and 2008, enter the following in the 'Hibernate Dialect' field on the Crowd Setup Wizard's Database Configuration screen: `com.atlassian.crowd.util.persistence.hibernate.SqlServerIntlDialect`
Database Option 3: JNDI Datasource

Select the 'JNDI Datasource' if you want to connect to an external database via a datasource managed by your application server.

Supply the details for your database:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database</td>
<td>Select your database server type.</td>
</tr>
<tr>
<td>JNDI Name</td>
<td>Enter the datasource name, e.g. jdbc/CrowdDS or java:comp/env/jdbc/CrowdDS.</td>
</tr>
<tr>
<td>Hibernate Dialect</td>
<td>This is the Hibernate configuration for the selected database type. The Crowd installation will supply a default dialect for the database type you have chosen. You should only alter this dialect if you need an alternative for the database type or you have selected an unsupported database type.</td>
</tr>
<tr>
<td></td>
<td>- To configure Crowd to support Unicode in MS SQL Server 2005 and 2008, enter the following in the 'Hibernate Dialect' field on the Crowd Setup Wizard's Database Configuration screen: com.atlassian.crowd.util.persistence.hibernate.SQLServerIntlDialect</td>
</tr>
<tr>
<td>Overwrite Existing Data</td>
<td>Crowd will prompt you to confirm that existing data should be overwritten, if both of the following are true:</td>
</tr>
<tr>
<td></td>
<td>- You chose 'New Installation' or 'Import data from an XML Backup' in Step 3 above, and</td>
</tr>
<tr>
<td></td>
<td>- The database configured on the above screen already exists and contains Crowd data.</td>
</tr>
</tbody>
</table>

Step 5. *(Optional)* Import Existing Crowd Data

Enter the Crowd XML backup file to upgrade from.

File Location: [This full file path to your existing data](e.g., C:/crowd/data.xml)
This screen will appear only if you selected 'Import data from an XML Backup' in Step 3 above.

In 'File Location', enter the full path to your XML backup file including the name of the XML file.

![Upgrading from an existing Crowd installation?](image)

If you have connected to an existing database or imported your data from XML, the setup will be complete once you have clicked 'Continue' on the above screen. See Step 11 below and read more about upgrading Crowd.

---

### Step 6. Options

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deployment Title</td>
<td>The name of this Crowd instance. You can change this value later, via the Crowd Administration Console.</td>
</tr>
<tr>
<td>Session Timeout</td>
<td>The number of minutes a session lasts before expiring. Must be greater than 0. You can change this value later, via the Crowd Administration Console.</td>
</tr>
<tr>
<td>Base URL</td>
<td>The base URL for this installation of Crowd. The URL must not be changed while Crowd is running.</td>
</tr>
</tbody>
</table>

This part of the setup process allows you to specify general options for the Crowd server.

- The deployment title is a unique name for your Crowd instance. The deployment title is used by default in the subject line of email notifications.

You can change this value later, via the Crowd Administration Console.

- The session timeout determines how long a session will be considered valid during any period of inactivity. This value is specified in minutes and must be greater than 0.

You can change this value later, via the Crowd Administration Console.

- The base URL is the website address of the Crowd server. This value is used during startup to put the correct values into the `crowd.properties` file for the Crowd Administration Console. There is no option to change this value via the Crowd Administration Console, because the URL must not be changed while Crowd is running.

---

### Step 7. Mail Server

Crowd can send email notifications to users for specific events, such as when a password is reset.

The 'Mail Configuration' screen allows you to choose between an SMTP and a JNDI mail server, as described below.

![If in any doubt, choose the 'SMTP Server' option for evaluation purposes.](image)

**Mail Server Option 1: SMTP**
Enter the details as follows:

- **Notification Email Address** — The email address which will receive notifications about server events.
- **From Email Address** — Crowd will add this email address as the 'sender' on the emails generated by Crowd and sent to users.
- **Subject Prefix** — The prefix which will appear at the start of the email subject, for all emails generated by Crowd. This can be useful for email client programs that offer filtering rules.
- **Mail Server Type** — Select the 'SMTP Server' radio button.
- **SMTP Host** — The hostname of the SMTP mail server, e.g. 'localhost' or 'smtp.acme.com'.
- **SMTP Port** — The port on which the SMTP mail server listens. The default is '25'.
- **Username** — The username that your Crowd server will use when it logs in to your mail server.
- **Password** — The password that your Crowd server will use when it logs in to your mail server.

**Mail Server Option 2: JNDI Location**
Select the ‘JNDI Location’ if you want to connect to a mail server via a datasource managed by your application server.

Enter the details as follows:

- **Notification Email Address** — The email address which will receive notifications about server events.
- **From Email Address** — Crowd will add this email address as the ‘sender’ on the emails generated by Crowd and sent to users.
- **Subject Prefix** — The prefix which will appear at the start of the email subject, for all emails generated by Crowd. This can be useful for email client programs that offer filtering rules.
- **Mail Server Type** — Select the ‘JNDI Location’ radio button.
- **JNDI Location** — The datasource name of a `javax.mail.Session` object which has been set up by your application server.

**Step 8. Default Directory**

Please configure a default user directory. For information about configuring different types of directories (Internal, LDAP, Delegated Authentication or Custom) refer to Adding a Directory.
Step 9. Default Administrator

Crowd administrators group is in default directory
The default group crowd-administrators will be automatically created in the default directory. Members of this group have rights to administer Crowd.

Please specify a default Crowd administrator. The default administrator will be automatically added to the default group crowd-administrators, thereby giving them rights to access the Crowd Administration Console.

Step 10. Integrated Applications

You have the option to auto-configure two applications. We recommend that you select 'True' for both:

- **OpenID Server** — This is the CrowdID application, which allows you to provide OpenID services for your end-users. For details please see the CrowdID Administration Guide and the CrowdID User Guide.
- **Demo Application** — The ‘demo’ application is an example of an application integrated with Crowd. It highlights best practices for using the Crowd framework, and is provided to assist you with quickly setting up and configuring Crowd. The Crowd download zip file (archive) contains the entire source for the ‘demo’ application, which you can use as an example when integrating your custom web applications.

Step 11. Setup Complete
You are now ready to use the Crowd Administration Console. For details, please see the Crowd Administration Guide.

**RELATED TOPICS**

- System Requirements
- Installing Crowd and CrowdID
- Running the Setup Wizard
- Configuring Crowd
- Installing Crowd as a Windows Service

**Troubleshooting your Configuration on Setup**

This page describes the 'Crowd Checklist' screen and tells you how to use the screen to troubleshoot your initial Crowd configuration. The 'Crowd Checklist' screen may appear when you start the Setup Wizard after installing Crowd.

⚠️ The 'Crowd Checklist' appears only if there is an error in your environment configuration, preventing you from completing the Setup Wizard.

**Troubleshooting your Configuration Problems**

The 'Crowd Checklist' shows a list of environmental requirements on the left and a 'Status' for each setting on the right. A red exclamation mark (⚠️) in the 'Status' column indicates a problem with one of the settings.

<table>
<thead>
<tr>
<th>Environmental Requirement</th>
<th>Possible Error Message</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java Development Kit 1.5 or higher</td>
<td><em>(The screen will show the version of JDK detected in your system, with a red exclamation mark in the 'Status' column if insufficient.)</em></td>
<td>Refer to the System Requirements page for information about the JDK required and where you can get it.</td>
</tr>
<tr>
<td>Servlet 2.3 API or higher</td>
<td><em>(The screen will show the application server and version detected in your system, with a red exclamation mark in the 'Status' column if insufficient.)</em></td>
<td>Make sure that the servlet container on your application server supports the Servlet 2.3 specification. Note: Crowd ships with Apache Tomcat (5.5.x) which is compliant.</td>
</tr>
<tr>
<td>Crowd Home directory</td>
<td>Invalid home directory specified in {CROWD-INSTALL}/crowd-webapp/WEB-INF/classes/crowd-init.properties. Please edit this file and set the crowd.home value to a directory of your choice. Crowd will use this directory to store its configuration files.</td>
<td>Define the directory which you want Crowd to use as its <em>home</em>. Read all about it in the installation guide.</td>
</tr>
</tbody>
</table>

_Screenshot: 'Crowd Checklist'_
The above screenshot shows a problem with the setting of the Crowd home directory.

**Configuring Crowd**

You can configure Crowd to suit your environment, as described on the following pages:

- Important Directories and Files
- Changing the Port that Crowd uses
- Configuring Crowd to Work with SSL

**Important Directories and Files**

This page contains information about the important directories and files to be aware of when configuring Crowd.

On this page:

- **The Crowd Home Directory**
  - The crowd.properties File
  - The crowd.cfg.xml File
  - The bundled-plugins Directory in Crowd Home
  - The caches Directory in Crowd Home
  - The database Directory in Crowd Home
  - The plugin-data Directory in Crowd Home
  - The plugins Directory in Crowd Home
When configuring an application to work with Crowd, you will be interested in the crowd.properties file.

The Crowd Home Directory

The Crowd Home directory is where Crowd will store its configuration information. If you are using the embedded HSQL database, supplied for evaluation purposes, Crowd will also store its database in this directory.

The location of this directory is specified in the crowd-init.properties file described below. You can set the location during installation.

Crowd's System Information screen shows the location of your Crowd Home directory.

Important files and directories in the Crowd Home directory, listed here and described below:

- The crowd.properties file
- The crowd.cfg.xml file
- The bundled-plugins Directory in Crowd Home
- The caches Directory in Crowd Home
- The database Directory in Crowd Home
- The plugin-data Directory in Crowd Home
- The plugins Directory in Crowd Home

The crowd.properties File

The crowd.properties file, containing application configuration settings for the Crowd Administration Console application, is located at the root of your Crowd Home directory.

For more information, refer to the page about the crowd.properties File.

The crowd.cfg.xml File

This file stores configuration information for the Crowd Administration Console application, including:

- License information
- Server ID
- Database configuration properties
- Setup phase reached.

The contents of this file is automatically generated when you run the Crowd Setup Wizard.

The file is located at the root of your Crowd Home directory.

Here's an example of the content of crowd.cfg.xml, when the embedded HSQL database was specified at setup:
The bundled-plugins Directory in Crowd Home

The bundled-plugins directory is a sub-directory of your Crowd Home directory. It contains plugins which are shipped with your Crowd installation, such as:

- The SAML integration plugin which provides the Google Apps SSO feature.
- The Shared Access Layer (SAL) plugins.
- The REST module plugin.
- And more.

The plugins are a collection of jars generated when you install the Crowd web application. The jars are obtained by unzipping atlassian-bundled-plugins.zip from {CROWD_INSTALL}\crowd-webapp\WEB-INF\classes.

The caches Directory in Crowd Home

The caches directory is a sub-directory of your Crowd Home directory. It contains various files that Crowd caches to improve performance. The files in sub-directories of this directory are either created or updated generated when you install or restart the Crowd web application.

Do not modify or remove these files while Crowd is running. It should be safe for you to delete these files between application restarts. It may improve Crowd's performance if you link this sub-directory to a fast disk.

The database Directory in Crowd Home

If you are using the embedded HSQL database, supplied for evaluation purposes, Crowd will store its database in this directory.

The plugin-data Directory in Crowd Home

The plugin-data directory is a sub-directory of your Crowd Home directory. This is a place for plugins to store their data. The directory will be created the first time a plugin needs it. For example, if you configure the Google Apps Connector, then the connector's SSO Keys will be stored in the plugin-data directory.

The plugins Directory in Crowd Home

The plugins directory is a sub-directory of your Crowd Home directory. This directory will contain plugins that are not shipped with Crowd and that you have installed separately onto your Crowd instance.

The Crowd Installation Directory

This is the directory into which the downloaded Crowd application has been unzipped during installation.
Important files in the Crowd Installation directory, listed here and described below:

- The `crowd-init.properties` File
- The `build.properties` File
- The `build.xml` File

**The `crowd-init.properties` File**

This is where you specify your Crowd Home directory (described above). You can set the location during installation.

The `crowd-init.properties` file is located in the Crowd Installation directory at `CROWD_INSTALL\crowd-webapp\WEB-INF\classes\crowd-init.properties`

The file content looks something like this before it has been customised:

```properties
## You can specify your crowd.home property here or in your system environment variables.
#
# On Windows-based operating systems, uncomment the following
# line and set crowd.home to a directory Crowd should use to
# store its configuration.
# NOTE: use forward slashes instead of backward slashes
#
#crowd.home=c:/data/crowd-home
#
# On Unix-based operating systems, uncomment the following
# line and set crowd.home to a directory Crowd should use to
# store its configuration.
#crowd.home=/var/crowd-home
```

**The `build.properties` File**

This configuration file stores various deployment properties of Crowd and the 'demo' application.

The file is located at the root of your Crowd Installation directory (described above).

The default `build.properties` file will look similar to the following:

```properties
# Modify the attributes of this file to quickly adjust the deployment values of Crowd.
#
# The Hibernate database dialect to use.
hibernate.dialect=org.hibernate.dialect.HSQLDialect
#
# The Hibernate transaction factory to use.
hibernate.transaction.factory_class=org.hibernate.transaction.JDBCTransactionFactory
#
# The http port you wish to run crowd from, ie: http://localhost:8095/crowd
crowd.tomcat.connector.port=8095
#
# Tomcat requires a unique port for shutdown
crowd.tomcat.shutdown.port=8020
#
# Crowd context root
crowd.url=http://localhost:8095/crowd
#
# Demo context root
demo.url=http://localhost:8095/dem
#
# OpenID server context root
openidserver.url=http://localhost:8095/openidserver
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hibernate.dialect</td>
<td>This parameter controls the database dialect the Hibernate persistence system will use when executing commands versus your database server.</td>
</tr>
</tbody>
</table>
hibernate.transaction.factory_class

This parameter controls the transaction factory to use when executing transactions at run-time: Hibernate provides two generic options, additional application server specific options are available:

- org.hibernate.transaction.JDBCTransactionFactory delegates to database (JDBC) transactions (default).
- org.hibernate.transaction.JTATransactionFactory delegates to JTA (if an existing transaction is under way, the work performed is done in that context. Otherwise a new transaction is started).

crowd.url
The path and port for the root of the Crowd Administration Console web-application.
demo.url
The path and port for the root of the Crowd demo web-application
openidserver.url
The path and port for the root of the CrowdID web-application

The build.xml File

This is an Ant script that loads properties from the build.properties configuration file.

The file is located at the root of your Crowd Installation directory (described above).

If configuring Crowd and/or the demo application to run on a port and context path other than the default, you will need to run the command build.sh (or build.bat) against the build.xml configuration file. This process will then edit all of the necessary Crowd configuration files for your deployment.

The sample output from running build.xml will look similar to the following:

```
shamid@mocha:~/atlassian-crowd-1.1.0$ ./build.sh
Buildfile: build.xml
init:

assistant:
Changing Tomcat's connector port to 8095
Changing Tomcat's shutdown port to 8020
Configuring the Crowd Console
Copying crowd.properties to: crowd-webapp/WEB-INF/classes
Configuring the Crowd hibernate configuration
Updating the HibernateDialect and TransactionFactory in crowd-webapp/WEB-INF/classes/jdbc.properties

Copying 1 file to /home/shamid/atlassian-crowd-1.1.0/crowd-webapp/WEB-INF/classes
Configuring the demo application
Renaming and copying demo.properties to: demo-webapp/WEB-INF/classes/crowd.properties
Copying 1 file to /home/shamid/atlassian-crowd-1.1.0/demo-webapp/WEB-INF/classes
Configuring the OpenID server application
Renaming and copying openidserver.properties to:
crowd-openidserver-webapp/WEB-INF/classes/crowd.properties
Copying 1 file to /home/shamid/atlassian-crowd-1.1.0/crowd-openidserver-webapp/WEB-INF/classes
Configuring the OpenID hibernate configuration
Updating the HibernateDialect and TransactionFactory in
crowd-openidserver-webapp/WEB-INF/classes/jdbc.properties
Updating property file:
/home/shamid/atlassian-crowd-1.1.0/crowd-openidserver-webapp/WEB-INF/classes/jdbc.properties

BUILD SUCCESSFUL
Total time: 2 seconds
```

RELATED TOPICS

- Installing Crowd and CrowdID
- Running the Setup Wizard
- Configuring Crowd
- Installing Crowd as a Windows Service

The crowd.properties File
When integrating an application with Crowd, you will copy Crowd's client library and the `crowd.properties` configuration file into the application's library. For details of the procedure, refer to Adding an Application.

The Crowd Administration Console application also has its own `crowd.properties` file, which is located at the root of your Crowd Home directory. (See Important Directories and Files for more about the Crowd Home directory.)

### Attributes of the `crowd.properties` File

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>application.name</td>
<td>The name that the application will use when authenticating with the Crowd server. This needs to match the name you specified in Adding an Application.</td>
</tr>
<tr>
<td>application.password</td>
<td>The password that the application will use when authenticating with the Crowd server. This needs to match the password you specified in Adding an Application.</td>
</tr>
<tr>
<td>application.login.url</td>
<td>Crowd will redirect the user to this URL if their authentication token expires or is invalid due to security restrictions.</td>
</tr>
<tr>
<td>crowd.server.url</td>
<td>The URL to use when connecting with the integration libraries to communicate with the Crowd server.</td>
</tr>
<tr>
<td>session.isauthenticated</td>
<td>The session key to use when storing a Boolean value indicating whether the user is authenticated or not.</td>
</tr>
<tr>
<td>session.tokenkey</td>
<td>The session key to use when storing a String value of the user's authentication token.</td>
</tr>
<tr>
<td>session.validationinterval</td>
<td>The session key to use when storing an Integer value of the number of minutes between authentication validation. If this value is set to 0, each HTTP request will be authenticated.</td>
</tr>
<tr>
<td>session.lastvalidation</td>
<td>The session key to use when storing a Date value of the user's last authentication.</td>
</tr>
</tbody>
</table>

The following optional attributes in the `crowd.properties` file allow further customisation of the client:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>http.proxy.host</td>
<td>The name of the proxy server used to transport SOAP traffic to the Crowd server.</td>
<td>(none)</td>
</tr>
<tr>
<td>http.proxy.port</td>
<td>The connection port of the proxy server (must be specified if a proxy host is specified).</td>
<td>(none)</td>
</tr>
<tr>
<td>http.proxy.username</td>
<td>The username used to authenticate with the proxy server (if the proxy server requires authentication).</td>
<td>(none)</td>
</tr>
<tr>
<td>http.proxy.password</td>
<td>The password used to authenticate with the proxy server (if the proxy server requires authentication).</td>
<td>(none)</td>
</tr>
<tr>
<td>http.max.connections</td>
<td>The maximum number of HTTP connections in the connection pool for communication with the Crowd server.</td>
<td>20</td>
</tr>
<tr>
<td>http.timeout</td>
<td>The HTTP connection timeout (milliseconds) used for communication with the Crowd server. A value of zero indicates that there is no connection timeout.</td>
<td>0</td>
</tr>
<tr>
<td>cookie.tokenkey</td>
<td>When using Crowd for single sign-on (SSO), you can specify the SSO cookie name for each application. Under the standard configuration, Crowd will use a single, default cookie name for all Crowd-connected applications. You can override the default with your own cookie name. As well as allowing you to define the SSO cookie name, this feature also allows you to divide your applications into different SSO groups. For example, you might use one SSO token for your public websites and another for your internal websites.</td>
<td>crowd.token_key</td>
</tr>
</tbody>
</table>

### Passing `crowd.properties` as an Environment Variable

You can pass the location of a client application's `crowd.properties` file to the client application as an environment variable when starting the client application. This means that you can choose a suitable location for the `crowd.properties` file, instead of putting it in the client application's WEB-INF/classes directory.

This applies to the Crowd Administration Console's `crowd.properties` file too. You may find this particularly useful when integrating with a WAR deployment of an integrated application.

Example:

```
-Dcrowd.properties={FILE-PATH}/crowd.properties
```
Passing the crowd.properties File as an Environment Variable

Important Directories and Files

Adding an Application

Changing the Port that Crowd uses

By default, Crowd is configured to use port 8095. If this port is already in use within your network, you will need to change the port that Crowd uses.

Follow these steps:

1. Edit the build.properties file, as described in Important Directories and Files.
2. Change the crowd.url property to the new port on which the Crowd Administration Console will be accessed.
3. Change the demo.url property to the new port on which the Crowd 'demo' application will be accessed.
4. Change the openidserver.url property to the new port on which the CrowdID Server will be accessed.
5. Run the build.xml script, as described in Important Directories and Files.

RELATED TOPICS

Configuring Crowd to Work with SSL

When web applications are accessed across the internet, there is always the possibility of usernames and passwords being intercepted by intermediaries. These intercepts may occur when the data is travelling between a client and the server. It is often a good idea to enable access via HTTPS (HTTP over SSL) and require the use of HTTPS for pages where passwords are sent.

In some cases where transmitted data is sensitive, all pages should be accessed via HTTPS.

⚠️ Note: Using HTTPS may result in slower performance.

What is SSL?

The Secure Sockets Layer (SSL) is a commonly-used protocol for managing the security of message transmission on the internet. SSL is included as part of most web browsers and web server products. For more information, take a look at Sun's Introduction to SSL.
Using Crowd over SSL

1. Step 1: Enable Tomcat SSL Access
2. Step 2: Create or Import your SSL Key (Self-Signed or CA-Issued)
   - Creating a Self-Signed SSL Key
   - Importing a CA-Issued Certificate
3. Step 3: Modify crowd.properties
4. Step 4: Create or Modify setenv.sh or setenv.bat

Troubleshooting

Using SSL between an LDAP Server and Crowd
- Microsoft Active Directory Connector using SSL Certificate
- Other LDAP Servers

Using Crowd over SSL

The process of enabling SSL access is specific to each application server, but specifying which pages require protection is generic. Below we describe the process for Tomcat, the application server bundled with Crowd.

Step 1: Enable Tomcat SSL Access

Edit CROWD/apache-tomcat/conf/server.xml, and at the bottom before the </Service> tag, add this section (or uncomment it if it's already there):

```xml
<Connector port="8443" maxHttpHeaderSize="8192" maxThreads="150" minSpareThreads="25" maxSpareThreads="75" enableLookups="false"
    disableUploadTimeout="true" acceptCount="100" scheme="https" secure="true"
    clientAuth="false" sslProtocol="TLS" />
```

This enables SSL access on port 8443. (The default for HTTPS is 443, but just as Tomcat uses 8080 instead of 80 to avoid conflicts, 8443 is used instead of 443 here).

Step 2: Create or Import your SSL Key (Self-Signed or CA-Issued)

You can either create a self-signed SSL key or import a certificate issued by a Certificate Authority (CA). We describe both methods below.

Creating a Self-Signed SSL Key

You can create a self-signed key for testing purposes with one of the following commands:

- `%JAVA_HOME%/bin/keytool -genkey -alias tomcat -keyalg RSA` (Windows)
- `$JAVA_HOME/bin/keytool -genkey -alias tomcat -keyalg RSA` (Unix)

The keytool utility will prompt you for two passwords: the keystore password and the key password for Tomcat. You must use the same value for both passwords, and the value must be either:

1. 'changeit' (this is the default value Tomcat expects), or
2. If you use a value other than 'changeit', you must also specify this value in conf/server.xml. You must add the following attribute to the Connector tag described above:

   ```xml
   keystorePass="<password value>"
   ```

For information on adding a key pair issued by a Certificate Authority (CA), refer to the section entitled ‘Installing a Certificate from a Certificate Authority’ in the Apache Tomcat documentation.

IE7 on Vista Issue

If your clients will access Crowd from Internet Explorer 7 on Vista, please ensure that you specify the -keyalg RSA flag. By default the SHA1 algorithm is used, which results in error 'Internet Explorer cannot display the webpage'. Apparently on JDK 1.6 you also need to specify the -sigalg MD5withRSA flag since -keyalg RSA will still result in SHA1 being used. If you like, you can refer to this Atlassian developer blog post for more information.

Importing a CA-Issued Certificate

When using certificates issued by a Certificate Authority, you also need import the certificate using the keytool command, rather than
generating a self-signed key.

Here is an example of the command:

```
keytool -import -alias tomcat -file certificate.cer -keystore some/path/to/file -storepass something.secure
```

The `-file` is your certificate and the `-keystore` is an optional destination, but it will guarantee that you know where your keystore is. By default, the keystore is placed in your user home directory. You can refer to the following Sun documentation for more information on the keytool:

- Solaris and Linux
- Windows

Try this blog post for a handy tutorial:

- Talkingtree blog post

Now edit the `server.xml` file as described in section ‘Edit the Tomcat Configuration File’ in the Apache Tomcat documentation. Basically, you'll need to add the `keystoreFile` and `keystorePass` to the SSL Connector definition to match your keystore settings.

**Step 3: Modify crowd.properties**

Modify your `crowd-webapp/WEB-INF/classes/crowd.properties` file to reflect your new SSL settings. For example:

```
#Wed Apr 09 12:36:21 EST 2008
session.lastvalidation=session.lastvalidation
session.isauthenticated=session.isauthenticated
application.password=password
application.name=crowd
session.validationinterval=0
crowd.server.url=https://localhost:8443/crowd/services/
session.tokenkey=session.tokenkey
application.login.url=https://localhost:8443/crowd/console/
```

**Step 4: Create or Modify setenv.sh or setenv.bat**

In order to ensure that XFire calls work over SSL you will need to pass keystore values to the JVM. To do this either edit or create a `setenv.sh` or `setenv.bat` file located in Tomcat's bin directory: `apache-tomcat/bin/setenv.sh` or `setenv.bat`

The contents of the file should look similar to this:

```
JAVA_OPTS=-Xms128m -Xmx256m $JAVA_OPTS -Djavax.net.ssl.keyStore=/<pathtokeystore>/.keystore
-Djavax.net.ssl.keyStorePassword=changeit -Djavax.net.ssl.trustStore=/<pathtokeystore>/.keystore
-Djavax.net.ssl.trustStorePassword=changeit
```

Replace `<pathtokeystore>` with the path to your `.keystore` file and the password with your keystore's password if modified.

Now restart your Crowd instance. You should be able to access Crowd at this URL:

```
https://localhost:8443/crowd/console
```

**Troubleshooting**

Here are some troubleshooting tips if you are using a self-signed key created by keytool, as described above.

When you enter `https://localhost:8443` in your browser, if you get a message such as 'Cannot establish a connection to the server at localhost:8443,' look for error messages in your `logs/catalina.out` log file. Here are some possible errors with explanations:

Can't Find the Keystore

```
java.io.FileNotFoundException: /home/idaniel/.keystore (No such file or directory)
```
This indicates that Tomcat cannot find the keystore. The keytool utility creates the keystore as a file called .keystore in the current user's home directory. For Unix/Linux the home directory is likely to be /home/<username>. For Windows it is likely to be C:\Documents And Settings\<UserName>.

Make sure you are running Crowd as the same user who created the keystore. If this is not the case, or if you are running Crowd on Windows as a service, you will need to specify where the keystore file is in conf/server.xml. Add the following attribute to the connector tag you uncommented: keystoreFile="<location of keystore file>"

**Incorrect Password**

java.io.IOException: Keystore was tampered with, or password was incorrect

You used a different password than 'changeit'. You must either use 'changeit' for both the keystore password and for the key password for Tomcat, or if you want to use a different password, you must specify it using the keystorePass attribute of the Connector tag, as described above.

**Passwords don't Match**

java.io.IOException: Cannot recover key

You specified a different value for the keystore password and the key password for Tomcat. Both passwords must be the same.

To find out more about the options that Tomcat offers, please take a look at the Apache Tomcat documentation.

**Using SSL between an LDAP Server and Crowd**

**Microsoft Active Directory Connector using SSL Certificate**

Please refer to Configuring an SSL Certificate for Microsoft Active Directory.

**Other LDAP Servers**

For other LDAP servers, please consult your LDAP server documentation.

On the Crowd side, when configuring the connector properties, you will have to simply check the 'Secure SSL' box and make sure you use the correct port in the 'URL' field (usually 636).

**RELATED TOPICS**

Configuring an SSL Certificate for Microsoft Active Directory
Configuring Crowd

**Installing Crowd as a Windows Service**

For long-term use, you should configure Crowd to restart automatically when the operating system restarts. For Windows servers, this means configuring Crowd to run as a Windows service.

Running Crowd as a Windows service has other advantages. When Crowd is started manually, a console window opens - there is a risk that someone may accidentally shut down Crowd by closing the window. Also, the Crowd logs are properly managed by the Windows service (reliably found in \atlassian-crowd.log in the root Crowd directory, and rotated by file size).

**Installing Crowd as a Windows Service**

1. Open a DOS prompt.
2. 'cd' to your Crowd directory, and then the Tomcat bin subdirectory, e.g. {CROWD_INSTALL}\apache-tomcat-5.5.20\bin
3. If a directory in the path has spaces (e.g. C:\Program Files\..), please convert it to its eight-character equivalent (e.g. C:\\Progra~1\)..)
4. Ensure the JAVA_HOME variable is set to the JDK base directory. Use echo %JAVA_HOME% to confirm this.
5. Run the following command:

```
    service.bat install Crowd
```

**Screenshot: Installing Crowd as a Windows Service**
Crowd should now have been installed as a service, and will be visible in the Windows Services console.  

*Screenshot: Windows Services Console*

6. Run the following command, to have the Crowd service start automatically when the server starts:

```
tomcat5 //US//Crowd --Startup auto
```

The Crowd service will automatically start up the next time the server reboots.

*You can manually start the Crowd service with the command `net start Crowd`, and stop it with `net stop Crowd`.  
To see what parameters the Crowd service is starting with, go to **Start -> Run** and run `regedit32.exe`.  There should be an entry at `HKEY_LOCAL_MACHINE -> SOFTWARE -> Apache Software Foundation -> Procrun 2.0 -> Crowd`.  

**Additional Crowd Setup Options (Optional)**

- To increase the maximum memory Crowd can use (the default will already be 256MB), run:

```
tomcat5 //US//Crowd --JvmMx 512
```

- If you are running Crowd with JIRA and/or Confluence in the same JVM, increase the MaxPermSize to 512 MB:

```
tomcat5 //US//Crowd ++JvmOptions="-XX:MaxPermSize=512m"
```

- Occasionally, it may be useful to view Crowd's Garbage Collection information.  This is especially true when investigating memory issues.
• To turn on the Verbose GC (garbage collection) logging, execute the following command in the command prompt:

```
tomcat5 //US//Crowd ++JvmOptions="-Xloggc:path\to\logs\atlassian-gc.log"
```

• The path (denoted by `path\to`) refers to the directory in which Crowd is currently installed. For example:

```
tomcat5 //US//Crowd ++JvmOptions="-Xloggc:c:\crowdinstall\logs\atlassian-gc.log"
```

• If you are using HSQL as your database server: after installing Crowd as a Windows service, you will need to copy your database files.
  1. Create a folder called `c:\windows\system32\database`
  2. Copy over the database files from your `atlassian-crowd-1.1.2/database`

⚠️ We recommend strongly that you use an external database server rather than the HSQL database supplied with Crowd for evaluation purposes.

Refer to the Tomcat documentation for further service options.

- Troubleshooting Crowd as a Windows Service

**Specifying Startup Order of Windows Services**

This page is relevant if you have installed Crowd as a Windows service.

If you have multiple Windows services that depend on each other, it is important that they are started in the correct order. For example, if you are running both JIRA and Crowd, it is important to start Crowd first, so that Crowd is running before people try to login to JIRA.

For information about specifying the startup order for multiple services, please refer to [http://support.microsoft.com/kb/193888](http://support.microsoft.com/kb/193888).

**Changing the User for the Crowd Windows Service**

This page is relevant if you have installed Crowd as a Windows service. You may want to change the user under which the Crowd Windows service is running, for security reasons.

**Changing the Windows User for the Crowd Service**

1. Navigate to the service: **Control Panel** > **Administrative Tools** > **Services**.
2. Locate the **Apache Tomcat Crowd** service, right-click and view the **Properties**.
3. Go to the **Log On** tab and change the user as desired.

![Screenshot: Changing the User for the Windows Service](image-url)

- Installing Crowd as a Windows Service

Removing the Crowd Windows Service

This page is relevant if you have installed Crowd as a Windows service

To remove the Crowd Windows service:

1. Open a DOS prompt.
2. `cd` to your Crowd directory, and then the Tomcat bin subdirectory, e.g. `{CROWD_INSTALL}\apache-tomcat-5.5.20\bin`
3. Run one of the following commands:
   - Either:
     ```
     service.bat remove Crowd
     ```
   - Or if the above does not work, use
     ```
     tomcat5 //DS//Crowd
     ```
Troubleshooting Crowd as a Windows Service

This page is relevant if you have installed Crowd as a Windows service.

Problems may occur when trying to set up Crowd to run as a Windows service with JDK 1.6. The problem is caused by a failure to locate MSVCR71.DLL, which can be found in your %JAVA_HOME%/bin. There are two options to resolve this problem:

- Add %JAVA_HOME%/bin to PATH, then restart the server.
- Or copy MSVCR71.DLL to system path: either C:\WINDOWS\SYSTEM32 or C:\WINNT\SYSTEM32

Notes for Windows Server 64-bit Operating Systems

Windows Server 64-bit will not start Crowd as a service as the tomcat.exe that ships is 32-bit. Install a 64-bit JDK and set JAVA_HOME to its location. Then follow the same steps above for Installing Crowd as a Windows Service. You'll need to replace {CROWD_INSTALL}\apache-tomcat-5.5.20\bin\tomcat.exe with one compiled for 64-bit from this location: http://svn.apache.org/viewvc/tomcat/connectors/trunk/procrun/bin/.

Upgrading Crowd

Below are instructions on upgrading an existing Crowd installation to the latest version of Crowd.

In summary, you will need to:

- Back up your Crowd database to XML before starting the upgrade.
- Do a clean installation of Crowd, pointing to a new Crowd Home directory.
- Restore your database from the XML backup as part of the setup process.

There is no automated process for the upgrade to Crowd 2.0, because we have changed Crowd's database schema in this version of Crowd.

On this page:

- Preparation: Read the Release Notes and Upgrade Notes
- Step 1. Export your Crowd Database to XML
- Step 2. Shut down Crowd and All Integrated Applications
- Step 3. Back Up your Crowd Files
- Step 4. Download and Re-Install Crowd
- Step 5. Start Crowd and Run the Setup Wizard
- Step 6. Update your Integrated Applications
- Troubleshooting

Preparation: Read the Release Notes and Upgrade Notes

Please read:

- The Release Notes for the version you are upgrading to, and
- The Upgrade Notes for any versions you are skipping as well as the version you are upgrading to:
  - Crowd 2.0 Upgrade Notes
  - Crowd 1.6 Upgrade Notes
  - Crowd 1.5 Upgrade Notes
  - Crowd 1.4 Upgrade Notes
  - Crowd 1.3 Beta Upgrade Notes
  - Crowd 1.3 Upgrade Notes
  - Crowd 1.2 Upgrade Notes
  - Crowd 1.1 Upgrade Notes
Crowd 1.0 Upgrade Notes

Step 1. Export your Crowd Database to XML

In the Crowd Administration Console, click the 'Administration' tab and then click 'Backup'. Follow the screen prompts to back up your Crowd database to an XML file. For full instructions, see our guide on backing up data.

Step 2. Shut down Crowd and All Integrated Applications

Shut down Crowd and all Crowd-connected applications.

Step 3. Back Up your Crowd Files

1. Use your database backup tools to back up your Crowd database and your CrowdID database. We highly recommend this step, in case something goes wrong during the upgrade process and you need to restore your data from backup.

2. Make backup copies of the following files:
   - The `crowd.properties` file for the CrowdID application, located at
     `{CROWD_INSTALL}/crowd-openidserver-webapp/WEBINF/classes/crowd.properties` — You will need to copy this file to your new Crowd installation.
   - Your Crowd JDBC Driver if you have configured Crowd with a database.
   - Your customised configuration files, if you have installed Crowd as a WAR distribution — You will need to copy these files to your new Crowd installation.
   - Your Crowd Home directory, in the location specified in the `crowd-init.properties` file — Recommended in case something goes wrong during the upgrade process.

3. We recommend that you rename your existing `{CROWD_INSTALL}` directory, because legacy files may cause problems if you unzip the new Crowd installation into an existing directory.

Step 4. Download and Re-Install Crowd

1. Download Crowd.

2. Unzip the downloaded archive into a directory of your choice, taking note of the following:
   - Please make sure that your new `{CROWD_INSTALL}` directory has a different name from your old `{CROWD_INSTALL}` directory.
   - Please check your unzip program before extracting the downloaded archive – see the note on the Crowd installation front page.
   - Do not specify directory names that contain spaces.
   - We will refer to this installation directory, where you unzipped the archive, as `{CROWD_INSTALL}`.

3. Specify a new Crowd Home directory for your new Crowd installation, by editing the configuration file at `{CROWD_INSTALL}/crowd-webapp/WEB-INF/classes/crowd-init.properties`.

The Crowd Home directory is where Crowd will store its configuration information. If you are using the embedded HSQL database, supplied for evaluation purposes, Crowd will also store its database in this directory. To specify the directory:

- Open the `crowd-init.properties` file.
- Choose the appropriate line in the file, depending upon your operating system (see below).
- Remove the `#` at the beginning of the line.
- Enter the name of the directory you want Crowd to use as its Home directory. For example,
  - On Windows:
    ```
    crowd.home=c:/data/crowd-home
    ```
  - Note: On Windows, make sure you use forward slashes as shown above, not backward slashes.
  - On Mac and Unix-based systems:
    ```
    crowd.home=/var/crowd-home
    ```
- Save the `crowd-init.properties` file.
4. Copy the following files, saved in Step 3 above, to your new Crowd installation folder:
   - Copy the crowd.properties file for the CrowdID application to your new {CROWD_INSTALL}/crowd-openidserver-webapp/WEBINF/classes directory.
   - Copy your Crowd JDBC Driver if you have configured Crowd with a database.
   - If you have installed Crowd as a WAR distribution, copy your customised configuration files.

Step 5. Start Crowd and Run the Setup Wizard

1. Run the start-up script, found in your {CROWD_INSTALL} directory:
   - start_crowd.bat for Windows.
   - start_crowd.sh for Mac and Unix-based systems.
2. Point a web browser at http://localhost:8095/crowd where you will see the Crowd Setup Wizard.
3. Enter your license key on the 'License' screen, as described in the instructions on the Setup Wizard.
4. When asked for your Installation Type, choose 'Import data from an XML Backup'. This step is required, to import your Crowd data from the XML file which you created in Step 1 above.
5. The Setup Wizard will now ask you to configure your database. Supply the JNDI datasource or JDBC connection details of a new database.
6. The Import Existing Crowd Data screen will appear. Enter the location of your XML backup file and click 'Continue'.
7. The Setup Wizard is now complete. You are now ready to log in to the Crowd Administration Console, using your administrator account from your earlier Crowd installation.

Step 6. Update your Integrated Applications

1. Copy the new {CROWD_INSTALL}/client/crowd-integration-client-X.X.X.jar file to each Crowd-integrated application's WEB-INF/lib folder, replacing the existing file. For details please see the configuration instructions for each application:
   - Integrating Crowd with Atlassian Bamboo
   - Integrating Crowd with Atlassian Confluence
   - Integrating Crowd with Atlassian CrowdID
   - Integrating Crowd with Atlassian Crucible
   - Integrating Crowd with Atlassian FishEye
   - Integrating Crowd with Atlassian JIRA
   - Integrating Crowd with Acegi Security
   - Integrating Crowd with Apache
   - Integrating Crowd with Jive Forums
   - Integrating Crowd with Spring Security
   - Integrating Crowd with Subversion
   - Integrating Crowd with a Custom Application
2. If you have installed Crowd on a new server, or changed Crowd's URL or port number, you will also need to edit the crowd.properties file in each integrated application accordingly.
3. For better caching, copy the new {CROWD_INSTALL}/client/conf/crowd-ehcache.xml file to each Crowd-integrated application's WEB-INF/classes/ folder, replacing the existing file.
4. If you are using CrowdID with an external database, you will need to use the manual JNDI datasource configuration method to configure an external database connection.

Troubleshooting

If you have any problems during upgrade, please raise a support request at https://support.atlassian.com/ and attach your atlassian-crowd.log file so that we can help you find out what's gone wrong.

Upgrade Notes

- Crowd 1.0 Upgrade Notes
- Crowd 1.1 Upgrade Notes
- Crowd 1.2 Upgrade Notes
- Crowd 1.3 Beta Upgrade Notes
- Crowd 1.3 Upgrade Notes
- Crowd 1.4 Upgrade Notes
- Crowd 1.5 Upgrade Notes
- Crowd 1.6 Upgrade Notes
- Crowd 2.0 Upgrade Notes

Crowd 1.0 Upgrade Notes

All LDAP configuration now need to have filters set. If you are using PostgreSQL you need to change the column name `attributevalues.attributevalueid` to `attributevalues.ATTRIBUTEVALUEID` (make it uppercase).

Crowd 1.1 Upgrade Notes

To upgrade to Crowd 1.1.x from 1.0.x or earlier,

- Follow the usual steps for upgrading Crowd.
- Configure two additional web applications, as described below.

Configuring OpenID Server and OpenID Demo Client applications

In Crowd 1.1, two new web applications have been added to Crowd, along with the Crowd Administration Console and the Demo Application. The new applications are:

<table>
<thead>
<tr>
<th>Application</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenID Server</td>
<td>Note: Logically, the OpenID Server is a client application of the Crowd Server, and must be configured as such. The OpenID Server requires a database. By default, a HSQL database is used.</td>
</tr>
<tr>
<td>OpenID Demo Client</td>
<td>A simple web application which can be used as a starting point to develop OpenID-enabled Java applications. This application is lightweight. It has no persistence store and does not talk to the Crowd Security Server.</td>
</tr>
</tbody>
</table>

Perform the following steps to finish the upgrade:

1. Create a database to house the data specific to the OpenID Server.
2. Point the application context to the new database. The application context for the OpenID Server is in `atlassian-crowd-1.1.0/apache-tomcat-5.5.20/conf/catalina/localhost/openidserver.xml`. More information on how to modify this file for your particular database can be found in Connecting CrowdID to a Database.
3. Update the `jdbc.properties` file in `atlassian-crowd-1.1.0/crowd-openidserver-webapp/WEB-INF/classes/jdbc.properties` to reflect the dialect of your database.
4. Update `crowd.properties` in `atlassian-crowd-1.1.0/crowd-openidserver-webapp/WEB-INF/classes/crowd.properties` to use a secure password for the OpenID Server application.
5. Add the application via the Crowd Administration Console. The default name of the application is `crowd-openid-server` and the password is whatever you specified in `crowd.properties` in the previous step. For more information on how to add an application, see Adding an Application.
6. Restart the server. This should set up the OpenID Server in Crowd.

Crowd 1.2 Upgrade Notes

Upgrade Procedure

To upgrade to Crowd 1.2.x from 1.1.x or earlier,

- Follow the instructions on upgrading Crowd.

Upgrade Notes
Application Directory Permissions

With Crowd 1.2, directory permissions can now be set at application level. When you upgrade to Crowd 1.2:

- The upgrade procedure will set all application-level permissions equal to your existing directory-level permissions. This means that, for a particular directory, all applications will have the same permissions immediately after the upgrade i.e. the permissions which were set at directory level before the upgrade.
- You can alter the permissions for each application after the upgrade is complete, if you wish.

Developer Notes

SOAP Service API

There are changes to the Crowd API, including new SOAP methods (see CWD-459 and CWD-537), so you should re-generate your WSDL bindings to the Crowd server.

Crowd 1.3 Beta Upgrade Notes

Crowd 1.3 will be launched in early March 2008. A beta release is currently undergoing internal testing. These upgrade notes apply to Crowd 1.3 beta. We'll publish the final upgrade notes with the release of Crowd 1.3.0.

Upgrade Procedure

To upgrade to Crowd 1.3.x from 1.2.x or earlier, please follow these upgrade instructions.

Upgrade Notes

Database Configuration

Crowd database configuration is now part of the Setup Wizard. You can choose between a JNDI datasource (i.e. server-managed) or a JDBC configuration.

⚠️ If you are using CrowdID with an external database, you will still need to use the manual JNDI datasource configuration method to configure an external database connection.

Database Import

You can now import an XML backup of your Crowd database when upgrading. So you don't have to go through the whole Setup Wizard again, nor do a manual backup and restore of your Crowd database files. Full instructions are in the Upgrade Guide.

Integrated Applications

Crowd's client libraries have been slimmed down to a single JAR file containing all required classes for a Crowd client. (See CWD-767.)

⚠️ Before upgrading, please remove all previous client libraries (crowd-XXXX-X.X.X.jar) from each Crowd-integrated application's WEB-INF/lib folder.

Developer Notes

Restructuring of Crowd Client Library

In Crowd 1.3, the Java client library API has been upgraded. This affects applications using the Crowd Client libraries and connectors. Read more about the Client API Changes.

Spring Configuration Upgrade for Crowd Acegi Connector

Applications using the Crowd Acegi connector will need to upgrade their Spring configuration. Refer to the updated documentation for more information.

Crowd 1.3 Upgrade Notes

On this page:

- Upgrade Notes
  - Database Configuration
  - Database Import
  - Integrated Applications
Developer Notes

Restructuring of Crowd Client Library
Spring Configuration Upgrade for Crowd Acegi Connector
Upgrade Procedure

Upgrade Notes

Database Configuration

Crowd database configuration is now part of the Setup Wizard. You can choose between a JNDI datasource (i.e. server-managed) or a JDBC configuration.

⚠️ If you are using CrowdID with an external database, you will still need to use the manual JNDI datasource configuration method to configure an external database connection.

Database Import

You can now import an XML backup of your Crowd database when upgrading. So you don't have to go through the whole Setup Wizard again, nor do a manual backup and restore of your Crowd database files. Full instructions are in the Upgrade Guide.

Integrated Applications

Crowd's client libraries have been slimmed down to a single JAR file containing all required classes for a Crowd client. (See CWD-767.)

⚠️ Before upgrading, please remove all previous client libraries (crowd-XXXX-X.X.X.jar) from each Crowd-integrated application's WEB-INF/lib folder.

Developer Notes

Restructuring of Crowd Client Library

In Crowd 1.3, the Java client library API has been upgraded. This affects applications using the Crowd Client libraries and connectors. Read more about the Client API Changes.

Spring Configuration Upgrade for Crowd Acegi Connector

Applications using the Crowd Acegi connector will need to upgrade their Spring configuration. Refer to the updated documentation for more information.

Upgrade Procedure

To upgrade to Crowd 1.3.x from 1.2.x or earlier, please follow these upgrade instructions.

Crowd 1.4 Upgrade Notes

This document contains notes on upgrading an existing Crowd installation to Crowd 1.4. You can see the features of this release in the Crowd 1.4 Release Notes.

On this page:

- Upgrade Notes
  - Crowd administrators must be in a group mapped to the 'crowd' application
  - Additional file to copy for client applications: crowd-ehcache.xml
  - Additional file to copy for integration with JIRA 3.12.2
- Upgrade Procedure

Upgrade Notes

Crowd administrators must be in a group mapped to the 'crowd' application

With Crowd 1.4 and later, non-administrators as well as Crowd administrators can log in to Crowd. Non-administrators can update their user profiles and view their authorisation details. To support this, the Crowd permissions now distinguish between Crowd administrators (users in groups mapped to the 'crowd' application) and other Crowd users (all users in directories allowed to authenticate to Crowd).

Impact:

- In previous versions of Crowd, any user authorised to log in to the 'crowd' application had access to the full functionality of the Crowd Administration Console. The default setup used the 'crowd-administrators' group to manage these users. Most of our customers will have
used the default group or customised groups for their Crowd administrators. But it was possible to grant entire directories administration access to Crowd, by mapping the directory to the 'crowd' application and allowing all to authenticate.

- In Crowd 1.4 and later, every Crowd administrator must be a member of a group mapped to the 'crowd' application (in any mapped directory). Other users will be able to log in to Crowd and use the Self-Service Console if they are members of mapped directories where all can authenticate. But if they are not members of mapped groups, they will not have full access to the Administration Console.

Before upgrading, check that you have a valid administrator

Before starting the upgrade, ensure that there is at least one user in a group that is mapped to the 'crowd' application.

Additional file to copy for client applications: crowd-ehcache.xml

For better caching, you will need to copy the new \{CROWD_INSTALL\}\client\conf\crowd-ehcache.xml file to each Crowd-integrated application's WEB-INF/classes/ folder, replacing the existing file.

We have included the above step in the upgrade instructions.

Additional file to copy for integration with JIRA 3.12.2

If you are using JIRA 3.12.2 or earlier, you will need to update JIRA's xfire libraries:

- Remove the xfire-all-1.2.1.jar file from JIRA's WEB-INF/lib/ directory.
- Copy the following two files from Crowd's client/lib/ directory to JIRA's WEB-INF/lib/ directory:
  - xfire-aegis-1.2.6.jar
  - xfire-core-1.2.6.jar

Upgrade Procedure

To upgrade to Crowd 1.4.x from 1.3.x or earlier, please follow these upgrade instructions.

Crowd 1.5 Upgrade Notes

This document contains notes on upgrading an existing Crowd installation to Crowd 1.5. You can see the features of this release in the Crowd 1.5 Release Notes.

On this page:

- Upgrade Notes
  - The crowd.properties file is now in Crowd Home
  - There are new required JAR files for Crowd WAR deployments
  - Upgrade Procedure

Upgrade Notes

The crowd.properties file is now in Crowd Home

As from Crowd 1.5, the crowd.properties file for the Crowd Administration Console is located in the Crowd Home directory and not the Installation directory. When upgrading from an earlier version of Crowd, you will need to copy the crowd.properties file to the root of your Crowd Home directory.

Notes

- The crowd.properties file for the CrowdID application is still located in the Installation directory.
- For future upgrades after Crowd 1.5.0, the upgrade process becomes easier because you will no longer need to copy the crowd.properties file.

The instructions are incorporated into the Upgrade Guide for Upgrading from Crowd 1.3.0 or Later and Upgrading from Crowd 1.2.x or Earlier.

There are new required JAR files for Crowd WAR deployments

WAR deployments need to ensure that JavaMail classes and the Java Beans Activation Framework are located in the application server's classpath. For more information, please review this guide.

Upgrade Procedure

To upgrade to Crowd 1.5.x from 1.4.x or earlier, please follow these upgrade instructions.
Crowd 1.6 Upgrade Notes

This document contains notes on upgrading an existing Crowd installation to Crowd 1.6. You can see the features of this release in the Crowd 1.6 Release Notes.

On this page:
- Upgrade Notes
- Upgrade Procedure

Upgrade Notes

Crowd 1.6 provides event-based caching updates for some LDAP directories. You may wish to enable it for better performance with client applications such as JIRA. As there are some important limitations to be aware of, please read the documentation before enabling it for your directory.

Upgrade Procedure

To upgrade to Crowd 1.6.x from 1.5.x or earlier, please follow these upgrade instructions.

Crowd 2.0 Upgrade Notes

This document contains notes on upgrading an existing Crowd installation to Crowd 2.0. You can see the features of this release in the Crowd 2.0 Release Notes.

On this page:
- Upgrade Notes
- Upgrade Procedure Requires New Home Directory and Database XML Export/Import
- Improved Search API
- Backwards-Compatible SOAP API
- Roles in Crowd now Deprecated
- Upgrade Procedure

Upgrade Notes

Please read the following sections and take action where the note applies to your Crowd installation, before upgrading to the new release of Crowd.

Upgrade Procedure Requires New Home Directory and Database XML Export/Import

With this release, we have redesigned Crowd's database schema. For that reason, you will need to:

- Back up your Crowd database to XML before starting the upgrade.
- Do a clean installation of Crowd, pointing to a new Crowd Home directory.
- Restore your database from the XML backup as part of the setup process.

The full instructions are in our Upgrade Guide.

Improved Search API

This point is of interest to developers who have created custom application integrations for Crowd. You can now make use of the performance benefits and other features provided by the new search API. The details are in the JavaDocs.

Backwards-Compatible SOAP API

This point is of interest to developers who have created custom application integrations for Crowd. Even though we have made major changes to the object model in Crowd to improve performance, the SOAP API is still backwards compatible with the previous version.

Roles in Crowd now Deprecated

At present, the implementation of roles in Crowd is identical to the implementation of groups. This design does not provide much useful functionality, so we are planning to redesign the way Crowd supports roles. If you would like to help us to design better role-based access control, please add a comment to the improvement request CWD-931, letting us know how you would like to see it work.

Advance Notice: We recommend that you move away from the use of roles in your Crowd installation, so that you will not be adversely affected by the planned redesign of role functionality. For this reason, roles are now disabled by default when you create a new LDAP directory.

Upgrade Procedure
To upgrade to Crowd 2.0.x from 1.6.x or earlier, please follow these upgrade instructions.

Migrating Crowd between Servers

This guide applies to situations when you may need to migrate Crowd because:

- Your Crowd server is changing.
- You are cloning your production server for a staging, test or development instance.

Preparation

1. Make sure you have a Crowd license for the new server you are targeting. Developer/staging licenses are available for any commercial or academic license. Create a developer license or contact us for help.

2. Add the IP address or hostname of the target Crowd server to the remote addresses in your existing Crowd server:
   - Find the IP address or hostname of the target Crowd server.
   - Log in to the Crowd Administration Console on your existing Crowd server.
   - Click the Applications tab, find the Crowd Console application and open the Remote Addresses tab.
   - If you have localhost or 127.0.0.1 listed there already, you should be fine. If not, add the new IP address or hostname to the list of remote addresses. This list determines the hosts that can access the Crowd Administration Console.

3. Perform an XML backup of your existing Crowd server. Make sure that you check the Reset Domain checkbox, otherwise you may be prevented from logging in to the new Crowd Administration Console.

From this point on, we will call your existing Crowd server the "original" server.

Migration

1. Copy the XML backup over to the target server.

2. Install Crowd on the target server using our installation guide.
   - The Crowd version can be the same or higher than the version on the original Crowd server.
   - When specifying your Crowd Home directory, make sure you choose a new location and not your original Crowd Home directory.

3. Run the Setup Wizard.
   - When asked for the type of installation, choose Import data from an XML backup. Provide the full path to your XML backup file and import the data.
   - When given the option of configuring Crowd to target a database, make sure you choose a new one and not your original Crowd database.

4. When the import finishes, shut down Crowd.

5. Locate the crowd.properties file in the target server's Crowd Home directory. (This file will have been generated from the data in the XML backup.) Edit the file and modify the Crowd server BaseURL to point to your new Crowd server.

Post Migration Verification

1. In your original Crowd server, you can now remove the IP address or hostname you added during the preparation steps. This will help prevent you from accidentally logging into your original Crowd server.

2. Start Crowd on the new server. You should be able to authenticate and access Crowd using the same credentials as on your original Crowd server.

Applications and Customisations

1. For any application you are going to test against this new Crowd server, you will need to modify the application's crowd.properties file to point to this new server.

2. If you have installed any Crowd plugins or added other customisations, you will need to re-apply them on the new server.

If you encounter any difficulties, please feel free to contact support and let us know which step you are having problems with.

About the Crowd Development Hub

There are two main ways to develop with Crowd — through our remote API and through the Atlassian Plugin Framework. If you're integrating Crowd with another application, you'll most likely want to use the API. If you wish to add capabilities to Crowd, a plugin may be the answer.

If neither the remote API or the plugin framework fits your needs, you can customise the Crowd source code. Atlassian does not support customised Crowd source.

💡 A 'principal' is a 'user'

In Crowd, the term 'principal' is equivalent to the term 'user'. In Crowd 1.3.0 and later, the Crowd Administration Console uses the term 'user'. Earlier versions of Crowd, and also certain API libraries, use the term 'principal'.

Using the Crowd Remote API

A developer can use Crowd's remote API to connect your own web applications or user directories to Crowd.

Crowd comes with a number of application and directory connectors. If you have a web application or a user directory which does not use a pre-supplied connector, your development team can create a custom connector for you.

This is a reasonably quick and easy job.

On this page:

- Skills Required to Write a Custom Connector for Crowd
- Getting Help
- Writing the Connectors

Skills Required to Write a Custom Connector for Crowd

- Familiarity with HTTP/webserver technology.
- Familiarity with the concepts of identity management, authentication and authorisation.
- Programming skills to write an application connector:
  - Medium-level experience with the Java programming language.
  - Or you can use our SOAP API in combination with a language like PHP, Ruby, etc. You need a medium-level understanding of SOAP APIs.
- Programming skills to write a directory connector:
  - Medium-level experience with the Java programming language.

Getting Help

- Atlassian partners can help you to write a custom connector and get your applications up and running. We recommend CustomWare and Appfire Technologies.
- Consult the online Crowd documentation.
- Ask questions and share tips in the Atlassian forum.
- If you have a problem with Crowd, log a ticket at Atlassian Support. Atlassian does not support customised Crowd source.

Crowd Development Hub

Creating a Crowd Client for your Custom Application
Crowd allows your applications to authenticate users against Crowd's user directories.

Crowd ships with ready-made connectors ('Crowd clients') for several popular applications. See Supported Applications and Directories for the complete list. If you need to connect Crowd to one of these applications, please see Managing Applications. If you need to connect Crowd to an application that is not listed, you can achieve this by creating a Crowd Client for your application, using the SOAP API.

**Creating a Crowd Client**

We recommend that you use the SOAP API for long-term compatibility.

If you have a Java application, you can use the Java client libraries shipped with Crowd, but please be aware that they may change between releases. You may need to re-compile your source and possibly change a package name.

For assistance please see:
- Application Integration Overview
- Sample Application ('demo')
- Java Integration Libraries

Application Integration Overview

The Crowd framework allows an application to perform authentication and authorisation calls against a mapped directory, including:

- Authenticate a principal (i.e. a user).
- Validate and invalidate an existing principal authentication.
- Find a principal by their authentication token.
- Search principals, groups and roles by name or attributes
- Add principals, groups and roles.
- Validate a principal's group and role membership.
- Add and remove principals from groups and roles.
- Update a principal's attribute data.
- Update or reset a principal's authentication credentials.

Crowd's application provisioning allows an application to be mapped to multiple directories. When an application needs to authenticate or authorise a principal, Crowd will call the directory listed first. If the security call can be processed by the directory, the operation will then return the result. If the call cannot be processed, the next directory in the list will then be used when processing the security call until all directories have been exhausted. If the security call cannot be processed, an Exception (based on the method) will be thrown.

Integration Overview

When an application needs to perform a security request (that is, needs to authenticate or authorise a user) via Crowd's API, the following two steps need to occur:

1. The application authenticates itself with Crowd; the authentication token may be reused by the application during subsequent calls. During this step, Crowd validates the application's credentials and address against known application credentials/addresses.
2. Using the authenticated token from the previous step, the application then performs the security request for a particular user.

Should the application's requesting token become invalid, the client library will attempt to re-authenticate and perform the security request. If the second authentication request fails, an Exception will be thrown, specifying that the application's credentials are invalid.

Diagram — Application Authorisation Sequence:

Next Step

- If you are using the SOAP interface, you will need to explicitly implement each step of the application authorisation sequence. As an example, please see the Microsoft .NET Client. We recommend that you use the SOAP API for long-term compatibility.
- If you have a Java application, you can use the Java client libraries shipped with Crowd. The application authorisation sequence above is fully handled by the supplied Java implementation. But please be aware that the libraries may change between releases. You may need
Sample Application ('demo')

To assist you when integrating your web applications, the entire sourcecode to the sample 'demo' application is included in the src folder of the Crowd download archive, and is (optionally) configured when you run the Setup Wizard.

The 'demo' application highlights best practices when using the Crowd framework, and can be used as an example when integrating your own web applications.

To access the 'demo' application, go to http://localhost:8095/demo.

SSO and the 'demo' Application

The 'demo' application uses the Spring Security framework to implement authentication. It supports single sign-on (SSO). To try the SSO functionality, assuming that you have installed the 'demo' application along with your Crowd installation:

- Log in to Crowd. For example, Crowd may be at this address: http://localhost:8095/crowd/
- Open the 'demo' application in your browser. For example, the 'demo' application may be at this address: http://localhost:8095/demo/
- You should find that you are already logged in to the 'demo' application.
- Log out of the 'demo' application.
- Go back to Crowd. You should find that you are also logged out of Crowd.

Java Integration Libraries

This page provides sample code for creating a Crowd Client using the supplied Java integration libraries.

We recommend that you use the SOAP API for long-term compatibility. If you have a Java application, you can use the Java client libraries shipped with Crowd, but please be aware that they may change between releases. You may need to re-compile your source and possibly change a package name.

SecurityServerClient

The SecurityServerClient is useful for common create, update and delete operations for principals, groups and roles. To accomplish this, the SecurityServerClient maps 1-to-1 with the SOAP API of the Crowd server. The class reads in the crowd.properties configuration file from your application's class path, setting client specific details such as the Crowd server URL and SSO integration details. When the client is
loaded into memory, it will then authenticate the client application with the Crowd security server for future SOAP requests.

A full list of the available methods for the SecurityServerClient is available here:

**HttpAuthenticator**

The HttpAuthenticator simplifies the authentication of HTTP based clients. When an authentication or invalidation is performed, the HttpAuthenticator manages the setting and resetting of integration variables for the principal's HTTP session. If the application has little need beyond authentication and validation, the HttpAuthenticator is a simple and very straightforward integration piece. Shown below is a code example of authenticating and logging off a principal:

Example 1:

```
HttpAuthenticatorFactory.getHttpAuthenticator().authenticate(request, response, username, password);
```

Example 2:

```
HttpAuthenticatorFactory.getHttpAuthenticator().logoff(request, response);
```

If there were any issues with the authentication or logoff calls, an Exception will be thrown to the application.

The HttpAuthenticator manages the following:

- Authenticating an HTTP request, and setting the session with the correct attributes for other integration points of the framework.
- Invalidating an HTTP request includes removing session related attributes.
- Obtaining a principal's authenticated token from a session or browser cookie.
- Validating an existing HTTP authentication for single sign-on. If another application in the same domain has already authenticated the principal, the HttpAuthenticator will attempt to validate the existing authentication.
- Building a standard AuthenticationContext for a principal. This can be used to assure the authentication is consistent across all applications when setting validation factors of the application client.

Note both the HttpAuthenticatorFactory and SecurityServerClientFactory manage singleton instances of the HttpAuthenticator and SecurityServerClient implementations respectively. You should never need to instantiate the HttpAuthenticator or SecurityServerClient manually.

**VerifyTokenFilter**

The VerifyTokenFilter is an HTTP servlet filter that protects secured resources by verifying the session or cookie token is active and the principal has access to the requesting application. The token filter works in conjunction with the HttpAuthenticator, validating and setting various session and cookie attributes. Should the principal's token become expired or invalid due to security restrictions, the principal will be redirected to the URL provided by the `crowd.properties`.

Using the token filter is very straightforward, simply edit your `web.xml` deployment descriptor to reflect the filter and desired resource mapping:

```
<filter>
  <filter-name>VerifyTokenFilter</filter-name>
</filter>

<filter-mapping>
  <filter-name>VerifyTokenFilter</filter-name>
  <url-pattern>/secure/*</url-pattern>
</filter-mapping>
```

In this example, the verify token filter will prevent any pages on the `/secure/` path from being accessed unless a valid token is found.
Should the token expire or be found invalid, the original URL will be stored in the principal’s session at a String with the key of VerifyTokenFilter.ORIGINAL_URL. This is useful because, when the principal later authenticates, the original URL and parameters can then be used as a redirect bringing the principal back to their original POST. An example of how this can be accomplished at login is shown below:

```java
HttpAuthenticatorFactory.getHttpAuthenticator().authenticate(request, response, username, password);

// Check if principal was requesting a page that was prevented, if so, redirect.
String requestingPage = (String) getSession().getAttribute(VerifyTokenFilter.ORIGINAL_URL);

if (requestingPage != null) {
    // redirect the principal to the requesting page
    response().sendRedirect(requestingPage);
}
else {
    // return the to the login page
    return SUCCESS;
}
```

Using dependency injection?

If you are using a dependency injection container which manages singleton instances, rather than using the SecurityServerClientFactory and HttpAuthenticatorFactory to manage singletons, you can wire up the objects themselves as shown in the following diagram:

Please use EITHER dependency injection OR the factories. Using both will result in multiple instances being maintained throughout your application.

If you are using Spring for dependency injection, a convenient applicationContext-CrowdClient.xml has been provided in the crowd-integration-client.jar. This Spring configuration file wires up the HttpAuthenticator and SecurityServerClient factory as beans named httpAuthenticator and securityServerClient respectively.
To use a Spring-injected VerifyTokenFilter change the filter definition in your web.xml to:

```xml
<filter>
    <filter-name>verifyTokenFilter</filter-name>
    <filter-class>org.springframework.web.filter.DelegatingFilterProxy</filter-class>
</filter>
```

Crowd Documentation

Compiling the Crowd Source

To compile the Crowd source code you will need to have Maven 2 installed.

Once you have installed Maven 2, you will then need to do the following:

1. Copy or merge the /atlassian-crowd-1.2.0-source/maven/conf/settings.xml with your ~/.m2/settings.xml maven 2 configuration file.
2. Install the JTA library available from Sun Microsystem's website into your local maven 2 repository
Missing:

----------
1) javax.transaction:jta:jar:1.0.1B

Try downloading the file manually from:
http://java.sun.com/products/jta

Then, install it using the command:

mvn install:install-file -DgroupId=javax.transaction -DartifactId=jta \
-Dversion=1.0.1B -Dpackaging=jar -Dfile=/path/to/file

Alternatively, if you host your own repository you can deploy the file there:

mvn deploy:deploy-file -DgroupId=javax.transaction -DartifactId=jta \
-Dversion=1.0.1B -Dpackaging=jar -Dfile=/path/to/file -Durl=[url] -DrepositoryId=[id]

Path to dependency:
1) com.atlassian.crowd:crowd-core:jar:1.2.0
2) javax.transaction:jta:jar:1.0.1B

----------
1 required artifact is missing.

for artifact:
com.atlassian.crowd:crowd-core:jar:1.2.0

from the specified remote repositories:
central (http://repo1.maven.org/maven2),
atlassian-m1-repository (http://repository.atlassian.com),
atlassian-proxy (https://m2proxy.atlassian.com/repository/public)

Once you have completed this you will be able to then run the command mvn compile.

Maven 2 Integration

To integrate Crowd with your Maven 2 project, you will need to include the following dependency in your pom.xml:

```
<dependency>
  <groupId>com.atlassian.crowd</groupId>
  <artifactId>crowd-integration-client</artifactId>
  <version>X.X</version>
  <type>pom</type>
</dependency>
```

Because the Crowd libraries are not published to the standard Maven repository, you will need to add Atlassian's public repository:

```
<repositories>
  <repository>
    <id>central</id>
    <url>https://m2proxy.atlassian.com/repository/public</url>
    <snapshots>
      <enabled>true</enabled>
      <updatePolicy>always</updatePolicy>
    </snapshots>
    <releases>
      <enabled>true</enabled>
    </releases>
  </repository>
</repositories>
```

Creating a Crowd Client using Crowd Integration Libraries
Crowd ships with Java integration libraries that allow you to create a Crowd client (also known as a Crowd-connected application) with minimal effort. This page gives a small demo of a stand-alone Crowd client to help you get started with using these libraries.

⚠️ Please be aware that the Java integration libraries may change between releases.

For further help and questions on Crowd development support, please post to our Crowd Development forum.

On this page:
- Creating a Crowd Client using Crowd Integration Libraries
  - Create an Application in Crowd Console for your Client
  - Prepare your Crowd Client
  - Sample Code
  - Hints
- Creating a Crowd Client using AXIS 1.x

Creating a Crowd Client using Crowd Integration Libraries

Create an Application in Crowd Console for your Client

If you do not yet have an application defined in Crowd, go ahead and create one via the Crowd Administration Console under 'Applications'.

- Give your application an Application Name and Password.
- You can specify remote IP addresses that can authenticate to this application.
- For this example, we recommend that you use a new Crowd internal directory.
- In this application's Permissions tab, give the application permission to add new users.

Prepare your Crowd Client

Copy the files from your Crowd installation folder CROWD_INSTALL/client for your project. These are the contents from a Crowd 1.6 installation:

```
- crowd-integration-client-X.X.jar (Crowd Integration Library)
+ lib (libraries you will need to include in your CLASSPATH)
+ conf
  -- crowd.properties (Settings for defining where your Crowd Server is, and what the Application you're trying to connect to is)
  -- crowd-ehcache.xml (Settings for Crowd Client cache)
```

Modify your local copy of crowd.properties such that crowd.server.url, application.name and application.password match the URL of your Crowd server and the application name and password you just defined.

Sample Code
import com.atlassian.crowd.integration.service.soap.client.SecurityServerClient;
import com.atlassian.crowd.integration.authentication.PasswordCredential;
import com.atlassian.crowd.integration.soap.SOAPPrincipal;
import com.atlassian.crowd.integration.soap.SOAPAttribute;
import com.atlassian.crowd.integration.model.RemotePrincipalConstants;

public class CrowdClientDemo {
    public static void main(String[] argv) {
        SecurityServerClient crowdClient = SecurityServerClientFactory.getSecurityServerClient();
        try {
            crowdClient.authenticate();
            SOAPPrincipal principal = new SOAPPrincipal("test-user");
            principal.setActive(true);
            principal.setAttributes(new SOAPAttribute[]{
                new SOAPAttribute(RemotePrincipalConstants.EMAIL, "test@example.com"),
                new SOAPAttribute("givenName", "Paul"),
                new SOAPAttribute("sn", "Smith")
            });
            PasswordCredential pwd = new PasswordCredential("secret");
            crowdClient.addPrincipal(principal, pwd);
        } catch (Exception e) {
            System.err.println(e.toString());
        }
    }
}

Hints

- The class SOAPPrincipalHelper has many helper methods you may find useful for extracting information from SOAPPrincipal objects.
- Ensure crowd.properties and crowd-ehcache.xml are in your classpath. You can force it to use a specific location with the option java CrowdSOAPClient -Dcrowd.properties=/path/to/the/crowd.properties.

Creating a Crowd Client using AXIS 1.x

If you prefer not to use the Crowd integration libraries and want to interface via the SOAP service directly, that can be done as well. In fact, the Crowd integration libraries actually use SOAP to communicate to the Crowd Server. One practical reason why you may want to interface via SOAP directly is to avoid the possibility of updating the Crowd Client libraries if they change in the future. Please see the example in the Axis 1.x client stub generation guide that performs the same function as the above example.

Java Integration Libraries
Creating a Crowd Client for your Custom Application

Using the Search API

Crowd currently supports searching for principals, groups and roles based on search criteria using the SecurityServerClient API. The search criteria is formed as a conjunction of SearchRestrictions, which are essentially name-value String pairs. The name String constants are defined on the SearchContext object.

Searching Principals

It is possible to search for principals using the method:

SecurityServerClient.searchPrincipals(SearchRestriction[] searchRestrictions)

This will perform a search on all the directories assigned to your application and return an array of SOAPPrincipal objects matching the search criteria.
restrictions. The following search restrictions are applicable to principal search:

- PRINCIPAL_NAME
- PRINCIPAL_EMAIL
- PRINCIPAL_ACTIVE (this is currently only supported by internal directories)
- PRINCIPAL_FULLNAME (this is currently only supported by internal directories)
- SEARCH_MAX_RESULTS
- SEARCH_INDEX_START

Example

Suppose we would like to obtain a list of 20 active users from Crowd. This could be achieved by performing the following:

```java
// obtain an instance of the security server client
SecurityServerClient securityServerClient = SecurityServerClientFactory.getSecurityServerClient();

// build search criteria
SearchRestriction[] criteria = new SearchRestriction[2];
criteria[0].setName(SearchContext.PRINCIPAL_ACTIVE);
criteria[0].setValue("true");
criteria[1].setName(SearchContext.SEARCH_MAX_RESULTS);
criteria[1].setValue("20");

// execute search
SOAPPrincipal[] principals = securityServerClient.searchPrincipals(criteria);
```

Searching Groups and Roles

You can search for groups and roles in a similar manner to searching for principals, by using the following methods:

```java
SecurityServerClient.searchGroups(SearchRestriction[] searchRestrictions)
SecurityServerClient.searchRoles(SearchRestriction[] searchRestrictions)
```

The following search restrictions are applicable to Group searches:

- GROUP_NAME
- GROUP_ACTIVE (this is currently only supported by internal directories)
- GROUP_POPULATE_MEMBERSHIPS
- SEARCH_MAX_RESULTS
- SEARCH_INDEX_START

The following search restrictions are applicable to Role searches:

- ROLE_NAME
- ROLE_ACTIVE (this is currently only supported by internal directories)
- ROLE_POPULATE_MEMBERSHIPS
- SEARCH_MAX_RESULTS
- SEARCH_INDEX_START

Direct Searches

It is possible to perform direct searches to determine if a principal is a member of a group, to list the members of a group, to list the group memberships of a principal, find a principal by their name and much more using methods on the SecurityServerClient interface.

SOAP API

This page provides sample code for creating a Crowd Client using the SOAP API.

⚠️ The Crowd API has been tested with: Axis 1/2, Microsoft .NET and XFire.

The SOAP WSDL is available on the following URL for the Crowd Standalone version (after you have downloaded and installed Crowd Standalone):

The Java Remote Interface that is used to generate the SOAP service is available here:

This JavaDoc file details inputs and outputs for the available Crowd security server SOAP server. You will see that all methods require an AuthenticatedToken. A valid token can be obtained by calling the authenticateApplication service method.

Like a user token, the application client token is valid only for the same period of time a user token would be. If you receive a SOAP fault for an invalid application client you will need to re-authenticate your application client and re-invoke the SOAP service.

Crowd ships with out of the box Java Integration Libraries that map one-to-one to these web services.

**authenticateApplication - Authenticating an Application Client**

Here is the server request which passes in the server name and a password credential.

```xml
  <soap:Body>
    <authenticateApplication xmlns="urn:SecurityServer">
      <in0>
        <credential xmlns="http://authentication.integration.crowd.atlassian.com">
          <credential>password</credential>
        </credential>
        <name xmlns="http://authentication.integration.crowd.atlassian.com">jira</name>
        <validationFactors xmlns="http://authentication.integration.crowd.atlassian.com" xsi:nil="true"/>
      </in0>
    </authenticateApplication>
  </soap:Body>
</soap:Envelope>
```

The server will respond with an application token:

```xml
  <soap:Body>
    <authenticateApplicationResponse xmlns="urn:SecurityServer">
      <out>
        <name xmlns="http://authentication.integration.crowd.atlassian.com">jira</name>
        <token xmlns="http://authentication.integration.crowd.atlassian.com">9vN5haaW+i+xBsJX1tgAIg==</token>
      </out>
    </authenticateApplicationResponse>
  </soap:Body>
</soap:Envelope>
```

**authenticatePrincipal - Authenticating a Principal**

In this message the principal is authenticated using the previously obtained application token.
  <soap:Body>
    <authenticatePrincipal xmlns="urn:SecurityServer">
      <in0>
        <name xmlns="http://authentication.integration.crowd.atlassian.com">jive</name>
        <token xmlns="http://authentication.integration.crowd.atlassian.com">9vN5haaWY+xGBs3XitgAIg==</token>
      </in0>
      <in1>
        <application xmlns="http://authentication.integration.crowd.atlassian.com">jive</application>
        <credential xmlns="http://authentication.integration.crowd.atlassian.com">
          <credential>password</credential>
        </credential>
        <name xmlns="http://authentication.integration.crowd.atlassian.com">jstepka</name>
        <validationFactors xmlns/>
      </in1>
    </authenticatePrincipal>
  </soap:Body>
</soap:Envelope>

The server then responds with the token for the now authenticated user:

  <soap:Body>
    <authenticatePrincipalResponse xmlns="urn:SecurityServer">
      <out>o7MSozJJbKQttOLvC4hN2w==</out>
    </authenticatePrincipalResponse>
  </soap:Body>
</soap:Envelope>

An invalid authentication attempt will look like the following:

  <soap:Body>
    <soap:Fault>
      <faultcode>soap:Server</faultcode>
      <faultstring>com.atlassian.crowd.integration.exception.InvalidAuthenticationException</faultstring>
      <detail>
        <InvalidAuthenticationException xmlns="urn:SecurityServer"/>
      </detail>
    </soap:Fault>
  </soap:Body>
</soap:Envelope>

findPrincipalByName - Finding a Principal by their Name

Now that the principal is authenticated, we may want to find additional details about the principal. The application can now look up a user by a token or their name. The example below shows looking up a principal by their name:
  <soap:Body>
    <findPrincipalByName xmlns="urn:SecurityServer">
      <in0>
        jive
        <name xmlns="http://authentication.integration.crowd.atlassian.com">jive</name>
        <token xmlns="http://authentication.integration.crowd.atlassian.com">9vN5haaWY+xGBs3XitgAlg==</token>
      </in0>
      <in1>jstepka</in1>
    </findPrincipalByName>
  </soap:Body>
</soap:Envelope>

The server lookup response:
    <soap:Body>
        <findPrincipalByNameResponse xmlns="urn:SecurityServer">
            <out>
                <ID xmlns="http://soap.integration.crowd.atlassian.com">-1</ID>
                <active xmlns="http://soap.integration.crowd.atlassian.com">true</active>
                <attributes xmlns="http://soap.integration.crowd.atlassian.com">
                    <SOAPAttribute>
                        <name>sn</name>
                        <values>
                            <ns1:string xmlns:ns1="urn:SecurityServer">Stepka</ns1:string>
                        </values>
                    </SOAPAttribute>
                    <SOAPAttribute>
                        <name>invalidPasswordAttempts</name>
                        <values>
                            <ns1:string xmlns:ns1="urn:SecurityServer">0</ns1:string>
                        </values>
                    </SOAPAttribute>
                    <SOAPAttribute>
                        <name>requiresPasswordChange</name>
                        <values>
                            <ns1:string xmlns:ns1="urn:SecurityServer">false</ns1:string>
                        </values>
                    </SOAPAttribute>
                    <SOAPAttribute>
                        <name>mail</name>
                        <values>
                            <ns1:string xmlns:ns1="urn:SecurityServer">justen.stepka@atlassian.com</ns1:string>
                        </values>
                    </SOAPAttribute>
                    <SOAPAttribute>
                        <name>lastAuthenticated</name>
                        <values>
                            <ns1:string xmlns:ns1="urn:SecurityServer">1169440408520</ns1:string>
                        </values>
                    </SOAPAttribute>
                    <SOAPAttribute>
                        <name>givenName</name>
                        <values>
                            <ns1:string xmlns:ns1="urn:SecurityServer">Justen</ns1:string>
                        </values>
                    </SOAPAttribute>
                    <SOAPAttribute>
                        <name>passwordLastChanged</name>
                        <values>
                            <ns1:string xmlns:ns1="urn:SecurityServer">1168995491407</ns1:string>
                        </values>
                    </SOAPAttribute>
                </attributes>
                <description xmlns="http://soap.integration.crowd.atlassian.com" xsi:nil="true"/>
                <directoryID xmlns="http://soap.integration.crowd.atlassian.com">1</directoryID>
                <lastModified xmlns="http://soap.integration.crowd.atlassian.com">2007-01-17T18:51:11+11:00</lastModified>
            </out>
        </findPrincipalByNameResponse>
    </soap:Body>
</soap:Envelope>
Please refer to the JavaDoc for the full list of exposed SOAP methods.

Crowd Documentation

Axis 1.x Client Stub Generation

Please note that these instructions assume that you are using Axis 1.x+. For more general information on installing and using this version of Axis please visit the Axis 1 website.

Refer to the attached sample client stub generated with Axis 1.4, including test client.

Add the required Axis libraries to your AXISCLASSPATH

This can be done as follows:

Windows:

```bash
set AXIS_HOME=c:\axis
set AXIS_LIB=%AXIS_HOME%\lib
set AXISCLASSPATH=%AXIS_LIB%\axis.jar;%AXIS_LIB%\commons-discovery.jar;
%AXIS_LIB%\commons-logging.jar;%AXIS_LIB%\jaxrpc.jar;%AXIS_LIB%\saaj.jar;
%AXIS_LIB%\log4j-1.2.8.jar;:%AXIS_LIB%\wsdl4j-1.5.1.jar
```

Unix:

```bash
export AXIS_HOME=/opt/java/axis-1_4/
export AXIS_LIB=$AXIS_HOME/lib
export AXISCLASSPATH=$AXIS_LIB/axis.jar:$AXIS_LIB/commons-discovery-0.2.jar:$AXIS_LIB/commons-logging-1.0.4.jar:
$AXIS_LIB/jaxrpc.jar:$AXIS_LIB/saaj.jar:$AXIS_LIB/log4j-1.2.8.jar:$AXIS_LIB/wsdl4j-1.5.1.jar
```

If you are using a version of Java earlier than 1.5 you may need to add xml-apis.jar and xercesImpl.jar to the Axis Classpath.

Generating the actual Axis stub classes

Assuming you have set up your AXISCLASSPATH as above, run the following command:

```bash
java -cp "$AXISCLASSPATH" org.apache.axis.wsdl.WSDL2Java
```

When the necessary objects are created off the Crowd server WSDL, you will end up with a directory structure similar to this:

```
drwxr-xr-x  6 jstepka jstepka 204 Apr 19 16:56 SecurityServer_pkg
drwxr-xr-x  3 jstepka jstepka 102 Apr 19 16:55 com
drwxr-xr-x  4 jstepka jstepka 136 Apr 19 17:05 java
```

Compiling the generated sources
When you attempt to compile the generated class files, you will end up with a compilation error similar to the following:

```java
java/rmi/RemoteException.java:[10,7] cyclic inheritance involving java.rmi.RemoteException
java/rmi/RemoteException.java:[11,32] modifier private not allowed here
java/rmi/RemoteException.java:[12,29] modifier private not allowed here
java/rmi/RemoteException.java:[64,29] modifier private not allowed here
java/rmi/RemoteException.java:[86,20] modifier private not allowed here
java/rmi/RemoteException.java:[104,56] modifier private static not allowed here
com/atlassian/crowd/integration/exception/InvalidCredentialException.java:[26,30] incompatible types
```

To resolve these compilation errors you will need to delete the generated `java` package and also remove all references to these custom `RemoteException` and `Throwable` exceptions in the stubs that Axis created. We highly recommend using an IDE for this as you will need to modify a number of classes.

**A small example of using the Axis-generated stubs**

The security server can then be used as below:

```java
// connect to the crowd server, using the supplied service URL, similar to
SecurityServerLocator secServer = new SecurityServerLocator();
secServer.setSecurityServerHttpPortEndpointAddress(secServer.getSecurityServerHttpPortAddress());

// obtain a reference to the SOAP service, which axis manages.
SecurityServerHttpBindingStub stub = null;
try {
    stub = (SecurityServerHttpBindingStub) secServer.getSecurityServerHttpPort();

    // authenticate the integrated crowd application
    AuthenticatedToken token = stub.authenticateApplication(
        new ApplicationAuthenticationContext(
            new PasswordCredential("password", Boolean.FALSE), "demo",
            new ValidationFactor[0]));

    // do your custom calls here, eg:
    SOAPPrincipal principal = new SOAPPrincipal();
    principal.setName("test-user");
    principal.setActive(Boolean.TRUE);
    principal.setAttributes(new SOAPAttribute[
        new SOAPAttribute("mail", new String[]{"test@example.com"}),
        new SOAPAttribute("givenName", new String[]{"Paul"}),
        new SOAPAttribute("sn", new String[]{"Smith"})
    ]);;
    stub.addPrincipal(token, principal, new PasswordCredential("secret", Boolean.FALSE));
}
```

**Microsoft .NET Client**

An updated version of this library has been made available through the Atlassian Codegeist competition.

You will need to create a .NET proxy to the SOAP API, as follows:

1. Open a Microsoft Visual Studio .NET Command Prompt.
2. Run the following command to generate a proxy class (change the location of the WSDL according to your installation):

(Note: Ignore any schema validation warnings returned here.)

3. Compile the generated class with the following references:

This should generate a .NET assembly called SecurityServer.DLL.

When creating your .NET client application, remember to add a reference to this proxy. You will also need to add a reference to System.Web.Services.DLL.

The sample code calls methods from the proxy to perform authentication in a sample Crowd application. Change the constants at the top of the code relevant to any application you have previously set up in Crowd.

Crowd Documentation

Creating a Custom Directory Connector

Crowd comes with a number of supplied directory connectors. If your directory is not listed in Supported Applications and Directories then you will need to create your own custom directory connector. Custom directory connectors allow developers to connect Crowd to custom user-stores, such as existing databases or legacy systems.

The directory connectors that come with Crowd implement the Java interface RemoteDirectory. The RemoteDirectory interface defines generic methods for authentication, searching and entity create, remove and update operations.

To connect Crowd to a custom directory server, you will need to write a Java class file that implements the RemoteDirectory interface.

In our example below, the MyCustomDirectoryServer class extends the Crowd DirectoryEntity utility class. The utility class manages setting runtime properties that may be used by the Crowd server in the future for operations such as getting the Crowd ID number of the directory server.
package com.atlassian.crowd.integration.directory.custom;

import com.atlassian.crowd.integration.SearchContext;
import com.atlassian.crowd.integration.authentication.PasswordCredential;
import com.atlassian.crowd.integration.directory.exception.*;
import com.atlassian.crowd.integration.model.DirectoryEntity;
import com.atlassian.crowd.integration.model.RemoteGroup;
import com.atlassian.crowd.integration.model.RemotePrincipal;
import com.atlassian.crowd.integration.model.RemoteRole;

import java.rmi.RemoteException;
import java.util.List;

public class MyCustomDirectoryServer extends DirectoryEntity implements RemoteDirectory {
  public RemotePrincipal authenticate(String name, PasswordCredential[] credentials) throws RemoteException, InvalidPrincipalException, InactiveAccountException, InvalidAuthenticationException {
    // Perform your custom directory server authentication code here.
    // The source code to the InternalDirectory, which comes with your commercial license is a good implementation example.
  }
  // Other RemoteDirectory interface methods will also need to be implemented ...
}

Once you have finished implementing all of the methods defined by the RemoteDirectory interface, you will then need to:

1. Create a JAR of the MyCustomDirectoryServer and any supporting class files.
2. Shut down Crowd.
3. Place the newly-created JAR from step one in the CROWD/crowd-webapp/WEB-INF/lib folder.
4. Start Crowd.
5. Follow the instructions on configuring a custom directory connector through the Crowd Administration Console.

Full Javadoc for the RemoteDirectory interface can be found here:

A 'principal' is a 'user'

In Crowd, the term 'principal' is equivalent to the term 'user'. In Crowd 1.3.0 and later, the Crowd Administration Console uses the term 'user'. Earlier versions of Crowd, and also certain API libraries, use the term 'principal'.

Next Steps

After creating your directory connector, please see Configuring a Custom Directory Connector.

Crowd REST APIs

⚠️ Experimental APIs
Crowd's REST APIs are experimental at this stage. We will be adding to them in future releases. So please expect some API changes 😵. We will be delighted if you use the APIs and give us your feedback via our JIRA project.

The REST APIs are for developers who want to integrate Crowd into their application and for administrators who want to script interactions with the Crowd server.

Introduction to Crowd's REST APIs

Crowd's REST APIs provide access to resources (data entities) via URI paths. To use a REST API, your application will make an HTTP request and parse the response. By default, the response format is XML. If you wish, you can request JSON instead of XML. Your methods will be the standard HTTP methods like GET, PUT, POST and DELETE.

Because the REST API is based on open standards, you can use any web development language to access the API.

A typical use case would be to get a list of users in a particular directory, retrieve the details of each user and update the user details where applicable.

Crowd's REST APIs provide the following capabilities:

- Retrieve a list of directories.
- Retrieve basic directory information for each directory.
- List the users in a directory.
- Add a user to a directory.
- Remove a user from a directory.
- Retrieve and update user details.
- List the groups in a directory.
- Add a group to a directory.
- Remove a group from a directory.
- List the groups to which a user belongs.

Getting Started

If you would like to know more about REST in general, start with the RESTwiki's guide to REST In Plain English.

Then jump right in and try our REST resources:

- Read our guide to using the REST APIs.
- Find the REST resources you need in our REST resources reference guide.

Advanced Topics
Below are some links to in-depth information on developing REST APIs and plugins:

- **Developing your own REST APIs for Crowd**: Crowd uses the Atlassian REST plugin to implement the Crowd APIs. The REST plugin is bundled with Crowd. You can add your own REST APIs to Crowd by creating a Crowd plugin that includes the REST plugin module.
- **Understanding the principles behind the Atlassian REST API design**: You may be interested in the guidelines followed by the Atlassian developers who are designing REST APIs for Atlassian applications, including the Crowd REST APIs.

- Example of Using the CROWD APIs

**REST Resources and URI Structure**

URIs for a Crowd REST API resource have the following structure:

**With context:**

http://host:port/context/rest/api-name/api-version/resource-name

**Or without context:**

http://host:port/rest/api-name/api-version/resource-name

In Crowd 2.0, the only api-name available is admin. This is the API that allows interaction with the Crowd Administration Console.

**Examples:**

**With context:**

http://myhost.com:8095/crowd/rest/admin/1/directory
http://localhost:8095/crowd/rest/admin/latest/directory

**Or without context:**

http://crowd.myhost.com:8095/rest/admin/1/directory
http://crowd.myhost.com:8095/rest/admin/latest/directory

Here is an explanation for each part of the URI:

- **host** and **port** define the host and port where the Crowd application lives.
- **context** is the servlet context of the Crowd installation. For example, the context might be crowd. Omit this section if your URI does not include a context.
- **rest** denotes the REST API.
- **api-name** identifies a specific Crowd API. For example, admin is the API that allows interaction with the Crowd Administration Console.
(This is the path declared in the REST module type in the REST plugin descriptor.)

- **api-version** is the API version number, e.g. 1 or 2. See the section on **API version control**.
- **resource-name** identifies the required resource. In some cases, this may be a generic resource name such as /foo. In other cases, this may include a generic resource name and key. For example, /foo returns a list of the foo items and /foo/{key} returns the full content of the foo identified by the given key.

Refer to the details of the specific REST resources.

**Media Types**

The Crowd REST APIs return HTTP responses in one of the following formats:

<table>
<thead>
<tr>
<th>Response Format</th>
<th>Requested via...</th>
</tr>
</thead>
</table>
| JSON            | Requested via one of the following:  
|                 | • application/json in the HTTP Accept header  
|                 | • .json extension |
| XML             | Requested via one of the following:  
|                 | • application/xml in the HTTP Accept header  
|                 | • .xml extension |

**API Versions**

The Crowd REST APIs are subject to version control. The version number of an API appears in its URI. For example, use this URI structure to request version 1 of the 'admin' API:

```
http://host:port/context/rest/admin/1/...
```

To get the latest version of the API, you can also use the **latest** keyword. For example, if versions 1 and 2 of the 'admin' API are available, the following two URIs will point to the same resources:

- `http://host:port/context/rest/admin/latest/...`
- `http://host:port/context/rest/admin/2/...

**Notes:**

- The API version number is an integer, such as 1 or 2.
- The API version is independent of the Crowd release number.
- The API version may, or may not, change with a new Crowd release. The API version number will change only when the updates to the API break the API contract, requiring changes in the code which uses the API. An addition to the API does not necessarily require a change to the API version number.
- In the future, when there are multiple API versions available, it is the intention that each version of Crowd will support at least two API versions i.e. the latest API version and the previous API version.

**Authentication**

Access to all resources (using any method) requires the client to be authenticated, via basic authentication. See [RFC 2617](https://tools.ietf.org/html/rfc2617).

For example, the following **cURL** request searches for a user called 'smith', with basic authentication where the username and password are both 'admin':

```
```

**HTTP Response Codes**
Methods

You will use the standard HTTP methods to access Crowd via the REST APIs. Please refer to the resource descriptions to see the HTTP methods available for each resource.

Example of Using the CROWD APIs

Below is a start-to-finish description of how to use the Crowd REST APIs to perform a simple task.

Documentation in progress
See CWD-1594.

REST Resources

The Crowd REST APIs allow you to address the Crowd data entities as ‘resources’. This means that they are identified by URIs and operated on by HTTP requests, chiefly GET and POST. Whenever you GET one of these resources, you receive a representation encoded using XML or JSON. Below are details of the resources made available by the APIs.

Experimental APIs

Crowd’s REST APIs are experimental at this stage. We will be adding to them in future releases. So please expect some API changes 😊 We will be delighted if you use the APIs and give us your feedback via our JIRA project.

Introduction

URI Structure

URLs for a Crowd REST API resource have the following structure:

With context:

http://host:port/context/rest/api-name/api-version/resource-name

Or without context:

http://host:port/rest/api-name/api-version/resource-name

In Crowd 2.0, the only api-name available is admin, This is the API that allows interaction with the Crowd Administration Console.

Examples:

With context:
Or without context:

<table>
<thead>
<tr>
<th>URI</th>
<th>/directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Lists all the directories managed by the Crowd server.</td>
</tr>
<tr>
<td>URI Parameters</td>
<td>None.</td>
</tr>
<tr>
<td>The directory resource does</td>
<td>The directory resource does not currently support the search parameter.</td>
</tr>
<tr>
<td>not currently support the</td>
<td>There is an existing improvement request: CWD-1603.</td>
</tr>
<tr>
<td>search parameter.</td>
<td></td>
</tr>
<tr>
<td>HTTP Methods</td>
<td>• GET — Returns a list of directories.</td>
</tr>
</tbody>
</table>

Example of a GET request:

```
http://localhost:8095/crowd/rest/admin/latest/directory
```

Example of XML response:
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
<directories>
  <directory>
    <name>Active Directory</name>
    <type>CONNECTOR</type>

<td>Refer to the section on directory information below for the elements describing each directory.</td>
<td></td>
</tr>
</tbody>
</table>

Example of JSON response:
Directory Information

<table>
<thead>
<tr>
<th>URI</th>
<th>/directory/DIRECTORY-KEY where DIRECTORY-KEY is the directory name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Retrieves information about a specific directory.</td>
</tr>
<tr>
<td>URI Parameters</td>
<td>None.</td>
</tr>
<tr>
<td>HTTP Methods</td>
<td>• GET — Returns the directory information.</td>
</tr>
</tbody>
</table>

Example of a request for information about directory 'atlassian crowd':

http://localhost:8095/crowd/rest/admin/latest/directory/atlassian%20crowd

Example of XML response:

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
<directory>
  <name>Atlassian Crowd</name>
  <type>INTERNAL</type>
  <implementationClass>com.atlassian.crowd.integration.directory.internal.InternalDirectory</implementationClass>
</directory>
```

Elements in the response:

</thead>
<tbody>
<tr>
<td>directory</td>
<td>A directory defined in Crowd.</td>
<td></td>
</tr>
<tr>
<td>name</td>
<td>The name of the directory, as defined in Crowd.</td>
<td></td>
</tr>
</tbody>
</table>
### User List

**URI**

/directory/DIRECTORY-KEY/user

*where* DIRECTORY-KEY is the directory name

**Description**

Lists all the users in the given directory and allows you to add a user to the list.

**URI Parameters**

- ?search=SEARCHVALUE — This parameter is **required** on a GET request. This resource returns an HTTP 403 (access forbidden) if a GET request is sent to the URL without the search parameter. Replace SEARCHVALUE with your search term. The search term can be all or part of the username, name or email address. Leave the search term empty to return all users. **⚠️** Requesting all users is not recommended if your Crowd installation manages a large number of users, as this can result in severe performance degradation.

**HTTP Methods**

- **GET** — Returns a list of users.
- **POST** — Adds a user to the given directory. For the XML specification, refer to the user information resource.

**Example of a search for users matching 'ad' in directory 'atlassian crowd':**

http://localhost:8095/crowd/rest/admin/latest/directory/atlassian%20crowd/user?search=ad

**Example of XML response to the above request:**

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
<users>
  <user>
    <identifier>adent</identifier>
    <username>adent</username>
    <firstName>Arthur</firstName>
    <lastName>Dent</lastName>
    <displayName>Arthur Dent</displayName>
    <emailAddress>adent@example.com</emailAddress>
  </user>
  <user>
    <identifier>admin</identifier>
    <username>admin</username>
    <firstName>Admin</firstName>
    <lastName>Administrator</lastName>
    <displayName>Admin Administrator</displayName>
    <emailAddress>admin@example.com</emailAddress>
  </user>
</users>
```
Elements in the response:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>users</td>
<td>A list of users in the Crowd directory.</td>
<td>Refer to the section on user information below for the elements describing each user.</td>
</tr>
</tbody>
</table>

Example of JSON response for a list of users:

```
{
    "users": [
        {
            "identifier": "adent",
            "username": "adent",
            "firstName": "Arthur",
            "lastName": "Dent",
            "displayName": "Arthur Dent",
            "emailAddress": "adent@example.com"
        },
        {
            "identifier": "admin",
            "username": "admin",
            "firstName": "Admin",
            "lastName": "Administrator",
            "displayName": "Admin Administrator",
            "emailAddress": "admin@example.com"
        }
    ],
    "emailAddress": "admin@example.com"
}
```

**User Information**

<table>
<thead>
<tr>
<th>URI</th>
<th>/directory/DIRECTORY-KEY/user/USER-KEY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Retrieves or updates information about a specific user and allows deletion of the user from the given directory.</td>
</tr>
<tr>
<td>URI Parameters</td>
<td>None.</td>
</tr>
<tr>
<td>HTTP Methods</td>
<td>GET — Returns information about the given user in the given directory. PUT — Updates the user details. DELETE — Removes the user from the directory.</td>
</tr>
</tbody>
</table>

Here is an example of a request for information on user 'adent' in directory 'atlassian crowd':

```
http://localhost:8095/crowd/rest/admin/latest/directory/atlassian%20crowd/user/adent
```

The following cURL request deletes the user 'adent', using basic authentication where the username and password are both 'admin':

```
curl -X DELETE http://localhost:8095/crowd/rest/admin/latest/directory/atlassian%20crowd/user/adent -u admin:admin
```

Example of XML response giving user information:
Elements in the response:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>A user defined in a Crowd directory</td>
<td></td>
</tr>
<tr>
<td>identifier</td>
<td>The user's username. Currently, this element contains the same value as the username element.</td>
<td></td>
</tr>
<tr>
<td>username</td>
<td>The user's username.</td>
<td></td>
</tr>
<tr>
<td>firstName</td>
<td>The user's first name.</td>
<td></td>
</tr>
<tr>
<td>lastName</td>
<td>The user's last name.</td>
<td></td>
</tr>
<tr>
<td>displayName</td>
<td>The user's full name, composed of first name plus last name.</td>
<td></td>
</tr>
<tr>
<td>emailAddress</td>
<td>The user's email address.</td>
<td></td>
</tr>
</tbody>
</table>

Example of JSON response giving user information:

```json
{
    "identifier":"adent",
    "username":"adent",
    "firstName":"Arthur",
    "lastName":"Dent",
    "displayName":"Arthur Dent",
    "emailAddress":"adent@example.com"
}
```

**Group List**

<table>
<thead>
<tr>
<th>URI</th>
<th>/directory/DIRECTORY-KEY/group</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>where DIRECTORY-KEY is the directory name</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>URI Parameters</th>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>?search=SEARCHVALUE — This parameter is <strong>required</strong> on a GET request. This resource returns an HTTP 403 (access forbidden) if a GET request is sent to the URL without the search parameter. Replace SEARCHVALUE with your search term. The search term can be all or part of the group name. Leave the search term empty to return all groups.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>HTTP Methods</th>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET — Returns a list of groups.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>POST — Adds a group to the given directory. For the XML specification, refer to the group information resource.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example of a search request for groups matching 'team' in directory 'atlassian crowd':

```
http://localhost:8095/crowd/rest/admin/latest/directory/atlassian%20crowd/group?search=team
```

Example of XML response to the above request:
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
<groups>
  <group>
    <identifier>my-team</identifier>
    <name>my-team</name>
    <description>My Team</description>
  </group>
  <group>
    <identifier>team2</identifier>
    <name>team2</name>
    <description>Team 2</description>
  </group>
  <group>
    <identifier>team3</identifier>
    <name>team3</name>
    <description>Team 3</description>
  </group>
  <group>
    <identifier>teamlead</identifier>
    <name>teamlead</name>
    <description>Team Leader</description>
  </group>
</groups>

Elements in the response:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>groups</td>
<td>A list of groups in the Crowd directory.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Refer to the section on group information below for the elements describing each group.</td>
<td></td>
</tr>
</tbody>
</table>

Example of JSON response for a list of groups:

```json
{
  "groups": [
    {
      "identifier": "my-team",
      "name": "my-team",
      "description": "My Team",
      "type": "GROUP"
    },
    {
      "identifier": "team2",
      "name": "team2",
      "description": "Team 2",
      "type": "GROUP"
    },
    {
      "identifier": "team3",
      "name": "team3",
      "description": "Team 3",
      "type": "GROUP"
    },
    {
      "identifier": "teamlead",
      "name": "teamlead",
      "description": "Team Leader",
      "type": "LEGACY_ROLE"
    }
  ]
}
```

**Group Information**

| URI       | /directory/DIRECTORY-KEY/group/GROUP-KEY where DIRECTORY-KEY is the directory name and GROUP-KEY is the group name |
Retrieves or updates information about a specific group.

**HTTP Methods**

- **GET** — Returns information about the given group in the given directory.
- **DELETE** — Deletes the given group from the given directory.

Here is an example of a request for information on group ‘my-team’ in directory ‘atlassian crowd’:

http://localhost:8095/crowd/rest/admin/latest/directory/atlassian%20crowd/group/my-team

The following cURL request deletes the group ‘my-team’, using basic authentication where the username and password are both ‘admin’:

```bash
curl -X DELETE http://localhost:8095/crowd/rest/admin/latest/directory/atlassian%20crowd/group/my-team
-u admin:admin
```

Example of XML response for group information:

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
<group>
  <identifier>my-team</identifier>
  <name>my-team</name>
  <description>My Team</description>
  <type>GROUP</type>
</group>
```

**Elements in the response:**

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>group</td>
<td>A group as defined in a Crowd directory.</td>
<td></td>
</tr>
<tr>
<td>identifier</td>
<td>The group name. Currently, this element contains the same value as the name element.</td>
<td></td>
</tr>
<tr>
<td>name</td>
<td>The group name.</td>
<td></td>
</tr>
<tr>
<td>description</td>
<td>A description of the group.</td>
<td></td>
</tr>
<tr>
<td>type</td>
<td>Indicates whether this item is a group or a role. Possible values are:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• GROUP — The returned item is a group.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• LEGACY_ROLE — The returned item is a role, as currently defined in Crowd.</td>
<td></td>
</tr>
</tbody>
</table>

Example of JSON response for group information:

```json
{
  "identifier":"my-team",
  "name":"my-team",
  "description":"My Team",
  "type":"GROUP"
}
```

**Group Membership for a User**

**URI**

`/directory/DIRECTORY-KEY/user/USER-KEY/memberships` where `DIRECTORY-KEY` is the directory name and `USER-KEY` is the username.
<table>
<thead>
<tr>
<th>Description</th>
<th>Retrieves a list of the groups a given user belongs to, in the given directory.</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI Parameters</td>
<td>None.</td>
</tr>
<tr>
<td>HTTP Methods</td>
<td>• GET — Returns a list of groups that the user belongs to.</td>
</tr>
</tbody>
</table>

Here is an example of a request for the groups to which user ‘adent’ belongs, in directory ‘atlassian crowd’:

```
http://localhost:8095/crowd/rest/admin/latest/directory/atlassian%20crowd/user/adent/memberships
```

Example of XML response for a list of group memberships:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
<groups>
  <group>
    <identifier>my-team</identifier>
    <name>my-team</name>
    <description>My Team</description>
    <type>GROUP</type>
  </group>
  <group>
    <identifier>techwriter</identifier>
    <name>techwriter</name>
    <description>Technical writer</description>
    <type>LEGACY_ROLE</type>
  </group>
  <group>
    <identifier>confluence-users</identifier>
    <name>confluence-users</name>
    <description>Confluence users</description>
    <type>GROUP</type>
  </group>
</groups>
```

Elements in the response:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>groups</td>
<td>A list of groups in the Crowd directory. Refer to the section on group information above for the elements describing each group.</td>
<td></td>
</tr>
</tbody>
</table>

Example of JSON response for a list of group members:

```
{
  "group": [
    {
      "identifier": "my-team",
      "name": "my-team",
      "description": "My Team",
      "type": "GROUP"
    },
    {
      "identifier": "techwriter",
      "name": "techwriter",
      "description": "Technical writer",
      "type": "LEGACY_ROLE"
    },
    {
      "identifier": "confluence-users",
      "name": "confluence-users",
      "description": "Confluence users",
      "type": "GROUP"
    }
  ]
}
```

Crowd REST APIs
Developing Plugins for Crowd

Crowd now ships with the Atlassian Plugin Framework 2. This gives developers lots of flexibility in extending Crowd and as more Atlassian applications migrate to version 2 you should see more similarities with configuration and development.

Plugin Framework Overview

For an overview of the plugin framework and plugin development, please refer to
- An overview of the Atlassian plugin development platform.
- Latest documentation for the Atlassian Plugin Framework 2.
- This version of Crowd supports version 2.2 of the Atlassian Plugin Framework. The documentation is in Atlassian Plugin Framework 2.2.

The Plugin Framework in Crowd

Currently Crowd has the following plugin points. A few of these are specific to Crowd, while others are more general across all Atlassian products.

1. Password Encoders
2. Web menu items and sections
3. Event listeners
4. Servlets
5. XWork actions
6. Spring components
7. Crowd Applications
8. REST plugin modules

The Crowd Google Apps connector is implemented as a plugin. Crowd customers get source-code access to both the plugin and Crowd itself, and can use the source in conjunction with the documentation to understand best practices for plugin development.

Adding your Plugin to your Crowd Instance

Once you have created your plugin, you should put the jar into the plugins directory, a sub-directory of your Crowd Home directory. See Important Directories and Files.

If you’d like to release your plugin to the world, please take a look at the guidelines in our Developer Network.

Component Plugin Modules

On this page:
- Purpose of this Module Type
- Configuration
  - Attributes
  - Elements
- Example
- Notes

Purpose of this Module Type

Component plugin modules enable you to share Java components between other modules in your plugin and optionally with other plugins in the application.

Configuration

The root element for the Component plugin module is component. It allows the following attributes and child elements for configuration:

Attributes

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td></td>
<td>The alias to use for the component when registering it in the internal bean factory.</td>
<td>The plugin key</td>
</tr>
</tbody>
</table>
The class which implements this plugin module. The class you need to provide depends on the module type. For example, Confluence theme, layout and colour-scheme modules can use classes already provided in Confluence. So you can write a theme-plugin without any Java code. But for macro and listener modules you need to write your own implementing class and include it in your plugin. The Java class of the component. This does not need to extend or implement any class or interface.

**key**

The identifier of the plugin module. This key must be unique within the plugin where it is defined. Sometimes you will need to uniquely identify a module. Do this with the module complete key. A module with key fred in a plugin with key com.example.modules will have a complete key of com.example.modules:fred. I.e. the identifier of the component.

**i18n-name-key**

The localisation key for the human-readable name of the plugin module.

**name**

The human-readable name of the plugin module. I.e. the human-readable name of the component.

**public**

Indicates whether this component should be made available to other plugins via the Component Import Plugin Module or not.

**system**

Indicates whether this plugin module is a system plugin module (value='true') or not (value='false'). Only available for non-OSGi plugins.

### Elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface</td>
<td></td>
<td>The Java interface under which this component should be registered. This element can appear zero or more times.</td>
<td>N/A</td>
</tr>
<tr>
<td>description</td>
<td></td>
<td>The description of the plugin module. The 'key' attribute can be specified to declare a localisation key for the value instead of text in the element body.</td>
<td>N/A</td>
</tr>
</tbody>
</table>

### Example

Here is an example `atlassian-plugin.xml` file containing a single public component:

```xml
<atlassian-plugin name="Hello World" key="example.plugin.helloworld" plugins-version="2">
  <plugin-info>
    <description>A basic component module test</description>
    <vendor name="Atlassian Software Systems" url="http://www.atlassian.com"/>
    <version>1.0</version>
  </plugin-info>

  <component key="helloWorldService" class="com.myapp.DefaultHelloWorldService">
    <description>Provides hello world services.</description>
    <interface>com.myapp.HelloWorldService</interface>
  </component>
</atlassian-plugin>
```

### Notes

Some information to be aware of when developing or configuring a Component plugin module:

- Components, at installation time, are used to generate the `atlassian-plugins-spring.xml` Spring Framework configuration file, transforming Component plugin modules into Spring bean definitions. The generated file is stored in a temporary plugin jar and installed into the framework. The plugin author should very rarely need to override this file.
- The injection model for components first looks at the constructor with the largest number of arguments and tries to call it, looking up parameters by type in the plugin's bean factory. If only a no-arg constructor is found, it is called then Spring tries to autowire the bean by looking at the types used by setter methods. If you wish to have more control over how your components are created and configured, you can create your own Spring configuration file, stored in `META-INF/spring` in your plugin jar.
- If the public attribute is set to 'true', the component will be turned into an OSGi service under the covers, using Spring Dynamic Modules to manage its lifecycle.
- This module type in non-OSGi (version 1) plugins supported the StateAware interface in some products to allow a component to react to when it is enabled or disabled. To achieve the same effect, you can use the two Spring lifecycle interfaces: InitializingBean and DisposableBean. The init() and destroy() methods on these interfaces will be called when the module is enabled or disabled, exactly like
State Aware. Making this change to a component in an existing plugin will be backwards compatible in all but JIRA. That is, a component module in a legacy plugin which implements InitializingBean will have its init() method called when it is enabled, exactly the same as such a component in an OSGi plugin.

- Components for non-OSGi (version 1) plugins behave very differently to components for OSGi plugins. For version 1 plugins, components are loaded into the application’s object container, be it PicoContainer for JIRA or Spring for all other products that support components. For OSGi plugins, components are turned into beans for the Spring bean factory for that specific plugin. This provides more separation for plugins, but means you cannot do things like override JIRA components in OSGi plugins, as you can for static plugins.

Developing Plugins for Crowd

Information sourced from Plugin Framework documentation

**Event Listeners**

On this page:

- The Listener Plugin Module
- The Event Listener Class
- Events and Event Types
- Limitations of Events
- Examples of Event Listeners

If you are familiar with writing a listener for Confluence, writing a listener plugin for Crowd should be almost identical.

In Crowd, events are thrown for almost all operations that occur to a user. (If you need more or find a spot we haven’t thought of, please let us know!)

**The Listener Plugin Module**

Below is an example atlassian-plugin.xml that will configure your event Listeners:

```xml
<atlassian-plugin name="Example Listeners" key="crowd.listeners.core" system="false">
  <plugin-info>
    <description>This contains example listeners</description>
    <vendor name="Atlassian Software Systems" url="http://www.atlassian.com"/>
    <version>1.0</version>
  </plugin-info>
  <listener name="Reset Password Listener" key="resetpasswordlistener" class="com.atlassian.crowd.event.listener.ResetPasswordListener">
    <description>Will handle reset password events, sending out a principal their new password.</description>
  </listener>
</atlassian-plugin>
```

**The Event Listener Class**

Your event listener must implement the `com.atlassian.event.EventListener` interface:
package com.atlassian.event;

/**
 * Defines a listener for Crowd events.
 */
public interface EventListener
{
    /**
     * Perform some action as a response to an event. The EventManager will
     * ensure that this is only called if the class of the event matches one of the
     * classes returned by getHandledEventClasses
     * @param event some event triggered within Crowd
     */
    void handleEvent(Event event);

    /**
     * Determine which event classes this listener is interested in.
     * The EventManager performs rudimentary filtering of events by their class. If
     * you want to receive only a subset of events passing through the system, return
     * an array of the Classes you wish to listen for from this method.
     * Listening for a class will also listen for all its subclasses. (And listening
     * for an interface will listen for any implementation of that interface)
     * Returning an empty array will allow you to receive every event.
     * @return An array of the event classes that this event listener is interested in,
     * or an empty array if the listener should receive all events. <b>Must not</b>
     * return null.
     */
    Class[] getHandledEventClasses();
}

Events and Event Types

Most event types in Crowd currently extend com.atlassian.crowd.event.DirectoryEvent. If you want to see the current list of available events, please take a look at Crowd's JavaDoc.

Generally Crowd uses the following naming scheme for events:
<Object><Operation>Event

For example:
PrincipalUpdatedEvent.
This event would indicate that a Principal (<Object>) has been updated (<Operation>).

Limitations of Events

Please take note of the following limitations:

- Events are a notification that something has occurred. The event system is not designed to allow a listener to veto the action that caused the event.
- There is no loop detection. If you write a listener for the GroupUpdatedEvent that itself causes a GroupUpdatedEvent to be generated, you are responsible for preventing the ensuing infinite loop.

Examples of Event Listeners

We would suggest looking at the current Crowd source. Currently there are only a few listeners implemented in Crowd, but more will come.

The above example of a module descriptor defines a ResetPasswordListener. Please look at this listener if you need a practical example.

RELATED TOPICS

Developing Plugins for Crowd
Password Encoders

This module type allows you to define your own password encoders for Crowd.

For example, say you want to implement a CRYPT password encoder.

Your `atlassian-plugin.xml` would look like this:

```xml
<atlassian-plugin name="Custom Password Encoders" key="mycompany.crowd.passwordencoders" system="false">
  <plugin-info>
    <description>Custom password encoders to work with my custom directory store</description>
    <vendor name="Atlassian Software Systems" url="http://www.atlassian.com"/>
    <version>1.0</version>
  </plugin-info>
  <encoder key="crypt" name="Crypt Password Encoder" class="com.atlassian.crowd.password.encoder.CryptPasswordEncoder">
    <description>CRYPT based encoder</description>
  </encoder>
</atlassian-plugin>
```

Your `com.atlassian.crowd.password.encoder.CryptPasswordEncoder` will need to implement one or both of the following interfaces:

- `com.atlassian.crowd.password.encoder.LdapPasswordEncoder`
- `com.atlassian.crowd.password.encoder.InternalPasswordEncoder`

These two interfaces extend a parent interface `com.atlassian.crowd.password.encoder.PasswordEncoder`. This interface may look very familiar if you have spent some time in the Spring Security source.1
package com.atlassian.crowd.password.encoder;

import com.atlassian.crowd.exception.PasswordEncoderException;

/**
 * Defines the operations and requirements for a class that needs to handle password
 * operations in Crowd
 * Some of the below documentation is taken from Spring Security
 */
public interface PasswordEncoder
{

    /**
     * Encodes the specified raw password with an implementation specific algorithm.
     * This will generally be a one-way message digest such as MD5 or SHA, but may also be a
     * plaintext
     * variant which does no encoding at all, but rather returns the same password it was fed. The
     * latter is useful to
     * plug in when the original password must be stored as-is.
     * The specified salt will potentially be used by the implementation to "salt" the initial
     * encoding. A salt is usually a user-specific value which is added to the password before the
     * digest is computed.
     * This means that computation of digests for common dictionary words will be different than those
     * in the backend
     * store, because the dictionary word digests will not reflect the addition of the salt. If a
     * per-user salt is
     * used (rather than a system-wide salt), it also means users with the same password will have
     * different digest
     * encoded passwords in the backend store. If a salt value is provided, the same salt value must be use when calling the
     * isPasswordValid(String, String, Object) method. Note that a specific implementation may
     * choose to ignore the
     * salt value (via null), or provide its own.
     * @param rawPass the password to encode
     * @param salt optionally used by the implementation to "salt" the raw password before
     * encoding. A
     * @return encoded password
     * @throws PasswordEncoderException if there were any issues trying to encode a password
     */
    String encodePassword(String rawPass, Object salt) throws PasswordEncoderException;

    /**
     * Validates a specified "raw" password against an encoded password.
     * The encoded password should have previously been generated by encodePassword(String,
     * Object). This method will encode the
     * rawPass (using the optional
     * salt) (encoding. A
     * compared it with the presented encPass).
     * For a discussion of salts, please refer to encodePassword(String, Object)).
     * @param encPass a pre-encoded password
     * @param rawPass a raw password to encode and compare against the pre-encoded password
     * @param salt optionally used by the implementation to "salt" the raw password before
     * encoding. A
     * @return true if the password is valid, false otherwise
     */
    boolean isPasswordValid(String encPass, String rawPass, Object salt);

    /**
     * The key to define this password encoder
     * @return
     */
    String getKey();
}
These two interfaces are marker interfaces that will determine whether or not your plugin will appear in the password encoder dropdown list which appears when a Crowd administrator adds an LDAP-based directory or an Internal directory.

Developing Plugins for Crowd

1 A big thanks to Ben Alex and the Spring Security team.

**REST Plugin Modules**

You can use a **REST plugin module type** to create plugin points easily in Crowd by exposing services and data entities as REST APIs.

**Background**

REST APIs provide access to resources via URI paths. To use a REST API, your plugin or script will make an HTTP request and parse the response. You can choose JSON or XML for the response format. Your methods will be the standard HTTP methods like GET, PUT, POST and DELETE.

Because the REST API is based on open standards, you can use any web development language to access the API.

✔ We used the REST plugin module type to develop Crowd's REST APIs for Crowd 2.0.

**Crowd and the REST Plugin Module Type**

The REST plugin module type is bundled with **Crowd 2.0 and later**.

To learn how to add your own REST APIs to Crowd and other Atlassian applications, please take a look at the documentation for the REST plugin module type.

**Servlet Plugin Modules**

On this page:

- Purpose of this Module Type
- Configuration
  - Attributes
  - Elements
- Example
- Accessing your Servlet
- Notes

**Purpose of this Module Type**

Servlet plugin modules enable you to deploy Java servlets as a part of your plugins.

**Configuration**

The root element for the Servlet plugin module is **servlet**. It allows the following attributes and child elements for configuration:

**Attributes**

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>class</td>
<td>✓</td>
<td>The servlet Java class. Must be a subclass of <code>javax.servlet.http.HttpServlet</code>.</td>
<td></td>
</tr>
<tr>
<td>disabled</td>
<td></td>
<td>Indicate whether the plugin module should be disabled by default (value='true') or enabled by default (value='false').</td>
<td>false</td>
</tr>
<tr>
<td>i18n-name-key</td>
<td></td>
<td>The localisation key for the human-readable name of the plugin module.</td>
<td></td>
</tr>
</tbody>
</table>
The identifier of the plugin module. This key must be unique within the plugin where it is defined. Sometimes you will need to uniquely identify a module. Do this with the module complete key. A module with key fred in a plugin with key com.example.modules will have a complete key of com.example.modules:fred, i.e. the identifier of the servlet.

The human-readable name of the plugin module. I.e. the human-readable name of the servlet.

Indicates whether this plugin module is a system plugin module (value='true') or not (value='false'). Only available for non-O SGi plugins.

Elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td></td>
<td>The description of the plugin module. The ‘key’ attribute can be specified to declare a localisation key for the value instead of text in the element body. I.e. the description of the servlet.</td>
<td></td>
</tr>
<tr>
<td>init-param</td>
<td></td>
<td>Initialisation parameters for the servlet, specified using param-name and param-value sub-elements, just as in web.xml. This element and its child elements may be repeated.</td>
<td>N/A</td>
</tr>
<tr>
<td>resource</td>
<td></td>
<td>A resource for this plugin module. This element may be repeated. A ‘resource’ is a non-Java file that a plugin may need in order to operate. Refer to Adding Plugin and Module Resources for details on defining a resource.</td>
<td>N/A</td>
</tr>
</tbody>
</table>
| url-pattern | ✔️       | The pattern of the URL to match. This element may be repeated. The URL pattern format is used in Atlassian plugin types to map them to URLs. On the whole, the pattern rules are consistent with those defined in the Servlet 2.3 API. The following wildcards are supported: *
- matches zero or many characters, including directory slashes
- ? matches zero or one character
  Examples
  - /mydir/* matches /mydir/myfile.xml
  - /*/admin/*/??ml matches /mydir/otherdir/admin/myfile.html | N/A     |

Example

Here is an example atlassian-plugin.xml file containing a single servlet:

```xml
<atlassian-plugin name="Hello World Servlet" key="example.plugin.helloworld" plugins-version="2">
  <plugin-info>
    <description>A basic Servlet module test - says "Hello World!"</description>
    <vendor name="Atlassian Software Systems" url="http://www.atlassian.com"/>
    <version>1.0</version>
  </plugin-info>
  <servlet name="Hello World Servlet" key="helloworld" class="com.example.myplugins.helloworld.HelloWorldServlet">
    <description>Says Hello World, Australia or your name.</description>
    <url-pattern>/helloworld</url-pattern>
    <init-param>
      <param-name>defaultName</param-name>
      <param-value>Australia</param-value>
    </init-param>
  </servlet>
</atlassian-plugin>
```

Accessing your Servlet

Your servlet will be accessible within the Atlassian web application via each url-pattern you specify, beneath the /plugins/servlet parent path.

For example, if you specify a url-pattern of /helloworld as above, and your Atlassian application was deployed at http://yourserver/jira —
then your servlet would be accessed at [http://yourserver/jira/plugins/servlet/helloworld](http://yourserver/jira/plugins/servlet/helloworld).

**Notes**

Some information to be aware of when developing or configuring a Servlet plugin module:

- Your servlet's `init()` method will not be called on web application startup, as for a normal servlet. Instead, this method will be called the first time your servlet is accessed after each time it is enabled. This means that if you disable a plugin containing a servlet, or a single servlet module, and re-enable it again, the servlet is re-instantiated and its `init()` method will be called again.
- Because all servlet modules are deployed beneath a common `/plugins/servlet` root, be careful when choosing each `url-pattern` under which your servlet is deployed. It is recommended to use a value that will always be unique to the world!

- **Example**

**Purpose of this Module Type**

Web Item plugin modules allow plugins to define new links in application menus.

**Configuration**

The root element for the Web Item plugin module is `web-item`. It allows the following attributes and child elements for configuration:

**Attributes**

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>class</td>
<td></td>
<td>The class which implements this plugin module. The class you need to provide depends on the module type. For example, Confluence theme, layout and colour-scheme modules can use classes already provided in Confluence. So you can write a theme-plugin without any Java code. But for macro and listener modules you need to write your own implementing class and include it in your plugin.</td>
<td></td>
</tr>
<tr>
<td>disabled</td>
<td></td>
<td>Indicate whether the plugin module should be disabled by default (value='true') or enabled by default (value='false').</td>
<td>false</td>
</tr>
<tr>
<td>i18n-name-key</td>
<td></td>
<td>The localisation key for the human-readable name of the plugin module.</td>
<td>false</td>
</tr>
<tr>
<td>key</td>
<td>✓</td>
<td>The identifier of the plugin module. This key must be unique within the plugin where it is defined.</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td></td>
<td><img src="https://confluence.atlassian.com/pages/attachments/download/1132907?version=1&amp;view=media&amp;at=default" alt=" Sometimes you will need to uniquely identify a module. Do this with the module complete key. A module with key fred in a plugin with key com.example.modules will have a complete key of com.example.modules:fred. " /></td>
<td></td>
</tr>
<tr>
<td>name</td>
<td></td>
<td>The human-readable name of the plugin module. Used only in the plugin's administrative user interface.</td>
<td></td>
</tr>
<tr>
<td>section</td>
<td>✓</td>
<td>Location into which this web item should be placed. For non-sectioned locations, this is just the location key. For sectioned locations it is the location key, followed by a slash ('/'), and the name of the web section in which it should appear.</td>
<td>N/A</td>
</tr>
<tr>
<td>system</td>
<td></td>
<td>Indicates whether this plugin module is a system plugin module (value='true') or not (value='false'). Only available for non-OSGi plugins.</td>
<td>false</td>
</tr>
</tbody>
</table>
Determines the order in which web items appear. Items are displayed top to bottom or left to right in order of ascending weight. The 'lightest' weight is displayed first, the 'heaviest' weights sink to the bottom. The weights for most applications' system sections start from 100, and the weights for the links generally start from 10. The weight is incremented by 10 for each in sequence so that there is ample space to insert your own sections and links.

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>condition</td>
<td></td>
<td>Defines a condition that must be satisfied for the web item to be displayed. If you want to 'invert' a condition, add an attribute 'invert=&quot;true&quot;' to it. The web item will then be displayed if the condition returns false (not true).</td>
<td>N/A</td>
</tr>
<tr>
<td>conditions</td>
<td></td>
<td>Defines the logical operator type to evaluate its condition elements. By default 'AND' will be used.</td>
<td>AND</td>
</tr>
<tr>
<td>context-provider</td>
<td></td>
<td>Allows dynamic addition to the velocity context available for various web item elements (in XML descriptors only). Currently only one context-provider can be specified per web item and section.</td>
<td></td>
</tr>
<tr>
<td>description</td>
<td></td>
<td>The description of the plugin module. The 'key' attribute can be specified to declare a localisation key for the value instead of text in the element body, i.e. the description of the web item.</td>
<td></td>
</tr>
<tr>
<td>icon</td>
<td></td>
<td>Defines an icon to display with or as the link. Note: In some cases the icon element seems to be required. Try adding it if your web section is not displaying properly.</td>
<td>N/A</td>
</tr>
<tr>
<td>label</td>
<td>✅</td>
<td>Is the i18n key that will be used to look up the textual representation of the link.</td>
<td>N/A</td>
</tr>
<tr>
<td>link</td>
<td>✅</td>
<td>Defines where the web item should link to. The contents of the link element will be rendered using Velocity, allowing you to include dynamic content in links. For more complex examples of links, see below.</td>
<td>N/A</td>
</tr>
<tr>
<td>param</td>
<td></td>
<td>Parameters for the plugin module. Use the 'key' attribute to declare the parameter key, then specify the value in either the 'value' attribute or the element body. This element may be repeated. An example is the configuration link described in Adding a Configuration UI for your Plugin. This is handy if you want to use additional custom values from the UI.</td>
<td>N/A</td>
</tr>
<tr>
<td>resource</td>
<td></td>
<td>A resource for this plugin module. This element may be repeated. A 'resource' is a non-Java file that a plugin may need in order to operate. Refer to Adding Plugin and Module Resources for details on defining a resource.</td>
<td>N/A</td>
</tr>
<tr>
<td>tooltip</td>
<td></td>
<td>Is the i18n key that will be used to look up the textual mouse-over text of the link.</td>
<td>N/A</td>
</tr>
</tbody>
</table>

Label Elements

Label elements may contain optional parameters, as shown below:

```xml
<label key="common.concepts.create.new.issue">
  <param name="param0">$helper.project.name</param>
</label>
```

- The parameters allow you to insert values into the label using Java's `MessageFormat` syntax.
- Parameter names must start with `param` and will be mapped in alphabetical order to the substitutions in the format string. I.e. `param0` is 0, `param1` is 1, `param2` is 2, etc.
- Parameter values are rendered using Velocity, allowing you to include dynamic content.

Tooltip Elements

Tooltip elements have the same attributes and parameters as the label elements. See above.

Link Elements

Link elements may contain additional information:
The `linkId` is **optional**, and provides an XML id for the link being generated.

The body of the link element is its URL. The URL is rendered with Velocity, so you can include dynamic information in the link. For example, in Confluence, the following link would include the page ID:

```xml
<link linkId="view-attachments-link">/pages/viewpageattachments.action?pageId=$page.id</link>
```

**Icon Elements**

Icon elements have a `height` and a `width` attribute. The location of the icon is specified within a `link` element:

```xml
<icon height="16" width="16">
  <link>/images/icons/print.gif</link>
</icon>
```

**Param Elements**

Param elements represent a map of key/value pairs, where each entry corresponds to the `param` elements attribute: `name` and `value` respectively.

```xml
<param name="key" value="value" />
```

The value can be retrieved from within the Velocity view with the following code, where `$item` is a `WebItemModuleDescriptor`:

```xml
$item.webParams.get("key") <!-- retrieve the value -->
$item.webParams.getRenderedParam("key", $user, $helper) <!-- retrieve the Velocity rendered value -->
```

If the `value` attribute is not specified, the value will be set to the body of the element. I.e. the following two param elements are equivalent:

```xml
<param name="isPopupLink" value="true" />
<param name="isPopupLink">true</param>
```

**Context-provider Element**

This feature only applies to JIRA

Only JIRA supports custom context providers.

The context-provider element adds to the Velocity context available to the `web section` and `web item` modules. You can add what you need to the context, to build more flexible section and item elements. Currently only one context-provider can be specified per module. Additional context-providers are ignored.

The `context-provider` element must contain a `class` attribute with the fully-qualified name of a Java class. The referenced class:

- must implement `com.atlassian.plugin.web.ContextProvider`, and
- will be auto-wired by Spring before any additions to the Velocity context.

For example, the following context-provider will add `historyWindowHeight` and `filtersWindowHeight` to the context.
In the following example, `HeightContextProvider` extends `AbstractJiraContextProvider`, which is only available in JIRA and happens to implement `ContextProvider`. The `AbstractJiraContextProvider` conveniently extracts the `User` and `JiraHelper` from the context map, which you would otherwise have to do manually.

```java
public class HeightContextProvider extends AbstractJiraContextProvider {
    private final ApplicationProperties applicationProperties;

    public HeightContextProvider(ApplicationProperties applicationProperties) {
        this.applicationProperties = applicationProperties;
    }

    public Map.getContextMap(User user, JiraHelper jiraHelper) {
        int historyIssues = 0;
        if (jiraHelper != null && jiraHelper.getRequest() != null) {
            UserHistory history = (UserHistory)
                jiraHelper.getRequest().getSession().getAttribute(SessionKeys.USER_ISSUE_HISTORY);
            if (history != null) {
                historyIssues = history.getIssues().size();
            }
        }
        int logoHeight = TextUtils.parseInt(applicationProperties.getDefaultBackedString(APKeys.JIRA_LF_LOGO_HEIGHT));
        String historyHeight = String.valueOf(80 + logoHeight + (25 * historyIssues));
        String filterHeight = String.valueOf(205 + logoHeight);
        return EasyMap.build("historyWindowHeight", historyHeight, "filtersWindowHeight", filterHeight);
    }
}
```

The above `HeightContextProvider` can be used by nesting the following element in a web item module:

```xml
<context-provider class="com.atlassian.jira.plugin.web.contextproviders.HeightContextProvider"/>
```

The newly added context entries `historyWindowHeight` and `filtersWindowHeight` can be used in the XML module descriptors just like normal velocity context variables, by prefixing them with the dollar symbol ($):

```xml
<!-- pass the value of historyWindowHeight as a parameter called windowHeight (see param element above for its usage) -->
<param name="windowHeight">$historyWindowHeight</param>

<!-- set the link's label to print the value of filtersWindowHeight -->
<label>filter window height is: $filtersWindowHeight</label>
```

### Condition and Conditions Elements

Conditions can be added to the web section and web item modules, to display them only when all the given conditions are true.

Condition elements must contain a class attribute with the fully-qualified name of a Java class. The referenced class:

- must implement `com.atlassian.plugin.web.Condition`, and
- will be auto-wired by Spring before any condition checks are performed.

Condition elements can take optional parameters. These parameters will be passed in to the condition's `init()` method as a map of string key/value pairs after autowiring, but before any condition checks are performed. For example:

```xml
<condition class="com.atlassian.jira.plugin.web.Condition">$params</condition>
```
To invert a condition, add the attribute "invert="true"" to the condition element. This is useful where you want to show the section if a certain condition is not satisfied.

Conditions elements are composed of a collection of condition/conditions elements and a type attribute. The type attribute defines what logical operator is used to evaluate its collection of condition elements. The type can be one of **AND** or **OR**.

For example: The following condition is true if the current user is a system administrator OR a project administrator:

```xml
<conditions type="OR">
  <condition class="com.atlassian.jira.plugin.web.conditions.JiraGlobalPermissionCondition">
    <param name="permission">admin</param>
  </condition>
  <condition class="com.atlassian.jira.plugin.web.conditions.UserHasProjectsCondition">
    <param name="permission">project</param>
  </condition>
</conditions>
```

**Example**

Here is an example `atlassian-plugin.xml` file containing a single web item:

```xml
<atlassian-plugin name="Hello World Plugin" key="example.plugin.helloworld" plugins-version="2">
  <plugin-info>
    <description>A basic web item module test</description>
    <vendor name="Atlassian Software Systems" url="http://www.atlassian.com"/>
    <version>1.0</version>
  </plugin-info>
  <web-item key="google_home" name="Google Home" section="system.admin/example1" weight="10">
    <description key="item.google.home.desc">Simple link to google.com.</description>
    <label key="item.google.home.label"/>
    <link linkId="google_home">http://google.com</link>
  </web-item>
</atlassian-plugin>
```

**Web Section Plugin Modules**

On this page:

- Purpose of this Module Type
- Configuration
  - Attributes
  - Elements
  - Label Elements
  - Tooltip Elements
  - Param Elements
  - Context-provider Element
  - Condition and Conditions elements
- Example

**Purpose of this Module Type**
Web Section plugin modules allow plugins to define new sections in application menus. Each section can contain one or more links. To insert the links themselves, see the Web Item Plugin Module.

**Configuration**

The root element for the Web Section plugin module is `web-section`. It allows the following attributes and child elements for configuration:

### Attributes

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>class</td>
<td></td>
<td>The class which implements this plugin module. The class you need to provide depends on the module type. For example, Confluence theme, layout and colour-scheme modules can use classes already provided in Confluence. So you can write a theme-plugin without any Java code. But for macro and listener modules you need to write your own implementing class and include it in your plugin.</td>
<td>N/A</td>
</tr>
<tr>
<td>disabled</td>
<td></td>
<td>Indicate whether the plugin module should be disabled by default (value=’true’) or enabled by default (value=’false’).</td>
<td>false</td>
</tr>
<tr>
<td>i18n-name-key</td>
<td></td>
<td>The localisation key for the human-readable name of the plugin module.</td>
<td></td>
</tr>
<tr>
<td>key</td>
<td></td>
<td>The identifier of the plugin module. This key must be unique within the plugin where it is defined. <strong>Tip:</strong> Sometimes you will need to uniquely identify a module. Do this with the module complete key. A module with key <code>fred</code> in a plugin with key <code>com.example.modules</code> will have a complete key of <code>com.example.modules:fred</code>.</td>
<td>N/A</td>
</tr>
<tr>
<td>name</td>
<td></td>
<td>The human-readable name of the plugin module. Only used in the plugin's administrative user interface.</td>
<td></td>
</tr>
<tr>
<td>section</td>
<td></td>
<td>Location into which this web item should be placed. For non-sectioned locations, this is just the location key. For sectioned locations it is the location key, followed by a slash (<code>/</code>), and the name of the web section in which it should appear.</td>
<td>N/A</td>
</tr>
<tr>
<td>system</td>
<td></td>
<td>Indicates whether this plugin module is a system plugin module (value=’true’) or not (value=’false’). Only available for non-OSGi plugins.</td>
<td>false</td>
</tr>
<tr>
<td>weight</td>
<td></td>
<td>Determines the order in which web items appear. Items are displayed top to bottom or left to right in order of ascending weight. The 'lightest' weight is displayed first, the 'heaviest' weights sink to the bottom. The weights for most applications' system sections start from 100, and the weights for their links generally start from 10. The weight is incremented by 10 for each in sequence so that there is ample space to insert your own sections and links.</td>
<td>N/A</td>
</tr>
</tbody>
</table>

### Elements

The table summarises the elements. The sections below contain further information.

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>condition</td>
<td></td>
<td>Defines a condition that must be satisfied for the web item to be displayed. If you want to 'invert' a condition, add an attribute 'invert=&quot;true&quot;' to it. The web item will then be displayed if the condition returns false (not true).</td>
<td>N/A</td>
</tr>
<tr>
<td>conditions</td>
<td></td>
<td>Defines the logical operator type used to evaluate the condition elements. By default 'AND' will be used.</td>
<td>AND</td>
</tr>
<tr>
<td>context-provider</td>
<td></td>
<td>Allows dynamic addition to the Velocity context available for various web item elements (in XML descriptors only). Currently only one context-provider can be specified per web item and section.</td>
<td>N/A</td>
</tr>
<tr>
<td>description</td>
<td></td>
<td>The description of the plugin module. The 'key' attribute can be specified to declare a localisation key for the value instead of text in the element body. Use this element to describe the section.</td>
<td></td>
</tr>
<tr>
<td>label</td>
<td></td>
<td>Is the i18n key that will be used to look up the textual representation of the link.</td>
<td>N/A</td>
</tr>
<tr>
<td>param</td>
<td></td>
<td>Parameters for the plugin module. Use the 'key' attribute to declare the parameter key, then specify the value in either the 'value' attribute or the element body. This element may be repeated. An example is the configuration link described in Adding a Configuration UI for your Plugin. Defines a key/value pair available from the web item. This is handy if you want to use additional custom values from the UI.</td>
<td>N/A</td>
</tr>
<tr>
<td>resource</td>
<td></td>
<td>A resource for this plugin module. This element may be repeated. A 'resource' is a non-Java file that a plugin may need in order to operate. Refer to Adding Plugin and Module Resources for details on defining a resource.</td>
<td>N/A</td>
</tr>
<tr>
<td>tooltip</td>
<td></td>
<td>Is the i18n key that will be used to look up the textual mouse-over text of the link.</td>
<td>N/A</td>
</tr>
</tbody>
</table>
**Label Elements**

Label elements may contain optional parameters, as shown below:

```xml
<label key="common.concepts.create.new.issue">
  <param name="param0">$helper.project.name</param>
</label>
```

- The parameters allow you to insert values into the label using Java's `MessageFormat` syntax.
- Parameter names must start with `param` and will be mapped in alphabetical order to the substitutions in the format string. I.e. `param0` is (0), `param1` is (1), `param2` is (2), etc.
- Parameter values are rendered using Velocity, allowing you to include dynamic content.

**Tooltip Elements**

Tooltip elements have the same attributes and parameters as the label elements. See above.

**Param Elements**

Param elements represent a map of key/value pairs, where each entry corresponds to the param elements attribute: `name` and `value` respectively.

```xml
<param name="key" value="value" />
```

The value can be retrieved from within the Velocity view with the following code, where `$item` is a `WebItemModuleDescriptor`:

```java
$item.webParams.get("key") <!-- retrieve the value -->
$item.webParams.getRenderedParam("key", $user, $helper) <!-- retrieve the Velocity rendered value -->
```

If the `value` attribute is not specified, the value will be set to the body of the element. I.e. the following two param elements are equivalent:

```xml
<param name="isPopupLink" value="true" />
<param name="isPopupLink">true</param>
```

**Context-provider Element**

This feature only applies to JIRA

Only JIRA supports custom context providers.

The context-provider element adds to the Velocity context available to the web section and web item modules. You can add what you need to the context, to build more flexible section and item elements. Currently only one context-provider can be specified per module. Additional context-providers are ignored.

The `context-provider` element must contain a class attribute with the fully-qualified name of a Java class. The referenced class:

- must implement `com.atlassian.plugin.web.ContextProvider`, and
- will be auto-wired by Spring before any additions to the Velocity context.

For example, the following context-provider will add `historyWindowHeight` and `filtersWindowHeight` to the context.

```java
HeightContextProvider extends AbstractJiraContextProvider, which is only available in JIRA and happens
to implement ContextProvider. The AbstractJiraContextProvider conveniently extracts the User and JiraHelper from the context
map, which you would otherwise have to do manually.
```
public class HeightContextProvider extends AbstractJiraContextProvider {
    private final ApplicationProperties applicationProperties;

    public HeightContextProvider(ApplicationProperties applicationProperties) {
        this.applicationProperties = applicationProperties;
    }

    public Map getContextMap(User user, JiraHelper jiraHelper) {
        int historyIssues = 0;
        if (jiraHelper != null && jiraHelper.getRequest() != null) {
            UserHistory history = (UserHistory) jiraHelper.getRequest().getSession().getAttribute(SessionKeys.USER_ISSUE_HISTORY);
            if (history != null) {
                historyIssues = history.getIssues().size();
            }
        }
        int logoHeight = TextUtils.parseInt(applicationProperties.getDefaultBackedString(APKeys.JIRA_LF_LOGO_HEIGHT));
        String historyHeight = String.valueOf(80 + logoHeight + (25 * historyIssues));
        String filterHeight = String.valueOf(205 + logoHeight);
        return EasyMap.build("historyWindowHeight", historyHeight,
                            "filtersWindowHeight", filterHeight);
    }
}

The above HeightContextProvider can be used by nesting the following element in a web item module.

    <context-provider class="com.atlassian.jira.plugin.web.contextproviders.HeightContextProvider" />

The newly added context entries historyWindowHeight and filtersWindowHeight can be used in the XML module descriptors just like normal velocity context variables, by prefixing them with the dollar symbol ($):

    <!-- pass the value of historyWindowHeight as a parameter called windowHeight (see param element above for its usage) -->
    <param name="windowHeight">$historyWindowHeight</param>

    <!-- set the link's label to print the value of filtersWindowHeight -->
    <label>filter window height is: $filtersWindowHeight</label>

Condition and Conditions elements

Conditions can be added to the web section and web item modules, to display them only when all the given conditions are true.

Condition elements must contain a class attribute with the fully-qualified name of a Java class. The referenced class:

- must implement com.atlassian.plugin.web.Condition, and
- will be auto-wired by Spring before any condition checks are performed.

Condition elements can take optional parameters. These parameters will be passed in to the condition's init() method as a map of string key/value pairs after autowiring, but before any condition checks are performed. For example:

    <condition class="com.atlassian.jira.plugin.web.conditions.JiraGlobalPermissionCondition">
        <param name="permission">admin</param>
    </condition>
To invert a condition, add the attribute `invert="true"` to the condition element. This is useful where you want to show the section if a certain condition is *not* satisfied.

Conditions elements are composed of a collection of condition/conditions elements and a type attribute. The type attribute defines what logical operator is used to evaluate its collection of condition elements. The type can be one of **AND** or **OR**.

For example: The following condition is true if the current user is a system administrator OR a project administrator:

```xml
<conditions type="OR">
  <condition class="com.atlassian.jira.plugin.web.conditions.JiraGlobalPermissionCondition">
    <param name="permission">admin</param>
  </condition>
  <condition class="com.atlassian.jira.plugin.web.conditions.UserHasProjectsCondition">
    <param name="permission">project</param>
  </condition>
</conditions>
```

### Example

Here is an example `atlassian-plugin.xml` file containing a single web section, using a condition that will be available in JIRA:

```xml
<atlassian-plugin name="Hello World Plugin" key="example.plugin.helloworld" plugins-version="#2">
  <plugin-info>
    A basic web section module test
    <vendor name="Atlassian Software Systems" url="http://www.atlassian.com"/>
    <version>1.0</version>
  </plugin-info>
  <web-section key="usersgroups" name="Users and Groups Section" location="system.admin" weight="110">
    <label key="admin.menu.usersandgroups.users.and.groups" />
    <condition class="com.atlassian.jira.plugin.web.conditions.UserIsAdminCondition" />
  </web-section>
</atlassian-plugin>
```

## Customising the Crowd Source Code

If neither the remote API nor the plugin framework fit your needs, you can customise the Crowd source code.

To help you get started:

- When you download Crowd, you also get the source code of a demo application.
- Read the guidelines on setting up your IDE.
- For ideas, take a look at what other people are doing.
- We supply full API documentation.

## Creating a new translation for Crowd

1. Copy the `crowd-webapp/WEB-INF/lib/crowd-language-<version>.jar` file from your Crowd application directory into a temporary directory.
1. Expand the JAR in the temporary directory.

   donna:lib dmcgahan$ cp crowd-language-1.5.1.jar ~/Desktop/crowd-language/.
   donna:crowd-language dmcgahan$ jar -xvf crowd-language-1.5.1.jar
   created: META-INF/
   inflated: META-INF/MANIFEST.MF
   created: com/
   created: com/atlassian/
   created: com/atlassian/crowd/
   created: com/atlassian/crowd/console/
   created: com/atlassian/crowd/console/action/
   created: com/atlassian/crowd/security/
   created: com/atlassian/crowd/security/demo/
   created: com/atlassian/crowd/security/demo/action/
   created: com/atlassian/crowd/openid/
   created: com/atlassian/crowd/openid/client/
   created: com/atlassian/crowd/openid/client/action/
   created: com/atlassian/crowd/openid/server/
   created: com/atlassian/crowd/openid/server/action/
   inflated: com/atlassian/crowd/console/action/BaseAction.properties
   inflated: com/atlassian/crowd/security/demo/action/BaseAction.properties
   inflated: com/atlassian/crowd/openid/client/action/BaseAction.properties
   inflated: com/atlassian/crowd/openid/server/action/BaseAction.properties
   created: META-INF/maven/
   created: META-INF/maven/com.atlassian.crowd/
   created: META-INF/maven/com.atlassian.crowd/crowd-language/
   inflated: META-INF/maven/com.atlassian.crowd/crowd-language/pom.xml
   inflated: META-INF/maven/com.atlassian.crowd/crowd-language/pom.properties

2. Once expanded, remove the original crowd-language-<version>.jar file from this temporary directory.

   donna:crowd-language dmcgahan$ rm crowd-language-1.5.1.jar
   Donna:crowd-language dmcgahan$ ll
   total 0
   drwxr-xr-x  4 dmcgahan  staff  136 Oct 15 16:27 .
   drwx------  16 dmcgahan  staff  544 Oct 15 16:25 ..
   drwxr-xr-x  4 dmcgahan  staff  136 Oct 15 16:27 META-INF
   drwxr-xr-x  3 dmcgahan  staff  102 Oct 15 16:27 com

3. In the temporary directory, modify each of the BaseAction.properties files with the new attribute translation. Apologies for my rough translation!

   console.welcome                Bienvenue à la foule console d'administration

4. If creating a new language translation for Crowd, you will need to rename each BaseAction.properties file in the temporary directory using the following format (e.g. for French, BaseAction_fr_FR.properties):

   BaseAction_<two-letter-language-code>_<two-letter-countrycode>.properties

   For more information on these codes please review the Locale javadoc. When finished the contents of your directories properties files should look similar to the following example (for our French translation):

   ./com/atlassian/crowd/console/action/BaseAction_fr_FR.properties
   ./com/atlassian/crowd/openid/client/action/BaseAction_fr_FR.properties
   ./com/atlassian/crowd/openid/server/action/BaseAction_fr_FR.properties
   ./com/atlassian/crowd/security/demo/action/BaseAction_fr_FR.properties

5. From within your temporary directory, create a new JAR for your translation:
So for our French translation example:

```
$ donna:crowd-language dmcgahan$ jar -cvf crowd-language-1.5.1_fr_FR.jar *
```

7. Place your new translation JAR in the crowd-webapp/WEB-INF/lib directory of Crowd and restart.

8. To set your locale for testing, simply add `-Duser.language=<language-code> -Duser.country=<country-code>" to JAVA_OPTS in Crowd's apache-tomcat/bin/setenv.sh:

```
JAVA_OPTS="-Xms128m -Xmx256m -XX:MaxPermSize=256m -Dfile.encoding=UTF-8 -Duser.language=fr
-Duser.country=FR"
```

or setenv.bat file:

```
set JAVA_OPTS=%JAVA_OPTS% -Xms128m -Xmx256m -Dfile.encoding=UTF-8 -Duser.language=fr
-Duser.country=FR
```

9. If you create a new language translation for Crowd that may be useful to others, please submit your translation on the

CROWD plugins page!

### Other options:

Please note that it is possible to add new language BaseAction_<language-code>_<country-code>.properties files to an expanded version of the existing crowd-language-<version>.jar file or modify the existing BaseAction.properties files for modifications to the default English text (e.g. Crowd = Company's Crowd). However, we would love to get new translations and make them available for customers. To do this, the method described above is the best approach.

### A few known issues:

Some exceptions handled in Crowd are not i18n complaint. For future updates, please add this issue to your watchlist.

</tr>
</tbody>
</table>

Example SQL Queries

Examples based on PostgreSQL

The following examples are written for a PostgreSQL database. SQL syntax may vary for other databases.

Examples in this section:

- Finding Users that are Members of a Group
- Finding Attributes for a Specific Directory
- Finding Attributes for a Specific User
- Finding Attributes for a Specific Application
- Finding the Groups which have Administrative Access to Crowd

Finding Users that are Members of a Group

```sql
select child_name from cwd_membership where parent_name = '<group-name>' and membership_type='GROUP_USER' and group_type='GROUP';
```

Where `<group-name>` is the name of the desired group, e.g. crowd-administrators.

Finding Attributes for a Specific Directory
```
select directory_name, attribute_name, attribute_value from cwd_directory, cwd_directory_attribute
where cwd_directory.id=cwd_directory_attribute.directory_id
and directory_name='<directory_name>';  
```

Where `<directory_name>` is the name of the desired directory.

**Finding Attributes for a Specific User**

```
select user_name, attribute_name, attribute_value from cwd_user, cwd_user_attribute
where cwd_user.id=cwd_user_attribute.user_id
and user_name = '<username>';  
```

Where `<username>` is the account name of the desired user.

**Finding Attributes for a Specific Application**

```
select application_name, attribute_name, attribute_value from cwd_application, cwd_application_attribute
where cwd_application.id=cwd_application_attribute.application_id
and application_name = '<application_name>';  
```

Where `<application_name>` is the name of the desired application.

**Finding the Groups which have Administrative Access to Crowd**

```
select group_name from cwd_app_dir_group_mapping where application_id = (select id from cwd_application where application_name='crowd')  
```

**Other Useful SQL Commands**

**Important — Back Up your Database!**
Before making changes to the Crowd database via SQL, please ensure you have an immediate backup of the Crowd database.

**Examples in this section:**

- **Resetting a User’s Password**

**Resetting a User’s Password**

The example below resets a user’s password to “admin” (no quotes):

```
update cwd_user set
credential='x61Ey612Kl2gpFL56FT9weDnpSo4AV8j8+qx2AuThdRyY036xxzTTrw10Wq3+4qQyB+XURPWx1ONxp3Y3pB37A=='
where user_name='<username>';  
```

Where `<username>` is the account name of the desired user.

IntelliJ IDEA Setup Guide

Atlassian does not support customised Crowd source

This document is intended to serve as an IntelliJ IDEA setup guide for those who have a Crowd source license and wish to customise Crowd 1.2.2 or later. For support beyond this document, please refer to our online forum.

Prerequisites

1. IntelliJ IDEA 6 or greater is installed.
2. JDK 1.5 or greater is installed.
3. Tomcat 5 or greater is installed. We will refer to the Tomcat root folder as TOMCAT.
4. MySQL 5 or greater is installed. Any Crowd-supported database server will work. This guide will assume you are using MySQL.
5. MySQL Connector/J 5.1 JDBC or greater is downloaded. We will refer to the extracted archive path as JDBC.
6. Maven 2.0.9 or greater is installed.
7. The latest Crowd source (version 1.2.2 or greater) is downloaded and extracted. We will refer to this extracted archive path as SOURCE.

Step 1. Configure MySQL

1. Create a database user which Crowd will connect as (e.g. crowduser).
2. Create a database for Crowd to store data in (e.g. crowddb).
3. Ensure that the user has permission to connect to the database, and to create and populate tables.

Step 2. Configure Tomcat

1. Copy the JDBC/mysql-connector-java-5.x.x-bin.jar to the TOMCAT/common/lib/ directory.
2. Copy the <MAVEN_REPOSITORY>/repository/javax/transaction/jta/1.0.1B/jta-1.0.1B.jar to the TOMCAT/common/lib/ directory.
3. Copy the <MAVEN_REPOSITORY>/repository/javax/activation/jaf/1.1/jaf-1.1.jar to the TOMCAT/common/lib/ directory.
4. Copy the <MAVEN_REPOSITORY>/repository/javax/mail/mail/1.4/mail-1.4.jar to the TOMCAT/common/lib/ directory.
5. Edit the TOMCAT/conf/context.xml configuration file to add a global JNDI JDBC connection. Make sure to customise the username and password for your specific environment.

   <Context>
   <!-- Default set of monitored resources -->
   <WatchedResource>WEB-INF/web.xml</WatchedResource>
   <!-- Uncomment this to disable session persistence across Tomcat restarts -->
   <Manager pathname="" />
   <!--
   
   Step 3. Run the Maven Build Commands

1. Copy (or merge) the SOURCE/maven/conf/settings.xml to your ~/.m2 directory.
2. Run the following Maven command in the root source directory (normally called atlassian-crowd-x.x.x-source) to download the project dependencies (otherwise known as download the Internet):

mvn clean install -Dmaven.test.skip

   The download may take a few hours when you do it for the first time.

   If this build is successful, run the following Maven command:
mvn idea:idea -Dmaven.test.skip

Step 4. Configure IntelliJ IDEA

1. Open the `SOURCE/atlassian-crowd.ipr` with IntelliJ IDEA.
2. Edit the `SOURCE/atlassian-crowd/crowd-web-app/src/main/resources/crowd.properties` configuration file and change `application.login.url` to contain the port and IP address you have configured Tomcat to run on. The default is `localhost:8080`.
3. Configure IntelliJ IDEA to have a new TOMCAT runtime configuration for the `crowd-web-app` module.

Setting up Tomcat in IDEA for Crowd

This guide assumes that you are running IDEA 7.x and that you have already installed and tested Tomcat 5.25 or greater.

1. Set up Tomcat as one of your application servers on this IDEA screen (Preferences -> IDE Settings -> Application Servers).

2. Add a new IDE configuration (Run -> Edit Configurations) called `tomcat-crowd-webapp` that uses the Tomcat application server added in the last step.
3. Click the **Deploy** tab. Select to deploy the crowd-webapp module. Once this is done, click the **Configure** button.
4. Select the **Java EE Build Settings** tab. Check **Create web module exploded directory** and **Exclude from module content**.
CrowdID Administration Guide

CrowdID is a free add-on that ships with Crowd versions 1.1 and later. It gives administrators a secure way to provide OpenID accounts for their users.
The CrowdID Administration Guide is for people who have CrowdID administration rights. For instructions on using CrowdID to access OpenID-enabled websites, please see the CrowdID User Guide.

Table of Contents

1. About CrowdID
   1.1 How CrowdID works with Crowd
      1.1.1 Determining the name of the CrowdID application
      1.1.2 Locating the Crowd Server that CrowdID is using
   1.1 How OpenID sites interact with CrowdID
2. Allowing users to access CrowdID
   2.1 Granting CrowdID access rights to a user
   2.2 Granting CrowdID Administration Rights to a User
3. Specifying the sites to which users can login
   3.1 Allowing all hosts
   3.2 Allowing all except specified hosts (‘Blacklist’)
   3.3 Allowing specified hosts only (‘Whitelist’)
4. Configuring CrowdID system settings
   4.1 Specifying the CrowdID URL
   4.2 Enabling localhost authentication
   4.3 Enabling immediate authentication requests
   4.4 Enabling communication with stateless clients

1. About CrowdID

CrowdID is a free add-on that ships with Crowd versions 1.1 and later. It gives administrators a secure way to provide OpenID accounts for their users.

Crowd is a middleware application that connects web applications (such as CrowdID, JIRA and Confluence) to specified directories (e.g. Microsoft Active Directory, OpenLDAP). For details please see Concepts in the Crowd Administration Guide.

1.1 How CrowdID works with Crowd
To access CrowdID, go to http://localhost:8095/openidserver.

1.1 How CrowdID works with Crowd

CrowdID is a free add-on that ships with Crowd versions 1.1 and later. It gives administrators a secure way to provide OpenID accounts for their users. Crowd is a middleware application that connects web applications (such as CrowdID, JIRA and Confluence) to specified directories (e.g. Microsoft Active Directory, OpenLDAP). For details please see Concepts in the Crowd Administration Guide.

This means that:

- CrowdID is a Crowd-connected application.
- CrowdID users are authenticated against Crowd-connected directories.
- If a user has already logged into any other Crowd-connected application (and single sign-on is enabled), they will not be prompted for any further login once they have entered their OpenID URL at an OpenID-enabled website.
- Multiple CrowdID instances can use one Crowd instance. Large organisations often find this useful.

CrowdID is automatically installed when you install Crowd. When you start Crowd for the first time and run the Setup Wizard, you will be offered the option of configuring CrowdID. If you choose not to setup CrowdID at that time, you can always set it up later as described in 4. Configuring CrowdID system settings. Note that you will also need to define the CrowdID application in Crowd, and map it to an appropriate directory — for details please see the Crowd Administration Guide.

To access CrowdID, go to http://localhost:8095/openidserver.

1.1.1 Determining the name of the CrowdID application

CrowdID is a Crowd-connected application (for more information please see Managing Applications in the Crowd Administration Guide).

To change the details or users of your CrowdID application within Crowd, you will need to know the name by which your Crowd application is defined in your Crowd server.

To see the name of your CrowdID application,
1. Login to CrowdID.
2. Click the 'Administration' link in the top navigation bar.
3. Click the 'Crowd Server' link in the left navigation column.
4. This will display the 'Crowd Server' details.
   The 'Application Name' field contains the name by which your CrowdID application is known to your Crowd server.

Screenshot: 'Application Name'

Crowd Documentation

1.1.2 Locating the Crowd Server that CrowdID is using

To change the details or users of your CrowdID application within Crowd, you will need to login to your Crowd server.

To determine the location of your Crowd server,

1. Login to CrowdID.
2. Click the 'Administration' link in the top navigation bar.
3. Click the 'Crowd Server' link in the left navigation column.
4. This will display the 'Crowd Server' details.
   The 'Crowd Services' field contains the URL of your Crowd server. Go to this URL to login to Crowd.
RELATED TOPICS

Crowd Documentation

### 1.1 How OpenID sites interact with CrowdID

This diagram shows how an OpenID-enabled website (known as a 'Relying Party') interacts with CrowdID (an 'OpenID Provider') to validate an end-user's login attempt.

For more information about the OpenID protocol please see [http://openid.net](http://openid.net).
RELATED TOPICS

- 1.1 How CrowdID works with Crowd
  - 1.1.1 Determining the name of the CrowdID application
  - 1.1.2 Locating the Crowd Server that CrowdID is using
- 1.1 How OpenID sites interact with CrowdID
2. Allowing users to access CrowdID

Granting access to CrowdID is done through Crowd. You can grant people rights to:

- **use CrowdID** —
  Granting CrowdID access rights to a user allows them to use CrowdID to access OpenID websites and perform all the actions described in the *CrowdID User Guide*.

- **administer CrowdID** —
  Granting administration rights to a user allows them to use the 'Administration' menu within CrowdID, which enables them to perform the actions described in the *CrowdID Administration Guide*.

2.1 Granting CrowdID access rights to a user

Granting CrowdID access rights to a user allows them to use CrowdID to access OpenID websites and perform all the actions described in the *CrowdID User Guide*.

Access to CrowdID is managed via Crowd. A user can only access CrowdID if they belong to a directory that is mapped to the CrowdID application within Crowd.

To grant CrowdID access rights to a particular user,

1. Login to your Crowd server¹.
2. View your CrowdID application² as described in *Using the Application Browser* in the *Crowd Administration Guide*.
3. Click the 'Directories' tab to see a list of directories that are mapped to your CrowdID application. You will need to add the user to one of these directories.
4. If your directory capabilities permit, add the user to the directory via Crowd as described in *Adding a User* in the *Crowd Administration Guide*. (Otherwise you may need to use your specific directory-management tool, instead of Crowd, to add the user to the directory.)

To grant CrowdID access rights to all the users in a particular directory,

- Login to your Crowd server¹.
- Map the directory to your CrowdID application² as described in *Mapping a Directory to an Application* in the *Crowd Administration Guide*.

To grant CrowdID access rights to a particular *group* of users within a directory,

1. Login to your Crowd server¹.
2. Map the group to your CrowdID application² as described in *Specifying which Groups can access an Application* in the *Crowd Administration Guide*.

¹ To find your Crowd server's URL, see 1.1.2 Locating the Crowd Server that CrowdID is using.
² To identify the name by which your CrowdID application is known within Crowd, see 1.1.1 Determining the name of the CrowdID application.
2.2 Granting CrowdID Administration Rights to a User

Granting administration rights to a user allows them to use the 'Administration' menu within CrowdID, which enables them to perform the actions described in the CrowdID Administration Guide.

CrowdID administration rights are managed via Crowd. To grant administration rights to a user, you need to add them to the 'crowd-administrators' group as described below.

Note:

- Adding a user to the 'crowd-administrators' group will also give them Crowd administration rights (unless you choose to use a different group to contain Crowd administrators). See Granting Crowd Administration Rights to a User in the Crowd Administration Guide.
- The 'crowd-administrators' group always contains CrowdID administrators, regardless of whether you are using it to contain Crowd administrators.

To grant administration rights to a user,

1. Log in to your Crowd server¹.
2. Click the 'Users' tab in the top navigation bar.
3. This will display the User Browser. Select the directory that contains the user to whom you wish to grant administration rights.
4. Use the 'Search' to locate the user, then click the 'View' link that corresponds to the user.
5. This will display the 'User Details' screen. Click the 'Groups' tab.
6. A list of the user's current groups (if any) will be displayed. Select the 'crowd-administrators' group from the drop-down box below the list, then click the 'Add' button.

¹ To find your Crowd server's URL, see 1.1.2 Locating the Crowd Server that CrowdID is using.

Screenshot: Granting Crowd administration rights
3. Specifying the sites to which users can login

There are three ways to specify which OpenID hosts (i.e. websites or IP addresses) your users can login to using their CrowdID:

- **No restriction** — your CrowdID users can login to any OpenID host
- **Blacklist** — your CrowdID users can login to any OpenID host except the one(s) that you specify
- **Whitelist** — your CrowdID users can login to only those OpenID host(s) that you specify

### 3.1 Allowing all hosts

There are three ways to specify which OpenID hosts (i.e. websites or IP addresses) your users can login to using their CrowdID:

- **No restriction** — your CrowdID users can login to any OpenID host
- **Blacklist** — your CrowdID users can login to any OpenID host except the one(s) that you specify
- **Whitelist** — your CrowdID users can login to only those OpenID host(s) that you specify

To allow users to login to any OpenID host,

1. Login to CrowdID.
2. Click the ‘Administration’ link in the top navigation bar.
3. Click the ‘Trust Relationships’ link in the left navigation column.
4. For ‘Restriction Type’, select ‘None’.

**Screenshot: ‘Restriction Type — None’**

- 3.2 Allowing all except specified hosts (‘Blacklist’)
- 3.3 Allowing specified hosts only (‘Whitelist’)
There are three ways to specify which OpenID hosts (i.e. websites or IP addresses) your users can login to using their CrowdID:

- **No restriction** — your CrowdID users can login to any OpenID host
- **Blacklist** — your CrowdID users can login to any OpenID host except the one(s) that you specify
- **Whitelist** — your CrowdID users can login to only those OpenID host(s) that you specify

To specify an OpenID blacklist,

1. Login to CrowdID.
2. Click the 'Administration' link in the top navigation bar.
3. Click the 'Trust Relationships' link in the left navigation column.
4. For 'Restriction Type', select 'Blacklist'.
5. Wait for a section titled 'Blacklist mode: hosts that can not login' to appear on the screen.
6. For each site to which you want to prevent users logging in,
   a. Type the URL or IP address in the 'Address' field.
   b. Click the 'Add' button.

**Screenshot: 'Restriction Type — Blacklist'**

### 3.3 Allowing specified hosts only ('Whitelist')

There are three ways to specify which OpenID hosts (i.e. websites or IP addresses) your users can login to using their CrowdID:

- **No restriction** — your CrowdID users can login to any OpenID host
- **Blacklist** — your CrowdID users can login to any OpenID host except the one(s) that you specify
- **Whitelist** — your CrowdID users can login to only those OpenID host(s) that you specify

To specify an OpenID whitelist,
1. Login to CrowdID.
2. Click the ‘Administration’ link in the top navigation bar.
3. Click the ‘Trust Relationships’ link in the left navigation column.
4. For ‘Restriction Type’, select ‘Blacklist’.
5. Wait for a section titled ‘Whitelist mode: hosts that can login’ to appear on the screen.
6. For each site to which you want to allow users to login,
   a. Type the URL or IP address in the ‘Address’ field.
   b. Click the ‘Add’ button.

- 4.3 Enabling immediate authentication requests
- 4.4 Enabling communication with stateless clients

4.1 Specifying the CrowdID URL

The CrowdID URL is the URL that your end-users will type when logging into OpenID-enabled websites.

To define the URL of your CrowdID instance,
1. Login to CrowdID.
2. Click the 'Administration' link in the top navigation bar.
3. Click the 'General Configuration' link in the left navigation column.
4. Type the URL into the 'Base URL' field.
5. Click the 'Update' button.

- 4.4 Enabling communication with stateless clients

Crowd Documentation

**4.2 Enabling localhost authentication**

Enabling **localhost authentication** prevents OpenID-enabled sites from directly accessing your end-users' local machines.

**To enable localhost authentication,**

1. Login to CrowdID.
2. Click the 'Administration' link in the top navigation bar.
3. Click the 'General Configuration' link in the left navigation column.
4. Select the 'Allow localhost authentications' checkbox.
5. Click the 'Update' button.
4.1 Specifying the CrowdID URL
4.2 Enabling localhost authentication
4.3 Enabling immediate authentication requests
4.4 Enabling communication with stateless clients

Crowd Documentation
4.3 Enabling immediate authentication requests

Enabling ‘Allow immediate authentication requests’ allows an OpenID-enabled site to check whether the user is logged in, without actually prompting the user to login. Known as pass-through authentication, this provides greater convenience for end-users, particularly when an end-user visits a site for which they have previously selected ‘Allow Always’ (see 2.4 Allowing or denying a login in the CrowdID User Guide).

To enable ‘Allow immediate authentication requests’,

1. Login to CrowdID.
2. Click the ‘Administration’ link in the top navigation bar.
3. Click the ‘General Configuration’ link in the left navigation column.
4. Select the ‘Allow immediate authentication requests’ checkbox.
5. Click the ‘Update’ button.

Crowd Documentation
4.4 Enabling communication with stateless clients

Some OpenID-enabled sites do not support pre-shared secrets (associations). Selecting allow stateless clients enables your CrowdID server to communicate with such sites.

To allow stateless clients,

1. Login to CrowdID.
2. Click the ‘Administration’ link in the top navigation bar.
3. Click the ‘General Configuration’ link in the left navigation column.
4. Select the ‘Allow stateless clients’ checkbox.
5. Click the ‘Update’ button.

**CrowdID User Guide**
With Crowd comes CrowdID, your OpenID provider.

CrowdID is an Atlassian product which allows you to use a single login for all OpenID-enabled websites.

This means that you don't have to remember a separate username and password for each different site that you visit. You can just use your OpenID for all of them.

You can use CrowdID if your administrator has installed it for your organisation. For instructions on setting up CrowdID, please see the CrowdID Administration Guide.

The CrowdID User Guide tells you how to

- Log in to websites using CrowdID.
- Instruct CrowdID to always allow login to a specific site.
- Set up your own profile(s) within CrowdID.
- Use CrowdID to change your password.

1. Getting started with CrowdID

CrowdID is an Atlassian product which allows you to use a single login for all OpenID-enabled websites.

This means that you don't have to remember a separate username and password for each different site that you visit. You can just use your OpenID for all of them.

You can use CrowdID if your administrator has installed it for your organisation.

1.1 What is OpenID?

The term 'OpenID' has two meanings:

- The OpenID protocol, described below.
- Your own identifier or URL.

OpenID is an open, free protocol which allows you to use a single identifier to login to any OpenID-enabled website. OpenID allows the website to communicate with your OpenID provider (e.g. your organisation's CrowdID server) when attempting to verify your login.
Do you have a zillion usernames and passwords, which you use for logging in to blogs and websites all over the place? OpenID allows you to throw them all away, for all websites that support it. More and more sites are coming on board.

CrowdID User Guide

1.2 What is CrowdID?

CrowdID is an Atlassian product which makes use of the OpenID protocol to allow you to use a single login for a number of websites. To put it another way: CrowdID is an ‘OpenID provider’. You can use CrowdID if your administrator has installed it for your organisation.

This means that you can:

- Securely store your username and password on your organisation's server.
- Use your OpenID as a single identifier to log in to all websites which support OpenID.
- Control how you allow or deny login requests from websites.

Your organisation can use CrowdID to set up an internal OpenID provider. There are also other OpenID providers, where you can get a free OpenID.

CrowdID User Guide

1.3 What is an OpenID URL or identifier?

To log in to an OpenID-enabled website you need an OpenID identifier, also called an OpenID URL or simply an OpenID. Your OpenID is a URL (web address) which points to your organisation's CrowdID server. Here are some examples of what your OpenID may look like:

```
http://my.server.name/mynname
http://myname.mysite.com
```

To find your OpenID URL, you can:

- Ask your system administrator, or
- Click the ‘My OpenID’ link on the ‘Home’ tab of the CrowdID page.

RELATED TOPICS
1.1 What is OpenID?
1.2 What is CrowdID?
1.3 What is an OpenID URL or identifier?
1.4 Viewing the CrowdID page

CrowdID User Guide

1.4 Viewing the CrowdID page

The CrowdID page allows you to:

- View your OpenID URL.
- Set up your profile(s).
- View your list of always-approved sites.
- View your login history.
- Resume approval of a login. (This option appears only during a login process, if you move away from the 'OpenID Verification' page.)
- Change your password.

There are two ways to access the CrowdID page:

- While you are logging in to another site.
- Directly via the CrowdID URL.

To access the CrowdID page while you are logging in to another site,

1. Use your OpenID to log in to the website you want to visit.
2. Log in to CrowdID if prompted.
3. The CrowdID 'OpenID Verification' page will appear, provided that you have not previously added the website to your list of always-approved sites. You can choose any of the CrowdID options on the left-hand navigation panel, even during the login process.
4. When you have finished your tasks in CrowdID, you can resume the login.

To access CrowdID directly via the CrowdID URL,

1. Ask your administrator for the CrowdID address (URL) as configured for your organisation.
2. Type or paste the address into the address or navigation bar of your internet browser.
3. The CrowdID Login page will appear. Type in your username and password.
4. Click the 'Login' button.
5. The CrowdID 'My OpenID' page will appear. The CrowdID options are displayed in the left-hand navigation panel and top menu bar.

Screenshot: CrowdID My OpenID page
2. Logging in to a website using OpenID

CrowdID enables you to log in to a website using your OpenID. The login process depends upon the following:

- Have you logged in to CrowdID already during this browser session?
- Have you previously added the website to your list of always-approved sites?
- Does the website you are visiting require additional profile information?

Steps in the login process:

1. Find the OpenID login page or section on the website you want to visit.
2. Enter your OpenID and click the login button.
3. If prompted, log in to CrowdID. (Required if you have not already logged in during this browser session.)
4. If prompted, instruct CrowdID to allow the website login. (Required if you have not previously added the website to your list of always-approved sites.)
5. If prompted, supply additional profile information. (Required if the website you are visiting wants more information.)

The login process can be very simple: just the first two steps above, provided that you have already logged in to CrowdID this session and have already added the website to your list of always-approved sites.

2.1 Does the website support OpenID?

You can only use your OpenID (also called an OpenID URL or identifier) to log in to a website if the site supports the OpenID protocol. The number of websites that support OpenID is growing rapidly.

To see if a particular website supports OpenID, check the site's login page for one or more of the following:

- The word ‘OpenID’.
- The OpenID logo

Related Topics

- 2.1 Does the website support OpenID?
- 2.2 Entering your OpenID URL
- 2.3 Logging in to CrowdID
- 2.4 Allowing or denying a login
- 2.5 Providing additional profile information to a website
1. Go to the login page of the website you want to visit.
2. Look for the OpenID login section.
   1. Sometimes the OpenID login will be on the same page as the standard login. Other sites will have a separate OpenID login page.
3. Type or paste your OpenID into the login text box.
   1. Usually, you must enter the full OpenID. In some sites, you can enter the OpenID without 'http://'
4. Click the login button. The button will probably be labelled 'Log in', 'Sign in' or 'Go'.

One of the following things will happen now:

- If you have not already logged in to CrowdID during this browser session, you will see the CrowdID login page.
- If you have already logged in to CrowdID and you have previously instructed CrowdID to allow this website always, then you will be logged straight into the website.
- If you have already logged in to CrowdID but have not previously set this site to "Allow Always", then CrowdID will ask you to approve the login.
- If your administrator has blocked access to this website, CrowdID will display an 'OpenID Verification Error' message.

**RELATED TOPICS**

- 2.3 Logging in to CrowdID
- 2.4 Allowing or denying a login
- 2.5 Providing additional profile information to a website

CrowdID User Guide

### 2.3 Logging in to CrowdID

CrowdID will ask you to log in, if you have not already done so during this browser session or if your session has timed out. The CrowdID login may appear during the process of logging in to another website, or when you are accessing CrowdID directly.

**To log in to CrowdID,**

1. Type in your username and password.
2. Click the 'Login' button.

You can reset your password, if you have forgotten it.

*Screenshot: CrowdID login page*
If you are in the process of logging in to another website, CrowdID will now ask you to approve the login.

**RELATED TOPICS**

- 2.1 Does the website support OpenID?

**CrowdID User Guide**

### 2.4 Allowing or denying a login

When you use your OpenID to log in to a website, CrowdID will present the ‘OpenID Verification’ page where you can allow or deny the login.

If you have previously instructed CrowdID to allow this site always, you will not see this page. You can remove a site from the ‘Allow Always’ list in CrowdID.

You can instruct CrowdID to:

- Allow the login for this session only (‘Allow Once’).
- Allow login to this site every time you use your OpenID (‘Allow Always’).
- Refuse login to this site (‘Deny’).
- Use a specific profile.

If you move away from the ‘OpenID Verification’ page within CrowdID, you can go back to the page and resume approval.

**Screenshot: OpenID Verification page**

To allow the login for this session only,
1. Click ‘Allow Once’ on the right of the CrowdID ‘OpenID Verification’ page. CrowdID will send you back to the original site, passing your profile information as well as the confirmed login. The website you are visiting may ask you to complete your profile information.

To allow login to this site every time you use your OpenID,

1. Click ‘Allow Always’ on the right of the CrowdID ‘OpenID Verification’ page. CrowdID will add the website to your list of approved sites and send you back to the original site, passing your profile information as well as the confirmed login. The website you are visiting may ask you to complete your profile information.

To refuse login to this site,

1. Click ‘Deny’ on the right of the CrowdID ‘OpenID Verification’ page. CrowdID will send you back to the original site and refuse the login. The original site will probably show a message something like ‘Verification cancelled’.

To use a specific profile,

1. If you have defined more than one profile, you can choose a specific profile for the website you are visiting. Select a profile from the dropdown list labelled ‘Use this profile’ on the CrowdID ‘OpenID Verification’ page.
2. The profile details will change in the ‘Select Profile’ section of the page. CrowdID will pass these profile details to the website when you allow the login.

To go back to the ‘OpenID Verification’ page and resume approval,

1. Click ‘Resume Approval’ in the left-hand navigation panel.
   - This option will appear if you move away from the ‘OpenID Verification’ page during the login process.
2. CrowdID will return to the ‘OpenID Verification’ page, where you can allow the login.

**RELATED TOPICS**

- 2.1 Does the website support OpenID?
- 2.2 Entering your OpenID URL
- 2.3 Logging in to CrowdID
- 2.4 Allowing or denying a login
- 2.5 Providing additional profile information to a website

CrowdID User Guide

2.5 Providing additional profile information to a website

When you log in to a website using your OpenID, CrowdID passes your profile information to the website. Some websites will then log you in immediately, while other websites may ask you to confirm or complete the profile information.

You are now outside CrowdID. Any dialogue here is between you and the website you are visiting.

To provide additional profile information to a website,

1. Check the profile information displayed, and add extra information as you wish.
2. Click the button or other option supplied by the website to complete the login process.
You can change your profile information and define more than one profile in CrowdID.

**RELATED TOPICS**

- 2.1 Does the website support OpenID?
- 2.2 Entering your OpenID URL
- 2.3 Logging in to CrowdID
- 2.4 Allowing or denying a login
- 2.5 Providing additional profile information to a website

CrowdID User Guide

### 3. Viewing your always-approved websites

When logging in to a website, you can instruct CrowdID to allow login to the site every time you use your OpenID (‘Allow Always’).

The CrowdID ‘Approved Sites’ page allows you to:

- View your list of always-approved sites.
- Remove a site from the list.
- Choose a profile for use when logging in to a site.

**Tip**
- If you have never instructed CrowdID to ‘Allow Always’ for any sites, the ‘Approved Sites’ page will display a message like ‘You currently have no approved sites.’
- You can add profiles on the CrowdID ‘Profiles’ page.

**To view your list of always-approved sites,**

1. Access CrowdID.
2. Click ‘Approved Sites’ in the left-hand navigation panel.

**To remove a site from the list,**

1. Access CrowdID.
2. Click ‘Approved Sites’ in the left-hand navigation panel.
3. Your list of always-approved sites will appear. Click the remove button next to the site which you want to remove.
4. Click the ‘Apply’ button.
5. ‘Update Successful’ message is displayed.

   **Tip** If you do not click the ‘Apply’ button, your changes will be cancelled.

**To choose a profile for use when logging in to a site,**

1. Access CrowdID.
2. Click ‘Approved Sites’ in the left-hand navigation panel.
3. Your list of always-approved sites will appear. Select the profile you want from the dropdown list next to the applicable site.
4. Click the ‘Apply’ button.
5. ‘Update Successful’ message is displayed.

   **Tip** If you do not click the ‘Apply’ button, your changes will be cancelled.
4. Viewing your login history

The CrowdID ‘Login History’ page displays a list of the sites you have visited and the type of approval you gave on each visit:

- ‘Allow Always’ - At the time of this login, you instructed CrowdID to allow login to the site every time you use your OpenID.
- ‘(Auto) Allow Always’ - This login was allowed automatically, because you have previously instructed CrowdID to allow login to the site every time you use your OpenID.
- ‘Allow Once’ - You instructed CrowdID to allow login to the site at that time only.
- 'Deny' - You instructed CrowdID to refuse the login to the site at that time.

To view your login history,

1. Access CrowdID.
2. Click ‘Login History’ in the left-hand navigation panel.

If you have used your OpenID many times, the login history items will be shown on more than one page. To move from one page to another, click the page numbers or the ‘Next’ and ‘Prev’ links at the bottom of the page.
When you log in to a website using your OpenID, CrowdID will pass some information to the website. The information is copied from your profile on CrowdID. When your profile is first created, CrowdID will auto-fill the information where possible, by copying:

- Country and language from the language information in your browser.
- Name and email address from your organisation's user directory.

You can update your profile information on CrowdID, as described below.

You can also:
• Add a new profile.
• Choose a profile for a website.
• Set a profile as default.
• Delete a profile.

To update your profile,

1. Access CrowdID.
2. Click ‘Profiles’ in the left-hand navigation panel.
3. Select the required profile from the ‘Profile’ dropdown list, if you have more than one profile.
4. Update the profile details then click the ‘Save’ button.
5. ‘Profile updated’ message is displayed at the top of the page.

Screenshot: CrowdID Profiles page

• 4. Viewing your login history
• 5. Updating your profile
• 6. Using more than one profile
• 7. Changing or resetting your password
6. Using more than one profile

You can create multiple profiles in CrowdID and then allocate specific profiles to specific websites.

- 6.1 Adding a profile
- 6.2 Choosing a profile for a website
- 6.3 Setting a default profile
- 6.4 Deleting a profile

6.1 Adding a profile

When you log in to a website using your OpenID, CrowdID will pass some information to the website. The information is copied from your profile on CrowdID. When your profile is first created, CrowdID will auto-fill the information where possible, by copying:

- Country and language from the language information in your browser.
- Name and email address from your organisation’s user directory.

To add a profile,

1. Access CrowdID.
2. Click ‘Profiles’ in the left-hand navigation panel.
3. Select ‘Create New Profile’ from the ‘Profile’ dropdown list.
4. CrowdID will auto-fill the information where possible. Update the profile details then click the ‘Save’ button.
5. ‘Profile updated’ message is displayed at the top of the page.

Screenshot: CrowdID adding a profile

RELATED TOPICS
6.2 Choosing a profile for a website

You can choose a specific profile for use when logging in to a website. There are different ways to choose a profile:

- Choose a profile for a specific login, during the login process. You can do this for sites which you have not set to 'Allow Always'.
- Choose a profile for a specific website, on the CrowdID 'Approved Sites' page. You can do this for sites which you have set to 'Allow Always'.
- Set your default profile on the CrowdID 'Profiles' page.

6.3 Setting a default profile

If you have more than one profile, you can choose one of them as default.

Effect of the 'default' profile when you are logging in to a website:

- If you have never logged in to the website before or have previously allowed or denied authentication to that site, the default profile will be pre-selected. You can still choose a different profile during the login.
- If you have set the website to 'Always Allow', CrowdID will use the profile selected for the site on the Approved Sites page.

To set a default profile,

1. Access CrowdID.
2. Click 'Profiles' in the left-hand navigation panel.
3. Select the required profile in the 'Profile' dropdown list.
4. Click the 'Make Default' link next to the 'Profile' dropdown list.

The 'Make Default' link does not appear if the selected profile is already the default.
5. The word '(default)' appears next to the profile name in the dropdown list.

Screenshot: CrowdID setting a default profile
6.4 Deleting a profile

You can delete one of your profiles on CrowdID, provided that it is not your default profile.

To delete a profile,

1. Access CrowdID.
2. Click ‘Profiles’ in the left-hand navigation panel.
3. Select the required profile in the ‘Profile’ dropdown list.
4. Click the ‘Delete’ button.
5. ‘Profile deleted’ message is displayed at the top of the page.

If you delete a profile which is linked to one or more of your always-approved websites, CrowdID will remove the affected website(s) from the list.
7. Changing or resetting your password

If your administrator has allowed it, you can use CrowdID to change your password across all Crowd applications. Note that you will need to be logged in to Crowd before you can do this.

When attempting to log in to Crowd, you can also reset your password, if you have forgotten the old one. A new password will be emailed to you.

7.1 Changing your password

The CrowdID ‘Change Your Password’ page allows you to change your password across all applications in your organisation, provided that the application is linked to Crowd.

Note:

- Crowd will attempt to change your password in all the user directories linked to Crowd. This will be successful where the directory allows it.
Your administrator may disable password-change via CrowdID. In that case, you will receive an error message when you apply the change.

To change your password,

1. Access CrowdID.
2. Click 'Change Password' in the top menu bar.
3. The 'Change Your Password' page will appear. Type in your old password once, and the new password twice.
4. Click the 'Update' button.
5. 'Password updated' message is displayed.

If the change is successful, your password may also have changed in other Crowd-connected applications.

Screenshot: CrowdID Change Your Password page

### RELATED TOPICS

- 1. Getting started with CrowdID

- 3. Viewing your always-approved websites
- 4. Viewing your login history
- 5. Updating your profile
- 6. Using more than one profile
- 7. Changing or resetting your password

### 7.2 Resetting your password

The CrowdID 'Login' page allows you to reset your password, which is useful when you have forgotten the password.

This will reset your password across all applications in your organisation, provided that the application is linked to Crowd.

To reset your password,
1. Access CrowdID.
2. Click the ‘Forgotten your password?’ link on the CrowdID Login page.
3. The ‘Reset Your Password’ page will appear. Type in your Crowd username and click the ‘Continue’ button.
4. A message will appear: ‘Your new password is on the way!’ Click the ‘Home’ link at the top of the page.
5. You will receive an email message with your new password. Copy the password.
6. Log in to CrowdID using the new password.
7. Change your password to one you can remember easily.

If the change is successful, your password may also have changed in other Crowd-connected applications.

Crowd FAQ

Known issues, hints and tips and answers to commonly raised questions about Crowd:

**General FAQ on the Atlassian Website**

**Concepts:**
- What is single sign-on (SSO)?
- What is authorisation?
- What is authentication?
- What is centralised authentication?
- What is identity management?
- What is a directory?
Technical:

- How does Crowd work? How is Crowd an "application security framework"?
- What is an application connector?
- What is a directory connector?
- How many users can Crowd manage?
- How many applications can be used with Crowd?
- We already have an LDAP server for Confluence and/or JIRA. Do we really need Crowd?

Compatibility:

- What are Crowd's system requirements?
- What directories and applications does Crowd support out of the box?
- How can Crowd be connected to new or currently unsupported applications?
- How does Crowd integrate with other Atlassian products?
- Does Crowd include Kerberos integration?
- Does Crowd support SAML or Liberty Alliance?

Common Evaluator Questions:

- Can Crowd run alongside another SSO solution?
- Can I setup a user frontend and login page for Crowd?
- Can I setup password-only delegated LDAP and AD integration?
- How can I filter unwanted LDAP entries?
- How do I fix a 'User Limited Exceeded' error?
- How do I fix slow performance?
- Is clustering supported?

- Troubleshooting CrowdID
Finding the atlassian-crowd.log File

The location of the `atlassian-crowd.log` file, often requested by Atlassian support, may vary based on your Crowd installation type.

### Possible Log Locations

<table>
<thead>
<tr>
<th>Installation Type</th>
<th>Log Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Crowd Standalone</td>
<td>The root directory of your Crowd application, e.g. <code>atlassian-crowd-1.4.4</code></td>
</tr>
<tr>
<td>Crowd Standalone running as a Windows service</td>
<td><code>C:\Windows\system32</code></td>
</tr>
<tr>
<td>WAR installation</td>
<td>The directory from which you start the application server, e.g.</td>
</tr>
<tr>
<td></td>
<td><code>apache-tomcat-6.0.16/bin</code></td>
</tr>
</tbody>
</table>

**How do I Change the Location?**

You can change the `atlassian-crowd.log` location by modifying the following line in the `WEB-INF/classes/log4j.properties` file of your Crowd installation to use an absolute file path:

```
log4j.appender.filelog.File=atlassian-crowd.log
```

Finding your Crowd Home Directory

The **Crowd Home** directory is where Crowd stores its configuration information. If you are using the embedded HSQLDB database supplied for evaluation purposes, Crowd will also store its database in this directory.

Crowd's **System Information** screen shows the location of your Crowd Home directory.

Read more about:

- Setting your Home Directory during installation.
- The location and function of the Crowd Home directory and other important files and directories.

Recovering your Console application password

The Crowd console itself must authenticate to the **Crowd framework** to perform authentication and authorisation calls.

Like an integrated application, if you have an improper password in the `crowd.properties` configuration file, the following exception will be thrown when the application attempts to connect to Crowd SOAP services:
at sun.reflect.NativeConstructorAccessorImpl.newInstance0(Native Method)

If the password for the Crowd console is lost, the only method of recovery is to reset the password in the crowd.properties configuration file to a known application password. To do this you will need to have access to the Crowd database server and run the following commands:

1. Get a list of the applications integrated with Crowd:

```sql
mysql> select id, application_name from cwd_application;
+--------+---------------------+
| id     | application_name    |
|--------+---------------------+
| 98305  | crowd               |
| 98306  | demo                |
| 98307  | crowd-openid-server |
| 655361 | jira                |
| 753665 | jiveforums          |
+--------+---------------------+
```

2. Choose an application for which you have the password, and where you’re happy to use the same password for the Crowd application. Let’s call your application ‘X’. Use application X’s application_name to query the database and retrieve X’s credentials:

```sql
mysql> select credential from cwd_application where name = 'jira';
+---------------------------------+
| credential                      |
+---------------------------------+
| sQnzu7wkTrgkQZ2F+OG1hi5Al3Qmzv0bXg5THBq17mAsdd4X1127AdBrRt9fEyavW1emQQP9BB1Thf+rDKy8hq==|
```

3. Now set Crowd’s application credentials to the credential of your application X:
Update your `crowd.properties` application.password value to the value of X's password. If you are using Crowd 1.5 or earlier, the file is located at `atlassian-crowd-X.X.X/crowd-webapp/WEB-INF/classes/`. If using 1.5.1 or later, the file will be located inside your Crowd-Home Directory.

You may now start Crowd.

Further information

- If you have installed only Crowd and no other integrated applications, you'll need to clear all the database tables (if you've already hooked up to a database server) and re-install Crowd. This should not cause you to lose much data, since no other applications have yet been defined.
- The issue is that the password for the crowd application is being changed during the setup process for crowd. This problem will be resolved with Crowd 1.2 - see [CWD-488](#).
- You may be tempted to try changing the password back to 'password'. Alas, this won't work, because the passwords are encrypted using SHA1.

Resetting the Domain Cookie Value

If you have set the SSO Domain to an invalid value, you may be prevented from authenticating to the Crowd Console.

To reset the SSO (single sign-on) cookie domain, run the following SQL command on the Crowd database:

```
update cwd_property set property_value = '' where property_name = 'domain';
```

Once you have done this you will need to restart Crowd and then log in. This will reset any domain SSO token misconfiguration.

Restarting the Setup Wizard from Scratch

If you get part-way through the Crowd Setup Wizard and then decide you want to start again from scratch, you can delete the Crowd Home directory. (See Important Directories and Files.)

Crowd uses the `crowd.cfg.xml` file, stored in the Crowd Home directory, to 'remember' the step you have reached in the setup procedure. Clearing the file will cause the Setup Wizard to start at the beginning again.

This strategy is useful if you want to re-do your setup without having to download Crowd again.

To restart the Crowd Setup Wizard:

1. Shut down Crowd.
2. Delete your Crowd Home directory.
3. Start Crowd again.
5. The Crowd Setup Wizard will start. Follow the steps from the beginning, as described in Running the Setup Wizard.

Embedded database will disappear too

If you are using the embedded database, the database files are stored in the Crowd Home directory too. Deleting the Crowd Home directory will remove all your Crowd Administration Console data as well (users, groups, roles, directories, applications and other configuration data).

Self Signed Certificate

I have a self Signed Certificate

You will need to add the self-signed certificate to your JDK truststore using the JDK keytool:
Using Crowd in a Cluster is Not Supported

Atlassian does not support clustering of Crowd, and we have not yet scheduled cluster support into the Crowd roadmap. The reason is that clustering problems are hard to diagnose and we do not have the expertise in-house to support the many possible configurations.

There is a feature request in CWD-1053. You can vote for the feature request, and "watch" it to receive progress reports.

Some of our customers are using Crowd clustering successfully. You may find some useful information in the discussion threads in our user forums [here](http://java.sun.com/j2se/1.3/docs/tooldocs/win32/keytool.html) and [here](http://java.sun.com/j2se/1.3/docs/tooldocs/win32/keytool.html).

Guides, Hints and Tips

- Principals and Users
- Using Apache Directory Studio for Crowd LDAP Configuration

Principals and Users

As far as Crowd is concerned, the terms ‘principals’ and ‘users’ are equivalent — they mean the same thing. Earlier versions of Crowd used the term ‘principals’. From Crowd 1.3 onwards, we call them ‘users’.

Using Apache Directory Studio for Crowd LDAP Configuration

This is a basic tutorial on using a wonderful Eclipse-based LDAP browser, known as [Apache Directory Studio](http://java.sun.com/j2se/1.3/docs/tooldocs/win32/keytool.html), to gather the information you need for your Crowd LDAP configuration.

Before you Start

**Step 1. Get Apache Directory Studio**

**Step 2. (Optional) Do Some Background Reading**

If you are an LDAP newbie, there are two great articles that may help you gain a better understanding of LDAP and LDAP search filters before you begin using Apache Directory Studio:

- [An Introduction to LDAP](http://java.sun.com/j2se/1.3/docs/tooldocs/win32/keytool.html)
- [How to write an LDAP search filter](http://java.sun.com/j2se/1.3/docs/tooldocs/win32/keytool.html)

**RELATED TOPICS**

- Configuring an LDAP Directory Connector

Creating a Connection to your LDAP Directory

You may find an LDAP browser useful to gather the information you need for your Crowd configuration. This page shows you how to create a connection to your LDAP directory when using Apache Directory Studio. You can then use the connection information gathered, to set up your LDAP directory in Crowd.

**Step 1: Create a New Connection in Apache Directory Studio**

2. Click the LDAP icon to create a new connection.
Step 2: Enter your Connection Information

1. Enter a name for your connection.
2. Enter the **Network Parameter** information as follows:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>The domain name for your LDAP server. If the LDAP server is not on the same network as Crowd, you may need to use the FQDN or IP address of the LDAP server.</td>
</tr>
<tr>
<td>Port</td>
<td>For normal LDAP connectivity, use 389. For SSL connectivity, use 636.</td>
</tr>
</tbody>
</table>

3. Click the **Check Network Parameter** button to ensure your connection is successful.
4. Click **Next**.
Step 3: Enter your Authentication Information

1. Choose the 'Authentication Method' from the dropdown list.
   - Some LDAP servers allow anonymous access. If your LDAP server allows this, you can change the 'Authentication Method' dropdown from 'Simple Authentication' to 'Anonymous Authentication' and click 'Finish' to go straight to Step 4.

2. Enter the 'Authentication Parameter' information as follows:

   | Bind DN or user | Enter the full DN of the account that will be used to connect to the LDAP directory. This account should have the ability to browse the entire LDAP directory tree. |
   | Bind password    | Enter the password for the Bind DN account. |

3. Click the 'Check Authentication' button to ensure this account can authenticate.
4. If this authentication is successful, click 'Finish'.

Screenshot: Entering the authentication information in Apache Directory Studio
4. If you are prompted for a ‘Referral Connection’, select the same directory.

Screenshot: Selecting a referral connection in Apache Directory Studio

Step 4: See the Base DNs

If the configuration is successful, you should now have a list of the base DNs available under this LDAP directory's root DSE.
**Step 5: Use the Same Connection Information in Crowd**

Use the same connection information to set up your LDAP directory in Crowd.

*Screenshot: LDAP directory configuration in Crowd*
Getting an LDIF Export of a User or Group

Occasionally, Atlassian Crowd Support may request an LDIF export of a user or group. LDIF is the LDAP Data Interchange Format. You can export all or part of your LDAP directory to an LDIF file. This page shows you how to do that when using Apache Directory Studio.

To generate an LDIF export of a user or group,

1. Highlight the user or group in Apache Directory Studio.
2. Right-click on the user or group.
3. Choose Export -> LDIF Export.

Screenshot: Generating an LDIF export of a user in Apache Directory Studio

Creating a Connection to your LDAP Directory
Using Apache Directory Studio for Crowd LDAP Configuration

Restricting LDAP Scope for User and Group Search

While you should already know the user DN you are using for your LDAP connection, it can be helpful to review the users and groups in Apache Directory Studio to determine the best scope for your Crowd LDAP directory configuration.

Crowd comes with default configurations that will work for most customers. In the examples below, we illustrate some common options for changing your user and group configurations.

There are a number of other attributes, not shown here, that can also be used to narrow the scope of users and groups.

Important Search Filter Notes

- If you are unfamiliar with LDAP search filter syntax, please review this guide.
- In order to use Object Filters larger than 255 characters, you will need to upgrade to Crowd to 1.5.1 or later, by installing a new Crowd instance (with a new database) and restoring an XML backup from your previous Crowd installation. For more information on upgrading Crowd please review the Upgrade Guide.

On this page:

- Example 1. Using a User’s DN for Crowd Configuration
- Example 2: Using a Group’s DN for Crowd Configuration

Example 1. Using a User’s DN for Crowd Configuration

1. Find a user in the scope you wish to use for Crowd. Highlight that user in Apache Directory Studio.

   [Screenshot: User information in Apache Directory Studio]
1. Using the information about the user dmccahan, you can narrow down the users returned in the Crowd directory to those in `cn=Users` who are members of either the `confluence-users` or the `confluence-administrators` group.

<table>
<thead>
<tr>
<th>User DN:</th>
<th><code>cn=Users</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>User Object Filter:</td>
<td></td>
</tr>
</tbody>
</table>
| `(&(objectCategory=Person)(sAMAccountName=*))
| (|(memberOf=cn=confluence-users,ou=Groups,dc=sydney,dc=atlassian,dc=com)
| (memberOf=cn=confluence-administrators,ou=Groups,dc=sydney,dc=atlassian,dc=com))` |
Example 2: Using a Group’s DN for Crowd Configuration

1. Find a group in the scope you wish to use for Crowd. Highlight that group in Apache Directory Studio.

Screenshot: Group information in Apache Directory Studio
2. Using the information about the group `confluence-users`, you can narrow down the groups returned in the Crowd directory to those in `ou=Groups` and return only the `confluence-users` or the `confluence-administrators` group. Under most circumstances, it is best to apply any changes to both group and role configuration for consistency.

<table>
<thead>
<tr>
<th>Group DN:</th>
<th>ou=Groups</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Object Filter:</td>
<td>((&amp;(objectCategory=Group) ((cn=confluence-users) (cn=confluence-administrators))))</td>
</tr>
</tbody>
</table>

Screenshot: The resulting group/role configuration in Crowd

All Integrations

- If I delete a user from Crowd, how will this affect integrated applications?
- Passing the crowd.properties File as an Environment Variable

If I delete a user from Crowd, how will this affect integrated applications?

We recommend that you deactivate a user rather than deleting them, in case some applications contain historical data, e.g. documents that the user has created.

For example, a user may be a participant in a JIRA issue. If you remove the user from the directory managed by Crowd, JIRA will not be able to find the user details when referencing the issue. If you do need to remove the user from Crowd, you must first remove the user's involvement in any JIRA issues, as described in the JIRA documentation.

Read more about deleting or deactivating users in Crowd.

Passing the crowd.properties File as an Environment Variable

When integrating a client application with Crowd, you need a crowd.properties file containing configuration details for that application. (See Important Directories and Files.)

You can pass the location of a client application's crowd.properties file to the client application as an environment variable when starting the client application. This means that you can choose a suitable location for the crowd.properties file, instead of putting it in the client application's WEB-INF/classes directory.

This applies to the Crowd Administration Console's crowd.properties file too. You may find this particularly useful when integrating with a WAR deployment of an integrated application.

Example:

```bash
-Dcrowd.properties={FILE-PATH}/crowd.properties
```

Atlassian Product Integration

This section covers general questions around Crowd's integration with other Atlassian products.

General Integration Questions

Why don't my Groups and Users show up in Bamboo, Confluence, Fisheye or JIRA?

I want to allow public signups, but don't what 'public' users in my company LDAP repository. How should I configure Crowd?

Confluence Integration

JIRA Integration

What is the difference between JIRA's direct LDAP integration & Crowd's JIRA integration?

If I delete a user from Crowd, how will this affect JIRA?

Bamboo Integration
Fisheye Integration

Application Caching

When Crowd is deployed into Bamboo, Confluence, Fisheye or JIRA, the Crowd client may be using caching. If you notice that changes made in Crowd do not appear in one of Crowd's configured applications, this will most likely mean that the changes have not yet propagated into the client caches.

The Crowd development team has opened an improvement request (CWD-1283) for this issue. Please vote on this issue and add it to your JIRA watch list for future updates.

For more information, refer to:

- An overview of the different caching options in Crowd.
- Configuring caching for an application.
- Caching of user permissions on the Crowd server.
- Caching for LDAP directories.

JIRA integration

What is the difference between JIRA's LDAP integration and Crowd's JIRA integration?

JIRA's LDAP integration only delegates authentication to LDAP. This means that you still need to create groups and users in JIRA, and those users must have usernames that match your users in LDAP.

When you use Crowd's JIRA integration, all user and group management is delegated to Crowd. This means that you no longer have to create users and groups in JIRA. Crowd gives you access to all these users and groups in your underlying LDAP directories.

Public Signup Setup

This tip applies if you:

- Have public-facing JIRA, Confluence and Bamboo servers and private LDAP repositories.
- Allow public signup via JIRA, Confluence and/or Bamboo.
- Want to partition where users are created via the public signup functionality.

Crowd allows for multiple directories to be assigned to an application. Follow these steps to direct all public signups into your chosen Crowd directory:

1. Define two directories in Crowd:
   a. An internal directory for 'public' users.
   b. An LDAP directory for staff and contractors.
2. Assign both these directories to the 'JIRA' application in Crowd. (See Mapping a Directory to an Application.)
3. Use the 'ordering' arrows to move the internal 'public' directory into the first position. (See Specifying the Directory Order for an Application.)
4. Grant the 'Add User' permission to the 'JIRA' application in the internal 'public' directory. (See Specifying an Application's Directory Permissions.)
5. Ensure that the 'Add User' permission is disabled for the 'JIRA' application in the private LDAP directory.

Using this configuration, when Crowd receives a request from JIRA to create a user, Crowd will create the user in the 'public' internal directory only.

Unless otherwise instructed, Crowd will add the user to all directories assigned to the 'JIRA' application. The above steps allow you to ensure that the signed-up users are added to your 'public' directory only.

IBM Lotus Domino Integration

Customers have reported successful Crowd integration with IBM Lotus Domino. For more information, take a look at CWD-125.

The Atlassian Crowd team does not officially support this integration, because we do not have test environments set up for Lotus Domino.
IBM Websphere Integration

If your client application is running in Websphere, there is a known problem with Websphere's XML libraries.

Crowd uses XFire to handle the requests between the client application (JIRA, Confluence, Bamboo etc.) and Crowd. XFire requires a newer version of an XML library than what is shipped with Websphere 5.1.

More information and a link to a newer version of the relevant JAR file is available on the XFire website

You will need to add the qname.jar file to the WebSphere\AppServer\lib directory and remove the old file.

----

Some users have also reported errors like the following:

```java
java.lang.VerifyError: (class: org/codehaus/xfire/aegis/type/basic/ObjectType, method: writeSchema signature: (Lorg/jdom/Element;)V) Incompatible argument to method
```

This is related to the following XFire issue the suggested fix for this is to upgrade the version of JDOM that is shipped with Websphere to something greater than 1.0 (Websphere ships with JDOM Beta 6).

If you add a later version of JDOM to the WebSphere\AppServer\lib directory and remove the old version, this should fix the above problem.

Troubleshooting

Finding Known Issues

We track the feature requests and bug reports in the Crowd project on our JIRA site. To find a known issue:

1. Browse the list of unresolved bugs and requests.
2. Click the 'Edit' button on the left.
3. Under 'Text Search', type keywords for your problem into the 'Query' field.
4. Click 'View' and browse the summaries of the unresolved issues.
5. Click an issue key to view the details of the issue and any fixes or workarounds.

Characters in User or Group DN's that will cause problems when using Crowd

At present, the AbstractEncodingFilter used by Crowd, JIRA and Confluence silently translates certain 'dangerous' characters. The AbstractEncodingFilter exists because Microsoft Word uses some special Unicode characters for text (e.g. curly quotes). Not all fonts on non-Windows systems contain these characters. This causes issues in JIRA and Confluence when users copy and paste text from Word into a page or issue. Users on non-Windows systems will see question marks or other odd characters if their fonts don't have these characters.

http://jira.atlassian.com/browse/CORE-100

Unfortunately, these translations obviously cause problems when querying for users or groups in Crowd which contain these characters.

http://jira.atlassian.com/browse/CWD-1152

Until we are able to resolve this issue, customers should be aware that user or group DN's that contain the following characters will not work in Crowd:

---

code

```java
java.lang.VerifyError: (class: org/codehaus/xfire/aegis/type/basic/ObjectType, method: writeSchema signature: (Lorg/jdom/Element;)V) Incompatible argument to method
```
### Problems when Importing Users into MySQL

If your Crowd installation is using a MySQL database, you may find that the user and group import process does not perform a complete import.

To solve this problem, please check the transaction level in your MySQL startup options, as defined in the `my.cnf` configuration file. See the Crowd MySQL configuration guide for instructions.

### Troubleshooting LDAP Error Codes

**Useful Links for translating LDAP Error codes:**

- [LDAP Error Codes](#)
- [How LDAP Error Codes Map to JNDI Exceptions](#)
- [Active Directory LDAP Errors](#)
- [Novell eDirectory or NDS Error Code List](#)

**Active Directory LDAP Errors**

AD-specific errors appear after the word "data" and before "vece" or "v893" in the actual error string returned to the binding process:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>525</td>
<td>user not found</td>
</tr>
<tr>
<td>52e</td>
<td>invalid credentials</td>
</tr>
<tr>
<td>530</td>
<td>not permitted to logon at this time</td>
</tr>
<tr>
<td>531</td>
<td>not permitted to logon at this workstation</td>
</tr>
<tr>
<td>532</td>
<td>password expired</td>
</tr>
<tr>
<td>533</td>
<td>account disabled</td>
</tr>
<tr>
<td>701</td>
<td>account expired</td>
</tr>
</tbody>
</table>
Troubleshooting SSL certificates and Crowd

1. Ensure that you are not using any parameters in the JAVA_OPTS variable that refer to your keystore. For example,

   ```
   -Djavax.net.ssl.trustStore="/my/key/store"
   ```

   The JAVA_OPTS variable is normally located in the standalone version of Crowd's apache-tomcat/bin/setenv.sh or setenv.bat file (depending on the OS you are using). Remove these references and restart Crowd.

2. Run this command on the Crowd server, replacing <ip address of LDAP server> with your LDAP server's IP address:

   ```
   openssl s_client -connect <ip address of LDAP server>:636
   ```

3. Save the certificate (including the BEGIN CERTIFICATE and END CERTIFICATE lines) of the response into a local file called tmp.pem.

4. Run this command on the local tmp.pem file. This should return an MD5 Fingerprint value.

   ```
   openssl x509 -fingerprint -md5 -noout -in tmp.pem
   ```

5. Run this command on the Crowd server. This assumes you are using the default keystore and the $JAVA_HOME (or for Windows %JAVA_HOME%) variable has been set. If not, please specify the correct keystore path.

   ```
   keytool -list -keystore $JAVA_HOME/jre/lib/security/cacerts
   ```

6. Ensure that the MD5 Fingerprint from step 3 is listed in your keystore. If it is not, you will need to import the tmp.pem certificate into your keystore.

   For additional information on SSL services and a great testing tool called SSLPoke, please visit this guide. Although this guide was written for JIRA, it is still extremely useful for troubleshooting SSL-related Crowd issues.

   If you continue to experience issues with your SSL configuration and Crowd, please open a new support issue. Attach the CROWD APPLICATION DIRECTORY/atlassian-crowd.log file and the output of the tests above to the support issue.

How to Optimise Crowd Client Caching

Crowd-integrated applications can store user, group and role data in a local cache. This helps improve the performance of Crowd since these applications do not have to repeatedly request information from Crowd. Generally, it is not necessary to configure application caching, although this depends on the size of your application deployments. But for larger installations, you may need to configure the application caching. Please refer to more information about:

- An overview of the different caching options in Crowd
- Configuring caching for an application.
- Troubleshooting the caching for Atlassian integrated applications.
- Caching of user permissions on the Crowd server.
- Caching for LDAP directories

Troubleshooting Crowd Performance

Please note:

This guide assumes you have already opened a Crowd support issue at http://support.atlassian.com and wish to provide additional information about your Crowd configuration in this issue.
1. The Crowd application is slow!

1. Ensure you are running the latest version of Crowd.
2. Under Admin -> Logging & Profiling in Crowd:
   - Change the com.atlassian.crowd package to DEBUG.
   - Enable profiling.
3. Replicate the performance issues you are seeing in Crowd (e.g. log out and log in, browse users, etc.)
4. Attach the resulting CROWD_DIRECTORY/atlassian-crowd.log file to your support ticket.
5. List the directories and applications active in your Crowd instance.
6. Provide rough estimates of the number of users and groups that are available in each LDAP directory configuration.
7. Provide information about the network location of any LDAP servers in respect to the Crowd server (e.g. same subnet, different networks, different states).
8. If using Active Directory, is SSL enabled?

2. JIRA/Confluence is slow!

1. Confirm that data caching is enabled in Crowd.
2. Confirm that the only crowd-integration-client JAR in the JIRA/Confluence WEB-INF/lib directory matches the version of Crowd you are running (e.g. crowd-integration-client-1.5.jar).
3. Confirm that the crowd-ehcache.xml file located in the JIRA/ConfluenceWEB-INF/classes directory matches the one in the CROWD/client/conf directory.
4. If your Crowd installation contains more than 50,000 users, review the guide at Configuring Caching for an Application.

a. JIRA/Confluence still slow?

1. Stop JIRA/Confluence.
2. Temporarily replace the WEB-INF/lib/crowd-integration-client-1.x.JAR file with the appropriate version from this issue.
4. Under Admin -> Logging & Profiling in JIRA/Confluence:
   - Change the com.atlassian package to DEBUG.
   - Enable profiling.
5. Perform actions in JIRA/Confluence that are slow to respond (e.g. log out and log in, browse users, etc.)
6. Attach the resulting JIRA/Confluence logs/catalina.out or stdout.log, if Confluence, also attach the atlassian-confluence.log file in the Confluence home directory (specified in the confluence-init.properties file at setup).
7. List the directories and applications active in your Crowd instance for the JIRA/Confluence application.
8. Provide rough estimates of the number of users and groups that are available in each LDAP directory configuration for the JIRA/Confluence application.
9. Provide information about the network location of any LDAP servers in respect to the Crowd server (e.g. same subnet, different networks, different states).

b. Using Active Directory?

1. Is SSL enabled?
2. Are you using nested groups (is the Use Nested Groups box checked in Crowd)?
3. If login is slow, please connect to your AD server using Apache Directory Studio and highlight the username used for this login. Provide a screenshot of this user — especially the list of memberOf attributes for this account (should contain full DNs).
4. Please also confirm that all domain controllers referenced in these groups are resolvable/reachable from the Crowd server using ping:

   ```
ping adl.mycompany.com
ping ad2.mycompany.au
```

Troubleshooting SSO with Crowd

Please follow the steps below to troubleshoot problems with SSO (single sign-on) in Crowd:

1. Ensure that each application is using the same version of the crowd-integration-client JAR file. For example, if you are using Crowd 1.4, the crowd-integration-client-1.4.jar file should be located in the WEB-INF/lib directory of each Crowd-integrated application. For more information, please review this Knowledge Base article.

2. Confirm that you can log in to each application with the same username and password.
   - In Crowd, click 'Applications' to view the Application Browser.
3. Set each application to use centralised authentication instead of SSO, as follows. Ensure that each Atlassian application’s WEB-INF/classes/seraph-config.xml file is using the original authenticator class instead of the com.atlassian.crowd authenticator class. For example in JIRA, instead of this:

```xml
<authenticator class="com.atlassian.crowd.integration.seraph.JIRAAuthenticator"/>
```

you should have this:

```xml
<authenticator class="com.atlassian.seraph.auth.DefaultAuthenticator"/>
```

4. Once each application is using centralised authentication instead of SSO, confirm you can log in to each application with the same username and password.

5. Ensure that each application is using the same sub-domain. For example:

   - **JIRA** -> jira.example.com
   - **Confluence** -> confluence.example.com
   - **Crowd** -> crowd.example.com

   SSO will only work with applications on the same sub-domain. Why? Crowd uses a cookie to manage SSO and your browser only has access to cookies in the same sub domain, e.g. *.example.com.

   This is the value that you set in the Domain property (e.g. .example.com) for Crowd to enable SSO. This is covered in the documentation on configuring the domain.

Still having trouble?

If the above steps have not solved your problem, please gather some debugging information as described below before contacting Atlassian support:

1. In Crowd, go to 'Administration' -> 'Logging & Profiling'. Change the com.atlassian.crowd package to DEBUG.
2. Replicate the SSO problem you are having.
3. Please raise a support issue on our [Support System](http://support.atlassian.com, attaching your {CROWD}/atlassian-crowd.log file with the debug information gathered.

Overview of SSO

Debugging SSO in environments with Proxy Servers

This is an example log file from Crowd 1.6 with Debugging turned On for com.atlassian.crowd under Admin > Logging & Profiling. In this example, I've logged into Crowd Console, then attempt to access JIRA.

Example of non-working SSO Configuration

In this example, **admin** signs into Crowd Console, and then visits JIRA. JIRA is being served behind a Apache proxy (mod_proxy for example).
Login to Crowd directly without a proxy

Crowd detects a user logging in for the first time from the IP address 192.168.0.174, with a Mozilla Browser on Linux. A token of onk7YDa9kfyPf consists of an IP address, User-Agent, Random Number.

Login to JIRA via proxy

After my visit to the Crowd Console, I then visit JIRA through a proxy. It detects my same User-Agent, but now sees that my IP is 192.168.3.125 which is really the proxy's. This results in a token that doesn't match my existing one: F6KXEhI3SDn7u1I7zVZLzhQ00 as compared to onk7YDa9kfyPp0ifp26gwA00 and thus, I'm prompted to login again. A clue that I was going through the proxy is the header. It also contains my real IP. The way to fix this is to add X-Forwarded-For header.
Troubleshooting CrowdID

If you are experiencing issues with Crowd's OpenID server (CrowdID), please take the following steps to help diagnose the problem:

**Step 1: Change the logging for Crowd's OpenID server and client.**

- Change the openid package from INFO to DEBUG in
  `CROWD/crowd-openidserver-webapp/WEB-INF/classes/log4j.properties`

```properties
# CROWD - CLASS-SPECIFIC LOGGING LEVELS

# Set the following lines to DEBUG to enable logging on incoming, outgoing and fault SOAP messages
log4j.logger.com.atlassian.crowd.integration.service.soap.xfire.XFireInLoggingMethodHandler=WARN
log4j.logger.com.atlassian.crowd.integration.service.soap.xfire.XFireOutLoggingMethodHandler=WARN

log4j.logger.com.atlassian.crowd.openid=DEBUG

log4j.logger.com.atlassian.crowd=INFO
```

- Change the openid package from INFO to DEBUG in
  `CROWD/crowd-openidclient-webapp/WEB-INF/classes/log4j.properties`

```properties
# CROWD - CLASS-SPECIFIC LOGGING LEVELS

log4j.logger.com.atlassian.crowd.openid=DEBUG

log4j.logger.com.atlassian.crowd=INFO
```

**Step 2: Test CrowdID with the bundled OpenID client:**

- [http://<your Crowd URL>:<Crowd port>/openidclient/](http://<your Crowd URL>:<Crowd port>/openidclient/)

If these tests are not successful, attach the `atlassian-crowd-openid-client.log` and `atlassian-crowd.openid-server.log` files (in the same location specified by this guide) to a support issue at [http://support.atlassian.com](http://support.atlassian.com). Note the username of the account tested.

**Step 3: Test CrowdID with your OpenID application:**

If these tests are not successful, attach the `atlassian-crowd-openid-client.log` and `atlassian-crowd.openid-server.log` files (in the same location specified by this guide) to a support issue at [http://support.atlassian.com](http://support.atlassian.com). Note the username of the account tested and the OpenID application you are attempting to use.

**Tips of the Trade**

Below are some links to blog posts and articles that contain technical tips and instructions on setting up and using Crowd.

The references here are specific to Crowd and are technical 'how to' guides. For more general information on identity management solutions, best practices and business cases, please refer to the [Atlassian website](http://www.atlassian.com).

⚠️ **Note:** Please check the relevancy of and support for the information in the linked articles. Most of the links point to external sites, and some of the information is relevant to a specific release of Crowd. Atlassian provides these links because the information is useful and relevant at the time it was written. Please check carefully whether the information is still relevant when you read it, and whether it is relevant to your version of Crowd. Unless explicitly stated, Atlassian does not offer support for third-party extensions or plugins.
