- Supported platforms
- Managing users and groups in FishEye
- Environment variables
- Managing your repositories
- Tuning FishEye performance

Extending FishEye...
- Integrating with JIRA
- APIs and add-ons

Latest release notes and changelog
Upgrading FishEye

Getting started
FishEye lets you view the contents of your Source Code Management (SCM) repositories in your web browser.

You can:
- view changesets, revisions, branches, tags, diffs and annotations.
- search everything – file names, commit messages, authors, text as well as the source code.
- visualise how source changes were introduced, what changed, when it changed, where it was changed, and who changed it.
• track activity in your source code repository.
• link specific source with related JIRA issues, Crucible code reviews, and Bamboo builds.
• get real-time notifications on code activity via email, RSS, or OpenSocial dashboards.
• construct your own sophisticated queries with EyeQL and integrate the results with other tools using the FishEye API.

Watch the video overview of FishEye’s features.

To get started with FishEye:

1. Install and start FishEye on either Windows, or Linux and Mac.
2. Work through Starting to use FishEye.
3. Tell FishEye about your repositories.
4. Set up users and groups.

Supported platforms

This page shows the supported platforms for FishEye 3.1.x and its minor releases.

Key: 🟢 = Supported ❌ = Not Supported

<table>
<thead>
<tr>
<th>Java Version</th>
<th>Support Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle JRE / JDK</td>
<td>✔️ 1.6 ✔️ 1.7</td>
</tr>
</tbody>
</table>

FishEye requires the Java Runtime (JDK or JRE), version as noted. Pre-release/Early access versions of the Java Runtime are not supported.

You can download an Oracle Java Runtime for Windows/Linux/Solaris. On Mac OS X, the JDK is bundled with the operating system.

For the OpenJDK, download and install instructions for Linux flavours are at http://openjdk.java.net/install/.

We highly recommend that you use the Oracle JVM or OpenJDK (for Linux only), or use the default Mac OS X JVM. Other implementations have not been tested.

Please note:

• Once you have installed Java, you must set the JAVA_HOME environment variable. See Installing FishEye on Windows or Installing FishEye on Linux and Mac.
• If you are using a 64-bit JVM, please ensure that you’ve set your max heap size (–Xmx) to a reasonable value, considering the RAM requirements of your system.
• If you intend to run FishEye as a Windows Service, using the Java Service Wrapper, we recommend that you use the Java JDK rather than the JRE so as to take advantage of the -server parameter.
• You’ll need the JDK for the JSP source download.
OpenJDK | 1.7 (Linux only) | Note also that a **bug** in Java 1.6.0_29 and above will prevent a connection to an external SQL Server 2008 database without an additional **workaround**.

### Operating Systems

<table>
<thead>
<tr>
<th>Operating System</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft Windows</td>
<td>✔️</td>
</tr>
<tr>
<td>Linux</td>
<td>✔️</td>
</tr>
<tr>
<td>Apple Mac OS X</td>
<td>✔️</td>
</tr>
</tbody>
</table>

- FishEye is a pure Java application and should run on any platform provided the requirements for the JRE or JDK are satisfied.
- **⚠️** Although FishEye can be run in virtualised environments, Atlassian is not yet able to provide technical support for performance-related problems in a virtualised environment. If you do choose to run FishEye in a VM, please ensure that you choose a VM with good IO throughput.

### Databases

<table>
<thead>
<tr>
<th>Database</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>MySQL</td>
<td>✔️ MySQL Enterprise Server 5.x ✔️ MySQL Community Server 5.x</td>
</tr>
<tr>
<td>PostgreSQL</td>
<td>✔️ 8.2, 8.3, 8.4</td>
</tr>
<tr>
<td>Oracle</td>
<td>✔️ 11g</td>
</tr>
<tr>
<td>HSQLDB</td>
<td>✔️ Bundled; for evaluation use only</td>
</tr>
</tbody>
</table>

The FishEye built-in database, running **HSQLDB**, is somewhat susceptible to data loss during system crashes.

External databases (such as MySQL) are generally more resistant to data loss during a system crash.

See the FishEye Database documentation for further details.

- **⚠️** For MySQL 5.0, version must be 5.0.21 or later.
- **⚠️** For MySQL 5.1, version must be 5.1.10 or later.
- **⚠️** For MySQL 5.6, version must be 5.6.11 or later.

### Web Browsers

<table>
<thead>
<tr>
<th>Web Browser</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft Internet Explorer</td>
<td>✔️ 8.0, 9.0 ✔️ 6.0 and 7.0 are not supported</td>
</tr>
<tr>
<td>Mozilla Firefox</td>
<td>✔️ Latest stable version supported ✔️ 3.6, 4.0</td>
</tr>
<tr>
<td>Safari</td>
<td>✔️ Latest stable version supported ✔️ 4, 5</td>
</tr>
<tr>
<td>Chrome</td>
<td>✔️ Latest stable version supported</td>
</tr>
</tbody>
</table>

### Version Control Systems
Subversion

Server:
- ✔ 1.1, 1.2, 1.3, 1.4, 1.5, 1.6, 1.7

Client:
- ✔ SVNKit (bundled & the default)
- ✔ Native JavaHL 1.7
- ✗ Native JavaHL 1.6
- ✔ FishEye 3.1, and later, supports SVN 1.7.x with the native JavaHL 1.7 client.
- ✗ FishEye 3.1, and later, do not support the native JavaHL 1.6 client.

See Native support for SVN 1.7 for discussion.

Subversion 1.8 support is currently being assessed. FishEye does not yet work for file:// access to repositories created with Subversion 1.8 when using the bundled SVNKit client.

CVS (and CVSNT)
- ✔ All versions

Perforce
- ✔ Client version 2007.3 or later

Git
- ✔ 1.7.1.1 or later

Support for internal hosting of Git repositories by FishEye will end on August 14th 2013, after which Git internal hosting will be removed from newer versions of FishEye.

Please see End of Support Announcement for Internally Managed Repositories.

Mercurial
- ✔ 1.5.1 or later

Mercurial 2.1 has a bug that makes it incompatible with FishEye. Please use Mercurial 2.1.1 or later. Mercurial 2.6.x is currently not compatible. You should restart FishEye after upgrading Mercurial.

Hardware requirements

FishEye should ideally run on a dedicated server. The most important aspect for a large-repository deployment will be I/O speed. You definitely want a fast local HDD for FishEye's cache. Note that NFS and SAN are not supported.

<table>
<thead>
<tr>
<th>Component</th>
<th>Specifications</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU</td>
<td>1.8GHz or higher, a single core is sufficient. More cores or higher GHz will result in better load-handling ability.</td>
</tr>
<tr>
<td>RAM</td>
<td>1GB minimum, 2GB will provide performance &quot;headroom&quot;. Your Java heap should be sized at 512MB with the FISHEYE_OPTS environment variable, adjustable up to 1024MB depending on performance.</td>
</tr>
<tr>
<td>I/O</td>
<td>FishEye's input/output is an important element of its overall performance. If FishEye accesses your repository remotely, make sure that the throughput is maximum and the latency minimum (ideally the servers are located in the same LAN, running at 100Mbps or faster).</td>
</tr>
</tbody>
</table>

While some of our customers run FishEye on SPARC-based hardware, Atlassian only officially supports FishEye running on x86 hardware and 64-bit derivatives of x86 hardware.

**Disk Space Requirement Estimates**

Disk space requirements for FishEye may vary due to a number of variables such as the repository...
implementation, file sizes, content types, the size of diffs and comments being stored. The following table contains some real-world examples of FishEye disk space consumption.

<table>
<thead>
<tr>
<th>Repository Technology</th>
<th>Commits</th>
<th>Codebase Size (HEAD of trunk)</th>
<th>FishEye Index Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subversion</td>
<td>14386</td>
<td>466 MB in 12151 files</td>
<td>647 MB</td>
</tr>
<tr>
<td>CVS</td>
<td>8210</td>
<td>115 MB in 11433 files</td>
<td>220 MB</td>
</tr>
</tbody>
</table>

⚠️ These disk space estimates are to be used as a guideline only. We recommend you monitor the disk space that your FishEye instance uses over time, as needs for your specific environment may vary. It may be necessary to allocate more space than indicated here. Additionally, you can reduce disk space consumption by turning off diff storage in FishEye.

Deployment notes for version control systems

**Subversion (server)**

FishEye can communicate with any repository running Subversion 1.1 or later.

**Subversion (client)**

FishEye now bundles the SVNkit client, which becomes the default Subversion interface. An alternative is to use the native subversion client, using JavaHL bindings. Please see Subversion Client Setup for more information.

**Perforce (client)**

FishEye needs access to the `p4` client executable. Due to some problems with earlier versions of the client, we recommend version 2007.3 or later.

**CVS**

If you are using CVS, FishEye needs read-access to your CVS repository via the file system. It does not support protocols such as `pserver` at the moment.

Support for other version control systems is planned for future releases. Let us know what SCM system you would like to see supported by creating a JIRA issue or adding your vote to an issue, if the request already exists.

**WAR deployment**

FishEye/Crucible is currently a Java program that runs on its own. It cannot be deployed to web application servers such as WebSphere, Weblogic or Tomcat.

**Single sign on with Atlassian Crowd**

From version 2.8.x, FishEye is bundled with the Crowd 2.4.1 client library, and supports the Crowd 2.4.x server.

**Font size tips**

(Especially for Linux users.) For best results you may want to tweak your default monospace font and font-size. The default browser font is usually Courier New which can be hard to read in some browsers. We recommend choosing the same font you use in your IDE and selecting a font size approximately 2 points larger than your variable width font. Firefox, Internet Explorer and Safari all have excellent font rendering. It is worth taking some time to tweak your fonts for the best experience.

**End of Support Announcements for FishEye**

This page contains announcements of the end of support for various platforms and browsers when used with FishEye. This is summarised in the table below. Please see the sections following for the full announcements.

**End of support matrix for upcoming versions of FishEye**

<table>
<thead>
<tr>
<th>Platform</th>
<th>Announcement date</th>
<th>FishEye End of Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>JIRA versions, earlier than 5.0</td>
<td>27 August 2013</td>
<td>As of FishEye 3.2</td>
</tr>
</tbody>
</table>
Internally managed repositories | 16 August 2012 | 14 August 2013
---|---|---

The table above summarises information regarding the end of support announcements for upcoming FishEye releases. If a platform (version) has already reached its end of support date, it is not listed in the table.

Why is Atlassian ending support for these platforms?
Atlassian is committed to delivering improvements and bug fixes as fast as possible. We are also committed to providing world class support for all the platforms our customers run our software on. However, as new versions of databases, web browsers etc. are released, the cost of supporting multiple platforms grows exponentially, making it harder to provide the level of support our customers have come to expect from us. Therefore, we no longer support platform versions marked as end-of-life by the vendor, or very old versions that are no longer widely used.

On this page (most recent announcements first):

- Deprecated FishEye 3.2 support for older versions of JIRA (announced 27 August 2013)
- Deprecated support for internally managed repositories in FishEye (announced 16 August 2012)
- Deprecated database support for FishEye (announced 4 October 2011)
- Deprecated web browsers for FishEye (announced 21 March 2011)
- Deprecated Java platforms for FishEye (announced 21 March 2011)
- Deprecated SCM repository support for FishEye (announced 4 April 2011)

Deprecated FishEye 3.2 support for older versions of JIRA (announced 27 August 2013)
Atlassian announces the deprecation of support for FishEye communication with older versions of Atlassian JIRA. We will stop supporting older versions of JIRA as follows:

- From FishEye 3.2, support for FishEye to JIRA communication for versions of JIRA earlier than 5.0, will end. Please note that communication from JIRA to FishEye will continue to work as it currently does. FishEye 3.2 is expected to be released late in 2013.

If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

Deprecated support for internally managed repositories in FishEye (announced 16 August 2012)
Atlassian announces the deprecation of support for internally managed repositories in FishEye. We will stop supporting internally managed repositories as follows:

- From 14 August 2013, Atlassian support for internally managed repositories in FishEye will end. Please read the full announcement for this change.

If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

Deprecated database support for FishEye (announced 4 October 2011)
This section announces the end of Atlassian support for certain databases for FishEye.

We will stop supporting older versions of databases as follows:

- For the next major version of FishEye, in January 2012, support for MySQL 5.0, PostgreSQL 8.0 and 8.1 will end.

Please refer to the Supported platforms for more details regarding platform support for FishEye. If you have questions or concerns regarding these announcements, please email eol-announcement at atlassian dot com.

<table>
<thead>
<tr>
<th>Database</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>MySQL 5.0</td>
<td>January 2012</td>
</tr>
<tr>
<td>PostgreSQL 8.0 and 8.1</td>
<td>January 2012</td>
</tr>
</tbody>
</table>
End of Support Notes for MySQL 5.0 and PostgreSQL 8.0 and 8.1:

- Atlassian intends to end of life support for MySQL 5.0, PostgreSQL 8.0 and 8.1 in January 2012. The release of FishEye after January 2012 will not support MySQL 5.0, PostgreSQL 8.0 or 8.1.
- As mentioned above, the releases of FishEye before January 2012 will contain support for MySQL 5.0 and PostgreSQL 8.0 and 8.1.

Deprecated web browsers for FishEye (announced 21 March 2011)

This section announces the end of Atlassian support for certain web browsers for FishEye.

We will stop supporting older versions of web browsers as follows:

- From FishEye 2.6, due in May 2011, support for Internet Explorer 7 will end.

The details are below. Please refer to the Supported platforms for more details regarding platform support for FishEye. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

<table>
<thead>
<tr>
<th>Web Browsers</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internet Explorer 7</td>
<td>When FishEye 2.6 releases (target May 2011)</td>
</tr>
</tbody>
</table>

Internet Explorer 7 Notes:

- FishEye 2.5 is the last version to officially support Internet Explorer 7.
- FishEye 2.6 is currently targeted to release in May 2011 and will not be tested with Internet Explorer 7. After the FishEye 2.6 release, Atlassian will not provide fixes in older versions of FishEye for bugs affecting Internet Explorer 7.

Deprecated Java platforms for FishEye (announced 21 March 2011)

This section announces the end of Atlassian support for certain Java Platforms for FishEye.

We will stop supporting the following Java Platforms:

- From FishEye 2.6, due in May 2011, support for Java Platform 5 (JDK/JRE 1.5) will end.

We are ending support for Java Platform 5, in line with Sun's Java SE Support Road Map (i.e. "End of Service Life" for Java Platform 5 dated October 30, 2009). We are committed to helping our customers understand this decision and assist them in updating to Java Platform 6, our supported Java Platform.

The details are below. Please refer to the Supported platforms for more details regarding platform support for FishEye. If you have questions or concerns regarding this announcement, please email eol-announcement at atlassian dot com.

<table>
<thead>
<tr>
<th>Java Platform</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java Platform 5 (JDK/JRE 1.5)</td>
<td>When FishEye 2.6 releases (target May 2011)</td>
</tr>
</tbody>
</table>

Java Platform 5 End of Support Notes:

- FishEye 2.5 is the last version to officially support Java Platform 5 (JDK/JRE 1.5).
- FishEye 2.6 is currently targeted to release in May 2011 and will not be tested with Java Platform 5 (JDK/JRE 1.5). After the FishEye 2.6 release, Atlassian will not provide fixes in older versions of FishEye for bugs affecting Java Platform 5 (JDK/JRE 1.5).

Deprecated SCM repository support for FishEye (announced 4 April 2011)
This section announces the end of Atlassian support for certain SCM repositories for FishEye. End of support means that Atlassian will remove all functionality related to certain SCM repositories past the specified date. Releases before that date will contain the functionality that supports the SCM, however, Atlassian will fix only critical bugs that affect functionality for that SCM, and will not add any new features for that SCM. After the specified date, Atlassian will not support the functionality in any version of FishEye.

Please refer to the Supported platforms for more details regarding platform support for FishEye. If you have questions or concerns regarding these announcements, please email eol-announcement at atlassian dot com.

<table>
<thead>
<tr>
<th>SCM Repository</th>
<th>Support End Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBM ClearCase (all versions)</td>
<td>4 April 2012</td>
</tr>
</tbody>
</table>

**IBM ClearCase End of Support Notes:**

- Atlassian intends to end of life IBM ClearCase functionality on 4 April 2012. The release of FishEye after 4 April 2012 will not contain any IBM ClearCase functionality.
- As mentioned above, the releases of FishEye before 4 April 2012 will contain support for IBM ClearCase. However, we will only be fixing critical bugs related to IBM ClearCase and will not be adding any features.
- After 4 April 2012, Atlassian will not support IBM ClearCase functionality in any version of FishEye

**End of Support Announcement for IBM ClearCase**

Support in FishEye for IBM ClearCase ended on **April 4th 2012**. FishEye 2.8, and later versions, do not have support for ClearCase.

We have made these decisions to reduce the testing time required for each release and to help us to deliver market-driven features faster.

You can stay on older versions of FishEye to support your existing installations with ClearCase. However, Atlassian will not be providing any ClearCase-related support for any FishEye version after 4 April 2012, and has removed all functionality related to ClearCase from FishEye versions released after April 4th 2012. We are committed to helping our customers understand this decision and to assist you in migrating to a different SCM, if needed.

For more details about the announcement, please refer to this page: End of Support Announcements for FishEye.

**End of Support Announcement for Internally Managed Repositories**

On **August 14th 2013**, we are ending support for internally managed repositories.

You can stay on older versions of FishEye to support your existing installations with Git repository management. However, Atlassian will remove all functionality related to repository management, from FishEye versions released after August 14th 2013. We are committed to helping our customers understand this decision and to assist you in migrating your repositories to one of the two other solutions offered by Atlassian if needed:

- **Stash** if you need to host your repositories behind your firewall
- **Bitbucket** if you prefer a SaaS hosting solution

**Why is repository management being removed?**

FishEye was built to enable browsing, searching and visualising source code in various Version Control Systems. With many customers requesting repository management, we have decided to provide a solution on top of FishEye. However, the part of FishEye's architecture that allows it to index different types of repositories and access your Subversion and Git repositories in one place, turned out to not be adequate for a repository management solution.

We have decided to focus on the core strengths of FishEye - browsing, searching and visualizing multiple source code management systems - and strengthen the product around these features. This also has enabled us to deliver a much more focused approach to Git repository management and offer a new solution – **Atlassian Stash** – which was build from the ground-up with repository management as a focus.

Going forward FishEye will continue to deliver new features and enhancements to help users browse, search
and visualize across different Version Control Systems including Git, Subversion, Mercurial, Perforce and CVS.

My team manages Git repositories in FishEye, how do we migrate?

Here are suggestions to migrating your repositories to Stash or Bitbucket. The following steps will guide you through the commands that you need to run to migrate your FishEye hosted repositories to a different location.

We will assume that you already have a new repository ready to be used and that you have the latest local copy on your computer. In this case we will use a Stash example.

1. Create a new repository on the service you chose (Stash, BitBucket...)

2. Open your terminal and go to the local copy of the directory that you want to push.

```bash
cd /path/to/myrepo
```

3. Update the address of your remote origin to point it a the new repository.

```bash
git remote set-url origin ssh://git@stash.mycompany.com/MYPROJECT/myrepo.git
```

4. Push all the branches to the remote repository.

```bash
git push --all origin
```

5. Push all the tags to the remote repository.

```bash
git push --tags origin
```

At this stage all your local branches and tags should be present in your new repository and you can have the same development process as the one you had before.

7. Index your newly created repository with FishEye to be able to search, track and view report on your source.

Past this point the migration is complete – your repository should be hosted on a different service and indexed by FishEye as an external Git repository.

8. Delete your old managed repository

You will push and pull against your new service and FishEye will index the changes just like for any external repository.

**Native support for SVN 1.7**

This page describes an advanced feature of FishEye's Subversion support. It explores the technical background, and some of the issues you may encounter, if you wish to use the native JavaHL access feature.

For most users we recommend that you use the default SVNKit Subversion access client that is bundled with FishEye. You are only likely to need the native JavaHL access described on this page for certain edge case repositories.

**FishEye Subversion access**

FishEye interacts with Subversion repositories though a layer, defined by the Apache Subversion project, known as JavaHL. This is the high-level Java language binding for Subversion. There are two implementations of the JavaHL interface available:

**Bundled SVNKit**

The SVNKit implementation is a largely Java-based implementation provided by the SVNKit project. It is bundled with FishEye and is the default JavaHL implementation used. As a Java implementation it operates on all of FishEye's supported platforms.

**Native JavaHL**
The JNI-based implementation, coupled with a shared dynamic library, is referred to here as native JavaHL. As a native library, native JavaHL is platform-dependent. The shared library is C-based and must be compatible with the remaining Subversion client components installed on the platform. It varies across each platform and distribution.

</tbody>
</table>

Native vs. bundled

Given that FishEye bundles the SVNKit implementation, why might you want to use the native implementation of JavaHL? In general our recommendation is to stick with the bundled SVNKit implementation. It is the simplest to use and works in the widest variety of scenarios. Nevertheless, there are some scenarios where it may be desirable to use the native implementation, if it is available.

The two implementations have quite different characteristics – these can affect the decision about which to use. Here is a high-level list of some of the considerations we have encountered over the years:

<table>
<thead>
<tr>
<th>Aspect</th>
<th>SVNKit - bundled with FishEye</th>
<th>Native JavaHL - platform dependent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory Usage</td>
<td>SVNKit uses the Java Heap. It therefore shares the heap that is being used for all FishEye's operations. It does benefit, however, from Java's garbage collection mechanism and we have not seen any memory leaks.</td>
<td>The native JavaHL implementation uses the native process heap and not the Java heap. It can increase the overall process memory usage but does not interfere with the Java heap usage. In some rare instances, we have seen memory leaks in the C-based JavaHL code. As FishEye is a long running service, these can cause problems over the life of the FishEye process.</td>
</tr>
<tr>
<td>Speed</td>
<td>In general, when using any of the Subversion network protocols, the JavaHL implementation speed is not a significant factor in the overall speed of Subversion operations as they are dominated by the network latency. Even for file:// access SVNKit is rarely the bottleneck.</td>
<td>If you are using file:// access to talk to a Subversion repository on the same server, then native JavaHL will most likely give the highest performance.</td>
</tr>
</tbody>
</table>
Compatibility

| SVNKit has proven to be highly compatible with Subversion across all releases. The project is very responsive to bug reports when any differences become apparent. |
| As an alternative implementation of JavaHL there will be differences between the SVNKit and the native Subversion JavaHL. This may affect some edge case repositories. |

JavaHL uses predominantly the same code as Subversion itself so it is virtually 100% compatible.

Availability

| SVNKit works on all of FishEye's supported platforms |
| It can be difficult to get an install of the JavaHL jar and shared library that is compatible with the version of Subversion installed on your platform. |

Native versions

The native JavaHL interface and implementation naturally change with every release of Subversion. Normally these changes are incremental and backward compatible. The change from Subversion 1.6 to Subversion 1.7 was much more significant and for a number of FishEye's usages of the interface, it broke compatibility.

In Subversion 1.7, the JavaHL interfaces were updated and moved from the org.tigris.subversion package to the org.apache.subversion package. This coincided with the move of the Subversion project to the Apache Software Foundation. In addition to moving the package, the interface was modernized in a number of ways:

- Extended use of callbacks.
- Use of Java collections rather than native arrays.
- Properties were clarified as byte arrays rather than Java Strings.
- Use of typed Enums rather than primitive integer and char fields.

The existing org.tigris package was retained in most 1.7 distributions and was implemented as an adapter layer over the new org.apache package classes. Unfortunately a number of incompatibilities in the adapter layer meant that FishEye could not use the 1.7 native implementation:

1. Property returning methods were wrapped in a String constructor to convert from the byte[] type of the new interface to the String type used in the old interface. This meant that any null returns would throw NullPointerExceptions rather than returning null Strings.
2. Some of the callbacks were changed from plain interfaces to being interface extensions of the corresponding callback in the new package. This changed the type definition of the callback from an untyped Map to a typed Map. This caused ClassCastException because the code is expecting a map containing byte[] but the underlying code was passing in a map containing strings.

For this reason, FishEye did not support native access using the 1.7 native library prior to FishEye 3.1. Prior to the 3.1 release the compatibility matrix for FishEye was as follows:

**Pre FishEye 3.1 Native JavaHL SVN client compatibility**

<table>
<thead>
<tr>
<th>SVNKit</th>
<th>Native JavaHL 1.6 client</th>
<th>Native JavaHL 1.7 client</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.7 Subversion Server (not file:// access)</td>
<td>✔</td>
<td>✔</td>
</tr>
<tr>
<td>1.7 Subversion Server (file:// access)</td>
<td>✔</td>
<td>✗</td>
</tr>
<tr>
<td>1.6 Subversion Server any access</td>
<td>✔</td>
<td>✔</td>
</tr>
</tbody>
</table>

Native JavaHL 1.7 support
FishEye 3.1 adds support for native 1.7 client. The resulting compatibility matrix is:

### FishEye 3.1 and higher Native JavaHL SVN client compatibility

<table>
<thead>
<tr>
<th></th>
<th>SVNKit</th>
<th>Native JavaHL 1.6 client</th>
<th>Native JavaHL 1.7 client</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.7 Subversion Server</td>
<td>✓</td>
<td>✗</td>
<td>✓</td>
</tr>
<tr>
<td>(not file:// access)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1.7 Subversion Server</td>
<td>✓</td>
<td>✗</td>
<td>✓</td>
</tr>
<tr>
<td>(file:// access)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1.6 Subversion Server</td>
<td>✓</td>
<td>✗</td>
<td>✓</td>
</tr>
<tr>
<td>any access</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Since FishEye now uses the org.apache.subversion package and this package is not provided in 1.6 JavaHL builds, FishEye 3.1 will no longer be compatible with the JavaHL 1.6 client (or older versions). From FishEye 3.1, you must use a 1.7 or later JavaHL library if you want native JavaHL access.

### Installing JavaHL for your platform

Atlassian FishEye bundles the SVNKit library to make connecting to your Subversion repository a painless process out of the box. If you do wish to use native JavaHL, it is your responsibility to install it onto your platform. Different organizations have different operating procedures and policies regarding how and what packages they are able to install on production servers.

In some cases the distribution you use will not provide a compatible JavaHL from an official package. In this case you will either need to build everything from source yourself (hard) or use a package from a Subversion vendor. We have used packages from two vendors over time, CollabNet and Wandisco. More recently, we have found it easier to use the Wandisco packages for JavaHL support. The following sections detail our experiences deploying JavaHL on a variety of platforms. This is not a definitive list or guide. It is to give you an idea of the some of the issues you are likely to encounter getting a compatible JavaHL install working on a range of platforms and distributions.

#### Windows 7

Windows does not include a Subversion client by default so you will need to install a Subversion package. We installed the 1.7.11 “client only” install from Wandisco. This installs Subversion, including the javahl components, in C:\Program Files\WANDisco\Subversion. It is interesting to note that the JavaHL package in this install does not include the org.tigris package adapter layer.

#### Ubuntu 12

Ubuntu provides packages for both core subversion and the JavaHL library for Subversion 1.7.5. We installed these as follows:

- `sudo apt-get install subversion`
- `sudo apt-get install libsvn-java`

Unfortunately the version installed seems to have a consistent assert failure:

```bash
java: /build/buildd/subversion-1.7.5/subversion/libsvn_subr/dirent_uri.c:1519:
uri_skip_ancestor: Assertion `svn_uri_is_canonical(child_uri, ((void *)0))' failed.
```

We then removed the two Subversion packages from Ubuntu itself:

- `sudo apt-get remove libsvn-java`
- `sudo apt-get remove subversion`

We installed the Wandisco packages by downloading and running the Wandisco installer:

`svn1.7Ubuntu_wandisco-precise.sh`
This configures the Wandisco servers as a source of packages and installs the core Subversion install. At the
time of writing this installs 1.7.11. Once installed, reinstall the javahl package:

- `sudo apt-get install libsvn-java`

This will now come from the Wandisco package repository. The location of the shared library and JavaHL jar is:

```
/usr/lib/jni/libsvnjavahl-1.so
/usr/share/java/svn-javahl.jar
```

### CentOS 6.4

If you install the Subversion packages (subversion and subversion-javahl) using yum, you will currently have a
1.6.11 install of Subversion which is not compatible with FishEye if you wish to use JavaHL as descibed above.

If you have previously upgraded to a version of SVN 1.7 before 1.7.11 you may see the message below in your
logs. If you do, please upgrade to the Wandisco SVN 1.7 as described below:

```
java: /build/buildd/subversion-1.7.5/subversion/libsvn_subr/dirent_uri.c:1519:
uri_skip_ancestor: Assertion `svn_uri_is_canonical(child_uri, ((void *)0))' failed.
```

You will need to remove the standard yum packages and use a Wandisco install, svn1.7_centos6_wandisco.sh.
This installs plain subversion and configures the Wandisco servers as a source of packages. You can then use
yum to install subversion-javahl. The following files are installed:

```
$ repoquery --list subversion-javahl
/usr/lib/libsvnjavahl-1.so
/usr/lib/svn-javahl/svn-javahl.jar
/usr/lib64/libsvnjavahl-1.so
/usr/lib64/svn-javahl/svn-javahl.jar
```

If you are using a 64bit JVM, use the /usr/lib64 library, otherwise use the 32bit library in /usr/lib.

### JavaHL considerations when upgrading to FishEye 3.1

If you are currently using SVNKit with FishEye (the default), then you do not have to do anything when
upgrading to FishEye 3.1. FishEye will continue to use the bundled SVNKit library, which has been updated to
SVNKit version 1.7.10. This was the latest release available when FishEye 3.1 was released.

FishEye's Admin UI now displays information about the Subversion client in use in the server section. With no
native client, configured, the display would look like:

```
The bundled Subversion client, SVNKit, is being used for Subversion operations.
The JavaHL client version is SVNKit v1.7.10.9848.
```

If you have been using native JavaHL prior to FishEye 3.1, FishEye will detect that you have configured a
pre-1.7 version of JavaHL and fallback to the bundled SVNKit client and startup normally. You will see the
following in the Server section of the admin UI:
You can use the FishEye admin UI to update the JavaHL client information to point FishEye to a 1.7 or later JavaHL jar and shared library. FishEye will perform some checks that the configured library supplies the correct classes. You will need to restart for the changes to take effect. If there are problems with the JavaHL library on restart, FishEye will again fallback to SVNKit. Once you have updated the configuration, FishEye will show a message that the configuration has been changed and a restart is required:

Upon restart, the display will show the operation of the native library and its version:

The Apache Software Foundation has recently released Subversion 1.8. At this time, FishEye is not completely compatible with Subversion 1.8. We are currently waiting for the SVNKit project to release their 1.8 support. We have not completed testing of FishEye against 1.8 at this time, however we expect the compatibility matrix for FishEye 3.1 against 1.8 Subversion servers is likely to be as follows:

<table>
<thead>
<tr>
<th>Subversion version</th>
<th>SVNKit Compatibility</th>
<th>Native JavaHL 1.7 client</th>
<th>Native JavaHL 1.8 client</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.8 Subversion Server (not file:// access)</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>1.8 Subversion Server (file:// access)</td>
<td>❌</td>
<td>❌</td>
<td>✔️</td>
</tr>
</tbody>
</table>

**Installing FishEye on Windows**

Hey! We’re going to install FishEye on Windows. There are a few steps involved, but we think you’ll find it easy...
to follow along. If you are upgrading an existing installation, please refer to the FishEye upgrade guide instead.

1. Check supported platforms

Better check the Supported platforms page first; it lists the application servers, databases, operating systems, web browsers and JDKs that we have tested FishEye with, and that we recommend.

Atlassian only officially supports FishEye running on x86 hardware and 64-bit derivatives of x86 hardware.

**Related pages:**
- Running FishEye as a Windows service
- Installing FishEye on Linux and Mac
- Starting to use FishEye
- Supported platforms
- FishEye upgrade guide

2. Check your version of Java

In a command prompt, run this:

```
java -version
```

The version of Java should be **1.6.0** or higher. If you intend to run FishEye as a Windows Service, using the Java Service Wrapper, you should use 32-bit Java (even on a 64-bit machine), and the JDK rather than the JRE (so as to take advantage of the `-server` parameter).

- If you don't see Java 1.6.0 or higher, then get Java...

  Download and install the Java Platform JDK from Oracle's website.

  **WARNING:** We recommend that the Java install path should not contain spaces, so don't install into `C:\Program Files\Java`. Instead, use a path like `C:\Java`.

  Now try running `java -version` again to check the installation. The version of Java should be **1.6.0** or higher.

3. Check that Windows can find Java

Windows uses the JAVA_HOME environment variable to find Java. To check that, in a new command prompt, run:

```
echo %JAVA_HOME%
```

You should see a path to the Java install location. We recommend that this path does **not** contain spaces, and that JAVA_HOME should point to the Java executable in your PATH.

- If you don't see a path without spaces...

  **For Windows 7:**
  1. Go to Start, search for "sys env" and choose Edit the system environment variables.
  2. Click Environment Variables, and then New under 'System variables'.
  3. Enter "JAVA_HOME" as the Variable name, and the absolute path to where you installed the Java executable as the Variable value, that is, something like `C:\Java\bin`. Don't use a trailing backslash. We recommend that JAVA_HOME should point to the Java executable specified in your PATH variable.
  4. Now, in a new command prompt, try running `%%JAVA_HOME%%\java -version`. You should see the same version of Java as you saw above.
4. Create a dedicated FishEye user (recommended)

For production installations, we recommend that you create a new dedicated Windows user that will run FishEye on your system. This user:

- Should not have admin privileges.
- Should be a non-privileged user with read, write and execute access on the FishEye home (install) directory and instance (data) directory. These directories are described below.
- Should only have read access to your repositories.

If you created a dedicated FishEye user, ensure you are logged in as this user to complete the remaining instructions.

5. Now it's time to get FishEye

Download FishEye from the Atlassian download site.

Extract the downloaded file to an install location:

- Folder names in the path to your FishEye executable should not have spaces in them. The path to the extracted directory is referred to as the <FishEye home directory> in these instructions.
- If you expect to have a large number of users for this FishEye installation, and FishEye will be connected to an external database, consider installing FishEye on a different server from the one running the external database, for improved performance.

6. Tell FishEye where to store your data

The FishEye instance directory is where your FishEye data is stored.

⚠️ You should not locate your FishEye instance directory inside the <FishEye home directory> — they should be entirely separate locations. If you do put the instance directory in the <FishEye home directory> it will be overwritten, and lost, when FishEye gets upgraded. And by the way, you'll need separate FishEye instance directories if you want to run multiple copies of FishEye.

Create your FishEye instance directory, and then tell FishEye where you created it by setting a FISHEYE_INST environment variable, as follows:

For Windows 7:

1. Go to Start, search for "sys env" and choose Edit the system environment variables.
2. Click Environment Variables, and then New under 'System variables'.
3. Enter "FISHEYE_INST" as the Variable name, and the absolute path to your new FishEye instance directory as the Variable value. Don't use a trailing backslash.
4. Now copy the newly extracted <FishEye home directory> /config.xml file to the root of your new FishEye instance directory.

ℹ️ Note that if FishEye is run as a Windows service using the Java Service Wrapper, FishEye-specific environment variables such as FISHEYE_INST are ignored – these must be set in the wrapper.conf file. See Running FishEye as a Windows service.

If you have a large number of repositories, we recommend you increase the default number of files that FishEye is allowed to open. See the following knowledge base article for more info: Subversion Indexer Paused with "Too many open files" Error.

7. Start FishEye!

In a command prompt, change directory to <FishEye home directory> and run this:

```
bin\start.bat
```

After a few moments, in a web browser on the same machine, go to http://localhost:8060/ (or, from another machine, type http://hostname:8060/, where hostname is the name of the machine where you installed FishEye).

Enter your license, then an admin password, to finish the setup. Note that this password is for the ‘built-in’
FishEye admin user. You can log in as this user, if necessary, by clicking the Administration link in the page footer. See also How to reset the Administration Page password in FishEye or Crucible.

You can postpone setting up JIRA integration until later if you wish; see Configuring JIRA integration in the Setup Wizard.

8. Add repositories

Now you can tell FishEye about any existing repositories you have. Please read Starting to use FishEye for the details.

FishEye will perform an initial index of your repositories, during which it accesses, indexes and organizes a view of your repositories (including all historical items) back to the earliest commits. If you are evaluating FishEye, we suggest that you index a single project, so you can use FishEye as soon as possible. If you choose to index your entire repository, be aware that this can take a long time (possibly days) for massive or complex repositories and can be more complex to set up (especially for Subversion). The basic process is slightly different for each SCM type.

9. Add users and groups

You will want to set up your users and groups in FishEye. You can add users directly to FishEye, or connect to an external user directory. Please read Starting to use FishEye for an introduction.

10. Set up your mail server

Configure the FishEye email server so that users can get notifications from FishEye. See Configuring SMTP.

11. Connect to an external database (recommended)

If you intend to use this FishEye installation in a production environment, it is highly recommended that you use one of the supported external databases. See Migrating to an external database.

If you are evaluating FishEye, or don't wish to do this now, FishEye will happily use its embedded HSQL database, and you can easily migrate later.

12. Stop FishEye (optional)

In a command prompt, change directory to <FishEye home directory> and run this:

```
bin\stop.bat
```

13. Tuning FishEye performance

To get the best performance from your new FishEye installation, please consult Tuning FishEye performance.

Running FishEye as a Windows service

FishEye can be run as a service under Microsoft Windows using a Java Service Wrapper.

The service wrapper provides the following benefits:

- Allows FishEye, which is a Java application, to be run as a Windows Service.
- No need for a user to be logged on to the system at all times, or for a command prompt to be open and running on the desktop to be able to run FishEye.
- The ability to run FishEye in the background as a service, for improved convenience, system performance and security.
- FishEye is launched automatically on system startup and does not require that a user be logged in.
- Users are not able to stop, start, or otherwise tamper with FishEye unless they are an administrator.
- Provides advanced failover, error recovery, and analysis features to make sure that FishEye has the maximum possible uptime.

⚠️ Please note that:

- This page should be read in conjunction with Installing FishEye on Windows.
- You should use 32-bit Java to run the service wrapper provided via the link in the install instructions below, even on a 64-bit machine.
You should use the Java JDK, rather than the JRE, to take advantage of the `-server` parameter, provided in the Wrapper configuration of wrapper.zip, which enables the Java HotSpot(TM) Server VM. See the note below for details.

On this page:

- Installing the Java Service Wrapper
- Setting FishEye environment variables for Windows Services
- Troubleshooting
  - Extracting files from wrapper.zip
  - Warning when using 64-bit Java JDK
  - Wrapper configuration and "-server" parameter

Related pages:

- Installing FishEye on Windows

Installing the Java Service Wrapper

To install the Java Service Wrapper on Windows:

1. Download wrapper.zip from here.
2. Unzip the wrapper zip file into your `<FishEye home directory>` (that is, the directory into which FishEye was originally installed). Note, the resulting folder structure should be `<FishEye home directory>\wrapper` or `<FishEye home directory>\wrapper\bin`, etc and NOT `<FishEye home directory>\wrapper\wrapper` or `<FishEye home directory>\wrapper\wrapper\bin`. The location of the wrapper directory is important.
3. Tell the wrapper where to find the Java JDK by editing the `<FishEye home directory>\wrapper\conf\wrapper.conf` file, replacing this:

```
# Java Application
wrapper.java.command=java
```

with the following, and comment out the option you don't wish to use:

```
# Java Application

# Option 1: If you have JAVA_HOME defined in your Windows system environment variables (for example, if JAVA_HOME is defined as C:/Java/bin, then you can use:
wrapper.java.command=%JAVA_HOME%/java

# Option 2: If you have multiple JDKs installed, and you don't want to use a Windows environment variable to specify which one to use, provide the absolute path to where the JDK is installed (e.g. C:/Java/jdk1.7.0_05/bin/java):
wrapper.java.command=C:/<path to Java location>/bin/java
```

To get confirmation in the wrapper log that the wrapper is using the correct Java JDK, add the following lines to the `wrapper.conf` file:

```
# Tell the Wrapper to log the full generated Java command line.
wrapper.java.command.loglevel=INF
```

You can find the logs at `<FishEye home directory>\var\log\wrapper.log`. 
4. Set the FISHEYE_INST environment variable (and other FishEye-specific environment variables) in the `<FishEye home directory>/wrapper/conf/wrapper.conf` file, following the instructions below.

5. Install FishEye as a service as follows:
   a. Open an Administrator command prompt by searching for 'Command prompt' in the Windows Start menu, right-clicking on Command Prompt and then choosing Run as administrator.
   b. Change directory to `<FishEye home directory>/wrapper/bin` and run `Fisheye-Install-NTService.bat`. If you run into any problems starting the wrapper, you'll find its logs in `<FishEye home directory>/var/log/wrapper.log`.

6. Start the FishEye service under the Windows Control Panel; you can search in the Start menu for 'services', and in the list of services, right-click on the 'FishEye' item and choose Start. You can also stop the FishEye service in this way.

   i Please note that:

   • If you make changes to the wrapper.conf file, having already started the service, you need to stop and then restart the service for it to make use of the changed configuration.
   • If in future you move the FishEye home directory, you will need to uninstall (using `Fisheye-Uninstall-NTService.bat`) and then reinstall the FishEye service.

Setting FishEye environment variables for Windows Services

Please note, that if you run FishEye as a Windows service, any FishEye-specific environment variables must be set in your `<FishEye home directory>/wrapper/conf/wrapper.conf` file.

If you run into any problems starting the wrapper, you’ll find its logs in `<FishEye home directory>/var/log/wrapper.log`.

If there are other Java parameters you wish to add, then you will need to add them under the additional parameters section, e.g.

```java
# JDK Additional Parameters for jmx
wrapper.java.additional.4=-Dcom.sun.management.jmxremote
wrapper.java.additional.5=-Dcom.sun.management.jmxremote.port=4242
wrapper.java.additional.6=-Dcom.sun.management.jmxremote.authenticate=false
wrapper.java.additional.7=-Dcom.sun.management.jmxremote.ssl=false
wrapper.java.additional.8=-Dcom.sun.management.jmxremote.password.file=./wrapper/jmxremote.password
wrapper.java.additional.9=-Dwrapper.mbean.name="wrapper:type=Java Service Wrapper Control"
wrapper.java.additional.10=-XX:PermSize=256m
```

To add the FISHEYE_INST environment variable, the Java MaxPermSize parameter, or the -Xrs options, use the following:

```java
wrapper.java.additional.11=-Dfisheye.inst="c:/path/to/FISHEYE_INST"
wrapper.java.additional.12=-XX:MaxPermSize=128m
wrapper.java.additional.13=-Xrs
```

Note that the -Xrs options should be used when running FishEye as a service under Windows to prevent the JVM closing when an interactive user logs out.

Your memory settings can also be found in this file:
# Initial Java Heap Size (in MB)
wrapper.java.initmemory=256

# Maximum Java Heap Size (in MB)
wrapper.java.maxmemory=1024

Increase these values if you have a large repository or expect to use more memory (init of 256, and a max of 1024 are the default values).

In Fisheye/Crucible 1.6.4 and higher, you can check the JVM input arguments by clicking System info, under 'System Settings' in the admin area.

Troubleshooting

Extracting files from wrapper.zip

Some customers have reported trouble running the wrapper. These can be avoided by:

- Uncompressing wrapper.zip with Winzip or Winrarar rather than using the Extract All command in the Windows right-click contextual menu.
- If the wrapper.zip filename appears green instead of black in Windows Explorer, decrypt it, prior to unzipping its contents, by right-clicking on the file, choose Properties, click the Advanced button, then clear the Encrypt contents to secure data checkbox.

Warning when using 64-bit Java JDK

When using a 64-bit Java JDK with the wrapper obtained via the link in the install instructions above, you may see the following in the wrapper.log file:

```
WARNING - Unable to load the Wrapper's native library 'wrapper.dll'. The file is located on the path at the following location but could not be loaded:
C:\installs\service\fisheye28\wrapper\lib\wrapper.dll.

Please verify that the file is readable by the current user and that the file has not been corrupted in any way. System signals will not be handled correctly.
```

This is caused by using a 64-bit JDK (even on a 64-bit machine). Changing to a 32-bit version of the JDK will prevent this warning. Community Edition versions of the 64-bit Windows Java Service Wrapper are not currently available.

Wrapper configuration and "-server" parameter

Please note that the wrapper configuration provided above uses the -server parameter to enable the Java HotSpot(TM) Server VM. This feature is only available if you use the JDK. If you use the JRE you will likely get the following error in your logs:

```
INFO | jvm 1 | 2010/12/20 18:19:28 | Error: missing `server’ JVM at `C:\Program Files\Java\jre6\bin\server\jvm.dll’.
```

A common issue is that customers remove the -server parameter from the wrapper.conf file. Please note that if you do this, the wrapper script will ignore any of the following JVM parameters in the file unless you change the sequence to be in order, starting from wrapper.java.additional.1. This is an issue with the wrapper application.

In this situation it’s best to install and run Fisheye/Crucible with the JDK to get all the advantages of the -server functionality. You also need to force the wrapper to use the JDK by specifying the path to the Java JDK in the wrapper.conf file, as described in the installation instructions above.

Installing FishEye on Linux and Mac

Hey! We’re going to install FishEye on a Linux box, or a Mac. There are a few steps involved, but we think you’ll find it easy to follow along. If you are upgrading an existing installation, please refer to the FishEye upgrade guide instead.
1. Check supported platforms

Better check the Supported platforms page first; it lists the application servers, databases, operating systems, web browsers and JDKs that we have tested FishEye with, and that we recommend.

Atlassian only officially supports FishEye running on x86 hardware and 64-bit derivatives of x86 hardware.

Related pages:
- Installing FishEye on Windows
- Starting to use FishEye
- Supported platforms
- FishEye upgrade guide

2. Check your version of Java

In a terminal, run this:

```bash
cal -version
```

The version of Java should be **1.6.0** or later (**1.7.0** or later for OpenJDK).

* If you don't see a supported version of Java, then get Java...

  Download and install the Oracle Java Platform JDK, or OpenJDK.

  Now try running `java -version` again to check the installation. The version of Java should be **1.6.0** or later (**1.7.0** or later for OpenJDK).

3. Check that the system can find Java

In a terminal, run this:

```bash
echo $JAVA_HOME
```

You should see a path like `/System/Library/Frameworks/JavaVM.framework/Versions/CurrentJDK/Home/`.

* If you don't see a path to the Java location, then set JAVA_HOME...
### Linux

Do either of the following:

- If `JAVA_HOME` is not set, log in with ‘root’ level permissions and run:

  ```bash
  echo JAVA_HOME="path/to/JAVA_HOME" >> /etc/environment
  ```

  where `path/to/JAVA_HOME` may be like: `/System/Library/Frameworks/JavaVM.framework/Versions/CurrentJDK/Home/`

- If `JAVA_HOME` needs to be changed, open the `/etc/environment` file in a text editor and modify the value for `JAVA_HOME` to:

  ```bash
  JAVA_HOME="path/to/JAVA_HOME"
  ```

  It should look like:

  ```bash
  JAVA_HOME=/System/Library/Frameworks/JavaVM.framework/Versions/CurrentJDK/Home/
  ```

### Mac

Insert the following in your `~/.profile` file:

```bash
JAVA_HOME="path/to/JAVA_HOME"
export JAVA_HOME
```

where `path/to/JAVA_HOME` may be like: `/System/Library/Frameworks/JavaVM.framework/Versions/CurrentJDK/Home/

Refresh your `~/.profile` in the terminal and confirm that `JAVA_HOME` is set:

```bash
source ~/.profile
$JAVA_HOME/bin/java -version
```

You should see a version of Java that is 1.6.0 or higher, like this:

```
java version "1.6.0_24"
```

---

4. **Create a dedicated FishEye user (recommended)**

For production installations, we recommend that you create a new dedicated user that will run FishEye on your system. This user:

- Should not have admin privileges.
- Should be a non-privileged user with read, write and execute access on the FishEye home (install) directory and instance (data) directory. These directories are described below.
- Should only have read access to your repositories.

If you created a dedicated FishEye user, ensure you are logged in as this user to complete the remaining instructions.

5. **Now it’s time to get FishEye**

Download FishEye from the Atlassian download site.

Extract the downloaded file to an install location:

- Folder names in the path to your FishEye executable should not have spaces in them. The path to the extracted directory is referred to as the `<FishEye home directory>` in these instructions.
- If you expect to have a large number of users for this FishEye installation, and FishEye will be connected to an external database, consider installing FishEye on a different server from the one running the external database, for improved performance.

6. **Tell FishEye where to store your data**

The FishEye instance directory is where your FishEye data is stored.

⚠️ You **should not** locate your FishEye instance directory inside the `<FishEye home directory>` — they should be entirely separate locations. If you do put the instance directory in the `<FishEye home directory>`
it will be overwritten, and lost, when FishEye gets upgraded. And by the way, you'll need separate FishEye instance directories if you want to run multiple copies of FishEye.

Create your FishEye instance directory, and then tell FishEye where you created it by adding a FISHEYE_INST environment variable as follows:

<table>
<thead>
<tr>
<th>Linux</th>
<th>Mac</th>
</tr>
</thead>
</table>
| Open the `/etc/environment` file in a text editor and insert: FISHEYE_INST="path/to/<FishEye instance directory>" | Open the `~/.profile` file for the current user in a text editor and insert: FISHEYE_INST="path/to/<FishEye instance directory>
| export FISHEYE_INST                        |                                          |

Now, copy the `<FishEye home directory> /config.xml` to the root of the FISHEYE_INST directory, so that FishEye can start properly.

Also, if you have a large number of repositories, we recommend you increase the default number of files that FishEye is allowed to open. See the following knowledge base article for more info: Subversion Indexer Paused with "Too many open files" Error.

7. Start FishEye!

In a terminal, change directory to `<FishEye home directory>` and run this:

```
bin/start.sh
```

After a few moments, in a web browser on the same machine, go to http://localhost:8060/ (or, from another machine, type http://hostname:8060/, where hostname is the name of the machine where you installed FishEye).

Enter your license, then an admin password, to finish the setup. Note that this password is for the 'built-in' FishEye admin user. You can log in as this user, if necessary, by clicking the Administration link in the page footer.

You can postpone setting up JIRA integration until later if you wish; see Configuring JIRA integration in the Setup Wizard.

8. Add repositories

Now you can tell FishEye about any existing repositories you have. Please read Starting to use FishEye for the details.

FishEye will perform an initial index of your repositories, during which it accesses, indexes and organizes a view of your repositories (including all historical items) back to the earliest commits. If you are evaluating FishEye, we suggest that you index a single project, so you can use FishEye as soon as possible. If you choose to index your entire repository, be aware that this can take a long time (possibly days) for massive or complex repositories and can be more complex to set up (especially for Subversion). The basic process is slightly different for each SCM type.

9. Add users and groups

You will want to set up your users and groups in FishEye. You can add users directly to FishEye, or connect to an external user directory. Please read Starting to use FishEye for an introduction.

10. Set up your mail server

Configure the FishEye email server so that users can get notifications from FishEye. See Configuring SMTP.

11. Connect to an external database (recommended)
If you intend to use this FishEye installation in a production environment, it is highly recommended that you use one of the supported external databases. See Migrating to an external database.

If you are evaluating FishEye, or don't wish to do this now, FishEye will happily use its embedded HSQL database, and you can easily migrate later.

12. Stop FishEye (optional)

In a terminal, change directory to `<FishEye home directory>` and run this:

```
bin/stop.sh
```

13. Tuning FishEye performance

To get the best performance from your new FishEye installation, please consult Tuning FishEye performance.

Starting to use FishEye

This page will guide you through the basics of using FishEye. By the end of it you should be able to:

- Create accounts for your collaborators, and organize them into groups.
- Add repositories that need to be indexed and setup permissions.
- Use the Commit Graph to trace the history of your code

This page assumes that:

- You have installed and started the latest version of FishEye. See Installing FishEye on Linux and Mac or Installing FishEye on Windows for details.
- You are using a supported browser.

On this page:

- Create users in FishEye
- Add a repository
- Move forward

Related pages:

- Installing FishEye on Windows
- Installing FishEye on Linux and Mac
- Supported platforms
- Managing your repositories
- Setting up your Users and Security

Create users in FishEye

FishEye doesn't have any user accounts after you have installed it for the first time. You need to go to the Administration interface to add the first users of the system.

Click on the Administration link in the footer:

In the Users listing page click Add User to go to the user creation form:
Fill in the form and create your user:

**Add New User**

**Information about the new user**

- **Username**: jdoe
- **Display name**: John Doe
- **Email**: john@doe.com
- **Auth Type**: built-in
- **Password**: ********
- **Confirm Password**: ********

From the **User** page you can click on **Create another user** to repeat this operation:
Add a repository

In this section we’re going to add a repository to FishEye.

Click on Add Existing... in the Repositories listing of the Administration:

Choose the repository type and fill in the name and description:
In the repository configuration, add the location of your repository. Fill in the authentication details if necessary.

Finally indicate whether or not you would like diff indexing should be turned on and if the repository should not be indexed right away.

Click **Add** to finish the process.
Move forward

Once it's created you can click **Browse**, in the repository options menu, to access your repository.

You can now browse your files in FishEye, search through your code or track modifications via the commit graph.
Configuring JIRA integration in the Setup Wizard

This page describes the **Connect to JIRA** tab of the FishEye setup wizard. You can connect your application to a JIRA server, to manage your users via JIRA and share information with JIRA. When you are installing the application, the setup wizard gives you the opportunity to configure the JIRA connection automatically. This is a quick way of setting up your JIRA integration with the most common options.

You can also configure the JIRA connections via the application administration screens. In that case, you will need to set up connections individually. There are two parts to the integration process:

- A peer-to-peer link between JIRA and the application for sharing information and facilitating integration features. This link is set up via Application Links.
- A client-server link between the application and JIRA for delegating user and group management to your JIRA server.

**Requirements:** You need JIRA 4.3 or later.

On this page:
- Connecting to JIRA in the Setup Wizard
- Troubleshooting
- Notes

Related pages:
- Starting to use FishEye
- Linking FishEye to JIRA
- JIRA Integration in FishEye
- Connecting to JIRA for user management
- User management limitations and recommendations

Connecting to JIRA in the Setup Wizard

To configure JIRA integration while running the FishEye setup wizard:

1. Configure the following setting in JIRA: **Allow remote API access**.
2. Enter the following information on the 'Connect to JIRA' step of the setup wizard:

<table>
<thead>
<tr>
<th>JIRA base URL</th>
<th>The base URL set for your JIRA server. Examples are: <a href="http://www.example.com:8080/jira/">http://www.example.com:8080/jira/</a> <a href="http://jira.example.com">http://jira.example.com</a></th>
</tr>
</thead>
<tbody>
<tr>
<td>JIRA admin username</td>
<td>The credentials for a user with the 'JIRA System Administrators' global permission in JIRA.</td>
</tr>
<tr>
<td>JIRA password</td>
<td></td>
</tr>
</tbody>
</table>
FishEye base URL
JIRA will use this URL to access your FishEye server. The URL you give here will override the base URL specified in your FishEye administration console, for the purposes of the JIRA connection.

Groups to synchronize
Click Advanced Options to see this field. Select at least one JIRA group to synchronize. The default group is jira-users. JIRA will synchronize all changes in the user information on a regular basis. The default synchronization interval is 1 hour.

Admin Groups
Click Advanced Options to see this field. Specify a JIRA group whose members should have administrative access to FishEye/Crucible. The default group is jira-administrators.

3. Click Connect to JIRA.
4. Finish the setup process.

Troubleshooting
Click to see troubleshooting information...
This section describes the possible problems that may occur when integrating your application with JIRA via the setup wizard, and the solutions for each problem.

<tr>
<td>Failed to authenticate application link from <code>&lt;application&gt;</code> server at <code>&lt;URL&gt;</code> to this JIRA server at <code>&lt;URL&gt;</code>.</td>
<td></td>
</tr>
<tr>
<td>Failed to register <code>&lt;application&gt;</code> configuration in JIRA for shared user management.</td>
<td>The setup wizard successfully established the peer-to-peer link with JIRA, but could not persist the client-server link for user management in your <code>config.xml</code> file. This may be caused by a problem in your environment, such as a full disk. Please investigate and fix the problem that prevented the application from saving the configuration file to disk. Then remove the partial configuration if it exists, try the 'Connect to JIRA' step again, and then continue with the setup. Detailed instructions are below.</td>
</tr>
<tr>
<td>Error setting Crowd authentication</td>
<td>The setup wizard has completed the integration of your application with JIRA, but is unable to start synchronizing the JIRA users with your application. Restart your application. You should then be able to continue with the setup wizard. If this solution does not work, please contact Atlassian Support.</td>
</tr>
<tr>
<td>Error reloading Crowd authentication</td>
<td></td>
</tr>
<tr>
<td>An error occurred: java.lang.IllegalStateException: Could not create the application in JIRA/Crowd (code: 500). Please refer to the logs for details.</td>
<td>The setup wizard has not completed the integration of your application with JIRA. The links are only partially configured. The problem occurred because there is already a user management configuration in JIRA for this <code>&lt;application&gt;</code> URL. Remove the partial configuration if it exists, try the 'Connect to JIRA' step again, and then continue with the setup. Detailed instructions are below.</td>
</tr>
</tbody>
</table>
Solution 1: Removing a Partial Configuration – The Easiest Way

If the application's setup wizard fails part-way through setting up the JIRA integration, you may need to remove the partial configuration from JIRA before continuing with your application setup. Please follow the steps below.

Remove the partial configuration if it exists, try the 'Connect to JIRA' step again, and then continue with the setup wizard:

1. Log in to JIRA as a user with the 'JIRA System Administrators' global permission.
2. Click the 'Administration' link on the JIRA top navigation bar.
3. Remove the application link from JIRA, if it exists:
   a. Click 'Application Links' in the JIRA administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
   b. Look for a link to your application. It will have a base URL of the application linked to JIRA. For example:
      - If you want to remove a link between JIRA and FishEye, look for the one where the 'Application URL' matches the base URL of your FishEye server.
      - If you want to remove a link between JIRA and Confluence, look for the one where the 'Application URL' matches the base URL of your Confluence server.
      - If you want to remove a link between JIRA and Stash, look for the one where the 'Application URL' matches the base URL of your Stash server.
   c. Click the 'Delete' link next to the application link that you want to delete.
   d. A confirmation screen will appear. Click the 'Confirm' button to delete the application link.
4. Remove the user management configuration from JIRA, if it exists:
   a. Go to the JIRA administration screen for configuring the applications that have been set up to use JIRA for user management:
      - In JIRA 4.3: Click 'Other Applications' in the 'Users, Groups & Roles' section of the JIRA administration screen.
      - In JIRA 4.4: Select 'Administration' > 'Users' > 'JIRA User Server'.
   b. Look for a link to your application. It will have a name matching this format:

   \[
   \text{<Type>} - \text{<HostName>} - \text{<Application ID>}
   \]

   For example:

   FishEye / Crucible - localhost - 92004b08-5657-3048-b5dc-f886e662ba15

   Or:
If you have multiple servers of the same type running on the same host, you will need to match the application ID of your application with the one shown in JIRA. To find the application ID:

1. Go to the following URL in your browser:

   `<baseUrl>/rest/applinks/1.0/manifest`

   Replace `<baseUrl>` with the base URL of your application.
   For example:

   ```
   http://localhost:8060/rest/applinks/1.0/manifest
   ```

   - The application links manifest will appear. Check the application ID in the `<id>` element.

2. In JIRA, click ‘Delete’ next to the application that you want to remove.

3. Go back to the setup wizard and try the ‘Connect to JIRA’ step again.

### Solution 2: Removing a Partial Configuration – The Longer Way

If solution 1 above does not work, you may need to remove the partial configuration and then add the full integration manually. Please follow these steps:

1. Skip the ‘Connect to JIRA’ step and continue with the setup wizard, to complete the initial configuration of the application.
2. Log in to JIRA as a user with the ‘**JIRA System Administrators**’ global permission.
3. Click the ‘**Administration**’ link on the JIRA top navigation bar.
4. Remove the application link from JIRA, if it exists:
   a. Click ‘**Application Links**’ in the JIRA administration menu. The ‘Configure Application Links’ page will appear, showing the application links that have been set up.
   b. Look for a link to your application. It will have a base URL of the application linked to JIRA. For example:
      - If you want to remove a link between JIRA and FishEye, look for the one where the ‘**Application URL**’ matches the base URL of your FishEye server.
      - If you want to remove a link between JIRA and Confluence, look for the one where the ‘**Application URL**’ matches the base URL of your Confluence server.
      - If you want to remove a link between JIRA and Stash, look for the one where the ‘**Application URL**’ matches the base URL of your Stash server.
   c. Click the ‘**Delete**’ link next to the application link that you want to delete.
   d. A confirmation screen will appear. Click the ‘**Confirm**’ button to delete the application link.
5. Remove the user management configuration from JIRA, if it exists:
   a. Go to the JIRA administration screen for configuring the applications that have been set up to use JIRA for user management:
      - In JIRA 4.3: Click ‘**Other Applications**’ in the ‘**Users, Groups & Roles**’ section of the JIRA administration screen.
      - In JIRA 4.4: Select ‘**Administration**’ > ‘**Users**’ > ‘**JIRA User Server**’.
   b. Look for a link to your application. It will have a name matching this format:

   ```
   <Type> - <HostName> - <Application ID>
   ```

   For example:
If you have multiple servers of the same type running on the same host, you will need to match the application ID of your application with the one shown in JIRA. To find the application ID:

- Go to the following URL in your browser:

```
<baseUrl>/rest/applinks/1.0/manifest
```

Replace `<baseUrl>` with the base URL of your application.

For example:

```http://localhost:8060/rest/applinks/1.0/manifest```

- The application links manifest will appear. Check the application ID in the `<id>` element.

In JIRA, click 'Delete' next to the application that you want to remove.

6. Add the application link in JIRA again, so that you now have a two-way trusted link between JIRA and your application:

   a. Click 'Add Application Link'. Step 1 of the link wizard will appear.
   b. Enter the server URL of the application that you want to link to (the 'remote application').
   c. Click the 'Next' button.
   d. Enter the following information:
      - 'Create a link back to this server' – Tick this check box to add a two-way link between the two applications.
      - 'Username' and 'Password' – Enter the credentials for a username that has administrator access to the remote application.
        *Note:* These credentials are only used to authenticate you to the remote application, so that Application Links can make the changes required for the new link. The credentials are not saved.
      - 'Reciprocal Link URL' – The URL you give here will override the base URL specified in your remote application’s administration console, for the purposes of the application links connection. Application Links will use this URL to access the remote application.
   e. Click the 'Next' button.
   f. Enter the information required to configure authentication for your application link:
      - 'The servers have the same set of users' – Tick this check box, because the users are the same in both applications.
      - 'These servers fully trust each other' – Tick this check box, because you trust the code in both applications and are sure both applications will maintain the security of their private keys.
        *For more information about configuring authentication, see Configuring Authentication for an Application Link_OLD.*
   g. Click the 'Create' button to create the application link.

7. Configure a new connection for user management in JIRA:

   a. Go to the JIRA administration screen for configuring the applications that have been set up to use JIRA for user management:
      - In JIRA 4.3: Click 'Other Applications' in the 'Users, Groups & Roles' section of the JIRA administration screen.
      - In JIRA 4.4: Select 'Administration' > 'Users' > 'JIRA User Server'.
   b. Add an application.
   c. Enter the application name and password that your application will use when accessing JIRA.
d. Enter the **IP address** or addresses of your application. Valid values are:
   - A full IP address, e.g. 192.168.10.12.
   - A wildcard IP range, using CIDR notation, e.g. 192.168.10.1/16. For more information, see the introduction to [CIDR notation on Wikipedia](http://en.wikipedia.org/wiki/CIDR_notation) and [RFC 4632](http://www.ietf.org/rfc/rfc4632.txt).
   - **Save** the new application.

8. Set up the JIRA user directory in the application.
   - **For Confluence:**
     a. Go to the [Confluence Administration Console](http://confluence.example.com/administration).
     b. Click 'User Directories' in the left-hand panel.
     c. **Add** a directory and select type 'Atlassian JIRA'.
     d. Enter the following information:
        - **Name** – Enter the name of your JIRA server.
        - **Server URL** – Enter web address of your JIRA server. Examples:
          
          http://www.example.com:8080/jira/
          http://jira.example.com
        
        - **Application name** and **Application password** – Enter the values that you defined for Confluence in the settings on JIRA.
     e. **Save** the directory settings.
     f. Define the **directory order** by clicking the blue up- and down-arrows next to each directory on the 'User Directories' screen. For details see Connecting to Crowd or JIRA for User Management.
   - **For FishEye/Crucible:**
     a. Click **Authentication** (under 'Security Settings').
     b. Click **Setup JIRA/Crowd authentication**. Note, if LDAP authentication has already been set up, you will need to remove that before connecting to JIRA for user management.
     c. Make the following settings:

<table>
<thead>
<tr>
<th>Authenticate against</th>
<th>Select a JIRA instance</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Application name</strong> and password</td>
<td>Enter the values that you defined for your application in the settings on JIRA.</td>
</tr>
<tr>
<td><strong>JIRA URL</strong></td>
<td>The web address of your JIRA server. Examples:</td>
</tr>
</tbody>
</table>

- http://www.example.com:8080/jira/
- http://jira.example.com

<table>
<thead>
<tr>
<th>Auto-add</th>
<th><strong>Select Create a FishEye user on successful login</strong> so that your JIRA users will be automatically added as a FishEye user when they first log in.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Periodically synchronise users with JIRA</strong></td>
<td><strong>Select Yes</strong> to ensure that JIRA will synchronize all changes in the user information on a regular basis. Change the value for <strong>Synchronise Period</strong> if required.</td>
</tr>
<tr>
<td><strong>When Synchronisation Happens</strong></td>
<td>Select an option depending on whether you want to allow changes to user attributes from within FishEye.</td>
</tr>
</tbody>
</table>
d. Click Next and select at least one user group to be synchronised from JIRA. If necessary, you could create a new group in JIRA, such as ‘fisheye-users’, and select this group here.
e. Click Save.

• For Stash:
  a. Go to the Stash administration area.
  b. Click User Directories in the left-hand panel.
  c. Add a directory and select type Atlassian JIRA.
  d. Enter the following information:
     • Name – Enter the name of your JIRA server.
     • Server URL – Enter web address of your JIRA server. Examples:
       
       http://www.example.com:8080/jira/
       http://jira.example.com

     • Application name and Application password – Enter the values that you defined for Stash in the settings on JIRA.
  e. Save the directory settings.
  f. Define the directory order by clicking the blue up- and down-arrows next to each directory on the ‘User Directories’ screen.
     For details see Connecting Stash to JIRA for user management.

Notes

When you connect to JIRA in the setup wizard, the setup procedure will configure Trusted Applications authentication for your application. Please be aware of the following security implications:

• Trusted applications are a potential security risk. When you configure Trusted Applications authentication, you are allowing one application to access another as any user. This allows all of the built-in security measures to be bypassed. Do not configure a trusted application unless you know that all code in the application you are trusting will behave itself at all times, and you are sure that the application will maintain the security of its private key.

Using FishEye

Using the FishEye screens

The sections below describe the different screens in FishEye and the information you can retrieve from them. Each page (tab) has a number of panes, and each pane is described separately.

Header

The header along the top of each FishEye page provides the following:

- The application navigator, at the left of the header, connects you directly to your other applications, such as JIRA and Bamboo. Admins can configure which apps appear in the navigator – just click Application navigator in the admin area.
- FishEye logo – click to go to the dashboard, to see your personal code commits, your reviews (if you are using Crucible) and your activity stream.
- **Repositories** — the list of all FishEye repositories. Click a repository name to browse the repository. A number of sub-tabs become available, as described below (see 'Repository sub-tabs' below).
- **Projects (when using with Crucible)** – a link to all projects (see the Crucible documentation). Logged-in users can see links to recently visited projects.
- **People** – tab to view statistics about committers to your FishEye repositories (see Viewing People's Statistics). Logged in users can see links to users they have recently visited.
- **Reviews (when using with Crucible)** – go to your code reviews (see the Crucible documentation). Logged-in users can see links to recently visited reviews as well as to the Crucible ‘Inbox’ and ‘Outbox’.
- **Create review (when using with Crucible)** – click the down arrow to choose Create snippet.
- Click your avatar to change your user settings (see Changing your user profile).

Repository sub-tabs

Once you have selected a repository, you can navigate through it by selecting files and folders on the tree in the left navigation bar. The sub-tabs in the 'Source' tab change depending on whether you are viewing a repository or a file.

**Viewing a repository**

See Browsing through a repository.

**Viewing a file**

When you reach a source file, a summary page is shown, displaying recent revisions to the file.

The horizontal sub-tabs above the file provide different views for the file:

<table>
<thead>
<tr>
<th>Sub-tab</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revisions</td>
<td>Shows the latest revisions of the file. See Viewing a file history.</td>
</tr>
<tr>
<td>Files</td>
<td>Shows the contents of the directory.</td>
</tr>
</tbody>
</table>
### Activity

Shows recent activity on the item. There are a number of sub-options here (see Viewing the changelog):

- **All Activity** — The default view, showing commits, reviews¹ and JIRA issues².
- **Commits** — Shows commits in the activity stream.
- **Reviews¹** — Shows review activity in the activity stream.
- **Scroll to Changeset** — Opens the changeset ID specified in the text field (press Enter to carry out the action).
- **Filter** — Applies constraints to the current activity stream.
- **Show Revisions** — If this is selected, then changeset items are automatically expanded to show modified files.
- **Earlier Activity (Left Arrow icon)** — Loads a page of earlier activity.
- **Later Activity (Right Arrow icon)** — Loads a page of later activity.

¹ If you are using Crucible
² If you are using JIRA

### Users

Shows the commit history of the different users that have committed changes on the item.

### Reports

Shows activity charts for the item. Various chart options can be selected in the left navigation bar (see FishEye Charts).

### Source

Shows the contents of the file.

### Query

Allows you to run an advanced search.

## Browsing through a repository

You can use FishEye to select a repository and browse through it. The repository view provides you with information about the files in the repository, activity occurring related to the repository and users committing to the repository. You can also generate charts and search for specific file revisions in the repository.

### On this page:

- Browsing a repository
- Hiding empty directories and deleted files
- Watching a repository

### Browsing a repository

To browse a repository:

1. Click **Repositories** in the header and choose either a recently viewed repository, or **All repositories**.
2. Click the name of a repository to view its contents. See the 'Viewing a repository' screenshot below.
3. If required, use the selector (under the repository or file name) to choose the branch or tag that you want to browse the changelog for.
4. You can view various information about the repository, as outlined below. If you navigate to a folder, the context of the information below will change. For example, if you navigate to a particular folder in the left navigation tree, the activity, files and users information, reports generated and search results will all relate to that folder.

   **A greyed out item is either a deleted file or an empty/deleted (folder).**

   - **Activity** tab — View the commit, review and issue (requires JIRA) activity related to the repository/folder. The activity stream is similar to the changelog activity stream, see Viewing the changelog for more information.
   - **Commit Graph** tab — Visualise the repository, using the commit graph. See Viewing the commit...
graph for a repository for more information.

- **Files** tab — View the contents of the repository/folder being viewed.
- **Users** tab — View the commit history of the users that have committed changes to files in the repository/folder. See Viewing People's Statistics for more information.
- **Reports** — View activity charts for the repository/folder. See FishEye Charts for more information.
- **Search** — Search the repository/folder. See Searching FishEye for more information.

5. Click any file, when browsing the repository, to view information about the file. See Viewing a file for more information.

**Screenshot: Browsing a repository**

Hiding empty directories and deleted files

FishEye tracks deleted files for your repository. Deleted files will be greyed out in your left-hand navigation tree. If all of the files in a directory are deleted, the empty directory will also be greyed out. Note, deleted files and empty directories are not removed from your left navigation.

You can choose to hide deleted files and empty directories in the left navigation tree when browsing through a repository, as described below.

**To hide deleted directories/files in your navigation tree:**

1. Click the **Source** tab and browse a repository.
2. In the left hand navigation panel, click the 📃 to show the dropdown menu:
   - **Hide empty directories** – hide all empty (greyed out) directories and their contents (i.e. deleted files and other empty directories).
   - **Hide deleted files** – hide deleted (i.e. greyed out) files. This does not affect directories.

   **i** Hence, if you choose to hide both empty directories and deleted files, you will only see files and directories that exist on the Head of that path. In repositories other than Subversion repositories, this could mean files/directories on any branch.

**Screenshot: Hiding deleted files/empty directories**
Watching a repository

You can "watch" a repository in FishEye/Crucible. Watching the repository allows you to receive emails when changes are made to the repository. You can view all of your watches and configure the frequency of your watch emails in your user profile. See Changing your user profile for more information.

Note, the option to add a watch will only be available if the administrator has enabled watches for the repository.

To watch a repository:

1. Navigate to the repository that you want to watch.
2. Choose Tools > Watch. (The watch icon becomes coloured, not grey).

To remove the watch, choose Tools > Watch again. (The watch icon becomes grey). You can also remove watches from within your user profile.

Searching FishEye

FishEye has a powerful search engine that allows you to find changesets, committers and files. There are two methods for searching in FishEye:

- **Quick Search** — The Quick Search allows you search all repositories connected to FishEye by entering a single search string. This search is the default search and will suggest "quick nav" results (header search box only). Results are weighted by most recent edit date; files edited within the last twelve months are given greater weighting.

- **Advanced Search** — The Advanced Search allows you to search a single repository by entering search criteria against a range of fields, e.g. commit comments, file contents, etc. These parameters can be selected on the standard search interface or specified using the FishEye's custom query language: EyeQL. This search is more complex to use, however you can define more precise search criteria.

### On this page:

- Using the Quick Search
- Using the Advanced Search
- Notes

Using the Quick Search

Before you begin:

- Cross-repository searching has a **100-repository limitation** on searches, to prevent it from becoming unresponsive on FishEye instances that have large numbers of repositories. This means that cross-repository Quick Search is not an exhaustive search if you have more than 100 repositories, as only
the first 100 repositories (alphabetically, as defined in FishEye) are included. For faster responses, you should limit your search to a particular repository, if possible. FishEye will also limit the search to the specific repository that you are looking at, if you are already navigating within a specific repository.

- The Quick Search will also return code reviews, if you are using Crucible with FishEye. For information on searching Crucible, see Searching Crucible in the Crucible documentation.

To search FishEye using the Quick Search:

1. Enter your search criteria in the search box in the FishEye header (i.e. Quick Nav). FishEye offers a number of parameters and functions that you can use to refine your expected results, see Refining your Quick Search Criteria below.
2. "Quick Nav" results will appear in a dropdown, as you type. "Quick Nav" will attempt to match against the file name, repository, committer and username.
   - If you want to use a quick nav result, use the up- and down-arrows on your keyboard and press enter or use your mouse to select the item.
   - If the quick nav results don’t have what you are looking for, press enter to run a search. Ensure that no items in the dropdown are selected when you press enter.
3. The Quick Search results page will be displayed. You can filter your results further, as described in Filtering Quick Search Results below. Results are sorted by relevance and boosted if they were edited recently. A maximum of 10 results are displayed per page.
   - If you have integrated your FishEye instance with a JIRA instance, you can display a summary of any JIRA issues referenced in your search results by hovering over the issue key. For more details, see JIRA Integration in FishEye.
4. If you want to run another search, enter your new criteria in the main search box or in the search box in the header.

Note, only the search box in the header provides “quick nav” results.

Refining your Quick Search Criteria

The FishEye Quick Search has a number of powerful tools that you can use to refine your search criteria before executing the search.

<table>
<thead>
<tr>
<th>Search Tool</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
</table>

Screenshot above: Quick Search displaying "quick nav" matches
## CamelCase Pattern Matching
Enter a CamelCase string pattern and FishEye find files and directories that match the pattern. This is a common search feature in many popular IDEs.

Search for BooQCTest and FishEye will return results like BooleanQueryCoordTest and BooleanQueryClassTest.

## Path/File Pattern Matching
Enter a path/file pattern and FishEye will find files and directories that match the pattern.

Search for common/final/Actions and FishEye will return results like /src/common/eu/systemworks/specialprojects/final/Actions.java.

## Field Handles
Use a field handle in your criteria to restrict your search to a particular field. Note, you cannot have multiple field handles in a query.

- **file** — Search against a file/directory name only.
- **commit** — Search against a commit message only.
- **diff** — Search against a diff (lines added/removed) only.
- **content** — Search against contents of a file only.
- **committer** — Search against a committer only.

Search for file:build.xml and FishEye will return files that have a name matching build.xml.

## Searching within a Directory (AntGlobs)
AntGlobs can be used in the Quick Search to help search within a specific directory.

Search for /src/**/gwt/*.xml and FishEye will return all files with a .xml suffix that are below both a src and a gwt directory. e.g. src/java/com/atlassian/fecru/gwt/FecruCore.gwt.xml but not src/java/com/atlassian/fecru/ApplicationContext.xml.

## Searching for Discrete Strings
Enter a specific string within quotation marks and FishEye will match against the exact string. Note, this search is not case-sensitive.

Enter "update version in build" and FishEye will only return results that match that exact string, i.e. it will not return a result with update build version or update version in file.

### Filtering Quick Search Results
Once you have a set of search results on the Quick Search page, you can filter them to a subset of the original results. The filter controls are in the left panel of the Quick Search page in the 'Source' section.

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
</table>

Using the Advanced Search

The Advanced Search can only be run against a specific repository, however you can specify more precise criteria against a number of fields for that repository.

To search a FishEye repository using the Advanced Search:

1. Navigate to the repository that you want to search, as described on Browsing through a Repository.
2. Click the 'Search' tab.
3. Enter your search criteria, as follows (Click the 'Switch to EyeQL Search'/ 'Switch to Standard Search' link at the bottom of the 'Search Criteria' panel to switch between the two search methods):
   - **Standard Search** — Fill in the desired fields in the 'Search Criteria' panel. See the Specifying Search Criteria using the Standard Search Interface section below for more details.
   - **EyeQL Search** — Enter your "EyeQL" query. See the Specifying Search Criteria using EyeQL section below for more details.

Specifying Search Criteria using the Standard Search Interface

The Advanced Search interface allows you to specify search criteria for multiple fields, order the results, group the results and choose the display fields in the results. You can link to the search results, as well as save the results to a CSV file.
Please note the following:

- **'Contents of files'** — Files must be non-binary, less than 5MB, and for svn repositories on trunk only. Only HEAD/tip revisions are searched. For older revisions, use the added/removed text search criteria.
- **'File names/paths'** — Antglobs can be used to specify the criteria for this field.

**Specifying Search Criteria using EyeQL**

The Advanced Search also allows you to run searches using FishEye's powerful query language, EyeQL.

For information on how to construct an EyeQL query, see the EyeQL Reference Guide. If you haven't built an EyeQL query before, we recommend that you use the Standard Search Interface interface to build your initial query, then switch to EyeQL to modify that query.
Searching Crucible *(Crucible documentation)*

**Viewing a file**

You can search or browse your repositories in FishEye to view a specific file. FishEye provides information about the file history, file content and activity related to the file.

To view a file:

1. Search, or browse through a repository, to find the file.
2. Click the file name. The revision history for the file will be displayed. See the screenshot below.
3. View information about the file on these tabs:
   - **Activity** — Displays the commits and reviews activity related to the file. See Viewing the changelog.
   - **Revisions** — Displays the history of revisions for the file. See Viewing a file history.
   - **Users** — Displays commit histories for users who have committed changes to the file. See Viewing people's statistics.
   - **Reports** — Displays charts for the file activity. See FishEye Charts.
   - **Source** — Displays the annotated file contents. The raw file can be downloaded from this tab. See Viewing file content.

*Screenshot: Viewing a file (Revisions tab)*
Viewing file content

You can search or browse your repositories in FishEye to view a specific file. FishEye allows you to view and download the source code for the file. You can also view diffs between different revisions of the file and annotations.

To view the source code for a file:

1. Search, or browse through a repository, to find the file.
2. Click the file name. The revision history for the file will be displayed.
3. Click the Source tab.

| Displaying the diff | Select revision numbers (e.g. '107905') from the two revision dropdowns to display the diff for those two revisions. |
| Changeset | View the changeset that the revision was a part of. |
| Raw | Download the raw source code for the file. |
| Annotation Highlighting | Choose Age, Author or None to colour the annotations by age, author or remove highlighting respectively. The highlights are displayed over the revision numbers, next to the authors. |
| Columns | Select the columns to display: Author, Revision and Line Number. |
| Reviews | Select Create Review to create a Crucible review from the file. (Requires Crucible) |

Screenshot: Viewing a file (Source tab)
Using Side by Side Diff View

This page describes FishEye's innovative 'side-by-side diff' view that shows how a file's content has changed, compared on the left and right hand sides of the screen.

On this page:

- Opening the side-by-side diff view
- Understanding side-by-side diffs
- Alternative ways to open side-by-side diffs
  - From the FishEye Dashboard
  - From the Revisions History view

Opening the side-by-side diff view

To open FishEye's side by side diff view:

1. Open the source code view for the file in question.
2. Select a range of revisions to compare.
3. Choose View > Side by Side Diff.

Screenshot: Choosing a Revision Range for the Diff

The left and right panes of the side-by-side diff view can scroll independently, and the view stays anchored around a central point. Colour coding is used to illustrate where lines have been added (green highlights) and where lines have been removed (red highlights). Grey highlights indicate that a line's internal content has changed. Each addition or deletion is linked to the adjacent pane by a coloured triangle that shows the location of that change in the comparison file.
Understanding side-by-side diffs

Features of the side-by-side diff are referenced in the annotated screenshot below.

1. Added lines are highlighted green, displayed in the right hand pane.
2. Edited lines are highlighted grey, with minor sections highlighted red and green to show deletions and additions.
3. Deleted lines are highlighted red, displayed in the left hand pane.
4. Line numbers in the margin are permanent links (“permalinks”) that can be sent to colleagues. When they open those links, the view will automatically open in side by side diff mode.

Alternative ways to open side-by-side diffs

From the FishEye Dashboard

You can also open side by side diffs from the Dashboard screens, by clicking the ‘Delta’ triangle icon next to an item when it appears in the stream of events. This will open the file in the diff view. If you have currently selected side by side diff as the viewing mode, then the diff will automatically be displayed in that mode. If not, you can select side by side diff from the ‘View’ menu.

From the Revisions History view

When in the revisions view, you can show a diff by checking the boxes next to two revisions, then clicking the ‘Diff’ button in the top control bar. If you have currently selected side by side diff as the viewing mode, then the diff will automatically be displayed in that mode. If not, you can select side by side diff from the View menu.
You can also launch into a diff of the latest revision and the second most recent by clicking 'Latest Diff' in the top control bar.

Viewing a file history

You can view a specific file when browsing a repository. This allows you to see information about the file, including the history of file revisions.

To view the history of revisions for a file:

1. Log into FishEye/Crucible.
2. Search, or browse through a repository, to find the file.
3. Click the Revisions tab. The history of revisions for the file will be displayed. See the 'File Revisions' screenshot below.

Diff 2 selected: Check boxes for two file revisions and then click to view the diff for those revisions.

Diff latest: View the diff of the two most recent file revisions.

Filter: View the file filter. Enter the desired fields to filter the file history results on.

Include other branches: Include revisions of the same file from other branches. A file can have many physical paths, all of which relate to the same filename in your project structure, or repository's logical structure. This applies to Subversion's branching and tagging directory structure in particular.

Show all details: Toggle expand or collapse of all file revisions to show additional information including the revision ID, parents and the branch where it is head, denoted with this graphic: HEAD.

See the 'Overview of a File Revision' diagram below for an explanation of the information provided about individual revisions.

Screenshot: File Revisions

Diagram: Overview of a file revision
Viewing the changelog

The changelog is a record of the commits and reviews for a repository, branch, directory or file. You can view the recent activity in the changelog when browsing a repository/branch/directory or viewing a file.

On this page:

- Viewing changelog activity
- Filtering commit activity in the changelog
- Watching the changelog activity

Viewing changelog activity

To view the changelog activity for a repository, branch, directory or file:

1. Browse to the desired repository, branch, directory or view the desired file.
2. If required, use the selector (under the repository or file name) to choose the branch or tag that you want to browse the changelog for.
3. Click the Activity tab. The recent changelog activity of your repository/branch/directory or file will be displayed.
4. Use the following functions of the Activity tab to see different aspects of the changelog activity:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>Click to show commits, reviews (requires integration with Crucible) and JIRA issues (requires integration with JIRA) activity in the activity stream.</td>
</tr>
<tr>
<td>Commits</td>
<td>Click to show only commits in the activity stream.</td>
</tr>
<tr>
<td>Reviews</td>
<td>Show only review activity. (Requires integration with Crucible)</td>
</tr>
<tr>
<td>Filter commits</td>
<td>See Filtering commit activity in the changelog (below) for more information.</td>
</tr>
<tr>
<td>Expand all</td>
<td>Show all modified files related to each changeset.</td>
</tr>
<tr>
<td>Scroll to changeset</td>
<td>Type a changeset ID (e.g. 107856) and press Enter to scroll to the that changeset in the activity stream.</td>
</tr>
</tbody>
</table>

Screenshot: Viewing the changelog activity for a file
Filtering commit activity in the changelog

You can filter the commits that are displayed in the activity stream, that is, the commits in the All and Commits tabs of the Activity tab. Note that you cannot use the commits filter to filter reviews.

To filter commit activity:

1. Go to the Activity tab, as described above.
2. When viewing either the All or Commits tab, click Filter commits.
3. Enter filtering criteria for the commits to be displayed:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Committer</td>
<td>Changesets checked in by the given committer/author.</td>
</tr>
<tr>
<td>Log Comment</td>
<td>Changesets where the commit comment matches the given text.</td>
</tr>
<tr>
<td>File Extension</td>
<td>Changesets that contain files with the specified file extension.</td>
</tr>
<tr>
<td>File Name</td>
<td>Changesets that contain a given file.</td>
</tr>
<tr>
<td>Start Date</td>
<td>Changesets created on or after that date. Must be of the form YYYY-MM-DDTHH:mm:ss, YYYY-MM-DD, YYYY-MM or YYYY (you can use '/' instead of '-').</td>
</tr>
<tr>
<td>End Date</td>
<td>Changesets created on or before that date. Must be of the form YYYY-MM-DDTHH:mm:ss, YYYY-MM-DD, YYYY-MM or YYYY (you can use '/' instead of '-').</td>
</tr>
</tbody>
</table>

4. Click Apply.
   - Use Clear to clear the filter.
   - Click Filter commits again to turn off the filter.

Screenshot: Using the filter

Watching the changelog activity
You can "watch" a changelog's activity stream in FishEye and Crucible. Watching the activity stream allows you to receive emails when updates occur in the activity stream. You can view all of your watches and configure the frequency of your watch emails in your user profile. See Changing your user profile for more information.

Note, the option to add a watch will only be available if the administrator has enabled watches for the repository.

To watch an activity stream:

1. Navigate to the activity stream that you want to watch.
2. Choose Tools > Watch. The page will reload and a watch will be set up for the activity stream (the watch icon will now be coloured, not grey).
   - To remove the watch, from the activity stream, choose Tools > Watch. The watch will be removed. You can also remove watches from your user profile.

FishEye Charts

When browsing a repository, the Reports tab displays graphical information about the lines of code (LOC) committed to the repository, over time. The following options are available:

- Charts
- Code Metrics
- Notes

Charts

Click Reports and then Charts when browsing a repository to see charts of activity in the repository.

You can control the chart type that is displayed and various chart options. Click the cog icon on the left, select the required options, and click Apply. The available options include:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Explanation</th>
<th>Values</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch/Tag selector</td>
<td>Limits the chart to the selected branch/tag.</td>
<td>Any branch/tag from the current repository.</td>
<td>Displays the default/trunk.</td>
</tr>
<tr>
<td>Chart type</td>
<td>Changes the chart's presentation.</td>
<td>Area, line, pie or change* chart.</td>
<td>Area</td>
</tr>
<tr>
<td>Author</td>
<td>Limits the chart to show specific author(s).</td>
<td>Any author configured in the system.</td>
<td>All</td>
</tr>
<tr>
<td>Extension</td>
<td>Limits the chart to show specific file type(s).</td>
<td>Any file extension; e.g. '.java'.</td>
<td>All</td>
</tr>
<tr>
<td>Subdirectory</td>
<td>Limit the chart to a folder under the current branch. Files in the current directory are represented by an element labelled '.(this dir)'.</td>
<td>A single folder.</td>
<td>None (show all)</td>
</tr>
<tr>
<td>Start Date</td>
<td>Date of the earliest data to show.</td>
<td>Date in format YYYY-MM-DD.</td>
<td>None (show all)</td>
</tr>
<tr>
<td>End Date</td>
<td>Date of the latest data to show.</td>
<td>Date in format YYYY-MM-DD.</td>
<td>None (show all)</td>
</tr>
</tbody>
</table>

*The 'Change' chart displays the change in lines of code, for a specific date range, expressed as a line graph. For example, if the lines of code at the start date is 100, the start point will be zero and the rest of the graph shifted by 100 lines.

Screenshot: FishEye custom chart settings
Screenshot: FishEye per-author LOC chart

Screenshot: FishEye per-author LOC chart showing multiple authors
Per-Author Lines of Code Statistics
You can view per-author statistics for lines of code as a chart. This allows you to see how many lines of code were contributed to your project by each author, over time. You can easily view this information on the charts page. Note, if you are upgrading from a previous version of FishEye, you will need to re-index the repository in order to show the per-author information.

Code Metrics
A number of built-in reports are also provided:

Screenshot: Commit Time/Volume
Adding favourites

To add an item to your favourites, follow one of the options below:

- Adding favourites
- Managing favourites

Notes

Related Topics

Browsing through a repository

Using favourites in FishEye

FishEye allows you to add changesets, files, people and repositories as favourites. You can view your favourites, or see a stream of all activity relating to your favourites. We suggest that you select items that you are currently working on as favourites, to create a more relevant personalised view.

You can always view your favourites from the menu at the top of the screen, next to your username.

On this page:

- Adding favourites
- Managing favourites

If you are using Crucible, you can also add code reviews to your favourites.
<table>
<thead>
<tr>
<th>People</th>
<th>Hover the mouse cursor over their avatar or username. In the context menu, click <strong>Follow</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changesets</td>
<td>Open the changeset and click the grey star icon next to its name, near the top of the screen.</td>
</tr>
<tr>
<td>Files or folders</td>
<td>Open the file or folder and click the grey star icon that appears next to its name. The name appears in the breadcrumb links at the top of the screen.</td>
</tr>
<tr>
<td>Repository</td>
<td>Click the <strong>Source</strong> tab and then the grey star icon that appears next to the name of the desired repository.</td>
</tr>
</tbody>
</table>

</thead>
<tbody>
<tr>
<td>FE</td>
<td>Running</td>
<td><img src="image" alt="Commit History" /></td>
</tr>
<tr>
<td>CLOV</td>
<td>Running</td>
<td><img src="image" alt="Commit History" /></td>
</tr>
</tbody>
</table>

**Managing favourites**

To change the display name for, or remove, a favourite:

1. Click the Favourites menu (at the top of the FishEye screen, next to your username) and choose **Manage favourites**.
2. Click the yellow star beside the favourite, and either:
   a. edit the display name, and click **Save label**
   b. click **Remove**.

*Due to **FE-2348** you cannot currently rename favourite directories, users or committers*

**Screenshot: Renaming a favourite**

**Changeset Discussions**

Please see the **Crucible documentation** for instructions on this feature.

**Viewing the commit graph for a repository**

The commit graph shows changesets in their respective branches, using configurable "swimlanes". This allows you to see key information such as branching and merging (and if you are using Git or Mercurial, you will be able to see anonymous branches as well).

The Highlight feature of the commit graph allows you to highlight different types of information in the swimlanes.
or changeset list:

- ancestors and descendants for a changeset
- commits with JIRA issues
- reviewed and unreviewed changesets.

For example, if you have the **JIRA issues** highlight active, clicking a changeset with a JIRA issue in the commit comment will show all other changesets with the same JIRA issue.

Before you begin:

- Subversion repositories currently do not show lines between branch swimlanes (i.e. merging). But in some cases, FishEye might pick up associations based on SVN branch points.
- Some features of the commit graph are only available if you are using Crucible with FishEye. For details, see the description below.
- Some features of the commit graph are only available if you are using JIRA with FishEye. For details, see the description below.

---

**Viewing the commit graph for a repository**

**To view the commit graph for a repository:**

1. Navigate to the desired repository, as described on Browsing through a repository.
2. Click the **Commit Graph** tab.

Selecting, or hovering on, a changeset (regardless of highlight) will display the following in the row for the changeset:

- an **i** icon. Click this icon to see details for the changeset.
- a **cog** icon with a menu that allows you to see the changeset ID, view the full changeset, view the changeset in the activity stream, or to create a review for the changeset.
Highlighting the lineage of a changeset

Choose **Highlight > Lineage** to show the ancestor and descendant changesets for a selected changeset.

<table>
<thead>
<tr>
<th>Action</th>
<th>Behaviour</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click on a changeset in the changeset list</td>
<td>Highlights where a changeset comes from and where it propagates to, i.e. its ancestors and descendants.</td>
</tr>
<tr>
<td>Hover over a changeset in a swimlane</td>
<td>Displays the changeset number and all the branches that the changeset is referenced in. This will include branches that you may not have swimlanes displayed for.</td>
</tr>
</tbody>
</table>

Highlighting JIRA issues

Choose **Highlight > JIRA issues** to highlight all the changesets that have a JIRA issue key in the commit message.
This highlight type is only available if you have integrated FishEye with JIRA and linked your repository to a JIRA project.

<table>
<thead>
<tr>
<th>Action</th>
<th>Behaviour</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click on a changeset in the changeset list</td>
<td>Highlights all other changesets that have the same JIRA issue key in the commit message.</td>
</tr>
<tr>
<td>Hover over a changeset in a swimlane</td>
<td>Displays all branches that the changeset is referenced in, and all referenced JIRA issues.</td>
</tr>
</tbody>
</table>

Highlighting reviewed changesets

Choose Highlight > Reviewed changesets to highlight the changesets that have been reviewed (i.e. included in a Crucible review):

- **Red**: unreviewed, i.e. the changeset is associated with a review in the 'Dead' or 'Rejected' state, or no review is associated.
- **Yellow**: under review, i.e. the changeset is associated with a review not in the 'Dead', 'Rejected' or 'Closed' state.
- **Green**: reviewed, i.e. the changeset is associated with a review in 'Closed' state.

This highlight type is only available if you are using FishEye with Crucible.

<table>
<thead>
<tr>
<th>Action</th>
<th>Behaviour</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click on a changeset in the changeset list</td>
<td>Highlights the changesets that are part of the same review as the selected changeset.</td>
</tr>
<tr>
<td>Hover over a changeset in a swimlane</td>
<td>Displays all branches that the changeset is referenced in, and the Crucible review key.</td>
</tr>
</tbody>
</table>

---

Highlighting commits by an author

Choose **Highlight > Author** to highlight all the changesets submitted by a particular author.

<table>
<thead>
<tr>
<th>Action</th>
<th>Behaviour</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click on a changeset in the changeset list</td>
<td>Highlights the changesets that were submitted by the same author.</td>
</tr>
<tr>
<td>Hover over a changeset in a swimlane</td>
<td>Displays the changeset number and all the branches that the changeset is referenced in.</td>
</tr>
</tbody>
</table>

Highlighting search results

Choose **Highlight > Search** to highlight all the changesets where the commit message contains the search term.

<table>
<thead>
<tr>
<th>Action</th>
<th>Behaviour</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click on a changeset in the changeset list</td>
<td>Highlights the changesets that match the search term.</td>
</tr>
</tbody>
</table>
Hover over a changeset in a swimlane | Displays the changeset number and all the branches that the changeset is referenced in.

1. Hover over a changeset in a swimlane. Displays the changeset number and all the branches that the changeset is referenced in.

Viewing changesets across all branches

The 'All Branches' mode allows you to view commit activity across all branches of a repository. In this mode, the swimlane headers are not displayed. However, you can hover over any changeset to display information about the changeset, as described in the 'Highlighting Information in the Commit Graph' section above.

To see all the repository's branches in the commit graph:

1. Click Select branches... when viewing the commit graph.
2. In the 'Select Branches' dialog, click Switch to all branches mode.

Reordering swimlanes for Git repositories

Reordering swimlanes is useful if you just want to show branches in a certain order. However, ordering swimlanes is vital for Git repositories, as it is the only way to determine which branch a commit is from.

When you view the commit graph for a Git repository, FishEye works from the leftmost swimlane to the right and, for each swimlane, checks if the commit is in that branch:

- If the commit is in the branch, a dot is shown representing the commit.
- If the commit is not in the branch, the dot for the commit is moved to the next column on the right.

For example, if the 'master' swimlane is to the left of another swimlane, e.g. 'fisheye-2.6' branch, there will be no changesets shown in the 'fisheye-2.6' swimlane, as all the commits will be picked up in the 'master' swimlane. However, if you move the 'fisheye-2.6' swimlane to the left of the 'master' swimlane, it will pick up all of the
FishEye 2.6 commits.

For more information, read this Knowledge Base article: Ordering of Branches Important When Visualising Git Changeset

**Viewing People's Statistics**

To see charts and activity of everyone who commits code to your FishEye repositories, click the **People** tab at the top of the screen.

*Screenshot: List of all committers in FishEye*

The All Users screen shows all those with accounts on the system. You can see their commit history (expressed as a bar graph) and their total number of commits.

Click on a person's name to see detailed information about their additions to the repository, and issue updates. If you are using FishEye with Crucible and have JIRA integration set up, you can see their review activity.

*Screenshot: Statistics on a Person in FishEye*
Avatars

By default, each user has a unique avatar that is randomly formed from the text in their email address. You can add your own avatar by uploading an image to an external service such as Gravatar, which Crucible supports. See Changing your User Profile.

If you are using Crucible, statistics for each person’s code reviews are also available.

Using smart commits

Smart commits allow repository committers to perform actions like transitioning JIRA issues or creating Crucible code reviews by embedding specific commands into their commit messages. Multiple smart commits can be used in one commit message, however they must be on separate lines. Note that smart commits don’t provide for field-level updates in JIRA issues.

Note that Smart commits require the following:

- An application link must be configured between FishEye/Crucible and JIRA. See Adding an application link.
- If you have JIRA 5.0 or later, and the JIRA FishEye Plugin (at least version 5.0.10), a project/entity link is unnecessary. Otherwise, a project link must be configured between FishEye/Crucible and JIRA. See Adding project links between applications.
- Smart commits must be enabled in FishEye. See Enabling smart commits.

Transition your JIRA issues

Compatibility

- In order to use smart commits with JIRA you need to have the JIRA FishEye Plugin version 3.4.5 or above installed on your JIRA instance.

Some users may not appear to have the correct number of Files Changed, despite regularly committing. In this situation, if they have committed to a directory which is not covered by the regexes in your symbolic definition (i.e. they have committed to a directory that is neither trunk, branches or tags) then that directory will be counted as part of trunk. Also note that creating tags and branches themselves does not count toward the totals in FishEye.
### Basic command line syntax

The basic command line syntax for your commit comment is:

\(<\text{ISSUE\_KEY}>\) \#<COMMAND> <optional COMMAND\_PARAMETERS>

Please note, commit commands cannot span more than one line (i.e. you cannot use carriage returns).

For example, if you include the following text in your commit message, FishEye will record 2 days and 5 hours of work against issue JRA-123, when you perform your commit:

```
JRA-123 #time 2d 5h
```

ℹ️ Please see the section below for further information on the command line parameters.

### Advanced command line syntax

If you wish to perform multiple actions on issues, you can create composite commands by combining keywords, as described below. Please note, commit commands cannot span more than one line (i.e. you cannot use carriage returns).

- **To perform multiple actions on a single issue:**

  \(<\text{ISSUE\_KEY}>\) \#<COMMAND1> <optional COMMAND1\_PARAMETERS> \#<COMMAND2> <optional COMMAND2\_PARAMETERS> \#<COMMAND3> <optional COMMAND3\_PARAMETERS> etc

  For example, if you include the following text in your commit message, FishEye will log 2 days and 5 hours of work against issue JRA-123, add the comment 'Task completed ahead of schedule' and resolve the issue, when you perform your commit:

  ```
  JRA-123 #time 2d 5h #comment Task completed ahead of schedule #resolve
  ```

- **To perform a single action on multiple issues:**

  \(<\text{ISSUE\_KEY1}>\) \(<\text{ISSUE\_KEY2}>\) \(<\text{ISSUE\_KEY3}>\) \#<COMMAND> <optional COMMAND\_PARAMETERS> etc
For example, if you include the following text in your commit message, FishEye will resolve issues JRA-123, JRA-234 and JRA-345, when you perform your commit:

```
JRA-123 JRA-234 JRA-345 #resolve
```

- **To perform multiple actions on multiple issues:**

```
<ISSUE_KEY1> <ISSUE_KEY2> <ISSUE_KEY3> #<COMMAND1> <optional
COMMAND1_PARAMETERS> #<COMMAND2> <optional COMMAND2_PARAMETERS>
#<COMMAND3> <optional COMMAND3_PARAMETERS> etc.
```

For example, if you include the following text in your commit message, FishEye will log 2 days and 5 hours of work against issues JRA-123, JRA-234 and JRA-345, add the comment ‘Task completed ahead of schedule’ to all three issues, and resolve all three issues, when you perform your commit:

```
JRA-123 JRA-234 JRA-345 #resolve #time 2d 5h #comment Task completed ahead of
schedule
```

**Commands**

Note that you can see the custom commands available for use with smart commits by visiting the JIRA issue and seeing its available workflow transitions (in an issue, click View Workflow, near the issue status).
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>#time</td>
<td>This command records <em>time tracking information</em> against an issue. Please note, time tracking must be enabled for your JIRA instance to use this command. Please check with your JIRA administrator, if you cannot record time tracking information against issues. <strong>Please note:</strong> Work log comments cannot be set using smart commits. See F E-3757.</td>
<td>#time 1w 2d 4h 30m Total work logged — this command would record 1 week, 2 days, 4 hours and 30 minutes against an issue, and add the comment 'Total work logged' in the <strong>Work Log</strong> tab of the issue.</td>
</tr>
<tr>
<td>#comment</td>
<td>This command records a comment against an issue.</td>
<td>#comment My comment. — this command would create the comment, &quot;My comment&quot;, against the issue.</td>
</tr>
</tbody>
</table>
| #<workflow command> e.g. #resolve | This command transitions an issue to a particular workflow state. Please see the documentation for Configuring Workflow in JIRA.                                                                          | #close Fixed the issue — this command would execute the 'Close Issue' workflow transition for an issue in the default JIRA workflow and adding the comment 'Fixed the issue'.
|               |                                                                                                                                             | #start — this command would execute the 'Start Progress' workflow transition for an issue in the default JIRA workflow |
FishEye will do prefix matching for issue transitioning. For example, if you have transition name with spaces, such as finish work then specifying #finis h is sufficient. Hyphens replace spaces: #finish-work

FishEye will only execute issue transitions if there is no ambiguity in valid workflow transitions. Take the following example:

An issue has two valid transitions:

- Start
- Progress
- Start Review

A smart commit with action #start is ambiguous as FishEye will not be able to determine which transition to execute. In order to execute one of these transitions, the smart commit specified will need to be fully qualified #start-review

Please note: If you want to resolve an issue using the #resolve command, you will not be able to set the resolution via smart commits. We are tracking this improvement request here:

FE-3873 - Smart Commits: Cannot set the resolution when using the "#resolve" command

Open
Integration with Crucible

Please note that:

- Each commit command in the commit message must not span more than one line (i.e. you cannot use carriage returns). You can use multiple commands in the same message as long as they are on separate lines.
- Creating a review in Crucible using a smart commit requires that the author of the changeset has already been mapped to a Crucible username. See ‘Author mapping’ on Changing your user profile.

Creating a review

With smart commits, it is also easy to create a Crucible review from a commit:

```
Fix a bug +review CR-TEST
```

The command “+review” tells FishEye to create a new review in the project CR-TEST with the content of the changeset. The review will be in a draft state unless the project has default reviewers or reviewers are explicitly mentioned. If you only have one project in Crucible, or a repository is a project's default repository, it is not necessary to mention the project key. Just use "fix a bug +review".

Adding reviewers

Reviewers can be added to a new review using a smart commit:

```
Fix a bug +review CR-TEST @jcage @skhan
```

That command will create a new review in PROJ and add the users jcage and skhan to the review. The review will be automatically started if reviewers are specified.

Note, you cannot add reviewers to existing reviews using smart commits.

Review objectives

When creating a new review using a smart commit the default project objectives are added to the review, and since Fisheye/Crucible 2.10.2, the commit message is also copied to the review objectives.

Note that you cannot add arbitrary objectives to the review from the smart commit.

Updating an existing review

Often, reviews require rework and changes in response to comments left by the team. When committing these changes, adding the review key will iteratively add these new changes to the review:

```
Implement rework on past work +review CR-TEST-123
```

With this command FishEye will add the changeset content to the review CR-TEST-123.

Linkers

When using smart commits you can use linkers that create a hyperlink to the JIRA issue. See Linkers for more information.

Error handling

If there are any errors during the processing of smart commits, they will be logged to FishEye's error console, as well as emailed to the actioning users. Please speak to your FishEye administrator about Configuring SMTP.

Changing your user profile

You can change FishEye (and Crucible) settings such as password, notifications, profile image and display
To change your FishEye settings:

1. Log into FishEye.
2. Choose **Profile settings** from the User Menu (labelled with your username) at the top of the screen.
3. Update your user settings as required. Each tab is described in more detail below.
4. Click **Close**.

<table>
<thead>
<tr>
<th>On this page:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Display Settings</td>
</tr>
<tr>
<td>• Profile and Email</td>
</tr>
<tr>
<td>• Change Password</td>
</tr>
<tr>
<td>• Open Authentication (OAuth)</td>
</tr>
<tr>
<td>• Author Mapping</td>
</tr>
<tr>
<td>• Watches</td>
</tr>
<tr>
<td>• Reviews</td>
</tr>
</tbody>
</table>

### Display Settings

| Display Settings | File history view mode | Default is **Logical**. In Subversion repositories, FishEye is able to show all operations on a single logical file spread across a number of physical paths - i.e. operations in different branches. When this is set to **Logical**, FishEye will show all the operations across all branches. In **Physical** mode, only the operations related to the physical path whose history is being viewed are shown. |
| Timezone | Default is the timezone of the FishEye server. |
| Changelog | Changesets per page | The default is 30 per page. |
| Always expand changesets in stream | Default is **Yes**. |
| Diff view | Diff mode | Default is **Unified**. |
| Line wrapping | Default is **None** i.e. long lines will never word-wrap. **Soft** is when long lines will word-wrap. |
| Context lines | Default is 3. The number of lines to show (for context), if the diff contains more than three lines of code. |
| Source view | Default annotation mode | Default is **Age**. |
| Highlighting colours | The default scheme uses bright colours for highlighting diffs in the code. If you prefer more muted colours, select **Classic (muted)**. |
| Tab width | Default is 8. Can be changed to a number between 1 and 10. |
### Profile and Email

<table>
<thead>
<tr>
<th><strong>Email settings</strong></th>
<th><strong>Display Name</strong></th>
<th>Name displayed for the user currently logged in.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Email Address</strong></td>
<td></td>
<td>The address to which all email notifications will be sent.</td>
</tr>
<tr>
<td><strong>Email Format</strong></td>
<td></td>
<td>Default is Text. Can be sent as HTML.</td>
</tr>
</tbody>
</table>

| **Email watches** | **Send Watch Emails** | The frequency at which emails will be sent for watch notifications. Immediately is the default value. Daily sends a summary of changes. |

| **Profile Picture** | **Choose picture** | Upload an avatar image of your choice. This image will be displayed next to your username throughout FishEye/Crucible. Accepted formats are JPG, GIF and PNG. Image file size limit is 2Mb. Images will be automatically cropped on upload. This is disabled if avatars are served from an external server – see Configuring avatar settings. |

### Change Password

Change your password from this tab, if required. Please note that passwords are case-sensitive.

⚠️ This tab is not displayed if your FishEye instance is connected to an external LDAP authentication source, such as LDAP. You will need to contact your administrator for assistance.

### Open Authentication (OAuth)

Configure your OAuth settings on this page. You can choose to allow gadgets/applications to access FishEye data using your account.

Read more about OAuth.

### Author Mapping

The Author Mapping tab allows you to make an association between you (as a logged-in user) and a committer, for each repository.

This is only necessary if the name or email of the user within FishEye is different from the committer name or email within the repository. By default, FishEye will automatically match users to committers where it can.

### Watches

By adding a 'watch', you can ask to receive emails about changes made to the repository. Any watches that you have set up in FishEye/Crucible will be displayed on this tab. You can watch the dashboard activity stream, changelogs and repositories. Watching an activity stream/repository allows you to receive emails when updates occur. Note, the option to add a watch may only be available if the administrator has enabled watches for the repository.

You can delete any of your watches by clicking Delete next to the watch.

### Reviews

This functionality is used by Crucible.
If the SMTP server is set up, then you will receive emails when different actions occur within Crucible.
You can change the options described below, to specify the stages at which emails will be sent.

<table>
<thead>
<tr>
<th>Auto-mark files as 'read'</th>
<th>Default is Yes.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Review Notifications Events</td>
<td>State change</td>
</tr>
<tr>
<td></td>
<td>Comment added</td>
</tr>
<tr>
<td></td>
<td>Comment reply added</td>
</tr>
<tr>
<td></td>
<td>Participant finished</td>
</tr>
<tr>
<td></td>
<td>General message</td>
</tr>
<tr>
<td></td>
<td>File revision added</td>
</tr>
<tr>
<td></td>
<td>Uncomplete review if defect is raised:</td>
</tr>
<tr>
<td></td>
<td>Uncomplete review if revision is added:</td>
</tr>
<tr>
<td></td>
<td>My actions</td>
</tr>
</tbody>
</table>

⚠️ **Batch Notifications** will be sent out by Crucible every 30 minutes. All notifications will be rolled up into a single digest e-mail.

**Screenshot: User Profile Settings**
Re-setting your password

If you need to reset your password, FishEye has an integrated mechanism to generate a new password and send it to the email address in your profile.

To reset your password:

1. On the log in screen, click the Forgot your password? link. The ‘Request New Password’ screen opens.
2. Fill out your username or email address and the Captcha step. That is, click in the form field labelled Please enter the word as shown below and type the graphical letters shown above the Submit button.
3. An email is then sent to the email address specified in your profile. When it arrives, click the link supplied to complete the password reset.
4. On the resulting web page, you will receive the message 'A new password has been sent to your account.'
5. An email will arrive in your inbox, containing your new password.

If you receive a password-reset email that you did not request, simply disregard it to continue using your current password.

Screenshot: The Log In dialog
Pattern matching guide

FishEye supports a powerful type of regular expression for matching files and directories (same as the pattern matching in Apache Ant).

These expressions use the following wild cards:

<table>
<thead>
<tr>
<th>Wild Card</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>?</td>
<td>Matches one character (any character except path separators)</td>
</tr>
<tr>
<td>*</td>
<td>Matches zero or more characters (not including path separators)</td>
</tr>
<tr>
<td>**</td>
<td>Matches zero or more path segments</td>
</tr>
</tbody>
</table>

Remember that Ant globs match paths, not just simple filenames.

- If the pattern does not start with a path separator i.e. / or \, then the pattern is considered to start with /** /.
- If the pattern ends with / then ** is automatically appended.
- A pattern can contain any number of wild cards.

Also see the Ant documentation.

Examples

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Matches</th>
</tr>
</thead>
<tbody>
<tr>
<td>*.txt</td>
<td>/foo.txt and /bar/foo.txt but not /foo.txty or /bar/foo.txty/</td>
</tr>
<tr>
<td>/*.txt</td>
<td>/foo.txt but not /bar/foo.txt</td>
</tr>
<tr>
<td>**/dir1/file.txt</td>
<td>Same as above.</td>
</tr>
<tr>
<td>/dir1/file.txt</td>
<td>Same as above.</td>
</tr>
</tbody>
</table>
Date Expressions Reference Guide

FishEye supports a wide variety of date expressions. A date has the two possible general forms:

- \texttt{DATE[+-]TIMEZONE[+-]DURATION}, or
- \texttt{DATECONSTANT[+-]DURATION}.

The \texttt{TIMEZONE} and \texttt{DURATION} parts are both optional.

\texttt{TIMEZONE} can be an offset from GMT \texttt{HHMM} or \texttt{HH:MM}, or simply the letter \texttt{Z} to denote GMT. If no timezone is given, the FishEye server's configured timezone is used.

\texttt{DATE} can be either of the following:

<table>
<thead>
<tr>
<th>YYYY-MM-DDThh:mm:ss</th>
<th>Specifies a time and date (separated by a \texttt{T}). The seconds part may contain a fractional component. A / can be used instead of - as a separator.</th>
</tr>
</thead>
<tbody>
<tr>
<td>YYYY-MM-DD</td>
<td>Specifies 00:00:00 on the given date. A / can be used instead of - as a separator.</td>
</tr>
</tbody>
</table>

\texttt{DATECONSTANT} can be any of:

<table>
<thead>
<tr>
<th>now</th>
<th>This very instant (at the time the expression was evaluated).</th>
</tr>
</thead>
<tbody>
<tr>
<td>today</td>
<td>The instant at 00:00:00 today. (server-time* or GMT)</td>
</tr>
<tr>
<td>todaygmt</td>
<td>The instant at 00:00:00 today. (server-time* or GMT)</td>
</tr>
<tr>
<td>thisweek</td>
<td>The instant at 00:00:00 on the first day of this week. Sunday is considered the first day. (server-time* or GMT)</td>
</tr>
<tr>
<td>thisweekgmt</td>
<td>The instant at 00:00:00 on the first day of this week. Sunday is considered the first day. (server-time* or GMT)</td>
</tr>
<tr>
<td>thismonth</td>
<td>The instant at 00:00:00 on the first day of this month. (server-time* or GMT)</td>
</tr>
<tr>
<td>thismonthgmt</td>
<td>The instant at 00:00:00 on the first day of this month. (server-time* or GMT)</td>
</tr>
<tr>
<td>thisyear</td>
<td>The instant at 00:00:00 on the first day of this year. (server-time* or GMT)</td>
</tr>
<tr>
<td>thisyeargmt</td>
<td>The instant at 00:00:00 on the first day of this year. (server-time* or GMT)</td>
</tr>
</tbody>
</table>

* The timezone used for server-time is part of the FishEye configuration

The syntax for \texttt{DURATION} is similar to the XML Schema duration type. It has the general form \texttt{PnYnMnDTnHnMnS}. See Section 3.2.6 of the XML Schema Datatypes document for more details.

Examples

<table>
<thead>
<tr>
<th>2005-01-02</th>
<th>The start of the day on January 1, 2005 (server's timezone)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2005-01-02-0500</td>
<td>The start of the day on January 1, 2005 at GMT offset -0500 (New York)</td>
</tr>
<tr>
<td>2005-01-02T12:00:00Z</td>
<td>Midday, January 1, 2005 GMT</td>
</tr>
<tr>
<td>today-P1D</td>
<td>Yesterday (start of day)</td>
</tr>
<tr>
<td>today+P1D</td>
<td>Start of tomorrow</td>
</tr>
<tr>
<td>thismonth-P1M</td>
<td>Start of last month</td>
</tr>
<tr>
<td>thisyear+P1Y</td>
<td>Start of next year</td>
</tr>
<tr>
<td>now-PT1H</td>
<td>One hour ago</td>
</tr>
</tbody>
</table>
EyeQL Reference Guide

FishEye contains a powerful query language called EyeQL. EyeQL is an intuitive SQL-like language that allows you to write your own specific queries. See examples.

EyeQL allows you to perform complex searches either within the Advanced Search or incorporated in scripts when programming the FishEye API.

query:

```plaintext
select revisions
(from (dir|directory) word)?
(where clauses)?
(order by date (asc | desc) )?
Notes: asc produces 'ascending order'.
desc produces 'descending order'.
(group by (file|dir|directory|csid|changeset))? 
(return return-clauses)?
(limit limit-args)?
(clauses:
  clause ((or|and|) clause)*
Notes: and binds more tightly than or.
  , (comma) means 'and'.
  clause: ( clauses )

not clause

path (not)? like word
Notes: word is an Antglob.

path = word
Notes: Defines an exact path without wildcards or variables. path must represent a complete (hard-coded) path.

path != word
Notes: Defines an exact path exclusion without wildcards or variables. path must represent a complete (hard-coded) path.

date in ( ( [ ] dateExp, dateExp ) | )
Notes: The edges are
  inclusive if [ or ] is used.
  exclusive if ( or ) is used.

date dateop dateExp
Notes: dateop can be <, >, <=, >=, =, == or !=.

author = word

author in (word-list)

comment matches word
Notes: Does a full-text search.

comment = string
```
Notes:
Matches \textit{string} exactly.
Most comments end in a new line, so remember to add \texttt{\backslash n} at the end of your string.

\texttt{comment =~ string}
Notes:
\textit{string} is a regular expression.

\texttt{content matches word}
Notes:
Does a full-text search.
At this time searches are restricted to HEAD revisions.

\texttt{(modified|added|deleted)? on branch word}
Notes:
Selects all revisions on a branch.
\textit{modified} excludes the branch-point of a branch.
\textit{added} selects all revisions on the branch if any revision was added on the branch.
\textit{deleted} selects all revisions on the branch if any revision was deleted on the branch.

\texttt{tagged op? word}
Notes:
\textit{op} can be \texttt{<, >, <=, >=, =, == or !=}.
\textit{op} defaults to \texttt{==} if omitted.
These operators are 'positional' and select revisions that appear on, after, and/or before the given tag.

\texttt{between tags tag-range}

\texttt{after tag word}

\texttt{before tag word}

\texttt{is head (on word)?}
Notes:
This selects the top-most revision on any branch, if no branch is specified.

\texttt{is ( dead | deleted )}
Notes:
Means the revision was removed/deleted.

\texttt{is added}
Notes:
Means the revision was added (or re-added).

\texttt{csid = word}
Notes:
Selects all revisions for the given changeset ID.

\texttt{p4:jobid = word}
Notes: finds revisions whose Perforce jobid is \textit{word}.

\texttt{p4:jobid =~ word}
Notes: finds revisions whose Perforce jobid matches regex \textit{word}.

\texttt{reviewed}
Notes: \textit{(applies to Crucible reviews)} alias for \texttt{in or before any closed review}.

\texttt{(in | before | in or before) review word}

\texttt{(in | before | in or before) any (review states)? review}
Notes:
\textit{word} is a review key.
in selects reviewed revisions. If a review contains a diff, then only the most recent revision is considered in the review.

before selects all revisions in a file prior to the revision in the review.

review states is a comma-separated list of open, closed, draft.

tag-range:

( \[ \] T1:word, T2:word ( ) )

Notes:
A range of revisions between those tagged T1 and T2.
The edges are:
inclusive if [ or ] is used.
exclusive if ( or ) is used.
You can mix edge types. These are all valid: (T1,T2), [T1,T2], (T1,T2) and (T1,T2).

Having trouble with Subversion tags? See How tags work in Subversion for more information.

word:
Any string, or any non-quoted word that does not contain white space or any other separators.

string:
A sequence enclosed in either " (double quotes) or ' (single quotes).
The following escapes work:\' " \n \r \t \b \f.
Unicode characters can be escaped with \uXXXX.
You can also specify strings in 'raw' mode like r"foo". (Similar to Python's raw strings.
See Python's own documentation).

dateExp:
See our Date Expressions Reference Guide for more information on date formats.

return-clauses:
return-clause ( , return-clause)*
A return clause signifies that you want control over what data is returned/displayed.

return-clause:
( path | dir | directory | revision | author | date | comment | csid | isBinary | totalLines
| linesAdded | linesRemoved | isAdded | isDeleted | isCopied | isMoved | tags | review
| ws | aggregate)

( as word )?
The attribute to return, optionally followed by a name to use for the column.

Notes: reviews applies to Crucible reviews.

aggregate-return-field:
( count(revisions ) | count(binary-field) | count(distinct other-field ) | sum( numeric-field ) | average( numeric-field ) | max( numeric-field ) | min( numeric-field )

The aggregate field to return.

Notes:

binary-fields are isBinary, isAdded, isDeleted, isCopied, isMoved. e.g. count(isAdded)
will return the number of added files.

numeric-fields are totalLines, linesAdded, linesRemoved.

other-field can be path, dir, author, date, csid, tags or reviews. e.g. count(distinct
path) will return the number of unique paths. count(distinct tags) will return the number
of unique tags.

If a group by is given, give sub-totals for each group.

With no group by clause, you can have:

- return normal columns
- return aggregates

With a group by changeset|csid clause:

- return normal columns
• return csid, comment, date, author, aggregates

With a group by file|path clause:

• return normal columns
• return path, aggregates

With a group by dir|directory clause:

• return normal columns
• return dir, aggregates

i.e. The EyeQL can contain a returns clause that contains all non-aggregate columns, or all aggregate columns.

Non-aggregate and aggregate columns can only be mixed if the columns are unique for the grouping.

limit-clause:
(length | offset, length | length offset offset)

Notes: Limits the number of results to return. offset specifies the starting point of the truncated result set and length specifies the set length. offset is zero-based.

Examples

The following examples demonstrate using EyeQL to extract information from your repository.

Find files removed on the Ant 1.5 branch:
select revisions where modified on branch ANT_15_BRANCH and is dead group by changeset

As above, but just return the person and time the files were deleted:
select revisions where modified on branch ANT_15_BRANCH and is dead return path, author, date

Find files on branch and exclude delete files:
slect revisions where modified on branch ANT_15_BRANCH and not is deleted group by changeset

Find changes made to Ant 1.5.x after 1.5FINAL:
slect revisions where on branch ANT_15_BRANCH and after tag ANT_MAIN_15FINAL group by changeset

Find changes made between Ant 1.5 and 1.5.1:
slect revisions where between tags (ANT_MAIN_15FINAL, ANT_151_FINAL) group by changeset

As above, but show the history of each file separately:
slect revisions where between tags (ANT_MAIN_15FINAL, ANT_151_FINAL) group by file

Find Java files that are tagged ANT_151_FINAL and are head on the ANT_15_BRANCH: (i.e. files that haven’t changed in 1.5.x since 1.5.1)
slect revisions from dir /src/main where is head and tagged ANT_151_FINAL and on branch ANT_15_BRANCH and path like *.java group by changeset

Find changes made by conor to Ant 1.5.x since 1.5.0:
slect revisions where between tags (ANT_MAIN_15FINAL, ANT_154) and author = conor group by changeset

Find commits that do not have comments:
slect revisions from dir / where comment = "" group by changeset

Find the 10 most recent revisions:
slect revisions order by date desc limit 10

Find the 5th, 6th & 7th revisions:
slect revisions order by date limit 4, 3
Find commits between two dates:
select revisions where date in [2008-03-08, 2008-04-08]

Find revisions that do not have any associated review:
select revisions where (not in any review)

Return number of matched revisions, the number of files modified, authors who modified code, changesets, tags, and reviews:

```
select revisions
where date in [ 2003-10-10, 2004-12-12 ]
return count(revisions), count(distinct path), count(distinct author),
    count(distinct csid), count(distinct tags), count(distinct reviews)
```

As Sub-totals for each distinct changeset, Return csid, the author, date, comment, number of matched revisions, the number of files modified, the lines added/removed:

```
select revisions
where date in [ 2003-10-10, 2004-12-12 ]
group by changeset
return csid, author, date, comment, count(revisions), count(distinct path),
    sum(linesAdded), sum(linesRemoved)
```

For each matched file, return the file name, number of matched revisions, the lines added/removed:

```
select revisions
where date in [ 2003-10-10, 2004-12-12 ]
group by file
return path, count(revisions), sum(linesAdded), sum(linesRemoved)
```

Show all the changesets with no review:

```
select revisions
from dir /
where not reviewed
group by changeset
return csid, author, count(revisions), comment
```

JIRA Integration in FishEye

JIRA is Atlassian’s issue tracking and project management application.

When FishEye is integrated with JIRA, you and your team get all the benefits described on this page.

In FishEye, you can:

- See the JIRA issues related to commits
- See the details for JIRA issues
- Transition JIRA issues from within FishEye
- See issues from multiple instances of JIRA
- Use smart commits in FishEye to transition JIRA issues

In JIRA, you can:

- View a JIRA issue’s FishEye changesets
- Browse a JIRA project’s FishEye changesets
- Add the FishEye Charts Gadget to your JIRA dashboard
- Add the FishEye Recent Changesets Gadget to your JIRA dashboard
You can also use JIRA for delegated management of your FishEye users. See JIRA and Crowd Authentication.

Related pages:
- Linking FishEye to JIRA
- Enabling Smart Commits

See the JIRA issues related to commits

FishEye recognises JIRA issue keys, and displays those as links in places such as the activity stream, side-by-side diffs, and commit messages:

Click on the linked key to see details for the issue.

See the details for JIRA issues

Click a linked issue key anywhere in FishEye to see the details of that issue in a dialog. And you can click the issue key at the top of the dialog to go straight to the issue in JIRA:

Transition JIRA issues from within FishEye

You can easily transition a JIRA issue from within FishEye. For example, when viewing a commit, you may want to transition the related JIRA issue into QA. Click on a linked JIRA issue anywhere in FishEye to see a dialog with the available workflow steps:

Click on a step in the dialog, and complete any displayed fields as required. If there are custom required fields that are unsupported by FishEye, just click Edit this field in JIRA to transition the issue directly in JIRA.

See issues from multiple instances of JIRA
FishEye can link to more than one JIRA server at a time, so different teams can work with their own projects in different JIRA instances, or a single team can link to issues across multiple JIRA servers.

FishEye releases

FishEye 3.1
27 August 2013
- An improved dashboard
- QuickNav and QuickSearch improvements
- New JIRA issue dialog
- Transition JIRA issues from within FishEye
- Small improvements: native SVN 1.7, OpenJDK
- More in the release notes and changelog

See the FishEye upgrade guide.

FishEye 3.0
30 May 2013
- Optimised indexing for new SVN repositories
- Commit graph highlighter
- Redesigned UX
- Platform upgrades: Jetty 8, Infinity 3 DB
- Small improvements
- More in the release notes and changelog

See the FishEye upgrade guide.

FishEye 2.10
15 January 2013
- Repository indexing REST API
- Bitbucket and GitHub polling integration
- More in the release notes
- FishEye 2.10 upgrade guide

FishEye 2.9
14 November 2012
- Simpler JIRA integration
- More JIRA data in FishEye
- Faster JIRA source tab
- More in the release notes
- FishEye 2.9 upgrade guide

FishEye 2.8
15 August 2012
- Mentions
- Shares
- Improved performance of the activity stream
- Support for Subversion 1.7
- End of life announcements
- More in the release notes
- FishEye 2.8 upgrade guide

FishEye 2.7
7 September 2011

- Managed Git Repositories
- Smart Commits
- Web Hooks
- JIRA FishEye Plugin Improvements
- Small Improvements
- More in the release notes
- FishEye 2.7 Upgrade Guide

FishEye 2.6

6 June 2011

- Repository Commit Graph
- User Management via JIRA
- Improved Quick Search
- Redesigned HTML Emails
- Dashboard and Navigation Improvements
- Improved Support for Git Branches
- Git Commit Authors include Email Address
- Mercurial Indexing Improvements
- More in the release notes
- FishEye 2.6 Upgrade Guide

FishEye 2.5

8 February 2011

- Search Revamp
- Redesigned Activity Stream
- Mercurial and Git Authentication
- RSS Improvements
- Universal Plugin Manager
- More in the release notes
- FishEye 2.5 Upgrade Guide

FishEye older releases (click to expand)

FishEye 2.4

20 October 2010

- Branch and Tag Selector
- File History Redesigned
- Easier Application Linking
- SSL Support
- User Interface Improvements
- Performance Improvements
- More in the release notes
- FishEye 2.4 Upgrade Guide

FishEye 2.3

26 May 2010

- Mercurial SCM Alpha
- New `Aggregate` functions in EyeQL query language
- Revamped Installation Process
- More in the release notes
- FishEye 2.3 Upgrade Guide

FishEye 2.2

Created by Atlassian in 2013. Licensed under a Creative Commons Attribution 2.5 Australia License.
18 Feb 2010

- Enhanced Side-by-Side Diff View Mode
- Improved Quick Navigation
- Annotation Context Menu
- Code Copying
- ClearCase and Git Support Now Final
- Numerous improvements and bug fixes
- More in the release notes
- FishEye 2.2 Upgrade Guide

FishEye 2.1

12 November 2009

- Wiki Markup in Commit Messages
- Streamlined JIRA Integration
- FishEye Admin API
- History Page Performance Increases
- ClearCase Support Now in Beta
- More in the release notes
- FishEye 2.1 Upgrade Guide

FishEye 2.0

30 June 2009

- Activity streams
- People statistics
- Favourites, bookmarks & saved search
- Enhanced JIRA integration
- New user interface
- Git beta
- More in the release notes
- FishEye 2.0 Upgrade Guide

FishEye 1.6

23 September 08

- FishEye search enhancements
- Multiple admin users
- Remote API improvements
- Changes to charts
- Perforce performance tweaks
- More in the release notes
- FishEye 1.6 Upgrade Guide

FishEye 1.5

14 April 2008

- Per-author lines of code statistics
- Charting improvements
- Customisable email templates
- More in the release notes
- FishEye 1.5 Upgrade Guide

FishEye 1.4

5 December 2007

- Enhancements to user management
- Crowd/SSO support
- Crucible integration
FishEye 1.3

1 August 2007

- Support for the Perforce version control system.
- SVN properties are now shown.
- Quicksearch now searches for changeset ids.
- New "mixed" chart on annotation pages, showing author-over-time breakdown.
- Side by Side diffs (1.3.1)
- More in the release notes
- FishEye 1.3 Upgrade Guide

FishEye upgrade guide

This page describes how to upgrade to a new version of FishEye.

- For the latest FishEye release, see FishEye releases.
- For production environments we recommend that you test the FishEye upgrade on a QA server before deploying to production.
- The first time you run a new version of FishEye, it will automatically upgrade its data. This may involve a complete re-index of your repository.

On this page:

- Upgrade steps
- Upgrading to FishEye 3.1
- Upgrading to FishEye 3.0
- Checking for known issues and troubleshooting the FishEye upgrade

Upgrade steps

This section provides general instructions for upgrading FishEye. See also the specific notes on this page for the version of FishEye you are upgrading to. We strongly recommend that you upgrade FishEye by following these steps:

- Back up your entire FishEye instance (see Backing up and restoring FishEye data), i.e.
  - If you are backing up your FishEye instance using the Admin interface, tick all of the 'Include' checkboxes (e.g. repository and application caches, plugins and their configuration data, SQL database, etc).
  - If you are backing up your FishEye instance using the command-line interface, do not use any excl
Your upgrade procedure depends on whether you are using a `FISHEYE_INST` directory (i.e. "FishEye instance" directory).

- **Method 1: Using a `FISHEYE_INST` directory**
  - Click here to expand...
  - If you have FishEye/Crucible configured to use a `FISHEYE_INST` directory, then follow the instructions below. This is the recommended scenario for production installations.
    1. Shut down your existing FishEye/Crucible server, using `bin\stop.bat` or `bin\stop.sh from the <FishEye home directory>`.
    2. Make a backup of your `FISHEYE_INST` directory.
    3. Download FishEye or Crucible.
    4. Extract the new FishEye/Crucible version to a new directory.
    5. Leave your `FISHEYE_INST` environment variable set to its existing location. Both FishEye and Crucible use this variable.
      - Please be aware that jar files in the `FISHEYE_INST/lib` directory may conflict with those required for FishEye's normal operation. Jar files in this directory should be limited to those which provide functionality not provided by FishEye (e.g. database drivers).
    6. Start FishEye/Crucible from the new installation directory by running `bin/run.sh`. (Use `run.bat` on Windows.)
    7. Follow any version-specific instructions found in the FishEye upgrade guide or Crucible upgrade guide.

- **Method 2: Without a `FISHEYE_INST` directory**
  - Click here to expand...
  - If you do not have FishEye/Crucible configured to use a `FISHEYE_INST` directory and do not want to set one up, then follow the instructions below. The `<FishEye home directory>` is the location of the existing FishEye/Crucible installation. Note that this is the typical scenario for evaluation installations, and is not recommended for production installations.

You will need to copy some files from your old FishEye/Crucible installation to your new one.

1. Download FishEye or Crucible.
2. Extract the new FishEye/Crucible archive into a directory such as `<New FishEye home directory>`.
3. Shut down the old FishEye/Crucible server, using `bin\stop.bat` or `bin\stop.sh` from the `<FishEye home directory>`.
4. Copy `<FishEye home directory>/config.xml to `<New FishEye home directory>`.
5. Delete the following directories from the `<New FishEye home directory>/var directory`:
   - `<New FishEye home directory>/var/cache`
   - `<New FishEye home directory>/var/data`
   - `<New FishEye home directory>/var/log`
6. Copy (or move) the following directories from `<FishEye home directory>/var` to `<New FishEye home directory>/var`:
   - `<FishEye home directory>/var/cache`
   - `<FishEye home directory>/var/data`
   - `<FishEye home directory>/var/log`

   DO NOT include the following directories when you do that:
   - `<FishEye home directory>/var/osgi-cache`
   - `<FishEye home directory>/var/plugins`
   - `<FishEye home directory>/var/tmp`

7. Delete the `<New FishEye home directory>/cache` directory.
8. Copy (or move) the `<<FishEye home directory>/cache` directory to `<New FishEye home directory>/cache`.
9. Start FishEye/Crucible from the new installation by running `<New FishEye home directory>/bin/run.sh`. (Use run.bat on Windows.)
10. Follow any version-specific instructions found in the FishEye upgrade guide or Crucible upgrade guide.

Method 3: Without a FISHEYE_INST directory, but would like to set one up

   Click here to expand...

   If you do not have FishEye/Crucible configured to use a FISHEYE_INST directory but would like to set one up, then follow the instructions below. You may wish to do this when reconfiguring an existing installation for a production environment.

   The FISHEYE_INST directory is the FishEye data directory, which has a location defined by the FISHEYE_INST environment variable, and which should be completely separate from the `<FishEye home directory>`. The `<FishEye home directory>` is the location of the existing FishEye/Crucible installation.

1. Download FishEye or Crucible.
2. Shut down the existing FishEye/Crucible server, using bin\stop.bat or bin\stop.sh from the `<FishEye home directory>`.
3. Set up the FISHEYE_INST environment variable, then create the FISHEYE_INST directory on your file system.
4. Copy `<FishEye home directory>/config.xml` to the FISHEYE_INST directory.
5. Copy the `<FishEye home directory>/var` directory to the FISHEYE_INST directory.
6. Copy the `<FishEye home directory>/cache` directory to the FISHEYE_INST directory.
7. If it exists, copy the `<FishEye home directory>/data` directory to the FISHEYE_INST directory.
8. Extract the new FishEye/Crucible archive into a directory such as `<New FishEye home directory>`.
9. Start FishEye/Crucible from the new installation by running `<New FishEye home directory>/bin/run.sh`. (Use run.bat on Windows.)
   - If your configuration is not automatically picked up and you cannot see your existing repositories, check your Administration > Sys-Info page, where you will see information about the `<FishEye home directory>` and FISHEYE_INST. Check that your FISHEYE_INST is pointing to the right directory.
10. Follow any version-specific instructions found in the FishEye upgrade guide or Crucible upgrade guide.

Upgrading to FishEye 3.1

Please also see the Upgrade steps section above, and read the End of Support Announcements for FishEye page.

Please note the following changes in FishEye 3.1:

*Native SVN access via JavaHL requires JavaHL 1.7*

You do **not** need to upgrade your subversion repositories to 1.7. SVN 1.6 is still supported.

If you are using native JavaHL to connect to your SVN repositories you may need to upgrade the SVN JavaHL client on your FishEye server. Please read Native support for SVN 1.7 for more information.
If you are using SVNKit (the default) you do not need to upgrade SVN.

FishEye 3.1 Merge some per-repository Lucene indices into a global cross-repository Lucene index

FishEye 3.1 has greatly improved performance and scalability for QuickSearch and QuickNav. To achieve this, the per-repository ‘METADATA’ Lucene indices will be moved into a single global cross-repository Lucene index. This means FishEye is able to search across more repositories in less time because now only a single search index needs to be queried instead of the previous N. Merging these indices into the single cross-repository index can be refreshed in two ways:

1. **Recommended**: As an upgrade task that is run automatically when FishEye 3.1 is run for the first time.
2. As an offline process on a separate staging server.

During the automatic upgrade task, FishEye is fully usable and functional, although search results for files, commits and committers may be incomplete.

In our testing we have found that the automatic upgrade task took 4 hours to complete on a FishEye instance with 144 repositories of different kinds, with 58 GB of data in the FISHEYE_INST folder (excluding logs). We are confident that the automatic upgrade task is suitable for the majority of production FishEye installations. *It is worth repeating that the instance was fully functional (reviews, JIRA Integration, Activity Streams, Charts etc) apart from Quick Nav and Quick Search during this time.*

Nevertheless, where required, we provide instructions for performing the reindex as an offline process on a separate staging server.

**Plugin Settings will be moved from the config.xml to the SQL database**

As of FishEye 3.1.0, plugin settings which were previously stored in the <properties> element inside config.xml will be stored in the SQL database. This includes settings for any bundled plugins such as ApplicationLinks, the UniversalPluginManager etc, and any 3rd party plugins.

An upgrade task is run on startup which will first insert all the properties found in config.xml into a new table in the SQL database. Once successful, the properties are removed from config.xml.

As part of this change, the RepositoryOptions.setProperties (Map<String, String>properties) and RepositoryOptions.getProperties() methods have been removed from our API. If you are using a plugin which uses either of these methods, you will need to update the plugin to a version which uses the Spring component PluginSettingsFactory. Plugins can use this to access the migrated global and per-repository properties that were previously available via the old RepositoryOptions API.

### Known issues for FishEye 3.1

**Upgrading to FishEye 3.0**
Please also see the Upgrade steps section above.

Please note the following changes in FishEye 3.0:

Jetty 8

FishEye 3.0 now uses Jetty 8 as its web server and Java servlet container. This change should be completely transparent when you upgrade to FishEye 3.0. However, if you have customised either your jetty-web.xml file, or the maxFormContentSize system property, you will need to update those in the new version. See Enabling Access Logging in FishEye and this FishEye KB page for more information.

Infinity DB

FishEye 3.0 now uses the InfinityDB 3.0 database internally to provide improved performance for concurrent access to FishEye. This change is transparent to users in all respects.

Pipelined indexing

FishEye 3.0 introduces a new indexing approach that splits the repository indexing process into separate tasks that can be performed in a phased and concurrent way. Users will benefit from the way in which FishEye functionality, such as repository browsing, now becomes available as indexing progresses. This change is transparent to users in all other respects. See Pipelined indexing.

Improved handling of user preferences with session cookies

Upgrading may result in some users losing their preferences.

SQL Server transaction isolation configuration

We recommend a configuration change for SQL Server to use snapshot mode for the transaction isolation level – see Migrating to SQL Server. This change avoids occasional database deadlocks, and prevents performance warning messages in the FishEye logs and admin screens.

Checking for known issues and troubleshooting the FishEye upgrade

If something is not working correctly after you have completed the steps above to upgrade your FishEye installation, please check for known FishEye issues and try troubleshooting your upgrade as described below:
• **Check for known issues.** Sometimes we find out about a problem with the latest version of FishEye after we have released the software. In such cases we publish information about the known issues in the FishEye Knowledge Base. Please check the FishEye and Crucible Known Issues in the FishEye Knowledge Base and follow the instructions to apply any necessary patches if necessary.

• **Did you encounter a problem during the FishEye upgrade?** Please refer to the guide to troubleshooting upgrades in the FishEye Knowledge Base.

• If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

**FishEye 3.1 release notes**

27 August 2013

Today we’re excited to release FishEye 3.1, which introduces a brand new dashboard, faster search and a new JIRA integration to ease your workflows.

If you are upgrading from an earlier version of FishEye, please read the FishEye upgrade guide. Please also read the End of Support Announcements for FishEye.

The FishEye 3.1 changelog is at the bottom of this page.

The new Dashboard

FishEye's new dashboard now includes a repository and project navigator. This will be the fastest and easiest way to jump to your recent content (try pressing Enter as soon as you launch the dashboard). It includes filters and keyboard shortcuts that facilitate navigation, especially when your organisation has hundreds of repositories.

QuickNav and QuickSearch improvements

Previously in FishEye, QuickSearch was limited to searching 100 repositories concurrently. Now, in FishEye 3.1, you can search across files and directories, commit messages, and committers, for every one of your repositories. And it's 40% faster. And you can order search results by date. Furthermore, QuickNav now uses the same indexes as QuickSearch, so it's faster too, and it produces the same results as QuickSearch:
Note that upgrading to FishEye 3.1 will move some per-repository indices into the cross-repository Lucene index. See the FishEye upgrade guide for details.

New JIRA issue dialog

Now, when you click on any linked JIRA issue key in FishEye, you'll see a dialog that displays a summary of the issue details. From that dialog, you can transition the workflow for the issue, and easily click through to edit the issue in JIRA:

Transition JIRA issues from within FishEye

Previously in FishEye, you could transition a JIRA issue linked to a review at the time that you closed the review. Now you can advance the workflow for any JIRA issue mentioned in FishEye at any time, right from within FishEye – just click the issue link to see the transitions available to you:

Small improvements

Improved browsing performance

The display of the file source page is now 60% faster in FishEye 3.1.

Native SVN 1.7 support

FishEye 3.1 now supports the native JavaHL 1.7 SVN client. It does not support the native JavaHL 1.6 SVN client. See Native support for SVN 1.7 for more details.

OpenJDK support
FishEye 3.1 now supports OpenJDK 1.7. See Supported platforms for details.

Change log

This section will contain information about the FishEye 3.1 minor releases as they become available. These releases will be free to all customers with active FishEye software maintenance.

If you are upgrading from an earlier version of FishEye, please read the FishEye upgrade guide.

The issues listed below are just the highlights of all those that have been resolved for the FishEye 3.1.x releases.

**17 September 2013 - FishEye 3.1.3** (No issues affecting FishEye)

This release fixed an issue in Crucible. See the Crucible 3.1 release notes

<table>

FishEye 3.0 release notes

30 May 2013

Today we're excited to release FishEye 3.0, which introduces huge indexing performance gains – especially for Subversion repositories – and search and code visualisation upgrades to help you track changes across your project. We think development teams will be able to work faster, every day.

If you are upgrading from an earlier version of FishEye, please read the FishEye upgrade guide.

The FishEye 3.0 changelog is at the bottom of this page.

Try it for FREE ➜

Use SVN repositories sooner

We've introduced a new approach that splits the indexing process into separate tasks that can be performed in a phased and concurrent way. This allows you to start using core functionality in FishEye, such as viewing recent changesets or commits in JIRA issues, up to 15X sooner than in FishEye 2.10. You can get on with your work, while FishEye quietly completes the fine details of indexing in the background. Read more...

Commit graph highlighter

We've added two new highlight types to the commit graph for a repository:

- use the Author highlight type to see all the changesets submitted by a particular author.
- use the Search highlight type to see the changesets with commit messages that contain the search term.
Read more...

Redesigned user experience

We’ve made a few key design changes to help you work faster with your repositories:

New global header

The new header across the top of the page makes it quicker to access recent repositories, projects, people and reviews, and has the large **Create review** button at top center, right where you can find it.

**Application navigator**

The new application navigator, on the left of the header, connects you directly to your other applications, such as JIRA and Bamboo. Now you can switch between FishEye and JIRA – or any other Atlassian application – all from the FishEye header. No more bookmarks in your browser; we do the job for you. Admins can easily configure which apps appear in the navigator – just click **Application navigator** in the admin area.

**JIRA Source tab redesign**

We wanted to simplify the experience but still give you the important information you need to make decisions around your issues.
Small improvements

Faster browsing for large teams

FishEye now uses the InfinityDB 3.0 internal database to provide improved performance for concurrent access. Your team gets a better browsing experience!

Diff hunk shortcuts

We've changed the 'j' and 'k' keyboard shortcuts to now work with diff hunks in the changeset page, rather than with files, as previously.

Improved handling of user preferences with session cookies

We've made session cookies more robust, but this may result in your existing preferences being lost at upgrade time.

Updated Jetty 8 web server

FishEye 3.0 includes an upgrade from Jetty 6 to Jetty 8 as its web server and Java servlet container.

Change log

This section will contain information about the FishEye 3.0 minor releases as they become available. These releases will be free to all customers with active FishEye software maintenance.

If you are upgrading from an earlier version of FishEye, please read the FishEye upgrade guide.

The issues listed below are just the highlights of all those that have been resolved for the FishEye 3.0.x releases.

FishEye 2.10 release notes

15 January 2013

Atlassian is proud to present FishEye 2.10, which provides further improvements in performance.

- Visit our issue tracker to see the full list of improvements and bug fixes in FishEye and Crucible for this release.
- See the change log for FishEye 2.10.x minor releases.
- Upgrading from a previous version of FishEye. Upgrading FishEye should be fairly straight forward. We strongly recommend that you back up FishEye before upgrading. Please refer to the FishEye 2.10 Upgrade Guide for essential information about upgrading.
- Known issues. Please check the important technical advisories on the front page of the Knowledge Base for information about any known issues for this release.
- JIRA 5.0 integration. The features described below are supported by JIRA 5.0, or later, with the latest version of the JIRA FishEye plugin.

Highlights of this release:

- Repository Indexing REST API
- Bitbucket and GitHub polling integration
- Other announcements

Providing feedback:

Please log your votes and issues. They help us decide what needs doing, and are much appreciated!

1

Repository Indexing REST API

With FishEye 2.10, you can now optimize your instance by using the REST API to trigger indexing when it's necessary. Instead of configuring FishEye to poll each repository every minute, you can add a post-commit or post-receive hook to your repositories which will ping FishEye when new commits need to be indexed. Read more...
Bitbucket and GitHub polling integration

We have implemented indexing hooks for Bitbucket and GitHub. Just provide the details of your repository and FishEye will be pinged whenever new commits need to be indexed. Read more...

Other announcements

- Improved performance of the repositories listing in the administration interface.
- Smart commits can now populate review objectives. More...
- The CVS poll periods can be configured. More...

FishEye 2.10 upgrade guide

Below are some important notes on upgrading to FishEye 2.10. For details of the new features and improvements in this release, please read the FishEye 2.10 release notes.

Upgrade notes

FishEye 2.10

- As of FishEye 2.10 the RepositoryAdminService API enforces permission checking. If you're writing a plugin that uses that API make sure to use ImpersonationService.doPrivilegedAction to execute the calls in privileged mode.
- Note that as of FishEye 2.9 the JDBC driver for MySQL is no longer bundled with FishEye/Crucible – due to license restrictions the MySQL JDBC driver cannot be bundled with FishEye/Crucible. Please download the driver from http://dev.mysql.com/downloads/connector/j/ and install it to the FISHEYE_INST/lib directory. For more information see Migrating to MySQL.

On this page:
- Upgrade notes
- Upgrade procedure
- Checking for known issues and troubleshooting the FishEye upgrade

Related pages:

Upgrade procedure

Before you begin

- Test your upgrades in your test environment before rolling into production.
- Back up your entire FishEye instance (see Backing up and restoring FishEye data), i.e.
  - If you are backing up your FishEye instance using the Admin interface, tick all of the 'Include' checkboxes (e.g. repository and application caches, plugins and their configuration data, SQL database, etc).
  - If you are backing up your FishEye instance using the command-line interface, do not use any exclusion options.

If you are already running a version of FishEye, please follow the instructions in the general FishEye upgrade guide.

Checking for known issues and troubleshooting the FishEye upgrade

If something is not working correctly after you have completed the steps above to upgrade your FishEye installation, please check for known FishEye issues and try troubleshooting your upgrade as described below:

- Check for known issues. Sometimes Atlassian finds out about a problem with the latest version of FishEye after the software is released. In such cases we publish information about the known issues in the FishEye Knowledge Base. Please check for any known issues in the FishEye Knowledge Base and follow the instructions to apply any necessary patches if necessary.
Did you encounter a problem during the FishEye upgrade? Please refer to the guide to troubleshooting upgrades in the FishEye Knowledge Base.

If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

FishEye 2.9 release notes

14 November 2012

Atlassian is proud to present FishEye 2.9, which provides the simplest and most powerful integration with the latest version of JIRA that FishEye has ever had.

- Visit our issue tracker to see the full list of improvements and bug fixes in FishEye and Crucible for this release.
- See the change log for FishEye 2.9.x minor releases.
- Upgrading from a previous version of FishEye. Upgrading FishEye should be fairly straightforward. **We strongly recommend that you back up FishEye before upgrading.** Please refer to the FishEye 2.9 Upgrade Guide for essential information about upgrading.
- Known issues. Please check the important technical advisories on the front page of the Knowledge Base for information about any known issues for this release.
- JIRA 5.0 integration. The features described below are supported by JIRA 5.0, or later, with the latest version of the JIRA FishEye plugin.

Highlights of this release:

- Simpler JIRA integration
- More JIRA data in FishEye
- Faster JIRA source tab
- Other announcements

Providing feedback:

*Please log your votes and issues. They help us decide what needs doing, and are much appreciated!*

1

Simpler JIRA integration

With FishEye 2.9, linking to JIRA is just like Plug & Play. You simply need to set up an Application Link between your JIRA server and your FishEye instance to get all the power of JIRA / FishEye integration:

- View in JIRA the list of changesets corresponding to a specific issue
- Navigate to the related changesets from your issue
- Get the JIRA data corresponding to issues mentioned in your commit messages and your source in FishEye

You no longer need to create and maintain multiple links between projects in JIRA and repositories in FishEye. Maintaining your JIRA / FishEye integration has never been simpler! *More...*
More JIRA data in FishEye

Before FishEye 2.9 you had to create links from FishEye to particular JIRA projects in order to see your issue data in FishEye. Without doing this, you just wouldn't see data for projects that were not linked to FishEye. Now, with the FishEye 2.9 release, you no longer have to create those project-specific links because all of your JIRA data is accessible in FishEye as soon as you link your instances together. Not only will you save time from not having to administer all the separate FishEye/JIRA links, but your FishEye instance is now also smarter and gets data from all the projects existing on your JIRA server.

Note that project links remain available in FishEye 2.9, but they now act as a restriction on the integration. If you set up project links from FishEye to JIRA, only issues from those particular projects will be linked in FishEye.

Faster JIRA source tab

Part of the effort of revamping the JIRA integration was to improve the performance of the issue source tab, especially for large instances with multiple repositories, each with many changesets. The chart below shows the performance gain in FishEye as a result of the effort to make it scale well as your data grows.
Other announcements

- **Remote API setting always on**
  We removed the Remote API setting from the Server Settings page. From this release onwards the Remote APIs will always be accessible, to make the JIRA integration straightforward.

- **JIRA FishEye Plugin option "Disable for unmapped JIRA Projects" has been removed**
  As of this release, it no longer makes sense to disable the Source and Reviews tabs when Project Links are not configured. If you still wish to disable the Source and Reviews tabs for a specific project, for example for one that has no relation to source code, you should use project-level permissions. See [How do I disable the FishEye tab panel for non-code projects?](#).

- **Changes to the diff view in the Changeset view**
  In order to facilitate file browsing, and to give a clearer interface to see all the modifications and comments on a particular file, we are now showing one file at a time in the Changeset view. You can use the file tree or the keyboard shortcuts to navigate between files.

FishEye 2.9 upgrade guide
Below are some important notes on upgrading to FishEye 2.9. For details of the new features and

Created by Atlassian in 2013. Licensed under a Creative Commons Attribution 2.5 Australia License.
improvements in this release, please read the FishEye 2.9 release notes.

Upgrade notes

FishEye 2.9

- **The JDBC driver for MySQL is no longer bundled with FishEye/Crucible** — Due to license restrictions the MySQL JDBC driver cannot be bundled with FishEye/Crucible. Please download the driver from http://dev.mysql.com/downloads/connector/j/ and install it to the FISHEYE_INST/lib directory. For more information see Migrating to MySQL.
- **The Connection pool manager has changed** — FishEye and Crucible now use the BoneCP connection pool manager instead of the third-party c3p0 library previously used in FishEye/Crucible 2.8 and earlier versions. The BoneCP connection pool manager has been preconfigured in FishEye and Crucible to work out-of-the-box for most customers. Read Configuring the database connection pool for a description of the default settings and for instructions on how to override them.
- **The 'Suggest Reviews' function has been removed from Crucible** — From this release onwards, a Crucible user will no longer be prompted to add to an existing review when creating a review from a changeset. We have removed this functionality based on user feedback that it was confusing and not being used. This allows users who want to add changesets to an existing review to simply navigate to that review and use the 'Add Content' option. Users can also add commits to an existing review via commit messages. Removing 'Suggest Reviews' also improves performance when creating reviews, as Crucible does not have to search for and suggest reviews.
- **Remote API is now permanently enabled** — From this release of FishEye and Crucible onwards, the 'Remote API' setting in 'Server Settings' will not be configurable. The remote API is now always turned on, to make integration with JIRA and other services more straightforward.

Upgrade procedure

⚠️ **Before you begin**

- Test your upgrades in your test environment before rolling into production.
- Back up your entire FishEye instance (see Backing up and restoring FishEye data), i.e.
  - If you are backing up your FishEye instance using the Admin interface, tick all of the 'Include' checkboxes (e.g. repository and application caches, plugins and their configuration data, SQL database, etc).
  - If you are backing up your FishEye instance using the command-line interface, do not use any exclusion options.

If you are already running a version of FishEye, please follow the instructions in the general FishEye upgrade guide.

Checking for known issues and troubleshooting the FishEye upgrade

If something is not working correctly after you have completed the steps above to upgrade your FishEye installation, please check for known FishEye issues and try troubleshooting your upgrade as described below:

- **Check for known issues**. Sometimes Atlassian finds out about a problem with the latest version of FishEye after the software is released. In such cases we publish information about the known issues in the FishEye Knowledge Base. Please check the FishEye 2.8 known issues in the FishEye Knowledge Base and follow the instructions to apply any necessary patches if necessary.
Did you encounter a problem during the FishEye upgrade? Please refer to the guide to troubleshooting upgrades in the FishEye Knowledge Base.

If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

FishEye 2.8 release notes

15th August 2012

Atlassian is proud to present FishEye 2.8, which provides a variety of social features as well as performance improvements.

See the change log for FishEye 2.8.x minor releases.

Highlights of this release:

- Mentions
- Shares
- Improved performance of the activity stream
- Support for Subversion 1.7
- End of life announcements

Providing feedback:

Please log your votes and issues. They help us decide what needs doing, and are much appreciated!

1

Mentions

In FishEye 2.8 you can notify other users in a changeset discussion, review comment or snippet comment by using mentions. To mention someone, simply type @ and then the person's name (not their username) and choose from the suggestions that FishEye offers. FishEye sends a notification to that person, so they know that you have mentioned them.
2 Shares

Share a changeset, a review, or a source repository with other members of your team, quickly and easily from where you are working. Just click the Share button at the top, enter their name, username or email address and add a cheery comment. FishEye sends an email.
Improved performance of the activity stream

The activity streams throughout FishEye (such as the commits and review activity, and on the dashboard) have an improved user experience due to faster speed and infinite scroll (that replaces paging).

Support for Subversion 1.7

FishEye now supports Subversion 1.7 (although not with a native SVN client).

End of life announcements

- **ClearCase**
  As previously announced, IBM ClearCase is no longer supported in FishEye 2.8.

- **Internally managed repositories**
  On August 13th 2013 we are ending support for internally managed repositories. Read more about this.

- **JIRA activity stream**
  We've removed JIRA information from the activity stream in order to simplify the user experience and improve the performance of FishEye. Please note that all other JIRA integration features still remain in FishEye.

FishEye 2.8 upgrade guide
Below are some important notes on upgrading to FishEye 2.8. For details of the new features and improvements in this release, please read the FishEye 2.8 release notes.

Upgrade notes

FishEye 2.8
Please be sure to read the End of Life Announcements for FishEye/Crucible 2.8. Most notably: Support for Clearcase repository types has been dropped.

On this page:
- Upgrade notes
- Upgrade procedure
- Checking for known issues and troubleshooting the FishEye upgrade

Related pages:
- FishEye 2.8 release notes

Upgrade procedure
Before you begin

- Test your upgrades in your test environment before rolling into production.
- Back up your entire FishEye instance (see Backing up and restoring FishEye data), i.e.
  - If you are backing up your FishEye instance using the Admin interface, tick all of the 'Include' checkboxes (e.g. repository and application caches, plugins and their configuration data, SQL database, etc).
  - If you are backing up your FishEye instance using the command-line interface, do not use any exclusion options.

If you are already running a version of FishEye, please follow the instructions in the general FishEye upgrade guide.

Checking for known issues and troubleshooting the FishEye upgrade

If something is not working correctly after you have completed the steps above to upgrade your FishEye installation, please check for known FishEye issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes Atlassian finds out about a problem with the latest version of FishEye after the software is released. In such cases we publish information about the known issues in the FishEye Knowledge Base. Please check for FishEye 2.8 known issues in our JIRA issue tracker and follow the instructions to apply any necessary patches if necessary.

- **Did you encounter a problem during the FishEye upgrade?** Please refer to the guide to troubleshooting the FishEye upgrade in the FishEye Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

Upgrading from FishEye 2.7 with existing ClearCase Repositories

**ClearCase Repositories**

FishEye 2.8 no longer supports ClearCase repositories. Please refer to the End of Support Announcement for IBM ClearCase.

If you have any ClearCase repositories present in your FishEye instance, FishEye 2.8 will log a warning and will not start. The intention behind this rather draconian behaviour is to give you the opportunity to backup and update your instance before FishEye performs the upgrade operations to convert your indexes and database into a 2.8 compatible format.

You can force FishEye to start with clearcase repositories disabled by setting the fisheye.clearcase.disable system property to true. Please see the documentation on setting up fisheye environment variables for more information.

For example, you can force startup by setting your FISHEYE_OPTS environment variable to

-Dfisheye.clearcase.disable=true

ie.: 

```
$ export FISHEYE_OPTS="${FISHEYE_OPTS} -Dfisheye.clearcase.disable=true"
```

On Windows Server 2008 or Windows 7, you can configure this as follows:

1. Open the Start menu, right-click on "Computer" and select Properties
2. Click on "Advanced System Settings" on the left of the dialog
3. Click the "Environment Variables" button at the bottom of the Advanced tab
4. Add a FISHEYE_OPTS environment variable to the "System variables" section

FishEye 2.8 EAP Release Notes

FishEye & Crucible 2.8.0-m1

The 2.8.0-m1 EAP release is being provided to give early access to Subversion 1.7 support. The build contains the same features as FishEye/Crucible 2.7.14 with the updated version of svnkit necessary to work with Subversion 1.7.

We have chosen to provide this as an EAP release because we felt it was not appropriate to ship an update to a library so fundamental to FishEye's operation in a 2.7 point release.

Although this is an EAP release, the only difference between this build and the 2.7.14 release is the updated svnkit libraries. We believe, therefore, that this version can safely be deployed to production environments. As always, please take suitable backups before any such deployments. Please see the FishEye 2.7 Upgrade Guide for more information.

FishEye 2.7 Release Notes

7 September 2011

With great pleasure, Atlassian presents FishEye 2.7 featuring Git repository management, Smart Commits and Web Hooks.

Highlights of this Release:
- Managed Git Repositories
- Smart Commits
- Web Hooks
- JIRA FishEye Plugin Improvements
- Small Improvements

Download latest version

- Thank you for all your issues and votes. Keep logging issues to help us keep improving!
- Read the release notices for important
Highlights of FishEye 2.7

Managed Git Repositories

Administrators can **create and manage Git repositories** directly from FishEye on their own servers. FishEye Git repository management gives you the flexibility to do the following:

- Create forks and clones of existing projects.
- Manage permissions easily with push and pull access per repository.
- Visualize the hierarchy of repository forks.
- Explore and visualize changes with the commit graph

More...

Smart Commits

Smart Commits allow repository committers to perform actions like transitioning JIRA issues or creating Crucible code reviews by embedding specific commands into their commit messages.

FishEye 2.7 comes bundled with support for creating and updating Crucible reviews, as well as transitioning, commenting, and logging work to JIRA issues.

Placed into a commit message, the example below would close the JIRA issue **BUG-123**.
The following example would create and start a review for the current changeset in the project CR-TEST, as well as add the user jdoe as a reviewer:

For more details on using Smart Commits, please see the User's guide to Smart Commits.

JIRA issue transitioning requires at least version 3.4.5 of the JIRA FishEye plugin. It can be downloaded via the Atlassian plugin manager from within JIRA or manually downloaded from the Atlassian plugin exchange.

Smart Commits are extensible via plugins, allowing you to simply implement your own handlers to integrate with services used in your workplace. Please see the Smart Commit Tutorial for developer resources on creating a Smart Commit plugin.

By default, smart commits are disabled if the FishEye instance has any Mercurial or Git repositories. Please see the Smart Commits administrator's guide for more details.

More...

Web Hooks

FishEye has added a Web Hooks capability. A Web Hook is a form of event-notification via HTTP POST.
In the case of FishEye Web Hooks, developers can add URLs which will receive commit(s) data through POST requests. This can be used to easily create useful gadgets in various programming languages that will give push notification of commit changes.

More...

JIRA FishEye Plugin Improvements

The FishEye team are also proud to update the JIRA FishEye plugin to version 3.4.5. Upgrades to the plugin are available immediately via the Atlassian plugin manager from within JIRA or the Atlassian plugin exchange.

This update provides significant performance improvements, most notably asynchronous loading of the "Source" and "Reviews" tab in JIRA which allows the JIRA view issue page to load without waiting for the FishEye server to respond with data.

More...

Small Improvements

FishEye 2.7 also comes bundled with numerous other bug fixes and improvements, including:

- Syntax highlighting for Java 7, Groovy, Velocity and Scala.
- FishEye can now run on Java 7.
- Improved user interface for the administration screens.
- HEAD label in revisions page only appears for currently selected branch (or default branch if All is selected).
- Improved plugin points for developers.

Visit our issue tracker to see the full list of improvements and bug fixes in FishEye and Crucible for this release.

Release Notices

FishEye 2.7 Upgrade Guide

Below are some important notes on upgrading to FishEye 2.7. For details of the new features and improvements in this release, please read the FishEye 2.7 Release Notes.

On this page:
- Upgrade Notes
  - FishEye 2.7
- Upgrade Procedure
- Checking for Known Issues and Troubleshooting the FishEye Upgrade

Upgrade Notes

FishEye 2.7

- When FishEye 2.7 is upgraded, it will run a one-time upgrade task that will create a new index of file revisions, and minor database indexing tasks. These should have no functional impact and should complete in a few minutes.
- FishEye 2.7 adds ActiveObjects support, which allows plugins to store configuration data in the database. Any already scheduled backups will not have plugin data included during backups. Please modify your scheduled backup configuration appropriately to include ActiveObjects backups.
If you are using Custom authentication, FishEye 2.7's managed repositories have changed the responsibilities of the com.cenqua.fisheye.user.plugin.FishEyeAuthenticator class. For external repositories the hasPermissionToAccess() method is still invoked to check whether a user may access a particular repository. For internal or managed repositories, hasPermissionToAccess() is used to determine whether a user has both read and write access to the repository.

Upgrade Procedure

- **Before you begin**
  - Test your upgrades in your test environment before rolling into production.
  - Back up your entire FishEye instance (see Backing up and restoring FishEye data), i.e.
    - If you are backing up your FishEye instance using the Admin interface, tick all of the 'Include' checkboxes (e.g. repository and application caches, plugins and their configuration data, SQL database, etc).
    - If you are backing up your FishEye instance using the command-line interface, do not use any exclusion options.

If you are already running a version of FishEye, please follow the instructions in the general FishEye Upgrade Guide.

Checking for Known Issues and Troubleshooting the FishEye Upgrade

If something is not working correctly after you have completed the steps above to upgrade your FishEye installation, please check for known FishEye issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes Atlassian finds out about a problem with the latest version of FishEye after the software is released. In such cases we publish information about the known issues in the FishEye Knowledge Base. Please check the FishEye 2.7 Known Issues in the FishEye Knowledge Base and follow the instructions to apply any necessary patches if necessary.

- **Did you encounter a problem during the FishEye upgrade?** Please refer to the guide to troubleshooting upgrades in the FishEye Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

**FishEye 2.7 Release Notes**

6 June 2011

With great pleasure, Atlassian presents FishEye 2.6 featuring the new repository commit graph, user management via JIRA and a host of DVCS improvements.

**Highlights of this Release:**

- Repository Commit Graph
- User Management via JIRA
- Improved Quick Search
- Redesigned HTML Emails
- Dashboard and Navigation Improvements
- Improved Support for Git Branches
- Git Commit Authors include Email Address
- Mercurial Indexing Improvements
- And Even More Improvements

**Responding to your Feedback:**

🌟 Over 269 votes satisfied

- Thank you for all your issues and votes. Keep

- Read the release notices for important information about this release.

Highlights of FishEye 2.6

1

Repository Commit Graph

FishEye 2.6 introduces a powerful visualisation tool to help you understand your repositories better – the commit graph. The commit graph shows changesets in their respective branches, using configurable "swimlanes". At a glance, you will be able to see key information such as branching and merging. If you are using Git or Mercurial, you will also be able to see anonymous branches.

Commit graph highlights provide further context, allowing you to highlight changesets in the same branch, commits with JIRA issues, and reviewed/unreviewed changesets. Clicking a changeset with the appropriate highlight active (selected in the 'Highlight' dropdown) shows you related changesets, such as changesets with the same lineage, the same JIRA issue or same Crucible review.

More...
User Management via JIRA

You can now use the same set of users in FishEye and JIRA, and manage your users and groups in JIRA. The FishEye setup wizard gives you the opportunity to configure a JIRA connection quickly and automatically, using the most common options. You can further configure the JIRA connections via the FishEye administration screens.

More...

Improved Quick Search

You'll be able to find information faster using FishEye's improved Quick Search. The Quick Search now pattern matches against CamelCase strings for files and directories, just like many popular IDEs. The search itself provides quicker and more accurate results. The search results are also easier to work with – the new user interface has a cleaner look and feel and features links to default/trunk for files, pop-up summaries for JIRA issues in commit messages and more.
Redesigned HTML Emails

A 20% time project has resulted in email notifications getting a dramatic facelift. Gone are the dreary old HTML emails, replaced by much better-looking ones. You'll see the new emails in action for changeset notifications.

Dashboard and Navigation Improvements

The Dashboard and Header have been tweaked to simplify the user interface in this release. You won't have to click different tabs to find the activity stream, as it will always be displayed. We've moved the other functions to the header to remove the clutter and provide you with a more streamlined view.
More...

6

Improved Support for Git Branches

We've improved the support for Git branches in FishEye. Previously, if FishEye detected a commit on a branch (other than the 'master' branch), it would be considered as part of that branch only, even if the branch was later merged back to the 'master' branch. In this release, FishEye will correctly consider the ancestry of a changeset. For example, if a branch 'fisheye-2.6' is merged back to the 'master' branch, then all changesets that were seen as part of the 'fisheye-2.6' branch will also be considered to be part of the 'master'.

The activity stream for a branch will now show all commits that contribute to (i.e. are in the ancestry of) the head of the branch. You can also see the improved Git branch support on the new commit graph and on the view changeset screen.

7

Git Commit Authors include Email Address
FishEye now includes the user email address for Git commit authors, in the same style as command line tools. The committer will be automatically mapped to the FishEye user with the same email address. This means that you won't have to set up explicit user mappings where the email address is the same.

Please note, if you are using FishEye with a starter license, this improvement may cause you to exceed the user limit for your license. See the FishEye 2.6 Upgrade Guide before upgrading for details.

Mercurial Indexing Improvements

We have changed the way that we index Mercurial. Indexing times for merge commits should be almost twice as fast. Commits with many file changes (especially binary file changes) will be even faster. The absolute change in indexing speed will vary depending on the content of your repository. As a reference, the indexing time for our repository of 24,000 commits improved from 18 hours to 6.5 hours.

And Even More Improvements

Visit our issue tracker to see the full list of improvements and bug fixes in FishEye and Crucible for this release.

Release Notices

- **Upgrading from a previous version of FishEye.** Upgrading FishEye should be fairly straightforward. **We strongly recommend that you back up FishEye before upgrading.** Please refer to the FishEye 2.6 Upgrade Guide for further essential information about your upgrade.

- **Known Issues.** Please check the [important technical advisories](http://fishEye.atlassian.com/KB/126402) on the front page of the Knowledge Base for information about any known issues for this release.

**FishEye 2.6 Changelog**

This page contains information about the FishEye 2.6 minor releases. See the FishEye 2.6 Release Notes for details of what's new in 2.6.0.

Please read the FishEye 2.6 Upgrade Guide before upgrading to any of the minor releases below.

3 'Save' button on Database Configuration, Edit Admin page doesn't save the new config

FishEye 2.6 Upgrade Guide

Below are some important notes on upgrading to FishEye 2.6. For details of the new features and improvements in this release, please read the FishEye 2.6 Release Notes.

On this page:
- Upgrade Notes
  - FishEye 2.6
  - Upgrade Procedure
  - Checking for Known Issues and Troubleshooting the FishEye Upgrade

Upgrade Notes

Created by Atlassian in 2013. Licensed under a Creative Commons Attribution 2.5 Australia License.
FishEye 2.6

- **Internet Explorer 7 and Java Platform 5 (JDK/JRE 1.5) no longer supported** — As per the End of Support Announcements for FishEye (published previously), we are no longer supporting Internet Explorer 7 and Java Platform 5 (JDK/JRE 1.5) in this release. See Supported platforms page for the full list of supported platforms for FishEye.

- **Starter Licence holders who use Git** — The inclusion of the user’s email address in Git committer names allows committers to be automatically mapped to FishEye users. However, if your repository has the same committer using multiple email addresses in their commits, this change means you will get extra committers (as uniquely identified by the combination of username and email address). This may cause you to exceed the committer limit allowed by your license, which would stop FishEye from indexing your repository. To correct this, you need to rewrite the history of your repository to remove these duplicates, so that each committer has only one unique email address. You can do this using the `git-filter-branch` command as detailed in this knowledge base article.

- **Set aside additional time for the upgrade** — When you upgrade to FishEye 2.6, FishEye will run a number of upgrade tasks and trigger an automatic upgrade of the metadata index. While this is happening, FishEye (and Crucible) can be be accessed, however no new changes in the repositories will be detected until the upgrade is complete. Hence, you should set aside time for these activities to complete. The time taken will depend on the complexity of your code base, as well as the type of repository that you are using. See the following repository-specific notes:

<table>
<thead>
<tr>
<th>Repository</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subversion</td>
<td>The upgrade tasks for Subversion repositories will take significantly longer in this release, than in previous releases. In previous releases (e.g. FishEye 2.5), the upgrade tasks only required a short amount of time to complete, relative to the time taken to upgrade the metadata index. In this release, the upgrade tasks and metadata index upgrade take approximately equal amounts of time. Hence, the overall upgrade may take up to twice as long, compared to prior releases. Our Subversion repository for JIRA development, which is quite complex, took about three hours to complete both the upgrade tasks and metadata index upgrade.</td>
</tr>
<tr>
<td>CVS, Perforce, ClearCase</td>
<td>As per Subversion, the upgrade tasks for CVS and Perforce will take proportionally longer to complete in this release, hence the overall upgrade will take longer. However, the tasks are not as complex as the Subversion upgrade tasks, so you shouldn’t notice a dramatic increase in time taken. The upgrade task for ClearCase is not complex at all, so you shouldn’t notice a significant increase in time taken for the overall upgrade.</td>
</tr>
<tr>
<td>Git, Mercurial</td>
<td>The upgrade tasks for Git &amp; Mercurial repositories will not take long to complete, perhaps a few minutes. You will still need to set aside time for the metadata index upgrade though.</td>
</tr>
</tbody>
</table>

To reduce the time taken for the upgrade tasks, you can configure additional update threads to allow repositories to be upgraded in parallel (otherwise, repositories will be upgraded one at a time). Please ensure that you have the compute capacity to run multiple threads before attempting this.

### Upgrade Procedure

- **Before you begin**
  - Test your upgrades in your test environment before rolling into production.
  - Back up your entire FishEye instance (see Backing up and restoring FishEye data), i.e.
If you are already running a version of FishEye, please follow these instructions on FishEye upgrade guide.

Checking for Known Issues and Troubleshooting the FishEye Upgrade

If something is not working correctly after you have completed the steps above to upgrade your FishEye installation, please check for known FishEye issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Sometimes we find out about a problem with the latest version of FishEye after we have released the software. In such cases we publish information about the known issues in the FishEye Knowledge Base. Please check the FishEye 2.6 Known Issues in the FishEye Knowledge Base and follow the instructions to apply any necessary patches if necessary.

- **Did you encounter a problem during the FishEye upgrade?** Please refer to the guide to troubleshooting upgrades in the FishEye Knowledge Base.

- If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

Troubleshooting

- After I commit a change to my CVS repository, it takes a long time before it appears in FishEye.
- FishEye freezes unexpectedly
- Generating a Thread DumpExternally
- I have installed FishEye, and the initial scan is taking a long time. Is this normal?
- I have installed FishEye, but there is no data in the Changelog.
- Initial scan and page loads are slow on Subversion
- It seems that FishEye's HTTP Header is Too Small
- JIRA Integration Issues
- Message `org.tigris.subversion.javahl.ClientException svn Java heap space`
- On my Red Hat Linux system, after running for several days FishEye freezes and does not accept any more connections.
- Problems with very long comments and MySQL migration
- URLs with encoded slashes don't work, especially in Author constraints

CVS FAQ

FishEye CVS FAQ

- How does FishEye calculate CVS changesets? — FishEye's goal is to allow changesets to be seen as a consistent stream of atomic commits. Revisions are collated into the same changeset provided that:
  - They have the same commit comment.
  - They are by the same author.
  - They are on the same branch.
  - The changeset does not span more than 10 minutes.
  - The same file does not appear in a changeset more than once.

How is changeset ancestry implemented for CVS?

About Changeset Ancestry in FishEye

When FishEye indexes a CVS repository, it synthesizes a changeset identifier to group file-level changes into a single consistent changeset. The grouping is described in this FAQ: How does FishEye calculate CVS changesets?

Changeset ancestry was added in FishEye 2.6. Changeset ancestry refers to the linking of a changeset to a preceding/parent changeset(s). This allows you to view the development progress of your repository using the Commit Graph (see Viewing the Commit Graph for a Repository).

Changeset Ancestry for CVS

For CVS repositories, changeset ancestry is implemented, as follows:

- For all but the first change on a branch, FishEye chooses the most recent change on that branch as the parent changeset.
- For the first change on a branch, FishEye examines the branchpoints of all files in the branch and chooses the latest changeset that affected any such files as the parent changeset.

This approach ensures that a branch, whose first change is to a file which is very old, is not considered to have been branched at the time that file was last changed. It is considered to be branched at the last change to the repository instead.
Example EyeQL Queries

<table>
<thead>
<tr>
<th>EyeQL</th>
</tr>
</thead>
<tbody>
<tr>
<td>• How do find changes made to a branch after a given tag?</td>
</tr>
<tr>
<td>• How do I filter results?</td>
</tr>
<tr>
<td>• How do I find changes between two versions, showing separate histories?</td>
</tr>
<tr>
<td>• How do I find changes made between two version numbers?</td>
</tr>
<tr>
<td>• How do I find commits without comments?</td>
</tr>
<tr>
<td>• How do I find files on a branch, excluding deleted files?</td>
</tr>
<tr>
<td>• How do I find files removed from a given branch?</td>
</tr>
<tr>
<td>• How do I find revisions made by one author between versions?</td>
</tr>
<tr>
<td>• How do I select the most recent revisions in a given branch?</td>
</tr>
<tr>
<td>• How do I show all changesets which do not have reviews?</td>
</tr>
</tbody>
</table>

For more information on using EyeQL, see the Reference guide.

How do find changes made to a branch after a given tag?

Find changes made to Ant 1.5.x after 1.5 FINAL:

```sql
select revisions where on branch ANT_15_BRANCH and after tag ANT_MAIN_15FINAL group by changeset
```

How do I filter results?

This query, finds files removed on the Ant 1.5 branch, but just returns the person and time the files were deleted:

```sql
select revisions where modified on branch ANT_15_BRANCH and is dead return path, author, date
```

How do I find changes between two versions, showing separate histories?

As above, but show the history of each file separately:

```sql
select revisions where between tags (ANT_MAIN_15FINAL, ANT_151_FINAL] group by file
```

How do I find changes made between two version numbers?

Find changes made between Ant 1.5 and 1.5.1:

```sql
select revisions where between tags (ANT_MAIN_15FINAL, ANT_151_FINAL] group by changeset
```

How do I find commits without comments?

Using the Advanced Search and EyeQL you can find commits that do not have comments using the following query:

```sql
select revisions from dir / where comment = "" group by changeset
```
How do I find files on a branch, excluding deleted files?

Find files on branch and exclude delete files:

```
select revisions where modified on branch ANT_15_BRANCH and not is deleted group by changeset
```

How do I find files removed from a given branch?

Find files removed on the Ant 1.5 branch:

```
select revisions where modified on branch ANT_15_BRANCH and is dead group by changeset
```

How do I find revisions made by one author between versions?

Find changes made by conor to Ant 1.5.x since 1.5.0:

```
select revisions where between tags (ANT_MAIN_15FINAL, ANT_154] and author = conor group by changeset
```

How do I select the most recent revisions in a given branch?

Find Java files that are tagged ANT_151_FINAL and are head on the ANT_15_BRANCH: (i.e. files that haven't changed in 1.5.x since 1.5.1)

```
select revisions from dir /src/main where is head and tagged ANT_151_FINAL and on branch ANT_15_BRANCH and path like *.java group by changeset
```

How do I show all changesets which do not have reviews?

The following query will return any changesets that have not been reviewed.

```
select revisions where (not in any review)
```

FishEye Developer FAQ

This page contains answers to frequently asked questions posed by FishEye developers. For detailed information about developing in FishEye, see the FishEye Developer documentation.

Feel free to comment, make submissions, or pose your own question on FishEye Development here.

- **Q:** I'm getting the error "API access is disabled" as a response from `http://fisheye/api/rest/repositories` on my installation. How do I enable the API as a FishEye administrator?
  - **A:** A toggle to enable the API under "Server Settings" in the web admin interface existed in versions prior to 2.9 (see Configuring the FishEye web server for more details).
  - See the FishEye 2.9 Release Notes
• Q: **Is there any way to return unique results from an EyeQL query?**
  
  **A:** It is not currently possible to return unique results.
  An improvement request exists: [FE-1136](#). Your vote and comments on that issue are appreciated.

---

**About database encoding**

It is possible to have files in your repository whose names differ only in case, e.g. `Foo.java` and `foo.java`. Hence, your database will need to use rules for comparing string values which recognise that upper and lower case letters are different, that is, the database should use ‘case sensitive collation’.

If your database was originally configured to use case-insensitive and/or non-UTF8 collation, FishEye will display the following message at the bottom of your screen:

> "Your database is not using a case sensitive UTF8 encoding for character fields."

The following sections provide instructions for changing your database collation for each database type supported by FishEye and Crucible.

---

**MySQL**

**On this page:**

- MySQL
- Oracle
- PostgreSQL
- SQL Server

**Related pages:**

- Migrating to an external database

---

MySQL

**Please take a backup of your database before changing its collation.**

To change your collation to `utf8_bin` you need to change your database's default collation, but as this only affects newly created tables you will also need to change the collation on the table for which case sensitivity is critical.

**Change your database’s collation**

Use the `ALTER DATABASE` command, as follows:

```sql
alter database character set utf8 collate utf8_bin;
```
Change collation for the CRU_STORED_PATH table

Use the ALTER TABLE command, as follows:

```sql
alter table cru_stored_path convert to character set utf8 collate utf8_bin;
```

Oracle

Oracle collation encoding must be configured when installing the database server. It cannot be configured on a per database level. When installing Oracle, you should select the AL32UTF8 encoding.

PostgreSQL

⚠️ **Please take a backup of your database before changing its collation.**

If you have created your PostgreSQL database with the incorrect encoding, you will need to dump your database, drop it, create a new database with the correct encoding and reload your data.

You can do this using the standard database migration procedure – instead of migrating from HSQLDB to PostgreSQL, you migrate from a PostgreSQL database with the incorrect encoding to one created with the correct encoding.

SQL Server

⚠️ **Please take a backup of your database before changing its collation.**

The recommended route for changing the collation for SQL Server is to migrate to a new database that has the correct collation configuration. You can do this using the standard database migration procedure – instead of migrating from HSQLDB to SQL Server, you migrate from a SQL Server database with the incorrect collation to one created with the correct collation.

The correct collation to use when you create the new SQL Server database is Latin1_General_CS_AS.

**About the Lines of Code Metric**

This page contains information about the Lines of Code metric and how it is processed and represented by FishEye.

*On this page:*

- Definition
- Disadvantages
- LOC in FishEye
- User-Specific LOC

**Definition**

Lines of Code or LOC (also known as Source Lines of Code - SLOC) is a quantitative measurement in computer programming for files that contains code from a computer programming language, in text form. The number of lines indicates the size of a given file and gives some indication of the work involved.

LOC is literally the count of the number of lines of text in a file or directory. In FishEye, blank lines and comment lines are counted toward the total lines of code.
LOC for a file/directory is the total number of lines in the relevant files, while LOC for an author is the number of lines blamed on that author. Neither of these should ever be less than zero. However, the change in LOC over a period of time can be negative if there was a net reduction in the LOC over the period.

**Disadvantages**

While it can be useful, LOC has some well documented disadvantages. Keep these disadvantages and limitations in mind when using LOC in your work environment.

In addition, the nature of branching in SCM applications means that calculating a LOC value for a whole project is not possible. A naive summation of the LOC of all the branches will give a meaningless number that jumps every time a branch is copied to create a new branch. Thus, in FishEye we usually look at the LOC of the trunk, unless we can infer from the context that another branch is more appropriate.

**LOC in FishEye**

FishEye calculates the LOC for the trunk only. For SVN repositories it can calculate LOC for a branch if it is "tricked" to see the branch as part of the trunk. FishEye also calculates the LOC for each user, unless that facility is turned off in the repository (see Store Diff Info). The LOC count will include all files except those identified by the SCM as binary.

FishEye presents LOC data as charts of the change in LOC over time, and as informational statistics in various places:

- **Chart pages**
  The best way to explore the evolution of LOC in your project is the LOC chart report where you can easily filter the LOC by branch, author, file extension and date range. Here you can investigate what caused a particular spike in the LOC charts, or find the user whom has the most lines of code blamed on them and how this has changed over time.

- **Repository-specific activity pages**
  These show trunk LOC statistics for the repository, limited to the directory being viewed and its subdirectories. The LOC charts show the LOC for the directory, using trunk LOC unless the directory can be identified as a branch.

- **User pages**
  Here, the statistics pane in the sidebar shows the trunk LOC blamed on the user for the all repositories that have user-specific LOC enabled. The chart shows the trunk LOC from all the repositories that the user has contributed to.

- **The global User List page**
  This shows the trunk LOC for all users from the repositories that have user-specific LOC enabled. Repository-specific user lists (in repositories that have user-specific LOC enabled) show the trunk LOC for the users and committers, limited to the directory being viewed and its subdirectories.

- **Project pages**
  This shows a chart of the LOC for all associated repository paths, and statistics include the trunk LOC for those paths.

**User-Specific LOC**

The evolution of user-specific LOC over subsequent commits can appear at first glance to be counter-intuitive. It is important to keep in mind that the LOC for a given user is the number of lines in the repository that were last changed by them (as calculated by Fisheye).

A couple of simple examples:

- Alice adds a files with 30 lines to the SCM. Her LOC for this file is now 30. She then edits the file, deletes 10 lines and adds 20 (+20 -10). Her LOC is now 40, as is the LOC of the file.

- Alice adds a files with 30 lines to the SCM. Her LOC for this file is now 30. Now Bob edits the file, deletes 10 lines and adds 20 (+20 -10). Alice now has LOC of 20, because Bob deleted 10 lines that were blamed on her, and Bob has LOC of 20, from the 20 lines he added. The total LOC is still 40.

A user can have LOC on a branch that they have never committed on, if something that has been blamed on them is copied. For example, a developer may have never committed to a particular branch, but FishEye may still report a lot of LOC for them in that area.
One current limitation of FishEye's user-specific LOC calculation is the handling of merging. For example, if a file has been changed on both trunk and branch, and the changes made on the branch are merged to trunk, the changes made on branch will generally be blamed on the person who did the merge; not the person who made the change.

**Cannot View Lines of Code Information in FishEye**

**Symptoms**

The LOC (Lines of Code) information in FishEye cannot be seen, for example in charts or when viewing the statistics for a user.

See About the Lines of Code Metric for more information about the usage of the LOC (Lines of Code) metric in FishEye.

**Cause**

There are four possible causes:

- LOC data will not be shown for users if the Store diff info setting is disabled. If a page is being viewed in FishEye that relates to a particular user or committer, and the Store Diff Info setting is disabled, no LOC information for the user will be visible.
- LOC data is currently not supported for Mercurial repositories.
- LOC data is currently not supported for Git repositories.
- The SVN repository is indexing branches only.

**Resolution**

Cannot view LOC information for specific users or committers:

- Enable the Store Diff Info setting for the repository in Administration > Repository Settings > Repositories, click on the repository name, and then "SCM Details". A full re-index needs to be performed on the repository after enabling this setting for FishEye to collect the diff information for all revisions in the repository. Please note that the Store Diff Info setting is always enabled for CVS repositories.

Cannot view LOC information for Mercurial repositories:

- There is an outstanding feature request for LOC support in Mercurial.

Cannot view LOC information for Git repositories:

- There is an outstanding feature request for LOC support in Git.

The SVN repository is indexing branches only:

- FishEye can calculate LOC for a branch if it is "tricked" to see the branch as part of the trunk.

**Finding your Server ID**

Your Server ID can be found in your FishEye administration console, as described below.

**To find your Server ID:**

1. Navigate to FishEye's administration console.
2. Click 'Sys-Info/Support' under the 'System settings' section. The 'Server ID' for your FishEye server will be displayed in the 'License' section. The Server ID should match the one set for your license. You can check this at http://my.atlassian.com.

**How Do I Archive a Branch within Perforce**

In SVN, a branch exists as a separate directory. However in Perforce, files are given a label to identify them as belonging to the branch. Thus it may not be possible to download the branch as a tarball via FishEye.

You may be able to download the branch as a tarball, depending on your structure:

⚠️ If it is not a single folder, then it is not possible to download the tarball in your perforce repository.
1. In FishEye, navigate to your perforce repository.
2. In the Constraint section on the left, select the branch. This will return the directories that belong to that branch.
3. If it is one single folder, download the tarball of it. Under constraint and sub directories, there is a panel tarball giving options on how to download the directory.

How do I Avoid Long Reindex Times When I Upgrade?

Mitigating lengthy reindex times

If reindexing your repository takes longer than you can allow, you can use a temporary copy of your repository and FishEye instance to reduce downtime during the reindexing process.

On this page:

- Mitigating lengthy reindex times
- Reindexing with a temporary copy of your FishEye instance
  - How to make a temporary copy of your FishEye instance
  - How to make a temporary copy of your repository
  - How to reindex a single repository on a test server
- Upgrading your cross-repository index using a temporary staging server

Reindexing with a temporary copy of your FishEye instance

This section describes how to perform a full reindex of a particular repository. Note that, depending on the repository size, the reindex could take up to several days.

To reindex a temporary copy of your FishEye instance:

1. Make a copy of your FishEye instance to another server. See ‘How to make a temporary copy of your FishEye instance’ below for instructions.
2. Upgrade the temporary FishEye, then start it up, connected to your repository. It will automatically begin the scanning process.
   - If you are concerned about the repository being overloaded by the scanning process, you can make a copy of that as well. See ‘How to make a temporary copy of your repository’ below for instructions.
   - If you do that, you must edit the config.xml of your temporary FishEye instance to point to your temporary repository.
3. The copied instance will run its course without affecting your production instance.
   a. Shutdown both your servers completely.
   b. Make a backup of your FISHEYE_INST directory.
   c. Replace the FISHEYE_INST/var/cache directory on live FishEye with the FISHEYE_INST/var/cache from your test server.
   d. Download the latest FishEye/Crucible from Atlassian downloads.
   e. Follow the instructions in the Upgrade Guide to upgrade to the new version.
4. The scan of the temporary FishEye instance (and repository, if you copied that also) is complete. You’re now free to delete the temporary copy(s).

How to make a temporary copy of your FishEye instance

To make a copy of your FishEye instance, follow the instructions for Migrating FishEye Between Servers.

How to make a temporary copy of your repository

To make a copy of your repository use rsync (for CVS repositories in the Linux environment) or svnsync documentation (for Subversion only).

How to reindex a single repository on a test server
If you need to reindex your repository on your production system but don’t want to burden your production server, carry out the following steps:

1. Install another instance of FishEye on a test server (the same FishEye version as the one you are using).
2. Add a repository to FishEye with the exact same name and details as that referenced by the production server.
3. Let it finish indexing. Go to Administration > View Repository List > Stop (shown next to the name of your repository) and disable on both production and test.
4. Copy over the FISHEYE_INST/var/cache/REPO directory on the production FishEye with the FISHEYE_INST/var/cache/REPO directory from the test server.
5. Trigger a review revision data re-index: Administration > Repository > Maintenance > Review-Revision Data Index.

For this procedure, neither server needs to be shut down.

Upgrading your cross-repository index using a temporary staging server

This section describes how to upgrade the cross-repository index for selected repositories. Note that, depending on the repository size, the reindex will typically finish in a few hours, but should never take longer than a few days.

In this procedure it is assumed that you have a production server (referred to as PROD in these instructions) that is running a FishEye version earlier than 3.1, and a separate staging server (STAGING) that will be used to perform the cross-repository index upgrade offline.

1. Make a live backup of the PROD server with the following options:
   a. Repository and application caches
   b. SQL database

   You can do this either from the FishEye Admin area (go to Administration > System Settings > Backup), or from a command line, for example:

   ```
   $ ./bin/fisheyectl.sh backup -f ~/Documents/backup.zip --no-uploads --no-templates --no-plugins --cache --no-ao
   ```

2. Install FishEye 3.1, or a later version, on the STAGING server.
3. Restore the backup of PROD to the STAGING server.
4. Start FishEye on the STAGING server. Note that:
   • The cross-repository index upgrade will start automatically on the STAGING server. If you want to perform the cross-repository index upgrade for selected repositories only, it is safe to remove unwanted repositories from the STAGING server now, either by going to Administration > Repositories, or by using REST endpoints (see below).
   • The STAGING server doesn't need to have access to configured SCM's as the cross-repository upgrade task does not interact with them.
   • You may want to disable polling on the STAGING server. You can either go to Administration > Repository Settings > Defaults > Updater to disable polling for all repositories (although this will n of affect particular repositories that have been configured to ignore default settings), or go to Administration > Repository Settings > Repositories > Repository X > Updates to disable polling for just Repository X. Disabling polling is not required, but will avoid logging errors to the FishEye log file if the SCMs are not accessible from the STAGING server.
5. Wait for the cross-repository index upgrade to finish on the STAGING server. Check by going to Administration > Repositories.
6. Stop the STAGING server.
7. Make a full backup of the PROD server and then stop it.
8. Install the same version of FishEye on the PROD server as used on the STAGING server (as in step 2 above).
9. Delete the following FishEye indexes on the PROD server and replace them with the equivalent caches from the STAGING server. You can choose your preferred option to copy files between machines using ssh/scp/rsync, possibly combined with tar/zip tools. The example below shows how the scp command could be used:

`scp /var/cache/REPO/* /var/cache/REPO/`
10. Start the **PROD** server.
11. All the changesets that were added to SCMs after backing up the **PROD** server in step 1 will now be indexed on the **PROD** server.

The only drawback with this procedure is that changeset comments added for changesets in **PROD** after step 1 will not get indexed, so they will not appear in the activity stream. There is no easy way to reindex them, apart from fully reindexing each affected repository, which is what this procedure is intended to avoid. A new REST endpoint could be implemented to address this (see [FECRU-3764 - Authenticate](#) to see issue details).

Note: the following REST endpoint could be used to force a cross-repository index upgrade for a selected repository: `/rest-service-fecru/admin/repositories-v1/repoX/reindex-search`. There should be no need to use this, but it may be useful if something goes wrong.

### Mercurial Known Issues

- **CRUC-3474**: If a file is removed and then another file is copied or moved over the same file within one commit, the ancestor revision is miscalculated and can result in errors in "diff to previous".
- **CRUC-3470**: Permission changes (and prop changes in repos converted from svn) may result in revisions that have no ancestors - subsequent changes will consider it's parent revision to be their parent revision.
- **CRUC-3468**: Scanning repositories converted from svn (especially using hgsubversion) can result in commits that take a long time to scan (due to the changes produced by merges from other branches).

### Ordering of Branches Important When Visualising Git Changesets

FishEye 2.6 introduced the repository commit graph. The commit graph allows you to visualise changesets in their branches by showing them in configurable branch "swimlanes". One of the ways in which you can configure the commit graph is by reordering the swimlanes. Reordering swimlanes is useful for non-Git repositories, if you want to show branches in a certain order. However, ordering swimlanes is vital for Git repositories, as it is the only way of determining which branch a commit is displayed in, when a commit belongs to multiple branches.

**Git Branches and Changesets in FishEye**

Before considering how Git repositories are visualised in the commit graph, it is important to understand how FishEye relates Git changesets to branches.

In FishEye 2.6 and later, FishEye considers the ancestry of a Git changeset when determining which branch it is a part of. Branches can effectively be considered as pointers to changesets. Hence, merging and branching can change the branches that a changeset is considered part of.

For example, if a branch 'fisheye-2.6' is merged back to the 'master' branch, then all changesets that were seen as part of the 'fisheye-2.6' branch only will also be considered to be part of the 'master' (e.g. the changeset will be seen as part of 'master' and 'fisheye-2.6' in the activity stream).

**Viewing Git Changesets and Branches in the Commit Graph**

The previous section describes how a changeset can be associated with multiple branches, due to its ancestry. Instead of showing the changeset in every branch swimlane on the commit graph, FishEye represents these changesets as described below.

When you view the commit graph for a Git repository, FishEye works from the leftmost swimlane to the right doing the following:

- For each swimlane, FishEye checks if the commit is in that branch. If the commit is in the branch, a dot is
shown representing the commit.

- If the commit is not in the branch, the dot for the commit is moved to the next column on the right.

For example, if the 'master' swimlane is to the left of another swimlane, e.g. 'fisheye-2.6' branch, there will be no changesets shown in the 'fisheye-2.6' swimlane, as all the commits will be picked up in the 'master' swimlane. However, if you move the 'fisheye-2.6' swimlane to the left of the 'master' swimlane, it will pick up all of the FishEye 2.6 commits.

This allows you to visually isolate changesets in the desired branches by reordering the swimlanes. For example, if you want to see the lineage of a branch, 'fisheye-2.6', but not 'fisheye-2.5' after both branches have previously been merged to 'master', you could arrange your swimlanes to 'fisheye-2.6', 'master', 'fisheye-2.5' from left to right. You will be able to see the 'fisheye-2.6' changesets and where the merge back to 'master' was made. The 'fisheye-2.5' changesets will just be seen as part of the 'master' branch.

Screenshots below: Example of how ordering swimlanes affects the branches that changesets are displayed on (click to view full-size images)

---

Perforce Changesets and Branches

Why does FishEye say this changeset is on more than one branch? Why does that changeset have multiple parents?

Perforce allows a single changeset to include files on multiple branches, so FishEye marks those changesets as being on all of the branches involved.

When a changeset is on multiple branches FishEye may consider it to have multiple parents from the different branches.

FishEye does not track merges in Perforce, so merges are not shown in the graph.

Changeset branches and parents are only annotations at the changeset level --- the individual file revisions will each only have a single branch and at most one parent.

What SCM systems are supported by FishEye?

To see the list of SCM systems that is supported by FishEye, see Supported platforms.

Automating Administrative Actions in Fisheye

With some command line scripting and a tool like wget, and Live HTTP Headers for firefox you can automate actions. In this example, Fisheye will automatically rescan revision properties of an SVN when the commit message is updated to reference a new JIRA issue.

1. Enable live HTTP headers in firefox, then perform the action you want to perform automatically via the Fisheye Administration UI.
2. In the live HTTP headers window you should see some output similar to the following:
3. The important parts are the URL I’ve highlighted above (http://erdinger.sydney.atlassian.com/fisheye/admin/indexMaint.do) and any GET/POST parameters (startRev=0&endRev=58&rep=2&action=rescan).

4. Now we can construct a script with wget to automate this:

```bash
wget --keep-session-cookies --save-cookies cookie.txt
http://erdinger.sydney.atlassian.com/fisheye/admin/login.do
--post-data="origUrl=&adminPassword=admin"
wget --load-cookies cookie.txt
--post-data="startRev=0&endRev=58&rep=2&action=rescan"
http://erdinger.sydney.atlassian.com/fisheye/admin/indexMaint.do
```

With that you could generate a post-revprop-change hook in svn that will update the repositories automatically.

**Installation & Configuration FAQ**
Can I deploy FishEye or Crucible as a WAR?

Unfortunately FishEye and Crucible can not be deployed as a WAR. FishEye has some special needs for performance reasons that are not easily supported on third-party containers. Whilst this is an often requested feature, there are no immediate plans to provide a WAR version of FishEye or FishEye+Crucible. However the upcoming separate edition of Crucible (i.e. without FishEye) may at some stage be available as a WAR.

Does FishEye support SSL (HTTPS)?

FishEye has built-in SSL support from FishEye 2.4 onwards. Read FishEye SSL configuration for more information.

Improve FishEye scan performance

This page contains information about improving the performance of FishEye repository scans.

Background information

When you add a repository, FishEye needs to perform a once-off scan through the repository to build up its initial index and cache. This scan can take some time. Until this scan is complete, you may find that some data is not displayed. As a guide, FishEye should be able to process about 100KB-200KB per second on an averaged-size PC. If FishEye is accessing the repository over the network (e.g. over a NFS mount), then you should expect the initial scan to take longer.

General improvements

You can increase the speed of your scans using the following options:

- If your repository is non-local, set up a local repository mirror on the FishEye server. This will provide a major speed boost for anyone scanning a repository across a network.
- Exclude unused file types, unused directories and specific large files from FishEye.

Improve update performance during initial scan

One option is break large repositories into multiple smaller repositories. While this technique will not improve the overall initial scan time, it allows for all fully scanned repositories to be updated while the initial scan is still being performed on those remaining.

In FishEye 1.3.4 and later, the initial and incremental scans happen in separate, single threads. So, splitting the repositories will allow incremental scans to run concurrently alongside the initial scans. You may also wish to split projects into separate repositories, since permissions in FishEye are applied on a per-repository basis.

Improving initial scan performance for an SVN repository

The http/s protocol has the slowest performance during the initial scan. The svn protocol (svn://) is faster and the file protocol (file:///) is the fastest. Therefore if you find your initial scan takes an extended amount of time (more than a day or two), you should...
consider switching over from the http/s protocol to the svn or file protocol to define the location of your SVN repository. (Use `svnsync` to mirror the repository onto the fisheye server, so that you can access it with the file protocol.)

E.g. Switch from
https://example.com/svn/project/
to
svn://example.com/svn/project/
or
file:///home/user/some/location/svn/project

In order for SVN protocol to work you need to have set up an svnservice based server.

More information on how to troubleshoot SVN indexing related issues can be found [here](#).

**Performance support**

If you have implemented at least one of the suggestions above but are still experiencing slow performance, ask us for help:

1. First read the Tuning FishEye performance document.
2. Turn on debug logging using the command line debug flag.
3. Allow FishEye to continue its initial scan overnight.
4. Create a new support request in the FishEye project, including your server environment and log files with the problem description.

**Migrating FishEye Between Servers**

This page describes the process for migrating FishEye between servers.

If you have defined the `FISHEYE_INST` Environment Variable, then upgrades and migrations of your FishEye instance will be relatively simpler.

**If you have defined FISHEYE_INST**

1) Shut down your current FishEye server completely.
2) Copy the FISHEYE_INST directory to your destination server.
3) Copy and set up all of your Environment Variables from your source server to your destination server (remembering to set up your FISHEYE_INST directory to point to the location where you copied the data to in Step 2).
4) Install FishEye on your destination server.
5) Start FishEye. It should pick up your environment variables, and from that access your FISHEYE_INST directory, which contains your configuration.

**If you have not defined FISHEYE_INST but would like to set it up**

1) Shut down your current FishEye server completely.
2) Copy the following three items into to a new folder on your destination server (for example, `fisheye_inst`):
   - `<FishEye home directory>/config.xml`
   - `<FishEye home directory>/var`
   - `<FishEye home directory>/cache`
3) Copy and set up all of your Environment Variables from your source server to your destination server. In addition to this, set up the FISHEYE_INST environment variable as follows, replacing the `/path/to/fisheye_inst` with the fully qualified path to the fisheye_inst folder you set up in Step 2:

   ```bash
   export FISHEYEINST=/path/to/fisheye_inst
   ```

4) Install FishEye on your destination server.
5) Start FishEye. It should pick up your environment variables, and from that access your `FISHEYE_INST` directory, which contains your configuration.

### External Databases

Please note that the steps above will only move your FishEye configuration data. If you are using an external database, that configuration will assume that your database is accessible from the new server.

However, if you want to make a copy of your server (You may want to create a copy, if you want a development server), then you will need to make a copy of your external database, and edit the `FISHEYE_HOME/config.xml` and update the database details to point to the copied database.

If you wish to migrate both FishEye and your external database to a different server, see Backing up and restoring FishEye data for more information.

### Setting up a CVS mirror with rsync

In situations where running FishEye on the same server as your CVS repository is not practical or possible, you can use the Linux utility 'rsync' to mirror the CVS repository contents onto the FishEye server. This is possible because CVS data is stored in a reasonably simple form in the file system.

We recommend this to achieve best performance when FishEye and CVS cannot be hosted on the same machine.

This workaround requires the ability to SSH into both machines. Linux and Mac OS X operating systems have rsync built in. For Windows, you will need to install rsync.

Diagram: A scenario where rsync is required

To set up a CVS mirror with rsync:

1. You will need to set up a local directory on the FishEye server for the mirrored CVS content, ensuring that this server has ample disk space to store the current CVS database and any future space requirements.
2. We will refer to the CVS instance (on your CVS Server, ) as <CVS_HOME> and the new 'mirror directory' (on your FishEye server) as <MIRROR_HOME>.

3. Type the following rsync command on the console at the command-line of the FishEye server:

   ```bash
   rsync --backup <CVS_HOME> <MIRROR_HOME>
   ```

   A real-world example would look something like this:

   ```bash
   rsync --backup user@cvs_server:/CVS_server/path/to/instance /datastore/FishEye/cvs-mirror
   ```

4. Schedule the rsync command to run regularly with a cron job. Running hourly is a good default interval. Under Windows, use a native task scheduler.

5. With the cron job active, you will have established rsync to run an hourly comparison of the two directories and copy any changes across to the mirror directory as they occur. Note that running the rsync process will impact the FishEye server's performance (and also the CVS server's) to a certain degree.

6. In the FishEye admin interface, add the local 'mirror directory' as a new CVS repository and run the initial scan. As this is local data on the same file system, FishEye's scanning of this data will be optimal.

7. Adjust the FishEye Updater Full Scan period to one hour (the default is 15 minutes).

8. The rsync configuration is now complete. Monitor the disk space on both servers to ensure there is adequate headroom for the mirroring process.

For more information on the syntax for rsync, visit the rsync home page.

### What are the FishEye System Requirements?

Visit the FishEye Supported platforms.

### How to reset the Administration Page password in Fisheye or Crucible

If you have forgotten or misplaced the password for the Admin page (http://<FECRU_URL>:<FECRU_PORT>/admin), you can reset it manually.

To manually reset the admin password, please edit your FISHEYE_INST/config.xml file (make a backup as well before editing).

You will see something like:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<config control-bind="127.0.0.1:8059" version="1.0"
  admin-hash="352353256326369233A801FC3">
```

To reset the password to "admin", please change the admin-hash value so that it appears as admin-hash="21232F297A57A5A743894A0E4A801FC3"

```xml
<?xml version="1.0" encoding="UTF-8"?>
<config control-bind="127.0.0.1:8059" version="1.0"
  admin-hash="21232F297A57A5A743894A0E4A801FC3">
```

Restart FishEye for this to take effect. You should now be able to access the FishEye Admin page (http://<FECRU_URL>:<FECRU_PORT>/admin) with the password "admin". Please change this password immediately from the Admin area: click Change Admin password (under "Security Settings").

See also Best practices for FishEye configuration.

### How Do I Configure an Outbound Proxy Server for FishEye

The Java Virtual Machine provides support for outbound proxy servers. To take advantage of this some additional parameters need to be passed to the JVM via the FISHEYE_OPTS environment variable:
User documentation for FishEye 3.1

export FISHEYE_OPTS="-Dhttp.proxyHost=proxy.example.org -Dhttp.proxyPort=8080 -Dhttp.nonProxyHosts=*.foo.com localhost -Dhttp.proxyUser=username -Dhttp.proxyPassword=password"

See Environment variables for instructions on how to set these parameters.

How to remove Crucible from FishEye 2.x or later

- Use the same process to remove FishEye and keep Crucible; just remove the FishEye license instead.
- Want to know What happens if I decide to stop using FishEye with Crucible?

To remove Crucible from a FishEye installation:

1. Go to the Admin area (choose Administration from your user menu) and click System Info (under "System Settings").
2. Click Edit License (in the "License" section).
3. Remove the Crucible license from this screen:

   - Click Update to save. Crucible will now be disabled and you will no longer see any reference to it in the application.

How to run FishEye or Crucible on startup on Mac OS X

- This article is only provided as a guide and has only been tested on Mac OS X 10.5
You need to create a .plist file to create items that will start at boot time. Please refer to the following page for details:

Here is an example .plist that should work for Fisheye/Crucible:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC ""//Apple/DTD PLIST 1.0//EN"
"http://www.apple.com/DTDs/PropertyList-1.0.dtd">
.plist version="1.0">
<dict>
  <key>Label</key>
  <string>com.atlassian.fisheye</string>
  <key>ProgramArguments</key>
  <array>
    <string>/path/to/FISHEYE_HOME/bin/run.sh</string>
  </array>
  <key>OnDemand</key>
  <false/>
  <key>RunAtLoad</key>
  <true/>
  <key>StandardOutPath</key>
  <string>/path/to/FISHEYE_INST/var/log/fisheye.out</string>
  <key>StandardErrorPath</key>
  <string>/path/to/FISHEYE_INST/var/log/fisheye.out</string>
  <key>EnvironmentVariables</key>
  <dict>
    <key>FISHEYE_INST</key>  <string>/path/to/FISHEYE_INST/</string>
    <key>FISHEYE_OPTS</key>  <string>-Xms512m -Xmx1024m -XX:MaxPermSize=128m</string>
  </dict>
</dict>
</plist>

Customise the /path/to/FISHEYE_INST/ and /path/to/FISHEYE_HOME/ with the FISHEYE_INST and FISHEYE_HOME directories respectively and make any required modifications to FISHEYE_OPTS. Save the file as com.atlassian.fisheye.plist and then try and load it with:

```
[amyers@erdinger:fecru-2.1.3]$ launchctl load com.atlassian.fisheye.plist
```

Fisheye should now start up and you should be able to access it via your web browser.

**Integration FAQ**

The following FAQs relate to integrating FishEye with other Atlassian applications. You may also wish to refer to Troubleshooting JIRA FishEye Plugin in the FishEye Knowledge Base.

- How do I disable the Source (FishEye) tab panel for non-code projects?
- How do I enable debug logging for the JIRA FishEye plugin?
- How do I uninstall the JIRA FishEye plugin?
- How is the Reviews (Crucible) tab panel for the JIRA FishEye/Stash Plugin populated?
- What do I do if I discover a bug with the JIRA FishEye plugin?

**How do I disable the Source (FishEye) tab panel for non-code projects?**
By removing all users and groups from the 'View Development Tools' permission (called the 'View Issue Source Tab' permission prior to JIRA 6.1) in your project's permission scheme, the Source and Reviews tabs will be effectively disabled for that project.

**How do I enable debug logging for the JIRA FishEye plugin?**

For Plugin versions prior to 3.0

You can enable DEBUG logging for the JIRA FishEye plugin temporarily (until JIRA is shutdown) by accessing the following URL in a web browser when logged in as an administrator:

```
http://YOUR-JIRA-BASE-URL/secure/admin/ConfigureLogging.jspa?loggerName=com.atlassian.jira.ext.fisheye&levelName=DEBUG
```

To enable debug logging across JIRA restarts, update the CLASS-SPECIFIC LOGGING LEVELS section of your WEB-INF/classes/log4j.properties file by inserting the following:

```
log4j.category.com.atlassian.jira.ext.fisheye = DEBUG, console, filelog
log4j.additivity.com.atlassian.jira.ext.fisheye = false
```

and restarting JIRA.

For Plugin versions 3.0+

You can enable DEBUG logging for the JIRA FishEye plugin temporarily (until JIRA is shutdown) by accessing the following URL in a web browser when logged in as an administrator:

```
http://YOUR-JIRA-BASE-URL/secure/admin/ConfigureLogging.jspa?loggerName=com.atlassian.jirafisheyeplugin&levelName=DEBUG
```

To enable debug logging across JIRA restarts, update the CLASS-SPECIFIC LOGGING LEVELS section of your WEB-INF/classes/log4j.properties file by inserting the following:

```
log4j.category.com.atlassian.jirafisheyeplugin = DEBUG, console, filelog
log4j.additivity.com.atlassian.jirafisheyeplugin = false
```

and restarting JIRA.

**How do I uninstall the JIRA FishEye plugin?**

Plugin versions prior to 3.0

To uninstall, simply remove the jira-fisheye-plugin-*.jar from your WEB-INF/lib directory.

Plugin version 3.0+

To uninstall, simply remove any jira-fisheye-plugin-*.jar jars from your WEB-INF/classes/com/atl assian/jira/plugin/atlassian-bundled-plugins.zip and %JIRA_HOME%/plugins/installed-plugins directory.

**How is the Reviews (Crucible) tab panel for the JIRA FishEye/Stash Plugin populated?**

The Crucible 'Reviews' tab is populated differently depending on the version of the FishEye JIRA plugin you are using:

- **Prior to Version 2.3** of the plugin, a review is displayed on the Crucible tab panel if (and only if) it contains a revision that is displayed on the FishEye tab panel. Having the issue key in the description will not automatically link it to the issue.
- **In Version 2.3+**, you can configure the Crucible tab panel to use the method described above and/or sear
If you associate reviews with JIRA issues from the Crucible user interface, they will not necessarily show up in the issue tab panel. We are working on this issue (see FISH-316), but in the meantime, a workaround is to include the related issue key in the title of the review.

What do I do if I discover a bug with the JIRA FishEye plugin?

If you need assistance or think you've encountered a bug with the JIRA FishEye plugin, please raise an issue in the JIRA FishEye Plugin project.

Licensing FAQ

| Are anonymous users counted towards FishEye's licence limits? | Users accessing FishEye anonymously are, for all intents and purposes, unlimited users. |
| Restrictions on FishEye Starter Licenses |

Are anonymous users counted towards FishEye's licence limits?

The short answer is no. If you are using FishEye in your organisation but most users require only anonymous access (that is, you have not set access restrictions on the content in your repositories), then an unlimited number of anonymous users can be accommodated regardless of the FishEye licence you are using.

Users accessing FishEye anonymously are, for all intents and purposes, unlimited users.

However, if your users require permissions and controlled access to specific content in your repositories, then they will need to log in to FishEye. Hence, these users will need to create accounts and will be factored into the licence limit.

Restrictions on FishEye Starter Licenses

This page explains the limitations of the FishEye Starter license and provides general information about using this license in production.

On this page:

- What is a Starter License?
- What are the Starter License restrictions?
- What happens if I exceed the Starter License limits?
  - Evaluate
  - Upgrade
  - Reconfigure your repository
- Frequently Asked Questions

What is a Starter License?

Starter licenses are low-cost licenses that allow small teams to make use of Atlassian products (see more information). FishEye Starter licenses were introduced with the release of FishEye 2.0.5 (October 2009).

What are the Starter License restrictions?

FishEye Starter Licenses are restricted to no more than:

- 10 users in FishEye
- 10 committers total per repository
- 5 repositories

What happens if I exceed the Starter License limits?

If you have more than five repositories, FishEye will prevent more than five repositories from being enabled at any given time. Administrators can control which five repositories are enabled.

If you exceed more than ten committers in a repository, a warning will appear at the top of pages for the entire system, stating the following:
NOTE: This repository, (repository-name) has more than ten committers which exceeds the limits for your Starter license. Indexing has stopped. To fix this, you can 'Evaluate', 'Upgrade' or 'Reconfigure your repository'.

The links in this warning will lead you to the following solutions:

**Evaluate**

30-day evaluation licenses are available to allow you to **try out FishEye** and other Atlassian products. You can select a license that allows more users than your current license.

**Upgrade**

You can upgrade your license at any time (via the Atlassian online store), which will remove the committer and repository limits which apply to the Starter License. Please ensure to restart your repository, after the license upgrade, to ensure the changes are picked up for the new committer limit.

**Reconfigure your repository**

This option lets you configure your repository to remain within the limits of the Starter License. You can take the following actions to reduce the scope of FishEye's indexing:

1. **Change the repository definition to look at a subset of your repository**
   Typically this involves setting the path within your repository that you wish FishEye to index. [Read more](#).

2. **Exclude parts of the repository**
   You can exclude portions of your repository that you are not interested in. [Committers](#) that are active in only these areas will not appear in FishEye and not be included in the committer count. [Read more](#).

3. **Set a starting point**
   Some of the FishEye SCM integrations allow you to configure a starting revision from which to start indexing. All commits prior to this starting point are not included in FishEye and do not contribute to the committer count. [Read more](#).

4. **Map Committers**
   If your developers have not correctly configured their committer names for Git or Mercurial, they may have committed with multiple identities. It is then possible to remap these to correct the problem. See the knowledge base article, [Git or Hg Repository exceeds number of allowed Committers](#).

Once you have reconfigured your repository, you will need to re-index the repository, allowing you to remain under the limits of the Starter license.

**Frequently Asked Questions**

<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>What happens when the 11th unique committer is encountered during indexing?</td>
<td>For all SCMs other than CVS FishEye will index all revisions up to but not including the revision that introduced the 11th committer. Since CVS is indexing is file-by-file based, FishEye will index files until it reaches the committer limit. Remaining files in the repository are not indexed. This means only files which have been indexed will be displayed in changesets and changesets may be incomplete.</td>
</tr>
<tr>
<td>Question</td>
<td>Answer</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>What happens when a FishEye instance with a Starter license is started, using existing indexes with more than five repositories?</td>
<td>FishEye will only start indexing on the first five repositories. An administrator can use admin UI to adjust which repositories are enabled and hence control the five repositories that are started. FishEye should then be restarted.</td>
</tr>
<tr>
<td>What happens when a FishEye instance with a Starter license is started, using existing indexes with one or more repositories with more than ten committers?</td>
<td>FishEye will display all information currently indexed but for each repository that has reached the ten committer limit, no further revisions will be indexed.</td>
</tr>
<tr>
<td>What happens on upgrade from a Starter license, if indexing has been paused due to the committer limit being reached?</td>
<td>On restart of FishEye, indexing will resume for all repositories. Each repository can restarted individually to avoid restarting FishEye. Due to the nature of CVS indexing, we recommend reindexing any CVS repositories which have reached the committer limit prior to the license upgrade.</td>
</tr>
<tr>
<td>What happens when upgrading from a Starter license, when repositories have not started due to the repository limit being reached?</td>
<td>On restart of FishEye, all enabled repositories will start. Each repository can restarted individually to avoid restarting FishEye.</td>
</tr>
<tr>
<td>What happens if my evaluation license has expired and I upgrade to a Starter license, however I have exceeded the Starter license limitations?</td>
<td>As described above, a maximum of five repositories will start and for any repository with more than 10 committers, no further indexing will occur. All existing indexed content is retained and can be viewed.</td>
</tr>
<tr>
<td>What happens when downgrading to a Starter license, where the repository limit has been exceeded?</td>
<td>A maximum of five of your configured repositories will start running. The remainder will not start but will continue to be available.</td>
</tr>
<tr>
<td>What happens when downgrading to a Starter license, where the committer limit has been exceeded for one or more repositories?</td>
<td>No further indexing will occur for the repositories where the committer limit has been exceeded.</td>
</tr>
</tbody>
</table>

### Repository Management FAQ

#### FishEye Repository Management FAQ

- Setting the root location for internal repositories
- Migrating repositories to a changed root location
- Repairing a broken hierarchy of forks
- Permanent authentication for Git repositories over HTTP(S)

### Setting the root location for internal repositories

If you have already created internal repositories, you must **migrate them when you update the repositories root attribute** - see Migrating repositories to a changed root location.

For security reasons, you can not change the path that internal repositories are created under via the FishEye administration UI. Instead, you must edit the `config.xml` file directly.

Steps to update your repositories root:

1. Shut down your FishEye server.
3. Edit your `config.xml` and change the `repositories-root` attribute of the `<repository-management>` element to the new location. This must be an **absolute path** to the directory where you wish to store internal repositories created by FishEye.
4. If you are migrating existing repositories, follow the steps at Migrating repositories to a changed root location.
5. Migrate any existing backup procedures that you have set up for your managed repositories.
6. Restart your FishEye server. The new root will be automatically created if it doesn't already exist.
Related Links

- Permanent authentication for Git repositories over HTTP(S)

Migrating repositories to a changed root location

Before you restart your FishEye server after modifying the repositories-root attribute of the <repository-management> element in your config.xml file, you will need to migrate any existing repositories to the new location.

Steps to migrate your existing managed repositories:

1. Follow the steps at Setting the root location for internal repositories up until the reference to migrating existing repositories.
2. Copy all of the directories in your current repositories-root (by default, this is in the %FISHEYE_IN STS/manged_repos directory) to the new location that you have specified.
3. Open your config.xml file for editing.
4. Update the location attribute of each <git> element that is the child of a managed <repository> element to reference the updated repository location under the new repositories root. Managed <repository> elements have the attribute managed="true".
5. Continue following the steps at Setting the root location for internal repositories.

Repairing a broken hierarchy of forks

If you see the error message "Failed to render fork tree for repository 'my-fork': The repository 'my-repository' does not exist but is referenced in the 'parent' attribute of another repository." on your repository's Forks tab...

...or see one of the following errors in your logs...
[java] 2011-09-06 12:24:51,093 WARN - The repository 'my-repository' does not exist but is referenced in the 'parent' attribute of another repository.

[java] 2011-09-06 12:24:51,093 WARN - Repository 'my-fork' has 'my-repository' set as parent, but no repository found named 'my-repository'

...you may need to repair some parent attribute references in your config.xml file.

Steps to repair your config.xml file:

1. Stop your FishEye instance.
3. Grep or otherwise search your config.xml for references to the repository that is missing (the name my-repository is used in the example above)
4. From the results of the above search, remove any parent attributes that reference the missing repository, e.g. `<repository parent="my-repository" name="my-fork">` should be modified to read `<repository name="my-fork">`.
5. Restart your FishEye instance and browse to the Forks tab for the affected repository.

- Permanent authentication for Git repositories over HTTP(S)

Permanent authentication for Git repositories over HTTP(S)

Currently, FishEye only supports HTTP or HTTPS for pushing and pulling from managed Git repositories. Git has no method of caching the user's credentials, so you need to re-enter them each time you perform a clone, push or pull.

Fortunately, there is a mechanism that allows you to specify which credentials to use for which server: the .netrc file.

⚠️ Warning!
Git uses a utility called cURL under the covers, which respects the use of the .netrc file. Be aware that other applications that use curl to make requests to servers defined in your .netrc file will also now be authenticated using these credentials. Also, this method of authentication is potentially unsuitable if you are accessing your FishEye server via a proxy, as all curl requests that target a path on that proxy server will be authenticated using your .netrc credentials.

⚠️ Warning!
cURL will not match the machine name in your .netrc if it has a username in it, so make sure you edit your .git/config file in the root of your clone of the repository and remove the user and '@' part from any clone url's (url fields) that look like https://user@machine.domain.com/... so instead they look like http://machine.domain.com/...

Linux or OSX

1. Create a file called .netrc in your home directory (~/.netrc). Unfortunately, the syntax requires you to store your passwords in plain text - so make sure you modify the file permissions to make it readable only to you.
2. Add credentials to the file for the server or servers you want to store credentials for, using the format below. You may use either IP addresses or hostnames, and you **do not** need to specify a port number, even if you're running FishEye on a non-standard port.
machine fisheye1.mycompany.com
login myusername
password mypassword

machine fisheye2.mycompany.com
login myotherusername
password myotherpassword

3. And that's it! Subsequent `git clone`, `git pull` and `git push` requests will be authenticated using the credentials specified in this file.

**Windows**

1. Create a text file called `_netrc` in your home directory (e.g. `c:\users\kannonboy\_netrc`). Curl has problems resolving your home directory if it contains spaces in its path (e.g. `c:\Documents and Settings\kannonboy`). However, you can update your `%HOME%` environment variable to point to any old directory, so create your `_netrc` in a directory with no spaces in it (for example `c:\curl-auth\`) then set your `%HOME%` environment variable to point to the newly created directory.

2. Add credentials to the file for the server or servers you want to store credentials for, using the format from the Linux or OS X section above.

**Subversion FAQ**

**FishEye Subversion FAQ**

- **Configuring Start Revision based on date** — For Subversion repositories Fisheye has the ability to configure a Start Revision parameter to allow you to only index content from a given point in your repository.
- **Errors 'SEVERE assert' or 'Checksum mismatch'** — SVNKit may have problems with older version Subversion servers - versions 1.1.x and prior.
- **FishEye fails to connect to the Subversion repository after a short time of successful operation.** — On Unix systems, the `svn://` protocol is usually handled by inetd or xinetd. These daemons apply, by default, a connection per second limit to incoming connections. Any connections above this rate are rejected by the server.
- **How can FishEye help with merging of branches in Subversion?** — In merge management, the main advantages of FishEye come from its search functionality. If you record the revisions merged when you check in a merge result, you can find this information in FishEye easily for the next merge operation.
- **Subversion Changeset Parents and Branches**
- **SVN Authentication Issues** — If multiple repositories have been defined in FishEye for the same SVN Server and those repositories use different credentials, FishEye may not use the correct credentials.
- **What are Subversion root and tag branches?**
- **Why do I need to describe the branch and tag structure for Subversion repositories?** — In Subversion, branches and tags are defined by convention, based on their path within a repository, and not directly defined by the repository. A few different layout alternatives are commonly used. It is also possible that you are using your own custom layout. As a result you need to describe to FishEye which paths in your repository are used as branches and tags.
- **Why don't all my tags show up in FishEye?**

**Configuring Start Revision based on date**

For Subversion repositories Fisheye has the ability to configure a **Start Revision** parameter to allow you to only index content from a given point in your repository.

Quite often users will find it helpful to index from a revision on a given date. For example, you may want to only...
index SVN data in the past year. To determine the revision based on date, you can use the following command:

```
svn log -r {YYYY-MM-DD}:HEAD <SVN_URL> -l 1
```

The output of this command will be the revision number closest to the date that you provide.

**Errors 'SEVERE assert' or 'Checksum mismatch'**

When using SVNKit, you may see errors in the FishEye log such as 'SEVERE: assert #B' or 'Checksum mismatch'.

SVNKit may have problems with older version Subversion servers - versions 1.1.x and prior. If this is the case you should either use the native JavaHL layer or upgrade your Subversion server to a more recent version.

**FishEye fails to connect to the Subversion repository after a short time of successful operation.**

If you use the `svn://` protocol to access a Subversion repository, you may notice that FishEye fails to connect to the repository after a short time of successful operation.

On Unix systems, the `svn://` protocol is usually handled by `inetd` or `xinetd`. These daemons apply, by default, a connection per second limit to incoming connections. Any connections above this rate are rejected by the server.

Two options for fixing this problem:

- Ask your system administrator increase the connection rate allowed for the svn connection by updating the `xinetd` configuration, or
- Specify a connection per second limit in your FishEye repository definition, to prevent FishEye from exceeding the `xinetd` limits.

**How can FishEye help with merging of branches in Subversion?**

FishEye gives you a logical view of your branched files so you can see activity on a single file across multiple branches/trunk.

In merge management, the main advantages of FishEye come from its search functionality. If you record the revisions merged when you check in a merge result, you can find this information in FishEye easily for the next merge operation.

As an example, let's say you have a branch `dev` created at revision 1300 from `trunk`. Development has proceeded on both `trunk` and `dev`. At some point you wish to add the latest `trunk` changes into the `dev` branch. Let's say that is at revision 1400. When you check in the results of this merge, you would use some standard format checkin comment such as:

```
merge from trunk to dev 1300:1400
```

When you come to do the next merge, say at revision 1500, you can use FishEye search to find this checkin comment and know what the starting point for the merge should be. You can then check this in as:

```
merge from trunk to dev 1400:1500
```

Merges back to `trunk` from the `dev` branch are managed in the same way.

**Subversion Changeset Parents and Branches**

**Why do some changesets have more than one branch? Why do these changesets have more than one parent?**

In Subversion, a single changeset can have files and directories that are on different branches, as defined by the SVN tag and branch structure. In this situation, the changeset is considered to be on all of the branches of its constituent file revisions. If a changeset is on more than one branch it can have a parent changeset of each of its branches, giving the changeset multiple parents.

FishEye does not track SVN merges, so merges are not indicated on the graph.

**When I create a complex branch, how does FishEye determine which is its parent changeset? When I create a complex tag, how does FishEye decide which changeset to tag?**
In Subversion, a simple branch or tag is created by copying a source directory, e.g. copying "/trunk" to "/branches/branch1" or "/tags/tag1". The tag or branch is considered complex if a part of the copied directory is replaced with another version, e.g. "/trunk" is copied to "/tags/tag1", and then "branches/branch1/dir1" is copied to "/tags/tag1/dirl".

For the purpose of the commit graph, FishEye looks at where the root directory was copied from, to determine where the branch or tag originated. In the example above, the label "tag1" would be applied to the latest changeset on trunk when the tag was created, even though part of the tag was copied from branch1. This only affects the annotation of the changeset, not the file revisions that are tagged — the tagged file revisions are still those on trunk or branch1 as appropriate.

SVN Authentication Issues

If multiple repositories have been defined in FishEye for the same SVN Server and those repositories use different credentials, FishEye may not use the correct credentials.

FishEye does not control directly when authentication information is used to access Subversion repositories. It delegates this operation to the JavaHL layer in use. JavaHL will then ask FishEye to supply credentials when required, using a callback. The default JavaHL layer shipped with FishEye, SVNKit, can cache credentials at the server level rather than at the repository level.

When experiencing this problem, FishEye can be configured to use the native JavaHL implementation, which will correctly apply the appropriate credentials.

The simplest solution is to have the same credentials for accessing the Subversion Server.

Alternatively, SVNKit can be tricked into thinking that different servers are being used. For each connection to a repository a hostname in the hosts file can be defined. All these entries then point to the same IP address of the SVN Server, but to SVNKit they look like different servers, thus bypassing the problem.

Example hosts entries (replace the IP address with the address of the SVN Server):

```
123.45.6.78 account1
123.45.6.78 account2
```

Replace these new server names in the SVN URLs:

```
http://account1/svn/project-a/
http://account2/svn/project-b/
```

What are Subversion root and tag branches?

FishEye identifies branches and tags in your Subversion repository by applying your specified SVN tag and branch structure.

**The "root:" branch**

Any files or directories that fall outside the tag and branch structure are identified as being on the special branch, "root:". Some directories will almost always fall outside this structure. In general, root directories of branches are considered to be on the "root:" branch. This means that any changeset in which a branch is created is considered to be on branch, "root:". Additionally, any files or directories that fall outside the defined structure will be assigned branch, "root:". If you’re seeing a lot of files and changesets on "root: ", you may need to update your branch and tag structure in FishEye and rescan your repository, or exclude parts of your repository that don’t follow your defined structure.

**"tag:" branches**

When FishEye detects that a tag has been created, it looks at the files that were tagged and adds the tag as an annotation to those file revisions. No file revisions are created at this point.

If a tag is modified after it has been created and committed, FishEye promotes the tag to a branch to preserve
the history of the modification. For example, a user may create the tag "build1" by copying "trunk" to "tags/build1". If they then modify contents of tags/build1, a new branch "tag:build1" will be created for the modification.

**Why do I need to describe the branch and tag structure for Subversion repositories?**

In Subversion, branches and tags are defined by convention, based on their path within a repository, and not directly defined by the repository. A few different layout alternatives are commonly used. It is also possible that you are using your own custom layout. As a result you need to describe to FishEye which paths in your repository are used as branches and tags.

It is very important that you correctly define in FishEye the layout you are using. If you do not, FishEye will not know which paths represent tags and branches. This will prevent FishEye from relating different versions of the same logical file across separate paths within your repository. It will also mean that FishEye’s cache will be much larger as each tagged path will be indexed separately. This will result in an increase in the initial scan time and may reduce runtime performance.

If you are having trouble using Subversion tags, see [How tags work in Subversion](#).

**Why don’t all my tags show up in FishEye?**

This page gives a detailed technical explanation of why certain issues affect Subversion users.

**On this page:**
- Introduction
- How Subversion Processes Tags and Branches
- An Example from a Live Subversion Repository
- Avoid Modifications in the Tag Area
- Conclusion

**Introduction**

When accessing Subversion via FishEye, you may see references to tags in the branches drop-down menu. In the example below, we can see tag1 and tag3 in the drop-down menu but not tag2:

**Screenshot: The Branches Drop-Down Menu in FishEye**

In actual fact, the branches drop-down menu shows only branch names. It does not show tags, but in some instances FishEye will synthesise a branch name to record certain operations. To understand how this occurs, you will need some background knowledge on Subversion tagging (introduced in the following segments of this page).

**How Subversion Processes Tags and Branches**

In Subversion, tags are only a convention and are typically the result of a copy operation from the trunk to a tag area in the tags directory. When FishEye processes this copy operation, it recognises that the destination is a tag directory and tags the source file on trunk with the name of the tag.

i.e. FishEye is interpreting the Subversion copy to a tag directory as a tagging operation on the trunk files.

For regular changes in your Subversion repository, FishEye records each change against a branch where the change took place. If, however, after tagging, you make a change to a file in the tagged area,
you are making a change outside trunk or a recognized branch. FishEye records such changes by creating an artificial branch name and associating that branch name with the change. The branch name is derived from the tag name by prepending "tag:" (in other words, the characters "tag:" appear as the first part of the name). The same thing will occur if you create a new file in the tagged area which does not come from an existing branch or trunk.

This is the reason you see some of your tags in the branch drop down. It means that for those tags, you have made a modification after the tagging operation.

**An Example from a Live Subversion Repository**

For example, consider **tag4** in this screenshot:

**Screenshot: Subversion Tag Changes in FishEye**

There are two changes here. The first creates the tag and the second adds a new file in the tagged area. This will result in the creation of an artificial branch, called **"tag:tag4"** within FishEye.

**Avoid Modifications in the Tag Area**

In general, it's not good practice to make changes in the tag areas of a Subversion repository. Such changes can easily get lost if they are not applied to trunk or a current branch. It is preferable to make the change in trunk or a branch and then create a new tag to capture the update. Nevertheless, since Subversion tagging is merely a convention, this is sometimes convenient. FishEye handles this situation as described above.

**Conclusion**

In general a lot of systems have a large number of tags which would make the drop-down unworkable. This is the reason the tag field is a text-entry box below the branch drop-down menu in FishEye.

Since tags and branches are based on location convention in Subversion, the constraint is less effective than on other SCMs. You can always see the tag or branch you are interested in, based on its location in the repository. For example, the subdirectory list here shows all tags:

**Screenshot: Subdirectory Listing in FishEye**
If you want to constrain to a tag, enter the tag name in the tag field of the constraint filter.

Support Policies

Welcome to the support policies index page. Here, you'll find information about how Atlassian Support can help you and how to get in touch with our helpful support engineers. Please choose the relevant page below to find out more.

- Bug Fixing Policy
- How to Report a Security Issue
- New Features Policy
- Patch Policy
- Security Advisory Publishing Policy
- Security Patch Policy
- Severity Levels for Security Issues

To request support from Atlassian, please raise a support issue in our online support system. To do this, visit support.atlassian.com, log in (creating an account if need be) and create an issue under FishEye. Our friendly support engineers will get right back to you with an answer.

Bug Fixing Policy

Summary

- Atlassian Support will help with workarounds and bug reporting.
- Critical bugs will generally be fixed in the next maintenance release.
- Non-critical bugs will be scheduled according to a variety of considerations.

Raising a Bug Report

Atlassian Support is eager and happy to help verify bugs — we take pride in it! Please open a support request in our support system providing as much information as possible about how to replicate the problem you are experiencing. We will replicate the bug to verify, then lodge the report for you. We'll also try to construct workarounds if they're possible.

Customers and plugin developers are also welcome to open bug reports on our issue tracking systems directly. Use http://jira.atlassian.com for the stand-alone products and http://studio.atlassian.com for JIRA Studio and Atlassian OnDemand.

When raising a new bug, you should rate the priority of a bug according to our JIRA usage guidelines. Customers should watch a filed bug in order to receive e-mail notification when a “Fix Version” is scheduled for release.
How atlassian approaches bug fixing

Maintenance (bug fix) releases come out more frequently than major releases and attempt to target the most critical bugs affecting our customers. The notation for a maintenance release is the final number in the version (ie the 1 in 3.0.1).

If a bug is critical (production application down or major malfunction causing business revenue loss or high numbers of staff unable to perform their normal functions) then it will be fixed in the next maintenance release provided that:

- The fix is technically feasible (i.e. it doesn't require a major architectural change).
- It does not impact the quality or integrity of a product.

For non-critical bugs, the developer assigned to fixing bugs prioritises the non-critical bug according to these factors:

- How many of our supported configurations are affected by the problem.
- Whether there is an effective workaround or patch.
- How difficult the issue is to fix.
- Whether many bugs in one area can be fixed at one time.

The developers responsible for bug fixing also monitor comments on existing bugs and new bugs submitted in JIRA, so you can provide feedback in this way. We give high priority consideration to security issues.

When considering the priority of a non-critical bug we try to determine a 'value' score for a bug which takes into account the severity of the bug from the customer's perspective, how prevalent the bug is and whether roadmap features may render the bug obsolete. We combine this with a complexity score (i.e. how difficult the bug is). These two dimensions are used when developers self serve from the bug pile.

Further reading

See Atlassian Support Offerings for more support-related information.

How to report a security issue

Finding and reporting a security issue

If you find a security issue in the product, open an issue on https://jira.atlassian.com in the relevant project.

- Set the security level of the bug to 'Reporters and Developers'.
- Set the priority of the bug to 'Blocker'.
- Provide as much information on reproducing the bug as possible.

All communication about the security issue should be performed through JIRA, so that Atlassian can keep track of the issue and get a patch out as soon as possible.

If you cannot find the right project to file your issue in, email the details to security@atlassian.com.

When reporting a security vulnerability, please keep in mind the following:

- We need a technical description that allows us to assess exploitability and impact of the issue.
  - Provide steps to reproduce the issue, including any URLs or code involved.
  - If you are reporting an XSS, your exploit should at least pop up an alert in the browser. It is much better if the XSS exploit shows user's authentication cookie.
  - If you are reporting an SQL injection, we want to see the exploit extracting database data, not just producing an error message.
  - HTTP request / response captures or simply packet captures are also very useful to us.

Please refrain from sending us links to non-Atlassian web sites, or reports in PDF / DOC / EXE files. Image files are ok. Make sure the bug is exploitable by someone other than the user himself (e.g. "self-XSS").

Without this information it is not possible to assess your report and it is unlikely to be addressed.

We are not looking for the reports listing generic "best practice" issues such as:

Created by Atlassian in 2013. Licensed under a Creative Commons Attribution 2.5 Australia License.
• Specific cookies being not marked as Secure or HTTPOnly
• Presence or absence of HTTP headers (X-Frame-Options, HSTS, CSP, nosniff and so on)
• Clickjacking
• Mixed HTTP and HTTPS content
• Auto-complete enabled or disabled
• SSL-related issues

Further reading

See Atlassian Support Offerings for more support-related information.

New Features Policy

Summary

• We encourage and display customer comments and votes openly in our issue tracking system, http://jira.atlassian.com.
• We do not publish roadmaps.
• Product Managers review our most popular voted issues on a regular basis.
• We schedule features based on a variety of factors.
• Our Atlassian Bug Fixing Policy is distinct from our Feature Request process.
• Atlassian provides consistent updates on the top 20 feature/improvement requests (in our issue tracker systems).

How to Track what Features are Being Implemented

When a new feature or improvement is scheduled, the 'fix-for' version will be indicated in the JIRA issue. This happens for the upcoming release only. We maintain roadmaps for more distant releases internally, but because these roadmaps are often pre-empted by changing customer demands, we do not publish them.

How Atlassian Chooses What to Implement

In every major release we aim to implement highly requested features, but it is not the only determining factor. Other factors include:

• Customer contact: We get the chance to meet customers and hear their successes and challenges at Atlassian Summit, Atlassian Unite, developer conferences, and road shows.
• Customer interviews: All product managers at Atlassian do customer interviews. Our interviews are not simply to capture a list of features, but to understand our customers' goals and plans.
• Community forums: There are large volumes of posts on answers, of votes and comments on jira.atlassian.com, and of conversations on community forums like groups on LinkedIn.
• Customer Support: Our support team provides clear insights into the issues that are challenging for customers, and which are generating the most calls to support
• Atlassian Experts: Our Experts provide insights into real-world customer deployments, especially for customers at scale.
• Evaluator Feedback: When someone new tries our products, we want to know what they liked and disliked and often reach out to them for more detail.
• In product feedback: The JIRA Issue Collectors that we embed our products for evaluators and our Early Access Program give us a constant pulse on how users are experiencing our product.
• Usage data: Are customers using the features we have developed?
• Product strategy: Our long-term strategic vision for the product.

How to Contribute to Feature Development

Influencing Atlassian’s release cycle

We encourage our customers to vote on feature requests in JIRA. The current tally of votes is available online in our issue tracking system, http://jira.atlassian.com. Find out if your improvement request already exists. If it does, please vote for it. If you do not find it, create a new feature or improvement request online.

Extending Atlassian Products

Atlassian products have powerful and flexible extension APIs. If you would like to see a particular feature implemented, it may be possible to develop the feature as a plugin. Documentation regarding the plugin APIs is available. Advice on extending either product may be available on the user mailing-lists, or at Atlassian Answers.
If you require significant customisations, you may wish to get in touch with our partners. They specialise in extending Atlassian products and can do this work for you. If you are interested, please contact us.

Further reading

See Atlassian Support Offerings for more support-related information.

Patch Policy

Atlassian will only provide software patches in extremely unusual circumstances. If a problem has been fixed in a newer release of the product, Atlassian will request that you upgrade your instance to fix the issue. If it is deemed necessary to provide a patch, a patch will be provided for the current release and the last maintenance release of the last major version only.

Patches are issued under the following conditions:

- The bug is critical (production application down or major malfunction causing business revenue loss or high numbers of staff unable to perform their normal functions).
- A patch is technically feasible (i.e., it doesn’t require a major architectural change)
- The issue is a security issue, and falls under our Security Patch Policy.

Atlassian does not provide patches for non-critical bugs.

Provided that a patch does not impact the quality or integrity of a product, Atlassian will ensure that patches supplied to customers are added to the next maintenance release. Customers should watch a filed bug in order to receive e-mail notification when a "Fix Version" is scheduled for release.

Patches are generally attached to the relevant http://jira.atlassian.com issue.

Further reading

See Atlassian Support Offerings for more support-related information.

Security Advisory Publishing Policy

Publication of Security Advisories

When a critical severity security vulnerability in an Atlassian product is discovered and resolved, Atlassian will inform customers through the following mechanisms:

- We will post a security advisory in the latest documentation of the affected product at the same time as releasing a fix for the vulnerability.
- We will send a copy of all posted security advisories to the 'Technical Alerts' mailing list for the product concerned.
  Note: To manage your email subscriptions and ensure you are on this list, please go to my.atlassian.com and click 'Communications Centre' near the top right of the page.
- If the person who reported the vulnerability wants to publish an advisory through some other agency, such as CERT, we will assist in the production of that advisory and link to it from our own.

If you want to track non-critical severity security vulnerabilities, you need to monitor the issue trackers for the relevant products on http://jira.atlassian.com. For example, https://jira.atlassian.com/browse/JRA for JIRA and https://jira.atlassian.com/browse/CONF for Confluence. Security issues in trackers will be marked with a "security" label. All security issues will be listed in the release notes of the release where they have been fixed, similar to other bugs.

One of the ways to monitor updates to security issues is subscribing to the results of a sample search via email or RSS.

Further reading

See Atlassian Support Offerings for more support-related information.

Security Patch Policy
Product Security Patch Policy

Atlassian makes it a priority to ensure that customers’ systems cannot be compromised by exploiting vulnerabilities in Atlassian products.

Scope

This page describes when and how we release security patches and security upgrades for our products. It does not describe the whole of disclosure process that we follow. It also excludes OnDemand, since OnDemand will always be patched by Atlassian without additional notifications.

Critical vulnerabilities

When a Critical security vulnerability is discovered by Atlassian or reported by a third party, Atlassian will do all of the following:

- Issue a new, fixed release for the current version of the affected product as soon as possible, usually in a few days.
- Issue a binary patch for the current release.
- Issue a binary patch for the latest maintenance release of the previous version of the product.
- Patches for older versions or releases normally will not be issued.

Patches will be attached to the relevant JIRA issue. You can use these patches as a “stop-gap” measure until you upgrade your installation in order to fully fix the vulnerability.

Non-critical vulnerabilities

When a security issue of a High, Medium or Low severity is discovered, Atlassian will do all of the following:

- Include the fix into the next scheduled release, both for the current and previous maintenance versions.
- Where practical, provide new versions of plugins or other components of the product that can be upgraded independently.

You should upgrade your installation in order to fix the vulnerability.

Other information

Severity level of vulnerabilities is calculated based on Severity Levels for Security Issues.

Visit our general Atlassian Patch Policy as well.

Examples

Example 1: A critical severity vulnerability is found in a (hypothetical current release) JIRA 5.3.2. The last bugfix release in 5.2.x branch was 5.2.3. In this case, a patch will be created for 5.3.2 and 5.2.3. In addition, new bugfix releases, 5.3.3 and 5.2.4, which are free from this vulnerability, will be created in a few days.

Example 2: A high or medium severity vulnerability is found in the same release as in the previous example. The fix will be included into the currently scheduled releases 5.3.3 and 5.2.4. Release schedule will not be brought forward and no patches will be issued. If the vulnerability is in a plugin module, then a plugin upgrade package may still be supplied.

Further reading

See Atlassian Support Offerings for more support-related information.

Severity Levels for Security Issues

Severity Levels

Atlassian security advisories include a severity level. This severity level is based on our self-calculated CVSS score for each specific vulnerability. CVSS is an industry standard vulnerability metric. You can learn more about CVSS at FIRST.org web site.

CVSS scores are mapped into the following severity ratings:

- Critical
- High
An approximate mapping guideline is as follows:

<table>
<thead>
<tr>
<th>CVSS score range</th>
<th>Severity in advisory</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 2.9</td>
<td>Low</td>
</tr>
<tr>
<td>3 – 5.9</td>
<td>Medium</td>
</tr>
<tr>
<td>6.0 – 7.9</td>
<td>High</td>
</tr>
<tr>
<td>8.0 – 10.0</td>
<td>Critical</td>
</tr>
</tbody>
</table>

Below is a summary of the factors which illustrate types of vulnerabilities usually resulting in a specific severity level. Please keep in mind that this rating does not take into account details of your installation.

**Severity Level: Critical**

Vulnerabilities that score in the critical range usually have most of the following characteristics:

- Exploitation of the vulnerability results in root-level compromise of servers or infrastructure devices.
- The information required in order to exploit the vulnerability, such as example code, is widely available to attackers.
- Exploitation is usually straightforward, in the sense that the attacker does not need any special authentication credentials or knowledge about individual victims, and does not need to persuade a target user, for example via social engineering, into performing any special functions.

For critical vulnerabilities, is advised that you patch or upgrade as soon as possible, unless you have other mitigating measures in place. For example, if your installation is not accessible from the Internet, this may be a mitigating factor.

**Severity Level: High**

Vulnerabilities that score in the high range usually have some of the following characteristics:

- The vulnerability is difficult to exploit.
- Exploitation does not result in elevated privileges.
- Exploitation does not result in a significant data loss.

**Severity Level: Medium**

Vulnerabilities that score in the medium range usually have some of the following characteristics:

- Denial of service vulnerabilities that are difficult to set up.
- Exploits that require an attacker to reside on the same local network as the victim.
- Vulnerabilities that affect only nonstandard configurations or obscure applications.
- Vulnerabilities that require the attacker to manipulate individual victims via social engineering tactics.
- Vulnerabilities where exploitation provides only very limited access.

**Severity Level: Low**

Vulnerabilities in the low range typically have very little impact on an organisation's business. Exploitation of such vulnerabilities usually requires local or physical system access.

See [Atlassian Support Offerings](https://support.atlassian.com) for more support-related information.

**Troubleshooting**
FishEye Troubleshooting

- **After I commit a change to my CVS repository, it takes a long time before it appears in FishEye.** — If you do not have a CVSROOT/history file, then a commit will not appear in FishEye until after FishEye has done a periodic full scan of your repository. You can configure the period of this scan in the Admin pages.

- **FishEye freezes unexpectedly** — If your FishEye 2.0 or 2.0.1 instance freezes unexpectedly, this could be caused by a known issue with FishEye and MySQL database technology.

- **Generating a Thread Dump Externally** — If FishEye stops responding or is showing poor performance, providing thread dumps to support can help diagnose the problem.

- **I have installed FishEye, and the initial scan is taking a long time. Is this normal?** — As a guide, FishEye should be able to process about 100KB-200KB per second on an averaged-size PC. If FishEye is accessing the repository over the network (e.g. over a NFS mount), then you should expect the initial scan to take longer.

- **I have installed FishEye, but there is no data in the Changelog.** — When you add a repository, FishEye needs to scan through the repository to build up its index and cache. This scan can take some time. Until this scan is complete, you may find that some data is not displayed.

- **Initial scan and page loads are slow on Subversion** — It's possible that you've mis-configured your tag and branch structure and caused FishEye to process some or all files as trunk files. You should recheck your tag configuration.

- **It seems that FishEye's HTTP Header is Too Small**

- **JIRA Integration Issues**

- **Message ‘org.tigris.subversion.javahl.ClientException svn Java heap space’** — The Java heap space needs to be increased to an acceptable size. See the FishEye Tuning documentation for more information.

- **On my Red Hat Linux system, after running for several days FishEye freezes and does not accept any more connections.** — On some Linux systems (particularly RH9), there are socket problems between the JVM and the kernel. To fix this, you need to set the LD_ASSUME_KERNEL environment variable before starting FishEye.

- **Problems with very long comments and MySQL migration** — There is a known issue with FishEye 2.0.x and very long comments when migrating your database to MySQL.

- **URLs with encoded slashes don't work, especially in Author constraints** — If the author names in your repository contain slashes or back slashes, and you are using Apache, you may run into a problem where these characters are incorrectly escaped.

FishEye Knowledge Base

See the troubleshooting guides and technical announcements in the FishEye knowledge base.

**After I commit a change to my CVS repository, it takes a long time before it appears in FishEye.**

If possible, FishEye will monitor and parse the CVSROOT/history file in your repository to quickly work out what has changed. You may want to check with your CVS administrator to ensure this feature of CVS is turned on.

If you do not have a CVSROOT/history file, then a commit will not appear in FishEye until after FishEye has done a periodic full scan of your repository. You can configure the period of this scan in the Admin pages.

**FishEye freezes unexpectedly**

**Issue Symptoms**

If your FishEye 2.0 or 2.0.1 instance freezes unexpectedly, this could be caused by a known issue with FishEye and MySQL database technology.

This issue manifests itself in some FishEye pages returning a server timeout error. To identify the issue, check the FishEye error log. For this issue, the following output will appear in the error log:
2009-07-15 15:34:45,555 ERROR [btpool0-519] fisheye.app
HibernateUtil-commitTransaction - Commit fail msg-0:Could not execute
JDBC batch update
2009-07-15 15:34:45,556 ERROR [btpool0-519] fisheye.app
HibernateUtil-commitTransaction - Commit fail msg-1:Lock wait timeout exceeded; try restarting transaction
2009-07-15 15:34:45,557 ERROR [btpool0-519] fisheye.app
HibernateUtil-commitTransaction - Commit failed rolling back.
...

Caused by: java.sql.BatchUpdateException: Lock wait timeout exceeded; try restarting transaction
  at com.mchange.v2.c3p0.impl.NewProxyPreparedStatement.executeBatch(NewProxyPreparedStatement.java:1723)
  at org.hibernate.jdbc.BatchingBatcher.doExecuteBatch(BatchingBatcher.java:48)
  at org.hibernate.jdbc.AbstractBatcher.executeBatch(AbstractBatcher.java:246)
  ... 163 more

The FishEye error log can be found under FISHEYE_INST/var/log/fisheye-error.log.YYYY-MM-DD.

See the JIRA issue for more information.

Workaround

Until the issue is solved, the suggested course of action is to restart your FishEye instance. This will return FishEye to normal operation.

The FishEye development team is actively working on a solution and this be part of an upcoming point release of FishEye.

Requesting Support

If you require assistance in resolving the problem, please raise a support request under the FishEye project.

Generating a Thread Dump Externally

If FishEye stops responding or is showing poor performance, providing thread dumps to support can help diagnose the problem.

If you were asked by Atlassian technical support to create the thread dump, please take 4 thread dumps with a time interval in between (eg. 30 secs) so we can see some patterns. Attach the log file to the support ticket.

Generating a Thread Dump for Windows

If you are not running FishEye via run.bat, click on the console and press <CTRL>+BREAK

Generating a Thread Dump on Linux, including Solaris and other Unixes

Find the process ID of the JVM and use the ps command to get list of all processes:
kill -3 <pid>

**Note:** This will not kill your server (so long as you included the "-3" option, no space in between).
The thread dump will be printed to FishEye's standard output (fisheye.out).
If you have trouble generating the thread dumps with this method, then use the method "Generating a Thread dump for Windows" as they can also apply for linux, etc.

**Jstack**

Sun JDK 1.5 and above ship with native tool called jstack to perform thread dump. To use the tool find the Process ID and execute the command:

```
jstack <ProcessID>
```

**Output**

Standard logging for FishEye is sent to the FISHEYE_INST/var/log/fisheye-debug.log.* files, in the FISHEYE_INST directory. Thread dumps are an exception since they dump the threads of the entire application server - they'll appear in the FISHEYE_INST/var/log/fisheye.out file. You can search for the term "thread dump" in the log file for the beginning of the dump.

**Thread Dump Tools**

- Samurai
- Thread Dump Analyzer TDA TDA 2.2 Final can be obtained from java.net

**I have installed FishEye, and the initial scan is taking a long time. Is this normal?**

When you add a repository, FishEye needs to scan through the repository to build up its index and cache. This scan can take some time. Until this scan is complete, you may find that some data is not displayed.

As a guide, FishEye should be able to process about 100KB-200KB per second on an averaged-size PC. If FishEye is accessing the repository over the network (e.g. over a NFS mount), then you should expect the initial scan to take longer.

For more details, see Improve FishEye scan performance.

**I have installed FishEye, but there is no data in the Changelog.**

When you add a repository, FishEye needs to scan through the repository to build up its index and cache. This scan can take some time. Until this scan is complete, you may find that some data is not displayed.

As a guide, FishEye should be able to process about 100KB-200KB per second on an averaged-size PC. If FishEye is accessing the repository over the network (e.g. over a NFS mount), then you should expect the initial scan to take longer.

**Initial scan and page loads are slow on Subversion**

**Background Information**

When you add a repository, FishEye needs to perform a once-off scan through the repository to build up its initial index and cache. This scan can take some time. Until this scan is complete, you may find that some data is not displayed. As a guide, FishEye should be able to process about 100KB-200KB per second on an averaged-size PC. If FishEye is accessing the repository over the network (e.g. over a NFS mount), then you should expect the initial scan to take longer. Read on if your scan appears to be considerably slower than expected.

**Solutions**

It's possible that you've mis-configured your tag and branch structure and caused FishEye to process some or all files as trunk files. You should recheck your tag configuration.

If that fails, then the Atlassian support team will be happy to help you with this issue. Please sign up for a support account if you don't have one already, then login and create a FishEye support request.
Users with very large or non-local repositories may be able to improve their FishEye scan performance.

It seems that FishEye's HTTP Header is Too Small

If you are receiving errors about FishEye's HTTP header being too small, it is adjustable. See the page on Setting JVM System Properties for instructions.

JIRA Integration Issues

Users are mapped to their own accounts when using Trusted Applications.

If you (or the general account used for JIRA access, if not using Trusted Applications) do not have the permissions to carry out the JIRA actions linked from FishEye, an error will occur. Depending on the error returned from JIRA, FishEye may not display the error correctly or display it at all, simply reporting that "An error has occurred". To investigate what the error was, you can access the FishEye debug log, named fisheye-debug.log.YYYY-MM-DD under the dist.inst/var/log folder of your FishEeye installation and look for the date and time when your error took place. Here, you will be able to follow the links and see what error the JIRA instance was producing by clicking through to JIRA.

Message 'org.tigris.subversion.javahl.ClientException svn Java heap space'

When adding a new repository and on the initial scan, you may receive messages similar to this in the logs: org.tigris.subversion.javahl.ClientException: svn: Java heap space

The Java heap space needs to be increased to an acceptable size. See the FishEye Tuning documentation for more information.

On my Red Hat Linux system, after running for several days FishEye freezes and does not accept any more connections.

On some Linux systems (particularly RH9), there are socket problems between the JVM and the kernel. To fix this, you need to set the LD_ASSUME_KERNEL environment variable before starting FishEye.

Add the following code to the script that starts FishEye:

```bash
export LD_ASSUME_KERNEL=2.4.1
```

Problems with very long comments and MySQL migration

**Issue Symptoms**

There is a known issue with FishEye 2.0.x and very long comments when migrating your database to MySQL. In some circumstances, this might result in truncation of very long comments, causing data loss.

Depending on your configuration, you may see an error message like this while migrating to MySQL, causing the migration to fail:

```
java.sql.BatchUpdateException: Data truncation: Data too long for column 'cru_message' at row 1
java.sql.BatchUpdateException: Data truncation: Data too long for column 'cru_message' at row 1
```

You may not see the message if you are running MySQL with default settings.

For more information, see the JIRA issue.

**Workaround**

If your data contains very long comments or review descriptions (longer than 21,845 multibyte unicode
characters), consider avoiding use of MySQL until this issue is resolved fully. Alternatively, use PostgreSQL or the default (built-in) HSQLDB database.

The FishEye developers are actively working on a solution to this problem and it will be addressed in an upcoming FishEye point release.

Requesting Support

If you require assistance in resolving the problem, please raise a support request under the FishEye project. **URLs with encoded slashes don’t work, especially in Author constraints**

If the author names in your repository contain slashes or back-slashes, and you are using Apache, you may run into a problem where these characters are incorrectly escaped. By default Apache explicitly forbids encoded slashes or back-slashes in URLs. You can change this behavior with the following httpd.conf directive:

```
AllowEncodedSlashes On
```

This directive is documented here.

Contributing to the FishEye Documentation

Would you like to share your FishEye hints, tips and techniques with us and with other FishEye users? We welcome your contributions.

Have you written a blog post describing a specific configuration of FishEye or a neat trick that you have discovered? Let us know, and we will link to your blog from our documentation. More....

Contributing Documentation in Other Languages

Have you written a guide to FishEye in a language other than English, or translated one of our guides? Let us know, and we will link to your guide from our documentation. More....

Updating the Documentation Itself

Have you found a mistake in the documentation, or do you have a small addition that would be so easy to add yourself rather than asking us to do it? You can update the documentation page directly

Getting Permission to Update the Documentation

Please submit the **Atlassian Contributor License Agreement**.

Our Style Guide

Please read our short guidelines for authors.

How we Manage Community Updates

Here is a quick guide to how we manage community contributions to our documentation and the copyright that applies to the documentation:

- **Monitoring by technical writers.** The Atlassian technical writers monitor the updates to the documentation spaces, using RSS feeds and watching the spaces. If someone makes an update that needs some attention from us, we will make the necessary changes.
- **Wiki permissions.** We use wiki permissions to determine who can edit the documentation spaces. We
ask people to sign the Atlassian Contributor License Agreement (ACLA) and submit it to us. That allows us to verify that the applicant is a real person. Then we give them permission to update the documentation.

- **Copyright.** The Atlassian documentation is published under a Creative Commons CC BY license. Specifically, we use a Creative Commons Attribution 2.5 Australia License. This means that anyone can copy, distribute and adapt our documentation provided they acknowledge the source of the documentation. The CC BY license is shown in the footer of every page, so that anyone who contributes to our documentation knows that their contribution falls under the same copyright.

Issue Tracker and Feature Requests for FishEye

Glossary

Code repository or SCM (Source Code Management) software terminology can be confusing. This page provides definitions for some of the most commonly used terms.

On this page:

Branch
Changeset
Commit
Committer
CSID
Head
Linker
Repository
SCM
Slurp
Tag
Trunk

FishEye and its documentation uses the following terms:

Branch

A branch is an independent stream of work in a repository. For example, you might copy a set of files in the repository into a new branch, where you can carry on with a separate stream of work without cluttering up the main production area on trunk.

Different SCMs handle branching and merging in different ways. The common aspects allow users to create a branch in which to make changes which do not affect the files in other branches and the trunk development stream. These changes can then be merged into the trunk in a controlled fashion when a development unit of work is complete. Branches can also be used for experimental changes so that these do not affect the main development.
Changeset

A changeset is a collection of changes to files in a repository which are committed to the repository in a single operation with a single commit message. Not all SCMs support atomic commit operations. For these SCMs, FishEye will determine the file revisions which make up the changeset using a reliable heuristic (set of rules).

Different SCMs use different terms for the concept of a changeset, such as "changelist", which is generally interchangeable with changeset.

Commit

A commit is a single entry of content (usually source code) into a repository. It can be a single file or comprised of multiple file versions.

Committer

A committer is a user of an SCM repository who is adding content to the repository (where it will be permanently archived). Typically, a committer is a programmer who is committing source code but SCMs can also store other files such as documents, images and schematics.

CSID

An abbreviation for 'Changeset ID', this is a code that is used to reference every set of files that is committed to a repository. For example, if you commit three files to a repository, they are collectively a changeset, and will share the one CSID. CSIDs normally appear as a number, for example '31905'. In FishEye, CSIDs appear as links that you can click to visit the 'Changeset View', which shows a list of the files in the left column, and the file contents or diffs in the right hand pane. In some circumstances you can hover your mouse over the CSID to see the 'Changeset Hover' dialog, which displays the commit message, author, timestamp and files in the changeset.

Head

The "head" revision is the latest change to be made to a file in either a trunk or a branch part of a repository.

Linker

FishEye can render issue IDs or Bug IDs that appear in commit messages or comments as hyperlinks to the relevant issue/bug in your issue/bug tracker. The "linker" patterns used to detect the ID substrings can be configured separately for each repository. See Linkers.

Repository

A repository is an area managed by an SCM where you store a set of related files, typically from a project or set of projects. The SCM is responsible for version controlling the files in the repository and maintaining their change history. A repository will contain the trunk and all branches for the files of the various projects. A single SCM instance can typically house multiple repositories.

SCM

SCM (Source Code Management) software is a category of computer software that archives complex sets of files, for example, all the source code comprised in a large multi-part software project. SCM systems keep copies of every version of every file, allowing you to completely restore and build any version of the software from any point in time.

Committers typically add new versions of code to the SCM once it is tested and approved by peer code review or quality assurance.

Each instance of an SCM can host multiple repositories.

Slurp

"Slurping" is a term that is synonymous with "repository scanning". FishEye must do intensive scans of the contents of repositories (SCM systems) in order to provide its lightning-fast web-based browsing of their...
Tag

In SCM terminology, a "tag" is a label that is added to a number of files, to capture their collective state at a particular moment in time. A typical tag would be a specific software version number, that could be referenced to see all the files that belong to a specific version build of a software project.

Trunk

In SCM terminology, the "trunk" is the central part of the version control "tree". For example, you might copy a set of files in the repository into a new branch, where you can do new experimental work without cluttering up the main production area on trunk.
