If you are using a database (called jiradb, for example) with your existing JIRA installation and the database for your new JIRA installation is running on the same machine or database server, create your new database with a different name (e.g. something intuitive like jiradb_440 for JIRA 4.4.0). However, ensure the new database has identical access permissions to the old JIRA database. Consult your database administrator if you need assistance with this.

You do not need to create a new database if you are using the embedded HSQL database.

3.4 Migrate your existing JIRA configurations over to your new JIRA installation

If you have modified properties in configuration files of your existing JIRA installation, make the same modifications in your new JIRA installation. However, because the properties in the configuration files may have changed between versions, you cannot simply copy the configuration files from your existing installation and replace the equivalent files in the new installation.

For each file you have modified in your existing JIRA installation, you need to manually edit each equivalent file in your new JIRA installation and re-apply your modifications. If a file is not present in your new JIRA installation (for example, osuser.xml in recent JIRA versions), then simply copy that file over to your new JIRA
installation.

The table below lists the most commonly modified files and their locations within your **JIRA Installation Directory**:

<table>
<thead>
<tr>
<th>File</th>
<th>Location in 'recommended' (formerly 'Standalone') JIRA distributions</th>
<th>Location in JIRA WAR</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jira-application.properties</td>
<td>atlassian-jira/WEB-INF/classes</td>
<td>webapp/WEB-INF/classes</td>
<td>Location of the JIRA Home Directory and Advanced JIRA Configuration in JIRA 4.3.x and earlier. Any custom property values defined in the jira-application.properties file of your existing JIRA 4.3.x (or earlier) installation must be migrated across to the jira-application.properties file of your new JIRA 6.2 installation <strong>before you start your new JIRA installation</strong>. Upon starting your new JIRA installation, any custom property values in the jira-application.properties file will automatically be migrated across to either the JIRA database or jira-config.properties file. jira.home is the only property of the jira-application.properties file subsequently used by JIRA.</td>
</tr>
<tr>
<td>setenv.bat (Windows) or setenv.sh (Linux)</td>
<td>bin</td>
<td>Application server's bin directory</td>
<td>Increasing JIRA Memory</td>
</tr>
<tr>
<td>osuser.xml (not required if upgrading from JIRA 4.3.0 or later)</td>
<td>atlassian-jira/WEB-INF/classes</td>
<td>webapp/WEB-INF/classes</td>
<td>Modified if you have integrated LDAP with JIRA, integrated Crowd with JIRA, or if you are using a custom form of external user management or user authentication.</td>
</tr>
<tr>
<td>seraph-config.xml</td>
<td>atlassian-jira/WEB-INF/classes</td>
<td>webapp/WEB-INF/classes</td>
<td>Modified if you have integrated Crowd with JIRA.</td>
</tr>
</tbody>
</table>
The version-specific upgrade notes contain details on properties which may have changed in these commonly modified files.

In addition to the files above, you should also consider and/or perform the following configurations as part of the upgrade process:

- **Using JIRA with Atlassian's Crowd?** — If you are using Crowd with JIRA, configure your new JIRA to talk to Crowd as described in Integrating Crowd with JIRA.
  - Remember to configure Crowd to grant JIRA's new hostname/IP access: Specifying an Application's Address or Hostname
- **Allocating additional memory to JIRA** — If you had previously allocated additional memory to JIRA, do the same for your new JIRA instance. For more information refer to Increasing JIRA memory.
- **Plugins** — For any plugins that you had installed in your old JIRA, download the plugin version for your new version of JIRA from the http://plugins.atlassian.com site.
- **Character encoding** — Ensure that character encoding (i.e. locale) is the same on the new and old locations. Your new version of JIRA may not function correctly if attachments are moved between two system with incompatible encoding.
- **Customisations** — If you had made any customisations (code, templates or configuration files), copy over compatible versions of these changes to the new JIRA. (The developers within your organisation who made the customisations to your old version will need to build and test equivalent changes for the new version, and provide you with the files to copy to your upgraded JIRA installation.)
- **(Optional) Running JIRA on a different port** — If your new JIRA is installed on the same machine as your old JIRA, you may wish to make sure it runs on a different port (in case you ever need to restart your old JIRA). See Changing JIRA's TCP Ports for details.

### 3.5 Start your new version of JIRA

1. Verify that your old JIRA installation is shut down — if this JIRA server is still operating, shut it down.
2. If you installed the JIRA WAR distribution within Tomcat, delete the Tomcat work directory before restarting JIRA. If you do not do this, users may encounter errors when they try to display JIRA pages.
3. Start up your new version of JIRA. For:
   - 'Recommended' distributions — follow the Starting JIRA instructions.
   - WAR distributions — follow the instructions for starting JIRA for your application server within the Installing JIRA WAR section.
   
   During the startup process, your new JIRA installation will create any required database indexes. If you created any custom database indexes, please check them afterwards and remove any that duplicate the indexes added by JIRA.

### Do not restart your old JIRA installation...

If your new JIRA 6.2 installation is on the same server as your old one, it may still be configured to use the same JIRA Home directory as your new JIRA installation. Running two separate JIRA installations which share a common JIRA Home directory can lead to serious data corruption.

Nevertheless, we recommend that you do not delete any aspect (or backed up component) of your old JIRA installation, until you are satisfied that your upgraded JIRA installation is functioning as expected.

### 3.6 Import your old JIRA data into your new JIRA

- Do not restart your old JIRA installation...
After you have started your new JIRA installation, import the data from your old instance into the new instance. You will need the backup file of data from your old JIRA that you created earlier in these instructions (above).

To import your old JIRA data into your new JIRA:

1. Log in as a user with the 'JIRA System Administrators' global permission.
2. Select Administration > System > Import & Export > Restore System (tab) to open the ‘Restore JIRA data from Backup’ page.
   - Keyboard shortcut: 'g' + 'g' + type 'rest'
3. In the File name field, specify the XML backup file you created previously during the export process (above). That zipped file should contain two xml files: activeobjects.xml and entities.xml. Both of these files must be included in the zipped file for the import process to work.
4. Restore the attachments directory that you backed up previously, into the attachments directory of your new JIRA. (See Restoring Data.)
   - Avoid passing through a proxy when performing an XML restore, especially if your JIRA instance is very large. Using a proxy may cause timeout errors.
5. Access JIRA via your web browser again and log in using a username from your previous JIRA installation.
6. Take a quick look around your JIRA site to confirm that your projects and issues are present and everything looks normal. You should see the new JIRA version number in the page footer.

4. Post upgrade checks and tasks

It is strongly recommended that you perform the following checks and tasks after you have started your new instance of JIRA:

1. Check your server logs for error messages, even if JIRA appears to be running correctly. If there are any errors there that you cannot resolve, create a support case in https://support.atlassian.com, attach your log file and we will advise you on the errors.
2. If you were previously using External User Management, enable it in the new JIRA instance.
3. If you changed machines when upgrading, change the paths to the indexes, attachments and backup directories, from within the Administration section of JIRA.
4. Enable email, if you disabled it during testing.
5. If you migrated any customisations from your old JIRA to the new JIRA, ensure that they are tested thoroughly.
   - If you had downloaded plugins for the new version of JIRA, install the downloaded JAR file(s) in your new JIRA version and carry out any other required installation for the plugin.
   - If the plugin has a properties file, apply the same changes to it as you had in the old properties file (don’t just copy over the old properties file).
6. Once you have confirmed that the new server is working correctly, ensure that the production license is updated for the new server ID, as follows:
   - Locate the appropriate license.
   - Edit the Server ID, as per the new production Server ID, and save it.
   - Update the production license in the new server.

Congratulations! You have completed your JIRA migration/upgrade.

Upgrading JIRA with a Fallback Method

This page describes how to upgrade JIRA 4.4.x or later in a way that allows you to safely roll back to your previous system if the upgrade process takes longer than expected or if you encounter issues. This method is especially useful for enterprise environments and for organisations where JIRA is mission-critical for the
business. You can also use this method so you have a fallback option if you are performing a complex system change, such as changing the operating system that will run JIRA, the database that will store JIRA's data or the location of JIRA's index and/or attachments paths.

Because this process is designed to provide the safest possible upgrade method, it requires advanced knowledge of database administration tasks. We recommend you have the following resources and/or skill sets available for your upgrade:

- **Database Administrator** - for general production-level database administration *(i.e. run backups, create, remove, restore, etc.)*
- **JIRA Application Administrator** - for general application administration and upgrade management *(i.e. JIRA SME, user with System Administrator privileges and deep understanding of application and associated dependencies within your organization.)*
- **Systems/Network Administrator** - for managing systems and networks *(i.e. proxy servers, DNS changes, monitoring, VM’s, hardware, etc.)*

This upgrade process also requires you to make backups of your database, which can be time-consuming. Customers with large JIRA environments should plan for four hours of downtime. If you know your system takes several hours to re-index, you might want to allocate more than four hours for the upgrade.

See [Upgrading JIRA](#) for more information on the methods you can use to upgrade JIRA.

---

**Before You Start**

- **Read about the new version** - Review the release notes and upgrade notes for the version of JIRA that you are upgrading to. See [Production Releases](#). If you plan to skip a few JIRA versions during your upgrade, consider the following:

---
upgrade, we strongly recommend that you read the upgrade guides for all major versions between your current version and the version to which you are upgrading. Refer to Important Version-Specific Upgrade Notes for quick links to these guides.

- **Check your license** - Verify that your license support period is still valid.
- **Check for known issues** - Use the JIRA Knowledge Base to search for any issues in the new version that will affect you.
- **Check for compatibility**:
  - Confirm that your operating system, database, other applicable platforms and hardware still comply with the requirements for JIRA 6.2. The End of Support Announcements for JIRA page also has important information regarding platform support for future versions of JIRA.
  - If you have installed JIRA plugins (i.e. not included with JIRA), verify that they will be compatible with the version of JIRA you are upgrading to. You can find a plugin's compatibility information from the plugin's home page on the Atlassian Plugin Exchange.
  - Some anti-virus or other Internet security tools may interfere with the JIRA upgrade process and prevent the process from completing successfully. If you experience or anticipate experiencing such an issue with your anti-virus/Internet security tool, disable this tool before proceeding with the JIRA upgrade.

If you have any problems during the upgrade process, create an issue at our support site so that we can help you resolve the problems with your upgrade. We strongly recommend that you perform the below procedure first as a test only. This will allow you to note any complications (e.g. with customized settings or add-ons) ahead of time so that you can minimize the downtime of the system.

1. **Prepare Your Production Instance for Upgrade**

   When you begin preparing to upgrade, it's best practice to halt any major changes to your production system (such as plugin upgrades, customisations, etc.). Keeping your production system as stable as possible will make testing the upgrade version simpler.

   It's also a good idea to let your users know about planned downtime, either through email or by using JIRA's announcement banner.

2. **Set Up a Proxy Server**

   Before beginning the upgrade process set up a reverse proxy, such as a load balancer. The proxy server allows you to redirect users to a different JIRA server without having to wait for a DNS change - this change will be invisible to the end-user. If, at any point during the upgrade process, you encounter issues you can't resolve and you need to rollback to your existing JIRA instance, simply restart your existing JIRA instance and reconfigure the proxy server to point to the old server.

   If you use monitoring, API calls (such as SOAP, REST, or CLI), or scripts associated with your production server, update them with the new proxy information.

   Please see the following documentation for further information on configuring Apache:

   - Integrating JIRA with Apache
   - Integrating JIRA with Apache using SSL

3. **Pre-Stage and Test the New Version of JIRA**

   1. If you want to use a copy of your production data when you test the upgraded JIRA system, make a copy of your production database using your native database backup tools. See Backing Up Data. You can alternatively skip this step and use a new database for testing.
   2. Install the version of JIRA you want to upgrade to onto a system you can use for testing (use either a test server or a separate directory on an existing system). This will become your new production system after you complete the upgrade process. Follow the instructions here to install a new version of JIRA: Installing JIRA.
   3. Migrate any customisations you use in your production system. Follow the instructions in step 3.4 (Migrate your existing JIRA configurations over to your new JIRA installation) in the "Migrating JIRA to Another Server" page.
   4. Connect the new version of JIRA to the copy of the production database (not the existing production database) or a new testing database. See Connecting JIRA to a Database.
   5. Start the new version of JIRA. See this Knowledge Base article about how to test mail settings without accidentally sending notifications to users from the test system: How to Prepare a Development Server's
Mail Configuration.

6. Install any plugins that you use in your existing production version of JIRA. Some plugins have different compatibility for different JIRA versions, so this step will ensure that your plugins are updated for this new JIRA version.

7. Re-index JIRA so the new plugin information is captured in the index.

8. Check out the features and functionality you use in the new version to understand how they behave and how any changes will impact your team. It can be very helpful to have a group of users look at the new system and carry out their usual tasks to make sure they won’t run into any issues when the new version is in production.

When you are ready to begin the process of migrating your production data to this new version, shut down JIRA (for example, by executing either the /bin/stop-jira.sh or \bin\stop-jira.bat file in your JIRA Installation Directory, or by stopping the JIRA service).

4. Disable the Old JIRA Production Instance and Start the New Instance

Before disabling your old JIRA production instance, identify the location of your attachments and index directories. If they are located outside of your JIRA Home Directory, you will back them up manually later during the upgrade process. These pages describe how to find out where these directories are located in your environment:

- Your attachments directory — Refer to the Configuring File Attachments page for your version of JIRA.
- Your index directory — Refer to the Search Indexing page for your version of JIRA.

If your attachments and index directories are located outside of the JIRA Home directory, note their location so you can easily find them later.

After you've located the attachments and index directories, disable the old JIRA production instance so you can perform a database backup:

1. Shut down your old production JIRA instance (for example, by executing either the /bin/stop-jira.sh or \bin\stop-jira.bat file in your JIRA Installation Directory, or by stopping the JIRA service).
2. Using your database's native backup tools, perform a backup of the data in your old production JIRA instance. See Backing Up Data.
3. Set the newest copy of the production database as the new database for production.

Make sure that the database set up for the new production version of JIRA is clearly distinguishable from the database backup of your old production JIRA, and that the new production instance is not configured to connect to the old production database.

4. Synchronise the JIRA attachment directories:

   a. Locate the JIRA Home directory. You can find information about the location of the directory by navigating to the <jira-application-dir>/WEB-INF/classes/jira-application.properties file in your JIRA Installation Directory. Alternatively, you can open the JIRA Configuration Tool to see the directory that is set as your JIRA Home.
   b. Navigate to the directory specified in the configuration file and create a backup of it in another directory.
   c. If the attachments and index directories are located outside of your JIRA Home Directory, you must back them up separately. (See the beginning of this task for information on how to find these files.)

   Also refer to Backing Up Data for more information about backing up attachments in JIRA.
   d. Replace the JIRA Home directory (and the attachment and index directories, if separate from the JIRA Home directory) in the new JIRA production environment with the backups you made of the old production directories.

5. Start the new version of JIRA in your new production environment. When you start this version, JIRA will upgrade your data and may perform a re-index. When the re-indexing is complete, verify that your data is present and that there are no issues with the system.

The re-indexing may take up to several hours, depending on the size of your instance. If you know that your instance takes a long time to index, make sure to plan your scheduled downtime accordingly.
6. Reconfigure the proxy server you set up in step 2 so that the new version of JIRA becomes your production instance. Make sure to let your users know about the new instance (including the new domain name) and any changes that might affect them.

If you experience any issues in the new production environment, you can simply revert the proxy server settings and re-instate your old production instance until you can resolve the issue.

9. Post Upgrade Checks and Tasks

It is strongly recommended that you perform the following checks and tasks after you have started your new instance of JIRA:

1. Check your server logs for error messages, even if JIRA appears to be running correctly. If there are any errors there that you cannot resolve, create a support case in https://support.atlassian.com, attach your log file and we will advise you on the errors.

2. If you were previously using External User Management, enable it in the new JIRA instance.

3. If you changed machines when upgrading, change the paths to the indexes, attachments and backup directories, from within the Administration section of JIRA.

4. Enable email, if you disabled it during testing.

5. If you migrated any customisations from your old JIRA to the new JIRA, ensure that they are tested thoroughly.
   a. If you had downloaded plugins for the new version of JIRA, install the downloaded JAR file(s) in your new JIRA version and carry out any other required installation for the plugin.
   b. If the plugin has a properties file, apply the same changes to it as you had in the old properties file (don't just copy over the old properties file).

6. Once you have confirmed that the new server is working correctly, ensure that the production license is updated for the new server ID, as follows:
   b. Locate the appropriate license.
   c. Edit the Server ID, as per the new production Server ID, and save it.
   d. Update the production license in the new server.

Once you have confirmed the availability of compatible versions, you should upgrade your plugins after successfully upgrading JIRA. This can be done via the 'Plugin Repository' in your Administration Console. It is recommended that you re-index JIRA after upgrading your plugins.

Congratulations! You have completed your JIRA migration/upgrade.

Upgrading JIRA Using a Rapid Upgrade Method

This page describes how to upgrade JIRA 4.3.0 or later in the quickest way possible. This method can save you time since it does not require you to set up a separate test instance before you upgrade (that is, you upgrade JIRA "in-place"). However, it does assume that your JIRA instance is not mission critical and that users or the business won't be negatively affected when JIRA is unavailable during the upgrade.

You should use this method to upgrade JIRA if you are upgrading from the recommended (not WAR) JIRA distribution 4.3.0 or later on Windows or Linux. See Upgrading JIRA for more information on the methods you can use to upgrade JIRA.

On this page:
- Before You Start
- 1. Checking for Customizations
- 2. Backing Up Your External Database
- 3. Performing the Upgrade
- 4. Post Upgrade Checks and Tasks

Before You Start

- Read about the new version - Review the release notes and upgrade notes for the version of JIRA that you are upgrading to. See Production Releases. If you plan to skip a few JIRA versions during your upgrade, we strongly recommend that you read the upgrade guides for all major versions between your current version and the version to which you are upgrading. Refer to Important Version-Specific Upgrade Notes for quick links to these guides.
• **Check your license** - Verify that your license support period is still valid.
• **Check for known issues** - Use the JIRA Knowledge Base to search for any issues in the new version that will affect you.

**Check for compatibility:**
- Confirm that your operating system, database, other applicable platforms and hardware still comply with the requirements for JIRA 6.2. The End of Support Announcements for JIRA page also has important information regarding platform support for future versions of JIRA.
- If you have installed JIRA plugins (i.e. not included with JIRA), verify that they will be compatible with the version of JIRA you are upgrading to. You can find a plugin's compatibility information from the plugin's home page on the Atlassian Plugin Exchange.
- Some anti-virus or other Internet security tools may interfere with the JIRA upgrade process and prevent the process from completing successfully. If you experience or anticipate experiencing such an issue with your anti-virus/Internet security tool, disable this tool before proceeding with the JIRA upgrade.

1. Checking for Customizations

Using the rapid upgrade method allows the installer to automatically perform many of the upgrade tasks for you. However, if you have made customizations to your JIRA installation, you must migrate customized files manually to the upgraded installation. The installer checks for and migrates automatically:

- Legacy database configurations defined as a datasource within the application server (used in JIRA 4.3.x and earlier) to the new database configuration used in JIRA 4.4 and later. See JIRA 4.4 Upgrade Notes for details.
- TCP port values in your existing JIRA installation's server.xml file. Other configurations or customizations in this file are not migrated.
- Custom values in your existing JIRA installation's jira-application.properties and setenv.sh/setenv.bat files.

In the setenv.sh/setenv.bat file, only the following values are migrated:
- JVM_SUPPORT_RECOMMENDED_ARGS
- JVM_MINIMUM_MEMORY
- JVM_MAXIMUM_MEMORY
- JIRA_MAX_PERM_SIZE

During the upgrade process, the installer detects and notifies you of any files (other than jira-application.properties and setenv.sh/setenv.bat) in the atlassian-jira subdirectory of your existing JIRA Installation Directory, which had been deleted, added or modified from a 'default' JIRA installation. If you have made customizations to your seraph-config.xml file or any other file customizations in your JIRA installation directory which are not handled by the upgrade wizard, you must migrate these to the upgraded JIRA installation manually.

The upgrade feature also re-uses your existing JIRA Home Directory so that any key data stored in this directory from your previous JIRA installation will be retained after the JIRA upgrade.

**Please Note:**

- The upgrade process requests that you conduct a backup of your database using your database's backup utilities. If your database does not support online backups, you can stop the upgrade process, shut down JIRA, perform your database backup and then restart the upgrade process to continue on.
- The installer automatically backs up the Installation and Home directories of the existing JIRA installation. If your attachments and index files are located outside your JIRA Home Directory, you must manually back up these files. These pages describe how to find out where these directories are located in your environment:
  - Your attachments directory — Refer to the Configuring File Attachments page for your version of JIRA.
  - Your index directory — Refer to the Search Indexing page for your version of JIRA.

2. Backing Up Your External Database

After you launch the upgrade wizard, but before it begins the upgrade, it asks you to back up your external database. You can back up the database using your database's native backup tools, however, note the following:
1. If your database's native backup tools support online backups (i.e. backups that would typically create a "snapshot" of your JIRA database while the database is still in use), you can leave the upgrade wizard running while you perform the database backup and then continue on with the wizard after verifying that the database backup was created correctly.

2. If your database's native backup tools do not allow you to perform an online backup of your JIRA database, you should:
   - Quit the upgrade wizard when it prompts you to back up the database.
   - Prevent users from updating your existing JIRA data (to ensure structural consistency of your database backup) by temporarily restricting access to JIRA. Refer to the Preventing users from accessing JIRA during backups page for more information.
   - Use your database's native backup tools to perform an "offline backup" of your JIRA database and verify that this backup was created correctly.
   - Re-start the Linux / Windows Installer to start the upgrade wizard again and continue from where you left off.

3. JIRA's 'internal' database is HSQLDB, which should be used for evaluating JIRA only. If you happen to accidentally use the HSQLDB database for a production system, quit the upgrade wizard when it prompts you about the backup and use the Migrating JIRA to Another Server procedure to upgrade JIRA.

**Inconsistent database backups may not restore correctly!** If you are unfamiliar with your database's native backup/restore facilities, then before proceeding, test your database backup's integrity by:

- restoring the database backup to a different (test) system and
- connecting a test instance of your current JIRA version to this restored database.

3. Performing the Upgrade

Refer to the appropriate upgrade instructions below for your operating system:

- **Windows**
- **Linux**

### Upgrading JIRA on Windows

1. Download the 'JIRA Windows Installer' (.exe) file (for the new version of JIRA) from the JIRA Download page.
2. Shut down JIRA.
3. Run the '.exe' file to start the upgrade wizard.
   - If a Windows 7 (or Vista) 'User Account Control' dialog box asks you to allow the upgrade wizard to make changes to your computer, specify Yes. If you do not, the installation wizard will have restricted access to your operating system and any subsequent installation options will be limited.
4. At the 'Upgrading JIRA?' step, choose the Upgrade an existing JIRA installation option.
5. In the Existing JIRA installation directory field, specify the JIRA Installation Directory of your JIRA installation to be upgraded.
   - The upgrade wizard will attempt to find an existing JIRA installation and use its location to pre-populate this field. However, always verify this location, particularly if you have multiple JIRA installations running on the same machine.
6. During subsequent steps of the upgrade wizard, you will be prompted to specify or do the following options:
   a. At the 'Back up JIRA directories' step, ensure the Back up these directories option is selected. This creates 'zip' archive file backups of your existing JIRA Installation and JIRA Home Directories in their respective parent directory locations.
      
      **Please Note:**
      - Choosing this option is strongly recommended!
      - At this point, the upgrade wizard notes any customizations in your existing JIRA Installation Directory which it cannot automatically migrate to your upgraded JIRA installation. If you are informed of any files containing such customizations, please make a note of these files as you will need to manually migrate their customizations (which are not mentioned in the overview above) to your upgraded JIRA installation. One relatively common customization that the upgrade wizard cannot automatically migrate is an SSL configuration defined in the con
      f/server.xml file of the JIRA Installation Directory.
   b. At the 'Upgrade Check List' step, back up your external database and check that any non-bundled plugins will be compatible with your upgraded JIRA version. You may have already backed up your database (in step 2: Backing Up Your External Database).
c. After the 'Upgrade Check List' step, the existing JIRA installation will be shut down if it is still running. The upgrade wizard will then:

i. Back up your existing JIRA installation.
ii. Delete the contents of the existing JIRA Installation Directory.
iii. Install the new version of JIRA to the existing JIRA Installation Directory.
iv. Start your new (upgraded) JIRA installation.

⚠️ If you noted any files that contain customizations which must be migrated manually to your upgraded JIRA installation (above), then:

1. Stop the upgraded JIRA installation.
2. Migrate the customizations from these files into the upgraded JIRA Installation Directory.
3. Restart the upgraded JIRA installation.

7. At the last step of the upgrade wizard, select the option to launch the upgraded JIRA installation in a browser so you can check the upgrade.

Congratulations, you have completed upgrading your JIRA installation on Windows!

Upgrading JIRA on Linux

1. Download the appropriate 'JIRA 'Linux 64-bit / 32-bit Installer' (.bin) file that suits your operating system (for the new version of JIRA) from the JIRA Download page.
2. Shut down JIRA.
3. Open a Linux console and change directory (cd) to the '.bin' file's directory.

⚠️ If the '.bin' file is not executable after downloading it, make it executable, for example:
```bash
chmod a+x atlassian-jira-X.Y.bin
```
(where X.Y represents your version of JIRA)
4. Execute the '.bin' file to start the upgrade wizard.
5. When prompted to choose between creating a new JIRA installation or upgrading an existing installation, choose the Upgrade an existing JIRA installation option.
6. Specify the JIRA Installation Directory of your JIRA installation to be upgraded.

⚠️ The upgrade wizard will attempt to find an existing JIRA installation and will provide its location as a choice. However, always verify this location, particularly if you have multiple JIRA installations running on the same machine.

7. During subsequent steps of the upgrade wizard, you will be prompted to specify or do the following options:

a. Choose the option to back up JIRA’s directories. This creates ‘zip’ archive file backups of your existing JIRA Installation and JIRA Home Directories in their respective parent directory locations.

⚠️ Please Note:

- **Choosing this option is strongly recommended!**
- At this point, the upgrade wizard notes any customizations in your existing JIRA Installation Directory which it cannot automatically migrate to your upgraded JIRA installation. If you are informed of any files containing such customizations, please make a note of these files as you will need to manually migrate their customizations (which are not mentioned in the over view above) to your upgraded JIRA installation. One relatively common customization that the upgrade wizard cannot automatically migrate is an SSL configuration defined in the `conf/f/server.xml` file of the JIRA Installation Directory.

b. At the 'Upgrade Check List' step, back up your external database. You may have already backed up your database (in step 2 Backing Up Your External Database).

c. After the 'Upgrade Check List' step, the existing JIRA installation will be shut down if it is still running. The upgrade wizard will then:

i. Back up your existing JIRA installation.
ii. Delete the contents of the existing JIRA installation directory.
iii. Install the new version of JIRA to the existing JIRA installation directory.
iv. Starts your new (upgraded) JIRA installation.

⚠️ If you noted any files that contain customizations which must be migrated manually to your upgraded JIRA installation (above), then:

1. Stop the upgraded JIRA installation.
2. Migrate the customizations from these files into the upgraded JIRA Installation Directory.
3. Restart the upgraded JIRA installation.

8. The last step of the upgrade wizard provides you with a link to launch the upgraded JIRA installation in a browser, so you can check the upgrade.
Congratulations, you have completed upgrading your JIRA installation on Linux!

4. Post Upgrade Checks and Tasks

Once you have confirmed the availability of compatible versions, you should upgrade your plugins after successfully upgrading JIRA. This can be done via the Plugin Repository in your Administration Console.

**Congratulations! You have completed your JIRA upgrade.**

**Skipping Major Versions When Upgrading JIRA**

To upgrade from early versions of JIRA (3.x or earlier) to newer versions, you must upgrade to JIRA 4.4.5 before upgrading to a later version.

Follow these steps to skip major versions as you upgrade JIRA:

1. **Prepare**: Read the upgrade guides for all the major versions between your current version and the version to which you are upgrading. You can read about important changes between versions in the Important Version-Specific Upgrade Notes.
2. **Upgrade to an interim version (JIRA 3.x or earlier only)**: Upgrade to JIRA 4.4.5 following these Upgrading JIRA with a Fallback Method instructions.
3. **Upgrade to the new version**: Upgrade to the new version of JIRA following these appropriate instructions. Use the table on Upgrading JIRA page to determine which method is appropriate for your environment.

**Disabling Auto-Export**

When upgrading JIRA, one points the new JIRA installation at the old JIRA database. JIRA will automatically make any structural database modifications required to support new JIRA features.

To be safe, JIRA first tries to create an XML backup of your data at the point just before the upgrade. This would allow you to ‘roll back’ to the old JIRA version, should anything go wrong.

Sometimes the automatic XML backup procedure fails, often resulting from characters in the database which cannot be represented in XML — such as non-displayable control characters that have been 'cut-and-pasted' into a JIRA field.

Disabling Auto-Export

In these circumstances, you can force the upgrade to proceed by editing your jira-config.properties file (in the JIRA Home Directory) and setting the property jira.autoexport=false

See Making changes to the jira-config.properties file for more information.

After having successfully upgraded JIRA, it is best to remove this property (or disable it with a '#') as it should no longer be required.
If you have any upgrade problems not covered here or in the upgrade documentation, please contact us — we’re happy to help.

**Rolling Back a JIRA Upgrade**

The ‘roll back' procedures on this page describe how to restore your previous version of JIRA in the unlikely event that you encounter an issue with your JIRA upgrade. Please follow the procedure below that relates to the upgrade procedure you used. Note that any data changed since the last backup will not be present after rolling back.

1. If you upgraded JIRA using the Migrating JIRA to Another Server procedure, your previous JIRA installation should still be ‘intact’ (assuming you haven’t deleted it) and there should not be a need to perform any ‘roll back’.

**Rolling Back a JIRA Upgrade Conducted Using the Upgrade Wizard**

Use this procedure to roll back a JIRA upgrade conducted using the upgrade wizard.

1. Prior to rolling back your JIRA upgrade, ensure that you have the following backups from your previous JIRA version:
   - The JIRA database (generated by your database’s own backup tools).
   - The JIRA Home Directory.
   - The JIRA Installation Directory.

To roll back your JIRA upgrade conducted using the upgrade wizard:

1. Stop the JIRA upgrade or the upgraded JIRA server if it is running.
2. Use your database server’s tools to restore the JIRA database backup you had created.
3. Delete the contents of the JIRA Installation Directory.
4. Restore the backed-up JIRA Installation Directory to the same location in the previous step.
5. Delete the contents of the JIRA Home Directory.
6. Restore the backed-up JIRA Home Directory to the same location in the previous step.
7. Start JIRA (by running the start-jira.sh or start-jira.bat file in the bin subdirectory of your restored JIRA installation directory).

   - On Windows based systems if JIRA was installed as a service, restart the Atlassian JIRA service from the Control Panel. The JIRA service entry will be retained even if there is an error during upgrade in order to facilitate the rollback.

**Rolling Back a JIRA Upgrade Conducted Manually**

Use this procedure to roll back a JIRA upgrade conducted using the manual JIRA upgrade procedure (involving an ‘in-place’ database upgrade). The intended result of this procedure is to restore your previous JIRA installation to its original state (consisting of the restored database as well as the JIRA Installation and Home directories in their original locations).

1. Prior to rolling back your JIRA upgrade, ensure that you have the following backups from your previous JIRA version:
   - The JIRA database (generated by your database’s own backup tools).
   - The JIRA Home Directory.
   - The JIRA Installation Directory.

To roll back your JIRA upgrade conducted manually with an 'in-place' database upgrade:

1. Stop the JIRA upgrade or the upgraded JIRA server if it is running.
2. Use your database server's tools to restore the JIRA database backup you had created.
3. If you had deleted the JIRA Installation Directory of your previous JIRA version, restore the backed-up JIRA Installation Directory to its original location.
4. Delete the contents of the JIRA Home Directory.
5. Restore the backed-up JIRA Home Directory to the same location in the previous step.
6. Start JIRA (by running the start-jira.sh or start-jira.bat file in the bin subdirectory of your restored JIRA installation directory).

**Migrating JIRA to Another Server**

This document describes how to migrate/upgrade to JIRA 6.2 on different server hardware or in a different server environment that entails one or more of the following:
• a new operating system that will run JIRA,
• new locations for storing your index and/or attachments, or
• a new database or database system that will store JIRA's data.

If you are upgrading to a newer version of JIRA during the migration, please see Upgrading JIRA for information on the pre-requisite tasks you need to complete before upgrading.

**On this page:**
- **1. Before You Start**
- **2. Backing Up**
  - 2.1 Stop users from updating JIRA data
  - 2.2 Back up your database
  - 2.3 Back up your JIRA Home directory
  - 2.4 Back up your attachments and index directories if located outside your JIRA Home directory
  - 2.5 Back up your JIRA Installation directory
- **3. Setting up your New JIRA Installation**
  - 3.1 Install the new version of JIRA
  - 3.2 Point your new JIRA to (a copy of) your existing JIRA Home directory
  - 3.3 Connect the new version of JIRA to a new, empty database
  - 3.4 Migrate your existing JIRA configurations over to your new JIRA installation
  - 3.5 Start your new version of JIRA
  - 3.6 Import your old JIRA data into your new JIRA
- **4. Post Migration Checks and Tasks**

### 1. Before You Start

- **Check your license** - Verify that your license support period is still valid.
- **Check for known issues** - Use the JIRA Knowledge Base to search for any issues in the new version that will affect you.
- **Check for compatibility:**
  - Confirm that your operating system, database, other applicable platforms and hardware still comply with the requirements for JIRA 6.2. The End of Support Announcements for JIRA page also has important information regarding platform support for future versions of JIRA.
  - If you have installed JIRA Add-ons (i.e. not included with JIRA), verify that they will be compatible. You can find a add-on's compatibility information from the the add-on's home page on the Atlassian Marketplace. You can also follow the procedure outlined here: Checking Add-on Compatibility with Application Updates to have the Universal Add-on Manager help you with this.

⚠️ **We strongly recommend performing your migration in a test environment first. Do not migrate your production JIRA server until you are satisfied that your test environment upgrade has been successful.**

- If you have any problems with your test environment which you cannot resolve, create an issue at our support site so that we can assist you.
- If you have any problems during the migration of your production JIRA server, do not allow your users to start using this server. Instead:
  - Continue to use your old JIRA server — this will help ensure that you do not lose production data.
  - Also create an issue at our support site so that we can help you resolve the problems with your migration.

Some anti-virus or other Internet security tools may interfere with the migration and prevent the process from completing successfully. If you experience or anticipate experiencing such an issue with your anti-virus/Internet security tool, disable this tool first before proceeding with the JIRA migration.

### 2. Backing Up

#### 2.1 Stop users from updating JIRA data

- We strongly recommend performing your migration in a test environment first. Do not migrate your production JIRA server until you are satisfied that your test environment upgrade has been successful.

- If you have any problems with your test environment which you cannot resolve, create an issue at our support site so that we can assist you.
- If you have any problems during the migration of your production JIRA server, do not allow your users to start using this server. Instead:
  - Continue to use your old JIRA server — this will help ensure that you do not lose production data.
  - Also create an issue at our support site so that we can help you resolve the problems with your migration.
During the upgrade process, you'll export JIRA's database from your existing JIRA installation (via an XML backup) and then restore this backup into a new JIRA installation. To ensure that the data in the XML backup is consistent with the latest data in the system, you must temporarily restrict access to JIRA so users can't update the data. Refer to the Preventing users from accessing JIRA during backups page for more information.

⚠️ Be aware! Inconsistent XML backups cannot be restored!

### 2.2 Back up your database

Perform an XML backup of your existing JIRA installation's external database. For large JIRA installations, this process may require several hours to complete.

The 'embedded database' is the HSQLDB database supplied with JIRA for evaluation purposes only. If you accidentally use the HSQLDB database in a production system, perform an XML backup of this database and continue on with this procedure.

### 2.3 Back up your JIRA Home directory

1. Shut down JIRA.
2. Locate the **JIRA Home directory.** You can find information about the location of the directory by navigating to the `<jira-application-dir>/WEB-INF/classes/jira-application.properties` file in your JIRA Installation Directory. Alternatively, you can open the JIRA Configuration Tool to see the directory that is set as your JIRA Home.
3. Navigate to the directory specified in the configuration file and create a backup of it in another directory.
4. Delete the file `<jira-home>/dbconfig.xml` as soon as the backup is complete.

### 2.4 Back up your attachments and index directories if located outside your JIRA Home directory

If the attachments and index directories are located outside of your JIRA Home Directory, you must back them up separately. These pages describe how to find out where these directories are located in your implementation:

- Your attachments directory — Refer to Configuring File Attachments page in the documentation for your version of JIRA.
- Your index directory — Refer to Search Indexing page in the documentation for your version of JIRA.

Also refer to Backing Up Data for more information about backing up attachments in JIRA.

### 2.5 Back up your JIRA Installation directory

The 'JIRA Installation Directory' is the directory into which the JIRA application files and libraries were extracted when JIRA was installed.

### 3. Setting up your New JIRA Installation

If you are running a 'mission-critical' JIRA server, we highly recommend performing the remaining steps of this guide in a test environment (e.g. using a separate test JIRA database and a copy of your JIRA Home directory) before performing the upgrade for production use.

### 3.1 Install the new version of JIRA

First, you must start with a fresh installation of JIRA, either the current version or a newer one. If you are upgrading JIRA during this process, please see Upgrading JIRA for information on the pre-requisite tasks you need to complete before upgrading.

Download and extract the JIRA distribution you require, to a new directory. **Do not overwrite your existing JIRA installation. Ensure this has been shut down and install the new JIRA version to a new location.**

Follow the installation instructions for either:

- Installing JIRA (recommended), or
- Installing JIRA WAR

If you are using JIRA WAR, remember to build your new JIRA web application and deploy it to your server. For specific instructions, refer to the JIRA WAR installation page for your application server within the Installing
3.2 Point your new JIRA to (a copy of) your existing JIRA Home directory

If your new JIRA 6.2 installation is on a new server, copy the backup of your existing JIRA Home Directory from the old server to the new server before proceeding.

To set up a "recommended" (not WAR) distribution:

1. Open the JIRA Configuration Tool.
2. Click the JIRA Home tab.
3. Update the JIRA Home Directory field:
   - If your JIRA 6.2 installation is on a new server, update the JIRA Home Directory field to the path of your copied JIRA Home directory.
   - If your JIRA 6.2 installation is on the same server, update the JIRA Home Directory field to the path of your existing JIRA Home directory.
   - For more information about this directory, see JIRA Home Directory.

To set up a WAR distribution:

1. Edit the jira-application.properties file located within the <jira-application-dir>/WEB-INF/classes subdirectory of your new JIRA 6.2 Installation Directory JIRA Installation Directory.
2. Update the jira.home property in this file to the path of the new JIRA Home Directory:
   - If your JIRA 6.2 installation is on a new server, update the jira.home property to the path of your copied JIRA Home directory.
   - If your JIRA 6.2 installation is on the same server, update the jira.home property to the path of your existing JIRA Home directory.
   - For more information about this directory, see JIRA Home Directory.
3. Remove the '#' at the beginning of the jira.home line (so that JIRA no longer regards this line as a comment).
4. Save your updated jira-application.properties file.

You can also set your JIRA Home Directory's location by defining an operating system environment variable JIRA_HOME. This value of this variable takes precedence over the value of the jira.home property in the jira-application.properties file in your JIRA Installation Directory. See Setting your JIRA Home Directory for details.

3.3 Connect the new version of JIRA to a new, empty database

Create a new, empty database that your new JIRA installation will use to store its data.

Follow the appropriate 'Connecting JIRA to...' instructions for your database from stage 2, although from stage 4 of that procedure, be aware of the yellow note below:

- Connecting JIRA to PostgreSQL
- Connecting JIRA to MySQL
- Connecting JIRA to Oracle
- Connecting JIRA to SQL Server 2005
- Connecting JIRA to SQL Server 2008

If you are using a database (called jiradb, for example) with your existing JIRA installation and the database for your new JIRA installation is running on the same machine or database server, create your new database with a different name (e.g. something intuitive like jiradb_440 for JIRA 4.4.0). However, ensure the new database has identical access permissions to the old JIRA database. Consult your database administrator if you need assistance with this.

You do not need to create a new database if you are using the embedded HSQL database.

3.4 Migrate your existing JIRA configurations over to your new JIRA installation

If you have modified properties in configuration files of your existing JIRA installation, make the same modifications in your new JIRA installation. However, because the properties in the configuration files may have changed between versions, you cannot simply copy the configuration files from your existing installation and
replace the equivalent files in the new installation.

For each file you have modified in your existing JIRA installation, you need to **manually edit each equivalent file in your new JIRA installation and re-apply your modifications**. If a file is not present in your new JIRA installation (for example, osuser.xml in recent JIRA versions), then simply copy that file over to your new JIRA installation.

The table below lists the most commonly modified files and their locations within your JIRA Installation Directory:

<table>
<thead>
<tr>
<th>File</th>
<th>Location in 'recommended' (formerly 'Standalone') JIRA distributions</th>
<th>Location in JIRA WAR</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jira-application.properties</td>
<td>atlassian-jira/WEB-INF/classes</td>
<td>webapp/WEB-INF/classes</td>
<td>Location of the JIRA Home Directory and Advanced JIRA Configuration in JIRA 4.3.x and earlier. Any custom property values defined in the jira-application.properties file of your existing JIRA 4.3.x (or earlier) installation must be migrated across to the jira-application.properties file of your new JIRA 6.2 installation before you start your new JIRA installation. Upon starting your new JIRA installation, any custom property values in the jira-application.properties file will automatically be migrated across to either the JIRA database or jira-config.properties file. jira.home is the only property of the jira-application.properties file subsequently used by JIRA.</td>
</tr>
<tr>
<td>setenv.bat (Windows) or setenv.sh (Linux)</td>
<td>bin</td>
<td>Application server's bin directory</td>
<td>Increasing JIRA Memory</td>
</tr>
<tr>
<td>osuser.xml (not required if upgrading from JIRA 4.3.0 or later)</td>
<td>atlassian-jira/WEB-INF/classes</td>
<td>webapp/WEB-INF/classes</td>
<td>Modified if you have integrated LDAP with JIRA, integrated Crowd with JIRA, or if you are using a custom form of external user management or user authentication.</td>
</tr>
<tr>
<td>seraph-config.xml</td>
<td>atlassian-jira/WEB-INF/classes</td>
<td>webapp/WEB-INF/classes</td>
<td>Modified if you have integrated Crowd with JIRA.</td>
</tr>
<tr>
<td>server.xml</td>
<td>conf</td>
<td>Application server's conf directory</td>
<td>Modified in the following situations:</td>
</tr>
<tr>
<td>------------</td>
<td>------</td>
<td>-------------------------------------</td>
<td>---------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• If you had previously configured JIRA's TCP ports differently from their defaults.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• If you had implemented SSL.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• When connecting JIRA to a database in JIRA 4.3.x and earlier.</td>
</tr>
</tbody>
</table>

The version-specific upgrade notes contain details on properties which may have changed in these commonly modified files.

In addition to the files above, you should also consider and/or perform the following configurations as part of the upgrade process:

- **Using JIRA with Atlassian's Crowd?** — If you are using Crowd with JIRA, configure your new JIRA to talk to Crowd as described in Integrating Crowd with JIRA.
  - Remember to configure Crowd to grant JIRA's new hostname/IP access: Specifying an Application's Address or Hostname
- **Allocating additional memory to JIRA** — If you had previously allocated additional memory to JIRA, do the same for your new JIRA instance. For more information refer to Increasing JIRA memory.
- **Plugins** — For any plugins that you had installed in your old JIRA, download the plugin version for your new version of JIRA from the http://plugins.atlassian.com site.
- **Character encoding** — Ensure that character encoding (i.e. locale) is the same on the new and old locations. Your new version of JIRA may not function correctly if attachments are moved between two system with incompatible encoding.
- **Customisations** — If you had made any customisations (code, templates or configuration files), copy over compatible versions of these changes to the new JIRA. (The developers within your organisation who made the customisations to your old version will need to build and test equivalent changes for the new version, and provide you with the files to copy to your upgraded JIRA installation.)
- **(Optional) Running JIRA on a different port** — If your new JIRA is installed on the same machine as your old JIRA, you may wish to make sure it runs on a different port (in case you ever need to restart your old JIRA). See Changing JIRA's TCP Ports for details.

### 3.5 Start your new version of JIRA

1. Verify that your old JIRA installation is shut down — if this JIRA server is still operating, shut it down.
2. If you installed the JIRA WAR distribution within Tomcat, delete the Tomcat work directory before restarting JIRA. If you do not do this, users may encounter errors when they try to display JIRA pages.
3. Start up your new version of JIRA. For:
   - **'Recommended' distributions** — follow the Starting JIRA instructions.
   - **WAR distributions** — follow the instructions for starting JIRA for your application server within the Installing JIRA WAR section.

During the startup process, your new JIRA installation will create any required database indexes. If you created any custom database indexes, please check them afterwards and remove any that duplicate the indexes added by JIRA.

**Do not restart your old JIRA installation...**

If your new JIRA 6.2 installation is on the same server as your old one, it may still be configured to use the same JIRA Home directory as your new JIRA installation. Running two separate JIRA installations which share a common JIRA Home directory can lead to serious data corruption.

Nevertheless, we recommend that you do not delete any aspect (or backed up component) of your old JIRA installation, until you are satisfied that your upgraded JIRA installation is functioning as expected.

### 3.6 Import your old JIRA data into your new JIRA
After you have started your new JIRA installation, import the data from your old instance into the new instance. You will need the backup file of data from your old JIRA that you created earlier in these instructions (above).

To import your old JIRA data into your new JIRA:

1. Log in as a user with the 'JIRA System Administrators' global permission.
2. Select Administration > System > Import & Export > Restore System (tab) to open the 'Restore JIRA data from Backup' page.
   - Keyboard shortcut: 'g' + 'g' + type 'rest'
3. In the File name field, specify the XML backup file you created previously during the export process (above). That zipped file should contain two xml files: activeobjects.xml and entities.xml. Both of these files must be included in the zipped file for the import process to work.
4. Restore the attachments directory that you backed up previously, into the attachments directory of your new JIRA. (See Restoring Data.)
   - Avoid passing through a proxy when performing an XML restore, especially if your JIRA instance is very large. Using a proxy may cause timeout errors.
5. Access JIRA via your web browser again and log in using a username from your previous JIRA installation.
6. Take a quick look around your JIRA site to confirm that your projects and issues are present and everything looks normal. You should see the new JIRA version number in the page footer.

4. Post Migration Checks and Tasks

It is strongly recommended that you perform the following checks and tasks after you have started your new instance of JIRA:

1. Check your server logs for error messages, even if JIRA appears to be running correctly. If there are any errors there that you cannot resolve, create a support case in https://support.atlassian.com, attach your log file and we will advise you on the errors.
2. If you were previously using External User Management, enable it in the new JIRA instance.
3. If you changed machines when upgrading, change the paths to the indexes, attachments and backup directories, from within the Administration section of JIRA.
4. Enable email, if you disabled it during testing.
5. If you migrated any customisations from your old JIRA to the new JIRA, ensure that they are tested thoroughly.
   a. If you had downloaded plugins for the new version of JIRA, install the downloaded JAR file(s) in your new JIRA version and carry out any other required installation for the plugin.
   b. If the plugin has a properties file, apply the same changes to it as you had in the old properties file (don't just copy over the old properties file).
6. Once you have confirmed that the new server is working correctly, ensure that the production license is updated for the new server ID, as follows:
   b. Locate the appropriate license.
   c. Edit the Server ID, as per the new production Server ID, and save it.
   d. Update the production license in the new server.

Congratulations! You have completed your JIRA migration/upgrade.

Migrating from JIRA OnDemand to a JIRA Installed Site

This page is for people who are currently using a JIRA OnDemand site and wish to move to a JIRA site that is hosted on their own servers. If you want to move a project, not your entire site, then see Restoring a Project from Backup instead (note, the version of your installed JIRA must match the version of JIRA in OnDemand).

Summary

You will need to download and install the latest production release of JIRA (for example, 'JIRA 6.0.2') and then move your data from your hosted JIRA OnDemand site into your newly installed site.
Before you begin

JIRA OnDemand is regularly updated with the absolute latest features and improvements — it is essentially running on a later version of JIRA than the latest downloadable version of JIRA. If you want to migrate from JIRA OnDemand to a site installed from the standard JIRA download, please be aware of the following information before you begin:

Feature loss

If you migrate from JIRA OnDemand to a site installed from the standard JIRA download, you will likely find a few features missing. This is because we have introduced features from the upcoming JIRA downloadable version into JIRA OnDemand. For example, the latest JIRA production release for download is JIRA 6.0.x. JIRA 6.1 is currently under development. Some of the JIRA 6.1 features have been made available in JIRA OnDemand, but will not become available for downloadable JIRA until the final JIRA 6.1 version is released.

JIRA license

Your Atlassian OnDemand license cannot be used in a site installed from the standard JIRA download. You will need to generate a new "JIRA" license from https://my.atlassian.com for your site installed from the standard JIRA download.

You can reuse your licenses for plugins in your site installed from the standard JIRA download. The licenses for Atlassian plugins and Gliffy for JIRA can be viewed on https://my.atlassian.com. You will need to contact your vendor for the licenses for all other third-party plugins.

Migrating other OnDemand applications

The instructions on this page only apply to JIRA. If you are migrating other OnDemand applications (e.g. Confluence OnDemand to a site installed from the standard Confluence download), please see this page: Backing up and exporting data.

Note, if you are migrating JIRA OnDemand and other applications (e.g. Confluence OnDemand) to a site hosted on your own servers, you will also lose a number of integration features that are native to OnDemand (e.g. Creating Links). These can be re-enabled by configuring application links between your applications. See Configuring Application Links and Quick Start: Application Links for instructions. Contact support if you need assistance.

Instructions

- 1. Generate a backup of your JIRA OnDemand data
- 2. Install JIRA from a standard download
- 3. Import your JIRA OnDemand data into your JIRA installation
- 4. Copy across attachments
- 5. Change the system administrator password
- 6. Check which plugins are installed on your JIRA OnDemand site
- 7. Install plugins (add-ons)

1. Generate a backup of your JIRA OnDemand data

   1. Log in to your JIRA OnDemand site as an administrator.
   2. Generate an XML export from your JIRA OnDemand data by following the instructions in Exporting issues. This includes instructions on how to back up your attachments.
   
      Note, the export process will strip your OnDemand license and plugin licenses out of the XML, they will not be available when importing into the installed site, but they will remain available in JIRA OnDemand.
   
   3. Download the backup file from your OnDemand WebDAV directory (also described in Exporting issues).

2. Install JIRA from a standard download

   You must use the latest version of downloadable JIRA.

2. Follow the instructions in Installing JIRA until you are instructed to run the setup wizard, then see step 4 below.

3. Import your JIRA OnDemand data into your JIRA installation

   Follow the instructions in Running the Setup Wizard until you have configured a database (described in step 1 of Running the Setup Wizard). We recommend that you use PostgreSQL for your database, although you can use any of the supported databases. If you already have some data in your JIRA installation, this step will overwrite it.

   In step 2 of the Setup Wizard (Application Properties), you will be asked whether you have existing data. Click import your existing data and follow the instructions to import the JIRA OnDemand backup that you generated earlier. Note, you may see the following message. This is a warning only, your import will still work.

   ![Import Existing Data]

   See Restoring Data for more information.

   For instances with large backups (2Gigabyte and up), we recommend importing the attachments separate from the Issue and user data.

4. Copy across attachments

   If you included your attachments in the export:

   1. Extract the backup file that was downloaded.
   2. Copy across the contents of the attachments folder to the $JIRA_HOME/data/attachments directory for the JIRA Installed version.

5. Change the system administrator password

   1. Log in to your new JIRA site, using the following credentials:
      - Username: sysadmin
      - Password: sysadmin
   2. Change the password immediately after logging in.

6. Check which plugins are installed on your JIRA OnDemand site

   Any plugins that you are currently using with JIRA OnDemand will need to be installed in your JIRA installation. For example, JIRA Agile, Tempo, etc.

   Choose > Add-ons. The 'Find add-ons' screen shows add-ons available via the Atlassian Marketplace. Choose Manage Add-ons to view the plugins currently installed on your JIRA site. Choose Manage Add-ons and note the plugins listed under the User-installed Plugins section. You will need to note the plugin names and versions.

7. Install plugins (add-ons)

   For each plugin that you noted in the previous step, install it in your JIRA installation. You must install a version of the plugin that is equal to or later than the plugin version that was installed JIRA OnDemand. Atlassian does not provide support for data that is downgraded as a result of installing an older version of a plugin.
See Managing Add-ons for instructions on how to install a plugin. You will need to manually add the plugin license keys.

⚠️ The Support Tools Plugin that comes bundled with JIRA will get disabled after completion of the migration. Look it up under "All add-ons" in the Manage add-ons section to re-enable it.

Version matrix for imports

The following table tells you which version of downloadable JIRA to use, when migrating from JIRA OnDemand. The version number is dependent on when you exported your data from JIRA OnDemand.

ℹ️ We recommend that you use the latest JIRA version unless otherwise specified below. Only use the versions listed below if you cannot use the latest JIRA version.

<table>
<thead>
<tr>
<th>Date when export was made</th>
<th>Version of downloadable JIRA to use</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prior to 3 Dec 2012</td>
<td>Contact support for assistance</td>
</tr>
<tr>
<td>3 Dec 2012 — 16 Dec 2012</td>
<td>5.2.1</td>
</tr>
<tr>
<td>17 Dec 2012 — 20 Jan 2013</td>
<td>5.2.2</td>
</tr>
<tr>
<td>21 Jan 2013 — 6 Feb 2013</td>
<td>5.2.5</td>
</tr>
<tr>
<td>7 Feb 2013 — current</td>
<td>Use the latest version available</td>
</tr>
</tbody>
</table>

Establishing Staging Server Environments for JIRA

This document describes best practices for an enterprise environment setup for JIRA:

- Best-practice recommendations for procedural governance around rolling out changes
- Recommendations for development / staging / production architecture
- Technical steps for how to deploy non-production servers

Assumptions:

- For this document we are assuming that as an administrator, you would rather script changes. Therefore we have omitted UI-based changes or separate tools such as the database configuration tool in favour of specifying file system locations.

On this page:

1. Architecture Strategy
2. Governance Strategy
3. How to Refresh a Staging Server
   - 3.1 Create a complete production backup
   - 3.2 Copy your complete production backup to a staging environment
   - 3.3 Modify your staging environment for the unique configurations
   - 3.4 Restart your Staging Server
   - 3.5 Post-Startup Modifications

⚠️ Please Note:

- The procedures described in this document will work with JIRA version 4.0 and later.
- Please read the entire document before bringing a staging server live. There are risks associated with connecting to production instances that require attention, which are called out in the document.

1. Architecture Strategy

Often systems administration teams will have an established architecture for enterprise applications, including staging environments and failover setups. We offer these recommendations in this section not to supplant or
change those company-wide strategies, but rather to help illustrate what some of the considerations will be with Atlassian products in staging environments.

Definitions

For the purpose of this document, we'll assume the following definitions:

- **Production**: your live instance, expecting minimal downtime and well tested changes.
- **Staging**: a pre-production environment, where the systems administration team can establish exact procedures prior to rollout.
- **Development**: a free-for-all environment where users can play with cutting-edge or risky changes.

Recommendation

If Atlassian products are critical systems, we recommend this 3-tier strategy for development, staging, and production.

- The staging environment is primarily for system administrators to test changes and upgrades before going into production.
- The development environment is for different business units to test changes on their own, before requesting a production rollout.

2. Governance Strategy

In addition to an architecture, we also recommend establishing a governance strategy for changes. This could include:

- Create a strategy for deploying and testing plugin installation requests. Note that some plugins that are extremely useful in some environments are not appropriate for high-volume critical systems.
- Publish a timeline for refreshing the development environment, so users know when to remove their changes.
- Set up a source control repository to house any file system changes, so you can track when changes were made and by whom, historically. If you don’t have one already established, Bitbucket is an option. In addition to file system customizations, record your procedures for upgrades, staging refresh (see below) and any other scripted changesets in your source control.

  Tip: JIRA has a tool to manage any changes in your installation. Check the System Information page in the UI for “modified files.” This will tell you which files have been customized in your installation directory.

- For changes such as creating new workflows (that require administrative access), you have two options:
  1. Create an administrative user which has temporary access to administrative functions, on a per-request basis. Add this user to the appropriate groups so they can perform the necessary administrative functions. When the user has completed their administrative functions, remove the user from these groups.
  2. Keep your development server devoid of production data and give more administrative privilege on this server. Require end-users to document specific workflow or scheme setups, then repeat these steps in production.

3. How to Refresh a Staging Server

We’re assuming that you have an existing staging installation. If not, you can use these instructions to set up your staging environment now.

Take care to make sure your staging server setup does not interfere with your production environment. Read the tips below before launching your staging (or development) server.

3.1 Create a complete production backup

1. **Back up your home directory.** See Setting your JIRA Home Directory for the location of your production home directory.

   Back up your production attachments and index directories if located outside your JIRA Home directory. If you're unsure where these are stored, refer to Configuring File Attachments and Search Indexing to determine these locations.

   Refer to Backing Up Data for more information about backing up attachments in JIRA.
2. **Back up your installation directory.** The 'JIRA Installation Directory' is the directory into which the JIRA application files and libraries were extracted when JIRA was installed.

3. **Back up your production database.** Use your native backup tools to take a snapshot of your production database.

### 3.2 Copy your complete production backup to a staging environment

1. **Shut down your staging server.**
2. **Restore your installation and home directories on the staging server.**
3. **Point the newly restored installation directory to the newly restored JIRA Home directory.**
   a. Edit the `jira-application.properties` file located within the `<jira-application-dir>/WEB-INF/classes` subdirectory of your new Installation Directory.
   b. Update the `jira.home` property in this file to the path of the new JIRA Home Directory to the path of your copied JIRA Home directory.
   c. Save your updated `jira-application.properties` file.

   You can also set your JIRA Home Directory's location by defining an operating system environment variable `JIRA_HOME` This value of this variable takes precedence over the value of the `jira.home` property in the `jira-application.properties` file in your JIRA Installation Directory. See Setting your JIRA Home Directory for details.

4. **Restore your database to a staging database.**
   ![Attention](image)

   If you are using a database (called `jiradb` for example) with your existing JIRA installation and the database for your new JIRA installation is running on the same machine or database server, create your new database with a different name (e.g. something intuitive like `jiradb_440` for JIRA 4.4.0). Oracle **does not** support schema names with periods or underscores. Ensure the new database has identical access permissions to the old JIRA database.

### 3.3 Modify your staging environment for the unique configurations

1. **Configure your database connection to point to your staging database.** Edit the `dbconfig.xml` file at the root of your JIRA Home Directory, or the datasource in `<jira-install>/conf/server.xml` for older versions.

   This is extremely important! Make sure your staging environment is not pointing to your production database.

2. **There are two options to handling email:**
   a. **Disable mail on your staging server.** If you need to perform some initial tests on your new JIRA installation, you can disable its email access to prevent unintended emails being sent. You can leave emails on, if you’re wanting to test email functionality. If you choose to do keep emails enabled, watch particularly for:
      i. Create or comment handlers, which can pull mail from your production mail servers. You can disable these from Administration > Advanced > Services, or delete them from the 'serviceconfig' table in the database.
      ii. Filter subscriptions, as your users will receive notifications for filters they’re subscribed to.
         Delete filter subscriptions from the 'filtersubscription' table in the database.
      iii. Notifications on tickets that are updated. For these, dissociate any notification schemes to projects you wish to test without email notifications.
   b. **Keep email enabled** and configure your staging instance to test email:
      i. See the guide here: How to Prepare a Development Server’s Mail Configuration

### 3.4 Restart your Staging Server

You are now ready to restart your server. Once you've restarted, perform the following checks to verify you've done the above steps safely:

1. **Ensure the database is not pointing to production.** To check this, see Viewing your System Information. Check the 'Database URL' to ensure it's pointing to the right place.

2. **Ensure emails are disabled or configured for dev server.** Also when Viewing your System Information 'JVM Input Arguments' for the line 'atlassian.mail.senddisabled'. If you configured the email for a dev server as described above, this line will not be there.

### 3.5 Post-Startup Modifications

1. **Modify the Site Colors.** See Customizing the Look and Feel. This is a good practice for users to identify that they’re on the staging server.

2. **Modify the Site Base URL.** See Configuring JIRA Options and change the Site URL to the staging URL.
3. **Consider the URL Whitelist.** You may wish to change some of the approved URLs. See Configuring the Whitelist.

4. **Apply a Development License.** See our licensing FAQ to generate a license for the staging server. Refer to Updating your JIRA License Details to apply it.

5. **Reconfigure applinks.** If you are connecting to other servers via applinks, you'll need to change the server ID for those instances.
   - If you leave applinks in place, it's possible to have your production instance point back to the staging server, if a link is generated.
     a. Confluence: How to Change the Server ID of Confluence
     b. JIRA: Changing Server ID for Test Installations

### Important Directories and Files

  - caches
  - tmp

**JIRA Installation Directory**

The 'JIRA Installation Directory' is the directory into which the JIRA application files and libraries have been extracted, either:

- by the Windows or Linux installers, or
- by extracting the contents of a JIRA installation archive or WAR distribution archive file (i.e. a `.tar.gz` or `.zip` file).

JIRA does not modify or store any data in this directory.

**Important Files and Directories**

The directories/files described below are found under different sub-directories of the 'JIRA Installation Directory', depending on whether you have installed a 'recommended' or WAR distribution of JIRA. Please substitute the following directories for the `<jira-application-dir>` placeholder (used throughout the rest of this section), as follows:

- **'Recommended' distributions** — the `atlassian-jira` subdirectory of the 'JIRA Installation Directory' installed using the 'Windows Installer', 'Linux Installer' or from an 'Archive File'.
- **WAR distribution** — the `webapp` subdirectory of the 'JIRA Installation Directory'.

Please Note: To edit files in this `webapp` directory, first copy them to the `edit-webapp` subdirectory (if they are not already present in `edit-webapp`) and edit the copies in `edit-webapp`. Refer to the 'Webapp Layout' section of the JIRA WAR Configuration Overview for details. Copies...
The sub-directories/files described below are found under the root of the JIRA Installation directory.

<jira-application-dir>/atlassian-jira/WEB-INF/classes/jira-application.properties

This file tells JIRA where to find the JIRA Home Directory. Be aware that your JIRA Home Directory defined in this file can be overridden. See Setting your JIRA Home Directory for more information.

<jira-application-dir>/atlassian-jira/WEB-INF/classes/jpm.xml

This file stores the default values for JIRA's advanced configuration settings and should not be modified. The default values of properties in this file are customized (i.e. overridden) by redefining them in either the jira-config.properties file (in your JIRA Home Directory) or the JIRA database (via the JIRA administration area). See Advanced JIRA Configuration for more information.

<jira-application-dir>/atlassian-jira/WEB-INF/lib/

This is the directory where plugins built on Atlassian's Plugin Framework 1 (i.e. 'Plugins 1' plugins) are stored. If you are installing a new 'Plugins 1' plugin, you will need to deploy it into this directory. 'Plugins 2' plugins should be stored in the JIRA Home Directory.

<jira-application-dir>/atlassian-jira/WEB-INF/classes/log4j.properties

JIRA's logging configuration file. See Logging and Profiling. The actual log files generated by JIRA can be found in the following locations:

- **JIRA application log** — bin/atlassian-jira.log
- **Application server log** — generally the application server log file can be found under the logs directory. However, this can vary depending on the application server you are running. Please see Where are the application server logs? for further details.

<jira-application-dir>/atlassian-jira/WEB-INF/classes/entityengine.xml

This file configures the OFBiz Entity Engine which JIRA uses to store persist data in a datasource. See Configuring the Entity Engine for JIRA.

Conf/server.xml

This file is used for JIRA SSL configuration. See Running JIRA over SSL or HTTPS.

**Memory Settings**

The file used to edit JAVA_OPTS memory settings will depend on the method used to install JIRA, as well as the operating system used for your installation.

For example, if you are running JIRA on Tomcat in Windows (manual startup), you would update the following file:

bin/setenv.bat

whereas for JIRA on Tomcat in Linux/Unix, you would update this file:

bin/setenv.sh

See Increasing JIRA Memory for further details.

JIRA Home Directory

The 'JIRA Home Directory' contains key data that help define how JIRA works. This document outlines the purpose of the various files and subdirectories within the JIRA Home Directory.
If JIRA was installed using the automated Windows or Linux installers, the default location of the JIRA Home Directory is:

- C:\Program Files\Atlassian\Application Data\JIRA (on Windows) or
- /var/atlassian/application-data/jira (on Linux)

If you install JIRA from an archive file, the JIRA Home Directory can be any suitable location that is accessible by your JIRA installation. Typical example locations might be:

- C:\jira\home (on Windows) or
- /var/jira-home (on Linux or Solaris)

However, avoid locating the JIRA Home Directory inside the JIRA Installation Directory.

For information on specifying the location of the JIRA Home Directory, please see Setting your JIRA Home Directory.

Important Files

dbconfig.xml

This file (located at the root of your JIRA Home Directory) defines all details for JIRA's database connection. This file is typically created by running the JIRA Setup Wizard on new installations of JIRA or by configuring a database connection using the JIRA Configuration Tool.

You can also create your own dbconfig.xml file. This is useful if you need to specify additional parameters for your specific database configuration, which are not generated by the Setup Wizard or JIRA Configuration Tool. For more information, refer to the 'manual' connection instructions of the appropriate database configuration guide in the Connecting JIRA to a Database section.

jira-config.properties

This file (also located at the root of your JIRA Home Directory) stores custom values for most of JIRA's advanced configuration settings. Properties defined in this file override the default values defined in the jpm.xm file (located in your JIRA Installation Directory). See Advanced JIRA Configuration for more information.

In new JIRA installations, this file may not initially exist and if so, will need to be created manually. See Making changes to the jira-config.properties file for more information. This file is typically present in JIRA installations upgraded from version 4.3 or earlier, whose advanced configuration options had been customized (from their default values).

Important Subdirectories

data

This directory contains application data for your JIRA instance, including attachments (for every version of each attachment stored in JIRA).

export

JIRA will place its automated backup archives into this directory.

log

JIRA will place its logs into this directory. (Note: if the JIRA home directory is not configured, then the logs will be placed into the current working directory instead).

The logs will only start showing up once the first log message is written to them. For example, the internal access log will not be created until JIRA starts writing to it.

You can change the location of the log file using log4j.properties as described in the documentation on Logging and Profiling.

plugins

This is the directory where plugins built on Atlassian's Plugin Framework 2 (i.e. 'Plugins 2' plugins) are stored. If
you are installing a new 'Plugins 2' plugin, you will need to deploy it into this directory under the **installed-plugins** sub-directory.

'Plugins 1' plugins should be stored in the **JIRA Installation Directory**.

This directory is created on JIRA startup, if it does not exist already.

**caches**

This is where JIRA stores caches including:

- Lucene indexes - see Searching, Indexing, and Filters Troubleshooting
- OSGi framework caches

These files are vital for JIRA performance and should not be modified or removed externally while JIRA is running.

See Search Indexing for further details.

**tmp**

Any temporary content created for various runtime functions such as exporting, importing, file upload and indexing is stored under this directory.

You can remove files from this directory while JIRA is running, but we recommend that you shut down JIRA first before altering the contents of this directory.

### JIRA Installation Directory

The 'JIRA Installation Directory' is the directory into which the JIRA application files and libraries have been extracted, either:

- by the Windows or Linux installers, or
- by extracting the contents of a **JIRA installation archive** or **WAR distribution** archive file (i.e. a .tar.gz or .zip file).

JIRA does not modify or store any data in this directory.

### Important Files and Directories

The directories/files described below are found under different sub-directories of the 'JIRA Installation Directory', depending on whether you have installed a 'recommended' or WAR distribution of JIRA. Please substitute the following directories for the `<jira-application-dir>` placeholder (used throughout the rest of this section), as follows:

- **'Recommended' distributions** — the **atlassian-jira** subdirectory of the 'JIRA Installation Directory' installed using the 'Windows Installer', 'Linux Installer' or from an 'Archive File'.
- The default installation directory on Linux is:

  `/opt/atlassian/jira/

- **WAR distribution** — the **webapp** subdirectory of the 'JIRA Installation Directory'.

  **Please Note:** To edit files in this **webapp** directory, first copy them to the **edit-webapp** subdirectory (if they are not already present in **edit-webapp** and edit the copies in **edit-webapp**. Refer to the 'Webapp Layout' section of the [JIRA WAR Configuration Overview](#) for details. Copies of the **jira-application.properties** and **entityengine.xml** file are already available in the **edit-webapp** sub-directory.

### Important Files and Directories

- `<jira-application-dir>/atlassian-jira/WEB-INF/classes/jira-application.properties`

  This file tells JIRA where to find the **JIRA Home Directory**.

  **Be aware that your JIRA Home Directory defined in this file can be overridden. See Setting your JIRA Home Directory for more information.**

- `<jira-application-dir>/atlassian-jira/WEB-INF/classes/jpm.xml`
This file stores the default values for JIRA's advanced configuration settings and should not be modified. The default values of properties in this file are customized (i.e. overridden) by redefining them in either the jira-config.properties file (in your JIRA Home Directory) or the JIRA database (via the JIRA administration area). See Advanced JIRA Configuration for more information.

<jira-application-dir>/atlassian-jira/WEB-INF/lib/

This is the directory where plugins built on Atlassian's Plugin Framework 1 (i.e. 'Plugins 1' plugins) are stored. If you are installing a new 'Plugins 1' plugin, you will need to deploy it into this directory. 'Plugins 2' plugins should be stored in the JIRA Home Directory.

<jira-application-dir>/atlassian-jira/WEB-INF/classes/log4j.properties

JIRA's logging configuration file. See Logging and Profiling.

The actual log files generated by JIRA can be found in the following locations:

- **JIRA application log** — bin/atlassian-jira.log
- **Application server log** — generally the application server log file can be found under the \logs\ directory. However, this can vary depending on the application server you are running. Please see Where are the application server logs? for further details.

<jira-application-dir>/atlassian-jira/WEB-INF/classes/entityengine.xml

This file configures the OFBiz Entity Engine which JIRA uses to store persist data in a datasource. See Configuring the Entity Engine for JIRA.

<i> The sub-directories/files described below are found under the root of the JIRA Installation directory. 

conf/server.xml

This file is used for JIRA SSL configuration. See Running JIRA over SSL or HTTPS.

Memory Settings

The file used to edit JAVA_OPTS memory settings will depend on the method used to install JIRA, as well as the operating system used for your installation.

For example, if you are running JIRA on Tomcat in Windows (manual startup), you would update the following file:

bin/setenv.bat

whereas for JIRA on Tomcat in Linux/Unix, you would update this file:

bin/setenv.sh

See Increasing JIRA Memory for further details.

**JIRA Home Directory**

The 'JIRA Home Directory' contains key data that help define how JIRA works. This document outlines the purpose of the various files and subdirectories within the JIRA Home Directory.

If JIRA was installed using the automated Windows or Linux installers, the default location of the JIRA Home Directory is:

- C:\Program Files\Atlassian\Application Data\JIRA (on Windows) or
- /var/atlassian/application-data/jira (on Linux)

If you install JIRA from an archive file, the JIRA Home Directory can be any suitable location that is accessible by your JIRA installation. Typical example locations might be:

- C:\jira\home (on Windows) or
- /var/jira-home (on Linux or Solaris)

However, avoid locating the JIRA Home Directory inside the JIRA Installation Directory.

For information on specifying the location of the JIRA Home Directory, please see Setting your JIRA Home
Directory.

Important Files

dbconfig.xml

This file (located at the root of your JIRA Home Directory) defines all details for JIRA's database connection. This file is typically created by running the JIRA Setup Wizard on new installations of JIRA or by configuring a database connection using the JIRA Configuration Tool.

You can also create your own dbconfig.xml file. This is useful if you need to specify additional parameters for your specific database configuration, which are not generated by the Setup Wizard or JIRA Configuration Tool. For more information, refer to the 'manual' connection instructions of the appropriate database configuration guide in the Connecting JIRA to a Database section.

jira-config.properties

This file (also located at the root of your JIRA Home Directory) stores custom values for most of JIRA's advanced configuration settings. Properties defined in this file override the default values defined in the jpm.xm file (located in your JIRA Installation Directory). See Advanced JIRA Configuration for more information.

In new JIRA installations, this file may not initially exist and if so, will need to be created manually. See Making changes to the jira-config.properties file for more information. This file is typically present in JIRA installations upgraded from version 4.3 or earlier, whose advanced configuration options had been customized (from their default values).

Important Subdirectories

data

This directory contains application data for your JIRA instance, including attachments (for every version of each attachment stored in JIRA).

export

JIRA will place its automated backup archives into this directory.

log

JIRA will place its logs into this directory. (Note: if the JIRA home directory is not configured, then the logs will be placed into the current working directory instead).

The logs will only start showing up once the first log message is written to them. For example, the internal access log will not be created until JIRA starts writing to it.

You can change the location of the log file using log4j.properties as described in the documentation on Logging and Profiling.

plugins

This is the directory where plugins built on Atlassian's Plugin Framework 2 (i.e. 'Plugins 2' plugins) are stored. If you are installing a new 'Plugins 2' plugin, you will need to deploy it into this directory under the installed-plugins sub-directory.

'Plugins 1' plugins should be stored in the JIRA Installation Directory.

This directory is created on JIRA startup, if it does not exist already.

caches

This is where JIRA stores caches including:

- Lucene indexes - see Searching, Indexing, and Filters Troubleshooting
- OSGi framework caches

These files are vital for JIRA performance and should not be modified or removed externally while JIRA is running.
You only need to specify the location of the root directory for your JIRA home. The sub-directories will be created automatically when JIRA is started or when you use a function in JIRA that requires a particular sub-directory.

### How do I set my JIRA home?

There are a few methods available for specifying the location of your JIRA Home Directory in JIRA. However, please be aware of the notes below before you specify this location.

**Recommended Methods**

The recommended methods for specifying the location of your JIRA Home Directory in JIRA are to:

- Use the JIRA Configuration Tool to change the location of your JIRA Home Directory. **(Note: The JIRA Configuration Tool is not available in JIRA WAR distributions.)**
- Edit the `jira-application.properties` file and set the value of the 'jira.home' property to the desired location for your JIRA Home Directory (this location should be something different than the application directory, or you may run into problems later). If you are specifying this location's path on Windows, use double back-slashes ("\") between subdirectories. For example, `X:\path\to\JIRA\`. **(Note: If you define an UNC path in Microsoft Windows, be sure to double escape the leading backslash: `\\machinename\path\to\JIRA\` home.)**
- Set an environment variable named `JIRA_HOME` in your operating system whose value is the location of your JIRA Home Directory. To do this:
  - On Windows, do one of the following:
    - Configure this environment variable through the Windows user interface (typically through 'My Computer' or 'Computer')
    - At the command prompt, enter the following command (with your own JIRA Home path) before running JIRA from the command prompt:
      ```
      set JIRA_HOME=X:\path\to\JIRA\Home
      ```
  - Please set your `JIRA_HOME` environment variable value using this format, where:
    - `x` is the drive letter where your JIRA Home Directory is located and
• no spacing has been added around the equal sign (‘=’)
• Specify the command above in a batch file used to start JIRA.
• On Linux/Solaris, do one of the following:
  • Enter the following command at a shell/console prompt (with your own JIRA Home path) before running JIRA:
    • `export JIRA_HOME=/path/to/jira/home`
  • Specify the command above in a script used to start JIRA.

⚠️ Please Note: If you have specified different values for a 'jira.home' property in the jira-application.properties file and a JIRA_HOME environment variable, the value of the JIRA_HOME environment variable takes precedence.

Alternative Method

Alternatively, you can specify the location of your JIRA Home Directory as a property within your application server:

• Configure a new web context property called 'jira.home' for your application server. To do this, you need to define this web context property inside a `<parameter/>` element (as a child of the `<context/>` element) in your server.xml file (or jira.xml file for JIRA WAR).
  • The server.xml file is located within the conf subdirectory of your JIRA Installation Directory and for JIRA WAR, the jira.xml file is typically located within the conf/Catalina/localhost subdirectory of the Apache Tomcat installation running JIRA:

```xml
<Context ...>
  ...
  <Parameter name="jira.home" value="c:/jira/home"/>
  ...
</Context>
```

⚠️ Please Note: A 'jira.home' web context property defined in your application server overrides the value of the 'jira.home' property defined in your jira-application.properties file. However, a JIRA_HOME environment variable defining your JIRA Home Directory will override either of these 'jira.home' values.

What location should I specify for my JIRA home?

You can specify any location on a disk for your JIRA home directory. Please be sure to specify an absolute path.

Please note that you cannot use the same JIRA home directory for multiple instances of JIRA. We recommend locating your JIRA Home Directory completely independently of the JIRA Installation Directory (i.e. not nesting one within the other) as this will minimise information being lost during major operations (e.g. backing up and restoring instances).

How do I change my JIRA home?

To change the location of your JIRA home directory,

1. Set your JIRA home to the new location, using your preferred method as described in "How do I set my JIRA home?" (above).
2. Restart JIRA.

What is stored in the JIRA Home Directory?

The following page describes the data stored in the JIRA Home Directory: JIRA Home Directory.

Notes

• If you are using the Windows installer, you do not need to configure the JIRA Home Directory separately as you will be prompted to specify this location during the installation process.
• If you installed a 'Recommended' distribution of JIRA, you do not need to do this — please see the JIRA Configuration Tool instead.
• If you are using JIRA WAR, you need to set your JIRA home before you build JIRA.
Tomcat security best practices

The following outlines some basic techniques to secure an Apache Tomcat instance. This is a basic must-do list and should not be considered comprehensive. For more advanced security topics see the “Further Information” section below.

- User Permissions
  - Unix/Linux cheat-sheet
  - Windows cheat-sheet
- Tomcat Installation Permissions
  - Unix/Linux cheat-sheet
  - Windows cheat-sheet
- Web-Application Installation Permissions
  - Unix/Linux cheat-sheet
  - Windows cheat-sheet
- Further Information

User Permissions

Tomcat should never be run as a privileged user (root on UNIX or Administrator or Local System on Windows).

Tomcat should be run as a low-privilege user. Ideally it should be run as a user created only for the purpose of running one application.

In practice this means you can't run it on port 80. If you need to run Tomcat on port 80, you should put it behind a webserver such as Apache; see Integrating JIRA with Apache for an example configuration.

Unix/Linux cheat-sheet

- Create a JIRA user:
  sudo adduser jira-tomcat
- Run Tomcat as a specific user:
  sudo -u jira-tomcat ${CATALINA_HOME}/bin/catalina.sh run

Windows cheat-sheet

- Create an unprivileged account (if your host is part of an Active Directory there may be already a template for service users). The user should have "Log on as a service" rights assigned to it.
- Make sure the Apache Tomcat service is set to run as that user. If Tomcat was installed using the JIRA Windows Installer, the system tray utility lets you set this via Configuration -> Log On:
Tomcat Installation Permissions

The Tomcat installation directory (sometimes referred to as CATALINA_HOME) should be installed as a user that is different to the one it will be run as. Under Linux, unpacking the Tomcat distribution as root is the simplest method of doing this.

Unfortunately, Tomcat does require write access to some directories in the distribution directory, but they should be enabled only as needed.

Tomcat ships with some default admin applications in its webapps directory. Unless you need these they should be disabled.

**Unix/Linux cheat-sheet**

- Unpack Tomcat as root:
  
sudo tar xzvf apache-tomcat-6.0.20.tar.gz

- Remove the default webapps:
  
sudo rm -rf apache-tomcat-6.0.20/webapps/*

- Remove write permissions:
  
sudo chmod -R go-w apache-tomcat-6.0.20

- Allow write on needed directories only:
  
  cd apache-tomcat-6.0.20/; sudo chown -R jira-tomcat work/ temp/ logs/

**Windows cheat-sheet**

*Note: If your host is part of a Domain/Active Directory, consult your Windows system administrator sysadmins to get the right permissions.*

- Unpack and install Tomcat, and update the permissions on CATALINA_HOME to be writeable by Administrators and System only. The Tomcat service user should have read, execute and directory traverse privileges
• Under CATALINA_HOME, the work, temp and logs directories need write and delete access for the
Tomcat user. Make sure it does not have permissions to change permission or take ownership.

Web-Application Installation Permissions

The directory you unpack the application WAR into should not be writable by the Tomcat user (i.e. jira-tomcat in the examples above). Again, the simplest method to do this is to unpack the WAR as root.

Unix/Linux cheat-sheet

- Unpack the war as root:
  
  ```bash
  sudo unzip confluence-webapp-3.2.war
  ```

Windows cheat-sheet

- Unpack the war as your user and confirm that the Tomcat user does not have write access to the webapp.

- [Integrating JIRA with a Web Server](#).
- [Securing JIRA with Apache HTTP Server](#).

Changing JIRA's TCP Ports

Why Change JIRA’s TCP Ports?
By default, JIRA uses TCP listening port 8080 (including default Apache Tomcat installations running JIRA WAR) and hence, JIRA is typically available at http://<yourserver>:8080.

If, however, an existing service running on your machine is claiming port 8080, there will be a conflict and JIRA will fail to start. You may see errors like this:

```
LifecycleException: Protocol handler initialization failed:
java.net.BindException: Address already in use:8080
```

This can be fixed by changing JIRA to use another TCP listening port (eg. 8100) and shutdown port (eg. 8015).

Changing JIRA's TCP Ports

Before you change JIRA's TCP ports, read the following:

- **Which port number should I choose?** If you are not sure which port number to choose, use a tool such as `netstat` to determine which port numbers are free to use by JIRA. The highest port number that can be used is 65535 because it is the highest number which can be represented by an unsigned 16 bit binary number. The Internet Assigned Numbers Authority (IANA) lists the registration of commonly used port numbers for well-known Internet services, it's advisable to avoid any of those ports.

- **A note about firewalls:** When you choose a port number for JIRA, bear in mind that your firewall may prevent people from connecting to JIRA based on the port number. Organisations with a local network protected by a firewall typically need to consider modifying their firewall configuration whenever they install a web-based application (such as JIRA) that is running on a new port or host. Even personal laptop and desktop machines often come with firewall software installed that necessitates the same sort of change as described above. If JIRA does not need to be accessed from outside the firewall, then no firewall configuration changes will be necessary.

- **If you are using JIRA WAR**, please be aware that changing JIRA's TCP ports of the Tomcat installation running JIRA will affect any other web applications deployed to the same Tomcat installation.

You can change JIRA's TCP ports by using the JIRA configuration tool or by manually editing the `server.xml` file. If you installed JIRA using the 'Windows Installer', 'Linux Installer' or from an 'Archive File', you can use the JIRA configuration tool. The JIRA WAR distribution does not include this tool.

Changing JIRA's TCP Ports using the JIRA Configuration tool

1. Start the JIRA configuration tool, see Using the JIRA Configuration Tool for instructions on where to find the tool.
2. Click the Web Server tab.
3. In the HTTP Port field, enter the new TCP listening port number.
4. In the Control Port field, enter the new TCP shutdown port number.
5. Click the Save button. Your changes are saved to the `server.xml` file located in the `conf` subdirectory of your JIRA Installation Directory.

Changing JIRA's TCP Ports by editing the `server.xml` file

Edit the `server.xml` file in the `conf` subdirectory of the JIRA Installation Directory (or of the Apache Tomcat installation that runs your JIRA WAR installation). The start of the file looks like:

```xml
<Server port="8005" shutdown="SHUTDOWN">
  <Service name="Catalina">
    <Connector port="8080" maxHttpHeaderSize="8192" maxThreads="150" minSpareThreads="25">
      maxSpareThreads="75"
      enableLookups=false redirectPort="8443" acceptCount="100"
      connectionTimeout="20000" disableUploadTimeout="true" />
  </Connector>
</Service>
```
For example, change the shutdown port from "8005" to "8015" and the listening port (i.e. in the <connector/> element) from "8080" to "8100". (See below to decide which TCP port numbers should be used for JIRA.)

Then, restart JIRA and point a browser to http://<yourserver>:8100

⚠️ If you are running on a Unix server and bind the ports below 1024 (such as port 80 for example), you will need to start JIRA as root in order to successfully bind to the port.

Changing Confluence's listening ports

**Running JIRA over SSL or HTTPS**

⚠️ Atlassian applications allow the use of SSL within our products, however Atlassian Support does not provide assistance for configuring it. Consequently, Atlassian **can not guarantee providing any support for it**.

- If assistance with conversions of certificates is required, please consult with the vendor who provided the certificate.
- If assistance with configuration is required, please raise a question on Atlassian Answers.

The instructions on this page describe how to run JIRA over SSL or HTTPS by configuring Apache Tomcat with HTTPS. This procedure only covers the common installation types of JIRA. It is by no means a definitive or comprehensive guide to configuring HTTPS and may not be applicable to your specific setup.

Why should you run JIRA over SSL or HTTPS?

When web applications are being accessed across the internet, there is always the possibility of usernames and passwords being intercepted by intermediaries between your computer and the ISP/company. It is often a good idea to enable access via HTTPS (HTTP over SSL) and make this a requirement for pages where passwords are sent. Note, however, that using HTTPS may result in slower performance.

Before you begin

Please note the following before you begin:

- Atlassian Support will refer SSL support to the Certificate Authority (CA) that issues the Certificate. The SSL-related instructions on this page are provided as a reference only.
- For JIRA installations installed using Windows Installer:
  - The 'Windows Installer' installs its own Java Runtime Environment (JRE) Java platform, which is used to run Tomcat. When updating SSL certificates, please do so in this JRE installation.
  - In this document, the term `<jira-install-dir>` refers to the JIRA Installation Directory itself.

⚠️ If hosting JIRA behind a reverse-proxy such as Apache, please follow our Integrating JIRA with Apache
Generate the Java KeyStore

In this section, you will create a Java Key Store (JKS) which will hold your SSL certificates. The SSL certificates are required in order for SSL to work in JIRA. In the SSL world, certificates fall into two major categories:

<table>
<thead>
<tr>
<th>Certificate</th>
<th>Description</th>
<th>When to Use</th>
<th>Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Self-signed</td>
<td>These are certificates that have not been digitally signed by a CA, which is a method of confirming the identity of the certificate that is being served by the web server. They are signed by themselves, hence the name self-signed.</td>
<td>Test, dev or internal servers only.</td>
<td>1 - 13</td>
</tr>
<tr>
<td>CA-signed</td>
<td>A certificate that has had its identity digitally signed by a Certificate Authority (CA). This will allow browsers and clients to trust the certificate.</td>
<td>Production servers.</td>
<td>1 - 21</td>
</tr>
</tbody>
</table>

Digital Certificate that are issued by trusted 3rd party CAs (Certification Authority) provide verification that your Website does indeed represent your company, thereby verifying your company's identity. Many CAs simply verify the domain name and issue the certificate, whereas other such as VeriSign verifies the existence of your business, the ownership of your domain name, and your authority to apply for the certificate, providing a higher standard of authentication.

A list of CA's can be found [here](#). Some of the most well known CAs are:

- Verisign
- Thawte
- CAcert (relatively new CA, providing free CA certificates)

We recommend using a CA-signed certificate.

> If you're unable to install Portecle on the server or prefer the command line please see our Command Line Installation section below.

1. Download and install the Portecle app onto the server that runs JIRA. This is a third-party application and is not supported by Atlassian.
2. Run the App as an Administrator, so it will have the appropriate permissions. Also, ensure the `<JAVA_HOME>` variable is pointing to the same version of Java that JIRA uses. See our Setting JAVA_HOME docs for further information on this.
3. If running on a Linux/UNIX server, X11 will need to be forwarded when connecting to the server (so you can use the GUI), as below:

```
ssh -X user@server
```

3. Select the Create a new Keystore option:
4. Select the type **JKS** and OK:

5. Select the **Generate Key Pair** button:
6. Select the RSA algorithm and a Key Size of 2048:

- Key Algorithm: **RSA**
- Key Size: **2048**

7. Make sure the **Signature Algorithm** is "SHA1withRSA" and then edit the certificate details, as per the below example and select OK:

- **Signature Algorithm**: SHA1withRSA
- **Validity (days)**: 365
- **Common Name (CN)**: jira.atlassian.com
- **Organisation Unit (OU)**: IT
- **Organisation Name (O)**: ATLASSIAN PTY LTD
- **Locality Name (L)**: Sydney
- **State Name (ST)**: NSW
- **Country (C)**: US
- **Email (E)**: admin@example.com
The **Common Name** MUST match the server's URL, otherwise errors will be displayed in the browser.

- **Important**: If you would like to use SHA256withRSA, please use the appropriate Signature Algorithm, and refer to: Default SSL ciphers too weak

8. Choose an alias for the certificate - for example jira.
9. Enter a password for the KeyStore (the default password used is typically `changeit`).
10. The Key Pair Generation will report as successful, as per the below example:

   ![Image of Key Pair Generation Successful]

   **Keystore type:** JKS, **provider:** SUN, **size:** 1 entry

11. Save the KeyStore in `<JIRA_HOME>/jira.jks`, ensuring the use the same password in step 11. This can be done by **File > Save Keystore**.

   - **Warning**: If using a self-signed certificate certificate, proceed to Configuring your web server using the JIRA configuration tool, otherwise continue on.

12. We need to generate a Certificate Signing Request for the CA to sign and confirm the identity of the certificate. To do so, right click on the certificate and choose **Generate CSR**. Save it in `<JIRA_HOME>/jira.csr`. 
13. Submit the CSR to a Certificate Authority for signing. They will provide a signed certificate (CA reply) and a set of root/intermediate CA certificates.

14. Import the root and/or intermediate CA certificates with **Import Trusted Certificate**, repeating this step for each certificate.
15. Import the signed certificate by right clicking on the jira certificate and selecting Import CA Reply:

16. Select the certificate provided by the CA, which should be jira.crt. This will respond with CA Reply.
Import successful.
17. Verify this by checking **Tools > Keystore Report**. It should display the certificate as a child of the root certificates.
18. Save the KeyStore and proceed to the next section.

Configuring your web server using the JIRA configuration tool

In this section, you will finish setting up SSL encryption for JIRA, by configuring your web server using the JIRA configuration tool. For more information on the JIRA configuration tool, see [Using the JIRA Configuration Tool](#).

**To configure your web server using the JIRA configuration tool:**

1. Run the JIRA configuration tool, as follows:
   - **Windows**: Open a command prompt and run `config.bat` in the `bin` sub-directory of the JIRA Installation Directory.
   - **Linux/Unix**: Open a console and execute `config.sh` in the `bin` sub-directory of the JIRA Installation Directory.
     
     * This may fail with the error as described in our [Unable to Start JIRA Config Tool due to No X11 DISPLAY variable was set error](#) KB article. Please refer to it for the workaround.

2. Click the **Web Server** tab.

   ![Screenshot: JIRA configuration tool — 'Web Server' tab](#)

   `JIRA Configuration Tool`
   
   **Field** | **Value**
   --- | ---
   Control Port | Leave as default. You can change the port number if you wish. See [Changing JIRA's TCP Ports](#).

3. Fill out the fields as follows:

   ![Check Certificate in Key Store](#)

   ![Save Close](#)
### Profile

A profile is a preset web server configuration. You can pick from the following values:

- Disabled
- HTTP only
- HTTP & HTTPS (redirect HTTP to HTTPS)
- HTTPS only

To run JIRA over HTTPS, you must pick either 'HTTP & HTTPS' or 'HTTPS'. Pick 'HTTP & HTTPS' if you want to run JIRA over HTTPS but you have users that access JIRA via HTTP. If you pick 'HTTP & HTTPS', users who try to access JIRA via HTTP will be redirected to the HTTPS address.

<table>
<thead>
<tr>
<th>HTTP port</th>
<th>Leave as default (8080). You can change the port number if you wish. See Changing JIRA's TCP Ports. This will be disabled if you set the Profile to 'HTTPS only'.</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTPS port</td>
<td>Leave as default (8443). You can change the port number if you wish. See Changing JIRA's TCP Ports.</td>
</tr>
<tr>
<td>Keystore path</td>
<td>Specify the location of the keystore of your certificate. This will have been chosen when the keystore was saved in step 13 and should be <code>&lt;JIRA_HOME&gt;/jira.jks</code>.</td>
</tr>
<tr>
<td>Keystore password</td>
<td>Specify the password for your keystore. If you generated a self-signed certificate, this is the password you specified for the key and keystore when generating the certificate in step 13.</td>
</tr>
<tr>
<td>Keystore alias</td>
<td>Each entry in the keystore is identified by an alias. We recommend using jira for this certificate as in step 10.</td>
</tr>
</tbody>
</table>

4. Click the **Check Certificate in Key Store** button to validate the following:
   - Test whether the certificate can be found in the key store.
   - Test whether keystore password works.
   - Test whether key can be found using key alias.

5. Click the **Save** button to save your changes.

---

**Advanced configuration**

**Running more than one instance on the same host**

When running more than one instance on the same host, it is important to specify the `address` attribute in the `<JIRA_INSTALLATION>/conf/server.xml` file because by default the connector will listen on all available network interfaces, so specifying the address will prevent conflicts with connectors running on the same default port. See the Tomcat Connector documentation for more about setting the address attribute in The HTTP Connector Apache Tomcat 7 docs.

### Command Line Installation
1. Generate the Java KeyStore (JKS):

   `<JAVA_HOME>/keytool -genkey -alias jira -keyalg RSA -keystore
   <JIRA_HOME>/jira.jks`

   Instead of first and last name, enter the server URL, excluding "https://" (e.g.: jira.atlassian.com).

2. Enter an appropriate password (e.g.: changeit).

3. Create the CSR for signing, using the password from step 2:

   `<JAVA_HOME>/keytool -certreq -keyalg RSA -alias jira -keystore
   <JIRA_HOME>/jira.jks -file jira.csr`

4. Submit the CSR to the CA for signing. They will provide a signed certificate and a root and/or intermediate CA.

   - If the certificate will not be signed, skip to step 7.

5. Import the root and/or intermediate CA:

   `<JAVA_HOME>/keytool -import -alias rootCA -keystore
   <JIRA_HOME>/jira.jks -trustcacerts -file root.crt`

6. Import the signed certificate (this is provided by the CA):

   `<JAVA_HOME>/keytool -import -alias jira -keystore
   <JIRA_HOME>/jira.jks -file jira.crt`

7. Follow the Configuring your web server using the JIRA configuration tool instructions.

Redirecting certain pages to HTTPS

You can redirect users from HTTP URLs to HTTPS URLs by choosing the 'HTTP & HTTPS' profile in the JIRA configuration tool. However, if you want to only redirect certain pages to HTTPS, you can do this manually. To do this, select the 'HTTPS only' profile in the JIRA configuration tool and save the configuration. Then edit the WEB-INF/web.xml file and add the following section at the end of the file, before the closing `<web-app>`:

   ```xml
   <security-constraint>
     <web-resource-collection>
       <web-resource-name>all-except-attachments</web-resource-name>
       <url-pattern>*.jsp</url-pattern>
       <url-pattern>*.jspa</url-pattern>
       <url-pattern>/browse/*</url-pattern>
     </web-resource-collection>
     <user-data-constraint>
       <transport-guarantee>CONFIDENTIAL</transport-guarantee>
     </user-data-constraint>
   </security-constraint>
   ```

   In the example above, all URLs except attachments are redirected from HTTP to HTTPS.

Restart JIRA after you have saved your changes.

Troubleshooting

Here are some troubleshooting tips if you are using a self-signed key created by Portecle, as described above.
When you enter "https://localhost:<port number>" in your browser, if you get a message such as "Cannot establish a connection to the server at localhost:8443", look for error messages in your logs/catalina.out log file. Here are some possible errors with explanations.

- **SSL + Apache + IE problems**: Some people have reported errors when uploading attachments over SSL using IE. This is due to an IE bug, and can be fixed in Apache by setting:

```
BrowserMatch ".MSIE." 
nokeepalive ssl-unclean-shutdown 
downgrade-1.0 force-response-1.0
```

Google has plenty more on this.

- **Can't find the keystore**:

```
java.io.FileNotFoundException: /home/user/.keystore (No such file or directory)
```

This indicates that Tomcat cannot find the keystore. The keytool utility creates the keystore as a file called .keystore in the current user's home directory. For Unix/Linux the home directory is likely to be /home/<username>. For Windows it is likely to be C:\Documents And Settings\<UserName>.

Make sure you are running JIRA as the same user who created the keystore. If this is not the case, or if you are running JIRA on Windows as a service, you will need to specify where the keystore file is in conf/server.xml. Add the following attribute to the connector tag you uncommented:

```
keystoreFile="<location of keystore file>"
```

This can also happen ("Cannot find /root/.keystore") if you add a keystoreFile attribute to the http connector in server.xml instead of the https connector.

- **Certificate reply and certificate in keystore are identical**:

```
keytool error: java.lang.Exception: Certificate reply and certificate in keystore are identical
```

This error will happen if you have identical names or fingerprints, which is the result of attempting to recreate the cert in your existing keystore. If you need to recreate or update the Cert, you may remove the existing keystore and creating a fresh, new keystore. In this case, creating a new keystore and adding the related certs will fix the issue. The default path for it in this documentation is $JAVA_HOME/jre/lib/security/cacerts.

- **Incorrect password**:

```
java.io.IOException: Keystore was tampered with, or password was incorrect
```

You used a different password than "changeit". You must either use "changeit" for both the keystore password and for the key password for Tomcat, or if you want to use a different password, you must specify it using the keystorePass attribute of the Connector tag, as described above.

- **Passwords don’t match**: 

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
You specified a different value for the keystore password and the key password for Tomcat. Both passwords must be the same.

- **Wrong certificate:**

```
javax.net.ssl.SSLException: No available certificate corresponds to the SSL cipher suites which are enabled.
```

If the Keystore has more than one certificate, Tomcat will use the first returned unless otherwise specified in the SSL Connector in `conf/server.xml`.

Add the `keyAlias` attribute to the Connector tag you uncommented, with the relevant alias, for example:

```
<Connector port="8443" maxHttpHeaderSize="8192"
           maxThreads="150" minSpareThreads="25" maxSpareThreads="75"
           enableLookups="false" disableUploadTimeout="true"
           useBodyEncodingForURI="true"
           acceptCount="100" scheme="https" secure="true"
           clientAuth="false" sslProtocol="TLS"
           keystoreFile="/opt/local/.keystore"
           keystorePass="removed"
           keyAlias="tomcat"/>
```

- **Using Apache Portable Runtime:**

APR uses a different SSL engine, and you will see an exception like this in your logs:

```
SEVERE: Failed to initialize connector [Connector[HTTP/1.1-8443]]
LifecycleException: Protocol handler initialization failed:
java.lang.Exception: No Certificate file specified or invalid file format
```

The reason for this is that the APR Connector uses OpenSSL and cannot use the keystore in the same way. You can rectify this in one of two ways:

- **Use the Htt11Protocol to handle SSL connections** — Edit the server.xml so that the SSL Connector tag you just uncommented specifies the Htt11Protocol instead of the APR protocol

```
<Connector port="8443"
           maxHttpHeaderSize="8192" SSLEnabled="true"
           keystoreFile="${user.home}/.keystore"
           maxThreads="150" enableLookups="false"
           disableUploadTimeout="true"
           acceptCount="100" scheme="https" secure="true"
           clientAuth="false" sslProtocol="TLS"
           useBodyEncodingForURI="true"/>
```

- **Configure the Connector to use the APR protocol** — This is only possible if you have PEM
encoded certificates and private keys. If you have used OpenSSL to generate your key, then you will have these PEM encoded files - in all other cases contact your certificate provider for assistance.

```xml
<Connector
    port="8443" maxThreads="200"
    scheme="https" secure="true" SSLEnabled="true"
    SSLCertificateFile="${user.home}/certificate.pem"
    SSLCertificateKeyFile="${user.home}/key.pem"
    clientAuth="optional" SSLProtocol="TLSv1"/>
```

- **Enabling Client Authentication:** To enable client authentication in Tomcat, ensure that the value of the `clientAuth` attribute in your `Connector` element of your Tomcat's `server.xml` file is `true`.

```
<Connector
    ... clientAuth="true"
    ... />
```

For more information about `Connector` element parameters, please refer to the SSL Configuration HOW-TO Tomcat 7 documentation.

### Installing Confluence and JIRA Together

For information on Atlassian's recommendation on JIRA and Confluence installation, see Installing Confluence and JIRA Together.

You may also wish to read Integrating JIRA and Confluence for helpful information on integrating JIRA and Confluence.

⚠️ **Do not deploy multiple Atlassian applications in a single Tomcat container** — Deploying multiple Atlassian applications in a single Tomcat container is not supported. We do not test this configuration and upgrading any of the applications (even for point releases) is likely to break it. There are also a number of known issues with this configuration (see this FAQ for more information).

There are also a number of practical reasons why we do not support deploying multiple Atlassian applications in a single Tomcat container. Firstly, you must shut down Tomcat to upgrade any application and secondly, if one application crashes, the other applications running in that Tomcat container will be inaccessible.

Finally, we recommend not deploying any other applications in the same Tomcat container that runs JIRA, especially if these other applications have large memory requirements or require additional libraries in Tomcat's `lib` subdirectory.

### Integrating JIRA with a Web Server

The following pages contain information on integrating JIRA with a web server.

- Integrating JIRA with IIS
- Integrating JIRA with Apache

Integrating JIRA with IIS

⚠️ The content on this page relates to platforms which are not supported by JIRA. Consequently, Atlassian can not guarantee providing any support for it. Please be aware that this material is provided for your information only and using it is done so at your own risk.

This page describes how to configure Microsoft's IIS web server and JIRA such that IIS forwards requests on to JIRA, and responses back to the user. This is useful if you already have IIS running serving web pages (e.g. `http://mycompany.com`), and wish to integrate JIRA as just another URL (e.g. `http://mycompany.com/jira`).

JIRA is written in Java, and needs a Java Application Server (servlet container) to run. As IIS does not provide services of a Java Application Server, it is not possible to deploy JIRA directly into IIS. It is possible, however, to
configure IIS to proxy requests for JIRA to an application server where JIRA is deployed. Therefore, if your main website is running in IIS, it is possible to integrate JIRA into this website.

If you need to integrate JIRA with IIS, JIRA needs to be deployed into a Java application server (such as Apache Tomcat), which provides IIS integration capability.

If you are running JIRA against an application server other than Apache Tomcat, please consult that application server's documentation to determine whether it is possible (and how) to integrate the application server with IIS.

To integrate JIRA with IIS you will need to:

1. Configure JIRA and test that it works on its own
2. Configure Tomcat to accept proxied requests from IIS
3. Configure IIS to forward JIRA requests to Tomcat
4. (Optional) Configure IIS to forward Confluence requests to Tomcat (if you are using both Confluence and JIRA).

1. **Configure JIRA**

1. Follow the JIRA installation guide to install and configure JIRA; or deploy the WAR distribution into Apache Tomcat. Note that JIRA can be installed on the same machine as IIS, but this is not necessary.
2. Change the context path of the JIRA web application:
   
   To allow IIS to proxy requests to JIRA, JIRA web application must be deployed with a context path (e.g. the 
   /jira in http://localhost:8080/jira (http://localhost:8080*/jira*)) in Tomcat. The context path must be set to the path in the URL that IIS will use to proxy requests. For example, if your website is running with address www.example.com in IIS, and you would like to make JIRA available under www.example.com /jira, you will need to set JIRA's context path to "/jira" in Tomcat.
   
   To do this, edit the conf/server.xml file (or the jira.xml file if you are using the WAR distribution of JIRA). Change the path attribute of the Context element to "/jira".
3. Restart JIRA after changing the context path.
4. Set the 'Base URL' to include the context path (see Configuring JIRA Options).
5. Turn JIRA's GZip compression OFF (since there will be no benefit from GZip compression once proxying is implemented).
6. Test that JIRA works correctly by pointing your web browser directly at Tomcat (e.g. http://localhost:8080/jira) and going through JIRA's Setup Wizard. If you have completed the Setup Wizard previously, try creating an issue or editing one. Please ensure that no errors occur.

2. **Configure Tomcat to accept proxied requests**

   **HTTP/1.1 Connector**

   If you are using the HTTP/1.1 Connector, you will need to add the following attributes to the Connector port in Tomcat’s server.xml:

   ```xml
   proxyName="mycompany.com" proxyPort="80"
   ```

   Please refer to the Integrating JIRA with Apache for reference.

1. Enable AJP/1.3 Connector in Tomcat: To allow Tomcat to accept requests for JIRA from IIS, edit the conf/server.xml file and ensure that the AJP/1.3 Connector is enabled (i.e. not commented out). To enable the AJP/1.3 Connector in a JIRA remove the comment symbols around the following section in the conf/server.xml file:

   ```xml
   <Connector port="8009" enableLookups="false" redirectPort="8443" protocol="AJP/1.3" />
   ```

   The above example configures Tomcat to listen for proxied IIS requests on port 8009. If this port is already in use on the machine where JIRA is running, please change to another port.
2. Restart Tomcat and ensure that no errors regarding used ports appear in the logs or in the Tomcat...
3. **Configure IIS to forward requests to JIRA**

On the machine where IIS is deployed:

1. Download the ISAPI Redirect DLL from the [Apache site](http://www.apache.org). When downloading, choose the version of Windows that IIS is running on (either win32 or win64), and then **choose the latest available jk version**.

   The file to download is named `isapi_redirect_X.X.X.dll`, where 'X.X.X' is the version number. You will need to remove the version number from the DLL file (i.e. it needs to be named `isapi_redirect.dll`).

2. Place the DLL and the associated properties files in an installation directory. For the purpose of this document, we will assume the directory is `C:\tomcat_iis_connector`. Place the `isapi_redirect.dll` in this directory. Then download the `isapi_redirect.properties` file and place this in the same directory as the `isapi_redirect.dll` file.

3. Create a directory called 'conf' in your installation directory (`C:\tomcat_iis_connector\conf`). Download the files `uriworkermap.properties` and `workers.properties.minimal` and place them in the `C:\tomcat_iis_connector\conf` directory.

4. Create a directory called 'logs' (`C:\tomcat_iis_connector\logs`). This is where the logs associated with the `isapi_redirect.dll` execution will be placed.

5. In the `C:\tomcat_iis_connector` directory you may need to modify the `isapi_redirect.properties` file. The `isapi_redirect.properties` file tells the connector where to find its configuration files and where the DLL can be found in relation to the IIS server. There are 5 properties in this file:
   a. `extension_uri` — the path to the virtual directory that contains the `isapi_redirect.dll`
   b. `log_file` — the path to write the log file to
   c. `log_level` — the level at which the logs should be generated
   d. `worker_file` — the path to your `workers.properties.minimal` file in your installation
   e. `worker_mount_file` — the path to your `uriworkermap.properties` file in your installation.

   If you are installing the connector in `C:\tomcat_iis_connector` and you follow the instructions below about setting up the virtual directory for the `isapi_redirect.dll`, then you should not have to change any properties in the provided file.

6. In the `C:\tomcat_iis_connector\conf` directory you may need to modify the `uriworkermap.properties` and the `workers.properties.minimal` files.
The provided files contain the changes mentioned here and should work if you completely follow this document. If you have deviated from this document, then you will need to modify these files as described below.

The **workers.properties.minimal** file tells IIS where (IP address and port) Tomcat is running. The **uriworkermap.properties** tells IIS what requests to proxy to Tomcat.

To edit these files:

a. Edit the **uriworkermap.properties** and ensure that it contains the following mapping for JIRA. You do not need any other mappings.

   ```
   /jira/*=worker1
   ```

b. Edit the **workers.properties.minimal** file and modify the **worker.ajp13w.host** property if necessary. This property should be set to the host name or the IP address of the machine where Tomcat (with JIRA) is running. If Tomcat is running on the same machine as IIS then you can leave the property set to localhost. If you have specified a host name as the value of this property, please ensure that the IIS machine can correctly resolve it to the appropriate IP address.

c. If you have modified the port for the AJP Connector you will need to modify the **worker.ajp13w.port** property. Here is an example of the file with Tomcat running on the same machine as IIS and using the default port (8009) for AJP:

   ```
   worker.list=worker1
   #
   # Defining a worker named worker1 and of type ajp13.
   # Note that the name and the type do not have to match.
   #
   worker.worker1.type=ajp13
   worker.worker1.host=localhost
   worker.worker1.port=8009
   ```

7. Open **Control Panel**, then **Administrative Tools** and open **Internet Information Services**.

8. **IIS 7.0 only:** If you are using **IIS 7.0**, you will need to install two required service roles, ISAPI Extensions and ISAPI Filters:
   a. Navigate to **Start Menu > All Programs > Administration Tools > Service Manager**.
   b. Select 'Web Server (IIS)' in **Server Manager > Roles**.
   c. Click 'Add Role Services' and follow the Wizard.

9. Add an **ISAPI Filter** to IIS, as described below:
   - **IIS 6.0 or earlier:**
     a. Right-click on **Default Web Site** (or the Web Site that should be responsible for proxying requests to JIRA), and click on **Properties**.
     b. Click the **ISAPI Filters** tab.
     c. Check if there is a Filter that points to the **isapi_redirect.dll** file and that it is in the right location. If not, click **Add** and create one. Enter **tomcat** as the Filter Name and enter the location of the **isapi_redirect.dll** file for the executable.
     d. Click **Apply** and then **OK**.
   - **IIS 7.0:**
     a. Click the **Default Web Site** (or the Web Site that should be responsible for proxying requests to JIRA), and click on **ISAPI Filters**.
     b. Click the **ISAPI Filters** icon.
     c. Check if there is a Filter that points to the **isapi_redirect.dll** file and that it is in the right location. If not, click **Add** and create one. Enter **tomcat** as the Filter Name and enter the location of the **isapi_redirect.dll** file.
     d. Click **OK**.
10. Create a **virtual directory** for JIRA in IIS.
   a. Right-click on **Default Web Site** (or the Web Site that should be responsible for proxying requests to JIRA), choose **New** and then **Virtual Directory**.
   b. Go through the creation wizard. Set the **alias** as the value of the Context Path (without slashes) that was set in the **Configure JIRA** section of this document (see above). In our example this is `jira`.
   c. This can point to any directory.
   d. Complete the wizard.

   The reason for creating a virtual directory is so that requests without the trailing slash still work. For example, if you are deploying JIRA under [http://www.example.com/jira/](http://www.example.com/jira/) without the virtual directory, then requests to [http://www.example.com/jira](http://www.example.com/jira) will fail.

11. Create a **virtual directory** for access to the isapi_redirect.dll in IIS, as described below:

   - **IIS 6.0 or earlier**:
     a. Right-click on **Default Web Site** (or the Web Site that should be responsible for proxying requests to JIRA), choose **New** and then **Virtual Directory**.
     b. Go through the creation wizard. Set the **alias** to be `jakarta`.
     c. This must point to the directory in which the **isapi_redirect.dll** is installed. In our example this is `C:\tomcat_iis_connector`.
     d. Complete the wizard, making sure that you grant the 'Execute' permission for the **Virtual Directory** by checking the 'Execute' checkbox.

   - **IIS 7.0**:
     a. Right-click on **Default Web Site** (or the Web Site that should be responsible for proxying requests to JIRA), and choose **Add Virtual Directory**.
     b. Set the **alias** to be `jakarta`.
     c. **Physical Path** must point to the directory in which the **isapi_redirect.dll** is installed. In our example this is `C:\tomcat_iis_connector`.
     d. Click the 'jakarta' Virtual Directory and double-click 'Handler Mappings'.
     e. Click 'Edit Feature Permissions' in the Action panel on the right-hand side.
     f. Check the 'Execute' permission checkbox.

   This Virtual Directory is needed for the connector to work. The alias that you give the directory needs to be the same as the path set in the **isapi_redirect.properties** file, `extension_uri` property. In our example this value is: `/jakarta/isapi_redirect.dll`.

12. If using IIS 6.0 or 7.0, you will need to add the dll as a **Web Service Extension**, as described below.

   - **IIS 6.0**:
     a. Right-click on **Web Service Extensions** and choose **Add a new Web Service Extension**...
     b. Enter **tomcat** for the **Extension Name** and then add the **isapi_redirect.dll** file to the required files.
     c. Select the **Set extension status to Allowed** check-box, then click **OK**.

   - **IIS 7.0**:
     a. Navigate to the servers and highlight your server.
     b. Navigate to 'ISAPI and CGI Restrictions'.
     c. Add and allow the isapi_redirect.dll extension.

13. You will need to restart the IIS Service. To do this, browse to **Control Panel**, click **Administrative Tools**, click on **Services**, find the IIS Admin Service and click **restart**.

14. You are done! To test the configuration, point your web browser at IIS and append JIRA's context path to the URL. For example, if your website is running under the address of [http://www.example.com](http://www.example.com) and you have deployed JIRA with the context path of `jira`, point your browser at [http://www.example.com/jira](http://www.example.com/jira).

---

**4. Configure IIS to forward requests to Confluence as well as JIRA**

You can configure IIS so that it forwards requests to both JIRA and Confluence.

The following instructions describe how to forward from IIS to separate instances of JIRA and Confluence, running in separate Tomcat servers. The instructions assume that you have already set up IIS to forward to JIRA as described in section 3 above. The instructions also assume that you have already installed Confluence as per
the Confluence Installation Guide.

The instructions describe how to make JIRA available under www.example.com/jira as described above, and Confluence available under www.example.com/confluence.

1. If JIRA and Confluence are running on the same machine, ensure that Confluence is listening on a different port to JIRA:
   a. Edit the conf/server.xml file (or the jira.xml file if you are using the WAR/EAR distribution of Confluence).
   b. At the top of the file, change the port attribute of the Server element to a different port to the value for JIRA. For example, change it from 8005 to 8006.
   c. Still in the Server element, Change the port attribute of the Connector sub-element to a different port to the value for JIRA. For example, change it from 8080 to 8090.

2. Change the Confluence context path:
   a. Edit the conf/server.xml file jira.xml file (or the jira.xml file if you are using the WAR/EAR distribution of Confluence).
   b. Change the path attribute of the Context element to "/confluence".

3. Restart Confluence after changing the ports and the context path, and test that Confluence works correctly by pointing your web browser at 

http://localhost:8090/confluence

4. Configure Confluence to accept proxied requests: Remove the comments around the AJP/1.3 Connector section in the Confluence conf/server.xml or jira.xml file and change the port attribute to a value different to the value for JIRA. For example, change it from 8009 to 8010.

5. Restart Confluence and ensure that no errors regarding used ports appear in the logs or in the Tomcat console.

6. Edit the uriworkermap.properties file and add the following mapping:

```
/confluence/*=worker2
```

The file should now contain the following mappings:

```
/jira/*=worker1
/confluence/*=worker2
```

7. Edit the workers.properties.minimal file:

Change the line starting with worker.list to the following:

```
worker.list=worker1,worker2
```

Add the following lines to the end of the file (assuming the host is on the same machine as IIS and you changed the AJP/1.3 Connector port for Confluence to 8010):

```
worker.worker2.type=ajp13
worker.worker2.host=localhost
worker.worker2.port=8010
```

The workers.properties.minimal file should now look like the following:
worker.list=worker1,worker2

# Defining a worker named worker1 and of type ajp13.
# Note that the name and the type do not have to match.
#
worker.worker1.type=ajp13
worker.worker1.host=localhost
worker.worker1.port=8009

worker.worker2.type=ajp13
worker.worker2.host=localhost
worker.worker2.port=8010

8. Create a virtual directory for Confluence in IIS. Set the alias to confluence. It can point to any directory.
9. Restart the IIS Service.
10. You are done! Confluence should now be available under www.example.com/confluence, and JIRA should still be available under www.example.com/jira.

Troubleshooting

- Whenever I go to JIRA in my browser, a login panel pops up. I enter a valid username and password for JIRA, but the panel pops up again. Make sure that you have Anonymous Access set on the jiravirtual directory in IIS. It will be set to that if you have followed the above instructions. To check this:
  1. In 'Internet Information Services', right click the jira virtual directory and choose 'Properties'.
  2. Click the 'Directory Security' tab.
  3. Click the 'Edit...' button in the 'Anonymous access and authentication control' section.
  4. Make sure that the 'Anonymous access' tick box is selected, and make sure that nothing is selected in the 'Authenticated access' section. Do not select 'Basic authentication'.

- Whenever I go to JIRA in Internet Explorer, a login panel pops up. I enter a valid username and password for JIRA, but the panel pops up again. This doesn’t happen, however, in another browser such as Firefox or Safari. I can successfully log in to JIRA in those browsers. Make sure that you have Internet Explorer’s User Authentication set to Anonymous login. To check this:
  1. In Internet Explorer, click the ‘Tools’ menu and select ‘Internet Options’.
  2. Click the ‘Security’ tab.
  3. Select the security zone that the JIRA server is in.
  4. Click the ‘Custom level...’ button.
  5. Scroll right down to the bottom to the ‘User Authentication’ section.
  6. Select ‘Anonymous logon’ (if it is not already selected).
  7. Click the ‘OK’ button on this screen, and again on the next screen.
  8. Restart Internet Explorer.

- When I try to navigate to my JIRA instance at http://localhost/jira in my browser, it prompts me to download a file with nonsensical information, rather than showing me my JIRA instance. Make sure that you have granted the ‘Execute’ permission to your Virtual Directory for JIRA in IIS. See step 11 of the ‘3. Configure IIS to forward requests to JIRA’ section in this document for detailed instructions.

Known Issues

- 64 bit IIS: If you are running a 64 bit OS, please use a 64 bit version of the Tomcat IIS connector.
- Customer submitted solution: If you must use a 32 bit IIS connector, you can do so by clicking Application Pools > Advanced Settings > Allow 32bit applications.
- Customer submitted solution: You need to set the ISAPI extension on the website.

Integrating JIRA with Apache
This page describes how to integrate Apache HTTP Server (also referred to as httpd) with JIRA, utilising mod_proxy so that Apache operates as a reverse-proxy over HTTP. If HTTPS configuration is required, please see our Integrating JIRA with Apache using SSL documentation. Configuring Apache allows for running JIRA on non-standard HTTP port (such as 8080) and users will be able to access JIRA over standard HTTP as their traffic will be routed through the proxy.

Apache can be configured to allow access to JIRA in any of the following methods:

- Directly on its own domain: http://jira.com
- As a subdomain of another domain: http://jira.atlassian.com
- It can also be accessed on a context path on either a domain or subdomain: http://atlassian.com/jira

This documentation will cover a straightforward implementation of mod_proxy using the above three configurations. If a more complicated solution is required, refer to the Apache HTTP Server Version Documentation, consult with the Apache SME within your organisation and if need be raise a question on Atlassian Answers or look at getting in touch with one of our Atlassian Experts.

Expand for an example of a common Apache configuration

1. JIRA is running on port 8080 on a server within the LAN that cannot be accessed externally (the router/firewall is not forwarding port 8080 to it).
2. Apache is set up on another server (or the same server as JIRA) that can be accessed externally on HTTP (80).
3. Apache is then accessed over HTTP on the appropriate URL (VirtualHost), routing the traffic to and from the JIRA server.

On this page:

- Step 1: Configure Tomcat
- Step 2: Configure Apache HTTP Server
  - 2.1 Enable the Proxy Modules
  - 2.2. Configure Apache to use those Modules
- Step 3: Configure JIRA
- Troubleshooting
- See Also

Step 1: Configure Tomcat

1. Stop JIRA.
2. (Optional: If JIRA does not require a context path, skip this step.)

   Edit Tomcat's server.xml to include the required JIRA context path. The below example uses path="jira" - this means JIRA is accessible on http://jiraserver:8080/jira given the default JIRA port is used.
Ensure the `path` value is set with a prepending forward slash (/). For example, `path="/jira"` rather than `path="jira"`.

3. Edit Tomcat's `server.xml` to include a separate connector to proxy the requests. This requires the `scheme`, `proxyName`, and `proxyPort` attributes. Replace them with the appropriate domain and port of the proxy, as in the below example:

```xml
<Service name="Catalina">

  <!-- Apache Proxy Connector -->
  <Connector acceptCount="100" connectionTimeout="20000" disableUploadTimeout="true" enableLookups="false" maxHttpHeaderSize="8192" maxThreads="150" minSpareThreads="25" port="8080" protocol="HTTP/1.1" redirectPort="8443" useBodyEncodingForURI="true" scheme="https" proxyName="jira.atlassian.com" proxyPort="443"/>

  <!-- Standard HTTP Connector -->
  <Connector acceptCount="100" connectionTimeout="20000" disableUploadTimeout="true" enableLookups="false" maxHttpHeaderSize="8192" maxThreads="150" minSpareThreads="25" port="8081" protocol="HTTP/1.1" redirectPort="8443" useBodyEncodingForURI="true"/>

</Service>
```

4. Disable any redirections within Tomcat to HTTPS if they have been enabled - for example the changes to `WEB-INF/web.xml` in Running JIRA over SSL or HTTPS will cause errors when using Apache.

5. Start JIRA.

6. Test that JIRA is accessible on the normal connector, using a context path if applicable - for example `http://jiraserver:8081/jira`.

7. Test that the new connector is working by accessing JIRA on the appropriate proxy connector, for example `http://jiraserver:8080/`. This should redirect to the proxy FQDN (in this example, `https://jira.atlassian.com`), which will fail as the proxy is not yet configured. The test is to ensure Tomcat is set up to correctly redirect to the proxy.

We use two different Tomcat connectors so that testing can be done on JIRA, bypassing the proxy when needed as this is a useful step when troubleshooting. It is expected that the standard connector will not be allowed
external access from outside the network (the firewall will not forward any ports to it).

**Step 2: Configure Apache HTTP Server**

The installation of Apache and configuration of a DNS is not covered in this documentation. Additionally, it is assumed that Apache 2.2 has been installed and DNS entries have been configured for the JIRA domain. As Apache's configuration is specific to the operating system that is used, only some distributions and their configurations are currently documented.

2.1 Enable the Proxy Modules

**Debian/Ubuntu**

- **Expand to see Debian/Ubuntu instructions**
  1. Enable the module with the following:

```
$ sudo a2enmod proxy_http
Considering dependency proxy for proxy_http:
Enabling module proxy.
Enabling module proxy_http.
To activate the new configuration, you need to run:
service apache2 restart
```

2. Restart Apache.

**Windows/Other OS**

- **Expand to see Windows/Other OS instructions**
  1. Locate and edit the `httpd.conf` file, adding the below lines:

```
LoadModule proxy_module modules/mod_proxy.so
LoadModule proxy_connect_module modules/mod_proxy_connect.so
LoadModule proxy_http_module modules/mod_proxy_http.so
```

2. Restart Apache.

2.2 Configure Apache to use those Modules

**Debian/Ubuntu**

- **Expand to see Debian/Ubuntu instructions**
  1. Switch into user **root**.
  2. Backup the existing site or create a new one. Creating a new site is not covered within this documentation (copying the default should be sufficient).
  3. Modify the existing site within `APACHE_INSTALL/sites-available`, for example `default`
  4. Add the following inside the `VirtualHost`, replacing `jiraserver` with the hostname of the JIRA server and also modifying the port if required.

```
# JIRA Proxy Configuration:
<Proxy *>
    Order deny,allow
    Allow from all
</Proxy>
ProxyRequests Off
ProxyPreserveHost On
ProxyPass    /       http://jiraserver:8080/
ProxyPassReverse /       http://jiraserver:8080/
```

ℹ️ Missing a forward slash at the end of the URL will cause proxy errors - ensure this is in place!
Using a context path:

```
# JIRA Proxy Configuration:
<Proxy *>
   Order deny,allow
   Allow from all
</Proxy>

ProxyRequests       Off
ProxyPreserveHost   On
ProxyPass           /jira       http://jiraserver:8080/jira
ProxyPassReverse    /jira       http://jiraserver:8080/jira
```

- The path used must be identical to the Tomcat context path. For example, forwarding `/jira` to `/jira` cannot be done without considerable rewrite rules that are not always reliable.

5. *(Optional):* Enable the site with the following:

```
# a2ensite jira
Enabling site jira.
To activate the new configuration, you need to run:
   service apache2 reload
```

- This is only required if a new site has been created in favour of using the default.

6. Reload the Apache configuration.

7. Test by accessing JIRA through Apache, for example `http://jira.com` or `http://atlassian.com/jira`.

Windows/Other OS

Expand to see Windows/Other OS instructions

1. Locate and edit the `httpd.conf` file.

2. Add the following inside the `VirtualHost`, replacing `jiraserver` with the hostname of the JIRA server and also modifying the port if required.

On its own domain or subdomain:

```
# JIRA Proxy Configuration:
<Proxy *>
   Order deny,allow
   Allow from all
</Proxy>

ProxyRequests       Off
ProxyPreserveHost   On
ProxyPass           /       http://jiraserver:8080/
ProxyPassReverse    /       http://jiraserver:8080/
```

- Missing a forward slash at the end of the URL will cause proxy errors - ensure this is in place!

Using a context path:
# JIRA Proxy Configuration:

```xml
<Proxy>*</Proxy>
Order deny,allow
Allow from all
```

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProxyRequests</td>
<td>Off</td>
</tr>
<tr>
<td>ProxyPreserveHost</td>
<td>On</td>
</tr>
<tr>
<td>ProxyPass</td>
<td>/jira <a href="http://jiraserver:8080/jira">http://jiraserver:8080/jira</a></td>
</tr>
<tr>
<td>ProxyPassReverse</td>
<td>/jira <a href="http://jiraserver:8080/jira">http://jiraserver:8080/jira</a></td>
</tr>
</tbody>
</table>

The path used must be identical to the Tomcat context path. For example, forwarding `/jira` to `/jiraserver:8080/jira` cannot be done without considerable rewrite rules that are not always reliable.

3. Restart Apache.
4. Test by accessing JIRA through Apache, for example `http://jira.com` or `http://atlassian.com/jira`.

**Step 3: Configure JIRA**

1. Set **Use gzip compression** to **OFF** as in **Configuring JIRA Options**. GZIP compression is known to cause performance issues using a reverse-proxy, especially if the proxy is also compressing the traffic.
2. Set the **Base URL** to be the FQDN that JIRA will be accessed on, for example `http://jira.atlassian.com`. This is also located in **Configuring JIRA Options**.
   - **JIRA can only be configured to respond to a single URL and the Base URL (as in Configuring JIRA Options) must match the URL end-users are accessing. Misconfiguration of this may cause significant problems within JIRA such as the Activity Stream and Dashboard Gadgets failing to function correctly.**
3. Test by accessing JIRA on the FQDN (e.g.: `http://jira.atlassian.com`), ensuring that JIRA is accessible and all dashboard gadgets correctly display.

**Troubleshooting**

- **Hijacked Sessions**: Some users have reported problems with user sessions being hijacked when the `mod_cache` module is enabled. If these problems are encountered, try disabling the `mod_cache` module.
  - This module is enabled by default in some Apache HTTP Server version 2 distributions.
- **Permission Denied Errors enabling mod_proxy (and mod_jk) on Linux distros that use SELinux**: Users have reported 'permission denied' errors when trying to get `mod_proxy` (and `mod_jk`) working. Disabling SELinux (`/etc/selinux/config`) apparently fixes this.
- **Running Mac OS X**: Disable `webperfcache`, which proxies port 80 by default. A user reported this as the likely cause of JIRA session problems, in the form of users' identities becoming mixed up, as below.
  - Additionally we do not recommend using Max OS X as it is not supported, as in our Supported Platforms.

  The OSX Servers enable webperfcache by default for Virtual Hosts, which for static content would be great, but for dynamic sites (which ALL of ours are) it is Evil and causes many issues.
  - Of note recently was the jira session issue. Also see :-
  - Unfortunately even if you disable webperfcache for a site, if there is a single site enabled then all sites will still proxy through webperfcache with resulting session problems.
- **Too many redirects**: Both Tomcat & Apache are redirecting, when only one should be. Disable redirection in Tomcat (revert any changes as in Running JIRA over SSL or HTTPS) and check that there is only one redirection in Apache.
- **General Problems**:
  1. Clear the browser cache and try again.
  2. Ensure that JIRA works as expected when running directly from Tomcat and bypassing Apache. For example, accessing `http://jiraserver:8080` instead of `http://jira.atlassian.com`.
  3. Increase the `LogLevel` for Apache to debug and restart it.
  4. Attempt to access JIRA and check the Apache Log Files for any errors.
  5. Raise a question on Atlassian Answers for assistance.
### 403 Forbidden error:
- Add the `RequestHeader unset Authorization` line to the apache configuration page to disable authorization headers.

```xml
<Location /jira>
  RequestHeader unset Authorization
  ProxyPreserveHost On
  ProxyPass http://jiraserver/jira
  ProxyPassReverse http://jiraserver/jira
</Location>
```

Configuring Apache Reverse Proxy Using the AJP Protocol

> Atlassian applications allow the use of reverse-proxies within our products, however Atlassian Support does not provide assistance for configuring them. Consequently, Atlassian can not guarantee providing any support for them.

If assistance with configuration is required, please raise a question on Atlassian Answers.

This page describes how to integrate Apache HTTP Server (also referred to as `httpd`) with JIRA, utilising `mod_proxy_ajp` so that Apache operates as a reverse-proxy. AJP is a wire protocol and is an optimized version of the HTTP protocol to allow a standalone web server such as Apache to talk to Tomcat.

This protocol can be used in favour of `HTTP/1.1` as in either of the following Apache configurations:

- Integrating JIRA with Apache
- Integrating JIRA with Apache using SSL

#### On this page:
- Step 1: Configure Tomcat
- Step 2: Configure Apache HTTP Server
  - 2.1 Enable the Proxy Modules
  - 2.2. Configure Apache to use those Modules
  - 2.3 Redirect HTTP to HTTPS
- Step 3: Configure JIRA
- Troubleshooting
- See Also

#### Step 1: Configure Tomcat
1. Stop JIRA.
2. Enable the AJP Connector on the Tomcat container hosting JIRA by uncommenting the following element in `$JIRA_INSTALL/conf/server.xml`:

   ```xml
   <Connector port="8009" URLEncoding="UTF-8" enableLookups="false" redirectPort="8443" protocol="AJP/1.3" />
   ```

3. Start JIRA.
4. Test that JIRA is accessible on the standard HTTP connector, for example `http://jiraserver:8080`. This is to ensure that Tomcat has successfully restarted.
Step 2: Configure Apache HTTP Server

The installation of Apache and configuration of a DNS is not covered in this documentation. Additionally, it is assumed that Apache 2.2 has been installed and DNS entries have been configured for the JIRA domain. As Apache's configuration is specific to the operation system that is used, only some distributions and their configurations are currently documented.

2.1 Enable the Proxy Modules

**Debian/Ubuntu**

Expand to see Debian/Ubuntu instructions

1. Enable the module with the following:

   ```bash
   $ sudo a2enmod proxy_ajp
   Considering dependency proxy for proxy_ajp:
   Module proxy already enabled
   Enabling module proxy_ajp.
   To activate the new configuration, you need to run:
   service apache2 restart
   ```

2. Restart Apache.

**Windows/Other OS**

Expand to see Windows/Other OS instructions

1. Locate and edit the `httpd.conf` file, adding the below lines:

   ```bash
   LoadModule proxy_module modules/mod_proxy.so
   LoadModule proxy_ajp_module modules/mod_proxy_ajp.so
   ```

2. Restart Apache.

2.2 Configure Apache to use those Modules

**Debian/Ubuntu**

Expand to see Debian/Ubuntu instructions

1. Switch into user root.
2. Backup the existing site or create a new one. Creating a new site is not covered within this documentation (copying the default should be sufficient).
3. Modify the existing site within `$APACHE_INSTALL/sites-available`, for example `default` (HTTP) or `default-ssl` (HTTPS).
4. Add the following inside the VirtualHost, replacing `jiraserver` with the hostname of the JIRA server and also modifying the port if required.

   ```apache
   # JIRA AJP Proxy Configuration:
   <Proxy *
       Order deny,allow
       Allow from all
   </Proxy>
   ProxyRequests           Off
   ProxyPass               /       ajp://jiraserver:8009/
   ProxyPassReverse        /       ajp://jiraserver:8009/
   ```

   * Missing a forward slash at the end of the URL will cause proxy errors - ensure this is in place!

5. *(Optional)*: Enable the site with the following:

   ```bash
   # a2ensite jira
   Enabling site jira.
   To activate the new configuration, you need to run:
   service apache2 reload
   ```
5. This is only required if a new site has been created in favour of using the default.

6. **If using HTTP, skip to step 8.** For HTTPS, the certificates need to be installed by copying the certificate and private key to the appropriate directories and the following will also need to be added to the site:

   ```
   SSLProxyEngine On
   ```

7. Include them in the Apache configuration, within the VirtualHost as below:

   ```
   SSLCertificateFile /etc/ssl/certs/jira.crt
   SSLCertificateKeyFile /etc/ssl/private/jira.key
   ```

8. Reload the Apache configuration.

**Windows/Other OS**

Expand to see Windows/Other OS instructions

1. Locate and edit the `httpd.conf` file.

2. Add the following inside the `VirtualHost`, replacing `jiraserver` with the hostname of the JIRA server and also modifying the port if required.

   ```
   # JIRA AJP Proxy Configuration:
   <Proxy *>
     Order deny,allow
     Allow from all
   </Proxy>

   ProxyRequests Off
   ProxyPass / ajp://jiraserver:8009/
   ProxyPassReverse / ajp://jiraserver:8009/
   ```

   **Missing a forward slash at the end of the URL will cause proxy errors - ensure this is in place!**

3. **If using HTTP, skip to step 5.** For HTTPS, the certificates need to be installed by copying the certificate and private key to the appropriate directories and the following will also need to be added to the site:

   ```
   SSLProxyEngine On
   ```

4. Include them in the Apache configuration, within the `VirtualHost` as below:

   ```
   SSLCertificateFile /etc/ssl/certs/jira.crt
   SSLCertificateKeyFile /etc/ssl/private/jira.key
   ```

5. Restart Apache.

2.3 Redirect HTTP to HTTPS

This is an optional step and is only required if using HTTPS. It can be done by using `mod_rewrite` (this module may require enabling), add the following to the HTTP `VirtualHost`:
Step 3: Configure JIRA

1. Set **Use gzip compression** to **OFF** as in *Configuring JIRA Options*. GZIP compression is known to cause performance issues using a reverse-proxy, especially if the proxy is also compressing the traffic.

2. Set the **Base URL** to be the FQDN that JIRA will be accessed on, for example http://jira.atlassian.com. This is also located in *Configuring JIRA Options*.

   JIRA can only be configured to respond to a single URL and the Base URL (as in *Configuring JIRA Options*) must match the URL end-users are accessing. Misconfiguration of this may cause significant problems within JIRA such as the Activity Stream and Dashboard Gadgets failing to function correctly.

3. Test by accessing JIRA on the FQDN (e.g.: http://jira.atlassian.com), ensuring that JIRA is accessible and all dashboard gadgets correctly display.

Troubleshooting

- **Hijacked Sessions**: Some users have reported problems with user sessions being hijacked when the `mod_cache` module is enabled. If these problems are encountered, try disabling the `mod_cache` module.

   This module is enabled by default in some Apache HTTP Server version 2 distributions.

- **Permission Denied Errors enabling mod_proxy (and mod_jk) on Linux distros that use SELinux**: Users have reported 'permission denied' errors when trying to get `mod_proxy (and mod_jk)` working. Disabling SELinux `/etc/selinux/config` apparently fixes this.

- **Running Mac OS X**: Disable `webperfcache`, which proxies port 80 by default. A user reported this as the likely cause of JIRA session problems, in the form of users' identities becoming mixed up, as below.

  Additionally we do not recommend using Max OS X as it is not supported, as in our *Supported Platforms*.

    The OSX Servers enable webperfcache by default for Virtual Hosts, which for static content would be great, but for dynamic sites (which ALL of ours are) it is Evil and causes many issues.

    Of note recently was the jira session issue. Also see: 

    Unfortunately even if you disable webperfcache for a site, if there is a single site enabled then all sites will still proxy through webperfcache with resulting session problems.

- **Too many redirects**: Both Tomcat & Apache are redirecting, when only one should be. Disable redirection in Tomcat (revert any changes as in *Running JIRA over SSL or HTTPS*) and check that there is only one redirection in Apache.

- **General Problems**:

  1. Clear the browser cache and try again.
  2. Ensure that JIRA works as expected when running directly from Tomcat and bypassing Apache.

  3. Increase the `LogLevel` for Apache to debug and restart it.
  4. Attempt to access JIRA and check the **Apache Log Files** for any errors.
  5. Raise a question on **Atlassian Answers** for assistance.

- **403 Forbidden error**:

  - Add the `RequestHeader unset Authorization` line to the apache configuration page to disable authorization headers.

```
<Location /jira>
  RequestHeader unset Authorization
  ProxyPreserveHost On
  ProxyPass http://jiraserver/jira
  ProxyPassReverse http://jiraserver/jira
</Location>
```
Integrating JIRA with Apache using SSL

This page describes how to integrate Apache HTTP Server (also referred to as httpd) with JIRA, utilising mod_proxy & mod_ssl so that Apache operates as a reverse-proxy over HTTPS. If a HTTP configuration is required, please see our Integrating JIRA with Apache documentation. Configuring Apache allows for running JIRA on non-standard HTTP port (such as 8080) and users will be able to access JIRA over standard HTTPS as their traffic will be routed through the proxy and encrypted outside of the network.

Apache can be configured to allow access to JIRA in any of the following methods:

- Directly on its own domain: https://atlassian.com/
- As a subdomain of another domain: https://jira.atlassian.com
- It can also be accessed on a context path on either a domain or subdomain: https://atlassian.com/jira

This means the SSL certificate will be managed within Apache and not Tomcat, additionally the connection between Apache and Tomcat will not be encrypted. However, the connection between the browser and the outside network will be encrypted. This is suitable for configurations where the JIRA server is within the same network as the Apache server and is illustrated below:

Client Browser -> HTTPS -> Apache Proxy -> HTTP -> Tomcat (JIRA)

This is a common configuration for networks with multiple SSL certificates and/or web applications as they are all managed in one location (Apache).

If a more complicated solution is required, refer to the Apache HTTP Server Version Documentation, consult with the Apache SME within your organisation and if need be raise a question on Atlassian Answers or look at getting in touch with one of our Atlassian Experts.

Expand for an example of a common Apache configuration

1. JIRA is running on port 8080 on a server within the LAN that cannot be accessed externally (the router/firewall is not forwarding port 8080 to it).
2. Apache is set up on another server (or the same server as JIRA) that can be accessed externally on HTTPS (443).
3. Apache is then accessed over HTTPS on the appropriate URL (VirtualHost), routing the traffic to and from the JIRA server.

Before you begin
It is expected that the SSL certificate has been signed by a CA and is in the PEM format prior to configuring Apache. For assistance preparing and generating SSL certificates, please consult with a SSL Vendor (for example, GoDaddy, Verisign, RapidSSL).

Identifying whether to use a domain, subdomain or context path largely depends on the type of SSL certificate provided and also any business rules around website configurations. For SSL to function without error, the domain must match the Common Name (CN) of the certificate.

Expand for further information on configuring the FQDN to match the certificate’s CN

This table indicates which URLs will work with the certificate CN and also makes a recommendation on the URL to use.

<table>
<thead>
<tr>
<th>JIRA FQDN</th>
<th>Common Name</th>
<th>Valid</th>
<th>Recommend JIRA FQDN</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="https://jira.atlassian.com">https://jira.atlassian.com</a></td>
<td>jira.atlassian.com</td>
<td>✔️</td>
<td><a href="https://jira.atlassian.com">https://jira.atlassian.com</a></td>
</tr>
<tr>
<td><a href="https://atlassian.com">https://atlassian.com</a></td>
<td>jira.atlassian.com</td>
<td>❌</td>
<td><a href="https://jira.atlassian.com">https://jira.atlassian.com</a></td>
</tr>
</tbody>
</table>

A certificate that has a CN with an asterisk (*) in it is a wildcard certificate and can support any subdomain of that domain. If you are uncertain about the URL to use, please consult with your System Administrator and the SSL vendor that provided the certificate.

Step 1: Configure Tomcat

1. Stop JIRA.
2. *(Optional: If JIRA does not require a context path, skip this step.)*

   Edit Tomcat's server.xml to include the required JIRA context path. The below example uses `path="jira"` - this means JIRA is accessible on `http://jiraserver:8080/jira` given the default JIRA port is used.
<Engine defaultHost="localhost" name="Catalina">
  <Host appBase="webapps" autoDeploy="true" name="localhost"
    unpackWARs="true">
    <Context docBase="${catalina.home}/atlassian-jira"
      path="/jira" reloadable="false" useHttpOnly="true">
      <!--
        Note, you no longer configure your database driver or connection parameters here.
        These are configured through the UI during application setup.
      -->
      <Resource auth="Container"
        factory="org.objectweb.jotm.UserTransactionFactory"
        jotm.timeout="60"
        name="UserTransaction" type="javax.transaction.UserTransaction"/>
      <Manager pathname=""/>
    </Context>
  </Host>
</Engine>

Ensure the `path` value is set with a prepending forward slash (/). For example, `path="/jira"` rather than `path="jira"`.

3. Edit Tomcat's `server.xml` to include a separate connector to proxy the requests. This requires the `scheme`, `proxyName` & `proxyPort` attributes. Replace them with the appropriate domain and port of the proxy, as in the below example:

```
<Service name="Catalina">
  <!-- Apache Proxy Connector -->
  <Connector acceptCount="100" connectionTimeout="20000"
    disableUploadTimeout="true" enableLookups="false" maxHttpHeaderSize="8192"
    maxThreads="150" minSpareThreads="25" port="8080" protocol="HTTP/1.1"
    redirectPort="8443" useBodyEncodingForURI="true" scheme="https"
    proxyName="jira.atlassian.com" proxyPort="443"/>
  <!-- Standard HTTP Connector -->
  <Connector acceptCount="100" connectionTimeout="20000"
    disableUploadTimeout="true" enableLookups="false" maxHttpHeaderSize="8192"
    maxThreads="150" minSpareThreads="25" port="8081" protocol="HTTP/1.1"
    redirectPort="8443" useBodyEncodingForURI="true"/>
```

4. Disable any redirections within Tomcat to HTTPS if they have been enabled - for example the changes to `WEB-INF/web.xml` in Running JIRA over SSL or HTTPS will cause errors when using Apache.

5. Start JIRA.

6. Test that JIRA is accessible on the normal connector, using a context path if applicable - for example `http://jiraserver:8081/jira`.

7. Test that the new connector is working by accessing JIRA on the appropriate proxy connector, for example `http://jiraserver:8080/`. This should redirect to the proxy FQDN (in this example, `https://jira.atlassian.com`), which will fail as the proxy is not yet configured. The test is to ensure Tomcat is set up to correctly redirect to the proxy.

We use two different Tomcat connectors so that testing can be done on JIRA, bypassing the proxy when needed as this is a useful step when troubleshooting. It is expected that the standard connector will not be allowed
external access from outside the network (the firewall will not forward any ports to it).

Step 2: Configure Apache HTTP Server

The installation of Apache and configuration of a DNS is not covered in this documentation. Additionally, it is assumed that Apache 2.2 has been installed and DNS entries have been configured for the JIRA domain. As Apache’s configuration is specific to the operation system that is used, only some distributions and their configurations are currently documented.

2.1 Enable the Proxy Modules

**Debian/Ubuntu**

- Expand to see Debian/Ubuntu instructions

  1. Enable the module with the following:

     ```
     $ sudo a2enmod proxy_http ssl
     Considering dependency proxy for proxy_http:
     Enabling module proxy.
     Enabling module proxy_http.
     Enabling module ssl.
     See /usr/share/doc/apache2.2-common/README.Debian.gz on how to configure
     SSL and create self-signed certificates.
     To activate the new configuration, you need to run:
     service apache2 restart
     ```

  2. Restart Apache.

**Windows/Other OS**

- Expand to see Windows/Other OS instructions

  1. Locate and edit the `httpd.conf` file, adding the below lines if they do not already exist:

     ```
     LoadModule proxy_module modules/mod_proxy.so
     LoadModule proxy_connect_module modules/mod_proxy_connect.so
     LoadModule proxy_http_module modules/mod_proxy_http.so
     LoadModule ssl_module modules/mod_ssl.so
     ```

  2. Restart Apache.

2.2. Configure Apache to use those Modules

**Debian/Ubuntu**

- Expand to see Debian/Ubuntu instructions

  1. Switch into user `root`.
  2. Backup the existing site or create a new one. Creating a new site is not covered within this documentation (copying the default should be sufficient).
  3. Modify the existing site within `$APACHE_INSTALL/sites-available`, for example `default-ssl`.
  4. Add the following inside the `VirtualHost`, replacing `jiraserver` with the hostname of the JIRA server and also modifying the port if required.

     **On its own domain or subdomain:**

     ```
     # JIRA Proxy Configuration:
     <Proxy>*</Proxy>*
     Order deny,allow
     Allow from all
     <Proxy>
     SSLProxyEngine On
     ProxyRequests Off
     ProxyPreserveHost On
     ProxyPass / http://jiraserver:8080/
     ProxyPassReverse / http://jiraserver:8080/
     ```
Missing a forward slash at the end of the URL will cause proxy errors - ensure this is in place!
Using a context path:

```
# JIRA Proxy Configuration:
<Proxy */>
    Order deny,allow
    Allow from all
</Proxy>

SSLProxyEngine On
ProxyRequests Off
ProxyPreserveHost On
ProxyPass /jira http://jiraserver:8080/jira
ProxyPassReverse /jira http://jiraserver:8080/jira
```

The path used must be identical to the Tomcat context path. For example, forwarding `/jira` to `/jira520` cannot be done without considerable rewrite rules that are not always reliable.

5.Enable the site with the following:

```
# a2ensite default-ssl
Enabling site default-ssl.
To activate the new configuration, you need to run:
    service apache2 reload
```

6. Copy the certificate and private key to the appropriate directories.
7. Include them in the Apache configuration, within the VirtualHost as below:

```
SSLCertificateFile /etc/ssl/certs/jira.crt
SSLCertificateKeyFile /etc/ssl/private/jira.key
```

8. *(OPTIONAL)*: Configuration of `SSLCertificateChainFile` will contain the intermediate certificates provided by the CA vendor who signed it. Please follow consult with the CA vendor to verify if this is required.

```
SSLCertificateChainFile /etc/ssl/certs/jiraintermediate.crt
```

9. Reload the Apache configuration.
10. Test by accessing JIRA through Apache, for example `http://jira.com` or `http://atlassian.com/jira`.

Windows/Other OS

Expand to see Windows/Other OS instructions

1. Locate and edit the `httpd.conf` file.
2. Add the following inside the `VirtualHost`, replacing `jiraserver` with the hostname of the JIRA server and also modifying the port if required.

   **On its own domain or subdomain:**
# JIRA Proxy Configuration:
<Proxy>*</Proxy>
    Order deny,allow
    Allow from all
</Proxy>

SSLProxyEngine On
ProxyRequests Off
ProxyPreserveHost On
ProxyPass / http://jiraserver:8080/
ProxyPassReverse / http://jiraserver:8080/

Missing a forward slash at the end of the URL will cause proxy errors - ensure this is in place!

Using a context path:

# JIRA Proxy Configuration:
<Proxy>*</Proxy>
    Order deny,allow
    Allow from all
</Proxy>

SSLProxyEngine On
ProxyRequests Off
ProxyPreserveHost On
ProxyPass /jira http://jiraserver:8080/jira
ProxyPassReverse /jira http://jiraserver:8080/jira

The path used must be identical to the Tomcat context path. For example, forwarding /jira to /jira cannot be done without considerable rewrite rules that are not always reliable.

3. Copy the certificate and private key to the appropriate directories.
4. Include them in the Apache configuration, within the VirtualHost as below:

SSLCertificateFile /etc/ssl/certs/jira.crt
SSLCertificateKeyFile /etc/ssl/private/jira.key

5. (OPTIONAL): Configuration of SSLCertificateChainFile will contain the intermediate certificates provided by the CA vendor who signed it. Please follow consult with the CA vendor to verify if this is required.

SSLCertificateChainFile /etc/ssl/certs/jiraintermediate.crt

6. Restart Apache.
7. Test by accessing JIRA through Apache, for example http://jira.com or http://atlassian.com/jira.

2.3 Redirect HTTP to HTTPS

This can be done with either of the following:

- Set up the HTTP VirtualHost to forward to the same Tomcat Connector. Tomcat will redirect to HTTPS using the scheme, proxyName & proxyPort parameters. This can be done as in our Integrating JIRA with Apache documentation.
- Using mod_rewrite (this module may require enabling), add the following to the HTTP VirtualHost:
Step 3: Configure JIRA

1. Set **Use gzip compression** to **OFF** as in Configuring JIRA Options. GZIP compression is known to cause performance issues using a reverse-proxy, especially if the proxy is also compressing the traffic.
2. Set the **Base URL** to be the FQDN that JIRA will be accessed on, for example https://jira.atlassian.com. This is also located in Configuring JIRA Options.
   
   **CAUTION**: JIRA can only be configured to respond to a single URL and the Base URL (as in Configuring JIRA Options) must match the URL end-users are accessing. Misconfiguration of this may cause significant problems within JIRA such as the Activity Stream and Dashboard Gadgets failing to function correctly.
3. Test by accessing JIRA on the FQDN (e.g.: https://jira.atlassian.com), ensuring that JIRA is accessible and all dashboard gadgets correctly display.

Troubleshooting

- **Hijacked Sessions**: Some users have reported problems with user sessions being hijacked when the **mod_cache** module is enabled. If these problems are encountered, try disabling the **mod_cache** module.
  
  **TIP**: This module is enabled by default in some Apache HTTP Server version 2 distributions.

- **Permission Denied Errors enabling mod_proxy (and mod_jk) on Linux distros that use SELinux**: Users have reported 'permission denied' errors when trying to get mod_proxy (and mod_jk) working. Disabling SELinux (/etc/selinux/config) apparently fixes this.

- **Running Mac OS X**: Disable webperfcache, which proxies port 80 by default. A user reported this as the likely cause of JIRA session problems, in the form of users’ identities becoming mixed up, as below. Additionally we do not recommend using Max OS X as it is not supported, as in our Supported Platforms.

  The OSX Servers enable webperfcache by default for Virtual Hosts, which for static content would be great, but for dynamic sites (which ALL of ours are) it is Evil and causes many issues. Of note recently was the jira session issue. Also see: -
  
  
  Unfortunately even if you disable webperfcache for a site, if there is a single site enabled then all sites will still proxy through webperfcache with resulting session problems.

- **Too many redirects**: Both Tomcat & Apache are redirecting, when only one should be. Disable redirection in Tomcat (revert any changes as in Running JIRA over SSL or HTTPS) and check that there is only one redirection in Apache.

- **General Problems**:
  1. Clear the browser cache and try again.
  2. Ensure that JIRA works as expected when running directly from Tomcat and bypassing Apache. For example, accessing http://jiraserver:8080 instead of http://jira.atlassian.com.
  3. Increase the **LogLevel** for Apache to debug and restart it.
  4. Attempt to access JIRA and check the Apache Log Files for any errors.
  5. Raise a question on Atlassian Answers for assistance.

- **403 Forbidden error**:
  
  Add the **RequestHeader unset Authorization** line to the apache configuration page to disable authorization headers.

```
<Location /jira>
  RequestHeader unset Authorization
  ProxyPreserveHost On
  ProxyPass http://jiraserver/jira
  ProxyPassReverse http://jiraserver/jira
</Location>
```

Troubleshooting Apache

- **Hijacked Sessions:** Some users have reported problems with user sessions being hijacked when the `mod_cache` module is enabled. If these problems are encountered, try disabling the `mod_cache` module.
  
  This module is enabled by default in some Apache HTTP Server version 2 distributions.

- **Permission Denied Errors enabling mod_proxy (and mod_jk) on Linux distros that use SELinux:** Users have reported 'permission denied' errors when trying to get `mod_proxy` (and `mod_jk`) working. Disabling SELinux (/etc/selinux/config) apparently fixes this.

- **Running Mac OS X:** Disable `webperfcache`, which proxies port 80 by default. A user reported this as the likely cause of JIRA session problems, in the form of users' identities becoming mixed up, as below.
  
  Additionally we do not recommend using Max OS X as it is not supported, as in our Supported Platforms.

  The OSX Servers enable webperfcache by default for Virtual Hosts, which for static content would be great, but for dynamic sites (which ALL of ours are) it is Evil and causes many issues.
  
  Of note recently was the jira session issue. Also see :-
  

  Unfortunately even if you disable webperfcache for a site, if there is a single site enabled then all sites will still proxy through webperfcache with resulting session problems.

- **Too many redirects:** Both Tomcat & Apache are redirecting, when only one should be. Disable redirection in Tomcat (revert any changes as in Running JIRA over SSL or HTTPS) and check that there is only one redirection in Apache.

- **General Problems:**
  1. Clear the browser cache and try again.
  2. Ensure that JIRA works as expected when running directly from Tomcat and bypassing Apache.
     
  3. Increase the `LogLevel` for Apache to debug and restart it.
  4. Attempt to access JIRA and check the `Apache Log Files` for any errors.
  5. Raise a question on Atlassian Answers for assistance.

- **403 Forbidden error:**
  
  - Add the `RequestHeader unset Authorization` line to the apache configuration page to disable authorization headers.

  ```
  <Location /jira>
  RequestHeader unset Authorization
  ProxyPreserveHost On
  ProxyPass http://jiraserver/jira
  ProxyPassReverse http://jiraserver/jira
  </Location>
  ```

Securing JIRA with Apache HTTP Server

The following outlines some basic techniques to secure a JIRA instance using Apache HTTP Server. These instructions are basic to-do lists and should not be considered comprehensive. For more advanced security topics see the "Further Information" section below.

- **Using Apache to Limit Access to the JIRA Administration Interface**
- **Using Fail2Ban to limit login attempts** (JIRA 4.1 has login-rate limiting, but Fail2Ban can be useful for older versions and more advanced security setups.)

Further information

- Integrating JIRA with Apache
- Using Apache to Limit Access to the JIRA Administration Interface
Limiting Administration to Specific IP Addresses

The JIRA administration interface is a critical part of the application; anyone with access to it can potentially compromise not only the JIRA instance but the entire machine. As well as limiting access to users who really need it, and using strong passwords, you should consider limiting access to it to certain machines on the network or internet. If you are using an Apache HTTP Server, this can be done with Apache's Location functionality as follows.

1. Create a file that defines permission settings

This file can be in the Apache configuration directory or in a system-wide directory. For this example we'll call it "sysadmin_ips_only.conf". This file should contain the following:

```
Order Deny,Allow
Deny from All

# Mark the Sysadmin's workstation
Allow from 192.168.12.42
```

2. Add the file to your Virtual Host

In your Apache Virtual Host, add the following lines to restrict the administration actions to the Systems Administrator:

```
<LocationMatch Administrators.jspa>
    Include sysadmin_ips_only.conf
</LocationMatch>
<LocationMatch DeleteAttachment>
    Include sysadmin_ips_only.conf
</LocationMatch>
<LocationMatch AcknowledgeTask>
    Include sysadmin_ips_only.conf
</LocationMatch>
<LocationMatch ActivateWorkflow>
    Include sysadmin_ips_only.conf
</LocationMatch>
<LocationMatch ActivateWorkflowStep2>
    Include sysadmin_ips_only.conf
</LocationMatch>

Using Fail2Ban to limit login attempts

JIRA 4.1 includes a rate-limiting mechanism, but older versions and other applications such as Confluence need external help from a tool such as Fail2Ban.

What is Fail2Ban?

We need a means of defending sites against brute-force login attempts. Fail2Ban is a Python application which trails logfiles, looks for regular expressions and works with Shorewall (or directly with iptables) to apply temporary blacklists against addresses that match a pattern too often. This can be used to limit the rate at which a given machine hits login URLs for Confluence.

Prerequisites

- Requires Python 2.4 or higher to be installed
- Needs a specific file to follow, which means your Apache instance needs to log your Confluence access to a known logfile. You should adjust the configuration below appropriately.

How to set it up

This list is a skeletal version of the instructions

- There's an RPM available for RHEL on the download page, but you can also download the source and set it up manually
- Its configuration files go into /etc/fail2ban
- The generic, default configuration goes into .conf files (fail2ban.conf and jail.conf). Don't change these, as it makes upgrading difficult.
- Overrides to the generic configuration go into .local files corresponding to the .conf files. These only need to contain the specific settings you want overridden, which helps maintainability.
- Filters go into filter.d — this is where you define regexps, each going into its own file
- Actions go into action.d — you probably won't need to add one, but it's handy to know what's available
- "jails" are a configuration unit that specify one regexp to check, and one or more actions to trigger when the threshold is reached, plus the threshold settings (e.g. more than 3 matches in 60 seconds causes that address to be blocked for 600 seconds)
- Jails are defined in jail.conf and jail.local. Don't forget the enabled setting for each one — it can be as bad to have the wrong ones enabled as to have the right ones disabled.

Running Fail2Ban

- Use /etc/init.d/fail2ban {start|stop|status} for the obvious operations
- Use fail2ban-client -d to get it to dump its current configuration to STDOUT. Very useful for troubleshooting.
- Mind the CPU usage; it can soak up resources pretty quickly on a busy site, even with simple regexp
- It can log either to syslog or a file, whichever suits your needs better

Common Configuration

- jail.local
# The DEFAULT allows a global definition of the options. They can be override
# in each jail afterwards.

[DEFAULT]

# "ignoreip" can be an IP address, a CIDR mask or a DNS host. Fail2ban will not
# ban a host which matches an address in this list. Several addresses can be
# defined using space separator.
# ignoreip = <space-separated list of IPs>

# "bantime" is the number of seconds that a host is banned.
bantime = 600

# A host is banned if it has generated "maxretry" during the last
# "findtime"
# seconds.
findtime = 60

# "maxretry" is the number of failures before a host get banned.
maxretry = 3

[ssh-iptables]

enabled = false

[apache-shorewall]

enabled = true
filter = cac-login
action = shorewall
logpath = /var/log/httpd/confluence-access.log
bantime = 600
maxretry = 3
findtime = 60
backend = polling

Configuring for Confluence

⚠️ The following is an example only, and you should adjust it for your site.

filter.d/confluence-login.conf

[Definition]

failregex = <HOST>.*"GET /login.action

ignoreregex =

Configuring for JIRA

The following is an example only, and you should adjust it for your site.

```
filter.d/jira-login.conf
```

- [Definition]
  - failregex = <HOST>.*"GET /login.jsp
  - ignoreregex =

Deployment Planning Activity

Planning for rolling out our products or capacity planning for large instances is better suited for service offerings than Atlassian Support. We will refer this kind of activity to our partner network. This includes establishing specific upgrade and deployment plans for existing installations.

We suggest customers run the Performance Testing Scripts available for products to see how well their software instance performs given the hardware, configuration in use and expected workload. Using this data, the instance can then be tuned for performance should there be any issues encountered.

It is also recommended that you closely monitor your production instance to ensure that performance does not degrade as your instance grows in size.

Atlassian does not have provide benchmarking data at this time. Should you require any assistance, it is best to take advantage of our public forums or contact our partners.

JIRA Releases

Latest production releases

Please view the release notes to get up-to-date information about the improvements made in each release.

If upgrading from a previous version of JIRA please pay attention to the Upgrade Notes/Guide of the latest version, including those for each important version of JIRA you are 'skipping' (between your current JIRA version that the JIRA version you are upgrading to).

Release summary

The features of each major JIRA release, up to and including the latest major version, can be found in the JIRA Release Summary.

For full details on each of the JIRA releases, please read the release notes for the previous releases listed below.

Previous releases

See the complete list of Releases Notes and Upgrade Guides for information about older releases.

Getting notified about new releases

We announce all new JIRA releases, including major and minor production versions and EAP milestones in our knowledge base.

To get the RSS feed of new releases:

1. Go to the JIRA knowledge base: https://confluence.atlassian.com/display/JIRAKB/JIRA+Knowledge+Base+Home
2. Click the RSS 2.0 icon in the Technical Announcements section.
JIRA Release Summary

This page shows the highlights of the major JIRA releases.

For an overview of each major and minor release of JIRA and links to the release notes for each of these releases, please refer to the Production Releases page.

JIRA 6.2 – 25 February 2014

- New Development panel for issues
- Enhanced workflow designer
- Simple issue type configuration
- New status lozenges
- Auditing
- Creator recorded for every issue
- Back up and recover indexes
- Re-index individual projects
- More in release notes

JIRA 6.1 – 24 September 2013

- New workflow designer
- New project templates
- Intuitive custom field configuration — Standard and Advanced field types, Add field from View Issue screen
- Edit project key
- Change usernames in LDAP
- JIRA password policy
- More integration with your coding tools — Create branch from JIRA and JIRA Agile
- GreenHopper renamed to JIRA Agile, Bonfire renamed to JIRA Capture
- More in release notes

JIRA 6.0 – 21 May 2013

- New JIRA look and feel that follows the Atlassian Design Guidelines
- Detail view and view issue improvements
- JIRA mobile
- Workflow sharing
- New project templates
- New administration gadget
- Editable usernames
- Global workflow schemes
- Ability to translate custom fields
- More in release notes

JIRA 5.2 — 12 November 2012

- Instant search — new instant search bar and search results, shared filters on the issue navigator, pre-built system filters
- Background reindexing
- SSL configuration via JIRA configuration tool
- Downloadable tools — improved data generator and HTTP requests log analyser
- New enterprise guides — federating JIRA and scaling GreenHopper
- Webhooks for issues
- Redesigned project workflows configuration
- Demonstration project
- Inline help tips
- And more — streamlined Browse Project user interface, JIRA admin helper, copy/edit issue collectors, UPM 2.7 with plugin requests, column ordering for standard JIRA gadgets, compatibility with Confluence
Workbox Notifications, Java 7 and Tomcat 7 support

- More in release notes

JIRA 5.1 — 9 July 2012

- Inline editing and fewer page reloads
- Enterprise scale and performance improvements
- Issue collector
- Project administration improvements — easier workflow editing
- Deactivate users
- ‘Autowatch’ issues you create or comment on
- Remote and local JIRA issue link improvements
- Get started faster — welcome page, automatically suggested project keys and invite users
- Automatic time zone detection
- Notify on my actions now disabled by default
- Configurable JIRA home page
- User Gravatar support
- More in release notes

JIRA 5.0 — 22 February 2012

- Remote issue links
- Share issues and mention users
- Rapid create and edit issues
- Search for issues based on their history
- Activity streams now show activity from other applications
- Manage other users’ shared filters and dashboards
- Administration user interface improvements
- REST API (with tutorials) for working with issues in JIRA
- Stable Java API
- New troubleshooting and debugging tools
- New email handler wizard
- Enhancements to the ‘view issue’ page
- JIRA Add-Ons (Plugins and Integrations)
- More in release notes

JIRA 4.4 — 2 August 2011

- User Time Zones
- Visual Workflow Designer
- Workflow Viewer on the ‘View Issue’ Screen
- Search (JQL) Enhancements
- Improved Setup Wizard with Database Configuration
- Improved JIRA Standalone Installer/Uninstaller and Automated Upgrade
- New-Look Administration Area
- Simplified Project Administration
- New Email Style
- Issue Linking when Resolving an Issue
- Editable Options for Custom Fields
- Multiple File Selection and Upload from the ‘File Upload’ Dialog Box
- New-look Activity Stream
- Graph of Vote History
- More in release notes

JIRA 4.3 — 16 March 2011

- Full Integration with LDAP and Active Directory
- New Plugin Management System
- Improved Importer
- JIRA Now Supports ‘In-place Database Upgrades’
- Search for Issue Changes, Relative Dates and Relative Versions with JQL
- Quick Search Enhancements
- Revamped User Avatars
- Improvements to Issue Links
- Remembered Assignees
- Security Enhancements
- Application Links: Connecting Applications Together
- REST API Improvements
- More in release notes

JIRA 4.2 — 21 October 2010
- Keyboard Shortcuts and ‘Operations Dialog’
- Editable ‘Original Estimate’
- ‘Log Work’ Fields Available When Resolving Issues
- Labels
- User Avatars
- Viewable ZIP Files
- REST API (Alpha)
- More in release notes

JIRA 4.1 — 8 April 2010
- New-look 'View Issue'
- Streamlined Keyboard Shortcuts
- Customisable Email Subject
- Image Gallery
- ZIP Download of Attachments
- List of Logged-in Users
- JIRA Standalone ships with JIRA Configuration Tool, Database Drivers and Tomcat 6.0
- More in release notes

JIRA 4.0 — 6 October 2009
- Advanced Searching
- Dashboard Gadgets
- Activity Streams
- New-look "Browse Project"
- Charting Now Comes Standard
- New-look Header
- Issue Actions in the Issue Navigator
- Project Icons
- Default Unit for Time Tracking
- "History" is now permanent
- Engine Room
- More in release notes

JIRA 3.13 — 9 September 2008
- Shareable dashboards
- Improved filter sharing
- Favourite filters and dashboards
- Restoring projects
- Editable active workflows
- Enhanced sub-task quick creation
- Personal licenses
- New plugins
- Progress bar for long-running operations
- Application improvements
- More in release notes

JIRA 3.12 — 7 December 2007
- 'Trusted' Confluence
- 'JIRA System Administrators' permission
• FishEye plugin now bundled with JIRA
• Improvements to the Subversion plugin
• Improvements to the ‘Project Statistics’ and ‘Filter Statistic’ portlets
• New post function for workflows: ‘Assign to Current User’
• Enhanced language support for searching
• Visual SourceSafe plugin
• More in release notes

JIRA 3.11 — 25 September 07
• Sub-task progress shown within issues
• Issue Navigator offers sub-task aggregates
• Time Tracking reports now include sub-tasks
• Multi-project ‘Road Map’ portlet
• Performance improvements
• Indexing improvements
• JIRA Labels Plugin
• More in release notes

JIRA 3.10 — 9 July 2007
• Editable Worklogs
• Start Date for Worklogs
• New way to browse Components
• New way to browse Versions
• Auto-complete ‘User-picker’ and ‘Issue-picker’
• Auto-complete ‘Issue-picker’
• More in release notes

JIRA 3.9 — 8 May 2007
• Ability to convert sub-tasks to issues (and vice versa)
• Convenient new scheduler for filter subscriptions
• Separate permissions for ‘Delete Comment’, ‘Delete Attachment’ and ‘Delete Issue’
• Performance Improvements for Project Roles
• More in release notes

JIRA 3.8 — 13 March 2007
• Editable comments
• Self-installer for JIRA
• CAPTCHA for new account signup
• Integration with Crowd
• Improvements to the Bugzilla importer
• DHTML-loading of Issue screens
• More in release notes

JIRA 3.7 — 18 December 2006
• Project Roles - assign users and groups to roles on a per project basis
• Chart View - view charts in Issue Navigator using the JIRA Charting plugin
• RSS Improvements
• User Properties - record arbitrary information to the user profile (admin only)
• SVN project panel plugin - provides a summary of all commits made against a particular project or a
  project version
• More in release notes

JIRA 3.6 — 18 April 2006
• Custom Events - extension point for notification and workflow schemes
• Group Picker Custom Field - searchable in the issue navigator
• Per-issue Group Notifications and Permissions - based on the group picker custom field
• "I'm Feeling Lucky" Quick Search
- Collapsible Fields - control the level of detail of environment, description, individual comment fields and any textarea custom field
- Nestable Conditions - construct complex workflow conditions using nested conditions with AND or OR statements
- More in release notes

JIRA 3.5 — 01 February 2006

- Bulk Workflow Transition
- FogBugz Importer
- Charting Plugin
- MS Word Export
- JIRA Page Linker Plugin - linking a JIRA issue with a Confluence URL
- Component Lead Notification Type
- Bulk Assignment of Users to Groups
- More in release notes

JIRA 3.4 — 15 November 2005

- Issue Types Per Project
- Renderers - Confluence markup in JIRA text-based fields such as description and comments
- Issue Operation Plugin
- Announcement Banner
- RSS Support Improvements - live bookmarking with supported browsers
- Change Parent of Sub-Task
- Multi-user Custom Field
- More in release notes

JIRA 3.3 — 05 August 2005

- Multiple Project Filters - execute a search across multiple projects
- Bulk Move
- User Custom Field as Notification Target
- Extended Search Capabilities - search by date range for 'Created' and 'Updated' system fields and the custom field 'Date Time'
- JIRA Standalone ships with Tomcat 5.5
- More in release notes

JIRA 3.2 — 27 May 2005

- Field screens - configuration of field position and visibility for each issue operation and in Professional and Enterprise editions for each workflow transition screen
- Contextual custom fields - shared between projects and issue types
- Extended Bulk Edit Capabilities - Due Date, Reporter, Issue Security Level, Issue Type
- Improved internationalisation - Issue Constant Translations (Priorities, Statuses, Issue Types and Resolutions)
- Improved performance - quicker searching in the issue navigator and reports generation
- Smart Query
- Excel View
- More in release notes

JIRA 3.1 — 14 February 2005

- CSV Importer Wizard
- Add Comment on 'View Issue' field
- Webwork Plugin Type
- Assign Issues by Mail (via the CC field) using the Create Issue Handler
- More in release notes

JIRA 3.0 — 12 October 2004

- Workflow editor and configurable workflows
- Sub-tasks
Production Releases

This page lists release notes and upgrade guides from past versions of JIRA.

If upgrading from a previous version of JIRA please pay attention to the Upgrade Guide of the version you are upgrading to, and any version of JIRA that you are 'skipping' during the upgrade.

You can also view lists of the Release Notes or Upgrade Guides separately.

- JIRA 6.2 Release Notes

JIRA 6.2 Release Notes

Visualize development

Unify issues and source like never before

In JIRA 6.1, we started the journey towards seamless integration with your coding tools. We’re continuing this in JIRA 6.2, by providing more code-related information in your issues, that you can assess and action. Create a branch, see commits and pull requests, watch builds, and more!

This release also includes an improved workflow designer, simpler issue type configuration, new status lozenges, auditing, and more!
New code integration features for issues

The new Development panel, which is shown on every issue, helps you to evaluate the development status of an issue at a glance. If you need to investigate further, click any item to display more details, or drill down into the development tool.

Connect to one of these compatible applications to enable the following:

- **Bitbucket** or **Stash**: view and create branches, view commits, view and create pull requests
- **FishEye/Crucible** (*Git/Subversion/Perforce/CVS*): view branches, view commits, view and create reviews
- **Bamboo**: view the status of builds and deployments
- **GitHub/GitHub Enterprise**: view branches, view commits, view and create pull requests

Learn more: Integrating with a development tool and Using the Development panel
Enhanced workflow designer

The workflow designer is faster and easier to use in this release. We've added a range of new features and made the user interface cleaner and less cluttered. You can now click to create transitions, reuse existing transitions, zoom (with the 'alt' key or the +/- controls), drag and drop to retarget the destination of a transition, and more!

In fact, the workflow designer can do everything that we supported in the old 'classic' workflow designer, so we've given the 'classic' designer a well earned retirement and removed it from JIRA.

Learn more...

Simple issue type configuration

We've simplified issue type configuration in this release. Don't hunt around in JIRA administration to find the workflow or screen for an issue type. The issue types associated with a project are now tabs on the project's administration screen.

This approach makes it easier to understand how your projects are set up. Each tab also provides access to the workflow designer and screen designer, so you can configure an issue type without leaving the project.

Learn more...
New status lozenges

This release introduces new "lozenges" to represent statuses in JIRA. We've switched from the old icon+text representation to make it easier for users to locate and identify statuses. The new status lozenges also conform to the Atlassian Design Guidelines (ADG). This blog post explains the background behind this change.

We no longer support custom images for status icons. However, you will be able to configure statuses to use any one of the slick new status colors (categories) in JIRA.

Learn more...

Auditing

JIRA now tracks and records a range of configuration changes in an audit log. This can help you diagnose problems in JIRA or can be used for security purposes. Find out when a user was added or removed, when a workflow scheme was modified, and more. Note, auditing is disabled by default — you will need to enable it to start tracking changes in JIRA.

This is the initial release of auditing. We're still working on a number of improvements that you'll see in future JIRA releases.

Learn more...
And more!

Of course, there’s more! You can read about the other JIRA 6.2 features below. A noteworthy one is that the **creator of an issue is now automatically recorded for every issue**. This is particularly useful, if you need to know the creator of an issue for compliance reasons. The creator is distinct from the reporter (which can still be configured to be an optional field). On upgrade to this release, JIRA will set the creator to the appropriate reporter in the change history, for existing issues.

The creator can be seen in the issue history. If the creator is the same as the reporter, the name of the creator will be shown in the **Reporter** field on the issue.

Click to view the other features and improvements in this release:

- **Back up and recover indexes** — Configure JIRA to take snapshots of indexes. Recover an index from a snapshot instead of rebuilding the index, if there is a failure. Learn more...
- **Re-index individual projects** — Re-index a single project, rather than re-indexing your entire JIRA instance. Learn more...
- **New ‘creator’ JQL field** — Find issues by their creator by using the new ‘creator’ JQL field. Learn more...
- **New ‘attachments’ JQL field** — Find issues that have attachments or issues that do not have attachments with the new ‘attachments’ JQL field. Just add the clause "attachments IS EMPTY" or "attachments IS NOT EMPTY" to your advanced search query. Learn more...
- **Filtering for User Picker custom field** — You can now limit the users that can be selected in a user picker custom field, to specified groups and/or project roles. Just configure your user picker custom field and choose the new **Edit User Filtering** link. Learn more...
- **Inline editing can now be disabled** — Inline editing, i.e. clicking to edit a field, can now be disabled for your JIRA site in the General Configuration options. It is still enabled by default.
- **Internet Explorer 11 is now supported**

JIRA 6.2 Upgrade Notes

Please follow the instructions in the general Upgrading JIRA guide, as well as the JIRA 6.2-specific instructions below. The general guide contains important tasks that are essential for getting your upgraded JIRA installation to work correctly and, if necessary, migrating existing configurations.

This page also describes known issues as well as changes you should be aware of before deciding whether or not to upgrade to JIRA 6.2.

On this page:

- Information for JIRA developers
- Upgrading to JIRA 6.2 from JIRA 6.1.x
- Upgrading to JIRA 6.2 from JIRA 6.0.8 or earlier

Information for JIRA developers

See Preparing for 6.2 for important information that could affect your add-ons or scripts. Also, see our Java API policy for JIRA.

Upgrading to JIRA 6.2 from JIRA 6.1.x

- Advance notice: End of support for Internet Explorer 8 (post-JIRA 6.2)
- Images are now correctly shown in email notifications
- Labels and Popular Issues tabs removed from Project Overview
- Rename user and JIRA as a Crowd server
- For developers: Source distribution — Internal Atlassian dependencies are now Maven-based archives

Advance notice: End of support for Internet Explorer 8 (post-JIRA 6.2)

JIRA 6.2 will be the last major release that supports Internet Explorer 8 (IE8). For more information, please see this page.

Images are now correctly shown in email notifications

This release fixes a highly-voted bug where images would only be shown in email notifications, if the user is accessing their email in the same session that has been used to log into JIRA. For details, see [JIRA-25705](https://jira.atlassian.com/browse/JIRA-25705).

Labels and Popular Issues tabs removed from Project Overview

The Labels and Popular Issues tabs are not used very much, so we have removed them to simplify the Project Overview page.

Rename user and JIRA as a Crowd server

In JIRA 6.0 and 6.1, the rename user function was disabled if you had JIRA configured as a Crowd server. In this release, the rename function is enabled by default, even if you have JIRA set up as a Crowd server.

If you want to disable rename user when JIRA is configured as a Crowd server, change `jira.option.user.crowd.allow.rename` to false in the advanced settings. For example, some client applications (depending on JIRA's Crowd server implementation) misinterpret renamed users as having been deleted and created again, so you may want to disable rename user.

For developers: Source distribution — Internal Atlassian dependencies are now Maven-based archives

The internal Atlassian dependencies for JIRA's source distribution are now Maven-based archives, rather than exports of the source repository for each dependency. There will be a Maven-based archive for each dependency, named `<dependency-name-version>-sources.jar`. For more information, see Preparing for JIRA 6.2.

Upgrading to JIRA 6.2 from JIRA 6.0.8 or earlier

In addition to the points listed above, please read the Important Version-Specific Upgrade Notes for every
version of JIRA you are skipping.

Note, you cannot upgrade from JIRA 4.3.x or earlier, directly to JIRA 6.2. You must upgrade to an interim version first. See Skipping Major Versions When Upgrading JIRA.

JIRA 6.1 Release Notes

Accelerate change

Help your team embrace change with JIRA 6.1

JIRA 6.1 picks up where JIRA 6.0 left off, introducing more improvements that help you get work done faster. Features like the new workflow designer and intuitive custom field configuration, let you introduce change to your team without slowing them down.

We are also starting a new journey towards seamless JIRA integration with your coding tools. The new create branch functionality in JIRA 6.1 is the first improvement, with many more to come.

Download latest version

JIRA 6.1 Upgrade Notes

24 September 2013

New workflow designer

The new workflow designer is fast, modern and easy to use. Built using HTML5, the latest HTML standard, it loads instantly and is incredibly responsive. On top of this, we’ve added features to help JIRA administrators build workflows more easily — design in full screen mode, snap lines to statuses (geometric snap lines), select a status to highlight transitions, and more.

Users also benefit from this feature: when viewing an issue, click View Workflow (next to the Status field) to show an accurate view of the workflow designer (one of our highest voted feature requests). Learn more...
New project templates

JIRA 6.1 continues our work from previous releases to get you started faster. You can now choose from two new templates when creating a new project in JIRA. Get up and running quickly with the Simple Issue Tracking project, which has a simple three-step workflow that is easy to understand; or choose the Software Development project, which is configured to reflect a basic development and review process.

Learn more: Simple Issue Tracking Project and Software Development Project

Intuitive custom field configuration

We’ve made it easier to create custom fields and put them where you want. Viewing an issue and think that it needs a new field? Simply click Admin > Add field to choose an existing custom field or create a new one. The field is also added to the Create and Edit screens, so you can use it straight away.

Field types are now categorized into Standard and Advanced when creating a custom field. Standard types also offer a preview of the field, so you can see what you are creating in advance.

Learn more...
Enterprise enhancements

*Edit project key*

One of the *most voted for feature requests* has been implemented in this release: the ability to edit a project key. It's simple but powerful — just change a single field to edit the key for an existing project. JIRA will automatically update related data across all of your projects.

Learn more...

*Change usernames in LDAP*

JIRA now supports changing usernames when connected to an external LDAP user directory. This means that JIRA treats name changes in LDAP as renames, rather than deleting and adding a user (which did not work). For most LDAP implementations, this will work out of the box. In a small minority of cases, further configuration is required.

*JIRA password policy*

The JIRA password policy feature enables JIRA Administrators to set limits and restrictions on the types of passwords their users can create.

Learn more...
More integration with your coding tools

You’ve always been able to link commits from Bitbucket and Stash to JIRA issues, making it easy to understand which issues are fixed and the code changes involved. However, we’re adding new features to expand the ways you can manage commits, builds, and deployments within the context of your planning resources in JIRA.

In this first release of these improvements, if you use Bitbucket or Stash to manage your code repositories, you’ll be able to create code branches directly from issues in JIRA or JIRA Agile. The new Create branch link will open your connected repository application and launch the process of creating a branch for you. If you have multiple applications connected, then you can choose where you’d like to create the branch.

⚠️ Note, the ability to create branches from JIRA in Stash requires Stash 2.8, which will be released next week on 1 October 2013 (watch this page for updates). You can create branches from JIRA in Bitbucket now.
And more!

We’re not stopping here! You will find plenty more 6.1 features listed below. The most notable of these are the name changes for JIRA add-ons: GreenHopper has been renamed to JIRA Agile and Bonfire has been renamed to JIRA Capture. This is part of a move to align these two add-ons more closely with JIRA. You will see associated user interface changes in JIRA in this release. Please be assured that your existing licenses and support entitlements are unchanged. This is a change of product name only. Read this blog post for more information.

![JIRA Agile](image)
![JIRA Capture](image)

Click to view the other features and improvements in this release:

- **Easier issue navigator column configuration** — Show exactly what you need when triaging issues. In this release, you can easily change the columns for search results displayed in List View. Simply click Columns (top right) to choose the desired columns, then drag and drop them where you want.

- **Improvements to workflow text mode** — In line with the updated workflow designer, we have also updated many of the pages in text mode. Specifically, the page that allows you to view a particular status or transition, as well as its post function, conditions and validators.

- **New default workflow and assignee** — We’ve made two changes to simplify the out-of-box experience for new projects in JIRA. First, the default workflow no longer requires a user to be the assignee to transition an issue from one status to another. Second, the default for Allow Unassigned Issues is now set to ON (for new instances only) and the Default Assignee is now set to ‘Unassigned’ when you create a new project. Together, these changes allow issues to be worked on by anyone, rather than have one person be the bottleneck.

  - **Please note...**
    - **Default workflow**: If you prefer the old default workflow behavior, you can change your workflow or import the Classic Default JIRA Workflow.
    - **Allow Unassigned Issues**: Existing instances keep the current default (Allow Unassigned Issues is set to OFF).

- **JIRA Redmine Importer now available** — We’ve added a JIRA Redmine Importer plugin that enables you to import data from Redmine directly into your local JIRA site. Learn more...

- **New look for email notifications** — Email templates for JIRA have been improved to reflect the Atlassian Design Guidelines look and feel. Learn more...

- **New whitelist for JIRA** — JIRA’s whitelist is now more intuitive and easier to configure. Learn more...

- **Faster access to JIRA reports** — You can now access JIRA reports directly from its own tab under the Browse Project page.

JIRA 6.1 Upgrade Notes

Please follow the instructions in the general Upgrading JIRA guide, as well as the JIRA 6.1-specific instructions below. The general guide contains important tasks that are essential for getting your upgraded JIRA installation to work correctly and, if necessary, migrating existing configurations.

This page also describes known issues as well as changes you should be aware of before deciding whether or not to upgrade to JIRA 6.1.

This page includes:

- Information for JIRA developers
- Upgrading to JIRA 6.1 from JIRA 6.0.x
  - Atlassian analytics
  - Supported platforms changes
  - JIRA Administrators cannot delete users that have commented on issues
  - "View Issue Source Tab" permission renamed
  - Custom field creation changes
  - JIRA workflow designer changes
  - JIRA workflow transition changes
  - JIRA default workflow
  - Removal of JQL function "echo()"
- Known Issues
  - JIRA upgrade fails due to duplicate issue keys or project keys
  - Flowdock loses API token after project key is changed
  - Unable to scroll when viewing the 'View Issue' and 'Issue Navigator' pages on iPad
  - Do not use the new 'reindex' REST endpoint
  - 'JIRA Bamboo plugin' and 'Remotable Plugins 118n plugin' fail to load during JIRA startup
- Upgrading to JIRA 6.1 from JIRA 5.1.8 or earlier

Information for JIRA developers

Please see Preparing for 6.1 for information about changes to JIRA's database, JIRA's stable (Java) API, changes to core JIRA CSS styles, changes to JavaScript components that build UI, or changes to HTML markup patterns.

Upgrading to JIRA 6.1 from JIRA 6.0.x

Atlassian analytics

There is a new General Configuration option for JIRA that enables you to turn on/off Atlassian analytics; see Data collection policy for more information.

This option is not available for JIRA OnDemand.
Supported platforms changes

- Project keys with characters other than letters, numbers and the underscore are no longer supported. See End of Support Announcements for JIRA for details.
- CVS/ViewCVS functionality has been removed from JIRA and is no longer supported. See End of Support Announcements for JIRA for details.
- "Voters and Watchers" and "Labels" plugins will not be supported in JIRA 6.1. Note, these plugins are not bundled with JIRA. See End of Support Announcements for JIRA for details.

JIRA Administrators cannot delete users that have commented on issues

If you are a JIRA administrator, you can delete a user from JIRA only if they have not performed any of the following actions:

- reported or been assigned to any issues
- commented on any issues

"View Issue Source Tab" permission renamed

The "View Issue Source Tab" project permission has been renamed to "View Development Tools".

Custom field creation changes

In JIRA 6.1, you no longer specify a Search Template during the custom field creation process. Similarly, all custom fields are created globally, so the context is set for you upon creation. You can change either of these settings later, if required, in your configuration settings.

JIRA workflow designer changes

Features which exist in the classic mode of the (Flash) workflow designer but not in the new workflow designer:

- Create common transitions
- Clone transitions
- Have global transitions with no result status
- Reassign the target of a transition (meaning that you cannot grab the arrow and make it point at a different status, you need to remove the transition and recreate it)

JIRA workflow transition changes

- Viewing All post-functions, conditions, and validators together has been removed.
- Workflow transition IDs are no longer displayed in the user interface. (You can still see it when viewing a workflow text mode.)

JIRA default workflow

The classic default JIRA system workflow prior to this JIRA release is now available on Atlassian Marketplace.

- Classic Default JIRA Workflow

If you import this workflow, you will need to add the 'Clear Resolution' post function back to the following three transitions:

- Start Progress
- Stop Progress
- Reopen Issue

To add a new post function, see this procedure.

Removal of JQL function "echo()"

The echo function is a testing function in JIRA. It has been removed from JIRA as it provides no user value. Existing filters that make use of this function will no longer work; please fix these filters, or remove them.

Known Issues

JIRA upgrade fails due to duplicate issue keys or project keys

Please see these knowledge base articles:
JIRA 6.1.7 Release Notes

21 January 2014
The Atlassian JIRA team announces the release of JIRA 6.1.7. This point release contains several updates and fixes.

- Upgrading To JIRA 6.1 Fails Due To Duplicate Issue Keys
- Upgrading to JIRA 6.1 Fails Due To Duplicate Project Keys

Flowdock loses API token after project key is changed

After a project key is changed, the Flowdock plugin loses the 'Flowdock API token' for that JIRA project. To work around this problem, navigate to the 'Configure Flowdock integration in JIRA' page after the JIRA project has been renamed and add the token again. This issue applies to this JIRA EAP release and Flowdock v1.60.1 and earlier Flowdock versions.

Unable to scroll when viewing the 'View Issue' and 'Issue Navigator' pages on iPad

When viewing JIRA via an iPad, you will not be able to scroll on the 'View Issue' and 'Issue Navigator' pages. See this issue: JRA-33889 - Unable to scroll on 'view issue' and 'issue navigator' pages with iOS

This has been fixed in JIRA 6.1.1, see release notes.

⚠️ Please note, iPad is not supported for JIRA and does not display the supported "mobile view". See Support ed Platforms and this feature request:

- JRA-34075 - As a user, I want the iPad to be supported for non-admin functions

Do not use the new 'reindex' REST endpoint

In this release, we built a new REST endpoint that allows a reindex to be initiated via REST: /rest/api/2/re index

However, there are known issues with this REST endpoint that can lead to index corruption or failure. We strongly recommend that you do not use this REST endpoint until a fix has been released. See this issue for further information:

- JRA-34921 - Warranty - Reindexes triggered by REST fail

'JIRA Bamboo plugin' and 'Remotable Plugins I18n plugin' fail to load during JIRA startup

During a clean install or an upgrade, two plugins will fail to load: the 'JIRA Bamboo Plugin' and the 'Remotable Plugins I18n plugin'. See this issue:

- JRA-34977 - On a clean install of JIRA 6.1 I get plugin errors in the log

This has been fixed in JIRA 6.1.1, see release notes.

Upgrading to JIRA 6.1 from JIRA 5.1.8 or earlier

In addition to the points listed above, please read the Important Version-Specific Upgrade Notes for every version of JIRA you are skipping.

Please check the Application Links Version Matrix for dependencies compatibility verification.

JIRA 6.1.7 Release Notes

21 January 2014
The Atlassian JIRA team announces the release of JIRA 6.1.7. This point release contains several updates and fixes.

This is the last release in the 6.1.x release cycle.

Upgrading to JIRA 6.1.7 is free to all customers with active JIRA software maintenance.
Don't have JIRA 6.1 yet?

JIRA 6.1.6 Upgrade Notes

Important information for developers
• 'creator' column added to jiraissues table — A new creator field was introduced in JIRA 6.1.6, and will also be in JIRA 6.2 when it is released. This field was implemented as a column in the jiraissues table in the JIRA database. Please note the following:
  • New JIRA 6.1.6 (or 6.2) instances: the creator field will be located after the assignee column
  • Existing JIRA instances that are upgraded to 6.1.6 (or 6.2): the creator field will be inserted as the last column in jiraissues table

We strongly recommend that you do not rely on the order of columns in the tables of the JIRA database, but instead refer to the columns explicitly by name.

Upgrading from JIRA 6.1 to 6.1.6

Follow the instructions in the general upgrading JIRA documentation.

Upgrading from JIRA 6.0.x and earlier

In addition to the above, please read the JIRA 6.1 Upgrade Notes and as well as Skipping Major Versions When Upgrading JIRA if you are skipping any major JIRA versions.

JIRA 6.1.5 Release Notes

10 December 2013
The Atlassian JIRA team announces the release of JIRA 6.1.5. This point release contains several updates and fixes.

Upgrading to JIRA 6.1.5 is free to all customers with active JIRA software maintenance.

Don't have JIRA 6.1 yet?

Highlights

Check out the full list of updates and fixes below. Here are a few of the highlights:

- The View Issue and Issue Navigator pages now scroll correctly on iPads. See:
  - JIRA-33889 - Unable to scroll on 'view issue' and 'issue navigator' pages with iOS
- The screen designer now works correctly again. See:
  - JIRA-35586 - Can NOT reorder fields on the screen designer in screen configurations
- AppLinks can now be created to JIRA on non-standard ports (other than 443). See:
  - JIRA-34550 - Unable to create AppLink to JIRA on a non-standard HTTPS port (other than 443)
- JIRA instances with the HipChat plugin disabled will no longer show error messages when users hover over usernames. See:
  - JIRA-29891 - HipChat Plugin errors "Can not forward a request to HipChat API" without HipChat being configured
- Gadgets that show a progress bar now render the progress bar correctly. See:
  - JIRA-25451 - Progress bar does not display properly in Gadgets
- Issue filters will no longer break (i.e. fail to show issues) when you transition an issue in the Detail View. See:
  - JIRA-34934 - Transitions in the Detail View are breaking the filters
- Fixed a memory leak. See:
  - JIRA-34361 - Thumbmer and DefaultThumbnailManager are leaking native resources.

Upgrading from a previous version of JIRA

JIRA 6.1.1 Release Notes

15 October 2013
The Atlassian JIRA team announces the release of JIRA 6.1.1. This point release contains several updates and fixes.

Upgrading to JIRA 6.1.1 is free to all customers with active JIRA software maintenance.

Don’t have JIRA 6.1 yet?
Take a look at all the new features in the JIRA 6.1 Release Notes and see what you are missing out on!

Download latest version

Highlights

This release is jam-packed full of bug fixes. We’ve fixed over 60 issues in this bugfix release, which is about three times the usual number. These include a number of highly voted issues as well as security fixes.

Check out the full list of updates and fixes below. Here are a few of the highlights:

- JIRA no longer inserts unwanted images when exporting issues to Excel. See:
  - JRA-34532 - When doing an export from JIRA the report is inserting unwanted images. RESOLVED
- JIRA now supports the attachment of CMYK jpeg files. See:
  - JRA-20072 - Attachment and thumbnail missing in issue when CMYK jpeg image attached. RESOLVED
- Previews for the ‘Pie Chart’ and ‘Created v. Resolved’ macro now work correctly when used in Confluence. See:
  - JRA-34911 - ‘Pie Chart’ and ‘Created v. Resolved’ macro preview do not display when used in Confluence RESOLVED
- Activity Streams should now use relative URLs for internal content, rather than the JIRA base URL. See:
  - JRA-27836 - Activity Stream using General Configurations Base URL for content RESOLVED
- The JIRA mail handler should no longer create duplicate issues when the email is not processed correctly. See:
  - JRA-29228 - Duplicate issues created by mail handler when the email is not processed correctly RESOLVED
- Administrators are now able to turn outgoing email on or off (previously, only System Administrators were able to do this). System Administrator access is still required to configure outgoing mail servers. See:
  - JRA-31041 - Allow OnDemand administrators to disable Outgoing mail when importing backups. RESOLVED
- We now have a Bitbucket importer. For details see the documentation.

JIRA 6.1.1 Upgrade Notes

Upgrading from JIRA 6.1 to 6.1.1

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Follow the instructions in the general upgrading JIRA documentation. In addition, note the following:

**jira.clone.link.legacy.direction flag removed**

In this release, we have removed the `jira.clone.link.legacy.direction` flag from the Advanced Settings in JIRA. This flag reversed the outward and inward descriptions for the link when an issue was cloned. The upgrade tasks for this release will point all links in the correct direction, i.e. descriptions will not be reversed.

**Upgrading from JIRA 6.0.x and earlier**

In addition to the above, please read the JIRA 6.1 Upgrade Notes and as well as Skipping Major Versions When Upgrading JIRA if you are skipping any major JIRA versions.

**JIRA 6.0 Release Notes**

Meet the new JIRA

JIRA 6.0 is a completely new JIRA. The redesigned look and feel brings a whole new user experience to JIRA. It is modern and simple, clearing away the clutter so that you can get your work done faster.

This release also includes a new detail view for search results, faster issue viewing, a mobile interface for JIRA, workflow sharing, features to help you get started faster, enterprise improvements, and much more!

Download latest version

JIRA 6.0 Upgrade Notes

New JIRA look and feel

JIRA 6.0 introduces a modernised look and feel that follows the new Atlassian Design Guidelines. This new user experience doesn't just look great, it also helps you get your work done faster. Information is easier to find and common tasks are simpler.

The new JIRA look and feel is consistent with other Atlassian applications, so users will find it easy to use JIRA with Confluence, Bitbucket, Stash and other Atlassian products.
New detail view and view issue improvements

JIRA is optimised to let you quickly navigate lists of issues and take action on those items that need your immediate attention. The new detail view lets you view an issue within the context of the filter it is a part of, showing you both at the same time. We have also streamlined the interaction with the View Issue screen and removed page loads to speed things up.

Learn more...

JIRA mobile

Take JIRA everywhere! You can now view mobile-optimised versions of JIRA pages on your iPhone or Android phone. Simply browse to your JIRA server’s URL using your mobile browser to bring up the mobile interface for JIRA.

The JIRA mobile interface is designed for viewing and interacting with issues on the go — triage your tasks for the day on the train, assign an issue to someone during a meeting, mention them in a comment, and more.

Learn more...
Workflow sharing

The new Workflow Sharing feature lets you import a workflow directly from the Atlassian Marketplace, enabling you to use workflows that other people have published. You can also use this feature to move a workflow from staging to production in your own organisation or to share your own custom workflows.
Learn more...

Get started fast!

JIRA 6.0 continues the work that we began in JIRA 5.1 and 5.2 to get you started faster with JIRA. When you create a new project, you can now select from different types of projects including Scrum and Kanban. The new administration gadget provides a handy checklist of tasks to get JIRA set up quickly, as well as links to useful functions and documentation.
Enterprise scale

Improvements

- **Editable usernames** — The second most requested feature, as determined by customer votes, is here! JIRA Administrators can now edit any username in the JIRA Internal Directory. [Learn more...](#)

- **Global workflow schemes** — Now you can edit an active workflow scheme on a project: a draft is created, and the migration is handled through the normal migration process. [Learn more...](#)

- **Translate custom fields** — Customers whose users operate in different languages can now translate the names and descriptions of custom fields.

- **JIRA to JIRA issue copy** (Marketplace Plugin) — For customers with more than one JIRA server, you can copy an issue from one project to another, even if the projects aren't on the same JIRA instance. [Learn more...](#)

Resources

Enterprise Resources are best practice guides for running Atlassian applications at high levels. Here are some of our more recent offerings:

- **Getting Started with JIRA Scale**
  - JIRA Sizing Guide
  - Scaling JIRA
  - Federating JIRA - Managing Multiple Instances

And more!

There's plenty more JIRA 6.0 features below to get excited about, but we think that this one is pretty cool. The **Auto look and feel** feature was a 20% project by one of our JIRA developers, Graeme Smith. With a single click, you can automatically apply a color scheme to JIRA that matches your company logo. Check out the example below:
Click to view the other features and improvements in this release:

- Learn more...
• **Stable search** — Now, when you search, your search results remain constant until you choose to refresh them. This provides you with a stable set of search results that you can work from when triaging issues.

• **Docking and undocking the filter panel** — You can now hide the filter panel to gain more screen real estate. Simply click **Undock** at the top right of the panel.

• **Bulk watch/unwatch feature** — You can now start or stop watching multiple issues using the watch / stop watching bulk operation. Learn more...

• **Browse Project Summary** — Starting a new project? You'll be greeted by a more informative screen when you next browse your empty project's summary.

• **New plugin points for the User Profile page** — For the ecosystem developers, we have implemented new plugin points for the web panels in the User Profile page. Learn more...

• **Reports have moved** — We have moved reports from the dropdown menu on the Browse Project > Summary tab to a panel on the same tab, making them more accessible.

• **Relative time used in date/time formats** — Issue date/time fields show a relative instead of absolute date/time format (for example: Yesterday 12:00 PM instead of 20 May 2013 12:00 PM). You can still see the absolute date/time by hovering over the field.

• **Global autowatch configuration** — We've implemented a new JIRA option that allows administrators to disable the autowatch feature (introduced in JIRA 5.0.3) for all users. To configure autowatch for all users, navigate to **Administration > User Preferences (in Users section) > Default autowatch**.

• **Maximum project name size and maximum project key size configuration** — JIRA administrators will be able to set the maximum size for both the project name and project key in this release. Navigate to **Administration > System > General Configuration** and update **Maximum project name size** or **Maximum project key size** as desired.

• **Application Navigator with configurable links** — JIRA administrators can now configure links that appear in a handy dropdown menu in the JIRA header. Learn more...

• **More direct access to JIRA Administration**

![Image of JIRA Admin page]

- The JIRA Admin page is no more. Instead of selecting **Cog menu > JIRA Admin > Projects** (for example), you skip the JIRA Admin page and select **Cog menu > Projects**, shown in the image to the right.

- Select the **Cog menu** to go straight to the Administration panel you are looking for. In this case, **Cog menu > Projects**.

- Click **Search JIRA Admin** to access the g + g shortcut menu.

- Click any option in the new **Admin header** to go to that page.

• **Supported platforms** — JIRA 6.0 supports Internet Explorer 10 and PostgreSQL 9.0. Learn more...
Special Thanks

Special thanks to our 3rd party developers that maintain open source plugins for OnDemand! These folks keep the great open source plugins that are a part of JIRA OnDemand up to date with each release, making sure you continue to get great use from our most popular plugins.

- JIRA Timesheet Report and Portlet Plugin – Andriy Zhdanov
- JIRA Suite Utilities – Beecom – Stefan Forstmoser
- JIRA Misc Workflow Extensions – David Fischer

Overview

Please follow the instructions in the general Upgrading JIRA guide, as well as the JIRA 6.0-specific instructions in the sections below. The general 'Upgrading JIRA' guide contains important tasks that are essential for getting your upgraded JIRA installation to work correctly and if necessary, migrating existing configurations.

This page also describes known issues as well as changes you should be aware of before deciding whether or not to upgrade to JIRA 6.0.

This page includes:
• Overview
• Known issues
  • Migrated pre-6.0 worklogs with mixed-case usernames are disassociated from authors
  • Get a sorted list of searchable fields is more than 160 times slower in JIRA 6 than in JIRA 5.2
• Upgrading to JIRA 6.0 from JIRA 5.2.x
  • Disabling inline edit no longer allowed
  • You may need to upgrade your GreenHopper version to work with JIRA 6.0
  • Cloners workarounds need to be disabled
  • JSON-P no longer supported
• Upgrading to JIRA 6.0 from JIRA 5.1.8 or earlier
• Information for JIRA developers

Known issues

Migrated pre-6.0 worklogs with mixed-case usernames are disassociated from authors

With the transition in JIRA 6 to user keys in lieu of user names, the pre-6.0 issue worklog is not being migrated correctly in the case of users who had LDAP-originating non-lowercase usernames. This results in the worklog entries not being associated with the user.

This will be fixed in an upcoming release.

Get a sorted list of searchable fields is more than 160 times slower in JIRA 6 than in JIRA 5.2

This comes from the fact that translatable field names was introduced in JIRA 6, which means that JIRA has to get a property set for each field where the translated name is stored when it get the field's name. These property sets should be cached, but that is not currently happening.

This will be fixed in an upcoming release.

Upgrading to JIRA 6.0 from JIRA 5.2.x

Disabling inline edit no longer allowed

We've removed the ability to disable inline edit because the preferred way to edit issues is with inline editing and we want to encourage use of this feature. This option is no longer available in JIRA Admin (under System > General Configuration).

You may need to upgrade your GreenHopper version to work with JIRA 6.0

GreenHopper versions older than 6.2 will not be compatible with JIRA 6.0.

Cloners workarounds need to be disabled

Any customers upgrading to JIRA 6.0 that applied a workaround for the cloners link type – see clone operation creates link in the wrong direction for details – may need to reverse that workaround.

JSON-P no longer supported

JSON-P will not be supported in JIRA 6.0 for security reasons: it is possible for an attacker use this to view information in a JIRA instance that they do not have permission to see.

If you have built integrations that rely on JSON-P, you can override this by setting the atlassian.allow.jsnp system property to true.

Creating a new project: Select Project Type dialog known behaviour

Please note, in JIRA 6.0, choosing Blank Project, Bug Tracking, Software Development or Project Management in the new Select Project Type dialog will create the same default JIRA project. We are in the
process of developing pre-configured project templates for project types. We are considering custom workflows, sample data, preset issue types, default fields, etc, for these templates. Your use of the dialog will give us with valuable data to help us build the right project types.

Upgrading to JIRA 6.0 from JIRA 5.1.8 or earlier

In addition to the points listed above, please read the Important Version-Specific Upgrade Notes for every version of JIRA you are skipping.

Information for JIRA developers

JIRA 6.0 is a major release for JIRA. As a result, there are a number of changes that may break add-ons. These include changes to JIRA’s stable (Java) API, changes to core JIRA CSS styles, changes to JavaScript components that build UI, changes to HTML markup patterns. For details, please see: Preparing for 6.0.

JIRA 6.0.8 Release Notes

3 September 2013

The Atlassian JIRA team announces the release of JIRA 6.0.8. This point release contains several updates and fixes.

Upgrading to JIRA 6.0.8 is free to all customers with active JIRA software maintenance.

Don’t have JIRA 6.0 yet?

Highlights

Simple Issue Tracking project

This project provides you with a quick and easy way to get JIRA up and running for simple issue tracking. For details on working with this project, see Simple Issue Tracking project.
Software Development project

This project provides you with a template to use for software development. For details on working with this project, see Software Development project.

Important fixes

- GreenHopper and Bonfire will soon be renamed to "JIRA Agile" and "JIRA Capture" respectively. See this blog post for details: http://blogs.atlassian.com/2013/06/simplify/. You will notice some of these name changes in this release of JIRA.
- We do not support Chrome Frame for Internet Explorer, however JIRA previously directed the browser to use it if it was available. JIRA no longer does this. See this issue: JRA-33941 - X-UA Compatibility Meta Tag in JIRA 6 templates should come before any script tags
- Integrity checker preview no longer breaks when issues have missing workflows. See this issue: JRA-4714 - Integrity checker preview breaks when issues have missing workflows
- This release also contains performance improvements.

Upgrading from a previous version of JIRA

If you are upgrading, please read the JIRA 6.0.7 Upgrade Notes.

Highlights

- Issue searches using wildcards have been improved. See these issues:
  - JRA-19216 - Wildcard search does not work if prefix is over 14 characters
  - JRA-6187 - Wildcard search fails to find matches

- The create issue dialog has been improved. See these issues:
  - JRA-33652 - Attachment files are lost after changing project or issue type on create issue pop-up screen
  - JRA-27544 - When creating a bug and "create another is checked" the description and time tracking fields are not cleared when creating the bug

- Upgrade bug due a missing entry in the moved_issue_key table has been fixed. See this issue:
  - JRA-34024 - Upgrade to 6.0.5 fails due to Missing moved_issue_key Entry

- This release also contains a number of minor security fixes.

Upgrading from a previous version of JIRA

If you are upgrading, please read the JIRA 6.0.6 Upgrade Notes.

Highlights

- Administrators can now configure the level of stemming applied when indexing JIRA (English only).
Stemming is the process of reducing derived words to their root or stem form. This can be used to improve the relevance of search results, depending on the content in JIRA.

See this issue:

- [JIRA-33739 - Stemming options for indexing in the english language](http://jira.atlassian.com#JIRA-33739) [RESOLVED]

This also resolves this long-standing related issue with 75 votes!

- [JIRA-5567 - Incorrect stemming causes some words to be unsearchable](http://jira.atlassian.com#JIRA-5567) [RESOLVED]

- JQL searches of more than 2,000 characters now work correctly on all browsers. See this issue:
  - [JIRA-31774 - JQL length limitation on Chrome and Firefox](http://jira.atlassian.com#JIRA-31774) [RESOLVED]

Please note however, that the JQL statement is part of the JIRA search page URL. Hence, a JQL statement may still be limited by the length of the URL allowed by the browser (e.g. 4,000 characters on Internet Explorer 8). See this issue:

- [JIRA-33848 - Allow URLs on the issue navigator to work for any size JQL](http://jira.atlassian.com#JIRA-33848) [OPEN]

- This release also contains a number of security fixes.

### Upgrading from a previous version of JIRA

**JIRA 6.0.5 Upgrade Notes**

**Upgrading from JIRA 6.0.x to 6.0.5**

Please follow the instructions in the general upgrading JIRA documentation. Please also take note of the following:

- **Known issue:** Upgrading to JIRA 6.0.5 fails due to missing entry in `moved_issue_key` table. We recommend that you upgrade to JIRA 6.0.6 or later instead. Otherwise, to work around this issue, disable auto-export. Please ensure that you back up your data before you upgrade, if you disable auto-export. See [JIRA-34024](#) - Upgrade to 6.0.5 Fails due to Missing moved_issue_key Entry.

**Upgrading from JIRA 5.2.x and earlier**

In addition to the above, please read the JIRA 6.0 Upgrade Notes and as well as Skipping Major Versions When Upgrading JIRA if you are skipping any major JIRA versions.

**JIRA 6.0.4 Release Notes**

**9 July 2013**

The Atlassian JIRA team announces the release of JIRA 6.0.4. This point release contains several updates and fixes.

Upgrading to JIRA 6.0.4 is free to all customers with active JIRA software maintenance.

**Don’t have JIRA 6.0 yet?**

Take a look at all the new features in the JIRA 6.0 Release Notes and see what you are missing out on!

[Download latest version](#)
Highlights

- Custom mail handlers will now work correctly. See this issue: 
  [JIRA-30451 - Mail Handler popup configuration seems to have lost the ability to access the 'com/atlassian/jira/plugins/mail/ServiceConfiguration' class] [RESOLVED]

- The JIRA issue collector now works in Internet Explorer 10 correctly. See this issue: 
  [JIRA-33476 - Issue Collector breaks in IE10 in standards mode] [RESOLVED]

Upgrading from a previous version of JIRA

If you are upgrading, please read the JIRA 6.0.4 Upgrade Notes.

### JIRA 6.0.4 Upgrade Notes

**Upgrading from JIRA 6.0.x to 6.0.4**

Please follow the instructions in the general upgrading JIRA documentation.

**Upgrading from JIRA 5.2.x and earlier**

In addition to the above, please read the [JIRA 6.0 Upgrade Notes](#) and as well as [Skipping Major Versions When Upgrading JIRA](#) if you are skipping any major JIRA versions.

### JIRA 6.0.3 Release Notes

**25 June 2013**

The Atlassian JIRA team announces the release of **JIRA 6.0.3**. This point release contains several updates and fixes.

Upgrading to JIRA 6.0.3 is free to all customers with active JIRA software maintenance.

### Don't have JIRA 6.0 yet?

Take a look at all the new features in the [JIRA 6.0 Release Notes](#) and see what you are missing out on!
Highlights

New default workflow behaviour

In order to be able to start progress on an issue, a user must have the 'Assignable User' permission. When a user starts progress on an unassigned issue, the issue gets automatically assigned to that user. Similarly, any user with this permission can stop progress on an issue, although in this case the issue does not get reassigned to the user doing so.

This is different from the classic default JIRA workflow in the following ways:

- Previously, when you started progress on an issue, it did not change the assignee to the current user. Whoever the assignee was at that time would remain as the issue's assignee.
- In the classic default JIRA system workflow, only the issue assignee was able to execute the 'Start Progress' and 'Stop Progress' transitions. Now, as long as you have 'Assignable User' permission, you can execute this step.

Classic JIRA workflow available from Atlassian Marketplace

The classic default JIRA system workflow prior to this JIRA release is now available on Atlassian Marketplace.

- Classic Default JIRA Workflow

If you import this workflow, you will need to add the 'Clear Resolution' post function back to the following three transitions:

- Start Progress
- Stop Progress
- Reopen Issue

To add a new post function, see this procedure.

All newly created issues are now unassigned by default

The default for 'Allow Unassigned Issues' is set to ON for new instances. The 'Default Assignee' is set to 'Unassigned' when you create a new project, see Defining a Project for details.

Existing instances keep the current default ('Allow Unassigned Issues' is set to OFF).

JIRA Redmine Importer now available

The JIRA Redmine Importer plugin allows you to import data from the Redmine Issue Tracker product into your local JIRA site. For more information, see Importing Data from Redmine.

Important Fixes

- We have improved the performance of the JIRA issue collector (see JIRA-31971 - Issue collector causes performance issues on host JIRA instance [RESOLVED]). Please be aware, if you edit an issue collector (e.g. change the trigger), there may be a delay of up to an hour until users see the updated issue collector in the target system, due to browser caching. Alternatively, the user can refresh the page in their browser to see the updated issue collector immediately.
- The date/time picker for JIRA now works correctly on all browsers (see JIRA-26265 - Date Time custom field doesn't calculate current time [RESOLVED]).
- There are a few minor security (XSS/XSRF) fixes in this release. Please see the list of fixes below for details.

Upgrading from a previous version of JIRA

If you are upgrading, please read the JIRA 6.0.3 Upgrade Notes.

JIRA 6.0.3 Upgrade Notes

Upgrading from JIRA 6.0.x to 6.0.3

Please follow the instructions in the general upgrading JIRA documentation.

Error message when using JIRA with Oracle 11g

If you have JIRA connected to Oracle 11g and upgrade to JIRA 6.0.3, you will see the following error message:

Error was: java.sql.SQLSyntaxErrorException: ORA-00972: identifier is too long

This error does not have any functional impact on JIRA and can be ignored. See this KB article for more details.

Upgrading from JIRA 5.2.x and earlier

In addition to the above, please read the JIRA 6.0 Upgrade Notes and as well as Skipping Major Versions When Upgrading JIRA if you are skipping any major JIRA versions.

JIRA 6.0.2 Release Notes

12 June 2013

The Atlassian JIRA team announces the release of JIRA 6.0.2. This point release contains several updates and fixes.

Don't have JIRA 6.0 yet?

Take a look at all the new features in the JIRA 6.0 Release Notes and see what you are missing out on!

Download latest version

Highlights

- Complex issue filter relationships (where filters rely on other filters) should now work correctly (see JRA-28270 - JQL Cycle Detection Regression (4.4 -> 5.0)).
- Webhooks should now pick up all issue events when a large number of issues are modified at the same time, i.e. bulk edit (see JRA-33289 - Webhooks lose "hits" in the event of a bulk edit).
- The dashboard now conforms to Look and Feel changes correctly (see JRA-21043 - Dashboard does not obey link "Look and feel" options).
- Project shortcuts now work on the View Issue page (see JRA-33064 - Project shortcuts broken on view issue page).

Upgrading from a previous version of JIRA

If you are upgrading, please read the JIRA 6.0.2 Upgrade Notes.

JIRA 6.0.2 Upgrade Notes

Upgrading from JIRA 6.0.x to 6.0.2

Please follow the instructions in the general upgrading JIRA documentation.

Error message when using JIRA with Oracle 11g

If you have JIRA connected to Oracle 11g and upgrade to JIRA 6.0.2, you will see the following error message:

Error was: java.sql.SQLSyntaxErrorException: ORA-00972: identifier is too long

This error does not have any functional impact on JIRA and can be ignored. See this KB article for more details.

Upgrading from JIRA 5.2.x and earlier

In addition to the above, please read the JIRA 6.0 Upgrade Notes and as well as Skipping Major Versions When Upgrading JIRA if you are skipping any major JIRA versions.

JIRA 6.0.1 Release Notes

28 May 2013

The Atlassian JIRA team announces the release of JIRA 6.0.1. This point release contains several updates and fixes.

Upgrading to JIRA 6.0.1 is free to all customers with active JIRA software maintenance.

Don't have JIRA 6.0 yet?

Take a look at all the new features in the JIRA 6.0 Release Notes and see what you are missing out on!

Download latest version

Highlights

- Worklog entries are now correctly associated with users that have non-lowercase usernames from LDAP (see JIRA-33074 - Migrated pre-6.0 worklogs with mixed-case usernames are disassociated from authors).
- JIRA now allows you to share an issue with yourself, even if you have opted to not be notified of your own changes (see JIRA-31689 - Cannot share issue with yourself if notifications are disabled for your own changes).
- Performance improvements:
  - Retrieving a sorted list of searchable fields is now much faster, e.g. "Group" select list on "Timesheet" report (see JIRA-33065 - Searchable Fields Slow - Get a sorted list of searchable fields is more than 160 times slower).
  - The IN operator for advanced searching is now up to 16 times faster for JIRA instances with a large number of projects (see JIRA-32402 - The "in" operator cause performance issue when having a huge number of project).
  - You are now able to navigate back to the main create project dialog after choosing an option (see JIRA-32308 - User interface for selecting a project is not correct).

JIRA 5.2 Release Notes

12 November 2012

Find clarity faster

Focus on what matters most with JIRA 5.2

The completely redesigned JIRA search lets you quickly find and organise your issues, so you – and your team – can focus on what matters most. Getting the job done!

JIRA 5.2 also includes enterprise scale improvements, redesigned project workflows, new webhooks integration, help features for new users and much more.

JIRA 5.2 Upgrade Notes
We made it easier to create and edit issues with inline editing in JIRA 5.1 and the create/edit issue dialog in JIRA 5.0. In this release, we’re making it easier for you to find issues fast.

The new instant search bar and search results let you build the right query the first time. Shared filters are easily accessible on the search page, helping each team member to track progress towards common goals. You can keep across your own priorities at a glance with pre-built system filters for the most common views in JIRA.

- **New system filters** — Easily filter for the most common views in JIRA: ‘My Open Issues’, ‘Reported by Me’, ‘Recently Viewed’ and ‘All Issues’.
- **Favourite filters on the navigator** — Quickly switch between views. Your favourite filters are now just a click away.
- **Intuitive filter management** — See who owns a filter at a glance and whether changes have been made.
- **New search bar** — Simply select the criteria you want in your search. Focus on the search criteria you care about and hide the rest.
- **Ad-hoc searches** — Search and refine on-the-fly with immediate results. Refresh your results without reloading your page.
- **Complex searches** — Create and execute complex searches with ease. The new search UI makes this simple, regardless of the number of projects, custom fields, or your JIRA configuration.

Read the documentation...
Enterprise scale
Improvements

<table>
<thead>
<tr>
<th>Re-indexing Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Background re-index</td>
<td>This will make sure that all users are accessed IDs during the re-index.</td>
</tr>
<tr>
<td>Load full index and rebuild index</td>
<td>This will also re-extract the issues and complete the re-index. It is slower, but may be quicker when running on a large scale.</td>
</tr>
</tbody>
</table>

JIRA now has the option of **re-indexing issues in the background**, so your users can use JIRA as normal. We’ve also made a number of other performance improvements.

- **Learn more...**

  **Background re-index** — JIRA now has the option of re-indexing issues in the background. Performing a background re-index allows your users to use JIRA as normal. You won’t need to schedule system-wide downtime just to perform a re-index.

  **Performance improvements** — This release includes a multitude of performance improvements. You may not notice every tweak we’ve made, but it all adds up to a better user experience.

  - **Faster loading of the View Issue page** — Smarter loading of attachment thumbnails and the speed to render wiki markup has been increased.
  - **Issue search** — Faster results for searching (up to four times faster) when a project has an extremely large number of issue type or custom fields.
  - **Searching with large "NOT IN" clauses** — Searches with clauses like “fixVersion not in releasedVersions()” are now at least ten times faster, depending on the data size.
  - **Other areas of increased performance** — GreenHopper queries that use nested filters, managing project versions with an extremely large list (all browsers except Internet Explorer), and calculating the assignee field when performing large bulk edits.
  - **Indexing** — More low level Lucene options exposed so you can tune Lucene to perform better in your specific environment.
  - **Smarter use of memory** — Reduction in the memory required to interpret Velocity files, resulting in faster page loads.
  - **Faster exports** — XML exports with Postgres and MySQL are no longer put into memory. They are now done in batches which allows JIRA to back up extremely large instances.
  - **Faster imports** — The garbage collection profile has been improved, resulting in less memory churn and a better performing import process.
  - **Notification table** — This table is no longer used and will automatically be deleted, resulting faster backups and imports as there is less data to migrate.

**Reduced Memory Usage**

- **More efficient Search Index caching** — Memory usage of searches has improved tenfold. This is particularly noticeable on very large instances that are very busy.
- **Removed the massive memory use of Postgres and MySQL in data export** — You no longer need to increase memory size to very large amount to get an export to work.
- **Smarter pooling of UI rendering resources** — This change saves 90MB of memory.

**SSL configuration via the JIRA configuration tool** — If you want to run JIRA over SSL or HTTPS, you won’t need to tinker around in XML files anymore. The JIRA configuration tool has a new screen that lets you easily configure access via HTTPS. The configuration tool also validates your configuration, so you won’t need to worry if you’ve mistakenly entered an invalid certificate. Read the documentation...
The JIRA data generator now supports more complex data requirements. We've also developed an HTTP requests log analyser to help you performance-tune your JIRA instance.

Learn more...

Improved JIRA Data Generator — In JIRA 5.1, we built the JIRA Data Generator as part of our Enterprise performance work. This tool helps customers create large JIRA data sets quickly, which is useful for testing how your instance will perform at a projected rate. We also released a set of performance test scripts that can be used to test against data sets created by the JIRA Data Generator. In this release, we've improved the JIRA Data Generator to support screen schemes and field configurations. The tool is not bundled with JIRA, but it is free and customers can get it from the Atlassian Marketplace: JIRA Data Generator.

HTTP Request Log Analyser — The new JIRA HTTP Request Log Analyser provides an analysis of the traffic on your JIRA instance, such as the maximum requests per minute, that can help you performance-tune your JIRA instance. We originally developed this tool to help our customers provide us with performance data for their JIRA instances. This tool is not bundled with JIRA, but it is available as a free download. We also have a summary of the results from our JIRA instances and from some anonymous customers.

Guides

We've written two new enterprise guides on federating JIRA and scaling GreenHopper. We've also published our investigations into custom field performance.

Learn more...

New guides — Federating JIRA - Managing Multiple Instances and Scaling JIRA Agile.

Enterprise resources — If you haven't browsed our enterprise resources before, you can find them here: Enterprise Resources. You'll find guides on scaling JIRA, establishing staging server environments for JIRA, garbage collection tuning, and more.

Custom field performance — In JIRA 5.1, we gave our Enterprise customers the Scaling JIRA guide which explains how customers can get the most out of JIRA in large deployments. This guide describes how there are many factors that affect JIRA performance, besides the total number of issues. One of these factors is custom fields. In this release, we've investigated how the configuration of custom fields can affect performance. You can view our findings in the updated Scaling JIRA guide.
Webhooks for issues

Managing information between systems is a challenge. Do you want to post notifications from JIRA to a chat room? Do you want bug changes to be pushed from JIRA to a test management system? Do you want to send an SMS when issues transition in your workflow?

Webhooks provide you with a lightweight mechanism for letting remote applications receive push notifications from JIRA. No polling required.

- Learn more...

Simply register a webhook in JIRA with the URL where the callback should be sent. Any time any issue changes in JIRA, a JSON notification will be sent to the URL.

You can also refine webhooks to suit your needs:

- Constrain a webhook to fire for a set of issues and/or specific issue events.
- Use a variable to include the key of the issue that fired it.
- Configure a workflow post-function to fire a webhook.

Read the documentation...
Intuitive workflow administration

Change is necessary for innovation. In this release, we've redesigned project workflows configuration and screen design to help you quickly adapt JIRA to your team's needs.

Configuring project workflows is easier and faster. View diagrams for all workflows for a project on a single page. Review your changes in draft format before publishing.

You'll also find screen design much more intuitive. Drag-and-drop and autocomplete help make this complex task much simpler.

Learn more...

Following on from the improvements to workflow administration in JIRA 4.4 and project administration in JIRA 5.1, we're continuing to make editing workflows easier within your project. You'll still have the power and flexibility of JIRA workflows at your fingertips, but configuration is much more intuitive.

Project workflows are now shown as a visual representation — a diagram of each project workflow is displayed in a table, with the associated issue types alongside. The old text-based view of each workflow is still available as well, if you prefer.

Configuring project workflows is also much easier. Want to preview changes as a draft before publishing? Want to browse through diagrams of the workflows in the system when adding a workflow? Want to assign multiple issue types to a workflow in a single step? You can now do all of these tasks and more.

Read the documentation...

The screen designer has been overhauled in this release. Screens are as customisable as ever, however the user interface is faster and much simpler to use. You won't have to wrestle with controls when reordering — just drag and drop to move a field or tab. Autocomplete is now used when adding fields, making this process quicker and easier as well.

Read the documentation...
A helping hand for new users

For new installations, you now have the option of creating a demonstration project. This demonstration project contains a number of sample issues that explain some JIRA basics: searching for issues, keyboard shortcuts, and editing issues.

JIRA also has inline help tips to guide new users in getting the most out of JIRA, such as a handy message instructing users to create issues. Others include administrator-only tips for tasks like creating users and editing workflows.

And more!

There are plenty more features and improvements in this release, including:

- a streamlined Browse Project user interface to help you focus on the task at hand without distractions,
- the JIRA admin helper which helps you to troubleshoot notifications or find out why a user can/cannot view issues or custom fields,
- copying and editing of issue collectors,
- the universal plugin manager 2.7 including the request plugin feature,
- column ordering for standard JIRA gadgets,
- compatibility with Confluence Workbox Notifications, and
- platform improvements, including support for Java 7 and Tomcat 7.

Streamlined user interfaces for projects

We've been working hard to improve the user interface when you are browsing a project, so that you can concentrate on the task at hand without any distractions. The list of improvements are in the table below:
<table>
<thead>
<tr>
<th>UI Feature</th>
<th>Notes</th>
<th>Screenshot of new UI</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Create New Project button on the Browse Projects &gt; All Projects page</td>
<td>N/A</td>
<td><img src="image1.png" alt="Screenshot" /></td>
</tr>
<tr>
<td>Browse Project &gt; Summary tab redesigned:</td>
<td>• Administer Project button used to be on Browse Project &gt; Summary tab (now removed) • Issues: Updated recently and Issue: Unresolved sections superseded by Activity Stream.</td>
<td><img src="image2.png" alt="Screenshot" /></td>
</tr>
<tr>
<td>• Administer Project button now available on the Browse Project page itself • Activity Stream only shows activity on JIRA issues and JIRA plugins • Issues: Updated recently section removed • Issue: Unresolved section removed • Versions: Unreleased section moved to different position on tab • Show/hide toggle for additional versions removed • &quot;Eyeball&quot; toggle replaced with smart switcher at bottom of list</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Standard issue filters directly available on Browse Project &gt; Issues page</td>
<td>Used to be in Filters dropdown on Browse Project &gt; Summary tab (now removed)</td>
<td><img src="image3.png" alt="Screenshot" /></td>
</tr>
<tr>
<td>Standard issue filters directly available on Browse Version &gt; Issues page</td>
<td>Used to be in Filters dropdown on Browse Version &gt; Summary tab (now removed)</td>
<td><img src="image4.png" alt="Screenshot" /></td>

<tr>
<td>Project &gt; Labels page redesigned</td>
<td>N/A</td>
<td><img src="image8.png" alt="Screenshot" /></td>
</tr>
</tbody>
</table>

**JIRA admin helper**

We've bundled the popular JIRA admin helper plugin in this release. This tool helps JIRA administrators to diagnose and fix any of the following problems:
• A custom field not showing on the View Issue, Edit Issue or Create Issue screens.
• A user being able to see an issue when they are not supposed to, or being unable to see an issue when they are supposed to.
• A user receiving a notification when they shouldn't have, or not receiving a notification when they should have.

Simply navigate to the issue and select the Where is my field?, Permission Helper or Notification Helper option from the More Actions menu. You can also access this via administration console (JIRA tab > Admin Helper).

Copying and editing issue collectors

In JIRA 5.1, we introduced the JIRA issue collector — letting you embed JIRA feedback forms in your websites that create issues in your JIRA instance. In this release, we've added the ability to edit and copy issue collectors. Tweak an existing issue collector or use it as the basis for an entirely new one.

Read the documentation...

Faster and more reliable mentions

We added mentions in JIRA 5.0, which gave JIRA users an easy way to share an issue with other users via email. This release includes a significant performance improvement to this feature. You'll notice that user names are suggested much more quickly, when you start typing after an '@' character. The suggested results are also more accurate and reliable.
Universal plugin manager 2.7

JIRA 5.2 now bundles the Atlassian Universal Plugin Manager 2.7.6 (we previously bundled UPM 2.1.5 in JIRA 5.1.8). This version of UPM includes the Request Plugin feature as well as user interface improvements. The Request Plugin feature provides users with a view of the Atlassian Plugin Marketplace in JIRA, allowing them to send requests for plugins to the JIRA system administrator. To find and request a plugin, click your user profile picture > Atlassian Marketplace in the JIRA header.

Column ordering for standard JIRA gadgets

Any customers who have followed this issue or this issue will be happy to know that our most recent Atlassian Shipit has delivered column ordering for standard JIRA gadgets. In JIRA 5.2, you’ll be able to re-order columns for gadgets like the filter results gadget, by simply dragging and dropping.

Compatibility with Confluence Workbox Notifications

JIRA 5.2 is compatible with Confluence Workbox Notifications (introduced in Confluence 4.3). Read more in the Confluence 4.3 release notes.

Platform changes

We have made a number of platform changes in this release, including upgrading JIRA to run on Tomcat 7 and support for Java 7. Some of these changes affect the installation and upgrade process for JIRA.

Please read the upgrade guide for details.

JIRA 5.2 Upgrade Notes

Upgrading to JIRA 5.2 from JIRA 5.1.x

In this section:

- Application links can now be configured by administrators
- Default notification scheme associated with new projects
- Important information for Japanese customers
- Incomplete translations for some JIRA functionality
- JQL history has been removed from the new issue navigator
- JQL "contains" operator (~) now relates multiple words by AND rather than OR
- Known issue using Windows installer to upgrade
- MySQL driver no longer bundled with JIRA
- New 'lastViewed' JQL field
- Supported platforms changes
- Webhooks JQL filtering may not always match
- Filters that are longer than 2000 characters are not supported
- Information for JIRA developers

Please follow the instructions in the general Upgrading JIRA guide, as well as the JIRA 5.2-specific instructions.
in the sections below. The general 'Upgrading JIRA' guide contains important tasks that are essential for getting your upgraded JIRA installation to work correctly and if necessary, migrating existing configurations.

**Application links can now be configured by administrators**

In previous versions of JIRA, only system administrators could configure application links (e.g. link JIRA to Confluence). In this release, JIRA administrators also have access to application links configuration. JIRA administrators will be able to add, modify and remove application links and entity links. However, JIRA administrators will be restricted to using OAuth authentication for application links.

**Default notification scheme associated with new projects**

The Default Notification Scheme (shipped with JIRA) is now associated with all new projects by default. This means that if you have an outgoing (SMTP) mail server set up, email notifications will be sent as soon as there is any activity (e.g. issues created) in the new project. Existing projects are not affected.

**Important information for Japanese customers**

If you are using JIRA with Japanese chosen as the default language, please read the information on the page linked below before upgrading to JIRA 5.2:

- [JIRA 5.2 Upgrade Note for Japanese Customers](#) (Japanese version of the page: JIRA 5.2 )

**Incomplete translations for some JIRA functionality**

Translations will be incomplete for a small set of JIRA functionality in this release. This mainly affects text for the new JIRA admin helper feature. Functionality that does not have translated text available will revert to English. Only the German translations will be 100% complete. We are aiming to provide full French and Spanish translations in JIRA 5.2.1.

**JQL history has been removed from the new issue navigator**

The new issue navigator no longer has a 'History' section when advanced searching. This section showed the JQL of advanced searches that had been run previously.

JQL History was not part of the new Issue Navigator scope of work, as we felt a lot of users would now be saving their filters which lessened the need for this functionality.

**JQL "contains" operator (~) now relates multiple words by AND rather than OR**

Previously, if you specified multiple words as the parameter for the "contains" operator (~) in JQL, the words would be logically related by an OR. This has been changed in this release, so that multiple words for a "contains" operator are related by an AND.

For example, if you enter `summary ~ "issue collector"` in an advanced search, it is now equivalent to entering `summary ~ "issue" AND summary ~ "collector"`.

**Known issue using Windows installer to upgrade**

(JIRA 5.2.5 and earlier only) A known issue exists with the JIRA Windows installer where it will incorrectly use Tomcat 6 instead of Tomcat 7. This means that the JIRA service will not start after the upgrade. Please see this Knowledge Base article for details of the problem and workarounds.

**MySQL driver no longer bundled with JIRA**

The MySQL driver is no longer bundled with JIRA. In prior versions of JIRA, we shipped the MySQL driver under a commercial license from MySQL Americas, Inc. MySQL Americas, Inc. was acquired by Oracle Corporation as part of Oracle's acquisition of Sun Microsystems. Oracle no longer offers a commercial license for the MySQL driver on a standalone basis as part of a partner program.

Please note the following if you use JIRA with MySQL:

- **New installation** — If you are installing JIRA, the Setup Wizard will display an error if you try to select MySQL as the database. You must download the MySQL driver and copy it in the `lib` folder of your JIRA installation, as described in Connecting JIRA to MySQL. You will also need to restart JIRA/JIRA service.

  You will be able to complete the Setup Wizard when you next access JIRA in your browser.

- **Upgrade** — If you are upgrading JIRA and are not using the recommended MySQL driver (JDBC
Connector/J 5.1), you must back up the driver from your existing JIRA installation before the upgrade. You will need to copy it into the lib folder of your JIRA installation after it has been upgraded, as described in Connecting JIRA to MySQL. If you try to upgrade JIRA without doing this, JIRA will fail to start up after the upgrade (you will be able to see MySQL driver-related errors in the logs). If you are using the recommended MySQL driver (JDBC Connector/J 5.1), you do not need to do this. The driver will be automatically copied over during the upgrade process.

New 'lastViewed' JQL field

The new 'lastViewed' field in JQL (see documentation) lets you search for issues based on the date that they were last viewed/edited. This field is only available for Advanced Search, not Simple Search.

Please note, if you have currently configured your issue navigator to show a column named 'lastViewed' (i.e. you have custom field named 'lastViewed' that you are displaying in the issue navigator), you must rename it before upgrading. If not, the conflict in column names will cause problems with the issue navigator.

Supported platforms changes

- Java 7 and Tomcat 7.0.29 are now supported in JIRA 5.2. See Supported Platforms for details.
- Tomcat 5.5 is no longer supported in JIRA 5.2, as previously advised in this announcement.
- PostgreSQL 8.2 is no longer supported in JIRA 5.2, as previously advised in this announcement.
- Please also read this clarification on browser support for JIRA 5.2 and beyond.

Webhooks JQL filtering may not always match

When an issue is updated, two things are triggered — the issue is reindexed (to ensure the indexes are up to date) and a webhook is fired. If you are using a JQL-based webhook, it will need to confirm whether the issue that has just been updated meets the JQL criteria. The problem is that the reindex may occur after the webhook.

For example, if an issue currently meets the JQL criteria, but you update it so that it does not meet the criteria, the webhook may incorrectly fire anyway. This is because the webhook JQL matching may occur before the issue index is updated.

We are working to resolve this issue in a 5.2.x bugfix release and you can track the progress of the issue here.

Filters that are longer than 2000 characters are not supported

Filters that are longer than 2000 characters – criteria plus value – do not work in the JIRA 5.2.x Issue Navigator.

Information for JIRA developers

Please be aware of the following changes in JIRA 5.2, which are covered in more detail on the Preparing for JIRA 5.2 page:

- Changes to handling Message-IDs on notification emails
- Changes to rendering of block macros
- Newlines in issue Summary no longer allowed
- Easy way to re-use an existing Custom Field Searcher
- New ISSUE_COMMENT_DELETED_ID event

Upgrading to JIRA 5.2 from JIRA 5.0.7 or earlier

In addition to the points listed above, please read the Important Version-Specific Upgrade Notes for every version of JIRA you are skipping.

JIRA 5.2 Upgrade Note for Japanese Customers

We advise Japanese customers to read the following information before upgrading to JIRA 5.2, as well as the JIRA 5.2 Upgrade Notes. Japanese translations are incomplete for the new issue navigator

If you are using JIRA with a Japanese chosen as the default language, then JIRA will incorrectly display a mixture of English and Japanese in some parts of the new issue navigator. Users who search for issues may be confused by the mixed language.

The following screenshots show examples of this problem (click to view full-size images):
This issue is being tracked [JRA-30323 - Cannot translate new issue navigator. RESOLVED]. We are aiming to fix this issue in JIRA 5.2.1, which is currently scheduled for 27 November 2012.

JIRA 5.2

JIRA 5.2 Upgrade Notes

JIRA 5.2.11 Release Notes

19 April 2013
The Atlassian JIRA team announces the release of JIRA 5.2.11. This point release contains several updates and fixes.

This is the last release in the 5.2.x release cycle.

Upgrading to JIRA 5.2.11 is free to all customers with active JIRA software maintenance.

Don't have JIRA 5.2 yet?

Take a look at all the new features in the JIRA 5.2 Release Notes and see what you are missing out on!

Download Latest Version

Highlights

- Viewing an issue's workflow via the View Issue screen now works, even if the name of the workflow has special characters (see [JRA-27809 - "View Workflow" link does not work in case when workflow name contains special symbols RESOLVED]).
Upgrading from a previous version of JIRA

If you are upgrading, please read the JIRA 5.2.11 Upgrade Notes.

## JIRA 5.2.9 Upgrade Notes

### Upgrading from JIRA 5.2.x to 5.2.9

Please follow the instructions in the general upgrading JIRA documentation.

Please also read the Important Version-Specific Upgrade Notes for any JIRA 5.0.x versions you are skipping.

### Upgrading from JIRA 5.1.x and earlier

In addition to the above, please read the JIRA 5.2 Upgrade Notes and as well as the Important Version-Specific Upgrade Notes for the versions of JIRA you are skipping.

### JIRA 5.2.8 Release Notes

#### 7 March 2013

The Atlassian JIRA team announces the release of **JIRA 5.2.8**. This point release contains several updates and fixes.

Upgrading to JIRA 5.2.8 is free to all customers with active JIRA software maintenance.

### Don’t have JIRA 5.2 yet?

Take a look at all the new features in the **JIRA 5.2 Release Notes** and see what you are missing out on!

### Redesigned project summary for new projects
Starting a new project? You'll be greeted by a more informative screen when you next browse your empty project's summary.

The placeholder text provides guidance on what will appear on the summary, once the project has been populated. It also helps prompt users to get started creating issues and browsing the project.

**Upgrading from a previous version of JIRA**

If you are upgrading, please read the JIRA 5.2.8 Upgrade Notes.

**Updates and fixes in this release**

JIRA 5.2.8 includes the following updates and bug fixes:

<table>
<thead>
<tr>
<th>Key</th>
<th>Summary</th>
<th>Created</th>
<th>Updated</th>
<th>Due</th>
<th>Assignee</th>
<th>Reporter</th>
<th>Status</th>
<th>Resolution</th>
</tr>

JIRA 5.2.7 Release Notes

21 February 2013
The Atlassian JIRA team announces the release of JIRA 5.2.7. This point release contains several updates and fixes.

Upgrading to JIRA 5.2.7 is free to all customers with active JIRA software maintenance.

Don't have JIRA 5.2 yet?

Take a look at all the new features in the JIRA 5.2 Release Notes and see what you are missing out on!

New setup wizard with license generation

We’re continuing our work to help you get started faster. If you are setting up JIRA for the first time, you can now get a JIRA evaluation license without leaving the setup wizard. Just enter your my.atlassian.com account details (or create an account) in the setup wizard, and JIRA will generate an evaluation license for you.

Learn more...

Other highlights

- Synchronising JIRA with LDAP no longer fails for duplicate memberships (see JIRA-27353 - JIRA Sync Fails when detecting duplicate memberships RESOLVED).

Upgrading from a previous version of JIRA

If you are upgrading, please read the JIRA 5.2.7 Upgrade Notes.

### JIRA 5.2.7 Upgrade Notes

#### Upgrading from JIRA 5.2.x to 5.2.7

Here are some considerations and steps to take when upgrading from JIRA 5.2.x to 5.2.7:

1. **Check Compatibility:** Ensure that all plugins and customizations are compatible with JIRA 5.2.7. Some plugins may require updating or disabling to avoid conflicts.
2. **Upgrade JIRA:** Follow the official upgrade guide available on Atlassian's website. This will include steps for back up, upgrade, and testing.
3. **Test the Upgrade:** Run the upgrade through a test environment to ensure that all functionalities work as expected.
4. **Update Permissions:** Review and update any permissions that may have been changed or added.
5. **Configure New Features:** Enable new features like the New Issue Form Designer and update any workflows accordingly.

JIRA 5.2.6 Release Notes

7 February 2013

The Atlassian JIRA team announces the release of JIRA 5.2.6. This point release contains several updates and fixes.

Don’t have JIRA 5.2 yet?

Take a look at all the new features in the JIRA 5.2 Release Notes and see what you are missing out on!

Download Latest Version

Highlights

- JIRA 5.2.6 now accepts imports from any JIRA OnDemand version from 3 Dec 2012 and later. See the migration guide.
- JIRA OnDemand exports can now be imported into JIRA instances that are already setup (see JRA-31239 - Remove Import From OD Data Restriction on an already setup JIRA ).
- Expired screenshot applet certificate error is now resolved (see JRA-31345 - Certificate for Screenshot Applet on latest JIRA version Expired ).
- Mail notifications no longer fail when an LDAP user is removed but still listed as watcher (see JRA-30059 - Mail notification fails when LDAP user is removed but still listed as watcher ).
- Users who are no longer in an AD/LDAP directory can now be removed from a Project Role within a Project (see JRA-25220 - AD/LDAP directory user who is no longer in that directory cannot be removed from Project Role within a Project ).
- The clone operation has regained its sense of direction and now creates links in the correct direction (see JRA-24563 - Clone operation creates links in the wrong direction ).

Upgrading from a previous version of JIRA

If you are upgrading, please read the JIRA 5.2.6 Upgrade Notes.

Take a look at all the new features in the JIRA 5.2 Release Notes and see what you are missing out on!

Download Latest Version

Performance Improvements

- JIRA performance with FishEye integration is improved.

Bug Fixes

- Page reload errors caused by a plugin passing a null into the macro are now fixed (see JIRA-30554 - Regression - /secure/EditAction/default.jspa [velocity] Left side ($totalSize) of `-` operation has null value at templates/plugins/jira/macros.vm[line 8, column 18] RESOLVED).
- It’s now safer to upgrade older versions of JIRA on Oracle (see JIRA-12304 - Oracle DB Text Columns Exceed 255 Character Limit on Import RESOLVED).

Upgrading from a previous version of JIRA

If you are upgrading, please read the JIRA 5.2.5 Upgrade Notes.

Updates and fixes in this release

JIRA 5.2.5 includes the following updates and bug fixes:

<table>
<thead>
<tr>

**Fixed JQL limitations for webhooks**

We’ve fixed a number of known issues/limitations with JQL in webhooks in JIRA 5.2.2 and this release. In summary, the following issues will be fixed by upgrading to JIRA 5.2.3:

- `currentUser()` function now works correctly. Fixed in 5.2.2.
- A JQL query now returns the desired results when filtering for a field that changes frequently (see the 5.2 Upgrade Notes for a description of this issue). Fixed in 5.2.2.
- The `${issue.key}` variable replacement now works in a webhook, when the webhook is used in a workflow post function. Fixed in this release.

**Upgrading from a previous version of JIRA**

If you are upgrading, please read the JIRA 5.2.3 Upgrade Notes.

Administrators can now disable autowatch

We've implemented a new JIRA option that allows administrators to disable the autowatch feature (introduced in JIRA 5.0.3) for all users. To configure autowatch for all users, navigate to Administration > User Preferences (in Users section) > Default autowatch.

Users can choose to inherit the global autowatch setting or override it via their user Profile > Preferences > Autowatch setting.

Please note, if you are upgrading from an older version of JIRA, then all users who have not explicitly set their Autowatch setting will have it set to 'Inherit from global settings'.

**Upgrading from JIRA 5.1.x and earlier**

In addition to the above, please read the **JIRA 5.2 Upgrade Notes** and as well as the **Important Version-Specific Upgrade Notes** for the versions of JIRA you are skipping.

**JIRA 5.2.1 Release Notes**

**28 November 2012**

The Atlassian JIRA team announces the release of **JIRA 5.2.1**. This point release contains several updates and fixes.

Upgrading to JIRA 5.2.1 is free to all customers with active JIRA software maintenance.

**Don't have JIRA 5.2 yet?**

Take a look at all the new features in the **JIRA 5.2 Release Notes** and see what you are missing out on!

**Reports have moved**

We have moved reports from the dropdown menu on the **Browse Project > Summary** tab to a panel on the same tab, so that they are more accessible.
New plugin points for the User Profile page

For the developers, we have implemented new plugin points for the web panels in the User Profile page. You can override the default 'Details', 'Preferences' and 'Assigned Open Issues per Project' web panels as well as add your own custom web panels.

Read the documentation...

Upgrading from a previous version of JIRA

If you are upgrading, please read the JIRA 5.2.1 Upgrade Notes.

Updates and fixes in this release

JIRA 5.2.1 includes the following updates and bug fixes:

JIRA 5.2.1 Upgrade Notes

Upgrading from JIRA 5.2 to 5.2.1

Please follow the instructions in the general upgrading JIRA documentation.

Upgrading from JIRA 5.1.x and earlier

In addition to the above, please read the JIRA 5.2 Upgrade Notes and as well as the Important Version-Specific Upgrade Notes for the versions of JIRA you are skipping.

JIRA 5.1 Release Notes

9 July 2012

Atlassian is proud to bring you the release of JIRA 5.1.
JIRA 5.1 continues on from where JIRA 5.0 left off, making the process of working with issues faster and easier. JIRA 5.1 gives users the ability to edit an issue's fields directly 'inline' for a speedier editing experience and makes all operations on the 'view issue' page faster by eliminating the need for the page to reload when the operation is submitted. The JIRA issue collector introduces a whole new way to create issues based on feedback from your colleagues or customers who don't use JIRA.

For enterprise customers, not only is JIRA 5.1 more efficient when it comes to working with issues, but improvements to the core performance of JIRA 5.1 makes all of JIRA, especially creating, editing, searching for and viewing issues, faster and more scalable than ever. Furthermore, we've officially removed the 200,000 issue limit!

Highlights

Inline editing and fewer page loads

- Modify an issue's fields directly when viewing the issue
- Operations on the 'view issue' page no longer require a page reload
- Full keyboard shortcut support for editing field
- More info...

Enterprise scale and performance improvements

- No more 200,000 issue limit
- Search for, view, and create issues faster than ever
- Monitor JIRA's database connection graphically
- Tune JIRA's connection to a JIRA database more conveniently
- More info...
Issue collector

- Create a feedback form on any web site that submits feedback in the form of JIRA issues.
- Use canned "Feedback" or "Bug report" forms or create your own form.
- Requires adding only one line of JavaScript or HTML code to any web page.

And more:

- Project administration improvements.
- Deactivate users.
- Auto watch.

- Remote and local JIRA issue link improvements.
- Get started faster.
- Other improvements.

Thank you for your feedback

🌟 More than 42 new feature requests implemented
🌟 Over 840 votes fulfilled

Your votes and issues help us keep improving our products, and are much appreciated.

Before upgrading to 5.1, please refer to the JIRA 5.1 Upgrade Notes.

Key features

1

Inline editing and fewer page reloads

JIRA 5.1 makes working with issues faster with inline editing and fewer page reloads.
Inline editing

You can now directly modify an issue’s fields when viewing an issue, without the page needing to reload (top-left screenshot).

When viewing an issue, simply click on a field's content to begin editing it. Once you've finished editing, simply click on the lower-right tick icon (or in a blank area away from the field you're editing) to save your changes – no page reload required.

For keyboard fans, inline editing provides its own keyboard shortcuts, which means you can avoid having to use a mouse when editing issues. When viewing an issue:

1. Simply type a comma ‘,’ and then start typing the name of the field you want to edit (using the cursor keys to select the specific field if necessary as shown in the middle-left screenshot)
2. Press ‘Enter’ to begin editing the field and type away to edit the field's content
3. Press ‘Enter’ again to save your modifications!

Refer to the documentation for more information.

Inline editing is enabled by default on new and upgraded JIRA installations. JIRA administrators can disable this feature by switching the Inline edit option to OFF through the General Configuration page.

Quick tips:

- When editing a field, click the lower-right X icon (or press the 'Esc' key) to cancel any changes.
- If a field's content is hyperlinked, like the Component/s field shown in the top-left screenshot, click to the right of any existing field content to edit the field.

Fewer page reloads

After performing an operation on an issue, such as adding a comment to an issue or performing a workflow transition (like the customised transition shown in the lower-left screenshot), JIRA updates the issue immediately without the page needing to reload.
Enterprise scale and performance improvements

JIRA 5.1 sees the start of a dedicated team focused on improving JIRA's core performance to make all aspects of JIRA, especially creating, editing, searching for and viewing issues, faster and more scalable than ever.

![Graph comparing performance of JIRA 5.1 and JIRA 4.4](image)

We've officially removed the 200,000 issue limit!

The graph on the left compares JIRA 5.1’s performance (blue line) against JIRA 4.4’s performance (green line). The Y-axis depicts the number of operations per second, where an operation can be anything a typical user performs in JIRA such as viewing, creating or editing an issue, searching for issues, browsing a project, and so on, while the X-axis depicts the number of issues in a JIRA installation.

You can see from the graph that JIRA 5.1 outperforms JIRA 4.4 at every level of the scale from 100,000 right through to 900,000 issues in a JIRA installation. This is an almost 40% increase in performance across the scale!

Previously, we recommended a soft limit of 200,000 issues — approximately 23 operations per second in JIRA 4.4 according to the graph. JIRA 5.1 can perform the same number of operations with nearly 500,000 issues - almost 2.5 times the number of issues in a JIRA installation compared to JIRA 4.4!

Hence, from JIRA 5.1, we're removing the soft limit of 200,000 issues and have provided a guide on how you to scale JIRA in your organisation.

Advanced database connection tuning

The JIRA Configuration Tool now includes an Advanced database connection tuning page which allows you to fine tune your database connection pool and validation query settings. This may be required with some default database configurations to maintain a successful connection between your JIRA server and JIRA database.

Refer to the documentation for more information.
New database monitoring page for JIRA system administrators

To help diagnose performance problems in JIRA associated with database connectivity, JIRA system administrators now have access to the new Database Monitoring page, which shows a graphical representation of JIRA’s database connection usage over time.

JIRA system administrators can access this page by selecting Administration > Plugins > Monitoring which opens the Database Monitoring page.

Refer to the documentation for more information.

Other performance improvements

- Searches that retrieve many thousands of issues are performed more rapidly.
- Users should also see significant performance improvements when mentioning other JIRA users in an issue's Description or Comment field.

The issue collector allows you to easily embed a feedback form into any website you develop, to collect feedback from your users and visitors. Every piece of feedback collected creates an issue in JIRA, according to the project, issue type and other details specified. Like all other JIRA issues, you can then use workflow, assignment, and all other JIRA features to triage and respond to the feedback.

JIRA project administrators can create an Issue Collector from the Issue Collectors tab on any JIRA project's P
**Project Summary** administration page (via Administration > Projects).

For each issue collector, JIRA generates a unique JavaScript or HTML snippet, which can be embedded in any web site or web application.

Anyone visiting your web site will see a tab with your label (such as "Provide Feedback!"). Clicking this tab launches a dialog box (similar to the example screenshot on the left) which upon submission, conveniently creates an issue in your JIRA project. The issue collector is designed for feedback from anyone who visits your website, so you don't have to be a JIRA user to submit feedback.

Refer to the documentation for more information.

^Top

---

**Project administration improvements**

Easier workflow editing

JIRA now makes editing a project's workflow much easier. When you begin editing a project's workflow for the first time, you'll be able to modify that workflow almost immediately, since JIRA automatically makes a copy of the system workflow (**jira**) and associated workflow scheme for your project, and then associates this new workflow scheme with your project, all from the click of an icon.
To begin editing a project's workflow for the first time, simply click the pencil icon either in the Workflows section of the project's Summary page (shown in the top-left screenshot) or on the project's Workflow page (accessed via the Workflow tab). JIRA will prompt you for confirmation before continuing.

- The copied system workflow (named 'Your Project Name Workflow') is automatically associated with all of your project's available issue types in your project's new workflow scheme (named 'Your Project Name Workflow').
- If existing issues are present in your project before you decide to start customising the project's workflow, JIRA automatically associates these issues with the newly copied 'Your Project Name Workflow'.
- Once this process is complete, JIRA takes you directly to a draft of your project's new workflow (shown in the lower-left screenshot) - ready for immediate editing!

In JIRA 5.1, we've also streamlined the Workflow Designer and View Workflow Steps pages, both of which can be accessed from conveniently adjacent Diagram and Text buttons, respectively (see the lower-left screenshot). We've also rationalised the main Workflows page, so that Active and Inactive workflows are presented in separate lists and drafts are simply indicated against an Active workflow with an 'information' icon.

Refer to the documentation for more information.

More administration improvements

Following on with improvements to the administration user interface in earlier JIRA releases:

- The forms for adding new issue types, sub-tasks, field configurations (+ field configuration schemes) and screens (+ screen schemes) are now dialog boxes, which are easily accessed by clicking a button at the top-right of the appropriate JIRA Administration pages.
- The original 'sub-tab' for adding issue type schemes has been converted to a full tab on the left of the JIRA UI and the form for adding an issue type scheme is now a dialog box, which is easily accessed by clicking the Add Issue Type Scheme button at the top-right of the Issue Type Scheme page.
- Whenever you add a field configuration (+ scheme) or a screen, screen scheme or issue type screen scheme, JIRA will take you directly to the pages for configuring any of these newly created entities, thereby saving you the need to locate such an entity in a list and click its Configure link. This is especially useful for customers with highly configured JIRA installations that contain extensive lists of these entities.

Deactivate users

JIRA administrators can 'deactivate' a JIRA user, which disables that user's access to JIRA. This highly voted feature is useful when a JIRA user leaves an organisation because a deactivated user's history of JIRA activity is preserved on the system.

If a user with a deactivated JIRA account rejoins the organisation at some point in the future, the JIRA administrator can easily re-activate their user account again.

A JIRA user's account can be deactivated when their account is edited through JIRA's 'User Browser'.

While a JIRA user account has been deactivated, that user:

- Cannot log in to JIRA.
- Appears on the JIRA user interface with (Inactive) displayed after their name.
- Do not receive any email notifications from JIRA, even if they remain the assignee, reporter, or watchers of issues.
• Do not count towards your JIRA user license limit.
• Cannot be assigned issues or added as a watcher to an issue.

In a JIRA search queries, other users can continue to filter issues by deactivated users.
Refer to the documentation for more information.

6

'Autowatch' issues you create or comment on

A JIRA user who either creates a new issue or comments on an existing issue, will automatically become a watcher of that issue.

This feature applies to all new and existing JIRA users in a new (or upgraded) JIRA 5.1 installation.

If you don't want to automatically become a watcher of an issue you create or comment on, you can disable this feature through your user profile, by choosing Disabled for the Autowatch option when editing the Preferences section of your user profile (see left screenshot).

7

Remote and local JIRA issue link improvements

Linking to issues is now easier than ever with the following improvements to the Link dialog box:

• We’ve combined the former Remote JIRA Issue and JIRA Issue options into a single JIRA Issue option, so that there’s now a consistent look and feel for linking to either a local or a remote issue.
• The 'autocomplete' dropdown list of issues now works against issues on remote JIRA sites.
• You can now use JQL to search for issues.

Welcome page

If you're installing JIRA for the first time, you'll be presented with a new welcome page to help guide you through the process of creating your first JIRA project. There is also no need to log in after running through the JIRA Setup Wizard.

After creating a new project through the welcome page, you'll be taken directly to the project's Summary page (instead of the Project Summary administration page).

Automatically suggested project keys

When creating a new project, the Add a new project dialog box now suggests a project key based on the name you specify.

Invite users

If you're faced with the task of creating multiple users in your JIRA site, you'll be happy to know that JIRA now includes the new Invite Users feature. This feature lets you email invitations that allow people to sign up to your
JIRA site. You just need a list of email addresses and a single click of a button.

Users receive an email message with a link to create their own account on your JIRA site. These improvements not only help new teams, but they make adding projects and new users easier for all JIRA customers.

Other improvements

Automatic time zone detection

JIRA now automatically detects the time zone of the computer you are working on. If the time zone specified in your JIRA user profile doesn’t match that of the computer you are working on, JIRA will prompt you with the choice of updating your user profile’s time zone settings to that of your computer’s settings.

This is especially useful for customers who frequently travel whilst using JIRA on a regular basis.

Notify on my actions now disabled by default

By default, any new JIRA users will no longer be automatically notified of their own actions. Individual users can change this option through their user profile by choosing Notify me for their My Changes option when editing the Preferences section of their user profile.

Configurable JIRA home page upon login

You can now configure your JIRA home page, which is the page JIRA presents to you immediately after you log in.

To configure your JIRA home page, click your username’s dropdown and select the appropriate home page option within the My JIRA Home section.

GreenHopper users can take advantage of this feature by selecting Agile from the My JIRA Home section. Upon selecting this option, you will be taken directly to your default GreenHopper Agile page upon logging in to JIRA.

Refer to the documentation for more information.

User Gravatar support
JIRA administrators can choose between whether their users specify either a Gravatar or a JIRA-specific avatar through their user profile.

The Gravatar support feature can be activated by switching the Use Gravatar for user avatars option to ON through the General Configuration page.

Refer to the documentation for more information.

HipChat notifications now available on workflow transitions

JIRA now allows you to send HipChat notifications on workflow transitions, which can be filtered by JQL. To do this:

1. First ensure that you have configured JIRA with HipChat for workflow transition notifications.
2. Add a Notify HipChat post function to the workflow transition you want to notify users about.
3. Specify an optional JQL query such that if the JQL criteria does not retrieve the issue that passes through this transition, the HipChat notification will not be sent.
4. Specify the HipChat rooms that you want these HipChat notifications to be sent.

Upgrading to JIRA 5.1 from JIRA 5.0.x

Please follow the instructions in the general Upgrading JIRA guide, as well as the JIRA 5.0-specific instructions in the sections below. The general 'Upgrading JIRA' guide contains important tasks that are essential for getting your upgraded JIRA installation to work correctly and if necessary, migrating existing configurations.

JIRA administrators can disable this feature by switching the Inline edit option to OFF through the General Configuration page.

If you had already deactivated one or more users in JIRA 5.0.6 or earlier and it is possible those users will be using JIRA again at some point in the future, then after upgrading to JIRA 5.1 or later, you may wish to:

1. Deactivate those users using the newer deactivate user feature in JIRA 5.1 and later.
2. Re-add those users to the JIRA groups and roles to which they belonged before they were deactivated (i.e. before the upgrade).

This step should allow these users (once reactivated) to regain the same level of access to the JIRA projects they used before their account was deactivated.

If you need to deactivate these users again (or any others), using the newer deactivate user feature in JIRA 5.1 or later means that you will no longer need to remove these users from groups or project roles.

JIRA 3.x browser bookmarks

If you had created browser bookmarks in JIRA version 3.x and are still using those bookmarks, please be aware that for performance improvement reasons in JIRA 5.1, the automatic 'redirection' of some constituent components of these URLs to their equivalent URL components in JIRA 5.1 has been removed.
Hence, for some customers, some of these old bookmarks may break after upgrading to JIRA 5.1. Therefore, if you want to continue using these old bookmarks, you should edit their URLs for JIRA 5.1 compatibility before upgrading to JIRA 5.1.

To find out which of your old bookmarks require updating, refer to the following subsections and their tables:

Field names in issue navigator queries

If you had created a JIRA 3.x bookmark to an issue navigator query, whose URL contains an old field name on the left of the following table, change this field name (in the bookmark URL) to its respective new field name on the right of the table before upgrading JIRA.

<table>
<thead>
<tr>
<th>Old field name (JIRA 3.x)</th>
<th>New field name</th>
</tr>
</thead>
<tbody>
<tr>
<td>resolutionIds</td>
<td>resolution</td>
</tr>
<tr>
<td>statusIds</td>
<td>status</td>
</tr>
<tr>
<td>priorityIds</td>
<td>priority</td>
</tr>
</tbody>
</table>

RSS feeds

If you had created an RSS feed from an issue navigator query in JIRA 3.x, then before upgrading to JIRA 5.1:

1. Open the RSS feed URL in a browser window.
   - JIRA 5.0.x will automatically 'redirect' your JIRA 3.x RSS feed URL into URL that is compatible with JIRA 5.0.x and later.
2. Replace your old JIRA 3.x RSS feed bookmark with the 'redirected' RSS feed URL.

'View issue' page tabs

If you had created a JIRA 3.x bookmark to a 'view issue' page which displays a specific tab and whose URL contains an old page parameter value on the left of the following table, change this value (in the bookmark URL) to its respective new value on the right of the table before upgrading JIRA.

<table>
<thead>
<tr>
<th>Old page parameter values (JIRA 3.x)</th>
<th>New page parameter values</th>
</tr>
</thead>
<tbody>
<tr>
<td>page=all</td>
<td>page=com.atlassian.jira.plugin.system.issuetabpanels:all-tabpanel</td>
</tr>
<tr>
<td>page=comment</td>
<td>page=com.atlassian.jira.plugin.system.issuetabpanels:comment-tabpanel</td>
</tr>
<tr>
<td>page=changehistory</td>
<td>page=com.atlassian.jira.plugin.system.issuetabpanels:changehistory-tabpanel</td>
</tr>
</tbody>
</table>

JIRA developers

Please note our Preparing for JIRA 5.1 page on the Atlassian Developers site. As a result of a stable Java API and other API improvements for JIRA developers introduced in JIRA 5.0, we do not anticipate a need for JIRA 5.0-compatible plugins to be significantly modified for compatibility with JIRA 5.1.

Nevertheless, please be aware of the following changes in JIRA 5.1, which are covered in more detail on the Preparing for JIRA 5.1 page:

- For enhanced security, JIRA 5.1 includes an upgrade to Velocity 1.6.

GreenHopper

Only GreenHopper versions 5.9 and higher are compatible with JIRA 5.1.

Voting/watching bug

A bug was introduced in JIRA 5.1.0 that may affect vote/watch functionality. If you are using a JIRA plugin that adds an activity tab to an issue, then voting and watching via the 'More Actions' menu of an issue or by clicking 👍 Vote and 👤 Watch on the view issue page will be broken. Voting and watching via other controls, e.g. keyboard shortcut, cog menu of issue navigator, will still work. This affects JIRA 5.1.0 and 5.1.1 only.

Actions for JIRA administrators
If voting and watching is not working as described above, after upgrading to 5.1.0, disable the Inline edit option in your General Configuration. This bug is scheduled to be fixed in 5.1.2 (see JIRA-28984 - jira.webresources:viewissue incorrectly separated for JIRA 5.1 RESOLVED).

**Actions for plugin developers**

In JIRA 5.1.0, the jira.webresources:viewissue resource was incorrectly separated into the following two resources:

- jira.webresources:viewissue-components which is always included on the page.
- jira.webresources:viewissue which is only included on the page if inline edit is disabled.

The problem is due to the fact that some plugins depend on jira.webresources:viewissue (see recommendation in this developer document). As a result, if there is plugin that depends on jira.webresources:viewissue and inline edit is enabled, then jira.webresources:viewissue will be pulled into the page when it shouldn't be. The symptoms of this bug are that voting and watching via certain controls will be broken (as described above), as there are two implementations of the watchers handler.

If you need to fix your plugin to work with JIRA 5.1.0 or JIRA 5.1.1, we recommend that you change your plugin to depend on jira.webresources:viewissue-components instead of jira.webresources:viewissue.

Please note:

- If you make this change, your plugin will not work with JIRA 5.0.x — you will need to maintain two separate versions.
- This bug is scheduled to be fixed in 5.1.2 (see JIRA-28984 - jira.webresources:viewissue incorrectly separated for JIRA 5.1 RESOLVED). That is, jira.webresources:viewissue-components will be deprecated in favour of jira.webresources:viewissue.

**Upgrading to JIRA 5.1 from JIRA 4.4.5 or earlier**

In addition to the points listed above, please read the Important Version-Specific Upgrade Notes for every version of JIRA you are skipping.

**JIRA 3.x RSS feeds**

If you are currently using JIRA 3.x and:

- Want to perform the RSS feed bookmark update procedure (above) and also
- As directed on the JIRA 5.0 Upgrade Notes, you are following the two-step procedure to first upgrade to a JIRA 4.x version before then upgrading directly to JIRA 5.1,

then ensure you perform the RSS feed bookmark update procedure on your interim JIRA 4.x upgrade first before upgrading directly to JIRA 5.1.

**JIRA 5.1.8 Release Notes**

31 October 2012

The Atlassian JIRA team announces the release of JIRA 5.1.8. This point release contains several updates and fixes.

Upgrading to JIRA 5.1.8 is free to all customers with active JIRA software maintenance.

**Don't have JIRA 5.1 yet?**

Take a look at all the new features in the JIRA 5.1 Release Notes and see what you are missing out on!

Download Latest Version

**Upgrading from a previous version of JIRA**

If you are upgrading, please read the JIRA 5.1.8 Upgrade Notes.

**Updates and fixes in this release**

JIRA 5.1.8 Upgrade Notes

Upgrading from JIRA 5.1.x to 5.1.8

Please follow the instructions in the general upgrading JIRA documentation.

Please also read the Important Version-Specific Upgrade Notes for any JIRA 5.0.x versions you are skipping. Incompatibility with some Greenhopper versions

JIRA 5.1.8 does not work with GreenHopper 6.0.4 and earlier. To use JIRA 5.1.8 with GreenHopper, download GreenHopper 6.0.5 or later.

Upgrading from JIRA 5.0.x and earlier

In addition to the above, please read the JIRA 5.1 Upgrade Notes and as well as the Important Version-Specific Upgrade Notes for the versions of JIRA you are skipping.

JIRA 5.1.7 Release Notes

15 October 2012

The Atlassian JIRA team announces the release of JIRA 5.1.7. This point release contains several updates and fixes.

Upgrading to JIRA 5.1.7 is free to all customers with active JIRA software maintenance.

Don't have JIRA 5.1 yet?

Performance improvements

Faster and more reliable mentions

We added mentions in JIRA 5.0, which gave JIRA users an easy way to share an issue with other users via email. This release includes a significant performance improvement to this feature. You'll notice that user names are suggested much more quickly, when you start typing after an '@' character. The suggested results are also more accurate and reliable.

Screenshot: Mentioning a user in an issue comment

HTTP Requests Log Analyser

We recently developed a tool to analyse request logs that we are now making available to customers. The HTTP requests log analyser provides you with information, such as the maximum requests per minute, that can help you performance tune your JIRA instance.

JIRA 5.1.1 Upgrade Notes

Upgrading from JIRA 5.1.x to 5.1.1

Please follow the instructions in the general upgrading JIRA documentation.

Please also read the Important Version-Specific Upgrade Notes for any JIRA 5.0.x versions you are skipping.

Voting/watching bug

A bug was introduced in JIRA 5.1.0 that may affect vote/watch functionality. If you are using a JIRA plugin that adds an activity tab to an issue, then voting and watching via the 'More Actions' menu or by clicking ⬅️ Vote an...
Watch on the view issue page will be broken. Voting and watching via other controls, e.g. keyboard shortcut, cog menu of issue navigator, will still work. This affects JIRA 5.1.0 and 5.1.1 only.

**Actions for JIRA administrators**

If voting and watching is not working as described above, after upgrading to 5.1.1, disable the **Inline edit** option in your General Configuration. This bug is scheduled to be fixed in 5.1.2 (see [JIRA-28984](https://jira.atlassian.com/browse/JIRA-28984) - jira.webresources:viewissue incorrectly separated for JIRA 5.1 | RESOLVED).

**Actions for plugin developers**

In JIRA 5.1.0, the `jira.webresources:viewissue` resource was incorrectly separated into the following two resources:

- `jira.webresources:viewissue-components` which is always included on the page.
- `jira.webresources:viewissue` which is only included on the page if inline edit is disabled.

The problem is due to the fact that some plugins depend on `jira.webresources:viewissue` (see recommendation in this developer document). As a result, if there is plugin that depends on `jira.webresources:viewissue` and inline edit is enabled, then `jira.webresources:viewissue` will be pulled into the page when it shouldn't be. The symptoms of this bug are that voting and watching via certain controls will be broken (as described above), as there are two implementations of the watchers handler.

If you need to fix your plugin to work with JIRA 5.1.0 or JIRA 5.1.1, we recommend that you change your plugin to depend on `jira.webresources:viewissue-components` instead of `jira.webresources:viewissue`.

Please note:

- If you make this change, your plugin will not work with JIRA 5.0.x — you will need to maintain two separate versions.
- This bug is scheduled to be fixed in 5.1.2 (see [JIRA-28984](https://jira.atlassian.com/browse/JIRA-28984) - jira.webresources:viewissue incorrectly separated for JIRA 5.1 | RESOLVED). That is, `jira.webresources:viewissue-components` will be deprecated in favour of `jira.webresources:viewissue`.

**Upgrading from JIRA 5.0.x and earlier**

In addition to the above, please read the JIRA 5.1 Upgrade Notes and as well as the Important Version-Specific Upgrade Notes for the versions of JIRA you are skipping.

**JIRA 5.0 Release Notes**

22 February 2012

The Atlassian team is proud to bring you JIRA 5.0.

**Overview**

JIRA 5.0 connects people, teams and applications. Users can share issues and search results with each other. They can also mention a colleague with '@username' in an issue to call their attention to an issue. Remote issue links connect JIRA issues to objects and pages in other web applications. Activity streams show events from all linked Atlassian applications and third-party apps.

Even further, JIRA 5.0's new APIs are designed for developers who want to connect JIRA to other applications:

- New REST APIs to manage every facet of an issue.
- New APIs for remote issue links and activity streams.
- A stable Java API for JIRA.

**Highlights:**

| Remote issue links | Share issues and mention users | Rapidly create and edit issues |
• Create links to JIRA issues on another JIRA site
• Create links to any URL
• Create links via JIRA's Java or REST API

• Share issues quickly with other users
• Mention a user in an issue comment
• The username or email address autocomplete as you type

• Rapidly create and edit issues in a dialog box
• Create multiple issues in succession
• Customise to show fields you use most often

And More:

• Search for issues based on their history
• Activity streams now show activity from other applications
• Manage other users shared filters and dashboards
• Administration user interface improvements
• REST API (with tutorials) for working with issues in JIRA
• Stable Java API
• New troubleshooting and debugging tools
• New email handler wizard
• Enhancements to the 'view issue' page
• JIRA Add-Ons (Plugins and Integrations)
• Other enhancements and fixes

Thank you for your feedback:

🌟 More than 30 new feature requests implemented
🌟 Over 1500 votes fulfilled

Your votes and issues help us keep improving our products, and are much appreciated.

Upgrading to JIRA 5.0
JIRA 5.0 can be downloaded from the JIRA Download Center. Before upgrading, please refer to the JIRA 5.0 Upgrade Notes.
**Note to developers:** Please see Preparing for JIRA 5.0 on the Atlassian Developers site.

**Highlights**

1. **Remote issue links**

   The remote issue links feature provides a powerful way to link JIRA issues to items external to your JIRA installation, residing on external applications.

   Along with a Java and REST API to add these links, end users can also:
   - Add an issue link from a JIRA issue to an issue on another JIRA site, including reciprocal links between these issues.
   - Search for a Confluence page from a JIRA issue and add an issue link to that page.
   - Add an issue link from a JIRA issue to any web page URL, such as a page of documentation, a technical note, or any other page on another web site.

   Check out a live example [here](#).

   If you are a:
   - JIRA user — see Linking Issues for details on using remote issue links within JIRA.
   - JIRA system administrator — see Configuring Issue Linking for details on how to make remote issue linking available to your users by setting up the required application links between JIRA and other applications.
   - JIRA developer — see on our developer documentation site.

2. **Share issues and mention users**

   Screenshot: Sharing a list of issues with other users
Screenshots: Mentioning a user in an issue comment

Need someone else to take a look at a JIRA issue or a list of issues?

- View any issue or a list of issues on the issue navigator, click the Share button at the top-right (or type s) and specify JIRA users (based on their names or user names) or any email address of people you want to share the issue with.

Recipients will be emailed a link to the issue (or a list of issues 'shared' via the issue navigator).

- When creating, editing or commenting on an issue, simply mention other JIRA users in an issue's description or Comment field.

Any JIRA users mentioned on an issue will receive details about the issue in an email message (sent to the addresses registered with their user accounts). The message's subject line will indicate that the person who used this feature 'mentioned' them on that issue.

**Please Note:**

- You require the Browse Users global permission to access the Share button or the 'suggested users' feature when 'mentioning' a user. However, if you know the username of a JIRA user, you can still mention them without this permission.
- JIRA system administrators will need to configure JIRA's outgoing SMTP mail server for the 'share' and 'mentions' features to work.

^Top

Rapidly create and edit issues

JIRA 5.0 lets you create and edit issues and sub-tasks much faster. Creating and editing is now performed in a dialog box (rather than a separate form), so that you do not need to leave the current page or have it reload just to start creating or editing an issue or sub-task.

You can customise fields on the Create Issue/Edit Issue dialog boxes by removing or adding fields fields through the Configure Fields button. JIRA remembers your last set of field choices, giving you a personally customised dialog box that presents you with your most commonly used fields whenever you create or edit an issue.

The Create Issue dialog box allows you to rapidly create a series of related issues with similar options. When you select the Create another check box before clicking the Create button, JIRA creates your issue and automatically pre-populates a new Create Issue dialog box with your previous field values, whilst leaving the Summary field blank. Be aware that any attachments attached to your previously created issue are not carried across by this feature.

The Assignee, Project and Issue Type fields use 'autocompletion' too. Hence, you no longer a need to scroll through a whole raft of items to specify these fields when creating or editing an issue.

You can easily access these dialog boxes by typing 'c' to create an issue, or 'e' from a selected issue on
the issue navigator or ‘view issue’ page to edit that issue.

^Top

4

Search for issues based on their history

'CHANGED' operator introduced

Introduced in JIRA 4.4.3, JQL's **CHANGED** operator can accept the optional predicates **FROM**, **TO**, **ON**, **DURING**, **BEFORE**, **AFTER** and **BY**, and can be used on the **Status**, **Assignee**, **Priority**, **Reporter**, **Resolution** and **Fix Version** fields.

For example, this link shows all the issues logged against the JIRA project on our 'jira.atlassian.com' site, whose **Fix Version** field was changed to "5.0".

You can also create more complex JQL queries with the **CHANGED** operator by fine-tuning them with predicates. For example, the following JQL query:

```
status changed FROM "In QA Review" TO "QA Rejected" BY freddo AFTER startOfWeek() BEFORE endOfWeek()
```

will find any issues whose **Status** field value was at some point "In QA Review" but changed to "QA Rejected", by user freddo between the start and end of the current week.

You can use complex queries such as these to generate the 'Single Level Group By Report' in the screenshot above, which shows grouping by **Team**.

'WAS' operator enhanced

Also introduced in JIRA 4.4.3 was the ability of the **WAS** operator to work with the **Fix Version** field. For example, the following JQL query:

```
fixVersion WAS 4.4
```

Will find any issues whose **Fix Version** field was at some point (or currently is) set to **4.4**.

^Top

5

Activity streams now show activity from other applications
We have expanded the Activity Stream features introduced in JIRA 4.4 with:

- The ability to show external activity from another Atlassian application (such as Confluence, FishEye/Crucible and Bamboo) via an Application Link.
- The ability to combine this external activity into an Activity Stream gadget on a JIRA dashboard.
- An API for creating entries in activity streams from remote applications via the REST API or locally via Java.

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

With these new features, you can:

- See Confluence page updates from your activity streams in JIRA, then drill down into those Confluence pages for more information.
- See updates from another JIRA site. For example, activity streams on your development team's JIRA site (behind the firewall) can include activity on your support team's customer facing JIRA site.

Manage other users’ shared filters and dashboards

Introduced in JIRA 4.4.1, JIRA administrators have the ability to change the ownership of or delete other user's shared filters and dashboards. A shared filter or dashboard is a filter/dashboard created (and hence, owned) by a user, which the user has then shared with others.

Since JIRA only allows the editing or modification of shared filters/dashboards by their owners, this new
JIRA feature is especially helpful in situations where a user has left an organisation, but the shared filters or dashboards they created continue to be used by others within the organisation. You can access these features by selecting Administration > Users > Shared Filters or Shared Dashboards (or using the keyboard shortcut g + g + start typing shared filters or shared dashboard).

On the 'Shared Filters' or 'Shared Dashboard' pages, you can search for any shared filters/dashboards, or use the cog icon to change the owner of a shared filter/dashboard to another user or delete the shared filter/dashboard.

Only users with the Create Shared Objects global permission can share their filters and dashboards with other JIRA users.

Administration user interface improvements

Following on with improvements to the Administration User Interface (UI) in JIRA 4.4, JIRA 5.0 provides further improvements to the Administration UI by converting forms on various Administration pages to convenient dialog boxes.

For example, the form for adding users is now a dialog box, which is accessed by clicking Add User on the Users page of JIRA's Administration area.

In addition to the dialog box for adding a new user, the 'Attachments' and 'Workflows' pages have been redesigned and the forms associated with these pages have been converted into convenient dialog boxes too.

REST API (with tutorials) for working with issues in JIRA

JIRA's REST API has undergone a significant number of changes and improvements to provide the following:

- Create new issues.
- Retrieve metadata for creating new issues and editing existing ones.
- Delete existing issues and their subtasks.
- Create remote 'issue links'.
- Retrieve metadata from your favourite filters and dashboards.
- Retrieve metadata about your permissions.
- Almost all system fields and JIRA's built-in custom field types are supported.

Please also note that the we have changed the api-version name component of URLs for JIRA's REST API calls from '2.0.alpha1' to simply '2' (or 'latest' to use the latest REST API version available with your version of JIRA).

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

We also have a series of REST API Tutorials to help you get started using our new REST API.
improvements.

You might also want to try out Atlassian's new REST API Browser, which is available in the Atlassian Plugin SDK and can be accessed by adding /plugins/servlet/restbrowser#/user/search to the end of the URL for accessing JIRA (e.g. http://localhost:2990/jira/plugins/servlet/restbrowser#/user/search) within the SDK environment.

Stable Java API

JIRA's Java API has undergone a significant number of changes and improvements to provide the following:

- More stability and compatibility with future versions of JIRA. See our Java API Policy for JIRA for details.
- Removal of deprecated OSUser classes.
- Removal of deprecated portlets (replaced by gadgets in JIRA 4.0) and their related APIs.

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

If you are developing plugins for JIRA 5.0, please also check out our newly published set of JIRA plugin tutorials.

New troubleshooting and debugging tools

JIRA 5.0 adds several tools to help Administrators debug the configuration of their instance.

- A number of email debugging tools are now provided to System Administrators in the new Logging and Profiling page under Troubleshooting and Support
  - Enable or disable mail logging
  - Turn debug mail logging on or off
  - Configure a logging level for a new package easily in the default loggers section.
- For testing and troubleshooting LDAP connections, much more comprehensive testing is now provided, including basic connections, user retrieval, user membership, group retrieval, group membership and authentication.

New email handler wizard
JIRA 5.0 incorporates a new mail handler wizard that greatly simplifies the process of configuring incoming mail handlers for creating issues or comments from email messages.

There is no longer a need to configure a JIRA service and enter a complex string of mail handler parameters to handle your email messages. Instead, simply configure your mail handler through a convenient wizard.

Improvements have been made to the layout of JIRA’s mail configuration options. The configuration options in the Mail Servers administration page have been separated into two separate pages — one for Outgoing Mail (SMTP) and another for Incoming Mail (POP/IMAP) configurations. The configuration options for mail handlers have been moved from the Services administration page and incorporated into the Incoming Mail page.

Enhancements to the 'view issue' page

The 'view issue' page has the following enhancements:

- The Issue Links section of the 'view issue' page has been redesigned to cater for remote issue links (above) and makes better use of space — the separate line used to group issue link types in earlier versions of JIRA has been removed.
- The right-hand side of the view issue page now uses a fixed width. Hence, when the 'view page' is maximised on large, high resolution monitors, the association between field names and values is not lost.
- In JIRA versions prior to 5.0, initially clicking any tab in the Activity section would reload the whole 'view issue' page. In JIRA 5.0, the content within each of these (non-selected) tabs only loads upon being clicked by a user and does so independently of the rest of the 'view issue' page. This modified behaviour provides more rapid access to the information on these tabs.
• **For plugin developers** - the left hand side of the 'view issue' page can be customised via web panels. Hence, you can now insert your own custom panels anywhere below the operations bar on the 'view issue' page.

  The web panel location for the left-hand side of the 'view issue' page is `atl.jira.view.issu.e.left.context` — refer to the View Issue Page Locations page of the Web Fragments guide in our Atlassian Developers documentation site for more information. Also see our plugin tutorial for an example of customising the right-hand side of the 'view issue' page (a feature which became available in JIRA 4.4).

^Top

### 13

**JIRA Add-Ons (Plugins and Integrations)**

JIRA 5.0 contains a great deal of new capabilities for developers who want to integrate with JIRA, including new integration features like remote issue links and activity streams, a new REST API (link) and a stable Java API.

JIRA Customers will already see the benefits of these new capabilities:

- Over 100 integrations to JIRA 5.0 are available (at 5.0 release), so many of the plugins customers depend on are already JIRA 5.0 compatible.
- JIRA's stable Java and new REST APIs allow Add-On developers to build integrations to JIRA which will be forwards compatible with future releases of JIRA 5.x, so upgrades become even easier for JIRA customers.
- Many of these new integrations use the new activity streams and remote issue links features.

See the full list of JIRA 5.0 compatible integrations on the Atlassian Plugin Exchange.

^Top

**Other enhancements and fixes**

When you access your new or upgraded JIRA 5.0 installation, JIRA launches the **What's New in JIRA** ... dialog box, which provides brief overview of the new features available in that JIRA version.

This dialog box can be prevented from showing up whenever you access JIRA by selecting the **Don't show again** check box at the base of the dialog box. However, you can access this dialog box again by choosing the **What's New** item from your user name drop down menu.

For a list of more issues resolved in JIRA 5.0 so far, [click here](#).

^Top

**JIRA 5.0 Upgrade Notes**

On this page:

- Upgrading from JIRA 4.4.x to 5.0
  - The 'trackbacks' feature has been removed
  - JIRA servers using Oracle databases require additional configuration
  - Mail handlers are no longer configured as a JIRA Service
  - Project key length restricted to 10 characters for new projects
  - GreenHopper plugin
  - JIRA Toolkit plugin
  - Other plugins
  - Translations
Licensing changes
Naming convention changes for JIRA distributions

Known issues
- When creating an issue in Internet Explorer 8, the 'Issue Type' field behaves differently
- Performance degradation when users view lists of issues sorted by date from large JIRA sites
- Upgrading to JIRA 5.0 (or later) from JIRA versions 4.0.0 through to 4.3.x
- Upgrading to JIRA 5.0 (or later) from a JIRA version prior to 4.0.0

Upgrading from JIRA 4.4.x to 5.0
Please follow the instructions in the general Upgrading JIRA guide, as well as the JIRA 5.0-specific instructions in the sections below. The general 'Upgrading JIRA' guide contains important tasks that are essential for getting your upgraded JIRA installation to work correctly and if necessary, migrating existing configurations.

The 'trackbacks' feature has been removed
The trackback feature has been removed in JIRA 5.0 and its functionality has been replaced solely by remote issue links.

JIRA servers using Oracle databases require additional configuration
Due to Active Objects changes in JIRA 5.0, any customers with a JIRA server connected to an Oracle database will need to ensure that the database user account (through which JIRA connects to Oracle) has the create sequence and create trigger Oracle database permissions. To apply these permissions, execute the following Oracle SQL commands with the relevant database user account, before upgrading JIRA to version 5.0:

```
grant create sequence to <user>;
grant create trigger to <user>;
```

Mail handlers are no longer configured as a JIRA Service
The introduction of the mail handler wizard in JIRA 5.0 means that after upgrading to JIRA 5.0, any existing mail handlers or any new mail handlers created will no longer be configurable through JIRA's Services page. Instead, all mail handlers are created and edited through the Mail Handlers section of the Incoming Mail page. See Configure a mail handler for details.

Project key length restricted to 10 characters for new projects
When creating new projects, the project key length is now restricted to a maximum of ten characters. This will not affect existing projects. This restriction is scheduled to be removed in JIRA 6.0 and later (see JIRA-28577 - As an admin, I would like the ability to set the maximum character limit for JIRA's project key)

GreenHopper plugin
Please note that JIRA 5.0 is only compatible with GreenHopper 5.9.

The GreenHopper plugin is no longer bundled with JIRA. Instead, please use the JIRA Universal Plugin Manager to update your GreenHopper plugin.

JIRA Toolkit plugin
From JIRA 5.0, version 0.21 or later of the JIRA Toolkit plugin is required.

Hence, if you are using any of the custom fields provided by this plugin and want to ensure that messages are always shown to users upon the creation of issues, please ensure that these fields are made "required" in your field configurations:

- Message Custom Field (for edit)
- Velocity processed Message Custom Field (for edit)

Other plugins
**PLEASE BE AWARE — JIRA 5.0 introduces several changes that may break existing plugins which are not bundled with JIRA.**

If you have developed a plugin, then please read the Preparing for JIRA 5.0 section of our developer documentation site for more details. This documentation describes changes in JIRA 5.0 which may affect the compatibility of your plugin with JIRA 5.0.

If you are using a plugin developed by a third party, please check with the plugin's author to see if the plugin has been tested with JIRA 5.0.

**Translations**

Please note that unlike earlier versions of JIRA, JIRA 5.0 ships with a reduced set of translations, which may not be the most up-to-date available. The most recent translations for French, German, Spanish, Japanese and other languages can be obtained easily via the Universal Plugin Manager by searching for "language pack". See Managing JIRA's Plugins for details on using this feature.

You can also download and install these language packs manually from our Plugin Exchange site.

Language packs for other languages which are not available through the Universal Plugin Manager or our Plugin Exchange site can be downloaded from our translation site (https://translations.atlassian.com/).

**Licensing changes**

Due to JIRA licensing changes introduced at the time of the release of JIRA 5.0, some customers may wish to modify their JIRA license to one with a lower user count. Since the number of users that count towards your JIRA license is defined by the number of users with the JIRA Users global permission, some customers who upgrade to JIRA 5.0 may experience problems with their users being unable to create issues (due to license counts being exceeded).

Customers can overcome this issue by reducing the number of users that count towards their JIRA license. See How do I reduce my user count in JIRA for details on how to do this.

**Naming convention changes for JIRA distributions**

In versions of JIRA prior to 5.0, JIRA distributions had the following naming conventions:

- **JIRA Standalone** — JIRA distributions that were 'bundled' with their own Apache Tomcat application server and were installed from either an executable or archive file.
- **JIRA WAR** — JIRA distributions that could be customised, then built for deployment to a separate Apache Tomcat application server installation.

Several customers misconstrued the meaning of term Standalone which was used to describe JIRA distributions bundled with their own Apache Tomcat application server. Hence, from JIRA 5.0:

- The naming convention for JIRA WAR distributions will not change. The installation files for these distributions include 'WAR' or 'war' in their file names.
- JIRA distributions which are bundled with their own Apache Tomcat application server are referred to as 'recommended' JIRA distributions (in the documentation) and the installation files for these distributions do not use a distinct term to distinguish them from JIRA WAR distributions.
- The installation files for 'recommended' JIRA distributions include:
  - JIRA Windows 32-/64-bit installer
  - JIRA Linux 32-/64-bit installer
  - JIRA zip/tar.gz archives

For installation instructions for 'recommended' JIRA distributions, see Installing JIRA. For installation instructions for JIRA WAR distributions, see Installing JIRA WAR.

**Known issues**

Before you begin the upgrade, please check for known issues. Sometimes we find out about a problem with the latest version of JIRA after we have released the software. In such cases we publish information about the known issues in the JIRA Knowledge Base. Please check for known issues and follow the instructions to apply any necessary patches.

If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.
When creating an issue in Internet Explorer 8, the 'Issue Type' field behaves differently

Due to existing behaviour in Internet Explorer 8, when creating an issue, JIRA does not select the default issue type for the specified project on the Create Issue dialog box or page if you have no history of having previously created issues. Instead, the issue type at the top of the dropdown list is selected if the user has not previously created an issue. See JIRA-27029 for more information.

Performance degradation when users view lists of issues sorted by date from large JIRA sites

On large JIRA sites, users may experience performance degradation in the following situations:

- Viewing search results in either the issue navigator or issue filters, which retrieve more than 25,000 issues sorted by date.
- For projects with more than 25,000 issues, viewing sections of the summary page that list issues sorted by date - for example, the 'Issues: Updated recently' section.

See JRA-27206 for more information.

Upgrading to JIRA 5.0 (or later) from JIRA versions 4.0.0 through to 4.3.x

In addition to the points listed above, please read the Important Version-Specific Upgrade Notes for every version of JIRA you are skipping.

Upgrading to JIRA 5.0 (or later) from a JIRA version prior to 4.0.0

Please be aware that you cannot directly upgrade to JIRA 5.0 or later from a version prior to 4.0.0 (for example from JIRA 3.10.3). Instead, you will need to upgrade your JIRA installation to a JIRA 4.x version first before you can upgrade to JIRA 5.0 or later. The latest JIRA 4.4.x version is recommended for this process. The following resources in the JIRA 4.4.x documentation are good places to start for upgrading to the latest JIRA 4.4.x release:

- JIRA 4.4.5 Upgrade Notes
- JIRA 4.4 Upgrade Notes
- Upgrading JIRA guide

You can then follow the JIRA 5.0 Upgrade Notes (above) to upgrade your JIRA 4.x installation to JIRA 5.0.

    - JIRA 3.5.2 Upgrade Guide
  - JIRA 3.4 and 3.4.1 Upgrade Guide
  - JIRA 3.3 Upgrade Guide
    - JIRA 3.3.3 Upgrade Guide
    - JIRA 3.3.1 Upgrade Guide
  - JIRA 3.2 Upgrade Guide
  - JIRA 3.1 Upgrade Notes
  - JIRA 3.0 Upgrade Notes

You will find the upgrade notes attached to the release notes for the relevant version.

- **Step 2 - Upgrade to JIRA 4.4.5**: follow the procedure in Migrating JIRA to Another Server.
  - For users who are connecting to Crowd or LDAP, please read the Changes to User Management in JIRA.
- **Step 3 - Upgrade to the latest version of JIRA**: follow the instructions in the general Upgrading JIRA guide, as well as the JIRA 6.x-specific instructions in the Production Releases.

JIRA 5.0.7 Release Notes
1 July 2012
The Atlassian JIRA team announces the release of **JIRA 5.0.7**. This point release contains several updates and fixes.

Upgrading to JIRA 5.0.7 is free to all customers with active JIRA software maintenance.

**Don’t have JIRA 5.0 yet?**
Take a look at all the new features in the [JIRA 5.0 Release Notes](#) and see what you are missing out on!

[Download Latest Version]

**Upgrading from a previous version of JIRA**
If you are upgrading, please read the JIRA 5.0.7 Upgrade Notes.

**Updates and fixes in this release**
JIRA 5.0.7 includes the following updates and bug fixes:

JIRA 5.0.7 Upgrade Notes

**Upgrading from JIRA 5.0.x to 5.0.7**
Please follow the instructions in the [general upgrading JIRA documentation](#).

Please also read the [Important Version-Specific Upgrade Notes](#) for any JIRA 5.0.x versions you are skipping.

**Upgrading from JIRA 4.4.x and earlier**
In addition to the above, please read the [JIRA 5.0 Upgrade Notes](#) and as well as the [Important Version-Specific Upgrade Notes](#) for the versions of JIRA you are skipping.

**JIRA 5.0.6 Release Notes**
4 June 2012
The Atlassian JIRA team announces the release of JIRA 5.0.6. This point release contains several updates and fixes. In particular, customers with large numbers of users will notice performance improvements with the ‘suggested users’ dropdown list, which appears when their users email issues to other users by mentioning them on issues.

Upgrading to JIRA 5.0.6 is free to all customers with active JIRA software maintenance.

Don't have JIRA 5.0 yet?
Take a look at all the new features in the JIRA 5.0 Release Notes and see what you are missing out on!

JIRA 5.0.4 Upgrade Notes

Upgrading from JIRA 5.0.x to 5.0.4
Please follow the instructions in the general upgrading JIRA documentation.

Please also read the Important Version-Specific Upgrade Notes for any JIRA 5.0.x versions you are skipping. Menu item change for the 'Database Monitoring' page

The position of the Monitoring menu item to access the Database Monitoring page in JIRA moved from Administration > System to Administration > Plugins.

Hence, JIRA system administrators can now access the Database Monitoring page by selecting Administration > Plugins > Monitoring. The keyboard shortcut to access this page has not changed.

Upgrading from JIRA 4.4.x and earlier

In addition to the above, please read the JIRA 5.0 Upgrade Notes and as well as the Important Version-Specific Upgrade Notes for the versions of JIRA you are skipping.

JIRA 5.0.3 Release Notes

23 April 2012

The Atlassian JIRA team announces the release of JIRA 5.0.3. This point release contains several updates and fixes.

Features and improvements in JIRA 5.0.3:

- Invite users
- 'Autowatch' issues you create or comment on
- Other improvements
- Updates and fixes in this release

Upgrading to JIRA 5.0.3 is free to all customers with active JIRA software maintenance.

Upgrading from a previous version of JIRA

If you are upgrading, please read the JIRA 5.0.3 Upgrade Notes.

Invite users

If you're faced with the task of creating multiple users in your JIRA instance, you'll be happy to know that JIRA now includes the new Invite Users feature. This feature lets you email invitations that allow people to sign up to your JIRA instance. You just need a list of email addresses and a single click of a button.

'Autowatch' issues you create or comment on
A JIRA user who either creates a new issue or comments on an existing issue, will automatically become a watcher of that issue.

This feature applies to all new and existing JIRA users in a new (or upgraded) JIRA 5.0.3 installation. JIRA users can easily disable this feature through their user profile by choosing Disabled for their Autowatch option when editing the Preferences section of their user profile.

Other improvements

Automatically suggested project keys

When creating a new project, the Add a new project dialog box now suggests a project Key based on the Name you specify.
Notify on my actions now disabled by default

By default, any new JIRA users will no longer be automatically notified of their own actions. Individual users can change this option through their user profile by choosing Notify me for their My Changes option when editing the Preferences section of their user profile.

Better performance when mentioning users on issues

You should now see significant performance improvements when mentioning other JIRA users in an issue's Description or Comment field.

Character limits on issue fields can now be imposed

JIRA system administrators can now specify a character limit across description, environment and comment fields. Hence, when an issue is created, edited or commented on, if the content in one of these three field types exceeds this character limit, the user will not be able to save the issue or their comment until the character limit of the field is reduced below the limit.

This character limit is specified through the jira.text.field.character.limit property, which can be accessed through the Advanced Settings page in the JIRA administration area. Specifying a value of 0 (i.e. zero, which is the default value) for this property disables this feature.

New database monitoring page for JIRA system administrators

To help diagnose performance problems in JIRA associated with database connectivity, JIRA system administrators now have access to the new Database Monitoring page, which shows a graphical representation of JIRA's database connection usage over time.

JIRA system administrators can access this page by selecting Administration > System > Monitoring which opens the Database Monitoring page below.

Keyboard Shortcut: g + g + start typing monitoring
Database Monitoring

This page allows you to monitor JIRA's database connection usage. You can use this information to tune the size of JIRA's connection pool and to diagnose performance problems. See Connecting JIRA to a Database for more info.

Connection Pool

### JIRA 5.0.2 Release Notes

**2 April 2012**

The Atlassian JIRA team announces the release of **JIRA 5.0.2**. This point release contains several updates and fixes.

**Features and improvements in JIRA 5.0.2:**

- Further Administration user interface improvements
- Performance Improvement
- Updates and fixes in this release

Upgrading to JIRA 5.0.2 is free to all customers with active JIRA software maintenance.
Upgrading from a previous version of JIRA

If you are upgrading, please read the JIRA 5.0.2 Upgrade Notes.

Further Administration user interface improvements

Continuing on with improvements to the Administration User Interface (UI) in earlier JIRA releases, JIRA 5.0.2 improves the Administration UI further with a redesign of the pages for administering issue types, including a more streamlined configuration process for adding field configurations and screens.

The original 'sub-tab' for adding issue type schemes has been converted to a full tab on the left of the JIRA UI and the form for adding an issue type scheme is now a dialog box, which is easily accessed by clicking the Add Issue Type Scheme button at the top-right of the Issue Type Scheme page.

Whenever you add a field configuration (+ scheme) or a screen, screen scheme or issue type screen scheme, JIRA will take you directly to the pages for configuring any of these newly created entities, thereby saving you the need to locate such an entity in a list and click its Configure link. This is especially useful for customers with highly configured JIRA installations that contain extensive lists of these entities.

Performance Improvement

JIRA 5.0.2 includes an important performance fix:

- [JIRA-27402 - SearchProvider.searchCount uses a TopDocCollector](https://jira.atlassian.com/browse/JIRA-27402) RESOLVED

Searches that retrieve many thousands of issues are performed more rapidly.

Don't have JIRA 5.0 yet?

Take a look at all the new features in the JIRA 5.0 Release Notes and see what you are missing out on!

Updates and fixes in this release

JIRA 5.0.2 includes the following updates and bug fixes:
JIRA 5.0.2 Upgrade Notes

Upgrading from JIRA 5.0.x to 5.0.2

Please follow the instructions in the general upgrading JIRA documentation.

Please also read the Important Version-Specific Upgrade Notes for any JIRA 5.0.x versions you are skipping.

New parameter (login.forward.path) in the seraph-config.xml file

As part of the fix for JIRA-22667, a new parameter has been introduced into JIRA's seraph-config.xml.

Customers who have customised the seraph-config.xml file in their JIRA installation should insert this new parameter (login.forward.path) as indicated below:
seraph-config.xml

```xml
<security-config>
  <parameters>
    ...
    <!--
    The path to *forward* to when the user tries to POST to a protected
    resource (rather than clicking on an explicit login link). Note that this is done using a servlet FORWARD,
    not a redirect. Information about the original request can be gotten from the javax.servlet.forward.*
    request attributes.
    At this point you will probably want to save the user's POST params so he can log in again and retry
    the POST.
    Defaults to undefined, in which case Seraph will just do a redirect
    instead of a FORWARD.
    -->
    <init-param>
      <param-name>login.forward.path</param-name>
      <param-value>/secure/XsrfErrorAction.jspa</param-value>
    </init-param>
    ...
  </parameters>
</security-config>
```

Please Note:

- If you are adding the new login.forward.path parameter to an existing seraph-config.xml file, the order of its containing <init-param/> element relative to the other <init-param/> elements in the file is not important, as long as the containing <init-param/> is a child of the <parameters/> elements in this file.
- Since the seraph-config.xml file is located within your JIRA Installation Directory, avoid copying the seraph-config.xml file from your original JIRA installation and overwriting the one in your upgraded JIRA 5.0.2 (or later) installation. Other changes in this file may have been made in any intervening versions of JIRA between your original JIRA version (from which you are upgrading) and JIRA 5.0.2, such that overwriting the file in your upgraded JIRA 5.0.2 installation may have unpredictable consequences.

Upgrading from JIRA 4.4.x and earlier

In addition to the above, please read the JIRA 5.0 Upgrade Notes and as well as the Important Version-Specific Upgrade Notes for the versions of JIRA you are skipping.

JIRA 5.0.1 Release Notes

19 March 2012

The Atlassian JIRA team announces the release of JIRA 5.0.1. This point release contains several updates and fixes.
Features and improvements in JIRA 5.0.1:

- More Administration user interface improvements
- Performance improvements
- Other improvements

Download Latest Version
Upgrading to JIRA 5.0.1 is free to all customers with active JIRA software maintenance.

Upgrading from a previous version of JIRA

If you are upgrading, please read the JIRA 5.0.1 Upgrade Notes.

More Administration user interface improvements

Following on with improvements to the Administration User Interface (UI) in earlier JIRA releases, JIRA 5.0.1 improves the Administration UI by converting more Administration page forms into convenient dialog boxes.

The forms for adding new issue types, sub-tasks, field configurations (+ field configuration schemes) and screen s (+ screen schemes) are now dialog boxes, which are easily accessed by clicking a button at the top-right of the appropriate JIRA Administration pages.

Performance improvements

JIRA 5.0.1 also has two important performance fixes:

- JIRA-27206 - The upgrade to using Lucene 3.0 has caused performance degradation where there are large result sets sorted by date and

- JIRA-27308 - The IssuesFragment panel has a poor performance profile.

Customers with larger JIRA installations who upgrade to JIRA 5.0.1 will see some performance improvements when using JIRA's Issue Navigator and project browser pages.

Other improvements

A new welcome page

If you are a new JIRA customer, you'll be presented with a new welcome page to help guide you through the process of creating your first JIRA project.
There is also no need to log in after running through the JIRA Setup Wizard.

**Upgraded plugin manager**

JIRA 5.0.1 also includes version 2.0 of the Atlassian Universal Plugin Manager Plugin. See Managing JIRA’s Plugins for details.

**Don't have JIRA 5.0 yet?**

Take a look at all the new features in the JIRA 5.0 Release Notes and see what you are missing out on!

**JIRA 5.0.1 Upgrade Notes**

#### Upgrading from JIRA 5.0 to 5.0.1

Please follow the instructions in the general upgrading JIRA documentation. Potential issues with plugins that reference Guava (formerly Google Collections) versions

In JIRA 5.0.1, the version of the JIRA's 3rd party Guava library was upgraded from r06 to Release 10.0.1, which is backwards compatible with r06. (See the Guava ReleaseHistory page for details).

Along with this upgrade, the Guava package version exported to OSGi changed from 6.0.0 to 10.0.1. If a plugin explicitly imports the Guava package with an upper-bound version constraint that excludes Guava version 10.0.1 and later, the plugin will not successfully load in an upgraded JIRA 5.0.1 installation.

For instance, an existing plugin may explicitly import the Guava package in their pom.xml with the following version constraint that excludes Guava 10.0 and later:

```xml
<Import-Package>
   com.google.common.*;version="[1.0,10.0)",
</Import-Package>
```

Such a plugin will not load successfully in JIRA 5.0.1.

Hence, we recommend that plugin developers avoid specifying an OSGi-upper-bound version constraint when explicitly importing the Guava/Google Collections package into their plugin. For example, simply specify an entry similar to the following in the maven-jira-plugin section of your pom.xml like this:

```xml
<Import-Package>
   com.google.common.*;version="1.0"
</Import-Package>
```

---

**Upgrading from JIRA 4.4.x and earlier**

**JIRA 4.4 Release Notes**

2 August 2011
The Atlassian JIRA team is proud to bring you a brand new version of one of the world's favourite issue-trackers. JIRA 4.4 brings you a visual Workflow Designer, a Workflow Viewer from the 'View Issue' page, simplified Administration and user-specific Time Zones. We are also very pleased to announce that the JIRA installation and upgrade processes have been improved and largely automated.

Upgrading to JIRA 4.4 is free for all customers with active JIRA software maintenance as of 2 August 2011.

**Highlights of JIRA 4.4:**

- For Users:
  - User Time Zones
  - New Email Style
  - Issue Linking when Resolving an Issue
  - Workflow Viewer on the 'View Issue' Screen
  - Multiple File Selection and Upload from the 'File Upload' Dialog Box

**Thank you for your feedback:**

- ★ More than 50 new feature requests implemented
- ★ Over 1400 votes fulfilled

Your votes and issues help us keep improving our products, and are much appreciated.

**Upgrading to JIRA 4.4**

JIRA 4.4 can be downloaded from the JIRA Download Center. Before upgrading, please refer to the JIRA 4.4 Upgrade Notes.

If you are upgrading a JIRA WAR installation, please ensure you read the section on **Upgrading a JIRA**
Note to developers: Please see the Plugin Developer Notes for JIRA 4.4.

Highlights of JIRA 4.4

For Users:

User Time Zones

We are very pleased to announce progress on JRA-9, one of the most highly-voted requests for JIRA: times will be displayed to a user in their local time zone, rather than the server's time zone.

You can set a default user time zone at an administration level, and individual users have the ability to choose their own time zone. Each user's time zone is displayed in their hover profile.

Time zone support has been implemented for quick searching, simple searching and advanced searching, chart and report gadgets, date/time-based custom fields, as well as issue histories, work logs and source code check-ins (via the JIRA FishEye Plugin).

Note: Date fields, which have no time component, such as due dates, release dates (associated with versions) and custom date fields, solely record date information (and no time zone-related information).

JIRA administrators can change the default time zone by going to 'Administration' > 'General Configuration' (under 'Global Settings'), and editing the 'Default user time zone'.

Users can also change their individual time zone setting via their user profile:
New Email Style

The HTML email templates have undergone a complete visual refresh.

They will also thread better in mail clients (such as Gmail), so all emails relating to one issue will thread together.

They will also render nicely in mobile mail clients:
Issue Linking when Resolving an Issue

When resolving an issue, you can create links to other issues on an issue resolution screen. This is handy when you want to resolve an issue as a 'duplicate' of another and at the same time link to the duplicate issue.

For convenience, your recent issue links and resolutions are readily accessible from the 'Linked Issues' fields (in the screenshot below). The 'Linked Issues' fields can also be added to any JIRA screen via the new 'Issue Linking' field in JIRA 4.4. See Defining a Screen for more information.

If you are upgrading from an earlier version of JIRA, you need to configure this feature manually through JIRA’s administration area. Please refer to the Upgrade Notes for details.
Workflow Viewer on the 'View Issue' Screen

You can also see a read-only view of the workflow from the 'View Issue' page — just click the 'View Workflow' link against the 'Status' field. We've made it simple for everyone to use, without requiring Flash to be installed.

The workflow viewer also highlights the current status of your issue in the workflow.

ℹ️ A new permission called 'View (Read-Only) Workflow' is required to access the workflow viewer feature from the 'View Issue' page.
Multiple File Selection and Upload from the 'File Upload' Dialog Box

When using JIRA's 'Attach Files' dialog box, you can now select multiple files in the 'File Upload' dialog box that appears after clicking the 'Browse' button.

This feature currently works with Firefox 3.6 or later and Chrome web browsers.
**JQL Enhancements**

**Do more with 'WAS'**

The ability to search an issue's Change History was introduced in JIRA 4.3 and allowed you to search the history of the **Status** field.

In JIRA 4.4 you can now also search the history of:

- the **Assignee** field, e.g.:

  assignee WAS "jsmith"

- the **Reporter** field, e.g.:

  reporter WAS "djones"

You can also now search for a field that had a particular value:

- **ON** a given date — e.g. find issues that had a status of "closed" on May 31st:

  status WAS "closed" ON "2011/05/31"

- **BEFORE** a given date — e.g. find issues that were assigned to jsmith before May 31st:
assignee WAS "jsmith" BEFORE "2011/05/31"

- **AFTER** a given date — e.g. find issues that were assigned to me after May 31st:
  
  ```
  assignee WAS currentUser() AFTER "2011/05/31"
  ```

- **DURING** a given date range — e.g. find issues that were assigned to me during May:

  ```
  assignee WAS currentUser() DURING ("2011/05/01","2011/05/31")
  ```

- set **BY** a particular user — e.g. find issues that were assigned to Fred by me:

  ```
  assignee WAS "Fred" BY currentUser()
  ```

**How many Watchers?**

The new 'Watchers' field allows you to search for issues with a specified number of watchers, e.g.:

```
watchers > 3
```

For more details please see Advanced Searching.

^Top

---

**New-look Activity Stream**

The Activity Stream has had a makeover. As well as looking prettier, it now lets you vote, start watching or comment on an issue with a single click:
Activity Stream

Tuesday

Andrew Prentice attached one file to ANGRY-73 - bonfire test

Monday

Mike Cannon-Brookes commented on ANGRY-37 - Nerd flight path does not take into account gravitational pull of moon

Are we building the physics engine for Newtonian or Einsteinian physics?

Sunday

Edwin Wong linked 3 issues
ANGRY-67 - As a nerd, I can flip in a chair while waiting to be shot into the air
is related to
ANGRY-70 - Some graphical glitches and ANGRY-69 - The nerd flies too fast

Edwin Wong updated 2 fields of ANGRY-67 - As a nerd, I can flip in a chair while waiting to be shot into the air

• Logged ‘2h’
• Changed the Remaining Estimato to ‘0h’

Edwin Wong attached one file to ANGRY-70 - Some graphical glitches
Graph of Vote History

You can now graph an issue's votes over time:

Vote history

For Administrators:

Visual Workflow Designer

JIRA 4.4 provides a visual representation of your workflow, making it easy to map out your business processes.

Simply go to ‘Workflows’ in JIRA administration as usual, and click the ‘Design’ link for the workflow you wish to edit. If you hover your mouse over an individual Step or Transition, a ‘cog’ icon appears, which you can click to access more functions.

The layout of a workflow is preserved whenever you ‘Copy’ or ‘Create a Draft’ of an existing workflow.
New-Look Administration Area

JIRA 4.4 brings you a dedicated ‘administration mode’, which replaces the left-hand column of the JIRA’s administration console with a series of drop-down menus across the top navigation bar.

To find the new location of a menu item, type it into the "Administration Quick Search" box at the top right of the screen — or click the drop-down in the “Administration Quick Search” box to get a full list of admin options.

You can bring up the "Administration Quick Search" box from anywhere in JIRA by typing g + g. This has replaced the A keyboard shortcut.

To leave JIRA’s ‘administration mode’, click the ‘Exit Administration’ link at the top-right of the screen to return JIRA to its standard user mode.
Simplified Project Administration

Project administration has become more visual and far simpler:
Editable Options for Custom Fields

We are also pleased to announce progress on JRA-2983. You can now edit the options for custom fields of the following field types:

- Select List
- Multi Select
- Cascading Select
- Radio Buttons
- Multi Checkboxes
Because your custom fields may change over time, JIRA now gives you the ability to:

- edit a field’s options — that is, change the text of an option.
- disable an option — that is, hide an option so that it is no longer available for selection. Options that have been used cannot be removed (to preserve data integrity), but due to changing business requirements, they may become invalid over time and so you may wish to make them unavailable for new issues.

**Note to developers:** If you develop JIRA plugins that handle single- and multi-select custom fields, please be aware of the Single- and Multi-Select Custom Field Changes section of the Plugin Developer Notes for JIRA 4.4.

Setup and Installation:

**Improved Setup Wizard with Database Configuration**

Our trusty Setup Wizard has had a makeover:

Database Configuration Now Part of the Setup Wizard

In JIRA 4.4, configuring a connection to an external database is now part of the standard Setup Wizard.
Upon completing the Setup Wizard, JIRA will create a direct JDBC connection (whose entire configuration is stored within your JIRA home directory).

Here is the new database configuration step of JIRA’s Setup Wizard:

![JIRA Setup](image)

**Improved JIRA Standalone Installer/Uninstaller and Automated Upgrade**

**Linux Installer and Uninstaller**

The Linux Installer provides a simple console (shell prompt) wizard that installs JIRA for Linux operating systems. The Linux Installer:

- Installs JIRA under a dedicated user account 'jira' with restricted write access to your JIRA installation directory.
- Can install JIRA as a service, so that JIRA automatically re-starts whenever your Linux operating system must be rebooted.

To install JIRA, simply download the Linux Installer (.bin) file and at a shell prompt, execute this file and follow the remaining prompts!

See [Installing JIRA on Linux](#) for details.

After using the Linux Installer, an executable file ‘uninstall’ (located in your JIRA Installation Directory) is available to conveniently uninstall JIRA from your Linux operating system.

See [Uninstalling JIRA from Linux](#) for details.

**Windows Installer**

The installation wizard for Windows now works smoothly for Windows 7 and Vista.

The process for installing JIRA as a Windows service has also improved and the wizard now allows you to specify the port numbers used to run and access JIRA.

See [Installing JIRA on Windows](#) for details.
Unattended Installation

When installing JIRA using the Linux or Windows Installers (above), a configuration file called `response.varfile` can be generated in the `.install4j` subdirectory of your JIRA Installation Directory.

The `response.varfile` file records all configuration options specified during your initial installation. This allows you to reinstall JIRA on multiple server machines based on the same configuration without the need for any user input.

See the 'Performing an Unattended Installation' sections for Linux and Windows for details.

Automated Upgrade

The new Linux and Windows Installers (above) include an option that allows you to upgrade an existing JIRA 4.3.x or later Standalone installation.

This upgrade feature automates the following tasks for you:

1. Backs up the Installation and Home Directories of the existing JIRA installation to be upgraded.
2. Installs JIRA 4.4 whilst migrating the following from your existing JIRA installation to the new JIRA 4.4 installation:
   - Legacy database configurations defined as a datasource within the application server (used in JIRA 4.3.x and earlier) to the new database configuration used in JIRA 4.4 and later. See JIRA 4.4 Upgrade Notes for details.
   - TCP port values in your existing JIRA installation's server.xml file.
   - Custom values in your existing JIRA installation's jira-application.properties, including key customisations from the setenv.sh/setenv.bat files.

The upgrade feature detects and notifies you of any other files in the `atlassian-jira` subdirectory of your existing JIRA Installation Directory, which had been deleted, added or modified from a 'default' JIRA installation. This informs you of any customisations you will need to migrate manually over to your upgraded JIRA installation directory.

Also note that the JIRA Configuration Tool (bundled with JIRA Standalone) is now capable of changing JIRA's TCP Ports.

Platforms, APIs:

IE 9 and Firefox 5 Support

We are very pleased to announce that JIRA 4.4 supports Internet Explorer 9.0 and Firefox 5.0.

Other Enhancements and Fixes

For the list of issues resolved in JIRA 4.4 so far, click here.
JIRA 4.4 Upgrade Notes

    - An Exception is Generated After Starting a New JIRA Installation
    - SOAP API Returns IDs Instead of Values for Multiselect Fields
    - Automated Upgrade Encounters Problems Reading the JIRA Installation Directory
    - JIRA Installations Connected to Microsoft SQL Server Databases
    - Other Known Issues
- Upgrading from JIRA 4.2.x and Earlier

Please Note:

From JIRA 4.4, version-specific 'upgrade guides' are now referred to as 'upgrade notes'. This change was made to avoid potential naming ambiguity with the general Upgrading JIRA guide and to match the naming conventions used for the equivalent documents of other Atlassian products.

Upgrading from JIRA 4.3 to 4.4

Please follow the instructions in the general Upgrading JIRA guide, as well as the JIRA 4.4-specific instructions in the sections below. The general 'Upgrading JIRA' guide contains important tasks that are essential for getting your upgraded JIRA installation to work correctly and if necessary, migrating existing configurations.

If you are upgrading a JIRA WAR installation:

Please ensure you read through all content in the section below for Upgrading a JIRA 4.3.x (or Earlier) WAR Installation, including the subsection on Migrating Your Database Configuration.

Changes to the jira-application.properties file

In JIRA 4.4.0 and later, advanced configuration options are no longer stored in the jira-application.properties file. Instead, the default values for nearly all these JIRA properties are stored in the new jpm.xml file (located in the JIRA Installation Directory) and any properties whose values you have customised are defined in either the new jira-config.properties (located in the JIRA Home Directory) or the JIRA database (for more commonly edited properties). The values of any properties defined in the jira-config.properties and JIRA database override those values stored in the jpm.xml file. For more information, see Advanced JIRA Configuration.
When upgrading and migrating your existing configurations to JIRA 4.4.x (most of which is handled automatically if you use the new 'automated upgrade' tools), any properties whose values you had customised in the `jira-application.properties` file of your earlier JIRA installation, will be read and migrated across to the new `jira-application.properties` file or JIRA database of your upgraded JIRA installation.

In JIRA 4.4.0 and later, the `jira-application.properties` file is still required, although only the `jira.home` property is used.

**Database Configuration Changes**

JIRA 4.4.0 and later uses a new file called `dbconfig.xml` (located within your JIRA Home Directory), which defines all JIRA database connection information for your JIRA installation.

Here is an example of a `dbconfig.xml` file defining a direct JDBC connection to an external PostgreSQL database:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<jira-database-config>
    <name>defaultDS</name>
    <delegator-name>default</delegator-name>
    <database-type>postgres72</database-type>
    <schema-name>public</schema-name>
    <jdbc-datasource>
        <url>jdbc:postgresql://dbserver:5432/jiradb</url>
        <driver-class>org.postgresql.Driver</driver-class>
        <username>jiradbuser</username>
        <password>password</password>
        <pool-size>15</pool-size>
    </jdbc-datasource>
</jira-database-config>
```

A direct JDBC connection means that JIRA's entire database configuration information is encapsulated within the `dbconfig.xml` file, with no references to a 'datasource'.

**Tip:** A `dbconfig.xml` file defining a direct JDBC connection to a JIRA database, effectively replaces values which defined the JIRA 'datasource' and 'database' connections from the `<jira-application-dir>/WEB-INF/classes/entityengine.xml` and `conf/server.xml` (JIRA Standalone only) files, respectively (within the JIRA Installation Directory of version 4.3.x or earlier). For JIRA WAR version 4.3.x or earlier, the JIRA database connection is typically defined in the `jira.xml` file within the `conf` subdirectory of the Tomcat installation running JIRA (instead of `server.xml`).

From JIRA 4.4.0, the `entityengine.xml` file is no longer used to store any information about your JIRA database/datasource. However, this file is still required by JIRA for other purposes.

**Migrating Existing Configurations to Your New JIRA During the Upgrade**

Upgrading a JIRA 4.3.x Standalone Installation on Linux or Windows

Use the upgrade feature of the Linux and Windows Installers to upgrade JIRA.

If you are upgrading a JIRA 4.3.x installation on Solaris, do not use the Linux Installer to upgrade JIRA. Instead, use either the manual (i.e. 'in-place' database upgrade) or migration (i.e. XML export/import) procedures and refer to the additional notes below.

This upgrade feature automates the following tasks for you:

1. Backs up the Installation and Home Directories of the existing JIRA installation to be upgraded.
2. Installs JIRA 4.4 whilst migrating the following from your existing JIRA installation to the new JIRA 4.4 installation:
   - Legacy database configurations defined as a datasource within the application server (used in JIRA 4.3.x and earlier) to the new database configuration used in JIRA 4.4 and later. See Database Configuration Changes (above) for details.
TCP port values in your existing JIRA installation's server.xml file.
Custom values in your existing JIRA installation's jira-application.properties and setenv.sh/setenv.bat files.

Be aware that in the setenv.sh/setenv.bat file, only the following values are migrated:
- JVM_SUPPORT_RECOMMENDED_ARGS
- JVM_MINIMUM_MEMORY
- JVM_MAXIMUM_MEMORY
- JIRA_MAX_PERM_SIZE

The upgrade feature detects and notifies you of any files (other than jira-application.properties and setenv.sh/setenv.bat) in the atlassian-jira subdirectory of your existing JIRA Installation Directory, which had been deleted, added or modified from a 'default' JIRA installation. This informs you of any customisations you will need to migrate manually over to your upgraded JIRA installation directory.

Please Note:
- The upgrade process requests that you conduct a backup of your database using your database's backup utilities. If your database does not support online backups, you can stop the upgrade process, shut down JIRA, perform your database backup and then restart the upgrade process to continue on.
- If you have made customisations to your seraph-config.xml file or any other files in your JIRA installation directory, these must be migrated manually.
- If your attachments and index files are located outside your JIRA Home Directory, then backups of these directories must be performed manually.

Upgrading a JIRA 4.2.x (or Earlier) Standalone or JIRA 4.3.x (or Earlier) WAR Installation

Use either the manual (i.e. 'in-place' database upgrade) or migration (i.e. XML export/import) procedures to upgrade your existing JIRA installation.

When migrating your existing JIRA configurations over to your new JIRA installation, ensure that any specific configurations to the following files of your existing JIRA installation have been re-applied to the equivalent files in your new JIRA installation before you start your upgraded JIRA installation:

- jira-application.properties (located in the <jira-application-dir>/WEB-INF/classes subdirectory of your JIRA Installation Directory.)
- Standalone distributions only — server.xml (located in the conf subdirectory JIRA Installation Directory).

Migrating Your Database Configuration

Both the manual and migration upgrade procedures require you to have properly configured a dbconfig.xml file in your JIRA Home Directory (which defines a direct JDBC connection as shown in the example above), before you start your upgraded JIRA installation.

If you are creating this dbconfig.xml file manually and you are not changing your JIRA database, it may help to migrate specific parameter values from within the following areas of your old JIRA Installation Directory:

- The <datasource name="defaultDS"/> element of the <jira-application-dir>/WEB-INF/classes/entityengine.xml file

For JIRA WAR, the <Resource name="jdbc/JiraDS" auth="Container" type="javax.sql.DataSource"/> element is typically located in the jira.xml file within the conf subdirectory of the Tomcat installation running your old JIRA server.

The following table shows which element values in the dbconfig.xml file for JIRA 4.4.x (or later) match the parameter values in the entityengine.xml and server.xml (or jira.xml) files of your JIRA 4.3.x (or earlier) installation:

<table>
<thead>
<tr>
<th>Element in dbconfig.xml for JIRA 4.4.x</th>
<th>Parameter in entityengine.xml from JIRA 4.3.x or earlier</th>
<th>Parameter in server.xml or jira.xml from JIRA 4.3.x or earlier</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;name&gt;defaultDS&lt;/name&gt;</td>
<td>name=&quot;defaultDS&quot;</td>
<td>-</td>
</tr>
</tbody>
</table>

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Avoid Migrating Your Database Configuration This Way

⚠️ If you do not create a `dbconfig.xml` file but instead, re-apply database configurations (in the `entityengine.xml` and `server.xml/jira.xml` files) from your old JIRA installation to your new JIRA installation, then upon starting your new JIRA installation, JIRA will write a new `dbconfig.xml` file defining your existing database configuration. However, this `dbconfig.xml` file will actually define a `datasource` connection to JIRA’s database (defined in your `server.xml/jira.xml` file), as opposed to a `direct JDBC connection` shown in the example above. **We strongly recommend avoiding this database migration approach**, as it will complicate future upgrades of JIRA.

**JIRA Configuration Tool**

The **JIRA Configuration Tool** (included with JIRA 4.4 Standalone) can only work with and modify JIRA 4.4 database configurations (above).

**New ‘View (Read-Only) Workflow’ permission**

Users require a new **project permission** called ‘View (Read-Only) Workflow’ to access the workflow viewer feature from the ‘View Issue’ page. On new installations of JIRA, this permission is granted to users automatically. However, for JIRA 4.4 upgrades, JIRA administrators will need to assign this permission to their
users manually.

**External Password Management**

The 'External Password Management' option in the 'General Configuration' area of JIRA has been removed as this is now handled through User Directories.

**Issue Linking when Resolving an Issue**

On clean installations of JIRA 4.4, when a user resolves or closes an issue which utilises JIRA’s default workflow, the user will be able to link that issue to another before submitting the transition.

If you have upgraded to JIRA 4.4, this feature will not automatically be available and it must be configured manually through the JIRA administration console.

To add this feature to JIRA’s default workflow, add the new Linked Issues field to the Resolve Issue Screen. (See Defining a Screen for more information.)

To add this feature to any workflow transition of any other custom workflow, add the Linked Issues field to the appropriate screen used by that workflow transition.

**Old Issue Import Functionality Removed**

The old issue import functionality has been removed and has been completely replaced by the JIRA importers plugin feature, which is included with JIRA.

**XML Backups Always Generate a ZIP Archive File**

JIRA’s XML backup utility now always generates a ZIP archive file. As a result of this change, the option to 'Backup As Zip' has been removed from the user interface.

**'Contact Administrators' Reintroduced**

The 'Contact Administrators' link has been reintroduced in JIRA 4.4. It operates a little differently from previously — please see the following two options on the 'General Configuration' page:

<table>
<thead>
<tr>
<th>Contact Administrators Form</th>
<th>Provides an email form for users to fill in when they click the 'Contact Administrators' link (which appears when necessary throughout the JIRA interface, e.g. on the Login screen). Applies only if outgoing email is enabled. Can be used with or without the custom 'Contact Administrators Message' below. Default: OFF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact Administrators Message</td>
<td>Displays a custom message when users click the 'Contact Administrators' link (which appears when necessary throughout the JIRA interface, e.g. on the Login screen). The 'Contact Administrators Message' will be displayed at the top of the 'Contact Administrators Form', if the form is enabled (see above), or by itself if the form is not enabled.</td>
</tr>
</tbody>
</table>

**Earlier Versions of JIRA with the Visual Workflow Designer Plugin**

Since the Visual Workflow Designer feature is now included with JIRA 4.4, if you used the JIRA Workflow Designer plugin with your earlier JIRA version, please remove it from your JIRA Home Directory before upgrading JIRA.

If you forget to do this before commencing the upgrade, then conduct the following after upgrading JIRA:

- Shut down your upgraded JIRA installation.
- Remove the old version of the Visual Workflow Designer plugin from your JIRA Home Directory.
- Restart your upgraded JIRA installation.

**Other Plugins**
JIRA 4.4 introduces several changes that may break existing plugins which are not bundled with JIRA.

If you have developed a plugin, then please read the Plugin Developer Notes for JIRA 4.4 guide. This guide describes changes in JIRA 4.4 which may affect the compatibility of your plugin with JIRA 4.4.

If you are using a plugin developed by a third party, please check with the plugin's author to see if the plugin has been tested with JIRA 4.4.

Translations

Please note that JIRA 4.4 may not ship with the very latest translations of all languages at this time. However, French, German and other translations can be obtained or updated easily via the Universal Plugin Manager by searching for "language pack". See Managing JIRA's Plugins for details on using this feature.

You can also download and install these language packs manually from our Plugin Exchange site.

Language packs for other languages which are not available through the Universal Plugin Manager or our Plugin Exchange site can be downloaded from our translation site (https://translations.atlassian.com/).

Java Platform Support

Please be aware that Oracle JDK / JRE 1.6 update 18 or later is now required to run JIRA. See Supported Platforms for more information.

Known Issues

An Exception is Generated After Starting a New JIRA Installation

Due to a bug (JIRA-24818), an ArrayIndexOutOfBoundsException exception is generated after starting a new JIRA 4.4 installation. However, this exception will not cause any issues with JIRA's functionality.

SOAP API Returns IDs Instead of Values for Multiselect Fields

Due to a bug (JIRA-25034), people using the SOAP API to get values for multiselect fields will now just see the "ids" (numbers) of each multiselect value, instead of their human-readable display name. Note that these fields can still be set using values (as opposed to ids).

Our proposed solution is here — please watch the issue for progress and resolution.

Automated Upgrade Encounters Problems Reading the JIRA Installation Directory

The automated upgrade feature of the Windows and Linux installers may report the error: "Problems reading the installation directory." This is usually caused by a missing HTTP connector definition in the conf/server.xml file of the JIRA Installation Directory. For more information on how to resolve this issue, please refer to our JIRA Installation Directory Knowledge Base article Unable to Upgrade to JIRA 4.4 due to Problems Reading the Installation Directory.

JIRA Installations Connected to Microsoft SQL Server Databases

If you are upgrading to JIRA version 4.4 or later, Microsoft SQL Server's default 'READ_COMMITTED_SNAPSHOT' database setting of 'OFF' may prevent the JIRA upgrade from completing successfully.

Hence, you should change this database setting to 'ON' before you restart your upgraded JIRA 4.4 or later installation. To do this, run the following SQL query:

```
ALTER DATABASE jiradb SET READ_COMMITTED_SNAPSHOT ON
```

(where jiradb is the name of your JIRA SQL Server database).

To confirm that this SQL query ran successfully, run the following SQL query:

```
SELECT is_read_committed_snapshot_on FROM sys.databases WHERE name= 'jiradb'
```

If you receive a value of '1', then the former statement ran successfully and your JIRA database's 'READ_COMMITTED_SNAPSHOT' setting is 'ON'.

Please Note:
Once you have upgraded to JIRA version 4.4 or later, you may wish to revert your JIRA database's 'READ COMMITTED_SNAPSHOT' setting to 'OFF' again.

For more information about this setting, please refer to the relevant page on Microsoft's MSDN site.

Other Known Issues

Before you begin the upgrade, please check for known issues. Sometimes we find out about a problem with the latest version of JIRA after we have released the software. In such cases we publish information about the known issues in the JIRA Knowledge Base. Please check for known issues and follow the instructions to apply any necessary patches.

If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

Upgrading from JIRA 4.2.x and Earlier

In addition to the points listed above, please read the Important Version-Specific Upgrade Notes for the versions of JIRA you are skipping.

Plugin Developer Notes for JIRA 4.4

On this page:

- Introduction
- PluggableProjectOperation
- Formatting and Parsing Dates Using the Appropriate Time Zone
  - Notes About OutlookDate and its Deprecation
- Single- and Multi-Select Custom Field Changes
  - Database Changes
  - Effect on Existing Plugins
- Restrictions on the Alias Names of plugin Webwork Actions
- View Issue Content & Project Admin Summary is now Pluggable via Web Panels
  - Adding action icons to the header
  - Adding links to the dropdown.
  - Adding sections to the dropdown
- Web-fragments and the administration navigation changes
  - Tab navigation in admin section
- Plugging in to the new Project Administration
- Version-related Atlassian Events
- Gadget Web-Resources
- As of JIRA 4.4, all plugin modules are now dynamically reloadable
- REST API Changes in JIRA 4.4 (from JIRA 4.3)
  - Retrieving a List of Groups
  - Deleting a Watcher from an Issue
  - Create, Read, Update or Delete Project Components
  - Create, Read, Update or Delete Project Versions
  - Date Format Improvements

Introduction

JIRA 4.4 introduces several changes that may break existing plugins which are not bundled with JIRA.

If you are using or have been involved in the development of such a plugin, it may need to be updated to work with JIRA 4.4. Please read through the information below to see if any of this content is relevant to your plugin.

If you are using a plugin developed by a third party, please check with the plugin's author to see if the plugin has been tested with JIRA 4.4.

Please Note:

- This is not the complete list of changes for JIRA 4.4 — it only describes changes in JIRA 4.4 that will impact plugin developers.
- For details about which versions of Atlassian's Plugin Development Platform and its components (such as the Plugin Framework, Shared Access Layer (SAL), Atlassian User Interface (AUI) and the Atlassian REST Plugin) are included in JIRA 4.4, please refer to Plugin Development Platform Version Matrix.
The `PluggableProjectOperation` interface allows plugin developers to add links to the project admin section. For example:

These plugin points are now rendered in a different location within JIRA. While the plugins will continue to render they will not look very nice. For example:

To make the plugins fit into the new panel the markup they generate will have to change. The new template looks something like:

```
<span class="project-config-list-label">Operation for User</span>
<span class="project-config-list-value"><a href="#">User Operation</a></span>
```

This markup is encapsulated in `DefaultPluggableProjectOperation`. You can extend this class and provide implementations of the `getLabelHtml` and `getContentHtml` methods in your plugin. For example:
```
public class ExampleOperation extends DefaultPluggableProjectOperation {
    public boolean showOperation(Project project, User user) {
        return true;
    }

    protected String getLabelHtml(Project project, User user) {
        return descriptor.getI18nBean().getText("com.example.plugin.projectop.label");
    }

    protected String getContentHtml(Project project, User user) {
        return descriptor.getHtml("view", ImmutableMap.of("some", "parameter"));
    }
}
```

This class should isolate you from small changes to the markup necessary to show your operation on the project summary page.

**Formatting and Parsing Dates Using the Appropriate Time Zone**

JIRA 4.4 introduces the concepts of **user time zone** and **default user time zone**. JIRA will attempt to use the **user time zone** when displaying dates to a user and similarly when interpreting dates entered by the user. If a user has not specified a time zone in their user profile, JIRA will fall back to the **default user time zone**, which can be configured by a JIRA administrator.

(Note: Date fields, which have no time component, such as due dates, release dates (associated with versions) and custom date fields, solely record date information (and no time zone-related information), and therefore remain in the default server timezone. If plugins are displaying these values, they might be inconsistent with JIRA otherwise, especially if they use OutlookDate which applies the user timezone.)

In order to provide a consistent user experience, plugins that target JIRA 4.4 should be mindful of the time zone that is in use when parsing and formatting dates. It is not enough to instantiate a `java.text.SimpleDateFormat` or a `org.joda.time.format.DateTimeFormatter` class, as these classes will use the default JVM time zone and locale, which may not necessarily match the user’s specified time zone in JIRA.

From JIRA 4.4, the recommended way of formatting and parsing dates is to use a `com.atlassian.jira.datetime.DateTimeFormatter`. Here is a plugin class example that creates a couple of formatters when the plugin is started, for use at a later point in time:
class MyPluginClass
{
    private final DateTimeFormatter defaultFormatter;
    private final DateTimeFormatter userFormatter;

    public MyPluginClass(DateTimeFormatterFactory factory)
    {
        defaultFormatter = factory.formatter().withStyle(DateTimeStyle.DATE);
        userFormatter = defaultFormatter.forLoggedInUser();
    }

    public String getDateInDefaultTimeZoneAndLocale()
    {
        // uses the default JIRA locale and time zone
        return defaultFormatter.format(new Date());
    }

    public String getDateForLoggedInUser()
    {
        // looks up the currently logged in user, and uses his/her time zone and
        locale
        return userFormatter.format(new Date());
    }
}

Notes About OutlookDate and its Deprecation

The OutlookDate class has been retrofitted to account for the new user time zone and default user time
zone concepts. Hence, plugins that use this class to display and parse time zones will automatically take on this
new user time zone behaviour. While this is generally the desired behaviour, plugin developers can override the
time zone and locale used in the com.atlassian.jira.datetime.DateTimeFormatter class.

OutlookDate has been deprecated and will be removed in a future version of JIRA. We encourage plugin
writers to port their plugins over to the new com.atlassian.jira.datetime.DateTimeFormatter API as
soon as possible.

Single- and Multi-Select Custom Field Changes

Since the following single- and multi-select custom fields are now editable, you should be aware of the changes
below which may affect your plugins.

- Select List
- Multi Select
- Cascading Select
- Radio Buttons
- Multi Checkboxes

See JRA-2983 for more information about this JIRA improvement.

Database Changes

There are two database changes that result from this improvement:

1. We now store the ID (as opposed to the literal value) of the custom field option in the customfieldvalu
table.
2. We have added a 'disabled' flag to the customfieldoption table. When this flag is set to 'true' for a
given option, that option is not available for selection when creating or editing an issue. You should
honour this behaviour when using or extending your single- and multi-select custom field types. Disabled
values are still available for searching.

Effect on Existing Plugins

This improvement will affect plugins that provide custom fields (of type select or multi-select) which reuse or
extend the following classes:

- `com.atlassian.jira.issue.customfields.impl.SelectCFType`
- `com.atlassian.jira.issue.customfields.impl.MultiSelectCFType`

If your plugin extends these types, you may need to adjust its behaviour. Velocity templates for editing and searching should be adjusted to accept and return the custom field option ID in the `value` attribute.

If your plugin consumes the output of the `com.atlassian.jira.issue.Issue.getCustomFieldValue()` you should be aware that this method now returns a `com.atlassian.jira.issue.customfields.option.Option` object rather than a String for Select or MultiSelect custom fields. You can use the `Option.toString()` method to make your plugin compatible with both JIRA 4.4 and earlier versions.

Please note:

- Only select and multi-select custom field types are affected by this change. Any custom fields of these types will continue to operate correctly, as the database will be updated during the upgrade to 4.4. Third party custom field types that extend the select and multi-select custom field types may break, but that depends upon their implementation, for example if they provided different templates for viewing or editing these would need to be updated.
- Plugins that provide custom field types that extend select and multi-select custom field types, can build a plugin that is compatible with both JIRA 4.3 and JIRA 4.4 but that may not be practical in some cases and it may be easier to have separate versions.

Restrictions on the Alias Names of plugin Webwork Actions

In JIRA 4.4 we have restricted the alias names that you can use for your Webwork actions in a small way. It can't start with 'webwork.'. So for example you can't have an action aliased as 'webwork.MyAction.jspa'.

We did this because for performance reason Webwork calls down to all layers to find webwork properties such as 'webwork.action.prefix' and so on as well as trying to find action aliases. This results in hundreds of calls to plugins for an answer we never intended that they answer. So we have limited the times they will be asked via this string matching rule.

View Issue Content & Project Admin Summary is now Pluggable via Web Panels

We have converted the right-hand side of the View Issue page and the entire Project Admin Summary page to use Web Panels for rendering content. This has enabled us to make this a plugin point for plugin writers.

E.g.

The location for the webpanel needs to be: “atl.jira.view.issue.right.context” for the View Issue page. In JIRA 5.0 we aim to make the left hand side pluggable as well.

✅ For the Admin Project Summary page use "webpanels.admin.summary.left-panels" or "webpanels.admin.summary.right-panels".
Here is how the Time Tracking block is created:

```xml
<!-- Time tracking web panel -->
<web-panel key="timetrackingmodule"
location="atl.jira.view.issue.right.context" weight="60">
<context-provider
class="com.atlassian.jira.plugin.viewissue.TimeTrackingViewIssueContextProvider"/>
<resource name="view" type="velocity"
location="timetracking/timetracking.vm"/>

<label key="timetracking.title" />
<condition
class="com.atlassian.jira.plugin.webfragment.conditions.IsFieldHiddenCondition"
invert="true">
  <param name="field">timetracking</param>
</condition>
<condition
class="com.atlassian.jira.plugin.webfragment.conditions.TimeTrackingEnabledCondition"/>
</web-panel>
```

In this example:

- The context provider, TimeTrackingViewIssueContextProvider, populates the context for the velocity template.
- The velocity template, timetracking.vm, is responsible for rendering the block.
- The label provides the label for the block.
- The conditions are evaluated to determine if we should show the block.

The Web Panel is responsible for providing the content inside the "module" chrome. The module chrome provides the block heading (from the Web Panel label), the collapsable states and further plugin points for the header. If you do not wish to have this chrome rendered for you (e.g., you may just want to include some javascript on the page), you need to specify the following inside your module descriptor:

```xml
<param name="headless">true</param>
```

This will just put the exact output of your Web Panel into the page.

The additional plugin points the common chrome provides are:
- Adding action icons to the header

These are actually just styled up Web Items.

The location is: "<web-panel-full-key>/header".

Here is how we render the "Add Attachment icon":
<!-- Add Attachment link -->
<web-item key="add-attachments-link"
  i18n-name-key="webfragments.view.issue.attachments.create" name="Create an Attachments"
  section="com.atlassian.jira.jira-view-issue-plugin:attachmentmodule/header"
  weight="1">
  <label key="admin.issue.operations.plugin.attach.file.name"/>
  <tooltip key="admin.issue.operations.plugin.attach.file.name"/>
  <styleClass>issueaction-attach-file icon icon-add16</styleClass>
  <link linkId="add-attachments-link">
    /secure/AttachFile!default.jspa?id=${issue.id}
  </link>
  <condition class="com.atlassian.jira.plugin.webfragment.conditions.CanAttachFileToIssueCondition"/>
</web-item>

**Note** the styleClass in this example as it is responsible for styling the link as an icon.

Adding links to the dropdown.

You can also add Web Items to the dropdown of a block.

The default location of these are: "<web-panel-full-key>/drop/default". E.g. "com.atlassian.jira.jira-view-issue-plugin:attachmentmodule/drop/default"

Adding sections to the dropdown

You can also define Web Sections for the dropdown, to group Web Items together.

The location for these are: "<web-panel-full-key>/drop". E.g. "com.atlassian.jira.jira-view-issue-plugin:attachmentmodule/drop"

To add Web Items to these sections, use the location: "<web-panel-full-key>/drop/<section-key>". E.g. "com.atlassian.jira.jira-view-issue-plugin:attachmentmodule/drop/attachment-sorting-options"

Web-fragments and the administration navigation changes
Traditionally navigation in the administration part of JIRA was done in a huge list of links down the left hand side of the page. We have moved to having an administration mode with menus at the top of the page. These menus follow a new, simpler way to generate themselves and web-items and web-sections in existing plugins will need to be updated to fit with the new structure. Unchanged web-items will still show in the menus, all together at the bottom of the "Plugins" menu.

The new structure follows the rules:

- Any level of web-section can have both or either web-items and web-sections in it.
- The location attribute for a web-section is the web-section it is inside of.
- The section attribute of a web-item is the locationOfTheSection/section.

The new structure has the new location of `system.admin.top.navigation.bar` and a section for each menu at that location. There are 2nd level web-sections for each menu under that. 3rd level web-sections for each section within a menu and 4th level web-sections so that a set of web-items that will appear as tabs at the side will appear as a single item in the top level menus, this menu item will link to the web-item with the lowest weight in that web-section.

It is strongly recommended to put all plugins web-sections and web-items in the Plugin menu (location `admin_plugins_menu`) and we have created some predefined sections to put you to use:

<table>
<thead>
<tr>
<th>Section Name</th>
<th>web-item's section attribute</th>
<th>web-section's location attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Control</td>
<td>admin_plugins_menu/source_control</td>
<td>source_control</td>
</tr>
<tr>
<td>Builds</td>
<td>admin_plugins_menu/builds_section</td>
<td>builds_section</td>
</tr>
<tr>
<td>Agile</td>
<td>admin_plugins_menu/agile_section</td>
<td>agile_section</td>
</tr>
<tr>
<td>Testing</td>
<td>admin_plugins_menu/testing_section</td>
<td>testing_section</td>
</tr>
<tr>
<td>Requirements</td>
<td>admin_plugins_menu/requirements_section</td>
<td>requirements_section</td>
</tr>
<tr>
<td>Timetracking</td>
<td>admin_plugins_menu/timetracking_section</td>
<td>timetracking_section</td>
</tr>
<tr>
<td>Integrations</td>
<td>admin_plugins_menu/integrations_section</td>
<td>integrations_section</td>
</tr>
<tr>
<td>Workflow</td>
<td>admin_plugins_menu/workflow_section</td>
<td>workflow_section</td>
</tr>
<tr>
<td>Drawing</td>
<td>admin_plugins_menu/drawing_section</td>
<td>drawing_section</td>
</tr>
</tbody>
</table>

Adding web-items and sections to these new sections means they will also be rendered in the administration summary page.

The Source Control and Builds sections of the Plugins menu are shown below:
And example of adding a web-item for Bamboo Configuration to the Builds section would be:

```xml
<web-item key="bambooConfigLink" name="Bamboo Config Web Item" section="admin_plugins_menu/builds_section" weight="10">
  <condition class="com.atlassian.jira.plugin.webfragment.conditions.JiraGlobalPermissionCondition">
    <param name="permission">admin</param>
  </condition>
  <label key="bamboo.config.title"/>
  <link linkId="bamboo_config">/secure/admin/jira/ViewBambooApplicationLinks.jspa</link>
</web-item>
```

If you want to keep your plugin compatible with versions of JIRA prior to 4.4, you can add a condition to your existing web-item for older versions of JIRA so that it will only show up for them. For example in the Bamboo Plugin we have a web-item:

```xml
<web-item key="bambooConfigLink-old" name="Bamboo Config Web Item" section="system.admin/globalsettings" weight="19">
  <condition class="com.atlassian.jira.plugin.webfragment.conditions.JiraGlobalPermissionCondition">
    <param name="permission">admin</param>
  </condition>
  <condition class="com.atlassian.jira.plugin.ext.bamboo.conditions.IsPriorToJiraVersion">
    <param name="majorVersion">4</param>
    <param name="minorVersion">4</param>
  </condition>
  <label key="bamboo.config.title"/>
  <link linkId="bamboo_config">/secure/admin/jira/ViewBambooApplicationLinks.jspa</link>
</web-item>
```

With the IsPriorToJiraVersion is:
public class IsPriorToJiraVersion implements Condition {

    private int maxMajorVersion;
    private int maxMinorVersion;
    private int majorVersion;
    private int minorVersion;

    public IsPriorToJiraVersion(ApplicationProperties applicationProperties) {
        String versionString = applicationProperties.getVersion();
        String versionRegex = "^\d+\.(\d+)\d+\d+$";
        Pattern versionPattern = Pattern.compile(versionRegex);
        Matcher versionMatcher = versionPattern.matcher(versionString);
        versionMatcher.find();
        majorVersion = Integer.decode(versionMatcher.group(1));
        minorVersion = Integer.decode(versionMatcher.group(2));
    }

    public void init(final Map<String, String> paramMap) throws PluginParseException {
        maxMajorVersion = Integer.decode(paramMap.get("majorVersion"));
        maxMinorVersion = Integer.decode(paramMap.get("minorVersion"));
    }

    public boolean shouldDisplay(final Map<String, Object> context) {
        return (majorVersion < maxMajorVersion) || (majorVersion == maxMajorVersion) && (minorVersion < maxMinorVersion);
    }
}

Tab navigation in admin section

To ensure that the new admin decorator can highlight the correct dropdown in the header and render the correct tabs on the left hand side, the page being decorated needs to tell the decorator which admin section it belongs to. This is done through the use of `<meta/>` tags.

For example the JIRA FishEye plugin provides three admin web-items to be rendered under the 'Source Control' section:

In order for this to work correctly, the page source for the FishEye Configuration page has to include the following `<meta/>` tags to tell the new admin decorator which tabs to render:
These meta tags will have to be included on every one of your admin pages and will have to refer back to the web-items you defined earlier.

**Plugging in to the new Project Administration**

This is fairly similar to the integrating with the new project tab look and feel.

To add content to the Summary tab, see above.

Instead it is a simple web-section/web-item, for example:

```xml
<web-section key="yoursection" name="Your Config Group"
location="atl.jira.proj.config" i18n-name-key="ayoukey" weight="50"/>
```

Or you can use the inbuilt sections - projectgroup1, projectgroup2, projectgroup3, projectgroup4.

Then add a web-item to it.

```xml
<web-item key="view_project_your_tab" name="Your Tab"
section="atl.jira.proj.config/yoursection" i18n-name-key="yourkey" weight="10">
  <label key="your_label" />
  <link linkId="view_project_your_tab">a_link_to_your_content</link>
</web-item>
```

That is enough to add your tab.

To then wrap your content with the project config decorator and have the right tab selected, your content should have the following in its header:

```xml
<head>
  <title>$title</title>
  <meta name="decorator" content="admin"/>
  <meta name="projectKey" content="$project.key"/>
  <meta name="projectId" content="$project.id"/>
  <meta name="admin.active.tab" content="id_of_your_tab"/>
  <meta name="admin.active.section" content="atl.jira.proj.config"/>
</head>
```

First create a tab group (web-section) you want to add to:

```xml
<web-section key="your_section_key" name="Your Config Group"
location="atl.jira.proj.config" i18n-name-key="your.i18n.key" weight="50"/>
```

or you can use an existing section (weights are in brackets after sections & items):

- **projectgroup1** (10) - Contains Summary(10)
- **projectgroup2** (20) - Contains Issue Types(10), Workflows(20), Screens(30) & Fields(40)
- **projectgroup3** (30) - Contains People(10), Permissions(20), Issue Security(30) & Notifications(40)
- **projectgroup4** (40) - Contains Versions(10) & Components(20)

Add a web-item to your section.
Now you will have a tab in Project Configuration. The link should point to some content. This can be provided by a WebWork Action, REST resource or Servlet.

To then wrap your content with the project config decorator and have the right tab selected, your content should have the following in its header:

```html
<head>
    <title>Your Page Title</title>
    <meta name="decorator" content="admin"/>
    <meta name="projectKey" content="key_of_active_project"/>
    <meta name="projectId" content="id_of_active_project"/>
    <meta name="admin.active.tab" content="view_project_your_tab"/>
    <meta name="admin.active.section" content="atl.jira.proj.config"/>
</head>
```

These meta tags will have to be included on every one of your project admin pages.

**Version-related Atlassian Events**

The following new Atlassian Events are available in JIRA 4.4:

- VersionMergeEvent
- VersionDeleteEvent
- VersionCreateEvent
- VersionReleaseEvent
- VersionUnreleaseEvent
- VersionArchiveEvent
- VersionUnarchiveEvent
- VersionMoveEvent

See [JIRA-specific Atlassian Events](#) for a complete list.

**Gadget Web-Resources**

As of JIRA 4.4 gadgets should no longer depend on the `com.atlassian.jira.gadgets:common` web resource. This change was introduced in JIRA 4.3, however due to some changes to the gadgets framework in JIRA 4.4 gadgets still depending on this web-resource will now break.

Instead gadgets should only need to rely on the more lightweight `com.atlassian.jira.gadgets:common-lite` web resource.

For more information, please refer to [JRA-25039](#).

**As of JIRA 4.4, all plugin modules are now dynamically reloadable**

Traditionally some of the modules were bearing the @RequiresRestart annotation, which indicated that installing plugins containing such modules required a full restart of JIRA. As of JIRA 4.4 each plugin module is capable of being dynamically added and removed from the running JIRA instance. This has some important implications for the plugin developers, encapsulated by the following recommendations:

- avoid using static caches or statically accessible components (the singleton pattern) in your plugins - use component module type instead
- avoid manipulating / storing class loaders and threads in your plugin components - this may potentially
lead to memory leaks given your plugin is installed and taken down from running JIRA instance multiple times

- the following life-cycle interfaces are available for your components to implement and will be called upon relevant plugin life cycle events:
  - `org.springframework.beans.factory.InitializingBean::afterPropertiesSet` method will be called each time the Spring context for given plugin is created, i.e. each time the plugin is enabled. **NOTE** this method is called immediately after given component instance is created and fully initialized, and not after the plugin has been fully enabled. In fact, when the whole plugin system is starting (as opposed to just your plugin being enabled), this is likely to be called **before** the plugin system has been initialized. Therefore you cannot rely on the plugin system state when implementing this interface. The preferred way in such case is to listen to Atlassian plugin framework events and use this method to only to register itself with the `EventPublisher`
  - `org.springframework.beans.factory.DisposableBean::destroy` method will be called when the component is being destroy as its Spring context is being removed. Similarly to the `InitializingBean`, implementing classes **cannot** rely on the state of the plugin system (e.g. calling other components within `destroy` may cause exceptions as those components may have already be removed from the destroyed context). Please use this method sparingly, e.g. to unregister the component from the `EventPublisher`, and otherwise use the plugin framework events instead
  - `com.atlassian.sal.api.lifecycle.LifecycleAware` (see javadoc) - called when the plugin system starts up
  - avoid implementing `com.atlassian.jira.extension.Startable` in you plugins, it is meant to be used by internal JIRA components only and its support for plugins will soon be removed.

REST API Changes in JIRA 4.4 (from JIRA 4.3)

Retrieving a List of Groups

You can now retrieve a list of all groups in a JIRA installation, as well as a filtered list of groups matching a specified 'query' substring using the following HTTP GET action on:

- `http://hostname/rest/api/2.0.alpha1/groups/picker`

For example, `http://hostname/rest/api/2.0.alpha1/groups/picker?query=admin` will retrieve a list of groups containing the 'admin' substring. Refer to the REST API documentation for more information.

Deleting a Watcher from an Issue

To delete a watcher from an issue, the REST API call format has changed.

For example, to delete a user with username 'fred' from issue 'PROJ-123', you would use the following formats:

- In JIRA 4.3 (and earlier) — `http://hostname/rest/api/2.0.alpha1/issue/PROJ-123/watchers/fred`
- In JIRA 4.4 (and later) — `http://hostname/rest/api/2.0.alpha1/issue/PROJ-123/watchers?fred`

Refer to the REST API documentation for more information.

Create, Read, Update or Delete Project Components

You can create, read, update or delete project components using the following REST calls:

<table>
<thead>
<tr>
<th>Action</th>
<th>REST API call</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a project component</td>
<td>HTTP POST on <code>http://hostname/rest/api/2.0.alpha1/component</code> [<a href="http://docs.atlassian.com/jira/REST/4.4/#id2475780">http://docs.atlassian.com/jira/REST/4.4/#id2475780</a>]</td>
</tr>
<tr>
<td>Read/get a project component along with the total number of issues with that component</td>
<td>HTTP GET on <code>http://hostname/rest/api/2.0.alpha1/component/{id}/relatedIssueCounts</code> [<a href="http://docs.atlassian.com/jira/REST/4.4/#id2475988">http://docs.atlassian.com/jira/REST/4.4/#id2475988</a>]</td>
</tr>
<tr>
<td>Read/get a detailed list of information about a project component</td>
<td>HTTP GET on <code>http://hostname/rest/api/2.0.alpha1/component/{id}</code> [<a href="http://docs.atlassian.com/jira/REST/4.4/#id2475844">http://docs.atlassian.com/jira/REST/4.4/#id2475844</a>]</td>
</tr>
</tbody>
</table>
### Modify a project component

HTTP PUT on http://hostname/rest/api/2.0.alpha1/component/{id}

http://docs.atlassian.com/jira/REST/4.4/#id2475844

### Delete a project component

HTTP DELETE on http://hostname/rest/api/2.0.alpha1/component/{id}?moveIssuesTo http://docs.atlassian.com/jira/REST/4.4/#id2475844

(You can assign any issues associated with the project component being deleted (i.e. `{id}`) to another component specified as the value of the `moveIssuesTo` parameter.)

### Create, Read, Update or Delete Project Versions

You can create, read, update or delete project versions using the following REST calls:

<table>
<thead>
<tr>
<th>Action</th>
<th>REST API call</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a project version</td>
<td>HTTP POST on <a href="http://hostname/rest/api/2.0.alpha1/version">http://hostname/rest/api/2.0.alpha1/version</a> <a href="http://docs.atlassian.com/jira/REST/4.4/#id2474955">http://docs.atlassian.com/jira/REST/4.4/#id2474955</a></td>
</tr>
<tr>
<td>Read/get a list of information about a project version</td>
<td>HTTP GET on <a href="http://hostname/rest/api/2.0.alpha1/version/%7Bid%7D">http://hostname/rest/api/2.0.alpha1/version/{id}</a> <a href="http://docs.atlassian.com/jira/REST/4.4/#id2475026">http://docs.atlassian.com/jira/REST/4.4/#id2475026</a></td>
</tr>
<tr>
<td>Read/get a project version along with the total number of issues fixed and affected in that version</td>
<td>HTTP GET on <a href="http://hostname/rest/api/2.0.alpha1/version/%7Bid%7D/relatedIssueCounts">http://hostname/rest/api/2.0.alpha1/version/{id}/relatedIssueCounts</a> <a href="http://docs.atlassian.com/jira/REST/4.4/#id2475180">http://docs.atlassian.com/jira/REST/4.4/#id2475180</a></td>
</tr>
<tr>
<td>Read/get a project version along with the total number of unresolved issues in that version</td>
<td>HTTP GET on <a href="http://hostname/rest/api/2.0.alpha1/version/%7Bid%7D/unresolvedIssueCount">http://hostname/rest/api/2.0.alpha1/version/{id}/unresolvedIssueCount</a> <a href="http://docs.atlassian.com/jira/REST/4.4/#id2475234">http://docs.atlassian.com/jira/REST/4.4/#id2475234</a></td>
</tr>
<tr>
<td>Modify a project version's sequence within the project</td>
<td>HTTP PUT on <a href="http://hostname/rest/api/2.0.alpha1/component/%7Bid%7D/move">http://hostname/rest/api/2.0.alpha1/component/{id}/move</a> <a href="http://docs.atlassian.com/jira/REST/4.4/#id2475287">http://docs.atlassian.com/jira/REST/4.4/#id2475287</a></td>
</tr>
<tr>
<td>Delete a project version</td>
<td>HTTP DELETE on <a href="http://hostname/rest/api/2.0.alpha1/version/%7Bid%7D">http://hostname/rest/api/2.0.alpha1/version/{id}</a> <a href="http://docs.atlassian.com/jira/REST/4.4/#id2475026">http://docs.atlassian.com/jira/REST/4.4/#id2475026</a></td>
</tr>
</tbody>
</table>

### Date Format Improvements

Due dates and custom field dates are now only parsed/presented in a simple year, month and day format. Additional timezone-specific content is no longer required, nor expected.

**JIRA 4.4.5 Release Notes**

**22 February 2012**

The Atlassian JIRA team announces the release of **JIRA 4.4.5**. This point release contains several **updates and fixes**.

Upgrading to JIRA 4.4.5 is free to all customers with **active** JIRA software maintenance.

**Don't have JIRA 4.4 yet?**

Take a look at all the new features in the **JIRA 4.4 Release Notes** and see what you are missing out on!

JIRA 4.4.4 Upgrade Notes

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Upgrading from JIRA 4.4.x to 4.4.4

Please follow the instructions in the general upgrading JIRA documentation.

Notes for plugin developers with custom mail handlers

JIRA 4.4.4 includes a dependency on atlassian-mail version 1.25 which is not 100% backward compatible with atlassian-mail 1.24 included in previous releases of JIRA.

JIRA 4.4.4 also ships with javaxmail 1.4.4, which we cannot guarantee is 100% compatible with javaxmail 1.4.1 (shipped with previous releases of JIRA).

Hence, there are two significant points to note as a result of these changes:

- The `com.atlassian.mail.server.MailServer.getSession()` method returns objects of the `javax.mail.Session` class rather than `alt.javamail.Session`
- The classes from `mockobjects-j1.3-j2ee1.3.jar` are no longer exported (i.e. made available) to Atlassian version 2 plugins. This `jar` is no longer distributed with JIRA.

Potential Impact and Solution

We believe that very few (if any) 3rd party plugins will be affected by the two changes mentioned above and that such plugins will be broken as a result of these changes.

- If your plugin uses the `com.atlassian.mail.server.MailServer.getSession()` method, doing either of the following should be sufficient to get it working with JIRA 4.4.4:
  - Recompile your plugin against 4.4.4
  - Use a higher level class like `MailQueueItem`
- If your plugin depends on `mockobjects-j1.3-j2ee1.3.jar` (which is highly unlikely and could be considered questionable), we encourage you to either:
  - Remove this dependency or
  - If it is not possible to remove this dependency, bundle this `jar` with the plugin.

According to the changelog for javaxmail ([http://www.oracle.com/technetwork/java/javaee/changes-220864.txt](http://www.oracle.com/technetwork/java/javaee/changes-220864.txt)), we believe that these changes should not negatively impact current plugins. On the contrary, many bug fixes and compatibility improvements in this new version of javaxmail should make existing JIRA mail handlers more robust.

Rationale

JIRA 4.4.4 comes with substantial mail logging improvements and capabilities, which should be valuable to customers and support personnel troubleshooting problems related to incoming and outgoing mail.

Part of this feature work required the need to upgrade both the atlassian-mail and javaxmail libraries to the versions mentioned above. The anticipated small negative impact resulting from these upgraded libraries led us to believe that there was little or no business justification for supporting their older versions.

Upgrading from JIRA 4.3.x and earlier

In addition to the above, please read the JIRA 4.4 Upgrade Notes and as well as the Important Version-Specific Upgrade Notes for the versions of JIRA you are skipping.

JIRA 4.4.3 Release Notes

- **JIRA 4.4.3** fixes a critical issue in JIRA 4.4.2 (JRA-25914 which may cause data corruption in a high-load environment).
  
  If you upgraded to JIRA 4.4.2, please upgrade to JIRA 4.4.3 as soon as possible. JIRA 4.4.3 includes an upgrade task that will fix any data corruption resulting from JRA-25914. See the JIRA 4.4.3 Upgrade Notes for more information.

19 October 2011

The Atlassian JIRA team announces the release of JIRA 4.4.3. This point release contains new features that give users more JQL enhancements to filter issues based on system fields that possessed a specified value at some point in the past, in addition to several updates and fixes.
Features and improvements in JIRA 4.4.3:

- More Enhancements to JQL — New "CHANGED" Operator and "WAS" Improvements
- Other Improvements

Thank you for your feedback:

🌟 More than three new features/improvements implemented
🌟 Over 420 votes fulfilled

Your votes and issues help us keep improving our products, and are much appreciated.

JIRA 4.4.3 is of course free to all customers with active JIRA software maintenance.

Upgrading from a Previous Version of JIRA

If you are upgrading, please read the JIRA 4.4.3 Upgrade Notes

More Enhancements to JQL — New "CHANGED" Operator and "WAS" Improvements

Enhancements were introduced in JIRA 4.4.0 that allowed you to search the history of an issue's Assignee and Reporter fields.

In JIRA 4.4.3, JQL supports the new "CHANGED" operator, which can accept the optional predicates "FROM", "TO", "ON", "DURING", "BEFORE", "AFTER" and "BY".

For example, the following JQL query:

```
status changed FROM "In QA Review" to "QA Rejected" BY freddo BEFORE endOfWeek() AFTER startOfWeek()
```

Will find any issues whose Status field value was at some point "In QA Review" but changed to "QA Rejected", by user 'freddo', and after the start and before the end of the current week.

You can use complex queries such as these to generate the following 'Single Level Group By Report', which in the example below, shows grouping by 'Team'.

The "CHANGED" operator can be used on the Status, Assignee, Priority, Reporter, Resolution and Fix Version fields.

The "WAS" operator can be used on the Fix Version field too. For example, the following JQL query:
fixVersion WAS 4.4

Will find any issues whose **Fix Version** field was at some point (or currently is) set to 4.4.

**Other Improvements**

- Mixed-case LDAP usernames are now treated as the same user when conducting searches in JIRA (JRA-24558).
- When a new user is added to JIRA, JIRA will only add that user to groups which explicitly have the ‘**JIRA Users**’ global permission. JIRA no longer adds new users to nested groups of a group that has the ‘**JIRA Users**’ global permission, unless those nested groups also explicitly have this permission (JRA-25554).
- The Application Links Link Rendering plugin, which was broken when JIRA 4.4 was released, is now fixed and is compatible with all JIRA 4.4.x versions (JRA-25594).
- GreenHopper 5.7.4 is now bundled with JIRA 4.4.3.

JIRA 4.4.3 Upgrade Notes

JIRA 4.4.3 fixes a critical issue in JIRA 4.4.2 (JRA-25914 which may cause data corruption in a high-load environment).

Upgrading from JIRA 4.4.x to 4.4.3

Please follow the instructions in the general upgrading JIRA documentation.

If you upgraded to JIRA 4.4.2, please upgrade to JIRA 4.4.3 as soon as possible. JIRA 4.4.3 includes an upgrade task that will fix any data corruption resulting from JRA-25914 (i.e. the creation of issues with duplicate keys in a high-load environment).

Upgrading from JIRA 4.3.x and earlier

In addition to the above, please read the JIRA 4.4 Upgrade Notes and as well as the Important Version-Specific Upgrade Notes for the versions of JIRA you are skipping.

JIRA 4.4.2 Release Notes

12 October 2011

The Atlassian JIRA team announces the release of JIRA 4.4.2. This point release contains new features that give users more JQL enhancements to filter issues based on system fields that possessed a specified value at some point in the past, in addition to several updates and fixes.

Features and improvements in JIRA 4.4.2:

- More Enhancements to JQL — New "CHANGED" Operator and "WAS" Improvements
- Other Improvements

Thank you for your feedback:

🌟 More than three new features/improvements implemented
🌟 Over 420 votes fulfilled

Your votes and issues help us keep improving our products, and are much appreciated.

Download Latest Version

JIRA 4.4.2 is of course free to all customers with active JIRA software maintenance.

Upgrading from a Previous Version of JIRA

If you are upgrading, please read the JIRA 4.4.2 Upgrade Notes

More Enhancements to JQL — New "CHANGED" Operator and "WAS" Improvements

Enhancements were introduced in JIRA 4.4.0 that allowed you to search the history of an issue’s Assignee and Reporter fields.

In JIRA 4.4.2, JQL supports the new "CHANGED" operator, which can accept the optional predicates "FROM", "TO", "ON", "DURING", "BEFORE", "AFTER" and "BY".

For example, the following JQL query:
status changed FROM "In QA Review" to "QA Rejected" BY freddo BEFORE endOfWeek() AFTER startOfWeek()

Will find any issues whose **Status** field value was at some point "In QA Review" but changed to "QA Rejected", by user 'freddo', and after the start and before the end of the current week.

You can use complex queries such as these to generate the following 'Single Level Group By Report', which in the example below, shows grouping by 'Team'.

<table>
<thead>
<tr>
<th>Report: Single Level Group By Report</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter: QA Rejected Issues that are still Open</td>
</tr>
<tr>
<td>Dream Team</td>
</tr>
<tr>
<td>JRADEV-7204 Unresolved No &quot;Status&quot; autocomplete options when user creates a JQL query like &quot;Status Changed From&quot;.</td>
</tr>
<tr>
<td>JRADEV-6906 Unresolved Shared Filter and Shared Dashboard names are double escaped in Change Owner and Delete Filter/Dashboard dialogs</td>
</tr>
<tr>
<td>JRADEV-8650 Unresolved Editing user formats in editlookandfeel plugin don't work</td>
</tr>
<tr>
<td>Integration</td>
</tr>
<tr>
<td>JRADEV-6894 Unresolved Update viewing remote links to meet the new spec</td>
</tr>
<tr>
<td>JRADEV-6772 Unresolved Users can view and delete local links on the view issue page</td>
</tr>
</tbody>
</table>

The "CHANGED" operator can be used on the **Status**, **Assignee**, **Priority**, **Reporter**, **Resolution** and **Fix Version** fields.

The "WAS" operator can be used on the **Fix Version** field too. For example, the following JQL query:

```
fixVersion WAS 4.4
```

Will find any issues whose **Fix Version** field was at some point (or currently is) set to 4.4.

**Other Improvements**

- Mixed-case LDAP usernames are now treated as the same user when conducting searches in JIRA (JRA-24558).
- When a new user is added to JIRA, JIRA will only add that user to groups which explicitly have the JIRA Users' global permission. JIRA no longer adds new users to nested groups of a group that has the JIRA Users' global permission, unless those nested groups also explicitly have this permission (JRA-25554).
- The Application Links Link Rendering plugin, which was broken when JIRA 4.4 was released, is now fixed and is compatible with all JIRA 4.4.x versions (JRA-25594).
- GreenHopper 5.7.4 is now bundled with JIRA 4.4.2.

</tr>
</tbody>
</table>
JIRA 4.4.2 Upgrade Notes

JIRA 4.4.2 has a critical issue (JRA-25914) which may cause data corruption. You may wish to wait until JIRA 4.4.3 is released before upgrading JIRA.

Upgrading from JIRA 4.4.x to 4.4.2

Please follow the instructions in the general upgrading JIRA documentation.

Upgrading from JIRA 4.3.x and earlier

In addition to the above, please read the JIRA 4.4 Upgrade Notes and as well as the Important Version-Specific Upgrade Notes for the versions of JIRA you are skipping.

JIRA 4.4.1 Release Notes

12 September 2011

The Atlassian JIRA team announces the release of JIRA 4.4.1. This point release contains new features that give administrators the ability to manage other users' shared filters and shared dashboards, in addition to several updates and fixes.

Features and improvements in JIRA 4.4.1:

- Manage Other Users' Shared Filters and Dashboards
- Other Improvements

Thank you for your feedback:

🌟 More than four new feature requests implemented
🌟 Over 672 votes fulfilled
Your votes and issues help us keep improving our products, and are much appreciated.

JIRA 4.4.1 is of course free to all customers with active JIRA software maintenance.

Upgrading from a Previous Version of JIRA

If you are upgrading, please read the JIRA 4.4.1 Upgrade Notes.

Manage Other Users' Shared Filters and Dashboards

JIRA administrators have the ability to change the ownership of or delete other user’s shared filters and dashboards. A shared filter or dashboard is a filter/dashboard created (and hence, owned) by a user, which the user has then shared with others.

Since JIRA only allows the editing or modification of shared filters/dashboards by their owners, this new JIRA feature is especially helpful in situations where a user has left an organisation, but the shared filters or dashboards they created continue to be used by others within the organisation.

Only users with the Create Shared Objects global permission can share their filters and dashboards with other JIRA users.

Other Improvements

- The ‘Advanced Settings’ page of JIRA’s Administration area now has improved validation (JRA-24974).
- GreenHopper 5.7.1 now bundled with JIRA 4.4.1.
- When configuring JIRA to connect to a MySQL database via the JIRA setup wizard or JIRA Configuration Tool, the sessionVariables=storage_engine=InnoDB property is now specified by default in the database URL and no longer needs to be added manually (JRA-24857).
- Improvements to JIRA’s issue importers.

Don’t have JIRA 4.4 yet?

JIRA 4.4.1 Upgrade Notes

Upgrading from JIRA 4.4 to 4.4.1

Please follow the instructions in the general upgrading JIRA documentation. Changes to the CSV Importer

Customers using the CSV importer feature and JIRA’s Jelly Tags should be aware that the CSVReader class is now based on au.com.bytecode.opencsv.CSVReader rather than com.mindprod.csv.CSVReader. As a result of this change, the backslash character (\") is now handled differently. If the backslash is found inside quoted text it will be ignored (removed) unless it precedes another backslash or a double quote. In case it does the following character will be kept but the first backslash will be omitted. See JRA-25315 and JIM-596 for details.

Fixes to SOAP and XML/RPC compatability

In JIRA 4.4 there was an accidental break compatibility of the SOAP and XML/RPC apis. Basically "Select" and "Multi-Select" custom fields were sending and expecting option ids instead of data values. This has been corrected and the SOAP and XML/APIs should now behave as they did for JIRA 4.3 and earlier. This is fully documented in issue JRA-25374. If you made changes to handle this compatibility breakage, you may need to revert your changes.

Changes to the default value of the jira.search.views.max.limit property

The jira.search.views.max.limit property sets a 'hard' limit on the number of issues returned. See Limiting the number of issues returned from a search view such as an RSS feed for details.

In JIRA 4.4.0, this value was disabled by default, by being either absent from the jira-config.properties file or present in this file but disabled with a preceding #. From JIRA 4.4.1, however, this property has a default value of 1000. See JRA-25298 for details about why this changed.

Upgrading from JIRA 4.3.x and earlier

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
In addition to the above, please read the [JIRA 4.4 Upgrade Notes](#) and as well as the [Important Version-Specific Upgrade Notes](#) for the versions of JIRA you are skipping.

**JIRA 4.3 Release Notes**

**16 March, 2011**

The Atlassian JIRA team is proud to bring you a brand new version of one of the world’s favourite issue-trackers. Identity management comes of age in JIRA 4.3, with complete LDAP integration. JIRA 4.3 also includes the Universal Plugin Manager for easier management of plugins, and a new data importer for easier migration from your old systems. Additionally, a raft of new JQL functions give you many powerful new searching options, such as the ability to search an issue’s change history.

Dashboard Publish/Subscribe with Confluence (i.e. Gadgets 2.0) is also included, so if you are using Confluence as well as JIRA, your Confluence gadgets will now appear in the JIRA Gadget Directory.

**Note to developers:** JIRA 4.3 includes Unified Application Links (UAL) 3.2, Gadgets 2.0, and the Atlassian Plugin Framework version 2.6.

Upgrading to JIRA 4.3 is free for all customers with [active JIRA software maintenance](#) as of March 15, 2011.

**Highlights of JIRA 4.3:**

- Full Integration with LDAP and Active Directory
- Easy Management of User Directories via JIRA Admin UI
- New Plugin Management System
- Add Another Application’s Gadgets to your JIRA Gadget Directory
- Improved Importer
- Dashboard Performance Improvements
- JIRA Now Supports 'In-place Database Upgrades'
- Search for Issue Changes, Relative Dates and Relative Versions with JQL
- Quick Search Enhancements
- Revamped User Avatars
- Improvements to Issue Links
- Remembered Assignees
- Mail Server Configuration Improvements
- Security Enhancements
- Support Tools Plugin Now Bundled
- Application Links: Connecting Applications Together
- Support for Chrome and Safari 5 Browsers
- REST API Improvements
- Other Enhancements and Fixes

**Thank you for your feedback:**

- More than 20 new feature requests implemented
- Over 1000 votes fulfilled

*Your votes and issues help us keep improving our products, and are much appreciated.*

[DOWNLOAD latest version](#)
Upgrading to JIRA 4.3

JIRA 4.3 can be downloaded from the JIRA Download Center. Before upgrading, please refer to the JIRA A 4.3 Upgrade Guide.

Highlights of JIRA 4.3

1. Full Integration with LDAP and Active Directory

The way users and groups are stored and accessed in JIRA has been totally rewritten in this release, giving you the ability to connect to an LDAP server — including Microsoft Active Directory — for all user information. Your options include:

Integrate JIRA with LDAP/Active Directory

Update your user details in either JIRA or LDAP/Active Directory and they will automatically populate to the other repository:

Use LDAP for authentication only

This was the old way of integrating JIRA with LDAP, prior to JIRA 4.3. You can still do this, but much more easily (see below).
Connect to a Crowd server for user management

For larger and more complex installations, you may need to install Atlassian Crowd for user management and single sign-on. (See our guide to limitations and recommendations.) When integrating earlier versions of JIRA and Crowd, you had to manually edit a number of configuration files. JIRA 4.3 offers the following new features:

- Simple and quick setup via the JIRA and Crowd administration consoles.
- Clever synchronisation and caching to ensure the best response times.
- More...

Use multiple LDAP and/or Crowd servers simultaneously

If you have multiple directories, you can now simply connect JIRA to all of them.

Connect Confluence to your JIRA User Directory

JIRA 4.3 can act as the directory manager for your Confluence site, interacting with one or more user directories and ensuring that you have the same set of users and groups across both applications.

The Confluence 3.5 administration UI can connect directly to JIRA 4.3. Clever synchronisation and caching ensure the best response times for your directory searches.
Earlier versions of Confluence can continue to use a direct JDBC connection to JIRA 4.2 and earlier.

**Easy Management of User Directories via JIRA Admin UI**

In JIRA 4.3, administrators can now manage external User Directories directly from the JIRA Administration screens. Gone are the days of manually editing XML files.
JIRA 4.3 brings a simple, powerful and flexible directory management interface:

- Choose from a list of supported directory types, including Microsoft Active Directory and ten other popular LDAP schemas.
- Configure all your LDAP settings via the JIRA Administration interface: permissions, server and schema settings. We pre-populate the fields with default values depending on your choice of directory type.
- Choose the LDAP permissions to suit your needs: read/write, read only, local groups or authentication only.
- Make use of the caching and copy-as-required configurations to optimise the performance of your LDAP searches.
- Add as many directory servers as you need. Connect directory servers of different types, including the JIRA internal directory (default), LDAP, Crowd and/or another JIRA server.
- Turn on support for nested groups.
- Configure your LDAP connection pool.

JIRA 4.3 includes the Universal Plugin Manager (UPM), which provides you with a simple way of adding and managing plugins:

- Auto-discovery of available plugins (see **Featured Plugins** in the screenshot below)
- Point-and-click installation — you no longer need to download JAR files and shut down JIRA to install them.
Add Another Application's Gadgets to your JIRA Gadget Directory

JIRA 4.3 includes Atlassian Gadgets 2.0 with Gadget Subscriptions. This allows you to quickly add all gadgets from your Confluence, Bamboo, FishEye or Crucible instance — or from another JIRA instance — to your JIRA Gadget Directory, for easy addition to your JIRA dashboard:

See Subscribing to Another Application's Gadgets.

Improved Importer

JIRA 4.3 provides a greatly improved Importer for Bugzilla, Mantis, FogBugz and CSV files, by bundling the JIRA Importers Plugin.
The web-based import wizard makes it easy to map fields — and individual field values — from your old bug-tracker to your new JIRA system:

<table>
<thead>
<tr>
<th>External field</th>
<th>Map field value</th>
</tr>
</thead>
<tbody>
<tr>
<td>bug_status</td>
<td></td>
</tr>
<tr>
<td>Value from importer</td>
<td>Target value in JIRA</td>
</tr>
<tr>
<td>Assignable</td>
<td>Open</td>

</tr>
</tbody>
</table>

6

Dashboard Performance Improvements

We are extremely pleased to announce that you should see a noticeable reduction in the time it takes to load a Dashboard.

- On average, dashboard performance has improved by 29%
- For large dashboards, the performance improvement is 35%

We are also extremely pleased to announce that you should see a noticeable reduction in the time it takes to load the Gadget Directory (depending on how many external gadgets you have configured).

7

JIRA Now Supports 'In-place Database Upgrades'

JIRA 4.3 now officially supports 'in-place database upgrades', when upgrading from JIRA 4.0.0 or later.

This method requires much less downtime during the JIRA upgrade process, especially if you operate a large JIRA installation. You no longer need to export your existing JIRA data to an XML backup and then restore this data into your new JIRA version. Instead, we now support simply 'pointing' your new version of JIRA at your existing JIRA database!
Search for Issue Changes, Relative Dates and Relative Versions with JQL

JIRA 4.3 incorporates new several functions and operators. You can now:

**Search the Change History with JQL 'WAS' Operator**

JIRA 4.3 introduces the ability to search the Change History of issues. In this release you can search for changes to the Status field, and there's much more functionality to come in future releases.

For example, the following will return all issues that currently have, or previously had, a status of 'In Progress':

```
status WAS "In Progress"
```

The `WAS` operator can be used with the `NOT`, `IN` and `NOT IN` operators, e.g. to find issues that have never had a status of 'In Progress' or 'Resolved':

```
status WAS NOT IN ("In Progress","Resolved")
```

**Search for relative dates and versions with JQL 'startOfDay', 'endOfDay', 'earliestUnreleasedVersion', 'latestReleasedVersion'**

JIRA 4.3 introduces the ability to search for issues relative to the current day, month, week or year. For example, to find issues that have been created today:

```
created > startOfDay()
```

Or to find issues that are due by the end of this month:

```
due < endOfMonth()
```

You can also perform searches based on the earliest unreleased version (i.e. the next version that is due to be released) of a specified project:

```
earliestUnreleasedVersion(project)
```

Or on the most recently released version of a specified project:

```
latestReleasedVersion(project)
```

**Quick Search Enhancements**

JIRA 4.3 incorporates several enhancements to Quick Search. You can now:
Use a wildcard when searching the 'Fix Version' field with Quick Search

When using Quick Search, you can now use the wildcard symbol: "*" to find issues that matches a core part of a Fix Version. For example, "ff:3.2*" will match any issue whose Fix For Version is:

- 3.2
- 3.2-beta
- 3.2.1
- 3.2.x

Use the r: prefix with Quick Search to find issues reported by a specific user

With Quick Search, you can find issues reported by you, another user or with no reporter, using the prefix "r:" followed by a specific reporter term such as "me", a username or "none", such that:

- "r:me" — finds issues reported by you.
- "r:samuel" — finds issues reported by the user whose username is "samuel".
- "r:none" — finds issues with no reporter.

Revamped User Avatars

JIRA 4.3 introduces the new-look Atlassian avatars:

User avatars are displayed as the icon for your profile, and to illustrate your comments on an issue. See the documentation on Adding a User Avatar.

We were fond of the old avatars, but think you'll agree they were looking a little dated by comparison:

Improvements to Issue Links

The 'Linked Issues' section of the 'View Issue' screen has been streamlined to make it both more compact and quicker to use. You can now delete links directly from this screen upon mouse hover:

JIRA 4.3: a linked issue
Previously, to delete a link you needed to click the ‘cog’ icon (which took you to a separate screen):

**JIRA 4.2: a linked issue**

JIRA now makes it easier to assign users to issues. The top of the assignee dropdown list shows the last five people you assigned issues to, as well as the reporter of the issue and all participants involved in the issue.
Mail Server Configuration Improvements

In JIRA 4.3, administrators can now test their mail server configuration with the "Test Connection" button.
A "Timeout" field has also been added.

^Top

Security Enhancements

For enhanced security:

'Whitelist' for External URLs

For security reasons, an administrator may wish to limit the URLs from which users can source content that is displayed on their JIRA site (e.g. via an External Gadget).

JIRA 4.3 allows you to create a 'Whitelist' of URLs — or URL patterns — whose content you wish to make
available to users of your JIRA site:

![Whitelisted URL Patterns](image)

See the documentation for more details.

**User Email Change is now Password Protected**

Users will now be prompted to enter their password when changing their email address.

**JIRA provides Secure Administration Sessions**

Access to JIRA’s administration features and functions is now password-protected.

See the documentation for more details.

^Top

**Support Tools Plugin Now Bundled**

We are very pleased to announce that the Atlassian Support Tools Plugin is now bundled with JIRA. The Atlassian Support Tools Plugin provides tools to help you troubleshoot issues with Atlassian products and get help from Atlassian Support.

See the documentation for more details.

^Top

**Application Links: Connecting Applications Together**
JIRA 4.3 includes Application Links, which makes it easy to connect your Atlassian applications together.

**Application Links** allows you to link your JIRA, Confluence, FishEye, Crucible, Bamboo and Subversion applications.

Linking two applications allows you to share information and access one application’s functions from within the other. For example, if you linked a Confluence server to a JIRA server, you can create, find and insert JIRA issues directly onto a Confluence page or blog post using the new 'Insert JIRA Issue' option in Confluence 3.5.

You can even choose to associate your JIRA project with the 'entities' of other Atlassian applications (i.e. Confluence spaces, FishEye repositories or projects, Crucible projects, Bamboo projects, or other JIRA projects). The 'Configure Application Links' option on your JIRA project configuration screen, allows you to easily associate your JIRA project with these entities.

Applications Links is bundled with JIRA 4.3, Confluence 3.5 and FishEye 2.4.

See the documentation for more details.

**Support for Chrome and Safari 5 Browsers**

We are very pleased to announce that Chrome and Safari 5 are supported for use with JIRA 4.3.

**REST API Improvements**

We have improved discoverability of issues and projects through the REST API: there is now a search resource, which can be used to search for issues using JIRA Query Language (JQL). It is also possible to obtain a list of projects in a JIRA instance. Have a look at the reference documentation to see if the REST API offers the features that you want (let us know if not).

Clients that log in through the REST API can now determine when the login has been denied due to a CAPTCHA requirement: the HTTP header X-Authentication-Denied-Reason has all the necessary information.

**Other Enhancements and Fixes**

For the list of issues resolved in JIRA 4.3, click here.

**JIRA 4.3 Upgrade Guide**

**On this page:**

- Upgrading from JIRA 4.2 to 4.3
  - General upgrade instructions
  - 'In-place database upgrade’ is now the recommended method
  - Changes in jira-application.properties
  - Changes in seraph-config.xml and Crowd Integration
  - Gadgets can only access External URLs that are on the Whitelist
  - Changes to user management in JIRA
    - Upgrade considerations
      - For customers with internally managed users
      - For customers using LDAP for authentication
      - For customers connecting to Crowd for user management
- For customers with a pre-Confluence 3.5 installation that uses JIRA for user management (IMPORTANT)
- For customers who have written a custom provider for user management
- For customers with non-standard configurations

Other considerations
- Duplicate groups MUST BE DELETED before upgrading
- Database tables have changed
- Usernames are not case sensitive
- Passwords no longer imported when importing a project

Migrating to LDAP user management
- Considerations
- Migrating from an Internal Directory with LDAP Authentication to a full LDAP directory.
  - Background
  - What happens when upgrading to JIRA 4.3
  - Migrating to full LDAP
    - Migrating from Internal with LDAP authentication to LDAP
    - Migrating from Internal Directory to LDAP

Known LDAP issues when upgrading to JIRA 4.3
- Additional JARs required when running JIRA WAR on Tomcat
  - Tomcat 5
  - Tomcat 6
- Upgrading JIRA connected to a MySQL database
- Upgrading JIRA running on a 64-bit Windows operating system
- GreenHopper
- Updated Toolkit Plugin for JIRA 4.3
- Upgrading from JIRA 4.2 with the Universal Plugin Manager installed
- Other Plugins
- Older Browsers are no longer supported
- Unsupported Modes
- Other Known Issues

Upgrading from JIRA 4.1 and Earlier

Upgrading from JIRA 4.2 to 4.3

General upgrade instructions

Please follow the instructions in the general upgrading JIRA documentation, as well as the JIRA 4.3-specific instructions in the sections below. The general upgrade guide contains important tasks that are essential for getting your upgraded JIRA instance to work correctly (e.g. merging jira-application.properties customisations from the old instance to the upgraded instance).

In-place database upgrade is now the recommended method

JIRA 4.3 now officially supports 'in-place database upgrades' (when upgrading from JIRA 4.0.0 or later). This method requires much less downtime during the JIRA upgrade process, especially if you operate a large JIRA installation. You no longer need to export your existing JIRA data to an XML backup and then restore this data into your new JIRA version. Instead, we now support simply 'pointing' your new version of JIRA at your existing JIRA database!

Changes in jira-application.properties

If you are merging your old and new configuration files, as described in the Upgrade Guide, the following tables list the changes which have been made to the jira-application.properties file in JIRA 4.3.

The purpose of each new property is documented in the jira-application.properties file itself.

New properties in jira-application.properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>jira.websudo.is.disabled</td>
<td>false</td>
</tr>
<tr>
<td>jira.websudo.timeout</td>
<td>10</td>
</tr>
</tbody>
</table>

As a result of changes in JIRA 4.3 to the 'Issue Links' section of the 'view issue' page, the jira.table.cols.linkedissue property is no longer recognised by JIRA. Modifying the value of this property in the jira-app
The configuration.properties file will not influence the order of columns represented in this section of the 'view issue' page.

Changes in serifh-config.xml and Crowd Integration

When merging your old and new configuration files, as described in the Upgrade Guide, please take extra care with the serifh-config.xml file, since this file contains a few changed entries in JIRA 4.3.

If you simply copy your old serifh-config.xml to your new 4.3 installation, then:

- Due to Crowd integration changes in JIRA 4.3 (reflected in serifh-config.xml), your users may have authentication problems when attempting to log in to JIRA.
- If any user attempts to view a JIRA page URL which they do not have permission to access, JIRA will not explicitly indicate a permission access problem.

The following table lists the changes to the serifh-config.xml file in JIRA 4.3:

<table>
<thead>
<tr>
<th>Elements in serifh-config.xml prior to JIRA 4.3</th>
<th>Change in JIRA 4.3</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;param-name&gt;login.url&lt;/param-name&gt; &lt;param-value&gt;/login.jsp?os_destination=${originalurl}&lt;/param-value&gt;</td>
<td>&lt;param-value&gt;/login.jsp?os_destination=${originalurl}&lt;/param-value&gt; has been changed to &lt;param-value&gt;/login.jsp?permissionViolation=true&amp;os_destination=${originalurl}&lt;/param-value&gt;</td>
</tr>
<tr>
<td>&lt;param-name&gt;invalidate.session.exclude.list&lt;/param-name&gt; &lt;param-value&gt;ASESSIONID&lt;/param-value&gt;</td>
<td>&lt;param-value&gt;ASESSIONID&lt;/param-value&gt; has been changed to &lt;param-value&gt;ASESSIONID,jira.websudo.timestamp&lt;/param-value&gt;</td>
</tr>
</tbody>
</table>

The following section Has been changed in JIRA 4.3 to

<!-- CROWD:START - If enabling Crowd SSO integration uncomment the following JIRAAuthenticator and comment out the DefaultAuthenticator below -->

<!-- <authenticator class="com.atlassian.crowd.integration.seraph.v22.JIRAAuthenticator"/> -->

<!-- CROWD:END -->

<!-- CROWD:START - The authenticator below here will need to be commented out for Crowd SSO integration -->

<authenticator class="com.atlassian.jira.security.login.JiraOsUserAuthenticator"/>

<!-- CROWD:END -->

<!-- CROWD:START - If enabling Crowd SSO integration uncomment the following SSOSeraphAuthenticator and comment out the JiraSeraphAuthenticator below -->

<!-- <authenticator class="com.atlassian.jira.security.login.SSOSeraphAuthenticator"/> -->

<!-- CROWD:END -->

<!-- CROWD:START - The authenticator below here will need to be commented out for Crowd SSO integration -->

<authenticator class="com.atlassian.jira.security.login.JiraSeraphAuthenticator"/>

<!-- CROWD:END -->

<interceptor class="com.atlassian.jira.portal.PortalPageInterceptor"/>

Removed as this <interceptor> class entry is no longer required in JIRA 4.3.
Gadgets can only access External URLs that are on the Whitelist

Due to a security enhancement in JIRA 4.3, any external gadgets (or gadgets that make requests to external URLs) will be disabled until you add the relevant external URLs to your Whitelist.

When you first log in to JIRA 4.3 as an administrator, a message will be displayed at the top of the screen, containing a link to the 'Whitelist' page. This page will also list your external gadgets. You can either delete these gadgets, or confirm that you wish to add the relevant external URLs to your whitelist.

For more details, please see Configuring the Whitelist.

Changes to user management in JIRA

The way users and groups are stored and accessed in JIRA has been totally rewritten in Release 4.3. This has provided a number of additional capabilities, mainly the ability to use an LDAP server (including Microsoft Active Directory) for all user information.

When you start up JIRA 4.3, the upgrade process will automatically upgrade your user data. The sections below describe the upgrade considerations for each supported configuration type.

Upgrade considerations

For customers with internally managed users

For users that are not currently connecting to Crowd or LDAP then there are no actions required on upgrade.

For customers using LDAP for authentication

If you had previously connected JIRA to an LDAP server for authentication (using the standard method), then this configuration will automatically be acquired by JIRA when upgrading to JIRA 4.3 (or later). However, the following must be observed:

- Prior to JIRA version 4.3, the osuser.xml file was used to configure the connection to an LDAP server. For JIRA 4.3 (or later) to acquire these configurations automatically, your existing osuser.xml file MUST be available to JIRA 4.3 (or later) before the upgrade process is started.

- If some of your users' passwords are stored in an LDAP directory but other users' passwords are stored in JIRA's internal user directory, you should not upgrade at this time (see JIRA-23858). Please wait for JIRA 4.3.1.

Regardless of which method you use to upgrade JIRA, when migrating your existing JIRA configurations to your new JIRA installation at the configuration migration step of either the 'in-place database upgrade' or migration procedures, ensure that you copy the osuser.xml file from the atlassian-jira/WEB-INF/classes directory of your old installation to the atlassian-jira/WEB-INF/classes directory of the new installation.

If you upgrade JIRA without the osuser.xml file in place, then the upgrade will proceed, but will not configure a connection to LDAP and there is no way to connect the migrated users to work with authentication via LDAP, without performing the upgrade again from a backup of JIRA or direct manipulation of the database, which is unsupported by Atlassian.

For customers connecting to Crowd for user management

JIRA 4.3 (or later) will only connect to Crowd 2.1 or higher. If you are using an earlier version of Crowd and wish to use this Crowd configuration in your upgraded JIRA 4.3 (or later) installation, you must upgrade Crowd to version 2.1 before you upgrade JIRA.

After upgrading JIRA, you will need to wait until a synchronisation task has copied your user and group information from Crowd to JIRA's internal cache before you can log in to JIRA. If a JIRA user attempts to log in to JIRA before this synchronisation task has finished, the user's authentication will fail.

If you had previously connected JIRA to a Crowd server (using the standard method), then this configuration will automatically be acquired by JIRA when upgrading to JIRA 4.3 (or later). However, the following must be observed:

- Prior to JIRA version 4.3, the osuser.xml and crowd.properties files were used to configure the connection to Crowd. For JIRA 4.3 (or later) to acquire these configurations automatically, your existing osuser.xml and crowd.properties files MUST be available to JIRA 4.3 (or later) before the upgrade process is started.
Regardless of which method you use to upgrade JIRA, when migrating your existing JIRA configurations to your new JIRA installation at the configuration migration step of either the ‘in-place database upgrade’ or migration procedures, ensure that you copy the osuser.xml and crowd.properties files from the atlassian-jira/WEB-INF/classes directory of your old installation to the atlassian-jira/WEB-INF/classes directory of the new installation.

If you upgrade JIRA without the osuser.xml file in place, then the upgrade will NOT proceed. JIRA has a table, EXTERNAL_ENTITIES, that contains some information regarding users maintained in a Crowd server. If there are entries in this table, but no osuser.xml file present, then the upgrade will stop and write a message to the log file.

For customers with a pre-Confluence 3.5 installation that uses JIRA for user management (IMPORTANT!)

If you are a customer with a Confluence installation that uses JIRA for user management, please do not upgrade to JIRA 4.3 until you have first upgraded to Confluence 3.5.

JIRA 4.3 possesses a significantly different database schema and exposes the Crowd REST interface, which Confluence will depend on for continued JIRA user management. If you upgrade to JIRA 4.3 before upgrading to Confluence 3.5, your Confluence users will no longer be able to log in until you upgrade to Confluence 3.5.

For customers who have written a custom provider for user management

Custom directory types are not possible and not supported in JIRA 4.3 and later.

Please see if one of the following solutions will work for you:

- If you have written a custom provider to provide LDAP support for JIRA 4.2 or earlier, you may no longer need your custom directory connector. Please check the supported LDAP schemas to see if you can use the new LDAP connectors supplied with JIRA 4.3.
- If you have written a custom provider to support nested groups, you can now use the new directory connectors supplied with JIRA 4.3. See Managing Nested Groups.
- If you have written a custom provider to connect to your own database, please consider loading the data into JIRA. For target upgrade versions 6.1 and above, you could complete your upgrade and do this using the JIRA REST API. If you need to use an external authentication source, consider migrating to a Seraph authenticator.

If you need to keep the custom directory connection, please consider whether Atlassian Crowd meets your requirements. See the documentation on developing a custom directory connector for Crowd.

For customers with non-standard configurations

If you have a non-standard configuration and the upgrade has stopped, please contact http://support.atlassian.com.

Other considerations

Duplicate groups MUST BE DELETED before upgrading

If your JIRA instance has two groups that have the same name, but differ only by case (eg “sydney” and “Sydney”), the JIRA 4.3 upgrade will fail. You need to remove any duplicates in your current JIRA instance before upgrading. That is, you should delete one of the groups and move any users and permissions to the other group or to a new group.

(Note: There will not be a problem if your JIRA instance is connected to an external Crowd instance, and the duplicate groups are in Crowd or in an LDAP directory connected to JIRA via Crowd.)

Database tables have changed

For customers who have written programs or used other tools that access the JIRA database directly, the tables used to hold user data have changed.

<table>
<thead>
<tr>
<th>Old table</th>
<th>New table</th>
<th>Information about new table</th>
</tr>
</thead>
<tbody>
<tr>
<td>userbase</td>
<td>cwd_user</td>
<td>Holds information about the user. This now includes full name and email address.</td>
</tr>
<tr>
<td>groupbase</td>
<td>cwd_group</td>
<td>Hold information about groups.</td>
</tr>
<tr>
<td>membershipbase</td>
<td>cwd_membership</td>
<td></td>
</tr>
</tbody>
</table>

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
These tables are indexed by directory and contain both details of all local users and groups and also cached details of external users and groups. Usernames are not case sensitive

In version 4.3, JIRA makes no distinction between two or more usernames that only differ by case. Furthermore, username searches are case-insensitive. These behaviours are in compliance with the LDAP specification.

In version 4.2 and earlier, JIRA's handling of usernames is case-sensitive. While JIRA's user interface prevents the creation of usernames containing upper-case characters, the use of data migration or other tools may lead to a JIRA database containing mixed-case usernames.

During migration, if two users exist whose usernames differ only by case, one user will be dropped and an entry placed in the log file to record this.

JIRA's behaviour has always been undefined when two users had usernames differing only by case. There may be some side effects of the dropping of the second user including:

- A user may not be able to log in because their password was attached to the dropped user. The user will need to reset their password.

Passwords no longer imported when importing a project

When a single project is imported (see Restoring a Project from Backup), users who do not exist already in the target system are created. In releases 4.2 and earlier of JIRA, the users' passwords were also set to the passwords in the exported XML file. This is no longer the case. Users will be given randomly allocated passwords and will need to use the 'Forgotten password' link to have their passwords reset.

Note: this only relates to the 'Project Import' feature, that is, when you import a single Project from a second JIRA instance into this JIRA instance. When doing a normal full import (see Restoring Data), the passwords are preserved as usual.

**Migrating to LDAP user management**

Some customers may wish to migrate to managing their users in LDAP. This may particularly appeal to customers whose JIRA instance is internal, and all users are already managed in the company LDAP Directory or Microsoft Active Directory.

**Considerations**

- **Are user names the same?**
  - If users have the same name in the LDAP directory as they do in the internal JIRA directory, then you can simply configure a new LDAP directory and then disable the internal directory. This would also apply if you are currently using LDAP authentication.
  - If users have different names in the LDAP directory to that in JIRA, then you could configure an LDAP directory to be used for new users and leave the internal directory in place for current JIRA users.

**Migrating from an Internal Directory with LDAP Authentication to a full LDAP directory.**

**Background**

In versions of JIRA prior to 4.3 it was possible to authenticate users against an LDAP directory, but you needed to add the users, groups and memberships manually in JIRA. In JIRA 4.3, support was added that allows you to directly use an LDAP directory for users groups and memberships as well as authentication.

**What happens when upgrading to JIRA 4.3**

If you were using an LDAP directory for authentication and your osuser.xml configuration file is available to JIRA during the upgrade task then JIRA will create 2 user directory configuration entries:

- An Internal Directory with Delegated LDAP, this is where all your users will be defined.
- An Internal Directory, this will not contain any users, but is required. More about this later.

If the osuser.xml file is not available during the upgrade then JIRA will create 1 user directory configuration entry:

- An Internal Directory, this is where all your users will be defined. Note: The users' passwords in this directory will not be set and no users will not be able to login until you reset the passwords.

**Note: If you wish to continue to use LDAP for authentication only, then ensure the osuser.xml is available during the upgrade.**

**Migrating to full LDAP**
Ensure the LDAP directory contains the necessary JIRA Groups and Memberships. All users that are going to use JIRA must belong to a group that has JIRA Use permission, typically "jira-users".

If you cannot add Groups and memberships to your LDAP server, then you can still migrate to LDAP but will need to set the privileges to "READ-ONLY with Local Groups". Once you have completed the migration described below, you will then need to manually add all the users to the required groups. See Managing Groups.

Go to Administration/User Directories and see what directories are configured.

Migrating from **Internal with LDAP authentication** to LDAP

The steps are:

- Add a user to the Internal Directory that has System Administrator privileges.
- Reorder the directories so that the Internal Directory is first in the list.
- Add a new user and give that user System Administrator privileges. New users are always added to the first directory that is not READ-ONLY.
- Log out and back in to JIRA as the user you just added.
- Add a new LDAP directory to the list of User Directories.
- Wait for the LDAP directory to be fully synchronised for the first time. This may take some time depending upon the number of users and speed of the LDAP server and your connection to it.
- Re-order the directories so that the Internal Directory with LDAP authentication is at the bottom of the list and the new LDAP directory is at the top of the list.
- Logoff
- Login as a user with System Administrator privileges.
- Go to Administration / User Browser and search for the user you logged in as. The user should show as coming from the LDAP directory you just added.
- Disable the Internal Directory with LDAP authentication.

Once you have completed testing you may delete the Internal Directory with LDAP authentication.

Migrating from **Internal Directory** to LDAP

The steps are:

- Log in to JIRA with as a user with System Administrator privileges.
- Add a new LDAP directory to the list of User Directories.
- Wait for the LDAP directory to be fully synchronised for the first time. This may take some time depending upon the number of users and speed of the LDAP server and your connection to it.
- Re-order the directories so that the new LDAP directory is at the top of the list.

At this stage all the users will be in both the Internal and LDAP directory. There is no simple mechanism to remove the users from the internal directory at this time. If you wish, you can delete these users by SQL. **Manipulating the database with SQL is not supported, and is at your own risk. TAKE A BACKUP FIRST.**

**Known LDAP issues when upgrading to JIRA 4.3**

- 'Sorry, an error occurred trying to log you in - please try again' Message when Trying to Login in JIRA 4.3 (JIRA Knowledge Base)
- JIRA Upgrade Fails due to osuser.xml configuration (JIRA Knowledge Base)
- Local Users Can't Log in, but LDAP Users Can after Upgrade to v4.3 (JIRA Knowledge Base)
- Troubleshooting User Management Upgrade Issues (JIRA Knowledge Base)

**Additional JARs required when running JIRA WAR on Tomcat**

Tomcat does not come with some libraries required to run JIRA. These include database libraries that must be in the Tomcat classpath. You will need to add these libraries to your `tomcat/lib` directory

**Tomcat 5**

- If you are upgrading a previous JIRA installation, you will need to delete older versions of those libraries that you previously added to `tomcat/lib`.

**Tomcat 6**

In particular, to prevent exceptions related to logging, please ensure that `commons-logging-.jar, slf4j.jar` and `log4j-1.2.15.jar` are present in Tomcat's `/lib` directory. Also ensure that these files are not present in Tomcat's `webapps/jira/WEB-INF/lib` directory.

- If you are upgrading a previous JIRA installation, you will need to delete older versions of those libraries that you previously added to `tomcat/lib`.

**Upgrading JIRA connected to a MySQL database**

If your JIRA installation is connected to a MySQL database that uses the MyISAM database engine (which is **not recommended**), some table indexes may not be created successfully upon upgrading to JIRA 4.3. MyISAM is not recommended for JIRA as its use can lead to serious data corruption — see [JIRA-24124](https://issues.atlassian.com/browse/JIRA-24124) for details.

Before upgrading, we recommend switching your MySQL database for JIRA over to the InnoDB database engine.

**Upgrading JIRA running on a 64-bit Windows operating system**

If you run JIRA on a 64-bit Windows operating system, be aware that the version of Apache Tomcat (6.0.20) bundled with JIRA Standalone cannot run as a Windows service on a 64-bit JDK/JRE (see [JIRA-12965](https://issues.atlassian.com/browse/JIRA-12965)).

If you need to run JIRA as a Windows service on a 64-bit Windows operating system, we recommend installing the [JIRA WAR-EAR distribution](https://confluence.atlassian.com/display/JIRA/Upgrading+JIRA+War-Ear) on Apache Tomcat version 6.0.26 or greater.

**GreenHopper**

Please be aware that only GreenHopper 5.5 (and later) is compatible with JIRA 4.3.x. If your existing version of GreenHopper is not compatible with JIRA 4.3.x, perform your GreenHopper upgrade immediately after performing your JIRA upgrade.

**Updated Toolkit Plugin for JIRA 4.3**

If you use the Toolkit Plugin with JIRA, you will need to update it to at least version 0.17 for compatibility with JIRA 4.3.

**Upgrading from JIRA 4.2 with the Universal Plugin Manager installed**

JIRA 4.2 supports the universal plugin manager. If you installed this plugin into your JIRA 4.2 installation, we recommend removing it from your JIRA Home directory while upgrading to JIRA 4.3 or later, as the presence of this plugin may cause problems when JIRA 4.3 is started.

When upgrading JIRA, remove this plugin **before** step 3.5 of the 'in-place database upgrade' or migration procedures.

The universal plugin manager plugin is located at:

```<JIRA-home-directory>/plugins/installed-plugins/atlassian-universal-plugin-manager-plugin-X.Y.Z.jar```

**Other Plugins**

JIRA 4.3 introduces several changes that may break existing plugins which are not bundled with JIRA.

If you have a developed a plugin, then please read the [Plugin Developer Notes for JIRA 4.3](https://confluence.atlassian.com/display/JIRA/Plugin+Developer+Notes+for+JIRA+4.3) guide. This guide describes changes in JIRA 4.3 which may affect the compatibility of your plugin with JIRA 4.3.

If you are using a plugin developed by a third party, please check with the plugin’s author to see if the plugin has been tested with JIRA 4.3.

**Older Browsers are no longer supported**

As mentioned on our [End of Support Announcements for JIRA](https://confluence.atlassian.com/display/JIRA/End+of+Support+Announcements+for+JIRA) page, from JIRA 4.3, we will no longer provide support for the following platforms with JIRA:

- Safari 4 and Firefox 3.0.x browsers, as mentioned in [Deprecated Web Browsers for JIRA](https://confluence.atlassian.com/display/JIRA/Deprecated+Web+Browsers+for+JIRA) announcement.

Please see the [Supported Platforms](https://confluence.atlassian.com/display/JIRA/Supported+Platforms) for a list of supported browsers, databases and application servers.

**Unsupported Modes**
JIRA does not support running in multitenant mode.

Other Known Issues

Before you begin the upgrade, please check for known issues. Sometimes we find out about a problem with the latest version of JIRA after we have released the software. In such cases we publish information about the known issues in the JIRA Knowledge Base. Please check for known issues and follow the instructions to apply any necessary patches.

If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

Upgrading from JIRA 4.1 and Earlier

In addition to the points listed above, please read the Important Version-Specific Upgrade Notes for the versions of JIRA you are skipping.

JIRA 4.3 now officially supports 'in-place database upgrades' when upgrading from JIRA 4.0.0 or later. This method requires much less downtime during the JIRA upgrade process, especially if you operate a large JIRA installation. You no longer need to export your existing JIRA data to an XML backup and then restore this data into your new JIRA version. Instead, we now support simply 'pointing' your new version of JIRA at your existing JIRA database!

Plugin Developer Notes for JIRA 4.3

On this page:

- Introduction
- I18nBean no longer in the PICO container
- GadgetRequestContextFactory no longer a host component
- CacheManager deleted
- ApplicationPropertiesImpl default constructor has been removed
- Accessing delegators, connections and datasources in OfBiz
  - Delegator and datasource names will change in a future release
  - EntityConfigUtil refactoring
- Embedded Crowd
  - Approach to compatibility
  - Important changes
- auth-refresh required for Gadget modules
  - Extension PICO Containers are no longer supported
- New way to include browser-specific CSS
- WebSudo - Temporary Administrative Access
- JavaScript Reorganisation
  - JavaScript Namespace Changes
  - JavaScript File Changes

Introduction

JIRA 4.3 introduces several changes that may break existing plugins which are not bundled with JIRA. For more details please see the API Change documentation.

If you are using or have been involved in the development of such a plugin, it may need to be updated to work with JIRA 4.3. Please read through the information below to see if any of this content is relevant to your plugin.

If you are using a plugin developed by a third party, please check with the plugin's author to see if the plugin has been tested with JIRA 4.3.

Please Note:

- This is not the complete list of changes for JIRA 4.3 — it only describes changes in JIRA 4.3 that will impact plugin developers.
- For details about which versions of Atlassian's Plugin Development Platform and its components (such as the Plugin Framework, Shared Access Layer (SAL), Atlassian User Interface (AUI) and the Atlassian REST Plugin) are included in JIRA 4.3, please refer to Plugin Development Platform Version Matrix.

I18nBean no longer in the PICO container

The I18nBean is no longer available for dependency injection. I doubt many people used it anyway, since it was
broken if you tried to use it. (The bean didn’t contain any keys defined in plugins.) As we move towards a translation-as-plugin and reloadable-plugin world the problem was just going to get worse. The current, correct way is to have an I18nHelper.BeanFactory injected and call getInstance() on it. This has the additional benefit of caching (only one object per-locale) which minimizes resource-bundle scanning.

GadgetRequestContextFactory no longer a host component

Previously there were two GadgetRequestContextFactory implementations being provided: one by JIRA directly (i.e. a "host component") and one by the gadget-renderer-plugin. The host component has been removed. If you are using a GadgetRequestContextFactory you will need to ensure that your atlassian-plugin.xml has a component-import statement so that OSGi gets wired up properly.

CacheManager deleted

The JIRA issue cache has not been in use for quite some time, and the CachingIssueManager has not updated the cache for a while. This has now been completely removed out of JIRA. Previously, it may have been necessary to depend on this class to flush it, or call ManagerFactory.getCacheManager() to flush it, after certain operations. This has been a noop for quite some time, and is no longer necessary.

ApplicationPropertiesImpl default constructor has been removed

As of JIRA 4.3, the default parameterless constructor of the ApplicationPropertiesImpl class has been removed. This class was never intended to be instantiated directly from within plugin code. If you need to get an instance of the ApplicationProperties component, please use one of the following approaches:

- dependency injection within plugin components,
- the ComponentManager.getComponent() method, or
- the ComponentLocator injectable component

All of these approaches are compatible with versions of JIRA from 4.0.

Accessing delegators, connections and datasources in OfBiz

Delegator and datasource names will change in a future release

Calls to the following methods:

- org.ofbiz.core.entity.GenericDelegator.getGenericDelegator("default");
- org.ofbiz.core.entity.ConnectionFactory.getConnection("defaultDS");

are deprecated, and will break in a future version of JIRA. It should still work in JIRA 4.3, but it is planned that this will break in JIRA 4.4. The correct generic delegator can be injected, or if static access is needed, com.atlassian.core.CoreFactory.getGenericDelegator() can be used. To get a connection, JIRA has added a new class called com.atlassian.jira.ofbiz.DefaultOfBizConnectionFactory. This can be used using the following code:

```
new DefaultOfBizConnectionFactory().getConnection();
```

EntityConfigUtil refactoring

org.ofbiz.core.entity.EntityConfigUtil has been significantly refactored. To access it, call EntityConfigUtil.getInstance(). Accessing DatasourceInfo should be done using the getDatasourceInfo() method on the above mentioned DefaultOfBizConnectionFactory.

Embedded Crowd

In JIRA v4.3 we have introduced a new User Management subsystem. Please refer to the JIRA 4.3 Upgrade Guide for general information.

This means that JIRA no longer uses the OSUser framework for user management. Instead it is now using modules taken from the Atlassian Crowd application, and hence this new subsystem is commonly referred to as "Embedded Crowd".
Approach to compatibility

In order to avoid compatibility and upgrade headaches for plugins, we have taken the following measures to transition the change as smoothly as possible:

A binary compatible copy of OSUser has been left in place

This means that existing code using OSUser Objects should continue to work.

The implementation of OSUser has been altered to call through to the underlying "embedded Crowd" user management layer.

The OSUser classes will remain for at least two versions (JIRA 4.3 and 4.4), but will be removed sometime after that.

OSUser's User and Group objects have been made to implement the new User and Group interfaces

```java
public class User extends Entity implements com.atlassian.crowd.embedded.api.User
public class Group extends Entity implements java.security.acl.Group, com.atlassian.crowd.embedded.api.Group
```

This is useful because it means you can use the old User (or Group) object anywhere that is expecting the new User (or Group) object, which allows you to migrate your code piece by piece instead of trying to do it all in one go.

JIRA API methods that accept OSUser classes as input will remain but are deprecated.

These methods will be removed when OSUser is removed.

For instance,

```java
IssueService.getIssue(com.opensymphony.user.User user, Long issueId)
```

is now deprecated in favour of

```java
IssueService.getIssue(com.atlassian.crowd.embedded.api.User user, Long issueId)
```

JIRA API methods that return OSUser classes as output will remain but are deprecated.

For instance,

```java
GroupManager.getGroup(String groupname);
```

will continue to return `com.opensymphony.user.Group`, but it is deprecated and replaced by

```java
GroupManager.getGroupObject(String groupname);
```

which returns `com.atlassian.crowd.embedded.api.Group`.

JIRA Plugin interfaces

Interfaces for plugin points sometimes include a User object in them (eg JqlFunction).

In these cases, we will leave the OSUser object in the short term for the sake of compatibility, and the interface will be altered when OSUser is removed.

Non-API Classes
Classes that are not considered part of JIRA's public API (Implementation classes) may be converted to the new User object at any time. Plugin developers should be avoiding these anyway.

New methods

New methods in API will only use the new User/Group interfaces.

Converting between old and new User objects.

The "old" User object has been made to implement the new User interface, and so no conversion is required in this direction.

You should not need to convert from the new to the old user Object very often, but if you do a Utility class OSUserConverter is available.

**Important changes**

Don't use com.opensymphony.user.UserManager

This is a static factory class that implemented OSUser. It is supported in the short term but will be removed.

Use JIRA's dependency-injected Managers and Services instead:

- com.atlassian.jira.user.util.UserManager
- UserUtil (an extended UserManager)
- UserService
- GroupService
- GroupManager

Changes to the User object.

User-names are now case-insensitive. This is to reflect the way user-names are treated by LDAP.

Previously user-names were case-sensitive but forced to be all lower-case, so this change should not cause problems.

- getEmail() is deprecated to be replaced by getEmailAddress()
- getFullName() is deprecated to be replaced by getDisplayName()

DirectoryID

JIRA is now capable of connecting to multiple "User Directories" at once. A User Directory might be an LDAP server, a Crowd Server, or the "Internal Directory" (that is, users stored in JIRA's DB).

In order to tell which directory a User came from, there is a DirectoryID added to the User object. This means that in theory, you can have two users from two directories with the same username. (Note that this should be considered a rare and unusual situation — documentation will recommend that users try to avoid this).

For this reason, the username and directoryID are both considered in User.equals().

User Properties

OSUser allows you to store custom properties in a PropertySet against a User. This will continue to be supported, but the PropertySet User.getPropertySet() method is deprecated. Use the UserPropertyManager to get user properties.

Changes to Seraph

If you are using a custom authenticator, note that two Seraph methods that were previously implemented in DefaultAuthenticator to use OSUser have become abstract methods:

```java
protected abstract java.security.Principal getUser(java.lang.String s);

protected abstract boolean authenticate(java.security.Principal principal, java.lang.String s) throws com.atlassian.seraph.auth.AuthenticatorException;
```

There is a concrete class in JIRA 4.3 called JiraSeraphAuthenticator which extends the abstract DefaultAuthenticator, implementing the above two abstract methods using Embedded Crowd. This means that, if you have written your own custom authenticator by extending DefaultAuthenticator, you will need to either:

- continue to extend DefaultAuthenticator, but make sure you implement both abstract methods; or
- extend JiraSeraphAuthenticator instead, which has already implemented those methods.

**auth-refresh required for Gadget modules**

You need to add the auth-refresh feature to your Gadget module preferences inside the gadget.xml file:

```xml
<Optional feature='auth-refresh' /> 
```

This enables your gadget to refresh its authentication token, which allows it to make requests. If you don't include the auth-refresh feature, a JavaScript error will occur if your gadget makes a request after 30 minutes of inactivity.

**Extension PICO Containers are no longer supported**

Please note that from JIRA 4.3 onwards, the use of jira.extension.container.provider in jira-application.properties is no longer supported.

**New way to include browser-specific CSS**

Previously when targeting a specific browser (e.g. IE6/IE7/IE8), you would put all CSS styles in a separate stylesheet and rely on IE-conditional comments to restrict which browsers received the files.

In JIRA 4.3 we have added some JavaScript which adds classes to the HTML tag on page load. This means that you can now put all browser-specific CSS fixes in the main stylesheet near related styles. Having styles in one file increases maintainability, and reduces the number of requests — which helps pages load faster.

Prior to 4.3 you would put IE styles in the IE stylesheet and prefix with * or _ depending on the browser. Now you can use the following:

- .msie (all versions of IE)
- .msie-7 (just IE7)
- .msie-8 (just IE8)
- .msie-gt-7 (IE8 and IE9)
- .msie-lt-8 (IE7, IE6, IE5.5, etc)
- .mozilla (all versions of Firefox. There are no version-specific options like IE)
- .webkit (all versions of Chrome/Safari. There are no version-specific options like IE)
- .opera (note: not a supported browser)

**WebSudo - Temporary Administrative Access**

We have added an extra layer of authentication to the administration actions in JIRA. If your plugin adds actions to the administration area, that is Actions that should only be for accessible by users with the admin or sys-admin roles, the Action should be annotated with WebSudoRequired on the class (not the action or package). If your administrative pages are not actions you can use the WebSudoManager following the instructions at Adding WebSudo Support to your Plugin.

**JavaScript Reorganisation**

To improve the consistency of JavaScript resources in JIRA 4.3, the namespaces of various JavaScript objects and functions have been changed and some JavaScript files have been moved or renamed.

### JavaScript Namespace Changes

The table below lists all namespace changes to JavaScript objects and functions in JIRA 4.3. If your plugin uses JavaScript which refers to any of these objects and functions by their old namespace, you will need to update these in your plugin to the new namespace.

<table>
<thead>
<tr>
<th>Old namespace</th>
<th>New namespace</th>
</tr>
</thead>
<tbody>
<tr>
<td>jira.app.issue</td>
<td>JIRA.Issue</td>
</tr>
<tr>
<td>jira.app.issuenavigator</td>
<td>JIRA.IssueNavigator</td>
</tr>
<tr>
<td>jira.app.issuenavigator.shortcuts</td>
<td>JIRA.IssueNavigator.Shortcuts</td>
</tr>
<tr>
<td>AJS.DropDown</td>
<td>AJS.Dropdown</td>
</tr>
</tbody>
</table>
Along with the JavaScript namespace changes (above), several JavaScript files have been moved or renamed. Any plugins that load JIRA's JavaScript files directly may encounter "Resource not found" warnings due to this change.

Instead of loading these files directly, we recommend using the Web Resource framework to include JIRA's JavaScript files with plugins, as this method is backwards-compatible with JIRA 4.2.

```xml
<web-resource key="my-resource">
  <dependency>jira.webresources:jira-global</dependency>
</web-resource>
```

### JIRA 4.3.4 Release Notes

**27 May 2011**

The Atlassian JIRA team announces the release of **JIRA 4.3.4**. This point release contains several updates and fixes, plus version 2.6 of the **JIRA Importers Plugin**, providing:

- support for Trac import; and
- improvements to **CSV import**, including the ability to import multiple columns of the same name (for fields that are multi-valued in JIRA) and the ability to import sub-tasks.

JIRA 4.3.4 is of course free to all customers with active JIRA software maintenance.

**Don’t have JIRA 4.3 yet?**

Take a look at all the new features in the [JIRA 4.3 Release Notes](#) and see what you are missing out on!

[Download Latest Version](#)

---

**Upgrading from a Previous Version of JIRA**

If you are upgrading, please read the [JIRA 4.3 Upgrade Guide](#).

### Updates and Fixes in this Release

JIRA 4.3.4 includes the following updates and bug fixes:

### JIRA 4.3.3 Release Notes

**29 April 2011**

The Atlassian JIRA team announces the release of **JIRA 4.3.3**. This point release contains several updates and fixes, plus version 2.3.1 of the JIRA Importers Plugin, providing support for Pivotal Tracker and improvements in the way attachments are imported. The FishEye plugin version 3.1.5 is also included.

JIRA 4.3.3 also delivers some improvements with LDAP and Crowd directories, including:

- Synchronisation performance gains of up to 400% in some cases.
- Changed behaviour for automatic group membership in LDAP directories: In previous releases, users were added to the given groups each time they logged in. In JIRA 4.3.3 and later, automatic group assignment will happen only the first time the user logs in. This allows administrators to remove group memberships after they have been granted. For more information, see Connecting to an LDAP Directory.
- Automatic user creation for internal directories with LDAP authentication: You can now configure the directory to automatically copy the user from LDAP to the internal directory on first login, and to add the user to given groups. See Connecting to an Internal Directory with LDAP Authentication.
- More directory types available when connecting to an internal directory with LDAP authentication: You can now select from a number of LDAP directory servers. See Connecting to an Internal Directory with LDAP Authentication.

JIRA 4.3.3 is of course free to all customers with active JIRA software maintenance.

**Don't have JIRA 4.3 yet?**

JIRA 4.3.3 Upgrade Guide

Upgrading from JIRA 4.3.x to 4.3.3

Please follow the instructions in the general upgrading JIRA documentation.

Upgrading from JIRA 4.2.x and earlier

In addition to the above, please read the JIRA 4.3 Upgrade Guide and as well as the Important Version-Specific Upgrade Notes for the versions of JIRA you are skipping.

JIRA 4.3.2 Release Notes

11 April 2011

The Atlassian JIRA team announces the release of JIRA 4.3.2. This point release fixes two issues (JIRA-24251 & JIRA-24291) associated with the Windows Installer.

JIRA 4.3.2 is of course free to all customers with active JIRA software maintenance.

Don't have JIRA 4.3 yet?

Take a look at all the new features in the JIRA 4.3 Release Notes and see what you are missing out on!

JIRA 4.3.1 Release Notes

1 April 2011

The Atlassian JIRA team announces the release of JIRA 4.3.1. This point release contains several updates and fixes, plus version 2.1 of the JIRA Importers Plugin, providing improved support for Bugzilla. Please see the documentation: Importing Data from Bugzilla.

JIRA 4.3.1 now supports anonymous binding when connecting to LDAP directories. Hence, when configuring an LDAP directory or an internal directory with LDAP authentication for user management in JIRA, you do not need to specify a Username and Password for JIRA to access your LDAP directory.

Notes for plugin developers:

- JIRA 4.3.1 resolves a Jersey-related issue that was preventing the building of plugins against 4.3.
- JIRA 4.3.1 provides backwards compatibility for the JavaScript Namespace Changes listed in the Plugin

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Developer Notes for JIRA 4.3.

The version of Tomcat included in JIRA 4.3.1 Standalone has been updated to Tomcat 6.0.32.

JIRA 4.3.1 is of course free to all customers with active JIRA software maintenance.

JIRA 4.3.1 Upgrade Guide

Upgrading from JIRA 4.3 to 4.3.1

Please follow the instructions in the general upgrading JIRA documentation.

Upgrading from JIRA 4.2.x and earlier
In addition to the above, please read the JIRA 4.3 Upgrade Guide and as well as the Important Version-Specific Upgrade Notes for the versions of JIRA you are skipping.

JIRA 4.2 Release Notes

21 October 2010

The Atlassian JIRA team is delighted to present a brand new version of one of the world's favourite issue-trackers.

JIRA 4.2 gives you a few extra minutes of precious time every day, by providing the ability to triage issues directly from the Issue Navigator without you having to open each issue. For the mouse-averse, the new 'Operations Dialog' box provides access to all menu options via the keyboard.

To help speed up your ability to work on issues, we've also made common actions and workflow operations accessible from convenient dialog boxes.

Time-tracking has become much more flexible: you can now edit the Original Estimate, and set the Remaining Estimate to zero when resolving an issue. You can also log work via workflow 'transition' (or any other) screens.

The 'Labels' plugin is now a permanent part of JIRA, simplifying system management for GreenHopper users and administrators — and everyone else who likes to label their JIRA issues.

Note to developers: JIRA 4.2 includes the Atlassian Plugin Framework version 2.5, and an alpha release of the JIRA REST API. We are very keen to hear your feedback on the REST API — please try it out and add your comments to JIRA-22139.

Upgrading to JIRA 4.2 is free for all customers with active JIRA software maintenance as of October 21, 2010.

Highlights of JIRA 4.2:

- Dialogs for Common Actions and Workflow Operations
- Keyboard Shortcuts and 'Operations Dialog'
- Issue Labelling
- Improvements to the 'View Issue' Screen
- Auto-complete for Versions and Components
- Attachment Sorting by Date or Name
- Viewable Files in Zipped Attachments
- 'Log Work' Improvements
- Improvements to the Issue Navigator
- 'Filter' Gadget creation via the Issue Navigator
- User Avatars and Hover Profile
- New JQL Functions
- Other Enhancements and Fixes
- Plus over 120 other fixes and improvements

Thank you for your feedback:

🌟 More than 40 new feature requests implemented
🌟 More than 850 votes fulfilled

Your votes and issues help us keep improving our products, and are much appreciated.

Upgrading to JIRA 4.2

JIRA 4.2 can be downloaded from the JIRA Download Center. Before upgrading, please refer to the JIRA 4.2 Upgrade Guide.
Highlights of JIRA 4.2

Dialogs for Common Actions and Workflow Operations

For faster edits to an issue, pop-up dialogs have replaced screen changes for common actions and workflow operations.

You can now perform an action on an issue (via a dialog) directly from the Issue Navigator — without opening the issue first. The issue marker shows which issue you have selected (via your keyboard) in the result list.
Keyboard Shortcuts and 'Operations Dialog'

JIRA users can now do more without a mouse — perfect for power users:
Hints also appear at the bottom of a dialog, helping you to learn keyboard shortcuts on the fly:

The new 'Operations Dialog' lets you perform actions via the keyboard (instead of the mouse), using the full-stop ('dot') key to access the 'Actions' and 'Workflow' menus. The Operations Dialog works from the Issue Navigator and also when viewing an individual issue.
Using Keyboard Shortcuts

The functionality from the Labels plugin is now included in JIRA out-of-the-box. The labels dialog has a great new UI, and email notifications are now optional when updating labels for an issue.
Improvements to the 'View Issue' Screen

We have improved the look and feel of the 'View Issue' screen even more. Some improvements include:

- Tighter spacing between lines to reduce space between elements
- Stronger section headings
- The 'Description' field separated into its own section
- Horizontal division lines between each custom field
- Votes and Watchers fields on the same line
- Labels represented as bubbles
Individual blocks can now be collapsed to streamline your issue view. The view state (i.e. which blocks are expanded/collapsed) will also be remembered across issues. You can also add a comment at the bottom of the 'Comments' section.

^Top

5

Auto-complete for Versions and Components

Editing the Component, Affects Version(s) and Fix Version(s) is now quicker and easier. Upon typing into one of these fields, a dropdown menu appears with a list of options matching the first few characters you typed.

For convenience, the version lists are divided into Released and Unreleased categories.
Attachment Sorting by Date or Name

Attachments can now be sorted by date or by name, in ascending or descending order.

See Attaching a File for more information.
Viewable Files in Zipped Attachments

You can expand an attached zip file to see its contents. The first 30 files will be shown for larger zip files.

See Accessing ZIP-format File Contents for more information.

'Log Work' Improvements

You can now log work when you resolve an issue, saving you a step. You can also set the Remaining Estimate to 0 upon resolving an issue.

You now have the ability to edit the Original Estimate, even if work has been logged on an issue (not shown here).

We've also included the ability to add work log descriptions in wiki-markup (not shown here).

Lastly, you can add the 'Log Work' fields to any screen in JIRA (not shown here).
Logging Work on an Issue

The Issue Navigator has been updated to match the look and feel of an issue. We've also added: an issue marker and colour highlight for keyboard navigation (blue); colour highlight for mouse selection (grey); toggle to collapse the search form.

See Logging Work on an Issue for more information.
When a change is made via a dialog, JIRA will give you feedback on that change as confirmation.

^Top

'Filter' Gadget creation via the Issue Navigator

When viewing search results, you can quickly add a 'Filter Results' gadget to your dashboard via the 'Views' menu.
User Avatars and Hover Profile

JIRA users can now add an avatar to their profile. You can then mouse-hover over a user's name to show information about that user — this is available when viewing an issue, using the Issue Navigator, browsing a project, viewing activity, viewing a user profile and performing some administration tasks.
See Adding a User Avatar and Using Hover Profile for more information.

New JQL Functions

Additional JQL functions for projectsLeadBy and componentsLeadBy — useful for finding all issues where a particular user is the lead of a component, or a project.
Other Enhancements and Fixes

- If you use Firefox or IE, you can now search JIRA issues from the convenience of your browser's search box. Just add your JIRA site as a search engine/provider, via the dropdown menu next to the browser's search box. This is because JIRA now supports the autodiscovery part of the OpenSearch standard.

Plus over 120 other fixes and improvements

The top 50 most popular issues resolved in JIRA 4.2 are listed below. Click here for the full list.

JIRA 4.2 Upgrade Guide

On this page:

- Upgrading from JIRA 4.1 to 4.2
  - General Upgrade Instructions
  - Changes in jira-application.properties
  - Changes in seraph-config.xml and Crowd Integration
  - Non-bundled Plugins
  - Updated Toolkit Plugin for JIRA 4.2
  - Labels Plugin is Now in Core JIRA
  - Time Tracking Changes
  - Changes to Sub-Tasks
  - Changes to Attachment Creation
  - System Path Changes for Attachments, Indexes, Automated Backups and Services
  - New Security Option Available in seraph-config.xml
  - 'Contact Administrators' Link has been Removed
  - GreenHopper Versions 5.2 and Older are Not Compatible
  - Crowd Versions 2.0.6 and Older are Not Supported
    - Users of Fisheye/Crucible
    - Various Platforms are No Longer Supported
    - Internet Explorer 7 and 8 users must have "native XMLHTTP support" enabled
    - Other Known Issues
  - Upgrading from JIRA 4.0 and Earlier

Upgrading from JIRA 4.1 to 4.2

General Upgrade Instructions

Please follow the instructions in the general JIRA upgrade guide (non-version specific), as well as the JIRA 4.2-specific instructions in the sections below. The general upgrade guide contains important tasks that are essential for getting your upgraded JIRA instance to work correctly (e.g. merging jira-application.properties customisations from the old instance to the upgraded instance).

Changes in jira-application.properties

If you are merging your old and new configuration files, as described in the Upgrade Guide, the following tables list the changes which have been made to the jira-application.properties file in JIRA 4.2.

The purpose of each new property is documented in the jira-application.properties file itself.

<table>
<thead>
<tr>
<th>New properties in jira-application.properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>jira.date.time.picker.use.iso8061 = false</td>
</tr>
<tr>
<td>jira.timetracking.estimates.legacy.behaviour=true</td>
</tr>
</tbody>
</table>
Properties removed from `jira-application.properties`

- `jira.attachment.number` (See Changes to Attachments below for more information.)
- `jira.paths.set.allowed` (See System Path Changes below for more information.)
- `jira.paths.safe.backup.path` (See System Path Changes below for more information.)

Properties changed in `jira-application.properties`

- `jira.avatar.megapixels=5` was changed to `jira.avatar.megapixels=10`.

Changes in `seraph-config.xml` and Crowd Integration

When merging your old and new configuration files, as described in the Upgrade Guide, please take extra care with the `seraph-config.xml` file, since this file contains several new entries in JIRA 4.2.

If you simply copy your old `seraph-config.xml` to your new 4.2 installation, then:

- Your users will find that the Remember my login... functionality will not work.
- If you had Crowd integrated with JIRA prior to upgrading, your Crowd integration with JIRA will no longer work after the upgrade.

The following table lists the changes to the `seraph-config.xml` file in JIRA 4.2:

<table>
<thead>
<tr>
<th>Elements in <code>seraph-config.xml</code> prior to JIRA 4.2</th>
<th>Change in JIRA 4.2</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;param-name&gt;login.cookie.key&lt;/param-name&gt;</code></td>
<td><code>&lt;param-value&gt;seraph.os.cookie&lt;/param-value&gt;</code> has been changed to <code>&lt;param-value&gt;seraph.rememberme.cookie&lt;/param-value&gt;</code></td>
</tr>
<tr>
<td><code>&lt;param-value&gt;seraph.os.cookie&lt;/param-value&gt;</code></td>
<td></td>
</tr>
<tr>
<td><code>&lt;param-name&gt;autologin.cookie.age&lt;/param-name&gt;</code></td>
<td><code>&lt;param-value&gt;31536000&lt;/param-value&gt;</code> has been changed to <code>&lt;param-value&gt;1209600&lt;/param-value&gt;</code></td>
</tr>
<tr>
<td><code>&lt;param-value&gt;31536000&lt;/param-value&gt;</code></td>
<td></td>
</tr>
<tr>
<td><code>&lt;init-param&gt;</code></td>
<td>Removed as this <code>&lt;init-param&gt;</code> entry is no longer required from JIRA 4.2.</td>
</tr>
</tbody>
</table>
Non-bundled Plugins

If you use or develop a plugin that is not bundled with JIRA, then please read the Updating JIRA Plugins for JIRA 4.2 guide. This guide describes changes in JIRA 4.2 which may affect the compatibility of your plugin with JIRA 4.2.

Updated Toolkit Plugin for JIRA 4.2

If you use the Toolkit Plugin with JIRA, you will need to update it to at least version 0.15 for compatibility with JIRA 4.2.

Labels Plugin is Now in Core JIRA

The Labels plugin functionality is now part of JIRA core, so the Labels plugin should no longer be installed. If an earlier version of the Labels plugin is installed when upgrading to JIRA 4.2, JIRA will not start up. An appropriate error message will be shown in the logs and UI.

All existing labels will continue to exist. As part of the 4.2 upgrade process, any data in a pre-existing "Labels" custom field (e.g. if you were using the Labels plugin) will be migrated to the new "Labels" system field.

Time Tracking Changes

Prior to JIRA 4.2, the Original Estimate and Remaining Estimate fields could not be edited independently and their values would be synchronised after logging work.

From JIRA 4.2, time tracking is more flexible. The values in these fields are not tied to each other and they can be edited independently. Additionally, it is now possible to change the Original Estimate value after work has been logged.

Clean installations of JIRA 4.2 will automatically have access to this more flexible time tracking feature. However, if you are a JIRA customer upgrading to version 4.2, JIRA's time tracking feature will be set to Legacy Mode so that users can continue to operate JIRA's original work logging features as usual.

If you have upgraded to JIRA 4.2 and wish to use the newer and more flexible time tracking features, you will need to disable Legacy Mode in JIRA's Time Tracking settings. (You will need to deactivate Time Tracking before you can disable Legacy Mode.)

If you have upgraded to JIRA 4.2 and have disabled Legacy Mode, the Log Work fields will not automatically be available on the 'Resolve' and 'Close' transitions of JIRA's default workflow, nor will they be available on any other (custom) workflow transition.

To add these fields to a workflow transition, add the Log Work field to the appropriate screen used by that workflow transition. Refer to Adding Time Tracking capabilities to a screen on the Defining a Screen page for more information.

(The Log Work field is actually a group of time-tracking fields.)
Changes to Sub-Tasks

On new installations of JIRA 4.2 or later, Sub-Tasks are enabled by default. However, upon upgrading to JIRA 4.2, your Sub-Task configuration will remain unchanged. Therefore, if Sub-Tasks are disabled on your JIRA site before upgrading to JIRA 4.2, Sub-Tasks will still be disabled after the upgrade is completed.

Changes to Attachment Creation

Attachments are uploaded 'inline', that is when a user selects a file it is immediately uploaded to the server. A temporary attachment will be created on the server for this file. Once the form the file was uploaded in is submitted, the temporary attachment will be converted to a real attachment for the issue in question. Due to this improvement, limiting the number of file upload boxes via the `jira.attachment.number` property is no longer necessary and can safely be removed from your `jira-application.properties` file.

System Path Changes for Attachments, Indexes, Automated Backups and Services

For security reasons, from JIRA 4.2, you are no longer able to customise directories for storing the following types of JIRA content:

- attachments,
- search indexes,
- automated XML backups and
- other JIRA services

JIRA now stores these types of content in 'Default' directories within the JIRA home directory.

- For new installations of JIRA 4.2, these types of content will only be stored within their default directories.
- If you upgrade to JIRA 4.2 from an earlier JIRA version that used custom directories to store these types of content, JIRA 4.2 will respect these custom directories. However, once you change to using the default directory for storing any of these types of content, you can no longer specify nor use a custom directory for that content type.

Note that you will need to copy your attachments to your JIRA Home Directory if you set your Attachments path to "default".

If you upgrade to JIRA 4.2 on a different machine (or different operating system) and previously:

- used custom directories to store attachments or search indexes, JIRA will warn you that it cannot create these custom directories if they do not exist on the new system.
  
  Hence, you can either:
  
  - Choose to use JIRA's default directories to store these types of content, or
  - Shutdown JIRA, recreate those custom directories (with permission for JIRA to write to them) and start the JIRA upgrade process again with the same XML backup.

  To identify these custom directories, JIRA will indicate them during the XML backup restore process.

- used custom storage directories for any JIRA service (such as an automated XML backup), JIRA will respect these custom directories and create them for you on the new system.

For more information about these changes, please refer to JRA-21232.

New Security Option Available in seraph-config.xml

Seraph can now be configured to invalidate your session upon login, which is a more secure configuration than before.

What this means is that the session you establish with JIRA before logging in is effectively destroyed and recreated with a new identity. This means that the session cookie value will be different after logging in. The implications of this are that you can be sure that even if you as a user have been unknowingly tricked into following a poison link to JIRA that forces you to use a session id that an attacker also already has access to, the act of logging in will free you from that session and you will not enable the attacker to gain access to your account.
In addition to the new identity, the new session will maintain, as best it can, the state of your interactions with JIRA. Your current project, current filter, etc, will remain after login. This is nice because sometimes you use JIRA without realising you are not authenticated, and logging in should disrupt your work as little as possible.

By default, seraph is configured to invalidate sessions in JIRA 4.2. This can be turned off in the seraph configuration file, typically called `seraph-config.xml`.

Here’s a sample of the part of the config file that enables session invalidation:

```xml
<init-param>
    <param-name>invalidate.session.on.login</param-name>
    <param-value>true</param-value>
</init-param>
<init-param>
    <param-name>invalidate.session.exclude.list</param-name>
    <param-value>ASSESSIONID,dashboardPage</param-value>
</init-param>
```

In the example above you can see that in addition to the `invalidate.session.on.login` parameter which activates the feature, there is a second (optional) parameter which can hold a list of session keys which are to be excluded from the new session after login. By default, all session attributes are copied to the new session. If there are any to be excluded from this, they should be defined in a comma separated list for the `invalidate.session.exclude.list` parameter.

'Contact Administrators' Link has been Removed

Please note that the 'Contact Administrators' link has been removed from the JIRA footer. If you have users who rely on this link, please publish a list of administrators elsewhere before upgrading to JIRA 4.2.

GreenHopper Versions 5.2 and Older are Not Compatible

If you use the GreenHopper plugin, please note that only version 5.3 is compatible with JIRA 4.2.

Crowd Versions 2.0.6 and Older are Not Supported

If you have integrated your JIRA instance with Atlassian Crowd, please upgrade to Crowd 2.0.7. Crowd versions up to and including 2.0.6 will not work with JIRA 4.2. See the Crowd 2.0.7 release notes.

Users of Fisheye/Crucible

Please note that there is a compatibility issue with the `crowd-integration-client-2.0.7.jar` and Fisheye/Crucible that is described in this JIRA issue.

Various Platforms are No Longer Supported

As mentioned in our End of Support Announcements for JIRA page, from JIRA 4.2, we will no longer provide support for the following platforms with JIRA:

- Oracle WebLogic and IBM WebSphere applications servers, as mentioned in Deprecated Application Servers for JIRA announcement,
- Java Platform 5, as mentioned in the Deprecated Java Platforms for JIRA announcement and
- Internet Explorer 6 web browser, as mentioned in Deprecated Web Browsers for JIRA announcement.

Internet Explorer 7 and 8 users must have "native XMLHTTP support" enabled

There is a known bug that will make transitioning issues impossible from Internet Explorer 7 and 8 when "native XMLHTTP support" is disabled. See http://jira.atlassian.com/browse/JRA-22609 or the JIRA Knowledge Base for details.

Other Known Issues

Before you begin the upgrade, please check for known issues. Sometimes we find out about a problem with the latest version of JIRA after we have released the software. In such cases we publish information about the known issues in the JIRA Knowledge Base. Please check for known issues and follow the instructions to apply any necessary patches.
If you encounter a problem during the upgrade and cannot solve it, please create a support ticket and one of our support engineers will help you.

**Upgrading from JIRA 4.0 and Earlier**

In addition to the points listed above, please read the Upgrade Guide for every version you are skipping during the upgrade, particularly the JIRA 4.0 Upgrade Guide as JIRA 4.0 introduced significant licensing and technical changes. The complete list of Upgrade Guides is available here: Production Releases.

Upgrading JIRA Plugins for JIRA 4.2

**On this page:**
- Plugin Developer Notes
  - Custom fields that require JavaScript
  - Custom fields that directly implement GroupSelectorField
  - Custom Issue Operations need to work without an issue being present

**Plugin Developer Notes**

JIRA 4.2 introduces several changes that may break existing plugins which are not bundled with JIRA.

If you are using or have been involved in the development of such a plugin, it may need to be updated to work with JIRA 4.2. Please read through the information below to see if any of this content is relevant to your plugin.

If you are using a plugin developed by a third party, please check with the plugin's author to see if the plugin has been tested with JIRA 4.2.

- Custom fields that require JavaScript
- Custom fields that directly implement GroupSelectorField
- Custom Issue Operations need to work without an issue being present

> This is not the complete list of changes for JIRA 4.2 — It only describes changes in JIRA 4.2 that will impact plugin developers.

**Custom fields that require JavaScript**

Use the following pattern to execute JavaScript when dialogs are loaded. The `dialogContentReady` event is fired after the dialog boxes are loaded. This pattern is mainly useful when adding behaviour to, or interacting with, custom fields/forms.

```javascript
AJS.$(function () {

    function initMyCustomField(dialog) {
        AJS.$(dialog || document.body).each(function () {
            var $dialog = AJS.$(this);
            ...
        });
    }

    // Init the control on DOM ready
    initDatePicker();

    // Bind the init function so it runs when the dialog loads
    AJS.$(document).bind("dialogContentReady", function (e, dialog) {
        initDatePicker(dialog.get$popupContent());
    });

});
```

**Custom fields that directly implement GroupSelectorField**

To address JIRA-20562, the `GroupSelectorField` marker interface (typically used for User and Group Picker-based custom fields), has been changed to an interface with the following method:
The intention of this method is to return a query that takes into account any case folding that has been done by the underlying custom field type. For instance, JIRA appends \_raw to the field id before indexing GroupSelect orField objects. Hence, if you want similar behaviour in your custom field, you would define the following (as used within JIRA):

```java
public Query getQueryForGroup(final String fieldID, String groupName) {
    return new TermQuery(new Term(fieldID+"_raw",groupName));
}
```

Custom Issue Operations need to work without an issue being present

JIRA 4.2 permits the use of keyboard shortcuts for custom issue operations on the Issue Navigator. To do this, we render on an Issue Navigator page (but hide from the user) all issue operation links defined in the system, without a specific issue being available in the context for the issue operation. Custom issue operations must be able to gracefully handle this scenario, or they will be ignored from this list and plugin developers will not be able to attach keyboard shortcuts to their issue operations.

Specifically, issue operation web-items need to handle the case where the JiraHelper does not provide an issue in its context!

Furthermore, issue operation URLs need to follow a specific format in order for keyboard shortcut actions to be attached to them via JavaScript. Here is an example of a valid issue operation URL format:

```html
<a id="assign-issue" class="issueaction-assign-issue" href="/jira/secure/AssignIssue!default.jspa?id={0}&returnUrl=/secure/IssueNavigator.jspa"></a>
```

The corresponding issue operation web-item definition looks as follows:
The important part of the Issue Navigator URL is the parameter \texttt{id=\{0\}}. The Issue Navigator will automatically substitute the \$\texttt{issueId} variable with \{0\}. This will then be substituted by the JavaScript triggered by a keyboard shortcut with the currently selected issueId on the Issue Navigator.

On the issue view page, which only deals with a single issue, the \$\texttt{issueId} will simply be substituted with the current issue id. The workbench action or servlet (in this case AssignIssue) needs to use the id URL parameter to resolve the issue.

**JIRA 4.2.4 Release Notes**

**8 February 2011**

The Atlassian JIRA team announces the release of **JIRA 4.2.4**. This point release fixes an issue with the 'Filter Results' gadget. It also contains version 1.7.1 of the **JIRA Importers Plugin**.

JIRA 4.2.4 is of course free to all customers with active JIRA software maintenance.

**Don't have JIRA 4.2 yet?**

Take a look at all the new features in the **JIRA 4.2 Release Notes** and see what you are missing out on!

**Upgrading from a Previous Version of JIRA**

If you are upgrading, please read the **JIRA 4.2.4 Upgrade Guide**.

**JIRA 4.2.4 Upgrade Guide**

**Upgrading from JIRA 4.2.x to 4.2.4**

Please follow the **JIRA general upgrade instructions**, plus note the following:

Changes to filenames

When you download JIRA, please note that the filename now includes the build number, e.g. "b588" in the filename "atlassian-jira-enterprise-4.2.1-b588-windows-installer.exe". This has no effect on the JIRA directory structure or on the upgrade process.
Please note that the inclusion of the build number has also been applied to the name of JIRA artifacts deployed to Maven and to the versions specified in the JIRA POMs.

Changes to the "JIRA Users" Global Permission

Please note that it is no longer possible for groups that have the "JIRA System Administrators" global permission to be also granted the "JIRA Users" global permission (see Managing Global Permissions). This is because newly-created users are automatically added to groups that have the "JIRA Users" permission, and it is not good security practice to automatically grant the "JIRA System Administrators" global permission to new users.

Upgrading from JIRA 4.1.x and earlier

In addition to the above, please read the JIRA 4.2 Upgrade Guide and the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

JIRA 4.2.3 Release Notes

31 January 2011

The Atlassian JIRA team announces the release of JIRA 4.2.3. This point release contains several updates and fixes, plus a new release of the JIRA Importers Plugin, providing improved support for Mantis and CSV imports. Please see the documentation: Importing Data from Mantis and Importing Data from CSV.

JIRA 4.2.3 is of course free to all customers with active JIRA software maintenance.

Don't have JIRA 4.2 yet?
Take a look at all the new features in the JIRA 4.2 Release Notes and see what you are missing out on!

JIRA 2.3.3 Upgrade Guide

Upgrading from JIRA 4.2.x to 4.2.3

Please follow the JIRA general upgrade instructions, plus note the following:

Changes to filenames

When you download JIRA, please note that the filename now includes the build number, e.g. "b588" in the filename "atlassian-jira-enterprise-4.2.1-b588-windows-installer.exe". This has no effect on the JIRA directory structure or on the upgrade process.

Please note that the inclusion of the build number has also been applied to the name of JIRA artifacts deployed to Maven and to the versions specified in the JIRA POMs.

Changes to the "JIRA Users" Global Permission

Please note that it is no longer possible for groups that have the "JIRA System Administrators" global permission to be also granted the "JIRA Users" global permission (see Managing Global Permissions). This is because newly-created users are automatically added to groups that have the "JIRA Users" permission, and it is not good security practice to automatically grant the "JIRA System Administrators" global permission to new users.

Upgrading from JIRA 4.1.x and earlier

In addition to the above, please read the JIRA 4.2 Upgrade Guide and the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

JIRA 4.2.2 Release Notes

4 January 2011

The Atlassian JIRA team announces the release of JIRA 4.2.2. This point release contains several updates and fixes, plus a Beta release of the JIRA Importers Plugin, providing improved support for Bugzilla. Please see the documentation: Importing Data from Bugzilla.

This point release is a highly recommended upgrade as it contains important fixes to security vulnerabilities — please refer to the JIRA Security Advisory 2011-02-21 for details.

JIRA 4.2.2 is of course free to all customers with active JIRA software maintenance.

Don't have JIRA 4.2 yet?

### JIRA 4.2.2 Upgrade Guide

**Upgrading from JIRA 4.2 or 4.2.1 to 4.2.2**

Please follow the JIRA general upgrade instructions, plus note the following:

#### Changes to filenames

When you download JIRA, please note that the filename now includes the build number, e.g. "b588" in the filename `atlassian-jira-enterprise-4.2.1-b588-windows-installer.exe`. This has no effect on the JIRA directory structure or on the upgrade process.

Please note that the inclusion of the build number has also been applied to the name of JIRA artifacts deployed to Maven and to the versions specified in the JIRA POMs.

#### Changes to the "JIRA Users" Global Permission

Please note that it is no longer possible for groups that have the "JIRA System Administrators" global permission to be also granted the "JIRA Users" global permission (see Managing Global Permissions). This is because newly-created users are automatically added to groups that have the "JIRA Users" permission, and it is not good security practice to automatically grant the "JIRA System Administrators" global permission to new users.

#### Upgrading from JIRA 4.1.x and earlier

In addition to the above, please read the JIRA 4.2 Upgrade Guide and the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available [here](#).

### JIRA 4.2.1 Release Notes

**6 December 2010**

The Atlassian JIRA team announces the release of **JIRA 4.2.1**. This point release contains several updates and fixes, including the issue of remembering which sections of the 'View Issue' screen are collapsed. This point release is a highly recommended upgrade as it contains important fixes to security vulnerabilities — please refer to the JIRA Security Advisory 2010-12-06 for details.

JIRA 4.2.1 is of course free to all customers with active JIRA software maintenance.

JIRA 4.2.1 Upgrade Guide

Upgrading from JIRA 4.2 to 4.2.1

Please follow the JIRA general upgrade instructions.

When you download JIRA, please note that the filename now includes the build number, e.g. "b588" in the filename "atlassian-jira-enterprise-4.2.1-b588-windows-installer.exe". This has no effect on the JIRA directory structure or on the upgrade process.

Please note that the inclusion of the build number has also been applied to the name of JIRA artifacts deployed...
to Maven and to the versions specified in the JIRA POMs.

Upgrading from JIRA 4.1.x and earlier

In addition to the above, please read the JIRA 4.2 Upgrade Guide and the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

**JIRA 4.1 Release Notes**

**April 7, 2010**

The Atlassian JIRA team is delighted to present a brand new version of one of the world's favourite issue-trackers. This release makes your JIRA experience easier and more convenient than ever. The issue UI has been redesigned for a simpler, friendlier experience, and keyboard shortcuts have been streamlined. Issues can now be actioned directly from your dashboard via a handy dropdown in the gadgets. Each issue's attachments are now displayed in an image gallery, and can all be downloaded to a single ZIP file with just one click.

The installation process has been improved by the inclusion of industry standard database drivers and a GUI database configuration tool, and JIRA Standalone is now being shipped with Tomcat 6.0.20.

JIRA 4.1 also addresses some other enhancements and fixes, notably a fix to the 'Malformed security token' error appearing in gadgets on the JIRA 4.0 dashboard.

![JIRA Plugin Developers:](image)

If you develop JIRA plugins, please refer to our guide on updating JIRA plugins for JIRA 4.1, for details on keeping your plugins compatible with JIRA 4.1.

Upgrading to JIRA 4.1 is free for all customers with active JIRA software maintenance as of April 7, 2010.

**Highlights of JIRA 4.1:**

- New-Look Issues
- Improved Global Keyboard Shortcuts
- 'Actions' Dropdown in Gadgets
- 'Bulk Move' Components and Versions
- New look User Profile, 'Manage Dashboards' and 'Manage Filters'
- New JQL Functions 'lastLogin' and 'currentLogin', and Fields 'Voter' and 'Watcher'
- List of Logged-In Users
- List of Upgrade History
- Time Tracking now accepts Fractions
- Image Gallery
- Download Attachments as a ZIP
- Customisable Email Subject
- 'Heat Map' Gadget
- Database Configuration Tool
- XSRF protection
- Database Drivers Included
- OtherEnhancements and Fixes
- Plus over 80 other fixes and improvements

**Thank you for your feedback:**

🌟 More than 33 new feature requests implemented
🌟 More than 658 votes fulfilled

Your votes and issues help us keep improving our products, and are much appreciated.
Highlights of JIRA 4.1

1 New-Look Issues

The ‘View Issue’ and ‘Edit Issue’ screens have been simplified and modernised:

See the documentation for details.

^Top

2 Improved Global Keyboard Shortcuts

JIRA now has improved global shortcuts to provide quick navigation around JIRA. You can now go directly to the dashboard from anywhere else in JIRA, simply by typing ‘g’ then ‘d’. Type ‘g’ then ‘p’ to jump to the browse project page, or type ‘c’ to start creating an issue. You can find what other keyboard shortcuts are available by typing ‘?’ to bring up the Keyboard Shortcuts dialog box.

Screenshot: Keyboard Shortcuts Dialog Box
See the documentation for full details.

**JIRA Plugin Developers:**
This feature is implemented as a plugin, which will facilitate the addition of more keyboard shortcuts in future JIRA versions and iterations.

^Top

3

'Actions' Dropdown in Gadgets

You can now action issues directly from your JIRA dashboard:
"Bulk Move" Components and Versions

When performing a 'Bulk Move' of issues from one project to another, JIRA now allows mapping of old project values (for Components, Versions) to new values, using multiple edit controls and a simple name matching strategy to preselect the smart choice.

See the documentation for details.

New-look User Profile, 'Manage Dashboards' and 'Manage Filters'

JIRA User Profile screens have been redesigned to show you more details about your personal information
and preferences, and to make it easier to access other useful features associated with your account.

**Screenshot: The New-Look User Profile Summary Screen**

Please see the **documentation** for more details.

**Manage Dashboards**

The interface for the Manage Dashboards screens have been streamlined to blend in with the rest of the JIRA 4.1.

**Screenshot: The New-Look Manage Dashboards Screen**
Please see the documentation for more details.

Manage Filters

Like the Managed Dashboards screens, the interface of the Manage Filters screens have also been streamlined to blend in with the rest of the product.

Screenshot: The New-Look Manage Filters Screen

New JQL Functions 'lastLogin' and 'currentLogin', and Fields 'Voter' and 'Watcher'

Now you can do JQL searches based on your current session, e.g. find all issues that have been created since you last logged in to JIRA:

```
created > lastLogin()
```

You can also search for issues that you (or anyone else) are watching or have voted for:

```
voter in membersOf("jira-developers")
```

See the documentation for details.

List of Logged-In Users

Need to see who's currently using JIRA? Now you can take a look:
List of Upgrade History

Just for the record (and to assist with troubleshooting, etc), the System Info page now shows you a list of the upgrades that have been performed on your JIRA system.

Time Tracking now accepts Fractions

Ever wanted to enter 1.5 hours, instead of 90 minutes? Now you can.

Image Gallery

Each issue’s attached images are now displayed for your convenience:

See the documentation for details.
Download Attachments as a ZIP

Another handy time-saver — simply click to download all of an issue’s attachments as a single ZIP file:

See the documentation for details.

Customisable Email Subject

We are very pleased to announce that this much-requested feature is now a reality: you can now customise the subject of your JIRA-generated emails. See the documentation on Customizing Email Content for details.

‘Heat Map’ Gadget

Brand new gadget to show a heatmap of a key statistic in a bunch of issues:

For more details, please see Adding the Heat Map Gadget.

Database Configuration Tool

JIRA 4.1 ships with a new GUI application that will help you set up and test your database connection.
XSRF protection

JIRA now implements a 'form token checking' mechanism. This provides JIRA with the ability to validate the origin and intent of key browser requests, thus adding an additional level of security against cross-site request forgery (XSRF).

For details, please see the documentation on Form Token Handling.

Database Drivers Included

To save you time when installing or upgrading JIRA, we are now shipping database drivers for MySQL, Postgres and MSSQL. Oracle drivers will be included soon.

Other Enhancements and Fixes

- The 'Malformed security token' error in JIRA dashboard gadgets was fixed – If a user logged in to JIRA and left the JIRA dashboard open for a period of time, gadgets on the Dashboard would generate a 'Malformed security token' error.

Plus over 80 other fixes and improvements

The top 50 most popular issues resolved in JIRA 4.1 are listed below. Click here for the full list.

JIRA 4.1 Upgrade Guide

On this page:

- Upgrading from JIRA 4.0 to 4.1
  - General Upgrade Instructions
  - New Location of JIRA Log Files
  - Changes to Plugins
  - Form Token Handling
  - Customers with Crowd Integration
- Upgrading from JIRA 3.13 and earlier

Upgrading from JIRA 4.0 to 4.1

General Upgrade Instructions

Please ensure that you follow the instructions in the general JIRA upgrade guide (non-version specific), as well as the JIRA 4.1 specific instructions in the sections below. The general upgrade guide contains important tasks that are essential for getting your upgraded JIRA instance to work correctly (e.g. merging jira-application.properties customisations from the old instance to the upgraded instance).

New Location of JIRA Log Files

As of 4.1, JIRA no longer writes logs in your working directory. All logs are now written to the $JIRA_HOME/log directory.

Changes to Plugins

Please read Updating JIRA Plugins for JIRA 4.1.

Form Token Handling

JIRA 4.1 employs a new token authentication mechanism, which is used whenever JIRA actions are performed either through link request or form submission. This provides JIRA with the means to validate the origin and intent of the request, thus adding an additional level of security against cross-site request forgery. While the core JIRA product and its bundled plugins use this token handling mechanism by default, non-bundled plugins or those developed by third parties may not.

Therefore, if you are a JIRA plugin developer, please refer to the Form Token Handling documentation for details on how to incorporate this token handling mechanism into your JIRA plugin.

If you choose to implement form token handling into your JIRA plugin, please be aware of the following points:

- Any functions that use screen scraping, such as the 'create sub-task' function in FishEye, will be broken.
- REST API end points will not be affected unless they use form encoding.

Form token checking is enabled by default in JIRA 4.1. However, JIRA administrators can disable it on their site by following the instructions in Disabling Form Token Checking.
Customers with Crowd Integration

If you use Crowd with JIRA, please be aware that when you upgrade to JIRA 4.1, the seraph-config.xml file located in JIRA/atlassian-jira/WEB-INF/classes/ will be overwritten to include a new element:

```xml
<elevatedsecurityguard
    class="com.atlassian.jira.security.login.JiraElevatedSecurityGuard"/>
```

This element is required for security features in JIRA 4.1.

After upgrading to JIRA 4.1, however, you may notice problems with the login gadget. For more information, please refer to JRA-21205.

If you encounter these problems, please run through step 2 (Configuring JIRA to talk to Crowd) of Integrating Crowd with Atlassian JIRA procedure to ensure that Crowd is successfully reconfigured with JIRA. If you had made any customisations to any of the files throughout this procedure prior to upgrading to JIRA 4.1 (for example, the seraph-config.xml file), then you will need to re-integrate these customisations after the upgrade process.

**Upgrading from JIRA 3.13 and earlier**

In addition to the points listed above, please read the Upgrade Guide for every version you are skipping during the upgrade, particularly the JIRA 4.0 Upgrade Guide as JIRA 4.0 introduced significant licensing and technical changes. The complete list of Upgrade Guides is available here: Production Releases.

Updating JIRA Plugins for JIRA 4.1

On this page:
- Plugin Developer Notes
  - Dashboard API changes
  - Issue Operation module type is no longer available
  - IssueService should be used for performing issue operations
  - User & Date Customfields
  - Form Token Handling
- JIRA 4.1 Early Access Program (EAP)

**Plugin Developer Notes**

JIRA 4.1 introduces several changes that may break existing plugins. If you are using a plugin that is not shipped with JIRA, the plugin may need to be updated to work with JIRA 4.1. If the plugin was written by you, please read through the information below and see if any of it is relevant to your plugin. If you are using a plugin written by a third party, please check with the plugin’s author to see if the plugin has been tested with JIRA 4.1.

- Dashboard API changes
- Issue Operation module type is no longer available
- IssueService should be used for performing issue operations
- User & Date Customfields
- Form Token Handling

Please note that this is not the complete list of changes for JIRA 4.1; it is just the changes that plugin developers are likely to encounter most often.

Dashboard API changes

The PortletConfigurationStore has had the following method renamed in JIRA 4.1:

- **old name** (introduced in JIRA 4.0): addLegacyGadget
- **new name** (changed in JIRA 4.1): addLegacyPortlet

In JIRA 4.1 the PortalPage interface has also been updated to become a final concrete class. The PortalPageImpl has been removed. Instances of the PortalPage final class can now be constructed using the PortalPage.Builder class. If your plugin was using the PortalPage interface it will need to be re-compiled against JIRA 4.1 to use the new PortalPage class.

Issue Operation module type is no longer available

The IssueOperation module type, which allowed plugin developers to add their own links to the "Issue
Operations" list on the "View Issue" screen, is no longer available. In JIRA 4.1+ any plugin that needs to add a new issue operation to the "View Issue" page will need to be updated to use a Web-Item module instead.

So for example to convert the existing "Edit Issue" operation you would have to change the following plugin definition:

```
<issue-operation key="edit-issue"
   i18n-name-key="admin.issue.operations.plugin.edit.issue.name" name="Edit this issue"
   class="com.atlassian.jira.issue.operations.EditIssueOperation"
   state='enabled'>
   <resource type="velocity" name="view"
   location="templates/plugins/operations/editissue.vm" />
   <order>80</order>
</issue-operation>
```

...to be a Web-Item:

```
<web-item key="edit-issue"
   i18n-name-key="webfragments.view.issue.opsbar.operations.top.edit"
   name="Edit this issue"
   section="operations-top-level" weight="1">
   <label key="common.words.edit"/>
   <tooltip key="admin.issue.operations.plugin.edit.issue.name"/>
   <link linkId="edit-issue">
     /secure/EditIssue!default.jspa?id=${issue.id}
   </link>
   <condition class="com.atlassian.jira.plugin.webfragment.conditions.IsIssueEditableCondition"/>
   <condition class="com.atlassian.jira.plugin.webfragment.conditions.HasIssuePermissionCondition">
     <param name="permission">edit</param>
   </condition>
   <condition class="com.atlassian.jira.plugin.webfragment.conditions.ContextContainsCondition" invert="true">
     <param name="context-key">display-context</param>
     <param name="context-value">view-issue</param>
   </condition>
</web-item>
```

The backing EditIssueOperation class required previously by the Issue Operation Module is no longer required.

Issue Operation Web-Items need to be added to an appropriate Web Section. The default structure for the issue operation sections is as follows:

- web-section key="opsbar-operations" name="Ops Bar Operations Section" location="view.issue.opsbar"
- web-section key="operations-top-level" name="Ops Bar Operations Top level Section" location="opsbar-operations"
- web-section key="operations-work" name="Ops Bar Operations Work Section" location="opsbar-operations"
- web-section key="operations-attachments" name="Ops Bar Operations Attachments Section" location="opsbar-operations"
- web-section key="operations-voteswatchers" name="Ops Bar Operations Votes & Watchers Section" location="opsbar-operations"
- web-section key="operations-subtasks" name="Ops Bar Operations Subtask Section Section" location="opsbar-operations"
- web-section key="operations-operations" name="Ops Bar Operations Operations Section Section" location="opsbar-operations"
Plugin developers can add an issue operation web-item to any of the default menu sections, or define their own menu web-section and add it there.

IssueService should be used for performing issue operations

JIRA 4.1 introduces a new IssueService for performing operations (e.g. create/read/update/delete) on issues, which makes it much easier to perform issue operations from within a plugin. Plugin developers are strongly encouraged to change their plugins to use the new IssueService. The existing "back-end Actions" (e.g. ISSUE_UPDATE, ISSUE_DELETE) have been deprecated in favour of the new IssueService and may be removed in future releases of JIRA. The IssueManager class should also no longer be used directly to create or retrieve issues, as the new IssueService provides more robust validation and error handling.

For more information please see the detailed documentation on the IssueService.

User & Date Customfields

With the new View Issue page in JIRA 4.1, Date and User fields are grouped together in their own sections.

In order for Customfields to be placed in either section, their implementation of CustomFieldType must also implement either DateField or UserField.
Form Token Handling

JIRA 4.1 employs a new token authentication mechanism, which is used whenever JIRA actions are performed either through link request or form submission. This provides JIRA with the means to validate the origin and intent of the request, thus adding an additional level of security against cross-site request forgery. While the core JIRA product and its bundled plugins use this token handling mechanism by default, non-bundled plugins or those developed by third parties may not.

Therefore, if you are a JIRA plugin developer, please refer to the Form Token Handling documentation for details on how to incorporate this token handling mechanism into your JIRA plugin.

If you choose to implement form token handling into your JIRA plugin, please be aware of the following points:

- Any functions that use screen scraping, such as the 'create sub-task' function in FishEye, will be broken.
- REST API end points will not be affected unless they use form encoding.

Form token checking is enabled by default in JIRA 4.1. However, JIRA administrators can disable it on their site by following the instructions in Disabling Form Token Checking.

JIRA 4.1 Early Access Program (EAP)

Pre-release versions of JIRA 4.1 can be downloaded from our main Atlassian website or from one of the links below.

JIRA plugin developers and other interested parties can download and install these pre-release versions to:

- Help update plugins for JIRA 4.1 compatibility and
- Check out JIRA 4.1’s new features.

⚠️ Do not use pre-release JIRA builds in production!

Beta releases should not be used in production environments as they may still contain bugs and are not
You can download one of the following pre-release JIRA beta distributions that best suits your needs:

- JIRA 4.1.0-beta Enterprise - WAR/EAR (TAR.GZ Archive)
- JIRA 4.1.0-beta Enterprise - WAR/EAR (ZIP Archive)
- JIRA 4.1.0-beta Enterprise - Standalone (ZIP Archive)

JIRA 4.1.2 Release Notes

18 June 2010

The Atlassian JIRA team is proud to announce the release of **JIRA 4.1.2**. This point release is a **highly recommended upgrade** as it contains important fixes to security vulnerabilities — please refer to the [JIRA Security Advisory 2010-06-18](#) for details.

This point release also contains over 40 fixes and improvements, notably including:

- **New 'Comment' button** — You can now add comments via a 'Comment' button at the end of the 'View Issue' page. Clicking this button opens a large text box immediately below the last comment, into which you can add your new comment. This function is useful when you want to reply to recently added comments. For more information, please refer to [Commenting on an Issue](#).

- **'HttpOnly' Session Cookies** — To improve the security of JIRA, JIRA standalone distributions (version 4.1.2 and later) now implement 'HttpOnly' session ID cookies, as indicated in our [Security Advisory](#). Please refer to our [Preventing Security Attacks](#) guide for details on implementing 'HttpOnly' session ID cookies for JIRA EAR-WAR distributions.

Please also note that the bundled FishEye plugin and Bamboo plugin have been updated with security improvements, which are also mentioned in our [Security Advisory](#).

JIRA 4.1.2 is of course free to all customers with [active JIRA software maintenance](#).

**Don't have JIRA 4.1 yet?**
Take a look at all the new features in the [JIRA 4.1 Release Notes](#) and see what you are missing out on!

JIRA 4.1.2 Upgrade Guide

Upgrading from JIRA 4.1 or 4.1.1 to 4.1.2

Please follow the JIRA general upgrade instructions, plus note the following:

- A loophole has been closed whereby users who have the 'JIRA Administrators' permission but not the 'JIRA Users' permission were previously able to log in to JIRA. After the upgrade to JIRA 4.1.2, if you find that JIRA administrators can no longer log in, please check that they have been granted the 'JIRA Users' permission (see Managing Global Permissions).
- For JIRA instances connected to Atlassian Crowd, a loophole has been closed whereby users who do not have the 'JIRA Users' permission were previously able to log in to JIRA via Crowd Single Sign On (SSO). After the upgrade to JIRA 4.1.2, if you find that users can no longer login, please check that they have been granted the 'JIRA Users' permission (see Managing Global Permissions).

Upgrading from JIRA 4.0.x and earlier

In addition to the above, please read the JIRA 4.1 Upgrade Guide and the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

JIRA 4.1.1 Release Notes

21 April 2010

The Atlassian JIRA team announces the release of JIRA 4.1.1. This point release is a highly recommended upgrade as it contains important fixes to security vulnerabilities in JIRA (listed below). For more information about these security vulnerabilities and patches to fix these vulnerabilities in earlier versions of JIRA, please refer to the JIRA Security Advisory 2010-04-16.

Please also refer to the JIRA 4.1.1 Upgrade Guide for important changes in JIRA, which are designed to minimise the risk of security attacks.

JIRA 4.1.1 is of course free to all customers with active JIRA software maintenance.

Don't have JIRA 4.1 yet?

Take a look at all the new features in the JIRA 4.1 Release Notes and see what you are missing out on!

Download Latest Version

Upgrading from a Previous Version of JIRA

If you are upgrading, please read the JIRA 4.1.1 Upgrade Guide.

Updates and Fixes in this Release

JIRA 4.1.1 includes the following updates and bug fixes:
JIRA 4.1.1 Upgrade Guide

On this page:
- Upgrade Notes
  - Setting File Paths via the Administration User Interface
  - Changing JIRA's File Path Settings
  - 'Contact Administrators' Link
  - Backing Up Data to XML
  - Announcement Banner
  - Data for Support Requests
  - Differences between JIRA 4.1.1 and the Security Patches for Earlier JIRA Versions
  - Developers Note
- Upgrading from JIRA 4.1 to 4.1.1
- Upgrading from JIRA 4.0.x and Earlier

Upgrade Notes

JIRA 4.1.1 fixes several security vulnerabilities in JIRA. Patches that fix these vulnerabilities in earlier versions of JIRA are also available. Please refer to the JIRA Security Advisory 2010-04-16 or JIRA issue JRA-21004 for more information about these vulnerabilities and links to these patches.

Please be aware that these fixes have resulted in the following changes to JIRA's behaviour.

Setting File Paths via the Administration User Interface

JIRA now recognises a new variable called `jira.paths.set.allowed` in the `jira-application.properties` file (located in your JIRA Installation Directory).

By default, the value of this variable is set to `false`, such that it appears as `jira.paths.set.allowed=false` in the `jira-application.properties` file.

JIRA's file path settings are secure when any of the following is true:

- the `jira.paths.set.allowed` variable in `jira-atlassian.properties` is set to `false`
- the `jira.paths.set.allowed` variable in `jira-atlassian.properties` is set to anything other than `false`
than true or its value is left blank
- the jira.paths.set.allowed property does not exist in jira-atlassian.properties or it is 'commented-out'

and the following JIRA screens:

.../secure/admin/ViewAttachmentSettings.jspa (see Configuring File Attachments)
.../secure/admin/IndexActivate.jspa (see Search Indexing)
.../secure/admin/jira/ViewServices!default.jspa (see Automating JIRA Backups)
.../secure/admin/XmlRestore!default.jspa (see Restoring Data)

will display this message:

Changing the attachment, index, backup or restore settings is not allowed for security reasons. You must edit jira-application.properties and explicitly set 'jira.paths.set.allowed=true'. Restart JIRA and then the path settings will be able to be changed.

Changing JIRA's File Path Settings

If you want to change the locations for storing file attachments, backups, etc, you will need to do the following:

1. Shutdown JIRA.
2. Ensure jira.paths.set.allowed=true has been set in the jira-application.properties file and restart JIRA.
3. Perform your location changes and shutdown JIRA.
4. Secure JIRA's file path settings again by disabling the jira.paths.set.allowed property in jira-application.properties using one of the methods above.
   - Although this step is optional, it is strongly recommended as it will minimise the risk of attack to your JIRA instance.
5. Restart JIRA.

Upon setting the value of the jira.paths.set.allowed variable to true in jira-atlassian.properties, this message is displayed in the screens above:

You have enabled the ability to change attachment, index, backup or restore path settings from within JIRA. Having this setting on can cause a known security risk. See http://jira.atlassian.com/browse/JIRA-21004 for more details.
To re-enable stronger security, edit jira-application.properties and explicitly set jira.paths.set.allowed=false'. Restart JIRA and then the path settings will be NOT able to be changed.

'Contact Administrators' Link

For security reasons, the list of JIRA administrators, which can be accessed via the 'Contact Administrators' link in the JIRA footer, will be blank unless jira.paths.set.allowed is set to true (which is not recommended — see above).

Back Up Data to XML

JIRA now recognises another new variable called jira.paths.safe.backup.path in the jira-application.properties file (located in your JIRA Installation Directory).

By default, this variable is present in the jira-application.properties file, but it is disabled ('commented-out') and its value is an example directory path value only. If you enable the jira.paths.safe.backup.path variable and set its value to a valid directory, the following screen in JIRA:

.../secure/admin/XmlBackup!default.jspa (see Backing Up Data for more information)

will display this message:

You have named a safe backup directory. Any arbitrary backups will be written to this directory.

Otherwise, this message is displayed:

You have not named a safe backup directory and hence you are not allowed to make backups for security reasons. You must edit jira-application.properties and explicitly set
"jira.paths.safe.backup.path=/to/some/safe/path'. Restart JIRA and then you will be able to make arbitrary backups. NOTE: If you are using Windows, you will need to use double \ characters, for example

\d:\\some\\safe\\path

Examples of valid directory paths used with this variable:

- **UNIX-based systems (e.g. Linux or Mac OS X)**

  jira.paths.safe.backup.path=/some/safe/path

- **Windows systems**

  jira.paths.safe.backup.path=d:\\some\\safe\\path

JIRA's manual 'Backup Data to XML' feature will not be available unless the value of the `jira.paths.safe.backup.path` variable in `jira-application.properties` has been set to a valid path.

**Announcement Banner**

For security reasons, the ability to preview the [Announcement Banner](#) has been disabled.

**Data for Support Requests**

For security reasons, we no longer attach XML backups and logs to the emails generated by the [Support Request](#) page.

**Differences between JIRA 4.1.1 and the Security Patches for Earlier JIRA Versions**

The main purpose of the JIRA 4.1.1 point release was to fix several security vulnerabilities in JIRA. (Patches to fix these vulnerabilities in earlier versions of JIRA can be obtained via the [JIRA Security Advisory 2010-04-16](#) or JIRA issue [JRA-21004](#).)

However, that there are some differences in behaviour between JIRA 4.1.1 and the patches applied to earlier JIRA versions:

- Upon upgrading to or initially installing JIRA 4.1.1, [Captcha](#) will automatically be activated after five failed login attempts.

  If you had set the [Maximum Authentication Attempts Allowed](#) option (via the 'Administration' -> 'Global Settings' page) to another value prior to upgrading, it will be overridden and set to 5 upon upgrading to JIRA 4.1.1. Hence, to revert this option back to your previous setting, you will need to do this manually via the 'Global Settings' -> 'General Configuration' page.

- From JIRA 4.1.1, the following additional JSP pages have been disabled and are no longer available:

  - `/secure/admin/cacheViewer.jsp`
  - `/secure/admin/editworklog.jsp`
  - `/secure/admin/manageyourkitprofiling.jsp`
  - `/secure/admin/plugin-bundles.jsp`
  - `/secure/admin/workflow-debug.jsp`

**Developers Note**

When using the Atlassian SDK, the correct JIRA version to reference is 4.1.1.1 (not 4.1.1). See the [Atlassian Plugin SDK 3.1.2 Release Notes](#) for details.

**Upgrading from JIRA 4.1 to 4.1.1**

Please follow the [JIRA general upgrade instructions](#).

**Upgrading from JIRA 4.0.x and Earlier**
In addition to the above, please read the JIRA 4.1 Upgrade Guide and the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

JIRA 4.0 Release Notes

October 6, 2009

The Atlassian JIRA team is delighted to present a brand new version of one of the world's favourite issue-trackers.

We have improved the UI to provide contextual awareness, improving the navigation and usability with features like activity streams and issue history. We have also added the most powerful searching capabilities ever seen in a bug tracker, called JIRA Query Language (JQL). The simple auto-complete entry system makes it incredibly easy for any user to create sophisticated queries.

We have completely overhauled the JIRA dashboards to make it quick and easy for anyone to create and add gadgets, move them around using drag & drop, and share dashboards with other team members. Using the new Plugins 2.0 architecture, we built new dashboards using OpenSocial. This means each JIRA dashboard is an OpenSocial container allowing you to consume any OpenSocial compliant gadgets from either Atlassian tools or other external sources. Conversely, JIRA gadgets can be exposed in any OpenSocial container (like iGoogle, and soon, Confluence).

Upgrading to JIRA 4.0 is free for all customers with active JIRA software maintenance as of October 6, 2009.

Highlights of JIRA 4.0:
- Advanced Searching
- Dashboard Gadgets
- Activity Streams
- New looks "Browse Project"
- Charting Now Comes Standard
- New look Header
- Issue Actions in the Issue Navigator
- Project Icons
- Default Unit for Time Tracking
- "History" is now permanent
- Engine Room
- Plus over 900 other fixes and improvements

Thank you for your feedback:

- More than 50 new feature requests implemented
- More than 2600 votes fulfilled

Your votes and issues help us keep improving our products, and are much appreciated.

Upgrading to JIRA 4.0

JIRA 4.0 can be downloaded from the JIRA Download Center. Before upgrading, please refer to the JIRA 4.0 Upgrade Guide.

Also note that you will need to obtain a new license key before you can upgrade. Obtaining a new JIRA 4 license key is free and the key is valid for the remainder of your existing maintenance period. For details, please see the JIRA licensing changes FAQ.

Highlights of JIRA 4.0
Advanced Searching

The power of search can never be understated, especially in a system like JIRA that sits at the centre of your development team.

**JIRA Query Language** (or JQL) brings search to whole new level!

JQL is a structured query language that provides support for logical operations, including `AND`, `OR`, `NOT`, `NULL`, `EMPTY` — even on custom fields:

Using JQL is simple even for those who don't know what “DBA” means. Just start typing and the auto-complete feature starts to suggest fields, operators and values for you to define your query.

You can now create more advanced filters such that you can stay up to date using RSS feeds & e-mail subscriptions, as well as see detailed statistics and charts, on issues that you are actually interested in.

Dashboard Gadgets

Whether you are tracking bugs or managing your entire development process, JIRA dashboards let you stay up to date on what matters most.

The new look JIRA dashboard not only looks awesome, it now uses industry-standard 'gadgets'. So you can add external gadgets to your JIRA dashboard, as well as displaying JIRA gadgets in other places (such as iGoogle).

You can easily customise your dashboard by choosing a different layout, adding more gadgets, dragging the gadgets into different positions and changing the look of individual gadgets.

What's happened to your favourite JIRA portlets? Don't worry, every portlet that previously shipped with JIRA has been converted to a gadget.

If you are a plugin developer and have created your own portlets, see the instructions for converting your portlets to gadgets.
Activity Streams

The new activity stream allows you to stay up to date with exactly what is going on right this moment, what happened in that last hour or last few days.

Activity streams appear where you need them most — your user profile, project summary and view issue screens. You can even add an activity stream as a gadget on your dashboard.

The activity stream also provides an RSS feed, allowing you to subscribe to very specific RSS feeds of only the information that is most relevant to you.
New-look "Browse Project"

Understanding the status of your projects just got a lot easier with the new browse project UI.

Quickly see what work is complete as well as outstanding. You can then drill down to specific issues you want to see.

Your Bamboo builds, FishEye source information and Crucible code reviews are only a click away, as well.

See the documentation for more details.
Charting Now Comes Standard

We've built charts into JIRA and given them a visual redesign as well.

- "Recently Created Issues" report and gadget — Shows the rate at which issues are being created.
- "Created vs Resolved Issues" report and gadget — Shows the number of issues created vs number of issues resolved over a given period of time.
- "Resolution Time" report and gadget — Shows the average time taken to resolve issues.
- "Pie Chart" report and gadget — Shows the search results from a specified issue filter (or project) in a pie-chart, based on a statistic of your choice.
- "Time Since Issues" report and gadget — Shows the number of issues for which your chosen date field (e.g. 'Created') was set on a given date.
- "Average Age" report and gadget — Shows the average age (in days) of unresolved issues, e.g.:

Also, the "Resolution Time" field from the Charting plugin is now part of JIRA, so every issue now automatically has its resolution time recorded.
The new-look JIRA header gives you quick access to all of the most commonly-used functions. Creating an issue just got even faster!

Click to zoom in:

If you prefer keystrokes rather than mouse-clicks, you'll be pleased to know that you can use your keyboard to navigate the new header menus.

Issue Actions in the Issue Navigator

By popular request, issues are now actionable directly from the Issue Navigator:
The "Actions" menu is also available for the list of sub-tasks within an issue.

Project Icons

You can now give your project a visual identity, thanks to the introduction of project icons ('avatars'):

Default Unit for Time Tracking

You can now specify your preferred Default Unit (minutes/hours/days/weeks) for your JIRA system. This will be applied whenever users log work on an issue without specifying a unit.
"History" is now permanent

Your list of recently-viewed issues is now stored in JIRA's database — so it's available after you log out and back in, even if you use a different machine.
Engine Room

Beyond the ‘Back’ Button

When navigating away from a page where you have modified data, you will be prompted to see if you would like to save the data or discard your changes (see JRA-14911).

Index Queue

Index updates are now put in a queue. So even if the update takes longer than 30 seconds, the operation remains on the queue and is not lost. (See JRA-14220.)

Plus over 900 other fixes and improvements

The top 50 most popular issues resolved in JIRA 4.0 are listed below. Click here for the full list.

Showing 20 out of 981 issues
Before You Upgrade

Please note the following points before starting your upgrade:

- **Problems running JIRA 4.0 with WebLogic** — We are currently aware of an issue that is preventing JIRA 4.0 from running on WebLogic. If you are currently using JIRA with WebLogic, we strongly recommend that you do not upgrade JIRA until a fix is available. You can track the progress of this issue here: JRA-19367
- **Problems running JIRA 4.0 with IBM JVM and JRocket JVM** — We recommend that you use the Sun JVM with JIRA 4.0. We are currently aware of issues preventing JIRA 4.0 from working with the IBM JVM and JRocket JVM. You can track the progress of these issues here:
  - IBM JVM issue (JRA-19379)
  - JRocket JVM issue (JRA-19384)
- **Problems using the JIRA Portlet Macro in Confluence 3.0.x with JIRA 4.0** — Please read JIRA Portlet Macro page in the Confluence documentation for further information.
- If you are upgrading from JIRA 3.12 or earlier, please read the ‘Upgrading from JIRA 3.12 and earlier’ section below before starting your upgrade.

**Upgrading from JIRA 3.13.x to 4.0**

**Licensing Changes**

JIRA 4.0 introduces some **significant licensing changes**. Before you begin the upgrade, please go to my.atlassian.com for your upgraded license. Please note, any existing 3.x license files will not work with 4.0.

JIRA has moved to a **user-based licensing model** in JIRA 4.0. This means that you will need to calculate the number of users in your JIRA system to determine what license you will need, before you can complete your upgrade. For more information on this, please see the JIRA pricing changes FAQ.

Once you have upgraded your license, please follow the instructions below:

**General Upgrade Instructions**

Please ensure that you follow the instructions in the **general JIRA upgrade guide** (non-version specific), as well as the JIRA 4.0 specific instructions in the sections below. The general upgrade guide contains important tasks that are essential for getting your upgraded JIRA instance to work correctly (e.g. merging jira-application.properties customisations from the old instance to the upgraded instance).
Scheduling the Upgrade

Please note that upgrading to JIRA 4.0 may take a long time, depending on the size of your instance as well as server and database performance. During the upgrade, several upgrade tasks will need to run to upgrade your data to be ready for JIRA 4.0, such as:

- Calculating a resolution date for all resolved issues in your system
- Re-indexing your issues
- Converting saved filters to use JQL
- Converting existing portlets to gadgets

Please schedule sufficient downtime time for the upgrade in your production environment. It is recommended to run an upgrade first in a test environment to see how long the upgrade will take for your data set and hardware configuration.

Java Version

If you are running JIRA under version 6 (1.6) of the Sun JRE, please ensure that you are running a point release JRE 6 (1.6) Update 10 or higher. The reasons for this are:

- JIRA 4.0 introduces a new REST plugin type based on Jersey, which will not work with JRE 6 - JRE 6 Update 3. If you are running JIRA with one of these versions of the JRE you will see the following errors:

```
java.lang.LinkageError: JAXB 2.0 API is being loaded from the bootstrap classloader, 
but this RI (from 
bundle://16.0:3/com/sun/xml/bind/v2/model/impl/ModelBuilder.class) 
needs 2.1 API. Use the endorsed directory mechanism to place 
jaxb-api.jar in the bootstrap 
classloader. (See 
http://java.sun.com/j2se/1.5.0/docs/guide/standards/)
```

Note: JRE 5 (1.5) doesn't have this problem since it doesn't bundle JAXB.

- JIRA 4.0 uses Lucene v2.3, which is affected by a Sun hotspot compiler bug in JRE 6 (1.6) Update 4 and upwards (see JIRA-15681). The bug is fixed in JRE 6 (1.6) Update10.

JIRA Home

JIRA 4.0 has a new directory structure — for details, please see Important Directories and Files.

Please ensure that you set the `jira.home` property as described here.

Recommended Browsers

The following browsers are recommended for use with JIRA 4:

- Internet Explorer 7 and 8
- Firefox 3.x
- Safari 4

**Tip:** If you are looking for our recommended databases and applications servers, you can find them here:

- Supported Platforms

Users May Encounter 'Advanced Search'

If any of your users have saved invalid filters, the new 'Advanced Search' screen may appear when they try to display them.

'mail.mime.decodeparameters' System Property

The following system property must be set in order for the JIRA mail handler to work correctly with emails from RFC 2231-compliant mail clients:
Refer to Setting Properties and Options on Startup for instructions.

'Resolution Date' System Field

JIRA 4.0 introduces a new system field, the Resolution Date. This field provides the date when an issue last entered into a 'Resolved' workflow state. When upgrading to JIRA 4.0, an upgrade task will run, calculating the Resolution Date for every resolved issue in your system. If you have a large number of issues, this may take a long time. The speed at which this upgrade task runs can be improved by ensuring that your database statistics are up to date for your changegroup and changeitem tables (to ensure the database will select the most effective query plan).

For example, on Postgres this can be done by executing the following commands:

```
jiratest=# ANALYZE changegroup;
ANALYZE
jiratest=# ANALYZE changeitem;
ANALYZE
```

JIRA's RPC interface now provides two new methods to retrieve an issue's Resolution Date:

- `getResolutionDateById(String token, Long issueId)` – retrieves the Resolution Date given an issue id
- `getResolutionDateByKey(String token, String issueKey)` – retrieves the Resolution Date given an issue key

The RemoteIssue class was left unchanged, to ensure backwards compatibility of RPC clients.

Database Schema Changes

If you are using an Oracle or MySQL database, please note that two column data types have been changed. Therefore, the easiest way to upgrade to JIRA 4.0 is to perform an XML backup and restore as described in the Migrating JIRA to Another Server instructions.

If in the past, instead of performing an XML backup and restore, you have been upgrading by "pointing" the new version of JIRA at an old database, this is still possible. However, the procedure is more complicated. You will need to use SQL scripts to perform database schema changes.

For details (and the scripts), please see JIRA 4.0 Database Schema Changes for MySQL and Oracle.

Charting Plugin

JIRA 4.0 now bundles most of the charts previously provided by the JIRA charting plugin. If you currently have the JIRA charting plugin installed (v1.4.1 or previous) in WEB-INF/lib, please remove it as otherwise JIRA will fail to start.

The following charts have not been bundled with JIRA 4.0. If you are using any of the following charts, you will need to upgrade to version 1.5 of the JIRA charting plugin:

- Time to First Response Chart
- Average Number of Times in Status Chart
- Average Time in Status Chart
- Workload Pie Chart Report

JIRA Toolkit

If you are using the JIRA Toolkit, you will need to upgrade it to the latest version.

You will also need to install it in your JIRA home directory, rather than your atlassian-jira/WEB-INF/lib/ directory as it now runs in an OSGi container. Read Managing Add-ons for more information.
GreenHopper Plugin

**GreenHopper for JIRA 4.0** is now available for use with JIRA 4.0. You can download it on the [GreenHopper Plugin for JIRA Downloads](http://my.atlassian.com) page. Please follow the [GreenHopper Installation and Upgrade Guide](http://my.atlassian.com) for instructions on how to upgrade GreenHopper.

Please note, you need to **upgrade your GreenHopper license** before you can use GreenHopper with JIRA 4.0. Any existing GreenHopper license files **will not work** with JIRA 4.0. You can obtain a license from [http://my.atlassian.com](http://my.atlassian.com).

**Issue 'Status' Field Problem**

Prior to JIRA 4.0, it was possible to create two statuses whose names differed only in case (e.g. 'Resolved' and 'RESOLVED'). If you upgrade to JIRA 4.0, this will lead to ambiguities. Consider this scenario:

1. You have defined two issue statuses in a project with names that differ only in case, ('In Progress (Services)' and 'IN PROGRESS (SERVICES)'), to use in different workflows.
2. At a point in time, 100 issues are assigned the first status of 'In Progress (Services)' and 50 issues are assigned the second status of 'IN PROGRESS (SERVICES)'.
3. You browse the project's issues. The 'Status Summary' will incorrectly show only one 'In Progress (Services)' status with either 100 or 50 issues (picked randomly). The issue totals in the other summaries (By Priority, etc) will also be incorrect, due to JIRA not recognising the statuses as distinct.

Additionally, you will receive ambiguous results if you attempt to perform a search by name on the status in the Advanced Search (e.g. "Status = In Progress (Services)").

To resolve this issue, we recommend that you **ensure that each issue status is distinct** by renaming the duplicate statuses appropriately. You may also need to update any issue filters that you have set up.

**Plugin Notes**

JIRA 4.0 introduces several changes that may break existing plugins.

There are now two different types of plugins. Each type of plugin needs to be installed into a different directory to work. Read [Managing Add-ons](http://my.atlassian.com) for more information.

If you are using a plugin that is not shipped with JIRA, the plugin may need to be updated to work with JIRA 4.0. If the plugin was written by you, please read through [Updating JIRA Plugins for JIRA 4.0](http://my.atlassian.com) and see if any of it is relevant to your plugin. If you are using a plugin written by a third party, please check with the plugin's author to see if the plugin has been tested with JIRA 4.0.

**Memory**

Running JIRA v4.0 may require more RAM than running v3.x.

The default settings (suitable for small to medium usage) for standalone allocates a total of 512MB memory to the JIRA application.

Please ensure your server has enough available RAM to cover this.

If you are installing JIRA as a WAR/EAR, then you may need to increase the amount of "PermGen" memory allocated to JIRA. 256MB PermGen is recommended.

**Upgrading from JIRA 3.12 and earlier**

In addition to the points listed above, please read the [Upgrade Guide](http://my.atlassian.com) for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available [here](http://my.atlassian.com).

Please also note the following:

**Upgrading from JIRA 2.x Data and earlier**

If you are upgrading from JIRA 2.x data (or earlier) to JIRA 4.0, you **must upgrade to any JIRA 3.x release first** (3.13.5 recommended). You can then follow the [JIRA 4.0 Upgrade Guide](http://my.atlassian.com) to upgrade your JIRA instance to 4.0.

**JIRA 4.0 Database Schema Changes for MySQL and Oracle**

If you are using the MySQL or Oracle database, two column data types have been changed as described in the [JIRA 4.0 Database Schema Changes for MySQL and Oracle](http://my.atlassian.com) section below.

- Recommended method of upgrade
Alternative method of upgrade

MySQL notes for alternative method of upgrade

Oracle notes for alternative method of upgrade

JIRA 4.0 Database Schema Changes

Column data types

Recommended method of upgrade

The easiest way to upgrade to JIRA 4.0 is to perform an **XML backup and restore** as described in the Migrating JIRA to Another Server instructions.

Alternative method of upgrade

If in the past, instead of performing an XML backup and restore, you have been upgrading by "pointing" the new version of JIRA at an old database, this is still possible. However, the procedure is more complicated. You will need to use SQL scripts to perform database schema changes.

MySQL notes for alternative method of upgrade

1. Shutdown your JIRA instance.
2. Perform a backup of your MySQL database as follows:
   
   ```
   mysql --opt db_name > db_name.sql
   ```
   
   e.g.: `mysql --opt jiradb > jiradb_before4.sql`
3. Download the attached `mysql_4_0.sql` script.
4. Execute the following script:
   
   ```
   mysql --user=username --password=password db_name < mysql_4_0.sql
   ```
   
   e.g.: `mysql --user=root --password=password jiradb < mysql_4_0.sql`
5. If you see any errors, please contact Support for further assistance.
6. Point your new installation of JIRA 4.0 at your MySQL database and watch for any errors in the log during the startup sequence.

Note: The following warnings regarding database changes can be ignored. They will only appear the first time you start JIRA after upgrading your JIRA database to 4.0.

```
main WARN     [core.entity.jdbc.DatabaseUtil] Entity "ExternalGadget" has no table in the database
main WARN     [core.entity.jdbc.DatabaseUtil] Entity "GadgetUserPreference" has no table in the database
main WARN     [core.entity.jdbc.DatabaseUtil] Entity "Issue" has 24 fields but table "jiraissue" has 23 columns.
main WARN     [core.entity.jdbc.DatabaseUtil] Field "resolutiondate" of entity "Issue" is missing its corresponding column "RESOLUTIONDATE"
main WARN     [core.entity.jdbc.DatabaseUtil] Entity "PortletConfiguration" has 7 fields but table "portletconfiguration" has 6 columns.
main WARN     [core.entity.jdbc.DatabaseUtil] Field "gadgetXml" of entity "PortletConfiguration" is missing its corresponding column "GADGET_XML"
```

Oracle notes for alternative method of upgrade

1. Shutdown your JIRA instance.
2. Perform a backup of your Oracle database. There are multiple strategies here, so we will leave this up to your DBA.
3. Download the attached `oracle_4_0.sql` script.
4. Connect to SQL*Plus and execute the following script:

```sql
Copyright (c) 1982, 2005, Oracle. All rights reserved.

Connected to:
Oracle Database 10g Enterprise Edition Release 10.2.0.1.0 - Production
With the Partitioning, OLAP and Data Mining options

SQL> @/home/oracle/oracle_4_0.sql
```

5. If you see any errors, please contact Support for further assistance.

6. Point your new installation of JIRA 4.0 at your Oracle database and watch for any errors in the log during the startup sequence.

Note: The following warnings regarding database changes can be ignored. They will only appear the first time you start JIRA after upgrading your JIRA database to 4.0.

```
main WARN     [core.entity.jdbc.DatabaseUtil] Entity "ExternalGadget" has no table in the database
main WARN     [core.entity.jdbc.DatabaseUtil] Entity "GadgetUserPreference" has no table in the database
main WARN     [core.entity.jdbc.DatabaseUtil] Entity "Issue" has 24 fields but table "jiraissue" has 23 columns.
main WARN     [core.entity.jdbc.DatabaseUtil] Field "resolutiondate" of entity "Issue" is missing its corresponding column "RESOLUTIONDATE"
main WARN     [core.entity.jdbc.DatabaseUtil] Entity "PortletConfiguration" has 7 fields but table "portletconfiguration" has 6 columns.
main WARN     [core.entity.jdbc.DatabaseUtil] Field "gadgetXml" of entity "PortletConfiguration" is missing its corresponding column "GADGET_XML"
```

### JIRA 4.0 Database Schema Changes

The table below summarises the changes to the database schema. Please note that if you have developed any custom utilities which query or modify the JIRA database directly (i.e. without using the JIRA API), you need to check whether the utilities need to be updated.

#### Column data types

The following database column data types have been changed. Their column name, old and new data types, as well as the database table they belong to, are shown below:

**For MySQL:**

<table>
<thead>
<tr>
<th>TABLE NAME</th>
<th>COLUMN NAME</th>
<th>OLD DATA TYPE</th>
<th>NEW DATA TYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>propertytext</td>
<td>propertyvalue</td>
<td>TEXT</td>
<td>LONGTEXT</td>
</tr>
<tr>
<td>searchrequest</td>
<td>reqcontent</td>
<td>TEXT</td>
<td>LONGTEXT</td>
</tr>
</tbody>
</table>

**For Oracle:**

<table>
<thead>
<tr>
<th>TABLE NAME</th>
<th>COLUMN NAME</th>
<th>OLD DATA TYPE</th>
<th>NEW DATA TYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>propertytext</td>
<td>propertyvalue</td>
<td>VARCHAR2</td>
<td>CLOB</td>
</tr>
</tbody>
</table>
### Plugin Developer Notes

JIRA 4.0 introduces several changes that may break existing plugins. If you are using a plugin that is not shipped with JIRA, the plugin may need to be updated to work with JIRA 4.0. If the plugin was written by you, please read through the information below and see if any of it is relevant to your plugin. If you are using a plugin written by a third party, please check with the plugin’s author to see if the plugin has been tested with JIRA 4.0.

- **RPC plugin**
- **Responses from Servlet Plugin Modules are no longer decorated**
- **Combined JavaScript servlet has been removed**
- **Project/Component/Version Tab Panel Plugins**
- **Issue View Plugins**
- **Issue Tab Panel Plugins**
- **Search Request View Plugins**
- **PortalManager and PortalPageConfiguration removed**
- **New Searching**
- **Examples**
- **Plugging into JQL and what happened to my Custom Field Searchers**
  - **What is a JQL Clause?**
  - **Integrating with JQL**
  - **Integrating into the Issue Navigator**
  - **JIRA 3.x to 4.0 Filter Upgrade**
- **Converting Portlets to Gadgets**

#### RPC plugin

A number of methods in the RPC plugin were refactored to use services provided by JIRA's core services layer. As a result they may now perform stricter validation on input data, in line with behaviour exhibited by JIRA's UI. A side effect of these changes is that method calls will now throw `RemoteValidationException` instead of `RemotePermissionException` for certain method calls. This change won't break client stubs, since all methods throw `RemoteException` which is the superclass for `RemotePermissionException` and `RemoteValidationException`. However, if client code depends on `RemotePermissionException`, it will need to be updated to expect a `RemoteException` or `RemoteValidationException`.

If you have developed custom code that uses JIRA's SOAP interface, the client code may need to be updated. Responses from Servlet Plugin Modules are no longer decorated.

**The response generated by Servlet Plugin Modules served under /plugins/servlet will no longer be decorated by SiteMesh.** This means that if you are using servlets to display contents directly in the browser, they may be missing the JIRA header and footer. If the response from your servlet needs to be decorated, you have two possible solutions:

1. The best is to convert the servlet to a Webwork Plugin Modules as this is better suited for processing requests that generate HTML responses.
2. Alternatively, add

   ```html
   <meta content="decorator_name" name="decorator" />
   ```

   in the `<head>` element of your HTML response, where `decorator_name` is the name of the SiteMesh decorator that should be applied.

#### Combined JavaScript servlet has been removed

In JIRA 4.0 we cleaned up a lot of the JavaScript resources that are included on every page. As a result, the `combined-javascript` servlet was removed, in favour of Web Resources. This means that if your plugin defines javascript resources of the form:

```html
<resource type="javascript">/path/to/my/resource.js</resource>
```

they will no longer be included. They should be replaced by Web Resources.
Project/Component/Version Tab Panel Plugins

The API for this plugin has changed. We removed the action being passed in (what were we thinking) and made it a cleaner, more consistent interface. If you have any custom Tab Panel Plugins plugins, you will need to update them to use the new interface:

```java
/**
 * Unified interface for all fragment-based tab panels.
 * @since v4.0
 */
public interface TabPanel<D extends AbstractTabPanelModuleDescriptor, C extends BrowseContext>
{
    /**
     * Initialize the tab panel panel with the plugins ProjectTabPanelModuleDescriptor. This is usually used for
     * rendering velocity views.
     * @param descriptor the descriptor for this module as defined in the plugin xml descriptor.
     */
    void init(D descriptor);

    /**
     * Used to render the tab.
     * @param ctx The current context the tab is rendering in.
     * @return Escaped string with the required html.
     */
    String getHtml(C ctx);

    /**
     * Determine whether or not to show this.
     * @param ctx The current context the tab is rendering in.
     * @return True if the conditions are right to display tab, otherwise false.
     */
    boolean showPanel(C ctx);
}
```

The specific plugin endpoints extend this in the following manner:

```java
/**
 * A Tab panel to be displayed on the Browse Project page.
 */
public interface ProjectTabPanel extends TabPanel<ProjectTabPanelModuleDescriptor, BrowseContext>

/**
 * A Tab panel to be displayed on the Browse Component page.
 */
public interface ComponentTabPanel extends TabPanel<ComponentTabPanelModuleDescriptor, BrowseComponentContext>

/**
 * A Tab panel to be displayed on the Browse Version page.
 */
public interface VersionTabPanel extends TabPanel<VersionTabPanelModuleDescriptor, BrowseVersionContext>
```
If you are using `WebResourceManager.requireResource("...")`, your javascript will not be loaded when your tab is loaded via AJAX. You can include it via `WebResourceManager.getStaticPluginResource()` in your actual content. Note: this will be fixed in the next beta.

**Issue View Plugins**

The `com.atlassian.jira.plugin.issueview.IssueView` interface has changed such that the following methods:

```java
public String getContent(Issue issue, IssueViewRequestParams issueViewRequestParams);
public void writeHeaders(Issue issue, RequestHeaders requestHeaders, IssueViewRequestParams issueViewRequestParams);
```

now take in the `IssueViewRequestParams` parameter. This allows the plugin to access the parameters that were submitted with the request.

If you have written an Issue View plugin, you will need to update it such that it conforms to the new interface.

**Issue Tab Panel Plugins**

In JIRA 4.0, a new `sortable` property was introduced to distinguish if the contents of an issue tab panel are sortable. If they are not, the sortable link in the top right corner will not be shown. By default issue tab panels are now not sortable. To make a tab panel sortable, plugin developers will have to add the following attribute:

```xml
<issue-tabpanel key="all-tabpanel" i18n-name-key="admin.issue.tabpanels.plugin.all.name" name="All Tab Panel" class="com.atlassian.jira.issue.tabpanels.AllTabPanel">
  <description key="admin.issue.tabpanels.plugin.all.desc">Display all tab panels as one</description>
  <label key="viewissue.tabs.all">All</label>
  <order>0</order>
  <sortable>true</sortable>
</issue-tabpanel>
```

**Search Request View Plugins**

In JIRA 4.0, the `com.atlassian.jira.plugin.searchrequestview.SearchRequestView` has the following new method:

```java
/**
 * Prints the HTML headers for non-typical HTML such as Word or Excel views. (e.g.: requestHeaders.addHeader("content-disposition", "attachment;filename="sample.doc";"));
 *
 * @param searchRequest the original search request submitted by the user
 * @param requestHeaders subset of HttpServletResponse responsible for setting headers only
 * @param searchRequestParams context about the current search request
 */
public void writeHeaders(SearchRequest searchRequest, RequestHeaders requestHeaders, SearchRequestParams searchRequestParams);
```

If you have written a Search Request View Plugin, and the plugin implements the interface without extending `com.atlassian.jira.plugin.searchrequestview.AbstractSearchRequestView`, you will need to update the plugin and implement the new method. The easiest thing to do is to proxy the call straight to the existing method:
/**
 * Prints the HTML headers for non-typical HTML such as Word or Excel views. (e.g.: requestHeaders.addHeader("content-disposition",
 "attachment;filename="sample.doc");)
 *
 * @deprecated since v3.13.3 please use @link #writeHeaders(com.atlassian.jira.issue.search.SearchRequest, RequestHeaders, SearchRequestParams)
 * @param searchRequest the original search request submitted by the user
 * @param requestHeaders subset of HttpServletResponse responsible for setting headers only
 */
public void writeHeaders(SearchRequest searchRequest, RequestHeaders requestHeaders);

Note that the SearchRequestParams object used by Search Request View Plugins now extends IssueViewRequestParams and therefore allows the plugin to access request parameters.

PortalManager and PortalPageConfiguration removed

The deprecated components PortalManager and PortalPageConfiguration have been removed. Developers should now be using the JiraDashboardStateStoreManager to obtain similar functionality.

The PortalPageConfiguration had methods that made changes directly to the database (e.g. store, addPortletConfig, deletePortletConfig, deletePortletConfigs, reload). The PortalPage does not have such methods. All persistent changes must now be made through the JiraDashboardStateStoreManager passing the required DashboardState as an argument.

The PortalPageManager & PortalPageService may also be used to manipulate a PortalPage within JIRA. These classes should no longer be used however since they will be re-written or removed for JIRA 4.1.

New Searching

The way a search is performed in JIRA has significantly changed. The introduction of advanced searching (JQL) necessitated a rewrite of the JIRA searching subsystem. In the process, the API for searching has also been changed (and improved) significantly. Unfortunately these changes will almost certainly mean that plugins that search will need to be updated for JIRA 4.0.

In JIRA 3.x and earlier, searching was achieved using a SearchRequest in combination with SearchParameters and SearchSorts. While the SearchRequest still continues to exist in JIRA 4.0, the SearchParameters have been replaced with the Query object.
The `Query` is JIRA's internal representation of a JQL search. It contains the search condition (i.e. the "where" clause) and the search order (i.e. the "order by" clause). The `Query` object can be created using the `JqlQueryBuilder`. For example, to create a query "find all issues assigned to either Dylan or Tokes that are unresolved and due in the next week" you would call:

```java
final JqlQueryBuilder builder = JqlQueryBuilder.newBuilder();
builder.where().assignee().in("Dylan", "Tokes").and().unresolved().and().due().lt().string("+1w");
builder.orderBy().dueDate(SortOrder.ASC);
Query query = builder.buildQuery();
```

Once the `Query` has been obtained, it can be used to execute a search. In JIRA 4.0 a new `SearchService` has been added to provide a central location for `Query` related operations. To run the search you can simply call `SearchService.search()` as documented on the `SearchService`. The `SearchProvider` is still available for those who need to control the finer details of searching.

The `Query` object is immutable; once it is created it cannot be changed. The `JqlQueryBuilder` represents the mutable version of a `Query` object. The `JqlQueryBuilder` can be primed with an already existing `Query` by calling `JqlQueryBuilder.newBuilder(existingQuery)`.

In JIRA 3.x the `SearchRequest` was the object that was passed to the searching system to perform a search. The `Query` object has taken over this role in JIRA 4.0; the `SearchProvider` and `SearchService` now take in `Query` objects rather than `SearchRequests`. The `SearchRequest` object has been reworked in JIRA 4.0 to significantly reduce its responsibility. For instance, ordering information is now stored on the `Query` object rather than on the `SearchRequest` object. The `SearchRequest` really represents a saved search (aka. filter). You should only need to deal with `SearchRequests` if you are working with filters. Even in this case, all searching operations need to be performed on `Query` objects by calling `SearchRequest.getQuery()`.
It is often necessary to get a URL for a particular Query. The SearchService provides the `getQueryString(query)` method for this. The method returns a parameter snippet of the form `jqlQuery=<jqlUrlEncodedQuery>`, which can be appended safely to an existing URL that points at the Issue Navigator. Note that the links that JIRA 4.0 generates are JQL based, so are incompatible with JIRA 3.x and before. Old valid JIRA 3.x URLs will still work with JIRA 4.0.

Given a `Query` object it is possible to retrieve its JQL representation by calling either `getGeneratedJqlString(query)` or `getQueryString(query)` on the SearchService. The service makes sure that any values in the query that need to be escaped are handled correctly. Importantly, the `Query.toString()` method does not return valid JQL (on purpose).

The `SearchService.parseQuery(jqlString)` method can be used to turn a JQL string into its `Query` representation. The return from this method has details on any parse errors encountered.

A `Query` object, especially those parsed directly from the user, may not be valid. For example, the user may be trying to find issues in a status that does not exist. The `SearchService.validateQuery(query)` method can be used to see if a particular `Query` object is valid. Errors are returned with messages that can be displayed to the user. Executing an invalid `Query` will not result in any errors and in fact may return results. To run an invalid query, JIRA will just make the invalid conditions equate to false and run the query. For example, searching for `status = "I don't Exist" or user = bbain` will result in the query `<false> or user = bbain` actually being run.

There are some methods on the `SearchService` that we did not discuss here. Check out documentation on the `SearchService` for more information.

**Examples**

Here’s a complete example how to obtain search results for the query “project is JRA and the reporter is the currently logged in user and custom field with id 10490 contains 'xss'”:

```java
String jqlQuery = "project = JRA and reporter = currentUser() and cf[10490] = xss";
final SearchService.ParseResult parseResult =
    searchService.parseQuery(authenticationContext.getUser(), jqlQuery);
if (parseResult.isValid())
{
    try
    {
        final SearchResults results =
            searchService.search(authenticationContext.getUser(), parseResult.getQuery(), PagerFilter.getUnlimitedFilter());
        final List<Issue> issues = results.getIssues();
    }
    catch (SearchException e)
    {
        log.error("Error running search", e);
    }
}
else
{
    log.warn("Error parsing jqlQuery: " + parseResult.getErrors());
}
```

The preceding search could have also been written using the `QueryBuilder`.
Plugging into JQL and what happened to my Custom Field Searchers

The introduction of advanced searching (JQL) necessitated a rewrite of the JIRA searching subsystem. Unfortunately these changes will certainly mean that any CustomFieldSearchers will need to be updated to work in 4.0.

The most fundamental change is that all JIRA 4.0 searching is implemented using JQL. A JQL search consists of two components: firstly, a number of conditions, or Clauses, that must be matched for an issue to be returned; and secondly, a collection of search orderings that define the order in which the issues should be returned. The Query object is JIRA’s internal representation of a search. It is now the responsibility of the CustomFieldSearcher to take a relevant Query, validate its correctness and generate a Lucene query to find issues that match it. By doing this your custom field becomes searchable using JQL.

The CustomFieldSearcher and/or the custom field is also responsible for ordering results if the order in the search includes the custom field. If your custom field ordered correctly in JIRA 3.x, then it will order correctly in JIRA 4.0. While the internal representation of an order has changed in JIRA 4.0, it still uses the same interfaces to order the search results. We will not address ordering again.

What is a JQL Clause?

A custom field must process the Clauses from a JQL search to integrate into JQL. Each Clause consists of a number of conditions (e.g. abc != 20) combined by the AND and OR logical operators (e.g. abc = 20 AND (jack < 20 OR jill > 34). In JIRA a condition is represented by a TerminalClause, the logical AND by an AndClause and a logical OR by an OrClause, all of which implement the Clause interface. Finally, the logical NOT operator can be used to negate any other Clause. It is represented by a NotClause that also implements Clause. These Clause objects are composed together to represent a complex conditions. For example, the condition abc = 20 AND NOT(jill > 34 OR NOT jack < 20) is represented by the following tree:
A **Clause** can be navigated by passing an instance of a **ClauseVisitor** to the `accept` method of a **Clause**. This follows the traditional visitor pattern.

The **TerminalClause** represents a **Clause** of the form "field operator value". Inside the **TerminalClause** the "operator" is one of the values from **Operator** enumeration while the "value" is represented as an **Operand**. An **Operand** can represent a single value (e.g. `field = "single"`), a list of values (e.g. `field in ("one", 1235)`), a function (e.g. `field = function(arg1, arg2)`) or **EMPTY** (e.g. `field is EMPTY`). In the end, all you want is the values from the **Operand**. These can be obtained as a list of **QueryLiteral** (see below) by calling `JqlOperandResolver.getValues()`. The **JqlOperandResolver** also has the `isEmptyOperand`, `isFunctionOperand`, `isListOperand` and `isValidOperand` methods that can be used to determine the type of the **Operand**.

A **QueryLiteral** represents either a **String**, **Long** or **EMPTY** value. These three represent JQL's distinguishable types. It is up to the **CustomFieldSearcher** to convert these values into something that makes sense to it. The type of a **QueryLiteral** can be determined by calling its `isEmpty`, `getLongValue` or `getStringValue` methods. The get methods will return `null` or `false` when the method and the **QueryLiteral** type do not match.

**Integrating with JQL**

In JIRA 3.x a **CustomFieldSearcher** was the way to provide customized searching functionality for custom fields. In JIRA 4.0 it is still the plugin point for searching; however, the **CustomFieldSearcher** interface has changed significantly to accommodate the introduction of JQL. One of the major changes is that the **CustomFieldSearcher** must return a **CustomFieldSearcherClauseHandler** in JIRA 4.0. This object is a composition of a **ClauseValidator** and a **ClauseQueryFactory**.

The **ClauseValidator** is used by JIRA to ensure that a JQL query is valid according to the **CustomFieldSearcher**.
It is up to the validator to ensure that the operator and the value from the passed TerminalClause makes sense for the CustomFieldSearcher and its associated custom field. Any errors can be placed in the returned MessageSet. They should be internationalised with respect to the passed user.

The validate method must always return a MessageSet as its result. A null return is not allowed. A MessageSet is an object that contains all of the errors and warnings that occur during validation. All messages in the MessageSet need to be translated with respect to the passed searching user. An empty MessageSet indicates that no errors have occurred. A MessageSet with errors indicates that the JQL is invalid and should not be allowed to run. The returned messages will be displayed to the user so that any problems may be rectified. A MessageSet with warnings indicates that the JQL may have problems but that it can still be run. Any warning messages will be displayed above the results.

The ClauseValidator does not need to check if the passed TerminalClause is meant for the for it, JIRA makes sure that it only passes TerminalClauses that the ClauseValidator is meant to process. It does that by only passing TerminalClauses whose "field" matches one of the names the custom field must handle.

ClauseValidators need to respect JIRA security. A ClauseValidator should not leak information about JIRA objects that the searcher does not have permission to use. For example, a ClauseValidator should not differentiate between an object not existing and an object that the user has no permission to see. A ClauseValidator that behaves badly will not cause JQL to expose issues that the searcher is not allowed to see (since JQL does permission checks when it runs the filter), though it does open up an attack vector for information disclosure.

The ClauseValidator must be thread-safe and re-entrant to ensure correct behavior. JIRA will only create one instance of the ClauseValidator per custom field instance. This means that multiple threads may be calling the validator at the same time.

The ClauseQueryFactory is used by JIRA to generate the Lucene search for a JQL Clause.
public interface ClauseQueryFactory
{
    /**
     * Generates a lucene query for the passed {@link TerminalClause}....
     *
     * @param queryCreationContext the context of the query creation call; used to indicate that permissions should be ignored for "admin queries"
     * @param terminalClause the clause for which this factory is generating a query.
     * @return QueryFactoryResult contains the query that lucene can use to search and metadata about the query. Null cannot be returned.
     */
    @NotNull
    QueryFactoryResult getQuery(@NotNull QueryCreationContext queryCreationContext, @NotNull TerminalClause terminalClause);
}

It is the responsibility of the ClauseQueryFactory to create the Lucene search for the passed TerminalClause and QueryCreationContext. The generated Lucene search is returned in the QueryFactoryResult. The result contains the search (a Lucene Query object which is not related the the JQL Query object) and a flag to indicate whether or not the Lucene search should be negated. When set to true, JIRA will actually only match issues that do not match the returned Lucene search. For example, a ClauseQueryFactory may decide to implement a condition like field != value by returning a Lucene search that matches field = value and setting the flag to true. You can also implement this condition by returning a Lucene search that matches field != value and setting the flag to false.

The new argument here is the QueryCreationContext. This object contains the variables that may be necessary when creating the query. The QueryCreationContext.getUser method returns the user that is running the search and as such should be used to perform any security checks that may be necessary. The QueryCreationContext.isSecurityOverridden method indicates whether or not this function should actually perform security checks. When it returns true, the factory should assume that the searcher has permission to see everything in JIRA. When it returns false, the factory should perform regular security checks.

A ClauseQueryFactory should try to limit the queries so that issues that the user cannot see are excluded. Consider the query affectsVersion = "1.0". The ClauseQueryFactory might detect that there are two versions named "1.0", one from project1 and the other from project2. The factory might then notice that the user doing the search cannot see project2. The factory can then return a query that contains only the version from project1. This is mainly an efficiency concern as JIRA filters all search results to ensure users cannot see issues they are not allowed to.

The ClauseQueryFactory does not need to check if the passed ClauseQueryFactory is meant for it; JIRA makes sure that it only passes TerminalClauses that the ClauseQueryFactory is meant to process. It does that by only passing TerminalClauses whose "field" matches one of the JQL names the custom field must handle. Put simply, the ClauseQueryFactory must handle any passed TerminalClause.

The ClauseQueryFactory must also handle the situation when an invalid TerminalClause is passed to it. An invalid TerminalClause is one whose associated ClauseValidator would not validate. The ClauseQueryFactory must return an empty Lucene search if the passed TerminalClause is invalid. Most importantly, the ClauseQueryFactory must not throw an exception on an invalid TerminalClause.

A ClauseQueryFactory needs to be careful when implementing any of the negating operators (i.e. !, !~, "not in"). These operators should not match what is considered empty by the custom field and CustomFieldSearcher. For example, the JQL query resolution is EMPTY will return all unresolved issues in JIRA. The query resolution != fixed will only return all resolved issues that have not been resolved as "fixed", that is, it will not return any unresolved issues. The user has to enter the query resolution != fixed or resolution is EMPTY to find all issues that are either unresolved or not resolved as "fixed".

A ClauseQueryFactory also needs to consider field visibility. A CustomFieldSearcher should not match
any issues where its associated custom field is not visible. Importantly, asking for EMPTY should not match issues where the custom field is not visible. For example, the JQL query `resolution is EMPTY` will not return issues from a project whose resolution field has been hidden. A hidden field is assumed not to exist.

There are some extra interfaces that the `CustomFieldSearcherClauseHandler` may also implement to provide optional functionality to the searching subsystem:

- `ValueGeneratingClauseHandler`: Gives the `CustomFieldSearcher` the ability to suggest some values during JQL entry auto-complete. This is really only useful for custom fields whose values come from an allowable finite set.
- `CustomFieldClauseSanitiserHandler`: Gives the `CustomFieldSearcher` the ability pre-process the query and remove sensitive information from the query before it is displayed to the passed user.
- `CustomFieldClauseContextHandler`: Gives the `CustomFieldSearcher` the ability to customize JIRA’s query context calculation. This interface is best left alone, unexplained and unimplemented.

**Integrating into the Issue Navigator**

The good old Issue Navigator still exists. The Issue Navigator actually has two modes: simple and advanced. The simple mode is what was considered the Issue Navigator in JIRA 3.x. Each searcher on the simple Issue Navigator represents a `Clause`. For example, selecting “JIRA” in the project searcher produces the `Clause` project = JIRA. Using multiple searchers is achieved by ANDing the multiple implied `Clauses` together. In this way the simple Issue Navigator actually generates JQL.

The advanced mode shows the raw JQL to the user. It allows a user to search by entering arbitrary JQL. Since it simply shows JQL, it is possible to create a query using the simple Issue Navigator and then view it in the advanced Issue Navigator. However, it may not always be possible to go from the advanced Issue Navigator to the simple Issue Navigator, as the simple view only allows a very limited set of JQL. A JIRA user will be able to move from the advanced to the simple Issue Navigator when the current JQL can be represented in the simple view. JIRA will stop a user from transitioning from the advanced to the simple Issue Navigator when the JQL is just too complicated to represent correctly.

The `CustomFieldSearcher` itself is still responsible for integrating into the Issue Navigator. The `CustomFieldSearcher` extends from the `IssueSearcher`, which has undergone major cosmetic surgery in JIRA 4.0. The main change is that the methods on the `IssueSearcher` have been relocated to new interfaces that the `IssueSearcher` composes. For example, JIRA 3.x used to call `issueSearcher.getEditHtml()` to get the searcher’s HTML but now in 4.0 it calls `issueSearcher.getSearchRenderer().getEditHtml()`. The following table shows a summary of all the changes:

<table>
<thead>
<tr>
<th>Old Searcher Method</th>

The SearcherRender interface groups together the rendering related IssueSearcher actions. The new method isRelevantForQuery takes over the role from the isRelevantForSearchRequest method. Its job is to take a complete Query object and determine if the CustomFieldSearcher is relevant for that Query. The result is used to decide if the HTML from the getViewHtml is included on some JIRA pages. As a general rule, this essentially involves walking the Query and looking for TerminalClauses related to the CustomField dSearcher. For example:

```java
final NamedTerminalClauseCollectingVisitor clauseVisitor = new NamedTerminalClauseCollectingVisitor(clauseNames.getJqlFieldNames());
if (query != null && query.getWhereClause() != null)
{
    query.getWhereClause().accept(clauseVisitor);
}
return clauseVisitor.containsNamedClause();
```

This code essentially walks the tree looking for all TerminalClauses that have a particular set of names. The Query is relevant if such a Clause exists or is not relevant otherwise.

The isRelevantForQuery method is only called if the passed Query fits in the simple Issue Navigator.

The SearcherInformation interface groups together methods that return data about the IssueSearcher into a single interface. The SearcherInformation.getField method simply returns the Field associated with the searcher. This information is available to the searcher once the CustomFieldSearcher.init() is called by JIRA.
**SearcherInformation.getSearcherGroupType** is a method that returns the group the searcher should be seen in on the navigator. The custom field has to return **SearcherGroupType.CUSTOM**. JIRA will always force this value even if it is specified as something different.

The **SearchInputTransformer** interface groups together those methods on the **IssueSearcher** that convert **Query** objects into different forms so that they can be displayed and manipulated using the simple Issue Navigator. The simple Issue Navigator does not have the ability to represent all possible JQL queries. The **SearchInputTransformer.doRelevantClausesFitFilterForm** method allows JIRA to ask the **CustomFieldSearcher** if the passed Query can be represented in the simple Issue Navigator. This is used by JIRA to stop people trying to view complex JQL in the simple Issue Navigator. When this call is made, the **CustomFieldSearcher** must decide if the relevant sections of the passed Query can be represented in the simple Issue Navigator form. Irrelevant Clauses (i.e. those Clauses unrelated to the Searcher) should be ignored. The method must return true when the Query is not at all relevant. This method is normally implemented by walking the Query and checking that any relevant TerminalClauses are connected via the correct set of logical conditions. For example, here is some common code encountered with JIRA’s internal searchers:

```java
if (query != null && query.getWhereClause() != null)
{
    final Clause whereClause = query.getWhereClause();
    final SimpleNavigatorCollectorVisitor collector = new SimpleNavigatorCollectorVisitor(clauseNames.getJqlFieldNames());
    whereClause.accept(collector);
    if (!collector.isValid() || collector.getClauses().size() > 1)
    {
        return false;
    }
    else if (collector.getClauses().size() == 1)
    {
        final TerminalClause terminalClause = collector.getClauses().get(0);
        return checkOperator(terminalClause.getOperator()) &&
               checkOperand(terminalClause.getOperand(), true);
    }
}
return true;
```

The code starts by creating a **ClauseVisitor** that will find all the TerminalClauses with particular names. This visitor will also detect whether or not the all paths from the root Clause of the tree to the TerminalClauses are only through AndClauses. This check is made to ensure that these TerminalClauses form part of a simple AND expression since the simple Issue Navigator can only support AND operators between Clauses. The code also ensures that only one TerminalClause is found since this is what the **CustomFieldSearcher** generates for the simple Issue Navigator. Note that the method will return true if no relevant TerminalClauses are found.

The new **SearchInputTransformer.populateFromQuery** method replaces the old **populateFromSearchRequest** method. It essentially takes the passed Query and serialises the relevant parts into their associated **FieldValuesHolder** representation. It is up to this **CustomFieldSearcher** to work out which parts of the Query are relevant to it. It must ignore those parts of the Query that it was not designed to handle. This method will only be called if it is known that the Query fits in into the simple Issue Navigator. It is generally implemented by walking the tree and looking for the relevant TerminalClauses and subsequently serialising them into the passed **FieldValuesHolder**. For example:
if (query.getWhereClause() != null) {
    final ClauseVisitor visitor = new DateSerializer();
    query.getWhereClause().accept(visitor);
    fieldValuesHolder.put(dateSearcherConfig.getPreviousField(),
                            visitor.getPreviousDate());
    fieldValuesHolder.put(dateSearcherConfig.getNextField(),
                            visitor.getPreviousDate());
}

In this example we used a ClauseVisitor that walks the Query and calculates the parameters for a
date-based searcher. Once the visitor is run, we simply add the calculated parameters to the FieldValuesHol-
der.

The SearchInputTransformer.getSearchClause method replaces the old populateSearchRequest.
Its job it to take the relevant values from the FieldValuesHolder and generate a Clause for them.
This Clause will be combined with the Clauses from other active searchers using the AND operator to produce
the final Query on the simple Issue Navigator. The irrelevant values from the FieldValueHolder must be
ignored. This method is generally called after JIRA has called SearchInputTransformer.populateFromPa-
rams with the web parameters returned from the filter form, that is, this method is how the filter form is converted
into a Clause and subsequently a Query. Consider the following example:

    final Clause relativeClause = createPeriodClause((String)
            fieldValuesHolder.get(dateSearcherConfig.getPreviousField()),
            (String) fieldValuesHolder.get(dateSearcherConfig.getNextField()));
    final Clause absoluteClause = createDateClause((String)
            fieldValuesHolder.get(dateSearcherConfig.getAfterField()),
            (String) fieldValuesHolder.get(dateSearcherConfig.getBeforeField()));
    return createCompoundClause(relativeClause, absoluteClause);

This example demonstrates how a date field looks in the FieldValueHolder for its relevant properties and
uses them to create a Clause. This example also shows that the returned Clause can be as complex as the Cu-
stomFieldSearcher wants.

The SearchInputTransformer.getSearchClause and SearchInputTransformer.populateFromQu-
ery really form a pair. The Clause returned from SearchInputTransformer.getSearchClause must be
correctly processed by SearchInputTransformer.populateFromQuery. If this does not occur, then it
would be possible to generate a query in the simple Issue Navigator view that cannot actually be viewed in it.
This also implies passing the Clause object returned from SearchInputTransformer.getSearchClause to
the SearchInputTransformer.doRelevantClausesFitFilterForm must return true.

JIRA 3.x to 4.0 Filter Upgrade

In JIRA 3.x saved searches (aka. filters) were stored in the database as XML. In JIRA 4.0, all searchers are
stored directly as JQL. An upgrade task has been written to convert 3.x filters into JQL. Unfortunately, there is no
way for plugin developers to integrate into this upgrade task. This essentially means that the upgrade may fail if
you have a custom SearchParameter or use an existing SearchParameter in an unorthodox way. JIRA will
inform users through e-mail if any of their filters could not be upgraded cleanly. The administrator is also made
aware of any problems through JIRA’s log files.

Converting Portlets to Gadgets

JIRA 4.0 introduces a new dashboard based on the OpenSocial specification. Legacy portlets will still be
supported, but they will miss out on a lot of new features (e.g. displaying the gadget on iGoogle). As such you
may wish to convert your plugin’s portlets to gadgets. To do so please follow the documentation available in the
Gadget Development Hub, as well as the instructions for writing a plugin upgrade task to convert any portlet
settings that users may have saved.

Upgrading JIRA 2.x Data to JIRA 4.0

If you are upgrading from JIRA 2.x data (or earlier) to JIRA 4.0, you must upgrade to any JIRA 3.x release
first (3.13.5 recommended). You can then follow the JIRA 4.0 Upgrade Guide to upgrade your JIRA instance to
4.0
Writing a Plugin Upgrade Task for JIRA 4.0

Overview

JIRA 4.0 will introduce a new dashboard, effectively making the Portlet Plugin Module obsolete. Legacy portlets will still be supported via a Legacy Gadget bridge; however, they will miss out on a lot of the new features that gadgets offer (e.g. the ability to share gadgets with other apps such as iGoogle). It therefore makes sense to convert portlets over to gadgets. Information about how to write a gadget can be found in the Gadget Development Hub, and specifically the page about gadgets and JIRA portlets.

If you've converted a portlet to a gadget, you will most likely need an upgrade task to convert existing data of your users into the new format used by the gadget you have written. This page describes the process of creating such an upgrade task.

Why an upgrade task?

Portlets generally have some configuration data associated with them by their users. For example, the First Response Time chart portlet, available in the Charting Plugin, allows users to configure how many days previous to draw the chart for (among other things). For efficiency reasons, gadgets do not use the same storage mechanism as portlets do to store these user preferences. An upgrade task is thus needed to convert existing user data over to the new format required by the new gadget.

Upgrade framework

JIRA 4.0 introduces a new plugin framework (version 2.2 or later of the Atlassian Plugin Framework, affectionately known as 'Plugins2'), which provides an events system that lets plugins register to listen for certain events (such as a 'Framework started' event). JIRA 4.0 also bundles SAL, which already includes a plugin upgrade framework. SAL provides a plugin upgrade manager that listens for the 'Framework started' event and will look for Plugin Upgrade Tasks to run in order to upgrade data for plugins.

What does all this mean? Effectively, plugin writers don't have to worry about providing an upgrade task framework. They can simply provide a Plugin Upgrade Task component and SAL will guarantee that their upgrade task is run on startup.

Example

Let's look at what needs to be done to run an upgrade task to convert the First Response Time chart portlet data over to gadget data.

1. Convert your Portlet to a Gadget

Please follow the documentation available in the Gadget Development Hub for this step, and specifically the page about gadgets and JIRA portlets.

2. Add dependency on SAL

First we'll need access to the SAL API in the charting plugin project. Add the following dependency to the plugin's pom.xml:

```
pom.xml

...<dependency>
   <groupId>com.atlassian.sal</groupId>
   <artifactId>sal-api</artifactId>
   <version>2.0.17</version>
   <scope>provided</scope>
</dependency>
...
```

Re-generate your IDE's project descriptor (`mvn idea:idea` or `mvn eclipse:eclipse`) after this step to allow you to access the new SAL API classes in your project.

3. Convert your plugin to Plugins2

SAL is a Plugins2 bundle and your plugin will have to be converted to the Plugins2 format first before you can
write an upgrade task that will be picked up by the PluginUpgradeManager. Gadgets are also only supported in Plugins2 bundles.

There are generic instructions available for how to do this, but let's look specifically at the Charting plugin example. The only thing that is needed is to add the `plugins-version="2"` attribute in `atlassian-plugins.xml`:

```xml
<atlassian-plugin key="${atlassian.plugin.key}" name="${project.name}" system="true" plugins-version="2">
...
```

4. Writing your upgrade task

Now that all the prerequisites are done, the Upgrade task for the plugin can be written. This class simply needs to implement the `PluginUpgradeTask` interface provided by SAL.

Here's an example implementation:

```java
public class GadgetUpgradeTask implements PluginUpgradeTask
{
    private static final Logger log = Logger.getLogger(GadgetUpgradeTask.class);

    private final PortletConfigurationStore portletConfigurationStore;
    private final JiraPropertySetFactory propertySetFactory;

    public GadgetUpgradeTask(JiraPropertySetFactory propertySetFactory)
    {
        //NOTE: Can't get the portletConfigStore injected here since it is not made available to plugins2
        this.portletConfigurationStore = ComponentManager.getComponentInstanceOfType(PortletConfigurationStore.class);
        this.propertySetFactory = propertySetFactory;
    }

    // ...
```
/**
 * The build number for this upgrade task. Once this upgrade task has run the
 * plugin manager will store this
 * build number against this plugin type. After this only upgrade tasks with
 * higher build numbers will be run
 */

public int getBuildNumber()
{
    return 1;
}

public String getShortDescription()
{
    return "Upgrades legacy portlet configuration to new gadget user prefs.";
}

public Collection<Message> doUpgrade() throws Exception
{
    final SimpleLegacyPortletUpgradeTask upgradeTask =
    new SimpleLegacyPortletUpgradeTask("com.atlassian.jira.ext.charting:firstresponsetime",
    URI.create("rest/gadgets/1.0/g/com.atlassian.jira.ext.charting:firstresponsetime/fi
    rstresponsetime.xml"));
    //First get all the portletConfigurations in the database.
    final EnclosedIterable<PortletConfiguration> iterable =
    portletConfigurationStore.getAllPortletConfigurations();
    iterable.foreach(new Consumer<PortletConfiguration>()
    {
        public void consume(@NotNull final PortletConfiguration pc)
        {
            //for each portletconfiguration, check if it's key matches the
           portlet key we want to upgrade
            if (pc.getKey() != null &&
            pc.getKey().startsWith(upgradeTask.getPortletKey()))
            {
                log.info("Upgrading portletconfig with id '" + pc.getId() +
                ";
            }
            //first lets convert the preferences for this portlet to the
            new prefs format used for gadgets.
            final Map<String, String> prefs;
            try
            {
                prefs = upgradeTask.convertUserPrefs(pc.getProperties());
            }
            catch (ObjectConfigurationException e)
            {
                throw new RuntimeException(e);
            }
            //then create essentially a copy of the old portletConfig.
            final PortletConfiguration newConfig =
            new PortletConfigurationImpl(pc.getId(),
            pc.getDashboardPageId(), null, null, pc.getColumn(), pc.getRow(),
            null, upgradeTask.getGadgetUri(), Color.color8,
            prefs);
            //Now lets store this new config back to the database.
            portletConfigurationStore.store(newConfig);
            //clear out the old properties for this portlet
private void removePropertySet(final PortletConfiguration pc) {
    final PropertySet livePropertySet = propertySetFactory.buildNoncachingPropertySet(OfbizPortletConfigurationStore.TABLE, pc.getId());
    @SuppressWarnings("unchecked")
    final Collection<String> keys = livePropertySet.getKeys();
    for (String propertyKey : keys) {
        livePropertySet.remove(propertyKey);
    }
}

/**
 * Identifies the plugin that will be upgraded.
 */
public String getPluginKey() {
    return "com.atlassian.jira.ext.charting";
There are a few things to note about this implementation:

- `getBuildNumber()` and `getPluginKey()` determine if this upgrade task will run. `getPluginKey()` needs to match the key of the plugin that is being upgraded (in this case the charting plugin). `getBuildNumber()` returns the build number for this upgrade task. '1' will do for any plugin that hasn't had any upgrade tasks run against it yet. SAL's PluginUpgradeManager will run this upgrade task and store the build number against the plugin once completed. After this, only upgrade tasks with a higher build number than '1' will be executed.
- `doUpgrade()` uses some helpers provided by JIRA (i.e. the SimpleLegacyPortletUpgradeTask) to convert the legacy portlet to a gadget. This is entirely optional, however, and plugin authors are free to implement this method however they like.

Please ensure that the plugin upgrade task ONLY upgrades `portletConfigurations` for the plugin that's being upgraded! Any other `portletConfigurations` MUST be left untouched, as otherwise there's a risk of clobbering other portlets' data!

5. Register the upgrade task

Now we simply need to register the upgrade task as a component in the plugin:

```
<component key="gadgetUpgradeTask" name="Gadget Upgrade Task"
    class="com.atlassian.jira.ext.charting.upgrade.GadgetUpgradeTask" public="true">
    <interface>com.atlassian.sal.api.upgrade.PluginUpgradeTask</interface>
</component>
```

The PluginUpgradeManager in SAL will automatically scan for components that implement the `PluginUpgradeTask` interface. Please note that they have to be declared as `public="true"`.

That's it. Simply re-package the plugin, deploy it to the instance of JIRA to upgrade and restart the JIRA instance. The plugin upgrade task should be executed when JIRA starts up.

⚠️ It's highly recommended that you perform a backup of your JIRA instance before attempting this!

JIRA 4.0.2 Release Notes

26 February 2010

The Atlassian JIRA team is proud to announce the release of **JIRA 4.0.2**. This point release contains over 40 bug fixes and improvements, notably including:

- The gadget resizing issue.
- Greatly improved stability of JIRA gadgets in Confluence.
- Support for WebLogic 9.2.

JIRA 4.0.2 is of course free to all customers with active JIRA software maintenance.

**Don't have JIRA 4 yet?**

Take a look at all the new features in the JIRA 4.0 Release Notes and see what you are missing out on!

[Download Latest Version](#)
If you are upgrading, please read the JIRA 4.0.2 Upgrade Guide.

**Updates and Fixes in this Release**

JIRA 4.0.2 includes the following updates and bug fixes:

<table>
<thead>

**JIRA 4.0.2 Upgrade Guide**

Please note the following before performing this upgrade:

⚠️ **Please test your business-critical gadgets**

As with any new and rapidly evolving technology, gadgets offer exciting opportunities — and potential technology incompatibilities. If your cross-server gadgets are working successfully with JIRA 4.0, and you rely on these gadgets for business purposes, please test them with JIRA 4.0.2 on a non-production server before upgrading.

Upgrading from JIRA 4.0 or 4.0.1 to 4.0.2

Please follow the JIRA general upgrade instructions.

Upgrading from JIRA 3.13.x and earlier

In addition to the above, please read the JIRA 4.0 Upgrade Guide and the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available [here](#).
JIRA 4.0.1 Release Notes

8 December 2009
The Atlassian JIRA team is proud to announce the release of JIRA 4.0.1. This point release contains over 60 bug fixes and improvements, notably including the gadget loopback issue. We are also very pleased to announce support for WebSphere 6.1.0.27.

JIRA 4.0.1 is of course free to all customers with active JIRA software maintenance.

Don’t have JIRA 4 yet?
Take a look at all the new features in the JIRA 4.0 Release Notes and see what you are missing out on!

JIRA 4.0.1 Upgrade Guide

Upgrading from JIRA 4.0 to 4.0.1

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Please note the following before performing this upgrade:

**WebLogic 9.2 not supported**
Please note that the WebLogic 9.2 patch issued for JIRA 4.0 in JRA-19367 may not work with JIRA 4.0.1 in all environments. We are addressing WebLogic 9.2 support and will provide a solution as soon as possible. If you are using WebLogic, please stay on JIRA 3.13.x in the interim.

**Websphere version is important**
WebSphere 6.1.0.27 is supported with JIRA 4.0.1. The version of WebSphere is important as we have seen issues running with WebSphere 6.1.0.3. Please see JRA-19421 for details. WebSphere 7.0 is not supported.

**Gadgets served to other servers may experience issues**
As a result of fixing the 'loopback' problem (where a server had problems serving a gadget to itself), issues such as JRA-19890 may now be encountered when serving JIRA gadgets to iGoogle. As with any new and rapidly evolving technology, gadgets offer exciting opportunities — and potential technology incompatibilities. If your cross-server gadgets are working successfully with JIRA 4.0, and you rely on these gadgets for business purposes, please test them with JIRA 4.0.1 on a non-production server before upgrading.

Please follow the JIRA general upgrade instructions.

Upgrading from JIRA 3.13.x and earlier

In addition to the above (particularly regarding Websphere and WebLogic), please read the JIRA 4.0 Upgrade Guide and the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

**JIRA 3.13 Release Notes**

9 September 2008

The Atlassian JIRA team is proud to present JIRA 3.13.

This release fulfils some of the most popular JIRA feature requests. Dashboards can now be shared, and filter sharing has been improved — so it’s easy to set up multiple ‘template’ dashboards, each with specific portlets and filters. New JIRA users can then simply select the dashboards most suited to them.

People using customised workflows will be pleased to learn that JIRA 3.13 provides the ability to edit active workflows — that is, workflows that are currently being used. So workflow logic, transitions, screens and post-functions can now be tweaked on the fly, and a JIRA wizard will guide decisions on how active issues should be handled.

By popular request, you can now restore individual projects from a backup, making it much easier to merge projects back into your existing JIRA instance. We are also happy to announce that personal licenses are available with this release of JIRA.

Please be aware of JIRA Security Advisory 2008-08-26, which is relevant to this release.

Upgrading to JIRA 3.13 is free for all customers with active JIRA software maintenance.

**Highlights of JIRA 3.13**
- Shareable dashboards
- Improved filter sharing
- Favourite filters and dashboards
- Restoring projects
- Editable active workflows
- Enhanced sub-task quick creation
- Personal licenses
- Plugins
- Progress bar for long-running
operations
- Application improvements
- Plus more than 200 other fixes and improvements

Thank you for your feedback
🌟 85 new feature and improvement requests implemented!
🌟 1485 votes fulfilled!
Your votes and issues help us keep improving our products, and are much appreciated.

Upgrading to JIRA 3.13
You can download JIRA 3.13 from the JIRA Download Center. Before upgrading, please refer to the JIRA 3.13 Upgrade Guide.

Highlights of JIRA 3.13

1. Shareable dashboards

In many organisations, different departments use different JIRA projects and so need a customised dashboard for people in each department to use. For instance, at Atlassian our HR team uses their own special 'Recruitment' project and workflow to manage the hiring process. JIRA 3.13 resolves this popular issue (434 votes!) by letting you set up dashboard pages that you can share with your user group, project or all JIRA users.

- Read more about shareable dashboards in the dashboard pages documentation.

2. Improved filter sharing

Previous versions of JIRA allowed you to share filters, but filter sharing was restricted to sharing with a single user group or sharing with all JIRA users. Filter sharing is much more flexible in this release. You can now also share your filter with multiple user groups, projects, specific project roles or any combination of these.

- Read more about shareable filters in the issue filters documentation.
Favourite filters and dashboards

Keep your most commonly used filters and dashboards at your fingertips by adding them as favourites. You can add your own filters and dashboards as favourites in JIRA 3.13, as well as filters and dashboards shared with you by other users. We have also added search for filters and dashboards to help you find the tools you need to manage your information.

- Read more about favourite filters and dashboards in the issue filters and dashboard pages documentation.

Restoring projects

One of the most voted for JIRA features has been included in this release — the ability to restore individual projects from a backup file (409 votes!). The project import feature allows you to select a project from a backup file and restore it into an existing JIRA instance, without losing the existing projects or data.

- Read more about restoring a project from backup.
Editable active workflows

We have added the ability to edit active workflows in this release. You can now change most features of your active workflow without having to edit a separate copy of it.

- Read more about editing active workflows in the JIRA workflow documentation.

Enhanced sub-task quick creation

The sub-task 'quick creation' form included on the issue page in JIRA has been enhanced, making it easier for you to quickly add sub-tasks to an issue without having to navigate to a new page. The sub-task quick creation form includes new fields, such as the 'Original Estimate' field and can be easily hidden to reduce clutter on your screen.

- Read more about the sub-task 'quick creation' form in the creating a sub-task documentation.
Personal licenses

Personal Licenses are now available with JIRA 3.13. Run your own individual non-commercial instance of JIRA under this free license. You can run your fully functional instance of JIRA indefinitely under this license, but you will not be eligible for Atlassian support.

- Read more about personal licenses.

Plugins

We are bundling a new version of the FishEye plugin for JIRA in this release, helping your JIRA instance to work even more closely with your FishEye and Crucible applications. You can now use the FishEye plugin for JIRA to integrate your JIRA instance with Perforce. In addition, we've added a bunch of cool new features to the plugin, including FishEye and Crucible specific charting portlets for JIRA, the integration of reviews and code commits into JIRA workflow and trusted applications support.

- Read more about the FishEye plugin for JIRA

You may also be interested in integrating your JIRA instance with your Bamboo application. We have recently updated the JIRA Bamboo plugin with a host of new functionality to let you monitor your builds and issues. (Note that the JIRA Bamboo plugin is currently not bundled with JIRA.)

- You can get the plugin from the JIRA BAMBOO Plugin page.

Progress bar for long-running operations

We have added a progress bar to a number of long-running operations in JIRA, including workflow migration, project import and re-indexing. This simple visual cue provides you with helpful information about your task, such as the time elapsed, percentage complete and the time you started it.
### Application Improvements

The version of Tomcat that is shipped with JIRA Standalone has also been upgraded to version 5.5.26 (previously Tomcat 5.5.20). Refer to the 5.5.x Release Notes on the Apache Tomcat website.

### Plus more than 200 other fixes and improvements

The top 50 most popular issues resolved in JIRA 3.13 are listed below. See all the issues here.

### JIRA 3.13 Upgrade Guide

Upgrading from JIRA 3.12.xx to 3.13

Please follow the JIRA general upgrade instructions, plus note the following:

1. Introduction of Favourite Dashboards and Filters
Favourite Dashboards

JIRA 3.13 introduces the favourite dashboards feature, which allows you to add dashboard pages that are owned by you or shared by other users as favourites (and hence, are displayed as tabs on your dashboard). On upgrade to JIRA 3.13, all your dashboard pages will be added as your favourites and displayed on your dashboard. If you do not wish any of your dashboards to be added as favourites, then you can remove them as favourites after the upgrade. See the dashboards documentation for details.

Favourite Filters

Similar to favourite dashboards, JIRA 3.13 introduces the favourite filters feature, which allows you to add issue filters that are owned by you or shared by other users as favourites. On upgrade to JIRA 3.13, all your issue filters will be added as your favourites. If you do not wish any of your filters to be added as favourites, then you can remove them as favourites after the upgrade. See the issue filters documentation for details.

Please note, this change will not affect issue filter sharing, e.g. if you are using a shared issue filter in one of your dashboard portlets, it will still be shared with you after the upgrade.

Please also note, that any custom developed portlets (or other JIRA objects that use filters that have been developed by 3rd parties) that have a dropdown list (not a pop-up picker) for filters, will now only show a list of the user's favourite filters, instead of all shared filters.

Favourite Filters portlet

The 'List All Filters' portlet has been replaced with the 'Favourite Filters' portlet in this release. Your dashboard will be automatically upgraded if it is currently configured to display the 'List All Filters' portlet.

2. Tomcat, MySQL database connection dropouts

Please note, if you wish to use a MySQL database with JIRA Standalone you must set up the bundled Tomcat server (version 5.5.26) to survive connection closures. You must also do this if you are running JIRA EAR/WAR in Tomcat 5.5.25 or later, or Tomcat 6.0.13 or later. Versions 5.5.25 and above of Tomcat 5, and versions 6.0.13 and above of Tomcat 6, have been noted to exhibit problems maintaining connections to MySQL databases. Please read this document for details on the changes required.

3. Changes to jira-application.properties

jira.subscription.email.max.issues property

The jira.subscription.email.max.issues property has been added to the jira-application.properties file. This property allows you to specify the maximum number of issues that can be included in an email subscription. The default value for this property is 200. You may wish to update this property after the upgrade if you wish to set a different limit on the number of issues that can be included in an email subscription. See the documentation on Advanced JIRA Configuration or further details on this file.

4. Support for Portlet Plugins with JSP Views Discontinued

Portlet plugins with JSP views are no longer supported. If you have written a custom Portlet plugin and have used a JSP as the view template, you will need to convert your JSP to Velocity.

5. Updates to JIRA SOAP and XML-RPC APIs
com.atlassian.jira.rpc.soap.JiraSoapService

- replaced
  
  ```java
  RemoteProject[] getProjects(String token) throws RemoteException;
  ```

  with

  ```java
  RemoteProject[] getProjectsNoSchemes(String token) throws RemoteException
  ```

  You should use `getProjectsNoSchemes()` instead because it much more memory efficient and quicker.

- added
  
  ```java
  RemoteProject getProjectWithSchemesById(String token, Long projectId) throws RemoteException;
  ```

- deprecated
  
  ```java
  RemoteFilter[] getSavedFilters(String token) throws RemoteException;
  ```

- added
  
  ```java
  RemoteFilter[] getFavouriteFilters(String token) throws RemoteException;
  ```

com.atlassian.jira.rpc.xmlrpc.XmlRpcService

- replaced
  
  ```java
  Vector getProjects(String token) throws Exception;
  ```

  with

  ```java
  Vector getProjectsNoSchemes(String token) throws Exception;
  ```

- deprecated
  
  ```java
  Vector getSavedFilters(String token) throws Exception;
  ```

- added
  
  ```java
  Vector getFavouriteFilters(String token) throws Exception;
  ```

6. Crowd Cache Timeout
This is only applicable if you are using Crowd.

The default timeout for caching user details has changed from 5 minutes to 2 hours. This will improve the performance of the application but will mean that it will take longer for changes to user details to reach the application. Details on how to configure the Crowd caches can be found here.

Upgrading from JIRA 3.12 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

JIRA 3.13.5 Release Notes

21 July 2009
The Atlassian JIRA team is proud to announce the release of JIRA 3.13.5 in Standard, Professional and Enterprise editions. This point release includes over 30 bug fixes and improvements.

JIRA 3.13.5 is of course free to all customers with active JIRA software maintenance.

Don’t have JIRA 3.13 yet?
Take a look at all the new features in the JIRA 3.13 Release Notes and see what you are missing out on!

JIRA 3.13.1 Upgrade Guide

Upgrading from JIRA 3.13 to 3.13.1

Please follow the JIRA general upgrade instructions

Upgrading from JIRA 3.12 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

Known Issues
IMAP message handling produces issues with no description

If your JIRA instance is set up to create issues and/or comments from e-mails that come from an IMAP mail box, you will need to deploy a patch to address a problem with issue creation (as described in JRA-15954). Please deploy the patch file attached to JRA-15954 (instructions for deploying the patch are contained in this comment of JRA-15954).

JIRA 3.12 Release Notes

Atlassian Software Systems is proud to present JIRA 3.12.

JIRA 3.12 provides a number of enhancements for the upcoming JIRA Studio. Because some of these enhancements may be of benefit to you, we have decided to provide them as a public release rather than making you wait until JIRA 4.0.

The major feature of this release is the ability to ‘trust’ Confluence. For people who use both JIRA and Confluence, the ability to configure a ‘trust’ relationship between the two will allow for a seamless end-user experience, e.g. the ‘JIRA Issues’ macro will now display exactly the same list of issues on a Confluence page that the user would see in the JIRA Issue Navigator. No longer is there a need to hard-code JIRA user names and passwords on a Confluence page. Note that you will need Confluence 2.7 (which is due for release this month) or later.

Also included in 3.12 is a new global permission, ‘JIRA System Administrators’. This will be particularly useful for organisations where the JIRA administrators are not necessarily the same people who are responsible for maintaining the file system and network environment. Granting the ‘JIRA System Administrators’ permission to only a controlled number of people will give your Windows or UNIX administrators greater peace of mind, while people with the ‘JIRA Administrators’ permission can enjoy full control over JIRA-specific administration.

Upgrading to JIRA 3.12 is free for all customers with active JIRA software maintenance as at 30 November 2007.

Highlights of JIRA 3.12:

- ‘Trusted’ Confluence
- ‘JIRA System Administrators’ permission
- FishEye plugin now bundled with JIRA
- Improvements to the Subversion plugin
- Improvements to the ‘Project Statistics’ and ‘Filter Statistic’ portlets
- New post function for workflows: ‘Assign to Current User’
- Enhanced language support for searching
- Visual SourceSafe plugin
- Plus more than 100 other fixes and improvements

Upgrading to JIRA 3.12 can be downloaded from the JIRA Download Center. Before upgrading, please refer to the JIRA 3.12 Upgrade Guide.

Highlights of JIRA 3.12

1. ‘Trusted’ Confluence
For people who use both JIRA and Confluence, the ability to configure a ‘trust’ relationship between the two will allow for a seamless end-user experience, e.g. the ‘JIRA Issues’ macro will now display exactly the same list of issues on a Confluence page that the user would see in the JIRA Issue Navigator. No longer is there a need to hard-code JIRA user names and passwords on a Confluence page. (Note that you will need Confluence 2.7 or later.)

The ‘JIRA Issues’ macro in Confluence will now display (to appropriate users) issues that have a Security Level set:

A new global permission has been added to JIRA, to allow for separation of duties.

- People who are granted the new ‘JIRA System Administrators’ permission can perform all of the administration functions in JIRA, including functions which could affect the application environment or network (e.g. data import/export, SMTP configuration, database connection).
- People with only the ‘JIRA Administrators’ permission can now perform most administration functions (e.g. creating new JIRA users; creating projects), but not functions which could affect the application environment or network.

This will be useful for organisations which need to delegate JIRA-specific administration privileges to particular people, without granting them total system administration privileges.

Note that everyone who had the ‘JIRA Administrators’ global permission before the upgrade will automatically receive the new ‘JIRA System Administrators’ global permission during the upgrade. This will ensure that everyone can still perform the same functions they could previously.

FishEye plugin now bundled with JIRA

The FishEye plugin automatically detects JIRA issue-keys in your code commit messages. Within your JIRA issues and projects, relevant commit messages will be displayed along with links to the FishEye changesets and files — and (optionally) Crucible code reviews.
Improvements to the Subversion plugin

Using the Subversion plugin (available separately), it is now possible to configure Subversion repositories from within JIRA. No longer do you need to muck around with .properties files and bounce JIRA every time you make a change! If you have existing SVN repositories configured in your properties file, the new SVN plugin will read that information and create identical settings for you.

Click to enlarge

Improvements to the 'Project Statistics' and 'Filter Statistic' portlets

The Project Statistics portlet and the Filter Statistic portlet now show the total number of issues that match...
New post function for workflows: 'Assign to Current User'

With the new post function 'Assign to Current User', you can now automatically assign an issue to the logged-in user when the issue moves through a particular workflow transition.

This is useful if you need to assign an issue to the logged-in user under particular circumstances, but not give them full rights to assign issues. For example, on Atlassian's support system, when a support specialist clicks 'Start Investigating', the issue is automatically assigned to them — even if they don't have 'Assign Issues' permission.

Enhanced language support for searching

The range of available languages for JIRA search indexes has been expanded. This means that even more people around the world can now choose to have JIRA index their issue data in their native language.

This provides more meaningful search results for end-users, because:

- 'stop' words (i.e. words that are deliberately ignored by the JIRA search engine, such as 'the') are now recognised in more non-English languages (Brazilian, Chinese, Czech, Greek, French, Dutch, Thai).

- 'stemming' (i.e. the derivation of related words, such as 'archived', from a stem such as 'archive) is now supported in French, Brazilian, German, French, Dutch, Russian and English. For example, if your index language is set to French:
  - a search for "marchera" will find "L'enfant a marché"; and
  - a search for "marché" will find "l'enfant marchera".

Visual SourceSafe plugin

The new VSS plugin displays Microsoft Visual SourceSafe commit information (along with the changed paths) related to JIRA issues, projects or project versions. This plugin is in beta and available for a separate download.
### All Projects: Relational DB Project (Key: REL-1)

**Project Lead:** Sys Admin

- Create a new issue in project Relational DB Project
- Administrator Project
- Release Notes

**Select:** Open Issues, Road Map, Change Log, Popular Issues, VSS Commits

JIRA 3.12 Upgrade Guide

Upgrading from JIRA 3.11 to 3.12

Please follow the JIRA general upgrade instructions, plus note the following:

1. Everyone who had the ‘JIRA Administrators’ global permission before the upgrade will automatically receive the new ‘JIRA System Administrators’ global permission during the upgrade. This will ensure that everyone can still perform the same functions they could previously.
2. The following new Seraph property can be used to fix JRA-10508:
   ```xml
   <init-param>
     <param-name>insecure.cookie</param-name>
     <param-value>true</param-value>
   </init-param>
   ```
3. Due to the Seraph upgrade, to fix JRA-10508 all users will be prompted to log in again. This will also affect users who have the ‘Remember me’ checkbox ticked.
4. If you are building JIRA from source, please note that Maven2 is now required for a build. This is because the JIRA Fisheye Plugin requires Maven2.
5. If you are using the JIRA Toolkit, it is recommended that you upgrade to the latest version in order to fix JRA-13553
6. Please note that the new Trusted Applications feature is not supported on Orion versions prior to 2.0.5. Also note that Resin2 has problems and you will need to update the Resin extra jars.
7. There is a new database table. Please see the following page for details

Upgrading from JIRA 3.10.2 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

Using the Trusted Applications feature with Crowd

Please note that older versions of the Crowd client, (i.e. version 1.2.1 or earlier), can interfere with the correct operation of the Trusted Applications feature. If you are enabling Trusted Applications and using Crowd, please ensure that your Crowd client is version 1.2.2 or later.

JIRA 3.12 DB Schema Changes

The table below summarises the changes to the database schema. Please note, that if you have developed any custom utilities which query or modify the JIRA database directly (i.e. without using the JIRA API), please check whether the utilities need to be updated.

**New Database Table Table - TRUSTEDAPP**

The database table trustedapp has been added to schema support Trusted Applications:

It has the following columns:
The ID column is the primary key.

For a mapping of the above type to your particular database, please see the appropriate `fieldtype-*.xml` file in JIRA's WEB-INF/classes/entitydefs/ directory.

### JIRA 3.12.3 Release Notes

**30 April 2008**

**JIRA 3.12.3 Release Notes**

The Atlassian JIRA team is proud to announce the release of **JIRA 3.12.3** in Standard, Professional and Enterprise editions. This point release includes over 40 bug fixes and improvements which can be viewed below. Click a specific issue to see details of the fix, and to download patches where relevant.

JIRA 3.12.3 is of course free to all customers with active JIRA software maintenance.

JIRA 3.12.2 Release Notes

21 February 2008

JIRA 3.12.2 Release Notes

Atlassian Software Systems is proud to announce the release of JIRA 3.12.2 in Standard, Professional and Enterprise editions. This point release includes over 30 bug fixes and improvements, including important security fixes: please see JIRA Security Advisory 2008-02-21 for details. Additionally, the FishEye plugin now supports trusted applications for increased security over the existing username and password authentication. Read more about using the FishEye plugin.

JIRA 3.12.2 is of course free to all customers with active JIRA software maintenance.

Don't have JIRA 3.12 yet?

JIRA 3.12.1 Upgrade Guide

Upgrading from JIRA 3.12 to 3.12.1

Please follow the JIRA general upgrade instructions

Upgrading from JIRA 3.11 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

JIRA 3.11 Release Notes

Atlassian Software Systems is delighted to present JIRA 3.11.

Upgrading to JIRA 3.11 is free for all customers with active JIRA software maintenance as at 24th September 2007. This release focuses on time-tracking. Time-tracking data (that is, the estimated and actual time spent on an issue) now includes the issue's sub-tasks. The aggregated time-tracking data is displayed both within individual 'parent' issues and in the Issue Navigator, so it can be easily reported on, exported to Excel, etc.

Being able to track your project's Road Map (scheduled issues) has long been a useful feature of JIRA. But how do you manage programs of multiple, related projects? In JIRA 3.11, the new Road Map portlet shows upcoming milestones across multiple projects of your choice.
Upgrading to JIRA 3.11

JIRA 3.11 can be downloaded from the JIRA Download Center. Before upgrading, please refer to the JIRA 3.11 Upgrade Guide.

Thank you for your feedback:

🌟 31 new feature and improvement requests implemented
🌟 223 votes fulfilled

Your votes and issues help us keep improving our products, and are much appreciated.

Highlights of JIRA 3.11:

- Sub-task progress shown within issues
- Issue Navigator offers sub-task aggregates
- Time Tracking reports now include sub-tasks
- Multi-project 'Road Map' portlet
- Performance improvements
- Indexing improvements
- JIRA Labels Plugin
- Plus over 70 other fixes and improvements

Highlights of JIRA 3.11:

1

Sub-task progress shown within issues

When viewing an issue, you can now choose whether to view time tracking data for the issue only, or for the issue plus its sub-tasks:
Click 'Issue' (in the Time Tracking box) to show time tracking data for the 'parent' issue only, or 'Issue & Sub-Tasks' to include the issue's sub-tasks.

Time tracking data comprises:
- **Original Estimate** (blue) — the amount of time the issue was expected to take to resolve, when it was first created.
- **Remaining Estimate** (orange) — the remaining amount of time the issue is currently expected to take to resolve.
- **Time Spent** (green) — the amount of time logged working on the issue so far.

Please note that sub-tasks are only available in the Enterprise and Professional editions of JIRA.

### Issue Navigator offers sub-task aggregates

To take advantage of the new sub-task aggregates, the following time tracking fields are now available in the Issue Navigator:

- **Progress** — an issue's Time Spent, as a percentage of the issue's Original Estimate.
- **Progress** — the aggregate time spent on an issue's sub-tasks, as a percentage of the sub-tasks' aggregate Original Estimate.
- **Original Estimate** — the aggregate Original Estimate for an issue's sub-tasks.
- **Remaining Estimate** — the aggregate Remaining Estimate for an issue's sub-tasks.
- **Time Spent** — the aggregate Time Spent for an issue’s sub-tasks.

### Time Tracking reports now include sub-tasks

- A 'parent' issue now has two separate sets of time tracking data, if applicable: (1) its own; and (2) an aggregate that includes the issue's own time-tracking plus all sub-tasks that the user has permission to see.
- The Time Tracking report now includes the aggregate data as shown in the new "columns:
Additionally, both the Time Tracking report and the Version Workload report now include options for choosing which sub-tasks you would like to include in your reports.

### Multi-project 'Road Map' portlet

The new Road Map portlet is a handy addition to your JIRA dashboard. It shows upcoming project milestones (i.e. versions which are due for release within a specified period of time), and a summary of progress made towards completing the issues in those versions.

You can:

- Click the name of a project (e.g. 'Dove') to browse the project.
- Click the name of a version (e.g. 'Version 1') to browse the version.
- Click the progress bar (shown in red and/or green) to view the version's issues in the Issue Navigator.

### Performance improvements

JIRA 3.11 includes some significant performance tuning which should improve the experience of every JIRA user.

- Page size has been reduced.
- The effect of GZip compression has been improved due to optimised handling of Javascript and CSS. This will be of benefit to people using Firefox or Internet Explorer 7 browsers.
- Caching has been optimised (see the [Developer Blog](https://developer.atlassian.com/blog)).

### Indexing improvements

- 'Bulk operations' now re-index issues one at a time instead of all at once. This allows JIRA to better handle concurrent operations and higher user loads while maintaining index integrity.
- JIRA now uses Lucene 2.2.0. This has two main benefits:
  - JIRA can now handle the input of and search on dates before January 1st, 1970.
  - JIRA now performs atomic updates to issue and comment indexes, providing greater consistency when searching.
JIRA 3.11 Upgrade Guide

- Upgrading from JIRA 3.10.x to 3.11
- Upgrading from JIRA 3.9.x and earlier

**Upgrading from JIRA 3.10.x to 3.11**

Please follow the JIRA general upgrade instructions, plus note the following:

*Administrative notes*

- To take advantage of the performance enhancements in JIRA 3.11, it is recommended that you enable GZip compression (unless you are using mod_proxy).

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
The **jira-application.properties** file has a new option, 'progress', for the following attribute:

```
jira.table.cols.subtasks
```

The 'progress' option controls the display of the **Progress** field in issues and reports.

- JIRA 3.11 introduces a bug fix for [JRA-12354](#). This means that the CVS and Perforce plugin will perform better at detecting commits for a particular issue key, avoiding partial matches on similar project keys. If users have taken advantage of the previous relaxed key matching, they can revert to the old behaviour by simply setting the following application property in the **jira-application.properties** file and restarting JIRA:

```
jira.option.key.detection.backwards.compatible=true
```

**Plugins**

**Updating plugins**
If you are using any of the following plugins, you will need to update them to their latest versions when performing the upgrade:

- Perforce plugin
- Subversion plugin
- Toolkit Plugin
- Charting Plugin
- RPC Plugin

3rd Party and personal plugins may also be affected (esp. if using lucene to store dates). These will need to be updated as well.

If these are updated after the upgrade (instead of as part of the upgrade), you will need to do a **reindex**.

A failure to update these plugins will result in lots of errors that look like:

**Error 1**
[charting.charts.createdvresolved.CreatedVsResolvedChart] Could not create velocity parameters For input string: "20070725144811"

If you see these errors, please ensure that you are using the latest compatible version of the plugin for 3.11. If there is no supported version for 3.11, please contact the plugin developer via the plugin's homepage.

**Developer notes**

**Modification to SOAP clients**

If you have written a SOAP client for any JIRA version prior to 3.11 and are invoking any methods to get Remote IssueType you will encounter the bug JRA-13529. The reason for this is that we have added extra information
to the `RemoteIssueType` object that indicates if the issue type is a subTask issue type. To avoid the problem you will need to regenerate your remote object stubs against the updated JIRA 3.11 wsdl.

If you would like your SOAP client to work against multiple versions of JIRA then you need to use the latest stubs that have been generated against JIRA 3.11. You will need to **not** use any of the new functionality and you will need to remember that the `isSubTask` variable in the `RemoteIssueType` objects will be defaulted to `false`.

**ThreadLocalQueryProfiler searchers have been moved to ThreadLocalSearcherCache**

There may be a number of plugins that reference the `ThreadLocalQueryProfiler` searcher methods directly. These need to now reference the `ThreadLocalSearcherCache`.

**Lucene Upgrade**

We upgraded our version of Lucene to 2.2. If your plugin uses to Lucene to index/read data, please ensure that it works with JIRA 3.11. If you are indexing/reading dates, more than likely it will have broken and you will need to use the new Lucene 2 methods.

**Database changes**

There were no database changes in this release.

**Upgrading from JIRA 3.9.x and earlier**

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

**JIRA 3.10 Release Notes**

Atlassian is proud to announce JIRA 3.10, the latest release of our award winning issue tracking, workflow and project management software.

Major new features include:

- **Editable worklogs**
- 'Start Date' for worklogs
- New ways to browse Components and Versions
- AJAX-based 'User-picker' and 'Issue-picker'

This release also includes several bug fixes.

To see a list of all new features and improvements in this release — ask JIRA!

JIRA 3.10 is a free upgrade for any customer who purchased/renewed JIRA after the 9th of July, 2006. This release can be downloaded from the JIRA Download Center. Before upgrading, please refer to the JIRA 3.10 Upgrade Guide.

Thank you for your feedback

Thank you to all the people who help us improve our products by 'voting' and providing ongoing feedback about what is important to you. JIRA 3.10 resolves nearly 360 of your votes.

In particular, our thanks to all those who voted for JRA-2411 (Ability to edit and remove work logs) and JRA-1959 (Allow date selection for work log). It gives us great satisfaction to deliver these features to you, and we hope you will find them useful (we know we will!)

**Editable worklogs**

Yes, worklogs can now be edited and deleted — with the issue's 'Time Spent' and 'Remaining Estimate' being adjusted appropriately in both cases.

To ensure that only appropriate people can edit/delete worklogs, four new permissions have been added:

- 'Edit Own Worklogs'
- 'Edit All Worklogs'
- 'Delete Own Worklogs'
- 'Delete All Worklogs'

Similarly, to ensure that email notifications only get sent to the appropriate recipients, there are two new events:
The email notification for an edited worklog looks like this:

All Worklog functions (create, retrieve, update and delete) are also available via the SOAP interface.

'Start Date' for worklogs

When logging work on an issue, you can now specify a ‘Start Date’. Simply click the calendar icon to select the date/time when you started work. The calendar popup will be displayed:
New ways to browse Components and Versions

We’re all familiar with browsing a project to see a list of ‘Open Issues’, ‘Popular Issues’, and various other screens showing you important statistics about your project.

Now you can drill-down to an individual component or version of a project, by browsing a:

- Component's 'Open Issues'
- Component's 'Road Map'
- Component's 'Change Log' (i.e. resolved issues)
- Component's 'Popular Issues'
- Version's 'Summary' (i.e. all issues for that version, regardless of issue status)
- Version's 'Popular Issues'

You can give this a try right now on JIRA. Just click on a component or version you're interested in!
The information on the new Component and Version summary pages is displayed using the Component Tab Panel and Version Tab Panel plugins. See the plugin types in the JIRA Plugin Guide for more information.

Auto-complete 'User-picker' and 'Issue-picker'

The 'Issue-picker' and 'User-picker' now have an AJAX-based auto-completion feature:
You're now able to simply start typing a user's name, or an issue's key or summary, and JIRA will provide a drop-down list of possible matches for you to select from. This should make selecting users and issues a lot quicker as you no longer need to click on the 'User-picker' icon or the '[select issue]' link and wait for the relevant pop-ups. The 'Issue-picker' will find matches within your latest search, as well as any matching issues you've been browsing recently.

This feature is enabled by default (though not for the 'User-picker' if you have more than 5,000 users).

If you wish to disable this feature (e.g. if you have very large numbers of users, or if your users' browsers are incompatible with AJAX), you can easily do so at the 'General Configuration' screen.

JIRA 3.10 Upgrade Guide

Upgrading from JIRA 3.9.3 to 3.10

Please follow the JIRA general upgrade instructions, plus note the following:

1. Plugins

There is a new version of the JIRA Calendar Plugin that links to the new 'Project Version' pages. This new version of the plugin is not backwards compatible.

Please note that the Kaamelot plugin for JIRA has not yet been updated. If you are currently using this plugin, you may want to hold off the upgrade to JIRA 3.10 until a compatible version of this plugin has been released.

2. Developer Notes

The ordering of the ListOrderedMap returned by SchemePermissions.getSchemePermissions() has changed.
This also means that the order of the RemotePermission[] array returned by the RPC Plugin's JiraSoapService.getAllPermissions() method has changed. If you have extended your instance of JIRA please confirm that any remote applications retrieving permissions via SOAP still work. You may encounter problems if you have been retrieving specific permissions by their array index.

**Database changes**

In JIRA 3.10, the worklog records have moved from the 'jiraactions' database table to the new 'worklog' table. This new table contains the following columns:

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Modifiers</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>numeric(18,0)</td>
<td>not null</td>
</tr>
<tr>
<td>issueid</td>

JIRA 3.9 Release Notes

Atlassian is proud to announce JIRA 3.9, the latest release of our award winning issue tracking, workflow and project management software.

New features include:

- Ability to convert sub-tasks to issues (and vice versa)
- Convenient new scheduler for filter subscriptions
- Separate permissions for 'Delete Comment', 'Delete Attachment' and 'Delete Issue'
- Performance Improvements for Project Roles

This release also includes over 30 bug fixes.

To see a list of all new features and improvements — ask JIRA!

494 of your votes have been addressed in this release. As always, thank you for taking the time to cast your vote and tell us what is important to you. We appreciate your feedback.

JIRA 3.9 is a free upgrade for any customer who purchased/renewed JIRA after 9 May, 2006. This release can be downloaded from the JIRA Download Center. Before upgrading, please refer to the JIRA 3.9 Upgrade Guide.

Convert sub-tasks to issues (and issues to sub-tasks)

In JIRA 3.9, sub-tasks can now be converted to issues, and vice versa.

- Perhaps a particular sub-task has become important enough to be an issue in its own right, with its own sub-tasks? Simply go to the sub-task and click 'Convert to Issue'. You can now create sub-tasks for the converted issue.
- Or perhaps an issue should really have been created as a sub-task of an existing issue. No problem: simply go to the issue and — you’ve guessed it — click 'Convert to Sub-task'.

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Convenient new scheduler for filter subscriptions

If you like to have your search results emailed to you, you will be pleased to see the new and improved schedule in JIRA 3.9.

It's now even easier to choose exactly when and how often you would like to receive your emails, e.g. 'Every day at 1.00am', 'Every hour between 9.00am and 5.00pm, Monday to Friday'.

For the adventurous, we have also included a cron-based scheduler.

Separate permissions for 'Delete Comment', 'Delete Attachment' and 'Delete Issue'

You can now give people the ability to delete comments and/or attachments, without giving them the ability to delete entire issues.

JIRA 3.9 has four new project-level permissions:

- 'Delete All Attachments': This permission gives the user the ability to delete any attachments, regardless of who added them.
- 'Delete Own Attachments': This permission gives the user the ability to delete attachments that they created.
- 'Delete All Comments': This permission gives the user the ability to delete any comments, regardless of who added them.
- 'Delete Own Comments': This permission gives the user the ability to delete comments that they created.

Project Role Permission check performance improvements

The performance of permission checks against project roles has been significantly improved.

This improvement allows much faster load times for pages such as Dashboard, especially when several users are hitting JIRA at the same time. The performance improvement is most noticeable with large numbers of projects containing large numbers of project role user members. See JIRA-12610 for details.

Previously this check was a CPU intensive operation that involved the intermediate creation of many intermediate objects - and degraded badly under concurrent access. The operation is now performed in constant time per project (basically a hash lookup).
Upgrading from JIRA 3.8.1 to 3.9

Please follow the JIRA general upgrade instructions. Additionally, please note the following:

In this version, there has been a change to the database which may cause problems for some customers.

The Recommended Upgrade Method

If you follow the recommended export/import upgrade procedure you should not experience any problems!

Pointing JIRA 3.9 at an existing, non-empty database

Some customers have a good reason for not following the recommended upgrade method. Using this method may result in database errors in your logs. You can avoid this if you modify your table structure manually, but the procedure is different depending on whether you have already started JIRA.

To avoid this, BEFORE you upgrade JIRA using this method, you can just drop the qrtz_cron_triggers table. This table has not been used by JIRA before 3.9, so it should be empty.

If you have ALREADY started JIRA 3.9 using your existing database, you may see the following log messages when JIRA starts up:

```
2007-04-18 15:31:53,345 main WARN [core.entity.jdbc.DatabaseUtil] Column "CRON_EXPRERSSION" of table "public.qrtz_cron_triggers" of entity "QRTZCronTriggers" exists in the database but has no corresponding field
```

The reason for this is that we have incorrectly changed a column in the qrtz_cron_triggers table. The intention was to fix a misspelling, but all we did was remove an underscore ("_")! The old column name is "CRON_EXPRERSSION". The new column name is "CRONEXPRSSION". Note that both columns spell the word "expression" incorrectly.

To remove the error message, you must remove the old column as it is redundant. This column will not contain any data. The following table shows all columns in the qrtz_cron_triggers table. Columns that should be present are in green and columns that should be deleted are in red.

<table>
<thead>
<tr>
<th>Keep</th>
<th>Keep</th>
<th>Keep</th>
<th>Delete</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>TRIGGER_ID</td>
<td>CRONEXPRSSION</td>
<td>CRONEXPRSSION</td>
</tr>
</tbody>
</table>

To delete the column, you can use SQL, but this may be slightly different between databases. Here’s how it might look:

```
alter table qrtz_cron_triggers drop column CRONEXPRSSION;
```

The data in this table

If you have users who have subscribed to issue filters, note that existing SimpleTriggers (time intervals) will be automatically converted into CronTriggers during the JIRA upgrade. In some cases, there may not be an exact mapping of time intervals to Cron Expressions, and approximations will be made (e.g. 'Every 5 weeks' will be converted to 'Once a month'). If this happens, the JIRA upgrade process will send an email to the user to inform them of the new schedule.

Upgrading from JIRA 3.8 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.
JIRA 3.9.3 Release Notes

JIRA 3.9.3 Release Notes

Atlassian Software Systems is proud to announce the release of JIRA 3.9.3 in Standard, Professional and Enterprise editions. This point release includes:

- 7 bug fixes.
- professional French and German translations (see below)

JIRA 3.9.3 can be downloaded here, and is of course free to all customers who purchased their JIRA licence or maintenance since June 28, 2006.

If upgrading, please refer to the JIRA 3.9.3 Upgrade Guide.

Professional French and German translations

The French and German language packs have been completely rewritten and are much more comprehensive than ever before. The administration sections of JIRA are now completely translated. To achieve this, we recently engaged a professional translation company to provide German and French versions of JIRA. These translations are now available in JIRA 3.9.3, and we hope they will make your experience with JIRA even better.

Thank you, danke and merci to all those people who have provided the previous translations over the years, and also to those who have recently been helping us to check the translations for style, consistency and correctness.

While we hope you enjoy the new more comprehensive translations, if the language changes are not ideal for you it is possible to use JIRA 3.9.3 with the old translations. Administrators can revert to the translations from JIRA 3.9.2 and earlier, simply by replacing the new language pack jar file with the corresponding jar file from the earlier version. The French jar file is language_fr_FR.jar and the German one is language_de_DE.jar, located in atlassian-jira/WEB-INF/lib in JIRA standalone.

Important Security Patch for JIRA versions 3.7.x & 3.8.x

Please find attached an important security patch for JIRA 3.7.x and 3.8.x

If you are using Project Roles and have Issue Security schemes that use Project Roles and you cannot upgrade to 3.9.1 then you must install this patch.

**Installation Instructions.**

If you are using JIRA Standalone please do the following:

1. Download the attached patch zip file
2. Extract the contained files to `<jira_install_dir>/atlassian-jira/WEB-INF/classes/` overwriting the files there
3. Restart JIRA

If you are using the WAR distribution of JIRA:

1. Download the attached patch zip file
2. Extract the contained files to `<jira_install_dir>/atlassian-jira/WEB-INF/classes/` overwriting the files there
3. Run 'build.sh clean' on unix or 'build.bat clean' on windows
4. Run 'build.sh' on unix or 'build.bat' on windows
5. Redeploy the JIRA web app into your application server
6. Restart the application server

JIRA 3.9.1 Upgrade Guide

`Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.`
Upgrading from JIRA 3.9 to 3.9.1

Please follow the JIRA general upgrade instructions.

Upgrading from JIRA 3.8.1 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

JIRA 3.8 Release Notes

Atlassian is proud to announce JIRA 3.8, the latest release of our award winning issue tracking, workflow and project management software.

New features include:
- Editable comments
- Self-installer for JIRA
- CAPTCHA for new account signup
- Integration with Crowd
- Improvements to the Bugzilla importer

Feature preview:
- DHTML-loading of Issue screens

This release also includes more than 30 bug fixes.

To see a list of all new features and improvements — ask JIRA!

⚠️ Weblogic Users

Please note that there is a known Weblogic and Firefox issue that affects JIRA 3.8.x when using Weblogic and Firefox. See the issue for more detail.

Upgrading

JIRA 3.8 is a free upgrade for any customer who purchased/renewed JIRA after 9 March, 2006. This release can be downloaded from the JIRA Download Center. Before upgrading, please refer to the JIRA 3.8 Upgrade Guide.

Editable comments

*SPECIAL NOTE: Thank you to the 175 people who voted on this feature request. Your input is vital to planning the JIRA development roadmap, and we appreciate you taking the time to tell us what is important to you.

Issue comments can now be edited. To ensure that comments can only be edited appropriately, two new project permissions have been provided so that you can restrict the ability to edit comments:
- 'Edit Own Comments' -- this allows users to edit comments which they have created. This permission is typically granted to end-users.
- 'Edit All Comments' -- this allows users to edit comments which other people have created. This permission is typically granted to administrators.

If a comment has been edited, the word 'Edited' will appear in the comment trail. You can hover your mouse over the word 'Edited' to see who edited the comment and when, e.g.:

<table>
<thead>
<tr>
<th>Mary Manager</th>
<th>03/Nov/00 10:57 AM</th>
<th>edited</th>
</tr>
</thead>
<tbody>
<tr>
<td>here is an edited comment</td>
<td>Joe Bloggs</td>
<td>01/Mar/07 07:43 PM</td>
</tr>
</tbody>
</table>

You can also configure email notifications to be sent when the 'Comment Edited' event occurs.

^Top
Self-installer for JIRA

New and existing customers can get the latest version of JIRA up and running on Windows within minutes, using our new installer. No more setting environment variables, installing Java, and running things from the command line. Even novice users will be able to access JIRA in as little as 5 clicks after the download.

For your convenience, we have even added controls to the Start Menu to make life as easy as possible:

- Self extracting -- no need for Winzip or any other tools.
- Optional installation as a Windows Service.
- 'Start' and 'Stop' menu items, for both normal installation and Windows Service installation.
- Tested on Windows Vista.
- Detection of any other JIRA instances installed on the same machine.
- Port detection (detects if any other web servers are running on the machine and resolves conflicts).
- Uninstaller (not that you will be needing it).

CAPTCHA for new account signup

If your JIRA server is accessible from outside your organisation's firewall, and you have enabled signup, then you may want to also enable CAPTCHA.

CAPTCHA helps ensure that only real humans (and not automated spam systems) can sign themselves up to JIRA. When CAPTCHA is enabled, visitors will need to recognise a distorted picture of a word (e.g. "pctding" in the screenshot below), and must type the word into a text field. This is easy for humans to do, but very difficult for computers. We are hoping that this feature will help to fight evil JIRA spammers (see JRA-12293 for some of
the background to this.)

We recommend anyone running a public JIRA instance (e.g. Codehaus, Apache, OpenSymphony) to enable this feature.

^Top

Integration with Crowd

JIRA can now be integrated with Atlassian Crowd, which is useful for organisations that have multiple user-repositories.

- How to integrate Crowd with JIRA

^Top

Improvements to the Bugzilla importer

JIRA’s Bugzilla importer has been enhanced. When importing Bugzilla bugs and creating corresponding issues, JIRA will now:

- create Issue Links of type ‘Duplicate’ between issues that have been imported and marked as duplicates in Bugzilla. The ‘Duplicate’ link type will be automatically created if it doesn't exist.
- import Component Lead information.
- concatenate the ‘URL’ field (from Bugzilla) to the ‘Environment’ field in JIRA issues.

Many thanks to Vladimir Alexiev for his contributions.

^Top

DHTML-loading of Issue screens (Feature Preview)

To facilitate faster loading of issue screens (e.g. the "Edit Issue" screen and the "Resolve Issue" screen), we are working on a feature that will allow JIRA to re-load only those parts of the screen that have changed. We hope this will save a little of your valuable time, and improve your experience with JIRA.
This feature is shipped in JIRA 3.8, but as it has a few known problems (JRA-12348 and JRA-12349) it is disabled by default. The known problems should not affect many users, so we encourage you to turn it on and provide any feedback by adding comments to this page. We would especially like to hear if you believe the feature is useful or if you find any problems that we are not aware of.

To enable the feature, please navigate to Administration -> General Configuration and enable the 'Dynamic HTML for issue screens' option.

Feedback for DHTML-loading of Issue screens

Please add any feedback you have about the 'DHTML-loading of Issue screens' in JIRA 3.8 as a comment to this page.

We would be very interested to know whether you think the feature is useful and hear about any problems that you find.

Currently we know about the following issues:

1. JRA-12348
2. JRA-12349

JIRA 3.8 Upgrade Guide

Upgrading from JIRA 3.7.4 to 3.8

Please follow the JIRA general upgrade instructions. Additionally, please note the following:

1. The 'Assign To' field name has been changed to 'Assignee' consistently across JIRA. This means that users need to be aware that the column heading in the Excel export has changed to 'Assignee' from 'Assign To'. Please be aware of this if for example you are exporting JIRA data to Excel and running macros on it. The field has been renamed for the following Issue Navigator Views:
   - Excel (all)
   - Word (all)
   - Full Content

2. The issuecommentedited.vm e-mail template for the new Issue Comment Edited event has been added to the WEB-INF/classes/email-template-id-mappings.xml file. The id of the e-mail template used for sending Filter Subscriptions has changed to 10000. If you have manually modified the WEB-INF/classes/email-template-id-mappings.xml file in the version of JIRA you are upgrading from, please do not simply copy the old file to JIRA 3.8. You will need to port your changes to the WEB-INF/classes/email-template-id-mappings.xml file that is shipped with JIRA 3.8. If you have not changed the WEB-INF/classes/email-template-id-mappings.xml file, you do not need to worry about this.

3. Two columns have been added to the jiraaction table to support editable comments.

Upgrading from JIRA 3.7.3 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

JIRA 3.8 Database Schema Changes

The table below summarises the changes to the database schema. Please note, that if you have developed any custom utilities which query or modify the JIRA database directly (i.e. without using the JIRA API), please check whether the utilities need to be updated.

**New Database Table Columns**

The following database columns have been added to the existing jiraaction table to support editable comments:

<table>
<thead>
<tr>
<th>TABLE NAME</th>
<th>NEW COLUMN NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>jiraaction</td>
<td>updateauthor</td>
</tr>
<tr>
<td>jiraaction</td>
<td>updated</td>
</tr>
</tbody>
</table>

JIRA 3.8.1 Release Notes
**JIRA 3.8.1 Release Notes**

Atlassian Software Systems is proud to announce the release of JIRA 3.8.1 in Standard, Professional and Enterprise editions. This point release includes 23 bug fixes and improvements, notably:

- **Integrity Checker can cause data corruption** — JRA-12491
- **SSH Connection to CVS in CVS plugin does not close stdout** — JRA-12480 particular thanks go to David Delbecq from the Royal Meteorological Institute of Belgium for help finding this one.
- **OutOfMemoryErrors when reindexing if large numbers of custom fields and issues** — a thread-local cache for custom field values was expanding unbounded when reindexing all issues - JRA-12411

JIRA 3.8.1 can be downloaded here, and is of course free to all customers who purchased their JIRA licence or maintenance within the last 12 months.

If upgrading, please refer to the JIRA 3.8.1 Upgrade Guide.

Not using 3.8? Learn about all the new features you’re missing out on!

JIRA 3.8.1 includes the following bug fixes.

<table>
<thead>
<tr>
<th>Key</th>
<th>Summary</th>
<th>Status</th>
</tr>

JIRA 3.8.1 Upgrade Guide

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Upgrading from JIRA 3.8 to 3.8.1

Please follow the JIRA general upgrade instructions.

⚠️ Charting Plugin must be upgraded to v1.3.5
Please note that the version of JFreeChart included in JIRA 3.8.1 is not compatible with older versions of the Charting Plugin. If you have the Charting Plugin installed, please make sure you upgrade it to version 1.3.5 or above.

The updated JFreeChart 1.0.4 version is not backwards compatible with the previous 1.0.0pre2 version, so if you have any plugins that utilise JFreeChart, please make sure you test them before upgrading.

Upgrading from JIRA 3.7.4 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

JIRA 3.7 Release Notes

Atlassian is proud to announce JIRA 3.7, the latest release of our award winning issue tracking, workflow and project management software.

New features include:

- Project Roles
- 'Charting' View for Issue Navigator
- RSS Improvements
- User Properties
- SVN Project Panel plugin
- SVN Commit Acceptance plugin
- And much more...

This release also includes over 100 bug fixes and 60 improvements. This version is a free upgrade for any customer who purchased/renewed JIRA after 13 December, 2005.

Upgrading

The 3.7 release can be downloaded from the JIRA Download Center. Before upgrading, please refer to the JIRA 3.7 Upgrade Guide.

Project Roles

In JIRA 3.7, you can configure project roles (e.g. developer, tester, administrator), and assign users/groups to these roles on a per-project basis. If you have more than a few projects, this will significantly simplify administration.

Users can belong to different project roles in different projects, e.g.:
### Ease of management

Does your system currently contain multiple, project-specific groups? Once you upgrade to JIRA 3.7, your permission schemes and notification schemes can use project roles instead of groups. By implementing project roles, you may be able to greatly reduce the number of groups, permission schemes and notification schemes in your JIRA system.

**Tools** are provided to help you migrate your permission schemes and notification schemes from using groups to using project roles, for example:

#### The old

<table>
<thead>
<tr>
<th>Group Name</th>
<th>Users</th>
<th>Permission Schemes</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABC Administrators</td>
<td>1 drip</td>
<td>ABC Project Permission Scheme</td>
</tr>
<tr>
<td>ABC Developers</td>
<td>1 drip</td>
<td>ABC Project Permission Scheme</td>
</tr>
<tr>
<td>ABC Users</td>
<td>1 drip</td>
<td>ABC Project Permission Scheme</td>
</tr>
<tr>
<td>XYZ Administrators</td>
<td>1 drip</td>
<td>XYZ Project Permission Scheme</td>
</tr>
<tr>
<td>XYZ Developers</td>
<td>1 drip</td>
<td>XYZ Project Permission Scheme</td>
</tr>
<tr>
<td>XYZ Users</td>
<td>1 drip</td>
<td>XYZ Project Permission Scheme</td>
</tr>
</tbody>
</table>

#### The new

<table>
<thead>
<tr>
<th>Role</th>
<th>Users</th>
<th>Permission Schemes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrators</td>
<td></td>
<td>ABC Project Permission Scheme</td>
</tr>
<tr>
<td>Developers</td>
<td></td>
<td>XYZ Project Permission Scheme</td>
</tr>
<tr>
<td>Users</td>
<td></td>
<td>XYZ Project Permission Scheme</td>
</tr>
</tbody>
</table>
Delegated administration

In JIRA Enterprise, a project administrator* can assign users and groups to project roles for their project. If their project's permission scheme and notification scheme are using project roles, the project administrator can control who may access their project and who receives email notifications. In Professional and Standard Editions the global administrator permission is required to manage role membership of a project.

Global access to JIRA is still controlled via groups, which are managed by JIRA global administrators.

*A project administrator is someone who has the 'Administer Project' permission, but not necessarily the global 'JIRA Administrator' permission.

'Charting' View for Issue Navigator

The JIRA Charting Plugin now integrates with your Issue Navigator. When viewing search results you can click the 'Chart' option in the Issue Navigator views to popup an instant chart view.

From the chart view popup you have the option to configure any chart that is available via the charting plugin. Once happy with your chart and its configuration you can, in one step, create a named filter and save the chart to any page on your dashboard.

RSS Improvements

RSS Feeds got a completely new look:

- **New RSS 2 compliant feed** — this feed will enable your RSS reader to recognise issue updates correctly, rather than report updates as newly created issues.
- **Much more readable RSS** — the new RSS feed presents issues in a much more readable format. If, with previous JIRA releases, you have been pointing your RSS reader at JIRA's XML feed, we strongly suggest switching to the new RSS feed.
- **Comments RSS feed** — an RSS feed that shows comments which have been recently added to issues matching your search criteria. If you have ever wanted to see new comments added to issues you are interested in, this feed is what you have been looking for:

User Properties
Ever wanted to record some additional information about a user? For instance, you might want to record their phone number, location, department, cost centre, etc.

In JIRA 3.7 you can easily add **user properties** of your choice. Once a user property is added, it is visible (to administrators) in the User Profile:

![User Profile](image)

SVN Project Panel plugin

The **JIRA Subversion Plugin** now features a new project tab, which shows all commits made against a particular project or a project version, giving you a summary of recent developer activity on the project.

This new tab is displayed on the Browse Project page for each project:

![SVN Project Panel](image)

You can download this plugin from its home page.

SVN Commit Acceptance plugin

In some environments, developers like the idea that there must be a one-to-one correlation between issues and check-ins. The new **SVN Commit Acceptance** plugin gives JIRA the ability to approve or deny any check-in made to CVS or SVN. We've started by allowing administrators to check three of the most common uses:

- Does this commit reference a valid issue key?
- Is that issue open?
- Does that issue belong to the committer?

This plugin has two parts: an RPC plugin and a client-side perl or python script. The perl script uses XML-RPC to call the plugin, passing in the committer and the commit message. The plugin checks any of the rules that the administrator has configured, and returns a yes or no, which causes the perl script to allow or disallow the commit.

You can download this plugin from its home page.
Other Improvements

JIRA 3.7 features a large number of other improvements, the most notable include:

1. **Internet Explorer 7 compatibility** — JIRA 3.7 is compatible with the latest browsers, including Internet Explorer 7. You may want to check out the [keyboard shortcuts](#).

2. **Improved search robustness** — In previous JIRA releases, each search caused additional memory usage and, during peak-hours, many concurrent searches could cause JIRA to run out of memory. In JIRA 3.7 the searching sub-system has been revamped so that many more searches can be executed concurrently in constant memory.

3. **AJAX-loading of dashboard portlets** — Portlets which can be slow to load are now loaded in two parts, making the Dashboard display much faster. The first (quick) part of the portlet is loaded with the Dashboard; the second is loaded as a separate request. For example, the [List All Filters](#) portlet shows the filter names first, and then fetches the count of matching issues for each filter.

4. **HSQLDB Upgrade** — The built-in database (which ships with JIRA Standalone) has been upgraded to a more stable version (1.8.0.5).

5. **Tomcat Upgrade** — The built-in application server (which ships with JIRA Standalone) has been upgraded to version 5.5.15.

6. **Performance improvements** — If you're using JIRA 3.6.3 or above, you have already seen some performance improvements. With JIRA 3.7, we've added:
   - Excel and XML exports, and RSS feeds, now use constant memory, which means that you are able to exports thousands of issues without affecting other JIRA users, or causing JIRA to run out of memory.
   - Faster page loads — all JavaScript and CSS files can now be cached by your browser, which makes every page in JIRA load faster.

7. **Time tracking improvements**:
   - It is now possible to import issue estimates via CSV.
   - It is possible to configure how the time tracking estimates and logged work information is formatted. You can choose 'days', 'hours' or 'pretty'. When choosing a specific time unit (e.g. days or hours) the information will be shown as fractions of the chosen unit (e.g. 6.5 hours). Pretty for mat preserves the way JIRA behaved in previous releases, i.e. breaks down the time into minutes, hours, days and weeks.

8. **Sub-task fields are now configurable** — You can now choose which sub-task fields are displayed on the sub-task 'Quick Create' form (shown on parent's 'View Issue' page). This is done via the [jira-applicatio n.properties](#) file.

9. **'Preset Filters' are now pluggable** — The 'Preset Filters' (which appear on the [Project portlet](#) and in the 'Browse Project' menu) are now pluggable. This means you can:
   - Add new 'Preset Filter' links. For example, add a link to a search that will find all issues in a custom status (e.g. Awaiting QA Approval).
   - Choose the display order of 'Preset Filter' links.
   - Place conditions on when a filter is visible (e.g. 'Assigned to me' filter is only shown to logged in users).
   For details, please see [How to create a custom preset filter](#).

10. **Navigation menus are now pluggable** — JIRA 3.7 gives the ability for plugins to inject links to various sections of JIRA's UI. For example:
    - Main navigation bar (which appears across the top of most JIRA pages).
    - Administration Menu (links appearing down the left-hand side in the administration section).
    This functionality greatly enhances how a plugin can interact with JIRA users. For example, plugins can now display a custom link in JIRA's Administration section and allow JIRA Administrators to provide configuration information via JIRA's UI, rather than having to tweak the [properties](#) file.
    The custom links are called 'Web UI Modules' in JIRA. For details on how to create these, please see this document.

11. **Pluggable Issue Navigator Views** — Issue Navigator views show results of a search in various formats. All built-in Issue Navigator views (e.g. Excel, Word, RSS) have been converted to plugins. This improvement creates the following advantages:
    - It is much easier to customise Issue Navigator views to your needs. For example, you can change the way that issue information is exported to MS Word.
    - By building a new plugin, you can show the results of a search in any format you wish.

12. **Pluggable Single Issue Views** — similar to Issue Navigator Views, the single-issue views (Word, XML) have been turned into plugins. This provides the ability to customise how the issue is exported to various...
13. **Issue Operations turned into plugins** — all issue operation links ('Assign Issue', 'Attach File', 'Edit Issue') have been turned into plugins, which allows the JIRA Administrator to easily disable unwanted operations. For example, if you do not need the clone issue functionality, simply disable the 'Clone Issue' operation.

To see a list of all new features and improvements — ask JIRA!

^Top

**Issue Operations plugin**

To remove an issue operations link (e.g. **Assign this issue**), simply navigate to 'Plugins' (in the 'Adminstration' menu) and click 'Disable module':
Once you have upgraded to JIRA 3.7, downgrading to a previous version is not a straightforward task and is not recommended.
JIRA 3.7 Upgrade Notes

This page lists a few things to be aware of when upgrading from previous releases of JIRA to JIRA 3.7. To perform the actual upgrade, see the upgrade documentation.

Note: If you are upgrading from a pre-3.6.5 release, please also refer to the relevant JIRA 3.x Upgrade Guides.

⚠️ Please note that JIRA 3.7 requires JDK 1.4 or above. Support for JDK 1.3 has been discontinued.

⚠️ Please note that some new functionality will not be available if you are running JIRA on WebLogic or Orion. The List All Filters portlet will not be able to fetch the issue counts for each issue. The new 'Charting' View will also be unavailable. The support for WebLogic and Orion will be added in JIRA 3.7.1.

Database Schema Changes

Due to the upgrade of HSQLDB, and to improve compatibility with Firebird and Frontbase, various database tables and columns have been renamed. For more details on the changes please see the JIRA 3.7 Database Schema Changes document.

Therefore, the easiest way to upgrade to JIRA 3.7 is to follow the Upgrading JIRA safely instructions.

If in the past, instead of performing an XML backup and restore, you have been upgrading by "pointing" new version of JIRA at an old database, this is still possible, however the procedure is more complicated. You will need to use SQL scripts to perform database schema changes. For more information please see the SQL Scripts for 3.6.x to 3.7 schema upgrade document.

⚠️ If you are using HSQLDB with JIRA, you must follow Upgrading JIRA safely instructions (i.e. perform a full XML backup and restore from XML), as simply copying the .script file will not work. The format of the .script file has changed between the HSQLDB versions, and therefore, copying the .script file will result in the following error on startup.

Request Context Changes

In order for plugins, customfields and portlets to function better outside of a web-context (e.g.: displaying a customfield in an e-mail), all direct references to the HttpServletRequest have been replaced by a VelocityRequestContext. If you have deployed your own plugins, customfields or portlets that use the HttpServletRequest directly (i.e.: any references to $req) than they should be changed to use the new $requestContext object. The $requestContext is an implementation of the VelocityRequestContext interface.

Currently the $requestContext supports the following properties:

- $requestContext.baseUrl - Returns the same as HttpServletRequest.getContextPath() or the base URL configured in your JIRA instance if no HttpServletRequest is available
- $requestContext.requestParameters - Returns an implementation of RequestContextParameterHolder or null if no HttpServletRequest is available
In JIRA 3.7 Database Integrity Checks (available from the Administration section) have been re-written to run as multiple transactions, which increased the throughput of the system while the checks are running. In large JIRA 3.6 (and earlier) installations, integrity checks could cause database lock escalation and stop users from performing operations (e.g. viewing issues).

Please note, that due to the change, each integrity check became about 10% slower.

As integrity checks are quite database intensive operations, it is still recommended to run them during off-peak hours (i.e. while the system is not under heavy load).

Change of `commentLevel` to `groupLevel` in the Comment and TransitionWorkflow jelly tags

We have changed the AddComment and TransitionWorkflow jelly tag attribute that specifies the group visibility level from 'commentLevel' to be 'groupLevel'. If you have existing jelly tags that use this attribute it will need to change. This was done so that we could introduce the 'roleLevel' attribute which allows you to specify a project role based visibility. Only one of the two attributes can be specified at a time.

Change of `level` to `grouplevel` in the XML view of a Comment

1. We have changed the XML view of a comment, as seen in the XML view of an Issue to contain either a 'grouplevel' attribute or a 'rolelevel' attribute. This attribute defines the visibility level specified on the comment. In the past the 'grouplevel' attribute was simply 'level'. If you have any existing custom code that expects the 'level' attribute in the Comment XML it must change to expect 'grouplevel'.
2. In previous versions of JIRA the XML view of the <comment> tag level attribute was always shown, even if there was no value for the level, it was rendered as an empty attribute. We have changed it so that the attributes themselves (grouplevel and rolelevel) do not display if there is no value.

Change to the RemoteComment object used via SOAP/RPC plugin

The RemoteComment object and therefore the remote SOAP/RPC api has changes to almost all properties. The 'roleLevel' attribute was added and the following attributes have changed:

1. level -> grouplevel
2. datePerformed -> created
3. username -> author

ActionManager removed

The ActionManager interface has been removed and its functionality has been delegated to new interfaces. For details please refer to ActionManager Removed documentation

Removal of 'Backend Actions'

1. We have removed the 'Backend Action' com.atlassian.jira.action.action.WorklogCreate if you were using this class in a plugin or custom code you will now need to use the com.atlassian.jira.issue.worklog.WorklogManager this now has method calls to return worklogs for a given user+issue and also create worklog entries.
2. We have removed the 'Backend Action' com.atlassian.jira.action.action.ActionCreate if you were using this class to create comments you will need to modify your code to use one of the create methods on the com.atlassian.jira.bc.issue.comment.CommentService

Issue Events

We have modified the com.atlassian.jira.event.issue.IssueEvent class to no longer use GenericValues. The GenericValue representing the comment is replaced by com.atlassian.jira.issue.comments.Comment class and the GenericValue representing the worklog is replaced by com.atlassian.jira.issue.worklog.Worklog class. If you have a custom listener in a previous version of JIRA this will need to...
be updated to use the newer IssueEvent class and `com.atlassian.jira.event.issue.IssueEventDispatcher.dispatchEvent(...)` methods.

**Renaming of XML export file**

By popular request, the XML filename (that is, the default filename when you choose to save the XML view in the Issue Navigator) has been changed from `issuenavigator.jspa` to `SearchRequest.xml`. Should you have any external systems or programs that utilise the exported XML file, please be aware of the changed filename.

**Confluence Users Only - Pre 2.2.10 Confluence Must Be Patched To Use JIRA Issues Macro**

Unable to render `{include}` The included page could not be found.

**JIRA 3.7 Downgrade Notes**

Once you have upgraded to JIRA 3.7, downgrading to a previous version is not a straightforward task and is not recommended. Please be aware that in JIRA 3.7 the database schema has changed.

If upgrade to JIRA 3.7 fails, the best way to proceed is to go back to the previous version of JIRA you were using, and to the latest pre-upgrade data that you have. The exact steps for doing this depend on how you have upgraded JIRA.

If you have created a new database for JIRA 3.7 by following the Upgrading JIRA safely instructions, you should be able to simply shutdown JIRA 3.7 and bring up the old version of JIRA your were using. The old version should be configured to use its old (unupgraded) database.

If you have upgraded JIRA by pointing JIRA 3.7 to an older database (and ran the SQL Scripts to upgrade the database schema), then you will need to:

1. Create a new database
2. Configure the old version of JIRA you were using to point at the new (empty) database
3. Restore the latest pre-upgrade backup that you have
4. Start the old JIRA installation

**ActionManager Removed**

From JIRA 3.7, the ActionManager has been refactored into several other interfaces, these include the `CommentManager`, `WorklogManager`, `ChangeHistoryManager`, `RepositoryManager` and `IssueTabPanel`. The following table is a mapping of the old ActionManager methods to the new refactored ones (including the new java interface the method resides in).

<table>
<thead>
<tr>
<th>ActionManager method (Pre JIRA 3.7)</th>
<th>Corresponding method (Post JIRA 3.7)</th>
<th>Corresponding Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>List <code>getComments</code>(GenericValue issue, User user)</td>
<td>List <code>getCommentsForUser</code>(Issue issue, User user)</td>
<td><code>CommentManager</code></td>
</tr>
<tr>
<td>List <code>getWorklog</code>(GenericValue issue, User user)</td>
<td>List <code>getWorklogsForUser</code>(Issue issue, User user)</td>
<td><code>WorklogManager</code></td>
</tr>
<tr>
<td>List <code>getChangeHistory</code>(GenericValue issue, User remoteUser)</td>
<td>List <code>getChangeHistoriesForUser</code>(Issue issue, User remoteUser)</td>
<td><code>ChangeHistoryManager</code></td>
</tr>
<tr>
<td>List <code>getWorkflow</code>(GenericValue issue, User remoteUser)</td>
<td>removed</td>
<td>-</td>
</tr>
<tr>
<td>List <code>getActions</code>(GenericValue issue, User remoteUser)</td>
<td>List <code>getActions</code>(Issue issue, User remoteUser)</td>
<td><code>AllTabPanel</code></td>
</tr>
<tr>
<td>List <code>getCommits</code>(GenericValue issue, User remoteUser)</td>
<td>Map <code>getCommits</code>(Issue issue, User remoteUser)</td>
<td><code>RepositoryManager</code></td>
</tr>
</tbody>
</table>

You will notice that the new methods in JIRA 3.7 take in the Issue object as opposed to the GenericValue.
JIRA 3.7 Database Schema Changes

Due to the upgrade of HSQLDB, and to improve compatibility with Firebird and Frontbase, various database tables and columns have been renamed.

The table below summarises the changes to the database schema. Please note, that if you have developed any custom utilities which query or modify the JIRA database directly (i.e. without using the JIRA API), please check whether the utilities need to be updated.

### Tables

The following database table has been renamed:

<table>
<thead>
<tr>
<th>OLD TABLE NAME</th>
<th>NEW TABLE NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>projectversion</td>
</tr>
</tbody>
</table>

### Columns

The following database columns have been renamed. Their old and new names, as well as the database table they belong to are shown below:

<table>
<thead>
<tr>
<th>TABLE NAME</th>
<th>OLD COLUMN NAME</th>
<th>NEW COLUMN NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>notification</td>
<td>type</td>
<td>notif_type</td>
</tr>
<tr>
<td>notification</td>
<td>parameter</td>
<td>notif_parameter</td>
</tr>
<tr>
<td>mailserver</td>
<td>type</td>
<td>server_type</td>
</tr>
<tr>
<td>jiraeventtype</td>
<td>type</td>
<td>event_type</td>
</tr>
<tr>
<td>schemepermissions</td>
<td>type</td>
<td>perm_type</td>
</tr>
<tr>
<td>schemepermissions</td>
<td>parameter</td>
<td>perm_parameter</td>
</tr>
<tr>
<td>fieldlayout</td>
<td>type</td>
<td>layout_type</td>
</tr>
<tr>
<td>schemeissuesecurities</td>
<td>type</td>
<td>sec_type</td>
</tr>
<tr>
<td>schemeissuesecurities</td>
<td>parameter</td>
<td>sec_parameter</td>
</tr>
<tr>
<td>portletconfiguration</td>
<td>position</td>
<td>positionseq</td>
</tr>
</tbody>
</table>

### Special note for MS SQL Server

Additionally to the schema changes described above, for MS SQL Server, all columns of type TEXT have been changed to NTEXT to ensure that international characters can be safely stored.

Possible upgrade problems + solutions

### HSQL DB Upgrade

JIRA 3.7 has been upgraded to use HSQL DB version 1.8. HSQL DB is the in-memory database that ships with the Standalone distribution of JIRA.

If you have upgraded to JIRA 3.7 and have tried to copy across the HSQL DB script files from your 3.6.x or earlier instance you will see an error like the following:
2006-09-20 16:33:49,858 [core.entity.jdbc.DatabaseUtil] Unable to establish a connection with the database... Error was:org.apache.tomcat.dbcp.dbcp.SQLNestedException: Cannot create PoolableConnectionFactory (error in script file line: 104 Unexpected token: POSITION in statement [CREATE TABLE PORTLETCONFIGURATION(ID BIGINT NOT NULL PRIMARY KEY,PORTALPAGE BIGINT,PORTLET_ID VARCHAR,COLUMN_NUMBER INTEGER,POSITION])

2006-09-20 16:33:51,729 ERROR [ContainerBase.[Catalina].[localhost].[/]] Exception sending context initialized event to listener instance of class com.atlassian.jira.upgrade.ConsistencyLauncher com.opensymphony.module.propertyset.PropertySetImplementationException: Unable to establish a connection with the database. (Cannot create PoolableConnectionFactory (error in script file line: 104 Unexpected token: POSITION in statement [CREATE TABLE PORTLETCONFIGURATION(ID BIGINT NOT NULL PRIMARY KEY,PORTALPAGE BIGINT,PORTLET_ID VARCHAR,COLUMN_NUMBER INTEGER,POSITION])))

If you see this error, JIRA will not be able to startup.

**Solution**

To resolve this problem you will need to 'safely' upgrade JIRA. The detailed instructions for doing this can be found in JIRA's online documentation.

A quick guide on doing this follows:

1. Startup your old version of JIRA, pointing it at your current HSQL DB scripts files
2. Perform an XML backup of JIRA
3. Shutdown your old 3.6.x JIRA instance.
4. Startup your new 3.7 instance of JIRA using a new script location

```xml
<Resource name="jdbc/JiraDS" auth="Container" type="javax.sql.DataSource"
    username="sa"
    password=""
    driverClassName="org.hsqldb.jdbcDriver"
    url="jdbc:hsqldb:${catalina.home}/database/jiradb37"
    minEvictableIdleTimeMillis="4000"
    timeBetweenEvictionRunsMillis="5000"/>
```

5. Perform an XML import

**SQL Scripts for 3.6.x to 3.7 schema upgrade**

<table>
<thead>
<tr>
<th>Audience</th>
<th>People who are upgrading from pre-JIRA 3.6.x to post-3.7, and cannot use the recommended 'XML backup/restore' upgrade method because it would take too long.</th>
</tr>
</thead>
</table>

If you are upgrading JIRA by the recommended method, ignore this page.

**Background**

In general, there are two ways to upgrade JIRA's database, both of which are described in the Upgrading JIRA document:

- **XML backup/restore (recommended)** — doing a full XML export and import into the new database.
- **Connect JIRA to a copy of your old database** — connecting the new JIRA to the old database, and letting it automatically upgrade the database tables.

In 3.7.x, the 'Connect JIRA to a copy of your old database' method will not work. If you point JIRA 3.7.x to an older database, JIRA will print a warning and refuse to do anything. This is because a large number of database schema changes were made between 3.6 and 3.7 (see JIRA 3.7 Database Schema Changes) and these changes are too great for JIRA's database engine to upgrade automatically.

So, the vast majority of users should follow the XML backup/restore method described in the Upgrading JIRA document.

However, there are a handful of users with large installations, for which a full export/import is impractical as it takes a relatively long time. These users may need to use the 'Connect JIRA to a copy of your old database' method — This page is intended for these users. We have provided SQL scripts for each database, which will
These scripts will only work on JIRA 3.6.x databases (they refer to a table only added in 3.6). If you are upgrading from an earlier release, please:

1. Download JIRA 3.6.5 Standalone
2. Back-up your database, and create a copy to be upgraded to 3.7.
3. Configure it to point to your 3.7 copy of the database
4. (optionally) Edit \atlassian-jira/WEB-INF/classes/jira-application.properties\ and set jira.autoexport=false to speed up the process.
5. Start JIRA Standalone. By watching the logs (atlassian-jira.log or logs/catalina.out, you will see JIRA automatically upgrading tables to the 3.6.x format.
6. Proceed with the instructions below.

If you are using HSQldb with JIRA, you must follow the 'XML backup/restore' instructions in the Upgrading JIRA guide, as simply copying the .script file will not work. The format of the .script file has changed between the HSQldb versions, and therefore, copying the .script file will result in the following error on startup.

DB2 upgrade notes

1. Shutdown your JIRA instance
2. Perform a backup of your DB2 database: `db2 backup database sample to /home/db2/backups`
3. Download the following script `db2_3.7_migration.ddl` and modify the connect statement within the file
4. Execute the script using the following command: `db2 +c -t -v -f db2_3.7_migration.ddl`
   If you see errors like:

   ```
   insert into SCHEMEISSUESECURITIES (select ID, SCHEME, SECURITY, TYPE, PARAMETER from TMP_SCHEMEISSUESECURITIES)  
   SQL0100W  No row was found for FETCH, UPDATE or DELETE; or the result of a query is an empty table. SQLSTATE=02000
   ```
   
   This is OK, it simply means that the inner SQL query did not return any data to be inserted into the new temporary table. This can occur if you are not using certain features in JIRA.
5. Point your new installation of JIRA 3.7 at your DB2 database and watch for any errors during the startup sequence.
6. If you see any other errors please contact support for further assistance.

PostgreSQL 8+ upgrade notes

1. Shutdown your JIRA instance
2. Perform a backup of your PostgreSQL database: `pg_dump -d database name > backup filename.sql`
   - for example `pg_dump -d jiradb > jiradb_365_14112006.sql`
3. Download the following script `postgres_3.7_migration.sql`
4. Execute the script using the following command: `psql -U jiraurser -v schema_name=public -d jiradb -f postgres_3.7_migration.sql`
   a. Where -U is the username, -v is the name of your schema -d is the database -f is the location of the script file
5. Point your new installation of JIRA 3.7 at your database and watch for any errors during the startup sequence.
6. If you see any errors please contact support for further assistance.

Oracle 10g upgrade notes

1. Shutdown your JIRA instance
2. Perform a backup of your Oracle database. There are multiple strategies here, so we will leave this up to your DBA.
3. Download the following script `oracle_3.7_migration.sql`
4. Connect to SQL*Plus and execute the following script:

```
Copyright (c) 1982, 2005, Oracle. All rights reserved.

Connected to:
Oracle Database 10g Enterprise Edition Release 10.2.0.1.0 -
Production
With the Partitioning, OLAP and Data Mining options

SQL> @/home/oracle/oracle_3.7_migration.sql
```

5. If you see any errors please contact support for further assistance.
6. Point your new installation of JIRA 3.7 at your DB2 database and watch for any errors during the startup sequence.

Microsoft SQL Server upgrade notes

1. Shutdown your JIRA instance
2. Perform a backup of your SQL Server database: `osql -U username -P password -Q "BACKUP DATABASE db_name TO DISK = backup_path_and_filename"`
   * for example `osql -U sa -P secret -Q "BACKUP DATABASE jiradb TO DISK = 'C:\MyBackup.dat'"`
3. Download the following script `sqlserver_3.7_migration.sql`
4. Execute the script: `osql -U username -P password -d db_name -i mssql_3.7_migration.sql`
   * for example `osql -U sa -P secret -d jiradb -i sqlserver_3.7_migration.sql`
5. If everything goes well the following should be displayed
Caution: Changing any part of an object name could break scripts and stored procedures. The COLUMN was renamed to 'NOTIF_TYPE'.
Caution: Changing any part of an object name could break scripts and stored procedures. The COLUMN was renamed to 'NOTIF_PARAMETER'.
Caution: Changing any part of an object name could break scripts and stored procedures. The COLUMN was renamed to 'SEVER_TYPE'.
Caution: Changing any part of an object name could break scripts and stored procedures. The COLUMN was renamed to 'EVENT_TYPE'.
Caution: Changing any part of an object name could break scripts and stored procedures. The COLUMN was renamed to 'PERM_TYPE'.
Caution: Changing any part of an object name could break scripts and stored procedures. The COLUMN was renamed to 'PERM_PARAMETER'.
Caution: Changing any part of an object name could break scripts and stored procedures. The COLUMN was renamed to 'LAYOUT_TYPE'.
Caution: Changing any part of an object name could break scripts and stored procedures. The COLUMN was renamed to 'SEC_TYPE'.
Caution: Changing any part of an object name could break scripts and stored procedures. The COLUMN was renamed to 'SEC_PARAMETER'.
Caution: Changing any part of an object name could break scripts and stored procedures. The COLUMN was renamed to 'POSITIONSEQ'.
Caution: Changing any part of an object name could break scripts and stored procedures. The object was renamed to 'projectversion'.

4. Point your new installation of JIRA 3.7 at your SQL Server database and watch for any errors during the startup sequence.

Sybase upgrade notes

1. Shutdown your JIRA instance
2. Perform a backup of your SQL Server database
   - for example using isql tool

   1> dump database db_name to "backup_path_and_filename"
   2> go

3. Download the following script sybase_3.7_migration.sql
4. Execute the script: osql -U username -P password -D db_name -i sybase_3.7_migration.sql
   - for example osql -U sa -P password -D jiradb -i sybase_3.7_migration.sql
5. If everything goes well the following should be displayed
6. Point your new installation of JIRA 3.7 at your Sybase database and watch for any errors during the startup sequence.

MySQL upgrade notes
1. Shutdown your JIRA instance
2. Perform a backup of your MySQL database: `mysqldump --opt db_name > db_name.sql`
   - for example `mysqldump --opt jiradb > jiradb_before37.sql`
3. Download the following script `mysql_3.7_migration.sql`
4. Execute the script: `mysql --user=username --password=password db_name < mysql_3.7_migration.sql`
   - for example `mysql --user=root --password=password jiradb < mysql_3.7_migration.sql`
5. Point your new installation of JIRA 3.7 at your MySQL database and watch for any errors during the startup sequence.

JIRA 3.7.4 Release Notes

Atlassian Software Systems is proud to announce the release of JIRA 3.7.4 in Standard, Professional and Enterprise editions. This point release includes 31 bug fixes and improvements, notably:

- **JIRA startup** — speed has been improved for Oracle - JRA-12049
- **Project roles** — a few minor bug fixes.
- **Getting ready for Crowd** — updates to JIRA infrastructure in preparation for integrating with Crowd in JIRA 3.8.

JIRA 3.7.4 can be downloaded here, and of course is free to all customers who purchased their JIRA licence or maintenance within the last 12 months.

If upgrading, please refer to the JIRA 3.7.4 Upgrade Guide.

Not using 3.7? Learn about all the new features you’re missing out on!

⚠️ **Weblogic Users**

Please note that there is a known Weblogic and Firefox issue that will affect JIRA 3.7.x when using Weblogic and Firefox. See the issue for more detail.

JIRA 3.7.4 includes the following bug fixes.

Unable to locate JIRA server for this macro. It may be due to Application Link configuration.

JIRA 3.7.4 Upgrade Guide

**Upgrading from JIRA 3.7.3 to 3.7.4**

Please follow the JIRA general upgrade instructions.

**Upgrading from JIRA 3.7.2 and earlier**

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

JIRA 3.7.3 Release Notes

⚠️ **Recommended Upgrade**

JIRA 3.7.3 contains a security update and is highly recommended, especially for instances of JIRA that are accessible via the Internet.

Atlassian Software Systems is proud to announce the release of JIRA 3.7.3 in Standard, Professional and Enterprise editions. This point release includes 15 bug fixes and improvements, notably:

- **Excel formatting** has been rectified (JRA-11928, JRA-8899).
- **French translations** have been rolled back (temporarily) to pre-3.7.1 (JRA-11973, JRA-11873).
- **Security Update** - a problem was fixed where, at worst, a malicious user could indirectly email (and obtain a list of) other users. No other project information could be leaked, apart from the users’ emails. This bug affects all previous versions.

JIRA 3.7.3 can be downloaded here, and of course is free to all customers who purchased their JIRA licence or maintenance within the last 12 months.

If upgrading, please refer to the JIRA 3.7.3 Upgrade Guide.
Not using 3.7? Learn about all the new features you’re missing out on!

**Weblogic Users**
Please note that there is a known Weblogic and Firefox issue that will affect JIRA 3.7.x when using Weblogic and Firefox. See the issue for more detail.

JIRA 3.7.3 includes the following **15 bug fixes and improvements.**
Unable to locate JIRA server for this macro. It may be due to Application Link configuration.

**JIRA 3.7.3 Upgrade Guide**

**Upgrading from JIRA 3.7.2 to 3.7.3**

Please follow the JIRA general upgrade instructions.

**Upgrading from JIRA 3.7.1 and earlier**

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

**JIRA 3.7.2 Release Notes**

**Recommended Upgrade**
This upgrade is strongly recommended for all users of JIRA 3.7.x as it contains a fix for a critical search indexing issue. Any users of JIRA 3.7 or 3.7.1 should upgrade immediately.

Atlassian Software Systems is proud to announce the release of JIRA 3.7.2 in Standard, Professional and Enterprise editions. This point release includes 32 bug fixes and improvements, including:

- **Most notably, 3.7.2 includes a fix for a critical search indexing issue**, which makes it a highly recommended upgrade for JIRA 3.7 and 3.7.1 users.
- A few small bugs in the CSV importer have been fixed (JRA-11847, JRA-11842).
- Deleting role members in Sybase now works (JRA-11890).

JIRA 3.7.2 can be downloaded here, and of course is free to all customers who purchased their JIRA license or maintenance within the last 12 months.

Not using 3.7? Learn about all the great new features you’re missing out on!

If upgrading, please read refer to the JIRA 3.7.2 Upgrade Guide.

**Weblogic Users**
Please note that there is a known Weblogic and Firefox issue that will affect JIRA 3.7.x when using Weblogic and Firefox. See the issue for more detail.

JIRA 3.7.2 includes the following **32 bug fixes and improvements.**
Unable to locate JIRA server for this macro. It may be due to Application Link configuration.

**JIRA 3.7.2 Upgrade Guide**

This page contains specific information you need to know when upgrading from JIRA 3.7.1 to JIRA 3.7.2. If upgrading from an older version of JIRA, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.
When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

- 3.7.2 will automatically perform a full reindex when upgrading. For more details please see JRA-11861

**JIRA 3.7.1 Release Notes**

Atlassian Software Systems is proud to announce the release of JIRA 3.7.1 in Standard, Professional and Enterprise editions. This point release includes 34 bug fixes and improvements, including many user interface and consistency fixes. It can be downloaded here.

Not using 3.7? Learn about all the new features you’re missing out on!

If upgrading from an earlier version please read through the JIRA 3.7.1 Upgrade guide.

### Weblogic Users

Please note that there is a known Weblogic and Firefox issue that will affect JIRA 3.7.x when using Weblogic and Firefox. See the issue for more detail.

JIRA 3.7.1 includes the following 34 bug fixes and improvements.

Unable to locate JIRA server for this macro. It may be due to Application Link configuration.

JIRA 3.7.1 Upgrade guide

**JIRA 3.7.1 Upgrade Guide**

This page contains specific information you need to know when upgrading from JIRA 3.7 to JIRA 3.7.1. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

- There are no specific instructions you need to be aware of related to upgrading from JIRA 3.7 to JIRA 3.7.1.

**JIRA 3.6 Release Notes**

Atlassian is proud to announce the latest release of the award winning issue tracking and project management software - JIRA 3.6. This release offers a range of new features and improvements throughout JIRA - from the introduction of custom events to wiki-style link aliasing - along with a number of bug fixes.

As always, this release can be downloaded from the JIRA Download Center - and don't forget to check out the upgrade guide if upgrading from a previous version!

### Contents

- New Features
- Improvements
- Bug Fixes
- Upgrading

### New Features

To see a full list of new features and improvements added - ask JIRA!

- Custom Events
- Group Picker Custom Field
- Per-Issue Group Notifications & Permissions
- Wiki-style Linking
- "I'm Feeling Lucky" Quick Search
- Collapsible Fields
- Nestable Conditions
- Charting Plugin Updates

**Custom Events**

JIRA uses an event-listener mechanism to alert the system that something has happened and allow it to perform
an action based on that event. In both Professional and Enterprise editions, this release presents the ability to add custom events to the system - providing a pivotal extension point for notification and workflow schemes.

For instance, a custom event can be added to the system and associated with a workflow post-function - fired on completion of the event. A notification scheme can then be configured to email particular recipients once this event has been fired. With custom events, the notification and workflow schemes can be configured extensively to respond to specific custom events added to the system.

Further, by adding custom listeners that monitor for custom events fired, the possible extensions to JIRA are countless.

<table>
<thead>
<tr>
<th><strong>Work stopped on issue</strong></th>
<th>This is the work stopped on issue event.</th>
<th><strong>Active</strong></th>
<th>Work stopped</th>
<th><strong>Default notification scheme</strong></th>
<th><strong>JIRA</strong> [Blog Progress (2011)]</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Generic Event</strong></td>
<td>This is the generic event event.</td>
<td><strong>Active</strong></td>
<td>Generic Event</td>
<td><strong>Default notification scheme</strong></td>
<td></td>
</tr>
</tbody>
</table>

**Add New Event**

Add a new event with a description and a default email template.

- **Name:** Issue Frozen Event
- **Description:** This issue is now frozen.
- **Template:** Generic Event

Select the default email template for this event.

![Add New Event](image)

**Group Picker Custom Field**

JIRA custom fields have become invaluable tools in extending the data associated with an issue. This release introduces two new custom fields into the fold:

- Group Picker
- Multi Group Picker

The Group Picker allows a JIRA-defined group to be associated with an issue while the Multi Group Picker allows the association of multiple JIRA-defined groups with an issue. It is possible to use these fields in an issue search as filter criteria in the Issue Navigator.

![Group Picker](image)

The assignee selector field in the Issue Navigator has also been updated with the Group Picker link - allowing...
the group to be selected from the available list.

---

**Per-issue Group Notifications and Permissions**

Building on the group picker custom field, one can now send notifications to members of a group determined by a custom field.

For example, add an **Assigned Group** custom field, and edit the notification scheme to send all notifications to the group's members:

```
Please select the type of Notification you wish to add to scheme: Default Notification Scheme.
```

```
Events:
- Issue Created
- Issue Updated
- Issue Assigned
- Issue Resolved
- Issue Closed
- Issue Commented
- Issue Reopened

(Select the notifications that you want to assign)
```

```
- Current Assignee
- Reporter
- Current User
- Project Lead
- Component Lead
- Single User
- Group
- Single Email Address
- All Watchers
- User Custom Field Value
- Group Custom Field Value
```

Now the "Assigned Group" on each issue will be notified of changes.
As with notifications, one can now grant a permission to members of a group(s) selected by a custom field. Continuing our **Assigned Group** example, by granting the **Assigned Group** the **Assignable** permission, the possible assignees of an issue will be the members the **Assigned Group** custom field group:

You can also restrict workflow operations to members of a custom field's group, with a custom field condition.

**Preset group lists**

Per-issue groups can also be chosen via select-lists, in addition to the group picker. Say you wish to restrict the **Assigned Group** to jira-managers or jira-qa. Simply create a select-list custom field with these two values, and add the select-list to the notification and permission schemes.

**Wiki-Style Linking**

Adding to the Wiki-style rendering functionality, users can now enrich their description, environment and comment entries with pertinent links to other JIRA data:

- User Aliasing
- Issue Aliasing

**User Aliasing**

Using the syntax `~username`, the username text will appear linked to the user profile of that user.
**Issue Aliasing**

Using the syntax `[some text here|TST-1]`, the text `some text here` will appear as a link to the specified issue. This text adopts the behaviour of a regular JIRA issue key link - if the issue is resolved, the text will appear with a strike-through.

```
Administrator [04/Apr/06 06:15 PM]  
You may wish to also look into this issue - which has been resolved.
```

**"I'm Feeling Lucky" Quick Search**

Letting the user skip the results screen in the Issue Navigator of a search, the 'I'm Feeling Lucky' search presents the user with the first result associated with the search query. This search can be engaged by pressing Control + Enter after submitting the search query to the 'Quick Search' query box.

**Collapsible Fields**

Enhancing the JIRA user interface, it is now possible to quickly configure the level of detail displayed while viewing an issue through collapsible and expandable issue fields.

The environment, description, individual comment fields and any textarea custom field can be hidden or displayed by simply clicking on the relevant link for a particular field - allowing fields with large amounts of data to be temporarily hidden while viewing other entries against that issue. JIRA only adds these options to fields that include a large amount of information.

**Nestable Conditions**

*Workflow conditions* allow workflow designers the ability to restrict the availability of a workflow transition. The criteria of the condition must be met in order for the workflow transition to become available.

Workflow conditions can now be configured to combine criteria with boolean OR statements - allowing condition specification to match the workflow design more closely. For example, a condition can be constructed whereby it is only met if the user is the assignee of the issue OR the user is a member of the jira-users group.

Extending this concept, more complex condition criteria can be constructed with the ability to nest conditions in groups. Each group can be combined with other individual conditions or groups with the boolean AND or OR statements.
Charting Plugin Updates

The latest version of the Charting Plugin includes two new charting options:

- **Pie Chart**
- **Average-Age Open Issues**

**Pie Chart**

Reports and portlets can be generated displaying data based on a statistic type (e.g. Status, Priority, etc.) of issues from a project or specified filter in pie-chart format.

```
1. Open = 8
2. Closed = 32
3. Resolved = 9
4. Reopened = 1
Issues: 50.
```

**Average-Age Open Issues**

This chart displays the average-open-age of issues over a specified period with a configurable interval. This
chart graphically conveys the trend for the average amount of time that issues remain unresolved.

<table>
<thead>
<tr>
<th>Average Age: Test Filter</th>
<th>more detail » »</th>

Improvements

- Email Notification & Internationalization
- Performance
- Clone Issue Extensions
- Disable Notification for Bulk Operation
- Banner Visibility
- ... and many more ...

**Email Notification & Internationalisation**

JIRA is shipped with over 15 language bundles - allowing the user to configure the language JIRA is displayed in globally and on a per-user basis. The internationalisation coverage now includes the email templates used in issue event notifications. Each template has been converted to allow full translations of the body of the email for all locales.

Taking JIRA into a truly global team environment, JIRA can now send individual email notifications to each recipient in their user-profile selected language. Hence, global team members located in regional sites around the world can be updated of issue events and updates with individually-tailored email notifications in their desired language.

This functionality becomes complete with the addition of properties files for the locales in use.

The translation process is greatly supported through the much appreciated efforts of the JIRA community. Many thanks to Gerd Gueldenast who has already provided a German translation for the email template properties - which is included in this release.

**Performance**

Improving overall response times while navigating through JIRA, this release introduces a caching servlet for all JavaScript and CSS resources. JIRA will cache these resources on the client system until the instance of JIRA is restarted. In-house testing and initial reports indicate that this change results in a significant performance improvement throughout JIRA.

**Clone Issue Extensions**
The **Clone Issue** functionality has been expanded with further configuration options. It is now possible to specify the level of detail cloned through:

- **Clone issue links** - links between the clone issue and those linked to/from the original cloned issue will be recreated in the clone issue
- **Clone sub-tasks** - sub-tasks associated with the original cloned issue will be re-created for the clone issue

![Clone Issue](image)

**Note**: The clone link type "Cloners" does not exist. A link to the original issue will not be created.

---

**Disable Notification for Bulk Operation**

JIRA administrators (and project administrators of the selected issues) can now configure whether notifications are sent for a bulk operation - avoiding mass emailing of all changes made during a bulk operation. With this configurability, it is possible to complete updates on a collection of issues without generating unwanted email notification noise. The possible scenarios where this option can be applied are many - e.g. adding a new custom field and setting a default value, updating old issues ...

![Bulk Operation: Operation Details](image)

**Banner Visibility**

The **announcement banner** allows pertinent information to be displayed on all JIRA pages. This feature has been extended to allow configuration of the banner visibility level:

- **Public** - show the banner to anyone
- **Private** - show the banner to logged-in users only

---

*Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.*
A number of other notable improvements included in this release ...

**Mail Server & Bulk Precedence**

The JIRA mail service can be configured to ignore emails with a *Precedence: bulk* header. This improvement eliminates potential issue/comment generation loops through the mail service from auto-generated emails.

**Statable VersionPicker Field**

JIRA provides a vast array of portlets that can populate your dashboard with instant access to issue information. The Version Picker custom field has been extended to allow inclusion in the 2-Dimensional Filter Statistics portlet - a portlet displaying the results of a search in table format with configurable axes.

**Quick Sub-Task Creation Form**

JIRA can now be configured so that the quick sub-task creation form is present on the View Issue screen at all times - even if the issue does not currently have any sub-tasks.

**Issue Link Configuration**

The issue link view can be configured to include various issue fields (e.g. issuetype, issuekey, etc.) - providing further details of the linked issue without having to navigate to that issue. Further, it is also possible to specify the sort order for this table.

**Bug Fixes**

This release includes a number of bug fixes - just ask JIRA to view the entire list!

**Upgrading**

In order to complete a successful upgrade, please refer to our Upgrade Guides. If you are upgrading from JIRA 3.5.3 please refer to the JIRA 3.6 Upgrade Guide.

If you are upgrading from a pre-3.5.3 release, please refer to the relevant JIRA 3.x Upgrade Guides.

JIRA 3.6 Upgrade Guide

This page contains specific information you need to know when upgrading to JIRA 3.6.x from JIRA 3.5.x. If upgrading from an older version of JIRA, please go to the complete list of Upgrade Guides, and read the notes for each version you are skipping during the upgrade.
When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

**Database Intensive Upgrade Task**

To introduce the Custom events to JIRA, it was necessary to upgrade a large data set within JIRA's database for 3.5.x and earlier releases. Depending on the size of your JIRA data the upgrade task (number 150) might get your DBMS to do a lot of work which might take some time. The exact amount of time also depends on the processing power of the machine running JIRA's database.

Please be patient with the upgrade task and do not restart JIRA while the upgrade is in progress. The upgrade task will report on its progress to JIRA's log file as it upgrades your data.

The following is the sample output that the upgrade task will produce. As you can see the upgrade task took roughly 5 and a half minutes to modify over 660,000 records in the database.
11:14:09 INFO [jira.upgrade.tasks.UpgradeTask_Build150] Inspecting workflow 'Phone Support Workflow v.6'.
11:14:10 INFO [jira.upgrade.tasks.UpgradeTask_Build150] Inspecting workflow 'Support Workflow v.3'.
11:14:10 INFO [jira.upgrade.tasks.UpgradeTask_Build150] Inspecting workflow 'Phone Support Workflow v.7'.
11:14:10 INFO [jira.upgrade.tasks.UpgradeTask_Build150] Inspecting workflow 'Test'.
11:14:10 INFO [jira.upgrade.tasks.UpgradeTask_Build150] Inspecting workflow 'Copy of Support Workflow'.
11:14:10 INFO [jira.upgrade.tasks.UpgradeTask_Build150] Inspecting workflow 'Support Workflow v.4'.
11:14:10 INFO [jira.upgrade.tasks.UpgradeTask_Build150] Inspecting workflow 'Support Workflow'.
11:14:18 INFO [jira.upgrade.tasks.UpgradeTask_Build150]

**Workflow Post Functions**

**Applies to**
users with custom workflow XMLs saved on disk - external to JIRA

JIRA stores its workflows in the database. During the upgrade, these workflows will be upgraded automatically. However, if you have stored your workflows on disk (outside the database), you will need to follow these instructions to upgrade the workflows manually.

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Previously, workflow post functions referenced the event to fire through a string value of the event name. All post functions now reference the event through a numeric ID value. As mentioned, all workflows stored within JIRA will be automatically updated. However, all workflows saved to disk - external to JIRA - should be updated manually as follows. The actual workflow XML file should be updated as follows:

For each workflow post function that accepts the event ID as an argument:

1. The value of the `name` attribute of the `arg` tag has to be changed from `eventType` to `eventTypeId`.
2. The body of the `arg` tag has to change according to the following table:

<table>
<thead>
<tr>
<th>Event Name</th>
<th>Event Type Id</th>
</tr>
</thead>
<tbody>
<tr>
<td>created</td>
<td>1</td>
</tr>
<tr>
<td>updated</td>
<td>2</td>
</tr>
<tr>
<td>assigned</td>
<td>3</td>
</tr>
<tr>
<td>resolved</td>
<td>4</td>
</tr>
<tr>
<td>closed</td>
<td>5</td>
</tr>
<tr>
<td>commented</td>
<td>6</td>
</tr>
<tr>
<td>reopened</td>
<td>7</td>
</tr>
<tr>
<td>deleted</td>
<td>8</td>
</tr>
<tr>
<td>moved</td>
<td>9</td>
</tr>
<tr>
<td>worklogged</td>
<td>10</td>
</tr>
<tr>
<td>workstarted</td>
<td>11</td>
</tr>
<tr>
<td>workstopped</td>
<td>12</td>
</tr>
<tr>
<td>genericevent</td>
<td>13</td>
</tr>
</tbody>
</table>

By default, the only post functions that accept event IDs are `FireIssueEventFunctions`. Therefore, unless you have implemented your own custom post function that also deals with events, you will only need to update the `arg` tags for the `FireIssueEventFunctions` everywhere in the workflows.

For example, `FireIssueEventFunction` for create issue workflow transition looked like:

```xml
<function type="class">
  <arg name="class.name">com.atlassian.jira.workflow.function.event.FireIssueEventFunction</arg>
  <arg name="eventType">created</arg>
</function>
```

and needs to be changed to:

```xml
<function type="class">
  <arg name="class.name">com.atlassian.jira.workflow.function.event.FireIssueEventFunction</arg>
  <arg name="eventTypeId">1</arg>
</function>
```

**Custom Events**
Releases before JIRA 3.6 did not allow users to create custom events. If you have modified the JIRA source to add custom events - please follow these instructions.

If you have previously defined a custom event within JIRA - it is necessary to add appropriate entries to the following files:

- `system-event-types.xml` - used to install and upgrade all event types within the system to the new 3.6 event type object.
- `email-template-id-mappings.xml` - maps the event id to an associated velocity template file.

The `system-event-types.xml` file requires name and description details of the previously added custom event. For example, if the custom event type "Issue Frozen" was added to the system - the following entry should be added to the XML file:

```xml
<eventtype id="10000">
  <name>Issue Frozen</name>
  <description>This is the 'Issue Frozen' event type.</description>
  <notificationName>ISSUE_FROZEN</notificationName>
  <eventName>issuefrozen</eventName>
</eventtype>
```

The elements provide the following information:

- `id` - the new id for the event type. All custom event types should be added from ID 10000 and above.
- `notificationName` - the original name for the event as found in the Notification table.
- `eventName` - the original name for the event as found in workflows.

The `email-template-id-mappings.xml` file requires an entry mapping the new custom event to an associated velocity email template. This mapping is used when a notification is sent for this event. Following from the above example, the following entry would be made:

```xml
<templatemapping id="10000">
  <name>Issue Frozen</name>
  <template>issuefrozen.vm</template>
</templatemapping>
```

The id should match that of the event as specified in the `system-event-types.xml` file. The template entity should reference the Velocity template to be used in email notifications of this event. A HTML and text version should be provided in the appropriate directory (html or text) at:

```
<JIRA>/src/etc/java/templates/email/
```

---

**Custom Listeners**

For all users who have added custom written listeners to JIRA, it might be necessary to update the listener to follow the new JIRA 3.6 API.
There are two things to look out for:

1. signature change of the `workflowEvent` method
2. change of return type of `getIssue()` method on the `IssueEvent` object

The signature of the method `workflowEvent` in the `IssueEventListener` has changed from:

```java
public void workflowEvent(int type, IssueEvent event);
```

to:

```java
public void workflowEvent(IssueEvent event);
```

*Note*: the type parameter has been removed.

If you have implemented `IssueEventListener` directly or have extended `AbstractIssueEventListener` and have overridden the method `workflowEvent`, you will need to change and recompile your listener before installing JIRA 3.6.

In JIRA 3.6, the event type ID can be retrieved by calling the following method on the `IssueEvent` object:

```java
Long eventID = event.getId();
```

However, the returned value of the `getId()` method is different to the values of the type parameter that was passed to the `workflowEvent` method. The following table represents these differences:

<table>
<thead>
<tr>
<th>Event Name</th>
<th>Old ID</th>
<th>New ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>created</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>updated</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>assigned</td>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>resolved</td>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>closed</td>
<td>4</td>
<td>5</td>
</tr>
<tr>
<td>commented</td>
<td>5</td>
<td>6</td>
</tr>
<tr>
<td>reopened</td>
<td>6</td>
<td>7</td>
</tr>
<tr>
<td>deleted</td>
<td>7</td>
<td>8</td>
</tr>
<tr>
<td>moved</td>
<td>8</td>
<td>9</td>
</tr>
<tr>
<td>worklogged</td>
<td>9</td>
<td>10</td>
</tr>
<tr>
<td>workstarted</td>
<td>10</td>
<td>11</td>
</tr>
<tr>
<td>workstopped</td>
<td>11</td>
<td>12</td>
</tr>
<tr>
<td>genericevent</td>
<td>-1</td>
<td>13</td>
</tr>
</tbody>
</table>

*Also*, the `getIssue()` method of the `IssueEvent` object has changed to return an `Issue` object instead of a `Generic Value` object representing an issue.

Users who have created and added custom listeners must update the listener to now operate with the `Issue` object. For example:
As a quick fix, you can modify your listener to use `event.getIssue().getGenericValue()`.

The event type ID constants are now only available from the class `EventType`. Any use of the original constants must be updated to use the `EventType` constants. For listeners that reference an event ID by its numeric value - it is necessary to ensure that the IDs now match those as defined in `EventType`.

### Custom permission types

| Applies to | users who have modified JIRA source to add new permission types (ie. in addition to the standard 'user', 'group', 'assignee' types). |

The `SecurityType` interface, used to implement permission types (‘single user’, ‘group’ etc) has had a `getUsers()` method added. If you have implemented your own SecurityType you will need to implement this. See the source of current implementations (eg. `GroupCF`) for tips.

### Plugin upgrades required

As usual, you should check whether the plugins you use are compatible with the new release. Generally, plugins (like the Subversion plugin or JIRA toolkit) need to be upgraded when JIRA is upgraded. See the list of plugins at:

http://confluence.atlassian.com/display/JIRAEXT/Home

### JIRA 3.6.5 Release Notes

Atlassian Software Systems is proud to announce the release of JIRA 3.6.5 in Standard, Professional and Enterprise editions. This point release includes 8 bug fixes and improvements, in particular improvements in performance and efficiency. It can be downloaded here.

Not using 3.6? Learn about all the new features you're missing out on!

If upgrading from an earlier version please read through the JIRA 3.6.5 Upgrade guide.

**JIRA 3.6.2 Upgrade guide**

**JIRA 3.6.2 Upgrade Guide**

This page contains specific information you need to know when upgrading to JIRA 3.6.2 from JIRA 3.6.1. If upgrading from an older version of JIRA, please go to the complete list of Upgrade Guides, and read the notes for each version you are skipping during the upgrade.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.
### Maximum Active Database Connections

<table>
<thead>
<tr>
<th>Applies to</th>
<th>JIRA Standalone users</th>
</tr>
</thead>
</table>

In version of JIRA before 3.6.2, the maximum number of database connections was limited to 8 by default. If JIRA was used by more than 8 concurrent users or under very heavy usages, the users could experience delays or JIRA could hang.

In JIRA 3.6.2 the default number of maximum active database connections has been increased to 20. When upgrading to JIRA 3.6.2, please ensure that your database will allow JIRA to establish 20 connections, or decrease this number to desired value. To adjust the number of connections change the value of the `maxActive` attribute of the `jdbc/JiraDS` resource in `config/server.xml` file. JIRA has to be restarted to apply the change.

### JIRA 3.6.1 Release Notes

Atlassian Software Systems is proud to announce the release of JIRA 3.6.1 in Standard, Professional and Enterprise editions. This point release includes over 30 bug fixes and improvements. It can be downloaded [here](https://confluence.atlassian.com/display/JIRADEV/Downloading+JIRA+3.6.1+Release+Notes).

If upgrading from an earlier version please read through the JIRA 3.6.1 Upgrade Guide.

JIRA 3.6.1 includes over 30 bug fixes and improvements.

JIRA 3.5 Release Notes

JIRA 3.5 Release Notes

Atlassian Software Systems, recipient of the Deloitte Fast 500 Award, is proud to announce the latest release of the issue tracking and project management application - JIRA 3.5 (download it here).

The latest release includes over 50 powerful new features and improvements along with over 50 bug fixes.

Contents

- New Features
- Improvements
- Bug Fixes

New Features

JIRA 3.5 includes an impressive array of new features and improvements - some of which are noted below. To view the entire new feature and improvement list - ask JIRA!

- Bulk Workflow Transition
- FogBugz Importer
- Charting Plugin
- MS Word Export
- JIRA Page Linker Plugin
- Component Lead Notification Type

Bulk Workflow Transition

JIRA 3.5 extends the bulk operation capabilities with the addition of Bulk Workflow Transition - allowing a selected collection of issues to be advanced through the associated workflow.

The Bulk Workflow Transition process is as simple as if transitioning one issue. Once the collection of issues is retrieved through the issue navigator, it is possible to progress the issues through the associated workflow. The associated screen for the transition is displayed to the user - allowing all related fields to be edited as normal. All edits (including comments) are applied to each issue and each issue is advanced to the associated workflow status. All field configurations, workflow conditions, validators and post functions are respected throughout the process.
FogBugz Importer

Users of the FogBugz issue tracking system can now easily import their FogBugz data into JIRA through the new configurable import wizard. The import wizard allows the user specify which projects, custom fields and issue links are to be imported.

Import issues from a FogBugz installation

To import issues from FogBugz you must have a valid configuration file saved on the server. Run the FogBugz Import Wizard to create or edit a configuration file.

The wizard will allow you to choose projects, custom fields and issue links to import. Once this is completed, you can save the file on the server and use it in the import process.

* FogBugz Database URL: jdbc:mysql://localhost:1433/FogBUGZ

Database Login Name: jira

Database Login Password: jira

* Driver Name: net.sourceforge.jtdb.Driver

* Existing configuration file: Location of your configuration file on the server. No configuration file? Run the Import Wizard first.
**Charting Plugin**

The ability to visually represent JIRA data in a graphical form is a key requirement for many JIRA users. With the **Charting Plugin**, users can translate their data into graphs and charts.

Allowing for more meaningful presentations with greater impact, graphs and charts are more easily absorbed than plain numerical data. Over time, users can also plot trend graphs - with the prospect of extrapolating and interpreting the graphical data to predict future trends and workloads.

The plugin can be [downloaded here](#).

---

**MS Word Export**

It is now easier to create Word document presentations, with the ability to export JIRA data to Microsoft Office Word format. It is possible to export an individual issue or the 'Full Content View' of any search to a Word document.
JIRA Page Linker Plugin

Providing further integration between JIRA and Confluence, the JIRA Page Linker Plugin provides a custom field plugin for linking a JIRA issue with a Confluence URL.

While you are creating or editing a JIRA issue, you can bring up a popup window that will allow you to quickly search a Confluence site for pages you would like to link to this issue. Clicking a link in the popup window will add the page to your new issue.

The JIRA Page Linker plugin can be downloaded here.
Component Lead Notification Type

JIRA 3.5 Enterprise introduces the notification type of **Component Lead**. With this option, notification schemes can be simplified through the specification of the **Component Lead** as a recipient of issue update emails. For each event specified in the scheme, the **Component Lead** will receive an email update - ensuring that the correct users are alerted.
Improvements

- Bulk Assignment of Users to Groups
- Jelly Improvements
- SOAP Improvements
- Configure CSV Delimiter
- Mantis Custom Field Import
- Plugin System Improvements
- Configure Email Address Format
- Internationalisation
- Multi-Select Version Picker Custom Fields in Filters
- Delete Trackbacks
- Configured Navigator Columns in Email Filter Subscription
- Convert Bugzilla Link to JIRA Link

Bulk Assignment of Users to Groups

Group management has been greatly simplified with the addition of **Bulk Assignment of Users to Groups** - allowing multiple users to be added or removed to a group at once.
Jelly Improvements

The Jelly tag `runSearchRequest` now accepts a filter ID - the ID of the filter to be executed. This tag allows one to execute any saved Search Request and then use its results in any JIRA Jelly script.

For instance, one could define a filter identifying all old/inactive issues, and write a Jelly script to move them to an 'Inactive' state (see the Jelly docs for examples). This Jelly script can be scheduled to run periodically with the Jelly service.

SOAP improvements

This release includes various SOAP improvements - including the ability to retrieve via SOAP:

- a list of general configuration properties - i.e. determine if attachments, time tracking, voting, unassigned issues, sub-tasks, issue linking or watching is turned on/off
- an issue by its ID
- a match count for a search filter - useful to determine how results should be displayed - e.g. full or partial list of results

Configure CSVDelimiter

Some versions of MS Office Excel (e.g. German) save CSV files with separating values using ';' instead of ','. The CSV Import Wizard has been improved to allow the delimiter to be specified for a particular import file.

Mantis Custom Field Import

Mantis 0.18+ has a basic custom field implementation. The JIRA Mantis Importer can now import any defined custom fields.

Plugin System Improvements

The ability to create more powerful plugins is now possible through the following improvements:

- Reference downloadable external resources. Additional static files such as images, Javascript or CSS can be served through Downloadable Plugin Resources. Further details available here.
- The plugin configuration screen has been improved with the ability to include a checkbox parameter. Further details available here.
- Servlet Plugin module enables users to deploy Java servlets as part of a plugin. Further details available here.
Maybe these improvements will be of use to the entrants of the Codegeist Competition?😊

**Configure Email Address Format**

Previously, it was necessary to stop JIRA and edit a properties file to modify the email address format. JIRA 3.5 now allows this modification to be made through the web interface - without the need to stop the server.

**Internationalisation**

The Administration section of the JIRA User Interface is now fully internationalized. This makes it possible to translate and present the entire JIRA web interface in a particular language, once the appropriate set of language files are included.

Further details on the translation process and how to get involved are available here. The continued support of those users who volunteer their translation skills is greatly appreciated.👍

**Multi-Select Version Picker Custom Field**

A new multi-select Version Picker Custom Field is now available - allowing this field to store multiple versions related to the associated project. It is also possible to use this field within a search through the Issue Navigator.

**Delete Trackbacks**

Trackback management has been improved to allow users delete specific trackbacks.

**Configured Navigator Columns in Email Filter Subscription**

In JIRA Enterprise edition, it is possible to configure which issue fields are displayed to the user for each saved filter. Previously, this configuration was only used throughout the web interface. JIRA 3.5 Enterprise now respects the chosen fields when sending e-mail notifications to subscribers of a filter.

**Convert Bugzilla text links to JIRA Issue links**

On import, original Bugzilla text links will be linked to the new JIRA issues. This improvement helps ease the migration to JIRA for users who still use the Bugzilla bug IDs.

**Bug Fixes**

This release includes over 50 bug fixes. To view the entire bug fix list - ask JIRA!

**JIRA 3.5 Upgrade Guide**

This page contains specific information you need to know when upgrading to JIRA 3.5 (release notes) from JIRA 3.4.3. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version your are skipping during the upgrade. The complete list of Upgrade Guides is available here. When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

**JIRA 3.5 Jira Service extension**

- If you have implemented a custom JIRA service you need to be aware of the following API change.

In JIRA 3.5 the `getName()` and `setName(String name)` methods was added to the `com.atlassian.jira.service.JiraService` interface. This method should return and set the name of the service respectively. The name of the service can be used to identify a service uniquely. (Fixed made due to JIRA-8352 bug)

Therefore, if you have implemented this interface, you need to implement these methods and recompile your service(s) before deploying it into JIRA 3.5. If you have extended a JIRA class instead, e.g. `com.atlassian.jira.service.AbstractService` or `com.atlassian.jira.service.JiraServiceContainer` you do not need to modify your custom services.

**Introduction of global Bulk Change permission**

JIRA 3.5 introduces the global Bulk Change permission. This permission governs the ability to execute the bulk
change operations:
- Workflow Transition
- Edit
- Move
- Delete

An upgrade task has been added to grant the new **Bulk Change** permission to all groups with the global **JIRA Users** permission.

The **JIRA documentation** includes further details on this new permission.

![Warning](image)

The decision to grant the **Bulk Change** permission should be considered carefully - the permission permits a user to modify a collection of accessible issues at once. For example, in JIRA installations configured to run in 'Public' mode (anybody can sign up and create issues), a user could comment on all accessible issues with the **Bulk Change** and **Add Comments** permission. Undoing such modifications may not be possible through the JIRA UI and may require changes made directly against the database.

**CustomFieldPersister** changes

CustomFieldPersister is used to store custom field values to database. The methods of this class has been refactored to remove the redundant parameter, `defaultValueMarker`. For example, the `create values` method went from:

```java
void createValues(CustomField field, Long issueId, String defaultValueMarker,
                 PersistenceFieldType persistenceFieldType, Collection values, String parentKey);
```

to:

```java
void createValues(CustomField field, Long issueId, PersistenceFieldType persistenceFieldType,
                 Collection values, String parentKey);
```

You will need to update and recompile any **CustomFieldType** that you wrote to use this new interface.

**VersionCFType** Changes

This affects plugin writers who uses the version custom field **VersionCFType**. The change is that previously the Transport Object type was a single **Version** object, but it is now a collection that contains a single **Version** object.

This was done to handle an improved version custom field which can be a multi-select version custom field as well

**JIRA 3.5.3 Release Notes**

Atlassian Software Systems is proud to announce the release of JIRA 3.5.3 in Standard, Professional and Enterprise editions. This point release includes over 20 bug fixes and improvements. It can be downloaded [here](#).

If upgrading from an earlier version please read through the **JIRA 3.5.3 Upgrade Guide**.

JIRA 3.5.3 includes over 20 bug fixes and improvements.

### JIRA 3.5.2 Upgrade Guide

#### JIRA 3.5.2 Upgrade Guide

This page contains specific information you need to know when upgrading to JIRA 3.5.2 from JIRA 3.5.1. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below. Issue Event Changelog Can Now Be Null

- If you have implemented a custom JIRA Issue Event Listener you need to be aware of the following API change.

In JIRA 3.5.2, the IssueEvent object thrown as a result of an edit operation, may now return null from a getChangeLog() call. The case where this happens is when a user chooses to edit an issue but only leaves a comment and makes no other changes to the issue. Prior to 3.5.2 no event was fired in this case and this was identified as a bug (JRA-9415) and has since been fixed. Check any calls to getChangeLog() for null.

#### JIRA 3.5.1 Release Notes

Atlassian Software Systems is proud to announce the release of JIRA 3.5.1 in Standard, Professional and Enterprise editions. This point release includes over 20 bug fixes and improvements. It can be downloaded here.

If upgrading from an earlier version please read through the JIRA 3.5.1 Upgrade Guide.

JIRA 3.5.1 includes over 20 bug fixes and improvements.

**JIRA 3.5.1 Upgrade Guide**

This page contains specific information you need to know when upgrading to JIRA 3.5.1 from JIRA 3.5. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available [here](http://confluence.atlassian.com/display/JIRA/JIRA+3.4+and+3.4.1+Upgrade+Guide).

When upgrading JIRA please follow the [general upgrade instructions](http://confluence.atlassian.com/display/JIRA/JIRA+3.4+and+3.4.1+Upgrade+Guide) keeping in mind the information below.

- There are no specific instructions you need to be aware of related to upgrading from JIRA 3.5 to JIRA 3.5.1.

**JIRA 3.4 and 3.4.1 Release Notes**

JIRA 3.4 Release Notes

Atlassian Software Systems, Australia's fastest growing software company, is proud to announce the latest release of the issue tracking and project management application - **JIRA 3.4** ([download it here](http://confluence.atlassian.com/display/JIRA/JIRA+3.4)). Just over 3 weeks since the final 3.3.x release, **JIRA 3.4** includes some 50 powerful new features and improvements along with over 70 bug fixes.

### Upgrade Information

In order to complete a successful upgrade, please refer to our Upgrade Guides. If you are upgrading from JIRA 3.3.3 please refer to the following document: [http://confluence.atlassian.com/display/JIRA/JIRA+3.4+and+3.4.1+Upgrade+Guide](http://confluence.atlassian.com/display/JIRA/JIRA+3.4+and+3.4.1+Upgrade+Guide)

If you are upgrading from a pre-3.3.3 release please read the following guides also: [http://confluence.atlassian.com/display/JIRA/All+JIRA+3.x+Upgrade+Guides](http://confluence.atlassian.com/display/JIRA/All+JIRA+3.x+Upgrade+Guides)

### Features and Improvements:

- Issue Types Per Project
- Renderers

*Created in 2014 by Atlassian. Licensed under a [Creative Commons Attribution 2.5 Australia License](http://creativecommons.org/licenses/by/2.5/au/).*
- Clone Portlets
- Issue Operation Plugin
- RSS Improvements
- RPC Searching
- Dynamic Header Banner
- Internationalisation
- Bulk Migration by Issue Type
- Change Parent Issue of Sub-Task
- Multi-User Custom Field
- Trackback Configuration

Contents

1. New Features
2. Improvements
3. Bug Fixes
4. Notes

New Features

This release includes over 50 new features and improvements - see the full list of features & improvements online

**Issue Types Per Project**

The **most highly requested** feature in JIRA - with over 200 votes - you can now configure **Issue Types Per Project**. Issue types can be defined for a specific project - adding contextual relevance to issue type selection when creating/editing/moving an issue.

This feature provides the ability to better define the context of a project with only relevant issue types available - resulting in a more intuitive user interface, and enables greater control over the users’ issue selection process.

For example, the **Sales** project may require a **Purchase Request** issue type, while this issue type would not apply to the context of the **Support** project. Further, the issue type **Support Request** is relevant within the **Support** project but would not apply to the context of the **Sales** project.
This release also introduces Renderers within JIRA text-based fields such as description and comments - allowing a greater range of expression within these fields.

This release ships with two renderers, the default text renderer, which preserves the functionality available in previous JIRA releases, and the Atlassian wiki renderer, which brings the power of the Confluence wiki engine to JIRA. In the Enterprise edition of JIRA, renderers can be configured on a per field, per project/issue type level, allowing a flexible combination of text and wiki markup. In the Standard and Professional editions renderers can be configured on a per field basis. Renderers are implemented as pure JIRA plugins, meaning that any renderer can be easily added to or removed from use within JIRA, including any custom renderers that may be developed.

Further details on the renderer functionality is available in the documentation:

http://www.atlassian.com/software/jira/docs/v3.4/renderers_overview.html
Clone Portlets

Dashboard administration is simplified with the ability to clone a portlet.
Issue Operation Plugin

This new system plugin allows new issue operations (links and HTML) to be added to the operations panel of the view issue screen. With a simple configuration process, it is possible to add quick access to commonly used links to every issue.

For example, the following operation will execute a Google search on the issue summary.

Information about how to create your own Issue Operations can be found in the docs online.

Improvements

RSS Support Improvements

JIRA has been improved to take advantage of browser support for RSS feeds. A result of any search can be accessed quickly and directly by adding 'live bookmarks'.

Basic authentication support for RSS feeds from JIRA has also been added in this release - allowing the option of avoiding the transmission of usernames and passwords across the wire in clear text format.
RPC Searching

The RPC searching functionality has been improved - results are returned quicker and more efficiently with fewer database calls.

Dynamic Announcement Banner

With thanks to Nick Minutello, the announcement banner can now be dynamically configured through the JIRA UI.

The announcement banner is displayed on all JIRA pages and is useful for alerting users to important information - for example, scheduled server maintenance, approaching project deadline, etc. This information can be updated immediately without having to restart JIRA.

Edit Announcement Banner

Here you can set HTML text which will display as a banner in all JIRA pages. This is useful for alerting users of upcoming system-wide changes.
Internationalisation

With the introduction of the Czech language pack, JIRA is now available in 16 different languages. This release also includes an updated Traditional Chinese language pack. Once again, the Atlassian team would like to thank our users who have contributed to the translation process - this work is much appreciated.

Bulk Migration by Issue Type

Previously, it was only possible to bulk migrate a collection of issues to a single project and issue type. Now, different issue types can be migrated to different projects and issue types - allowing you to specify exactly how each issue should be moved. With this fine-grained configuration capability, bulk migration operations are now easier and quicker.

Change Parent of Sub-Task

The parent issue of a sub-task can now be changed - allowing a sub-task to be 'moved' from one parent issue to another.

Multi-user Custom Field

It is now possible to select multiple users through the multi-user custom field.

This improvement has also been extended to the configuration of security level, permission and notification schemes. This means that by selecting users for the Multi-user field it is possible to control who will have access to the an issue and who will be notified when the issue is updated. Please note that using Multi-user custom field for permissions and security levels is only supported by the Enterprise Edition.
Trackback Configuration

Trackback configuration has been extended with three possible modes for Outgoing Trackbacks:

- **Off for All Issues**
- **On for Public Issues Only**
- **On for All Issues**

By using the **On for Public Issues Only** setting, trackbacks from issues protected by a security or permission scheme (i.e. issues not visible by non-logged in users) will not be sent - the external sites referenced in these secure issues will not be notified of the referral.

The operation of **Incoming Trackbacks** has also been modified such that 'secure' issues can receive trackback notifications. The issues will remain secure based on their security settings, but users who have access to the issues will be able to see the trackback references that issues have received.

Notable Features & Improvements

Some other notable improvements included in this release:
• New Jelly tag allowing a field (including custom field) to be placed onto a Screen
• Bugzilla importer preserves inter-issue dependencies
• Bugzilla importer converts Bugzilla text links to JIRA links
• Search user custom fields using group membership

Bug Fixes
This release includes over 70 bug fixes - the full list of bug fixes online

Notes

Javascript Caching
In some instances, the browser may read from a cached version of the Javascript files used throughout JIRA. This will result in certain elements appearing incorrectly - e.g. the issue type selection list may appear with repeated icons. This problem can be corrected by forcing a reload on the page in question - i.e. pressing 'CTRL-R' or 'F5'.

JIRA 3.4.1 Release Notes
JIRA 3.4.1 is released today in Standard, Professional and Enterprise editions. This point release fixes JIRA 3.4’s incompatibility with MySQL and MS SQL Server and includes bug fixes and improvements which appear below.

If upgrading from JIRA 3.3.3 or 3.4 please read through JIRA 3.4 and 3.4.1 Upgrade Guide. If upgrading from an earlier version of JIRA please read through all the Upgrade Guides for all versions that you are skipping during the upgrade.

JIRA 3.4.1 bug fixes and improvements.

JIRA 3.4 and 3.4.1 Upgrade Guide

JIRA 3.4 Upgrade Guide
This page contains specific information you need to know when upgrading to JIRA 3.4 from JIRA 3.3.3. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version your are skipping during the upgrade. The complete list of Upgrade Guides is available here.

Two major new features of JIRA 3.4, wiki renderer previews, and issue types per project require that javascript be enabled to make use of their full functionality. You will still be able to use all the core features of JIRA with javascript disabled.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

1. Please do not copy jira-application.properties file from your old JIRA installation. Edit the file that is shipped with JIRA 3.4 and make needed changes. New properties have been added to this file so if you simply copy the old file across the following error would occur JRA-8645.
2. If you have written any CustomFieldType or CustomFieldSearcher plugins please refer to Upgrading Custom Field Types in JIRA 3.4
3. The default user preferences are now configured in the jira-application.properties file and are configurable through the admin section of JIRA. Any properties in the old file preferences-default.xml will no longer effect JIRA configuration.
4. Please note that to configure issue types per project you must have JavaScript turned on in your web browser.
5. If you are using MySQL please do not use Connector/J 3.1.11 JDBC Driver as it has the following bug. Connector/J 3.1.10 and earlier work fine.

JIRA 3.4.1 Upgrade Guide

This section contains specific information you need to know when upgrading to JIRA 3.4.1 from JIRA 3.4. If upgrading from JIRA 3.3.3 please read the previous section as well. If upgrading from an older version than JIRA 3.3.3, please read the Upgrade Guide for each version your are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

1. Please do not copy jira-application.properties file from your old JIRA installation. Edit the file that is shipped with JIRA 3.4 and make needed changes. New properties have been added to this file so if you simply copy the old file across the following error would occur JRA-8645.
2. If you have written a CustomFieldType that implements the com.atlassian.jira.issue.customfields.CustomFieldType interface directly rather than extending one of the Abstract classes that ship with JIRA please read Upgrading Custom Field Types in JIRA 3.4.1.
3. If you have written an Custom Field Searcher please have a look at Upgrading Custom Field Types in JIRA 3.4.1.
4. JIRA 3.4 and 3.4.1 do not generate an Issue Assigned event. The Issue Updated event is generated instead. In previous versions of JIRA the Issue Assigned event was generated when issues are assigned using the "Assign" operation on the View Issue page. This means that even when the "Assign" operation is used JIRA will send notifications to parties listed under the Issue Updated event. The patch to correct this behaviour is available at JRA-8533.

Upgrading Custom Field Types in JIRA 3.4

JIRA 3.4 and higher

Changes to the custom field types code

For JIRA 3.4, there has been further upgrades to the custom fields code. If you have written your own Custom Field Types of Custom Field Searchers, you'll want to read this document. We recommend that you ensure that your custom field types compile against the latest 3.4 build and verify this under a testing environment before putting it into production.

You can download the latest JIRA Development Kit from its confluence space.

CustomFieldType Interface changes CustomFieldConfig and CustomFieldConfigItemType changed to FieldConfig and FieldConfigItemType respectively. This change is to bring CustomFields and SystemFields closer...
so that, in the future, fields can be configured in uniform way.

```java
com.atlassian.jira.issue.customfields.config.CustomFieldConfig;
com.atlassian.jira.issue.customfields.config.CustomFieldConfigItemType;
```

has become

```java
com.atlassian.jira.issue.fields.config.FieldConfig;
com.atlassian.jira.issue.fields.config.FieldConfigItemType;
```

A straight replacement should do the trick.

**isRenderable()**

With the addition of renderers in JIRA 3.4 there has been a minor addition to the CustomFieldType interface. There is now a method of the signature:

```java
public boolean isRenderable();
```

There is a default implementation of this method in the AbstractCustomFieldType class that returns false. If you are extending any of the existing base classes, AbstractCustomFieldType, TextCFType, SelectCFType, then there are no changes needed to upgrade your CustomField Types.

If you are implementing the CustomFieldType interface then you will need to implement the isRenderable method in your class. To retain the functionality that you always had the method should return false. With the introduction of renderable fields in JIRA 3.4 if you return true in the isRenderable method then you will be able to assign the custom field a renderer. This only really makes sense for text fields where you can use the power of the wiki syntax.

**getChangelogString()**

To better support logging of change history from custom fields there is now a method of the signature:

```java
public String getChangelogString(CustomField field, Object value);
```

This method allows a custom field type to provide a string that can give a custom fields value meaning. The two examples that ship with JIRA are the ProjectPicker and VersionPicker custom fields. Both of these fields store the database id of the value (e.g. My Project is id 10000, so it stores 10000). The ProjectCFTType object will return the value 'My Project' from this new method so that we can register in the change item bean that the string is 'My Project' and that the value is '10000'. The AbstractCustomFieldType object returns null for this method by default. If you are extending any of the existing base classes, AbstractCustomFieldType, TextCFType, SelectCFType, then there are no changes needed to upgrade your CustomField Types.

**Upgrading Custom Field Types in JIRA 3.4.1**

**valuesEquals method addition**

If you have implemented a CustomFieldType by directly implementing the `com.atlassian.jira.issue.customfields.CustomFieldType` interface instead of extending one of the Abstract classes that ship with JIRA, you will need to add the following method to your implementation:
/**
 * Used to compare old field value to the new field value when the issue is being updated
 * and work out whether a change item should be generated.
 * @param v1 current value
 * @param v2 new value
 * @return true if the change item should be generated, false otherwise
 */
boolean valuesEqual(Object v1, Object v2);

This means that you will need to implement this method and recompile your class before deploying it into JIRA 3.4.1.

The method has been introduced to resolve bug JIRA-8480 and allows the CustomFieldType to have control over change items that JIRA generates when an issue is updated.

The `com.atlassian.jira.issue.customfields.impl.AbstractCustomFieldType` implements the method as follows:

```java
if (v1 == v2)
{
    return true;
}
if (v1 == null || v2 == null)
{
    return false;
}
return v1.equals(v2);
```

which is compatible with the behaviour of previous JIRA releases. Therefore if your CustomFieldType extends AbstractCustomFieldType, or any of its subclasses, you do not need to add this method, unless you would like to take advantage of it.

CustomFieldSearchers - AbstractCustomFieldSearcher constructor change

If you have implemented any CustomFieldSearchers that extend the `com.atlassian.jira.issue.customfields.searchers.AbstractCustomFieldSearcher` class then you will have to modify your CustomFieldSearcher. The constructor of the AbstractCustomFieldSearcher class has changed from being a no-arg constructor to taking an instance of `com.atlassian.jira.web.bean.FieldVisibilityBean`. You must pass the FieldVisibilityBean to the super classes constructor. You will need to include code that will look something like this:

```java
public MultiProjectSearcher(FieldVisibilityBean fieldVisibilityBean)
{
    super(fieldVisibilityBean);
}
```

JIRA 3.4.3 Release Notes

JIRA 3.4.3 Release Notes

In the tradition of worthwhile updates, JIRA 3.4.3 is released today in Standard, Professional and Enterprise editions. This point release includes over 40 bug fixes and improvements. It can be downloaded here.
If upgrading from an earlier version than JIRA 3.4.2 please read through the Upgrade Guides for all versions that your are skipping during the upgrade. If upgrading from JIRA 3.4.2 please read the 3.4.3 Upgrade Guide before continuing.

JIRA 3.4.3 includes over 40 bug fixes and improvements.

This page contains specific information you need to know when upgrading to JIRA 3.4.2 from JIRA 3.4.1. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available here. When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

- There are no specific instructions you need to be aware of related to upgrading from JIRA 3.4.1 to JIRA 3.4.2.

JIRA 3.4.1 Release Notes

JIRA 3.4.1 is released today in Standard, Professional and Enterprise editions. This point release fixes JIRA 3.4's incompatibility with MySQL and MS SQL Server and includes bug fixes and improvements which appear below.

If upgrading from JIRA 3.3.3 or 3.4 please read through JIRA 3.4 and 3.4.1 Upgrade Guide. If upgrading from an earlier version of JIRA please read through all the Upgrade Guides for all versions that you are skipping during the upgrade.
JIRA 3.4.1 bug fixes and improvements.

JIRA 3.3 Release Notes

JIRA 3.3 Release Notes

Atlassian Software Systems is proud to announce the latest release of the issue tracking and project management application - JIRA 3.3 - download it here. Only 10 weeks since the last release, JIRA 3.3 includes some of the most requested features along with a host of bug fixes and improvements.

Upgrade Information

In order to complete a successful upgrade, please refer to the following guides:

- JIRA 3.2 Upgrade Guide
- JIRA 3.3 Upgrade Guide

It is necessary to follow both guides if upgrading from a pre 3.2.x version. It is only necessary to follow the JIRA 3.3 Upgrade Guide when upgrading from a 3.2.x version.

Features and Improvements:

- Multiple Project Filters
- Bulk Move
- User Custom Field Notification Target
- Extended Search Capabilities
- SOAP Enhancements
- Performance Improvements
- New Translations
1. New Features
2. Improvements
3. Bug Fixes

New Features

This release of JIRA includes some of the most requested features as logged at http://jira.atlassian.com - the full list can be viewed at JIRA 3.3 New Features & Improvements.

Multiple Project Filters

The Issue Navigator has been completely overhauled to pave the way for future extended search functionality and enhancements. Addressing one of the most popular feature requests (with over 50 votes), this release includes the ability to execute a search across multiple projects.

This feature increases the searching capabilities available to the user with the ability to aggregate a collection of issues from across multiple projects. Users can now design a search query that directly addresses their requirements for searching throughout JIRA.

The applications of this improved search capability are countless ... for example:

- Retrieve all issues opened in the last week from selected projects - add these results to an RSS feed or view them on the JIRA dashboard
- Add a statistics portlet to the JIRA dashboard with results from a multi-project filter
- Subscribe to a multi-project filter containing issues assigned to your team members - with issues retrieved only from the projects you manage!

Bulk Move

Extending the range of bulk operations available in JIRA, it is now possible to move multiple issues at once.

The Bulk Move operation allows a collection of issues (from multiple projects and consisting of multiple issue types) to be moved to another project and/or issue type. The ability to update multiple issues in this manner gives the user even more power - for instance, it is now possible to merge issues from multiple projects into one project.

User Custom Field as Notification Target

It is now possible to specify an additional notification target by selecting a user in a 'CC' custom field. This provides the issue creator/editor the ability to add another user to the notification recipient list for a specific issue. Many thanks to Chris Wood at MetOcean Engineers for his work on this feature!

Improvements

This release of JIRA includes some significant improvements in available functionality and overall system
performance.

**Extended Search Capabilities**

More precise search filters can be created by specifying a date range in relation to the system fields ‘Created’ and ‘Updated’ and the custom field ‘Date Time’. A number range can also be specified for the ‘Number’ custom field. The ability to specify a range in this manner provides the user with a very fine-grained filter over a specific set of issues.

**SOAP Enhancements**

JIRA’s SOAP capabilities are growing more complete with each release. For JIRA 3.3, you can now progress an issue through a workflow remotely; find out what actions are available for an issue, update the fields and progress through the workflow. It’s now easier than ever to seamlessly integrate JIRA with external tools.

**Extended XML-RPC Functionality**

Bringing the XML-RPC functionality inline with the current SOAP plugin, it is now possible to update an issue & run a search request.

**Performance Improvements**

Continually striving to advance system efficiency, this release includes a number of notable performance improvements:

- **Issue Navigator** performance has been improved with fewer database access calls - displaying filter results quicker
- **Workflow Activation** is now less memory intensive - the operation completes without pulling all issues into memory to make the new workflow association
- **Version Management** operations have been streamlined to complete quicker
- The **Link Issue** pop-up displays quicker
- The **Permission Schemes** and **Notification Schemes** management pages have been refined to return
scheme information quicker

- **Date Range** searches are executed more efficiently

**New Translations**

Along with updates to the **Traditional Chinese** and **German** translations, JIRA is now available to use in **Italian** and **Slovakian**. Once again, we would like to thank all those who have contributed to the translation process - JIRA is now available in **14** different languages.

**JIRA Standalone**

JIRA Standalone now ships with **Tomcat 5.5** - allowing users to use JIRA out of the box with the latest version of the popular application server.

**Previous Standalone Installations**

Due to incompatibilities in the format of the `server.xml` file between versions of Tomcat - please do not copy the `server.xml` file from previous standalone installations to the new standalone installation.

**Bug Fixes**

This release includes over 90 bug fixes - the best way to see them is them is to ask JIRA - [Issues Resolved for JIRA 3.3](#).

**JIRA 3.3 Upgrade Guide**

**This page contains specific information you need to know when upgrading to JIRA 3.3 from JIRA 3.2.x. If upgrading from an older version of JIRA, please go to the complete list of Upgrade Guides, and read the notes for each version you are skipping during the upgrade.**

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

**Known incompatibilities**

3.3.x is not a good release for IBM shops:

1. JIRA 3.3.x may not work on **Websphere 5.0.x and 5.1.x** due to JRA-7699
2. When using DB2, JIRA may hang when deleting projects or performing workflow operations. See the full problem description (and possible workaround) in the documentation

WebSphere or DB2 users, please stick with 3.2.x or move on to 3.4.x or higher, where these problems have been resolved.

**Notes on upgrading**

1. Due to web browser caches, changes to JIRA's Issue Navigator might appear corrupted or unstyled. Please refresh your browser's cache (press Shift+Reload on the Find Issue's page) for the changes to appear correctly.
2. JIRA's issue cache size will be automatically set to 0 during the upgrade, as it is no longer needed due to performance improvements in JIRA (JRA-7166)
3. If you have written any CustomField Type or CustomFieldSearcher plugins please refer to this document
4. Users with outgoing trackback pings enabled (not the default) may wish to disable this until JRA-7589 is fixed, to avoid the risk of the mail queue hanging.
5. If you have bookmarks or deal with hard coded links to the issue navigator, you should read about the changed issue navigator parameters
6. If you are using JIRA Standalone, please do not simply copy your old `conf/server.xml` file to the new installation of JIRA. Please read this document.
7. If upgrading JIRA in an external Tomcat installation, be sure to delete the `work/` temporary directory before restarting JIRA, to clear cached JSPs from the old JIRA.

Parameter changes in Issue Navigator

We've made significant backend changes to the issue navigator in 3.3. This resulted in some parameters being changed and are deprecated.
What does this affect?

This affects only direct links to the issue navigator that's been saved outside JIRA. e.g. a bookmark to an RSS feed, a Confluence page with the search parameters hard coded. This will not affect saved filters in JIRA, or portlets shipped with JIRA.

What has changed?

For 3.3 parameters that have changed are:

1. resolutionIds -> resolution
2. priorityIds -> priority
3. statusIds -> status
4. createBefore -> create:before
5. createAfter -> create:after
6. createPrevious -> create:previous
7. updateBefore -> update:before
8. updateAfter -> update:after
9. updatePrevious -> update:previous
10. duedateBefore -> duedate:before
11. duedateAfter -> duedate:after
12. duedatePrevious -> duedate:previous
13. duedateNext -> duedate:next

Also the values for the createNext and updateNext parameters has been modified.

What this means for me? What do I need to do?

We've put in place mechanisms that makes the issue navigator backwards compatible, so you won't actually notice any difference using links with deprecated parameters. However, it's strongly recommended that you re-bookmark any affected links to JIRA. We can't guarantee that this will be in place forever and it's better if you update it as a soon as possible.

For system administrators, all searches using the deprecated parameters will be logged to the server with the client's URL and IP address. You should try to chase up the user so that there's no major problems down the track.

If you find these warnings impossibly annoying, you can update your log4j.properties to disable them by adding the line below to your log4j.properties. However, we strongly discourage you from doing this. The warnings are there so that they can be identified and stop any problems further down the track.

```log4j.category.com.atlassian.jira.util.retro = ERROR, console```

Upgrading custom CustomFieldTypes in JIRA 3.3

⚠️ Applies to JIRA 3.3 and higher

Changes to the custom field types code

For JIRA 3.3, there has been further upgrades to the custom fields code. If you have written your own Custom Field Types of Custom Field Searchers, you'll want to read this document. We recommend that you ensure that your custom field types compile against the latest 3.3 build and verify this under a testing environment before putting it into production.

You can download the latest JIRA Development Kit from its confluence space.

CustomFieldType Interface changes

We removed all references to GenericValue objects in the CustomFieldType and replaced it with Issue. The issue object provides powerful accessors to the issue's parameters such as affects versions and components. If you still need the old GenericValue object, you can call getGenericValue on the issue object.

We've also added a new method to the interface.
/**
 * Returns a list of indexers that will be used for the field. This will over-ride the anonymous searcher specified by
 * @link AbstractCustomFieldSearcher#getRelatedIndexers() and @link AbstractCustomFieldSearcher#index(Document,
 * CustomField, Object)
 * @return List of instantiated and initialised @link FieldIndexer objects. Null if no related indexers.
 */
List getRelatedIndexers(CustomField customField);

Through this method you can over-ride how this custom field will get indexed.

CustomFieldSearcher Interface over-haul

The CustomFieldSearcher interface now extends the new IssueSearcher interface. This allows you to write more flexible searchers as well as easily extend and reuse code from the default system searchers.

If you haven't developed your own custom searchers, then there's nothing you need to do. If you do have custom searchers but they extend AbstractCustomFieldSearcher then you shouldn't have to make any changes to the Java code as we have tried to keep this class backwards compatible. However, you should still recompile to make sure.

You will need to update all velocity pages used by the searcher. For the edit pages you'll need to use the new header (rather than the controlHeaders)

```
#searcherEditHeader ($customField.id $customField.name)
...
#searcherEditFooter ($customField.id $customField.description)
```

and for the view templates:

```
#searcherHeader ($customField)
...
#searcherFooter ($customField)
```

This change is in order to give the search templates greater flexibility (i.e. allow different rendering behaviour of the searcher from the standard edit screens.

Upgrading to JIRA 3.3 Standalone

Upgrading to JIRA 3.3 Standalone

JIRA Standalone now ships with Tomcat 5.5 - allowing users to use JIRA out of the box with the latest version of the popular application server.

Previous version of JIRA shipped with an older version of Tomcat, for example, JIRA 3.2.x shipped with Tomcat 4.1.29. The configuration files for Tomcat 5.5 are not compatible with files from older Tomcat releases.

This means that you cannot simply copy the conf/server.xml from your old JIRA Standalone installation. You will need to use the conf/server.xml shipped with JIRA 3.3 Standalone as a starting point, and then customise it for your database as described in our documentation.

JIRA 3.3.3 Release Notes
**JIRA 3.3.3 Release Notes**

In the tradition of worthwhile updates, JIRA 3.3.3 is released today in Standard, Professional and Enterprise editions. This point release includes over 70 bug fixes and improvements. It can be downloaded here.

If upgrading from an earlier version than JIRA 3.3.2 please read through the Upgrade Guides for all versions that your are skipping during the upgrade. If upgrading from JIRA 3.3.2 please read the 3.3.3 Upgrade Guide before continuing.

JIRA 3.3.3 includes over 70 bug fixes and improvements.

JIRA 3.3.3 Upgrade Guide

This page contains specific information you need to know when upgrading to JIRA 3.3.3 from JIRA 3.3.2. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

1. the release notes templates, releasenotes-html.vm and releasenotes-text.vm are no longer provided with an Issue GenericValue, they are now provided an Issue object. If you have customized these templates you will need to modify your velocity syntax to access the Object methods instead of accessing the values via the GenericValue.
JIRA 3.3.2 Release Notes

In the tradition of worthwhile updates, JIRA 3.3.2 is released today in Standard, Professional and Enterprise editions. This point release includes over 40 bug fixes and improvements. It can be downloaded here.

If upgrading from an earlier version than JIRA 3.3.1 please read through the Upgrade Guides for all versions that your are skipping during the upgrade. If upgrading from JIRA 3.3.1 there is no specific Upgrade Guide for JIRA 3.3.2.

JIRA 3.3.2 includes over 40 bug fixes and improvements.

**JIRA 3.3.1 Upgrade Guide**

This page contains specific information you need to know when upgrading to JIRA 3.3.1 from JIRA 3.3.

If upgrading from an older version of JIRA, please read the Upgrade Guide for each version your are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below:

1. If you have implemented a custom Issue Tab Panel plugin you need to be aware of this API change.

If you are upgrading to JIRA 3.3.1 from a previous version, due to web browser caches, changes to JIRA's Issue Navigator might appear corrupted or unstyled. Please refresh your browser's cache (press Shift+Reload on the Find Issue's page) for the changes to appear correctly.

**JIRA 3.3.1 Issue Tab Panel extension**

If you only need to worry about this page if you have a implemented a custom [Issue Tab Panel] JIRA plugin.
Before JIRA 3.3.1 every IssueAction object that a IssueTabPanel returned would appear on the "All" tab on the View Issue page. Therefore an Issue Tab Panel could not return an IssueAction with a simple informational message, without polluting the "All" tab with this message. (This caused the JIRA-7822 bug).

In JIRA 3.3.1 the `isDisplayActionAllTab()` method was added to the `com.atlassian.jira.issue.action.IssueAction` interface. This method should return "true" if the IssueAction should appear on the "All" tab, and "false" otherwise.

Therefore, if you have implemented this interface directly in your plugin, you will need to implement this method and recompile your plugin before deploying it into JIRA 3.3.1. If you have extended a JIRA class instead, `com.atlassian.jira.issue.action.AbstractIssueAction` or `com.atlassian.jira.issue.action.AbstractGVIssueAction` you do not need to recompile your plugin.

**JIRA 3.2 Release Notes**

**JIRA 3.2 Release Notes**

**Atlassian Software Systems** is proud to announce the latest release of the issue tracking and project management application - **JIRA 3.2** (download). Following the tradition of frequent and worthwhile upgrades, **JIRA 3.2** once again raises the bar in the professional issue tracking arena with a host of new features, improvements and bug fixes. Included in this release:

- Customisable fields for transitions
- Tabbed field screens
- Contextual custom fields
- Extended Bulk Edit Capabilities
- Improved internationalisation
- Improved performance
- ...and much more!

**JIRA just got a whole lot better!**

ℹ️ **Upgrading to JIRA 3.2?**

Please refer to the following documentation regarding the upgrade process to JIRA 3.2 from previous versions - **JIRA 3.2 Upgrade Guide**

Contents

1. New Features
2. Improvements
3. Bug Fixes

**New Features**

ℹ️ **JIRA 3.2 Documentation**

Further information on all these new features can be found in the JIRA 3.2 documentation. A full list of the new features and improvements in JIRA 3.2 can be found here.

**Field Screens**

JIRA 3.2 allows configuration of field position and visibility for each issue operation and in Professional and Enterprise editions for each workflow transition screen.

Each page on which you view and enter data for an issue is now a customisable "field screen". This provides for a flexible, more intuitive interface, with the ability to configure exactly which fields are presented for each operation. Each screen contains only those fields that directly relate to the operation being performed - while fields that do not relate to the operation can be hidden.

For example, it is possible to configure the 'Create Issue' screen to display the 'Assignee' field, while hiding this field in the 'Edit Issue' screen. It is also possible to configure JIRA such that certain fields (including custom fields) appear only on specific workflow transitions: for example, if you have a 'QA Contact' custom field, you can now configure JIRA to ensure that it is shown only on the 'Close Issue' transition.
Field Screen Tabs

With JIRA Enterprise edition, you aren’t even limited to a single field screen. Each page can have its fields divided amongst a group of tabs, creating a less cluttered environment as less used fields (e.g. attachments) can be placed in separate tabs.

Contextual Custom Fields

Custom fields have been enhanced even further to allow greater flexibility and potential for customisation. Custom Fields are no longer limited to a single project or issue type, but can be shared between multiple issue types and multiple projects. Gone is the need to create the same custom field over and over again. Custom fields can be defined within a specified context or set of issue types, allowing them to be defined exactly where you need them.

Custom fields related to several projects and/or issue types can be configured to appear for those projects.
and/or issue types. For example, a custom field 'Customer ID' could be associated with the 'Sales' and 'Customer Info' projects, while a custom field 'Operating System' could be associated with the 'Bug' and 'Improvement' issue types in the 'Support' project.

With configuration contexts, the same custom fields can still be configured differently for each project: for example having different default values.

### Extended Bulk Edit

Further extending the bulk edit functionality, it is now possible to bulk edit more fields - a much requested feature. The list of fields that can be modified has been extended to include:

- Due Date
- Reporter
- Issue Security Level
- Issue Type

The bulk edit of assignee also works across multiple projects - allowing the selection of only valid assignees across all projects.

### Internationalisation - Viva la JIRA!

#### Issue Constant Translations

Continuing our commitment to a fully internationalisable issue manager, JIRA 3.2 provides the ability to translate
all issue settings - i.e. Priorities, Statuses, Issue Types and Resolutions. This allows for even more complete translations to present JIRA to each user in their own chosen language.

Hence, users who have selected the French locale will be presented with the French translations for the issue settings, while the Spanish users will be presented with the Spanish translations. The translations are presented throughout the JIRA interface - in issue creation/editing/viewing, reports, portlets, etc.

### Issue Type Translations

On this page, you can add 'Issue Type' translations for the installed locales.

- **View** issue types

### New Language Pack

With the addition of Traditional Chinese, JIRA's user interface can be displayed in 12 languages.

### Subversion - Multiple Repositories Support

The most popular JIRA Subversion plugin feature request has been addressed with support for multiple repositories now included in the latest plugin release. This allows users to map multiple JIRA projects to multiple Subversion repositories.

### New Portlets

JIRA 3.2 introduces the Voted Issues and Watched Issues portlets - respectively showing the issues voted for and watched by the current user. These portlets can be added to the dashboard in the normal manner - providing quick access to the data you need.

### Shortcuts

Navigating through JIRA is now quicker than ever with the addition of a number of shortcuts. Every form - from issue creation to editing a version - in JIRA can be submitted with the shortcut **ALT+S**. Form submission can be canceled using the shortcut **ALT+`** (ALT + backquote).
Profile Email

In order to protect against spammers harvesting email addresses from JIRA, this release includes the functionality to hide the email addresses located on the user profile page. It is possible to configure the display of this information as follows:

- Show
- Hide
- Mask (e.g. 'user@example.com' becomes 'user at example dot com')
- Show to logged in users only

Improvements

Performance - JIRA goes to boot camp!

One of the main goals of this release was to improve on overall performance of JIRA and there are major improvements in memory usage and speed. Utilising the Lucene search engine and some clever coding, some of the notable enhancements include:

- Issue Navigator
  - Much quicker searching and Sorting (usually under 1s)
- Browse Project
  - Quicker Project, Popular Issues and Open Issues reports benefit with up to 10x improvement
- Portlets
  - Project portlet is now 2x faster
  - Assigned to Me portlet is up to 10x faster and more efficient
- Importing and Indexing
  - Restoring JIRA backups or upgrading to a new version of JIRA is now 2x faster.

Smart Query - let JIRA find it for you!

The ‘Smart Query’ functionality within JIRA has been further extended to provide easy access to commonly requested searches. For example, entering the query 'unresolved' will direct the user to a list of unresolved issues. Further details on this feature can be found here.

EXCEL View

Many users requested that the EXCEL view display the same columns as displayed in the Issue Navigator view ... now it is possible to display all columns or just those visible in the the issue navigator.
Email Notification

Many users requested the ability to change the format of the From email address within JIRA notifications. The format is now fully configurable - with the ability to include or exclude the user name, email address and email hostname: for example, the format can be set to display as follows 'John Doe (ATLASSIAN) <jira@atlassian.com>'.

JDK 1.5 Compatibility

JIRA 3.2 is now fully compatible with JDK 1.5!

Bug Fixes

This release includes nearly 200 bug fixes - the best way to see them is to ask JIRA - JIRA 3.2 Bug Fixes.

Upgrading to JIRA 3.2

Please refer to the following documentation regarding the upgrade process to JIRA 3.2 from previous versions - JIRA 3.2 Upgrade Guide

JIRA 3.2 Upgrade Guide

This page contains information you need to know when upgrading to JIRA 3.2. The general upgrade instructions can be found here.

1. If you have written any Custom Field Type plugins please refer to this document
2. If you have created any Workflow plugins (custom Validators or Post Functions) please read this document.
3. If you have any custom file based workflows (workflows not created through JIRA's Workflow Editor) please read this document.
4. If you wish issues that are associated with the default system workflow and are closed to be bulk editable - please read this.

Notifications now respect permissions

In 3.2, JIRA respects the permission scheme and security levels when sending notifications (see JRA-5743). People who won't be able to see an update online won't get a notification email.

This has one important effect: if you have a project where:

- the notification scheme specifies that a raw email address (eg. developers@mycompany.com) should be notified, and
- 'Browse' permission has not been granted to 'Anyone' (eg. it is granted to 'jira-users'

then that email address ('developers@mycompany.com' in our example) won't be mailed. As JIRA cannot verify that the recipient(s) of the email address have the 'browse' permission, it makes the conservative assumption that they are not.

This can be fixed by creating a user (eg. 'developers') for the email address, making it a member of a group that has 'Browse' permission, and adding it as a recipient of notifications. The raw email address should then be
In 3.2, JIRA respects the permission scheme and security levels when sending notifications (see JRA-5743). People who won't be able to see an update online won't get a notification email.

This has one important effect: if you have a project where:

- the notification scheme specifies that a raw email address (eg. developers@mycompany.com) should be notified, and
- 'Browse' permission has not been granted to 'Anyone' (eg. it is granted to 'jira-users' then that email address ('developers@mycompany.com' in our example) won't be mailed. As JIRA cannot verify that the recipient(s) of the email address have the 'browse' permission, it makes the conservative assumption that they are not.

This can be fixed by creating a user (eg. 'developers') for the email address, making it a member of a group that has 'Browse' permission, and adding it as a recipient of notifications. The raw email address should then be removed from the notification scheme, as it serves no purpose.

### Restricting Edit based on Issue Status

JIRA 3.2 ensures that issues cannot be bulk edited if they cannot be edited normally due to their workflow status. The default workflow restricts issues in the **Closed** status from being edited.

### Restricting Edits

A new property - **jira.issue.editable** - has been added that allows the administrator to specify which statuses/steps within a workflow are editable. The administrator can set the flag to be false for a given status - any issue associated with the workflow in this status will not be editable or bulk editable.

An example can be found in the default workflow - the **Closed** status has the property key set to false - restricting the ability to bulk edit any issue in this status.

In order to change this behaviour, it is necessary to copy and edit the default workflow and associate your issues with the new workflow.

### Upgrading custom CustomFieldTypes in JIRA 3.2

Changes to the custom field types code

For JIRA 3.2, there has been incremental upgrades to the custom fields code. If you have written your own Custom Field Types, you'll want to read this document. We recommend that you ensure that your custom field types still compile against the latest 3.2 build and verify this under a testing environment before putting it into production. It is vital that at the time of the data upgrade, all of your custom field types are functioning correctly, or else they may not be upgraded correctly.

- CustomFieldType Interface changes
- Velocity template changes
- Abstract class changes
- CustomFieldType deal with CustomFieldConfig and not CustomField objects

CustomFieldType Interface changes

There has been some new methods added to the CustomFieldType interface. You may need to implement them if you didn't extend one of the existing concrete classes or AbstractCustomFieldType. The main change here is that FieldValidationException are now thrown instead of CustomFieldValidationException and the addition of two methods.
Velocity Template Changes

The parameters passed to velocity templates for view and editing custom fields have also significantly changed. To update your velocity templates, you should change your headers to be:

```mermaid
#controlHeader ($action $customField.id $customField.name $fieldLayoutItem.required $displayParameters.noHeader)
...
#controlFooter ($action $fieldLayoutItem.fieldDescription $displayParameters.noHeader)
```

Abstract class changes

There has also been changes to the abstract CustomFieldTypes with an addition of a GenericConfigManager dependency. You'll need to add this to all constructors of classes which extends them. You can use GenericConfigManager as an arbitrary data store.

CustomFieldType deal with CustomFieldConfig and not CustomField objects

Custom fields can now be configured differently per context. Thus the CustomFieldType now gets passed the CustomFieldConfig object (which is an instance of the configuration set) rather than just the CustomField themselves.

Upgrading Workflow Plugins for JIRA 3.2

If you have written a workflow plugin (Validator or Post Function) for JIRA 3.0 or 3.1 you might have to modify it to make it work for JIRA 3.2. If you are getting ClassCastException while transitioning issues through workflow after upgrading to JIRA 3.2 there is a high chance that this document is what you are looking for.

⚠️ Workflow Conditions still use GenericValues for issues, so if you have written a custom Workflow Condition it should work with JIRA 3.2

Regular Workflow Transition

For a regular workflow transition in JIRA 3.1 the transientVars map contained a GenericValue object that represented an issue. The transientVars Map also contained the fields that were changed during the transition (if any), namely Fix Versions, Assignee and Resolution.

In JIRA 3.2 an Issue object has been created, and all the changes that have been made to the issue can be
obtained from the Issue object:

```java
Issue issue = (Issue) transientVars.get("issue");
Map modifiedFields = issue.getModifiedFields();
```

Please note that in version of JIRA 3.1 and earlier the `transientVars` map contained a `GenericValue` object with the key "issue". If your code does something like:

```java
GenericValue issue = (GenericValue) transientVars.get("issue");
```

This will cause a `ClassCastException` in JIRA 3.2. You need to cast the object to `Issue` instead of `GenericValue`. If you need to get the `GenericValue` of the issue, you can do that by calling:

```java
GenericValue issueGV = issue.getGenericValue();
```

As mentioned earlier, the `modifiedFields` map contains all the fields that have been updated during the workflow transition. The keys of the `modifiedFields` map are ids of fields (please see `com.atlassian.jira.issue.IssueFieldConstants`) that have been modified, and the values of the `modifiedFields` map are `ModifiedValue` objects. A `ModifiedValue` object represents an updated field. The object stores the old and the new value of the field for the issue. You can use this object like so:

```java
Map modifiedFields = issue.getModifiedFields();
for (Iterator iterator = modifiedFields.keySet().iterator(); iterator.hasNext();)
{
    String fieldId = (String) iterator.next();
    ModifiedValue modifiedValue = (ModifiedValue) modifiedFields.get(fieldId);
    // Old value of the field
    Object oldValue = modifiedValue.getOldValue();
    // New Value of the field
    Object newValue = modifiedValue.getNewValue();
}
```

Please note, that the `comment` and `commentLevel` are still recorded in the `modifiedFields` map.

**Initial Workflow Transition**

An initial workflow transition is the transition that creates an issue.

In JIRA 3.1 and earlier the `transientVars` map contained the field values that should be used to create an issue. In JIRA 3.2 the value of the fields are recorded in the `Issue` object rather than in the `transientVars` map. You can use various getter methods to retrieve values of these fields. For example, if you need to get issue's description, instead of doing:

```java
String description = (String) transientVars.get(IssueFieldConstants.DESCRIPTION);
```

do this:

```java
String description = (String) issue.getGenericValue().get(IssueFieldConstants.DESCRIPTION);
```
Using Oracle 10g drivers to solve the 4000 character limitation

As you might be aware Oracle has a 4000 character limitation on VARCHAR2 fields. Which causes quite a few headaches when dealing with custom workflows or working with issues that have long descriptions, comments or custom field values.

Fortunately Oracle have worked around the VARCHAR2 limitation in their latest Oracle 10g JDBC driver. This fix (described online here) works with Oracle 9 and 10. We strongly recommend using Oracle 10g drivers and the setup described below if you are using Oracle 9i or 10g.

Even though Oracle suggests that Oracle 10g drivers work with Oracle 8i, users have reported problems with this configuration.

Please follow the Upgrading JIRA Safely instructions, keeping the following in mind:

Use Oracle 10g driver

This configuration will work only with Oracle 10g drivers. Therefore, from Oracle's site download the ojdbc14.jar (or applicable) JDBC driver, and copy it to your app server's lib/ directory (eg. common/lib/ for Tomcat). Remove the old JDBC jar used previously.

Create a new database for JIRA 3.2

Please create a new database for JIRA 3.2 and configure JIRA's data source to use it. Please do not point JIRA 3.2 at your old database.

Set the SetBigStringTryClob flag

When configuring the data source for the new database set the SetBigStringTryClob flag to true. The way this must be done depends on your application server

JIRA Standalone, Tomcat 4 and 5.0:

Edit conf/server.xml (Tomcat 4) or conf/Catalina/localhost/jira.xml (Tomcat 5.0), locate the section where the 'jdbc/JiraDS' DataSource is set up, and add:

```xml
<parameter>
    <name>connectionProperties</name>
    <value>SetBigStringTryClob=true</value>
</parameter>
```

For instance, in JIRA Standalone one would then have:
<Resource name="jdbc/JiraDS" auth="Container" type="javax.sql.DataSource"/>
<ResourceParams name="jdbc/JiraDS">
  <parameter>
    <name>driverClassName</name>
    <value>oracle.jdbc.driver.OracleDriver</value>
  </parameter>
  <parameter>
    <name>url</name>
    <value>jdbc:oracle:thin:@<database host machine>:<port>:<SID></value>
  </parameter>
  <parameter>
    <name>username</name>
    <value>...</value>
  </parameter>
  <parameter>
    <name>password</name>
    <value>...</value>
  </parameter>
  <parameter>
    <name>connectionProperties</name>
    <value>SetBigStringTryClob=true</value>
  </parameter>
  <parameter>
    <name>factory</name>
    <value>org.apache.commons.dbcp.BasicDataSourceFactory</value>
  </parameter>
</ResourceParams>

Tomcat 5.5

In Tomcat 5.5, the format for the added section would be:

<Resource name="jdbc/JiraDS" auth="Container" type="javax.sql.DataSource" username="jirauser" password="jirauser" driverClassName="oracle.jdbc.driver.OracleDriver" url="jdbc:oracle:thin:@localhost:1521:jiradb">
  connectionProperties="SetBigStringTryClob=true"
</Resource>

Orion / OC4J

For Orion/OC4J, edit config/data-sources.xml, and add the property as a nested tag:
Other app servers

Consult the relevant JIRA app server guide and the app server documentation to find how to add the property.

Use oracle10g field-type-name

Please specify oracle10g (not oracle) as the field-type-name when editing WEB-INF/classes/entitengine.xml

After the data is re-imported and JIRA upgrades the data the 4000 character limitation should disappear.

Workflows using default "Closed" status

Prior to JIRA 3.2, workflow steps using the default "Closed" JIRA status had the special behaviour that disabled certain operations such as "Edit". Since 3.2, this behaviour has been made available to all workflow steps, regardless to status. You can disable issue editing on a workflow step by adding a meta attribute "jira.issue.editable=false" to the relevant steps.

For backwards compatibility, all workflow steps with the "Closed" step that is stored in the database have been upgraded to have this new meta attribute. So for the majority of users, JIRA will have already done the upgrading for you. For those with workflows that are stored in the file system, you will have upgrade manually (if you want the closed status to disallow edits). Instructions are below:

Upgrading file based workflows

First, find the workflow step with the status id of 6 (closed)

```xml
<meta name="jira.status.id">6</meta>
```

Simply add the following to the step:

```xml
<meta name="jira.issue.editable">false</meta>
```

Restart JIRA and all the new changes should take effect.

3.2 performance benchmarks

Here are some quick benchmarks to illustrate the performance improvements in JIRA 3.2 vs. 3.1.1.

<tr>
<td>Country</td>
<td></td>
<td><img src="#" alt="Assignee drop-down" /></td>
</tr>
</tbody>
</table>

The wizard provides the following features:

- Automatic creation of missing users, versions and components
- Easy creation of resolutions, priorities and issue types.
- Creation of custom fields on the fly
Simple mapping of issue values to values in JIRA

Webwork Plugin Type

JIRA 3 plugins allow developers to extend JIRA in many different ways - with new reports, custom fields, workflow conditions and more. JIRA 3.1 gives developers even more power with the webwork plugin type: enabling plugin creators to integrate their own actions right into JIRA’s web framework.

Add Comment on 'View Issue' field

A much-requested feature, you can now see what you are commenting on! The comment panel is now displayed in the same page as the issue details, so you don’t have to switch between comment and issue to remember what you’re talking about.

Workflow Action Keyboard Shortcuts

For the power-user or just the impatient, alt-1 to alt-9 (ctrl-1 to ctrl-9 on OS X) will execute the corresponding workflow action for an issue.

Improvements

RPC / SOAP Improvements

The RPC/SOAP integration with JIRA has been improved to include new types (e.g. RemoteGroup, RemoteUser, RemotePermission, etc.) and new services (e.g. IssueService, ProjectService, UserService, etc.). A full list of the new features is available here.

Improved Performance

JIRA 3.1 includes a number of performance improvements. Most notably, the data import process has been revised - now requiring less memory with the process completing in less time. The import process should also handle invalid characters encountered in the XML. A number of reports regarding slow responses from JIRA while editing workflows have also been addressed.

Assign Issues by Mail

The ‘Create Issue Handler’ can be configured so that issues created via email are automatically assigned to the user listed in the email’s 'CC:' field.

Internet Explorer UI Compatibility
This release contains many fixes addressing issues with Internet Explorer UI incompatibilities. All pages should appear identically - whether viewed in IE or Firefox or Safari or ...

Notable Bug Fixes

JIRA 3.1 includes over **70 Bug Fixes**.

<table>
<thead>
<tr>
<th>T</th>
<th>Key</th>
<th>Summary</th>
<th>Assignee</th>
<th>Reporter</th>
<th>P</th>
<th>Status</th>
<th>Resolution</th>
<th>Created</th>
<th>Updated</th>
<th>Due</th>
</tr>
</thead>
</table>

Notable Bug Additions

The following bugs have been reported so far, and will be fixed in 3.1.1:

Unable to locate JIRA server for this macro. It may be due to Application Link configuration.

Editions

In order to provide you with greater choice, JIRA is offered in a number of editions - with different feature sets and capabilities available in each edition.

Check out the feature comparison at:

http://www.atlassian.com/software/jira/comparison.jsp

or download an evaluation to determine which edition best addresses your requirements.

JIRA 3.1 Upgrade Notes

This page lists a few things to be aware of when upgrading from JIRA 3.0.x to JIRA 3.1. To perform the actual upgrade, see the upgrade documentation. For upgrading from JIRA 2.x to JIRA 3.x see JIRA 3.0 Upgrade Notes

MySQL Users dB upgrade (JRA-5635)

The size of the descriptor field in the jiraworkflow table has been increased. MySQL users will see warnings when they start their app server. This can be fixed by running the SQL below. This will also allow for Workflows of up to 4GB as opposed to just 64k

```
alter table jiraworkflows change DESCRIPTOR DESCRIPTOR LONGTEXT;
```

JIRA 3.1.1 Release Notes

**JIRA 3.1.1 Release Notes**

In the tradition of frequent and worthwhile updates, JIRA 3.1.1 is released today in Standard, Professional and Enterprise editions. This point release includes over 40 bug fixes along with a number of improvements and new features. It can be downloaded here. See the JIRA 3.1 Upgrade Notes before upgrading.

**New Features, Improvements and Bug Fixes**

This release includes a number of new features and improvements - including:

- Ability to specify custom field values while creating an issue via XML-RPC/SOAP
- Improved translations for various locales.
- New custom field - DateTime
- Fixed portlet hyperlinks

JIRA 3.1.1 also includes over **40 Bug Fixes**.

JIRA 3.0 Release Notes

Atlassian is proud to present the next major evolution in JIRA - JIRA 3.0! These are the release notes for the final release of JIRA 3.0. There are addendum pages for **3.0.1, 3.0.2 and 3.0.3**.

Existing customers who wish to upgrade, or new users who wish to try out JIRA 3.0 for 30 days can download...
either the standalone or WAR distributions from the Atlassian website.

**What's new in JIRA 3.0?**

JIRA 3.0 is the second major JIRA overhaul (after 2.x), and the largest release in Atlassian's short history. As always, all existing customers who are still within the 12 months maintenance period can upgrade for free, thanks to the provision for one year of free upgrades in your license.

You will find JIRA 3.0 contains many significant new features as well as the many, many enhancements, bug fixes and things we just couldn't resist throwing in at the last minute. By our calculations, over 400 issues were collectively resolved for JIRA 3.0!

**New JIRA editions**

Previously, JIRA came in 2 flavours - Professional and Enterprise. JIRA 3.0 marks the introduction of a new family member, JIRA Standard edition, which fits below the Professional edition. For more details on what features are in which editions - see [JIRA 3.0 Feature Comparison](#).

Note: all existing JIRA Professional licenses who are still within the 12 months maintenance period are able to upgrade to JIRA 3.0 Professional at no cost - so for example if you are a JIRA 2.x Professional customer, you can upgrade to JIRA 3.0 Professional and will get all the Professional features.

**Upgrading from previous versions**

Upgrading JIRA should be pretty easy, see the [JIRA 3.0 Upgrade Notes](#), and the [guide to upgrading JIRA](#).

**Documentation**

The JIRA 3.0 documentation is online [here](#).

Contents

1. **New Features**
2. **Improvements**

**New Features**

JIRA 3.0 contains a lot of major new features - more than in any other single release of JIRA. Let's look at a few of the most important ones:

**Workflow Editor & Configurable Workflow**

The most anticipated new features in JIRA 3.0 are the workflow editing features. JIRA now contains a workflow editor (see screenshot) that allows you to view and edit workflows through the web interface, in the Professional and Enterprise editions. The workflow controls the set of steps which an issue moves through in order to move to a resolution.

**Editor features:**

- Workflows can be created with arbitrary steps (linked to statuses) and transitions between them.
- Statuses can be added and removed through the web interface.
- Conditions, functions, validators are now JIRA plugins (see below for details of the new plugin system):
  - Conditions allow you to govern when transitions can be executed and by whom (for example the transition from "Open" to "Closed" can only be executed by a user with the "Close Issue" permission).
  - Functions control exactly what happens after a workflow transition is executed (for example an event is fired, an issue field is changed or an email is sent).
  - Validators ensure that the data provided for a transition is correct.
Multiple Workflows - Enterprise users can configure multiple workflows for their JIRA installation, assigning a default workflow to each project, and then overriding that workflow for particular issue types if required (via a new workflow scheme). This powerful feature allows an issue to progress through a uniquely tailored workflow - one specifically designed for the life-cycle of that issue.

Sub-tasks

Issues are like people, they come in all shapes and sizes - large and small. Sometimes a given issue will be solved in multiple 'stages', often by different people. This is the genesis behind the sub-tasks feature.

Sub-tasks allow you to break an issue up into multiple tasks, each of which is a full issue in itself (with its own individual workflows). As you can see from the screenshot here, sub-tasks are very rapid to create and manipulate almost never requiring you to leave the View Issue screen.

Unlike other issues, sub-tasks also have a defined order and the issue contains an indicator of overall sub-task progress (see arrows and red/green indicators on screenshot).

As with all issue types, Enterprise users can override the default project workflow association and specify a custom workflow for each sub-task type.

Plugin System

JIRA now has a plugin system. This means that developers can build plugins, which extend the functionality of JIRA in different ways, plugged in at multiple points within the interface.

Detailed information for developers interested in building their own plugins will be coming soon, but as a summary: each plugin is one or more classes and a simple XML plugin descriptor. Often plugins will also contain Velocity templates to render portions of the UI as necessary. A brief guide to JIRA plugins is available here.

Each plugin consists of one or more plugin modules, each of a specific type (see below). Both plugins and individual modules can be disabled or enabled through the administration interface (see screenshot).

The 12 current module types shipping with JIRA 3.0 are:

- Reports - define a report with the information collected to run it and the resulting HTML.
- Portlets - define portlets and the parameters they accept when configured.
- Custom Field Types - define new types of custom fields (for example a "User Picker") including their rendering templates.
- Custom Field Searchers - provide index and search capabilities to custom field types.
- Issue Tab Panels - add new panels to the View Issue screen (like existing "Comments" and "Version Control" panels).
- Project Tab Panels - add new panels to the Browse Project screen (like existing "Roadmap" and "Popular Issues" panels).
- SOAP RPC Endpoints - define new SOAP web services for JIRA.
- XML-RPC Endpoints - define new XML-RPC web services for JIRA.
- Components - implement new components within JIRA (or override existing components) that are provided to other plugin modules (via PicoContainer).
- Workflow Conditions / Functions / Validators - define extra conditions, functions and validators to be used in your JIRA workflow.

Upcoming Plugins

The popular requests for Subversion and Perforce support within JIRA will be addressed with the forthcoming release of two new plugins. While providing support for these extensions to JIRA, they are also great examples of creating plugins within the new plugin system. These plugins are due to be released shortly.
Dashboard Overhaul

The Dashboard has long been one of the best, most loved features in JIRA. With JIRA 3, it gets a whole lot better!

**Inline Editing** - the usability of the Dashboard has been greatly improved with the new inline editing mode. This allows you to move, add, delete and edit your portlets from the Dashboard itself, instead of having to switch back and forth to the Dashboard configuration screen (see screenshot).

**Pluggable Portlets** - portlets within JIRA have now moved within the plugin system as well, enabling easy creation and sharing of portlets with other users.

**Filter Statistics Portlet** - a new, very useful portlet has been added which allows you to calculate statistics for any saved filter. For example, you can create a filter showing the currently open issues assigned to yourself for a particular project - and then put a chart of those issues onto your Dashboard, broken down by component.

**Two Dimensional Filter Statistics Portlet** - building on the Filter Statistics portlet, this portlet allows you to display statistics from a filter in a configurable table. The X and Y axis of the table are configurable - for example, issue type against priority - and provides a powerful tool for manipulating the display of the statistics.

**Multiple Dashboard Pages** - And, to save the best for last, you can now have multiple dashboard pages in the Professional and Enterprise editions. This allows you to create multiple, named Dashboard pages which show up as different tabs on screen (see top right hand side of screenshot).

This is extremely useful in a number of scenarios. Often we’ve noticed that users’ Dashboard pages become extremely long (up to 10 screens!) due to adding more statistic portlets - multiple dashboards allows you to split up these long pages. If you work with multiple projects it is fantastic to be able to create a Dashboard per project, each with relevant statistics providing deeper insight into the project.

Custom Fields

**Custom Field Types** - The custom field system has been completely overhauled for JIRA 3.0 (thanks to Joseph Dane of Hawaii University for the initial impetus!). Custom field types are now JIRA plugins, so new custom field types can be easily created, installed and shared by users. Custom fields themselves can now support multiple values, multiple search methods and can have configurable view / edit / search templates.

For example, imagine you wished to connect certain internal users within your organisation with a particular field in your issue. You could create an ‘internal user’ custom field type edited with a simple drop down select box of user’s full names pulled from a remote web service. To display this custom field, you could have a completely different template which actually included a picture of that user from your intranet!

**New System Types** - Using this custom field system, we’ve created a number of new custom field types for JIRA 3.0. The existing custom fields - text field, free text, select list, date picker and number field - all still exist, but now they’re joined by the following new types out of the box:

- User Picker - choose a user from the user base via a popup picker window.
- Project Picker - choose from projects that the user can view in the system.
- Cascading Select - choose multiple values using two select lists.
- Multi Checkboxes - choose multiple values using checkboxes.
- Multi Select - choose multiple values in a select list.
- Radio Buttons - a list of radio buttons.
- URL Field - allow the user to input a single URL.
Read-only Text Field - a read-only text label (only possible to create values programatically).

Version Picker - choose from available versions in the project.

**Voting and Watching**

The most voted for JIRA feature has arrived! Users with the "Edit Watcher List" permission can now update and remove watchers. In this way, other users can be added as watchers of a particular issue (for example, I may want to make sure that Bob is notified of changes to a given issue).

For visibility, there is also a new governing "View Watchers and Voters" permission. Users with this permission can see the list of people who have voted on or are watching an issue.

The number of votes an issue has can now also be added to the issue navigator.

**Other New Features**

- **Change Reporter** - the second most requested JIRA feature has also arrived! Users with the "Modify Reporter" permission can now update the reporter of an issue.
- **Clone Issue** - you can now duplicate existing issues, optionally linked to the original issue. The sub-tasks of an issue are also cloned if any exist.
- **Multiple Attachments** - you can now upload multiple attachments at the same time if you want.
- **Attachments while Creating** - attachments can also be added while creating the issue in a single step, rather than the existing two step 'create issue', 'attach file' process.
- **XML issue view** - each issue can now be viewed or downloaded as XML, including its comments and custom fields.

**Improvements**

There were many, many improvements made in JIRA 3.0, here are the major items of note:

- **Version management** - version management has been overhauled and versions now have a due date.
- **Issue Navigator** - sorting of columns has been extended with the ability to sort by Versions, Fix for Versions and Components (sorting on the earliest of each found).
- **CVS integration** - improved hugely in JIRA 3.0. JIRA can now access CVS repositories via SSH and the local file system (in addition to the existing pserver support), as well as display branch information for commits. The performance has also been worked on a lot, such that CVS access now requires a near constant amount of memory regardless of repository size.
- **More languages** - JIRA has now been translated to German, Spanish, Danish, Russian, French and Brazilian Portuguese.
- **Issue linking** - you can now link multiple issues at a time, as well as use search filters to find issues to link.
- **Project keys** - there is a configurable regular expression to govern the project key structure within JIRA.
- **SSO support** - JIRA integrates with a number of existing single sign-on frameworks, and can easily be customised to work with custom SSO systems.
- **Remote API** - the SOAP and XML-RPC remote APIs are distributed as a plugin, which can be updated independently of the main JIRA installation.
- **Remote Issue Creation** - issues can now be created and retrieved via the remote APIs.
- **Field Layouts** - Enterprise users can now define field layout schemes for each issue type within a project.
- **Reports** - there is now a version workload report (thanks to the JetBrains developers for this contribution) which shows the estimated times against developers for a given version.
- **Email notifications** - improvements have been made to the format of notifications sent out by JIRA, especially text emails.
- **Startup time** - JIRA should now start up much faster than it did previously!
- **User interface** - As always, we've worked on improving the user interface in various areas (most notably the browse projects screen and the version administration screen).

and much, much more... 😊

JIRA 3.0 Upgrade Notes
This page lists a few things to be aware of when upgrading from previous releases of JIRA to JIRA 3. To perform the actual upgrade, see the upgrade documentation.

**Existing SMTP Mail Server 'From' address may break notifications (JRA-5089)**

In JIRA 3, email notification 'From' addresses now contain the reporter name, eg. "Joe Bloggs (JIRA) <jira@company.com>", where "jira@company.com" is set by the admin as the SMTP mail server From address. If you have this address to already include a name (eg "Tech Support <jira@company.com>", then email notifications will fail with errors like:

```
2005-01-06 11:30:53,856 ERROR [atlassian.mail.queue.MailQueueImpl]
com.atlassian.mail.MailException: Sending failed;
    nested exception is: javax.mail.internet.AddressException:
Missing '<' in string `"Joe Bloggs (JIRA)" <Tech Support
<jira@company.com>>' at position 62
```

**Fix**

The fix is to edit `WEB-INF/classes/jira-application.properties`, and change the following property value to `false`:
```
jira.option.include.user.in.mail.from.address = true
```

- If using JIRA Standalone, the file is `atlassian-jira/WEB-INF/classes/jira-application.properties`, after which you should run bin/shutdown and bin/startup to restart.
- If using JIRA deployed as a webapp, copy `webapp/WEB-INF/classes/jira-application.properties` to `edit-webapp/WEB-INF/classes`, make the change to the `edit-webapp` copy, run `build` to rebuild the webapp, and redeploy it on your app server.

**Invalid characters break XML import**

JIRA's recommended upgrade process involves deploying an XML backup of your data. Some users will find that the import fails with this error:

```
This is usually because the database contains control characters that cannot be represented in Unicode, and hence XML.
```

**Fix**

The fix is to follow these instructions to remove the invalid characters from the XML before import.

**JIRA 3.0.3 Release Notes**

JIRA 3.0.3 is a bugfix release. For the full list of changes from 2.x releases, see the JIRA 3.0 Release Notes. The JIRA 3.0 Upgrade Notes apply.

**Changes since 3.0.2:**

**Bugs and improvements fixed:**

<table>
<thead>
<tr>
<th>T</th>
<th>Key</th>
<th>Summary</th>
<th>P</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>No issues found</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
JIRA 3.0.2 Release Notes

JIRA 3.0.2 is a bugfix release, mainly to address a performance problem with the ‘find issues’ page when there are large numbers of projects. For the full list of changes from 2.x releases, see the JIRA 3.0 Release Notes. The JIRA 3.0 Upgrade Notes apply.

Changes since 3.0.1:

Bugs and improvements fixed:

<table>
<thead>
<tr>
<th>T</th>
<th>Key</th>
<th>Summary</th>
<th>P</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>JRA-4986</td>
<td>Cannot delete an issue type when used in a field layout scheme</td>
<td></td>
<td>RESOLVED</td>
</tr>
<tr>
<td></td>
<td>JRA-4933</td>
<td>Cant move Issues</td>
<td></td>
<td>CLOSED</td>
</tr>
<tr>
<td></td>
<td>JRA-5001</td>
<td>Add Frontbase database entity files</td>
<td></td>
<td>RESOLVED</td>
</tr>
<tr>
<td></td>
<td>JRA-4999</td>
<td>‘Assign to reporter’ workflow function</td>
<td></td>
<td>CLOSED</td>
</tr>
<tr>

<td></td>
<td>CLOSED</td>
</tr>
</tbody>
</table>

7 issues

JIRA 3.0.1 Release Notes

JIRA 3.0.1 is a minor bugfix release. For the full list of changes from 2.x releases, see the JIRA 3.0 Release Notes. The JIRA 3.0 Upgrade Notes apply.

Issues addressed since 3.0

Bugs fixed:

JIRA 3.0.1 fixes one bug, which prevented users importing backup data into an empty JIRA instance:

<table>
<thead>
<tr>
<th>T</th>
<th>Key</th>
<th>Summary</th>
<th>P</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>JRA-4944</td>
<td>Cannot import old data into JIRA from setup wizard</td>
<td></td>
<td>CLOSED</td>
</tr>
</tbody>
</table>

All JIRA Upgrade Guides (version 3.x and later)

This page lists the upgrade guides from JIRA versions 3.x and later. You can also view the aggregated upgrade guides from JIRA versions 3.x and later (warning: the aggregated upgrade guides page is big!).

If upgrading from a previous version of JIRA please pay attention to the Upgrade Guide of the version you are upgrading to, and any version of JIRA that you are 'skipping' during the upgrade.

You may be interested in the list of release notes from JIRA versions 3.x and later.
Aggregated JIRA 3.x Upgrade Guides

This page contains a live aggregate of all JIRA upgrade guides since version 3. You can also view the lists of Release Notes or Upgrade Guides for JIRA.

JIRA 2.x to 3
This page lists a few things to be aware of when upgrading from previous releases of JIRA to JIRA 3. To perform the actual upgrade, see the upgrade documentation.

**Existing SMTP Mail Server 'From' address may break notifications (JRA-5089)**

In JIRA 3, email notification 'From' addresses now contain the reporter name, eg. "Joe Bloggs (JIRA) <jira@company.com>", where "jira@company.com" is set by the admin as the SMTP mail server From address. If you have this address to already include a name (eg "Tech Support <jira@company.com>"), then email notifications will fail with errors like:

```
2005-01-06 11:30:53,856 ERROR
[atlassian.mail.queue.MailQueueImpl]
com.atlassian.mail.MailException: Sending failed;
   nested exception is: javax.mail.internet.AddressException:
Missing '<' in string ""Joe Bloggs (JIRA)" <Tech Support <jira@company.com>>'' at position 62
```

**Fix**

The fix is to edit WEB-INF/classes/jira-application.properties, and change the following property value to `false`:

```
jira.option.include.user.in.mail.from.address = true
```

- If using JIRA Standalone, the file is `atlassian-jira/WEB-INF/classes/jira-application.properties`, after which you should run `bin/shutdown` and `bin/startup` to restart.
- If using JIRA deployed as a webapp, copy `webapp/WEB-INF/classes/jira-application.properties` to `edit-webapp/WEB-INF/classes`, make the change to the `edit-webapp` copy, run `build` to rebuild the webapp, and redeploy it on your app server.

**Invalid characters break XML import**

JIRA's recommended upgrade process involves deploying an XML backup of your data. Some users will find that the import fails with this error:

```
Failed to import data: Error in action: com.atlassian.jira.action.ActionImpl.DataImport@1.266b10, result: error Exception occurred: org.xml.sax.SAXParseException: An invalid XML character (Unicode: 0x13) was found in the CDATA section.
```

This is usually because the database contains control characters that cannot be represented in Unicode, and hence XML.

**Fix**

The fix is to follow these instructions to remove the invalid characters from the XML before import.

JIRA 3.0 to 3.1
This page lists a few things to be aware of when upgrading from JIRA 3.0.x to JIRA 3.1. To perform the actual upgrade, see the upgrade documentation. For upgrading from JIRA 2.x to JIRA 3.x see JIRA A 3.0 Upgrade Notes

MySQL Users dB upgrade (JRA-5635)

The size of the descriptor field in the jiraworkflow table has been increased. MySQL users will see warnings when they start their app server. This can be fixed by running the SQL below. This will also allow for Workflows of up to 4GB as opposed to just 64k

```sql
alter table jiraworkflows change DESCRIPTOR DESCRIPTOR LONGTEXT;
```

JIRA 3.1 to 3.2

This page contains information you need to know when upgrading to JIRA 3.2. The general upgrade instructions can be found here.

1. If you have written any Custom Field Type plugins please refer to this document
2. If you have created any Workflow plugins (custom Validators or Post Functions) please read this document.
3. If you have any custom file based workflows (workflows not created through JIRA's Workflow Editor) please read this document.
4. If you wish issues that are associated with the default system workflow and are closed to be bulk editable - please read this.

Notifications now respect permissions

In 3.2, JIRA respects the permission scheme and security levels when sending notifications (see JIRA -5743. People who won't be able to see an update online won't get a notification email.

This has one important effect: if you have a project where:

- the notification scheme specifies that a raw email address (eg. developers@mycompany.com) should be notified, and
- 'Browse' permission has not been granted to 'Anyone' (eg. it is granted to 'jira-users' then that email address ('developers@mycompany.com' in our example) won't be mailed. As JIRA cannot verify that the recipient(s) of the email address have the 'browse' permission, it makes the conservative assumption that they are not.

This can be fixed by creating a user (eg. 'developers') for the email address, making it a member of a group that has 'Browse' permission, and adding it as a recipient of notifications. The raw email address should then be removed from the notification scheme, as it serves no purpose.

JIRA 3.2 to 3.3
JIRA 3.3 Upgrade Guide

This page contains specific information you need to know when upgrading to JIRA 3.3 from JIRA 3.2.x. If upgrading from an older version of JIRA, please go to the complete list of Upgrade Guides, and read the notes for each version you are skipping during the upgrade.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

**Known incompatibilities**

3.3.x is not a good release for IBM shops:

1. JIRA 3.3.x may not work on Websphere 5.0.x and 5.1.x due to JRA-7699
2. When using DB2, JIRA may hang when deleting projects or performing workflow operations. See the full problem description (and possible workaround) in the documentation

Websphere or DB2 users, please stick with 3.2.x or move on to 3.4.x or higher, where these problems have been resolved.

**Notes on upgrading**

1. Due to web browser caches, changes to JIRA's Issue Navigator might appear corrupted or unstyled. Please refresh your browser's cache (press Shift+Reload on the Find Issue's page) for the changes to appear correctly.
2. JIRA's issue cache size will be automatically set to 0 during the upgrade, as it is no longer needed due to performance improvements in JIRA (JRA-7166)
3. If you have written any CustomFieldtype or CustomFieldSearcher plugins please refer to this document
4. Users with outgoing trackback pings enabled (not the default) may wish to disable this until JRA-7589 is fixed, to avoid the risk of the mail queue hanging.
5. If you have bookmarks or deal with hard coded links to the issue navigator, you should read about the changed issue navigator parameters
6. If you are using JIRA Standalone, please do not simply copy your old conf/server.xml file to the new installation of JIRA. Please read this document.
7. If upgrading JIRA in an external Tomcat installation, be sure to delete the work/ temporary directory before restarting JIRA, to clear cached JSPs from the old JIRA.

---

JIRA 3.3 to 3.3.x

JIRA 3.3.1 Upgrade Guide

This page contains specific information you need to know when upgrading to JIRA 3.3.1 from JIRA 3.3.

If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below:

1. If you have implemented a custom Issue Tab Panel plugin you need to be aware of this API change.

If you are upgrading to JIRA 3.3.1 from a previous version, due to web browser caches, changes to JIRA's Issue Navigator might appear corrupted or unstyled. Please refresh your browser's cache (press Shift+Reload on the Find Issue's page) for the changes to appear correctly.

---

JIRA 3.3.x to 3.4.x
JIRA 3.4 Upgrade Guide

This page contains specific information you need to know when upgrading to JIRA 3.4 from JIRA 3.3.3. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

Two major new features of JIRA 3.4, wiki renderer previews, and issue types per project require that javascript be enabled to make use of their full functionality. You will still be able to use all the core features of JIRA with javascript disabled.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

1. Please do not copy jira-application.properties file from your old JIRA installation. Edit the file that is shipped with JIRA 3.4 and make needed changes. New properties have been added to this file so if you simply copy the old file across the following error would occur JRA-8645.
2. If you have written any CustomField Type or CustomFieldSearcher plugins please refer to Upgrading Custom Field Types in JIRA 3.4.
3. The default user preferences are now configured in the jira-application.properties file and are configurable through the admin section of JIRA. Any properties in the old file preferences-default.xml will no longer effect JIRA configuration.
4. Please note that to configure issue types per project you must have JavaScript turned on in your web browser.
5. If you are using MySQL please do not use Connector/J 3.1.11 JDBC Driver as it has the following bug. Connector/J 3.1.10 and earlier work fine.

JIRA 3.4.1 Upgrade Guide

This section contains specific information you need to know when upgrading to JIRA 3.4.1 from JIRA 3.4. If upgrading from JIRA 3.3.3 please read the previous section as well. If upgrading from an older version than JIRA 3.3.3, please read the Upgrade Guide for each version your are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

1. Please do not copy jira-application.properties file from your old JIRA installation. Edit the file that is shipped with JIRA 3.4 and make needed changes. New properties have been added to this file so if you simply copy the old file across the following error would occur JRA-8645.
2. If you have written a CustomField Type that implements the com.atlassian.jira.issue.customfields CustomField Type interface directly rather than extending one of the Abstract classes that ship with JIRA please read Upgrading Custom Field Types in JIRA 3.4.1.
3. If you have written an Custom Field Searcher please have a look at Upgrading Custom Field Types in JIRA 3.4.1.
4. JIRA 3.4 and 3.4.1 do not generate an Issue Assigned event. The Issue Updated event is generated instead. In previous versions of JIRA the Issue Assigned event was generated when issues are assigned using the "Assign" operation on the View Issue page. This means that even when the "Assign" operation is used JIRA will send notifications to parties listed under the Issue Updated event. The patch to correct this behaviour is available at JRA-8533.

JIRA 3.4.2 Upgrade Guide

This page contains specific information you need to know when upgrading to JIRA 3.4.2 from JIRA 3.4.1. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

- There are no specific instructions you need to be aware of related to upgrading from JIRA 3.4.1 to JIRA 3.4.2.

JIRA 3.4.3 Upgrade Guide

This page contains specific information you need to know when upgrading to JIRA 3.4.3. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

- Two major new features of JIRA 3.4, wiki renderer previews, and issue types per project require that javascript be enabled to make use of their full functionality. You will still be able to use all the core features of JIRA with javascript disabled.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

1. Please do not copy jira-application.properties file from your old JIRA installation. Edit the file that is shipped with JIRA 3.4 and make needed changes. New properties have been added to this file so if you simply copy the old file across the following error would occur JRA-8645.
2. If you have written any CustomField Type or CustomFieldSearcher plugins please refer to Upgrading Custom Field Types in JIRA 3.4.
3. The default user preferences are now configured in the jira-application.properties file and are configurable through the admin section of JIRA. Any properties in the old file preferences-default.xml will no longer effect JIRA configuration.
4. Please note that to configure issue types per project you must have JavaScript turned on in your web browser.
5. If you are using MySQL please do not use Connector/J 3.1.11 JDBC Driver as it has the following bug. Connector/J 3.1.10 and earlier work fine.

JIRA 3.4.1 Upgrade Guide

This section contains specific information you need to know when upgrading to JIRA 3.4.1 from JIRA 3.4. If upgrading from JIRA 3.3.3 please read the previous section as well. If upgrading from an older version than JIRA 3.3.3, please read the Upgrade Guide for each version your are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

1. Please do not copy jira-application.properties file from your old JIRA installation. Edit the file that is shipped with JIRA 3.4 and make needed changes. New properties have been added to this file so if you simply copy the old file across the following error would occur JRA-8645.
2. If you have written a CustomField Type that implements the com.atlassian.jira.issue.customfields CustomField Type interface directly rather than extending one of the Abstract classes that ship with JIRA please read Upgrading Custom Field Types in JIRA 3.4.1.
3. If you have written an Custom Field Searcher please have a look at Upgrading Custom Field Types in JIRA 3.4.1.
4. JIRA 3.4 and 3.4.1 do not generate an Issue Assigned event. The Issue Updated event is generated instead. In previous versions of JIRA the Issue Assigned event was generated when issues are assigned using the "Assign" operation on the View Issue page. This means that even when the "Assign" operation is used JIRA will send notifications to parties listed under the Issue Updated event. The patch to correct this behaviour is available at JRA-8533.

JIRA 3.4.2 Upgrade Guide

This page contains specific information you need to know when upgrading to JIRA 3.4.2 from JIRA 3.4.1. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

- There are no specific instructions you need to be aware of related to upgrading from JIRA 3.4.1 to JIRA 3.4.2.
This page contains specific information you need to know when upgrading to JIRA 3.4.3 from JIRA 3.4.2. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available here. When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

- There are no specific instructions you need to be aware of related to upgrading from JIRA 3.4.2 to JIRA 3.4.3.

JIRA 3.4.x to 3.5.x

JIRA 3.5 Upgrade Guide

This page contains specific information you need to know when upgrading to JIRA 3.5 (release notes) from JIRA 3.4.3. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available here. When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

JIRA 3.5 Jira Service extension

- If you have implemented a custom JIRA service you need to be aware of the following API change.

In JIRA 3.5 the `getName()` and `setName(String name)` methods was added to the `com.atlassian.jira.service.JiraService` interface. This method should return and set the name of the service respectively. The name of the service can be used to identify a service uniquely. (Fixed made due to JIRA-8352 bug)

Therefore, if you have implemented this interface, you will need to implement these methods and recompile your service(s) before deploying it into JIRA 3.5. If you have extended a JIRA class instead, e.g. `com.atlassian.jira.service.AbstractService` or `com.atlassian.jira.service.JiraServiceContainer` you do not need to modify your custom services.

Introduction of global Bulk Change permission

JIRA 3.5 introduces the global Bulk Change permission. This permission governs the ability to execute the bulk change operations:

- Workflow Transition
- Edit
- Move
- Delete

An upgrade task has been added to grant the new Bulk Change permission to all groups with the global JIRA Users permission.

The JIRA documentation includes further details on this new permission.

The decision to grant the Bulk Change permission should be considered carefully - the permission permits a user to modify a collection of accessible issues at once. For example, in JIRA installations configured to run in 'Public' mode (anybody can sign up and create issues), a user could comment on all accessible issues with the Bulk Change and Add Comments permission. Undoing such modifications may not be possible through the JIRA UI and may require changes made directly against the database.

CustomFieldPersister changes

CustomFieldPersister is used to store custom field values to database. The methods of this class has been refactored to remove the redundant parameter, `defaultValueMarker`. For example, the create values method went from:
void createValues(CustomField field, Long issueId, String defaultValueMarker, PersistenceFieldType persistenceFieldType, Collection values, String parentKey);

to:

void createValues(CustomField field, Long issueId, PersistenceFieldType persistenceFieldType, Collection values, String parentKey);

You will need to update and recompile any CustomFieldType that you wrote to use this new interface.

VersionCFType Changes

This affects plugin writers who uses the version custom field VersionCFType. The change is that previously the Transport Object type was a single Version object, but it is now a collection that contains a single Version object.

This was done to handle an improved version custom field which can be a multi-select version custom field as well

JIRA 3.5.1 Upgrade Guide

This page contains specific information you need to know when upgrading to JIRA 3.5.1 from JIRA 3.5. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version your are skipping during the upgrade. The complete list of Upgrade Guides is available here. When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

- There are no specific instructions you need to be aware of related to upgrading from JIRA 3.5 to JIRA 3.5.1.

JIRA 3.5.2 Upgrade Guide

This page contains specific information you need to know when upgrading to JIRA 3.5.2 from JIRA 3.5.1. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version your are skipping during the upgrade. The complete list of Upgrade Guides is available here. When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

Issue Event Changelog Can Now Be Null

- If you have implemented a custom JIRA Issue Event Listener you need to be aware of the following API change.

In JIRA 3.5.2, the IssueEvent object thrown as a result of an edit operation, may now return null from a getChangeLog() call. The case where this happens is when a user chooses to edit an issue but only leaves a comment and makes no other changes to the issue. Prior to 3.5.2 no event was fired in this case and this was identified as a bug (JIRA-9415) and has since been fixed. Check any calls to getChangeLog() for null.

JIRA 3.5.3 Upgrade Guide

This page contains specific information you need to know when upgrading to JIRA 3.5.3 from JIRA 3.5.2. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version your are skipping during the upgrade. The complete list of Upgrade Guides is available here. When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.
• There are no specific instructions you need to be aware of related to upgrading from JIRA 3.5.3 from JIRA 3.5.2.

JIRA 3.5.x to 3.6.x

JIRA 3.6 Upgrade Guide

This page contains specific information you need to know when upgrading to JIRA 3.6.x from JIRA 3.5.x. If upgrading from an older version of JIRA, please go to the complete list of Upgrade Guides, and read the notes for each version you are skipping during the upgrade.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

Database Intensive Upgrade Task

To introduce the Custom events to JIRA, it was necessary to upgrade a large data set within JIRA’s database for 3.5.x and earlier releases. Depending on the size of your JIRA data the upgrade task (number 150) might get your DBMS to do a lot of work which might take some time. The exact amount of time also depends on the processing power of the machine running JIRA’s database.

Please be patient with the upgrade task and do not restart JIRA while the upgrade is in progress. The upgrade task will report on its progress to JIRA’s log file as it upgrades your data.

The following is the sample output that the upgrade task will produce. As you can see the upgrade task took roughly 5 and a half minutes to modify over 660,000 records in the database.
Workflow Post Functions

| Applies to | users with custom workflow XMLs saved on disk - external to JIRA |

JIRA stores its workflows in the database. During the upgrade, these workflows will be upgraded automatically. However, if you have stored your workflows on disk (outside the database), you will need to follow these instructions to upgrade the workflows manually.
Previously, workflow post functions referenced the event to fire through a string value of the event name. All post functions now reference the event through a numeric ID value. As mentioned, all workflows stored within JIRA will be automatically updated. However, all workflows saved to disk - external to JIRA - should be updated manually as follows. The actual workflow XML file should be updated as follows:

For each workflow post function that accepts the event ID as an argument:

1. The value of the **name** attribute of the **arg** tag has to be changed from **eventType** to **eventTypeId**
2. The body of the **arg** tag has to change according to the following table:

<table>
<thead>
<tr>
<th>Event Name</th>
<th>Event Type Id</th>
</tr>
</thead>
<tbody>
<tr>
<td>created</td>
<td>1</td>
</tr>
<tr>
<td>updated</td>
<td>2</td>
</tr>
<tr>
<td>assigned</td>
<td>3</td>
</tr>
<tr>
<td>resolved</td>
<td>4</td>
</tr>
<tr>
<td>closed</td>
<td>5</td>
</tr>
<tr>
<td>commented</td>
<td>6</td>
</tr>
<tr>
<td>reopened</td>
<td>7</td>
</tr>
<tr>
<td>deleted</td>
<td>8</td>
</tr>
<tr>
<td>moved</td>
<td>9</td>
</tr>
<tr>
<td>worklogged</td>
<td>10</td>
</tr>
<tr>
<td>workstarted</td>
<td>11</td>
</tr>
<tr>
<td>workstopped</td>
<td>12</td>
</tr>
<tr>
<td>genericevent</td>
<td>13</td>
</tr>
</tbody>
</table>

By default, the only post functions that accept event IDs are **FireIssueEventFunctions**. Therefore, unless you have implemented your own custom post function that also deals with events, you will only need to update the arg tags for the **FireIssueEventFunctions** everywhere in the workflows.

For example, **FireIssueEventFunction** for create issue workflow transition looked like:

```xml
<function type="class">
  <arg name="class.name">com.atlassian.jira.workflow.function.event.FireIssueEventFunction</arg>
  <arg name="eventType">created</arg>
</function>
```

and needs to be changed to:

```xml
<function type="class">
  <arg name="class.name">com.atlassian.jira.workflow.function.event.FireIssueEventFunction</arg>
  <arg name="eventTypeId">1</arg>
</function>
```
Custom Events

| Applies to | users who have **modified JIRA source code or added custom code to define new notification events**. Also of interest to users wishing to define new notification templates |

Releases before JIRA 3.6 did not allow users to create custom events. If you have modified the JIRA source to add custom events - please follow these instructions.

If you have previously defined a custom event within JIRA - it is necessary to add appropriate entries to the following files:

- system-event-types.xml - used to install and upgrade all event types within the system to the new 3.6 event type object.
- email-template-id-mappings.xml - maps the event id to an associated velocity template file.

The system-event-types.xml file requires name and description details of the previously added custom event. For example, if the custom event type "Issue Frozen" was added to the system - the following entry should be added to the XML file:

```xml
<eventtype id="10000">
  <name>Issue Frozen</name>
  <description>This is the 'Issue Frozen' event type.</description>
  <notificationName>ISSUE_FROZEN</notificationName>
  <eventName>issuefrozen</eventName>
</eventtype>
```

The elements provide the following information:

- **id** - the new id for the event type. **All custom event types should be added from ID 10000 and above**
- **notificationName** - the original name for the event as found in the Notification table
- **eventName** - the original name for the event as found in workflows

The email-template-id-mappings.xml file requires an entry mapping the new custom event to an associated velocity email template. This mapping is used when a notification is sent for this event. Following from the above example, the following entry would be made:

```xml
<templatemapping id="10000">
  <name>Issue Frozen</name>
  <template>issuefrozen.vm</template>
</templatemapping>
```

The id should match that of the event as specified in the system-event-types.xml file. The template should reference the Velocity template to be used in email notifications of this event. A HTML and text version should be provided in the appropriate directory (html or text) at:

```
<JIRA>/src/etc/java/templates/email/
```

⚠️ **All custom event types added to the file system-event-types.xml should be added with an ID of 10000 and above**

Custom Listeners
Applies to | users who have added custom listeners to JIRA.
---|---

For all users who have added custom written listeners to JIRA, it might be necessary to update the listener to follow the new JIRA 3.6 API.

There are two things to look out for:

1. signature change of the workflowEvent method
2. change of return type of getIssue() method on the IssueEvent object

The signature of the method workflowEvent in the IssueEventListener has changed from:

```java
public void workflowEvent(int type, IssueEvent event);
```

to:

```java
public void workflowEvent(IssueEvent event);
```

**Note:** the type parameter has been removed.

If you have implemented IssueEventListener directly or have extended AbstractIssueEventListener and have overridden the method workflowEvent, you will need to change and recompile your listener before installing JIRA 3.6.

In JIRA 3.6, the event type ID can be retrieved by calling the following method on the IssueEvent object:

```java
Long eventID = event.getId();
```

However, the returned value of the getId() method is different to the values of the type parameter that was passed to the workflowEvent method. The following table represents these differences:
<table>
<thead>
<tr>
<th>Event Name</th>
<th>Old ID</th>
<th>New ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>created</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>updated</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>assigned</td>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>resolved</td>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>closed</td>
<td>4</td>
<td>5</td>
</tr>
<tr>
<td>commented</td>
<td>5</td>
<td>6</td>
</tr>
<tr>
<td>reopened</td>
<td>6</td>
<td>7</td>
</tr>
<tr>
<td>deleted</td>
<td>7</td>
<td>8</td>
</tr>
<tr>
<td>moved</td>
<td>8</td>
<td>9</td>
</tr>
<tr>
<td>worklogged</td>
<td>9</td>
<td>10</td>
</tr>
<tr>
<td>workstarted</td>
<td>10</td>
<td>11</td>
</tr>
<tr>
<td>workstopped</td>
<td>11</td>
<td>12</td>
</tr>
<tr>
<td>genericevent</td>
<td>-1</td>
<td>13</td>
</tr>
</tbody>
</table>

**Also**, the `getIssue()` method of the `IssueEvent` object has changed to return an `Issue` object instead of a `GenericValue` object representing an issue.

Users who have created and added custom listeners must update the listener to now operate with the `Issue` object. For example:

```java
Issue issueObject = event.getIssue();
```

As a quick fix, you can modify your listener to use `event.getIssue().getGenericValue()`.

The event type ID constants are now only available from the class `EventType`. Any use of the original constants must be updated to use the `EventType` constants. For listeners that reference an event ID by its numeric value - it is necessary to ensure that the IDs now match those as defined in `EventType`.

**Custom permission types**

<table>
<thead>
<tr>
<th>Applies to</th>
<th>users who have modified JIRA source to add new permission types (ie. in addition to the standard 'user', 'group', 'assignee' types).</th>
</tr>
</thead>
</table>

The `SecurityType` interface, used to implement permission types ('single user', 'group' etc) has had a `getUsers()` method added. If you have implemented your own SecurityType you will need to implement this. See the source of current implementations (eg. `GroupCF`) for tips.

**Plugin upgrades required**

As usual, you should check whether the plugins you use are compatible with the new release. Generally, plugins (like the Subversion plugin or JIRA toolkit) need to be upgraded when JIRA is upgraded. See the list of plugins at:

http://confluence.atlassian.com/display/JIRAOOS/Home

JIRA 3.6.1 Upgrade Guide
This page contains specific information you need to know when upgrading to JIRA 3.6.1 from JIRA 3.6. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

- There are no specific instructions you need to be aware of related to upgrading from JIRA 3.6.1 from JIRA 3.6.

**JIRA 3.6.2 Upgrade Guide**

This page contains specific information you need to know when upgrading to JIRA 3.6.2 from JIRA 3.6.1. If upgrading from an older version of JIRA, please go to the complete list of Upgrade Guides, and read the notes for each version you are skipping during the upgrade.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

*Maximum Active Databased Connections*

<table>
<thead>
<tr>
<th>Applies to</th>
<th>JIRA Standalone users</th>
</tr>
</thead>
</table>

In version of JIRA before 3.6.2, the maximum number of database connections was limited to 8 by default. If JIRA was used by more than 8 concurrent users or under very heavy usages, the users could experience delays or JIRA could hang.

In JIRA 3.6.2 the default number of maximum active database connections has been increased to 20. When upgrading to JIRA 3.6.2, please ensure that your database will allow JIRA to establish 20 connections, or decrease this number to desired value. To adjust the number of connections change the value of the maxActive attribute of the jdbc/JiraDS resource in config/server.xml file. JIRA has to be restarted to apply the change.

**JIRA 3.6.3 Upgrade Guide**

This page contains specific information you need to know when upgrading to JIRA 3.6.3 from JIRA 3.6.2. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

- There are no specific instructions you need to be aware of related to upgrading from JIRA 3.6.3 from JIRA 3.6.2.

**JIRA 3.6.4 Upgrade Guide**

This page contains specific information you need to know when upgrading to JIRA 3.6.4 from JIRA 3.6.3. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

- There are no specific instructions you need to be aware of related to upgrading to JIRA 3.6.4 from JIRA 3.6.3.

**JIRA 3.6.5 Upgrade Guide**

This page contains specific information you need to know when upgrading to JIRA 3.6.5 from JIRA 3.6.4. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

- There are no specific instructions you need to be aware of related to upgrading to JIRA 3.6.5 from JIRA 3.6.4.
JIRA 3.6.x to 3.7.x

Once you have upgraded to JIRA 3.7, downgrading to a previous version is not a straightforward task and is not recommended.

JIRA 3.7 Upgrade Notes

This page lists a few things to be aware of when upgrading from previous releases of JIRA to JIRA 3.7. To perform the actual upgrade, see the upgrade documentation.

Note: If you are upgrading from a pre-3.6.5 release, please also refer to the relevant JIRA 3.x Upgrade Guides.

![Warning icon]

Please note that JIRA 3.7 requires JDK 1.4 or above. Support for JDK 1.3 has been discontinued.

![Warning icon]

Please note that some new functionality will not be available if you are running JIRA on WebLogic or Orion. The List All Filters portlet will not be able to fetch the issue counts for each issue. The new 'Charting' View will also be unavailable. The support for WebLogic and Orion will be added in JIRA 3.7.1.

Database Schema Changes

Due to the upgrade of HSQLDB, and to improve compatibility with Firebird and Frontbase, various database tables and columns have been renamed. For more details on the changes please see the JIRA 3.7 Database Schema Changes document.

Therefore, the easiest way to upgrade to JIRA 3.7 is to follow the Upgrading JIRA safely instructions. If in the past, instead of performing an XML backup and restore, you have been upgrading by "pointing" new version of JIRA at an old database, this is still possible, however the procedure is more complicated. You will need to use SQL scripts to perform database schema changes. For more information please see the SQL Scripts for 3.6.x to 3.7 schema upgrade document.

![Warning icon]

If you are using HSQLDB with JIRA, you must follow Upgrading JIRA safely instructions (i.e. perform a full XML backup and restore from XML), as simply copying the .script file will not work. The format of the .script file has changed between the HSQLDB versions, and therefore, copying the .script file will result in the following error on startup.

Request Context Changes
In order for plugins, customfields and portlets to function better outside of a web-context (e.g.: displaying a customfield in an e-mail), all direct references to the HttpServletRequest have been replaced by a VelocityRequestContext. If you have deployed your own plugins, customfields or portlets that use the HttpServletRequest directly (i.e.: any references to `req`) than they should be changed to use the new `requestContext` object. The `requestContext` is an implementation of the VelocityRequestContext interface.

Currently the `requestContext` supports the following properties:

- `baseUrl` - Returns the same as HttpServletRequest.getContextPath() or the base URL configured in your JIRA instance if no HttpServletRequest is available
- `requestParameters.servletPath` - Returns the same as HttpServletRequest.getServletPath()
- `requestParameters.requestURL` - Returns the same as HttpServletRequest.getRequestURL()
- `requestParameters.queryString` - Returns the same as HttpServletRequest.getQueryString()

**Integrity Checks**

In JIRA 3.7 Database Integrity Checks (available from the Administration section) have been re-written to run as multiple transactions, which increased the throughput of the system while the checks are running. In large JIRA 3.6 (and earlier) installations, integrity checks could cause database lock escalation and stop users from performing operations (e.g. viewing issues).

Please note, that due to the change, each integrity check became about 10% slower.

As integrity checks are quite database intensive operations, it is still recommended to run them during off-peak hours (i.e. while the system is not under heavy load).

**Change of commentLevel to groupLevel in the Comment and TransitionWorkflow jelly tags**

We have changed the AddComment and TransitionWorkflow jelly tag attribute that specifies the group visibility level from 'commentLevel' to be 'groupLevel'. If you have existing jelly tags that use this attribute it will need to change. This was done so that we could introduce the 'roleLevel' attribute which allows you to specify a project role based visibility. Only one of the two attributes can be specified at a time.

**Change of level to grouplevel in the XML view of a Comment**

1. We have changed the XML view of a comment, as seen in the XML view of an Issue to contain either a 'grouplevel' attribute or a 'rolelevel' attribute. This attribute defines the visibility level specified on the comment. In the past the 'grouplevel' attribute was simply 'level'. If you have any existing custom code that expects the 'level' attribute in the Comment XML it must change to expect 'grouplevel'.
2. In previous versions of JIRA the XML view of the `<comment>` tag level attribute was always shown, even if there was no value for the level, it was rendered as an empty attribute. We have changed it so that the attributes themselves (grouplevel and rolelevel) do not display if there is no value.

**Change to the RemoteComment object used via SOAP/RPC plugin**

The RemoteComment object and therefore the remote SOAP/RPC api has changes to almost all properties. The 'roleLevel' attribute was added and the following attributes have changed:

1. level -> grouplevel
2. datePerformed -> created
3. username -> author

**ActionManager removed**

The ActionManager interface has been removed and its functionality has been delegated to new interfaces. For details please refer to ActionManager Removed documentation.
Removal of 'Backend Actions'

1. We have removed the 'Backend Action' `com.atlassian.jira.action.action.WorklogCreate` if you were using this class in a plugin or custom code you will now need to use the `com.atlassian.jira.issue.worklog.WorklogManager` this now has method calls to return worklogs for a given user+issue and also create worklog entries.
2. We have removed the 'Backend Action' `com.atlassian.jira.action.action.ActionCreate` if you were using this class to create comments you will need to modify your code to use one of the create methods on the `com.atlassian.jira.bc.issue.comment.CommentService`.

Issue Events

We have modified the `com.atlassian.jira.event.issue.IssueEvent` class to no longer use GenericValues. The GenericValue representing the comment is replaced by `com.atlassian.jira.issue.comments.Comment` class and the GenericValue representing the worklog is replaced by `com.atlassian.jira.issue.worklog.Worklog` class. If you have a custom listener in a previous version of JIRA this will need to be updated to use the newer IssueEvent class and `com.atlassian.jira.event.issue.IssueEventDispatcher.dispatchEvent(...)` methods.

Renaming of XML export file

By popular request, the XML filename (that is, the default filename when you choose to save the XML view in the Issue Navigator) has been changed from `issuenavigator.jspa` to `SearchRequest.xml`. Should you have any external systems or programs that utilise the exported XML file, please be aware of the changed filename.

Confluence Users Only - Pre 2.2.10 Confluence Must Be Patched To Use JIRA Issues Macro

Unable to render {include} The included page could not be found.

JIRA 3.7 Downgrade Notes

Once you have upgraded to JIRA 3.7, downgrading to a previous version is not a straightforward task and is not recommended. Please be aware that in JIRA 3.7 the database schema has changed.

If upgrade to JIRA 3.7 fails, the best way to proceed is to go back to the previous version of JIRA you were using, and to the latest pre-upgrade data that you have. The exact steps for doing this depend on how you have upgraded JIRA.

If you have created a new database for JIRA 3.7 by following the Upgrading JIRA safely instructions, you should be able to simply shutdown JIRA 3.7 and bring up the old version of JIRA you were using. The old version should be configured to use its old (unupgraded) database.

If you have upgraded JIRA by pointing JIRA 3.7 to an older database (and ran the SQL Scripts to upgrade the database schema), then you will need to:

1. Create a new database
2. Configure the old version of JIRA you were using to point at the new (empty) database
3. Restore the latest pre-upgrade backup that you have
4. Start the old JIRA installation

JIRA 3.7.1 Upgrade Guide

This page contains specific information you need to know when upgrading from JIRA 3.7 to JIRA 3.7.1. If upgrading from an older version of JIRA, please read the Upgrade Guide for each version your are skipping during the upgrade. The complete list of Upgrade Guides is available here. When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

- There are no specific instructions you need to be aware of related to upgrading from JIRA 3.7 to JIRA 3.7.1.

JIRA 3.7.2 Upgrade Guide
This page contains specific information you need to know when upgrading from JIRA 3.7.1 to JIRA 3.7.2. If upgrading from an older version of JIRA, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

When upgrading JIRA please follow the general upgrade instructions keeping in mind the information below.

- 3.7.2 will automatically perform a full reindex when upgrading. For more details please see JR A-11861

Upgrading from JIRA 3.7.2 to 3.7.3

Please follow the JIRA general upgrade instructions.

Upgrading from JIRA 3.7.1 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

Upgrading from JIRA 3.7.3 to 3.7.4

Please follow the JIRA general upgrade instructions.

Upgrading from JIRA 3.7.2 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

**JIRA 3.7.x to 3.8.x**
Upgrading from JIRA 3.7.4 to 3.8

Please follow the JIRA general upgrade instructions. Additionally, please note the following:

1. The 'Assign To' field name has been changed to 'Assignee' consistently across JIRA. This means that users need to be aware that the column heading in the Excel export has changed to 'Assignee' from 'Assign To'. Please be aware of this if for example you are exporting JIRA data to Excel and running macros on it. The field has been renamed for the following Issue Navigator Views:
   - Excel (all)
   - Word (all)
   - Full Content

2. The issuecommentedited.vm e-mail template for the new Issue Comment Edited event has been added to the WEB-INF/classes/email-template-id-mappings.xml file. The id of the e-mail template used for sending Filter Subscriptions has changed to 10000. If you have manually modified the WEB-INF/classes/email-template-id-mappings.xml file in the version of JIRA you are upgrading from, please do not simply copy the old file to JIRA 3.8. You will need to port your changes to the WEB-INF/classes/email-template-id-mappings.xml file that is shipped with JIRA 3.8. If you have not changed the WEB-INF/classes/email-template-id-mappings.xml file, you do not need to worry about this.

3. Two columns have been added to the jiraaction table to support editable comments.

Upgrading from JIRA 3.7.3 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

Upgrading from JIRA 3.8 to 3.8.1

Please follow the JIRA general upgrade instructions.

⚠️ Charting Plugin must be upgraded to v1.3.5

Please note that the version of JFreeChart included in JIRA 3.8.1 is not compatible with older versions of the Charting Plugin. If you have the Charting Plugin installed, please make sure you upgrade it to version 1.3.5 or above.

The updated JFreeChart 1.0.4 version is not backwards compatible with the previous 1.0.0pre2 version, so if you have any plugins that utilise JFreeChart, please make sure you test them before upgrading.

Upgrading from JIRA 3.7.4 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

JIRA 3.8.x to 3.9.x

Upgrading from JIRA 3.8.1 to 3.9

Please follow the JIRA general upgrade instructions. Additionally, please note the following:

In this version, there has been a change to the database which may cause problems for some customers.

The Recommended Upgrade Method

If you follow the recommended export/import upgrade procedure you should not experience any problems!

Pointing JIRA 3.9 at an existing, non-empty database
Some customers have a good reason for not following the recommended upgrade method. Using this method may result in database errors in your logs. You can avoid this if you modify your table structure manually, but the procedure is different depending on whether you have already started JIRA.

To avoid this, **BEFORE** you upgrade JIRA using this method, you can just drop the `qrtz_cron_triggers` table. This table has not been used by JIRA before 3.9, so it should be empty.

If you have **ALREADY** started JIRA 3.9 using your existing database, you may see the following log messages when JIRA starts up:

```
2007-04-18 15:31:53,345 main WARN [core.entity.jdbc.DatabaseUtil] Column "CRON_EXPRERSSION" of table "public.qrtz_cron_triggers" of entity "QRTZCronTriggers" exists in the database but has no corresponding field
```

The reason for this is that we have incorrectly changed a column in the `qrtz_cron_triggers` table. The intention was to fix a misspelling, but all we did was remove an underscore ("_"). The old column name is "CRON_EXPRERSSION". The new column name is "CRONEXPRERSSION". Note that both columns spell the word "expression" incorrectly.

To remove the error message, you must remove the old column as it is redundant. This column will not contain any data. The following table shows all columns in the `qrtz_cron_triggers` table. Columns that should be present are in **green** and columns that should be deleted are in **red**.

<table>
<thead>
<tr>
<th>Keep</th>
<th>Keep</th>
<th>Keep</th>
<th>Delete</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>TRIGGER_ID</td>
<td>CRONEXPRERSSION</td>
<td>CRON_EXPRERSSION</td>
</tr>
</tbody>
</table>

To delete the column, you can use SQL, but this may be slightly different between databases. Here's how it might look:

```
alter table qrtz_cron_triggers drop column CRON_EXPRERSSION;
```

The data in this table

If you have users who have subscribed to **issue filters**, note that existing SimpleTriggers (time intervals) will be automatically converted into CronTriggers during the JIRA upgrade. In some cases, there may not be an exact mapping of time intervals to Cron Expressions, and approximations will be made (e.g. 'Every 5 weeks' will be converted to 'Once a month'). If this happens, the JIRA upgrade process will send an email to the user to inform them of the new schedule.

**Upgrading from JIRA 3.8 and earlier**

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available [here](#).

**Upgrading from JIRA 3.9 to 3.9.1**

Please follow the JIRA general upgrade instructions.

**Upgrading from JIRA 3.8.1 and earlier**

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available [here](#).
Upgrading from JIRA 3.9/3.9.1 to 3.9.2

Please follow the JIRA general upgrade instructions.

Upgrading from JIRA 3.8.1 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

Upgrading from JIRA 3.9.2 to 3.9.3

Please follow the JIRA general upgrade instructions.

Upgrading from JIRA 3.9.1 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

**JIRA 3.9.x to 3.10.x**

*Upgrading from JIRA 3.9.3 to 3.10*

Please follow the JIRA general upgrade instructions, plus note the following:

1. Plugins

There is a new version of the JIRA Calendar Plugin that links to the new 'Project Version' pages. This new version of the plugin is not backwards compatible.

Please note that the Kaamelot plugin for JIRA has not yet been updated. If you are currently using this plugin, you may want to hold off the upgrade to JIRA 3.10 until a compatible version of this plugin has been released.

2. Developer Notes

The ordering of the ListOrderedMap returned by SchemePermissions.getSchemePermissions() has changed. This also means that the order of the RemotePermission[] array returned by the RPC Plugin's JiraSoapService.getAllPermissions() method has changed. If you have extended your instance of JIRA please confirm that any remote applications retrieving permissions via SOAP still work. You may encounter problems if you have been retrieving specific permissions by their array index.

**Database changes**

In JIRA 3.10, the worklog records have moved from the 'jiraactions' database table to the new 'worklog' table. This new table contains the following columns:

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Modifiers</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>numeric(18,0)</td>
<td>not null</td>
</tr>
<tr>
<td>issueid</td>
<td>numeric(18,0)</td>
<td></td>
</tr>
<tr>
<td>author</td>
<td>character varying(255)</td>
<td></td>
</tr>
<tr>
<td>grouplevel</td>
<td>character varying(255)</td>
<td></td>
</tr>
<tr>
<td>rolelevel</td>
<td>numeric(18,0)</td>
<td></td>
</tr>
<tr>
<td>worklogbody</td>
<td>text</td>
<td></td>
</tr>
<tr>
<td>created</td>
<td>timestamp with time zone</td>
<td></td>
</tr>
<tr>
<td>updateauthor</td>
<td>character varying(255)</td>
<td></td>
</tr>
<tr>
<td>updated</td>
<td>timestamp with time zone</td>
<td></td>
</tr>
<tr>
<td>startdate</td>
<td>timestamp with time zone</td>
<td></td>
</tr>
<tr>
<td>timeworked</td>
<td>numeric(18,0)</td>
<td></td>
</tr>
</tbody>
</table>
Upgrading from JIRA 3.9.2 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

Upgrading from JIRA 3.10 to 3.10.1

Please follow the JIRA general upgrade instructions.

Upgrading from JIRA 3.9.3 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

Upgrading from JIRA 3.10.1 to 3.10.2

Please follow the JIRA general upgrade instructions.

Upgrading from JIRA 3.9.3 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

JIRA 3.10.x to 3.11.x

- Upgrading from JIRA 3.10.x to 3.11
- Upgrading from JIRA 3.9.x and earlier

Upgrading from JIRA 3.10.x to 3.11

Please follow the JIRA general upgrade instructions, plus note the following:

Administrative notes

- To take advantage of the performance enhancements in JIRA 3.11, it is recommended that you enable GZip compression (unless you are using mod_proxy).
- The jira-application.properties file has a new option, 'progress', for the following attribute:

```
jira.table.cols.subtasks
```

The 'progress' option controls the display of the 'Progress' field in issues and reports.
- JIRA 3.11 introduces a bug fix for JRA-12354. This means that the CVS and Perforce plugin will perform better at detecting commits for a particular issue key, avoiding partial matches on similar project keys. If users have taken advantage of the previous relaxed key matching, they can revert to the old behaviour by simply setting the following application property in the jira-application.properties file and restarting JIRA:

```
jira.option.key.detection.backwards.compatible=true
```

Plugins

Updating plugins

If you are using any of the following plugins, you will need to update them to their latest versions when performing the upgrade:

- Perforce plugin
- Subversion plugin
- Toolkit Plugin
- Charting Plugin
- RPC Plugin
3rd Party and personal plugins may also be affected (esp. if using lucene to store dates). These will need to be updated as well.

If these are updated after the upgrade (instead of as part of the upgrade), you will need to do a `reinde x`.

A failure to update these plugins will result in lots of errors that look like:

**Error 1**

```
[charting.charts.createdvsresolved.CreatedVsResolvedChart] Could not create velocity parameters For input string: "20070725144811"
java.lang.NumberFormatException: For input string: "20070725144811"

...

If you see these errors, please ensure that you are using the latest compatible version of the plugin for 3.11. If there is no supported version for 3.11, please contact the plugin developer via the plugin's homepage.

**Developer notes**
Modification to SOAP clients
If you have written a SOAP client for any JIRA version prior to 3.11 and are invoking any methods to get RemoteIssueType you will encounter the bug JRA-13529. The reason for this is that we have added extra information to the RemoteIssueType object that indicates if the issue type is a subTask issue type. To avoid the problem you will need to regenerate your remote object stubs against the updated JIRA 3.11 wsdl.

If you would like your SOAP client to work against multiple versions of JIRA then you need to use the latest stubs that have been generated against JIRA 3.11. You will need to **not** use any of the new functionality and you will need to remember that the isSubTask variable in the RemoteIssueType objects will be defaulted to false.

ThreadLocalQueryProfiler searchers have been moved to ThreadLocalSearcherCache
There may be a number of plugins that reference the ThreadLocalQueryProfiler searcher methods directly. These need to now reference the ThreadLocalSearcherCache.

Lucene Upgrade
We upgraded our version of Lucene to 2.2. If your plugin uses to Lucene to index/read data, please ensure that it works with JIRA 3.11. If you are indexing/reading dates, more than likely it will have broken and you will need to use the new Lucene 2 methods.

Database changes
There were no database changes in this release.

Upgrading from JIRA 3.9.x and earlier
In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available [here](#).

JIRA 3.11 to 3.12.x

Upgrading from JIRA 3.11 to 3.12

Please follow the JIRA general upgrade instructions, plus note the following:
1. Everyone who had the ‘JIRA Administrators’ global permission before the upgrade will automatically receive the new ‘JIRA System Administrators’ global permission during the upgrade. This will ensure that everyone can still perform the same functions they could previously.

2. The following new Seraph property can be used to fix JRA-10508:

```xml
<!-- If this parameter is set to true, the cookie will never be set secure. This is useful if you're logging into JIRA via https, but want to browse JIRA over http. This flag will ensure that the remember me option works correctly. -->
<init-param>
  <param-name>insecure.cookie</param-name>
  <param-value>true</param-value>
</init-param>
```

3. Due to the Seraph upgrade, to fix JRA-10508 all users will be prompted to log in again. This will also affect users who have the ‘Remember me’ checkbox ticked.

4. If you are building JIRA from source, please note that Maven2 is now required for a build. This is because the JIRA Fisheye Plugin requires Maven2.

5. If you are using the JIRA Toolkit, it is recommended that you upgrade to the latest version in order to fix JIRA-13553

6. Please note that the new Trusted Applications feature is not supported on Orion versions prior to 2.0.5. Also note that Resin2 has problems and you will need to update the Resin extra jars.

7. There is a new database table. Please see the following page for details

**Upgrading from JIRA 3.10.2 and earlier**

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

**Using the Trusted Applications feature with Crowd**

Please note that older versions of the Crowd client, (i.e. version 1.2.1 or earlier), can interfere with the correct operation of the Trusted Applications feature. If you are enabling Trusted Applications and using Crowd, please ensure that your Crowd client is version 1.2.2 or later.

**Upgrading from JIRA 3.12 to 3.12.1**

Please follow the JIRA general upgrade instructions

**Upgrading from JIRA 3.11 and earlier**

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

**Upgrading from JIRA 3.12.1 to 3.12.2**

Please follow the JIRA general upgrade instructions

**Upgrading from JIRA 3.11 and earlier**

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

**Upgrading from JIRA 3.12.2 to 3.12.3**

Please follow the JIRA general upgrade instructions

**Upgrading from JIRA 3.11 and earlier**
In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

**JIRA 3.12.x to 3.13**

Upgrading from JIRA 3.12.xx to 3.13

Please follow the JIRA general upgrade instructions, plus note the following:

1. **Introduction of Favourite Dashboards and Filters**

   **Favourite Dashboards**

   JIRA 3.13 introduces the favourite dashboards feature, which allows you to add dashboard pages that are owned by you or shared by other users as favourites (and hence, are displayed as tabs on your dashboard). On upgrade to JIRA 3.13, all your dashboard pages will be added as your favourites and displayed on your dashboard. If you do not wish any of your dashboards to be added as favourites, then you can remove them as favourites after the upgrade. See the dashboards documentation for details.

   **Favourite Filters**

   Similar to favourite dashboards, JIRA 3.13 introduces the favourite filters feature, which allows you to add issue filters that are owned by you or shared by other users as favourites. On upgrade to JIRA 3.13, all your issue filters will be added as your favourites. If you do not wish any of your filters to be added as favourites, then you can remove them as favourites after the upgrade. See the issue filters documentation for details.

   Please note, this change will not affect issue filter sharing, e.g. if you are using a shared issue filter in one of your dashboard portlets, it will still be shared with you after the upgrade.

   Please also note, that any custom developed portlets (or other JIRA objects that use filters that have been developed by 3rd parties) that have a dropdown list (not a pop-up picker) for filters, will now only show a list of the user's favourite filters, instead of all shared filters.

   **Favourite Filters portlet**

   The 'List All Filters' portlet has been replaced with the 'Favourite Filters' portlet in this release. Your dashboard will be automatically upgraded if it is currently configured to display the 'List All Filters' portlet.

2. **Tomcat, MySQL database connection dropouts**

   Please note, if you wish to use a MySQL database with JIRA Standalone you must set up the bundled Tomcat server (version 5.5.26) to survive connection closures. You must also do this if you are running JIRA EAR/WAR in Tomcat 5.5.25 or later, or Tomcat 6.0.13 or later. Versions 5.5.25 and above of Tomcat 5, and versions 6.0.13 and above of Tomcat 6, have been noted to exhibit problems maintaining connections to MySQL databases. Please read this document for details on the changes required.

3. **Changes to jira-application.properties**

   **jira.subscription.email.max.issues property**

   The jira.subscription.email.max.issues property has been added to the jira-application.properties file. This property allows you to specify the maximum number of issues that can be included in an email subscription. The default value for this property is 200. You may wish to update this property after the upgrade if you wish to set a different limit on the number of issues that can be included in an email subscription. See the documentation on Advanced JIRA Configuration for further details on this file.
4. Support for Portlet Plugins with JSP Views Discontinued

Portlet plugins with JSP views are no longer supported. If you have written a custom Portlet plugin and have used a JSP as the view template, you will need to convert your JSP to Velocity.

5. Updates to JIRA SOAP and XML-RPC APIs
com.atlassian.jira.rpc.soap.JiraSoapService

- replaced

```java
RemoteProject[] getProjects(String token) throws RemoteException;
```

with

```java
RemoteProject[] getProjectsNoSchemes(String token) throws RemoteException;
```

You should use `getProjectsNoSchemes()` instead because it much more memory efficient and quicker.

- added

```java
RemoteProject getProjectWithSchemesById(String token, Long projectId) throws RemoteException;
```

- deprecated

```java
RemoteFilter[] getSavedFilters(String token) throws RemoteException;
```

- added

```java
RemoteFilter[] getFavouriteFilters(String token) throws RemoteException;
```

com.atlassian.jira.rpc.xmlrpc.XmlRpcService

- replaced

```java
Vector getProjects(String token) throws Exception;
```

with

```java
Vector getProjectsNoSchemes(String token) throws Exception;
```

- deprecated

```java
Vector getSavedFilters(String token) throws Exception;
```

- added

```java
Vector getFavouriteFilters(String token) throws Exception;
```

6. Crowd Cache Timeout
This is only applicable if you are using Crowd.

The default timeout for caching user details has changed from 5 minutes to 2 hours. This will improve the performance of the application but will mean that it will take longer for changes to user details to reach the application. Details on how to configure the Crowd caches can be found here.

Upgrading from JIRA 3.12 and earlier

In addition to the above, please read the Upgrade Guide for every version you are skipping during the upgrade. The complete list of Upgrade Guides is available here.

JIRA 2.6 Release Notes

JIRA 2.6

Only three months after the release of JIRA 2.5 (and two after our last point-release), Atlassian are continuing our tradition of frequent, worthwhile upgrades with JIRA 2.6. In the process, we've fixed more than 110 known bugs, and added over 70 individual improvements or new features. All a free upgrade if you've purchased your JIRA license in the last year.

As always, we strongly encourage you to back up your data before upgrading.

2. Improvements
3. Notable Bug-fixes
4. Outstanding Issues
5. Enterprise Features

New Features

CVS Integration

Prior to 2.6, the only way to integrate JIRA with CVS was via syncmail, a clumsy and error-prone solution. For 2.6, we have overhauled the CVS support so that now JIRA can get all the information it needs directly from the CVS repository itself. Wherever a JIRA issue key is mentioned in a CVS commit message, JIRA will link the commit to the issue, as shown below:

Enterprise customers also have the ability to associate multiple CVS repositories with a single project, just in case your project spans multiple repositories, or moves from one to another.

Quick Search
The quick search bar on the top right of the screen is a very useful feature in JIRA, allowing you to quickly jump to an issue by its key, or run a full text search. If you use the keyboard shortcut (ALT+Q), then it is even quicker.

In JIRA 2.6, we've made the quick search even more powerful: it now tries much harder to guess what you are searching for. It will recognise the following in your search terms, and narrow your search accordingly:

- Project keys
- Project names (single word names only)
- Issue statuses
- Issue types
- "my"

So, for example:

- "JRA open bugs" will search for all open bugs in the JIRA project.
- "my JIRA open improvements" will search for all open improvements in the JIRA project that are assigned to you.

Streamlined Search Results

On the subject of searching, we've improved the site's navigation by giving you the ability to move through your list of search results without returning to the search results page. When you visit an issue from a search, the navigation box shown below will allow you to skip quickly to the next and previous results, conveniently bound to the hot-keys ALT+N and ALT+P respectively. ALT+F will take you back to the search results page.

Per-Search Column Ordering (Enterprise)

Users of the Enterprise version of JIRA can now have custom column-ordering for each of their saved searches (previously, there was just one column-ordering preference that applied to every search). This gives you much more power to build custom issue reports containing just the information you want to know, in the right order.

XML-RPC/SOAP interface to JIRA

JIRA now has an external programmatic API, a much-demanded feature from users who wanted a more direct way to interact with their issue-tracker, or to integrate JIRA more seamlessly with their business. It also provides a raft of new features for Mark Derricutt's IntelliJ IDEA JIRA Plugin. The API is available in SOAP and XML-RPC flavours, and is documented here.

You can also get an XML view of any issue by adding '?view=rss' to the end of any issue page's URL.

If you come up with some interesting use for the API, or application that takes advantage of it, let us know. Similarly, if you have any suggestions for features that would make the API more useful to you, don't hesitate to tell us.
**Screenshots and Thumbnails**

Our new screenshot feature makes it easy to attach screenshots to your issue: it’s as simple as pasting your screenshot directly into the applet provided, and hitting enter. (Currently, this feature is only available for Windows clients)

Any image that is attached to an issue is automatically displayed as a thumbnail, giving you a much better idea of what each attachment might contain. You can see an example of this online: JRA-2789. These thumbnails can also be configured to display in search results, for organisations that make heavy use of screenshots in issue reports.

**Trackback and Confluence Integration**

Confluence is the latest Atlassian product, and you can now link Confluence docs to JIRA issues and vice versa. When a JIRA issue contains a link to a Confluence page the server will automatically inform Confluence that it has been linked to, so Confluence can in turn refer back to the issue. This works both ways, of course, so when a Confluence page refers to a JIRA issue, JIRA also links back to the page. (For example, see [http://jira.atlassian.com/browse/JRA-2789](http://jira.atlassian.com/browse/JRA-2789))

This is all done with the standard trackback API. Trackback is also widely supported by weblogging software, so you can see when people are talking about a particular issue on their blogs.

If you don't want trackback, you can easily turn it off in the administrative configuration. (By default, JIRA will receive trackback pings, but not send them)

**Email Integration**

JIRA’s email integration is greatly improved. For people sending email to JIRA:

- JIRA can be configured to create new user accounts for anyone who sends an email to JIRA who does not already have an account (great for support!)
- HTML emails that do not contain a plaintext alternative will be converted to text
- Email attachments are automatically added as attachments to the issue

And for people receiving email from JIRA:

- Emails sent by JIRA are properly threaded, so if your email client supports threading, all notifications on a particular issue will be grouped together.
- JIRA's emails will no longer prompt mail clients to send 'vacation' messages (which previously would cause erroneous issues to be created)
- JIRA can be configured to use a different “from” address per project.
- Administrators can now send emails to a group of JIRA users from within JIRA.

**Release Notes**

JIRA can now produce release notes: a cleanly formatted changelog of issues that have been resolved since the previous version. You can see the 2.6 Professional release notes online, or read the documentation.

The release-notes page contains a convenient text-box that allows you to cut and paste the HTML source directly from JIRA to your website.

**Page Compression**

JIRA now ships with a gzip filter, which will compress pages before sending them to the web browser. In some pages, this results in a size-reduction of 90%, massively decreasing download times and bandwidth usage for JIRA installations. This is most useful for installations of JIRA on the Internet: if you enable it on your LAN, the time the server takes to compress the pages will likely be greater than the time saved by them being compressed.

It is not enabled by default, but can be enabled from the Administration pages.

**Improvements**

**Internationalisation**

- Searching in all UTF-8 languages is now supported.
- The process of translating JIRA has been improved: adding support for a new language is now as simple as dropping in the localised jar file and restarting.
- The Calendar popup window now works in your selected language.
JIRA 6.2 Documentation

- JIRA i18n now works on Resin 2.1.12 on linux.

**Bulk Edit**
- Bulk delete of issues is now supported
- Bulk edit can set issues’ fix-for version

**Import**
There is now a Mantis import available, and the Bugzilla import has been greatly improved.

**Other Features**
There are 70 new features or improvements. Take a look.

**Notable Bug-fixes**
There are over 110 Bug Fixes in this release. If you raised a bug, chances are that it is fixed.

**Outstanding Issues**
- Currently we only have internationalised files for JIRA 2.5.3, so much of the interface is only half translated. We are in the process of co-ordinating the translation of 2.6, and new translations will be made available in future 2.6 point releases.
- If you are upgrading from 2.6 RC1, mail threading may not work correctly for issues that were created before the upgrade unless you upgrade via export / import. Issues created after upgrading to the 2.6 release will thread correctly.
- The printable view for a single issue is broken: it just redirects you to the normal, less printer-friendly page.

**Important Version-Specific Upgrade Notes**
While the procedure for upgrading JIRA remains fairly consistent from one JIRA version to the next, each major release of JIRA (i.e. with an X.Y version number format) and some minor releases (i.e. with X.Y.Z version numbers), come with specific recommendations for upgrading from the previous version.

If you plan to skip a few JIRA versions for your next JIRA upgrade, then we strongly recommend reading all the upgrade notes/guides mentioned in the list below, between your current version and the version to which you are upgrading. These version-specific upgrade notes/guides contain important information that may be relevant to your current JIRA installation and the JIRA version you are upgrading to.

**For example:** If you plan to upgrade from JIRA 4.2 to JIRA 4.4.5, then read the upgrade notes/guides for JIRA 4.2, JIRA 4.3, JIRA 4.4, JIRA 4.4.1, JIRA 4.4.3 and JIRA 4.4.4.

From JIRA 4.4, the names of these documents were changed to ‘upgrade notes’ (from ‘upgrade guides’) to avoid potential naming ambiguity with the general Upgrading JIRA guide and for consistency with other Atlassian products.

The following list of upgrade notes/guides contain important information you should be aware of for your JIRA upgrade:

- Upgrade notes/guides for minor releases are indented.

- JIRA 6.2 Upgrade Notes
- JIRA 6.1 Upgrade Notes
- JIRA 6.0 Upgrade Notes
- JIRA 5.2 Upgrade Notes
- JIRA 5.1 Upgrade Notes
- JIRA 5.0 Upgrade Notes
  - JIRA 5.0.4 Upgrade Notes
  - JIRA 5.0.2 Upgrade Notes
  - JIRA 5.0.1 Upgrade Notes
- JIRA 4.4 Upgrade Notes
  - JIRA 4.4.4 Upgrade Notes
  - JIRA 4.4.3 Upgrade Notes
  - JIRA 4.4.1 Upgrade Notes
- JIRA 4.3 Upgrade Guide
- JIRA 4.2 Upgrade Guide
  - JIRA 4.2.2 Upgrade Guide
- JIRA 4.1 Upgrade Guide
• JIRA 4.1.2 Upgrade Guide
• JIRA 4.1.1 Upgrade Guide
• JIRA 4.0 Upgrade Guide
• JIRA 4.0.1 Upgrade Guide
• JIRA 4.0.2 Upgrade Guide
• JIRA 3.13 Upgrade Guide
• JIRA 3.13.1 Upgrade Guide

EAP Releases

An Early Access Program (EAP) release is a public development release leading up to the official release of a JIRA version. Development releases are a snapshot of our work in progress, primarily focused on allowing JIRA users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release.

EAP releases, which include more mature Beta and Release Candidate (RC) builds are available for download and their release notes are listed below. Your help with testing them is very much appreciated! Please log the bugs you find on https://jira.atlassian.com in the “JIRA” project.

About JIRA Labs — The JIRA EAP is for customers who download and install JIRA. The JIRA Labs program extends feature previews to JIRA OnDemand and JIRA plugin customers as well. For information about JIRA Labs, please see Labs Features in JIRA.

JIRA 6.2 EAP 1 (m01) Release Notes

21 October 2013

Atlassian is proud to present JIRA 6.2 EAP 1 (m01). This public development release is part of our Early Access Program (EAP) leading up to the official JIRA 6.2 release. We are making these EAP milestones publicly available so that developers can start assessing the impact of the changes that we are making.

If you are a JIRA developer, please see Preparing for JIRA 6.2 as well as our Java API policy for JIRA.

Please provide us with your feedback here.

JIRA 6.2 EAP 1 (m01)
Upgrade Notes

⚠️ Do not use in production
EAP releases should not be used in production environments as they are not officially supported.

⚠️ Please also take note of the following information:
- **EAP Releases are Not Safe**—EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No Upgrade Path**—Because EAP releases represent work in progress, we cannot provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

---

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Read before you install/upgrade: Atlassian does not support upgrades both 'from' and 'to' EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

Key Features
This release does not contain any new features. Check back later for feature updates.

Important Note
To allow us to dedicate resources to providing the best experience on modern browsers, JIRA 6.2 (including minor releases) will be the last release that supports Internet Explorer 8 (IE8). For more information, please see this page.

JIRA 6.2 EAP 3 (m03) Release Notes
18 November 2013
Atlassian is proud to present JIRA 6.2 EAP 3 (m03). This public development release is part of our Early Access Program (EAP) leading up to the official JIRA 6.2 release. We are making these EAP milestones publicly available so that developers can start assessing the impact of the changes that we are making.

If you are a JIRA developer, please see Preparing for JIRA 6.2 as well as our Java API policy for JIRA.

Please provide us with your feedback here.

JIRA 6.2 EAP 3 (m03) Upgrade Notes

Key Features
We've added the following features to the workflow designer:

- You can now scroll over the workflow editor with your mouse. Zooming in only occurs when you press the keyboard shortcut for zooming while scrolling.
- You can easily create transitions with the transition tool.
- Improved the zoom in and zoom out capabilities.

Important Note
To allow us to dedicate resources to providing the best experience on modern browsers, JIRA 6.2 (including minor releases) will be the last release that supports Internet Explorer 8 (IE8). For more information, please see this page.

JIRA 6.2 EAP 4 (m04) Release Notes
9 December 2013
Atlassian is proud to present JIRA 6.2 EAP 4 (m04). This public development release is part of our Early Access Program (EAP) leading up to the official JIRA 6.2 release. We are making these EAP milestones publicly available so that developers can start assessing the impact of the changes that we are making. Please provide us with your feedback on this release here.

We want your feedback!

**JIRA 6.2 Upgrade Notes**

[Download EAP]

**Read before you install/upgrade:** Atlassian does not support upgrades both 'from' and 'to' EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

**Key Features**

**Auditing**

JIRA now tracks and records a range of activities in an audit log. Find out when a user was added or removed, or even when a workflow scheme was modified. The audit log doesn't record every single event in JIRA, but it does capture configuration changes that can impact users and projects. This can help you diagnose problems in JIRA or can be used for security purposes.

Note, auditing is disabled by default. You will need to enable it to start tracking changes in JIRA.

We would love to hear your feedback on this feature. Click the button on the audit log to let us know which events you'd like to see supported in future.

More improvements to the workflow designer

The following features have been added to the workflow designer in this release:

- You can now scroll over the workflow editor with your mouse. Zooming in only occurs when you press the keyboard shortcut for zooming while scrolling.
- You can easily create transitions with the transition tool.
- The zoom in and zoom out capabilities have been improved.

Creator of an issue is now recorded

The creator of an issue is now automatically recorded for every issue. This is particularly useful, if you need to know the creator of an issue for compliance reasons. The creator is distinct from the reporter (which can still be configured to be an optional field). On upgrade to this release, JIRA will set the creator to the appropriate reporter in the change history, for existing issues.

The creator can be seen in the issue history. If the creator is the same as the reporter, the name of the creator will be shown in the Reporter field on the issue. You can also search for issues by creator.

New 'attachments' JQL field

Find issues that have attachments or issues that do not have attachments with the new 'attachments' JQL field. Just add the clause "attachments IS EMPTY" or "attachments IS NOT EMPTY" to your advanced search query.

Key Features

New status lozenges

This release introduces new "lozenges" to represent statuses in JIRA. We've switched from the old icon+text representation to make it easier for users to locate and identify statuses. The new status lozenges also conform to the Atlassian Design Guidelines. This blog post explains the background behind this change.

We no longer support custom images for status icons. However, you will be able to configure statuses to use any one of the slick new status colors (categories) in JIRA. Learn more...

Auditing

JIRA now tracks and records a range of activities in an audit log. Find out when a user was added or removed, or even when a workflow scheme was modified. The audit log doesn’t record every single event in JIRA, but it does capture configuration changes that can impact users and projects. This can help you diagnose problems in JIRA or can be used for security purposes.

Note, auditing is disabled by default. You will need to enable it to start tracking changes in JIRA.

We would love to hear your feedback on this feature. Click the button on the audit log to let us know which events you'd like to see supported in future.

Learn more...

Read before you install/upgrade: Atlassian does not support upgrades both 'from' and 'to' EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.
Simple issue type configuration

Issue types associated with the project are now listed on the main project administration page. The issue type tab has also been redesigned, allowing you to access the workflow designer or screen designer for the issue type with a single click.

Improvements to the workflow designer

You can now reuse existing transitions in the workflow designer. Just add a transition and choose the Reuse a transition tab.
You will only be able to reuse transitions that have the same destination status as the new transition you are adding — the values in Transition to reuse field will change depending on the value of the To Status field.

Other features that have been added to the workflow designer include:

- You can now scroll over the workflow editor with your mouse. Zooming in only occurs when you press the keyboard shortcut for zooming while scrolling.
- You can easily create transitions with the transition tool.
- The zoom in and zoom out capabilities have been improved.

Creator of an issue is now recorded

The creator of an issue is now automatically recorded for every issue. This is particularly useful, if you need to know the creator of an issue for compliance reasons. The creator is distinct from the reporter (which can still be configured to be an optional field). On upgrade to this release, JIRA will set the creator to the appropriate reporter in the change history, for existing issues.

The creator can be seen in the issue history. If the creator is the same as the reporter, the name of the creator will be shown in the Reporter field on the issue. You can also search for issues by creator.

New 'attachments' JQL field

Find issues that have attachments or issues that do not have attachments with the new 'attachments' JQL field. Just add the clause "attachments IS EMPTY" or "attachments IS NOT EMPTY" to your advanced search query.

Learn more...

Filtering for User Picker custom field

You can now limit the users that can be selected in a user picker custom field, to specified groups and/or project roles. Just configure your user picker custom field and choose the new Edit User Filtering link.

JIRA 6.2 RC 1 Release Notes
10 February 2014

Atlassian is proud to present JIRA 6.2 RC 1. This public development release is part of our Early Access Program (EAP) leading up to the official JIRA 6.2 release. We are making these EAP milestones publicly available so that developers can start assessing the impact of the changes that we are making. Please provide us with your feedback on this release here.

If you are a JIRA developer, please see Preparing for JIRA 6.2 as well as our Java API policy for JIRA.

JIRA 6.2 RC 1 Upgrade Notes

Read before you install/upgrade: Atlassian does not support upgrades both 'from' and 'to' EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

Key Features

New status lozenges

This release introduces new "lozenges" to represent statuses in JIRA. We've switched from the old icon+text representation to make it easier for users to locate and identify statuses. The new status lozenges also conform to the Atlassian Design Guidelines. This blog post explains the background behind this change.

We no longer support custom images for status icons. However, you will be able to configure statuses to use any one of the slick new status colors (categories) in JIRA. Learn more...

Old status lozenges

JIRA 6.1 RC 2 Release Notes
16 September 2013

Atlassian is proud to present JIRA 6.1 RC 2. This public development release is part of our Early Access Program (EAP) up to the official JIRA 6.1 release. We are making these EAP milestones publicly available so that developers can assess the impact of the changes that we are making.

Important Information for JIRA Developers
If you are a JIRA developer, please see Preparing for JIRA 6.1 as well as our Java API policy for JIRA. This milestone contains potentially breaking changes that could stop your add-ons from working.

We are announcing potentially breaking changes as far in advance as possible; check this Summary of Changes for details.

Please provide us with your feedback here.

JIRA 6.1 Upgrade Notes

Download EAP

Read before you install/upgrade: Atlassian does not support upgrades either "from" or "to" EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

Key features
- Create workflows and fields with ease
- New project templates
- More integration with your coding tools
- A feast of usability improvements
- Enterprise Enhancements
- Additional Improvements and Changes

Create workflows and fields with ease

New workflow designer

JIRA has a new workflow designer – it loads quickly, scrolls easily, and lets you build and edit workflows faster than appears in view issue, one of our highest voted feature requests.

Workflows are one of the tools in JIRA that provide it with its amazing flexibility and we want to ensure that workflows best in its class. Making sure that all of our users (JIRA administrators to our most casual users) understand workflows and feature improvement goals. Look for more changes in this area in the near future.
Highlights

- Full screen mode!
- Workflow viewer shows the transition lines as they are drawn using the Workflow Designer, another big feature request.
- Incoming and outgoing transitions relevant to each status are displayed.
- Global transitions are now first class citizens in the designer.
- Geometric snap lines (snap to other statuses!).

Click here for usage notes on the new workflow designer...

- Zoom the diagram with your mouse wheel. Pan the diagram by clicking and holding the mouse while or mouse across the diagram.
- Click and drag a status to move it.
- Red lines popping up indicate snap points that can be used to change your diagram layout.
- You can change where the transitions connect to the statuses by clicking on the connection line and move it.
- Delete statuses and transitions with the delete key.
- On the View Issue page, all statuses except the current one are displayed with the white background in the blue background and white text to give it more prominence.
- The concept of a current status does not exist outside of the View Issue page.
- The project workflows pages have also been updated to show the new workflow designer.
- Pages for transition post-functions, conditions, and validators have been redesigned with the Atlassian.
- The Flash version is still accessible from classic mode, as shown here.

For differences from the previous version of the workflow designer, please see the Upgrade Notes.

Add a field while viewing an issue

JIRA Admins can now add an existing field or create a custom field while in View Issue with the Admin > Add fie configure the options for that custom field without having to break your stride.
Custom fields are another powerful JIRA tool that enable JIRA administrators to quickly customize the way issues process. This new way of adding custom fields is much simpler, making the entire experience fast, effective, and field to the View screen, but we add it to the Create and Edit screens as well. This means you can edit the field the next time you add an issue.

Also, when creating a custom field, you now can choose between Standard and Advanced types. For Standard type each field, you can see what you are creating in advance. This ensures that you get the custom field you want.

**New project templates**

**Simple Issue Tracking project**

This project provides you with a quick and easy way to get JIRA up and running for simple issue tracking. This provides users with a simple three-step workflow, while taking advantage of JIRA’s other powerful features. On the other, more complex workflows provided by JIRA.

For more details on this project template, see Simple Issue Tracking project.

**Software Development project**

This project provides you with an easy to use template for software development. It includes a simple workflow with statuses representing tasks that go through a development and review process. You can later customize this further to suit your team’s evolving processes.

For more details on this project template, see Software Development project.

**More integration with your coding tools**

You've always been able to link commits from Bitbucket and Stash to JIRA issues, making it easy to understand changes involved. However, we're adding new features to expand the ways you can manage commits, builds, and your planning resources in JIRA.

In this first release of these improvements, if you use Bitbucket or Stash to manage your code repositories, you'll directly from issues in JIRA or JIRA Agile. The new **Create branch** link will open your connected repository appli...
creating a branch for you. If you have multiple applications connected, then you can choose where you’d like to create the branch. If you use these features, we’d love to hear what you think!

The ability to create feature branches will be available in Stash at the end of September.

Expand this section for the project administration changes associated with this functionality...

A new section on the project administration screen, Development Tools, has been added to give you an overview of the development tools that are connected and which users can use the integration features between them.

- **View permission** - This section lists which users can see the development tools integration features (like view issue screen, as well as other development-related information, like commits, reviews and build information) by the "View Development Tools" project permission (which was previously named the "View Issue Source Tab" permission).
- **Applications** - This section shows which development tools are connected to JIRA via application links and new integration features in any development tool that's connected to JIRA.
A feast of usability improvements

Continuing on from JIRA 6, the JIRA 6.1 release improves usability in a number of areas, described below.

Easier issue navigator column configuration

JIRA lets you change the columns of the table of search results for any search results displayed using the List view. Click **Columns** at top right of the issue table to open the column configuration dialog, shown below.
Read more...

Edit project key

One of the most voted for feature requests has been implemented in this release: the ability to edit a project key. This has wide-ranging implications for your projects and related data.

![Edit Project: Sample Scrum Project](image)

Read more...

Updates to workflow text mode

In line with the updated workflow designer, we have also updated many of the pages in text mode. Specifically, the particular status or transition, as well as its post function, conditions and validators.

New look for email notifications

Email notifications are improved in JIRA. For details, check [here](url).

New default workflow

We've simplified JIRA's out-of-the-box experience, with new, better defaults to make issue tracking quick and simple. Previously, the JIRA default workflow required you to be the assignee in order to move an issue from one status to another, this is no longer the case. Anyone can transition issues and the assignee field will automatically be updated to that user. You can always change back to the old Default JIRA Workflow from Marketplace.

All newly created issues are now unassigned by default

Along with a new default workflow we've also simplified JIRA's out-of-the-box experience for new projects and the issues to be worked on by anyone, rather than having one person being the bottleneck.

The default for Allow Unassigned Issues is now set to ON for new instances and the Default Assignee is now set to OFF. Existing instances keep the current default (Allow Unassigned Issues is set to OFF).

Faster access to JIRA reports

You can now access JIRA reports directly from its own tab under the Browse Project page.

New whitelist for JIRA

JIRA’s whitelist is now more intuitive and easier to configure. Read more...

Enterprise Enhancements

Change usernames in LDAP

JIRA now supports changing usernames when connected to an external LDAP user directory. Previously, if you connected LDAP, JIRA would interpret that as deleting and adding a user. This wouldn't work because of the data associated correctly treated as a rename.

For most LDAP implementations, this will work out of the box. However, in a very small minority of cases, you may need to configure the LDAP settings in JIRA:
JIRA password policy

The JIRA password policy feature enables JIRA Administrators to set limits and restrictions on the types of passwords their users can create.

Additional Improvements and Changes

Name changes for JIRA add-ons

GreenHopper has been renamed to JIRA Agile and Bonfire has been renamed to JIRA Capture. This is part of a move to align these two add-ons more closely with JIRA. You will see associated UI changes in JIRA in this release. Please be assured that your entitlements are unchanged. This is a change of product name only. Read this blog post for more information.

JIRA Agile  JIRA Capture

JIRA Redmine Importer now available

We've added a JIRA Redmine Importer plugin that enables you to import data from Redmine directly into your local JIRA site. For more information, see Importing Data from Redmine.

JIRA 6.1 RC 1 Release Notes

9 September 2013

Atlassian is proud to present JIRA 6.1 RC 1. This public development release is part of our Early Access Program up to the official JIRA 6.1 release. We are making these EAP milestones publicly available so that developers can assess the impact of the changes that we are making.

Important Information for JIRA Developers

If you are a JIRA developer, please see Preparing for JIRA 6.1 as well as our Java API policy for JIRA. This contains breaking changes that could stop your add-ons from working.

We are announcing potentially breaking changes as far in advance as possible; check this Summary of Changes for details.

Please provide us with your feedback here.

JIRA 6.1 Upgrade Notes

Download EAP

Read before you install/upgrade: Atlassian does not support upgrades either 'from' or 'to' EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

Create workflows and fields with ease

New workflow designer

JIRA has a new workflow designer – it loads quickly, scrolls easily, and lets you build and edit workflows faster than appears in view issue, one of our highest voted feature requests.

Workflows are one of the tools in JIRA that provide it with its amazing flexibility and we want to ensure that workflow best in its class. Making sure that all of our users (JIRA administrators to our most casual users) understand workflow and feature improvement goals. Look for more changes in this area in the near future.
Highlights

- Full screen mode!
- Workflow viewer shows the transition lines as they are drawn using the Workflow Designer, another big feature request.
- Incoming and outgoing transitions relevant to each status are displayed.
- Global transitions are now first class citizens in the designer.
- Geometric snap lines (snap to other statuses!).

*Click here for usage notes on the new workflow designer...*

- Zoom the diagram with your mouse wheel. Pan the diagram by clicking and holding the mouse while or mouse across the diagram.
- Click and drag a status to move it.
- Red lines popping up indicate *snap points* that can be used to change your diagram layout.
- You can change where the transitions connect to the statuses by clicking on the connection line and moving your mouse.
- Delete statuses and transitions with the `delete` key.
- On the *View Issue* page, all statuses except the current one are displayed with the white background and blue text to give it more prominence.
- The concept of a *current* status does not exist outside of the *View Issue* page.
- The project workflows pages have also been updated to show the new workflow designer.
- Pages for transition post-functions, conditions, and validators have been redesigned with the Atlassian Design Guidelines.
- The Flash version is still accessible from classic mode, as shown here.

For differences from the previous version of the workflow designer, please see the Upgrade Notes.

*Add a field while viewing an issue*

JIRA Admins can now add an existing field or create a custom field while in View Issue with the Admin > Add field option. We'll even let you configure the options for that custom field without having to break your stride.
Custom fields are another powerful JIRA tool that enable JIRA administrators to quickly customize the way issues process. This new way of adding custom fields is much simpler, making the entire experience fast, effective, and field to the View screen, but we add it to the Create and Edit screens as well. This means you can edit the field you created the next time you add an issue.

Also, when creating a custom field, you now can choose between Standard and Advanced types. For Standard types, a preview image is shown for each type, so you can see what you are creating in advance. This ensures that you get the custom field you want.

Read more...

**New project templates**

**Simple Issue Tracking project**

This project provides you with a quick and easy way to get JIRA up and running for simple issue tracking. This project is aimed at users who want to track their issues through a simple three-step workflow, while taking advantage of JIRA’s other powerful features. Later on, it’s easy to extend to other, more complex workflows provided by JIRA.

For more details on this project template, see [Simple Issue Tracking project](#).

**Software Development project**

This project provides you with an easy to use template for software development. It includes a simple workflow going through a development and review process. You can later customise this further to suit your team’s evolving processes.

For more details on this project template, see [Software Development project](#).

**More integration with your coding tools**

You’ve always been able to link commits from Bitbucket and Stash to JIRA issues, making it easy to understand changes involved. However, we’re adding new features to expand the ways you can manage commits, builds, and your planning resources in JIRA.

In this first release of these improvements, if you use Bitbucket or Stash to manage your code repositories, you’ll directly from issues in JIRA or JIRA Agile. The new **Create branch** link will open your connected repository applic.
creating a branch for you. If you have multiple applications connected, then you can choose where you’d like to create the branch.

Create Branch link in JIRA

If you use these features, we’d love to hear what you think!

The ability to create feature branches will be available in Stash at the end of September.

Expand this section for the project administration changes associated with this functionality...

A new section on the project administration screen, Development Tools, has been added to give you an overview of the development tools that are connected and which users can use the integration features between them.

- **View permission** - This section lists which users can see the development tools integration features (like the Create Branch link) on the Create Branch view issue screen, as well as other development-related information, like commits, reviews and build information. This ability is controlled by the "View Development Tools" project permission (which was previously named the "View Issue Source Tab" permission).
- **Applications** - This section shows which development tools are connected to JIRA via application links and new integration features in any development tool that's connected to JIRA.
Open the detailed view by clicking the Development Tools link on the left navigation bar to administer the Development Tools.

**A feast of usability improvements**

Continuing on from JIRA 6, the JIRA 6.1 release improves usability in a number of areas, described below.

**Easier issue navigator column configuration**

JIRA lets you change the columns of the table of search results for any search results displayed using the List view. Click Columns at top right of the issue table to open the column configuration dialog, shown below.
Read more...

Edit project key

One of the most voted for feature requests has been implemented in this release: the ability to edit a project key. Project and bulk move issues anymore — just update a single field to edit the key for an existing project. This has wide-ranging implications for your projects and related data.

Read more...

Updates to workflow text mode

In line with the updated workflow designer, we have also updated many of the pages in text mode. Specifically, the particular status or transition, as well as its post function, conditions and validators.

New look for email notifications

Email notifications are improved in JIRA. For details, check here.

New default workflow

We've simplified JIRA's out-of-the-box experience, with new, better defaults to make issue tracking quick and simple. Previously, the JIRA default workflow required you to be the assignee in order to move an issue from one status to another, this is no longer the case. Anyone can transition issues and the assignee field will automatically be updated to that user. You can always change back to the old Default JIRA Workflow from Marketplace

All newly created issues are now unassigned by default

Along with a new default workflow we've also simplified JIRA's out-of-the-box experience for new projects and the issues to be worked on by anyone, rather than having one person being the bottleneck.

The default for Allow Unassigned Issues is now set to ON for new instances and the Default Assignee is now set to the default.

Existing instances keep the current default (Allow Unassigned Issues is set to OFF).

Faster access to JIRA reports

You can now access JIRA reports directly from its own tab under the Browse Project page.

New whitelist for JIRA

JIRA's whitelist is now more intuitive and easier to configure. Read more...

Enterprise Enhancements

Change usernames in LDAP

JIRA now supports changing usernames when connected to an external LDAP user directory. Previously, if you connected LDAP, JIRA would interpret that as deleting and adding a user. This wouldn't work because of the data associated with the user correctly treated as a rename.

For most LDAP implementations, this will work out of the box. However, in a very small minority of cases, you may need to configure the LDAP settings in JIRA: Read more.
JIRA password policy

The JIRA password policy feature enables JIRA Administrators to set limits and restrictions on the types of passwords their users can create.

Additional Improvements and Changes

Name changes for JIRA add-ons

GreenHopper has been renamed to JIRA Agile and Bonfire has been renamed to JIRA Capture. This is part of JIRA moving more closely with JIRA. You will see associated UI changes in JIRA in this release. Please be assured that your existing licenses and entitlements are unchanged. This is a change of product name only. Read this blog post for more information.

JIRA Redmine Importer now available

We've added a JIRA Redmine Importer plugin that enables you to import data from Redmine directly into your local JIRA site. For more information, see Importing Data from Redmine.

Removal of JQL function "echo()"

The echo function is a testing function in JIRA. It has been removed from JIRA as it provides no user value. Existing JQL filters that make use of this function will no longer work; please fix these filters, or remove them.

JIRA 6.1 Beta 1 Release Notes

26 August 2013

Atlassian is proud to present JIRA 6.1 Beta 1. This public development release is part of our Early Access Program (EAP) leading up to the official JIRA 6.1 release. We are making these EAP milestones publicly available so that developers can start assessing the impact of the changes that we are making.

Important Information for JIRA Developers

If you are a JIRA developer, please see Preparing for JIRA 6.1 as well as our Java API policy for JIRA. This milestone contains breaking changes that could stop your add-ons from working.

We are announcing potentially breaking changes as far in advance as possible; check this Summary of Changes for details.

Please provide us with your feedback here.

JIRA 6.1 Upgrade Notes

Download EAP

Read before you install/upgrade: Atlassian does not support upgrades either ‘from’ or ‘to’ EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

creating a branch for you. If you have multiple applications connected, then you can choose where you’d like to create a branch.

Create Branch link in JIRA

If you use these features, we’d love to hear what you think!

The ability to create feature branches will be available in Stash at the end of September.

Expand this section for the project administration changes associated with this functionality...

A new section on the project administration screen, Development Tools, has been added to give you an overview of the development tools that are connected and which users can use the integration features between them.

- **View permission** - This section lists which users can see the development tools integration features (like commits, reviews and build information) on the issue screen, as well as other development-related information.
- **Applications** - This section shows which development tools are connected to JIRA via application links and new integration features in any development tool that's connected to JIRA.
Open the detailed view by clicking the Development Tools link on the left navigation bar to administer these settings.

**A feast of usability improvements**

Continuing on from JIRA 6, the JIRA 6.1 release improves usability in a number of areas, described below.

**Easier issue navigator column configuration**

JIRA lets you change the columns of the table of search results for any search results displayed using the List view.

Click **Columns** at top right of the issue table to open the column configuration dialog, shown below.
Updates to workflow text mode

In line with the updated workflow designer, we have also updated many of the pages in text mode. Specifically, the particular status or transition, as well as its post function, conditions and validators.

New look for email notifications

Email notifications are improved in JIRA. For details, check here.

New default workflow

We've simplified JIRA's out-of-the-box experience, with new, better defaults to make issue tracking quick and simple. Previously, the JIRA default workflow required you to be the assignee in order to move an issue from one status to another, this is no longer the case. Anyone can transition issues and the assignee field will automatically be updated to that user. You can always change back to the old Default JIRA Workflow from Marketplace.

All newly created issues are now unassigned by default

Along with a new default workflow we've also simplified JIRA's out-of-the-box experience for new projects and the issues to be worked on by anyone, rather than having one person being the bottleneck.

The default for Allow Unassigned Issues is now set to ON for new instances and the Default Assignee is now set to new project. See Defining a Project for details.

Existing instances keep the current default (Allow Unassigned Issues is set to OFF).

Faster access to JIRA reports

You can now access JIRA reports directly from its own tab under the Browse Project page.

New whitelist for JIRA

JIRA's whitelist is now more intuitive and easier to configure. Read more...

Enterprise Enhancements

Change usernames in LDAP

JIRA now supports changing usernames when connected to an external LDAP user directory. Previously, if you changed a user in LDAP, JIRA would interpret that as deleting and adding a user. This wouldn't work because of the data associated with the user. Now, it will be correctly treated as a rename.

For most LDAP implementations, this will work out of the box. However, in a very small minority of cases, you may need to configure the LDAP settings in JIRA: read more.

JIRA password policy

The JIRA password policy feature enables JIRA Administrators to set limits and restrictions on the types of passwords users can create. Read more...

Additional Improvements and Changes

Name changes for JIRA add-ons

GreenHopper has been renamed to JIRA Agile and Bonfire has been renamed to JIRA Capture. This is part of a move to align these two add-ons more closely with JIRA. You will see associated UI changes in JIRA in this release. Please be assured that your entitlements are unchanged. This is a change of product name only. Read this blog post for more information.

JIRA Redmine Importer now available

We've added a JIRA Redmine Importer plugin that enables you to import data from Redmine directly into your local site. See Importing Data from Redmine.
Removal of JQL function "echo()"

The echo function is a testing function in JIRA. It has been removed from JIRA as it provides no user value. Existing filters will no longer work; please fix these filters, or remove them.

JIRA 6.1 EAP 5 (m05) Release Notes
12 August 2013

Atlassian is proud to present JIRA 6.1 EAP 5 (m05). This public development release is part of our Early Access Program up to the official JIRA 6.1 release. We are making these EAP milestones publicly available so that developers can assess the impact of the changes that we are making.

Important Information for JIRA Developers

If you are a JIRA developer, please see Preparing for JIRA 6.1 as well as our Java API policy for JIRA. This milestone contains potentially breaking changes that could stop your add-ons from working.

We are announcing potentially breaking changes as far in advance as possible; check this Summary of Changes.

Please provide us with your feedback here.

JIRA 6.1 EAP 5 (m05) Upgrade Notes

Read before you install/upgrade: Atlassian does not support upgrades either 'from' or 'to' EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

Key Features

Easier column configuration

JIRA lets you change the columns of the table of search results for any search results displayed using the List view. Click the icon at top right of the issue table to open the column configuration dialog, shown below.
JIRA password policy

The JIRA password policy feature enables JIRA Administrators to set limits and restrictions on the types of passwords users can create. Use this feature to create a more secure JIRA system for your company. Read more...

Custom fields types have changed

When creating a custom field, you now can choose between Standard and Advanced types. For Standard types, a preview image is shown for each type, so you can see what you are creating in advance. This ensures that you get the custom field you want, much faster.

To configure search templates or add contexts to custom fields, use the 'Configure' option on each custom field. This is no longer part of the custom field creation process.

New look for email notifications

Email notifications are improved in JIRA. For details, check here.

New default workflow behaviour

We've simplified JIRA's out of the box experience, with new, better defaults:

- By default, JIRA allows unassigned issues
- The default workflow allows transitions when you're not the assignee

Previously, by default JIRA required an assignee anytime you created an issue, and the default workflow required when you transition an issue. You can always change back to the old behavior, or just import the Classic Default Marketplace (described below).

Classic JIRA workflow available from Atlassian Marketplace

The classic default JIRA system workflow prior to this JIRA release is now available on Atlassian Marketplace.
Classic Default JIRA Workflow

If you import this workflow, you will need to add the 'Clear Resolution' post function back to the following three transitions:

- Start Progress
- Stop Progress
- Reopen Issue

To add a new post function, see this procedure.

All newly created issues are now unassigned by default

The default for 'Allow Unassigned Issues' is set to ON for new instances. The 'Default Assignee' is set to 'Unassigned' when you create a new project, see Defining a Project for details.

Existing instances keep the current default ('Allow Unassigned Issues' is set to OFF).

JIRA Redmine Importer now available

The JIRA Redmine Importer plugin allows you to import data from the Redmine Issue Tracker product into your information, see Importing Data from Redmine.

Removal of JQL function "echo()"

The echo function is a testing function in JIRA. It has been removed from JIRA as it provides no user value. Exist of this function will no longer work; please fix these filters, or remove them.

- Easier column configuration
- JIRA password policy
- Custom fields types have changed
- New look for email notifications
- New default workflow behaviour
- Classic JIRA workflow available from Atlassian Marketplace
- All newly created issues are now unassigned by default
- JIRA Redmine Importer now available
- Removal of JQL function "echo()"

JIRA 6.1 EAP 4 (m04) Release Notes

29 July 2013

Atlassian is proud to present JIRA 6.1 EAP 4 (m04). This public development release is part of our Early Access Program up to the official JIRA 6.1 release. We are making these EAP milestones publicly available so that developers can assess the impact of the changes that we are making.

Important Information for JIRA Developers

If you are a JIRA developer, please see Preparing for JIRA 6.1 as well as our Java API policy for JIRA. JIRA 6.1 EAP 3 contained breaking changes that could stop your add-ons from working.

We are announcing potentially breaking changes as far in advance as possible; check this Summary of Changes.

Please provide us with your feedback here.

JIRA 6.1 EAP 4 (m04) Upgrade Notes

Download EAP

Read before you install/upgrade: Atlassian does not support upgrades either 'from' or 'to' EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.
### Key Features

#### JIRA password policy

The JIRA password policy feature enables JIRA Administrators to set limits and restrictions on the types of passwords users can create. Use this feature to create a more secure JIRA system for your company. [Read more...](#)

#### Custom fields types have changed

When creating a custom field, you now can choose between Standard and Advanced types. For Standard types, for each type, you can see what you are creating in advance. This ensures that you get the custom field you want, much faster.

To configure search templates or add contexts to custom fields, use the 'Configure' option on each custom field creation process.

#### New look for email notifications

Email notifications are improved in JIRA. For details, check [here](#).

#### New default workflow behaviour

We've simplified JIRA's out of the box experience, with new, better defaults:

- By default, JIRA allows unassigned issues
- The default workflow allows transitions when you're not the assignee

Previously, by default JIRA required an assignee anytime you created an issue, and the default workflow required you to be the assignee when you transition an issue. You can always change back to the old behavior, or just import the [Classic Default JIRA Workflow](#) Marketplace (described below).

**Classic JIRA workflow available from Atlassian Marketplace**

The classic default JIRA system workflow prior to this JIRA release is now available on Atlassian Marketplace.

- [Classic Default JIRA Workflow](#)

If you import this workflow, you will need to add the 'Clear Resolution' post function back to the following three transitions:

- Start Progress
- Stop Progress
- Reopen Issue

To add a new post function, see this [procedure](#).

**JIRA 6.1 EAP 1 (m01) Release Notes**

24 June 2013

Atlassian is proud to present **JIRA 6.1 EAP 1 (m01)**. This public development release is part of our Early Access Early Access Program (EAP) up to the official JIRA 6.1 release. We are making these EAP milestones publicly available so that developers can assess the impact of the changes that we are making.

If you are a JIRA developer, please see [Preparing for JIRA 6.1](#) as well as our [Java API policy for JIRA](#).

Please provide us with your feedback [here](#).

**JIRA 6.1 EAP 1 (m01) Upgrade Notes**

- **Read before you install/upgrade:** Atlassian does not support upgrades both 'from' and 'to' EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

**Key Features**

This release does not contain any new features. Check back later for feature updates.

**JIRA 6.0 EAP Release Notes**

- JIRA 6.0 RC 1 Release Notes
- JIRA 6.0 Beta 1 Release Notes
- JIRA 6.0 EAP 8 (m10) Release Notes
- JIRA 6.0 EAP 7 (m09) Release Notes
- JIRA 6.0 EAP 6 (m08) Release Notes
- JIRA 6.0 EAP 5 (m07) Release Notes
- JIRA 6.0 EAP 4 (m06) Release Notes
- JIRA 6.0 EAP 3 (m05) Release Notes
JIRA 6.0 has been redesigned in accordance with the new Atlassian Design Guidelines. We want to provide you with an experience that helps you get your work done as effectively as possible. We think you'll find most common tasks simple and unobtrusive, with improved efficiency.

In most cases, the changes are cosmetic and the functionality is the same.

- The documentation will be updated for functional changes, but not for all cosmetic changes, at least not for the next few months.
- We've rewritten and redesigned several dozen User Management pages.
- View issue keeps evolving and is getting faster.
- We have beautiful new icons throughout the product.

If you are a developer, you need to update your plugins to work in JIRA 6.0. The following documents are designed to help you with this transition:

- Preparing for JIRA 6.0 – summary of technical changes, with links to additional resources
- Building UI for a plugin shipping to multiple versions of JIRA – how to manage plugins for multiple versions

We have made changes to JIRA's stable (Java) API. For details on this, see the Clirr results. Also see our Java API technical information on the JIRA Java APIs and our approach to changing them.
**Detail View**

JIRA is optimized to let you quickly navigate lists of issues, switch to a detail view from the basic list view and back on those items that need your immediate attention. The detail view lets you view an issue within the context of the great when you are triaging issues and you need a bit more context.

**More direct access to JIRA Administration**

JIRA Administrators now have easier direct access to the pages they use most. Now, instead of navigating to the features by choosing theCog menuat the top right of the screen, then choosing JIRA Admin > Projects (for ex: directly from theCog menu to the functional area you wish to administer, e.g., Cog menu > Projects. See the ill

**JIRA Mobile**

You can now view mobile-optimised versions of JIRA pages on your iPhone or Android phone. The JIRA mobile i viewing and interacting with issues on the go. Simply browse to your JIRA server's URL using your mobile browser interface for JIRA.
Search improvements

Stable Search

Now, when you search, your search results remain constant until you choose to refresh them. This provides you with results that you can work from when triaging issues. And, since your search results don’t change as you are making changes to the list, you maintain the original list you started with.

A faster view issue experience

In this release, we’ve streamlined the interaction with the View Issue screen and removed page loads to speed things up. We’ve also made additional performance improvements that make navigation between issues much faster. This makes going from stable search to viewing an issue and back again much faster. We will continue to improve performance for searching and viewing issues.

Editable usernames

For all of you who have been anxiously awaiting this feature – “rename user” being the #2 most requested feature by customer votes – JIRA Administrators can now edit any username in the JIRA Internal Directory. This ability is important to have when you connect JIRA to an LDAP directory and the username format is different. Now you can edit the usernames before connecting to your LDAP directory and have them match in JIRA. Once the username is changed in the internal directory, all parts of the JIRA interface display the updated username.

Better workflow

Global workflow schemes

Now you can edit an active workflow scheme on a project: a draft is created, and the migration is handled through the normal migration process.

Click here to expand...

The following functionality is available:
Add existing workflows
Remove workflows from scheme
Reassign issue types between workflows in the scheme
Publish draft
Discard draft

In addition to this, workflow schemes can be edited even if they are associated with more than one project.

Workflow sharing

The new Workflow Sharing feature allows you to share your team's workflow with other teams in your organisation, instances, or external parties in other organisations via the Atlassian Marketplace. This feature allows you to easily use workflows that other people have published, or to move a workflow from staging to production in your own organisation.

Get started faster

Faster JIRA setup with the new administration gadget

We're in the process of redesigning JIRA to help new administrators and users of JIRA get started faster. In this milestone, we've overhauled the administration gadget, which is displayed on the default dashboard for JIRA administrators.

The new administration gadget now displays a handy checklist of common tasks. Click on any task and you'll be taken to the relevant administration screen to complete it. The gadget also provides other helpful information for new administrators, such as links to the JIRA administrator documentation and license details.

Read more...

Project Templates

We've added a new dialog that allows you to select from different types of projects, when creating a new project.
Please note, in this release, choosing **Blank Project, Bug Tracking, Software Development** or **Project Management** will create the default JIRA project. However, we are in the process of developing pre-configured project templates for considering custom workflows, sample data, preset issue types, default fields, etc, for these templates.

Your use of the dialog will give us with valuable data to help us build the right project types.

**Read more...**

**New plugin points for the User Profile page**

For the ecosystem developers, we have implemented new plugin points for the web panels in the User Profile page: default 'Details', 'Preferences' and 'Assigned Open Issues per Project' web panels as well as add your own custom web panels.

**Read more...**

**Other improvements**

**Translate custom fields**

You can translate the name and description of any custom field that you create into another language. You can only select from the language packs that are installed in JIRA.

**Browse Project Summary**

Starting a new project? You'll be greeted by a more informative screen when you next browse your empty project. The placeholder text provides guidance on what will appear on the summary, once the project has been populated. Users will get started creating issues and browsing the project.
Reports have moved

We have moved reports from the dropdown menu on the Browse Project > Summary tab to a panel on the same tab. This makes the reports more accessible and presents a cleaner user interface.

Auto look and feel

You can now create a new look and feel for your JIRA instance based on your company's logo. When you upload a logo, you can choose to have JIRA change your colour scheme based upon the colours in your logo (see example below).

If you don't want to accept the change, simply click Undo in the displayed message.

Click here to expand...

Global autowatch configuration

We've implemented a new JIRA option that allows administrators to disable the autowatch feature (introduced in JIRA 5.0.3). To configure autowatch for all users, navigate to Administration > User Preferences (in Users section) > Default autowatch.

Users can choose to inherit the global autowatch setting or override it via their user Profile > Preferences > Autowatch.

Please note, if you are upgrading from an older version of JIRA, then all users who have not explicitly set their autowatch setting will have it set to 'Inherit from global settings'.

Maximum project name size and maximum project key size configuration

JIRA administrators will be able to set the maximum size for both the project name and project key in this release.
The **Maximum project name size** or **Maximum project key size** are defaulted to 80 and 10 respectively. These names or keys for your existing projects.

---

### JIRA 6.0 RC 1 Upgrade Notes

**Upgrading to JIRA 6.0 from JIRA 5.2.x**

**In this section:**
- Project key format configuration no longer supported
- Disabling inline edit no longer allowed
- You may need to upgrade your GreenHopper version to work with JIRA 6.0
- Cloners workarounds need to be disabled

**Project key format configuration no longer supported**

We are ending support for project key format configuration in downloadable JIRA in this release. Project key configuration is currently not supported in JIRA OnDemand. End of support means that Atlassian will not fix bugs related to project key configuration past the support end date.

We strongly recommend that you do not change the project key format in JIRA. Changing the project key format will break JIRA plugins, integration with other Atlassian products, as well as core JIRA functionality.

Disabling inline edit no longer allowed

We've removed the ability to disable inline edit because the preferred way to edit issues is with inline editing and we want to encourage use of this feature. This option is no longer available in **JIRA Admin** (under **System > General Configuration**).

You may need to upgrade your GreenHopper version to work with JIRA 6.0.

GreenHopper versions older than 6.2 will not be compatible with JIRA 6.0.

Cloners workarounds need to be disabled

Any customers upgrading to JIRA 6.0 that applied a workaround for the cloners link type – see clone operation creates link in the wrong direction for details – may need to reverse that workaround.

**Upgrading to JIRA 6.0 from JIRA 5.1.8 or earlier**

In addition to the points listed above, please read the Important Version-Specific Upgrade Notes for every version of JIRA you are skipping.

---

### JIRA 6.0 Beta 1 Release Notes

**22 April 2013**

Atlassian is proud to present **JIRA 6.0 Beta 1**. This public development release is part of our **Early Access Program** leading up to the official **JIRA 6.0** release. We are making these EAP milestones publicly available so that developers can start assessing the impact of the changes that we are making.

Please provide us with your general feedback here; and please provide us with your design (i.e. new look and feel) feedback here.

**Love what you see in JIRA 6.0?**

If you've tried out the JIRA 6 EAP and like what you see, we'd love to include your quotes, comments, and story of how JIRA 6 will change the way your teams work. Email Sara Yin to send us your quote.
Read before you install/upgrade: Atlassian does not support upgrades both ‘from’ and ‘to’ EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

Key Features

New JIRA look and feel

JIRA 6.0 has been redesigned in accordance with the new Atlassian Design Guidelines. We want to provide you with an experience that helps you get your work done as effectively as possible. We think you'll find most common tasks with improved efficiency.

In most cases, the changes are cosmetic and the functionality is the same.

- The documentation will be updated for functional changes, but not for all cosmetic changes, at least not for that screen shots in the documentation will not match the product during this transition period.
- We’ve rewritten and redesigned several dozen User Management pages.
- View issue keeps evolving and is getting faster.
- We have beautiful new icons throughout the product.

If you are a developer, you need to update your plugins to work in JIRA 6.0. The following documents are designed to help you with this transition:

- Preparing for JIRA 6.0 – summary of technical changes, with links to additional resources
- Building UI for a plugin shipping to multiple versions of JIRA – how to manage plugins for multiple versions

We have made changes to JIRA’s stable (Java) API. For details on this, see the Clirr results. Also see our Java A technical information on the JIRA Java APIs and our approach to changing them.

In this release:

- Detail View
- More direct access to JIRA Administration
- JIRA Mobile
- Search improvements
- Editable usernames
- Better workflow
- Get started faster
- Project Templates
- New plugin points for the User Profile page
- Other improvements

Detail View

JIRA is optimized to let you quickly navigate lists of issues, switch to a detail view from the basic list view and bar on those items that need your immediate attention. The detail view lets you view an issue within the context of the project when you are triaging issues and you need a bit more context.
More direct access to JIRA Administration

JIRA Administrators now have easier direct access to the pages they use most. Now, instead of navigating to the features by choosing the Cog menu at the top right of the screen, then choosing JIRA Admin > Projects (for example), you can navigate directly from the Cog menu to the functional area you wish to administer, e.g., Cog menu > Projects. See the image for details.

JIRA Mobile

You can now view mobile-optimised versions of JIRA pages on your iPhone or Android phone. The JIRA mobile interface is designed for viewing and interacting with issues on the go. Simply browse to your JIRA server's URL using your mobile browser interface for JIRA.
Search improvements

Stable Search

Now, when you search, your search results remain constant until you choose to refresh them. This provides you \ results that you can work from when triaging issues. And, since your search results don't change as you are maki you maintain the original list you started with.

A faster view issue experience

In this release, we've streamlined the interaction with the View Issue screen and removed page loads to speed th additional performance improvements that make navigation between issues much faster. This makes going from an issue and back again much faster. We will continue to improve performance for searching and viewing issues

Editable usernames

For all of you who have been anxiously awaiting this feature – "rename user" being the #2 most requested feature customer votes – JIRA Administrators can now edit any username in the JIRA Internal Directory. This ability is im connect JIRA to an LDAP directory and the username format is different. Now you can edit the usernames before LDAP directory and have them match in JIRA. Once the username is changed in the internal directory, all parts o display the updated username.

Better workflow

Global workflow schemes

Now you can edit an active workflow scheme on a project: a draft is created, and the migration is handled through process.

Click here to expand...

The following functionality is available:
• Add existing workflows
• Remove workflows from scheme
• Reassign issue types between workflows in the scheme
• Publish draft
• Discard draft

In addition to this, workflow schemes can be edited even if they are associated with more than one project.

Read more...

Workflow sharing

The new Workflow Sharing feature allows you to share your team's workflow with other teams in your organisation, instances, or external parties in other organisations via the Atlassian Marketplace. This feature allows you to easily use workflows that other people have published, or to move a workflow from staging to production in your own organisation.

Get started faster

Faster JIRA setup with the new administration gadget

We're in the process of redesigning JIRA to help new administrators and users of JIRA get started faster. In this milestone, we've overhauled the administration gadget, which is displayed on the default dashboard for JIRA administrators.

The new administration gadget now displays a handy checklist of common tasks. Click on any task and you'll be taken to the relevant administration screen to complete it. The gadget also provides other helpful information for new administrators, such as links to the JIRA administrator documentation and license details.

Read more...

Project Templates

We've added a new dialog that allows you to select from different types of projects, when creating a new project.
Please note, in this release, choosing Blank Project, Bug Tracking, Software Development or Project Management will create the default JIRA project. However, we are in the process of developing pre-configured project templates for considering custom workflows, sample data, preset issue types, default fields, etc, for these templates.

Your use of the dialog will give us with valuable data to help us build the right project types.

New plugin points for the User Profile page

For the ecosystem developers, we have implemented new plugin points for the web panels in the User Profile page. You can override the default ‘Details’, ‘Preferences’ and ‘Assigned Open Issues per Project’ web panels as well as add your own custom web panels.

Other improvements

Translate custom fields

You can now translate the field name and description of any custom field into another language. The translated strings will be included in the language pack that you specify (i.e. one of the language packs that is installed in JIRA).

Browse Project Summary

Starting a new project? You’ll be greeted by a more informative screen when you next browse your empty project. The placeholder text provides guidance on what will appear on the summary, once the project has been populated. Users will be prompted to get started creating issues and browsing the project.
Reports have moved

We have moved reports from the dropdown menu on the Browse Project > Summary tab to a panel on the same tab. This makes the reports more accessible and presents a cleaner user interface.

Auto look and feel

You can now create a new look and feel for your JIRA instance based on your company's logo. When you upload a logo, you can choose to have JIRA change your colour scheme based upon the colours in your logo (see example below).

If you don't want to accept the change, simply click Undo in the displayed message.

Global autowatch configuration

We've implemented a new JIRA option that allows administrators to disable the autowatch feature (introduced in JIRA 5.0.3) for all users. To configure autowatch for all users, navigate to Administration > User Preferences (in Users section) > Default autowatch. Users can choose to inherit the global autowatch setting or override it via their user Profile > Preferences >>.

Please note, if you are upgrading from an older version of JIRA, then all users who have not explicitly set their autowatch have it set to 'Inherit from global settings'.

Bulk watch/unwatch feature

You can now start or stop watching multiple issues using the watch / stop watching bulk operation. More detail
Maximum project name size and maximum project key size configuration

JIRA administrators will be able to set the maximum size for both the project name and project key in this release. Navigate to Administration > System > General Configuration and update Maximum project name size or Maximum project key size as desired.

The Maximum project name size or Maximum project key size are defaulted to 80 and 10 respectively. This will not affect the names or keys for your existing projects.

JIRA 6.0 EAP 8 (m10) Release Notes

8 April 2013

Atlassian is proud to present JIRA 6.0 EAP 8 (m10). This public development release is part of our Early Access Program up to the official JIRA 6.0 release. We are making these EAP milestones publicly available so that developers can assess the impact of the changes that we are making.

Please provide us with your general feedback here; and please provide us with your design (i.e. new look and feel) feedback here.

Important information for developers

The EAP 4 (m6) milestone included all "breaking changes" for JIRA 6.0. These are changes to JIRA APIs that developers must change how they build their plugins. These include changes to the following areas:

- JIRA's stable (Java) API
- JIRA CSS styles
- JavaScript components that build UI
- HTML markup patterns

If you haven't already, start updating your plugins for JIRA 6.0 now. We are not planning on making further breaking changes if they do occur they will be highlighted in the release notes. For further information, see Preparing for JIRA 6.0 API policy for JIRA.

Love what you see in JIRA 6.0?

If you've tried out the JIRA 6 EAP and like what you see, we'd love to include your quotes, comments, and story of how JIRA 6 will change the way your teams work. Just send us your quote by emailing Sara Yin.

JIRA 6.0 EAP 8 (m10) Upgrade Notes

Read before you install/upgrade: Atlassian does not support upgrades both 'from' and 'to' EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

Key Features

New JIRA look and feel

JIRA 6.0 has been redesigned in accordance with the new Atlassian Design Guidelines. We want to provide you with an experience that helps you get your work done as effectively as possible. At this point, these changes are across the entire product, making your experience that helps you get your work done as effectively as possible. At this point, these changes are across the entire product, making it modern, fast, and easy to use. We think you'll find most common tasks simple and unobtrusive, with improved efficiency.

In most cases, the changes are cosmetic and the functionality is the same.

- The documentation will be updated for functional changes, but not for all cosmetic changes, at least not for that screen shots in the documentation will not match the product during this transition period.
- We've rewritten and redesigned several dozen User Management pages.
- View issue keeps evolving and is getting faster.
- We have beautiful new icons throughout the product.
If you are a developer, you need to update your plugins to work in JIRA 6.0. The following documents are designed to help you with this transition:

- Preparing for JIRA 6.0 – detailed information on the Atlassian Design Guidelines implementation
- Building UI for a plugin shipping to multiple versions of JIRA – how to manage plugins for multiple versions
- Bonfire ADG Migration Guidelines – a case study on shipping to multiple versions of JIRA

We’d love to hear your feedback on the new JIRA look and feel. Please provide us with your feedback here.

In this release:

- New JIRA look and feel
- Detail View
- Search improvements
- Editable usernames
- Better workflow
- Get started faster
- Project Templates
- New plugin points for the User Profile page
- Other improvements

Detail View

JIRA 6.0 is optimised to let you quickly navigate lists of issues, switch to a ‘detail view’ from the basic ‘list view’ action on those items that need your immediate attention.

If you’ve used JIRA for some time, the ‘list view’ is the view you are used to seeing; namely, the search results list for a quick search, or an advanced search.

The new ‘detail view’ lets you view an issue within the context of the filter it’s a part of. This is great when you are need a bit more context.
Search improvements

Stable search

Now, when you search, your search results remain constant until you choose to refresh them. This provides you with stable results that you can work from when triaging issues. And, since your search results don’t change as you are making changes to the list, you maintain the original list you started with.

A faster view issue experience

In this release, we’ve streamlined the interaction with the View Issue screen and removed page loads to speed things up. We’ve also made additional performance improvements that make navigation between issues much faster. This makes going from stable search to viewing an issue and back again much faster. We will continue to improve performance for searching and viewing issues.

Editable usernames

JIRA Administrators can now edit any username in the JIRA Internal Directory (this is often referred to as the "rename user" feature). This ability is important to have when you connect JIRA to an LDAP directory and the username format is different. No usernames before you connect to your LDAP directory and have them match in JIRA. The other most common use case is when a staff member wishes to change their surname. Once the username is changed in the internal directory, all parts of the updated username.
Better workflow

Global workflow schemes

Now you can edit an active workflow scheme on a project: a draft is created, and the migration is handled through process. The following functionality is available:

- Add existing workflows
- Remove workflows from scheme
- Reassign issue types between workflows in the scheme
- Publish draft
- Discard draft

In addition to this, workflow schemes can be edited even if they are associated with more than one project.

Workflow sharing

The new Workflow Sharing feature allows you to share your team's workflow with other teams in your organisation instances, or external parties in other organisations via the Atlassian Marketplace. This feature allows you to easily use workflows that other people have published, or to move a workflow from staging to production in your own organisation.

Get started faster

*Faster JIRA setup with the new administration gadget*

We're in the process of redesigning JIRA to help new administrators and users of JIRA get started faster. In this milestone, we've overhauled the administration gadget, which is displayed on the default dashboard for JIRA administrators.

The new administration gadget now displays a handy checklist of common tasks. Click on any task and you'll be taken to the relevant administration screen to complete it. The gadget also provides other helpful information for new administrators, such as links to the JIRA administrator documentation and license details.

Read more...

Project Templates

We've added a new dialog that allows you to select from different types of projects, when creating a new project.

Please note, in this release, choosing any project type in the dialog will create the default JIRA project. However, developing pre-configured project templates for project types. We are considering custom workflows, sample data, default fields, etc, for these templates.

Your use of the dialog will give us with valuable data to help us build the right project types.

Other improvements

*Browse Project Summary*

Starting a new project? You'll be greeted by a more informative screen when you next browse your empty project.

The placeholder text provides guidance on what will appear on the summary, once the project has been populate.

users to get started creating issues and browsing the project.
Reports have moved

We have moved reports from the dropdown menu on the **Browse Project > Summary** tab to a panel on the same tab. Reports are now more accessible and present a cleaner user interface.

Auto look and feel

You can now create a new look and feel for your JIRA instance based on your company’s logo. When you upload a company logo, you can choose to have JIRA change your colour scheme based upon the colours in your logo (see example below).

If you don’t want to accept the change, simply click **Undo** in the displayed message.

**Global autowatch configuration**

We've implemented a new JIRA option that allows administrators to disable the autowatch feature (introduced in JIRA 5.0.3). To configure autowatch for all users, navigate to **Administration > User Preferences (in Users section) > Default autowatch**.

Users can choose to inherit the global autowatch setting or override it via their user **Profile > Preferences > Autowatch**.

Please note, if you are upgrading from an older version of JIRA, then all users who have not explicitly set their autowatch preference will have their autowatch preference set to the default.
it set to 'Inherit from global settings'.

**Maximum project name size and maximum project key size configuration**

JIRA administrators will be able to set the maximum size for both the project name and project key in this release. Navigate to **System > General Configuration** and update **Maximum project name size** or **Maximum project key size** as desired. The **Maximum project name size** or **Maximum project key size** are defaulted to 80 and 10 respectively. This will affect the names and keys for your existing projects.

**Love what you see in JIRA 6.0?**

If you've tried out the JIRA 6 EAP and like what you see, we'd love to include your quotes, comments, and story of how JIRA 6 will change the way your teams work. Just send us your quote by emailing Sara Yin.

---

**JIRA 6.0 EAP 7 (m09) Upgrade Notes**

**Read before you install/upgrade:** Atlassian does not support upgrades both 'from' and 'to' EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

**Key Features**

New JIRA look and feel

JIRA 6.0 has been redesigned in accordance with the new Atlassian Design Guidelines. We want to provide you with an amazing user experience that helps you get your work done as effectively as possible. In EAP 7, these changes are across the modern, fast, and easy to use. We think you'll find most common tasks simple and unobtrusive, with improved efficienciness.

In most cases, the changes are cosmetic and the functionality is the same.
The documentation will be updated for functional changes, but not for all cosmetic changes, at least not for that screen shots in the documentation will not match the product during this transition period.)

We've rewritten and redesigned several dozen User Management pages.

View issue keeps evolving and is getting faster.

We have beautiful new icons throughout the product.

If you are a developer, you need to update your plugins to work in JIRA 6.0. The following documents are designed to help you with this transition:

- Preparing for JIRA 6.0 – detailed information on the Atlassian Design Guidelines implementation
- Building UI for a plugin shipping to multiple versions of JIRA – how to manage plugins for multiple versions
- Bonfire ADG Migration Guidelines – a case study on shipping to multiple versions of JIRA

We'd love to hear your feedback on the new JIRA look and feel. Please provide us with your feedback here.

In this release:

- New JIRA look and feel
- Detail View
- Search improvements
- Editable usernames
- Better workflow
- Get started faster
- New plugin points for the User Profile page
- Other improvements

Detail View

JIRA 6.0 is optimised to let you quickly navigate lists of issues, switch to a ‘detail view’ from the basic ‘list view’ and take action on those items that need your immediate attention.

If you've used JIRA for some time, the 'list view' is the view you are used to seeing; namely, the search results for a quick search, or an advanced search.

The new 'detail view' lets you view an issue within the context of the filter it's a part of. This is great when you are need a bit more context.
Search improvements

**Stable search**

Now, when you search, your search results remain constant until you choose to refresh them. This provides you with a stable set of search results that you can work from when triaging issues. And, since your search results don’t change as you are making changes to the list, you maintain the original list you started with.

We are in the early stages of testing this feature, you can help by providing us with feedback. We’d like to know what works and what doesn’t. Does this feature help when you are working with a large number of issues? How could it be better? To provide feedback, click **Give Feedback** at the top right of your JIRA screen.

**A faster view issue experience**

In this release, we’ve streamlined the interaction with the **View Issue** screen and removed page loads to speed things up. We’ve also made additional performance improvements that make navigation between issues much faster. This makes going from stable search to viewing an issue and back again much faster. We will continue to improve performance for searching and viewing issues.

**Editable usernames**

JIRA Administrators can now edit any username in the JIRA Internal Directory (this is often referred to as the “rename user” feature). This ability is important to have when you connect JIRA to an LDAP directory and the username format is different. No usernames before you connect to your LDAP directory and have them match in JIRA. The other most common use case is when a staff member wishes to change their surname. Once the username is changed in the internal directory, all parts of the JIRA interface display the updated username.
Better workflow

Global workflow schemes

Now you can edit an active workflow scheme on a project: a draft is created, and the migration is handled through process. The following functionality is available:

- Add existing workflows
- Remove workflows from scheme
- Reassign issue types between workflows in the scheme
- Publish draft
- Discard draft

In addition to this, workflow schemes can be edited even if they are associated with more than one project.

Workflow sharing

The new Workflow Sharing feature allows you to share your team’s workflow with other teams in your organisation, instances, or external parties in other organisations via the Atlassian Marketplace. This feature allows you to easily use workflows that other people have published, or to move a workflow from staging to production in your own organisation.

Export Your Workflow to a Bundle File

Where you can use a workflow bundle

**Other improvements**

**Browse Project Summary**

Starting a new project? You'll be greeted by a more informative screen when you next browse your empty project. The placeholder text provides guidance on what will appear on the summary, once the project has been populate users to get started creating issues and browsing the project.
Reports have moved

We have moved reports from the dropdown menu on the Browse Project > Summary tab to a panel on the same tab. This makes the reports more accessible and presents a cleaner user interface.

Auto look and feel

You can now create a new look and feel for your JIRA instance based on your company's logo. When you upload a new logo, you can choose to have JIRA change your colour scheme based upon the colours in your logo (see example below).

If you don't want to accept the change, simply click Undo in the displayed message.

Global autowatch configuration

We've implemented a new JIRA option that allows administrators to disable the autowatch feature (introduced in JIRA 5.0.3). To configure autowatch for all users, navigate to Administration > User Preferences (in Users section) > Default autowatch.

Users can choose to inherit the global autowatch setting or override it via their user Profile > Preferences > Autowatch.

Please note, if you are upgrading from an older version of JIRA, then all users who have not explicitly set their Autowatch setting will have it set to 'Inherit from global settings'.

Maximum project name size and maximum project key size configuration

JIRA administrators will be able to set the maximum size for both the project name and project key in this release. To configure maximum project size, navigate to System > General Configuration and update Maximum project name size or Maximum project key size.

The Maximum project name size or Maximum project key size are defaulted to 80 and 10 respectively. This will not affect the names or keys for your existing projects.

JIRA Rest Ruby Gem - Help Wanted!

For all the Ruby on Rails fans out there, there's a great Ruby gem to use JIRA's REST API. Trineo, an Atlassian partner, created this gem and has lovingly evolved it, but is looking for a new owner. Give our kiwi mates a hand! Contact abhinav.keswani@trineo.co.nz if you're interested.

JIRA 6.0 EAP 6 (m08) Release Notes

5 March 2013

Atlassian is proud to present JIRA 6.0 EAP 6 (m8). This public development release is part of our Early Access Program, leading up to the official JIRA 6.0 release. We are making these EAP milestones publicly available so that developers can start assessing the impact of the changes that we are making.

Please provide us with your general feedback here; and please provide us with your design (i.e. new look and feel).
### Important information for developers
The EAP 4 (m6) milestone included all "breaking changes" for JIRA 6.0. These are changes to JIRA APIs that developers to change how they build their plugins. These include changes to the following areas:

- JIRA's stable (Java) API
- JIRA CSS styles
- JavaScript components that build UI
- HTML markup patterns

If you haven't already, start updating your plugins for JIRA 6.0 now. We are not planning on making further breaking changes if they do occur they will be highlighted in the release notes. For further information, see [Preparing for JIRA API policy for JIRA](#).

### Love what you see in JIRA 6.0?
If you've tried out the JIRA 6 EAP and like what you see, we'd love to include your quotes, comments, and story of how JIRA 6 will change the way your teams work. Just send us your quote by emailing Sara Yin.

### JIRA 6.0 EAP 6 (m08)
#### Upgrade Notes

**Read before you install/upgrade:** Atlassian does not support upgrades both ‘from’ and ‘to’ EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

#### Key Features

1. **A new JIRA look and feel**

   The JIRA look and feel is being redesigned in JIRA 6.0 according to the new [Atlassian Design Guidelines](#). We want an amazing user experience that helps you get your work done as effectively as possible. These changes are being implemented during 6.0 development.

   We are not there yet, so some things may not look quite right. However, you'll notice design improvements to a number of screens in JIRA, including the Project Summary page in the Administration Console, the Create/Edit issue screen and the JIRA Issues Calendar gadget.

   1. **If you are a developer, these changes will affect you; start making changes to your plugins now.** The following documents are designed to help you with this transition:
      - [Preparing for JIRA 6.0](#) – detailed information on the Atlassian Design Guidelines implementation
      - [Building UI for a plugin shipping to multiple versions of JIRA](#) – how to manage plugins for multiple versions
      - [Bonfire ADG Migration Guidelines](#) – a case study on shipping to multiple versions of JIRA

   We'd love to hear your feedback on the new JIRA look and feel. Please provide us with your feedback [here](#).
In this release:

- A new JIRA look and feel
- Issue navigator improvements
- Administrators can edit usernames
- Workflow improvements
- Get started faster
- New plugin points for the User Profile page
- Other improvements

**Issue navigator improvements**

**Stable search**

Now, when you search, your search results remain constant until you choose to refresh them. This provides you with results that you can work from when triaging issues. And, since your search results don't change as you are making changes, you maintain the original list you started with.

We are in the early stages of testing this feature, you can help by providing us with feedback. We'd like to know what doesn't work. Does this feature help when you are working with a large number of issues? How could it be better? To provide feedback, click **Give Feedback** at the top right of your JIRA screen.

**A faster view issue experience**
In this release, we've streamlined the interaction with the View Issue screen and removed page loads to speed things up. We've also made additional performance improvements that make navigation between issues much faster. This makes going from an issue and back again much faster. We will continue to improve performance for searching and viewing issues.

Administrators can edit usernames

JIRA Administrators can now edit any username in the JIRA Internal Directory (this is often referred to as the "rename user" feature). This ability is important to have when you connect JIRA to an LDAP directory and the username format is different. No usernames before you connect to your LDAP directory and have them match in JIRA. The other most common use case is when a staff member wishes to change their surname. Once the username is changed in the internal directory, all parts of the JIRA interface display the updated username.

For more information, see Renamable Users in JIRA 6.0.

Workflow improvements

Global workflow schemes

Now you can edit an active workflow scheme on a project: a draft is created, and the migration is handled through the normal migration process. The following functionality is available:

- Add existing workflows
- Remove workflows from scheme
- Reassign issue types between workflows in the scheme
- Publish draft
- Discard draft

In addition to this, workflow schemes can be edited even if they are associated with more than one project.

The **Maximum project name size** or **Maximum project key size** are defaulted to 80 and 10 respectively. This will not affect the names or keys for your existing projects.

**Reports have moved**

We have moved reports from the dropdown menu on the **Browse Project > Summary** tab to a panel on the same tab, making the reports more accessible and presenting a cleaner user interface.
JIRA 6.0 EAP 5 (m07) Release Notes
21 February 2013

Atlassian is proud to present JIRA 6.0 EAP 5 (m07). This public development release is part of our Early Access Program (EAP) to the official JIRA 6.0 release. We are making these EAP milestones publicly available so that developers can start assessing the impact of the changes that we are making.

Please provide us with your general feedback here; and please provide us with your design (i.e. new look and feel) feedback here.

Important information for developers
The EAP 4 (m6) milestone was the last release to include "breaking changes" for JIRA 6.0. "Breaking changes" are changes to the JIRA APIs that require ecosystem developers to change how they build their plugins. These include changes to (Java) API, changes to core JIRA CSS styles, changes to JavaScript components that build UI, changes to patterns.

You should start updating your plugins for JIRA 6.0 now. We are not planning on making any further breaks do occur in future EAP releases, we will ensure that they are highlighted in the release notes. For details or changes for 6.0, see Preparing for JIRA 6.0. Please also see our Java API policy for JIRA for technical info on Java APIs and our approach to changing them.

Love what you see in JIRA 6.0?
If you've tried out the JIRA 6 EAP and like what you see, we'd love to include your quotes, comments, and story of how JIRA 6 will change the way your teams work. Just send us your quote by emailing Sara Yin.

Auto look and feel

You can now create a new look and feel for your JIRA instance based on your company’s logo. When you upload a new logo, you can choose to have JIRA change your colour scheme based upon the colours in your logo (see example below).

If you don’t want to accept the change, simply click Undo in the displayed message.

Global autowatch configuration

We’ve implemented a new JIRA option that allows administrators to disable the autowatch feature (introduced in JIRA 5.0.3). To configure autowatch for all users, navigate to Administration > User Preferences (in Users section) > Default autowatch. Users can choose to inherit the global autowatch setting or override it via their user Profile > Preferences > Autowatch setting.

Please note, if you are upgrading from an older version of JIRA, then all users who have not explicitly set their Autowatch setting will have it set to ‘Inherit from global settings’.

Maximum project name size and maximum project key size configuration

JIRA administrators will be able to set the maximum size for both the project name and project key in this release. To do this, navigate to Administration > System > General Configuration and update Maximum project name size or Maximum project key size as desired.

The Maximum project name size or Maximum project key size are defaulted to 80 and 10 respectively. This will not affect the names or keys for your existing projects.

Reports have moved

We have moved reports from the dropdown menu on the Browse Project > Summary tab to a panel on the same tab reports more accessible and presents a cleaner user interface.
JIRA 6.0 EAP 4 (m06) Release Notes
4 February 2013

Atlassian is proud to present JIRA 6.0 EAP 4 (m6). This public development release is part of our Early Access Program leading up to the official JIRA 6.0 release. We are making these EAP milestones publicly available so that developers can start assessing the impact of the changes that we are making.

Please provide us with your general feedback here; and please provide us with your design (i.e. new look and feel) feedback here.

---

Important information for developers

We intend for this release, the EAP 4 (m6) milestone, to be the last release that includes "breaking changes": changes that are considered to be "breaking changes" are changes to the JIRA APIs that require ecosystem developers to change how they build UI, changes to HTML markup patterns.

You should start updating your plugins for JIRA 6.0 now. We are not planning on making any further breaking changes; however, we will ensure that they are highlighted in the release notes. For details on changes for 6.0, see Preparing for JIRA 6.0. Please also see our Java API policy for JIRA for technical information about Java APIs and our approach to changing them.

---

JIRA 6.0 RC 1 Upgrade Notes

Read before you install/upgrade: Atlassian does not support upgrades both 'from' and 'to' EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

Key Features

A new JIRA look and feel

The JIRA look and feel is being redesigned in JIRA 6.0 according to the new Atlassian Design Guidelines. We want to provide you with an amazing user experience that helps you get your work done as effectively as possible. These changes are being implemented during 6.0 development.

We are not there yet, so some things may not look quite right. However, you'll notice design improvements to a number of screens in JIRA, including the Project Summary page in the Administration Console and the Create/Edit issue screen.

If you are a developer, these changes will affect you; start making changes to your plugins now. The following documents are designed to help you with this transition:

- Preparing for JIRA 6.0 – detailed information on the Atlassian Design Guidelines implementation
- Building UI for a plugin shipping to multiple versions of JIRA – how to manage plugins for multiple versions
- Bonfire ADG Migration Guidelines – a case study on shipping to multiple versions of JIRA

We'd love to hear your feedback on the new JIRA look and feel. Please provide us with your feedback here.
In this release:

- A new JIRA look and feel
- Issue navigator improvements
- Workflow improvements
- Get started faster
- New plugin points for the User Profile page
- Other improvements

Issue navigator improvements

Stable search

Now, when you search, your search results remain constant until you choose to refresh them. This provides you with results that you can work from when triaging issues. And, since your search results don’t change as you are making changes to the list, you maintain the original list you started with.

*We are in the early stages of testing this feature, you can help by providing us with feedback. We’d like to know does it help when you are working with a large number of issues? How could it be better? To provide feedback, click Give Feedback at the top right of your JIRA screen.*

*A faster view issue experience*
In this release, we’ve streamlined the interaction with the View Issue screen and removed page loads to speed things up. Additional performance improvements that make navigation between issues much faster. This makes going from an issue and back again much faster. We will continue to improve performance for searching and viewing issues.

Workflow improvements

Global workflow schemes

Now you can edit an active workflow scheme on a project: a draft is created, and the migration is handled through the normal migration process. The following functionality is available:

- Add existing workflows
- Remove workflows from scheme
- Reassign issue types between workflows in the scheme
- Publish draft
- Discard draft

In addition to this, workflow schemes can be edited even if they are associated with more than one project.

Read more...

Workflow sharing

The new Workflow Sharing feature allows you to share your team’s workflow with other teams in your organisation or with external parties in other organisations via the Atlassian Marketplace. This feature allows you to easily use workflows that other people have published, or to move a workflow from staging to production in your own organisation.

Get started faster

Faster JIRA setup with the new administration gadget

We’re in the process of redesigning JIRA to help new administrators and users of JIRA get started faster. In this milestone, we’ve overhauled the administration gadget, which is displayed on the default dashboard for JIRA administrators.

The new administration gadget now displays a handy checklist of common tasks. Click on any task and you’ll be taken to the relevant administration screen to complete it. The gadget also provides other helpful information for new administrators, such as links to the JIRA administrator documentation and license details.

Read more...

New plugin points for the User Profile page

For the ecosystem developers, we have implemented new plugin points for the web panels in the User Profile page. You can override the default 'Details', 'Preferences' and 'Assigned Open Issues per Project' web panels as well as add your own custom web panels.

Key Features

New issue navigator

We made it easier to create and edit issues with inline editing in JIRA 5.1 and the create/edit issue dialog in JIRA making it easier for you to find issues with a brand new issue navigator. Here's a summary of the features we've added:

- **New default filters** — Easily filter for the most common views in JIRA: 'My issues', 'Reported by Me', 'Recently Viewed' and 'All Issues'.
- **Favourite filters on the navigator** — Quickly switch between views. Your favourite filters are now just a click away.
- **New search bar** — Simply select the criteria you want in your search. Focus on the search criteria you care about and hide the rest.
- **Ad-hoc searches** — Search and refine on the fly with immediate results.
- **Complex searches** — Create and execute complex searches with ease. The new search UI makes this si
number of projects, custom fields, or your JIRA configuration.

We'll be adding more features and improvements with each new EAP milestone.

The new issue navigator is a Labs feature in this EAP milestone. We would love to hear your feedback on this early preview. You can provide feedback via the Give Feedback link on the new issue navigator in your JIRA instance. Being a technology preview, the issue navigator is incomplete and will have bugs. For a list of known issues, please see this page: New Issue Search Known Issues.

For more information about Labs features and instructions on how to enable Labs features, see: Enabling Labs Features in JIRA 5.2. The property for this feature is jira.search.kickass.

In this release:

- New issue navigator
- Workflow administration improvements — Workflow scheme viewer
- Getting started
- Copying and editing issue collectors
- Other improvements

Workflow administration improvements — Workflow scheme viewer

Following on from the improvements to workflow administration in JIRA 5.1, we’re continuing to make editing your project. You’ll still have the power and flexibility of JIRA fingertips, but configuration will be much more intuitive.

This release provides you with the perfect complement to the workflow scheme viewer. The workflow replaces the existing workflow scheme page for a project. It representation of the scheme by showing the diagrams for as well as the associated issue types. Each workflow can be schemes page. You can still see the old text-based view if you prefer.

Getting started

For new installations, JIRA now gives you the option of creating a demonstration project. This demonstration project contains a number of sample issues that explains some JIRA basics: searching shortcuts, and editing issues. You can keep this project for future new users, or delete it at a later stage if you no
Copying and editing issue collectors

In JIRA 5.1, we introduced the JIRA issue collector — letting you embed JIRA feedback forms in your websites that create issues in your JIRA instance. In this release, we've added the ability to edit and copy issue collectors. Tweak an existing issue collector or use it as the basis for an entirely new one.

Other improvements

HTTP Requests Log Analyser

We recently developed a tool to analyse request logs that we are now making available to customers. The HTTP requests log analyser provides you with information, such as the maximum requests per minute, that can help you performance tune your JIRA instance.

Read more...

Create issue prompt on Project Issues page

If you've just created a JIRA project without any issues, JIRA will now display a handy message prompting users to create issues.

Faster and more reliable mentions

We added mentions in JIRA 5.0, which gave JIRA users an easy way to share an issue with other users via email. This release includes a significant performance improvement to this feature. You'll notice that user names are suggested much more quickly, when you start typing after an '@' character. The suggested results are also more accurate and reliable.

SSL configuration via the JIRA configuration tool

If you want to run JIRA over SSL or HTTPS, you'll be happy to know that we've simplified this process. You won't XML files anymore, as the JIRA configuration tool has a new screen that lets you easily configure access via HTT tool also validates your configuration, so you won't need to worry if you've mistakenly entered an invalid certificat
Atlassian is proud to present JIRA 5.2 EAP 2 (m4). This public development release is part of our Early Access Program (EAP) leading up to the official JIRA 5.2 release. Development work on JIRA 5.2 commenced relatively recently and we want your involvement from the start!

Please provide us with your feedback here.

Highlights

JIRA EAP 5.2m4 Upgrade Guide

- New issue navigator
- Workflow administration improvements
- Getting started
- Webhooks for issues
- Enterprise scale and performance improvements
- Other improvements
- Additional tools for download
Workflow administration improvements

Following on from the improvements to workflow administration in JIRA 4.4 and project administration in JIRA 5.1 make editing workflows easier within your project. You’ll still have the power and flexibility of JIRA workflows at your fingertips, but configuration will be much more intuitive.

Workflow scheme viewer

This release provides you with the perfect complement to the workflow scheme viewer. The workflow replaces the existing workflow scheme page for a project. It represents the scheme by showing the diagrams for each workflow as well as the associated issue types. Each workflow can be edited from the workflows page. You can still see the old text-based view if you prefer.

Read more...

Getting started

For new installations, JIRA now gives you the option of creating a demonstration project. This demonstration project contains a number of sample issues that explain some JIRA basics: searching for issues, keyboard shortcuts and keeping the project for future new users, or delete it at a later stage if you no longer need it.

When you create a project (a demonstration project or other), display a handy message prompting users to create issues.

Webhooks for issues

Webhooks provide you with a lightweight mechanism for letting remote applications receive push notifications from JIRA so they can be retested. In this release, we’ve implemented webhooks for issues. Registering a webhook is as simple as entering the name of the remote application and the URL where the callback should be sent. Any time an issue changes in JIRA, a JSON notification will be sent to it.

We’ve released webhooks for issues as a Labs feature, so you can start to experiment with it. We’ll be moving it out of Labs in the near future.
Enterprise scale and performance improvements

In JIRA 5.1 we started a dedicated team focused on improving JIRA's core performance to make all aspects of JIRA faster and more scalable than ever. This work has continued in this release. You'll also notice a few additional features in JIRA 5.2, easing the setup if you are running JIRA in an enterprise environment.

Performance improvements

This release includes a multitude of performance improvements. You may not notice every tweak we've made, but it all adds up to a better user experience. Here are some of the areas that we've tackled:

- **Speed** — faster rendering for attachments, increased performance for nested filters, faster display of version lists (except Internet Explorer), faster rendering of wiki markup.
- **Indexing** — more low level Lucene options exposed.
- **Memory usage** — a reduction in velocity files and more efficient searching.

We've also released an HTTP requests log analyser, which you can download separately. See the Additional tool below.

SSL configuration via the JIRA configuration tool

If you want to run JIRA over SSL or HTTPS, you'll be happy to know that we've simplified this process. You won't need to tinker around in XML files anymore, as the JIRA configuration tool has a new screen that lets you easily configure access via HTTPS. The configuration tool also validates your configuration, so you won't need to worry if you've mistakenly entered an invalid certificate.

Other improvements

Streamlined user interfaces for projects

You'll notice more improvements to the user interface for projects in this release, including:

<table>
<thead>
<tr>
<th>UI Feature</th>
<th>Where did it use to be?</th>
<th>Screenshot</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Create New Project button on the</td>

Copying and editing issue collectors

In JIRA 5.1, we introduced the JIRA issue collector — letting you embed JIRA feedback forms in your websites that create issues in your JIRA instance. In this release, we’ve added the ability to edit and copy issue collectors. Tweak an existing issue collector or use it as the basis for an entirely new one.

Read more...

Faster and more reliable mentions

We added mentions in JIRA 5.0, which gave JIRA users an easy way to share an issue with other users via email. This release includes a significant performance improvement to this feature. You'll notice that user names are suggested much more quickly, when you start typing after an '@' character. The suggested results are also more accurate and reliable.

Platform changes

We have made a number of platform changes in this release, including upgrading JIRA to run on Tomcat 7. These changes affect the installation and upgrade process for JIRA.

Please read the upgrade guide for details.
Additional tools for download

HTTP Requests Log Analyser

We recently developed a tool to analyse request logs that we are now making available to customers. The HTTP requests log analyser provides you with information, such as the maximum requests per minute, that can help you performance tune your JIRA instance. The tool is not bundled with JIRA, but you can download it for free.

JIRA 5.2 EAP 3 (m5) Release Notes
19 September 2012

Atlassian is proud to present JIRA 5.2 EAP 3 (m5). This public development release is part of our Early Access Program (EAP) to the official JIRA 5.2 release. Development work on JIRA 5.2 is underway and we want your involvement!

Please provide us with your feedback here.

Highlights

JIRA EAP 3 5.2m5 Upgrade Guide
Getting started

Start with a demo project
Get started with a pre-populated project to get an idea of what you can do in JIRA.

Webhooks

Webhooks in Labs

Webhooks

New Webhook
http://postcatcher.in/postcatcher/50484acdb79372dc9

⚠️ Read before you install/upgrade: Atlassian does not support upgrades both 'from' and 'to' EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

Key Features

1

New issue navigator

We made it easier to create and edit issues with inline editing in JIRA 5.1 and the create/edit issue dialog in JIRA making it easier for you to find issues with a brand new issue navigator. Here's a summary of the features we've added:

- **New default filters** — Easily filter for the most common views in JIRA: 'My Open Issues', 'Reported by Me', 'Recently Viewed' and 'All Issues'.
- **Favourite filters on the navigator** — Quickly switch between views. Your favourite filters are now just a click away.
- **New search bar** — Simply select the criteria you want in your search. Focus on the search criteria you care about and hide the rest.
- **Ad-hoc searches** — Search and refine on the fly with immediate results.
- **Complex searches** — Create and execute complex searches with ease. The new search UI makes this simple, regardless of the number of projects, custom fields, or your JIRA configuration.

We'll be adding more features and improvements with each new EAP milestone.

The new issue navigator is a Labs feature in this EAP milestone. We would love to hear your feedback on this early preview. You can provide feedback via the link on the new issue navigator in your JIRA instance. Being a technology preview, the issue navigator is incomplete and will have bugs. For a list of known issues, please see this page: New Issue Search Known Issues

This Labs feature needs to be manually enabled. For instructions, see Enabling Labs Features in JIRA 5.2. For more information about Labs features, see Labs Features in JIRA.

In this release:

- New issue navigator
- Workflow administration
Workflow administration improvements

Following on from the improvements to workflow administration in JIRA 4.4 and project administration in JIRA 5.1 make editing workflows easier within your project. You’ll still have the power and flexibility of JIRA workflows at your fingertips, but configuration will be much more intuitive.

Workflow scheme designer

This release provides you with the perfect complement to the workflow scheme designer. The workflow scheme designer replaces the existing workflow scheme page for a project (not the global list of workflow schemes). It provides you with a powerful tool for viewing and configuring a workflow scheme.

The workflow scheme designer shows a visual representation of each workflow in the scheme, displayed in a table, with the associated issue types alongside. The old text-based view of each workflow is still available as well, if you prefer.

Configuring a workflow scheme is also much easier. Want to preview changes as a draft before publishing? Want to browse through diagrams of workflows in the system when adding a workflow? Want to assign multiple issue types to a workflow in a single step? You can now do all of these tasks and more.

Read more...

Screen design made easy

The screen designer has been overhauled in this release. It's still customisable as ever, however the user interface is faster and simpler to use. You won’t have to wrestle with controls when reordering—just drag and drop to move a field or tab. Autocomplete is now used making this process quicker and easier as well.

Read more...

Getting started

For new installations, JIRA now gives you the option of creating a demonstration project. This demonstration project contains a number of sample issues that explains some JIRA basics: searching for issues, keyboard shortcuts, and editing issues. You can keep this project for future new users, or delete it at a later stage if you no longer need it.

When you create a project (a demonstration project or other project), JIRA will also display a handy message pro issues.
Webhooks for issues

Webhooks provide you with a lightweight mechanism for letting remote applications receive push notifications from JIRA. For any changes for bugs in JIRA to be pushed to a test management they can be retested.

Registering a webhook is as simple as entering the name of where the callback should be sent. Any time any issue changes in JIRA, a JSON notification will be sent to the URL. No polling required. If you constrain a webhook to fire for a set of issues (using JQL) or events, like when an issue is commented.

Webhooks for issues is a Labs feature, so you can start to experiment with it. We’ll be moving it out of Labs in the information about Labs features, see Labs Features in JIRA.

Please note, the webhooks plugin is not bundled with JIRA in this release. You will need to download and install JIRA 5.2 Upgrade Notes for details.

Read more...

Enterprise scale and performance improvements

In JIRA 5.1 we created a dedicated team focused on improving JIRA's core performance to make all aspects of JIRA and easier to manage. In 5.2, we’ve continued on to deliver more scale and management improvements for customers running JIRA in an enterprise environment.

Performance improvements

This release includes a multitude of performance improvements. You may not notice every tweak we've made, but they’re in user experience. Here are some of the areas that we’ve tackled:

- Speed — faster rendering for attachments, increased performance for nested filters, faster display of versions except Internet Explorer), faster rendering of wiki markup.
- Indexing — more low level lucene options exposed.
- Memory usage — a reduction in velocity files and more efficient searching.

We’ve also released an HTTP requests log analyser, which you can download separately. See the Additional tools for download section below.

SSL configuration via the JIRA configuration tool

If you want to run JIRA over SSL or HTTPS, you’ll be happy to know that we’ve simplified this process. You won’t need to tinker around in XML files anymore, as the JIRA configuration tool has a new screen that lets you easily configure access via HTTPS. The configuration tool also validates your configuration, so you won’t need to worry if you’ve mistakenly entered an invalid certificate.

### Getting started

For new installations, JIRA now gives you the option of creating a demonstration project. This demonstration project contains a number of sample issues that explains some JIRA basics: searching for issues, keyboard shortcuts, and editing issues. You can keep this project for future new users, or delete it at a later stage if you no longer need it.

When you create a project (a demonstration project or other project), JIRA will also display a handy message prompting users to create issues.

### Webhooks for issues

Webhooks provide you with a lightweight mechanism for letting remote applications receive push notifications from JIRA. For example, you may want any changes for bugs in JIRA to be pushed to a test management system, so that they can be retested.

Registering a webhook is as simple as entering the name of where the callback should be sent. Any time any issue changes in JIRA, a JSON notification will be sent to the URL. No polling required.

You can also refine a webhook to suit your needs — constrain a webhook to fire for a set of issues and/or specific issue events; use a variable to include the key of the issue that fired it; or configure a workflow post-function to fire.

Webhooks for issues is a Labs feature, so you can start to experiment with it. We’ll be moving it out of Labs in the near future.

For more information about Labs features, see [Labs Features in JIRA](#).

Other improvements

Streamlined user interfaces for projects

We've been working hard to improve the user interface when you are browsing a project, so that you can concentrate without any distractions. The list of improvements are in the table below:

<table>
<thead>
<tr>
<th>UI Feature</th>
<th>Notes</th>
<th>Screenshot of new</th>
</tr>
</thead>
<tbody>
<tr>
<td>New <strong>Create New Project</strong> button on the Browse Projects &gt; All Projects page</td>
<td>N/A</td>
<td><img src="screenshot.png" alt="New Create New Project button" /></td>
</tr>
</tbody>
</table>
Browse Project > Summary tab redesigned:

- **Administer Project** button now available on the Browse Project page itself
- **Activity Stream** only shows activity on JIRA issues and JIRA plugins
- **Issues: Updated recently** section removed
- **Issue: Unresolved** section removed
- **Versions: Unreleased** section moved to different position on tab
  - Show/Hide toggle for additional versions removed
  - "Eyeball" toggle replaced with smart switcher at bottom of list

<table>
<thead>
<tr>
<th>Standard issue filters</th>
<th>Used to be in Filters dropdown on Browse Project &gt; Summary tab (now removed)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard issue filters</td>
<td>Used to be in Filters dropdown on Browse Version &gt; Summary tab (now removed)</td>
</tr>
<tr>
<td>Standard issue filters</td>
<td>Used to be in Filters dropdown on Browse Component &gt; Summary tab (now removed)</td>
</tr>
<tr>
<td>People section in Project Summary and page renamed to <strong>Roles</strong></td>
<td>N/A</td>
</tr>
<tr>
<td>Project &gt; Popular Issues page redesigned</td>
<td>N/A</td>
</tr>
<tr>
<td>Project &gt; Labels page redesigned</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Copying and editing issue collectors**

In JIRA 5.1, we introduced the JIRA issue collector — letting you embed JIRA feedback forms in your websites that create issues in your JIRA instance. In this release, we've added the ability to edit and copy issue collectors. Tweak an existing issue collector or use it as the basis for an entirely new one.

Read more...

**Faster and more reliable mentions**

We added mentions in JIRA 5.0, which gave JIRA users an easy way to share an issue with other users via email.

Significant performance improvement to this feature. You'll notice that user names are suggested much more quickly after an '@' character. The suggested results are also more accurate and reliable.
Platform changes

We have made a number of platform changes in this release, including upgrading JIRA to run on Tomcat 7 and support for Java 7. Some of these changes affect the installation and upgrade process for JIRA.

Please read the upgrade guide for details.

Additional tools for download

HTTP Requests Log Analyser

We recently developed a tool to analyse request logs that we are now making available to customers. The HTTP requests log analyser provides you with information, such as the maximum requests per minute, that can help you performance tune your JIRA instance. The tool is not bundled with JIRA, but you can download it for free.

JIRA 5.2 RC 1 (m8) Release Notes

Atlassian is proud to present JIRA 5.2 RC 1 (m8). This public release candidate is part of our Early Access Program leading up to the official JIRA 5.2 release. We have finished adding features for JIRA 5.2, however we still want your feedback touches.

Please provide us with your feedback here.

The completely redesigned JIRA search lets you quickly find and organize your issues, so you – and your team – matters most. Getting the job done! JIRA 5.2 also includes workflow editing improvements, new webhooks integration improvements and much more.

Highlights

5 November 2012

JIRA RC 1 5.2m8 Upgrade Guide
Read before you install/upgrade: Atlassian does not support upgrades both 'from' and 'to' EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

Key Features

New issue navigator

We made it easier to create and edit issues with inline editing in JIRA 5.1 and the create/edit issue dialog in JIRA making it easier for you to find issues with a brand new issue navigator. With easily accessible filters, each team access team priorities, view and remove blockers, and track progress toward a common goal.

Here's a summary of the features we've added so far:
• **New system filters** — Easily filter for the most common views in JIRA: ‘My Open Issues’, ‘Reported by Me’, ‘All Issues’.

• **Favourite filters on the navigator** — Quickly switch between views. Your favourite filters are now just a click away.

• **Intuitive filter management** — See who owns a filter at a glance and whether changes have been made.

• **New search bar** — Simply select the criteria you want in your search. Focus on the search criteria you care about and hide the rest.

• **Ad-hoc searches** — Search and refine on the fly with immediate results. Refresh your results without reloading your page.

• **Complex searches** — Create and execute complex searches with ease. The new search UI makes this simple, regardless of the number of projects, custom fields, or your JIRA configuration.

We’ll be adding more improvements with each new EAP milestone. However, being a technology preview, the issue navigator is incomplete and will have bugs. For a list of known issues, please see this page: New Issue Search Known Issues.

The new issue navigator is the **default issue navigator** in this EAP milestone. You will not be able to revert back to the old issue navigator. We would love to hear your feedback on this preview. You can provide feedback via the **Give Feedback** link on the new issue navigator in your JIRA instance.

**In this release:**

- **Highlights**
- **New issue navigator**
- **Workflow administration improvements**
- **Getting started**
- **Webhooks for issues**
- **Enterprise scale and performance improvements**
- **Other improvements**
- **Additional tools for download**

---

**Workflow administration improvements**

Following on from the improvements to workflow administration in JIRA 4.4 and project administration in JIRA 5.1 make editing workflows easier within your project. You’ll still have the power and flexibility of JIRA workflows at your fingertips, but configuration will be much more intuitive.

**Workflow scheme designer**

This release provides you with the perfect complement to the existing workflow ‘**Diagram mode**’ — the workflow scheme designer. The workflow scheme designer replaces the existing workflow (note, it is not available from the global list of workflow schemes). It provides you with a powerful tool for viewing and editing a workflow scheme.

The workflow scheme designer shows a visual representation of a workflow scheme. A diagram of each workflow displayed in a table, with the associated issue types alongside. The old text-based view of each workflow is still available.
Configuring a workflow scheme is also much easier. Want to preview changes as a draft before publishing? Want to browse through diagrams of the workflows in the system when adding a workflow? Want to assign multiple issue types to a workflow in a single step? You can and more.

**Screen design made easy**

The screen designer has been overhauled in this release. Screens are just as customisable as ever, however the user interface is faster and much simpler to use. You won't have to wrestle with controls when reordering — just drag and drop to move a field or tab. Autocomplete is now used when adding fields, making this process quicker and easier as well.

**Getting started**

For new installations, JIRA now gives you the option of creating a demonstration project. This demonstration project contains a number of sample issues that explains some JIRA basics: searching for issues, keyboard shortcuts, and editing issues. You can keep this project for future new users, or delete it at a later stage if you no longer need it.

JIRA now has inline help tips to guide new users in getting the most out of JIRA, the most prominent being a handy message instructing users to create issues. Others include admin only tips for creating users and editing workflows.

**Webhooks for issues**

Webhooks provide you with a lightweight mechanism for letting remote applications receive push notifications from JIRA. For example, you may want any changes for bugs in JIRA to be pushed to a test management system, so that they can be retested.

Registering a webhook is as simple as entering the name of where the callback should be sent. Any time any issue changes in JIRA, a JSON notification will be sent to the URL. No polling required.

You can also refine a webhook to suit your needs — constrain set of issues and/or specific issue events; use a variable to include the issue that fired it; or configure a workflow post-function to fire...
Enterprise scale and performance improvements

In JIRA 5.1 we created a dedicated team focused on improving JIRA's core performance to make all aspects of J and easier to manage. In 5.2, we've continued on to deliver more scale and management improvements for custc enterprise environment.

Performance improvements

This release includes a multitude of performance improvements. You may not notice every tweak we've made, bu user experience. Here are some of the areas that we've tackled:

- Speed — faster rendering for attachments, increased performance for nested filters, faster display of versi except Internet Explorer), faster rendering of wiki markup.
- Indexing — more low level lucene options exposed.
- Memory usage — a reduction in velocity files and more efficient searching

We've also released an HTTP requests log analyser, which you can download separately. See the Additional tool below.

SSL configuration via the JIRA configuration tool

If you want to run JIRA over SSL or HTTPS, you'll be happy to know that we've simplified this process. You won't need to tinker around in XML files anymore, as the JIRA configuration tool has a new screen that lets you easily configure access via HTTPS. The configuration tool also validates your configuration, so you won't need to worry if you've mistakenly entered an invalid certificate.

**Faster and more reliable mentions**

We added mentions in JIRA 5.0, which gave JIRA users an easy way to share an issue with other users via email. A significant performance improvement to this feature. You'll notice that user names are suggested much more quickly after an '@' character. The suggested results are also more accurate and reliable.
Platform changes

We have made a number of platform changes in this release, including upgrading JIRA to run on Tomcat 7 and support for Java 7. Some of these changes affect the installation and upgrade process for JIRA.

Please read the upgrade guide for details.

Additional tools for download

HTTP Requests Log Analyser

We recently developed a tool to analyse request logs that we are now making available to customers. The HTTP requests log analyser provides you with information, such as the maximum requests per minute, that can help you performance tune your JIRA instance. The tool is not bundled with JIRA, but you can download it for free.

JIRA 5.2 RC4 (m11) Release Notes

Atlassian is proud to present JIRA 5.2 RC 4 (m11). This public release candidate is part of our Early Access Program leading up to the official JIRA 5.2 release. We have finished adding features for JIRA 5.2, however we still want your feedback as we make the final touches.

Please provide us with your feedback here.

The completely redesigned JIRA search lets you quickly find and organize your issues, so you – and your team – matters most. Getting the job done!  JIRA 5.2 also includes workflow editing improvements, new webhooks integration improvements and much more.

---

⚠️ **Read before you install/upgrade**: Atlassian does not support upgrades both 'from' and 'to' EAP releases. EAP releases should not be used in production environments as they are not officially supported. For all production use and testing of JIRA, please use the latest official release instead.

**Key Features**

1. **New issue navigator**

We made it easier to create and edit issues with inline editing in JIRA 5.1 and the create/edit issue dialog in JIRA making it easier for you to find issues with a brand new issue navigator. With easily accessible filters, each team access team priorities, view and remove blockers, and track progress toward a common goal.

Here's a summary of the features we've added so far:
New system filters — Easily filter for the most common views in JIRA: ‘My Open Issues’, ‘Reported by Me’ and ‘All Issues’.

Favourite filters on the navigator — Quickly switch between views. Your favourite filters are now just a click away.

Intuitive filter management — See who owns a filter at a glance and whether changes have been made.

New search bar — Simply select the criteria you want in your search. Focus on the search criteria you care about and hide the rest.

Ad-hoc searches — Search and refine on the fly with immediate results. Refresh your results without reloading your page.

Complex searches — Create and execute complex searches with ease. The new search UI makes this simple, regardless of the number of projects, custom fields, or your JIRA configuration.

We’ll be adding more improvements with each new EAP milestone. However, being a technology preview, the issue navigator is incomplete and will have bugs. For a list of known issues, please see this page: [New Issue Search Known Issues](#).

The new issue navigator is the default issue navigator in this EAP milestone. You will not be able to revert back to the old issue navigator. We would love to hear your feedback on this preview. You can provide feedback via the Give Feedback link on the new issue navigator in your JIRA instance.

In this release:

- Highlights
- New issue navigator
- Workflow administration improvements
- Getting started
- Webhooks for issues
- Enterprise scale and performance improvements
- Other improvements
- Additional tools for download

Workflow administration improvements

Following on from the improvements to workflow administration in JIRA 4.4 and project administration in JIRA 5.1 make editing workflows easier within your project. You’ll still have the power and flexibility of JIRA workflows at your fingertips, but the configuration will be much more intuitive.

Workflow scheme designer

This release provides you with the perfect complement to the existing workflow ‘Diagrams’ — the workflow scheme designer. The workflow scheme designer replaces the existing workflow designer (note, it is not available from the global list of workflow schemes). It provides you with a powerful tool for viewing a workflow scheme.

The workflow scheme designer shows a visual representation of a workflow scheme. A diagram of each workflow is displayed in a table, with the associated issue types alongside. The old text-based view of each workflow is still a preference.
Configuring a workflow scheme is also much easier. Want to preview changes as a draft before publishing? Want to browse through diagrams of the workflows in the system when adding a workflow? Want to assign multiple issue types to a workflow in a single step? You can and more.

Read more...

Screen design made easy

Screen design has been overhauled in this release. Screens are just as customisable as ever, however the user interface is faster and much simpler to use. You won’t have to wrestle with controls when reordering — just drag and drop to move a field or tab. Autocomplete is now used when adding fields, making this process quicker and easier as well.

3

Getting started

For new installations, JIRA now gives you the option of creating a demonstration project. This demonstration project contains a number of sample issues that explains some JIRA basics: searching for issues, keyboard shortcuts, and editing issues. You can keep this project for future new users, or delete it at a later stage if you no longer need it.

JIRA now has inline help tips to guide new users in getting the most out of JIRA, the most prominent being a handy message instructing users to create issues. Others include admin only tips for creating users and editing workflows.

4

Webhooks for issues

Webhooks provide you with a lightweight mechanism for letting remote applications receive push notifications from JIRA. You may want any changes for bugs in JIRA to be pushed to a test management system, so that they can be retested.

Registering a webhook is as simple as entering the name of where the callback should be sent. Any time any issue changes in JIRA, a JSON notification will be sent to the URL. No polling required.

You can also refine a webhook to suit your needs — constrain set of issues and/or specific issue events; use a variable to include the key of the issue that fired it; or configure a workflow post-function to fire.

Read more...
Enterprise scale and performance improvements

In JIRA 5.1 we created a dedicated team focused on improving JIRA's core performance to make all aspects of J and easier to manage. In 5.2, we've continued on to deliver more scale and management improvements for custc enterprise environment.

Performance improvements

This release includes a multitude of performance improvements. You may not notice every tweak we’ve made, but user experience. Here are some of the areas that we've tackled:

- Speed — faster rendering for attachments, increased performance for nested filters, faster display of versi except Internet Explorer), faster rendering of wiki markup.
- Indexing — more low level lucene options exposed.
- Memory usage — a reduction in velocity files and more efficient searching

We've also released an HTTP requests log analyser, which you can download separately. See the Additional tool below.

SSL configuration via the JIRA configuration tool

If you want to run JIRA over SSL or HTTPS, you'll be happy to know that we've simplified this process. You won't need to tinker around in XML files anymore, as the JIRA configuration tool has a new screen that lets you easily configure access via HTTPS. The configuration tool also validates your configuration, so you won't need to worry if you've mistakenly entered an invalid certificate.

</tbody>
</table>

**JIRA admin helper**

We've bundled the popular JIRA admin helper plugin in this release. This tool helps JIRA administrators to diagnose and fix any of the following problems:

- A custom field not showing on the View Issue, Edit Issue or Create Issue screens.
- A user being able to see an issue when they are not supposed to, or being unable to see an issue when they are supposed to.
- A user receiving a notification when they shouldn't have, or not receiving a notification when they should have.

Simply navigate to the issue and select the **Where is my field?**, **Permission Helper** or **Notification Helper** option from the **More Actions** menu. You can also access this via administration console (**JIRA** tab > **Admin Helper**).

**Copying and editing issue collectors**

In JIRA 5.1, we introduced the JIRA **issue collector** — letting you embed JIRA feedback forms in your websites that create issues in your JIRA instance. In this release, we've added the ability to copy and edit these collectors. Tweak an existing issue collector or use it as the basis for an entirely new one.
Faster and more reliable mentions

We added mentions in JIRA 5.0, which gave JIRA users an easy way to share an issue with other users via email. This release includes a significant performance improvement to this feature. You'll notice that user names are suggested much more quickly, when you start typing after an '@' character. The suggested results are also more accurate and reli

Platform changes

We have made a number of platform changes in this release, including upgrading JIRA to run on Tomcat 7 and support for Java 7. Some of these changes affect the installation and upgrade process for JIRA. Please read the upgrade guide for details.

Additional tools for download

HTTP Requests Log Analyser

We recently developed a tool to analyse request logs that we are now making available to customers. The HTTP requests log analyser provides you with information, such as the maximum requests per minute, that can help you performance tune your JIRA instance. The tool is not bundled with JIRA, but you can download it for free.

Enabling Labs Features in JIRA 5.2

A Labs feature is a feature that is currently in development, but previewed in the product. For more information about JIRA Labs, see Labs Features in JIRA.

In JIRA 5.2, some Labs features need to be enabled by configuring a "dark feature" property. This can only be done by JIRA administrators or JIRA system administrators.

Enabling a Labs feature in JIRA 5.2

1. Log in as a user with the JIRA Administrators or JIRA System Administrators global permission.
2. Go to the URL in your browser and enter the following address:
   <hostname>/secure/admin/SiteDarkFeatures!Default.jspa
   e.g. http://jira.examplecompany.com/secure/admin/SiteDarkFeatures!Default.jspa
3. Enter your password when prompted.
4. In the **Enable dark feature** field, enter the property of the dark feature that you want to enable. This will
   look something like this, jira.search.kickass
5. Click **Submit**.

### New Issue Search Known Issues

This page provides details of known issues in the new JIRA issue search (under development in 2012). Currently the new issue search is only available to selected OnDemand customers on an opt-in basis.

The known issues listed below will be updated continuously, as we progress with development of the new issue search.

#### Known Issues

<table>
<thead>
<tr>
<th>Cause</th>
<th>Symptoms</th>
<th>Workaround</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Some fields may be broken</td>
<td>Some fields in the search area may be ugly or even broken. There are a lot of fields and we are working through them.</td>
<td>Switch to advanced search or the old search screen.</td>
<td></td>

JIRA 5.1 RC 3 Release Notes

26 June 2012
The Atlassian team is proud to bring you the release of **JIRA 5.1 Release Candidate (RC) 3**.

**JIRA 5.1 RC 3** is a public development release leading up to **JIRA 5.1**. An RC release is part of our Early Access Program (EAP) and represents a preliminary release of JIRA leading up to the official release of the next major JIRA version. EAP releases are primarily focused on allowing JIRA enthusiasts to:

- see new features in advance of an upcoming major release and
- provide us with some useful feedback.

Thank you for your feedback during earlier JIRA 5.1 EAP releases and please keep providing your feedback [here](#).

EAP releases also give plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

Be aware that a few of the features in this JIRA 5.1 EAP release (described below) were also included in previous JIRA 5.0.x releases.

**Upgrading to JIRA 5.1 RC 3:**

- JIRA EAP releases are available [here](#). Although Atlassian does not support upgrades both ‘from’ and ‘to’ EAP releases, if you would like to upgrade to this EAP release, please follow the [JIRA 5.1 Upgrade Notes](#).

**Overview**

JIRA 5.1 continues along where JIRA 5.0 left off, making creating, editing and working with issues faster and easier. JIRA 5.1 gives users the ability to edit an issue’s fields directly ‘inline’ for a faster editing experience and makes all operations on the ‘view issue’ page faster by eliminating the need for the page to reload when the operation is submitted. The JIRA issue collector introduces a whole new way to create issues based on feedback from your colleagues or customers who don’t use JIRA.

Not only is JIRA 5.1 more efficient for working with issues, but improvements to the core performance of JIRA 5.1 makes all of JIRA, especially creating, editing, searching for and viewing issues, faster and more scalable than ever.

**Highlights:**

<table>
<thead>
<tr>
<th>Inline editing and fewer page reloads</th>
<th>Enterprise scale and performance improvements</th>
<th>Issue collector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modify an issue’s fields directly when viewing the issue</td>
<td>Search for, view, and create issues faster than ever</td>
<td>Create a feedback form on any web site that submits feedback in the form of JIRA issues</td>
</tr>
<tr>
<td>Operations on the ‘view issue’ page no longer require a page reload</td>
<td>Monitor JIRA’s database connection graphically</td>
<td>Use canned “Feedback” or “Bug report” forms or create your own form</td>
</tr>
<tr>
<td>Full keyboard shortcut support for editing fields</td>
<td>Tune JIRA’s connection to a JIRA database more conveniently</td>
<td>Requires adding only one line of JavaScript or HTML code to any web page</td>
</tr>
</tbody>
</table>
And more:

- Project administration improvements
- Deactivate users
- Autowatch
- Remote and local JIRA issue link improvements
- Get started faster
- Other improvements

Thank you for your interest in JIRA 5.1 RC 3
Download RC 3

⚠️ Do not use in production
- **EAP releases are not safe** — EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because EAP releases represent work in progress, we **can not** provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

Key features

1. **Inline editing and fewer page reloads**

JIRA 5.1 makes working with issues faster with inline editing and fewer page reloads.

**Inline editing**

You can now directly modify an issue's fields when viewing an issue, without the page needing to reload (top-left screenshot).

When viewing an issue, simply click on a field's content to begin editing it. Once you've finished editing, simply click on the lower-right tick icon (or in a blank area away from the field you're editing) to save your changes — no page reload required.
For keyboard fans, inline editing provides its own keyboard shortcuts, which means you can avoid having to use a mouse when editing issues. When viewing an issue:

1. Simply type a comma ‘,’ and then start typing the name of the field you want to edit (using the cursor keys to select the specific field if necessary as shown in the middle-left screenshot)
2. Press ‘Enter’ to begin editing the field and type away to edit the field’s content
3. Press ‘Enter’ again to save your modifications!

Inline editing is enabled by default on new and upgraded JIRA installations. JIRA administrators can disable this feature by switching the Inline edit option to OFF through the General Configuration page.

Quick tips:

- When editing a field, click the lower-right X icon (or press the ‘Esc’ key) to cancel any changes.
- If a field's content is hyperlinked, like the Component/s field shown in the top-left screenshot, click to the right of any existing field content to edit the field.

Lesser page reloads

After performing an operation on an issue, such as adding a comment to an issue or performing a workflow transition (like the customised transition shown in the lower-left screenshot), JIRA updates the issue immediately without the page needing to reload.

Enterprise scale and performance improvements

The following performance improvements are available:

- Customers with larger JIRA installations will see some performance improvements when using JIRA's Issue Navigator and project browser pages.
- Searches that retrieve many thousands of issues are performed more rapidly.
- Users should also see significant performance improvements when mentioning other JIRA users in an issue’s Description or Comment field.

Advanced database connection tuning
The JIRA Configuration Tool now includes an Advanced database connection tuning page which allows you to fine tune your database connection pool and validation query settings. This may be required with some default database configurations to maintain a successful connection between your JIRA server and JIRA database.

![Database Connection Tuning Page](image)

### New database monitoring page for JIRA system administrators

To help diagnose performance problems in JIRA associated with database connectivity, JIRA system administrators now have access to the new Database Monitoring page, which shows a graphical representation of JIRA's database connection usage over time.

JIRA system administrators can access this page by selecting Administration > System > Monitoring which opens the Database Monitoring page.

> Keyboard Shortcut: $g + g +$ start typing monitoring

### Issue collector

![Issue Collector](image)

The issue collector allows you to easily embed a JIRA feedback form into a different web site which, when used by people visiting that site, creates an issue in JIRA.

JIRA project administrators can begin this process by simply visiting their JIRA project's Project Summary administration page (via Administration > Projects) and clicking the Issue Collectors tab on the left.

After configuring an issue collector, JIRA generates a JavaScript or HTML snippet for it, which creates a tab on any pages of your web site that includes this snippet.

When anyone visiting your web site clicks this tab, a JIRA feedback dialog box appears (similar to the example screenshot on the left) which upon submission, conveniently creates an issue in your JIRA.
Project administration improvements

Easier workflow editing

JIRA now makes editing a project's workflow much easier. When you begin editing a project's workflow for the first time, you'll be able to modify that workflow almost immediately, since JIRA automatically makes a copy of the system workflow (jira) and associated workflow scheme for your project, and then associates this new workflow scheme with your project, all from the click of an icon.

To begin editing a project's workflow for the first time, simply click the pencil icon either in the Workflows section of the project's Summary page (shown in the top-left screenshot) or on the the project's Workflow page (accessed via the Workflow tab). JIRA will prompt you for confirmation before continuing.

- The copied system workflow (named 'Your Project Name Workflow') is automatically associated with all of your project's available issue types in your project's new workflow scheme (named 'Your Project Name Workflow Scheme').
- If existing issues are present in your project before you decide to start customising the project's workflow, JIRA automatically migrates these issues across to use the newly copied 'Your Project Name Workflow'.
- Once this process is complete, JIRA takes you directly to a draft of your project's new workflow (shown in the lower-left screenshot) - ready for immediate editing!
In JIRA 5.1, we've also streamlined the **Workflow Designer** and **View Workflow Steps** pages, both of which can be accessed from conveniently adjacent **Diagram** and **Text** buttons, respectively (see the lower-left screenshot). We've also rationalised the main **Workflows** page, so that **Active** and **Inactive** workflows are presented in separate lists and drafts are simply indicated against an **Active** workflow with an 'information' icon.

**More administration improvements**

Following on with improvements to the administration user interface in earlier JIRA releases:

- The forms for adding new **issue types**, **sub-tasks**, **field configurations** (+ **field configuration schemes**) and **screens** (+ **screen schemes**) are now dialog boxes, which are easily accessed by clicking a button at the top-right of the appropriate JIRA Administration pages.
- The original 'sub-tab' for adding **issue type schemes** has been converted to a full tab on the left of the JIRA UI and the form for adding an issue type scheme is now a dialog box, which is easily accessed by clicking the **Add Issue Type Scheme** button at the top-right of the **Issue Type Scheme** page.
- Whenever you add a **field configuration** (+ **scheme**) or a screen, screen scheme or issue type screen scheme, JIRA will take you directly to the pages for configuring any of these newly created entities, thereby saving you the need to locate such an entity in a list and click its **Configure** link. This is especially useful for customers with highly configured JIRA installations that contain extensive lists of these entities.

**Deactivate users**

JIRA administrators can 'deactivate' a JIRA user, which disables that user's access to JIRA. This highly voted feature is useful when a JIRA user leaves an organisation because a deactivated user's history of JIRA activity is preserved on the system.

If a user with a deactivated JIRA account rejoins the organisation at some point in the future, the JIRA administrator can easily re-activate their user account again.

A JIRA user's account can be deactivated when their account is edited through JIRA's 'User Browser'.

While a JIRA user account has been deactivated, that user:

- Will no longer be able to log in to JIRA.
- Cannot be assigned issues or added as a watcher to an issue.
- Will continue to appear on the JIRA user interface with '(Inactive)' displayed after their name, where applicable.
- Can still be used to filter issues in a JIRA search query.
- Will not receive any email notifications from JIRA, even if they continue to remain the assignee, reporter, or watchers of issues.
- Will not count towards your JIRA user license limit.

**'Autowatch' issues you create or comment on**
A JIRA user who either creates a new issue or comments on an existing issue, will automatically become a watcher of that issue.

This feature applies to all new and existing JIRA users in a new (or upgraded) JIRA 5.1 installation.

If you don't want to automatically become a watcher of an issue you create or comment on, you can disable this feature through your user profile, by choosing Disabled for the Autowatch option when editing the Preferences section of your user profile (see left screenshot).

Remote and local JIRA issue link improvements

Linking to issues is now easier than ever with the following improvements to the Link dialog box:

- We’ve combined the former Remote JIRA Issue and JIRA Issue options into a single JIRA Issue option, so that there’s now a consistent look and feel for linking to either a local or a remote issue.
- The 'autocomplete' dropdown list of issues now works against issues on remote JIRA sites.
- You can now use JQL to search for issues.
Welcome page

If you're installing JIRA for the first time, you'll be presented with a new welcome page to help guide you through the process of creating your first JIRA project. There is also no need to log in after running through the JIRA Setup Wizard.

After creating a new project through the welcome page, you'll be taken directly to the project's Summary page (instead of the Project Summary administration page).

Automatically suggested project keys

When creating a new project, the Add a new project dialog box now suggests a project key based on the name you specify.

Invite users

If you're faced with the task of creating multiple users in your JIRA site, you'll be happy to know that JIRA now includes the new Invite Users feature. This feature lets you email invitations that allow people to sign up to your JIRA site. You just need a list of email addresses and a single click of a button.

Users receive an email message with a link to create their own account on your JIRA site. These improvements not only help new teams, but they make adding projects and new users easier for all JIRA customers.
Automatic time zone detection

JIRA now automatically detects the time zone of the computer you are working on. If the time zone specified in your JIRA user profile doesn't match that of the computer you are working on, JIRA will prompt you with the choice of updating your user profile's time zone settings to that of your computer's settings.

This is especially useful for customers who frequently travel whilst using JIRA on a regular basis.

Notify on my actions now disabled by default

By default, any new JIRA users will no longer be automatically notified of their own actions. Individual users can change this option through their user profile by choosing Notify me for their My Changes option when editing the Preferences section of their user profile.

Configurable JIRA home page upon login

You can now configure your JIRA home page, which is the page JIRA presents to you immediately after you log in.

To configure your JIRA home page, click your username's dropdown and select the appropriate home page option within the My JIRA Home section.

GreenHopper users can take advantage of this feature by selecting Agile from the My JIRA Home section. Upon selecting this option, you will be taken directly to your default GreenHopper Agile page upon logging in to JIRA.

User Gravatar support

JIRA administrators can choose between whether their users specify either a Gravatar or a JIRA-specific avatar through their user profile.

The Gravatar support feature can be activated by switching the Use Gravatar for user avatars option to ON through the General Configuration page.

JIRA 5.1 RC 2 Release Notes

15 June 2012

The Atlassian team is proud to bring you the release of JIRA 5.1 Release Candidate (RC) 2.

JIRA 5.1 RC 2 is a public development release leading up to JIRA 5.1. An RC release is part of our Early Access Program (EAP) and represents a preliminary release of JIRA leading up to the official release of the next major JIRA version. EAP releases are primarily focused on allowing JIRA enthusiasts to:
EAP releases also give plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

Be aware that a few of the features in this JIRA 5.1 EAP release (described below) were also included in previous JIRA 5.0.x releases.

**Upgrading to JIRA 5.1 RC 2:**

- JIRA EAP releases are available here. Although Atlassian does not support upgrades both 'from' and 'to' EAP releases, if you would like to upgrade to this EAP release, please follow the JIRA 5.1 Upgrade Notes.

**Overview**

JIRA 5.1 continues along where JIRA 5.0 left off, making creating, editing and working with issues faster and easier. JIRA 5.1 gives users the ability to edit an issue's fields directly 'inline' for a faster editing experience and makes all operations on the 'view issue' page faster by eliminating the need for the page to reload when the operation is submitted. The JIRA issue collector introduces a whole new way to create issues based on feedback from your colleagues or customers who don't use JIRA.

Not only is JIRA 5.1 more efficient for working with issues, but improvements to the core performance of JIRA 5.1 makes all of JIRA, especially creating, editing, searching for and viewing issues, faster and more scalable than ever.

**Highlights:**

<table>
<thead>
<tr>
<th>Inline editing and fewer page reloads</th>
<th>Enterprise scale and performance improvements</th>
<th>Issue collector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modify an issue's fields directly when viewing the issue</td>
<td>Search for, view, and create issues faster than ever</td>
<td>Create a feedback form on any web site that submits feedback in the form of JIRA issues</td>
</tr>
<tr>
<td>Operations on the 'view issue' page no longer require a page reload</td>
<td>Monitor JIRA's database connection graphically</td>
<td>Use canned &quot;Feedback&quot; or &quot;Bug report&quot; forms or create your own form</td>
</tr>
<tr>
<td>Full keyboard shortcut support for editing fields</td>
<td>Tune JIRA's connection to a JIRA database more conveniently</td>
<td>Requires adding only one line of JavaScript or HTML code to any web page</td>
</tr>
</tbody>
</table>

**And more:**

- Project administration improvements
- Deactivate users *(New in RC 2)*
- Autowatch
Remote and local JIRA issue link improvements
Get started faster
Other improvements

Thank you for your interest in JIRA 5.1 RC 2
Download RC 2

Do not use in production

- EAP releases are not safe — EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

Key features

1

Inline editing and fewer page reloads

JIRA 5.1 makes working with issues faster with inline editing and fewer page reloads.

Inline editing

You can now directly modify an issue’s fields when viewing an issue, without the page needing to reload (top-left screenshot).

When viewing an issue, simply click on a field’s content to begin editing it. Once you’ve finished editing, simply click on the lower-right tick icon (or in a blank area away from the field you’re editing) to save your changes – no page reload required.

For keyboard fans, inline editing provides its own keyboard shortcuts, which means you can avoid having to use a mouse when editing issues. When viewing an issue:

1. Simply type a comma ‘,’ and then start typing the name of the field you want to edit (using the cursor keys to select the specific field if necessary as shown in the middle-left screenshot)
2. Press ‘Enter’ to begin editing the field and type away to edit the field’s content
3. Press ‘Enter’ again to save your modifications!

Inline editing is enabled by default on new and upgraded JIRA installations. JIRA administrators can disable this feature by switching the Inline edit option to OFF through the General Configuration page.

Quick tips:
- When editing a field, click the lower-right X icon (or press the ‘Esc’ key) to cancel any changes.
- If a field’s content is hyperlinked, like the Component/s field shown in the top-left screenshot, click to the right of any existing field content to edit the field.

Fewer page reloads

After performing an operation on an issue, such as adding a comment to an issue or performing a workflow transition (like the customised transition shown in the lower-left screenshot), JIRA updates the issue immediately without the page needing to reload.

Enterprise scale and performance improvements

The following performance improvements are available:
- Customers with larger JIRA installations will see some performance improvements when using JIRA’s Issue Navigator and project browser pages.
- Searches that retrieve many thousands of issues are performed more rapidly.
- Users should also see significant performance improvements when mentioning other JIRA users in an issue’s Description or Comment field.

Advanced database connection tuning

The JIRA Configuration Tool now includes an Advanced database connection tuning page which allows you to fine tune your database connection pool and validation query settings. This may be required with some default database configurations to maintain a successful connection between your JIRA server and JIRA database.
New database monitoring page for JIRA system administrators

To help diagnose performance problems in JIRA associated with database connectivity, JIRA system administrators now have access to the new Database Monitoring page, which shows a graphical representation of JIRA’s database connection usage over time.

JIRA system administrators can access this page by selecting Administration > System > Monitoring which opens the Database Monitoring page.

✅ Keyboard Shortcut: g + g + start typing monitoring

Issue collector

The issue collector allows you to easily embed a JIRA feedback form into a different web site, which when used by people visiting that site, creates issues in JIRA.

JIRA project administrators can begin this process by simply visiting their JIRA project's Project Summary administration page (via Administration > Projects) and clicking the Issue Collectors tab on the left.

After configuring an issue collector, JIRA generates a JavaScript or HTML snippet for it, which creates a tab on any pages of your web site that includes this snippet.

When anyone visiting your web site clicks this tab, a JIRA feedback dialog box appears (similar to the example screenshot on the left) which upon submission, conveniently creates an issue in your JIRA project.

Visitors clicking this tab don’t require a user account in JIRA.

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Easier workflow editing

JIRA now makes editing a project's workflow much easier. When you begin editing a project's workflow for the first time, you'll be able to modify that workflow almost immediately, since JIRA automatically makes a copy of the system workflow (jira) and associated workflow scheme for your project, and then associates this new workflow scheme with your project, all from the click of an icon.

To begin editing a project's workflow for the first time, simply click the pencil icon either in the Workflows section of the project's Summary page (shown in the top-left screenshot) or on the the project's Workflow page (accessed via the Workflow tab). JIRA will prompt you for confirmation before continuing.

- The copied system workflow (named 'Your Project Name Workflow') is automatically associated with all of your project's available issue types in your project's new workflow scheme (named 'Your Project Name Workflow Scheme').
- If existing issues are present in your project before you decide to start customising the project's workflow, JIRA automatically migrates these issues across to use the newly copied 'Your Project Name Workflow'.
- Once this process is complete, JIRA takes you directly to a draft of your project's new workflow (shown in the lower-left screenshot) - ready for immediate editing!

In JIRA 5.1, we've also streamlined the Workflow Designer and View Workflow Steps pages, both of which can be accessed from conveniently adjacent Diagram and Text buttons, respectively (see the
lower-left screenshot). We've also rationalised the main Workflows page, so that Active and Inactive workflows are presented in separate lists and drafts are simply indicated against an Active workflow with an 'information' icon.

**More administration improvements**

Following on with improvements to the administration user interface in earlier JIRA releases:

- The forms for adding new issue types, sub-tasks, field configurations (+ field configuration schemes) and screens (+ screen schemes) are now dialog boxes, which are easily accessed by clicking a button at the top-right of the appropriate JIRA Administration pages.
- The original 'sub-tab' for adding issue type schemes has been converted to a full tab on the left of the JIRA UI and the form for adding an issue type scheme is now a dialog box, which is easily accessed by clicking the Add Issue Type Scheme button at the top-right of the Issue Type Scheme page.
- Whenever you add a field configuration (+ scheme) or a screen, screen scheme or issue type screen scheme, JIRA will take you directly to the pages for configuring any of these newly created entities, thereby saving you the need to locate such an entity in a list and click its Configure link. This is especially useful for customers with highly configured JIRA installations that contain extensive lists of these entities.

**Deactivate users (New in RC 2)**

JIRA administrators can ‘deactivate’ a JIRA user, which disables that user's access to JIRA. This highly voted feature is useful when a JIRA user leaves an organisation because a deactivated user's history of JIRA activity is preserved on the system.

If a user with a deactivated JIRA account rejoins the organisation at some point in the future, the JIRA administrator can easily re-activate their user account again.

A JIRA user's account can be deactivated when their account is edited through JIRA's 'User Browser'. While a JIRA user account has been deactivated, that user:

- Will no longer be able to log in to JIRA.
- Cannot be assigned issues or added as a watcher to an issue.
- Will continue to appear on the JIRA user interface with '(Inactive)' displayed after their name, where applicable.
- Can still be used to filter issues in a JIRA search query.
- Will not receive any email notifications from JIRA, even if they continue to remain the assignee, reporter, or watchers of issues.
- Will not count towards your JIRA user license limit.

**'Autowatch' issues you create or comment on**
A JIRA user who either creates a new issue or comments on an existing issue, will automatically become a watcher of that issue.

This feature applies to all new and existing JIRA users in a new (or upgraded) JIRA 5.1 installation.

If you don't want to automatically become a watcher of an issue you create or comment on, you can disable this feature through your user profile, by choosing Disabled for the Autowatch option when editing the Preferences section of your user profile (see left screenshot).

Remote and local JIRA issue link improvements

Linking to issues is now easier than ever with the following improvements to the Link dialog box:

- We've combined the former Remote JIRA Issue and JIRA Issue options into a single JIRA Issue option, so that there's now a consistent look and feel for linking to either a local or a remote issue.
- The 'autocomplete' dropdown list of issues now works against issues on remote JIRA sites.
- You can now use JQL to search for issues.
Welcome page

If you're installing JIRA for the first time, you'll be presented with a new welcome page to help guide you through the process of creating your first JIRA project. There is also no need to log in after running through the JIRA Setup Wizard.

After creating a new project through the welcome page, you'll be taken directly to the project's Summary page (instead of the Project Summary administration page).

Automatically suggested project keys

When creating a new project, the Add a new project dialog box now suggests a project key based on the name you specify.

Invite users

If you're faced with the task of creating multiple users in your JIRA site, you'll be happy to know that JIRA now includes the new Invite Users feature. This feature lets you email invitations that allow people to sign up to your JIRA site. You just need a list of email addresses and a single click of a button.

Users receive an email message with a link to create their own account on your JIRA site. These improvements not only help new teams, but they make adding projects and new users easier for all JIRA customers.

Other improvements
Automatic time zone detection

JIRA now automatically detects the time zone of the computer you are working on. If the time zone specified in your JIRA user profile doesn't match that of the computer you are working on, JIRA will prompt you with the choice of updating your user profile's time zone settings to that of your computer's settings.

This is especially useful for customers who frequently travel whilst using JIRA on a regular basis.

Notify on my actions now disabled by default

By default, any new JIRA users will no longer be automatically notified of their own actions. Individual users can change this option through their user profile by choosing Notify me for their My Changes option when editing the Preferences section of their user profile.

Configurable JIRA home page upon login

You can now configure your JIRA home page, which is the page JIRA presents to you immediately after you log in.

To configure your JIRA home page, click your username's dropdown and select the appropriate home page option within the My JIRA Home section.

GreenHopper users can take advantage of this feature by selecting Agile from the My JIRA Home section. Upon selecting this option, you will be taken directly to your default GreenHopper Agile page upon logging in to JIRA.

User Gravatar support

JIRA administrators can choose between whether their users specify either a Gravatar or a JIRA-specific avatar through their user profile.

The Gravatar support feature can be activated by switching the Use Gravatar for user avatars option to ON through the General Configuration page.

JIRA 5.1 RC 1 Release Notes

29 May 2012

The Atlassian team is proud to bring you the release of JIRA 5.1 Release Candidate (RC) 1.

JIRA 5.1 RC 1 is a public development release leading up to JIRA 5.1. An RC release is part of our Early Access Program (EAP) and represents a preliminary release of JIRA leading up to the official release of the next major JIRA version. EAP releases are primarily focused on allowing JIRA enthusiasts to:
• see new features in advance of an upcoming major release and
• provide us with some useful feedback.

Thank you for your feedback during earlier JIRA 5.1 EAP releases and please keep providing your feedback here.

EAP releases also give plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

Be aware that a few of the features in this JIRA 5.1 EAP release (described below) were also included in previous JIRA 5.0.x releases.

### Upgrading to JIRA 5.1 RC 1:

• JIRA EAP releases are available here. Although Atlassian does not support upgrades both 'from' and 'to' EAP releases, if you would like to upgrade to this EAP release, please follow the [JIRA 5.1 Upgrade Notes](#).

### Overview

JIRA 5.1 continues along where JIRA 5.0 left off, making creating, editing and working with issues faster and easier. JIRA 5.1 gives users the ability to edit an issue's fields directly 'inline' for a faster editing experience and makes all operations on the 'view issue' page faster by eliminating the need for the page to reload when the operation is submitted. The JIRA issue collector introduces a whole new way to create issues based on feedback from your colleagues or customers who don't use JIRA.

Not only is JIRA 5.1 more efficient for working with issues, but improvements to the core performance of JIRA 5.1 makes all of JIRA, especially creating, editing, searching for and viewing issues, faster and more scalable than ever.

### Highlights:

<table>
<thead>
<tr>
<th>Inline editing and fewer page reloads</th>
<th>Enterprise scale and performance improvements</th>
<th>Issue collector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modify an issue’s fields directly when viewing the issue</td>
<td>Search for, view, and create issues faster than ever</td>
<td>Create a feedback form on any web site that submits feedback in the form of JIRA issues</td>
</tr>
<tr>
<td>Operations on the 'view issue' page no longer require a page reload</td>
<td>Monitor JIRA's database connection graphically</td>
<td>Use canned &quot;Feedback&quot; or &quot;Bug report&quot; forms or create your own form</td>
</tr>
<tr>
<td>Full keyboard shortcut support for editing fields</td>
<td>Tune JIRA's connection to a JIRA database more conveniently</td>
<td>Requires adding only one line of JavaScript or HTML code to any web page</td>
</tr>
</tbody>
</table>

### And more:

• Project administration improvements (**Enhanced in RC 1**)
• Autowatch
Key features

1. Inline editing and fewer page reloads

JIRA 5.1 makes working with issues faster with inline editing and fewer page reloads.

Inline editing

You can now directly modify an issue’s fields when viewing an issue, without the page needing to reload (top-left screenshot).

When viewing an issue, simply click on a field’s content to begin editing it. Once you’ve finished editing, simply click on the lower-right tick icon (or in a blank area away from the field you’re editing) to save your changes – no page reload required.

For keyboard fans, inline editing provides its own keyboard shortcuts, which means you can avoid having to use a mouse when editing issues. When viewing an issue:

1. Simply type a comma ‘,’ and then start typing the name of the field you want to edit (using the cursor keys to select the specific field if necessary as shown in the middle-left screenshot)
2. Press ‘Enter’ to begin editing the field and type away to edit the field's content
3. Press ‘Enter’ again to save your modifications!

Inline editing is enabled by default on new and upgraded JIRA installations. From JIRA 5.1 EAP 2, JIRA administrators can disable this feature by switching the Inline edit option to OFF through the General Configuration page.

Quick tips:
- When editing a field, click the lower-right X icon (or press the 'Esc' key) to cancel any changes.
- If a field's content is hyperlinked, like the Component/s field shown in the top-left screenshot, click to the right of any existing field content to edit the field.

Fewer page reloads

After performing an operation on an issue, such as adding a comment to an issue or performing a workflow transition (like the customised transition shown in the lower-left screenshot), JIRA updates the issue immediately without the page needing to reload.

Enterprise scale and performance improvements

The following performance improvements are available:

- Customers with larger JIRA installations will see some performance improvements when using JIRA's Issue Navigator and project browser pages.
- Searches that retrieve many thousands of issues are performed more rapidly.
- Users should also see significant performance improvements when mentioning other JIRA users in an issue’s Description or Comment field.

Advanced database connection tuning

The JIRA Configuration Tool now includes an Advanced database connection tuning page which allows you to fine tune your database connection pool and validation query settings. This may be required with some default database configurations to maintain a successful connection between your JIRA server and
JIRA database.

New database monitoring page for JIRA system administrators

To help diagnose performance problems in JIRA associated with database connectivity, JIRA system administrators now have access to the new Database Monitoring page, which shows a graphical representation of JIRA's database connection usage over time.

JIRA system administrators can access this page by selecting Administration > Plugins > Monitoring which opens the Database Monitoring page.

**Keyboard Shortcut:** `g + g +` start typing `monitoring`

### Issue collector

The issue collector allows you to easily embed a JIRA feedback form into a different web site, which when used by people visiting that site, creates issues in JIRA.

JIRA project administrators can begin this process by simply visiting their JIRA project's Project Summary administration page (via Administration > Projects) and clicking the Issue Collectors tab on the left.

After configuring an issue collector, JIRA generates a JavaScript or HTML snippet for it, which creates a tab on any pages of your web site that includes this snippet.

When anyone visiting your web site clicks this tab, a JIRA feedback dialog box appears (similar to the example screenshot on the left) which upon submission, conveniently creates an issue in your JIRA project.

**Visitors clicking this tab don't require a user account in JIRA.**
Project administration improvements

Easier workflow editing (Enhanced in RC 1)

JIRA now makes editing a project's workflow much easier. When you begin editing a project's workflow for the first time, you'll be able to modify that workflow almost immediately, since JIRA automatically makes a copy of the system workflow (jira) and associated workflow scheme for your project, and then associates this new workflow scheme with your project, all from the click of an icon.

To begin editing a project's workflow for the first time, simply click the pencil icon either in the Workflows section of the project's Summary page (shown in the top-left screenshot) or on the the project's Workflow page (accessed via the Workflow tab). JIRA will prompt you for confirmation before continuing.

- The copied system workflow (named 'Your Project Name Workflow') is automatically associated with all of your project's available issue types in your project's new workflow scheme (named 'Your Project Name Workflow Scheme').
- If existing issues are present in your project before you decide to start customising the project's workflow, JIRA automatically migrates these issues across to use the newly copied 'Your Project Name Workflow'.
- Once this process is complete, JIRA takes you directly to a draft of your project's new workflow (shown in the lower-left screenshot) - ready for immediate editing!

In JIRA 5.1, we've also streamlined the Workflow Designer and View Workflow Steps pages, both of which can be accessed from conveniently adjacent Diagram and Text buttons, respectively (see the lower-left screenshot). We've also rationalised the main Workflows page, so that Active and Inactive wor
kflows are presented in separate lists and drafts are simply indicated against an Active workflow with an 'information' icon.

More administration improvements

Following on with improvements to the administration user interface in earlier JIRA releases:

- The forms for adding new issue types, sub-tasks, field configurations (+ field configuration schemes) and screens (+ screen schemes) are now dialog boxes, which are easily accessed by clicking a button at the top-right of the appropriate JIRA Administration pages.
- The original 'sub-tab' for adding issue type schemes has been converted to a full tab on the left of the JIRA UI and the form for adding an issue type scheme is now a dialog box, which is easily accessed by clicking the Add Issue Type Scheme button at the top-right of the Issue Type Scheme page.
- Whenever you add a field configuration (+ scheme) or a screen, screen scheme or issue type screen scheme, JIRA will take you directly to the pages for configuring any of these newly created entities, thereby saving you the need to locate such an entity in a list and click its Configure link. This is especially useful for customers with highly configured JIRA installations that contain extensive lists of these entities.

'Autowatch' issues you create or comment on

A JIRA user who either creates a new issue or comments on an existing issue, will automatically become a watcher of that issue.

This feature applies to all new and existing JIRA users in a new (or upgraded) JIRA 5.1 installation.

If you don't want to automatically become a watcher of an issue you create or comment on, you can disable this feature through your user profile, by choosing Disabled for the Autowatch option when editing the Preferences section of your user profile (see left screenshot).

Remote and local JIRA issue link improvements
Linking to issues is now easier than ever with the following improvements to the Link dialog box:

- We've combined the former Remote JIRA Issue and JIRA Issue options into a single JIRA Issue option, so that there's now a consistent look and feel for linking to either a local or a remote issue.
- The 'autocomplete' dropdown list of issues now works against issues on remote JIRA sites.
- You can now use JQL to search for issues.

Get started faster

Welcome page

If you're installing JIRA for the first time, you'll be presented with a new welcome page to help guide you through the process of creating your first JIRA project. There is also no need to log in after running through the JIRA Setup Wizard.

After creating a new project through the welcome page, you'll be taken directly to the project's Summary page (instead of the Project Summary administration page).

Automatically suggested project keys

When creating a new project, the Add a new project dialog box now suggests a project key based on the name you specify.
Invite users

If you’re faced with the task of creating multiple users in your JIRA site, you’ll be happy to know that JIRA now includes the new Invite Users feature. This feature lets you email invitations that allow people to sign up to your JIRA site. You just need a list of email addresses and a single click of a button.

Users receive an email message with a link to create their own account on your JIRA site. These improvements not only help new teams, but they make adding projects and new users easier for all JIRA customers.

Other improvements

Automatic time zone detection

JIRA now automatically detects the time zone of the computer you are working on. If the time zone specified in your JIRA user profile doesn't match that of the computer you are working on, JIRA will prompt you with the choice of updating your user profile's time zone settings to that of your computer's settings.

This is especially useful for customers who frequently travel whilst using JIRA on a regular basis.

Notify on my actions now disabled by default

By default, any new JIRA users will no longer be automatically notified of their own actions. Individual users can change this option through their user profile by choosing Notify me for their My Changes option when editing the Preferences section of their user profile.

Configurable JIRA home page upon login

You can now configure your JIRA home page, which is the page JIRA presents to you immediately after you log in.

To configure your JIRA home page, click your username's dropdown and select the appropriate home page option within the My JIRA Home section.

GreenHopper users can take advantage of this feature by selecting Agile from the My JIRA Home section. Upon selecting this option, you will be taken directly to your default GreenHopper Agile page upon
logging in to JIRA.

User Gravatar support

JIRA administrators can choose between whether their users specify either a Gravatar or a JIRA-specific avatar through their user profile.

The Gravatar support feature can be activated by switching the Use Gravatar for user avatars option to ON through the General Configuration page.

17 May 2012

JIRA 5.1 Beta 1 is a public development release leading up to JIRA 5.1. A Beta release is part of our Early Access Program (EAP) and is a more mature snapshot of our work in progress, primarily focused on allowing JIRA users to see new features in advance of an upcoming major release and providing us with some useful feedback. EAP releases also give plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

The Atlassian team is proud to bring you the release of JIRA 5.1 Beta 1. Thank you for your feedback during earlier JIRA 5.1 EAP releases and please keep providing your feedback here.

Be aware that a few of the features in this JIRA 5.1 EAP release (described below) were also included in previous JIRA 5.0.x releases.

Upgrading to JIRA 5.1 Beta 1:

JIRA EAP releases are available here. Although Atlassian does not support upgrades both 'from' and 'to' EAP releases, if you would like to upgrade to this EAP release, please follow the JIRA 5.1 Upgrade Notes.

Overview

JIRA 5.1 continues along where JIRA 5.0 left off, making creating, editing and working with issues faster and easier. JIRA 5.1 gives users the ability to edit an issue's fields directly 'inline' for a faster editing experience and makes all operations on the 'view issue' page faster by eliminating the need for the page to reload when the operation is submitted. The JIRA issue collector introduces a whole new way to create issues based on feedback from your colleagues or customers who don't use JIRA.

Not only is JIRA 5.1 more efficient for working with issues, but improvements to the core performance of JIRA 5.1 makes all of JIRA, especially creating, editing, searching for and viewing issues, faster and more scalable than ever.

Highlights:

<table>
<thead>
<tr>
<th>Inline editing and fewer page reloads</th>
<th>Enterprise scale and performance improvements</th>
<th>Issue collector</th>
</tr>
</thead>
</table>
### Key features

1. **Inline editing and fewer page reloads**

   JIRA 5.1 makes working with issues faster with inline editing and fewer page reloads.

---

**Do not use in production**

- **EAP releases are not safe** — EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
  - **No upgrade path** — Because EAP releases represent work in progress, we **cannot** provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

---

**Thank you for your interest in JIRA 5.1 Beta 1**

Download Beta 1
Inline editing

You can now directly modify an issue’s fields when viewing an issue, without the page needing to reload (top-left screenshot).

When viewing an issue, simply click on a field’s content to begin editing it. Once you’ve finished editing, simply click on the lower-right tick icon (or in a blank area away from the field you’re editing) to save your changes – no page reload required.

For keyboard fans, inline editing provides its own keyboard shortcuts, which means you can avoid having to use a mouse when editing issues. When viewing an issue:

1. Simply type a comma ‘,’ and then start typing the name of the field you want to edit (using the cursor keys to select the specific field if necessary as shown in the middle-left screenshot)
2. Press ‘Enter’ to begin editing the field and type away to edit the field’s content
3. Press ‘Enter’ again to save your modifications!

Inline editing is enabled by default on new and upgraded JIRA installations. From JIRA 5.1 EAP 2, JIRA administrators can disable this feature by switching the Inline edit option to OFF through the General Configuration page.

Quick tips:

- When editing a field, click the lower-right X icon (or press the ‘Esc’ key) to cancel any changes.
- If a field’s content is hyperlinked, like the Component/s field shown in the top-left screenshot, click to the right of any existing field content to edit the field.

Fewer page reloads

After performing an operation on an issue, such as adding a comment to an issue or performing a workflow transition (like the customised transition shown in the lower-left screenshot), JIRA updates the issue immediately without the page needing to reload.
Enterprise scale and performance improvements

The following performance improvements are available:

- Customers with larger JIRA installations will see some performance improvements when using JIRA's Issue Navigator and project browser pages.
- Searches that retrieve many thousands of issues are performed more rapidly.
- Users should also see significant performance improvements when mentioning other JIRA users in an issue's Description or Comment field.

Advanced database connection tuning

The JIRA Configuration Tool now includes an Advanced database connection tuning page which allows you to fine tune your database connection pool and validation query settings. This may be required with some default database configurations to maintain a successful connection between your JIRA server and JIRA database.

New database monitoring page for JIRA system administrators

To help diagnose performance problems in JIRA associated with database connectivity, JIRA system administrators now have access to the new Database Monitoring page, which shows a graphical representation of JIRA's database connection usage over time.

JIRA system administrators can access this page by selecting Administration > System > Monitoring which opens the Database Monitoring page.
**Keyboard Shortcut:** `g + g +` start typing **monitoring**

**Issue collector**

The issue collector, initially bundled with JIRA 5.1 Beta 1, allows you to easily embed a JIRA feedback form into a different web site, which when used by people visiting that site, creates issues in JIRA.

JIRA project administrators can begin this process by simply visiting their JIRA project's **Project Summary** administration page (via Administration > Projects) and clicking the **Issue Collectors** tab on the left.

After configuring an issue collector, JIRA generates a JavaScript or HTML snippet for it, which creates a tab on any pages of your web site that includes this code.

When anyone visiting your web site clicks this tab, a dialog box appears (similar to the example screenshot on the left) which upon submission, conveniently creates an issue in your JIRA project.

Visitors clicking this tab don't require a user account in JIRA.

**Project administration improvements**

**Easier workflow editing**

JIRA now makes editing a project's workflow much easier. When you begin editing a project's workflow for the first time, you'll be able to modify that workflow almost immediately, since JIRA automatically makes a copy of the system workflow (**jira**) and associated workflow scheme for your project, and then associates this new workflow scheme with your project, all from the click of an icon.
To begin editing a project's workflow, simply click the pencil icon on the project's Workflow page (shown in the top-left screenshot).

Note also that:

- The copied system workflow (named 'Your Project Name Workflow') is automatically associated with all of your project's available issue types in your project's new workflow scheme (named 'Your Project Name Workflow Scheme').
- If existing issues are present in your project before you decide to start customising the project's workflow, JIRA automatically migrates these issues across (lower-left screenshot) to use the newly copied 'Your Project Name Workflow'.

More administration improvements

Following on with improvements to the administration user interface in earlier JIRA releases:

- The forms for adding new issue types, sub-tasks, field configurations (+ field configuration schemes) and screens (+ screen schemes) are now dialog boxes, which are easily accessed by clicking a button at the top-right of the appropriate JIRA Administration pages.
- The original 'sub-tab' for adding issue type schemes has been converted to a full tab on the left of the JIRA UI and the form for adding an issue type scheme is now a dialog box, which is easily accessed by clicking the Add Issue Type Scheme button at the top-right of the Issue Type Scheme page.
- Whenever you add a field configuration (+ scheme) or a screen, screen scheme or issue type screen scheme, JIRA will take you directly to the pages for configuring any of these newly created entities, thereby saving you the need to locate such an entity in a list and click its Configure link. This is especially useful for customers with highly configured JIRA installations that contain extensive lists of these entities.

'Autowatch' issues you create or comment on

A JIRA user who either creates a new issue or comments on an existing issue, will automatically become a watcher of that issue.

This feature applies to all new and existing JIRA users in a new (or upgraded) JIRA 5.1 installation.

If you don't want to automatically become a watcher of an issue you create or comment on, you can disable this feature through your user profile, by choosing Disabled for the Autowatch option when editing the Preferences section of your user profile (see left screenshot).

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
**Remote and local JIRA issue link improvements**

Linking to issues is now easier than ever with the following improvements to the **Link** dialog box:

- We've combined the former **Remote JIRA Issue** and **JIRA Issue** options into a single **JIRA Issue** option, so that there's now a consistent look and feel for linking to either a local or a remote issue.
- The 'autocomplete' dropdown list of issues now works against issues on remote JIRA sites.
- You can now use JQL to search for issues.

**Get started faster**

**Welcome page**

If you're installing JIRA for the first time, you'll be presented with a new welcome page to help guide you through the process of creating your first JIRA project. There is also no need to log in after running through the **JIRA Setup Wizard**.

After creating a new project through the welcome page, you'll be taken directly to the project's **Summary page** (instead of the **Project Summary** administration page).

**Automatically suggested project keys**

When creating a new project, the **Add a new project** dialog box now suggests a project key based on the name you specify.
Invite users

If you're faced with the task of creating multiple users in your JIRA site, you'll be happy to know that JIRA now includes the new Invite Users feature. This feature lets you email invitations that allow people to sign up to your JIRA site. You just need a list of email addresses and a single click of a button.

Users receive an email message with a link to create their own account on your JIRA site. These improvements not only help new teams, but they make adding projects and new users easier for all JIRA customers.

Other improvements

Automatic time zone detection

JIRA 5.1 Beta 1 now automatically detects the time zone of the computer you are working on. If the time zone specified in your JIRA user profile doesn't match that of the computer you are working on, JIRA will prompt you with the choice of updating your local time zone.

This is especially useful for customers who frequently travel whilst using JIRA on a regular basis.

Notify on my actions now disabled by default

By default, any new JIRA users will no longer be automatically notified of their own actions. Individual users can change this option through their user profile by choosing Notify me for their My Changes option when editing the Preferences section of their user profile.

Configurable JIRA home page upon login

You can now configure your JIRA home page, which is the page JIRA presents to you immediately after you log in.

To configure your JIRA home page, click your username's dropdown and select the appropriate home page option within the My JIRA Home section.

GreenHopper users can take advantage of this feature by selecting Agile from the My JIRA Home section. Upon selecting this option, you will be taken directly to your default GreenHopper Agile page upon
logging in to JIRA.

User Gravatar support

JIRA administrators can choose between whether their users specify either a Gravatar or a JIRA-specific avatar through their user profile.

The Gravatar support feature can be activated by switching the Use Gravatar for user avatars option to ON through the General Configuration page.

JIRA 5.1 EAP 2 Release Notes

3 May 2012

JIRA 5.1 EAP 2 (a.k.a 5.1 milestone 3 or ’m3’) is a public development release leading up to JIRA 5.1. An Early Access Program (EAP) release is a snapshot of our work in progress, primarily focused on allowing JIRA users to see new features in advance of an upcoming major release and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

Please note that a number of features in this JIRA 5.1 EAP release (described below) were also included in previous JIRA 5.0.x releases.

While development work on JIRA 5.1 commenced relatively recently, we want your involvement from the earliest days. Please provide feedback here.

Upgrading to JIRA 5.1 EAP 2:

- JIRA EAP releases are available here. Although Atlassian does not support upgrades both ’from’ and ’to’ EAP releases, if you would like to upgrade to this EAP release, please follow the JIRA 5.1 Upgrade Notes.

List of highlights in JIRA 5.1 EAP 2:

- Inline editing
- No page reloading required for issue operations
- Performance improvements
- Easier workflow editing and more administration improvements
- Invite users
- Issue link improvements
- 'Autowatch' issues you create or comment on
- Advanced database connection tuning
- Other improvements

Thank you for your interest in JIRA 5.1 EAP 2

Download EAP 2

Do not use in production

- EAP releases are not safe — EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed.
Highlights

1. **Inline editing**

JIRA 5.1 allows you to edit issues more rapidly with inline editing. You can now directly modify an issue’s fields when viewing an issue, without the page needing to reload (top-left screenshot).

When viewing an issue, simply click on a field’s content to begin editing it. Once you’ve finished editing, simply click on the lower-right tick icon (or in a blank area away from the field you’re editing) to save your changes — no page reload required.

Inline editing is enabled by default on new and upgraded JIRA installations. From JIRA 5.1 EAP 2, JIRA administrators can disable this feature by switching the Inline edit option to OFF through the General Configuration page.

For keyboard fans, inline editing provides its own keyboard shortcuts, which means you can avoid the need to use a mouse when editing issues. When viewing an issue:

1. Simply type a comma ‘,’ and then start typing the name of the field you want to edit (using the cursor keys to select the specific field if necessary as shown in the lower-left screenshot)
2. Press ‘Enter’ to begin editing the field and type away to edit the field’s content
3. Press ‘Enter’ again to save your modifications!

Quick tips:

- When editing a field, click the lower-right X icon (or press the ‘Esc’ key) to cancel any changes.
- If a field’s content is hyperlinked, like the Component/s field shown in the top-left screenshot, click to the right of any existing field content to edit the field.

No page reloading required for issue operations
After performing an issue operation, such as commenting on an issue or performing a workflow transition (like the customised transition shown in the left screenshot), JIRA updates the issue immediately without the page needing to reload.

This, combined with inline editing (above), makes working with issues in JIRA even faster.

Performance improvements

The following performance improvements are available:

- Customers with larger JIRA installations will see some performance improvements when using JIRA's Issue Navigator and project browser pages.
- Searches that retrieve many thousands of issues are performed more rapidly.
- Users should also see significant performance improvements when mentioning other JIRA users in an issue's Description or Comment field.

Easier workflow editing and more administration improvements

Easier workflow editing

JIRA now makes editing a project's workflow much easier. When you begin editing a project's workflow for the first time, you'll be able to modify that workflow almost immediately, since JIRA automatically makes a copy of the system workflow (jira) and associated workflow scheme for your project, and then associates this new workflow scheme with your project, all from the click of an icon.

To begin editing a project's workflow, simply click the pencil icon on the project's Workflow page (shown in the top-left screenshot).
Note also that:

- The copied system workflow (named 'Your Project Name Workflow') is automatically associated with all of your project's available issue types in your project's new workflow scheme (named 'Your Project Name Workflow Scheme').
- If existing issues are present in your project before you decide to start customising the project's workflow, JIRA automatically migrates these issues across (lower-left screenshot) to use the newly copied 'Your Project Name Workflow'.

More administration improvements

Following on with improvements to the administration user interface in earlier JIRA releases:

- The forms for adding new issue types, sub-tasks, field configurations (+ field configuration schemes) and screens (+ screen schemes) are now dialog boxes, which are easily accessed by clicking a button at the top-right of the appropriate JIRA Administration pages.
- The original 'sub-tab' for adding issue type schemes has been converted to a full tab on the left of the JIRA UI and the form for adding an issue type scheme is now a dialog box, which is easily accessed by clicking the Add Issue Type Scheme button at the top-right of the Issue Type Scheme page.
- Whenever you add a field configuration (+ scheme) or a screen, screen scheme or issue type screen scheme, JIRA will take you directly to the pages for configuring any of these newly created entities, thereby saving you the need to locate such an entity in a list and click its Configure link. This is especially useful for customers with highly configured JIRA installations that contain extensive lists of these entities.

Invite users

If you're faced with the task of creating multiple users in your JIRA site, you'll be happy to know that JIRA now includes the new Invite Users feature. This feature lets you email invitations that allow people to sign up to your JIRA site. You just need a list of email addresses and a single click of a button.

Users receive an email message with a link to create their own account on your JIRA site.

Issue link improvements
Linking to issues is now easier than ever with the following improvements to the Link dialog box:

- The user interface has been simplified, with the former Remote JIRA Issue option on the left of the Link dialog box being incorporated into the JIRA Issue option.
- The ‘autocomplete’ dropdown list of issues now works against issues on remote JIRA sites.
- You can now use JQL to search for issues.

'Autowatch' issues you create or comment on

A JIRA user who either creates a new issue or comments on an existing issue, will automatically become a watcher of that issue.

This feature applies to all new and existing JIRA users in a new (or upgraded) JIRA 5.1 installation.

JIRA users can easily disable this feature through their user profile by choosing Disabled for their Autowatch option when editing the Preferences section of their user profile (see left screenshot).

Advanced database connection tuning
The JIRA Configuration Tool now includes an **Advanced** database connection tuning page which allows you to fine tune your database connection pool and validation query settings. This may be required with some default database configurations to maintain a successful connection between your JIRA server and JIRA database.

Other improvements

A new welcome page

If you're installing JIRA for the first time, you'll be presented with a new welcome page to help guide you through the process of creating your first JIRA project. There is also no need to log in after running through the JIRA Setup Wizard.

From JIRA 5.1 EAP 2, after creating a new project through the welcome page, you'll be taken directly to the project's **Summary** page (instead of the **Project Summary** administration page).

Automatically suggested project keys

When creating a new project, the **Add a new project** dialog box now suggests a project key based on the name you specify.
Configurable JIRA home page upon login

You can now configure your JIRA home page, which is the page JIRA presents to you immediately after you log in.

To configure your JIRA home page, click your username's dropdown and select the appropriate home page option within the My JIRA Home section.

GreenHopper users can take advantage of this feature by selecting Agile from the My JIRA Home section. Upon selecting this option, you will be taken directly to your default GreenHopper Agile page upon logging in to JIRA.

User Gravatar support

JIRA administrators can choose between whether their users specify either a Gravatar or a JIRA-specific avatar through their user profile.

The Gravatar support feature can be activated by switching the Use Gravatar for user avatars option to ON through the General Configuration page.
New database monitoring page for JIRA system administrators

To help diagnose performance problems in JIRA associated with database connectivity, JIRA system administrators now have access to the new Database Monitoring page, which shows a graphical representation of JIRA’s database connection usage over time.

JIRA system administrators can access this page by selecting Administration > System > Monitoring which opens the Database Monitoring page.

- **Keyboard Shortcut:** `g + g +` start typing `monitoring` Notify on my actions now disabled by default

By default, any new JIRA users will no longer be automatically notified of their own actions. Individual users can change this option through their user profile by choosing Notify me for their My Changes option when editing the Preferences section of their user profile.

JIRA 5.1 EAP 1 Release Notes

19 April 2012

**JIRA 5.1 EAP 1** (a.k.a 5.1 milestone 2 or ‘m2’) is a public development release leading up to JIRA 5.1. An Early Access Program (EAP) release is a snapshot of our work in progress, primarily focused on allowing JIRA users to see new features in advance of an upcoming major release and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

- **Please note** that a number of features in this JIRA 5.1 EAP release (described below) were also included in previous JIRA 5.0.x releases.

While development work on JIRA 5.1 commenced relatively recently, we want your involvement from the earliest days. Please provide feedback here.

- **Upgrading to JIRA 5.1 EAP 1:**

  - JIRA EAP releases are available here. Although Atlassian does not support upgrades both ‘from’ and ‘to’ EAP releases, if you would like to upgrade to this EAP release, please follow the JIRA 5.1 Upgrade Notes.

**List of highlights in JIRA 5.1 EAP 1:**

- Inline editing
- No page reloading required for issue operations
- Performance improvements
- Easier workflow editing and more
administration improvements
• Invite users
• Issue link improvements
• 'Autowatch' issues you create or comment on
• Advanced database connection tuning
• Other improvements

Thank you for your interest in JIRA 5.1 EAP 1
Download EAP 1

⚠️ Do not use in production
• EAP releases are not safe — EAP releases are snapshots of the ongoing JIRA development process. As such:
  • While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  • Features in development releases may be incomplete, or may change or be removed before the next full release.
• No upgrade path — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

Highlights

1

Inline editing

When viewing an issue, you now only have to click on a field's content to begin editing it.

Once you've edited a field's content, simply click on the lower-right tick icon (or in a blank area away from the field you're editing) to save your changes.

These inline editing features allow you to edit issues more rapidly as the page never needs to reload when editing and saving fields.

✔️ Quick tips:

• When editing a field, click the lower-right X icon to cancel any changes.
• If a field's content is hyperlinked, like the Component/s field shown in the left screenshot, click to the right of any existing field content to edit the field.

2

No page reloading required for issue operations
After performing an issue operation, such as commenting on an issue or performing a workflow transition (like the customised transition shown in the left screenshot), JIRA updates the issue immediately without the page needing to reload.

Performance improvements

The following performance improvements are available:

- Customers with larger JIRA installations will see some performance improvements when using JIRA's Issue Navigator and project browser pages.
- Searches that retrieve many thousands of issues are performed more rapidly.
- Users should also see significant performance improvements when mentioning other JIRA users in an issue's Description or Comment field.

Easier workflow editing and more administration improvements

Easier workflow editing

JIRA now makes editing a project's workflow much easier. When you begin editing a project's workflow for the first time, you'll be able to modify that workflow almost immediately, since JIRA automatically makes a copy of the default workflow (jira) and associated workflow scheme for your project, and then associates this new workflow scheme with your project, all from the click of an icon.

To begin editing a project's workflow, simply click the pencil icon on the project's Workflow page (shown in the top-left screenshot).
Note also that:

- The copied *JIRA* workflow is automatically associated with all of your project's available issue types in your project's new workflow scheme.
- If existing issues are present in your project before you decide to start customising the project's workflow, JIRA automatically migrates these issues across to use the newly copied *JIRA* workflow (shown in the lower-left screenshot).

**More administration improvements**

Following on with improvements to the administration user interface in earlier JIRA releases:

- The forms for adding new *issue types*, *sub-tasks*, *field configurations* (+ *field configuration schemes*), and *screens* (+ *screen schemes*) are now dialog boxes, which are easily accessed by clicking a button at the top-right of the appropriate JIRA Administration pages.
- The original 'sub-tab' for adding *issue type schemes* has been converted to a full tab on the left of the JIRA UI and the form for adding an issue type scheme is now a dialog box, which is easily accessed by clicking the *Add Issue Type Scheme* button at the top-right of the *Issue Type Scheme* page.
- Whenever you add a *field configuration* (+ scheme) or a *screen*, *screen scheme* or *issue type screen scheme*, JIRA will take you directly to the pages for configuring any of these newly created entities, thereby saving you the need to locate such an entity in a list and click its *Configure* link. This is especially useful for customers with highly configured JIRA installations that contain extensive lists of these entities.

**Invite users**

If you're faced with the task of creating multiple users in your JIRA instance, you'll be happy to know that JIRA now includes the new *Invite Users* feature. This feature lets you email invitations that allow people to sign up to your JIRA instance. You just need a list of email addresses and a single click of a button.

**Issue link improvements**

Linking to issues is now easier than ever with the following improvements to the *Link* dialog box:
- The user interface has been simplified, with the former Remote JIRA Issue option on the left of the Link dialog box being incorporated into the JIRA Issue option.
- The ‘autocomplete’ dropdown list of issues now works against issues on remote JIRA sites.
- You can now use JQL to search for issues.

A JIRA user who either creates a new issue or comments on an existing issue, will automatically become a watcher of that issue.

This feature applies to all new and existing JIRA users in a new (or upgraded) JIRA 5.1 EAP 1 installation.

JIRA users can easily disable this feature through their user profile by choosing Disabled for their Autowatch option when editing the Preferences section of their user profile (see left screenshot).

Advanced database connection tuning

The JIRA Configuration Tool now includes an Advanced database connection tuning page which allows you to fine tune your database connection pool and validation query settings. This may be required with some default database configurations to maintain a successful connection between your JIRA server and JIRA database.
Other improvements

A new welcome page

If you're installing JIRA for the first time, you'll be presented with a new welcome page to help guide you through the process of creating your first JIRA project. There is also no need to log in after running through the JIRA Setup Wizard.

Add a new project

Automatically suggested project keys

When creating a new project, the Add a new project dialog box now suggests a project key based on the name you specify.

New database monitoring page for JIRA system administrators

To help diagnose performance problems in JIRA associated with database connectivity, JIRA system administrators now have access to the new Database Monitoring page, which shows a graphical representation of JIRA's database connection usage over time.
JIRA system administrators can access this page by selecting Administration > System > Monitoring which opens the Database Monitoring page.

☑️ Keyboard Shortcut: `g + g +` start typing monitoring
Notify on my actions now disabled by default

By default, any new JIRA users will no longer be automatically notified of their own actions. Individual users can change this option through their user profile by choosing Notify me for their My Changes option when editing the Preferences section of their user profile.

**JIRA 5.0 EAP Release Notes**

- JIRA 5.0 RC 3 Release Notes
- JIRA 5.0 RC 2 Release Notes
- JIRA 5.0 RC 1 Release Notes
- JIRA 5.0 Beta 3 Release Notes
- JIRA 5.0 Beta 2 Release Notes
- JIRA 5.0 Beta 1 Release Notes
- JIRA 5.0 EAP 5 Release Notes
- JIRA 5.0 EAP 4 Release Notes
- JIRA 5.0 EAP 3 Release Notes
- JIRA 5.0 EAP 2 Release Notes

JIRA 5.0 RC 3 Release Notes

24 January 2012

**JIRA 5.0 RC 3** (a.k.a. 5.0 milestone 11 or ‘m11’) is a public development release leading up to JIRA 5.0. A Release Candidate (RC) is a preliminary release leading up to the official release of a JIRA version. RC releases are a fairly stable snapshot of our work in progress and provide an advance preview of new features to the general public. JIRA plugin developers can also use RC releases to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

The Atlassian team is proud to bring you the JIRA 5.0 RC 3 release. Thank you for your feedback during the recent Beta and EAP releases and please keep providing it here.

ℹ️ Upgrading to JIRA 5.0 RC 3:

- JIRA EAP/Beta/RC releases are available here. When upgrading, please follow the JIRA 5.0 Upgrade Notes.

**Overview**

JIRA 5.0 connects people, teams and other applications together. JIRA 5.0 helps connect people and teams by allowing them to share issues and search results and mention other team members in an issue. People and teams are better connected to other applications with remote 'issue links' to other JIRA sites or web page URLs and activity streams that span all your linked Atlassian applications.

JIRA 5.0 also introduces a large number of improvements for developers to help connect JIRA to other applications, including the introduction of:

- New REST APIs to manage every facet of an issue,
- New remote 'issue link' and activity stream features, specifically for integration with other applications, and
- A stable Java API for JIRA.

**Highlights:**

<table>
<thead>
<tr>
<th>Remote 'issue links'</th>
<th>Sharing issues and 'mentions'</th>
<th>Rapidly create and edit issues</th>
</tr>
</thead>
</table>

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
• Create links to JIRA issues on another JIRA site
• Create links to any URL
• Create links via JIRA’s Java or REST API

• Share issues quickly with other users
• Mention a user in an issue comment
• JIRA uses autocomplete whenever you ‘share’ or ‘mention’ a user

• Rapidly create and edit issues in a dialog box
• Create multiple issues in succession
• Customise to show fields you use most often

And More:

• Search for issues based on their history
• Activity streams now show activity from other applications
• Manage other users shared filters and dashboards
• Administration user interface improvements
• REST API (with tutorials) for working with issues in JIRA
• Stable Java API
• Performance improvements
• New troubleshooting and debugging tools
• New email handler wizard
• Enhancements to the ‘view issue’ page
• JIRA to JIRA issue copy

Thank you for your interest in JIRA 5.0 RC 3
Download RC 3

Do not use in production
Beta releases should not be used in production environments as they are not officially supported.

Please also take note of the following information:

• Beta releases are not safe—Beta releases are snapshots of the ongoing JIRA development process. As such:
  • While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  • Features in development releases may be incomplete, or may change or be removed before the next full release.
• No upgrade path — Because Beta releases represent work in progress, we cannot provide a supported upgrade path between Beta releases, or from any Beta to the eventual final release. Thus, any data you store in a JIRA Beta release may not be able to be migrated to a future JIRA release.

Highlights
Remote 'issue links'

The remote 'issue links' feature provides a powerful way to link JIRA issues to items external to your JIRA installation, residing on external applications.

Along with a Java and REST API to add these links, end users can also:

- Add an issue link from a JIRA issue to an issue on another JIRA site, including reciprocal links between these issues.
- Search for a Confluence page from a JIRA issue and add an issue link to that page.
- Add an issue link from a JIRA issue to any web page URL, such as a page of documentation, a technical note, or any other page on another web site.

Check out a live example here.

If you are a:

- JIRA user — see Linking Issues for details on using remote 'Issue Links' within JIRA.
- JIRA system administrator — see Configuring Issue Linking for details on how to make remote 'Issue Linking' available to your users by setting up the required application links between JIRA and other applications.
- JIRA developer — see on our developer documentation site.

^Top

Sharing issues and 'mentions'

Screenshot: Sharing a list of issues with other users

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Screenshot: Mentioning a user in an issue comment
Need someone else to take a look at a JIRA issue or a list of issues?

- View any issue or a list of issues on the issue navigator, click the Share button at the top-right (or type s) and specify JIRA users (based on their names or user names) or any email address of people you want to share the issue with.

Recipients will be emailed a link to the issue (or a list of issues 'shared' via the issue navigator).

- Mention other JIRA users in an issue's Description or Comment field when creating, editing or commenting on an issue.

JIRA users will receive details of the issue in an email message (sent to the addresses registered with their user accounts). The message's subject line will indicate that the person who used this feature 'mentioned' them on that issue.

Please Note:

- Users required the Browse Users global permission to access the Share button or the autocomplete feature when 'mentioning' a user. However, if you know the username of a JIRA user, you can still mention them.
- JIRA system administrators will need to configure JIRA's outgoing SMTP mail server for the 'share' and 'mentions' features to work.

Rapidly create and edit issues

JIRA 5.0 lets you create and edit issues and sub-tasks much faster. Creating and editing is now performed in a dialog box (rather than a separate form), so that you do not need to leave the current page or have it reload just to start creating or editing an issue or sub-task.

You can customise fields on the Create Issue/Edit Issue dialog boxes by removing or adding fields through the Configure Fields button. JIRA remembers your last set of field choices, giving you a personally customised dialog box that presents you with your most commonly used fields whenever you create or edit an issue.

The Create Issue dialog box allows you to rapidly create a series of related issues with similar options. When you select the Create another check box before clicking the Create button, JIRA creates your issue and automatically pre-populating a new Create Issue dialog box with your previous field values, whilst leaving the Summary field blank. Note that this feature does not carry across any attachments that were attached to your previously created issue.

The Assignee, Project and Issue Type fields use 'autocompletion' too. Hence, you no longer a need to scroll through a whole raft of items to specify these fields when creating or editing an issue.

You can easily access this feature by typing 'c' to access the create issue dialog box or 'e' from a currently selected issue on the issue navigator or 'view issue' page to access the edit dialog box for that issue.
Search for issues based on their history

“CHANGED” operator introduced

Introduced in JIRA 4.4.3, JQL's "CHANGED" operator can accept the optional predicates \texttt{FROM}, \texttt{TO}, \texttt{ON}, \texttt{DURING}, \texttt{BEFORE}, \texttt{AFTER} and \texttt{BY}, and can be used on the \texttt{Status}, \texttt{Assignee}, \texttt{Priority}, \texttt{Reporter}, \texttt{Resolution} and \texttt{Fix Version} fields.

For example, this link shows all the issues logged against the JIRA project on our 'jira.atlassian.com' site, whose \texttt{Fix Version} field was changed to "5.0".

You can also create more complex JQL queries with the "CHANGED" operator by fine-tuning them with predicates. For example, the following JQL query:

\begin{verbatim}
status changed FROM "In QA Review" TO "QA Rejected" BY freddo AFTER startOfWeek() BEFORE endOfWeek()
\end{verbatim}

will find any issues whose \texttt{Status} field value was at some point "In QA Review" but changed to "QA Rejected", by user 'freddo' between the start and end of the current week.

You can use complex queries such as these to generate the 'Single Level Group By Report' in the screenshot above, which shows grouping by 'Team'.

"WAS" operator enhanced

Also introduced in JIRA 4.4.3 was the ability of the "WAS" operator to work with the \texttt{Fix Version} field. For example, the following JQL query:

\begin{verbatim}
fixVersion WAS 4.4
\end{verbatim}

Will find any issues whose \texttt{Fix Version} field was at some point (or currently is) set to 4.4.

\textsuperscript{Top}
We have expanded the Activity Stream features introduced in JIRA 4.4 with:

- The ability to show external activity from another Atlassian application (such as Confluence, FishEye/Crucible and Bamboo) via an Application Link.
- The ability to combine this external activity into an Activity Stream gadget on a JIRA dashboard.
- An API for creating entries in activity streams from remote applications via the REST API or locally via Java.

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

With these new features, you can:

- See Confluence page updates from your activity streams in JIRA, then drill down into those Confluence pages for more information.
- See updates from another JIRA site. For example, activity streams on your development team's JIRA site (behind the firewall) can include activity on your support team's customer facing JIRA site.

Manage other users’ shared filters and dashboards

Introduced in JIRA 4.4.1, JIRA administrators have the ability to change the ownership of or delete other user’s shared filters and dashboards. A shared filter or dashboard is a filter/dashboard created (and hence,
owned) by a user, which the user has then shared with others.

Since JIRA only allows the editing or modification of shared filters/dashboards by their owners, this new JIRA feature is especially helpful in situations where a user has left an organisation, but the shared filters or dashboards they created continue to be used by others within the organisation.

You can access these features by selecting Administration > Users > Shared Filters or Shared Dashboards (or using the keyboard shortcut g + g + start typing shared filters or shared dashboard).

On the 'Shared Filters' or 'Shared Dashboard' pages, you can search for any shared filters/dashboards, or use the cog icon to change the owner of a shared filter/dashboard to another user or delete the shared filter/dashboard.

Only users with the Create Shared Objects global permission can share their filters and dashboards with other JIRA users.

### Administration user interface improvements

![Administration User Interface](image)

Following on with improvements to the Administration User Interface (UI) in JIRA 4.4, JIRA 5.0 provides further improvements to the Administration UI by converting forms on various Administration pages to convenient dialog boxes.

For example, the form for adding users is now a dialog box, which is accessed by clicking Add User on the Users page of JIRA's Administration area.

In addition to the dialog box for adding a new user, the 'Attachments' and 'Workflows' pages have been redesigned and the forms associated with these pages have been converted into convenient dialog boxes too.

### REST API (with tutorials) for working with issues in JIRA

JIRA's REST API has undergone a significant number of changes and improvements to provide the following:

- Create new issues.
- Retrieve metadata for creating new issues and editing existing ones.
- Delete existing issues and their subtasks.
- Create remote 'issue links'.
- Retrieve metadata from your favourite filters and dashboards.
- Retrieve metadata about your permissions.
- Almost all system fields and JIRA's built-in custom field types are supported.
Please also note that the we have changed the `api-version` name component of URLs for JIRA’s REST API calls from ’2.0.alpha1’ to simply ’2’ (or ’latest’ to use the latest REST API version available with your version of JIRA).

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

We also have a series of REST API Tutorials to help you get started using our new REST API improvements.

You might also want to try out Atlassian’s new REST API Browser, which is available in the Atlassian Plugin SDK and can be accessed by adding `http://localhost:2990/jira/plugins/servlet/restbrowser#/user/search` to the end of the URL for accessing JIRA (e.g. `http://localhost:2990/jira/plugins/servlet/restbrowser#/user/search`) within the SDK environment.

Stable Java API

JIRA’s Java API has undergone a significant number of changes and improvements to provide the following:

- More stability and compatibility with future versions of JIRA. See our Java API Policy for JIRA for details.
- Removal of deprecated OSUser classes.
- Removal of deprecated portlets (replaced by gadgets in JIRA 4.0) and their related APIs.
- Active Objects is bundled with JIRA 5.0. A new version of Active Objects will be available in the official JIRA 5.0 release. However, if you are developing against JIRA 5.0 RC 3, we recommend that you can obtain the latest version of Active Objects (0.18.4) from our public Maven repository. Refer to our instructions on how to upgrade to this version of Active Objects in JIRA 5.0 RC 3.

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

If you are developing plugins for JIRA 5.0, please also check out our newly published set of JIRA plugin tutorials.

Performance improvements

Lucene 3.2 is now fully integrated into JIRA. Customers with moderate to large JIRA installations may notice a significant performance improvement in searches, particularly when other actions and operations such as creating and editing issues are conducted simultaneously.

The content of each ‘activity’ tab on the ‘view issue’ page now loads independently of the rest of the ‘view issue’ page. Instead, the content of an activity tab now only loads when the user clicks the tab. This revised behaviour allows the information on these tabs to show up more rapidly.
New troubleshooting and debugging tools

JIRA 5.0 adds several tools to help Administrators debug the configuration of their instance.

- A number of email debugging tools are now provided to System Administrators in the new Logging and Profiling page under Troubleshooting and Support
  - Enable or disable mail logging
  - Turn debug mail logging on or off
  - Configure a logging level for a new package easily in the default loggers section.
- For testing and troubleshooting LDAP connections, much more comprehensive testing is now provided, including basic connections, user retrieval, user membership, group retrieval, group membership and authentication.

New email handler wizard

JIRA 5.0 incorporates a new mail handler wizard that greatly simplifies the process of configuring incoming mail handlers for creating issues or comments from email messages.

There is no longer a need to configure a JIRA service and enter a complex string of mail handler parameters to handle your email messages. Instead, simply configure your mail handler through a convenient wizard.

Improvements have been made to the layout of JIRA’s mail configuration options. The configuration options in the Mail Servers administration page have been separated into two separate pages — one for Outgoing Mail (SMTP) and another for Incoming Mail (POP/IMAP) configurations. The configuration options for mail handlers have been moved from the Services administration page and incorporated into the Incoming Mail page.

Enhancements to the ‘view issue’ page
The 'view issue' page has the following enhancements:

- The Issue Links section of the 'view issue' page has been redesigned to cater for remote issue links (above) and makes better use of space — the separate line used to group issue link types in earlier versions of JIRA has been removed.

- The right-hand side of the view issue page now uses a fixed width. Hence, when the 'view page' is maximised on large, high resolution monitors, the association between field names and values is not lost.

- For plugin developers - the left hand side of the 'view issue' page can be customised via web panels. Hence, you can now insert your own custom panels anywhere below the operations bar on the 'view issue' page.

The web panel location for the left-hand side of the 'view issue' page is `atl.jira.view.issue.left.context` — refer to the View Issue Page Locations page of the Web Fragments guide in our Atlassian Developers documentation site for more information. Also see our plugin tutorial for an example of customising the right-hand side of the 'view issue' page (a plugin developer-feature which became available in JIRA 4.4).

**New plugin to try out — JIRA to JIRA issue copy**

This new JIRA 5.0-compatible feature currently under development as a plugin, allows you to copy issues from one JIRA site to another.

After establishing an Application Link between your JIRA site and another and one or more Project Links a cross these sites, a new 'Remote Copy' action will become available when viewing an issue belonging to a project involved in this project link.

Using JIRA to JIRA issue copy

After clicking the Remote Copy menu item, the Remote Copy 'wizard' will prompt you to choose a remote
JIRA project to copy the issue to and will then automatically map fields between your local and remote JIRA projects.

Most system fields and some custom fields are supported. For a detail list of supported fields, see our Issue Field copy rules documentation.

When copying an issue, you can define a bidirectional remote 'issue link' between the issues. If the remote site is on a version of JIRA that does not support remote 'issue links' (prior to 5.0), you can create a single remote 'issue link' from the local issue to the remote issue and a comment will be added to the remote issue with a link to the local issue it was copied from.

Configuring JIRA to JIRA issue copy

The JIRA to JIRA issue copy feature is available to all users by default, although it can be restricted to a particular group.

If certain mandatory System or Custom fields in your local JIRA project are unlikely to exist or have valid values in the remote JIRA projects from which you are copying issues, you can specify default values for these required fields in your local JIRA project. These default values will also be used in the event that the user copying an issue remotely does not have permission to set these fields in your local JIRA project.

Getting the JIRA to JIRA issue copy plugin

The JIRA to JIRA issue copy feature is currently available as a plugin that needs to be installed on each JIRA server you wish to copy issues between.

⚠️ The JIRA to JIRA issue copy plugin is not bundled with JIRA, although it can currently be downloaded from the Atlassian Plugin Exchange.

Other enhancements and fixes

When you access your new or upgraded JIRA 5.0 installation, JIRA launches the What's New in JIRA ... dialog box, which provides brief overview of the new features available in that JIRA version.

✔️ This dialog box can be prevented from showing up whenever you access JIRA by selecting the Don't show again check box at the base of the dialog box. However, you can access this dialog box again by choosing the What's New item from your user name drop down menu.

For a list of more issues resolved in JIRA 5.0 so far, click here.

Upgrading to JIRA 5.0 RC 2:

- JIRA EAP/Beta/RC releases are available here. When upgrading, please follow the JIRA 5.0 Upgrade Notes. If you are a plugin developer, please also note the minor differences in markup/style handling between RC 1 and RC 2.

Overview

The focus of JIRA 5.0 is to help connect people, teams and other applications together. JIRA 5.0 helps connect people and teams by allowing them to share issues and search results and mention other team members in an issue. People and teams are better connected to other applications with Remote 'Issue Links' to other JIRA sites.
or web page URLs and Activity Streams that span all your linked Atlassian applications.

JIRA 5.0 also introduces a large number of improvements for developers to help connect JIRA to other applications, including the introduction of:

- New REST APIs to manage every facet of an issue,
- New Remote 'Issue Link' and Activity Stream features, specifically for integration with other applications, and
- A stable Java API for JIRA.

**Highlights:**

<table>
<thead>
<tr>
<th>Remote 'issue links'</th>
<th>Sharing issues and 'mentions'</th>
<th>Create and edit issues rapidly</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Remote issue links" /></td>
<td><img src="image2.png" alt="Sharing issues and mentions" /></td>
<td><img src="image3.png" alt="Create and edit issues rapidly" /></td>
</tr>
</tbody>
</table>

- Create links to JIRA issues on another JIRA site
- Create links to any URL
- Create links via JIRA's Java or REST API
- Share issues quickly with other users
- Mention a user in an issue comment
- JIRA uses autocomplete whenever you 'share' or 'mention' a user
- Create and edit issues rapidly in a dialog box
- Create multiple issues in succession
- Customise to show fields you use most often

And More:

- Search for issues based on their history
- Activity streams now show activity from other applications
- Manage other users shared filters and dashboards
- Administration user interface improvements
- REST API (with tutorials) for working with issues in JIRA
- Stable Java API
- Performance improvements
- New troubleshooting and debugging tools
- New email handler wizard
- JIRA to JIRA issue copy

Thank you for your interest in JIRA 5.0 RC 2

Download RC 2

**Do not use in production**

Beta releases should not be used in production environments as they are not officially supported.

**Please also take note of the following information:**

- Beta releases are not safe—Beta releases are snapshots of the ongoing JIRA development
process. As such:

- While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
- Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because Beta releases represent work in progress, we cannot provide a supported upgrade path between Beta releases, or from any Beta to the eventual final release. Thus, any data you store in a JIRA Beta release may not be able to be migrated to a future JIRA release.

### Highlights

1. **Remote 'issue links'**

   The **remote 'issue links'** feature provides a powerful way to link JIRA issues to items external to your JIRA installation, residing on external applications.

   Along with a Java and REST API to add these links, end users can also:

   - Add an issue link from a JIRA issue to an issue on another JIRA site via application links.
   - Add a reciprocal issue link from your JIRA issue to an issue on another JIRA site.
   - Search for a Confluence page from a JIRA issue and add an issue link to that page via application links.
   - Add an issue link from a JIRA issue to any web page URL, such as a page of documentation, a technical note, or any other page on another web site.

   Check out a live example [here.](#)

2. **Sharing issues and 'mentions'**

   If you are a:

   - JIRA user — see [Linking Issues](#) for details on using remote 'Issue Links' within JIRA.
   - JIRA system administrator — see [Configuring Issue Linking](#) for details on how to make remote 'Issue Linking' available to your users by setting up the required application links between JIRA and other applications.

   JIRA developer — see on our developer documentation site.
Want to let others know about a JIRA issue or a list of search results quickly? Simply visit a JIRA issue or a list of issues on the issue navigator and then do either of the following:

- **Click the new Share button at the top-right (or type s) and specify JIRA users (based on their names or user names) or any email address of people you want to share the page with. Add an optional note and then click Share.**

  JIRA users specified in the **User name or email** field will receive details of the issue or a link to a list of issues in an email message (sent to the addresses registered with their JIRA user accounts). The message's subject line will indicate that the person who used this feature 'shared' the issue(s) with them.

- **In an issue comment or the issue's description field, type the @ symbol and begin typing the name or username of a JIRA user. Select the appropriate user from the dropdown. You can do this with multiple users and after submitting the form, those users will be notified that you mentioned them in the comment or the issue's description field.**

  Users will receive details of the issue in an email message (sent to the addresses registered with their JIRA user accounts). The message's subject line will indicate that the person who used this feature 'mentioned' them on that issue.

**Please Note:**

- Users required the **Browse Users global permission** to access the Share button or the autocomplete feature when 'mentioning' a user. However, if you know the username of a JIRA user, you can still mention them.

- **JIRA system administrators will need to configure JIRA's outgoing mail server for the 'share' and 'mentions' features to work.**

^Top

**Create and edit issues rapidly**
JIRA 5.0 provides a rapid and customisable dialog box for creating and editing JIRA issues and sub-tasks. Unlike the old Create/Edit Issue forms, these dialog boxes do not require a page reload.

By default, the Create/Edit Issue dialog boxes show all available fields, which you can quickly remove or re-add. JIRA remembers your last set of field choices, giving you a personally customised dialog box that presents you with your most commonly edited fields whenever you create or edit an issue. The Create/Edit Issue dialog box allows you to rapidly create a series of related issues with similar options. When you select the ‘Create another’ check box before clicking the ‘Create’ button, JIRA creates your Create another issue and automatically pre-populates a new ‘Create Issue’ dialog box with your previous options, whilst leaving the ‘Summary’ field blank. Note that this feature does not carry across any attachments that were attached to your previously created issue.

Note that the ‘Assignee’, ‘Project’ and ‘Issue Type’ fields use ‘autocompletion’ too. Hence, you no longer a need to scroll through a whole raft of items to specify these fields when creating or editing an issue.

You can easily access this feature by typing ‘c’ to access the create issue dialog box or ‘e’ from a currently selected issue on the Issue Navigator or ‘View Issue’ page to access the edit dialog box for that issue.

Search for issues based on their history

“CHANGED” operator introduced

Introduced in JIRA 4.4.3, JQL’s “CHANGED” operator can accept the optional predicates FROM, TO, ON, DURING, BEFORE, AFTER and BY, and can be used on the Status, Assignee, Priority, Reporter, Resolution and Fix Version fields.

For example, this link shows all the issues logged against the JIRA project on our ‘jira.atlassian.com’ site, whose Fix Version field was changed to “5.0”.

You can also create more complex JQL queries with the “CHANGED” operator by fine-tuning them with predicates. For example, the following JQL query:

```
status changed FROM "In QA Review" TO "QA Rejected" BY freddo AFTER startOfWeek() BEFORE endOfWeek()
```

will find any issues whose Status field value was at some point “In QA Review” but changed to “QA Rejected”, by user ‘freddo’ between the start and end of the current week.

You can use complex queries such as these to generate the ‘Single Level Group By Report’ in the screenshot above, which shows grouping by ‘Team’.

“WAS” operator enhanced
Also introduced in JIRA 4.4.3 was the ability of the "WAS" operator to work with the **Fix Version** field. For example, the following JQL query:

```sql
fixVersion WAS 4.4
```

Will find any issues whose **Fix Version** field was at some point (or currently is) set to 4.4.

**Activity streams now show activity from other applications**

The ability to show external activity from another Atlassian application (such as Confluence, FishEye/Crucible and Bamboo) via an Application Link.

The ability to combine this external activity into an Activity Stream gadget on a JIRA dashboard.

An API for creating entries in activity streams from remote applications via the REST API or locally via Java.

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

With these new features, you can:

- See Confluence page updates from your activity streams in JIRA, then drill down into those Confluence pages for more information.
- See updates from another JIRA site. For example, activity streams on your development team's JIRA site (behind the firewall) can include activity on your support team's customer facing JIRA site.
Manage other users’ shared filters and dashboards

Introduced in JIRA 4.4.1, JIRA administrators have the ability to change the ownership of or delete other user's shared filters and dashboards. A shared filter or dashboard is a filter/dashboard created (and hence, owned) by a user, which the user has then shared with others.

Since JIRA only allows the editing or modification of shared filters/dashboards by their owners, this new JIRA feature is especially helpful in situations where a user has left an organisation, but the shared filters or dashboards they created continue to be used by others within the organisation.

You can access these features by selecting ‘Administration’ > ‘Users’ > ‘Shared Filters’ or ‘Shared Dashboards’ (or using the keyboard shortcut ‘g’ + ‘g’ + start typing ‘shared filters’ or ‘shared dashboard’).

On the ‘Shared Filters’ or ‘Shared Dashboard’ pages, you can search for any shared filters/dashboards, or use the cog icon to change the owner of a shared filter/dashboard to another user or delete the shared filter/dashboard.

Only users with the Create Shared Objects global permission can share their filters and dashboards with other JIRA users.

Administration user interface improvements

Following on with improvements to the Administration User Interface (UI) in JIRA 4.4, JIRA 5.0 will provide further improvements to the Administration UI by converting various forms and pages in this area to convenient dialog boxes.

In addition to the dialog box for adding a new user, the ‘Attachments’ and ‘Workflows’ pages have been redesigned and the forms associated with these pages have been converted into convenient dialog boxes too.

For example, the form for editing attachment settings is now a dialog box, which is accessed by clicking ‘E
**REST API (with tutorials) for working with issues in JIRA**

JIRA's REST API is undergoing a significant number of changes and improvements to provide the following:

- Create new issues.
- Retrieve metadata for creating new issues and editing existing ones.
- Delete existing issues and their subtasks.
- Create remote 'issue links'.
- Retrieve metadata from your favourite filters and dashboards.
- Retrieve metadata about your permissions.
- Almost all system fields and JIRA's built-in custom field types are supported.

Please also note that we have changed the api-version name component of URLs for JIRA's REST API calls from ’2.0.alphal’ to simply ’2’ (or ’latest’) to use the latest REST API version available with your version of JIRA).

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

We also have a series of REST API Tutorials to help you get started using our new REST API improvements.

You might also want to try out Atlassian's new REST API Browser, which is available in the Atlassian Plugin SDK and can be accessed by adding /plugins/servlet/restbrowser#/user/search to the end of the URL for accessing JIRA (e.g. http://localhost:2990/jira/plugins/servlet/restbrowser#/user/search) within the SDK environment.

**Stable Java API**

JIRA's Java API is undergoing a significant number of changes and improvements to provide the following:

- More stability and reliability with future versions of JIRA. See our Java API Policy for JIRA for details.
- Removal of deprecated OSUser classes.
- Removal of deprecated portlets (replaced by gadgets in JIRA 4.0) and their related APIs.
- Active Objects is bundled with JIRA 5.0. A new version of Active Objects will be available in the official JIRA 5.0 release. However, if you are developing against JIRA 5.0 RC 2, we recommend that you can obtain the latest version of Active Objects (0.18.4) from our public Maven repository. Refer to our instructions on how to upgrade to this version of Active Objects in JIRA 5.0 RC 2.

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

If you are developing plugins for JIRA 5.0, please also check out our newly published set of JIRA plugin tutorials.

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Performance improvements

Lucene 3.2 is now fully integrated into JIRA. Customers with moderate to large JIRA installations may notice a significant performance improvement in searches, particularly when other actions and operations such as creating and editing issues are conducted simultaneously.

The content of each 'activity' tab on the 'view issue' page now loads independently of the rest of the 'view issue' page. Instead, the content of an activity tab now only loads when the user clicks the tab. This revised behaviour allows the information on these tabs to show up more rapidly.

New troubleshooting and debugging tools

JIRA 5.0 adds several tools to help Administrators debug the configuration of their instance.

- A number of email debugging tools are now provided to System Administrators in the new 'Logging and Profiling' page under 'Troubleshooting and Support'
  - Enable or disable mail logging
  - Turn debug mail logging on or off
  - Configure a logging level for a new package easily in the default loggers section.
- For testing and troubleshooting LDAP connections, much more comprehensive testing is now provided, including basic connections, user retrieval, user membership, group retrieval, group membership and authentication.

New email handler wizard

JIRA 5.0 incorporates a new email handler wizard that greatly simplifies the process of configuring
incoming mail handlers for creating issues or comments from email messages.

You no longer have to configure a JIRA service and enter in a complex string of Handler parameters for your email handler. Instead you configure your email handler through a convenient wizard.

Improvements have been made to the layout of JIRA’s mail configuration options. The configuration options in the 'Mail Servers' tab has been separated into two tabs — one for 'Outgoing Mail' (SMTP) and another for 'Incoming Mail' (POP/IMAP) configuration. The configuration options for mail handlers in the 'Services' tab has been incorporated into the 'Incoming Mail' tab.

New plugin to try out — JIRA to JIRA issue copy

This new JIRA 5.0-compatible feature currently under development as a plugin, allows you to copy issues from one JIRA site to another.

After establishing an Application Link between your JIRA site and another and one or more Project Links across these sites, a new 'Remote Copy' action will become available when viewing an issue belonging to a project involved in this project link.

Using JIRA to JIRA issue copy

After clicking the 'Remote Copy' menu item, the Remote Copy 'wizard' will prompt you to choose a remote JIRA project to copy the issue to and will then automatically map fields between your local and remote JIRA projects.

Most system fields and some custom fields are supported. For a detail list of supported fields, see our Issue Field copy rules documentation.

When copying an issue, you can define a bidirectional remote 'issue link' between the issues. If the remote site is on a version of JIRA that does not support remote 'issue links' (prior to 5.0), you can create a single remote 'issue link' from the local issue to the remote issue and a comment will be added to the remote issue with a link to the local issue it was copied from.

Configuring JIRA to JIRA issue copy

The JIRA to JIRA issue copy feature is available to all users by default, although it can be restricted to a particular group.

If certain mandatory System or Custom fields in your local JIRA project are unlikely to exist or have valid values in the remote JIRA projects from which you are copying issues, you can specify default values for these required fields in your local JIRA project. These default values will also be used in the event that the user copying an issue remotely does not have permission to set these fields in your local JIRA project.
The JIRA to JIRA issue copy feature is currently available as a plugin that needs to be installed on each JIRA server you wish to copy issues between.

⚠️ The JIRA to JIRA issue copy plugin is not bundled with JIRA, although it can currently be downloaded from the Atlassian Plugin Exchange.

Other enhancements and fixes

For a list of more issues resolved in JIRA 5.0 so far, click here.

Plugin Developers: Differences between RC1 and RC2

There were some minor changes to markup/style handling between RC1 and RC2, notably:

- If you are not using the JIRA decorators, but your plugin includes markup with `<div class="content-body">` elements, you will need to add an additional `aui-panel` class attribute to these elements, i.e. `<div class="content-body aui-panel">`
- If your plugin was replicating the behaviour of the 'view issue' page, there were some changes made to the markup:
  1. A new class `page-type-viewissue` is required on the body.
  2. The content of the stalker `<header id="stalker" class="stalker">` is now wrapped in a `div` element with a `stalker-content` class attribute, i.e. `<header id="stalker" class="stalker"> ... </header>` is now `<div class="stalker-content"> ... </div>`

JIRA 5.0 RC 1 Release Notes

21 November 2011

JIRA 5.0 RC 1 (a.k.a 5.0 milestone 9 or 'm9') is a public development release leading up to JIRA 5.0. A Release Candidate (RC) is a preliminary release leading up to the official release of a JIRA version. RC releases are a fairly stable snapshot of our work in progress and provide an advance preview of new features to the general public. JIRA plugin developers can also use RC releases to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

The Atlassian team is proud to bring you the JIRA 5.0 RC 1 release. Thank you for your feedback during the recent Beta and EAP releases and please keep providing it here.

ℹ️ Upgrading to JIRA 5.0 RC 1:

- JIRA EAP/Beta/RC releases are available here. When upgrading, please follow the JIRA 5.0 Upgrade Notes.

Overview

The focus of JIRA 5.0 is to help connect people, teams and other applications together. JIRA 5.0 helps connect people and teams by allowing them to share issues and search results and mention other team members in an issue. People and teams are better connected to other applications with Remote 'Issue Links' to other JIRA sites or web page URLs and Activity Streams that span all your linked Atlassian applications.

JIRA 5.0 also introduces a large number of improvements for developers to help connect JIRA to other applications, including the introduction of:

- New REST APIs to manage every facet of an issue,
- New Remote 'Issue Link' and Activity Stream features, specifically for integration with other applications, and
- A stable Java API for JIRA.

Highlights:
### Remote 'Issue Links'

- Create links to JIRA issues on another JIRA site
- Create links to any URL
- Create links via JIRA's Java or REST API

### Sharing Issues and 'Mentions'

- Share issues quickly with other users
- Mention a user in an issue comment
- JIRA uses autocomplete whenever you 'share' or 'mention' a user

### Create and Edit Issues Rapidly

- Create and edit issues rapidly in a dialog box
- Create multiple issues in succession
- Customise to show fields you use most often

### And More:

- More Enhancements to JQL
- Activity Streams Now Show External Content
- Manage Other Users Shared Filters and Dashboards
- Administration User Interface Improvements
- REST API Improvements
- Java API Improvements
- Performance Improvements
- New Troubleshooting and Debugging Tools
- New Email Handler Wizard
- JIRA to JIRA Issue Copy

---

**Thank you for your interest in JIRA 5.0 RC 1**

Download RC 1

⚠️ Please be aware of a known issue specific to this JIRA 5.0 RC 1 Release.

⚠️ **Do not use in production**

Beta releases should not be used in production environments as they are not officially supported.

⚠️ **Please also take note of the following information:**

- **Beta releases are not safe**— Beta releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because Beta releases represent work in progress, we cannot provide a supported upgrade path between Beta releases, or from any Beta to the eventual final release. Thus, any data you store in a JIRA Beta release may not be able to be migrated to a future JIRA release.

---

**Highlights**
Remote 'Issue Links' (improved in RC 1)

The Remote 'Issue Links' feature provides a powerful way to link JIRA issues to items external to your JIRA installation, residing on external applications.

Along with a Java and REST API to add these links, end users can also:

- Add a link from a JIRA issue to another issue on a different JIRA installation or site using application links with trusted applications or OAuth-based authentication.
- Add a reciprocal link from a JIRA issue to another issue on a different JIRA installation or site using application links.
- Search for a Confluence page from a JIRA issue and add a link to that page from the issue (new in RC 1).
- Add a link from a JIRA issue to any web page URL, such as a page of documentation, a technical note, or any other page on another web site.

For more information about this feature, see [Remote Issue Links](#).
list of issues on the issue navigator and then do either of the following:

- Click the new 'Share' button at the top-right (or type 's') and specify JIRA users (based on their names or user names) or any email address of people you want to share the 'view issue' page with. Add an optional note and then click 'Share'.

  JIRA users specified in the 'User name or email' field will receive details of the issue or a link to a list of issues in an email message (sent to the addresses registered with their JIRA user accounts). The message's subject line will indicate that the person who used this feature 'shared' the issue(s) with them.

- In an issue comment or the issue's description field, type the '@' symbol and begin typing the name or username of a JIRA user. Select the appropriate user from the dropdown. You can do this with multiple users and after submitting the form, those users will be notified that you mentioned them in the comment or the issue's description field.

  Users will receive details of the issue in an email message (sent to the addresses registered with their JIRA user accounts). The message's subject line will indicate that the person who used this feature 'mentioned' them on that issue.

Please Note:

- Users required the 'Browser User' global permission to access the 'Share' button or the autocomplete feature when 'mentioing' a user. However, if you know the username of a JIRA user, you can still mention them.
- JIRA system administrators will need to configure JIRA's outgoing mail server for the 'Share' and 'mentions' features to work.

Create and Edit Issues Rapidly

JIRA 5.0 provides a rapid and customisable dialog box for creating and editing JIRA issues and sub-tasks. Unlike the old Create/Edit Issue forms, these dialog boxes do not require a page reload.

By default, the Create/Edit Issue dialog boxes show all available fields, which you can quickly remove or re-add. JIRA remembers your last set of field choices, giving you a personally customised dialog box that presents you with your most commonly edited fields whenever you create or edit an issue.

The Create/Edit Issue dialog box allows you to rapidly create a series of related issues with similar options. When you select the 'Create another' check box before clicking the 'Create' button, JIRA creates your issue and automatically pre-populates a new 'Create Issue' dialog box with your previous options, whilst leaving the 'Summary' field blank. Note that this feature does not carry across any attachments that were attached to your previously created issue.

You can easily access this feature by typing 'c' to access the create issue dialog box or 'e' from a currently selected issue on the Issue Navigator or 'View Issue' page to access the edit dialog box for that issue.
More Enhancements to JQL — New "CHANGED" Operator and "WAS" Improvements

Enhancements were introduced in JIRA 4.4 that allowed you to search the history of an issue's Assignee and Reporter fields.

Introduced in JIRA 4.4.1, JQL's "CHANGED" operator can accept the optional predicates "FROM", "TO", "ON", "DURING", "BEFORE", "AFTER" and "BY".

For example, the following JQL query:

```
status changed FROM "In QA Review" to "QA Rejected" BY freddo BEFORE endOfWeek() AFTER startOfWeek()
```

Will find any issues whose Status field value was at some point "In QA Review" but changed to "QA Rejected", by user 'freddo', and after the start and before the end of the current week.

You can use complex queries such as these to generate the 'Single Level Group By Report' in the screenshot above, which shows grouping by 'Team'.

The "CHANGED" operator can be used on the Status, Assignee, Priority, Reporter, Resolution and Fix Version fields.

The "WAS" operator can now be used on the Fix Version field too. For example, the following JQL query:

```
fixVersion WAS 4.4
```

Will find any issues whose Fix Version field was at some point (or currently is) set to 4.4.
We are expanding the Activity Stream features introduced in JIRA 4.4 with:

- The ability to show external activity from another Atlassian application (such as Confluence, FishEye/Crucible and Bamboo) via an Application Link.
- The ability to combine this external activity into an Activity Stream gadget on a JIRA dashboard.
- An API for creating entries in activity streams from remote applications via the REST API or locally via Java.

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

Manage Other Users’ Shared Filters and Dashboards

Introduced in JIRA 4.4.1, JIRA administrators have the ability to change the ownership of or delete other user’s shared filters and dashboards. A shared filter or dashboard is a filter/dashboard created (and hence, owned) by a user, which the user has then shared with others.

Since JIRA only allows the editing or modification of shared filters/dashboards by their owners, this new JIRA feature is especially helpful in situations where a user has left an organisation, but the shared filters or dashboards they created continue to be used by others within the organisation.

You can access these features by selecting 'Administration' > 'Users' > 'Shared Filters' or 'Shared Dashboards' (or using the keyboard shortcut 'g' + 'g' + start typing 'shared filters' or 'shared dashboard').

On the 'Shared Filters' or 'Shared Dashboard' pages, you can search for any shared filters/dashboards, or use the cog icon to change the owner of a shared filter/dashboard to another user or delete the shared filter/dashboard.

Only users with the Create Shared Objects global permission can share their filters and dashboards with other JIRA users.
Administration User Interface Improvements

Following on with improvements to the Administration User Interface (UI) in JIRA 4.4, JIRA 5.0 will provide further improvements to the Administration UI by converting various forms and pages in this area to convenient dialog boxes.

In addition to the dialog box for adding a new user, the 'Attachments' and 'Workflows' pages have been redesigned and the forms associated with these pages have been converted into convenient dialog boxes too.

For example, the form for editing attachment settings is now a dialog box, which is accessed by clicking 'Edit Settings' on the 'Attachments' page of JIRA’s Administration area.

REST API Improvements

JIRA’s REST API is undergoing a significant number of changes and improvements to provide the following:

- Create new issues.
- Retrieve metadata for creating new issues and editing existing ones.
- Delete existing issues and their subtasks.
- Create remote ’issue links’.
- Retrieve metadata from your favourite filters and dashboards.
- Retrieve metadata about your permissions.
- Almost all system fields and JIRA’s built-in custom field types are supported.

Please also note that the we have changed the api-version name component of URLs for JIRA’s REST API calls from '2.0.alpha1' to simply '2' (or 'latest' to use the latest REST API version available with your version of JIRA).

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details. We also have a series of REST API Tutorials to help you get started using our new REST API improvements.

You might also want to try out Atlassian's new REST API Browser, which is available in the Atlassian Plugin SDK and can be accessed by adding /plugins/servlet/restbrowser#/user/search to the end of the URL for accessing JIRA (e.g. http://localhost:2990/jira/plugins/servlet/restbrowser#/user/search) within the SDK environment.
Java API Improvements

JIRA’s Java API is undergoing a significant number of changes and improvements to provide the following:

- More stability and reliability with future versions of JIRA.
- Removal of deprecated OSUser classes.
- Removal of deprecated portlets (replaced by gadgets in JIRA 4.0) and their related APIs.

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

Please also be aware that the JIRA's Java API is likely to undergo a rapid number of changes from one JIRA 5.0 EAP release to the next.

Performance Improvements

Lucene 3.2 is now fully integrated into JIRA. Customers with moderate to large JIRA installations may notice a significant performance improvement in searches, particularly when other actions and operations such as creating and editing issues are conducted simultaneously.

The 'Activity' tabs on the 'View Issue' page are now loaded in the background when this page is first viewed, allowing the information on these tabs to be displayed more rapidly.

New Troubleshooting and Debugging Tools

JIRA 5.0 adds several tools to help Administrators debug the configuration of their instance.

- A number of email debugging tools are now provided to System Administrators in the new 'Logging and Profiling' page under 'Troubleshooting and Support'
  - Enable or disable mail logging
  - Turn debug mail logging on or off
  - Configure a logging level for a new package easily in the default loggers section.
- For testing and troubleshooting LDAP connections, much more comprehensive testing is now provided, including basic connections, user retrieval, user membership, group retrieval, group membership and authentication.

New Email Handler Wizard
JIRA 5.0 incorporates a new email handler wizard that greatly simplifies the process of configuring incoming mail handlers for creating issues or comments from email messages.

You no longer have to configure a JIRA service and enter in a complex string of Handler parameters for your email handler. Instead you configure your email handler through a convenient wizard.

Improvements have been made to the layout of JIRA's mail configuration options. The configuration options in the 'Mail Servers' tab has been separated into two tabs — one for 'Outgoing Mail' (SMTP) and another for 'Incoming Mail' (POP/IMAP) configuration. The configuration options for mail handlers in the 'Services' tab has been incorporated into the 'Incoming Mail' tab.

**New Plugin to Try Out — JIRA to JIRA Issue Copy**

This new JIRA 5.0-compatible feature currently under development as a plugin, allows you to copy issues from one JIRA site to another.

After establishing an Application Link between your JIRA site and another and one or more Project Links a cross these sites, a new 'Remote Copy' action will become available when viewing an issue belonging to a project involved in this project link.
Using JIRA to JIRA Issue Copy

After clicking the 'Remote Copy' menu item, the Remote Copy 'wizard' will prompt you to choose a remote JIRA project to copy the issue to and will then automatically map fields between your local and remote JIRA projects.

Most system fields and some custom fields are supported. For a detail list of supported fields, see our Issue copy rules documentation.

When copying an issue, you can define a bidirectional remote 'issue link' between the issues. If the remote site is on a version of JIRA that does not support remote 'issue links' (prior to 5.0), you can create a single remote 'issue link' from the local issue to the remote issue and a comment will be added to the remote issue with a link to the local issue it was copied from.

Configuring JIRA to JIRA Issue Copy

The JIRA to JIRA issue copy feature is available to all users by default, although it can be restricted to a particular group.

If certain mandatory System or Custom fields in your local JIRA project are unlikely to exist or have valid values in the remote JIRA projects from which you are copying issues, you can specify default values for these required fields in your local JIRA project. These default values will also be used in the event that the user copying an issue remotely does not have permission to set these fields in your local JIRA project.

Getting the JIRA to JIRA Issue Copy Plugin

The JIRA to JIRA issue copy feature is currently available as a plugin that needs to be installed on each JIRA server you wish to copy issues between.

⚠️ The JIRA to JIRA issue copy plugin is not bundled with JIRA, although it can currently be downloaded from the Atlassian Plugin Exchange.

Other Enhancements and Fixes

For a list of more issues resolved in JIRA 5.0 so far, click here.

Known Issues in JIRA 5.0 RC 1

JIRA 5.0 RC 1 possesses a bug (JRA-26300) which prevents the ability to attach files to issues when using the Safari web browser. This will be fixed in JIRA 5.0 RC 2.

JIRA 5.0 Beta 3 Release Notes

1 November 2011

JIRA 5.0 Beta 3 (a.k.a 5.0 milestone 8 or 'm8') is a public development release leading up to JIRA 5.0. A Beta release is a preliminary release leading up to the official release of a JIRA version. Beta releases are a snapshot of our work in progress and provide an advance preview of new features to the general public. JIRA plugin developers can also use Beta releases to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

The Atlassian team is proud to bring you the JIRA 5.0 Beta 3 release. Thank you for your feedback during the recent EAP releases and please keep providing it here.

ℹ️ Upgrading to JIRA 5.0 Beta 3:

- JIRA EAP/Beta releases are available here. When upgrading, please follow the JIRA 5.0 Upgrade Notes.

Overview

The focus of JIRA 5.0 is to help connect people, teams and other applications together. JIRA 5.0 helps connect people and teams by allowing them to share issues and search results and mention other team members in an issue. People and teams are better connected to other applications with Remote 'Issue Links' to other JIRA sites or web page URLs and Activity Streams that span all your linked Atlassian applications.
JIRA 5.0 also introduces a large number of improvements for developers to help connect JIRA to other applications, including the introduction of:

- New REST APIs to manage every facet of an issue,
- New Remote 'Issue Link' and Activity Stream features, specifically for integration with other applications,
- A stable Java API for JIRA.

Main Highlights:

<table>
<thead>
<tr>
<th>Remote 'Issue Links'</th>
<th>Sharing Issues and 'Mentions'</th>
<th>Create and Edit Issues Rapidly</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Remote Issue Links" /></td>
<td><img src="image2" alt="Sharing Issues and 'Mentions'" /></td>
<td><img src="image3" alt="Create and Edit Issues Rapidly" /></td>
</tr>
</tbody>
</table>

- Create links to JIRA issues on another JIRA site
- Create links to any URL
- Create links via JIRA's Java or REST API
- Share issues quickly with other users
- Mention a user in an issue comment
- JIRA uses autocomplete whenever you 'share' or 'mention' a user
- Create and edit issues rapidly in a dialog box
- Create multiple issues in succession
- Customise to show fields you use most often

Other Highlights:

- More Enhancements to JQL
- Activity Streams Now Show External Content
- Manage Other Users Shared Filters and Dashboards
- Administration User Interface Improvements *(improved in Beta 3)*
- REST API Improvements *(improved in Beta 3)*
- Java API Improvements
- Performance Improvements
- New Troubleshooting and Debugging Tools
- New Email Handler Wizard
- Remote Issue Copying

Thank you for your interest in JIRA 5.0 Beta 3
Download Beta

⚠️ Do not use in production
Beta releases should not be used in production environments as they are not officially supported.

⚠️ Please also take note of the following information:
- Beta releases are not safe— Beta releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
Highlights

1

Remote 'Issue Links' (improved in Beta 3)

The Remote 'Issue Links' feature provides a powerful way to link JIRA issues to items external to your JIRA installation, residing on external applications.

Along with a Java and REST API to add these links, end users can also:

- Add a link from a JIRA issue to another issue on a different JIRA installation or site using application links with trusted applications or OAuth-based authentication (improved in Beta 3).
- Add a reciprocal link from a JIRA issue to another issue on a different JIRA installation or site using application links.
- Add a link from a JIRA issue to any web page URL, such as a page of documentation, a technical note, or any other page on another web site.

For more information about this feature, see .

2

Sharing Issues and 'Mentions' (improved in Beta 3)

Screenshot: Sharing an issue with other users
Want to let others know about a JIRA issue or a list of search results quickly? Simply visit a JIRA issue or a list of issues on the issue navigator and then do either of the following:

- Click the new 'Share' button at the top-right (or type '@') and specify JIRA users (based on their names or user names) or any email address of people you want to share the page with. Add an optional note and then click 'Share'.

  JIRA users specified in the 'User name or email' field will receive details of the issue or a link to a list of issues in an email message (sent to the addresses registered with their JIRA user accounts). The message's subject line will indicate that the person who used this feature 'shared' the issue(s) with them.

- In an issue comment or the issue's description field (new in Beta 3), type the '@' symbol and begin typing the name or username of a JIRA user. Select the appropriate user from the dropdown. You can do this with multiple users and after submitting the form, those users will be notified that you mentioned them in the comment or the issue's description field.

  Users will receive details of the issue in an email message (sent to the addresses registered with their JIRA user accounts). The message's subject line will indicate that the person who used this feature 'mentioned' them on that issue.

  Users required the 'Browser User' global permission to access the 'Share' button or the autocomplete feature when 'mentioning' a user. However, if you know the username of a JIRA user, you can still mention them.

Create and Edit Issues Rapidly (improved in Beta 3)

JIRA 5.0 provides a rapid and customisable dialog box for creating and editing JIRA issues and sub-tasks (new in Beta 3). This feature replaces the Create and Edit Issue forms.

The Create/Edit Issue dialog boxes show all available fields by default. However, you can quickly remove or re-add fields via the 'Configure Fields' button at the top-right of the dialog box. JIRA remembers your last set of field choices, giving you a personally customised dialog box that presents you with your most commonly edited fields whenever you create or edit an issue.

If you select the 'Create another' check box, JIRA will create your issue and automatically pre-populate a new 'Create Issue' dialog box with your previous options, whilst leaving the 'Summary' field blank. This allows you to rapidly create a series of related issues with similar options. Note that this feature does not carry across any attachments that were attached to your previously created issue.
Consistent with JIRA's existing keyboard shortcuts, type 'c' to access the create issue dialog box or 'e' from a currently selected issue on the Issue Navigator or 'View Issue' page to access the edit dialog box for that issue.

^Top

More Enhancements to JQL — New "CHANGED" Operator and "WAS" Improvements

Enhancements were introduced in JIRA 4.4 that allowed you to search the history of an issue's Assignee and Reporter fields.

In JIRA 5.0, JQL supports the new "CHANGED" operator, which can accept the optional predicates "FROM", "TO", "ON", "DURING", "BEFORE", "AFTER" and "BY". For example, the following JQL query:

```
status changed FROM "In QA Review" to "QA Rejected" BY freddo BEFORE endOfWeek() AFTER startOfWeek()
```

Will find any issues whose Status field value was at some point "In QA Review" but changed to "QA Rejected", by user 'freddo', and after the start and before the end of the current week.

You can use complex queries such as these to generate the 'Single Level Group By Report' in the screenshot above, which shows grouping by 'Team'.

The "CHANGED" operator can be used on the Status, Assignee, Priority, Reporter, Resolution and Fix Version fields.

The "WAS" operator can now be used on the Fix Version field too. For example, the following JQL query:

```
fixVersion WAS 4.4
```

Will find any issues whose Fix Version field was at some point (or currently is) set to 4.4.

^Top

Activity Streams Now Show External Content
We are expanding the Activity Stream features introduced in JIRA 4.4 with:

- The ability to show external activity from another Atlassian application (such as Confluence, FishEye/Crucible and Bamboo) via an Application Link.
- The ability to combine this external activity into an Activity Stream gadget on a JIRA dashboard.
- An API for creating entries in activity streams from remote applications via the REST API or locally via Java.

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

Manage Other Users' Shared Filters and Dashboards

JIRA administrators have the ability to change the ownership of or delete other user’s shared filters and dashboards. A shared filter or dashboard is a filter/dashboard created (and hence, owned) by a user, which the user has then shared with others.

Since JIRA only allows the editing or modification of shared filters/dashboards by their owners, this new JIRA feature is especially helpful in situations where a user has left an organisation, but the shared filters or dashboards they created continue to be used by others within the organisation.

Only users with the Create Shared Objects global permission can share their filters and dashboards with other JIRA users.
You can access these features by selecting 'Administration' > 'Users' > 'Shared Filters' or 'Shared Dashboards' (or using the keyboard shortcut 'g' + 'g' + start typing 'shared filters' or 'shared dashboard').

On the 'Shared Filters' or 'Shared Dashboard' pages, you can search for any shared filters/dashboards, or use the cog icon to change the owner of a shared filter/dashboard to another user or delete the shared filter/dashboard.

^Top

Administration User Interface Improvements (improved in Beta 3)

Following on with improvements to the Administration User Interface (UI) in JIRA 4.4, JIRA 5.0 will provide further improvements to the Administration UI by converting various forms and pages in this area to convenient dialog boxes.

In addition to the dialog box for adding a new user, the 'Attachments' and 'Workflows' pages (the latter of which is improved in Beta 3) have been redesigned and the forms associated with these pages have been converted into convenient dialog boxes too.

For example, the form for editing attachment settings is now a dialog box, which is accessed by clicking 'Edit Settings' on the 'Attachments' page of JIRA's Administration area.

^Top

REST API Improvements (improved in Beta 3)

JIRA's REST API is undergoing a significant number of changes and improvements to provide the following:

- Create new issues.
- Retrieve metadata for creating new issues and editing existing ones.
- Delete existing issues and their subtasks.
- Create remote 'issue links'.
- Retrieve metadata from your favourite filters and dashboards (new in Beta 3).
- Retrieve metadata about your permissions (new in Beta 3).
- Almost all system fields and JIRA's built-in custom field types are supported (improved in Beta 3).

Please also note that the we have changed the api-version name component of URLs for JIRA's REST API calls from '2.0.alpha1' to simply '2' (or 'latest' to use the latest REST API version available with your version of JIRA).

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details. We also
have a series of REST API Tutorials to help you get started using our new REST API improvements.

**Java API Improvements**

JIRA’s Java API is undergoing a significant number of changes and improvements to provide the following:

- More stability and reliability with future versions of JIRA.
- Removal of deprecated OSUser classes.
- Removal of deprecated portlets (replaced by gadgets in JIRA 4.0) and their related APIs.

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

Please also be aware that the JIRA’s Java API is likely to undergo a rapid number of changes from one JIRA 5.0 EAP release to the next.

**Performance Improvements**

Lucene 3.2 is now fully integrated into JIRA. Initial benchmarking shows performance improvements across a number of JIRA features.

The 'Activity' tabs on the 'View Issue' page are now loaded in the background when this page is first viewed, allowing the information on these tabs to be displayed more rapidly.

**New Troubleshooting and Debugging Tools**

JIRA 5.0 adds several tools to help Administrators debug the configuration of their instance.

- A number of email debugging tools are now provided to System Administrators in the new 'Logging and Profiling' page under 'Troubleshooting and Support'
  - Enable or disable mail logging
  - Turn debug mail logging on or off
  - Configure a logging level for a new package easily in the default loggers section.
- For testing and troubleshooting LDAP connections, much more comprehensive testing is now provided, including basic connections, user retrieval, user membership, group retrieval, group membership and authentication.
New Email Handler Wizard

JIRA 5.0 incorporates a new email handler wizard that greatly simplifies the process of configuring incoming mail handlers for creating issues or comments from email messages.

You no longer have to configure a JIRA service and enter in a complex string of Handler parameters for your email handler. Instead you configure your email handler through a convenient wizard.

Improvements have been made to the layout of JIRA’s mail configuration options. The configuration options in the ‘Mail Servers’ tab has been separated into two tabs — one for ‘Outgoing Mail’ (SMTP) and another for ‘Incoming Mail’ (POP/IMAP) configuration. The configuration options in the ‘Mail Handlers’ tab has been incorporated into the ‘Outgoing Mail’ tab.

New Plugin to Try Out — Remote Issue Copying

This new JIRA 5.0-compatible feature currently under development as a plugin, allows you to copy issues from one JIRA site to another.

After establishing an Application Link between your JIRA site and another, a new ‘Remote Copy’ action will become available when viewing an issue.

While this action is available to everyone by default, it can be restricted to a particular group.

You will be prompted to map field values by field names for JIRA’s built-in (system) fields and/or to configure default values for required fields.

You will require the appropriate permissions to set the field value on the target site.

Custom fields are generally supported, although so far, we have only provided a mapper for the SelectCFType custom field type. Supporting more custom fields is a matter of writing more mappers (which we intend to make pluggable for the final JIRA 5.0 release).
The Remote Issue Copy feature is currently available as a plugin that needs to be installed on each JIRA server you wish to copy issues between. You also need to configure the following before you can copy issues between your JIRA sites:

1. An Application Link between your JIRA sites — see Adding an Application Link.
2. One or more Project Links between JIRA projects across these JIRA sites — Adding Project Links between Applications.

⚠️ The Remote Issue Copying plugin is not yet bundled with JIRA. However, you can download it from the following link:

Other Enhancements and Fixes

For a list of more issues resolved in JIRA 5.0 so far, click here. Some notable fixes in JIRA 5.0 Beta 3 include:

- A critical issue (JIRA-25914) which may cause data corruption in a high-load environment was fixed.

JIRA 5.0 Beta 2 Release Notes

18 October 2011

JIRA 5.0 Beta 2 (a.k.a 5.0 milestone 7 or ‘m7’) is a public development release leading up to JIRA 5.0. A Beta release is a preliminary release leading up to the official release of a JIRA version. Beta releases are a snapshot of our work in progress and provide an advance preview of new features to the general public. JIRA plugin developers can also use Beta releases to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

The Atlassian team is proud to bring you the JIRA 5.0 Beta 2 release. Thank you for your feedback during the recent EAP releases and please keep providing it here.

The focus of JIRA 5.0 is on making JIRA easier to use and manage. There are also a large number of improvements for the JIRA developer community. New REST APIs have been added to create issues, a stable JIRA API is being refined and every block area on the ‘View Issue’ page is now a Web Panel.

Main Highlights of JIRA 5.0 Beta 2:

<table>
<thead>
<tr>
<th>Create and Edit Issues Rapidly (improved in Beta 2)</th>
<th>Remote ‘Issue Links’ (improved in Beta 2)</th>
<th>Sharing Issues and ‘Mentions’ (new in Beta 2)</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Create and Edit Issues Rapidly" /></td>
<td><img src="image" alt="Remote ‘Issue Links’" /></td>
<td><img src="image" alt="Sharing Issues and ‘Mentions’" /></td>
</tr>
<tr>
<td>• Create and edit issues rapidly in a dialog box</td>
<td>• Create links to JIRA issues on another JIRA site</td>
<td></td>
</tr>
<tr>
<td>• Create multiple issues in succession</td>
<td>• Create links to any URL</td>
<td></td>
</tr>
<tr>
<td>• Customise to show fields you use most often</td>
<td>• Create links via JIRA’s Java or REST API</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Share an issue quickly with other users</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Mention a user in an issue comment</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• JIRA uses autocomplete whenever you share or mention a user</td>
<td></td>
</tr>
</tbody>
</table>

Other Highlights:
- More Enhancements to JQL
- Activity Streams Now Show External Content
- Manage Other Users Shared Filters and Dashboards
- Administration User Interface Improvements (*improved in Beta 2*)
- REST API Improvements (*improved in Beta 2*)
- Java API Improvements
- Performance Improvements
- New Troubleshooting and Debugging Tools
- New Email Handler Wizard (*improved in Beta 2*)
- Remote Issue Copying

Thank you for your interest in JIRA 5.0 Beta 2

Download Beta

⚠️ Please be aware of known issues specific to this JIRA 5.0 Beta 2 Release.

ℹ️ Upgrading to JIRA 5.0 Beta 2

JIRA EAP releases are available here. When upgrading, please follow the JIRA 5.0 Upgrade Notes.

⚠️ Do not use in production

Beta releases should not be used in production environments as they are not officially supported.

⚠️ Please also take note of the following information:

- **Beta releases are not safe**— Beta releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because Beta releases represent work in progress, we cannot provide a supported upgrade path between Beta releases, or from any Beta to the eventual final release. Thus, any data you store in a JIRA Beta release may not be able to be migrated to a future JIRA release.

Highlights of JIRA 5.0 Beta 2

1

*Create and Edit Issues Rapidly (*improved in Beta 2*)*

JIRA 5.0 provides a rapid and customisable dialog box for creating and editing JIRA issues, which replaces the Create and Edit Issue forms.

The Create/Edit Issue dialog boxes show all available fields by default. However, you can quickly remove or re-add fields via the *Configure Fields* button at the top-right of the dialog box. JIRA remembers your last set of field choices, giving you a personally customised dialog box that presents you with your most commonly edited fields whenever you create or edit an issue.

If you select the *Create another* check box, JIRA will create your issue and automatically pre-populate a new 'Create Issue' dialog box with your previous options, whilst leaving the 'Summary' field blank. This
allows you to rapidly create a series of related issues with similar options. Note that this feature does not carry across any attachments that were attached to your previously created issue.

Consistent with JIRA's existing keyboard shortcuts, type ‘c’ to access the create issue dialog box or ‘e’ from a currently selected issue on the Issue Navigator or 'View Issue' page to access the edit dialog box for that issue.

Remote 'Issue Links' (improved in Beta 2)

The Remote 'Issue Links' feature provides a powerful way to link JIRA issues to items external to your JIRA installation, residing on external applications. Along with a Java and REST API to add these links, end users can also:

- Add a link from a JIRA issue to another issue on a different JIRA installation or site using application links with trusted applications authentication. OAuth-based application links will also work but currently possess some minor UI bugs to be fixed.
- Add a reciprocal link from a JIRA issue to another issue on a different JIRA installation or site using application links with either trusted applications or OAuth-based authentication.
- Add a link from a JIRA issue to any web page URL, such as a page of documentation, a technical note, or any other page on another web site.

For more information about this feature, see.
Sharing Issues and ‘Mentions’ (new in Beta 2)

Want to let others know about a JIRA issue quickly? Simply visit that JIRA issue and then do either of the following:

- Click the new ‘Share’ button (or type ‘s’) and specify the people you want to share the page with. Add an optional note then click ‘Share’.

  Screenshot: Sharing an issue with other users

⚠ Please be aware that the 'User name or email' field only accepts JIRA users in Beta 2. Arbitrary email addresses currently cannot be entered.

Users specified in the 'User name or email' field will receive details of the issue in an email message (sent to the addresses registered with their JIRA user accounts). The email message’s subject line will indicate that the person who used this feature 'shared' the issue with them.

- In an issue comment, type the '@' symbol and begin typing the name or username of a JIRA user. Select the appropriate user from the dropdown. You can do this with multiple users and after adding your comment, those users will be notified that you mentioned them in a comment.

  Screenshot: Mentioning a user in an issue comment
Users will receive details of the issue in an email message (sent to the addresses registered with their JIRA user accounts). The email message's subject line will indicate that the person who used this feature 'mentioned' them on that issue.

The 'Mentions' feature has a few bugs in Beta 2:
- You currently cannot 'mention' users when editing a comment or using the 'Add Comment' dialog box.
- Some minor UI bugs are still present.

More Enhancements to JQL — New “CHANGED” Operator and “WAS” Improvements

Enhancements were introduced in JIRA 4.4 that allowed you to search the history of an issue’s Assignee and Reporter fields.

In JIRA 5.0, JQL supports the new "CHANGED" operator, which can accept the optional predicates "FROM", "TO", "ON", "DURING", "BEFORE", "AFTER" and "BY".

For example, the following JQL query:

```
status changed FROM "In QA Review" to "QA Rejected" BY freddo BEFORE endOfWeek() AFTER startOfWeek()
```

Will find any issues whose Status field value was at some point "In QA Review" but changed to "QA Rejected", by user 'freddo', and after the start and before the end of the current week.

You can use complex queries such as these to generate the following 'Single Level Group By Report', which in the example below, shows grouping by 'Team'.

```
4
```
The "CHANGED" operator can be used on the **Status, Assignee, Priority, Reporter, Resolution** and **Fix Version** fields.

The "WAS" operator can now be used on the **Fix Version** field too. For example, the following JQL query:

```
fixVersion WAS 4.4
```

Will find any issues whose **Fix Version** field was at some point (or currently is) set to 4.4.

**Activity Streams Now Show External Content**

We are expanding the [Activity Stream features introduced in JIRA 4.4](https://confluence.jetbrains.com/viewdoc/attachedfile?docId=137584) with:

- The ability to show external activity from another Atlassian application (such as Confluence, FishEye/Crucible and Bamboo) via an [Application Link](https://confluence.jetbrains.com/viewdoc/attachedfile?docId=137584).
- The ability to combine this external activity into an [Activity Stream gadget](https://confluence.jetbrains.com/viewdoc/attachedfile?docId=137584) on a JIRA dashboard.
- An API for creating entries in activity streams from remote applications via the REST API or locally via Java.

*Screenshot: Activity stream gadget showing activity from other Atlassian applications*
Screenshot: Activity stream gadget showing activity from non-Atlassian applications

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

Manage Other Users’ Shared Filters and Dashboards
JIRA administrators have the ability to change the ownership of or delete other user's shared filters and dashboards. A shared filter or dashboard is a filter/dashboard created (and hence, owned) by a user, which the user has then shared with others.

Since JIRA only allows the editing or modification of shared filters/dashboards by their owners, this new JIRA feature is especially helpful in situations where a user has left an organisation, but the shared filters or dashboards they created continue to be used by others within the organisation.

Only users with the Create Shared Objects global permission can share their filters and dashboards with other JIRA users.

You can access these features by selecting 'Administration' > 'Users' > 'Shared Filters' or 'Shared Dashboards' (or using the keyboard shortcut 'g' + 'g' + start typing 'shared filters' or 'shared dashboard').

On the 'Shared Filters' or 'Shared Dashboard' pages, you can search for any shared filters/dashboards, or use the cog icon to change the owner of a shared filter/dashboard to another user or delete the shared filter/dashboard:

---

Administration User Interface Improvements (improved in Beta 2)

Following on with improvements to the Administration User Interface (UI) in JIRA 4.4, JIRA 5.0 will provide further improvements to the Administration UI by converting various forms and pages in this area to convenient dialog boxes.

In addition to the dialog box for adding a new user, in Beta 2, the 'Attachments' and 'View Workflows' pages have been redesigned and the forms associated with these pages have been converted into convenient dialog boxes too.

For example, the form for editing attachment settings is now a dialog box, which is accessed by clicking 'Edit Settings' on the 'Attachments' page of JIRA’s Administration area:
REST API Improvements (improved in Beta 2)

JIRA's REST API is undergoing a significant number of changes and improvements to provide the following:

- Create new issues.
- Retrieve metadata for creating new issues.
- Retrieve metadata for editing existing issues.
- Delete existing issues and their subtasks.
- Create remote issue links.
- More system fields are supported by the REST API.

Please also note that we have changed the `api-version` name component of URLs for JIRA's REST API calls from '2.0.alpha1' to simply '2'.

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details. We also have a series of REST API Tutorials to help you get started using our new REST API improvements.
• Removal of deprecated portlets (replaced by gadgets in JIRA 4.0) and their related APIs. Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

Please also be aware that the JIRA's Java API is likely to undergo a rapid number of changes from one JIRA 5.0 EAP release to the next.

Performance Improvements

Lucene 3.2 is now fully integrated into JIRA. Initial benchmarking shows performance improvements across a number of JIRA features.

The 'Activity' tabs on the 'View Issue' page are now loaded in the background when this page is first viewed, allowing the information on these tabs to be displayed more rapidly.

^Top

11

New Troubleshooting and Debugging Tools

JIRA 5.0 adds several tools to help Administrators debug the configuration of their instance.

• A number of email debugging tools are now provided to System Administrators in the new 'Logging and Profiling' page under 'Troubleshooting and Support'
  • Enable or disable mail logging
  • Turn debug mail logging on or off
  • Configure a logging level for a new package easily in the default loggers section.
• For testing and troubleshooting LDAP connections, much more comprehensive testing is now provided, including basic connections, user retrieval, user membership, group retrieval, group membership and authentication.

New Email Handler Wizard (improved in Beta 2)

JIRA 5.0 incorporates a new email handler wizard that greatly simplifies the process of configuring incoming mail handlers for creating issues or comments from email messages.

You no longer have to configure a JIRA service and enter in a complex string of Handler parameters for your email handler. Instead you configure your email handler through a convenient wizard:
In Beta 2, we've improved the layout of JIRA's mail configuration options. The configuration options in the 'Mail Servers' tab has been separated into two tabs — one for 'Outgoing Mail' (SMTP) and another for 'Incoming Mail' (POP/IMAP) configuration. The configuration options in the 'Mail Handlers' tab has been incorporated into the 'Outgoing Mail' tab.

New Plugin to Try Out — Remote Issue Copying

This new JIRA 5.0-compatible feature, currently undergoing development as a plugin, allows you to copy issues from one JIRA site to another.

Once you have an Application Link established between your JIRA site and another, a new issue action 'Remote Copy' will appear in the view issue page. You can limit this action to a particular user group, but by default everyone can use it.
You will be prompted to map field values by field names for JIRA's built-in (system) fields and/or to configure default values for required fields.

ℹ️ You will require the appropriate permissions to set the field value on the target site.

Custom fields are generally supported, although so far, we have only provided a mapper for the SelectCFType custom field type. Supporting more custom fields is a matter of writing more mappers (which we intend to make pluggable for the final JIRA 5.0 release).

The Remote Issue Copy feature is currently available as a plugin that needs to be installed on each JIRA server you wish to copy issues between. You also need to configure the following before you can copy issues between your JIRA sites:

1. An Application Link from the source JIRA site to the target JIRA site — see Adding an Application Link.
2. A Project Link from the source JIRA Project to the target JIRA Project — Adding Project Links between Applications.

⚠️ The Remote Issue Copying plugin is not yet bundled with JIRA. However, you can download it from the following link:

Other Enhancements and Fixes

For a list of more issues resolved in JIRA 5.0 so far, click here.

Known Issues in JIRA 5.0 Beta 2

- JIRA 5.0 EAP and Beta releases currently possess a critical issue (JRA-25914) which may cause data corruption in a high-load environment. This issue will be resolved in 5.0 Beta 3. However, as mentioned above, JIRA EAP and Beta releases should not be used in production environment, nor are they supported.
- When you use the dialog box for creating an issue and you select the 'Create another' check box before clicking the 'Create' button, an error will be generated if you had uploaded attachments to that issue.

JIRA 5.0 Beta 1 Release Notes

28 September 2011

JIRA 5.0 Beta 1 (a.k.a 5.0 milestone 6 or 'm6') is a public development release leading up to JIRA 5.0. A Beta release is a preliminary release leading up to the official release of a JIRA version. Beta releases are a snapshot of our work in progress and provide an advance preview of new features to the general public. JIRA plugin developers can also use Beta releases to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

The Atlassian team is proud to bring you the JIRA 5.0 Beta 1 release. Thank you for your feedback during the recent EAP releases and please keep providing it here.

The focus of JIRA 5.0 is on making JIRA easier to use and manage. There are also a large number of improvements for the JIRA developer community. New REST APIs have been added to create issues, a stable JIRA API is being refined and every block area on the 'View Issue' page is now a Web Panel.

Main Highlights of JIRA 5.0 Beta 1:

<table>
<thead>
<tr>
<th>Customisable Dialog Box for Creating and Editing Issues</th>
<th>Remote Links</th>
<th>More Enhancements to JQL</th>
<th>Activity Streams Now Show External Content</th>
<th>Manage Other Users Shared Filters and Dashboards</th>
</tr>
</thead>
</table>

Other Highlights:

- REST API Improvements
- Java API Improvements
- Performance Improvements
- New Troubleshooting and Debugging Tools
- New Email Handler Wizard
- Remote Issue Copying

Thank you for your interest in JIRA 5.0 Beta 1

Download Beta

⚠️ Please be aware of known issues specific to this JIRA 5.0 Beta 1 Release.

Upgrading to JIRA 5.0 Beta 1

JIRA EAP releases are available here. When upgrading, please follow the JIRA 5.0 Upgrade Notes.
Do not use in production
Beta releases should not be used in production environments as they are not officially supported.

Please also take note of the following information:
- **Beta releases are not safe**— Beta releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because Beta releases represent work in progress, we **cannot** provide a supported upgrade path between Beta releases, or from any Beta to the eventual final release. Thus, any data you store in a JIRA Beta release may not be able to be migrated to a future JIRA release.

Highlights of JIRA 5.0 Beta 1

**Customisable Dialog Box for Creating and Editing Issues (new in Beta 1)**

JIRA 5.0 provides a convenient and customisable dialog box for creating and editing JIRA issues, replacing the Create and Edit Issue forms.

The Create/Edit Issue dialog boxes provide a standard set of default fields. However, you can quickly add or remove fields via the 'Configure Fields' button at the top-right of the dialog box. JIRA remembers your last set of field choices, giving you a personally customised dialog box that presents you with your most commonly edited fields whenever you create or edit an issue.

If you select the 'Create another' check box, JIRA will create your issue and automatically pre-populate a new 'Create Issue' dialog box with your previous options, whilst leaving the 'Summary' field blank. This allows you to rapidly create a series of related issues with similar options. Note that this feature does not carry across any attachments that were attached to your previously created issue.

Type 'c' to access the create issue dialog box or 'e' from a currently selected issue on the Issue Navigator or 'View Issue' page to access the edit dialog box for that issue.
Remote Links (improved in Beta 1)

The Remote Issue Linking feature provides a powerful way to link JIRA issues to items external to your JIRA installation or external applications. Along with a Java and REST API to add these links, end users can also add links from a JIRA issue to:

- another JIRA issue on a different JIRA installation or site using application links with trusted applications authentication. OAuth-based application links will also work but currently possess some minor UI bugs to be fixed.
- any web page URL, such as a page of documentation, a technical note, or any other page on another web site.

For more information about this feature, see [JIRA Remote Issue Links](#).
The "CHANGED" operator can be used on the Status, Assignee, Priority, Reporter, Resolution and Fix Version fields.

The "WAS" operator can now be used on the Fix Version field too. For example, the following JQL query:

```plaintext
fixVersion WAS 4.4
```

Will find any issues whose Fix Version field was at some point (or currently is) set to 4.4.

Activity Streams Now Show External Content

We are expanding the Activity Stream features introduced in JIRA 4.4 with:

- The ability to show external activity from another Atlassian application (such as Confluence, FishEye/Crucible and Bamboo) via an Application Link.
- The ability to combine this external activity into an Activity Stream gadget on a JIRA dashboard.
- An API for creating entries in activity streams from remote applications via the REST API or locally via Java.

Screenshot: Activity stream gadget showing activity from other Atlassian applications
Screenshot: Activity stream gadget showing activity from non-Atlassian applications

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.

Manage Other Users’ Shared Filters and Dashboards
JIRA administrators have the ability to change the ownership of or delete other user’s shared filters and dashboards. A shared filter or dashboard is a filter/dashboard created (and hence, owned) by a user, which the user has then shared with others.

Since JIRA only allows the editing or modification of shared filters/dashboards by their owners, this new JIRA feature is especially helpful in situations where a user has left an organisation, but the shared filters or dashboards they created continue to be used by others within the organisation.

Only users with the Create Shared Objects global permission can share their filters and dashboards with other JIRA users.

You can access these features by selecting 'Administration' > 'Users' > 'Shared Filters' or 'Shared Dashboards' (or using the keyboard shortcut 'g' + 'g' + start typing 'shared filters' or 'shared dashboard').

On the 'Shared Filters' or 'Shared Dashboard' pages, you can search for any shared filters/dashboards, or use the cog icon to change the owner of a shared filter/dashboard to another user or delete the shared filter/dashboard:

![Shared Dashboards](image)

Administration User Interface Improvements

Following on with improvements to the Administration User Interface (UI) in JIRA 4.4, JIRA 5.0 will provide further improvements to the Administration UI by converting various forms and pages in this area to convenient dialog boxes.

The form for adding a new user, accessed by clicking 'Add User' on the 'User Browser' page of JIRA’s Administration area, is now a dialog box:
REST API Improvements

JIRA's REST API is undergoing a significant number of changes and improvements to provide the following:

- Create new issues.
- Retrieve metadata for creating new issues.
- Retrieve metadata for editing existing issues.
- Delete existing issues and their subtasks.
- Create remote issue links.

Please also note that we have changed the `api-version` name component of URLs for JIRA's REST API calls from '2.0.alpha1' to simply '2'.

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details. We also have a series of REST API Tutorials to help you get started using our new REST API improvements.

Java API Improvements

JIRA's Java API is undergoing a significant number of changes and improvements to provide the following:

- More stability and reliability with future versions of JIRA.
- Removal of deprecated OSUser classes.
- Removal of deprecated portlets (replaced by gadgets in JIRA 4.0) and their related APIs.

Refer to the Preparing for JIRA 5.0 section of our developer documentation site for more details.
Please also be aware that the JIRA's Java API is likely to undergo a rapid number of changes from one JIRA 5.0 EAP release to the next.

**Performance Improvements**

Lucene 3.2 is now fully integrated into JIRA. Initial benchmarking shows performance improvements across a number of JIRA features.

The 'Activity' tabs on the 'View Issue' page are now loaded in the background when this page is first viewed, allowing the information on these tabs to be displayed more rapidly.

**New Troubleshooting and Debugging Tools**

JIRA 5.0 adds several tools to help Administrators debug the configuration of their instance.

- A number of email debugging tools are now provided to System Administrators in the new 'Logging and Profiling' page under 'Troubleshooting and Support'
  - Enable or disable mail logging
  - Turn debug mail logging on or off
  - Configure a logging level for a new package easily in the default loggers section.
- For testing and troubleshooting LDAP connections, much more comprehensive testing is now provided, including basic connections, user retrieval, user membership, group retrieval, group membership and authentication.

**New Email Handler Wizard**

JIRA 5.0 incorporates a new email handler wizard that greatly simplifies the process of configuring POP or IMAP mail servers with JIRA for creating issues or comments from email messages.

You no longer have to configure a JIRA service and enter in a complex string of Handler parameters for your email handler. Instead you configure your email handler through a convenient wizard:
New Plugin to Try Out — Remote Issue Copying

This new JIRA 5.0-compatible feature, currently undergoing development as a plugin, allows you to copy issues from one JIRA site to another.

Once you have an Application Link established between your JIRA site and another, a new issue action ‘Remote Copy’ will appear in the view issue page. You can limit this action to a particular user group, but by default everyone can use it.
You will be prompted to map field values by field names for JIRA's built-in (system) fields and/or to configure default values for required fields.

ℹ️ You will require the appropriate permissions to set the field value on the target site.

Custom fields are generally supported, although so far, we have only provided a mapper for the SelectCFType custom field type. Supporting more custom fields is a matter of writing more mappers (which we intend to make pluggable for the final JIRA 5.0 release).

The Remote Issue Copy feature is currently available as a plugin that needs to be installed on each JIRA server you wish to copy issues between. You also need to configure the following before you can copy issues between your JIRA sites:

1. An Application Link from the source JIRA site to the target JIRA site — see Adding an Application Link.
2. A Project Link from the source JIRA Project to the target JIRA Project — Adding Project Links between Applications.

⚠️ The Remote Issue Copying plugin is not yet bundled with JIRA. However, you can download it from the following link:

Known Issues in JIRA 5.0 Beta 1

- If you use a Microsoft SQL Server database with JIRA 5.0 Beta 1, saved filters will not be stored correctly in the database. Hence, whenever JIRA accesses these saved filters, no results will be returned and an error will be generated in JIRA’s logs.
- If you add a gadget to a JIRA 5.0 Beta 1 dashboard, which originates from another JIRA installation on version 4.4.x or earlier, the contents of the gadget will not be displayed and will appear to be constantly loading.
- When you use the customisable dialog box for creating an issue and you select the ‘Create another’ check box before clicking the ‘Create’ button, an error will be generated if you had uploaded attachments to that issue.

JIRA 5.0 EAP 5 Release Notes

15 September 2011

JIRA 5.0 EAP 5 (a.k.a 5.0 milestone 5 or ‘m5’) is a public development release leading up to JIRA 5.0. An Early Access Preview (EAP) release is a snapshot of our work in progress, primarily focused on allowing JIRA users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

While development work on JIRA 5.0 commenced relatively recently, we want your involvement from the earliest days. Please provide feedback here.

A lot of the features in JIRA 5.0 focus on making JIRA easier to use and manage. With JIRA 5.0, you can link JIRA issues to other applications, search for issues whose fixVersion WAS a particular value at some point in the past, and administrators can manage shared filters and dashboards that were created by other people and issues can be copied between different JIRA sites.

There are a large number of improvements for the JIRA developer community (and more to come in future EAPs). In JIRA 5.0 EAP 5, new REST APIs have been added to create issues, a stable JIRA API is undergoing refinement and every block area on the 'View Issue' page is now a Web Panel.

Highlights of JIRA 5.0 EAP 5:

- Remote Issue Linking (improved in EAP 5)
- More Enhancements to JQL — New “CHANGED” Operator and “WAS” Improvements (improved in EAP 5)
- Activity Streams Now Show External Content
- Manage Other Users’ Shared Filters and Dashboards
- Administration User Interface Improvements (new in EAP 5)
- REST API Improvements
- Java API Improvements
- Performance Improvements
- New Troubleshooting and Debugging Tools (new in EAP 5)
- New Plugin to Try Out — Remote Issue Copying
- Other Enhancements and Fixes

Thank you for your interest in JIRA 5.0 EAP 5

JIRA 6.2 Documentation

Upgrading to JIRA 5.0 EAP 5
JIRA EAP releases are available here. When upgrading, please follow the JIRA 5.0 Upgrade Notes.

Do not use in production
- **EAP releases are not safe** — EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

Highlights of JIRA 5.0 EAP 5

1

**Remote Issue Linking (improved in EAP 5)**

The Remote Issue Linking feature provides a powerful way to link JIRA issues to another application. Along with a Java and REST API to add links, end users can also add a link in a JIRA issue to any URL, such as some documentation on another site, a technical note, or any relevant web page or URL.

2

**More Enhancements to JQL — New “CHANGED” Operator and “WAS” Improvements (improved in EAP 5)**

Enhancements were introduced in JIRA 4.4 that allowed you to search the history of an issue's **Assignee** and **Reporter** fields.

In JIRA 5.0, **JQL** supports the new "CHANGED" operator, which can accept the optional predicates "FROM", "TO", "ON", "DURING", "BEFORE", "AFTER" and "BY".

For example, the following JQL query:
status CHANGED FROM "In Progress" TO "Open" BY pslade BEFORE endOfWeek() AFTER startOfWeek()

Will find any issues whose **Status** field value was at some point "In Progress" but changed to "Open", by user 'pslade', and after the start and before the end of the current week.

The "CHANGED" operator can be used on the **Status**, **Assignee**, **Priority**, **Reporter**, **Resolution** and **Fix Version** fields.

![Filter: QA Rejected Issues that are still Open](image)

The "WAS" operator can be used on the **Fix Version** field too. For example, the following JQL query:

```
fixVersion WAS 4.4
```

Will find any issues whose **Fix Version** field was at some point (or currently is) set to 4.4.

**Activity Streams Now Show External Content**

We are expanding the [Activity Stream features introduced in JIRA 4.4](https://confluence.atlassian.com/display/JIRA/Activity+Stream) with:

- The ability to show external activity from another Atlassian application (such as Confluence, FishEye/Crucible and Bamboo) via an [Application Link](https://confluence.atlassian.com/display/JIRA/Working+with+Applications).
- The ability to combine this external activity into an [Activity Stream gadget](https://confluence.atlassian.com/display/JIRA/Creating+Activity+Streams+Gadgets) on a JIRA dashboard.
- An API for creating entries in activity streams from remote applications via the REST API or locally via Java.
Refer to the Plugin Developer Notes for JIRA 5.0 for more details.

**Manage Other Users' Shared Filters and Dashboards**

JIRA administrators have the ability to change the ownership of or delete other user's shared filters and dashboards. A shared filter or dashboard is a filter/dashboard created (and hence, owned) by a user, which the user has then shared with others.

Since JIRA only allows the editing or modification of shared filters/dashboards by their owners, this new JIRA feature is especially helpful in situations where a user has left an organisation, but the shared filters or dashboards they created continue to be used by others within the organisation.

Only users with the Create Shared Objects global permission can share their filters and dashboards with other JIRA users.

You can access these features by selecting 'Administration' > 'Users' > 'Shared Filters' or 'Shared Dashboards' (or using the keyboard shortcut 'g' + 'g' + start typing 'shared filters' or 'shared dashboard').

On the 'Shared Filters' or 'Shared Dashboard' pages, you can search for any shared filters/dashboards, or use the cog icon to change the owner of a shared filter/dashboard to another user or delete the shared filter/dashboard:
Administration User Interface Improvements (new in EAP 5)

Following on with improvements to the Administration User Interface (UI) in JIRA 4.4, JIRA 5.0 will provide further improvements to the Administration UI by converting various forms and pages in this area to convenient dialog boxes.

In JIRA 5.0 EAP 5, the 'Create New User' form, accessed by clicking 'Add User' on the ‘User Browser’ page of JIRA's Administration area, is now a dialog box.

REST API Improvements

JIRA's REST API is undergoing a significant number of changes and improvements to provide the following:

- Create new issues.
- Retrieve metadata for creating new issues.
- Retrieve metadata for editing existing issues.
- Delete existing issues and their subtasks.
- Create remote issue links.

Please also note that the we have changed the api-version name component of URLs for JIRA's REST API calls from '2.0.alpha1' to simply '2'.

Refer to the Plugin Developer Notes for JIRA 5.0 for more details.

Java API Improvements

JIRA's Java API is undergoing a significant number of changes and improvements to provide the following:

- More stability and reliability with future versions of JIRA.
- Removal of deprecated OSUer classes.
- Removal of deprecated portlets (replaced by gadgets in JIRA 4.0) and their related APIs.

Please see the Plugin Developer Notes for JIRA 5.0 for more details.

Please also be aware that the JIRA's Java API is likely to undergo a rapid number of changes from one JIRA 5.0 EAP release to the next.
Performance Improvements

Lucene 3.2 is now fully integrated into JIRA. Initial benchmarking shows performance improvements across a number of JIRA features.

The 'Activity' tabs on the 'View Issue' page are now loaded in the background when this page is first viewed, allowing the information on these tabs to be displayed more rapidly.

New Troubleshooting and Debugging Tools (new in EAP 5)

JIRA 5.0 adds several tools to help Administrators debug the configuration of their instance.

- A number of email debugging tools are now provided to System Administrators in the new 'Logging and Profiling' page under 'Troubleshooting and Support'
  - Enable or disable mail logging
  - Turn debug mail logging on or off
  - Configure a logging level for a new package easily in the default loggers section.
- For testing and troubleshooting LDAP connections, much more comprehensive testing is now provided, including basic connections, user retrieval, user membership, group retrieval, group membership and authentication.

New Plugin to Try Out — Remote Issue Copying

This new JIRA 5.0-compatible feature, currently undergoing development as a plugin, allows you to copy issues from one JIRA site to another.

Once you have an Application Link established between your JIRA site and another, a new issue action 'Remote Copy' will appear in the view issue page. You can limit this action to a particular user group, but by default everyone can use it.
You will be prompted to map field values by field names for JIRA's built-in (system) fields and/or to configure default values for required fields.

You will require the appropriate permissions to set the field value on the target site.

Custom fields are generally supported, although so far, we have only provided a mapper for the SelectCFType custom field type. Supporting more custom fields is a matter of writing more mappers (which we intend to make pluggable for the final JIRA 5.0 release).

The Remote Issue Copy feature is currently available as a plugin that needs to be installed on each JIRA server you wish to copy issues between. You also need to configure the following before you can copy issues between your JIRA sites:

1. An Application Link from the source JIRA site to the target JIRA site — see Adding an Application Link.
2. A Project Link from the source JIRA Project to the target JIRA Project — Adding Project Links between Applications.

The Remote Issue Copying plugin is not yet bundled with JIRA. However, you can download it from the following link:

Other Enhancements and Fixes

For a list of more issues resolved in JIRA 5.0 so far, click here.

JIRA 5.0 EAP 4 Release Notes

6 September 2011

JIRA 5.0 EAP 4 (a.k.a 5.0 milestone 4 or ‘m4’) is a public development release leading up to JIRA 5.0. An Early Access Preview (EAP) release is a snapshot of our work in progress, primarily focused on allowing JIRA users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

While development work on JIRA 5.0 commenced relatively recently, we want your involvement from the earliest days. Please provide feedback here.

A lot of the features in JIRA 5.0 focus on making JIRA easier to use and manage. With JIRA 5.0, it is now possible to link JIRA issues to other applications, you can search for issues whose fixVersion WAS a particular value at some point in the past, administrators can manage shared filters and dashboards that were created by other people and issues can be copied between different JIRA sites.

There are a large number of improvements for the JIRA developer community (and more to come in future EAPs). In JIRA 5.0 EAP 4, new REST APIs have been added to create issues, a stable JIRA API is undergoing refinement and every block area on the 'View Issue' page is now a Web Panel.

Highlights of JIRA 5.0 EAP 4:

- Remote Issue Linking (new in EAP 4)
- More Enhancements to the JQL "WAS" Function (new in EAP 4)
- Activity Streams Now Show External Content (improved since EAP 3)
- Manage Other Users' Shared Filters and Dashboards
- REST API Improvements
- Java API Improvements
- Performance Improvements
- New Plugin to Try Out — Remote
Issue Copying
- Other Enhancements and Fixes

Thank you for your interest in JIRA 5.0 EAP 4
Download EAP

Upgrading to JIRA 5.0 EAP 4
JIRA EAP releases are available here. When upgrading, please follow the JIRA 5.0 Upgrade Notes.

Do not use in production
- EAP releases are not safe — EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because EAP releases represent work in progress, we cannot provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

Highlights of JIRA 5.0 EAP 4

1

Remote Issue Linking (new in EAP 4)
The Remote Issue Linking feature provides a powerful way to link JIRA issues to your application.

JIRA Remote Issue Links
For more information about this feature, see .

2

More Enhancements to the JQL "WAS" Function (new in EAP 4)
Enhancements were introduced in JIRA 4.4 that allowed you to search the history of an issue's Assignee and Reporter fields.

In JIRA 5.0, you can now also search the history of the fixVersion field, e.g.
This will find any issues whose **fixVersion** field was at some point (or currently is) set to 4.4.

```
project = "JIRA Development" AND fixVersion WAS "4.4" AND fixVersion = "5.0"
```

---

### Activity Streams Now Show External Content (Improved since EAP 3)

We are expanding the Activity Stream features introduced in JIRA 4.4 with:

- The ability to show external activity from another Atlassian application (such as Confluence, FishEye/Crucible and Bamboo) via an Application Link.
- The ability to combine this external activity into an Activity Stream gadget on a JIRA dashboard.
- An API for creating entries in activity streams from remote applications via the REST API or locally via Java.

Refer to the Plugin Developer Notes for JIRA 5.0 for more details.
Manage Other Users' Shared Filters and Dashboards

JIRA administrators have the ability to change the ownership of or delete other user's shared filters and dashboards. A shared filter or dashboard is a filter/dashboard created (and hence, owned) by a user, which the user has then shared with others.

Since JIRA only allows the editing or modification of shared filters/dashboards by their owners, this new JIRA feature is especially helpful in situations where a user has left an organisation, but the shared filters or dashboards they created continue to be used by others within the organisation.

Only users with the Create Shared Objects global permission can share their filters and dashboards with other JIRA users.

You can access these features by selecting 'Administration' > 'Users' > 'Shared Filters' or 'Shared Dashboards' (or using the keyboard shortcut 'g' + 'g' + start typing 'shared filters' or 'shared dashboard' ).

On the 'Shared Filters' or 'Shared Dashboard' pages, you can search for any shared filters/dashboards, or use the cog icon to change the owner of a shared filter/dashboard to another user or delete the shared filter/dashboard:

<table>

REST API Improvements

JIRA's REST API is undergoing a significant number of changes and improvements to provide the following:

- Create new issues.
- Retrieve metadata for creating new issues.
- Retrieve metadata for editing existing issues.
- Delete existing issues and their subtasks.
- Create remote issue links.

Please also note that the we have changed the api-version name component of URLs for JIRA's REST API calls from '2.0.alpha1' to simply '2'.

Refer to the Plugin Developer Notes for JIRA 5.0 for more details.

6

Java API Improvements

JIRA's Java API is undergoing a significant number of changes and improvements to provide the following:

- More stability and reliability with future versions of JIRA.
- Removal of deprecated OSUser classes.
- Removal of deprecated portlets (replaced by gadgets in JIRA 4.0) and their related APIs.

Please see the Plugin Developer Notes for JIRA 5.0 for more details.

Please also be aware that the JIRA's Java API is likely to undergo a rapid number of changes from one JIRA 5.0 EAP release to the next.

^Top

7

Performance Improvements

Lucene 3.2 is now fully integrated into JIRA. Initial benchmarking shows performance improvements across a number of JIRA features.

The 'Activity' tabs on the 'View Issue' page are now loaded in the background when this page is first viewed, allowing the information on these tabs to be displayed more rapidly.

New Plugin to Try Out — Remote Issue Copying

This new JIRA 5.0-compatible feature, currently undergoing development as a plugin, allows you to copy issues from one JIRA site to another.

Once you have an Application Link established between your JIRA site and another, a new issue action 'Remote Copy' will appear in the view issue page. You can limit this action to a particular user group, but by default everyone can use it.
You will be prompted to map field values by field names for JIRA’s built-in (system) fields and/or to configure default values for required fields.

You will require the appropriate permissions to set the field value on the target site.

Custom fields are generally supported, although so far, we have only provided a mapper for the SelectCFType custom field type. Supporting more custom fields is a matter of writing more mappers (which we intend to make pluggable for the final JIRA 5.0 release).

The Remote Issue Copy feature is currently available as a plugin that needs to be installed on each JIRA server you wish to copy issues between. You also need to configure the following before you can copy issues between your JIRA sites:

1. An Application Link from the source JIRA site to the target JIRA site — see Adding an Application Link.
2. A Project Link from the source JIRA Project to the target JIRA Project — Adding Project Links between Applications.

The Remote Issue Copying plugin is not yet bundled with JIRA. However, you can download it from the following link:

Other Enhancements and Fixes
JIRA 5.0 EAP 3 Release Notes

26 August 2011

**JIRA 5.0 EAP 3** (a.k.a 5.0 milestone 3 or 'm3') is a public development release leading up to **JIRA 5.0**. An **Early Access Preview (EAP) release** is a snapshot of our work in progress, primarily focused on allowing JIRA users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

While development work on JIRA 5.0 commenced relatively recently, we want your involvement from the earliest days. Please provide feedback here.

A lot of the features in JIRA 5.0 focus on making JIRA easier to use and manage. With JIRA 5.0, administrators can manage shared filters and dashboards that were created by other people and issues can be copied between different JIRA sites.

There are a large number of improvements for the JIRA developer community (and more to come in future EAPs). In JIRA 5.0 EAP 3, new REST APIs have been added to create issues, a stable JIRA API is undergoing refinement and every block area on the 'View Issue' page is now a Web Panel.

**Highlights of JIRA 5.0 EAP 3:**
- Manage Other Users' Shared Dashboards (new since EAP 2)
- Manage Other Users' Shared Filters
- Activity Stream API (new since EAP 2)
- REST API Improvements (improved since EAP 2)
- Java API Improvements
- Performance Improvements (improved since EAP 2)
- New Plugin to Try Out — Remote Issue Copying
- Other Enhancements and Fixes

**Thank you for your interest in JIRA 5.0 EAP 3**

Download EAP

### Upgrading to JIRA 5.0 EAP 3

JIRA EAP releases are available here. When upgrading, please follow the JIRA 5.0 Upgrade Notes.

### Do not use in production
- **EAP releases are not safe** — EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because EAP releases represent work in progress, we **can not** provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

**Highlights of JIRA 5.0 EAP 3**
Manage Other Users' Shared Dashboards (new since EAP 2)

JIRA administrators have the ability to manage other people's shared dashboards. This is especially helpful in situations where a user has left an organisation, but the shared dashboards they owned continue to be used by others within the organisation.

You can access this feature by selecting 'Administration' > 'Users' > 'Shared Dashboards' (or using the keyboard shortcut 'g' + 'g' + start typing 'shared dashboards'). On the 'Shared Dashboards' page, you can search for any shared dashboards, or use the cog icon to change the owner of a dashboard to another user or delete a dashboard:

![Shared Dashboards](image)

Manage Other Users' Shared Filters

JIRA also gives administrators the ability to manage other people's shared filters. Like Shared Dashboards (above), this is also useful in situations where a user has left an organisation, but the shared filters they owned continue to be used by others within the organisation.

You can access this feature by selecting 'Administration' > 'Users' > 'Shared Filters' (or using the keyboard shortcut 'g' + 'g' + start typing 'shared filters').

On the 'Shared Filters' page, you can search for any shared filter, or use the cog icon to change the owner of a filter to another user or delete a filter:

![Shared Filters](image)
Activity Stream API (new since EAP 2)

We are expanding the Activity Stream features introduced in JIRA 4.4 with a new Activity Stream API in JIRA 5.0 that makes it easy for any application to post activities into JIRA's activity streams.

REST API Improvements (improved since EAP 2)

JIRA's REST API is undergoing a significant number of changes and improvements to provide the following:

- Create new issues.
- Retrieve metadata for creating new issues.
- Retrieve metadata for editing existing issues.
- Delete existing issues and their subtasks.
- Create remote issue links.

Please also note that we have changed the api-version name component of URLs for JIRA's REST API calls from '2.0.alpha1' to simply '2'.

Java API Improvements

JIRA's Java API is undergoing a significant number of changes and improvements to provide the following:

- More stability and reliability with future versions of JIRA.
- Removal of deprecated OSUser classes.
- Removal of deprecated portlets (replaced by gadgets in JIRA 4.0) and their related APIs.
Please see the Plugin Developer Notes for JIRA 5.0 for more details.

Please also be aware that the JIRA's Java API is likely to undergo a rapid number of changes from one JIRA 5.0 EAP release to the next.

Performance Improvements (improved since EAP 2)

Lucene 3.2 is now fully integrated into JIRA. Initial benchmarking shows performance improvements across a number of JIRA features.

The 'Activity' tabs on the 'View Issue' page are now loaded in the background when this page is first viewed, allowing the information on these tabs to be displayed more rapidly.

New Plugin to Try Out — Remote Issue Copying

This new JIRA 5.0-compatible feature, currently undergoing development as a plugin, allows you to copy issues from one JIRA site to another.

Once you have an Application Link established between your JIRA site and another, a new issue action 'Remote Copy' will appear in the view issue page. You can limit this action to a particular user group, but by default everyone can use it.
You will be prompted to map field values by field names for JIRA’s built-in (system) fields and/or to configure default values for required fields. You will require the appropriate permissions to set the field value on the target site.

Custom fields are generally supported, although so far, we have only provided a mapper for the SelectCFType custom field type. Supporting more custom fields is a matter of writing more mappers (which we intend to make pluggable for the final JIRA 5.0 release).

The Remote Issue Copy feature is currently available as a plugin that needs to be installed on each JIRA server you wish to copy issues between. You also need to configure the following before you can copy issues between your JIRA sites:

1. An Application Link from the source JIRA site to the target JIRA site — see Adding an Application Link.
2. A Project Link from the source JIRA Project to the target JIRA Project — Adding Project Links between Applications.

⚠️ The Remote Issue Copying plugin is not yet bundled with JIRA. However, you can download it from the following link:

JIRA 5.0 EAP 2 Release Notes

10 August 2011

JIRA 5.0 EAP 2 (a.k.a 5.0 milestone 2 or 'm2') is a public development release leading up to JIRA 5.0. An Early Access Preview (EAP) release is a snapshot of our work in progress, primarily focused on allowing JIRA users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

Please note that JIRA 5.0 EAP 1 was not released to the public.

While development work on JIRA 5.0 commenced relatively recently, we want your involvement from the earliest days. Please provide feedback here.

A lot of the features in JIRA 5.0 focus on making JIRA easier to use and manage. With JIRA 5.0, administrators can manage filters that were created by other people.

There are a large number of improvements for the JIRA developer community (and more to come in future EAPs). In JIRA 5.0 EAP 2, new REST APIs have been added to create issues, a stable JIRA API is being defined and every block area on the 'View Issue' page is now a Web Panel.

Highlights of JIRA 5.0 EAP 2:
- Manage Other Users' Shared Filters
- JIRA 5.0 API Improvements
- Performance Improvements
- Other Enhancements and Fixes

Thank you for your interest in JIRA 5.0 EAP 2

Download EAP

Upgrading to JIRA 5.0 EAP 2

JIRA EAP releases are available here. When upgrading, please follow the JIRA 5.0 Upgrade Notes.

Do not use in production
- EAP releases are not safe — EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

Highlights of JIRA 5.0 EAP 2

Manage Other Users’ Shared Filters

JIRA 5.0 will give administrators the ability to manage other people's shared filters. This is especially helpful in situations where a user has left an organisation, but the shared filters they owned continue to be used by others within the organisation.

As the first step toward this, EAP 2 provides the ability for JIRA administrators to search for any shared filters:
JIRA 5.0 API Improvements

For plugin developers, JIRA's API is undergoing a significant number of changes and improvements to provide the following:

- More stability and reliability with future versions of JIRA.
- A more functional REST API with the ability to create new issues in JIRA 5.0 EAP 2.
- Removal of deprecated OSUser classes.
- Removal of deprecated portlets (replaced by gadgets in JIRA 4.0) and their related APIs.

Please see the Plugin Developer Notes for JIRA 5.0 for more details.

Please also be aware that JIRA's API is likely to undergo a rapid number of changes from one JIRA 5.0 EAP release to the next.

Performance Improvements

Lucene 3.2 is now fully integrated into JIRA. Initial benchmarking shows performance improvements across a number of JIRA features.

Other Enhancements and Fixes

For a list of more issues resolved in JIRA 5.0 so far, click here.
24 June 2011

**JIRA 4.4 RC 1** (a.k.a 4.4 milestone 8 or 'm8') is a public development release leading up to **JIRA 4.4**. A Release Candidate (RC) is a preliminary release leading up to the official release of a JIRA version. RC releases are a fairly stable snapshot of our work in progress and provide an advance preview of new features to the general public. JIRA plugin developers can also use RC releases to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

The Atlassian team is proud to bring you the JIRA 4.4 RC 1 release. Thank you for your feedback during the recent Beta and EAP releases, and please keep providing it here.

JIRA 4.4 brings you a visual Workflow Designer and Workflow Viewer, simplified Administration, and user-specific Time Zones. We are also very pleased to announce that the JIRA installation and upgrade processes have been improved and largely automated.

**Note to developers:** Please see the Plugin Developer Notes for JIRA 4.4.

**Highlights of JIRA 4.4 RC 1:**

- **For Users:**
  - User Time Zones
  - New Email Style
  - Issue Linking when Resolving an Issue
  - Workflow Viewer on the 'View Issue' Screen
  - Multiple File Selection and Upload from the 'File Upload' Dialog Box
  - JQL Enhancements (expanded since Beta 1)
  - New-look Activity Stream (new since Beta 1)
  - Graph of Vote History (new since Beta 1)

- **For Administrators:**
  - Visual Workflow Designer
  - New-Look Administration Area
  - Simplified Project Administration
  - Editable Options for Custom Fields

- **Setup and Installation:**
  - Improved Setup Wizard with Database Configuration
  - Improved JIRA Standalone Installer/Uninstaller and Automated Upgrade

- **Platforms, APIs:**
  - IE 9 and Firefox 4 Support
  - REST API improvements

- **Other Enhancements and Fixes**

Thank you for your interest in JIRA 4.4 RC 1

Download the RC

---

**Upgrading to JIRA 4.4 RC 1**

JIRA RC releases are available [here](#). When upgrading, please follow the JIRA 4.4 Upgrade Notes.
Do not use in production
Beta releases should not be used in production environments as they are not officially supported.

Please also take note of the following information:
- **Beta releases are not safe**— Beta releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because Beta releases represent work in progress, we cannot provide a supported upgrade path between Beta releases, or from any Beta to the eventual final release. Thus, any data you store in a JIRA Beta release may not be able to be migrated to a future JIRA release.

**Highlights of JIRA 4.4 RC 1**

**For Users:**

1. **User Time Zones**

   We are very pleased to announce progress on JRA-9, one of the most highly-voted requests for JIRA: times will be displayed to a user in their local time zone, rather than the server's time zone.

   You can set a default user time zone at an administration level, and individual users have the ability to choose their own time zone. Each user's time zone is displayed in their hover profile.

   ![Time Zone Support](image_url)

   Time zone support has been implemented for quick searching, simple searching and advanced searching, chart and report gadgets, date/time-based custom fields, as well as issue histories, work logs and source code check-ins (via the JIRA FishEye Plugin).

   Note: Date fields, which have no time component, such as due dates, release dates (associated with versions) and custom date fields, solely record date information (and no time zone-related information).

   JIRA administrators can change the default time zone by going to 'Administration' => 'General Configuration' (under 'Global Settings'), and editing the 'Default user time zone'.

   Users can also change their individual time zone setting via their user profile:
Note to developers: If you develop JIRA plugins that handle dates and times, please be aware of the Formatting and Parsing Dates Using the Appropriate Time Zone section of the Plugin Developer Notes for JIRA 4.4.

New Email Style

The HTML email templates have undergone a complete visual refresh. They will also render nicely in mobile mail clients:
They will also thread better in mail clients (such as Gmail), so all emails relating to one issue will thread together.

^Top

3

Issue Linking when Resolving an Issue

When resolving an issue, you can create links to other issues on an issue resolution screen. This is handy when you want to resolve an issue as a 'duplicate' of another and at the same time link to the duplicate issue.

For convenience, your recent issue links and resolutions are readily accessible from the 'Linked Issues' fields (in the screenshot below). The 'Linked Issues' fields can also now be added to any JIRA screen. See Defining a Screen for more information.

If you are upgrading from an earlier version of JIRA, you need to configure this feature manually through JIRA's administration area. Please refer to the Upgrade Notes for details.
Workflow Viewer on the 'View Issue' Screen

You can also see a read-only view of the workflow from the 'View Issue' page — just select 'View Workflow' from the 'More Actions' menu. We've made it simple for everyone to use, without requiring Flash to be installed.

The workflow viewer also highlights the current status of your issue in the workflow.

A new permission called 'View Read-Only Workflow' is required to access the workflow viewer feature from the 'View Issue' page.
Multiple File Selection and Upload from the 'File Upload' Dialog Box

When using JIRA's 'Attach Files' dialog box, you can now select multiple files in the 'File Upload' dialog box that appears after clicking the 'Browse' button.
JQL Enhancements (expanded since Beta 1)

Do more with 'WAS'

The ability to search an issue's Change History was introduced in JIRA 4.3 and allowed you to search the history of the Status field.

In JIRA 4.4 you can now also search the history of:

- the Assignee field, e.g.:

  assignee WAS "jsmith"

- the Reporter field, e.g.:

  reporter WAS "djones"

You can also now search for a field that had a particular value:

- **ON** a given date — e.g. find issues that had a status of "closed" on May 31st:

  status WAS "closed" ON "2011/05/31"

- **BEFORE** a given date — e.g. find issues that were assigned to jsmith before May 31st:
assignee WAS "jsmith" BEFORE "2011/05/31"

- **AFTER**a given date — e.g. find issues that were assigned to me after May 31st:

  assignee WAS currentUser() AFTER "2011/05/31"

- **DURING**a given date range — e.g. find issues that were assigned to me during May:

  assignee WAS currentUser() DURING ("2011/05/01","2011/05/31")

- **set** **BY**a particular user — e.g. find issues that were assigned to Fred by me:

  assignee WAS "Fred" BY currentUser()

**How many Watchers?**

The new Watchers field allows you to search for issues with a specified number of watchers, e.g.:

  watchers > 3

For more details please see [Advanced Searching](#).

^Top

7

**New-look Activity Stream (new since Beta 1)**

The Activity Stream has had a makeover. As well as looking prettier, it now lets you vote, start watching or comment on an issue with a single click:
Activity Stream

Tuesday

Andrew Prentice attached one file to ANGRY-73 - bonfire test

Monday

Mike Cannon-Brookes commented on ANGRY-77 - Nerd flight path does not take into account gravitational pull of moon

Are we building the physics engine for Newtonian or Einsteinian physics?

Sunday

Edwin Wong linked 3 issues

ANGRY-67 - As a nerd, I can flip in a chair while waiting to be shot into the air is related to

ANGRY-70 - Some graphical glitches and ANGRY-69 - The nerd flies too fast

Edwin Wong updated 2 fields of ANGRY-67 - As a nerd, I can flip in a chair while waiting to be shot into the air

• Logged '2h'
• Changed the Remaining Estimate to '0h'

Edwin Wong attached one file to ANGRY-70 - Some graphical glitches

Show more...

^Top
Graph of Vote History (new since Beta 1)

You can now graph an issue's votes over time:

^Top

For Administrators:

Visual Workflow Designer

JIRA 4.4 provides a visual representation of your workflow, making it easy to map out your business processes.

Simply go to 'Workflows' in JIRA administration as usual, and click the 'Design' link for the workflow you wish to edit. If you hover your mouse over an individual Step or Transition, a 'cog' icon appears, which you can click to access more functions.

The layout of a workflow is preserved whenever you 'Copy' or 'Create a Draft' of an existing workflow.
New-Look Administration Area

JIRA 4.4 brings you a dedicated 'administration mode', which replaces the left-hand column of the JIRA's administration console with a series of drop-down menus across the top navigation bar:
To find the new location of a menu item, type it into the "Administration Quick Search" box at the top right of the screen — or click the drop-down in the "Administration Quick Search" box to get a full list of admin options.

You can bring up the "Administration Quick Search" box from anywhere in JIRA by typing G + G. This has replaced the A keyboard shortcut.

To leave JIRA's 'administration mode', click the 'Exit Administration' link at the top-right of the screen to return JIRA to its standard user mode.

Simplified Project Administration

Project administration has become more visual and far simpler:
Editable Options for Custom Fields

We are also pleased to announce progress on JIRA-2983. You can now edit the options for custom fields of the following field types:

- Select List
- Multi Select
- Cascading Select
- Radio Buttons
- Multi Checkboxes

Because your custom fields may change over time, JIRA now gives you the ability to:

- edit a field's options — that is, change the text of an option.
• disable an option — that is, hide an option so that it is no longer available for selection. Options that have been used cannot be removed (to preserve data integrity), but due to changing business requirements, they may become invalid over time and so you may wish to make them unavailable for new issues.

**Note to developers:** If you develop JIRA plugins that handle single- and multi-select custom fields, please be aware of the Single- and Multi-Select Custom Field Changes section of the Plugin Developer Notes for JIRA 4.4.

**Setup and Installation:**

### Improved Setup Wizard with Database Configuration

Our trusty setup wizard has had a makeover:

*The new Setup Wizard*

**Database Configuration Now Part of the Setup Wizard**

In JIRA 4.4, configuring a connection to an external database is now part of the standard setup wizard. Upon completing the setup wizard, JIRA will create a direct JDBC connection (whose entire configuration is stored within your JIRA home directory).
Here is the database configuration step of the JIRA Setup Wizard:

**Improved JIRA Standalone Installer/Uninstaller and Automated Upgrade**

**Linux Installer and Uninstaller**

The Linux Installer provides a simple console (shell prompt) wizard that installs JIRA for Linux operating systems. The Linux Installer:

- Installs JIRA under a dedicated user account 'jira' with restricted write access to your JIRA installation directory.
- Can install JIRA as a service, so that JIRA automatically re-starts whenever your Linux operating system must be rebooted.

To install JIRA, simply download the Linux Installer (.bin) file and at a shell prompt, execute this file and follow the remaining prompts!

See [Installing JIRA on Linux](#) for details.

After using the Linux Installer, an executable file 'uninstall' (located in your JIRA Installation Directory) is available to conveniently uninstall JIRA from your Linux operating system.

See [Uninstalling JIRA from Linux](#) for details.

**Windows Installer**

The installation wizard for Windows now works smoothly for Windows 7 and Vista.

The process for installing JIRA as a Windows service has also improved and the wizard now allows you to specify the port numbers used to run and access JIRA.

See [Installing JIRA on Windows](#) for details.

**Unattended Installation**

When installing JIRA using the Linux or Windows Installers (above), a configuration file called `response`
varfile is generated in the .install4j subdirectory of your JIRA Installation Directory.

The response.varfile file records all configuration options specified during your initial installation. This allows you to reinstall JIRA on multiple server machines based on the same configuration without the need for any user input.

See the 'Performing an Unattended Installation' sections for Linux and Windows for details.

Automated Upgrade

The new Linux and Windows Installers (above) include an option that allows you to upgrade an existing JIRA 4.3.x or later Standalone installation.

This upgrade feature automates the following tasks for you:

1. Backs up the Installation and Home Directories of the existing JIRA installation to be upgraded.
2. Installs JIRA 4.4 whilst migrating the following from your existing JIRA installation to the new JIRA 4.4 installation:
   - Legacy database configurations defined as a datasource within the application server (used in JIRA 4.3.x and earlier) to the new database configuration used in JIRA 4.4 and later. See JIRA 4.4 Upgrade Notes for details.
   - TCP port values in your existing JIRA installation's server.xml file.
   - Custom values in your existing JIRA installation's jira-application.properties, including key customisations from the setenv.sh/setenv.bat files.

The upgrade feature detects and notifies you of any other files in the atlassian-jira subdirectory of your existing JIRA Installation Directory, which had been deleted, added or modified from a 'default' JIRA installation. This informs you of any customisations you will need to migrate manually over to your upgraded JIRA installation directory.

Also note that the JIRA Configuration Tool (bundled with JIRA Standalone) is now capable of changing JIRA's TCP Ports.

Platforms, APIs:

15

IE 9 and Firefox 4 Support

We are very pleased to announce that JIRA 4.4 supports Internet Explorer 9.0 and Firefox 4.0.

16

REST API improvements

There are new REST APIs for

- Listing and managing Project Components.
- Listing and managing Project Versions.
- Listing and managing Project Roles.

Have a look at the reference documentation.

Other Enhancements and Fixes

For the list of issues resolved in JIRA 4.4 so far, click here.
JIRA 4.4 Beta 1 Release Notes

6 June 2011

JIRA 4.4 Beta 1 (a.k.a 4.4 milestone 7 or 'm7') is a public development release leading up to JIRA 4.4. A Beta release is a preliminary release leading up to the official release of a JIRA version. Beta releases are a snapshot of our work in progress and provide an advance preview of new features to the general public. JIRA plugin developers can also use Beta releases to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

The Atlassian team is proud to bring you the JIRA 4.4 Beta 1 release. Thank you for your feedback during the recent EAP releases, and please keep providing it here.

JIRA 4.4 brings you a visual Workflow Designer and Workflow Viewer, simplified Administration, and user-specific Time Zones. We are also very pleased to announce that the JIRA installation and upgrade processes have been improved and largely automated.

Note to developers: Please see the Plugin Developer Notes for JIRA 4.4.

Highlights of JIRA 4.4 Beta 1:
- Visual Workflow Designer For Administrators
- Workflow Viewer on the 'View Issue' Screen
- User Time Zones
- Editable Options for Custom Fields
- Simplified Project Administration (new since EAP 6)
- New-Look Administration Area (improved since EAP 6)
- Classy New Email Templates (new since EAP 6)
- Issue Linking when Resolving an Issue
- Multiple File Selection and Upload from the 'File Upload' Dialog Box
- Enhancements to JQL "WAS" Function (new since EAP 6)
- Improved Setup Wizard
- Database Configuration Now Part of the Setup Wizard
- Improved JIRA Standalone Linux Installer with Uninstall and Automated Upgrade (improved since EAP 6)
- Improved JIRA Standalone Windows Installer with Automated Upgrade (improved since EAP 6)
- REST API improvements
- Other Enhancements and Fixes

Thank you for your interest in JIRA 4.4 Beta 1

Download Beta

Upgrading to JIRA 4.4 Beta 1
JIRA Beta releases are available here. When upgrading, please follow the JIRA 4.4 Upgrade Notes.

Do not use in production
Beta releases should not be used in production environments as they are not officially supported.

Please also take note of the following information:
- Beta releases are not safe—Beta releases are snapshots of the ongoing JIRA development
process. As such:

- While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
- Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because Beta releases represent work in progress, we **cannot** provide a supported upgrade path between Beta releases, or from any Beta to the eventual final release. Thus, any data you store in a JIRA Beta release may not be able to be migrated to a future JIRA release.

## Highlights of JIRA 4.4 Beta 1

### Visual Workflow Designer For Administrators

JIRA 4.4 provides a visual representation of your workflow, making it easy to map out your business processes.

Simply go to 'Workflows' in JIRA administration as usual, and click the 'Design' link for the workflow you wish to edit. If you hover your mouse over an individual Step or Transition, a 'cog' icon appears, which you can click to access more functions.

In EAP 5, the layout of a workflow is now preserved whenever you 'Copy' or 'Create a Draft' of an existing workflow. We have also implemented a few improvements to the status editor.
**Workflow Viewer on the 'View Issue' Screen**

You can also see a read-only view of the workflow from the 'View Issue' page — just select 'View Workflow' from the 'More Actions' menu. We've made it simple for everyone to use, without requiring Flash to be installed.

The workflow viewer also highlights the current status of your issue in the workflow.

A new permission called 'View Read-Only Workflow' is required to access the workflow viewer feature from the 'View Issue' page.
We are very pleased to announce progress on JRA-9, one of the most highly-voted requests for JIRA: times will be displayed to a user in their local time zone, rather than the server's time zone.

You can set a default user time zone at an administration level, and individual users have the ability to choose their own time zone. Each user's time zone is displayed in their hover profile.

Time zone support has been implemented for quick searching, simple searching and advanced searching, chart and report gadgets, date/time-based custom fields, as well as issue histories, work logs and source code check-ins (via the JIRA FishEye Plugin).

Note: Date fields, which have no time component, such as due dates, release dates (associated with versions) and custom date fields, solely record date information (and no time zone-related information).

JIRA administrators can change the default time zone by going to 'Administration' => 'General Configuration' (under 'Global Settings'), and editing the 'Default user time zone'.

Users can also change their individual time zone setting via their user profile:
Editable Options for Custom Fields

We are also pleased to announce progress on JRA-2983. You can now edit the options for custom fields of the following field types:

- Select List
- Multi Select
- Cascading Select
- Radio Buttons
- Multi Checkboxes

Because your custom fields may change over time, JIRA now gives you the ability to:

- edit a field's options — that is, change the text of an option.
- disable an option — that is, hide an option so that it is no longer available for selection. Options that have been used cannot be removed (to preserve data integrity), but due to changing business requirements, they may become invalid over time and so you may wish to make them unavailable for new issues.

Note to developers: If you develop JIRA plugins that handle single- and multi-select custom fields, please be aware of the Single- and Multi-Select Custom Field Changes section of the Plugin Developer Notes for JIRA 4.4.

Simplified Project Administration (new since EAP 6)

Project administration has become more visual and far simpler:
New-Look Administration Area (improved since EAP 6)

JIRA 4.4 brings you a dedicated 'administration mode', which replaces the left-hand column of the JIRA's administration console with a series of drop-down menus across the top navigation bar:
To find the new location of a menu item, type it into the "Administration Quick Search" box at the top right of the screen — or click the drop-down in the "Administration Quick Search" box to get a full list of admin options.

You can bring up the "Administration Quick Search" box from anywhere in JIRA by typing G + A (note that this will change to G + G in the final 4.4 release).

To leave JIRA’s ‘administration mode’, click the ‘Exit Administration’ link at the top-right of the screen to return JIRA to its standard user mode.

Classy New Email Templates (new since EAP 6)

The HTML email templates have undergone a complete visual refresh. They will also render nicely in mobile mail clients:
They will also thread better in mail clients (such as Gmail), so all emails relating to one issue will thread together.
Issue Linking when Resolving an Issue

When resolving an issue, you can create links to other issues on an issue resolution screen. This is handy when you want to resolve an issue as a 'duplicate' of another and at the same time link to the duplicate issue.

For convenience, your last 10 issue links and resolutions are readily accessible from the 'Linked Issues' fields (in the screenshot below). The 'Linked Issues' fields can also be added to any JIRA screen via the new 'Issue Linking' field in JIRA 4.4. See Defining a Screen for more information.

If you are upgrading from an earlier version of JIRA, you need to configure this feature manually through JIRA's administration area. Please refer to the Upgrade Notes for details.

Multiple File Selection and Upload from the 'File Upload' Dialog Box

When using JIRA's 'Attach Files' dialog box, you can now select multiple files in the 'File Upload' dialog box that appears after clicking the 'Browse' button.
Enhancements to JQL "WAS" Function (new since EAP 6)

The ability to search an issue's Change History was introduced in JIRA 4.3 and allowed you to search the history of the Status field.

In JIRA 4.4 you can now also search the history of:

- the Assignee field, e.g.:
  
  assignee WAS "jsmith"

- the Reporter field, e.g.:
  
  reporter WAS "djones"

You can also now search for a field that had a particular value:

- **ON** a given date — e.g. find issues that had a status of "closed" on May 31st:
  
  status WAS "closed" ON "2011/05/31"

- **BEFORE** a given date — e.g. find issues that were assigned to jsmith before May 31st:
  
  assignee WAS "jsmith" BEFORE "2011/05/31"
• **AFTER** a given date — e.g. find issues that were assigned to me after May 31st:

```plaintext
assignee WAS currentUser() AFTER "2011/05/31"
```

• **DURING** a given date range — e.g. find issues that were assigned to me during May:

```plaintext
assignee WAS currentUser() DURING ("2011/05/01","2011/05/31")
```

• **set BY** a particular user — e.g. find issues that were assigned to Fred by me:

```plaintext
assignee WAS "Fred" BY currentUser()
```

**Improved Setup Wizard**

Our trusty wizard has had a makeover:

![The new Setup Wizard](image-url)
Database Configuration Now Part of the Setup Wizard

In JIRA 4.4, configuring a connection to an external database is now part of the standard setup wizard. Upon completing the setup wizard, JIRA will create a direct JDBC connection (whose entire configuration is stored within your JIRA home directory).

The database configuration step of the setup wizard will change before the final 4.4 release, but here is how it looks so far:

![Database Configuration Screen](image-url)
Improved JIRA Standalone Linux Installer with Uninstall and Automated Upgrade (improved since EAP 6)

Console Installer

A simple console (command line) wizard is now available for Linux operating systems. The console wizard:

- Installs JIRA under a dedicated user account 'jira' with restricted write access to your JIRA installation directory.
- Can install JIRA as a service, so that JIRA automatically re-starts whenever your Linux operating system must be rebooted.

To install JIRA, simply download the Linux .bin installer file and at a shell prompt, execute this file and follow the remaining prompts!

The console wizard can install JIRA as either the 'root' user or a non-root user. However, to install JIRA as a service, the console wizard must be executed as the 'root' user.

See Installing JIRA on Linux for details.

Unattended Installation

After installing JIRA on Linux using the .bin installer file above, a configuration file called response.var file is generated in the .install4j subdirectory of your JIRA Installation Directory.

See Performing an Unattended Installation (on Linux) for details.

Uninstaller

After installing JIRA on Linux using the .bin installer file above, an executable file called uninstall (located in your JIRA Installation Directory) is available to conveniently uninstall JIRA.

See Uninstalling JIRA from Linux for details.

Automated Upgrade (improved since EAP 6)

The console wizard includes an option that allows you to upgrade an existing JIRA Standalone installation from version 4.3.x or later.

While the upgrade feature installs a new version of JIRA, it automates the following tasks for you:

1. Backs up your existing JIRA installation and home directories.
2. Migrates database configurations used in JIRA 4.3.x and earlier to the new database configuration used in JIRA 4.4.
3. Migrates port values in your existing JIRA installation's server.xml file to your new version of JIRA.
4. Migrates custom values in your existing JIRA installation's jira-application.properties and setenv.sh files to your new version of JIRA.

   (New in Beta 1) The upgrade feature detects and notifies you of any files (other than jira-application.properties and setenv.sh) in the atlassian-jira subdirectory of your existing JIRA Installation Directory, which had been deleted, added or modified from a 'default' JIRA installation. This informs you of any customisations you will need to migrate manually over to your upgraded JIRA installation directory.

Please Note:

- The upgrade process requests that you conduct a backup of your database using your database's backup utilities. If your database does not support online backups, you can stop the upgrade process, shut down JIRA, perform your database backup and then restart the upgrade process to
1. If you have made customisations to your `seraph-config.xml` file or any other files in your JIRA installation directory, these must be migrated manually.
2. If your attachments and index files are located outside your JIRA home directory, then backups of these directories must be performed manually.

**Improved JIRA Standalone Windows Installer with Automated Upgrade (improved since EAP 6)**

The installation wizard for Windows now works smoothly for Windows 7 and Vista.

The process for installing JIRA as a Windows service has also improved and the wizard now allows you to specify the port numbers used to run and access JIRA.

See [Installing JIRA on Windows](#) for details.

**Unattended Installation**

When you execute the installer file at the Windows command prompt and complete your installation of JIRA, a file called `response.varfile` is generated in the `.install4j` subdirectory of your JIRA Installation Directory.

See [Performing an Unattended Installation](#) (on Windows) for details.

**Automated Upgrade (improved since EAP 6)**

The installation wizard includes an option that allows you to upgrade an existing JIRA Standalone installation from version 4.3.x or later.

While the upgrade feature installs a new version of JIRA, it automates the following tasks for you:

1. Backs up your existing JIRA installation and home directories.
2. Migrates database configurations used in JIRA 4.3.x and earlier to the new database configuration used in JIRA 4.4.
3. Migrates port values in your existing JIRA installation's `server.xml` file to your new version of JIRA.
4. Migrates custom values in your existing JIRA installation's `jira-application.properties` and `setenv.bat` files to your new version of JIRA.

   In the `setenv.bat` file, only the following values are migrated:
   - `JVM_SUPPORT_RECOMMENDED_ARGS`
   - `JVM_MINIMUM_MEMORY`
   - `JVM_MAXIMUM_MEMORY`
   - `JIRA_MAX_PERM_SIZE`

   *(New in Beta 1)* The upgrade feature detects and notifies you of any files (other than `jira-application.properties` and `setenv.sh`) in the `atlassian-jira` subdirectory of your existing JIRA Installation Directory, which had been deleted, added or modified from a 'default' JIRA installation. This informs you of any customisations you will need to migrate manually over to your upgraded JIRA installation directory.

**Please Note:**

1. The upgrade process requests that you conduct a backup of your database using your database's backup utilities. If your database does not support online backups, you can stop the upgrade process, shut down JIRA, perform your database backup and then restart the upgrade process to continue on.
2. If you have made customisations to your `seraph-config.xml` file or any other files in your JIRA installation directory, these must be migrated manually.
3. If your attachments and index files are located outside your JIRA home directory, then backups of these directories must be performed manually.
REST API improvements

There are new REST APIs for

- Listing and managing Project Components.
- Listing and managing Project Versions.
- Listing and managing Project Roles.

Have a look at the reference documentation.

Other Enhancements and Fixes

For the list of issues resolved in JIRA 4.4 so far, click here.

JIRA 4.4 EAP 6 Release Notes

24 May 2011

JIRA 4.4 EAP 6 (a.k.a 4.4 milestone 6 or 'm6') is a public development release leading up to JIRA 4.4. An Early Access Preview (EAP) release is a snapshot of our work in progress, primarily focused on allowing JIRA users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

While development work on JIRA 4.4 commenced relatively recently, we want your involvement from the earliest days. Please provide feedback here.

JIRA 4.4 brings you a visual Workflow Designer and Workflow Viewer. We are also very pleased to announce that the JIRA installation process has been improved and simplified.

Note to developers: Much of the View Issue page is now rendered via Web Panel Plugin Modules. Also please see the Plugin Developer Notes for JIRA 4.4.

Highlights of JIRA 4.4 EAP 6:

- Visual Workflow Designer For Administrators
- Workflow Viewer on the 'View Issue' Screen
- User Time Zones (improved since EAP 5)
- Editable Options for Custom Fields
- Issue Linking when Resolving an Issue
- Multiple File Selection and Upload from the 'File Upload' Dialog Box
- New-Look Administration Area (new since EAP 5)
- Improved Setup Wizard
- Database Configuration Now Part of the Setup Wizard
- Improved JIRA Standalone Linux Installer with Uninstall and Upgrade Capabilities (improved since EAP 5)
- Improved JIRA Standalone Windows Installer with Upgrade Capabilities (improved since EAP 5)
- REST API improvements
- Other Enhancements and Fixes

Thank you for your interest in JIRA 4.4 EAP 6
Upgrading to JIRA 4.4 EAP 6
JIRA EAP releases are available here. When upgrading, please follow the JIRA 4.4 Upgrade Notes.

Do not use in production

- **EAP releases are not safe** — EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because EAP releases represent work in progress, we cannot provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

Highlights of JIRA 4.4 EAP 6

**Visual Workflow Designer For Administrators**

JIRA 4.4 provides a visual representation of your workflow, making it easy to map out your business processes.

Simply go to 'Workflows' in JIRA administration as usual, and click the 'Design' link for the workflow you wish to edit. If you hover your mouse over an individual Step or Transition, a 'cog' icon appears, which you can click to access more functions.

In EAP 5, the layout of a workflow is now preserved whenever you 'Copy' or 'Create a Draft' of an existing workflow. We have also implemented a few improvements to the status editor.
Workflow Viewer on the 'View Issue' Screen

You can also see a read-only view of the workflow from the 'View Issue' page — just select 'View Workflow' from the 'More Actions' menu. We've made it simple for everyone to use, without requiring Flash to be installed.

The workflow viewer also highlights the current status of your issue in the workflow.

A new permission called 'View Read-Only Workflow' is required to access the workflow viewer feature from the 'View Issue' page.
User Time Zones (improved since EAP 5)

We are very pleased to announce progress on JRA-9, one of the most highly-voted requests for JIRA: times will be displayed to a user in their local time zone, rather than the server's time zone.

You can set a default user time zone at an administration level, and individual users have the ability to choose their own time zone. In EAP 6, each user's time zone is displayed in their hover profile.

Time zone support has been implemented for quick searching, simple searching and advanced searching, chart and report gadgets, date/time-based custom fields, as well as issue histories, work logs and source code check-ins (via the JIRA FishEye Plugin).

Note: Date fields, which have no time component, such as due dates, release dates (associated with versions) and custom date fields, solely record date information (and no time zone-related information). JIRA administrators can change the default time zone by going to 'Administration' => 'General Configuration' (under 'Global Settings'), and editing the 'Default user time zone'.

Users can also change their individual time zone setting via their user profile:
Note to developers: If you develop JIRA plugins that handle dates and times, please be aware of the For matting and Parsing Dates Using the Appropriate Time Zone section of the Plugin Developer Notes for JIRA 4.4.

Editable Options for Custom Fields

We are also pleased to announce progress on JRA-2983. You can now edit the options for custom fields of the following field types:

- Select List
- Multi Select
- Cascading Select
- Radio Buttons
- Multi Checkboxes

Because your custom fields may change over time, JIRA now gives you the ability to:

- edit a field's options — that is, change the text of an option.
- disable an option — that is, hide an option so that it is no longer available for selection. Options that have been used cannot be removed (to preserve data integrity), but due to changing business requirements, they may become invalid over time and so you may wish to make them unavailable for new issues.

Note to developers: If you develop JIRA plugins that handle single- and multi-select custom fields, please be aware of the Single- and Multi-Select Custom Field Changes section of the Plugin Developer Notes for JIRA 4.4.

Issue Linking when Resolving an Issue

When resolving an issue, you can create links to other issues on an issue resolution screen. This is handy
when you want to resolve an issue as a 'duplicate' of another and at the same time link to the duplicate issue.

For convenience, your last 10 issue links and resolutions are readily accessible from the 'Linked Issues' fields (in the screenshot below). The 'Linked Issues' fields can also be added to any JIRA screen via the new 'Issue Linking' field in JIRA 4.4. See Defining a Screen for more information.

ℹ️ If you are upgrading from an earlier version of JIRA, you need to configure this feature manually through JIRA's administration area. Please refer to the Upgrade Notes for details.

Multiple File Selection and Upload from the 'File Upload' Dialog Box

When using JIRA's 'Attach Files' dialog box, you can now select multiple files in the 'File Upload' dialog box that appears after clicking the 'Browse' button.
New-Look Administration Area (new since EAP 5)

JIRA 4.4 brings you a dedicated 'administration mode', which replaces the left-hand column of the JIRA's administration console with a series of drop-down menus across the top navigation bar.

To leave JIRA's 'administration mode', click the 'Exit Administration' link at the top-right of the screen to return JIRA to its standard user mode.

We are still refining this, but here's the first version:
Improved Setup Wizard

Our trusty wizard has had a makeover:

The new Setup Wiz

Database Configuration Now Part of the Setup Wizard

In JIRA 4.4, configuring a connection to an external database is now part of the standard setup wizard. Upon completing the setup wizard, JIRA will create a direct JDBC connection (whose entire configuration is stored within your JIRA home directory).

The database configuration step of the setup wizard will change before the final 4.4 release, but here is how it looks so far:
Improved JIRA Standalone Linux Installer with Uninstall and Upgrade Capabilities (improved since EAP 5)

Console Installer

A simple console (command line) wizard is now available for Linux operating systems. The console wizard:

- Installs JIRA under a dedicated user account 'jira' with restricted write access to your JIRA installation directory.
- Can install JIRA as a service, so that JIRA automatically re-starts whenever your Linux operating system must be rebooted.

To install JIRA, simply download the Linux .bin installer file and at a shell prompt, execute this file and follow the remaining prompts!

The console wizard can install JIRA as either the 'root' user or a non-root user. However, to install JIRA as a service, the console wizard must be executed as the 'root' user.

See Installing JIRA on Linux for details.

Unattended Installation

After installing JIRA on Linux using the .bin installer file above, a configuration file called response.var file is generated in the .install4j subdirectory of your JIRA Installation Directory.

See Performing an Unattended Installation (on Linux) for details.

Uninstaller

After installing JIRA on Linux using the .bin installer file above, an executable file called uninstall (located in your JIRA Installation Directory) is available to conveniently uninstall JIRA.

See Uninstalling JIRA from Linux for details.
Upgrade Feature (new in EAP 6)

The console wizard includes an option that allows you to upgrade an existing JIRA Standalone installation from version 4.3.x or later.

While the upgrade feature installs a new version of JIRA, it automates the following tasks for you:

1. Backs up your existing JIRA installation and home directories.
2. Migrates database configurations used in JIRA 4.3.x and earlier to the new database configuration used in JIRA 4.4.
3. Migrates port values in your existing JIRA installation's server.xml file to your new version of JIRA.
4. Migrates custom values in your existing JIRA installation's jira-application.properties and setenv.sh files to your new version of JIRA.

In the setenv.sh file, only the following values are migrated:

- JVM_SUPPORT_RECOMMENDED_ARGS
- JVM_MINIMUM_MEMORY
- JVM_MAXIMUM_MEMORY
- JIRA_MAX_PERM_SIZE

Please Note:

- The upgrade process requests that you conduct a backup of your database using your database's backup utilities. If your database does not support online backups, you can stop the upgrade process, shut down JIRA, perform your database backup and then restart the upgrade process to continue on.
- If you have made customisations to your seraph-config.xml file or any other files in your JIRA installation directory, these must be migrated manually.
- If your attachments and index files are located outside your JIRA home directory, then backups of these directories must be performed manually.

^Top

Improved JIRA Standalone Windows Installer with Upgrade Capabilities (improved since EAP 5)

The installation wizard for Windows now works smoothly for Windows 7 and Vista.

The process for installing JIRA as a Windows service has also improved and the wizard now allows you to specify the port numbers used to run and access JIRA.

See Installing JIRA on Windows for details.

Unattended Installation

When you execute the installer file at the Windows command prompt and complete your installation of JIRA, a file called response.varfile is generated in the .install4j subdirectory of your JIRA Installation Directory.

See Performing an Unattended Installation (on Windows) for details.

Upgrade Feature (new in EAP 6)

The installation wizard includes an option that allows you to upgrade an existing JIRA Standalone installation from version 4.3.x or later.

While the upgrade feature installs a new version of JIRA, it automates the following tasks for you:

1. Backs up your existing JIRA installation and home directories.
2. Migrates database configurations used in JIRA 4.3.x and earlier to the new database configuration used in JIRA 4.4.
3. Migrates port values in your existing JIRA installation's server.xml file to your new version of JIRA.
4. Migrates custom values in your existing JIRA installation's jira-application.properties and
In the setenv.bat file, only the following values are migrated:

- JVM_SUPPORT_RECOMMENDED_ARGS
- JVM_MINIMUM_MEMORY
- JVM_MAXIMUM_MEMORY
- JIRA_MAX_PERM_SIZE

**Please Note:**

- The upgrade process requests that you conduct a backup of your database using your database's backup utilities. If your database does not support online backups, you can stop the upgrade process, shut down JIRA, perform your database backup and then restart the upgrade process to continue on.
- If you have made customisations to your seraph-config.xml file or any other files in your JIRA installation directory, these must be migrated manually.
- If your attachments and index files are located outside your JIRA home directory, then backups of these directories must be performed manually.

**JIRA 4.4 EAP 5 Release Notes**

9 May 2011

**JIRA 4.4 EAP 5** (a.k.a 4.4 milestone 5 or 'm5') is a public development release leading up to **JIRA 4.4**. An **Early Access Preview (EAP) release** is a snapshot of our work in progress, primarily focused on allowing JIRA users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

While development work on JIRA 4.4 commenced relatively recently, we want your involvement from the earliest days. Please provide feedback [here](#).

JIRA 4.4 brings you a visual Workflow Designer and Workflow Viewer. We are also very pleased to announce that the JIRA installation process has been improved and simplified.

**Note to developers:** Much of the View Issue page has been converted to **Web Panel Plugin Modules** — a new type of plugin module in JIRA 4.4. Also please see the [Plugin Developer Notes for JIRA 4.4](#).

**Highlights of JIRA 4.4 EAP 5:**

- **Visual Workflow Designer For Administrators** (improved since EAP 4)
- **Workflow Viewer on the 'View Issue' Screen**
- **User Time Zones** (improved since...
Highlights of JIRA 4.4 EAP 5

**Visual Workflow Designer For Administrators (improved since EAP 4)**

JIRA 4.4 provides a visual representation of your workflow, making it easy to map out your business processes.

Simply go to 'Workflows' in JIRA administration as usual, and click the 'Design' link for the workflow you wish to edit. If you hover your mouse over an individual Step or Transition, a 'cog' icon appears, which you can click to access more functions.

In EAP 5, the layout of a workflow is now preserved whenever you 'Copy' or 'Create a Draft' of an existing workflow. We have also implemented a few improvements to the status editor.
Workflow Viewer on the 'View Issue' Screen

You can also see a read-only view of the workflow from the 'View Issue' page — just select 'View Workflow' from the 'More Actions' menu. We've made it simple for everyone to use, without requiring Flash to be installed.

The workflow viewer also highlights the current status of your issue in the workflow.

A new permission called 'View Read-Only Workflow' is required to access the workflow viewer feature from the 'View Issue' page.
User Time Zones (improved since EAP 4)

We are very pleased to announce progress on JRA-9, one of the most highly-voted requests for JIRA: times will be displayed to a user in their local time zone, rather than the server’s time zone.

You can set a default user time zone at an administration level, and individual users have the ability to choose their own time zone.

Time zone support has been implemented for quick searching, simple searching and advanced searching, chart and report gadgets, date/time-based custom fields, as well as issue histories, work logs and source code check-ins (via the JIRA FishEye Plugin).

In EAP 5, all times are now associated with user time zones. Date fields, which have no time component, such as due dates, release dates (associated with versions) and custom date fields, solely record date information (and no time zone-related information).

Be aware that EAP 5 shipped with a bug (JRA-24525) that affects the date selection calendar. To resolve this bug, please install the patch file (zip archive) attached to this JIRA issue after you install or upgrade to EAP 5. Patch instructions are included in the patch file.
JIRA administrators can change the default time zone by going to 'Administration' => 'General Configuration' (under 'Global Settings'), and editing the 'Default user time zone'.

Users can also change their individual time zone setting via their user profile:

Note to developers: If you develop JIRA plugins that handle dates and times, please be aware of the Formatting and Parsing Dates Using the Appropriate Time Zone section of the Plugin Developer Notes for JIRA 4.4.

Editable Options for Custom Fields

We are also pleased to announce progress on JRA-2983. You can now edit the options for custom fields of the following field types:

- Select List
- Multi Select
- Cascading Select
- Radio Buttons
- Multi Checkboxes

Because your custom fields may change over time, JIRA now gives you the ability to:

- edit a field's options — that is, change the text of an option.
• disable an option — that is, hide an option so that it is no longer available for selection. Options that have been used cannot be removed (to preserve data integrity), but due to changing business requirements, they may become invalid over time and so you may wish to make them unavailable for new issues.

**Note to developers:** If you develop JIRA plugins that handle single- and multi-select custom fields, please be aware of the Single- and Multi-Select Custom Field Changes section of the Plugin Developer Notes for JIRA 4.4.

---

**Issue Linking when Resolving an Issue (new in EAP 5)**

When resolving an issue, you can create links to other issues on an issue resolution screen. This is handy when you want to resolve an issue as a ‘duplicate’ of another *and at the same time* link to the duplicate issue.

![Issue Resolution Screen](image)

If you are upgrading from an earlier version of JIRA, you need to configure this feature manually through the JIRA administration console. Please refer to the Upgrade Notes for details.

---

**Multiple File Selection and Upload from the 'File Upload' Dialog Box (new in EAP 5)**

When using JIRA's 'Attach Files' dialog box, you can now select multiple files in the 'File Upload' dialog box.
that appears after clicking the 'Browse' button.

**Improved Setup Wizard**

Our trusty wizard has had a makeover:

---

*The new Setup Wizard*
Database Configuration Now Part of the Setup Wizard

In JIRA 4.4, configuring a connection to an external database is now part of the standard setup wizard. Customers can now connect JIRA to their database directly via JDBC, rather than having to rely on a JNDI-based connection to a datasource specified in the application server.

The database configuration step of the setup wizard will change before the final 4.4 release, but here is how it looks so far:
**Improved Linux Installers and Uninstaller**

**Console Installer**

A simple command line/console installer wizard is now available for Linux operating systems.

To install JIRA, simply download the Linux .bin installer file and at a shell prompt, execute this file and follow the remaining prompts!

You can install JIRA as either the 'root' user or a non-root user under Linux. Currently, however, JIRA will be *run as the same Linux user account* which is used to install JIRA via this wizard. We intend to change this behaviour in a future EAP.

- If you use the console installer wizard to install JIRA as the root user on your Linux operating system, then for security reasons, you should not use this JIRA installation in a public-facing environment.

**Silent Installation**

After installing JIRA on Linux using the .bin installer file above, a configuration file called `response.var` file is generated in the `.install4j` subdirectory of your `<JIRA Installation Directory>`. This file contains all the settings you specified manually while installing JIRA at the shell prompt, such as the Tomcat port numbers for JIRA and the location of your JIRA Installation and Home directories.

You can use this `response.var` file to re-install JIRA again 'silently' (without the need for any user input) by doing the following:

1. Before deleting your original JIRA installation, copy (`cp`) the `<JIRA Installation Directory>/install4j/response.var` file to the same directory containing the Linux .bin installer file.
2. Enter the following command at the shell prompt:
   
   ```
   ./atlassian-jira-4.4-m3.bin -q -varfile response.var
   ```

**Uninstaller**

After installing JIRA on Linux using the .bin installer file above, an executable file called `uninstall` (located in `<JIRA Installation Directory>/`) is available to conveniently uninstall JIRA.

To uninstall JIRA:

1. Log in as the user who installed JIRA.
2. At the shell prompt, change directory (`cd`) into your `<JIRA Installation Directory>`.
3. Execute the `uninstall` command.
   - No additional flags or parameters are required.

**Please note:**

- The uninstaller will not delete the JIRA Home Directory.
- All log files that were generated while JIRA was running will not be deleted.
- All files within the JIRA Installation Directory will be deleted (with the exception of the Tomcat log folder located in `<JIRA Installation Directory>/logs`).

**Improved Windows Installers**

The installer wizard for Windows now works smoothly for Windows 7 and Vista.

The process for installing JIRA as a Windows service has also improved and the wizard now allows you to specify the port numbers used to run and access JIRA.
**Silent Installation**

When you execute the installer file at a shell prompt and complete your installation of JIRA, a file called `response.varfile` is generated in the \install4j subdirectory of your `<JIRA Installation Directory>`.

This file contains all the settings you specified manually while installing JIRA at the command prompt, such as the Tomcat port numbers for JIRA and the location of your JIRA Installation and Home directories. You can use `response.varfile` to re-install JIRA again ‘silently’ (without the need for any user input) by doing the following:

1. Before deleting your original JIRA installation, copy the `<JIRA Installation Directory>\install4j\response.varfile` to the same directory containing the Windows .exe installer file.
2. Open a command prompt and enter the following command:
   ```
   atlassian-jira-4.4-m2.exe -q -varfile response.varfile
   ```

**REST API improvements**

There are new REST APIs for

- Listing and managing Project Components.
- Listing and managing Project Versions.

**JIRA 4.4 EAP 4 Release Notes**

2 May 2011

**JIRA 4.4 EAP 4** (a.k.a 4.4 milestone 4 or 'm4') is a public development release leading up to JIRA 4.4. An Early Access Preview (EAP) release is a snapshot of our work in progress, primarily focused on allowing JIRA users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

While development work on JIRA 4.4 commenced relatively recently, we want your involvement from the earliest days. Please provide feedback here.

JIRA 4.4 brings you a visual Workflow Designer and Workflow Viewer. We are also very pleased to announce that the JIRA installation process has been improved and simplified.

**Note to developers:** In JIRA 4.4 EAP 4 all plugin points are now reloadable — yes, all 51 of them! Also please see the Plugin Developer Notes for JIRA 4.4, plus note that JIRA 4.4 includes the Atlassian Plugin Framework version 2.8.

**Highlights of JIRA 4.4 EAP 4:**

- Visual Workflow Designer For Administrators
- Workflow Viewer on the 'View Issue' Screen
- User Time Zones (improved since EAP 3)
• Editable Options for Custom Fields
• Improved Setup Wizard
• Database Configuration Now Part of the Setup Wizard
• Improved Linux Installers and Uninstaller
• Improved Windows Installers
• REST API improvements (improved since EAP 3)
• Other Enhancements and Fixes

Thank you for your interest in JIRA 4.4 EAP 4
Download EAP

Upgrading to JIRA 4.4 EAP 4
JIRA EAP releases are available here. When upgrading, please follow the JIRA 4.4 Upgrade Notes.

Do not use in production
• EAP releases are not safe — EAP releases are snapshots of the ongoing JIRA development process. As such:
  • While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  • Features in development releases may be incomplete, or may change or be removed before the next full release.
• No upgrade path — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

Highlights of JIRA 4.4 EAP 4

Visual Workflow Designer For Administrators
JIRA 4.4 provides a visual representation of your workflow, making it easy to map out your business processes.

Simply go to 'Workflows' in JIRA administration as usual, and click the 'Design' link for the workflow you wish to edit. If you hover your mouse over an individual Step or Transition, a 'cog' icon appears, which you can click to access more functions.
Workflow Viewer on the 'View Issue' Screen

You can also see a read-only view of the workflow from the 'View Issue' page — just select 'View Workflow' from the ‘More Actions’ menu. We've made it simple for everyone to use, without requiring Flash to be installed.

The workflow viewer also highlights the current status of your issue in the workflow.

A new permission called 'View Read-Only Workflow' is required to access the workflow viewer feature from the 'View Issue' page.
We are very pleased to announce progress on JRA-9, one of the most highly-voted requests for JIRA: dates will be displayed to a user in their local time zone, rather than the server's time zone.

You can set a default user time zone at an administration level, and individual users have the ability to choose their own time zone.

In EAP 4, time zone support has been implemented for quick and advanced searching, chart and report gadgets, date/time-based custom fields, as well as issue histories, work logs and source code check-ins (via the JIRA FishEye Plugin). We are still in the process of implementing time zone support for the date/time formats used by all relevant fields and features in JIRA.

In order to see which fields honour an individual's time zone, you must first configure JIRA to use a Date Format that includes the time zone. To do this, go to 'Administration' => 'Look and Feel' and edit the 'Date/Time Formats', adding the letter 'z' or 'Z' in JIRA's Date and Time pattern format. For example, the format 'yyyy.MM.dd G 'at' HH:mm:ss z' includes the abbreviated time zone as indicated in http://java.sun.com/j2se/1.4.2/docs/api/java/text/SimpleDateFormat.html. You will now see some dates in JIRA display the individual's time zone while other dates still display the default time zone set at the administrative level.
JIRA administrators can change the default time zone by going to 'Administration' => 'General Configuration' (under 'Global Settings'), and editing the 'Default user time zone'.

Users can also change their individual time zone setting via their user profile:

Note to developers: If you develop JIRA plugins that handle dates and times, please be aware of the Formatting and Parsing Dates Using the Appropriate Time Zone section of the Plugin Developer Notes for JIRA 4.4.

Editable Options for Custom Fields

We are also pleased to announce progress on JRA-2983. You can now edit the options for custom fields of the following field types:

- Select List
- Multi Select
- Cascading Select
- Radio Buttons
- Multi Checkboxes

Because your custom fields may change over time, JIRA now gives you the ability to:

- edit a field's options — that is, change the text of an option.
• disable an option — that is, hide an option so that it is no longer available for selection. Options that have been used cannot be removed (to preserve data integrity), but due to changing business requirements, they may become invalid over time and so you may wish to make them unavailable for new issues.

**Note to developers:** If you develop JIRA plugins that handle single- and multi-select custom fields, please be aware of the Single- and Multi-Select Custom Field Changes section of the Plugin Developer Notes for JIRA 4.4.

---

**5**

**Improved Setup Wizard**

Our trusty wizard has had a makeover:

![Improved Setup Wizard](image-url)

---

**6**
**Database Configuration Now Part of the Setup Wizard**

In JIRA 4.4, configuring a connection to an external database is now part of the standard setup wizard. Customers can now connect JIRA to their database directly via JDBC, rather than having to rely on a JNDI-based connection to a datasource specified in the application server.

The database configuration step of the setup wizard will change before the final 4.4 release, but here is how it looks so far:

![Database Configuration Image]

**Improved Linux Installers and Uninstaller**

**Console Installer**

A simple command line/console installer wizard is now available for Linux operating systems.

To install JIRA, simply download the Linux `.bin` installer file and at a shell prompt, execute this file and follow the remaining prompts!

You can install JIRA as either the 'root' user or a non-root user under Linux. Currently, however, JIRA will be *run as the same Linux user account* which is used to install JIRA via this wizard. We intend to change this behaviour in a future EAP.

If you use the console installer wizard to install JIRA as the root user on your Linux operating system, then for security reasons, you should not use this JIRA installation in a public-facing environment.

**Silent Installation**

After installing JIRA on Linux using the `.bin` installer file above, a configuration file called `response.var` file is generated in the `.install4j` subdirectory of your `<JIRA Installation Directory>`. This file contains all the settings you specified manually while installing JIRA at the shell prompt, such as the Tomcat port numbers for JIRA and the location of your JIRA Installation and Home directories.
You can use this response.varfile file to re-install JIRA again 'silently' (without the need for any user input) by doing the following:

1. Before deleting your original JIRA installation, copy (cp) the `<JIRA Installation Directory>/install4j/response.varfile` to the same directory containing the Linux .bin installer file.

2. Enter the following command at the shell prompt:
   ./atlassian-jira-4.4-m3.bin -q -varfile response.varfile

**Uninstaller**

After installing JIRA on Linux using the .bin installer file above, an executable file called uninstall (located in `<JIRA Installation Directory>/bin`) is available to conveniently uninstall JIRA.

To uninstall JIRA:

1. Log in as the user who installed JIRA.
2. At the shell prompt, change directory (cd) into your `<JIRA Installation Directory>/bin` directory.
3. Execute the uninstall command.

   Please note:
   - The uninstaller will not delete the JIRA Home Directory.
   - All log files that were generated while JIRA was running will not be deleted.
   - All files within the JIRA Installation Directory will be deleted (with the exception of the Tomcat log folder located in `<JIRA Installation Directory>/logs`).

**Improved Windows Installers**

The installer wizard for Windows now works smoothly for Windows 7 and Vista.

The process for installing JIRA as a Windows service has also improved and the wizard now allows you to specify the port numbers used to run and access JIRA.

**Silent Installation**

When you execute the installer file at a shell prompt and complete your installation of JIRA, a file called response.varfile is generated in the .install4j subdirectory of your `<JIRA Installation Directory>/bin` directory.

This file contains all the settings you specified manually while installing JIRA at the command prompt, such as the Tomcat port numbers for JIRA and the location of your JIRA Installation and Home directories. You can use response.varfile to re-install JIRA again ‘silently’ (without the need for any user input) by doing the following:

1. Before deleting your original JIRA installation, copy the `<JIRA Installation Directory>/install4j/response.varfile` to the same directory containing the Windows .exe installer file.

2. Open a command prompt and enter the following command:
   atlassian-jira-4.4-m2.exe /q /varfile response.varfile

**REST API improvements (improved since EAP 3)**

There are new REST APIs for
• Listing and managing Project Components (*improved since EAP 3*).
• Listing and managing Project Versions.
• Listing and managing Project Roles (*new in EAP 4*).

Have a look at the reference documentation.

JIRA 4.4 EAP 3 Release Notes

12 April 2011

**JIRA 4.4 EAP 3** (a.k.a 4.4 milestone 3 or ‘m3’) is a public development release leading up to JIRA 4.4. An Early Access Preview (EAP) release is a snapshot of our work in progress, primarily focused on allowing JIRA users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

While development work on JIRA 4.4 commenced relatively recently, we want your involvement from the earliest days. Please provide feedback here.

JIRA 4.4 brings you a visual Workflow Designer and Workflow Viewer. We are also very pleased to announce that the JIRA installation process has been improved and simplified.

**Note to developers:** In JIRA 4.4 EAP 3 we have now implemented the majority of the reloadable plugin points — we are aiming to have them all done for EAP 4. Also please see the Plugin Developer Notes for JIRA 4.4.

**Highlights of JIRA 4.4 EAP 3:**

• Visual Workflow Designer For Administrators
• Workflow Viewer on the "View Issue" Screen
• User Time Zones (new in EAP 3)
• Editable Options for Custom Fields (new in EAP 3)
• Improved Setup Wizard (new in EAP 3)
• Database Connection Now Included In Setup
• Improved Linux Installer + Uninstaller (New in EAP 3)
• Improved Windows Installer
• REST API improvements (new in EAP 3)

**Other Enhancements and Fixes**

**Thank you for your interest in JIRA 4.4 EAP 3**

Download EAP

---

**Upgrading to JIRA 4.4 EAP 3**

JIRA EAP releases are available here. When upgrading, please follow the JIRA 4.4 Upgrade Notes.

---

**Do not use in production**

- **EAP releases are not safe** — EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
**No upgrade path** — Because EAP releases represent work in progress, we **cannot** provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

### Highlights of JIRA 4.4 EAP 3

#### Visual Workflow Designer For Administrators

JIRA 4.4 provides a visual representation of your workflow, making it easy to map out your business processes.

Simply go to "Workflows" in JIRA administration as usual, and click the "Design" link for the workflow you wish to edit. If you hover your mouse over an individual Step or Transition, a 'cog' icon appears, which you can click to access more functions.
**Workflow Viewer on the "View Issue" Screen**

You can also see a read-only view of the workflow from the "View Issue" page — just select "View Workflow" from the "More Actions" menu. We've made it simple for everyone to use, without requiring Flash to be installed.

The workflow viewer also highlights the **current status** of your issue in the workflow.

ℹ️ A new permission called 'View Read-Only Workflow' is required to access the workflow viewer feature from a view issue page.

---

**User Time Zones (new in EAP 3)**

We are very pleased to announce progress on JRA-9, one of the most highly-voted requests for JIRA: dates will be displayed to a user in their local time zone, rather than the server's time zone.

In EAP 3, you have the ability to set a default user time zone at an administration level, and individual users have the ability to choose their own time zone. We are in the process of implementing this for the date/time formats used by all relevant fields and features in JIRA. For example, time zone support has not yet been implemented for searching.

In order to see which fields honour an individual's time zone you must first configure JIRA to use a Date Format that includes the time zone. To do this, go to "Administration" => "Look and Feel" and edit the "Date/Time Formats", adding the letter "z" or "Z" in JIRA's Date and Time pattern format. For example, the
format "yyyy.MM.dd G 'at' HH:mm:ss z" includes the abbreviated time zone as indicated in http://java.sun.com/j2se/1.4.2/docs/api/java/text/SimpleDateFormat.html. You will now see some dates in JIRA display the individual's time zone while other dates still display the default time zone set at the administrative level.

JIRA Administrators can change the default time zone by going to "Administration" => "General Configuration" (under "Global Settings"), and editing the "Default user time zone".

Users can also change their individual time zone setting via their user profile:

Note to developers: If you develop JIRA plugins that handle dates and times, please be aware of the For matting and Parsing Dates Using the Appropriate Time Zone section of the Plugin Developer Notes for JIRA 4.4.

^Top

4

Editable Options for Custom Fields (new in EAP 3)

We are also pleased to announce progress on JIRA-2983. You can now edit the options for custom fields of the following field types:

- Select List
- Multi Select
- Cascading Select
- Radio Buttons

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Multi Checkboxes

Because your custom fields may change over time, JIRA now gives you the ability to:

- edit a field's options — that is, change the text of an option.
- disable an option — that is, hide an option so that it is no longer available for selection. Options that have been used cannot be removed (to preserve data integrity), but due to changing business requirements, they may become invalid over time and so you may wish to make them unavailable for new issues.

**Note to developers:** If you develop JIRA plugins that handle single- and multi-select custom fields, please be aware of the Single- and Multi-Select Custom Field Changes section of the Plugin Developer Notes for JIRA 4.4.

> Top

5

**Improved Setup Wizard (new in EAP 3)**

Our trusty wizard has had a makeover:
Database Connection Now Included In Setup

In JIRA 4.4, connecting to a database is now part of the standard setup wizard. It will change before the final 4.4 release, but here is how it looks in M3:

![Database Connection Image]

Improved Linux Installer + Uninstaller (New in EAP 3)

A simple command line/console installer wizard is now available for Linux operating systems.

To install JIRA, simply download the Linux .bin installer file and at a shell prompt, execute this file and follow the remaining prompts!

You can install JIRA as either the 'root' user or a non-root user under Linux. Currently, however, JIRA will be run as the same Linux user account which is used to install JIRA via this wizard. We intend to change this behaviour in a future EAP.

If you use the console installer wizard to install JIRA as the root user on your Linux operating system, then for security reasons, you should not use this JIRA installation in a public-facing environment.

Uninstaller for Linux (New in EAP 3)

After installing JIRA on Linux using the .bin installer file above, an executable file called uninstall (located in <JIRA Installation Directory>) is available to conveniently uninstall JIRA.

To uninstall JIRA:

1. Log in as the user who installed JIRA.
2. At the shell prompt, change directory (cd) into your <JIRA Installation Directory>.
3. Execute the uninstall command.
   - No additional flags or parameters are required.

Please note:
- The uninstaller will not delete the JIRA Home Directory.
- All log files that were generated while JIRA was running will not be deleted.
- All files within the JIRA Installation Directory will be deleted (with the exception of the Tomcat log folder located in <JIRA Installation Directory>/logs).

Silent Installations (New in EAP 3)

After installing JIRA on Linux using the .bin installer file above, a configuration file called response.var file is generated in the .install4j subdirectory of your <JIRA Installation Directory>. This file contains all the settings you specified manually while installing JIRA at the shell prompt, such as the Tomcat port numbers for JIRA and the location of your JIRA Installation and Home directories.

You can use this response.var file to re-install JIRA again 'silently' (without the need for any user input) by doing the following:

1. Before deleting your original JIRA installation, copy (cp) the <JIRA Installation Directory>/install4j/response.var file to the same directory containing the Linux .bin installer file.
2. Enter the following command at the shell prompt:
   ./atlassian-jira-4.4-m3.bin -q -varfile response.varfile

Improved Windows Installer

The installer wizard for Windows now works smoothly for Windows 7 and Vista.

The process for installing JIRA as a Windows service has also improved and the wizard now allows you to specify the port numbers used to run and access JIRA.

Silent Installations (New in EAP 3)

When you execute the installer file at a shell prompt and complete your installation of JIRA, a file called response.var file is generated in the .install4j subdirectory of your <JIRA Installation Directory>.

This file contains all the settings you specified manually while installing JIRA at the command prompt, such as the Tomcat port numbers for JIRA and the location of your JIRA Installation and Home directories. You can use response.var file to re-install JIRA again 'silently' (without the need for any user input) by doing the following:

1. Before deleting your original JIRA installation, copy the <JIRA Installation Directory>\install4j\response.var file to the same directory containing the Windows .exe installer file.
2. Open a command prompt and enter the following command:
   atlassian-jira-4.4-m2.exe /q /varfile response.varfile

REST API improvements (new in EAP 3)

There are new REST APIs for
• Listing and managing Project Components.
• Listing and managing Project Versions.

Have a look at the reference documentation.

Other Enhancements and Fixes

For the list of issues resolved in JIRA 4.4 so far, click here.

JIRA 4.4 EAP 2 Release Notes

31 March 2011

JIRA 4.4 EAP 2 (a.k.a 4.4 milestone 2 or ‘m2’) is a public development release leading up to JIRA 4.4. An Early Access Preview (EAP) release is a snapshot of our work in progress, primarily focused on allowing JIRA users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

Please note that JIRA 4.4 EAP 1 was not released to the public.

While development work on JIRA 4.4 commenced relatively recently, we want your involvement from the earliest days. Please provide feedback here.

JIRA 4.4 brings you a visual Workflow Designer and Workflow Viewer. We are also very pleased to announce that the JIRA installation process has been improved and simplified.

Highlights of JIRA 4.4 EAP 2:

• Visual Workflow Designer For Administrators
• Workflow Viewer on the "View Issue" Screen
• Database Connection Now Included In Setup
• Console Installer Wizard for Linux
• Improvements to the Windows Installer Wizard
• Other Enhancements and Fixes

Thank you for your interest in JIRA 4.4 EAP 2

Download EAP

Upgrading to JIRA 4.4 EAP 2

JIRA EAP releases are available here. When upgrading, please follow the JIRA 4.4 Upgrade Notes.

Do not use in production

• EAP releases are not safe — EAP releases are snapshots of the ongoing JIRA development process. As such:
  • While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  • Features in development releases may be incomplete, or may change or be removed before the next full release.
• No upgrade path — Because EAP releases represent work in progress, we cannot provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

Highlights of JIRA 4.4 EAP 2
**Visual Workflow Designer For Administrators**

JIRA 4.4 provides a visual representation of your workflow, making it easy to map out your business processes.

Simply go to "Workflows" in JIRA administration as usual, and click the "Design" link for the workflow you wish to edit. You can right-click on individual Steps and Transitions to view more information.

**Workflow Viewer on the "View Issue" Screen**

You can also see a read-only view of the workflow from the "View Issue" page — just select "View Workflow" from the "More Actions" menu. We've made it simple for everyone to use, without requiring Flash to be installed.

The workflow viewer also highlights the current status of your issue in the workflow.
In JIRA 4.4, connecting to an external database is now part of the standard setup wizard. It will change before the final 4.4 release, but here is how it looks in M2:
Console Installer Wizard for Linux

A simple command line/console installer wizard is now available for Linux operating systems. To install JIRA, simply download the Linux .bin installer file and at the command line or shell prompt, execute this file and follow the remaining prompts!

You can install JIRA as either the 'root' user or a non-root user under Linux. Currently, however, JIRA will be run as the same Linux user account which is used to install JIRA via this wizard. We intend to change this behaviour in a future EAP.

- If you use the console installer wizard to install JIRA as the root user on your Linux operating system, then for security reasons, you should not use this JIRA installation in a public-facing environment.

Improvements to the Windows Installer Wizard

The installer wizard for Windows now works smoothly for Windows 7 and Vista. The process for installing JIRA as a Windows service has also improved and wizard now allows you to specify the port numbers used to run and access JIRA.
Other Enhancements and Fixes

For the list of issues resolved in JIRA 4.4 so far, click here.

JIRA 4.3 EAP Release Notes

- JIRA 4.3 RC1 Release Notes
- JIRA 4.3 Beta 1 Release Notes
- JIRA 4.3 EAP 5 Release Notes
- JIRA 4.3 EAP 3 Release Notes
- JIRA 4.3 EAP 2 Release Notes
- JIRA 4.3 EAP 1 Release Notes

JIRA 4.3 RC1 Release Notes

18 February 2011

JIRA 4.3 RC1 (a.k.a 4.3 milestone 7 or 'm7') is a public development release leading up to JIRA 4.3. A Release Candidate (RC) is a preliminary release leading up to the official release of a JIRA version. RC releases are a fairly stable snapshot of our work in progress and provide an advance preview of new features to the general public. JIRA plugin developers can also use RC releases to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

The Atlassian team is proud to bring you the JIRA 4.3 RC1 release. As always, we would love to hear your feedback and comments about this release. To keep the discussion centralised, please provide your feedback as a comment on JIRA-23131.

Identity management comes of age in JIRA 4.3, with complete LDAP integration. JIRA 4.3 also includes the Universal Plugin Manager for easier management of plugins, and a new data importer for easier migration from your old systems. Additionally, a raft of new JQL functions give you many powerful new searching options, such as the ability to search an issue's change history.

Dashboard Publish/Subscribe with Confluence (i.e. Gadgets 2.0) is also included, so if you are using Confluence as well as JIRA, your Confluence gadgets will now appear in the JIRA Gadget Directory.

Note to developers: JIRA 4.3 RC1 includes Unified Application Links (UAL), Gadgets 2.0, and the Atlassian Plugin Framework version 2.6. Also please see the Plugin Developer Notes for JIRA 4.3, plus note that the REST API continues to evolve — please watch the Developer blog for the latest news on the REST API.

Highlights of JIRA 4.3 RC1:

- Full integration with LDAP and Active Directory
- Easy management of User Directories via JIRA Admin UI
- New Plugin Management System
- Application Links: Connecting Applications Together
- Add another application’s Gadgets to your JIRA Gadget Directory
- Improved Importer (new since Beta 1)
- Dashboard Performance Improvements
- JQL and Quick Search Enhancements
- Revamped User Avatars
- Improvements to Issue Links
- Remembered Assignees
- 'Whitelist' for External URLs (new since Beta 1)
- Mail Server Configuration Improvements
- Security Enhancements
- JIRA now supports 'In-place
Database Upgrades’
- Support Tools Plugin now bundled
  (new since Beta 1)
- Support for Chrome and Safari 5
  Browsers
- REST API Improvements
- Other Enhancements and Fixes

Thank you for your interest in JIRA 4.3 RC1
Download RC

⚠️ Upgrading to JIRA 4.3 RC1
JIRA RC releases are available here. When upgrading, please follow the JIRA 4.3 Upgrade Guide.

⚠️ Do not use in production
RC releases should not be used in production environments as they are not officially supported.

⚠️ Please also note:
- **RC releases may not be safe** — RC releases are snapshots of the ongoing JIRA development process. As such:
  - While we deem these releases to be fairly stable, they have not undergone sufficient testing to be deemed an official (final) release.
  - While feature development work is complete, some features may be subject to change or may be removed before the next full release.
- **No upgrade path** — Because RC releases still represent work in progress, we cannot provide a supported upgrade path between RC releases, from EAP or Beta to RC releases, or from any RC to the eventual final release. Thus, any data you store in a JIRA RC release may not be able to be migrated to a future JIRA release.

**Highlights of JIRA 4.3 RC1**

1

*Full integration with LDAP and Active Directory*

The way users and groups are stored and accessed in JIRA has been totally rewritten in Release 4.3, giving you the ability to connect to an LDAP server — including Microsoft Active Directory — for all user information. Your options include:

Integrate JIRA with LDAP/Active Directory

Update your user details in either JIRA or LDAP/Active Directory and they will automatically populate to the other repository:
Use LDAP for authentication only

This was the old way of integrating JIRA with LDAP, prior to JIRA 4.3. You can still do this, but much more easily (see below).

Connect to a Crowd server for user management

For larger and more complex installations, you may need to install Atlassian Crowd for user management and single sign-on. (See our guide to limitations and recommendations.) When integrating earlier versions of JIRA and Crowd, you had to manually edit a number of configuration files. JIRA 4.3 offers the following...
new features:

- Simple and quick setup via the JIRA and Crowd administration consoles.
- Clever synchronisation and caching to ensure the best response times.
- More...

Use multiple LDAP and/or Crowd servers simultaneously

If you have multiple directories, you can now simply connect JIRA to all of them.

Connect Confluence to your JIRA User Directory

JIRA 4.3 can act as the directory manager for your Confluence site, interacting with one or more user directories and ensuring that you have the same set of users and groups across both applications.

Confluence 3.5 can connect directly to JIRA 4.3 via the administration UI. Clever synchronisation and caching ensure the best response times for your directory searches.
Earlier versions of Confluence can continue to use a direct JDBC connection to JIRA 4.2 and earlier.

Easy management of User Directories via JIRA Admin UI

In JIRA 4.3, administrators can now manage external User Directories directly from the JIRA Administration screens. Gone are the days of manually editing XML files.
JIRA 4.3 brings a simple, powerful and flexible directory management interface:

- Choose from a list of supported directory types, including Microsoft Active Directory and ten other popular LDAP schemas.
- Configure all your LDAP settings via the JIRA Administration interface: permissions, server and schema settings. We pre-populate the fields with default values depending on your choice of directory type.
- Choose the LDAP permissions to suit your needs: read/write, read only, local groups or authentication only.
- Make use of the caching and copy-as-required configurations to optimise the performance of your LDAP searches.
- Add as many directory servers as you need. Connect directory servers of different types, including the JIRA internal directory (default), LDAP, Crowd and/or another JIRA server.
- Turn on support for nested groups.
- Configure your LDAP connection pool.

New Plugin Management System

JIRA 4.3 includes the Universal Plugin Manager (UPM), which provides you with a simple way of adding and managing plugins:

- Auto-discovery of available plugins (see **Featured Plugins** in the screenshot below)
- Point-and-click installation — you no longer need to download JAR files and shut down JIRA to install them.
Application Links: Connecting Applications Together

JIRA 4.3 includes Application Links, which makes it easy to connect your Atlassian applications together.

**Application Links** allows you to link your JIRA, Confluence, FishEye, Crucible, Bamboo and Subversion applications. You can even choose to associate individual entities (i.e. JIRA projects, Confluence spaces, FishEye repositories, FishEye projects, Crucible projects, Bamboo projects) with each other. Applications Links is bundled with FishEye 2.4, Confluence 3.5, JIRA 4.3, and all later versions of those applications. In addition, Bamboo 3.1 is compatible with AppLinks. You can configure JIRA-to-Bamboo links via the JIRA administration screens.

Linking two applications allows you to share information and access one application's functions from within the other. For example, if you linked a Confluence server to a JIRA server, you can create, find and insert JIRA issues directly onto a Confluence page or blog post using the new 'Insert JIRA Issue' option in Confluence 3.5.

You also can associate entities of two linked applications. For example, you could associate a JIRA project with a Confluence space. This allows you to take advantage of additional integration features like link rendering, which lets you create links to issues or pages in the project or space using a simple textual reference, e.g. [JIRA-1234], [myConfluenceSpace:Test Page].

- In JIRA 4.3 there is now a 'Configure Application Links' option on the 'Project' management screen, enabling you to easily configure application links for a given project.

For more about configuring Application Links, please see the Application Links Administrator's Guide.
Add another application's Gadgets to your JIRA Gadget Directory

JIRA 4.3 includes Atlassian Gadgets 2.0, allowing you to quickly add all gadgets from your Confluence, Bamboo, FishEye or Crucible instance — or from another JIRA instance — to your JIRA Gadget Directory, for easy addition to your JIRA dashboard:

In the JIRA Gadget Directory, you can now click ‘Gadget Subscriptions’. There you can provide the URL for the other application (or other JIRA instance), and all the gadgets from that instance will be added to your JIRA Gadget Directory.

Improved Importer (new since Beta 1)

JIRA 4.3 provides a greatly improved Importer for Bugzilla, Mantis, FogBugz and CSV files, by bundling the JIRA Importers Plugin.

The web-based import wizard makes it easy to map fields — and individual field values — from your old bug-tracker to your new JIRA system:
Dashboard Performance Improvements

We are extremely pleased to announce that you should see a noticeable reduction in the time it takes to load a Dashboard.

- On average, dashboard performance has improved by 29%
- For large dashboards, the performance improvement is 35%

We are also extremely pleased to announce that you should see a noticeable reduction in the time it takes to load the Gadget Directory (depending on how many external gadgets you have configured).

JQL and Quick Search Enhancements

JIRA 4.3 incorporates several JQL and Quick Search enhancements. You can now:

Search the Change History with JQL ‘WAS’ Operator

JIRA 4.3 introduces the ability to search the Change History of issues. There is much more functionality to follow, but in this release you can search for changes to the Status field.

For example, the following will return all issues that currently have, or previously had, a status of ‘In
Progress:

status WAS "In Progress"

The WAS operator can be used with the NOT, IN and NOT IN operators, e.g. to find issues that have never had a status of 'In Progress' or 'Resolved':

status WAS NOT IN ("In Progress","Resolved")

Search for relative dates and versions with JQL 'startOfDay', 'endOfDay', 'earliestUnreleasedVersion', 'latestReleasedVersion' (new since Beta 1)

JIRA 4.3 introduces the ability to search for issues relative to the current day, month, week or year. For example, to find issues that have been created today:

created > startOfDay()

Or to find issues that are due by the end of this month:

due < endOfMonth()

You can also perform searches based on the earliest unreleased version (i.e. the next version that is due to be released) of a specified project:

earliestUnreleasedVersion(project)

Or on the most recently released version of a specified project:

latestReleasedVersion(project)

Use a wild card when searching the 'Fix Version' field with Quick Search

When using Quick Search, you can now use the wildcard symbol: "*" to find issues that matches a core part of a Fix Version. For example, "ff:3.2*" will match any issue whose Fix For Version is:

- 3.2
- 3.2-beta
- 3.2.1
- 3.2.x

Use the r: prefix with Quick Search to find issues reported by a specific user

With Quick Search, you can find issues reported by you, another user or with no reporter, using the prefix "r:" followed by a specific reporter term such as "me", a username or "none", such that:

- "r:me" — finds issues reported by you.
- "r:samuel" — finds issues reported by the user whose username is "samuel".
- "r:none" — finds issues with no reporter.
Revamped User Avatars

JIRA 4.3 introduces the new-look Atlassian avatars:

- User avatars are displayed as the icon for your profile, and to illustrate your comments on an issue. See the documentation on Adding a User Avatar.

We were fond of the old avatars, but think you'll agree they were looking a little dated by comparison:

Improvements to Issue Links

The 'Linked Issues' section of the 'View Issue' screen has been streamlined to make it both more compact and quicker to use. You can now delete links directly from this screen upon mouse hover:

Previously, to delete a link you needed to click the 'cog' icon (which took you to a separate screen):
Remembered Assignees

JIRA now makes it easier to assign users to issues. The top of the assignee dropdown list shows the last five people you assigned issues to, as well as the reporter of the issue and all participants involved in the issue.

'Whitelist' for External URLs (new since Beta 1)

For security reasons, an administrator may wish to limit the URLs from which users can source content that is displayed on their JIRA site (e.g. via an External Gadget).

JIRA 4.3 allows you to create a 'Whitelist' of URLs — or URL patterns — whose content you wish to make available to users of your JIRA site:
Mail Server Configuration Improvements

In JIRA 4.3, administrators can now test their mail server configuration with the "Test Connection" button.

See the documentation for more details.
A 'Timeout' field has also been added.

**Security Enhancements**

For enhanced security:

**User Email Change is now Password Protected**

Users will now be prompted to enter their password when changing their email address.

**JIRA provides Secure Administration Sessions (new since Beta 1)**

Access to JIRA’s administration features and functions is now password-protected.

See the documentation for more details.
**JIRA now supports ‘In-place Database Upgrades’**

JIRA 4.3 now officially supports ‘in-place database upgrades’, when upgrading from JIRA 4.0.0 or later.

This method requires much less downtime during the JIRA upgrade process, especially if you operate a large JIRA installation. You no longer need to export your existing JIRA data to an XML backup and then restore this data into your new JIRA version. Instead, we now support simply ‘pointing’ your new version of JIRA at your existing JIRA database!

See the documentation for more details.

^Top

**Support Tools Plugin now bundled (new since Beta 1)**

We are very pleased to announce that the Atlassian Support Tools Plugin is now bundled with JIRA. The Atlassian Support Tools Plugin proves tools to help you troubleshoot issues with Atlassian products and get help from Atlassian Support.

See the documentation for more details.

^Top

**Support for Chrome and Safari 5 Browsers**

We are very pleased to announce that Chrome and Safari 5 are supported for use with JIRA 4.3.

^Top

**REST API Improvements**

We have improved discoverability of issues and projects through the REST API: there is now a search resource, which can be used to search for issues using JIRA Query Language (JQL). It is also possible to obtain a list of projects in a JIRA instance. Have a look at the reference documentation to see if the REST API offers the features that you want (let us know if not).

Clients that log in through the REST API can now determine when the login has been denied due to a CAPTCHA requirement: the HTTP header X-Authentication-Denied-Reason has all the necessary information.

JIRA 4.3 Beta 1 Release Notes

1 February 2011
**JIRA 4.3 Beta 1** (a.k.a 4.3 milestone 6 or 'm6') is a public development release leading up to JIRA 4.3. A Beta release is a preliminary release leading up to the official release of a JIRA version. Beta releases are a snapshot of our work in progress and provide an advance preview of new features to the general public. JIRA plugin developers can also use Beta releases to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

The Atlassian team is proud to bring you the JIRA 4.3 Beta 1 release. Thank you for your feedback during the recent EAP releases, and please keep providing it here.

Identity management comes of age in JIRA 4.3, with complete LDAP integration. Additionally, you now have the ability to search an issue's change history. JIRA 4.3 also includes the Universal Plugin Manager for easier management of plugins.

Dashboard Publish/Subscribe with Confluence (i.e. Gadgets 2.0) is also included, so if you are using Confluence as well as JIRA, your Confluence gadgets will now appear in the JIRA Gadget Directory (and vice versa).

**Note to developers:** JIRA 4.3 Beta 1 includes Unified Application Links (UAL), Gadgets 2.0, and the Atlassian Plugin Framework version 2.6. Also please see the Plugin Developer Notes for JIRA 4.3, plus note that the REST API will continue to evolve through the 4.3 Beta releases — please watch the Developer blog for the latest news on the REST API.

**Highlights of JIRA 4.3 Beta 1:**
- Full LDAP integration
- User Directory management via JIRA Admin UI
- New Plugin Management System
- AppLinks pre-installed and configurable from the JIRA Admin UI
- Add another application's Gadgets to your JIRA Gadget Directory
- Dashboard Performance Improvements (enhanced since EAP 5)
- Search the Change History with JQL 'WAS' Function (improved since EAP 5)
- Revamped User Avatars
- Enhancements to Quick Search
- Improvements to Issue Links (new since EAP 5)
- Remembered Assignees
- Mail Server Configuration Improvements
- User Email Change is now Password Protected
- Support for Chrome and Safari 5 Browsers
- REST API improvements
- Other Enhancements and Fixes

Thank you for your interest in JIRA 4.3 Beta 1

Download Beta

---

**Upgrading to JIRA 4.3 Beta 1**

JIRA Beta releases are available here. When upgrading, please follow the JIRA 4.3 Upgrade Guide.

---

**Do not use in production**

Beta releases should not be used in production environments as they are not officially supported.

---

**Please also take note of the following information:**
- Beta releases are not safe—Beta releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of
Highlights of JIRA 4.3 Beta 1

Full LDAP integration

The way users and groups are stored and accessed in JIRA has been totally rewritten in Release 4.3. This provides a number of additional capabilities, mainly the ability to use an LDAP server for all user information. Key features are:

• Ability to connect to an LDAP server, including to Microsoft Active Directory, for user management. This includes:
  • Read-write access
  • Read-only access
  • Read-only access with local groups
  • Use LDAP for authentication only — Previous functionality
• Ability to connect to a Crowd server for user management — Previous functionality
• Ability to manage users fully within JIRA — Previous functionality
• Ability to use 2 or more LDAP and/or Crowd servers simultaneously for user management.

Note when upgrading from EAP 3

If you are upgrading to Beta 1 from EAP 3, please note that there have been changes to Crowd that require extra data in the cwd_application table.

You will need to update the table and add 'CROWD' into the application_type column.

(This will not be necessary when upgrading to the final release of JIRA 4.3.)

User Directory management via JIRA Admin UI

In JIRA 4.3, administrators can now manage external User Directories directly from the JIRA Administration screens. Gone are the days of manually editing XML files.
New Plugin Management System

JIRA 4.3 includes the Universal Plugin Manager (UPM), which provides you with a simple way of adding and managing plugins:

- Auto-discovery of available plugins (see Featured Plugins in the screenshot below)
- Point-and-click installation — no more downloading JAR files

Featured Plugins
Plugins featured on the Atlassian Plugin Exchange.
**AppLinks pre-installed and configurable from the JIRA Admin UI**

JIRA 4.3 includes Unified Application Links (UAL), so you no longer need to install it separately.

**Application Links (AppLinks)** is a plugin that allows you to link your JIRA, Confluence, FishEye, Crucible, Bamboo and Subversion applications. You can even choose to associate individual entities (i.e. JIRA projects, Confluence spaces, FishEye repositories, FishEye projects, Crucible projects, Bamboo projects) with each other. Applications Links is bundled with FishEye 2.4, Confluence 3.5, JIRA 4.3, and all later versions of those applications. In addition, Bamboo 3.1 is compatible with AppLinks. You can configure JIRA-to-Bamboo links via the JIRA administration screens.

Linking two applications allows you to share information and access one application's functions from within the other. For example, if you linked a JIRA server and a Confluence server, you could view JIRA issues in a Confluence page via the JIRA Issues Macro.

You also can associate entities of two linked applications. For example, you could associate a JIRA project with a Confluence space. This allows you to take advantage of additional integration features like link rendering, which lets you create links to issues or pages in the project or space using a simple textual reference, e.g. [JRA-1234], [myConfluenceSpace:Test Page].

- In JIRA 4.3 there is now a 'Managed Unified Application Links' option on the 'Manage Project' screen, enabling you to easily configure application links for a given project.

For more about configuring Application Links, please see the Application Links Administrator's Guide.

^Top

**Add another application’s Gadgets to your JIRA Gadget Directory**

JIRA 4.3 includes Atlassian Gadgets 2.0, allowing you to quickly add all gadgets from your Confluence, Bamboo, FishEye or Crucible instance — or from another JIRA instance — to your JIRA Gadget Directory, for easy addition to your JIRA dashboard:

In the JIRA Gadget Directory, you can now click 'Gadget Subscriptions'. There you can provide the URL for the other application (or other JIRA instance), and all the gadgets from that instance will be added to your JIRA Gadget Directory.

^Top

**Dashboard Performance Improvements (enhanced since EAP 5)**

We are extremely pleased to announce that you should see a noticeable reduction in the time it takes to load a Dashboard.
On average, dashboard performance has improved by 29%
For large dashboards, the performance improvement is 35%

In Beta 1 we are also extremely pleased to announce that you should see a noticeable reduction in the time it takes to load the Gadget Directory (depending on how many external gadgets you have configured).

Search the Change History with JQL 'WAS' Function (improved since EAP 5)

JIRA 4.3 introduces the ability to search the Change History of issues. There is much more functionality to follow, but in this release you can search for changes to the Status field.

For example, the following will return all issues that currently have, or previously had, a status of 'In Progress':

```
status WAS "In Progress"
```

In Beta 1, support for the **NOT**, **IN** and **NOT IN** operators has been added.

E.g. to find issues that have never had a status of 'In Progress':

```
status WAS NOT "In Progress"
```

To find issues that currently have, or previously had, a status of 'In Progress' or 'Resolved':

```
status WAS IN "In Progress,Resolved"
```

Revamped User Avatars

JIRA 4.3 introduces the new-look Atlassian avatars:

- User avatars are displayed as the icon for your profile, and to illustrate your comments on an issue.
  See the documentation on Adding a User Avatar.

We were fond of the old avatars, but think you'll agree they were looking a little dated by comparison:

Enhancements to Quick Search

When using Quick Search to find issues with a particular version, you can now use the wildcard symbol: "*". For example, "ff:3.2*" will match any issue whose Fix For Version is:

- 3.2
- 3.2-beta
- 3.2.1
- 3.2.x

You can also find issues reported by you, another user or with no reporter, using the prefix "r:" followed by a specific reporter term such as "me", a username or "none", such that:

- "r:me" — finds issues reported by you.
- "r:samuel" — finds issues reported by the user whose username is "samuel".
- "r:none" — finds issues with no reporter.

Improvements to Issue Links (new since EAP 5)

The 'Linked Issues' section of the 'View Issue' screen has been streamlined to make it both more compact and quicker to use. You can now delete links directly from this screen:

JIRA 4.3: a linked issue

Previously, to delete a link you needed to click the 'cog' icon (which took you to a separate screen):

JIRA 4.2: a linked issue
**Remembered Assignees**

JIRA now makes it easier to assign users to issues. The top of the assignee dropdown list shows the last five people you assigned issues to, as well as the reporter of the issue and all participants involved in the issue.

**Mail Server Configuration Improvements**

In JIRA 4.3, administrators can now test their mail server configuration with the "Test Connection" button.

![Update SMTP Mail Server](image)

A 'Timeout' field has also been added.
User Email Change is now Password Protected

For enhanced security, users will now be prompted to enter their password when changing their email address.

Support for Chrome and Safari 5 Browsers

We are very pleased to announce that Chrome and Safari 5 are supported for use with JIRA 4.3.

REST API improvements

We have improved discoverability of issues and projects through the REST API: there is now a search resource, which can be used to search for issues using JIRA Query Language (JQL). It is also possible to obtain a list of projects in a JIRA instance. Have a look at the reference documentation to see if the REST API offers the features that you want (let us know if not).

Clients that log in through the REST API can now determine when the login has been denied due to a CAPTCHA requirement: the HTTP header X-Authentication-Denied-Reason has all the necessary information.

Other Enhancements and Fixes

For the list of issues resolved in JIRA 4.3 so far, click here.

JIRA 4.3 EAP 5 Release Notes

14 January 2011

JIRA 4.3 EAP 5 (a.k.a 4.3 milestone 5 or ‘m5’) is a public development release leading up to JIRA 4.3. An Early Access Preview (EAP) release is a snapshot of our work in progress, primarily focused on allowing JIRA users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

- A note for the curious: we skipped the EAP 4 release due to the holiday season.

The Atlassian team is proud to bring you the JIRA 4.3 EAP 5 release. Thank you for your feedback so far, and please keep providing it here.

Identity management comes of age in JIRA 4.3, with complete LDAP integration. Additionally, you now have the ability to search an issue’s change history. JIRA 4.3 also includes the Universal Plugin Manager for easier management of plugins.

Dashboard Publish/Subscribe with Confluence (i.e. Gadgets 2.0) is also included, so if you are using Confluence as well as JIRA, your Confluence gadgets will now appear in the JIRA Gadget Directory (and vice versa).

Note to developers: JIRA 4.3 EAP 5 includes Unified Application Links (UAL), Gadgets 2.0, and the Atlassian Plugin Framework version 2.6. Also please see the Plugin Developer Notes for JIRA 4.3, plus note that the
REST API will continue to evolve through the 4.3 EAP releases — please watch the Developer blog for the latest news on the REST API.

**Highlights of JIRA 4.3 EAP 5:**

- Add another application’s Gadgets to your JIRA Gadget Directory
- Search the Change History with JQL ‘WAS’ Function (improved since EAP 3)
- Full LDAP integration (upgrade note added since EAP 3)
- User Directory management via JIRA Admin UI
- Revamped User Avatars (new since EAP 3)
- Mail Server Configuration Improvements (improved since EAP 3)
- User Email Change is now Password Protected (new since EAP 3)
- New Plugin Management System
- AppLinks pre-installed and configurable from the JIRA Admin UI
- Enhancements to Quick Search (improved since EAP 3)
- Faster Dashboards
- REST API improvements
- Other Enhancements and Fixes

**Thank you for your interest in JIRA 4.3 EAP 5**

Download EAP

---

**Upgrading to JIRA 4.3 EAP 5**

JIRA EAP releases are available here. When upgrading, please follow the JIRA 4.3 Upgrade Guide.

---

**Do not use in production**

- **EAP releases are not safe** — EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because EAP releases represent work in progress, we **can not** provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

---

**Highlights of JIRA 4.3 EAP 5**

---

**Add another application’s Gadgets to your JIRA Gadget Directory**

JIRA 4.3 EAP 2 includes Atlassian Gadgets 2.0, allowing you to quickly add all gadgets from your Confluence, Bamboo, FishEye or Crucible instance — or from another JIRA instance — to your JIRA Gadget Directory, for easy addition to your JIRA dashboard:
In the JIRA Gadget Directory, you can now click 'Gadget Subscriptions'. There you can provide the URL for the other application (or other JIRA instance), and all the gadgets from that instance will be added to your JIRA Gadget Directory.

2

Search the Change History with JQL 'WAS' Function (improved since EAP 3)

In EAP 2 we released the first cut of Change History searching. There is much more functionality to follow, but for now you can search for changes to the Status field.

For example, the following will return all issues that currently have, or previously had, a status of 'In Progress':

```
status WAS "In Progress"
```

Autocomplete has been implemented in EAP 5.

3

Full LDAP integration (upgrade note added since EAP 3)

The way users and groups are stored and accessed in JIRA has been totally rewritten in Release 4.3. This provides a number of additional capabilities, mainly the ability to use an LDAP server for all user information. Key features are:

- Ability to connect to an LDAP server, including to Microsoft Active Directory, for user management. This includes:
  - Read-write access
  - Read-only access
  - Read-only access with local groups
  - Use LDAP for authentication only — Previous functionality
- Ability to connect to a Crowd server for user management — Previous functionality
- Ability to manage users fully within JIRA — Previous functionality
- Ability to use 2 or more LDAP and/or Crowd servers simultaneously for user management.

Note when upgrading from EAP 3

If you are upgrading to EAP 5 from EAP 3, please note that there have been changes to Crowd that require extra data in the cwd_application table.

You will need to update the table and add ‘CROWD’ into the application_type column:
UPDATE cwd_application SET application_type = 'CROWD';

(This will not be necessary when upgrading to the final release of JIRA 4.3.)

5

Revamped User Avatars (new since EAP 3)

JIRA 4.3 introduces the new-look Atlassian avatars:

- User avatars are displayed as the icon for your profile, and to illustrate your comments on an issue. See the documentation on Adding a User Avatar.

We were fond of the old avatars, but think you'll agree they were looking a little dated by comparison:
Mail Server Configuration Improvements (improved since EAP 3)

In JIRA 4.3, administrators can now test their mail server configuration with the "Test Connection" button.

A 'Timeout' field has also been added in EAP 5.
User Email Change is now Password Protected (new since EAP 3)

For enhanced security, users will now be prompted to enter their password when changing their email address.

New Plugin Management System

JIRA 4.3 includes the Universal Plugin Manager (UPM), which provides you with a simple way of adding and managing plugins:

- Auto-discovery of available plugins (see Featured Plugins in the screenshot below)
- Point-and-click installation — no more downloading JAR files

![Install](https://example.com/install.png)

**Featured Plugins**

Plugins featured on the Atlassian Plugin Exchange.

- Green-keeper
- JIRA Calendar Plugin
- JIRA Charting Plugin
- JIRA Drag and Drop Attachment Plugin
- JIRA iPhone Web Interface
- JIRA Toolkit Plugin
- MyZone for JIRA
- Wallboard Plugin

Unified Application Links (AppLinks) is a plugin that allows you to link your JIRA, Confluence, FishEye, Crucible, Bamboo and Subversion applications. You can even choose to associate individual entities (i.e. JIRA projects, Confluence spaces, FishEye repositories, FishEye projects, Crucible projects, Bamboo projects).
with each other. Applications Links is bundled with FishEye 2.4, Confluence 3.5, JIRA 4.3, and all later versions of those applications. In addition, Bamboo 3.1 is compatible with AppLinks. You can configure JIRA-to-Bamboo links via the JIRA administration screens.

Linking two applications allows you to share information and access one application's functions from within the other. For example, if you linked a JIRA server and a Confluence server, you could view JIRA issues in a Confluence page via the JIRA Issues Macro.

You also can associate entities of two linked applications. For example, you could associate a JIRA project with a Confluence space. This allows you to take advantage of additional integration features like link rendering, which lets you create links to issues or pages in the project or space using a simple textual reference, e.g. [JRA-1234], [myConfluenceSpace:Test Page].

• In JIRA 4.3 EAP 5 there is now a 'Managed Unified Application Links' option on the 'Manage Project' screen, enabling you to easily configure application links for a given project.

For more about configuring Application Links, please see the Application Links Administrator's Guide.

JIRA 4.3 EAP 3 Release Notes

20 December 2010

JIRA 4.3 EAP 3 (a.k.a. 4.3 milestone 3 or 'm3') is a public development release leading up to JIRA 4.3. An Early Access Preview (EAP) release is a a snapshot of our work in progress, primarily focused on allowing JIRA users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

The Atlassian team is proud to bring you the JIRA 4.3 EAP 3 release. Development work on JIRA 4.3 has only commenced very recently, but we want your involvement from the earliest days. Please provide feedback here.

Identity management comes of age in JIRA 4.3, with complete LDAP integration. Additionally, you now have the ability to search an issue's change history. JIRA 4.3 also includes the Universal Plugin Manager for easier management of plugins.

Dashboard Publish/Subscribe (i.e. Gadgets 2.0) is also included, so you can now add gadgets from another Atlassian application (Confluence, FishEye, Crucible, Bamboo) — or from another JIRA instance — to your JIRA Gadget Directory.

Note to developers: JIRA 4.3 EAP 3 includes Unified Application Links (UAL) (new since EAP 2), Gadgets 2.0 (new since EAP 2), and the Atlassian Plugin Framework version 2.6. Also please see the Plugin Developer Notes for JIRA 4.3, plus note that the REST API will continue to evolve through the 4.3 EAP releases — please watch the Developer blog for the latest news on the REST API.

Highlights of JIRA 4.3 EAP 3:

- Add another application’s Gadgets to your JIRA Gadget Directory (new since EAP 2)
- Search the Change History with JQL 'WAS' Function
- Full LDAP integration
- User Directory management via JIRA Admin UI
- Mail Server Configuration Improvements
- New Plugin Management System
- AppLinks pre-installed and configurable from the JIRA Admin UI (new since EAP 2)
- Quick Search now has a Wild Card
- Faster Dashboards (new since EAP 2)
- REST API improvements
- Other Enhancements and Fixes

Thank you for your interest in JIRA 4.3 EAP 3

Download EAP

Interested in a prototype plugin that simplifies JIRA project administration? http://atlss.in/ik76w
Upgrading to JIRA 4.3 EAP 3
JIRA EAP releases are available here. When upgrading, please follow the JIRA 4.3 Upgrade Guide.

Do not use in production
- **EAP releases are not safe** — EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because EAP releases represent work in progress, we **cannot** provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

Highlights of JIRA 4.3 EAP 3

1. **Add another application’s Gadgets to your JIRA Gadget Directory (new since EAP 2)**

JIRA 4.3 EAP 3 includes Atlassian Gadgets 2.0, allowing you to quickly add all gadgets from your Confluence, Bamboo, FishEye or Crucible instance — or from another JIRA instance — to your JIRA Gadget Directory, for easy addition to your JIRA dashboard:

In the JIRA Gadget Directory, you can now click ‘Gadget Subscriptions’. There you can provide the URL for the other application (or other JIRA instance), and all the gadgets from that instance will be added to your JIRA Gadget Directory.

2. **Search the Change History with JQL ‘WAS’ Function**

We have released the first cut of Change History searching. There is much more functionality to follow, but for now you can search for changes to the Status field.

For example, the following will return all issues that currently have, or previously had, a status of ‘In Progress’:

```
status WAS "In Progress"
```

Note that autocomplete has not yet been implemented, but full error reporting is supported.

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Full LDAP integration

The way users and groups are stored and accessed in JIRA has been totally rewritten in Release 4.3. This provides a number of additional capabilities, mainly the ability to use an LDAP server for all user information. Key features are:

- Ability to connect to an LDAP server, including to Microsoft Active Directory, for user management. This includes:
  - Read-write access
  - Read-only access
  - Read-only access with local groups
  - Use LDAP for authentication only — Previous functionality
- Ability to connect to a Crowd server for user management — Previous functionality
- Ability to manage users fully within JIRA — Previous functionality
- Ability to use 2 or more LDAP and/or Crowd servers simultaneously for user management.

User Directory management via JIRA Admin UI

In JIRA 4.3, administrators can now manage external User Directories directly from the JIRA Administration screens. Gone are the days of manually editing XML files.

Mail Server Configuration Improvements

In JIRA 4.3, administrators can now test their mail server configuration with the "Test Connection" button.
New Plugin Management System

JIRA 4.3 includes the Universal Plugin Manager (UPM), which provides you with a simple way of adding and managing plugins:

- Auto-discovery of available plugins (see Featured Plugins in the screenshot below)
- Point-and-click installation — no more downloading JAR files
AppLinks pre-installed and configurable from the JIRA Admin UI (new since EAP 2)

JIRA 4.3 EAP 3 includes Unified Application Links (UAL), so you no longer need to install it separately.

Application Links (AppLinks) is a plugin that allows you to link your JIRA, Confluence, FishEye, Crucible, Bamboo and Subversion applications. You can even choose to associate individual entities (i.e. JIRA projects, Confluence spaces, FishEye repositories, FishEye projects, Crucible projects, Bamboo projects) with each other.

Linking two applications allows you to share information and access one application's functions from within the other. For example, if you linked a JIRA server and a Confluence server, you could view JIRA issues in a Confluence page via the JIRA Issues Macro.

You also can associate entities of two linked applications. For example, you could associate a JIRA project with a Confluence space. This allows you to take advantage of additional integration features like link rendering, which lets you create links to issues or pages in the project or space using a simple textual reference, e.g. [JRA-1234], [myConfluenceSpace:Test Page].

- In JIRA 4.3 EAP 3 there is now a 'Managed Unified Application Links' option on the 'Manage Project' screen, enabling you to easily configure application links for a given project.

For more about configuring Application Links, please see the Application Links Administrator's Guide.

Quick Search now has a Wild Card
When using Quick Search to find issues with a particular version, you can now use the wildcard symbol: "*". For example, "ff:3.2*" will match any issue whose Fix For Version is:

- 3.2
- 3.2-beta
- 3.2.1
- 3.2.x

### Faster Dashboards (new since EAP 2)

We are extremely pleased to announce that you should see a noticeable reduction in the time it takes to load a Dashboard.

- On average, dashboard performance has improved by 29%
- For large dashboards, the performance improvement is 35%

### REST API improvements

We have improved discoverability of issues and projects through the REST API: there is now a search resource, which can be used to search for issues using JIRA Query Language (JQL). It is also possible to obtain a list of projects in a JIRA instance. Have a look at the reference documentation to see if the REST API offers the features that you want (let us know if not).

Clients that log in through the REST API can now determine when the login has been denied due to a CAPTCHA requirement: the HTTP header X-Authentication-Denied-Reason has all the necessary information.

### Other Enhancements and Fixes

For the list of issues resolved in JIRA 4.3 so far, click here.

**JIRA 4.3 EAP 2 Release Notes**

7 December 2010

JIRA 4.3 EAP 2 (a.k.a 4.3 milestone 2 or 'm2') is a public development release leading up to JIRA 4.3. An Early Access Preview (EAP) release is a snapshot of our work in progress, primarily focused on allowing JIRA users to see the new features in advance and provide us with some useful feedback. It also gives plugin developers an opportunity to test and fix their plugins in advance of an official release. For all production use and testing of JIRA, please use the latest official release.

The Atlassian team is proud to bring you the JIRA 4.3 EAP 2 release. Development work on JIRA 4.3 has only commenced very recently, but we want your involvement from the earliest days. Please provide feedback here.

Identity management comes of age in JIRA 4.3, with complete LDAP integration. Additionally, you now have the ability to search an issue's change history. JIRA 4.3 also includes the Universal Plugin Manager for easier management of plugins.

**Note to developers**: JIRA 4.3 EAP 2 includes the Atlassian Plugin Framework version 2.6. Also please see the Plugin Developer Notes for JIRA 4.3, plus note that the REST API will continue to evolve through the 4.3 EAP releases — please watch the Developer blog for the latest news on the REST API.

**Highlights of JIRA 4.3 EAP 2:**
• Search the Change History with JQL 'WAS' Function (new since EAP 1)
• Full LDAP integration (Crowd 2.1 connectivity is new since EAP 1)
• User Directory management via JIRA Admin UI
• Mail Server Configuration Improvements
• New Plugin Management System (new since EAP 1)
• Quick Search now has a Wild Card (new since EAP 1)
• REST API improvements
• Other Enhancements and Fixes

Thank you for your interest in JIRA 4.3 EAP 2

Download EAP

Upgrading to JIRA 4.3 EAP 2

JIRA EAP releases are available here. When upgrading, please follow the JIRA 4.3 Upgrade Guide.

Do not use in production

• EAP releases are not safe — EAP releases are snapshots of the ongoing JIRA development process. As such:
  • While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  • Features in development releases may be incomplete, or may change or be removed before the next full release.

• No upgrade path — Because EAP releases represent work in progress, we cannot provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

Highlights of JIRA 4.3 EAP 2

1

Search the Change History with JQL 'WAS' Function (new since EAP 1)

In EAP 2 we are releasing the first cut of Change History searching. There is much more functionality to follow, but for now you can search for changes to the Status field.

For example, the following will return all issues that currently have, or previously had, a status of 'In Progress':

```
status WAS "In Progress"
```

Note that autocomplete has not yet been implemented, but full error reporting is supported.

2

Full LDAP integration (Crowd 2.1 connectivity is new since EAP 1)

The way users and groups are stored and accessed in JIRA has been totally rewritten in Release 4.3. This provides a number of additional capabilities, mainly the ability to use an LDAP server for all user information. Key features are:
• Ability to connect to an LDAP server, including to Microsoft Active Directory, for user management. This includes:
  • Read-write access
  • Read-only access
  • Read-only access with local groups
  • Use LDAP for authentication only — Previous functionality
• Ability to connect to a Crowd server for user management — Previous functionality
• Ability to manage users fully within JIRA — Previous functionality
• Ability to use 2 or more LDAP and/ or Crowd servers simultaneously for user management.

User Directory management via JIRA Admin UI

In JIRA 4.3, administrators can now manage external User Directories directly from the JIRA Administration screens. Gone are the days of manually editing XML files.

Mail Server Configuration Improvements

In JIRA 4.3, administrators can now test their mail server configuration with the "Test Connection" button.
New Plugin Management System (new since EAP 1)

JIRA 4.3 includes the Universal Plugin Manager (UPM), which provides you with a simple way of adding and managing plugins:

- Auto-discovery of available plugins (see **Featured Plugins** in the screenshot below)
- Point-and-click installation — no more downloading JAR files and restarting JIRA
Quick Search now has a Wild Card (new since EAP 1)

When using Quick Search to find issues with a particular version, you can now use the wildcard symbol: "*".
For example, "ff:3.2" will match any issue whose Fix For Version is:

- 3.2
- 3.2-beta
- 3.2.1
- 3.2.x

REST API improvements

We have improved discoverability of issues and projects through the REST API: there is now a search resource, which can be used to search for issues using JIRA Query Language (JQL). It is also possible to obtain a list of projects in a JIRA instance, and to create links between issues.

Clients that log in through the REST API can now determine when the login has been denied due to a CAPTCHA requirement: the HTTP header X-Authentication-Denied-Reason has all the necessary information.

Have a look at the reference documentation to see if the REST API offers the features that you want (let us know if not).

JIRA 4.3 EAP 1 Release Notes

18 November 2010

JIRA 4.3 EAP 1 (a.k.a 4.3 milestone 1 or 'm1') is a public development release leading up to JIRA 4.3. For all production use and testing of JIRA, please use the latest official release.

⚠️ Do not use in production
EAP releases should not be used in production environments as they are not officially supported.

Please also take note of the following information:

- **EAP Releases are Not Safe**— EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No Upgrade Path** — Because EAP releases represent work in progress, we **cannot** provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

The Atlassian team is proud to bring you the JIRA 4.3 EAP 1 release. Development work on JIRA 4.3 has only commenced very recently, but we want your involvement from the earliest days. Please provide feedback [here](#).

Note to developers: JIRA 4.3 EAP 1 includes [Atlassian Plugin Framework version 2.6](#). Also please see the [Plugin Developer Notes for JIRA 4.3](#), plus note that the REST API will continue to evolve through the 4.3 EAP releases — please watch the JIRA blog for the latest news on the REST API.

**Highlights of JIRA 4.3 EAP 1:**

- Full LDAP integration
- User Directory management via JIRA Admin UI
- Mail Server Configuration Improvements
- REST API improvements
- Other Enhancements and Fixes

Thank you for your interest in JIRA 4.3 EAP 1

JIRA 4.2 EAP Release Notes

12 October 2010

JIRA 4.2 RC1 is a public development release leading up to JIRA 4.2. For all production use and testing of JIRA, please use the latest official release.

A Release Candidate (RC) is a preliminary release leading up to the official release of a JIRA version. RC releases are a fairly stable snapshot of our work in progress and provide an advance preview of new features to the general public. JIRA plugin developers can also use RC releases to test and fix their plugins in advance of an official release.

Do not use in production

RC releases should not be used in production environments as they are not officially supported.

Please also take note of the following information:

- RC releases may not be safe — RC releases are snapshots of the ongoing JIRA development process. As such:
  - While we deem these releases to be fairly stable, they have not undergone sufficient testing to be deemed an official (final) release.
  - While feature development work is complete, some features may be subject to change or be removed before the next full release.
- No upgrade path — Because RC releases still represent work in progress, we cannot provide a supported upgrade path between RC releases, from Beta to RC releases, or from any RC to the eventual final release. Thus, any data you store in a JIRA RC release may not be able to be migrated to a future JIRA release.

The Atlassian team is proud to bring you the JIRA 4.2 RC1 release. As always, we would love to hear your feedback and comments about this release. To keep the discussion centralised, please provide your feedback as a comment on JIRA-22093.

JIRA 4.2 gives you a few extra minutes of precious time every day, by providing the ability to triage issues directly from the Issue Navigator without you having to open each issue. For the mouse-averse, the new 'Operations Dialog' box provides access to all menu options via the keyboard.

To help speed up your ability to work on issues, we've also made common actions and workflow operations accessible from convenient dialog boxes.

Time-tracking has become much more flexible: you can now edit the Original Estimate and set the Remaining Estimate to zero when resolving an issue. You can also log work via workflow 'transition' (or any other) screens — now accessible via speedy dialog boxes.

The 'Labels' plugin is now a permanent part of JIRA, simplifying system management for GreenHopper users and administrators — and everyone else who likes to label their JIRA issues.

GreenHopper 5.3 RC1 is also available for download, and is compatible with JIRA 4.2 RC1. A feature highlight coming up in GreenHopper 5.3 are GreenHopper-specific keyboard shortcuts.

JIRA 4.2 RC1 differs from the Beta 3 release in the following respects:

- We've fixed 209 bugs, including 56 relating to Internet Explorer and 10 relating to the REST API
- Improved flow and navigation through issue actions — users are more likely to land on the page from
which they performed an action.

- More performance improvements have been incorporated into the auto-complete feature for multi-select fields (such as the Component and Versions fields) and the JQL auto-complete feature.

Note to developers: JIRA 4.2 includes the Atlassian Plugin Framework version 2.5, and an alpha release of the JIRA REST API. We are very keen to hear your feedback on the REST API — please try it out and add your comments to JIRA-22139.

Supported Platforms: Please note from our announcements in late 2009/early 2010 that JIRA 4.2 will not support Oracle WebLogic, IBM WebSphere, Java Platform 5 and Internet Explorer 6.

Highlights of JIRA 4.2:

- Dialogs for Common Actions and Workflow Operations
- Keyboard Shortcuts and 'Operations Dialog'
- Issue Labelling
- Improvements to the 'View Issue' Screen
- Auto-complete for Versions and Components
- Attachment Sorting by Date or Name
- Viewable Files in Zipped Attachments
- 'Log Work' Improvements
- Improvements to the Issue Navigator
- 'Filter' Gadget creation via the Issue Navigator
- User Avatars and Hover Profile
- New JQL Functions
- Other Enhancements and Fixes

Thank you for your interest in JIRA 4.2 RC1
Download RC1

Upgrading to JIRA 4.2 RC1
Development releases of JIRA are available here. Before upgrading, please refer to the JIRA 4.2 Upgrade Guide.

Highlights of JIRA 4.2

Dialogs for Common Actions and Workflow Operations

For faster edits to an issue, pop-up dialogs have replaced screen changes for common actions and workflow operations.
You can now perform an action on an issue, via a dialog, directly from the Issue Navigator — without opening the issue first. The issue marker shows which issue you have selected (via your keyboard) in the result list.
Keyboard Shortcuts and ‘Operations Dialog’

JIRA users can now do more without a mouse — perfect for power users:

Hints also appear at the bottom of a dialog, helping you to learn keyboard shortcuts on the fly:

The new ‘Operations Dialog’ lets you perform actions via the keyboard (instead of the mouse), using the full-stop (‘dot’) key to access the ‘Actions’ and ‘Workflow’ menus. The Operations Dialog works from the Issue Navigator and also when viewing an individual issue.
See Using Keyboard Shortcuts for more information.

**Issue Labelling**

The functionality from the Labels plugin is now included in JIRA out-of-the-box. The labels dialog has a great new UI, and issue notifications are now optional when updating labels for an issue.
Improvements to the 'View Issue' Screen

We have improved the look and feel of the 'View Issue' screen even more. Some improvements include:

- Tighter spacing between lines to reduce space between elements
- Stronger section headings
- The 'Description' field separated into its own section
- Horizontal division lines between each custom field
- Votes and Watchers fields on the same line
- Labels represented as bubbles

See Labeling an Issue for more information.
Individual blocks can now be collapsed to streamline your issue view. The view state (i.e. which blocks are expanded/collapsed) will also be remembered across issues. After much feedback on the 4.1 updates to the 'View Issue' screen, you can now also add a comment at the bottom of the 'Comments' section.

^Top

Auto-complete for Versions and Components

Editing the Component, Affects Version(s) and Fix Version(s) is now quicker and easier. Upon typing into one of these fields, a dropdown menu appears with a list of options matching the first few characters you typed.

For convenience, the version lists are divided into Released and Unreleased categories.
Attachment Sorting by Date or Name

Attachments can now be sorted by date or by name, in ascending or descending order.

See Attaching a File for more information.
**Viewable Files in Zipped Attachments**

You can expand an attached zip file to see its contents. The first 30 files will be shown for larger zip files.

See [Accessing ZIP-format File Contents](#) for more information.

**'Log Work' Improvements**

You can now log work when you resolve an issue, saving you a step. You can also set the Remaining Estimate to 0 upon resolving an issue.

You now have the ability to edit the Original Estimate, even if work has been logged on an issue (not shown here).

We've also included the ability to add work log descriptions in wiki-markup (not shown here).

Lastly you can add the 'Log Work' field to any screen in JIRA (not shown here).
Logging Work on an Issue for more information.

Improvements to the Issue Navigator

The Issue Navigator has been updated to match the look and feel of an issue.

We've also added: an issue marker and colour highlight for keyboard navigation (blue); colour highlight for mouse selection (grey); toggle to collapse the search form.
When a change is made via a dialog, JIRA will give you feedback on that change as confirmation.

'Filter' Gadget creation via the Issue Navigator

When viewing search results, you can quickly add a 'Filter Results' gadget to your dashboard via the 'Views' menu.
User Avatars and Hover Profile

JIRA users can now add an avatar to their profile. You can then mouse-hover over a user’s name to show information about that user — this is available when viewing an issue, using the Issue Navigator, browsing a project, viewing activity, viewing a user profile and performing some administration tasks.
Adding a User Avatar and Using Hover Profile

See Adding a User Avatar and Using Hover Profile for more information.

New JQL Functions

Additional JQL functions for projectsLeadBy and componentsLeadBy — useful for finding all issues where a particular user is the lead of a component, or a project.
If you use Firefox or IE, you can now search JIRA issues from the convenience of your browser’s search box. Just add your JIRA site as a search engine/provider, via the dropdown menu next to the browser’s search box. This is because JIRA now supports the autodiscovery part of the OpenSearch standard.

Click here for the full list of issues resolved in 4.2.

JIRA 4.2 Beta 3 Release Notes

29 September 2010

JIRA 4.2 Beta 3 is a public development release leading up to JIRA 4.2. For all production use and testing of JIRA, please use the latest official release.

Do not use in production

Beta releases should not be used in production environments as they are not officially supported.

Please also take note of the following information:

- Beta releases are not safe— Beta releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because Beta releases represent work in progress, we cannot provide a supported upgrade path between Beta releases, or from any Beta to the eventual final release. Thus, any data you store in a JIRA Beta release may not be able to be migrated to a future JIRA release.

The Atlassian team is proud to bring you the JIRA 4.2 Beta 3 release. As always, we would love to hear your feedback and comments about this release. To keep the discussion centralised, please provide your feedback.
as a comment on JRA-22093.

JIRA 4.2 gives you a few extra minutes of precious time every day, by providing the ability to triage issues directly from the Issue Navigator without you having to open each issue. For the mouse-averse, the new ‘Operations Dialog’ box provides access to all menu options via the keyboard.

To help speed up your ability to work on issues, we’ve also made common actions and workflow operations accessible from convenient dialog boxes.

Time-tracking has become much more flexible: you can now edit the Original Estimate and set the Remaining Estimate to zero when resolving an issue. You can also log work via workflow ‘transition’ (or any other) screens — now accessible via speedy dialog boxes.

The ‘Labels’ plugin is now a permanent part of JIRA, simplifying system management for GreenHopper users and administrators — and everyone else who likes to label their JIRA issues.

GreenHopper 5.3 Beta 3 is also available for download, and is compatible with JIRA 4.2 Beta 3.

**JIRA 4.2 Beta 3 differs from the Beta 2 release in the following respects:**

- The FishEye plugin was upgraded
- The auto-complete feature for multi-select fields (such as the Component and Versions fields) contains several performance improvements and bug fixes
- The JQL auto-complete feature is now much faster and more responsive
- Several fixes were made to the ‘Are you sure you want to navigate away from this page?’ confirmation message to make it less obtrusive
- The REST API contains several bug fixes
- Several web browser-specific bugs were fixed

**Note to developers:** JIRA 4.2 includes the Atlassian Plugin Framework version 2.5, and an alpha release of the JIRA REST API. We are very keen to hear your feedback on the REST API — please try it out and add your comments to JIRA-22139.

**Supported Platforms:** Please note from our announcements in late 2009/early 2010 that JIRA 4.2 will not support Oracle WebLogic, IBM WebSphere, Java Platform 5 and Internet Explorer 6.

Adding a User Avatar and Using Hover Profile for more information.

New JQL Functions

Additional JQL functions for projectsLeadBy and componentsLeadBy — useful for finding all issues where a particular user is the lead of a component, or a project.
See Advanced Searching for more information.

Other Enhancements and Fixes

- If you use Firefox or IE, you can now search JIRA issues from the convenience of your browser's search box. Just add your JIRA site as a search engine/provider, via the dropdown menu next to the browser's search box. This is because JIRA now supports the autodiscovery part of the OpenSearch standard.

- Click here for the full list of issues resolved in 4.2.

JIRA 4.2 Beta 2 Release Notes

15 September 2010

JIRA 4.2 Beta 2 is a public development release leading up to JIRA 4.2. For all production use and testing of JIRA, please use the latest official release.

⚠️ Do not use in production
Beta releases should not be used in production environments as they are not officially supported.

⚠️ Please also take note of the following information:
- Beta releases are not safe—Beta releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because Beta releases represent work in progress, we cannot provide a supported upgrade path between Beta releases, or from any Beta to the eventual final release. Thus, any data you store in a JIRA Beta release may not be able to be migrated to a future JIRA release.

The Atlassian team is proud to bring you the JIRA 4.2 Beta 2 release. As always, we would love to hear your feedback and comments about this release. To keep the discussion centralised, please provide your feedback.
as a comment on JRA-22093.

JIRA 4.2 gives you a few extra minutes of precious time every day, by providing the ability to triage issues directly from the Issue Navigator without you having to open each issue. For the mouse-averse, the new 'Operations Dialog' box provides access to all menu options via the keyboard.

To help speed up your ability to work on issues, we've also made common actions and workflow operations accessible from convenient dialog boxes.

Time-tracking has become much more flexible: you can now edit the Original Estimate and set the Remaining Estimate to zero when resolving an issue. You can also log work via workflow 'transition' (or any other) screens — now accessible via speedy dialog boxes.

The 'Labels' plugin is now a permanent part of JIRA, simplifying system management for GreenHopper users and administrators — and everyone else who likes to label their JIRA issues.

GreenHopper 5.3 Beta 2 is also available for download, and is compatible with JIRA 4.2 Beta 2.

Differences between JIRA 4.2 Beta 1 and Beta 2:
- JIRA 4.2 Beta 2 includes a number of bug fixes, including an issue with the dialog boxes and mod_proxy.
- The JIRA 4.2 documentation is being released with Beta 2. We would be very grateful for your feedback — please leave comments on individual pages.

Note to developers: JIRA 4.2 includes the Atlassian Plugin Framework version 2.5, and an alpha release of the JIRA REST API. We are very keen to hear your feedback on the REST API — please try it out and add your comments to JIRA-22139.

Highlights of JIRA 4.2:
- Dialogs for Common Actions and Workflow Operations
- Keyboard Shortcuts and 'Operations Dialog'
- Issue Labelling
- Improvements to the 'View Issue' Screen
- Auto-complete for Versions and Components
- Attachment Sorting by Date or Name
- Viewable Files in Zipped Attachments
- 'Log Work' Improvements
- Improvements to the Issue Navigator
- 'Filter' Gadget creation via the Issue Navigator
- User Avatars and Hover Profile
- New JQL Functions
- Other Enhancements and Fixes

Thank you for your interest in JIRA 4.2 Beta 2

Upgrading to JIRA 4.2 Beta 2

JIRA Beta releases are available here. Before upgrading, please refer to the JIRA 4.2 Upgrade Guide.

Highlights of JIRA 4.2

Dialogs for Common Actions and Workflow Operations

For faster edits to an issue, pop-up dialogs have replaced screen changes for common actions and workflow operations.
You can now perform an action on an issue, via a dialog, directly from the Issue Navigator — without opening the issue first. The issue marker shows which issue you have selected (via your keyboard) in the result list.
**Keyboard Shortcuts and ‘Operations Dialog’**

JIRA users can now do more without a mouse — perfect for power users:

Hints also appear at the bottom of a dialog, helping you to learn keyboard shortcuts on the fly:

The new ‘Operations Dialog’ lets you perform actions via the keyboard (instead of the mouse), using the full-stop (‘dot’) key to access the ‘Actions’ and ‘Workflow’ menus. The Operations Dialog works from the Issue Navigator and also when viewing an individual issue.
See Using Keyboard Shortcuts for more information.

3

**Issue Labelling**

The functionality from the Labels plugin is now included in JIRA out-of-the-box. The labels dialog has a great new UI, and issue notifications are now optional when updating labels for an issue.
Improvements to the ‘View Issue’ Screen

We have improved the look and feel of the ‘View Issue’ screen even more. Some improvements include:

- Tighter spacing between lines to reduce space between elements
- Stronger section headings
- The ‘Description’ field separated into its own section
- Horizontal division lines between each custom field
- Votes and Watchers fields on the same line
- Labels represented as bubbles

See Labeling an Issue for more information.
Individual blocks can now be collapsed to streamline your issue view. The view state (i.e. which blocks are expanded/collapsed) will also be remembered across issues. After much feedback on the 4.1 updates to the 'View Issue' screen, you can now also add a comment at the bottom of the 'Comments' section.

^Top

Auto-complete for Versions and Components

Editing the Component, Affects Version(s) and Fix Version(s) is now quicker and easier. Upon typing into one of these fields, a dropdown menu appears with a list of options matching the first few characters you typed.

ℹ️ For convenience, the version lists are divided into Released and Unreleased categories.
Attachment Sorting by Date or Name

Attachments can now be sorted by date or by name, in ascending or descending order.

See Attaching a File for more information.
Viewable Files in Zipped Attachments

You can expand an attached zip file to see its contents. The first 30 files will be shown for larger zip files.

See Accessing ZIP-format File Contents for more information.

'Log Work' Improvements

You can now log work when you resolve an issue, saving you a step. You can also set the Remaining Estimate to 0 upon resolving an issue.

You now have the ability to edit the Original Estimate, even if work has been logged on an issue (not shown here).

We've also included the ability to add work log descriptions in wiki-markup (not shown here).

Lastly you can add the 'Log Work' field to any screen in JIRA (not shown here).
See Logging Work on an Issue for more information.

^Top

9

**Improvements to the Issue Navigator**

The Issue Navigator has been updated to match the look and feel of an issue.

We’ve also added: an issue marker and colour highlight for keyboard navigation (blue); colour highlight for mouse selection (grey); toggle to collapse the search form.
When a change is made via a dialog, JIRA will give you feedback on that change as confirmation.

'Filter' Gadget creation via the Issue Navigator

When viewing search results, you can quickly add a 'Filter Results' gadget to your dashboard via the 'Views' menu.
User Avatars and Hover Profile

JIRA users can now add an avatar to their profile. You can then mouse-hover over a user's name to show information about that user — this is available when viewing an issue, using the Issue Navigator, browsing a project, viewing activity, viewing a user profile and performing some administration tasks.
Adding a User Avatar and Using Hover Profile

See Adding a User Avatar and Using Hover Profile for more information.

New JQL Functions

Additional JQL functions for projectsLeadBy and componentsLeadBy — useful for finding all issues where a particular user is the lead of a component, or a project.
Other Enhancements and Fixes

- If you use Firefox or IE, you can now search JIRA issues from the convenience of your browser's search box. Just add your JIRA site as a search engine/provider, via the dropdown menu next to the browser's search box. This is because JIRA now supports the autodiscovery part of the OpenSearch standard.

- Click here for the full list of issues resolved in 4.2.

Do not use in production
Beta releases should not be used in production environments as they are not officially supported.

Please also take note of the following information:
- Beta releases are not safe—Beta releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because Beta releases represent work in progress, we cannot provide a supported upgrade path between Beta releases, or from any Beta to the eventual final release. Thus, any data you store in a JIRA Beta release may not be able to be migrated to a future JIRA release.

The Atlassian team is proud to bring you the JIRA 4.2 Beta 1 release. As always, we would love to hear your feedback and comments about this release. To keep the discussion centralised, please provide your feedback
JIRA 4.2 gives you a few extra minutes of precious time every day, by providing the ability to triage issues directly from the Issue Navigator without you having to open each issue. For the mouse-averse, the new 'Operations Dialog' box provides access to all menu options via the keyboard.

To help speed up your ability to work on issues, we've also made common actions and workflow operations accessible from convenient dialog boxes.

Time-tracking has become much more flexible: you can now edit the Original Estimate and set the Remaining Estimate to zero when resolving an issue. You can also log work via workflow 'transition' (or any other) screens — now accessible via speedy dialog boxes.

The 'Labels' plugin is now a permanent part of JIRA, simplifying system management for GreenHopper users and administrators — and everyone else who likes to label their JIRA issues.

The FishEye plugin has been updated to version 3.0.

GreenHopper 5.3 Beta 1 is also available for download, and is compatible with JIRA 4.2 Beta 1.

Note to developers: JIRA 4.2 includes the Atlassian Plugin Framework version 2.5, and an alpha release of the JIRA REST API. We are very keen to hear your feedback on the REST API — please try it out and add your comments to JRA-22139.

Highlights of JIRA 4.2:

- Dialogs for Common Actions and Workflow Operations
- Keyboard Shortcuts and 'Operations Dialog'
- Issue Labelling
- Improvements to the 'View Issue' Screen
- Auto-complete for Versions and Components
- Attachment Sorting by Date or Name
- Viewable Files in Zipped Attachments
- 'Log Work' Improvements
- Improvements to the Issue Navigator
- 'Filter' Gadget creation via the Issue Navigator
- User Avatars and User Hover
- New JQL Functions
- Other Enhancements and Fixes

JIRA 4.2 EAP 4 Release Notes

4 August 2010

JIRA 4.2 EAP 4 (a.k.a 4.2 milestone 9) is a public development release leading up to JIRA 4.2. For all production use and testing of JIRA, please use the latest official release.

Do not use in production
EAP releases should not be used in production environments as they are not officially supported.

Please also take note of the following information:
- EAP Releases are Not Safe— EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No Upgrade Path — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

GreenHopper Support
Please be aware that GreenHopper 5.0.1 is not compatible with the JIRA 4.2 EAP 4 release.
The Atlassian team is proud to bring you the JIRA 4.2 EAP 4 release. We are getting closer to the final release of JIRA 4.2, but we want your feedback.

Time-tracking is now much more flexible: you can edit the Original Estimate, and set the Remaining Estimate to zero on resolving an issue. You can also log work via workflow 'transition' screens — which are now provided as in-place dialogs rather than separate screens. For the mouse-averse, the new 'Operations Dialog' provides access to all menu options via the keyboard. The 'Labels' plugin is now a permanent part of JIRA, simplifying system management for GreenHopper users — and everyone else who likes to label their JIRA issues. Dashboard Publish/Subscribe with Confluence is also included.

Note to developers: JIRA 4.2 includes Atlassian Plugin Framework version 2.5.

Note to partners and translators: The preliminary translation diff files will be made available when we release JIRA 4.2 beta in the coming weeks.

**Highlights of JIRA 4.2:**

- Dialogs for Common Actions and Workflow Operations
- Dialogs in the Issue Navigator
- 'Operations Dialog' Replaces the Mouse
- Improvements to the 'View Issue' Screen
- Attachment Sorting by Date or Name
- Viewable Files in Zipped Attachments
- 'Log Work' Improvements
- Improvements to the Issue Navigator
- New JQL Functions
- 'Filter' Gadget creation via the Issue Navigator
- More Keyboard Shortcuts
- User Avatars and User Hover
- Labels Now Included
- Other Enhancements and Fixes

**Thank you for your interest in JIRA 4.2 EAP 4**

Download EAP

ℹ️ **Upgrading to JIRA 4.2 EAP 4**
JIRA EAP releases are available [here](#). To upgrade from JIRA 4.1.x to this release, please follow the normal JIRA Upgrade Guide.

**Highlights of JIRA 4.2**

1. **Dialogs for Common Actions and Workflow Operations**

For faster edits to an issue, pop-up dialogs have replaced screen changes:
Dialogs in the Issue Navigator

You can now perform an action on an issue, via a dialog, directly from the Issue Navigator — without opening the issue first. The issue marker shows which issue you have selected (via your keyboard) in the result list.
'Operations Dialog' Replaces the Mouse

The new 'Operations Dialog' lets you perform actions via the keyboard (instead of the mouse), using the full-stop ('dot') key to access the 'Actions' and 'Workflow' menus. The Operations Dialog works from the Issue Navigator and also when viewing an individual issue.
Improvements to the 'View Issue' Screen

We have improved the look and feel of the view issue screen even more. Some improvements include:

- A tighter spacing between lines to reduce space between elements
- Stronger section headings
- The description field separated into its own section
- Horizontal division lines between each custom field
- Votes and Watchers fields on the same line
- Labels represented as bubbles
Individual blocks can now be collapsed to streamline your issue view. The view state (i.e. which blocks are expanded/collapsed) will also be remembered across issues. After much feedback on the 4.1 updates to the 'View Issue' screen, you can now also add a comment at the bottom of the commenting section.

We've also updated the look and feel of the Components and Affects/Fix Versions lists in Edit mode. Upon typing into one of these fields, a dropdown menu appears with a list of options matching the first few characters you typed.

For convenience, the version lists are divided into **Released** and **Unreleased** categories.
5

Attachment Sorting by Date or Name

Attachments can now be sorted by date or by name, in ascending or descending order.

6

Viewable Files in Zipped Attachments

You can expand an attached zip file to see its contents. The first 30 files will be shown for larger zip files.
'Log Work' Improvements

You can now log work when you resolve an issue, saving you a step. You can also set the Remaining Estimate to 0 upon resolving an issue.

You now have the ability to edit the Original Estimate, even if work has been logged on an issue (not shown here).

We've also included the ability to add work log descriptions in wiki-markup (not shown here).
Improvements to the Issue Navigator

The Issue Navigator has been updated to match the look and feel of an issue.

We've also added: an issue marker and colour highlight for keyboard navigation (blue); colour highlight for mouse selection (grey); toggle to collapse the search form.
When a change is made via a dialog, JIRA will give you feedback on that change as confirmation.

New JQL Functions

Additional JQL functions for `projectLeadBy` and `componentsLeadBy` — useful for finding all issues where a particular user is the lead of a component, or a project.
**'Filter' Gadget creation via the Issue Navigator**

When viewing search results, you can quickly add a 'Filter Results' gadget to your dashboard via the 'Views' menu.

![Issue Navigator](image)

More Keyboard Shortcuts

JIRA users can now do more without a mouse --- perfect for those power users.
Hints also appear at the bottom of a dialog, helping you to learn keyboard shortcuts on the fly.

User Avatars and User Hover

JIRA users can now add an avatar to their profile. You can then mouse-hover over a user's name to show information about that user — this is available when viewing an issue, using the Issue Navigator, browsing
a project, viewing activity, viewing a user profile and performing some administration tasks.

Labels Now Included

The functionality from the Labels plugin is now included in JIRA out-of-the-box. The labels dialog has a great new UI, and issue notifications are now optional when updating labels for an issue.
Other Enhancements and Fixes

Click here for the full list of issues resolved in 4.2.

JIRA 4.2 EAP 3 Release Notes

19 July 2010

**JIRA 4.2 EAP 3** (a.k.a 4.2 milestone 8) is a public development release leading up to **JIRA 4.2**. For all production use and testing of JIRA, please use the latest official release.

⚠️ Do not use in production

EAP releases should not be used in production environments as they are not officially supported.

⚠️ Please also take note of the following information:
- **EAP Releases are Not Safe**— EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No Upgrade Path** — Because EAP releases represent work in progress, we **cannot** provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.
The Atlassian team is proud to bring you the JIRA 4.2 EAP 3 release. We are getting closer to the final release of JIRA 4.2, but we want your feedback.

Time-tracking is now much more flexible: you can edit the Original Estimate, and set the Remaining Estimate to zero on resolving an issue. You can also log work via workflow ‘transition’ screens — which are now provided as in-place dialogs rather than separate screens. For the mouse-averse, the new ‘Operations Dialog’ provides access to all menu options via the keyboard. The ‘Labels’ plugin is now a permanent part of JIRA, simplifying system management for GreenHopper users — and everyone else who likes to label their JIRA issues. Dashboard Publish/Subscribe with Confluence is also included.

Note to developers: JIRA 4.2 includes Atlassian Plugin Framework version 2.5.

Note to partners and translators: The preliminary translation diff files will be made available when we release JIRA 4.2 beta in the coming weeks.

Highlights of JIRA 4.2:
- Dialogs for Common Actions and Workflow Operations
- Dialogs in the Issue Navigator
- ‘Operations Dialog’ Replaces the Mouse
- Improvements to the ‘View Issue’ Screen
- Attachment Sorting by Date or Name
- Viewable Files in Zipped Attachments
- ‘Log Work’ Improvements
- Improvements to the Issue Navigator
- New JQL Functions
- ‘Filter’ Gadget creation via the Issue Navigator
- More Keyboard Shortcuts
- User Avatars and User Hover
- Labels Now Included
- Other Enhancements and Fixes

What's New in EAP 3
- For EAP 3, we've mainly focused on improving the view issue screen. Some highlights include:
  1. Reduced line height of text in the entire page.
  2. Stronger and colored section headings.
  3. Description field separated into its own separate section.
  4. Division lines for custom fields
  5. Labels as highlighted bubbles.
  6. Votes and Watchers fields on the same line.

- When creating or editing an issue, the versions fields now have the same look and feel as the component field.

- We've also reduced the size of labels in dialog boxes.

Thank you for your interest in JIRA 4.2 EAP 3

JIRA 4.2 EAP 2 Release Notes

6 July 2010

JIRA 4.2 EAP 2 (a.k.a 4.2 milestone 7) is a public development release leading up to JIRA 4.2. For all production use and testing of JIRA, please use the latest official release.

Do not use in production

EAP releases should not be used in production environments as they are not officially supported.

Please also take note of the following information:

- EAP Releases are Not Safe— EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No Upgrade Path — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA
The Atlassian team is proud to bring you the JIRA 4.2 EAP 2 release. We still have a little more work to do, but overall, this is how 4.2 will look when it gets rolled out later this year. And we want your feedback.

Time-tracking is now much more flexible: you can edit the Original Estimate, and set the Remaining Estimate to zero on resolving an issue. You can also log work via workflow 'transition' screens — which are now provided as in-place dialogs rather than separate screens. For the mouse-averse, the new 'Operations Dialog' provides access to all menu options via the keyboard. The 'Labels' plugin is now a permanent part of JIRA, simplifying system management for GreenHopper users — and everyone else who likes to label their JIRA issues.

Dashboard Publish/Subscribe with Confluence is also included.

Note to developers: JIRA 4.2 includes Atlassian Plugin Framework version 2.5.

Note to partners and translators: The preliminary translation diff files will be made available when we release JIRA 4.2 beta in the coming weeks.

Highlights of JIRA 4.2 EAP 2:
- Dialogs for Common Actions and Workflow Operations
- Dialogs in the Issue Navigator
- 'Operations Dialog' Replaces the Mouse
- Improvements to the 'View Issue' Screen
- Attachment Sorting by Date or Name
- Viewable Files in Zipped Attachments
- 'Log Work' Improvements
- Improvements to the Issue Navigator
- New JQL Functions
- 'Filter' Gadget creation via the Issue Navigator
- More Keyboard Shortcuts
- User Avatars and User Hover
- Labels Now Included
- Other Enhancements and Fixes

What's New in JIRA 4.2 EAP 2
1. Components Look and Feel update.
2. Colour highlight for keyboard navigation (blue).
3. Feedback on changes made via dialogs in the issue navigator as confirmation.
4. Ability to add work log descriptions in wiki-markup (no screenshot).

Thank you for your interest in JIRA 4.2 EAP 2
Download EAP

Upgrading to JIRA 4.2 EAP 2
JIRA EAP releases are available here. To upgrade from JIRA 4.1.x to this release, please follow the normal JIRA Upgrade Guide.

Highlights of JIRA 4.2 EAP 2
Dialogs for Common Actions and Workflow Operations

For faster edits to an issue, pop-up dialogs have replaced screen changes:

Dialogs in the Issue Navigator

You can now perform an action on an issue, via a dialog, directly from the Issue Navigator — without opening the issue first. The issue marker shows which issue you have selected (via your keyboard) in the result list.
'Operations Dialog' Replaces the Mouse

The new 'Operations Dialog' lets you perform actions via the keyboard (instead of the mouse), using the full-stop ('dot') key to access the 'Actions' and 'Workflow' menus. The Operations Dialog works from the Issue Navigator and also when viewing an individual issue.
Improvements to the 'View Issue' Screen

Individual blocks can now be collapsed to streamline your issue view. The view state (i.e. which blocks are expanded/collapsed) will also be remembered across issues.
After much feedback on the 4.1 updates to the 'View Issue' screen, you can now also add a comment at the bottom of the commenting section.

We've also managed to update the look and feel of the component list in Edit mode.
Attachment Sorting by Date or Name

Attachments can now be sorted by date or by name, in ascending or descending order.
**Viewable Files in Zipped Attachments**

You can expand an attached zip file to see its contents. The first 30 files will be shown for larger zip files.

---

**'Log Work' Improvements**

You can now log work when you resolve an issue, saving you a step. You can also set the Remaining Estimate to 0 upon resolving an issue.

You now have the ability to edit the Original Estimate, even if work has been logged on an issue (not shown here).

We've also included the ability to add work log descriptions in wiki-markup (not shown here).
Improvments to the Issue Navigator

The Issue Navigator has been updated to match the look and feel of an issue.

We've also added: an issue marker and colour highlight for keyboard navigation (blue); colour highlight for mouse selection (grey); toggle to collapse the search form.
When a change is made via a dialog, JIRA will give you feedback on that change as confirmation.

New JQL Functions

Additional JQL functions for projectLeadBy and componentsLeadBy — useful for finding all issues where a particular user is the lead of a component, or a project.
‘Filter’ Gadget creation via the Issue Navigator

When viewing search results, you can quickly add a 'Filter Results' gadget to your dashboard via the 'Views' menu.

More Keyboard Shortcuts

JIRA users can now do more without a mouse --- perfect for those power users.
Hints also appear at the bottom of a dialog, helping you to learn keyboard shortcuts on the fly.

**User Avatars and User Hover**

JIRA users can now add an avatar to their profile. You can then mouse-hover over a user's name to show information about that user — this is available when viewing an issue, using the Issue Navigator, browsing
Labels Now Included

The functionality from the Labels plugin is now included in JIRA out-of-the-box. The labels dialog has a great new UI, and issue notifications are now optional when updating labels for an issue.
Other Enhancements and Fixes

Click here for the full list of issues resolved in 4.2.

JIRA 4.2 EAP 1 Release Notes

8 June 2010

JIRA 4.2 EAP 1 (a.k.a 4.2 milestone 6) is a public development release leading up to JIRA 4.2. For all production use and testing of JIRA, please use the latest official release.

Do not use in production
EAP releases should not be used in production environments as they are not officially supported.

Please also take note of the following information:

- **EAP Releases are not safe** — EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No Upgrade Path** — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

GreenHopper Support
Please be aware that GreenHopper 5.0 is not compatible with the JIRA 4.2 EAP releases.

The Atlassian team is proud to bring you the JIRA 4.2 EAP 1 release. We still have a little more work to do, but overall, this is how 4.2 will look when it gets rolled out later this year. And we want your feedback.

Time-tracking is now much more flexible: you can edit the Original Estimate, and set the Remaining Estimate to zero on resolving an issue. You can also log work via workflow 'transition' screens — which are now provided as in-place dialogs rather than separate screens. For the mouse-averse, the new 'dot dialog' provides access to all menu options via the keyboard. The 'Labels' plugin is now a permanent part of JIRA, simplifying system management for GreenHopper users — and everyone else who likes to label their JIRA issues. Dashboard Publish/Subscribe with Confluence is also included.

Note to developers: JIRA 4.2 includes Atlassian Plugin Framework version 2.5.

Note to partners and translators: The preliminary translation diff files will be made available when we release JIRA 4.2 beta in the coming weeks.

Highlights of JIRA 4.2 EAP:

- Dialogs for Common Actions and Workflow Operations
- Dialogs in the Issue Navigator
- 'Dot Dialog' Replaces the Mouse
- Improvements to the 'View Issue' Screen
- Attachment Sorting by Date or Name
- Viewable Files in Zipped Attachments
- 'Log Work' Improvements
- Improvements to the Issue Navigator
Separate Searching in Multiple Tabs
New JQL Functions
User Avatars and User Hover
'Filter' Gadget creation via the Issue Navigator
Labels Now Included
Other Enhancements and Fixes

Thank you for your interest in JIRA 4.2 EAP 1
Download EAP

Upgrading to JIRA 4.2 EAP 1
JIRA EAP releases are available here. To upgrade from JIRA 4.1.x to this release, please follow the normal JIRA Upgrade Guide.

Highlights of JIRA 4.2 EAP 1

1

Dialogs for Common Actions and Workflow Operations
For faster edits to an issue, pop-up dialogs have replaced screen changes:

Dialogs in the Issue Navigator
You can now perform an action on an issue, via a dialog, directly from the Issue Navigator — without opening the issue first. The issue marker shows which issue you have selected (via your keyboard) in the
result list.

'Dot Dialog' Replaces the Mouse

The new 'dot dialog' lets you perform actions via the keyboard (instead of the mouse), using the full-stop ('dot') key to access the 'Actions' and 'Workflow' menus. The dot dialog works from the Issue Navigator and also when viewing an individual issue.
Improvements to the 'View Issue' Screen

Individual blocks can now be collapsed to streamline your issue view. The view state (i.e. which blocks are expanded/collapsed) will also be remembered across issues.
After much feedback on the 4.1 updates to the 'View Issue' screen, you can now also add a comment at the bottom of the commenting section.
5 Attachment Sorting by Date or Name

Attachments can now be sorted by date or by name, in ascending or descending order.

6 Viewable Files in Zipped Attachments

You can expand an attached zip file to see its contents. The first 30 files will be shown for larger zip files.
'Log Work' Improvements

You can now log work when you resolve an issue, saving you a step. You can also set the remaining time to 0 upon resolving an issue.

You also now have the ability to edit the Original Estimate, even if work has been logged on an issue (not shown here).
Improvements to the Issue Navigator

The Issue Navigator has been updated to match the look and feel of an issue. We've also added a collapsible search form to increase the size of the results area.
Separate Searching in Multiple Tabs

This is for those of us who are addicted to having lots of browser tabs open at once. You can now have a different JIRA search in each tab!

New JQL Functions

Additional JQL functions for projectLeadBy and componentsLeadBy — useful for finding all issues where a particular user is the lead of a component, or a project.
User Avatars and User Hover

JIRA users can now add an avatar to their profile. You can then mouse-hover over a user's name to show information about that user — this is available when viewing an issue, using the Issue Navigator, browsing a project, viewing activity, viewing a user profile and performing some administration tasks.
'Filter' Gadget creation via the Issue Navigator

When viewing search results, you can quickly add a 'Filter Results' gadget to your dashboard via the 'View' menu.

Labels Now Included

The functionality from the Labels plugin is now included in JIRA out-of-the-box. The labels dialog has a great new UI and issue notifications are now optional when updating labels for an issue.
## Other Enhancements and Fixes

The top 50 most popular issues resolved in JIRA 4.2 are listed below. Click here for the full list.

### JIRA 4.0 EAP Release Notes

- JIRA 4.0 RC1 Release Notes
- JIRA 4.0 Beta 5 Release Notes
- JIRA 4.0 Beta 4 Release Notes
- JIRA 4.0 Beta 3 Release Notes
- JIRA 4.0 Beta 2 Release Notes
- JIRA 4.0 Beta 1 Release Notes

JIRA 4.0 RC1 Release Notes

September 22, 2009

**JIRA 4.0 Release Candidate 1 (RC1)** is a public development release leading up to **JIRA 4.0**. For all production use and testing of JIRA, please use the latest official release.

A release candidate is a preliminary release leading up to the official release of a JIRA version. Release candidates are a snapshot of our work in progress and provide an advance preview of new features to the general public. JIRA plugin developers can also use release candidates to test and fix their plugins in advance of an official release.

⚠️ It is not possible to upgrade JIRA 4.0 Beta 1, 2, 3, 4 or 5 data to RC1. The data needs to come from an already released JIRA version (for example, JIRA 3.13.5).
The only plugins that are compatible with JIRA 4.0 RC1 are the latest JIRA Toolkit and the GreenHoppe r Beta 5 plugin. Do not install any other plugins.

The Atlassian JIRA team is delighted to present a brand new version of one of the world's favourite issue-trackers.

**Highlights of JIRA 4.0 RC1:**

- Advanced Searching
- Dashboard Gadgets
- Activity Streams
- New-looking "Browse Project"
- Charting Now Comes Standard
- New-looking Header
- Issue Actions in the Issue Navigator
- Project Icons
- Default Unit for Time Tracking
- "History" is now permanent
- Engine Room
- Plus over 900 other fixes and improvements

**Thank you for your interest in JIRA 4.0 RC1**

Download JIRA 4.0 RC1

---

### Installing/Upgrading to JIRA 4.0

JIRA 4.0 RC1 can be downloaded [here](https://www.atlassian.com/software/jira/download). Before upgrading, please refer to the [JIRA 4.0 Upgrade Guide](https://confluence.atlassian.com/jirataskboard/jira-upgrade-guide-455939725.html). You will also need to go to [my.atlassian.com](https://www.atlassian.com/my/atlassian) and generate a "JIRA 4 Evaluation" license, if you haven't done so previously, as any existing 3.x license files will not work with 4.0 RC1.

---

### Highlights of JIRA 4.0 RC1

1. **Advanced Searching**

   The power of search can never be understated, especially in a system like JIRA that sits at the centre of your development team.

   JIRA Query Language (or JQL) brings search to whole new level!

   JQL is a structured query language that provides support for logical operations, including AND, OR, NOT, NULL, EMPTY — even on custom fields:

   ![Issue Navigator](image)

   ```
   project = BOOK AND ISBN is EMPTY AND status
   ```

   ![Turn off auto-complete](image)

   ![Query syntax](image)

   ![1 2 3 4 Next++](image)

   ![Turn off auto-complete](image)

   ![Query syntax](image)

   ![1 2 3 4 Next++](image)

   ![Turn off auto-complete](image)

   ![Query syntax](image)

   ![1 2 3 4 Next++](image)

   ![Turn off auto-complete](image)

   ![Query syntax](image)

   ![1 2 3 4 Next++](image)

   ![Turn off auto-complete](image)

   ![Query syntax](image)

   ![1 2 3 4 Next++] (image)
Using JQL is simple even for those who don't know what "DBA" means. Just start typing and the auto-complete feature starts to suggest fields, operators and values for you to define your query.

You can now create more advanced filters such that you can stay up to date using RSS feeds & e-mail subscriptions, as well as see detailed statistics and charts, on issues that you are actually interested in.

Dashboard Gadgets

Whether you are tracking bugs or managing your entire development process, JIRA dashboards let you stay up to date on what matters most.

The new-look JIRA dashboard not only looks awesome, it now uses industry-standard 'gadgets'. So you can add external gadgets to your JIRA dashboard, as well as displaying JIRA gadgets in other places (such as iGoogle).

You can easily customise your dashboard by choosing a different layout, adding more gadgets, dragging the gadgets into different positions and changing the look of individual gadgets.

What's happened to your favourite JIRA portlets? Don't worry, every portlet that previously shipped with JIRA has been converted to a gadget.

If you are a plugin developer and have created your own portlets, see the instructions for converting your portlets to gadgets.

Activity Streams

The new activity stream allows you to stay up to date with exactly what is going on right this moment, what happened in that last hour or last few days.

Activity streams appear where you need them most — your user profile, project summary and view issue screens. You can even add an activity stream as a gadget on your dashboard.

The activity stream also provides an RSS feed, allowing you to subscribe to very specific RSS feeds of only the information that is most relevant to you.
New-look “Browse Project”

Understanding the status of your projects just got a lot easier with the new browse project UI. Quickly see what work is complete as well as outstanding. You can then drill down to specific issues you want to see.

Your Bamboo builds, FishEye source information and Crucible code reviews are only a click away, as well.
Charting Now Comes Standard

We've built charts into JIRA and given them a visual redesign as well.

- "Recently Created Issues" report and gadget — Shows the rate at which issues are being created.
- "Created vs Resolved Issues" report and gadget — Shows the number of issues created vs number of issues resolved over a given period of time.
- "Resolution Time" report and gadget — Shows the average time taken to resolve issues.
- "Pie Chart" report and gadget — Shows the search results from a specified issue filter (or project) in a pie-chart, based on a statistic of your choice.
- "Time Since Issues" report and gadget — Shows the number of issues for which your chosen date field (e.g. 'Created') was set on a given date.
- "Average Age" report and gadget — Shows the average age (in days) of unresolved issues, e.g.:

![Average Age Chart](chart.png)

Also, the "Resolution Time" field from the Charting plugin is now part of JIRA, so every issue now automatically has its resolution time recorded.

New-look Header
The new-look JIRA header gives you quick access to all of the most commonly-used functions. Creating an issue just got even faster!

Click to zoom in:

If you prefer keystrokes rather than mouse-clicks, you'll be pleased to know that you can use your keyboard to navigate the new header menus.

^Top

**Issue Actions in the Issue Navigator**

By popular request, issues are now actionable directly from the Issue Navigator:
The "Actions" menu is also available for the list of sub-tasks within an issue.

Project Icons

You can now give your project a visual identity, thanks to the introduction of project icons ('avatars'):

Default Unit for Time Tracking

You can now specify your preferred Default Unit (minutes/hours/days/weeks) for your JIRA system. This will be applied whenever users log work on an issue without specifying a unit.
**Time Tracking**

Time Tracking is currently **OFF**. Activate Time Tracking below.

- **Hours per day:** 24
  - Please specify the number of hours per working day. The default for this value is 24 hours.
- **Days per week:** 7
  - Please specify the number of working days per week. The default for this value is 7 days.
- **Time format:**
  - **Day** (e.g. 1 day, 12 hours, 30 minutes)
  - **Day** (e.g. 1.52d)
  - **Hours** (e.g. 36.5h)
- **Default Unit:**
  - **Minute**
  - **Hour**
  - **Day**
  - **Week**

^Top

**"History" is now permanent**

Your list of recently-viewed issues is now stored in JIRA’s database — so it's available after you log out and back in, even if you use a different machine.
Engine Room

Beyond the 'Back' Button

When navigating away from a page where you have modified data, you will be prompted to see if you would like to save the data or discard your changes (see JRA-14911).

Index Queue

Index updates are now put in a queue. So even if the update takes longer than 30 seconds, the operation remains on the queue and is not lost. (See JRA-14220.)

Plus over 900 other fixes and improvements

Click here for full list.

JIRA 4.0 Beta 5 is a public development release leading up to JIRA 4.0. For all production use and testing of JIRA, please use the latest official release.

⚠️ Do not use in production
Beta releases should not be used in production environments as they are not officially supported.

⚠️ Please also take note of the following information:
- Beta releases are not safe—Beta releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because Beta releases represent work in progress, we cannot provide a supported upgrade path between Beta releases, or from any Beta to the eventual final release. Thus, any data you store in a JIRA Beta release may not be able to be migrated to a future JIRA release.

⚠️ It is not possible to upgrade JIRA 4.0 Beta 1, 2, 3 or 4 data to Beta 5. The data needs to come from an already released JIRA version (for example, JIRA 3.13.5).

⚠️ The only plugin that is compatible with JIRA 4.0 Beta is the latest JIRA Toolkit. Do not install any other plugins.

The Atlassian JIRA team is delighted to present a brand new version of one of the world’s favourite issue-trackers.

**Highlights of JIRA 4.0 Beta 5:**
- Advanced Searching
- Dashboard Gadgets
- Activity Stream
- Issue Actions in the Issue Navigator
- Charting Now Comes Standard
- New-look "Browse Project"
- Project Icons
- New-look Header
- Default Unit for Time Tracking
- "History" is now permanent
- Engine Room
- Plus over 800 other fixes and improvements

**Thank you for your interest in JIRA 4.0 Beta 5**
Download Beta

---

**Installing/Upgrading to JIRA 4.0**

JIRA 4.0 Beta 5 can be downloaded here. Before upgrading, please refer to the JIRA 4.0 Upgrade Guide. You will also need to go to my.atlassian.com and generate a "JIRA 4 Evaluation" license, if you haven’t done so previously, as any existing 3.x license files will not work with 4.0 Beta 5.

---

**Highlights of JIRA 4.0 Beta 5**

1

**Advanced Searching**

The new advanced search (JQL) provides support for logical operations, including AND, OR, NOT, NULL,
EMPTY --- even on custom fields:

For more on the new JQL search syntax, please see the documentation.

Dashboard Gadgets

The new-look JIRA dashboard not only looks awesome: it now uses industry-standard 'gadgets'. So you can add external gadgets to your JIRA dashboard, as well as displaying JIRA gadgets in other places (such as iGoogle).

You can easily customise your dashboard by choosing a different layout, adding more gadgets, dragging the gadgets into different positions, and changing the look of individual gadgets.

What's happened to your favourite JIRA portlets? Don't worry: every portlet that previously shipped with JIRA has been converted to a 'legacy gadget'. And if you are a plugin developer and have created your own portlets, see the instructions for converting your portlets to gadgets.

The following gadgets are available in Beta 4:

- 'Activity Stream' gadget (see below)
- 'Admin' gadget
- 'Bamboo Plan Summary' gadget*
- 'Bamboo Status' gadget*
- 'Crucible Charting' gadget
- 'Create Issue' gadget
- 'Favourite Filters' gadget
- 'Filter Results' gadget
- 'FishEye Charting' gadget
- 'Introduction' gadget
- 'Issue Completed This Iteration' gadget
- 'Login' gadget
- 'Quicklinks' gadget
- 'Voted Issues' gadget

* Requires Bamboo 2.3.2 Beta 1 or later.

Activity Stream

The new 'Activity Stream' gadget displays a summary of the latest activity in JIRA projects (and/or by particular people) in which you are interested.
The 'Activity Stream' gadget also provides an RSS feed, allowing you to create very specific RSS feeds of only the information that is most relevant to you.

See the documentation for more details.

Issue Actions in the Issue Navigator

By popular request, issues can now be actioned directly from the Issue Navigator:
The "Actions" menu is also available for the list of sub-tasks within an issue.

Charting Now Comes Standard

The following reports and gadgets from the Charting plugin have now been integrated into JIRA:

- "Average Age" report and gadget — Shows the average age (in days) of unresolved issues, e.g.:

  ![Average Age Graph](chart.png)

  This chart shows the average number of days issues were unresolved for on a given day over the past 30 days.

- "Created vs Resolved Issues" report and gadget — Shows the number of issues created vs number of issues resolved over a given period of time.

- "Pie Chart" report and gadget — Shows the search results from a specified issue filter (or project) in
a pie-chart, based on a statistic of your choice.

- "Recently Created Issues" report and gadget — Shows the rate at which issues are being created.
- "Resolution Time" report and gadget — Shows the average time taken to resolve issues.
- "Time Since Issues" report and gadget — Shows the number of issues for which your chosen date field (e.g. 'Created') was set on a given date.

Also, the "Resolved" field from the Charting plugin is now part of JIRA, so every issue now automatically has its resolution date recorded.

New-look "Browse Project"

JIRA 4.0 provides a cleaner, more interactive view into a project:

![Issues](image)

See the documentation for more about browsing projects, versions and components.

Project Icons

You can now give your project a visual identity, thanks to the introduction of project icons ('avatars'):
New-look Header

The new-look JIRA header gives you quick access to all the most commonly-used functions. Creating an issue just got super-fast!

Click to zoom in:

If you prefer keystrokes rather than mouse-clicks, you’ll be pleased to know that you can use your keyboard to navigate the new header menus.

Default Unit for Time Tracking
You can now specify your preferred **Default Unit** (minutes/hours/days/weeks) for your JIRA system. This will be applied whenever users log work on an issue without specifying a unit.

"History" is now permanent

Your list of recently-viewed issues is now stored in JIRA's database — so it's available after you log out and back in, even if you use a different machine.
Engine Room

Beyond the 'Back' Button

When navigating away from a page where you have modified data, you will be prompted to see if you would like to save the data or discard your changes (see JRA-14911).

Index Queue

Index updates are now put in a queue. So even if the update takes longer than 30 seconds, the operation remains on the queue and is not lost. (See JRA-14220.)

Plus over 800 other fixes and improvements

**JIRA 4.0 Beta 4 Release Notes**

**September 6, 2009**

**JIRA 4.0 Beta 4** is a public development release leading up to **JIRA 4.0**. For all production use and testing of JIRA, please use the latest official release.

**Do not use in production**

Beta releases should not be used in production environments as they are not officially supported.

**Please also take note of the following information:**

- **Beta releases are not safe**— Beta releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.

- **No upgrade path**— Because Beta releases represent work in progress, we **cannot** provide a supported upgrade path between Beta releases, or from any Beta to the eventual final release. Thus, any data you store in a JIRA Beta release may not be able to be migrated to a future JIRA release.

**It is not possible to upgrade JIRA 4.0 Beta 1, 2 or 3 data to Beta 4. The data needs to come from an already released JIRA version (for example, JIRA 3.13.5).**

**The only** plugin that is compatible with JIRA 4.0 Beta is the latest JIRA Toolkit. Do not install any other plugins.

The Atlassian JIRA team is delighted to present a brand new version of one of the world's favourite issue-trackers.

Highlights of JIRA 4.0 Beta 4

1

Advanced Searching

The new advanced search (JQL) provides support for logical operations, including AND, OR, NOT, NULL, EMPTY --- even on custom fields:

For more on the new JQL search syntax, please see the documentation.

2

Dashboard Gadgets

The new-look JIRA dashboard not only looks awesome: it now uses industry-standard ‘gadgets’. So you can add external gadgets to your JIRA dashboard, as well as displaying JIRA gadgets in other places (such as iGoogle).

You can easily customise your dashboard by choosing a different layout, adding more gadgets, dragging the gadgets into different positions, and changing the look of individual gadgets.

What’s happened to your favourite JIRA portlets? Don’t worry: every portlet that previously shipped with JIRA has been converted to a ‘legacy gadget’. And if you are a plugin developer and have created your
own portlets, see the instructions for converting your portlets to gadgets.

The following gadgets are available in Beta 4:

- 'Activity Stream' gadget (see below)
- 'Admin' gadget
- 'Bamboo Plan Summary' gadget*
- 'Bamboo Status' gadget*
- 'Crucible Charting' gadget
- 'Create Issue' gadget
- 'Favourite Filters' gadget
- 'Filter Results' gadget
- 'FishEye Charting' gadget
- 'Introduction' gadget
- 'Issue Completed This Iteration' gadget
- 'Login' gadget
- 'Quicklinks' gadget
- 'Voted Issues' gadget

* Requires Bamboo 2.3.2 Beta 1 or later.

Activity Stream

The new 'Activity Stream' gadget displays a summary of the latest activity in JIRA projects (and/or by particular people) in which you are interested.

The 'Activity Stream' gadget also provides an RSS feed, allowing you to create very specific RSS feeds of only the information that is most relevant to you.

See the documentation for more details.
Issue Actions in the Issue Navigator

By popular request, issues can now be actioned directly from the Issue Navigator:
Charting Now Comes Standard

The following reports and gadgets from the Charting plugin have now been integrated into JIRA:

- **"Average Age" report and gadget** — Shows the average age (in days) of unresolved issues, e.g.:

  ![Average Age Chart](chart.png)

  This chart shows the average number of days issues were unresolved for on a given day over the past 30 days.

- **"Created vs Resolved Issues" report and gadget** — Shows the number of issues created vs number of issues resolved over a given period of time.
- **"Pie Chart" report and gadget** — Shows the search results from a specified issue filter (or project) in
a pie-chart, based on a statistic of your choice.

- "Recently Created Issues" report and gadget — Shows the rate at which issues are being created.
- "Resolution Time" report and gadget — Shows the average time taken to resolve issues.
- "Time Since Issues" report and gadget — Shows the number of issues for which your chosen date field (e.g. 'Created') was set on a given date.

Also, the "Resolved" field from the Charting plugin is now part of JIRA, so every issue now automatically has its resolution date recorded.

New-look "Browse Project"

JIRA 4.0 provides a cleaner, more interactive view into a project:

<table>
<thead>
<tr>
<th>Issues</th>
<th>Status Summary</th>
<th>Unresolved: By Assignee</th>
<th>Unresolved: By Component</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

</tbody>
</table>

Unresolved: By Priority

- Critical 2 1%
- Major 50 37%
- Minor 63 47%
- Trivial 20 16%

See the documentation for more about browsing projects, versions and components.

Project Icons

You can now give your project a visual identity, thanks to the introduction of project icons ('avatars'):
**New-look Header**

The new-look JIRA header gives you quick access to all the most commonly-used functions. Creating an issue just got super-fast!

If you prefer keystrokes rather than mouse-clicks, you’ll be pleased to know that you can use your keyboard to navigate the new header menus.

**Default Unit for Time Tracking**
You can now specify your preferred **Default Unit** (minutes/hours/days/weeks) for your JIRA system. This will be applied whenever users log work on an issue without specifying a unit.

"History" is now permanent

Your list of recently-viewed issues is now stored in JIRA's database — so it's available after you log out and back in, even if you use a different machine.
Engine Room

Beyond the 'Back' Button

When navigating away from a page where you have modified data, you will be prompted to see if you would like to save the data or discard your changes (see JRA-14911).

Index Queue

Index updates are now put in a queue. So even if the update takes longer than 30 seconds, the operation remains on the queue and is not lost. (See JRA-14220.)

Plus over 800 other fixes and improvements

Click here for full list.

JIRA 4.0 Beta 3 Release Notes

August 27, 2009

JIRA 4.0 Beta 3 is a public development release leading up to JIRA 4.0. For all production use and testing of JIRA, please use the latest official release.

Do not use in production
Beta releases should not be used in production environments as they are not officially supported.

Please also take note of the following information:

- Beta releases are not safe—Beta releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because Beta releases represent work in progress, we cannot provide a supported upgrade path between Beta releases, or from any Beta to the eventual final release. Thus, any data you store in a JIRA Beta release may not be able to be migrated to a future JIRA release.

It is not possible to upgrade JIRA 4.0 Beta 1 or 2 data to Beta 3. The data needs to come from an already released JIRA version (for example, JIRA 3.13.5).

The only plugin that is compatible with JIRA 4.0 Beta is the latest JIRA Toolkit. Do not install any other plugins.

The Atlassian JIRA team is delighted to present a brand new version of one of the world's favourite...
issue-trackers.

**Highlights of JIRA 4.0 Beta 3:**
- Advanced Searching
- Dashboard Gadgets
- Activity Stream
- Issue Actions in the Issue Navigator
- Charting Now Comes Standard
- New-look "Browse Project"
- Project Icons
- New-look Header
- Default Unit for Time Tracking
- "History" is now permanent
- Engine Room
- Plus over 450 other fixes and improvements

**Thank you for your interest in JIRA 4.0 Beta 3**

Download Beta

---

**Installing/Upgrading to JIRA 4.0**

JIRA 4.0 Beta 3 can be downloaded here. Before upgrading, please refer to the JIRA 4.0 Upgrade Guide. You will also need to go to my.atlassian.com and generate a "JIRA 4 Evaluation" license, as any existing 3.x license files will not work with 4.0 Beta 3.

---

**Highlights of JIRA 4.0 Beta 3**

1. **Advanced Searching**

   The new advanced search (JQL) provides support for logical operations, including AND, OR, NOT, NULL, EMPTY --- even on custom fields:
   
   ![Issue Navigator](image)

   For more on the new JQL search syntax, please see the [documentation](#).

   ^Top

2. **Dashboard Gadgets**

   The new-look JIRA dashboard not only looks awesome: it now uses industry-standard 'gadgets'. So you can add external gadgets to your JIRA dashboard, as well as displaying JIRA gadgets in other places (such as iGoogle).

   You can easily customise your dashboard by choosing a different layout, adding more gadgets, dragging
the gadgets into different positions, and changing the look of individual gadgets.

What's happened to your favourite JIRA portlets? Don't worry: every portlet that previously shipped with JIRA has been converted to a 'legacy gadget'. And if you are a plugin developer and have created your own portlets, see the instructions for converting your portlets to gadgets.

The following gadgets are available in Beta 3:

- 'Activity Stream' gadget (see below)
- 'Admin' gadget
- 'Bamboo Plan Summary' gadget*
- 'Bamboo Status' gadget*
- 'Crucible Charting' gadget
- 'Create Issue' gadget
- 'Favourite Filters' gadget
- 'Filter Results' gadget
- 'FishEye Charting' gadget
- 'Introduction' gadget
- 'Issue Completed This Iteration' gadget
- 'Login' gadget
- 'Quicklinks' gadget
- 'Voted Issues' gadget

* Requires Bamboo 2.3.2 Beta 1 or later.

**Activity Stream**

The new 'Activity Stream' gadget displays a summary of the latest activity in JIRA projects (and/or by particular people) in which you are interested.

The 'Activity Stream' gadget also provides an RSS feed, allowing you to create very specific RSS feeds of only the information that is most relevant to you.

See the documentation for more details.
**Issue Actions in the Issue Navigator**

By popular request, issues can now be actioned directly from the Issue Navigator:
The "Actions" menu is also available for the list of sub-tasks within an issue.

Charting Now Comes Standard

The following reports and gadgets from the Charting plugin have now been integrated into JIRA:

- "Average Age" report and gadget — Shows the average age (in days) of unresolved issues, e.g.:

- "Created vs Resolved Issues" report and gadget — Shows the number of issues created vs number of issues resolved over a given period of time.
- "Pie Chart" report and gadget — Shows the search results from a specified issue filter (or project) in
a pie-chart, based on a statistic of your choice.

- "Recently Created Issues" report and gadget — Shows the rate at which issues are being created.
- "Resolution Time" report and gadget — Shows the average time taken to resolve issues.
- "Time Since Issues" report and gadget — Shows the number of issues for which your chosen date field (e.g. 'Created') was set on a given date.

Also, the "Resolved" field from the Charting plugin is now part of JIRA, so every issue now automatically has its resolution date recorded.

New-look "Browse Project"

JIRA 4.0 provides a cleaner, more interactive view into a project:

See the documentation for more about browsing projects, versions and components.

Project Icons

You can now give your project a visual identity, thanks to the introduction of project icons ('avatars'):
**New-look Header**

The new-look JIRA header gives you quick access to all the most commonly-used functions. Creating an issue just got super-fast!

If you prefer keystrokes rather than mouse-clicks, you’ll be pleased to know that you can use your keyboard to navigate the new header menus.

**Default Unit for Time Tracking**
You can now specify your preferred **Default Unit** (minutes/hours/days/weeks) for your JIRA system. This will be applied whenever users log work on an issue without specifying a unit.

"History" is now permanent

Your list of recently-viewed issues is now stored in JIRA’s database — so it’s available after you log out and back in, even if you use a different machine.
**Engine Room**

**Beyond the 'Back' Button**

When navigating away from a page where you have modified data, you will be prompted to see if you would like to save the data or discard your changes (see JRA-14911).

**Index Queue**

Index updates are now put in a queue. So even if the update takes longer than 30 seconds, the operation remains on the queue and is not lost. (See JRA-14220.)

**Plus over 450 other fixes and improvements**

Click here for full list.

JIRA 4.0 Beta 2 Release Notes

July 23, 2009

JIRA 4.0 Beta 2 is a public development release leading up to JIRA 4.0. For all production use and testing of JIRA, please use the latest official release.

Do not use in production
Beta releases should not be used in production environments as they are not officially supported.

Please also take note of the following information:

- Beta releases are not safe— Beta releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- No upgrade path — Because Beta releases represent work in progress, we cannot provide a supported upgrade path between Beta releases, or from any Beta to the eventual final release. Thus, any data you store in a JIRA Beta release may not be able to be migrated to a future JIRA release.

It is not possible to upgrade JIRA 4.0 Beta 1 data to Beta 2. The data needs to come from an already released JIRA version (for example, JIRA 3.13.5).

The only plugin that is compatible with JIRA 4.0 Beta is the latest JIRA Toolkit. Do not install any other plugins.

The Atlassian JIRA team is delighted to present a brand new version of one of the world's favourite...
Highlights of JIRA 4.0 Beta 2:

- Advanced Searching
- Dashboard Gadgets
- Activity Stream
- Issue Actions in the Issue Navigator
- Charting Now Comes Standard
- New-look "Browse Project"
- Project Icons
- New-look Header
- Default Unit for Time Tracking
- "History" is now permanent
- Engine Room
- Plus over 250 other fixes and improvements

Thank you for your interest in JIRA 4.0 Beta 2

Download Beta

Known Issues

Upgrading to JIRA 4.0

JIRA 4.0 Beta can be downloaded here. Before upgrading, please refer to the JIRA 4.0 Upgrade Guide.

Known Issues

- **Supported browsers**: For optimal experience with JIRA 4.0 Beta 2, please use Firefox 3.x. Support for other browsers will be added prior to the launch of JIRA 4.0.
- **Portlet-to-gadget upgrade task**: This has not yet been implemented. Your existing portlets will be displayed in legacy mode.

Highlights of JIRA 4.0 Beta 2

**Advanced Searching**

The new advanced search (JQL) provides support for logical operations (including AND/OR/NOT/NULL, even on custom fields) when filtering issues:

```sql
project = TST and assignee != jsmith
```

For more on the new JQL search syntax, please see the documentation.
Dashboard Gadgets

The new-look JIRA dashboard now uses industry-standard 'gadgets'. So you can add external gadgets to your JIRA dashboard, as well as displaying JIRA gadgets in other places (such as iGoogle).

What's happened to your favourite JIRA portlets? Don't worry: every portlet that previously shipped with JIRA has been converted to a 'legacy gadget'. And if you are a plugin developer and have created your own portlets, see the instructions for converting your portlets to gadgets.

The following gadgets are available in Beta 2:

- 'Activity Stream' gadget (see below)
- 'Admin' gadget
- 'Create Issue' gadget
- 'Favourite Filters' gadget
- 'Filter Results' gadget
- 'Introduction' gadget
- 'Issue Completed This Iteration' gadget
- 'Login' gadget
- 'Quicklinks' gadget
- 'Voted Issues' gadget

Activity Stream

The new 'Activity Stream' gadget displays a summary of the latest activity in JIRA projects (and/or by particular people) in which you are interested.

The 'Activity Stream' gadget also provides an RSS feed, allowing you to create very specific RSS feeds of only the information that is most relevant to you.

See the documentation for more details.
Issue Actions in the Issue Navigator

By popular request, issues can now be actioned directly from the Issue Navigator:
The "Actions" menu is also available for the list of sub-tasks within an issue.

Charting Now Comes Standard

The following reports and gadgets from the Charting plugin have now been integrated into JIRA:

- **"Average Age" report and gadget** — Shows the average age (in days) of unresolved issues, e.g.:

  ![Average Age Chart](chart.png)

  This chart shows the average number of days issues were unresolved for on a given day over the past 30 days.

- **"Created vs Resolved Issues" report and gadget** — Shows the number of issues created vs number of issues resolved over a given period of time.
- "Pie Chart" report and gadget — Shows the search results from a specified issue filter (or project) in a pie-chart, based on a statistic of your choice.
- "Recently Created Issues" report and gadget — Shows the rate at which issues are being created.
- "Resolution Time" report and gadget — Shows the average time taken to resolve issues.
- "Time Since Issues" report and gadget — Shows the number of issues for which your chosen date field (e.g. 'Created') was set on a given date.

Also, the "Resolved" field from the Charting plugin is now part of JIRA, so every issue now automatically has its resolution date recorded.

**New-look "Browse Project"

JIRA 4.0 provides a cleaner, more interactive view into a project:

![Issues and Status Summary](image)

See the documentation for more about browsing projects, versions and components.

**Project Icons**

You can now give your project a visual identity, thanks to the introduction of project icons (‘avatars’):

![Choose an Avatar](image)
New-look Header

The new-look JIRA header gives you quick access to all the most commonly-used functions. Creating an issue just got super-fast!

Click to zoom in:

The new 'Create Issue'

The new 'User' menu

The new 'Issues' menu

The new 'Projects' menu

Default Unit for Time Tracking

You can now specify your preferred Default Unit (minutes/hours/days/weeks) for your JIRA system. This will be applied whenever users log work on an issue without specifying a unit.
"History" is now permanent

Your list of recently-viewed issues is now stored in JIRA's database — so it's available after you log out and back in, even if you use a different machine.

<table>

Showing 20 out of 981 issues
JIRA 4.0 Beta 1 is a public development release leading up to JIRA 4.0. For all production use and testing of JIRA, please use the latest official release.

⚠️ Do not use in production
Beta releases should not be used in production environments as they are not officially supported.

⚠️ Please also take note of the following information:
- **Beta releases are not safe**— Beta releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No upgrade path** — Because Beta releases represent work in progress, we cannot provide a supported upgrade path between Beta releases, or from any Beta to the eventual final release. Thus, any data you store in a JIRA Beta release may not be able to be migrated to a future JIRA release.

⚠️ The only plugin that is compatible with JIRA 4.0 Beta is the latest JIRA Toolkit. Do not install any other plugins.

The Atlassian JIRA team is delighted to present a brand new version of one of the world's favourite issue-trackers.

**Highlights of JIRA 4.0 Beta 1:**
- Advanced Searching
- Issue Actions in the Issue Navigator
- Charting Now Comes Standard
- New-look "Browse Project"
- Project Icons
- Dashboard Gadgets
- Activity Stream
- "History" is now permanent
- Plus over 150 other fixes and improvements

**Thank you for your interest in JIRA 4.0 Beta 1**

<tbody>
<tr>
<td>JIRA 4.0 Beta can be downloaded <a href="#">here</a>. Before upgrading, please refer to the <a href="#">JIRA 4.0 Upgrade Guide</a>.</td>
</tr>
</tbody>
</table>

**Highlights of JIRA 4.0 Beta 1**

1. **Advanced Searching**

The new advanced search (JQL) provides support for logical operations (including AND/OR/NOT=NULL, even on custom fields) when filtering issues:
**Issue Navigator**

Project = TST and assignee = jsmith

For more on the new JQL search syntax, please see the documentation.

**Issue Actions in the Issue Navigator**

By popular request, issues can now be actioned directly from the Issue Navigator:

The "Actions" menu is also available for the list of sub-tasks within an issue.

**Charting Now Comes Standard**

The following reports and gadgets from the Charting plugin have now been integrated into JIRA:

- "Average Age" report and gadget — Shows the average age (in days) of unresolved issues, e.g.:
"Created vs Resolved Issues" report and gadget — Shows the number of issues created vs number of issues resolved over a given period of time.

"Pie Chart" report and gadget — Shows the search results from a specified issue filter (or project) in a pie-chart, based on a statistic of your choice.

"Recently Created Issues" report and gadget — Shows the rate at which issues are being created.

"Resolution Time" report and gadget — Shows the average time taken to resolve issues.

"Time Since Issues" report and gadget — Shows the number of issues for which your chosen date field (e.g. 'Created') was set on a given date.

Also, the "Resolved" field from the Charting plugin is now part of JIRA, so every issue now automatically has its resolution date recorded.

New-look "Browse Project"

JIRA 4.0 provides a cleaner, more interactive view in to a project:
### Project Icons

You can now give your project a visual identity, thanks to the introduction of project icons ('avatars'):

![Project Icons](image)

### Dashboard Gadgets

The new-look JIRA dashboard now uses industry-standard 'gadgets'. So you can add external gadgets to your JIRA dashboard, as well as displaying JIRA gadgets in other places (such as iGoogle).

What's happened to your favourite JIRA portlets? Don't worry: every portlet that previously shipped with JIRA has been converted to a 'legacy gadget'. And if you are a plugin developer and have created your own portlets, see the instructions for converting your portlets to gadgets.

The following new gadgets are available in Beta 1:

- 'Activity Stream' gadget (see below)
- 'Create Issue' gadget
- 'Filter Results' gadget
- 'Issue Completed This Iteration' gadget

For optimal experience of the new dashboard, please use Firefox 3.x. Support for other browsers will
Activity Stream

The new 'Activity Stream' gadget displays a summary of the latest activity in JIRA projects (and/or by particular people) in which you are interested.

See the documentation for more details.
"History" is now permanent

Your list of recently-viewed issues is now stored in JIRA's database — so it's available after you log out and back in, even if you use a different machine.

![Top](^Top)

JIRA 3.11 EAP Release Notes

Do not use in production
EAP releases should not be used in production environments as they are not officially supported.

Please also take note of the following information:

- **EAP Releases are Not Safe**— EAP releases are snapshots of the ongoing JIRA development process. As such:
  - While we try to keep these releases stable, they have not undergone the same degree of testing as a full release.
  - Features in development releases may be incomplete, or may change or be removed before the next full release.
- **No Upgrade Path** — Because EAP releases represent work in progress, we can not provide a supported upgrade path between EAP releases, or from any EAP to the eventual final release. Thus, any data you store in a JIRA EAP release may not be able to be migrated to a future JIRA release.

JIRA 3.11 EAP is a public development release leading up to JIRA 3.11.

**Who should download this release?**

This EAP release is being made available specifically for JIRA plugin developers to test their existing plugins against indexing changes in JIRA 3.11. This affects all plugins that maintain their own indexes or interact with JIRA’s index (e.g. via a custom field with a custom searcher that the plugin implements).

For all production use and testing of JIRA, please use the latest official release.

Plugins that depend on indexing will have to be updated to remove the use of any methods that were deprecated in Lucene 1.9.1. These plugins will have to be re-compiled against Lucene 2.2.0 and re-released for JIRA 3.11.

**What’s new?**

This EAP release includes the following features:

- **Aggregate Time Tracking information across sub-tasks**
- **Lucene upgrade to v2.2.0**

JIRA 3.11 aims to upgrade Lucene to version 2.2.0. A number of deprecated methods that JIRA and JIRA plugins relied on where removed from this version of Lucene. Aside from the API changes, there were also changes to how certain fields are stored in the index themselves. Luckily Lucene 2.2.0 is backwards compatible and is able to read indexes created by earlier versions of Lucene (indexes will be converted to the Lucene 2.2.0 format as soon as documents are added). Once an index has been upgraded to Lucene 2.2.0 any previous version of Lucene will not be able to read this index any longer.

One change that may require you to re-index are how dates are stored in the index. For example, DateFields have been deprecated in favour of DateTools, which stores dates in a human readable form. If you convert your plugins to store dates using DateTools, you will need to advise all users that they will need to perform a re-index.
(currently the only way to do this for plugins is to delete the plugin's index files).

**What should I do?**

If you have developed custom plugins that use Lucene, either publicly in the JIRA Plugin Library, or privately for your company's internal use, it is critical that you test those plugins against the JIRA 3.11 EAP. Because of the upgrade Lucene 2.2 and the large number of deprecations, it is likely that you will need to make changes.

You should make any necessary changes to the plugin, and be prepared to release those fixes in conjunction with JIRA 3.11, so that users will have a smooth upgrade experience.

If you have any trouble with the EAP or the upgrade process, please contact developer-support@atlassian.com for assistance.

The EAP is available for download here.

**Labs Features in JIRA**

**JIRA Labs** is an extension of the JIRA Early Access Program (EAP). The JIRA Early Access Program (EAP) provides a sneak-peek of the next JIRA release to customers who download and install JIRA. The JIRA EAP also allows us to gather feedback on “work-in-progress” features to help us improve them.

JIRA Labs extends this program to customers who use JIRA OnDemand and JIRA add-ons.

- It lets OnDemand customers opt-in to work-in-progress features and provide feedback.
- It gives JIRA add-ons a way to provide work-in-progress features to both OnDemand and download customers, while maintaining frequent releases to customers.

Please note, JIRA Labs does not replace the JIRA EAP. We will continue to provide EAP releases to give customers a full view of the in-progress changes coming in the next major release of downloadable JIRA. However, JIRA Labs is similar to the JIRA EAP, in that:

- JIRA Labs features will be introduced while they are “work-in-progress” features. This means that they will not be feature complete nor have the final desired user experience. They are also likely to have bugs that need to be fixed before becoming a fully supported feature.
- JIRA Labs features are not supported.
- JIRA Labs is designed to get feedback from users that can impact the final shape of a feature in JIRA.
- JIRA Labs is used to test new JIRA concepts. As a result, there is no actual guarantee that all Labs feature will make it into a final release. We may choose to remove a Labs feature.

**Using JIRA Labs features**

**Identifying Labs features**

JIRA Labs features will appear in:

1. JIRA OnDemand. For example, the new issue navigator appeared as Labs feature in JIRA OnDemand between JIRA 5.1 and JIRA 5.2.
2. JIRA add-ons (e.g. JIRA Agile and JIRA Capture). Labs features for add-ons may exist across multiple OnDemand or downloadable releases, as Add-Ons often have a much faster release cycle than JIRA.

Everywhere you see a Labs feature, you will see the Labs logo (see example screenshot below).

**Enabling/Disabling Labs features**

You will also have the option of enabling or disabling that feature. If the feature is an administration feature, only administrators will be able to configure it. If the feature is an end-user feature, like the new Issue Navigator for 5.2, each end user can opt in or out of the new feature.
By default, users will need to opt in to use the new Labs features.

**Giving feedback**

We want your feedback! We'd love to hear what you like or don't like. Each Labs feature will usually provide a way for you to provide feedback on the feature and tell us what you think.

**Enabling/Disabling the Give Feedback links**

If you want to disable the Give Feedback links, you can do this by disabling the JIRA Feedback Plugin. Note, if you are using JIRA OnDemand, you will not be able to disable this plugin — please raise a support request for assistance.

**Security Advisories**

As a public-facing web application, JIRA's application-level security is important. This document contains links to version-specific security advisories and related documents for the JIRA application.

This document is intended to provide information to system administrators about the security of the JIRA application. It does not address JIRA's internal security model — user management and permissions — except as it relates to the overall application security.

Latest security advisory:

- [JIRA Security Advisory 2014-02-26](#)
In this advisory:
- Security vulnerabilities
  - XSS vulnerability in Issue Actions
  - Anyone can delete a filter which is shared with them
  - Default language setting can be changed by an unauthorised user
- Available JIRA Patches
  - JIRA 3.12
  - JIRA 3.11
  - JIRA 3.10.2

Security vulnerabilities

XSS vulnerability in Issue Actions

Severity

Atlassian rates this vulnerability as **HIGH**, according to the scale published in the JIRA Security documentation. This scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security flaw which may affect JIRA instances in a public environment. This flaw is an XSS (cross-site scripting) vulnerability in JIRA's issue actions, which potentially allows a malicious user (hacker) to insert their own HTML tags or script into an action.

- The hacker might take advantage of this flaw to steal other users' session cookies or other credentials, by sending the credentials back to the hacker's own web server.
- The hacker's text and script might be displayed to other people viewing the JIRA issue. This is potentially damaging to your company's reputation.

Atlassian recommends that you upgrade to JIRA **3.12.1**, or download the patch for JIRA 3.11 or 3.10.2, to fix the vulnerabilities described below.

You can read more about XSS attacks at cgisecurity, CERT and other places on the web.

Risk Mitigation

If you judge it necessary, you can disable public access (i.e. anonymous access and public signup) to your JIRA system until you have applied the necessary patch or upgrade. For even tighter control, you could restrict JIRA access to trusted groups only.

Vulnerability

All issue actions (e.g. 'Create issue') are affected. The problem is with 500page.jsp. It does not HTML-escape the error messages it prints out.

Fix

The fix is to escape all of the error messages rendered on the 500 page, so that no user input, which is propagated to error messages, is interpreted as HTML or CSS.

This issue has been fixed in JIRA **3.12.1**. The fix is also provided as a patch for JIRA 3.12, 3.11 and 3.10.2. For more information, please see JIRA-14105.

Anyone can delete a filter which is shared with them

Severity
Atlassian rates this vulnerability as **LOW**, according to the scale published in the [JIRA Security documentation](https://confluence.atlassian.com/display/JIRA/JIRA+Security+documentation). This scale allows us to rank a vulnerability as critical, high, moderate or low.

**Risk Assessment**

We have identified and fixed a security flaw which may affect JIRA instances in a public environment. This flaw allows users to delete filters which are shared with them, which is an inconvenience to the user who is the true owner of the filter.

Atlassian recommends that you upgrade to **JIRA 3.12.1**, or download the patch for JIRA 3.12, 3.11 or 3.10.2, to fix the vulnerabilities described below.

**Risk Mitigation**

If you judge it necessary, you can disable public access (i.e. anonymous access and public signup) to your JIRA system until you have applied the necessary patch or upgrade. For even tighter control, you could instruct all users to share their filters with trusted groups only (i.e. instruct them not to use 'Global' sharing).

**Vulnerability**

When a user commences deleting one of their own filters, if they replace their filter ID with the ID of another user's filter which is shared with them, they can delete the other user's filter.

**Fix**

The fix is to check that the currently logged-in user is indeed the owner of the filter, before deleting a filter.

This issue has been fixed in **JIRA 3.12.1**. The fix is also provided as a patch for JIRA 3.12, 3.11 and 3.10.2. For more information, please see [JRA-13999](https://jira.atlassian.com/browse/JRA-13999).

---

**Default language setting can be changed by an unauthorised user**

**Severity**

Atlassian rates this vulnerability as **LOW**, according to the scale published in the [JIRA Security documentation](https://confluence.atlassian.com/display/JIRA/JIRA+Security+documentation). This scale allows us to rank a vulnerability as critical, high, moderate or low.

**Risk Assessment**

We have identified and fixed a security flaw which may affect JIRA instances in a public environment. This flaw potentially allows a malicious user (hacker) to change the default language of your JIRA instance, which is potentially damaging to your company's reputation, and an inconvenience to users.

Atlassian recommends that you upgrade to **JIRA 3.12.1**, or download the patch for JIRA 3.11 or 3.10.2, to fix the vulnerabilities described below.

**Risk Mitigation**

If you judge it necessary, you can disable public access (i.e. anonymous access and public signup) to your JIRA system until you have applied the necessary patch or upgrade. For even tighter control, you could restrict JIRA access to trusted groups only.

**Vulnerability**

After a JIRA instance has been setup, the first page of the Setup Wizard can still be accessed by manually browsing to the URL.

Attempting to advance beyond this screen, or import data, correctly results in the "Already Setup" page being displayed. However, the default language for the JIRA instance can be modified without any security checks.

**Fix**

The fix is to check that JIRA has not already been setup, when a user attempts to access the any page of the Setup Wizard. Similar checks also occur when a user attempts direct access to the setup JSPs.

This issue has been fixed in **JIRA 3.12.1**. The fix is also provided as a patch for JIRA 3.11 and 3.10.2. For more information, please see [JRA-14086](https://jira.atlassian.com/browse/JRA-14086).

Please let us know what you think of the format of this security advisory and the information we have provided.

**JIRA Security Advisory 2008-02-21**

In this advisory:
- **Security vulnerabilities**
  - XSS vulnerability in Issue Actions
- **Available JIRA Patches**
  - JIRA 3.12.1
  - JIRA 3.11
  - JIRA 3.10.2

**Security vulnerabilities**

**XSS vulnerability in Issue Actions**

**Severity**

Atlassian rates this vulnerability as **HIGH**, according to the scale published in the JIRA Security documentation. This scale allows us to rank a vulnerability as critical, high, moderate or low.

**Risk Assessment**

We have identified and fixed a security flaw which may affect JIRA instances in a public environment. This flaw is an XSS (cross-site scripting) vulnerability in JIRA’s 'Saved Filter', 'Filter Statistics', 'Project Statistics' and '2D Filter Statistics' portlets. This potentially allows a malicious user (hacker) to create a shared filter with special JavaScript in the name, and then create a link to run the vulnerable portlets using the shared filter. If this link was sent to a user and clicked by the user, the special JavaScript would be executed in the user's session.
The hacker might take advantage of this flaw to steal other users' session cookies or other credentials, by sending the credentials back to the hacker's own web server.

The hacker could also gain control over the underlying system, based on the privileges of the user whose session cookie has been stolen, by using the jelly runner.

The hacker's text and script might be displayed to other people viewing the JIRA Dashboard. This is potentially damaging to your company's reputation.

Atlassian recommends that you upgrade to JIRA 3.12.2, or download the patch for JIRA 3.12.1, 3.11 or 3.10.2, to fix the vulnerabilities described below.

You can read more about XSS attacks at cgisecurity, CERT and other places on the web.

Risk Mitigation

If you judge it necessary, you can disable public access (i.e. anonymous access and public signup) to your JIRA system until you have applied the necessary patch or upgrade. For even tighter control, you could restrict JIRA access to trusted groups only.

Vulnerability

The 'Saved Filter', 'Filter Statistics', 'Project Statistics' and '2D Filter Statistics' portlets are affected. The name of a shared filter is not HTML-escaped when the the portlet is viewed.

Fix

The fix is to escape the name of a shared filter when run by the 'Saved Filter', 'Filter Statistics', 'Project Statistics' and '2D Filter Statistics' portlets, so that no content in the filter name is interpreted as HTML or CSS.

This issue has been fixed in JIRA 3.12.2. The fix is also provided as a patch for JIRA 3.12.1, 3.11 and 3.10.2. For more information, please see JRA-14277 and JRA-14357.

Available JIRA Patches

JIRA 3.12.1

</tbody>
</table>
Please let us know what you think of the format of this security advisory and the information we have provided.

**JIRA Security Advisory 2008-08-26**

In this advisory:
- Security vulnerabilities
  - XSS vulnerability in serving HTML attachments with the text/html MIME type
  - MailHandlers may create an infinite loop if the monitored mailbox receives notifications from the same instance of JIRA
  - Directory listings are enabled on Tomcat by default
  - Filters/Search Requests can be modified by URL Hacking
  - 'Manage Project Role Membership for Project' page can be viewed publicly

**Security vulnerabilities**

**XSS vulnerability in serving HTML attachments with the text/html MIME type**

**Severity**

Atlassian rates this vulnerability as **HIGH**, according to the scale published in the JIRA Security documentation. This scale allows us to rank a vulnerability as critical, high, moderate or low.

**Risk Assessment**

We have identified and addressed a security vulnerability which may affect JIRA instances in a public environment. This is an XSS (cross-site scripting) vulnerability in JIRA's service of HTML attachments (or other active content, such as Javascript, Flash, etc) with the text/html MIME type, which potentially allows a malicious user (attacker) to insert their own HTML tags or script into an action.

- The attacker could take advantage of this vulnerability to steal other users' session cookies or other credentials, by sending the credentials back to the attacker's own web server.
- The attacker's text and script could be displayed to other people viewing the JIRA issue. This is potentially damaging to your company's reputation.

Atlassian recommends that you upgrade to **JIRA 3.13** to fix the vulnerabilities described below.

You can read more about XSS attacks at [cgisecurity](#), [CERT](#) and other places on the web.

**Risk Mitigation**

If you judge it necessary, you can disable attachments or restrict public access (i.e. anonymous access and public signup) to your JIRA system until you have applied the necessary patch or upgrade. For even tighter control, you could restrict JIRA access to trusted groups only.

**Vulnerability**

Any malicious script contained in an HTML attachment of with the text/html MIME type will be run as JIRA serves the attachment, i.e. when an admin or user clicks on the uploaded HTML attachment.

**Fix**

The fix is to add an administration option to force all attachments in JIRA to be downloaded rather than displayed inline. Administrators can choose from the following:

- force all attachments to be downloaded in JIRA,
- let all attachments be displayed inline, or,
- for Internet Explorer users, force the download of attachments that IE detects to be html files (via mime sniffing). Declared html attachments are also never displayed inline.

Read the [documentation](#) for further details on configuring this setting.

This issue has been fixed in **JIRA 3.13** only. There are no patches available for previous versions of JIRA, for this fix.
MailHandlers may create an infinite loop if the monitored mailbox receives notifications from the same instance of JIRA.

Severity
Atlassian rates this vulnerability as MEDIUM, according to the scale published in the JIRA Security documentation. This scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment
We have identified and fixed a security flaw which may affect JIRA instances in a public environment. This flaw means that mailhandlers can potentially cause infinite loops if the monitored mailbox receives notifications from the same JIRA instance.

Atlassian recommends that you upgrade to JIRA 3.13 to fix the vulnerability described below.

Risk Mitigation
If you judge it necessary, you can disable your mail servers or disable public access (i.e. anonymous access and public signup) to your JIRA system until you have applied the necessary patch or upgrade.

Vulnerability
User sends an email to a JIRA mailbox, where the From and To address are the same, e.g. if an email is sent to a mailbox monitored by JIRA with a 'From' email address identical to the mailbox address it is being sent to, then JIRA will pick up the email again and start an infinite loop for that issue.

This also applies to scenarios where JIRA sends emails to an address which is an alias for a mailbox that it checks.

Fix
The fix is to add a header to the outgoing email that contains a special JIRA "fingerprint" (X-JIRA-FINGERPRINT) that is unique to the JIRA instance. This issue has been fixed in JIRA 3.13 only. There are no patches available for previous versions of JIRA, for this fix.

Directory listings are enabled on Tomcat by default

Severity
Atlassian rates this vulnerability as LOW, according to the scale published in the JIRA Security documentation. This scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment
We have identified and addressed a security flaw which may affect JIRA instances in a public environment. This flaw means that directory listings on the Tomcat application server are public by default.

Atlassian recommends that you upgrade to JIRA 3.13 to fix the vulnerability described below. Alternatively, you can manually disable the directory listing (via the <TOMCAT_HOME>/conf/web.xml file in Tomcat directory), which will force JIRA to throw HTTP 404 errors appropriately.

Risk Mitigation
If you judge it necessary, you can disable public access (i.e. anonymous access and public signup) to your JIRA system until you have applied the necessary patch or upgrade.

Vulnerability
Users can browse the directory listing on the Tomcat application server, e.g. /images/. Please note, the information accessible by the user is already readily available to the user, or can be obtained by downloading JIRA. The webapp directories do not contain any user content.

Fix
The fix is to disable directory listings in Tomcat. Please refer to JIRA-11634 for details.
The directory listings are disabled by default in Tomcat 5.5.26. This version is bundled with the latest version of JIRA.
This issue has been fixed in JIRA 3.13 for JIRA Standalone and for the sample Tomcat (i.e. versions 4.1, 5.0, 5.5 and 6.0) configuration files shipped with JIRA WAR/EAR. There are no patches available for previous versions of JIRA, for this fix.

Filters/Search Requests can be modified by URL Hacking

Severity

Atlassian rates this vulnerability as MODERATE, according to the scale published in the JIRA Security documentation. This scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and addressed a security flaw which may affect JIRA instances in a public environment. This flaw means that issue filters can be modified by hacking the URL, regardless of permissions on the filter.

Atlassian recommends that you upgrade to JIRA 3.13 to fix the vulnerability described below.

Risk Mitigation

If you judge it necessary, you can disable public access (i.e. anonymous access and public signup) to your JIRA system until you have applied the necessary patch or upgrade.

Vulnerability

Users can run an issue filter, which they do not have access to, by entering the appropriate URL (although the filter will not return any issues that the user does not have permission to see). By the same means, users can edit a filter, rename a filter and access share and column selection. Filter deletion cannot be actioned purely by the URL, as it requires interaction with the user interface (which enforces permissions).

Fix

The fix is to revise the issue filter functionality as part of the Shareable Filters feature, so that URL hacks are no longer valid.

This issue has been fixed in JIRA 3.13 only. There are no patches available for previous versions of JIRA, for this fix.

'Manage Project Role Membership for Project' page can be viewed publicly

Severity

Atlassian rates this vulnerability as LOW, according to the scale published in the JIRA Security documentation. This scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and addressed a security flaw which may affect JIRA instances in a public environment. This flaw means that the 'Manage Project Role Membership for Project' page can be viewed by users who are not logged in. Users cannot view any project role members or modify project roles.

Atlassian recommends that you upgrade to JIRA 3.13 to fix the vulnerability described below.

Risk Mitigation

If you judge it necessary, you can disable public access (i.e. anonymous access and public signup) to your JIRA system until you have applied the necessary patch or upgrade.
Vulnerability

Users, who are not logged in, can manually enter the URL for the ’Manage Project Role Membership for Project’ to access the page. Project role members will not be visible, nor will the user be able to modify project roles. The only new information available to the user will be the project name.

Fix

The fix is to prompt the user with the appropriate page for unauthorised access, if they are not logged in.

This issue has been fixed in JIRA 3.13 only. There are no patches available for previous versions of JIRA, for this fix.

Please let us know what you think of the format of this security advisory and the information we have provided.

JIRA Security Advisory 2008-10-29

In this advisory:

- Security vulnerabilities
  - XSS vulnerability on ViewProfile page
  - Return URL is not HTML escaped

Security vulnerabilities

XSS vulnerability on ViewProfile page

Severity

Atlassian rates this vulnerability as HIGH, according to the scale published in the JIRA Security documentation. This scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security flaw which may affect JIRA instances in a public environment. This flaw is an XSS (cross-site scripting) vulnerability in JIRA's ViewProfile page. This potentially allows a malicious user (hacker) to create a user with special JavaScript in the fullname of the user. If this user was viewed by another user in the ViewProfile page, the special JavaScript would be executed in the user’s session.

- The hacker might take advantage of this flaw to steal other users’ session cookies or other credentials, by sending the credentials back to the hacker's own web server.
- The hacker could also gain control over the underlying system, based on the privileges of the user whose session cookie has been stolen.

Atlassian recommends that you upgrade to JIRA 3.13.1 to fix the vulnerabilities described below.

You can read more about XSS attacks at cgisecurity, CERT and other places on the web.

Risk Mitigation

If you judge it necessary, you can disable public access (i.e. anonymous access and public signup) to your JIRA system until you have applied the necessary patch or upgrade. For even tighter control, you could restrict JIRA access to trusted groups only.

Vulnerability

The ViewProfile page is affected. The user's 'fullname' is not HTML-escaped when the the page is viewed.

Fix

The fix is to HTML-encode the fullname of the user on the ViewProfile page, so that it cannot be used to run special scripts.

This issue has been fixed in JIRA 3.13.1 only. There are no patches available for previous versions of JIRA, for this fix. For more information, please see JRA-15733.
Return URL is not HTML escaped

Severity

Atlassian rates this vulnerability as **HIGH**, according to the scale published in the JIRA Security documentation. This scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security flaw which may affect JIRA instances in a public environment. This flaw is an XSS (cross-site scripting) vulnerability in the returnURL parameter of the URL of a form (e.g. Add Comment). This potentially allows a malicious user (hacker) to hack the URL to insert special JavaScript in the returnURL parameter. A hacker could present the hacked URL to users (e.g. disguised in an email). If any users click the URL, the special JavaScript would be executed in the user's session.

- The hacker might take advantage of this flaw to steal other users' session cookies or other credentials, by sending the credentials back to the hacker's own web server.
- The hacker could also gain control over the underlying system, based on the privileges of the user whose session cookie has been stolen.
- The hacker's text and script might be displayed to other people on any JIRA page which has a form. This is potentially damaging to your company's reputation.

Atlassian recommends that you upgrade to **JIRA 3.13.1** to fix the vulnerabilities described below.

You can read more about XSS attacks at [cgitsecurity](http://cgitsecurity.org), [CERT](http://www.cert.org) and other places on the web.

Risk Mitigation

If you judge it necessary, you can disable public access (i.e. anonymous access and public signup) to your JIRA system until you have applied the necessary patch or upgrade. For even tighter control, you could restrict JIRA access to trusted groups only.

Vulnerability

All forms in JIRA are affected. The returnURL is not HTML-escaped when the the page is viewed.

Fix

The fix is to HTML-encode the returnURL of form URLs, so that it cannot be used to run special scripts.

This issue has been fixed in **JIRA 3.13.1** only. There are no patches available for previous versions of JIRA, for this fix. For more information, please see **JRA-15707**.

---

Please let us know what you think of the format of this security advisory and the information we have provided.

**JIRA Security Advisory 2008-12-09**

In this advisory:

- **Security Vulnerabilities**
  - WebWork 1 Parameter Injection Hole
- **Available JIRA Patches**
  - JIRA 3.13.1
  - JIRA 3.12.3
  - JIRA 3.11
  - JIRA 3.10.2
  - JIRA 3.9.3
  - JIRA 3.8.1
  - JIRA 3.7.4
  - JIRA 3.6.5
  - JIRA 3.5.3
  - JIRA 3.4.x and earlier
WebWork 1 Parameter Injection Hole

Severity

Atlassian rates this vulnerability as CRITICAL, according to the scale published in the JIRA Security documentation. This scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security flaw which may affect JIRA instances in a public environment. This flaw is a parameter injection vulnerability in the implementation of the WebWork 1 web application framework in JIRA. The Webwork 1 web application framework allows for the dynamic transformation of URL parameters into method calls. This potentially allows a malicious user (hacker) to call exposed public methods in JIRA via specially formatted URLs.

Atlassian recommends that you upgrade to JIRA 3.13.2 to fix the vulnerabilities described below.

Risk Mitigation

We strongly recommend that you upgrade or apply the necessary patch as soon as possible. If you judge it necessary, you can disable public access (i.e. anonymous access and public signup) to your JIRA system. For even tighter control, you could restrict JIRA access to trusted groups only.

Vulnerability

All versions of JIRA are vulnerable to this security flaw.

A number of public JIRA methods are exposed to this vulnerability. These methods can be called via specially formatted URLs. The method names are not listed for security reasons.

Fix

The fix is to process parameters via a trusted implementation of the action factory in the Webwork 1 web application framework, which provides more secure method transformations.

This issue has been fixed in JIRA 3.13.2 or later. The fix is also provided as a patch for JIRA 3.12.3, 3.11, 3.10.2, 3.9.3, 3.8.1, 3.7.4, 3.6.5 and 3.5.3. There are no patches available for JIRA versions 3.4.x or earlier. We recommend that you upgrade to at least JIRA 3.5.x to apply this patch.

Available JIRA Patches

JIRA 3.13.1

The patches for JIRA 3.13.1 are available in the file jra-15664-3.13.1-patch.zip

<table>
<thead>
<tr>
<th>Patch Zip File</th>
<th>jra-15664-3.13.1-patch.zip</th>
</tr>

<tr>
<td>Patch CheckSum</td>
<td>jra-15664-3.8.1-patch.zip.md5</td>
</tr>
</tbody>
</table>

ℹ️ If you are using a version of JIRA 3.8.x prior to version 3.8.1, you will need to upgrade to JIRA 3.8.1 before applying this patch.

JIRA 3.7.4

The patches for JIRA 3.7.4 are available in the file jra-15664-3.7.4-patch.zip

<table>
<thead>
<tr>
<th>Patch Zip File</th>
<th>jra-15664-3.7.4-patch.zip</th>
</tr>
</thead>
<tbody>
<tr>
<td>Patch Instructions</td>
<td>jra-15664-3.7.4-patch-instructions.txt</td>
</tr>
<tr>
<td>Patch CheckSum</td>
<td>jra-15664-3.7.4-patch.zip.md5</td>
</tr>
</tbody>
</table>

ℹ️ If you are using a version of JIRA 3.7.x prior to version 3.7.4, you will need to upgrade to JIRA 3.7.4 before applying this patch.

JIRA 3.6.5

The patches for JIRA 3.6.5 are available in the file jra-15664-3.6.5-patch.zip
If you are using a version of JIRA 3.6.x prior to version 3.6.5, you will need to upgrade to JIRA 3.6.5 before applying this patch.

JIRA 3.5.3

The patches for JIRA 3.5.3 are available in the file jra-15664-3.5.3-patch.zip

If you are using a version of JIRA 3.5.x prior to version 3.5.3, you will need to upgrade to JIRA 3.5.3 before applying this patch.

JIRA 3.4.x and earlier

There are no patches available for JIRA versions 3.4.x or earlier. We recommend that you upgrade to at least JIRA 3.5.x.

Please let us know what you think of the format of this security advisory and the information we have provided.

**JIRA Security Advisory 2009-04-02**

In this advisory:

- Security Vulnerabilities
  - HTTP Header Injection Flaw
  - DWR XSS Security Hole
  - XSS vulnerability in various JIRA parameters
  - Security Vulnerabilities — JIRA Plugins
  - JIRA Charting Plugin XSS Security Hole

Security Vulnerabilities

HTTP Header Injection Flaw

Severity

Atlassian rates this vulnerability as HIGH, according to the scale published in the JIRA Security documentation. This scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security flaw which may affect JIRA instances in a public environment. This flaw is a HTTP Header injection vulnerability in JIRA. This potentially allows a malicious user (hacker) to hack the header response to insert malicious code. A hacker could present the hacked URL to users (e.g. disguised in an email). If any users click the URL, the malicious code would be executed in the user's session.

- The hacker might take advantage of this flaw to steal other users' session cookies or other credentials, by sending the credentials back to the hacker's own web server.
- The hacker could also gain control over the underlying system, based on the privileges of the user whose session cookie has been stolen.
- The hacker could redirect the user to undesirable web sites. This is potentially damaging to your company's reputation.

Atlassian recommends that you upgrade to JIRA 3.13.3 to fix the vulnerabilities described below.
Risk Mitigation

We strongly recommend that you upgrade or apply the necessary patch as soon as possible.

If you are unable to do this, you may wish to consult the vendor of your application server to see whether your application server is immune to header injection vulnerabilities or has configuration options to prevent such attacks. For example, the Coyote (HTTP) connector in Tomcat version 5.5 and later is immune to header injection attacks, as acknowledged in this reference.

Please note, the time required to fix this vulnerability and the extent of its effectiveness will depend on your application server and its configuration.

Technical Note

In your application server, header injection vulnerabilities can be mitigated if the setHeader(), addHeader(), and sendRedirect() methods in the HttpServletResponse class have their parameters properly checked for header termination characters. You may wish to forward this information to the vendor of your application server to help them advise whether they have any countermeasures to protect your application server against header injection attacks.

Vulnerability

All versions of JIRA are vulnerable to this security flaw.

Fix

The fix updates the Seraph framework to a version which correctly encodes and validates redirect URLs before sending them back to the user.

This issue has been fixed in JIRA 3.13.3 or later. The fix is also provided as a patch for JIRA 3.12.3 and 3.11. There are no patches available for JIRA versions 3.10.x and earlier. We recommend that you upgrade to at least JIRA 3.11 to apply this patch.

Available JIRA Patches

JIRA 3.12.3

A replacement seraph jar for JIRA 3.12.3 is available here: atlassian-seraph-0.38.3.jar

Replace JIRA’s existing seraph jar with the updated one:

1. Delete the existing seraph jar in WEB-INF/lib/atlassian-seraph-0.37.2.jar
2. Place the replacement atlassian-seraph-0.38.3.jar into WEB-INF/lib

<table>
<thead>
<tr>
<th>jar file</th>
<th>atlassian-seraph-0.38.3.jar</th>
</tr>
</thead>
<tbody>
<tr>
<td>MD5 sum</td>
<td>atlassian-seraph-0.38.3.jar.md5</td>
</tr>
</tbody>
</table>

JIRA 3.11

A replacement seraph jar for JIRA 3.11 is available here: seraph-0.7.21.1.jar

Replace JIRA’s existing seraph jar with the updated one:

1. Delete the existing seraph jar in WEB-INF/lib/seraph-0.7.21.jar
2. Place the replacement seraph-0.7.21.1.jar into WEB-INF/lib

<table>
<thead>
<tr>
<th>jar file</th>
<th>seraph-0.7.21.1.jar</th>
</tr>
</thead>
<tbody>
<tr>
<td>MD5 sum</td>
<td>seraph-0.7.21.1.jar.md5</td>
</tr>
</tbody>
</table>

JIRA 3.10.x and earlier

There are no patches available for JIRA versions 3.10.x or earlier. We recommend that you upgrade to at least JIRA 3.11.
DWR XSS Security Hole

Severity

Atlassian rates this vulnerability as **HIGH**, according to the scale published in the JIRA Security documentation. This scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a security flaw which may affect JIRA instances in a public environment. This flaw is a XSS vulnerability in the DWR library in JIRA. This potentially allows a malicious user (hacker) to hack the URL to insert special JavaScript. A hacker could present the hacked URL to users (e.g. disguised in an email). If any users click the URL, the special JavaScript would be executed in the user's session.

- The hacker might take advantage of this flaw to steal other users' session cookies or other credentials, by sending the credentials back to the hacker's own web server.
- The hacker could also gain control over the underlying system, based on the privileges of the user whose session cookie has been stolen.
- The hacker's text and script might be displayed to other people on any JIRA page which has a form. This is potentially damaging to your company's reputation.

Atlassian recommends that you upgrade to JIRA 3.13.3 to fix the vulnerabilities described below.

Risk Mitigation

We recommend that you upgrade or apply the necessary patch as soon as possible. If you judge it necessary, you can disable public access (i.e. anonymous access and public signup) to your JIRA system. For even tighter control, you could restrict JIRA access to trusted groups only.

Vulnerability

All versions of JIRA are vulnerable to this security flaw.

Fix

The fix is to upgrade the DWR library shipped with JIRA to version 2.0.3. This version of the DWR library does not have this security flaw.

This issue has been fixed in JIRA 3.13.3 or later. The fix is also provided as a patch for JIRA 3.12.3 and 3.11. There are no patches available for JIRA versions 3.10.x or earlier. Please see JIRA-16072 for further details.

Available JIRA Patches

**JIRA 3.12.3**

The patches for JIRA 3.12.3 are available in the file jra-16072-3.12.3-patch.zip

<table>
<thead>
<tr>
<th>Patch Zip File</th>
<th>jra-16072-3.12.3-patch.zip</th>
</tr>
</thead>
<tbody>
<tr>

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
JIRA 3.10.x and earlier

There are no patches available for JIRA versions 3.10.x or earlier. We recommend that you upgrade to at least JIRA 3.11.

XSS vulnerability in various JIRA parameters

Severity

Atlassian rates this vulnerability as **HIGH**, according to the scale published in the JIRA Security documentation. This scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a number of security flaws which may affect JIRA instances in a public environment. The flaws are all XSS (cross-site scripting) vulnerabilities in various JIRA parameters. Each vulnerability potentially allows a malicious user (hacker) to embed their own JavaScript into a JIRA page.

- The hacker might take advantage of this flaw to steal other users' session cookies or other credentials, by sending the credentials back to the hacker's own web server.
- The hacker could also gain control over the underlying system, based on the privileges of the user whose session cookie has been stolen.

Atlassian recommends that you upgrade to JIRA 3.13.3 to fix the vulnerabilities described below.

You can read more about XSS attacks at [cgisecurity](http://cgisecurity), [CERT](http://cert) and other places on the web.

Risk Mitigation

If you judge it necessary, you can disable public access (i.e. anonymous access and public signup) to your JIRA system until you have applied the necessary patch or upgrade. For even tighter control, you could restrict JIRA access to trusted groups only.

Vulnerability

A hacker can inject their own JavaScript into various JIRA parameters, described in the table below. If rogue JavaScript is injected into a parameter of a URL, the JavaScript will be executed when a user invokes the URL for the page.

<table>
<thead>
<tr>
<th>JIRA page</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>lazyLoader</code> (portlet loader)</td>
<td>portletId</td>
</tr>
<tr>
<td><code>CreateIssueDetails.jspa</code></td>
<td>dueDate</td>
</tr>
<tr>
<td><code>EditIssue.jspa</code></td>
<td>dueDate</td>
</tr>
<tr>
<td><code>jira.issueviews:searchrequest-fullcontent</code></td>
<td>sorter/field, sorter/order</td>
</tr>
<tr>
<td><code>jira.issueviews:searchrequest-printable</code></td>
<td>sorter/order</td>
</tr>
</tbody>
</table>

For more information, please see [JRA-16369](http://jira.atlassian.com/browse/JRA-16369).

Fix

The fix is to HTML-encode the vulnerable parameters to prevent scripts from being executed from them.

This issue has been fixed in JIRA 3.13.3 only. There are no patches available for previous versions of JIRA, for this fix.
Security Vulnerabilities — JIRA Plugins

JIRA Charting Plugin XSS Security Hole

Severity

Atlassian rates this vulnerability as **HIGH**, according to the scale published in the JIRA Security documentation. This scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed two security flaws in the **JIRA Charting plugin** which may affect JIRA instances in a public environment that use this plugin. These flaws are XSS vulnerabilities in view actions for the JIRA Charting plugin. This potentially allows a malicious user (hacker) to hack the URL to insert special JavaScript. A hacker could present the hacked URL to users (e.g. disguised in an email). If any users click the URL, the special JavaScript would be executed in the user's session.

- The hacker might take advantage of this flaw to steal other users' session cookies or other credentials, by sending the credentials back to the hacker's own web server.
- The hacker could also gain control over the underlying system, based on the privileges of the user whose session cookie has been stolen.
- The hacker's text and script might be displayed to other people on any JIRA page which has a form. This is potentially damaging to your company's reputation.

Atlassian recommends that you upgrade your JIRA Charting plugin to **version 1.4.1** to fix the vulnerabilities described below.

Risk Mitigation

We recommend that you upgrade your JIRA Charting plugin as soon as possible. If you judge it necessary, you can disable public access (i.e. anonymous access and public signup) to your JIRA system. For even tighter control, you could restrict JIRA access to trusted groups only.

Vulnerability

JIRA instances that use the JIRA Charting plugin (any version) are vulnerable to this security flaw.

Fix

The fix is to HTML encode the appropriate values in the JIRA Charting plugin actions. Please see JCHART-256 and JCHART-257 for further details.

This issue has been fixed in the **JIRA Charting plugin 1.4.1** or later. Please see the plugin page to check compatibility with your JIRA version.

Please let us know what you think of the format of this security advisory and the information we have provided.

JIRA Security Advisory 2010-04-16

Several security vulnerabilities have been exposed on JIRA. Please refer to this document before proceeding to determine if your system has been compromised.

In this advisory:

- Privilege Escalation Vulnerabilities
  - Severity
  - Risk Assessment
  - Risk Mitigation
  - Vulnerability
  - Fix
- XSS Vulnerabilities in JIRA
  - Severity
Privilege Escalation Vulnerabilities

Severity

Atlassian rates these vulnerabilities as **critical**, according to the scale published in [Severity Levels for Security Issues](#). The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed several privilege escalation vulnerabilities, which may affect JIRA instances. These vulnerabilities have security implications and are especially important for anyone running publicly accessible instances of JIRA.

An attacker, who has gained administrator access to a JIRA instance, could set the attachment, index or backup paths to a location within the JIRA web application directory. Once this has been done, the attacker can upload malicious code that can execute in the context of the user running the application server in which JIRA is deployed. The attacker could potentially modify JIRA's files and capture user credentials. If you have followed standard guidelines for hardening your application servers, then your instance should be less susceptible to this vulnerability.

The JIRA web application directory is either the `atlassian-jira` subdirectory (for JIRA Standalone installations) or the `webapps` subdirectory for JIRA WAR installations on Tomcat. For other application servers, please consult that application server's relevant documentation for discovering the web application directory.

Risk Mitigation

We strongly recommend either upgrading or patching your JIRA installation to fix these vulnerabilities. Please see the 'Fix' section below.

We also strongly recommend that you secure your JIRA instance by following these instructions, even if you are not in a position to apply the patches immediately.

Vulnerability

All versions of JIRA are affected by these privilege escalation vulnerabilities.

As a consequence of these security fixes, the following changes to JIRA's behaviour have occurred.

- **JIRA now recognises a new variable called** `jira.paths.set.allowed` **in the** `jira-application.properties` **file that collectively enables or disables the following capabilities through the JIRA user interface:**
  - Setting the attachments directory
  - Setting the indexing directory
  - Setting the backup directory for the backup service
  - Restoring XML data from a JIRA XML backup
  - Setting the directory in the "Create issues from local files" service
  - Viewing the list of administrators through the "Contact Administrators" link in the footer.

  **On initial application of this patch, the** `jira.paths.set.allowed` **property will not be present in this file and all settings above will be disabled by default. We recommend that this property be absent from your** `jira-application.properties` **file if it is present, set its value to false.**

- **JIRA now recognises another new variable called** `jira.paths.safe.backup.path` **in the** `jira-application.properties` **file which specifies a safe path for XML backup. This property only applies to the 'Backup Data to XML' function and not the scheduled backup service. If the property is not present,**
'Backup Data to XML' will not be allowed. The file name specified in the user interface will be appended to the safe path and used to determine the destination of the backup file. Please ensure that the safe path is separate from your web application directory.

On initial application of this patch, the `jira.paths.safe.backup.path` property will not be present in this file.

- System logs and customer data from generated support requests have been removed. The automatically generated support request sent to Atlassian will no longer include system logs and the XML backup.

Fix

These issues have been fixed in JIRA 4.1.1 and later.

These fixes are also provided as a patch for JIRA 4.1 and previous versions of JIRA. See Available Patches (below) for the complete list of available patches.

These patches are also available from JIRA issue JIRA-21004. These patches also address the XSS vulnerabilities described below.

In addition to patching your instance, we strongly recommend that you also review these instructions on securing your JIRA instance (and any other web application).

### XSS Vulnerabilities in JIRA

#### Severity

Atlassian rates these vulnerabilities as **critical**, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank a vulnerability as critical, high, moderate or low.

#### Risk Assessment

We have identified and fixed several cross-site scripting (XSS) vulnerabilities in JIRA, which may affect JIRA instances. These vulnerabilities have security implications and are especially important for anyone running publicly accessible instances of JIRA.

- The attacker might take advantage of the vulnerability to steal other users' session cookies or other credentials, by sending the credentials back to the attacker's own web server.
- The attacker's text and script might be displayed to other people viewing a JIRA page. This is potentially damaging to your company's reputation.

You can read more about XSS attacks at cgisecurity, CERT and other places on the web.

#### Risk Mitigation

We strongly recommend either upgrading or patching your JIRA installation to fix these vulnerabilities. Please see the 'Fix' section below.

We also strongly recommend that you secure your JIRA instance by following these instructions, even if you are not in a position to apply the patches immediately.

#### Vulnerability

All versions of JIRA are affected by these XSS vulnerabilities.

An attacker can inject their own JavaScript into the JIRA components listed in the table below. Each of the actions is invoked when a user performs a specific function in JIRA, such as clicking a link or a button. The actions can also be invoked by simply entering the URL into the browser address bar. The rogue JavaScript will be executed when a user invokes the URL.

<table>
<thead>
<tr>
<th>JIRA page</th>
<th>Routes of XSS attack</th>
</tr>
</thead>
<tbody>
<tr>
<td>Colour Picker (colorpicker.jsp)</td>
<td>XSS code injection into the 'element' or 'defaultColor' URL parameters.</td>
</tr>
<tr>
<td>User Picker</td>
<td>XSS code injection into the 'formName' or 'element' URL parameters. The full name field is another route, in which XSS scripts in this field can be executed when a user views its field content via the User Picker.</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Group Picker</td>
<td>XSS code injection into the 'formName' or 'element' URL parameter. The group name field is another route, in which code in this field can be executed when a user views its field content via the Group Picker.</td>
</tr>
<tr>
<td>Announcement Banner Preview</td>
<td>If the URL parameter 'announcement_preview_banner_st' is appended to the URL for most pages in JIRA, it is a potential route for exploitation by XSS scripts.</td>
</tr>
<tr>
<td>Support-related JSP pages</td>
<td>The following JSP pages can be exploited by XSS scripts. We have disabled these pages in JIRA and they are no longer available.</td>
</tr>
<tr>
<td>runportleterror.jsp</td>
<td>XSS code injection into the 'portletKey' URL parameter.</td>
</tr>
<tr>
<td>issuelinksmall.jsp</td>
<td>XSS scripts appended to the end of the URL.</td>
</tr>
<tr>
<td>screenshot-redirecter.jsp</td>
<td>XSS code injection into the 'afterURL' URL parameter.</td>
</tr>
<tr>
<td>500page.jsp</td>
<td>XSS code injection into the 'Referrer' HTTP request header.</td>
</tr>
</tbody>
</table>

**Fix**

These issues have been fixed in JIRA 4.1.1 and later.

These fixes are also provided as a patch for JIRA 4.1 and previous versions of JIRA. See Available Patches (below) for the complete list of available patches.

These patches are also available in JIRA issue JRA-21004. The patches also address the privilege escalation vulnerabilities described above.

In addition to patching your instance, we strongly recommend that you also review these instructions on securing your JIRA instance (and any other web application).

**Available Patches**

The available patches address both the Privilege Escalation and XSS Vulnerabilities. They can be obtained from JRA-21004, or directly downloaded from the table below. To install the patch, please follow the instructions in the patch file.

The patches below override the patches previously available at JRA-20994 and JRA-20995. We have incorporated both patches into one. Please ensure that you install this unified patch regardless of whether you have previously applied patches at JRA-20994 or JRA-20995 as it contains additional improvements. You do not need to uninstall previous patches.
Overview

1. Check for modified files on the server
2. Check your access logs for the attack vectors
   - 2.1 Administrative setting changes from unknown IP addresses
   - 2.2 Check for an unusually large number of login attempts
   - 2.3 Cross-Site Scripting attacks
3. Verify the integrity of existing JIRA administrator accounts
Additional Resources
If you suspect that your JIRA instance has been compromised

On this page:

Security Addendum 2010-04-16 - Determining if your public JIRA instance has been compromised

Several security vulnerabilities have been exposed on JIRA. Please refer to this page to determine if your system has been compromised.

This information only applies to JIRA instances accessible from the Internet.
If you are an Atlassian JIRA Studio or Hosted customer, we have assessed that your system is secure and implemented additional protections for it.

Overview

In April 2010, some public JIRA sites were attacked via security vulnerabilities in JIRA. This document provides instructions on how to determine if your JIRA instance has been compromised. Please refer to the JIRA Security Advisory 2010-04-16 for more information about these vulnerabilities and patching your JIRA instances.

The attacker would require web access to your JIRA instance. If your JIRA instance is behind a firewall and you are maintaining usual security measures to restrict external access to this JIRA instance (for example, removing user accounts of individuals who no longer require access to it), then there is low risk of your JIRA instance being attacked.

If your JIRA instance was compromised, the attacker would have initially gained administrative privileges via an XSS attack or by successfully discovering a JIRA administrator’s password. Once the system is compromised, the attacker would be able to read and modify files and database information.
To determine if your JIRA instance has been compromised, please do the following:

1. Check the server running JIRA for recently modified files
2. Check your access logs for the attack vectors
3. Verify the integrity of existing JIRA administrator accounts

1. Check for modified files on the server

Running the following command in UNIX-based systems (for example, Linux and Mac OS X) will show all files modified in the last fifteen days:

```
find /path/to/JIRA -mtime -15
```

On Windows, you can search for files using the graphical search utility:

Check for any files in the JIRA installation that have not been modified by you or one of your known administrators within this time period.

The files which are likely to have been affected by these attacks include the following:

- a modified WEB-INF/web.xml file, such as the addition of new servlet filters
- newly added or modified JAR files in WEB-INF/lib/
- newly added JSP files at various places inside the web application
- newly added GIF files in /images/

This information only refers to known exploits. You should check all modified files in the web application, including files for which you do not have records of having changed and compare them to an unmodified copy of a JIRA distribution, such as one downloaded from the Atlassian website.

If you need more information, please contact Atlassian support using the Get Support link below.

2. Check your access logs for the attack vectors

JIRA does not keep access logs unless you have manually configured it. However, many web servers like Apache HTTPD are set up to capture access logs by default. If your web server or application server or JIRA has been configured to generate access logs, you can use these logs to check for the access patterns below.

To check for patterns in access logs on Unix-based systems (e.g. Linux, Mac OS X), you can use the `grep` tool on one or more files:
grep 'search-string' *.log

To check for patterns in access logs on Windows, you can use the `findstr` tool on the command line:

`findstr "search-string" *.log`

### 2.1 Administrative setting changes from unknown IP addresses

The attacker may have modified the attachment directory configured in the JIRA administration area. To check for access to the vulnerable settings pages, search the access logs for:

- `secure/admin/EditAttachmentSettings`
- `secure/admin/IndexReIndex`
- `secure/admin/EditService`
- `secure/admin/XmlBackup`
- `secure/admin/XmlRestore`
- `secure/admin/JiraSupportRequest`

Below is an example of access logs which contain changes to the attachment settings on a JIRA instance.

```
... ...
xxx.xxx.xxx.xxx - - [xx/Apr/2010:00:00:00 -0500] "GET /secure/admin/jira/EditAttachmentSettings!default.jspa HTTP/1.1" 200 7259 "-" "-" 518092
xxx.xxx.xxx.xxx - - [xx/Apr/2010:00:00:00 -0500] "POST /secure/admin/jira/EditAttachmentSettings.jspa HTTP/1.1" 302 20 "-" "-" 50425
xxx.xxx.xxx.xxx - - [xx/Apr/2010:00:00:00 -0500] "GET /secure/admin/jira/EditAttachmentSettings!default.jspa HTTP/1.1" 200 7288 "-" "-" 53665
xxx.xxx.xxx.xxx - - [xx/Apr/2010:00:00:00 -0500] "POST /secure/admin/jira/EditAttachmentSettings.jspa HTTP/1.1" 302 20 "-" "-" 13190
... ...
```

If you need more information, please contact Atlassian support using the [Get Support](https://www.atlassian.com/support) link below.

### 2.2 Check for an unusually large number of login attempts

It is possible that administrative access may have been gained via a brute-force attack. To get a list of all login attempts, search the access logs for:

- `/login.jsp`

Evidence of such an attack will look like this in the access logs where the timestamps between requests are very close together and the number of attempts is extremely high:
If you need more information, please contact Atlassian support using the Get Support link below.

2.3 Cross-Site Scripting attacks

Cross-Site Scripting (XSS) attacks were attempted on sites at Apache. These XSS attacks were attempts to steal other users' session cookies or other credentials, by sending the credentials back to the attacker's own web server.

For more information about XSS attacks, please refer to the relevant articles on the cgisecurity, CERT websites.

If XSS attacks have occurred on your JIRA instance, the following strings may be present in your access logs:

- `<script`%
- `</script>`
- `document.cookie`
- `document.write`
- `window.location`

More advanced patterns to identify XSS requests (and those of other injection-type attacks) from access logs can be found on Symantec's Detection of SQL Injection and Cross-site Scripting Attacks.

If you need more information, please contact Atlassian support using the Get Support link below.

3. Verify the integrity of existing JIRA administrator accounts

The attacker could gain administration access via a brute-force attack to determine an administrator's password. Once access is gained, a number of different actions could be performed, including:

- The addition of a new administrative account
- Modification of an existing user account's email address or password and subsequent use of that account

You should check that all emails are valid and that all administrator accounts are known users.

If you need more information, please contact Atlassian support using the Get Support link below.

Additional Resources
If you suspect that your JIRA instance has been compromised

If you suspect your JIRA instance has been compromised we strongly recommend involving your local security team for further investigation. Atlassian is happy to review your customer log files and provide an opinion on whether your system has been compromised. To request this please file a support request via http://support.atlassian.com/.

Please note, however, that the final determination of whether your JIRA instance has been compromised and what actions to take as a result remains with you the customer.

If it is determined that your JIRA instance has been compromised, our advice is to immediately shut down JIRA and disconnect the server from the network/Internet. Also, you may want to immediately shut down any other systems which potentially share a userbase or have common username/password combinations with the compromised system. Do not apply the patch described in JIRA Security Advisory 2010-04-16 until you have worked with your local security team to identify the scope of the breach and your recovery options.

Security Addendum 2010-04-16 - Preventing security attacks

In April 2010, JIRA sites were attacked via security vulnerabilities in JIRA. These vulnerabilities will be fixed in JIRA 4.1.1, and patches are available for earlier versions of JIRA.

For more information:

- about these vulnerabilities and patching your JIRA instance, see JIRA Security Advisory 2010-04-16
- on how to determine whether your public JIRA instance has been compromised please refer to the detection guide.

Note: If you are an Atlassian JIRA Studio or Hosted customer, we have assessed that your system is secure and implemented additional protections for it.

To the best of our knowledge, the following guidelines will help prevent attacks of the kind recently experienced.

1. Use Strong Passwords
   1.1 Administrators should use Strong Passwords
   1.2 Administrators should have Different Passwords for Different Systems
2. Apply JIRA Security Patches
3. Protect Against Brute Force Attack
   3.1 Upgrade to JIRA 4.1
   3.2 Enable Brute Force Login Protection on your Web Server
4. Restrict Network Access to Administrative Sections of Applications
5. Restrict File System Access by the Application Server
6. Disable Jelly

1. Use Strong Passwords

   1.1 Administrators should use Strong Passwords

   All your JIRA administrators, JIRA system administrators and administrators of all Atlassian products should have strong passwords. Ask your administrators to update their passwords to strong passwords.

   Do not use passwords that are dictionary words. Use mixed-case letters, numbers and symbols for your administrator passwords and make sure they are sufficiently long (e.g. 14 characters). We encourage you to refer to the Strong Password Generator for guidelines on selecting passwords.

   Using strong passwords greatly increases the time required by an attacker to retrieve your passwords by brute force, making such an attack impractical.

   1.2 Administrators should have Different Passwords for Different Systems

   As well as choosing a strong password, administrators should have different strong passwords for different systems.

   This will reduce the impact the attacker can have if they do manage to obtain administrator credentials on one of
2. Apply JIRA Security Patches

Apply the patches found in JIRA Security Advisory 2010-04-16 for your version of JIRA.

These patches protect JIRA from recently detected privilege escalation and XSS vulnerabilities.

3. Protect Against Brute Force Attack

You can also actively protect your systems against repeated unsuccessful login attempts, known as "brute force" login attacks.

3.1 Upgrade to JIRA 4.1

JIRA 4.1 contains built-in protection for brute force attacks by displaying a CAPTCHA after a number of failed authentication attempts.

3.2 Enable Brute Force Login Protection on your Web Server

It is possible to also enable brute force login protection on your web server by detecting repeated authentication failures in application logs. Once repeated login failures have been detected, you can set up an automated system to ban access to your web server from that particular IP address.

For more information on how to configure an automated approach to this kind of login prevention, refer to Using Fail2Ban to limit login attempts.
4. Restrict Network Access to Administrative Sections of Applications

An Atlassian application's administration interface is a critical part of the application; anyone with access to it can potentially compromise not only the application instance but the entire machine. As well as limiting access to only users who really need it, and using strong passwords, you should consider limiting access to it to certain machines on the network.

For more information on how to implement Apache blocking rules to restrict access to administrative or sensitive actions in:

- JIRA, refer to Using Apache to Limit Access to the JIRA Administration Interface
- Confluence, refer to Using Apache to limit access to the Confluence administration interface

You can use a similar approach to protecting all Atlassian applications.

5. Restrict File System Access by the Application Server

The application server (e.g. Tomcat) runs as a process on the system. This process is run by a particular user and inherits the file system rights of that particular user. By restricting the directories that can be written to by the application server user, you can limit unnecessary exposure of your file system to the application.

For example, ensure that only the following directories can be written to by JIRA's application server:

- The following subdirectories of your JIRA Installation Directory for 'recommended' JIRA distributions (or JIRA WAR distributions, the installation directory of the Apache Tomcat application running JIRA):
  - logs
  - temp
  - work
- Your JIRA Home Directory.

For detailed instructions, please see Tomcat security best practices.

6. Disable Jelly

Jelly is disabled in JIRA by default. If you need to use Jelly, you should enable it immediately prior to use and disable it immediately afterwards. See the JIRA Jelly Tags documentation for details.

**JIRA Security Advisory 2010-06-18**

In this advisory:

- XSS Vulnerabilities in URL Query Strings
- JIRA Standalone Vulnerability with Session Cookies
- Users without the 'JIRA Users' Permission can Login via Crowd Single Sign On
- XSRF Vulnerability in 'Logout' Action
- Security Vulnerabilities in FishEye Plugin
- Security Vulnerabilities in Bamboo Plugin

**XSS Vulnerabilities in URL Query Strings**

**Severity**

Atlassian rates these vulnerabilities as **critical**, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank a vulnerability as critical, high, moderate or low.

**Risk Assessment**

We have identified and fixed several cross-site scripting (XSS) vulnerabilities in JIRA, which may affect JIRA instances. These vulnerabilities have security implications and are especially important for anyone running publicly accessible instances of JIRA.

- An attacker might take advantage of the vulnerability to steal other users' session cookies or other credentials, by sending the credentials back to the attacker's own web server. The attacker could potentially then gain control over the underlying JIRA system and/or the underlying operating system, based on the privileges of the user whose credentials had been stolen.
- The attacker's text and script might be displayed to other people viewing a JIRA page. This is potentially damaging to your company's reputation.

You can read more about XSS attacks at cgisecurity, CERT and other places on the web.
Vulnerability

Some values from JIRA URLs were not correctly HTML-escaped, potentially enabling an attacker to add scripts to another user's response.

Risk Mitigation

We strongly recommend upgrading your JIRA installation to fix these vulnerabilities. Please see the 'Fix' section below.

Fix

These issues have been fixed in JIRA 4.1.2 and later. If you absolutely cannot upgrade, a patch that has been tested on JIRA 4.0.2 is available on the following holding bug: http://jira.atlassian.com/browse/JRA-21624

JIRA Standalone Vulnerability with Session Cookies

Severity

Atlassian rates this vulnerability as high, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and incorporated an enhancement in JIRA Standalone distributions in the handling of session cookies. This has security implications which are especially important for anyone running publicly accessible instances of JIRA.

- An attacker might take advantage of this vulnerability to steal other users' session cookies, by sending the session ID credentials contained within them back to the attacker's own web server. The attacker could potentially then gain control over the underlying JIRA system and/or the underlying operating system, based on the privileges of the user whose credentials had been stolen.

Vulnerability

If an attacker makes a successful XSS attack, this vulnerability could allow the attacker to use JavaScript to access the session ID contained within a session cookie.

Risk Mitigation

We recommend upgrading your JIRA installation to fix this vulnerability. Please see the 'Fix' section below.

Fix

Cookies are now set to 'HttpOnly' in the Standalone distributions of JIRA 4.1.2 and later. 'HttpOnly' session cookies dramatically reduce the likelihood of privilege escalation through XSS attack vectors. Therefore, please upgrade to this version of JIRA to mitigate this risk.

If you are running a JIRA EAR-WAR distribution or an earlier version of JIRA, please refer to the Preventing Security Attacks guide for information on how to implement 'HttpOnly' session cookies with specific examples for configuring Tomcat version 5.5.27+.

Users without the 'JIRA Users' Permission can Login via Crowd Single Sign On

Severity

Atlassian rates this vulnerability as high, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a vulnerability in JIRA, relating to login permission. This vulnerability has security implications and is especially important for anyone running publicly accessible instances of JIRA.

- A user might take advantage of the vulnerability to login to a JIRA instance which they are not authorised to view.
Vulnerability

This vulnerability only relates to JIRA instances that are connected to Atlassian Crowd and are using Crowd Single Sign On (SSO).

When JIRA is using the Crowd connector and Crowd SSO, a user who doesn't have the 'JIRA Users' permission can log in to JIRA using Crowd SSO.

Project-specific permissions are still enforced, so the user would only be able to see unsecured projects (that is, projects which 'Anyone' can view).

Risk Mitigation

We strongly recommend upgrading your JIRA installation to fix this vulnerability. Please see the 'Fix' section below.

Fix

This issue has been fixed in JIRA 4.1.2 and later. If you absolutely cannot upgrade, you can try replacing the crowd-integration-client-1.6.1.jar located in the <root-dir>/WEB-INF/lib directory with the newer version that comes with JIRA 4.1.2, namely crowd-integration-client-2.0.4.jar. Although this configuration has not been subjected to Atlassian's quality assurance processes, we believe the upgrade of that library should work and will fix this security bug. Customers who absolutely cannot upgrade to JIRA 4.1.2 who have any trouble with this should raise a support request at https://support.atlassian.com/ for help.

XSRF Vulnerability in 'Logout' Action

Severity

Atlassian rates this vulnerability as high, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed an XSRF (cross-site request forgery) vulnerability in JIRA, relating to the Logout action.

- An attacker might take advantage of the vulnerability to force logout. This could be used for a DOS (denial of service) attack.

You can read more about XSRF attacks at cgisecurity.

Vulnerability

An attacker could insert malicious text into an issue, which would force logout for any user who viewed that issue.

Risk Mitigation

We strongly recommend upgrading your JIRA installation to fix this vulnerability. Please see the 'Fix' section below.

Fix

This issue has been fixed in JIRA 4.1.2 and later.

Security Vulnerabilities in FishEye Plugin

Severity

Atlassian rates these vulnerabilities as critical, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

Please see the JIRA FishEye Plugin Security Advisory 2010-06-18 for details.
Vulnerability
These vulnerabilities relate to the JIRA FishEye Plugin, which is bundled with JIRA. Only JIRA instances where the JIRA FishEye Plugin is enabled are affected.

Risk Mitigation
We strongly recommend upgrading your JIRA installation (or this plugin) to fix this vulnerability. Please see the 'Fix' section below.

Fix
These issues have been fixed in JIRA 4.1.2 and later. Upgrading to this version of JIRA will fix these vulnerabilities.

Alternatively, if you are running JIRA 4.1 or 4.1.1 and cannot upgrade JIRA to version 4.1.2 immediately, you can fix these vulnerabilities by upgrading the FishEye plugin. Otherwise, you can disable the JIRA FishEye plugin via the JIRA administration interface.

Security Vulnerabilities in Bamboo Plugin

Severity
Atlassian rates these vulnerabilities as critical, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment
Please see the JIRA Bamboo Plugin Security Advisory 2010-06-18 for details.

Vulnerability
These vulnerabilities relate to the JIRA Bamboo Plugin, which is bundled with JIRA. Only JIRA instances where the JIRA Bamboo Plugin is enabled are affected.

Risk Mitigation
We strongly recommend upgrading your JIRA installation (or this plugin) to fix this vulnerability. Please see the 'Fix' section below.

Fix
These issues have been fixed in JIRA 4.1.2 and later. Upgrading to this version of JIRA will fix these vulnerabilities.

Alternatively, if you are running a version of JIRA from 4.0 to 4.1.1 (inclusive) and cannot upgrade JIRA to version 4.1.2 immediately, you can fix these vulnerabilities by upgrading the Bamboo plugin. Otherwise, you can disable the JIRA Bamboo plugin via the JIRA administration interface.

JIRA Security Advisory 2010-12-06

In this advisory:
- XSS Vulnerabilities in URL Query Strings
- XSRF Vulnerabilities
- Vulnerability in Secure Tokens
- Vulnerability in Component Data

XSS Vulnerabilities in URL Query Strings

Severity
Atlassian rates these vulnerabilities as high, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment
We have identified and fixed a number of cross-site scripting (XSS) vulnerabilities which may affect JIRA instances. These vulnerabilities have security implications and are especially important for anyone running publicly accessible instances of JIRA. XSS vulnerabilities allow an attacker to embed their own JavaScript into a JIRA page. You can read more about XSS attacks at cgisecurity, the Web Application Security Consortium and other places on the web.

Vulnerability

Some values from JIRA URLs were being injected directly into JavaScript, potentially enabling an attacker to add scripts to another user's response.

All versions of JIRA prior to 4.2.1 are affected.

Risk Mitigation

We strongly recommend upgrading your JIRA installation to fix these vulnerabilities. Please see the 'Fix' section below.

Fix

These issues have been fixed in JIRA 4.2.1 and later, and are available as a patch for JIRA 3.13.5, 4.0.2 and 4.1.2 (please see JRA-22493).

XSRF Vulnerabilities

Severity

Atlassian rates this vulnerability as high, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed several cross-site request forgery (XSRF/CSRF) vulnerabilities in JIRA. These vulnerabilities have security implications and are especially important for anyone running publicly accessible instances of JIRA.

- An attacker might take advantage of the vulnerability to fraudulently act on behalf of a legitimate user.

You can read more about XSRF/CSRF attacks at cgisecurity, wikipedia and other places on the web.

Vulnerability

Some JIRA administration screens did not have XSRF protection. A targeted attack on a vulnerable system could result in an attacker gaining access to user credentials, potentially giving them access to the JIRA data and system.

All versions of JIRA prior to 4.2.1 are affected.

Risk Mitigation

We strongly recommend upgrading your JIRA installation to fix these vulnerabilities. Please see the 'Fix' section below.

Fix

JIRA's XSRF protection has been extended to cover previously unprotected areas. The known XSRF issues have been fixed in JIRA 4.2.1 and later, and are available as a patch for JIRA 3.13.5, 4.0.2 and 4.1.2 (please see JRA-22493).

Vulnerability in Secure Tokens

Severity

Atlassian rates this vulnerability as moderate, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank a vulnerability as critical, high, moderate or low.
Risk Assessment

We have identified and fixed a vulnerability relating to the creation of secure tokens, which are used in various authentication mechanisms. These vulnerabilities have security implications and are especially important for anyone running publicly accessible instances of JIRA.

- Unauthorised users may be able to gain access to JIRA on behalf of a legitimate user.

Vulnerability

A highly skilled attacker could potentially forge a secure token, allowing them to impersonate a legitimate user. All versions of JIRA prior to 4.2 are affected.

Risk Mitigation

We strongly recommend upgrading your JIRA installation to fix this vulnerability. Please see the ‘Fix’ section below.

Fix

This issue has been fixed in JIRA 4.2 and later. The random number-generator that is used to generate tokens has been hardened.

Vulnerability in Component Data

Severity

Atlassian rates this vulnerability as low, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank a vulnerability as critical, high, moderate or low.

Risk Assessment

We have identified and fixed a data vulnerability in JIRA. This vulnerability has security implications and is especially important for anyone running publicly accessible instances of JIRA.

- Unauthorised users may be able to view a list of components defined in your JIRA system.

Vulnerability

Component data could be view by unauthorised users. All versions of JIRA prior to 4.2 are affected.

Risk Mitigation

We strongly recommend upgrading your JIRA installation to fix this vulnerability. Please see the ‘Fix’ section below.

Fix

This issue has been fixed in JIRA 4.2 and later.

JIRA Security Advisory 2011-02-21

This advisory announces a security vulnerability that has been found in all versions of JIRA prior to 4.2.2 and fixed in 4.2.2 and later versions. Enterprise Hosted customers should request an upgrade by filing a ticket at http://support.atlassian.com. JIRA Studio is not vulnerable to any of the issues described in this advisory.

Atlassian is committed to improving product security. The vulnerability listed in this advisory has been discovered by Atlassian, unless noted otherwise. The reporter may also have requested that we do not credit them.

If you have questions or concerns regarding this advisory, please raise a support request at http://support.atlassian.com/.

In this advisory:
Parameter-Based Redirection Vulnerability

Severity

Atlassian rates this vulnerability as **high**, according to the scale published in *Severity Levels for Security Issues*. The scale allows us to rank a vulnerability as critical, high, moderate or low. This vulnerability is **not** critical.

This is an independent assessment and you should evaluate its applicability to your own IT environment.

Risk Assessment

Parameter-based redirection vulnerabilities allow an attacker to craft a JIRA URL in such a way that a user clicking on this URL will be redirected to a different web site. This can be used for phishing.

You can read more about link manipulation attacks at [Wikipedia](https://en.wikipedia.org/wiki/Link_manipulation), and about phishing at [Fraud.org](https://www.fraud.org) and other places on the web.

Vulnerability

Some actions in JIRA redirect users to a new page after the action has been completed. It was possible to hand-craft an URL that would redirect to a site outside the current instance of JIRA. Starting with JIRA 4.2.2 all such redirections are limited to pages inside the current instance of JIRA.

All versions of JIRA prior to 4.2.2 are affected.

Risk Mitigation

We recommend upgrading your JIRA installation to fix this vulnerability. Please see the 'Fix' section below.

Fix

These issues have been fixed in **JIRA 4.2.2** and later.

Patches

We have created a patch for the latest maintenance release 4.1.2 of JIRA for this vulnerability.

Please note that we have released a number of advisories about JIRA recently. We recommend that you review them and upgrade to the most recent release of the product or apply external security controls if you cannot. Most of the disclosed vulnerabilities are not critical and often present less risk when used in a corporate environment with no access from the Internet.

We usually provide patches only for vulnerabilities of critical severity, as an interim solution until you can upgrade. You should not expect that you can continue patching your system instead of upgrading. Our patches are often non-cumulative – we do not recommend that you apply multiple patches from different advisories on top of each other, but strongly recommend to upgrade to the most recent version regularly.

**We recommend patching only when you can neither upgrade nor apply external security controls.**

JIRA Security Advisory 2011-09-27

This advisory announces a number of security vulnerabilities that we have found in versions 4.2.x - 4.3.x of JIRA and fixed in version 4.4 of JIRA. You need to upgrade your existing JIRA installations to fix these vulnerabilities. Enterprise Hosted customers should request an upgrade by filing a ticket at http://support.atlassian.com, in the 'Enterprise Hosting Project'. JIRA Studio is not vulnerable to any of the issues described in this advisory.

Atlassian is committed to improving product security. The vulnerabilities listed in this advisory have been discovered by Atlassian, unless noted otherwise. The reporter may also have requested that we do not credit them.

If you have questions or concerns regarding this advisory, please raise a support request at http://support.atlassian.com.

In this advisory:
- XSS Vulnerabilities in Labelling and Issue Linking
- XSS Vulnerability in Administration Interface of JIRA Bamboo Plugin

XSS Vulnerabilities in Labelling and Issue Linking

Severity

Atlassian rates the severity level of this vulnerability as high, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank the severity as critical, high, moderate or low. This vulnerability is not critical.

This is an independent assessment and you should evaluate its applicability to your own environment.

Risk Assessment

We have identified and fixed several cross-site scripting (XSS) vulnerabilities which may affect JIRA instances. XSS vulnerabilities potentially allow an attacker to embed their own JavaScript into a JIRA page. The attacker needs to have a valid user account in order to exploit this vulnerability.

You can read more about XSS attacks at cgisecurity, the Web Application Security Consortium and other places on the web.

Vulnerability

Issue linking:
- The way issue summaries were rendered when displaying issue links allows arbitrary JavaScript execution.
- Versions of JIRA 4.2.x to 4.3.x prior to 4.4 are affected.

Labelling:
- Certain issue labels could be created containing JavaScript, which then could be rendered on other pages.
- Versions of JIRA 4.2.x to 4.3.x prior to 4.4 are affected.

Risk Mitigation

We strongly recommend upgrading your JIRA installation to fix these vulnerabilities. Please see the 'Fix' section below.

Fix

These vulnerabilities have been fixed in JIRA 4.4 and later versions.

For a full description of the latest version of JIRA, see the release notes. You can download the latest version of JIRA from the download centre.

If you cannot upgrade to the latest version of JIRA, you can temporarily patch your existing installation of JIRA 4.3.x or JIRA 4.2.x using the patches listed below. We strongly recommend upgrading and not patching.
Patches

If you are running JIRA 4.3.x, you can apply the following patch to fix these vulnerabilities.

<table>
<thead>
<tr>
<th>Vulnerability</th>
<th>Patch</th>
<th>Patch File Name</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linking and Labelling</td>

XSS Vulnerability in Administration Interface of JIRA Bamboo Plugin

Severity

Atlassian rates the severity level of this vulnerability as **high**, according to the scale published in [Severity Levels for Security Issues](https://confluence.atlassian.com/display/JIRA/Severity+Levels). The scale allows us to rank the severity as critical, high, moderate or low. This vulnerability is not critical.

This is an independent assessment and you should evaluate its applicability to your own environment.

Risk Assessment

We have identified and fixed a cross-site scripting (XSS) vulnerability which may affect JIRA instances. XSS vulnerabilities potentially allow an attacker to embed their own JavaScript into a JIRA page. The attacker does not need a valid user account in order to exploit this vulnerability.

You can read more about XSS attacks at [cgisecurity](https://cgisecurity.com), the [Web Application Security Consortium](https://www.wasc.org) and other places on the web.

Vulnerability

JIRA administration interface (Bamboo plugin):

- There is a non-persistent XSS vector in the JIRA administration interface related to managing JIRA Bamboo settings.
- Versions of JIRA 4.3.x are affected.

Risk Mitigation

We strongly recommend upgrading your JIRA installation to fix this vulnerability. Please see the ‘Fix’ section below.

Fix

This vulnerability has been fixed in **JIRA 4.4** and later versions.

For a full description of the latest version of JIRA, see the [release notes](https://confluence.atlassian.com/display/JIRA/Release+Notes). You can download the latest version of JIRA from the [download centre](https://www.atlassian.com/software/jira/downloads).

If you cannot upgrade to the latest version of JIRA, you can upgrade only the Bamboo Plugin in your existing installation of JIRA 4.3.x or JIRA 4.2.x using the patches listed below. We strongly recommend upgrading full JIRA instance instead of a single plugin.

Patches

If you are running JIRA 4.3.x, use the plugin manager to upgrade the Bamboo plugin to a version equal to or greater than that specified in the file name below. Both Bamboo Plugin 4.2.x and 4.3.x support JIRA 4.3.x, see the compatibility matrix at [Plugin Exchange](https://plugins.atlassian.com).
### JIRA Security Advisory 2012-05-17

This advisory discloses a **high severity** security vulnerability that exists in all versions of JIRA up to and including 5.0.0.

- **Customers who have downloaded and installed JIRA** should upgrade their existing JIRA installations to fix this vulnerability. We also provide a patch that you will be able to apply to existing installations of JIRA to fix this vulnerability. However, we recommend that you upgrade your complete JIRA installation rather than applying the patch.

- **Enterprise Hosted customers** need to request an upgrade by raising a support request at http://support.atlassian.com in the “Enterprise Hosting Support” project.

- **JIRA Studio and Atlassian OnDemand customers** are not affected by any of the issues described in this advisory.

Atlassian is committed to improving product security. The vulnerability listed in this advisory has been discovered by Atlassian, unless noted otherwise. The reporter may also have requested that we do not credit them.

If you have questions or concerns regarding this advisory, please raise a support request at http://support.atlassian.com.

### In this advisory:

- **High Severity XML Parsing Vulnerability**
  - **Severity**
  - **Description**
  - **Risk Mitigation**
  - **Fix**

High Severity XML Parsing Vulnerability

### Severity

Atlassian rates the severity level of this vulnerability as **high**, according to the scale published in **Severity Levels for Security Issues**. The scale allows us to rank the severity as critical, high, moderate or low. This vulnerability is **not** critical.

This is an independent assessment and you should evaluate its applicability to your own IT environment.

### Description

We have identified and fixed a vulnerability in JIRA that results from the way third-party XML parsers are used in JIRA. This vulnerability allows an attacker who is an authenticated JIRA user to execute denial of service attacks against the JIRA server.

---

<table>
<thead>
<tr>

Acknowledgement

Our thanks to Dave B, who reported one of the vulnerabilities in this advisory. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

---

**High Severity XML Parsing Vulnerability**

#### Severity

Atlassian rates the severity level of this vulnerability as **high**, according to the scale published in **Severity Levels for Security Issues**. The scale allows us to rank the severity as critical, high, moderate or low. This vulnerability is **not** critical.

This is an independent assessment and you should evaluate its applicability to your own IT environment.

#### Description

We have identified and fixed a vulnerability in JIRA that results from the way third-party XML parsers are used in JIRA. This vulnerability allows an attacker who is an authenticated JIRA user to execute denial of service attacks against the JIRA server.
All versions of JIRA up to and including 5.0.0 are affected by this vulnerability. This issue can be tracked here:

[JIRA-27719 - XML Vulnerability in JIRA | CLOSED]

The Tempo and Gliffy for JIRA plugins are also vulnerable to this exploit. If you are using these plugins with any version of JIRA, you will need to upgrade them (see ‘Fix’ section below) or disable them.

Risk Mitigation

We recommend that you upgrade your JIRA installation to fix this vulnerability.

Alternatively, if you are not in a position to upgrade immediately, you should disable public access (such as anonymous access and public signup) to your JIRA installation until you have applied the necessary patch or upgraded.

Fix

Upgrade (recommended)

1. Upgrade to JIRA 5.0.1 or later which fixes this vulnerability. For a full description of this release, see the JIRA 5.0.1 Release Notes. You can download this version of JIRA from the download centre.
2. Upgrade the following JIRA third-party plugins, if you are using them. The table below describes which version of the plugin you should upgrade to, depending on your JIRA version. See Managing JIRA’s Plugins for instructions on how to upgrade a plugin. In general, you should upgrade these plugins to the latest available version compatible with your version of JIRA.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>JIRA 5.0</th>
<th>JIRA 4.4</th>
<th>JIRA 4.3</th>
<th>JIRA 4.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gliffy plugin for JIRA</td>
<td>3.7.1</td>
<td>3.7.1</td>
<td>3.7.1</td>
<td>3.7.2</td>
</tr>
<tr>
<td>Tempo</td>
<td>7.0.3</td>
<td>6.5.0.2</td>
<td>6.4.3.1</td>
<td>6.4.3.1</td>
</tr>
</tbody>
</table>

Patches (not recommended)

We recommend patching only when you can neither upgrade nor apply external security controls. Patches are usually only provided for vulnerabilities of critical severity (as per our Security Patch Policy), as an interim solution until you can upgrade. You should not expect that you can continue patching your system instead of upgrading. Our patches are often non-cumulative – we do not recommend that you apply multiple patches from different advisories on top of each other, but strongly recommend upgrading to the most recent version regularly.

If for some reason you cannot upgrade to the latest version of JIRA, you must do all of the following steps to fix the vulnerability described in this security advisory.

1. Download the patch file for your version of JIRA. Note, the patches are only available for the point release indicated. If you are using an earlier point release for a major version, you must upgrade to the latest point release first.

<table>
<thead>
<tr>
<th>Version</th>
<th>Patch</th>
</tr>
</thead>
<tbody>
<tr>
<td>JIRA 4.4.5</td>
<td>patch-JIRA-27719-4.4.5-atlassian-bundled-plugins.zip</td>
</tr>
<tr>
<td>JIRA 4.3.4</td>
<td>patch-JIRA-27719-4.3.4-atlassian-bundled-plugins.zip</td>
</tr>
<tr>
<td>JIRA 4.2.4</td>
<td>patch-JIRA-27719-4.2.4-atlassian-bundled-plugins.zip</td>
</tr>
<tr>
<td>JIRA 4.1.2</td>
<td>patch-JIRA-27719-4.1.2-atlassian-bundled-plugins.zip</td>
</tr>
</tbody>
</table>

2. Update the following files in your JIRA installation, as described below.
   - JIRA:
     a. Shut down JIRA.
b. Replace $JIRA_INSTALL/atlassian-jira/WEB-INF/classes/atlassian-bundled-plugins.zip with the patch file downloaded in Step 1 above.

c. Delete the $JIRA_HOME/plugins/.bundled-plugins directory.

d. Restart JIRA.

- JIRA WAR:
  a. Replace $JIRA_WAR_INSTALL/webapp/WEB-INF/classes/atlassian-bundled-plugins.zip with the patch file downloaded in Step 1 above.
  b. Regenerate the WAR file.
  c. Shut down JIRA.
  d. Install the new WAR you generated.
  e. Delete the $JIRA_HOME/plugins/.bundled-plugins directory.
  f. Restart JIRA.

3. Upgrade the following JIRA third-party plugins, if you are using them. The table below describes which version of the plugin you should upgrade to, depending on your JIRA version. See Managing JIRA's Plugins for instructions on how to upgrade a plugin. In general, you should upgrade these plugins to the latest available version compatible with your version of JIRA.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>JIRA 5.0</th>
<th>JIRA 4.4</th>
<th>JIRA 4.3</th>
<th>JIRA 4.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gliffy plugin for JIRA</td>
<td>3.7.1</td>
<td>3.7.1</td>
<td>3.7.1</td>

<tr>
<td>Tempo</td>
<td>7.0.3</td>
<td>6.5.0.2</td>
<td>6.4.3.1</td>
<td>6.4.3.1</td>
</tr>
</tbody>
</table>

4. Verify that patches succeeded by checking plugin versions. Versions of Tempo and Gliffy are listed in the table above. For the JIRA patch (step 1 above) you need to verify the version of Atlassian REST plugin.

<table>

JIRA Security Advisory 2012-08-28

This advisory discloses security vulnerabilities that we have found in JIRA and fixed in a recent version of JIRA.

- Customers who have downloaded and installed JIRA should upgrade their existing JIRA installations to fix this vulnerability.

- Enterprise Hosted customers need to request an upgrade by raising a support request at http://support.atlassian.com in the “Enterprise Hosting Support” project.

- Atlassian OnDemand customers are not affected by any of the issues described in this advisory.

Atlassian is committed to improving product security. The vulnerability listed in this advisory has been discovered by Atlassian, unless noted otherwise. The reporter may also have requested that we do not credit.
Privilege escalation vulnerability

Severity

Atlassian rates the severity level of this vulnerability as **Critical**, according to the scale published in **Severity Levels for Security Issues**. The scale allows us to rank the severity as critical, high, moderate or low.

This is an independent assessment and you should evaluate its applicability to your own IT environment.

Description

We have identified and fixed a privilege escalation vulnerability that affects JIRA instances, including publicly available instances (that is, Internet-facing servers). This vulnerability allows an attacker to bypass administrator-only authorisation controls via specially crafted URLs. The attacker does not need to have an account on the affected JIRA server. As a result, the attacker will be able to execute a large number of administrative actions.

This vulnerability has been fixed in JIRA 5.0.7 and later. Patches are available for JIRA 4.3.4, 4.4.5 and 5.0.6. This issue can be tracked here: [JIRA-29403](http://jira.atlassian.com/browse/JIRA-29403).

Risk Mitigation

If you cannot upgrade immediately, you can disable public access to your JIRA instance. You can also turn on **Secure Administrator sessions** (also known as WebSudo) which will significantly reduce the number of actions available to an attacker. WebSudo does not completely mitigate this vulnerability, as it does not protect non-administrative actions.

Fix

Upgrade

The vulnerability and fix versions are described in the 'Description' section above.

We recommend that you upgrade to JIRA 5.0.7 or later. For a full description of the latest version of JIRA, see the **release notes**. You can download the latest version of JIRA from the [download centre](http://www.atlassian.com/software/jira/download).

If you cannot upgrade to the latest version of JIRA, you can temporarily patch your existing installation using the patch listed below. We strongly recommend upgrading and not patching.

### Patches

</tbody>
</table>

Instructions on how to apply patches are listed in the table above.

---

If you have questions or concerns regarding this advisory, please raise a support request at [http://support.atlassian.com/](http://support.atlassian.com/).
XSS Vulnerabilities

**Severity**

Atlassian rates the severity level of these vulnerabilities as **High**, according to the scale published in *Severity Levels for Security Issues*. The scale allows us to rank the severity as critical, high, medium or low. This is an independent assessment and you should evaluate its applicability to your own IT environment. These vulnerabilities are **not** of Critical severity.

**Description**

We have identified and fixed nine cross-site scripting (XSS) vulnerabilities that affect JIRA instances, including publicly available instances (that is, Internet-facing servers). XSS vulnerabilities allow an attacker to embed their own JavaScript into a JIRA page.

You can read more about XSS attacks at [cgisecurity.com](http://www.cgisecurity.com), [The Web Application Security Consortium](http://www.wasc.org) and other places on the web.

These vulnerabilities affect JIRA 4.2 and above, and have been fixed in JIRA 5.1.1. This issue can be tracked here: [JIRA-29402 - Cross-Site Scripting Vulnerabilities](https://issues.atlassian.com/browse/JIRA-29402) - RESOLVED

**Risk Mitigation**

We strongly recommend upgrading your JIRA installation to fix these vulnerabilities. Please see the 'Fix' section below.

**Fix**

**Upgrade**

The vulnerabilities and fix versions are described in the 'Description' section above.

We recommend that you upgrade to JIRA 5.1.1 or later. For a full description of the latest version of JIRA, see the release notes. You can download the latest version of JIRA from the download centre.

Patches are not available for this vulnerability.

Our thanks to **Nils Juenemann** who reported three of the XSS vulnerabilities mentioned in this section. Our thanks also to **Conrad Rolack** and **Brandon Sterne** who each reported one XSS vulnerability. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

XSRF Vulnerability

**Severity**

Atlassian rates the severity level of this vulnerability as **Medium**, according to the scale published in *Severity Levels for Security Issues*. The scale allows us to rank the severity as critical, high, medium or low. This is an independent assessment and you should evaluate its applicability to your own IT environment. This vulnerability is **not** of Critical severity.

**Description**

We have identified and fixed a cross-site request forgery (XSRF) vulnerability that affects JIRA instances, including publicly available instances (that is, Internet-facing servers).

This XSRF vulnerability relates to commenting on issues. An attacker might take advantage of the vulnerability to make other users post issue comments of his choice.

You can read more about XSRF attacks at [http://www.cgisecurity.com/csrf-faq.html](http://www.cgisecurity.com/csrf-faq.html) and other places on the web.

This vulnerability affects JIRA 4.2 and above, and has been fixed in JIRA 5.1. This issue can be tracked here: [JIRA-29401 - Cross-Site Request Forgery vulnerability](https://issues.atlassian.com/browse/JIRA-29401) - RESOLVED

**Risk Mitigation**

We strongly recommend upgrading your JIRA installation to fix this vulnerability. Please see the ‘Fix’ section
below.

**Fix**

**Upgrade**

The vulnerability and fix versions are described in the 'Description' section above.

We recommend that you upgrade to JIRA 5.1 or later. For a full description of the latest version of JIRA, see the release notes. You can download the latest version of JIRA from the download centre.

Patches are not available for this vulnerability.

---

**Our thanks to João Paulo Lins of Tempest Security Intelligence, who reported the XSRF vulnerability mentioned in this section. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.**

---

Open Redirect Vulnerabilities

**Severity**

Atlassian rates the severity level of these vulnerabilities as **Medium**, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank the severity as critical, high, moderate or low.

This is an independent assessment and you should evaluate its applicability to your own IT environment. These vulnerabilities are **not** of Critical severity.

**Description**

We have identified and fixed two open redirect vulnerabilities that affect JIRA instances, including publicly available instances (that is, Internet-facing servers).

Parameter-based redirection vulnerabilities allow an attacker to craft a JIRA URL in such a way that a user clicking on the URL will be redirected to a different web site. This can be used for phishing.

You can read more about link manipulation attacks at [Wikipedia](https://en.wikipedia.org/wiki/Redirect), and about phishing at [Fraud.org](http://fraud.org) and other places on the web.

These vulnerabilities affect JIRA 4.3.3 and above, and have been fixed in JIRA 5.1.1. This issue can be tracked here: JIRA-29400 - Open Redirect vulnerabilities [RESOLVED](https://jira.atlassian.com/browse/JIRA-29400)

---

**Risk Mitigation**

We strongly recommend upgrading your JIRA installation to fix these vulnerabilities. Please see the 'Fix' section below.

---

**Fix**

**Upgrade**

The vulnerabilities and fix versions are described in the 'Description' section above.

We recommend that you upgrade to JIRA 5.1 or later. For a full description of the latest version of JIRA, see the release notes. You can download the latest version of JIRA from the download centre.

Patches are not available for this vulnerability.

---

**Our thanks to João Paulo Lins of Tempest Security Intelligence, who reported one of the open redirect vulnerabilities mentioned in this section. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.**

---

**JIRA Security Advisory 2013-02-21**

This advisory discloses a **critical severity** security vulnerability that exists in all versions of JIRA up to and including 5.1.4.
Customers who have downloaded and installed JIRA should upgrade their existing JIRA installations to fix this vulnerability. We also provide a patch that you will be able to apply to existing installations of JIRA to fix this vulnerability. However, we recommend that you upgrade your complete JIRA installation rather than applying the patch.

Enterprise Hosted customers need to request an upgrade by raising a support request at http://support.atlassian.com in the "Enterprise Hosting Support" project.

JIRA Studio customers will need to disable SOAP API (see Risk Mitigation below for details).

Atlassian OnDemand customers are not affected by any of the issues described in this advisory.

Atlassian is committed to improving product security. The vulnerability listed in this advisory has been discovered by Atlassian, unless noted otherwise. The reporter may also have requested that we do not credit them.

If you have questions or concerns regarding this advisory, please raise a support request at http://support.atlassian.com/

In this advisory:
- File Overwrite Vulnerability
- Risk Mitigation
- Fix

File Overwrite Vulnerability

Severity

Atlassian rates the severity level of this vulnerability as critical, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank the severity as critical, high, moderate or low.

This is an independent assessment and you should evaluate its applicability to your own IT environment.

Description

We have identified and fixed a vulnerability in JIRA’s SOAP API that allows an attacker who has a valid JIRA account to overwrite any files that are writeable by the OS user JIRA runs under. This may result in the attacker being able to execute arbitrary Java code in the context of JIRA server.

NOTE: This API is OFF by default, unless you have turned it on. In order to verify its state, check whether "Accept remote API calls" setting is OFF. This page describes configuring JIRA options: https://confluence.atlassian.com/display/JIRA/Configuring+JIRA+Options#ConfiguringJIRAOptions-Options

All versions of JIRA up to and including 5.1.4 are affected by this vulnerability. The vulnerability is fixed in JIRA 5.1.5 and later. This issue can be tracked here: [JIRA-29786 - File overwrite via SOAP API](https://jira.atlassian.com/browse/JIRA-29786) resolved

Risk Mitigation

If you're unable to upgrade or patch the instance: as a workaround, the remote API can be completely disabled by setting the Accept remote API calls value to OFF in the General Configuration (as in our Configuring JIRA Options documentation). However, this will disable all XML-RPC or SOAP calls and can consequently cause additional problems to other applications or scripts that rely upon the remote API.

Usage of SOAP has been deprecated as of JIRA 5.x, and this can be disabled without causing problems to JIRA. However versions of JIRA prior to 4.x may experience problems, such as integrating with other applications through AppLinks. REST calls will be unaffected.

If you want to continue using SOAP API interface, you need to either upgrade your JIRA or apply patches.

Fix

This section outlines the upgrades and/or patches for this vulnerability. The Security Patch Policy describes when and how we release security patches and security upgrades for our products.

Upgrade (recommended)

The vulnerabilities and fix versions are described in the 'Description' section above.

We recommend that you upgrade to the latest version of JIRA, if possible. For a full description of the latest
version of JIRA, see the release notes. You can download the latest version of JIRA from the download centre.

If you cannot upgrade to the latest version of JIRA, you can temporarily patch your existing installation using the patch listed below. We strongly recommend upgrading and not patching.

**Patches (not recommended)**

We recommend patching only when you can neither upgrade nor apply external security controls. Patches are usually only provided for vulnerabilities of critical severity (as per our Security Patch Policy), as an interim solution until you can upgrade. You should not expect that you can continue patching your system instead of upgrading. Our patches are often non-cumulative – we do not recommend that you apply multiple patches from different advisories on top of each other, but strongly recommend upgrading to the most recent version regularly.

If for some reason you cannot upgrade to the latest version of JIRA, you need do all of the steps described in the patch instructions to fix the vulnerability described in this security advisory.

Download the patch file for your version of JIRA. Note, the patches are only available for the point release indicated. If you are using an earlier point release for a major version, you must upgrade to the latest point release first. For example, if you have 5.0.6, then you need to upgrade to 5.0.7 before applying this patch.

<table>

Steps for applying the patches can be found inside the zip archive.

**JIRA Security Advisory 2014-02-26**

This advisory details critical security vulnerabilities that we have found in JIRA and fixed in recent versions of JIRA.

- **Customers who have downloaded and installed JIRA** should upgrade their existing JIRA installations or apply the patches to fix these vulnerabilities.
- **Atlassian OnDemand customers** have been upgraded with the fixes for the issues described in this advisory.

These vulnerabilities affect all versions of JIRA up to and including 6.1.3.

Atlassian is committed to improving product security. We fully support the reporting of vulnerabilities and we appreciate it when people work with us to identify and solve the problem.

If you have questions or concerns regarding this advisory, please raise a support request at http://support.atlassian.com.

  - Fix
Issue 1: Path traversal in JIRA Issue Collector plugin (Windows only)

**Severity**

Atlassian rates the severity level of this vulnerability as **critical**, according to the scale published in **Severity Levels for Security Issues**. The scale allows us to rank the severity as critical, high, moderate or low.

This is an independent assessment and you should evaluate its applicability to your own IT environment.

**Description**

We have identified and fixed a vulnerability in JIRA which allowed unauthenticated users to create files in any valid directory inside a JIRA install. In order to exploit this vulnerability, an attacker requires access to your JIRA web interface.

This issue only affects JIRA servers running on Windows OS. It is not exploitable on Linux and OSX systems.

The vulnerability affects all supported versions of JIRA up to and including 6.0.3. It has been fixed in 6.0.4. The issue is tracked in **JRA-36442**.

Our thanks to Philippe Arteau of Groupe Technologies Desjardins who reported this vulnerability.

**Risk Mitigation**

If you are unable to upgrade or patch your JIRA server, you can **disable the JIRA Issue collector plugin** via the JIRA administration interface.

In case you require the plugin, do the following as a **temporary workaround**:

- Block access to your JIRA server web interface from untrusted networks, such as the Internet.

**Fix**

This vulnerability can be fixed by upgrading JIRA. Alternatively, you can upgrade only the vulnerable plugin.

The **Security Patch Policy** describes when and how we release security patches and security upgrades for our products.

**Upgrading JIRA**

Upgrade to JIRA 6.0.4 or a later version, which fixes this vulnerability. For a full description of these releases, see the **JIRA Release Notes**. You can download these versions of JIRA from the download centre.

If you cannot upgrade JIRA at the moment, you can upgrade only the Issue Collector plugin. See **Managing JIRA’s Plugins** for instructions on how to upgrade a plugin. In general, you should upgrade this plugins to the latest available version compatible with your version of JIRA.

---

Issue 2: Path traversal in JIRA Importers plugin (Windows only)

**Severity**

Atlassian rates the severity level of this vulnerability as **critical**, according to the scale published in **Severity Levels for Security Issues**. The scale allows us to rank the severity as critical, high, moderate or low.

This is an independent assessment and you should evaluate its applicability to your own IT environment.

**Description**

We have identified and fixed a vulnerability in JIRA which allowed unauthenticated users to create files in any valid directory inside a JIRA install. In order to exploit this vulnerability, an attacker requires access to your JIRA web interface.

This issue only affects JIRA servers running on Windows OS. It is not exploitable on Linux and OSX systems.

The vulnerability affects all supported versions of JIRA up to and including 6.0.4. It has been fixed in 6.0.5. The issue is tracked in **JRA-36441**.

Created in 2014 by Atlassian. Licensed under a **Creative Commons Attribution 2.5 Australia License**.
Risk Mitigation

If you are unable to upgrade or patch your JIRA server you can disable the JIRA Importers plugin via the JIRA administration interface.

In case you require the plugin, do the following as a temporary workaround:

- Block access to your JIRA server web interface from untrusted networks, such as the Internet.

Fix

This vulnerability can be fixed by upgrading JIRA. Alternatively, you can upgrade only the vulnerable plugin.

The Security Patch Policy describes when and how we release security patches and security upgrades for our products.

Upgrading JIRA

Upgrade to JIRA 6.0.4 or a later version, which fixes this vulnerability. For a full description of these releases, see the JIRA Release Notes. You can download these versions of JIRA from the download centre.

If you cannot upgrade JIRA at the moment, you can upgrade only the JIRA Importers plugin. See Managing JIRA’s Plugins for instructions on how to upgrade a plugin. In general, you should upgrade this plugins to the latest available version compatible with your version of JIRA.

Issue 3: Privilege escalation

Severity

Atlassian rates the severity level of this vulnerability as critical, according to the scale published in Severity Levels for Security Issues. The scale allows us to rank the severity as critical, high, moderate or low.

This is an independent assessment and you should evaluate its applicability to your own IT environment.

Description

We have identified and fixed a vulnerability in JIRA which allowed unauthenticated attackers to commit actions on behalf of any other authorised user. In order to exploit this vulnerability, an attacker requires access to your JIRA web interface.

The vulnerability affects all supported versions of JIRA up to and including 6.1.3. It has been fixed in 6.1.4. The issue is tracked in JIRA-35797 - Privilege escalation CLOSED.

Risk Mitigation

If you are unable to upgrade or patch your JIRA server you can do the following as a temporary workaround:

- Block access to your JIRA server web interface from untrusted networks, such as the Internet.
- Turn on Secure Administrator Sessions, this prevents privilege escalation to administrative accounts. Non-privileged accounts will still be vulnerable.

Fix

This vulnerability can be fixed by upgrading JIRA. There is also a patch available for this vulnerability for the following supported versions of JIRA. If you have any questions, please raise a support request at http://support.atlassian.com. We recommend upgrading.

The Security Patch Policy describes when and how we release security patches and security upgrades for our products.

Upgrading JIRA

Upgrade to JIRA 6.1.4 or a later version, which fixes this vulnerability. For a full description of these releases, see the JIRA Release Notes. You can download these versions of JIRA from the download centre.

Patches
We recommend patching only when you cannot upgrade or cannot apply external security controls. Patches are usually only provided for vulnerabilities of critical severity (as per our Security Patch Policy) as an interim solution until you can upgrade. You should not continually patch your system instead of upgrading. Our patches are often non-cumulative – we do not recommend that you apply multiple patches from different advisories on top of each other, and we strongly recommend upgrading to the most recent version regularly.

If for some reason you cannot upgrade to the latest version of JIRA, you must upgrade to the last minor version of the release. For example, if you have JIRA 5.1.1, you will have to upgrade to 5.1.8 and then apply the patch provided below to fix the vulnerability described in this advisory.

Download the patch package:
Patches are provided for the last minor version of each major release. If you don't have the exact JIRA version installed, you will need to upgrade to the last minor version of the release in order to apply the patch (this means if you have JIRA 5.1.1, you will have to upgrade to 5.1.8 in order to be able to apply the patch).

WINDOWS USERS: Do not use the built in Windows ZIP extractor to apply this patch! By default it replaces all the files in a directory instead of merging the files in. If this happens, JIRA will not be able to work correctly. Use another zip tool such as WinZip or 7-Zip. Alternatively, extract the files into a different directory and copy them to `<jira_install>/atlassian-jira/WEB-INF/lib` manually.

Instructions for specific versions of JIRA are available in a file `JRA-35797-x.x.x-patch-instructions.txt` located inside the corresponding ZIP file.

For reference, instructions for JIRA 6.0.8 are below (please be sure to follow the instructions in the patch zip you have downloaded as each version has slightly different instructions):

Before applying the patch file, make a copy of your JIRA web application directory in case things go wrong. This will allow you to more easily back out any changes.

If you are using the Standalone distribution of JIRA:

1. Download the file patch-JRA-35797/patches/JRA-35797-6.0.8-patch.zip
2. In the `<jira_install>/atlassian-jira/WEB-INF/lib` directory delete the following files:
   - atlassian-gadgets-api-3.2.0-m26.jar
   - atlassian-gadgets-spi-3.2.0-m26.jar
   - atlassian-trusted-apps-core-2.5.2.jar
   - atlassian-trusted-apps-seraph-integration-2.5.2.jar
   - sal-api-2.10.2.jar
   - sal-spi-2.10.2.jar
3. Expand the zip file into `<jira_install_dir>/atlassian-jira/` overwriting the files there
4. Restart JIRA

If you are using the WAR distribution of JIRA:

1. Download the file patch-JRA-35797/patches/JRA-35797-6.0.8-patch.zip
2. In the `<jira_install_jir>/webapp/WEB-INF/lib` directory delete the following files:
   - atlassian-gadgets-api-3.2.0-m26.jar
   - atlassian-gadgets-spi-3.2.0-m26.jar
   - atlassian-trusted-apps-core-2.5.2.jar
   - atlassian-trusted-apps-seraph-integration-2.5.2.jar
- sal-api-2.10.2.jar
- sal-spi-2.10.2.jar

3. Expand the zip file to `<jira_install_dir>/webapp` overwriting the files there
4. Run `build.sh clean` on unix or `build.bat clean` on windows
5. Run `build.sh` on unix or `build.bat` on windows
6. Redeploy the JIRA web app into your application server

IDE Connectors

- Use the Atlassian Connector for Eclipse or the Atlassian Connector for IntelliJ IDEA to work with your JIRA issues, right there in your development environment. Do you use Bamboo, Crucible or FishEye too? With the connector you can manage your builds and code reviews within your IDE, or move quickly between the IDE and a FishEye view of your source repository. Hint: The Atlassian IDE Connectors are free.

Support Policies

Welcome to the support policies index page. Here, you'll find information about how Atlassian Support can help you and how to get in touch with our helpful support engineers. Please choose the relevant page below to find out more.

- Bug Fixing Policy
- How to Report a Security Issue
- New Features Policy
- Patch Policy
- Security Advisory Publishing Policy
- Security Patch Policy
- Severity Levels for Security Issues

To request support from Atlassian, please raise a support issue in our online support system. To do this, see Getting Help. Our friendly support engineers will get right back to you with an answer.

Bug Fixing Policy

Summary

- Atlassian Support will help with workarounds and bug reporting.
- Critical bugs will generally be fixed in the next maintenance release.
- Non critical bugs will be scheduled according to a variety of considerations.

Raising a Bug Report

Atlassian Support is eager and happy to help verify bugs — we take pride in it! Please open a support request in our support system providing as much information as possible about how to replicate the problem you are experiencing. We will replicate the bug to verify, then lodge the report for you. We'll also try to construct workarounds if they're possible.

Customers and plugin developers are also welcome to open bug reports on our issue tracking systems directly. Use http://jira.atlassian.com for the stand-alone products and http://studio.atlassian.com for JIRA Studio and Atlassian OnDemand.

When raising a new bug, you should rate the priority of a bug according to our JIRA usage guidelines. Customers should watch a filed bug in order to receive e-mail notification when a "Fix Version" is scheduled for release.

How Atlassian Approaches Bug Fixing

Maintenance (bug fix) releases come out more frequently than major releases and attempt to target the most critical bugs affecting our customers. The notation for a maintenance release is the final number in the version (i.e. 1 in 3.0.1).

If a bug is critical (production application down or major malfunction causing business revenue loss or high numbers of staff unable to perform their normal functions) then it will be fixed in the next maintenance release provided that:

- The fix is technically feasible (i.e. it doesn't require a major architectural change).
- It does not impact the quality or integrity of a product.
For non-critical bugs, the developer assigned to fixing bugs prioritises the non-critical bug according to these factors:

- How many of our supported configurations are affected by the problem.
- Whether there is an effective workaround or patch.
- How difficult the issue is to fix.
- Whether many bugs in one area can be fixed at one time.

The developers responsible for bug fixing also monitor comments on existing bugs and new bugs submitted in JIRA, so you can provide feedback in this way. We give high priority consideration to security issues.

When considering the priority of a non-critical bug we try to determine a ‘value’ score for a bug which takes into account the severity of the bug from the customer’s perspective, how prevalent the bug is and whether roadmap features may render the bug obsolete. We combine this with a complexity score (i.e. how difficult the bug is). These two dimensions are used when developers self serve from the bug pile.

See Atlassian Support Offerings for more support-related information.

How to Report a Security Issue

Finding and Reporting a Security Issue

If you find a security issue in the product, open an issue on https://jira.atlassian.com in the relevant project.

- Set the security level of the bug to ‘Reporters and Developers’.
- Set the priority of the bug to ‘Blocker’.
- Provide as much information on reproducing the bug as possible.

All communication about the security issue should be performed through JIRA, so that Atlassian can keep track of the issue and get a patch out as soon as possible.

If you cannot find the right project to file your issue in, email the details to security@atlassian.com.

When reporting a security vulnerability, please keep in mind the following:

- Provide steps to reproduce the issue, including any URLs or code involved.
- If you are reporting a cross-site scripting (XSS), your exploit should at least pop up an alert in the browser. It is much better if the XSS exploit shows user's authentication cookie.
- For a cross-site request forgery (CSRF), use a proper CSRF case when a third party causes the logged in victim to perform an action.
- For a SQL injection, we want to see the exploit extracting database data, not just producing an error message.
- HTTP request / response captures or simply packet captures are also very useful to us.

Please refrain from sending us links to non-Atlassian web sites, or reports in PDF / DOC / EXE files. Image files are ok. Make sure the bug is exploitable by someone other than the user himself (e.g. "self-XSS").

Without this information it is not possible to assess your report and it is unlikely to be addressed.

We are not looking for the reports listing generic "best practice" issues such as:

- Specific cookies being not marked as Secure or HTTPOnly
- Presence or absence of HTTP headers (X-Frame-Options, HSTS, CSP, nosniff and so on)
- Clickjacking
- Mixed HTTP and HTTPS content
- Auto-complete enabled or disabled
- SSL-related issues

We are also not looking for reports on the following bug classes:
• Username enumeration using login or password reset features. While username enumeration can be a vulnerability in web applications, most of Atlassian products and web sites include a number of social features. As a result, usernames can be discovered by design in a number of ways.

Further reading

See Atlassian Support Offerings for more support-related information.

New Features Policy

Summary

• We encourage and display customer comments and votes openly in our issue tracking system, http://jira.atlassian.com.
• We do not publish roadmaps.
• Product Managers review our most popular voted issues on a regular basis.
• We schedule features based on a variety of factors.
• Our Atlassian Bug Fixing Policy is distinct from our Feature Request process.
• Atlassian provides consistent updates on the top 20 feature/improvement requests (in our issue tracker systems).

How to Track what Features are Being Implemented

When a new feature or improvement is scheduled, the ‘fix-for’ version will be indicated in the JIRA issue. This happens for the upcoming release only. We maintain roadmaps for more distant releases internally, but because these roadmaps are often pre-empted by changing customer demands, we do not publish them.

How Atlassian Chooses What to Implement

In every major release we aim to implement highly requested features, but it is not the only determining factor. Other factors include:

• Customer contact: We get the chance to meet customers and hear their successes and challenges at Atlassian Summit, Atlassian Unite, developer conferences, and road shows.
• Customer interviews: All product managers at Atlassian do customer interviews. Our interviews are not simply to capture a list of features, but to understand our customers' goals and plans.
• Community forums: There are large volumes of posts on answers, of votes and comments on jira.atlassian.com, and of conversations on community forums like groups on LinkedIn.
• Customer Support: Our support team provides clear insights into the issues that are challenging for customers, and which are generating the most calls to support.
• Atlassian Experts: Our Experts provide insights into real-world customer deployments, especially for customers at scale.
• Evaluator Feedback: When someone new tries our products, we want to know what they liked and disliked and often reach out to them for more detail.
• In product feedback: The JIRA Issue Collectors that we embed our products for evaluators and our Early Access Program give us a constant pulse on how users are experiencing our product.
• Usage data: Are customers using the features we have developed?
• Product strategy: Our long-term strategic vision for the product.

How to Contribute to Feature Development

Influencing Atlassian’s release cycle

We encourage our customers to vote on feature requests in JIRA. The current tally of votes is available online in our issue tracking system, http://jira.atlassian.com. Find out if your improvement request already exists. If it does, please vote for it. If you do not find it, create a new feature or improvement request online.

Extending Atlassian Products

Atlassian products have powerful and flexible extension APIs. If you would like to see a particular feature implemented, it may be possible to develop the feature as a plugin. Documentation regarding the plugin APIs is available. Advice on extending either product may be available on the user mailing-lists, or at Atlassian Answers.

If you require significant customisations, you may wish to get in touch with our partners. They specialise in extending Atlassian products and can do this work for you. If you are interested, please contact us.
Further reading

See Atlassian Support Offerings for more support-related information.

Patch Policy

Patch Policy

Atlassian will only provide software patches in extremely unusual circumstances. If a problem has been fixed in a newer release of the product, Atlassian will request that you upgrade your instance to fix the issue. If it is deemed necessary to provide a patch, a patch will be provided for the current release and the last maintenance release of the last major version only.

Patches are issued under the following conditions:

- The bug is critical (production application down or major malfunction causing business revenue loss or high numbers of staff unable to perform their normal functions) AND a patch is technically feasible (i.e., it doesn't require a major architectural change)
- OR
- The issue is a security issue, and falls under our Security Patch Policy.

Atlassian does not provide patches for non-critical bugs.

Provided that a patch does not impact the quality or integrity of a product, Atlassian will ensure that patches supplied to customers are added to the next maintenance release. Customers should watch a filed bug in order to receive e-mail notification when a "Fix Version" is scheduled for release.

Patches are generally attached to the relevant http://jira.atlassian.com issue.

Further reading

See Atlassian Support Offerings for more support-related information.

Security Advisory Publishing Policy

Publication of Security Advisories

When a critical severity security vulnerability in an Atlassian product is discovered and resolved, Atlassian will inform customers through the following mechanisms:

- We will post a security advisory in the latest documentation of the affected product at the same time as releasing a fix for the vulnerability.
- We will send a copy of all posted security advisories to the Technical Alerts mailing list for the product concerned.
  
Note: To manage your email subscriptions and ensure you are on this list, please go to my.atlassian.com and click 'Communications Centre' near the top right of the page.
- If the person who reported the vulnerability wants to publish an advisory through some other agency, such as CERT, we will assist in the production of that advisory and link to it from our own.

If you want to track non-critical severity security vulnerabilities, you need to monitor the issue trackers for the relevant products on http://jira.atlassian.com. For example, https://jira.atlassian.com/browse/JRA for JIRA and https://jira.atlassian.com/browse/CONF for Confluence. Security issues in trackers will be marked with a "security" label. All security issues will be listed in the release notes of the release where they have been fixed, similar to other bugs.

One of the ways to monitor updates to security issues is subscribing to the results of a sample search via email or RSS.

See Atlassian Support Offerings for more support-related information.

Security Patch Policy

Product Security Patch Policy

Atlassian makes it a priority to ensure that customers' systems cannot be compromised by exploiting vulnerabilities in Atlassian products.
Scope

This page describes when and how we release security patches and security upgrades for our products. It does not describe the whole of disclosure process that we follow. This policy excludes OnDemand and Bitbucket, since these services are always patched by Atlassian without additional notifications.

Critical vulnerabilities

When a Critical security vulnerability is discovered by Atlassian or reported by a third party, Atlassian will do all of the following:

- Issue a new, fixed release for the current version of the affected product as soon as possible, usually in a few days.
- Issue a binary patch for the current release.
- Issue a binary patch for the latest maintenance release of the previous version of the product.
- Patches for older versions or releases normally will not be issued.

Patches will be attached to the relevant JIRA issue. You can use these patches as a "stop-gap" measure until you upgrade your installation in order to fully fix the vulnerability.

Non-critical vulnerabilities

When a security issue of a High, Medium or Low severity is discovered, Atlassian will do all of the following:

- Include the fix into the next scheduled release, both for the current and previous maintenance versions.
- Where practical, provide new versions of plugins or other components of the product that can be upgraded independently.

You should upgrade your installation in order to fix the vulnerability.

Other information

Severity level of vulnerabilities is calculated based on Severity Levels for Security Issues.

Visit our general Atlassian Patch Policy as well.

Examples

Example 1: A critical severity vulnerability is found in a (hypothetical current release) JIRA 5.3.2. The last bugfix release in 5.2.x branch was 5.2.3. In this case, a patch will be created for 5.3.2 and 5.2.3. In addition, new bugfix releases, 5.3.3 and 5.2.4, which are free from this vulnerability, will be created in a few days.

Example 2: A high or medium severity vulnerability is found in the same release as in the previous example. The fix will be included into the currently scheduled releases 5.3.3 and 5.2.4. Release schedule will not be brought forward and no patches will be issued. If the vulnerability is in a plugin module, then a plugin upgrade package may still be supplied.

Further reading

See Atlassian Support Offerings for more support-related information.

Severity Levels for Security Issues

Severity Levels

Atlassian security advisories include a severity level. This severity level is based on our self-calculated CVSS score for each specific vulnerability. CVSS is an industry standard vulnerability metric. You can learn more about CVSS at FIRST.org web site.

CVSS scores are mapped into the following severity ratings:

- Critical
- High
- Medium
- Low

An approximate mapping guideline is as follows:
Below is a summary of the factors which illustrate types of vulnerabilities usually resulting in a specific severity level. Please keep in mind that this rating does not take into account details of your installation.

**Severity Level: Critical**

Vulnerabilities that score in the critical range usually have most of the following characteristics:

- Exploitation of the vulnerability results in root-level compromise of servers or infrastructure devices.
- The information required in order to exploit the vulnerability, such as example code, is widely available to attackers.
- Exploitation is usually straightforward, in the sense that the attacker does not need any special authentication credentials or knowledge about individual victims, and does not need to persuade a target user, for example via social engineering, into performing any special functions.

For critical vulnerabilities, is advised that you patch or upgrade as soon as possible, unless you have other mitigating measures in place. For example, if your installation is not accessible from the Internet, this may be a mitigating factor.

**Severity Level: High**

Vulnerabilities that score in the high range usually have some of the following characteristics:

- The vulnerability is difficult to exploit.
- Exploitation does not result in elevated privileges.
- Exploitation does not result in a significant data loss.

**Severity Level: Medium**

Vulnerabilities that score in the medium range usually have some of the following characteristics:

- Denial of service vulnerabilities that are difficult to set up.
- Exploits that require an attacker to reside on the same local network as the victim.
- Vulnerabilities that affect only nonstandard configurations or obscure applications.
- Vulnerabilities that require the attacker to manipulate individual victims via social engineering tactics.
- Vulnerabilities where exploitation provides only very limited access.

**Severity Level: Low**

Vulnerabilities in the low range typically have very little impact on an organisation's business. Exploitation of such vulnerabilities usually requires local or physical system access.

**Further reading**

See [Atlassian Support Offerings](https://www.atlassian.com/support) for more support-related information.

**Local JIRA documentation**

**On this page:**

- Why would I set up local online documentation?
- How to set up local online documentation for JIRA 4.0.x and later
  - Additional documentation spaces required
    - Why you need the additional documentation spaces
    - Determining the Version Required
    - List of Spaces Required
- How to set up local online documentation for JIRA 3.13.x and earlier
- Local field documentation
Why would I set up local online documentation?

You may wish to run the documentation locally, and have JIRA link to it. There are a few reasons you may wish to do this:

- JIRA's interface contains links (🔗) to help pages, some to pages within JIRA, but many to the online documentation on www.atlassian.com. For deployments in environments without an internet connection, a local copy of the documentation is desirable.
- If you have customized JIRA, you may wish to update the documentation to reflect your changes, or add new pages.
- You can change the look and feel of the documentation to integrate into your company's intranet.

How to set up local online documentation for JIRA 4.0.x and later

1. Install Atlassian Confluence. (If you don't already have Confluence, ask for a free Evaluation License. You can use 'Anonymous' access to allow your users to view the documentation.)
2. Download the JIRA Documentation's XML source. Note that the Confluence version of the XML source needs to be the same major Confluence version as your local Confluence site.
3. Import the XML file into your Confluence site. (Note: if there is already a 'JIRA' space in your Confluence site, it will be overwritten.) For detailed instructions, see the Confluence documentation on Restoring a Space.
4. If you are importing the documentation for JIRA 4.1 or later, you will need to remove or adjust the customized header, footer and left-hand navigation bar in your new space. Explanation: When you create your new space from our XML source code, the space will inherit the Confluence 'Documentation' theme. The XML source code also includes the customizations we have made to the header, footer and left-hand navigation bar. These customizations include references to our Atlassian Documentation space. Since your Confluence site does not have that space, you will see errors like this in the left-hand navigation bar, header and footer in your new space:

   Unable to render (include) Couldn't find a space with key: ALLDOC

   To fix these errors, take one of the following steps:
   - Customize the navigation, header and footer sections to suit your Confluence site or environment. See our documentation on configuring the Documentation theme.
   - Or restore the default left-hand navigation bar, by removing all content from the navigation, header and footer sections and selecting the 'Page Tree' check box. See our documentation on configuring the Documentation theme.
   - Or change the theme of your space to the Confluence default theme or another theme of your choice.
5. Download the XML source code for the additional documentation spaces listed below and import them into your Confluence site too.
6. (Optional) If you want JIRA's help links (🔗) to point to your local documentation, you will need to:
   a. edit JIRA's /WEB-INF/classes/help-paths.properties file and change the url-prefix line so that it points to the 'JIRA' space in your local Confluence site, e.g.:

   ```properties
   url-prefix=http://confluence.mycompany.com/display/JIRA/
   ```
   b. restart JIRA.

Additional documentation spaces required

Why you need the additional documentation spaces

The JIRA documentation shares some content with other Atlassian products, such as Confluence. For the sake of efficiency, we reuse the same content across documentation spaces. You will notice that some of our pages contain an {include} macro that draws in content from another space.

For example, the following macro includes content from the Application Links (APPLINKS) space into the JIRA documentation space:
You will need to import those documentation spaces into your Confluence site, to ensure that the reused content is accessible in your JIRA documentation.

Determining the Version Required

We supply different versions of the documentation, for each version of the software or plugin concerned. To see which version you need, take a look at the space key in the {include} macro concerned.

- If the space key has a number at the end, that number indicates the version. For example, 012 means version 1.2, and 011 means version 1.1.
- If the space key does not include a number, you need the latest version of the documentation.

Here is an example of an include macro that requires version 1.2 of the Application Links documentation:

```
{include:APPLINKS012:_securityTrustedApps}
```

This example requires the latest version of the Application Links documentation:

```
{include:APPLINKS:_securityTrustedApps}
```

List of Spaces Required

Retrieve the relevant version of the XML backups from these pages:

- Application Links
- Universal Plugin Manager
- User Management

How to set up local online documentation for JIRA 3.13.x and earlier

JIRA licensees can download the XML source for the documentation.

To build JIRA’s docs locally:

1. Download Apache Forrest 0.5.1 (zip, tar.gz), used to render the docs.
2. Download the JIRA Documentation's XML source (6.2Mb). Note: the download is restricted to JIRA license holders.
3. Follow the JIRA_DOCUMENTATION.txt instructions in the package.

Local field documentation

If you just want to document usage of a custom field, please see Creating Help for a Custom Field.

JIRA FAQ

- What does JIRA mean?
- How is JIRA pronounced?
- Licensing

For technical articles please see the JIRA Knowledge Base.

What does JIRA mean?
Like all good names in the software industry, it started as an in-house code name.

We originally used Bugzilla for bug tracking and the developers in the office started calling it by the Japanese name for Godzilla, Gojira (the original black-and-white Japanese Godzilla films are also office favorites). As we developed our own bug tracker, and then it became an issue tracker, the name stuck, but the Go got dropped - hence JIRA!

Further investigation into the name has revealed that Gorira is Japanese for "gorilla", whilst Kujira is Japanese for "whale". So Gojira is roughly translated to mean "gorilla the size of a whale"! (Thanks to yusuke_arclamp — Oct 2002)

For those who care - it sounds best if you yell it loudly, as though charging into battle. C'mon - try it!

Related

1. Talking that JIRA-slang language, or jiralang, if I may

How is JIRA pronounced?

We pronounce it ‘JEEra', based on the pronunciation of ‘Kujira' (see What does JIRA mean?)

Licensing

Please see our licensing FAQ

Related

JIRA 4.0 introduced new licensing — please see Licensing Changes.

How JIRA Documentation Updates are Published

Documentation is organised by major product version

As you can see from this web site, Atlassian's technical writers use Confluence to prepare and publish documentation for Atlassian's products.

The documentation for each major version of JIRA is housed in its own Confluence space. Examples of major versions of JIRA are '4.3.x', '4.4.x' or '5.0.x', where 'x' represents a minor version/release number. Any documentation relating to specific features in minor versions/releases of a major JIRA version are also housed in the documentation space for that major version.

While the names of spaces can be changed in Confluence, each space is identified by a unique 'space key', which remains static.

When viewing a Confluence page, the 'space key' of the space to which the page belongs can be found immediately after the display/ part of that Confluence page's URL.

Traditional documentation publishing process

This process is no longer being employed to publish JIRA documentation updates. All version numbers mentioned in this section are used solely for demonstrating this process and do not reflect our current online JIRA documentation.

Documentation for the latest official major version of JIRA (for example, JIRA 4.2.x) is housed in the Confluence space on this site with the 'JIRA' space key.

Documentation updates for the next major version of JIRA (for example, JIRA 4.3.0) are drafted in this same Confluence space (with the 'JIRA' space key). Each draft page created is hidden from public view by applying page viewing restrictions.

Just prior to the release of the next major version of JIRA, we begin 'branching' the documentation.

This documentation 'branching' process involves the following steps:
1. We create a copy of the 'JIRA' space on this site using Confluence's 'Copy Space' plugin. The copied space is given a space key which reflects the latest official major version of JIRA, based on the format 'JIRA0XY' (where X and Y reflect the first two numbers that constitute this major version of JIRA). Documentation in the new 'JIRA0XY' space, which is initially hidden from public view via space permissions, will apply to the previous major version of JIRA once the next major version of JIRA is officially released.

2. Immediately after the next major version of JIRA is officially released, we perform the following sub-steps:
   a. The 'JIRA' space is renamed to reflect the new latest official major version of JIRA, for example, 'JIRA 4.3'.
   b. The 'JIRA0XY' space (for example, 'JIRA042') is revealed to the public by adjusting space permissions and we ensure it is renamed to reflect the previous major version of JIRA, for example, 'JIRA 4.2'.
   c. We publish the drafted content for what is now the new latest official major version of JIRA in the 'JIRA' space.

For more information about this process, please refer to 'From draft to published document' and 'Documentation on Release Management' in our blog series on 'Technical Writing in a Wiki'.

Recent documentation publishing process

Since the release of JIRA 4.3.0, we have modified the traditional documentation publishing process above. Instead of waiting until the next major version of JIRA is officially released, we begin the 'branching' steps (above) earlier during development of the next major version of JIRA. For the release of:

- JIRA 4.3.0 — we performed the branching steps just prior to the release of JIRA 4.3 Beta 1 and at sub-step 2a, the 'JIRA' space was renamed 'JIRA 4.3 Beta'.
- JIRA 4.4.0 — we performed the branching even earlier (just prior to the release of JIRA 4.4 EAP 2) and at sub-step 2a, the 'JIRA' space was renamed 'JIRA 4.4 EAP'.
  - When JIRA 4.4 Beta 1 was released, we performed sub-step 2a again, by renaming the 'JIRA' space 'JIRA 4.4 Beta'.

Implications of this new process

Branching our documentation early during early development of the next major version of JIRA has the following implications:

- A dedicated documentation space for the latest official major version of JIRA becomes available. For instance, the 'JIRA 4.3' documentation space (with space key 'JIRA043') became available when JIRA 4.4 EAP 2 was released.
- The 'JIRA' space reflects JIRA documentation for the next major version of JIRA. For instance, the 'JIRA 4.4 EAP' documentation (with space key 'JIRA') became available when JIRA 4.4 EAP 2 was released.

Customers searching our documentation via Google may find that their Google search results selectively choose pages in the 'JIRA' space for the next major version of JIRA, as mentioned in JIRA-24805.

Why have we adopted this new process?

Branching our documentation early offers the following important benefits:

- Customers who wish to try out early versions of the next major version of JIRA, as well as developers who wish to update their JIRA plugins for compatibility with that JIRA version will have access to documentation for that JIRA version (if available).
- Publishing documentation updates is easier since we work with live content in documentation spaces with 'EAP' or 'Beta' in their name, rather than working on draft pages which are hidden from public view.

If you reach a JIRA documentation page for the next major version of JIRA (for example, via a Google search), most headers of these pages have a link that will lead you to the equivalent page for latest official major version of JIRA.

For more information about our reasons for adopting this new process, please refer to our response to JIRA-24805.
How to reference JIRA documentation from external sources

If you wish to reference our JIRA documentation from an external source, you may wish to refer to version-specific pages of our documentation, by ensuring that you use the appropriate space key in your URL. For example:

- http://confluence.atlassian.com/display/JIRA042/Managing+Groups (for JIRA 4.2.x)
- http://confluence.atlassian.com/display/JIRA043/Managing+Groups (for JIRA 4.3.x)

Sometimes, if the functionality of a particular aspect of JIRA has changed, we may need to change the name of a page. For example, due to the significant changes in 'advanced JIRA configuration' in JIRA 4.4, we've had to change the name of:

- http://confluence.atlassian.com/display/JIRA043/Advanced+JIRA+configuration+with+jira-application.properties (for JIRA 4.3.x)
  to
- http://confluence.atlassian.com/display/JIRA/Advanced+JIRA+configuration (for JIRA 4.4.x)

We almost never change the names of pages in earlier versions of documentation (unless of course they are incorrect).

Contributing to the JIRA Documentation

Would you like to share your JIRA hints, tips and techniques with us and with other JIRA users? We welcome your contributions.

Contributing Documentation in Other Languages

Have you written a guide to JIRA in a language other than English, or translated one of our guides? Let us know, and we will link to your guide from our documentation. More....

Updating the Documentation Itself

Have you found a mistake in the documentation, or do you have a small addition that would be so easy to add yourself rather than asking us to do it? You can update the documentation page directly.

Getting Permission to Update the Documentation

Please submit the [Atlassian Contributor License Agreement](#).

Our Style Guide
Please read our short guidelines for authors.

How we Manage Community Updates

Here is a quick guide to how we manage community contributions to our documentation and the copyright that applies to the documentation:

- **Monitoring by technical writers.** The Atlassian technical writers monitor the updates to the documentation spaces, using RSS feeds and watching the spaces. If someone makes an update that needs some attention from us, we will make the necessary changes.
- **Wiki permissions.** We use wiki permissions to determine who can edit the documentation spaces. We ask people to sign the Atlassian Contributor License Agreement (ACLA) and submit it to us. That allows us to verify that the applicant is a real person. Then we give them permission to update the documentation.
- **Copyright.** The Atlassian documentation is published under a Creative Commons CC BY license. Specifically, we use a Creative Commons Attribution 2.5 Australia License. This means that anyone can copy, distribute and adapt our documentation provided they acknowledge the source of the documentation. The CC BY license is shown in the footer of every page, so that anyone who contributes to our documentation knows that their contribution falls under the same copyright.

Tips of the Trade

Below are some links to external blog posts and articles containing technical tips and instructions on setting up and using JIRA. This page presents an opportunity for customers and community authors to share information and experiences.

The references here are links to technical 'how to' guides written by bloggers who use JIRA. For feature tours, solution tours and other information about bug and issue trackers, please refer to the Atlassian website and to our evaluator resources.

Please be aware that these are external blogs and articles.
Most of the links point to external sites, and some of the information is relevant to a specific release of JIRA. Atlassian provides these links because the information is useful and relevant at the time it was written. Please check carefully whether the information is still relevant when you read it, and whether it is relevant to your version of JIRA. Unless explicitly stated, Atlassian does not offer support for third-party extensions or plugins. The information in the linked blog posts has not been tested or reviewed by Atlassian. We recommend that you test all solutions on a test server before trying them on your production site.

JIRA 4 Linux Administrator's Guide and Workflow Management

- By: James Intriglia, on 'Getting Things Done in a Virtual World'
- About — This article covers the following topics:
  - Installing JIRA on different flavours of Linux with additional sections on how to configure and administer JIRA
    (This is a PDF document, whose link can be found at the end of this page.)
  - JIRA workflow diagrams speeding up JIRA application development
- Date: May 2010
- Related documentation: JIRA Installation and Upgrade Guide

Install JIRA on RHEL5, Single Tomcat with AJP and MySQL

- By: Brett Ryan, on the 'JIRA Community Space'
- About: How to install JIRA on Red Hat Enterprise Linux 5, using Apache Tomcat behind an Apache HTTP Server with AJP and MySQL
- Date: 9 April 2010
- Related documentation: JIRA Installation and Upgrade Guide

Please be aware that this guide contains advanced procedures that should only be attempted by individuals who are familiar with configuring Apache Tomcat, Apache HTTP Server and AJP on Linux.

Administration

JIRA Groups and JIRA Project Roles

- By: Matt Doar, on blog 'jiradev.blogspot.com'
- About: How to set up JIRA permissions for specific projects
- Date: 27 September 2010
- Related documentation: Managing Groups, Managing Project Roles

'Send reminder on' custom field for Jira

- By: Sam Haldane, on blog 'blog.samhaldane.com'
- About: How to set up JIRA to send issue reminders to users on specified dates
- Date: 17 August 2009
- Related documentation: Adding a Custom Field, Using Filters

User Activity Statistics

- By: Zaccary Craven, on blog 'Tips and tricks for JIRA administrators'
- About: How to show a list of all usernames along with the number of times each user has created a comment
- Date: 19 January 2009
- Related documentation: Adding the Issue Statistics Gadget

Showing custom fields in 'sub-task' columns

- By: Zaccary Craven, on blog 'Tips and tricks for JIRA administrators'
- About: How to show the values of subtask custom fields on your issue screens
- Date: 8 December 2008
- Related documentation: Custom fields

Using User Properties

- By: Matt Doar, on blog 'Consulting Toolsmiths'
- About: How to add, display and filter the user properties with the JIRA Toolkit plugin
- Date: 20 February 2008
- Related documentation: Managing Users
## Workflow

Making it easier to maintain JIRA workflows

- **By:** Matt Doar, on blog 'Consulting Toolsmiths'
- **About:** How to display the name of the screen used by each transition in a workflow in one place
- **Date:** 1 July 2009
- **Related documentation:** Configuring Workflow

### Jira Workflow Report Update

- **By:** Jamie Echlin, on the 'onresolve team blog'
- **About:** Visualising JIRA workflows, with hints about a common problem when defining resolutions in JIRA workflows
- **Date:** 19 December 2008
- **Related documentation:** Configuring Workflow

## Integration with Other Tools

### NetBeans 6.7 RC1 - and JIRA support (beta)

- **By:** Fabrizio Giudici, on 'Fabrizio Giudici's Blog'
- **About:** How to get JIRA integration in NetBeans 6.7 RC1
- **Date:** 1 June 2009

### JIRA To Omnifocus Script

- **By:** David Martinez, on blog 'Hackerdude'
- **About:** A script that logs into JIRA and creates OmniFocus tasks for each of the JIRA items that are assigned to you, so they sync to your Omnifocus for iPhone, you only have to keep track of one inbox, etc.
- **Date:** 4 March 2009

### Update JIRA-issues with OmniFocus

- **By:** Alain Petignat, on blog 'sequenz'
- **About:** Updating JIRA fields (time estimate, due date and assignee) directly from OmniFocus
- **Date:** 12 April 2009

## Development

### Git branches to handle contributor patches

- **By:** Julien Ponge, on "JPz'log"
- **About:** Managing patches in pending state via Git, SVN and JIRA
- **Date:** 4 December 2008

### Setting issue security level by issue type

- **By:** Jamie Echlin, on the 'onresolve team blog'
- **About:** Two ways to set JIRA issue security levels by issue type
- **Date:** 5 August 2008
- **Related documentation:** Configuring Issue-level Security

### Unique Issue ID Across Projects

- **By:** Surya Suravarapu, on 'Surya Suravarapu's Blog'
- **About:** A plugin that allows you to have unique issue IDs across all your JIRA projects
- **Date:** 14 July 2009
- **Related documentation:**
  - Changing the Project Key Format
  - Change History

Tips via Twitter

This page displays a continuously-updated list of tweets from Atlassians and others, giving hints and tips about JIRA issue tracker. Anyone can write a tip and have it show on this page. The live Twitter stream shows recent tweets containing the word 'JIRATips' or the tag '#JIRATips'.

Want to join in? Just tweet with the tag '#JIRATips' somewhere in the text. Then grab a badge for your blog.

- Viewing the Tweets in Twitter
- Adding a JIRA Tweets Badge to your Blog
- Adding your own Tip

Viewing the Tweets in Twitter

If you prefer, you can view the search in Twitter itself.

Adding a JIRA Tweets Badge to your Blog

Would you like to let other people know that you tweet your JIRA tips? Use the code samples below to add a badge to your blog or another social site.

Choose one of these options to add the badge:

- **Badge only**
  Copy the code below and paste it into your blog to include just the badge with a link to this documentation page:

  ```html
  ```

  This is what you will get:

Please be aware that anyone can tweet anything.

Atlassian does not monitor the tips in this Twitter stream. Anyone can tweet anything they like. We display these tips because we believe most people will do the right thing and tweet good tweets. Please check that a tweet is relevant to you before following its advice.
- **Badge and words**
  Copy the code below and paste it into your blog to include the badge and some words encouraging other people to tweet too:

  ```html
  ```

  This is what you will get:

  ![Badges](http://confluence.atlassian.com/download/attachments/222200745/Twitter-Tips-JIRA.png)

  Got a JIRA tip? Tweet it now then see it in the JIRA docs.

### Adding your own Tip

- **Quick guide to tweeting a tip**
  Just tweet with the word '#JIRATips' somewhere in the text. Your tweet will appear in the Twitter stream on this page.

Would you like to share your information and experiences via Twitter and have your tweet appear on this page? **Awesome!** Here are the full instructions.

- **To tweet a JIRA tip,**
1. Go to Twitter.com in your browser.
2. If you already have a Twitter username, sign in to Twitter now. If you do not have a Twitter username, sign up for one and follow the Twitter instructions to confirm your account details.
3. Enter your tip into the Twitter text box labelled ‘What’s happening’. Note that your tip can contain a maximum of 140 characters:
   - Type the words for your tip.
   - If you want people to click through to a web page to see more details about your tip, enter a web address. If the web address is long, you can convert it to a shortened address at bit.ly or one of the other web services that offer URL shortening.
   - Include the key word #JIRATips somewhere in your tweet. This will ensure that your tip appears in the Twitter stream on this documentation page.
4. Click ‘Tweet’ to send your tweet.
5. Refresh this documentation page to see your tweet appear. It may take a few minutes, depending on the volume of tweets that Twitter is handling.

Modifying the JIRA Footer
deploying velocity templates without a restart

In a development instance, you can play with picking up velocity file changes without a restart.

From `<jira-install>/atlassian-jira/WEB-INF/classes/velocity.properties`:

1. Change `class.resource.loader.cache` from true to false
2. Uncomment (remove the # sign from) `#velocimacro.library.autoreload=true`

keep in mind that the next time you upgrade JIRA – or need a new installation for any reason – you will have to manually copy any changes you have made to the JSPs or templates into the new installation of JIRA. If the JSPs or templates have changed in the newer version, you will have to port your customization into them.

'powered by atlassian'
also see clause 7 of the Atlassian End User License Agreement. This states that you must not remove the "Powered by Atlassian" link at the end of this file.

how to modify the footer

The footer can be modified by editing `<install directory>/atlassian-jira/WEB-INF/classes/templates/plugins/footer/footer.vm`

```...```},

```
...<span #if($smallFooter) class="smallfooter" #else class="poweredbymessage" #end>
&nbsp;&nbsp;&nbsp; #if ($longFooterMessage)Powered by #end<a href="$externalLinkUtil.getProperty('external.link.jira.product.site')"
class="smalltext">Atlassian JIRA</a>&nbsp;&nbsp;&nbsp; the Professional &lt;a href="$externalLinkUtil.getProperty('external.link.jira.product.site')">Issue Tracker</a>&lt;/a&gt;

&nbsp;&nbsp;&nbsp; &lt;a href="$externalLinkUtil.getProperty('external.link.jira.raise.issue')">Bug/feature request</a>&lt;/a&gt;

&nbsp;&nbsp;&nbsp; &lt;a href="$externalLinkUtil.getProperty('external.link.atlassian.news')">Atlassian news</a>&lt;/a&gt;

</span>

\#if($smallFooter)

\#end

</div>```

Keep in mind the considerations about modifying jira templates and JSPs. Restart JIRA after your customization in order for it to take effect.

Related Pages

- Changing the Size of the Text Area Custom Field

'Road Map', 'Change Log ', and 'Versions' Project Tabs Are Not Visible

Sometimes users cannot view the Road Map, Change Log, and Versions project tab panels under the Browse Project page. By default, Road Map, Change Log and Versions tab panels will be visible if at least a version is created on the project.

However, there are times that the Road Map, Change Log, and Versions project tab panels are still not visible despite having a version on the project. This is usually because the Fix version/s field is configured as hidden or the Road Map Panel, Change Log Panel, and Versions Panel plugin has been disabled in Project Panels Plugin.

For more information, please refer to Generating Reports and Specifying Field Behavior.

To enable the plugin modules, go to Administration > System > Plugins > Project Panels Plugin and enable the following:

- Road Map Panel
- Change Log Panel
- Versions Panel

This will enable these tab panels to appear on the Browse Project page.

Why Do Linked Issues in JIRA Appear with a Strike-Through

JIRA shows linked issues as closed, even though they are open. There are no corresponding error messages found in JIRA’s logs. This is caused by issues in the JIRA database having an invalid resolution. The following SQL query can be executed to confirm this:

```sql
SELECT pkey, resolution FROM jiraissue WHERE resolution NOT IN (SELECT id FROM resolution);
```

To fix the problem, run this SQL statement and reset the resolution to UNRESOLVED for the issues with invalid resolution.

```sql
UPDATE jiraissue SET resolution = NULL WHERE resolution NOT IN (SELECT id FROM resolution);
```

How to Enable the FishEye Plugin from the Plugin Administration Screen

When navigation to the Fisheye Plugin page under, Administration > Plugins > FishEye Plugin, JIRA shows that the plugin is disabled and the enable link to activate the plugin is missing. This occurs if the FishEye plugin was disabled in a previous version of JIRA. After an upgrade of JIRA, the enable link in Plugin Administration is missing. First paste the following URL into your web browser as the JIRA Administrator:

http://<JIRA--BASE_URL>/secure/admin/jira/ViewPlugins.jspa?mode=enable&pluginKey=com.atlassian.jira.ext.fisheye

If that fails to resolve the issue, then run the following SQL Query:

```sql
Please backup your data before running any SQL queries.
```
How to Add the Priority Field Into the Email Subject

You wish to add the priority into the Email Notification subject line that JIRA sends out when an issue is created or updated. This feature is available as of JIRA 4.1. More information on this feature can be found in our blog or in Customizing Email Content.

How to Change the Number of Rows Allowed in the Text Type Custom Field Renderer

Atlassian does not support customisations to Velocity templates or other JIRA files. For more information about Atlassian support, see Atlassian Support Offerings.

Deploying Velocity Templates without a Restart

In a development instance, you can play with picking up velocity file changes without a restart. From `<jira-install>/atlassian-jira/WEB-INF/classes/velocity.properties`

1. Change class.resource.loader.cache from true to false
2. Uncomment (remove the # sign from) `#velocimacro.library.autoreload=true`

Keep in mind that the next time you upgrade JIRA – or need a new installation for any reason – you will have to manually copy any changes you have made to the JSPs or templates into the new installation of JIRA. If the JSPs or templates have changed in the newer version, you will have to port your customization into them.

The default Free Text Custom Field editor renders as a textarea that is 4 lines long. This may be too small for comfortable data entry and editing. The functionality that controls the behavior of that field is hardcoded in file `<install directory>/atlassian-jira/WEB-INF/classes/templates/plugins/fields/edit/edit-textarea.vm`. Edit all occurrences of parameter `rows` in the `edit-textarea.vm` file to the desired value and restart JIRA for the changes to take effect.

How to Make a Federated JIRA Instance

This page discusses some of the options around integrating one JIRA instance with another, when trying to update an issue in one instance based on an update from another.

The solution is fairly complex, and Atlassian recommends working with a partner on a solution.

Options

- Option one is to use a notification scheme from the original instance, then a Create or Comment Mail Handler on the destination instance, to update the tickets across instances.
- Option two is to use a Jelly Service and the remote Api script to do something similar. You’d have to watch out for both problems above as well.

Challenges

A couple challenges with either approach:
1. You can run into a loop, where one instance updates the other, then vice-versa, ad infinitum.
2. You have a challenge of mapping which issue from the source maps to which issue from the destination.
   We thought you might be able to use a custom field from the source instance, then populate that with the
   issue from the destination instance, but you’d still need a bit of customisation from your mail handler to
   parse the email to do that mapping.

Consult our partner network for guidance.

**How to Remove 'Unknown' Option from 'Component' and 'Fix Versions'**

There is always an Unknown option in Component and Fix Version/s fields when creating/editing an issue.

To remove the field, make the Components and Fix Version/s field a required field in field configuration
Adm
inistration >> Issue Fields >> Field Configurations. This will cause the Unknown option to
disappear and also make the field as a mandatory field on Create Issue screen. For more information
on field configuration, please refer to our documentation on Specifying Field Behavior.

**Automatic Escalation of issues**

JIRA does not have the ability to auto-escalate issues meeting a certain criteria. There are a two solutions on
how to implement Automatic Escalation in JIRA:

1. By using a Jelly script, issues that meet a certain criteria from a filter can be made to perform an action as
described in the Jelly Escalation documentation.
2. Users/groups can also be notified with subscription to filters (e.g. Users can be periodically notified if an
   issue has been update for the last 2 days). Please refer to Receiving Search Results via Email for more
   information.

**How to Activate Header Row for Subtask List in Issue Detail View**

Warning: Atlassian does not support customisations to Velocity templates or other JIRA files. For more information
about Atlassian support, see Atlassian Support Offerings.

**Deploying Velocity Templates without a Restart**

In a development instance, you can play with picking up velocity file changes without a restart.
From /atlassian-jira/WEB-INF/classes/velocity.properties:

1. Change class.resource.loader.cache from true to false
2. Uncomment (remove the # sign from) velocimacro.library.autoreload=true

Keep in mind that the next time you upgrade JIRA – or need a new installation for any reason – you will
have to manually copy any changes you have made to the JSPs or templates into the new installation of
JIRA. If the JSPs or templates have changed in the newer version, you will have to port your
customization into them.

Some times it is nice to display the header row when viewing a list of sub-tasks in the Issue Detail view. There
was a post about this in our forum community: [http://forums.atlassian.com/thread.jspa?threadID=27500](http://forums.atlassian.com/thread.jspa?threadID=27500)

In order to accomplish this, it is necessary to modify directory>/atlassian-jira/includes/panels/issue/view_subtaskissues.jsp. Then implement
the following method. setDisplayHeader as follows:

```java
layout.setDisplayHeader(true);
```

Restart JIRA for the change to take effect.

Warning: this is not applicable for JIRA version 4.4 and above as the view_subtaskissues.jsp file no longer exist

**How to Limit the Number of Characters Entered in a Summary Field**
To limit the number of characters entered in a summary field modify, the following velocity file `<installation directory>/atlassian-jira/WEB-INF/classes/templates/jira/issue/field/summary-edit.vm`. Please restart JIRA after the changes have been made. Note, these changes will also affect the size of summary fields for existing issues.

> Atlassian does not support customisations to Velocity templates or other JIRA files. For more information about Atlassian support, see Atlassian Support Offerings.

**Deploying Velocity Templates without a Restart**

In a development instance, you can play with picking up velocity file changes without a restart. From `<jira-install>/atlassian-jira/WEB-INF/classes/velocity.properties`:

1. Change class.resource.loader.cache from true to false
2. Uncomment (remove the # sign from) #velocimacro.library.autoreload=true

> Keep in mind that the next time you upgrade JIRA – or need a new installation for any reason – you will have to manually copy any changes you have made to the JSPs or templates into the new installation of JIRA. If the JSPs or templates have changed in the newer version, you will have to port your customization into them.

**JIRA’s Timestamp Doesn’t Match the System Time**

This can occur from one of two reasons:

**First Scenario:**

Timestamps shown in the JIRA UI don’t match the users’ timezone but that of the server location. The timezone used is a JVM system property which defaults - unless specified - to that of the hosting operating system. It is not possible to localize the timezone on a per-user basis. It is possible to change the JVM timezone by setting the following JVM command line property: `-Duser.timezone=<TZ>`. Possible values are in the `zoneinfo` format (please see this list of zoneinfo time zones).

---

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Second Scenario:

JIRA's date/time may not have been updated after day light savings has taken affect - this is generally an issue with older versions of JAVA.

Upgrading JVM to the latest version will solve the problem. Please download the latest version from java.sun.com.

For further reference, see the following document:

- [http://www.atlassian.com/software/jira/docs/latest/java.html](http://www.atlassian.com/software/jira/docs/latest/java.html)

### How to Attach a File During Issue Creation

It is possible to attach files during the issue creation screen. Attachment is a field which must be configured to display on the issue creation screen.

1. Under Administration >> Issue Fields >> Field Configuration, ensure that the Attachment field is not hidden.
2. Inspect JIRAs Screen Schemes and see this article on how Screens are associated with Issue Operations. Once you've identified the screen that's used for Issue Creation, ensure that the Attachment field is there.

### How to Remove Duplicate Entries for Names and Groups

There are duplicate entries for names and groups in User browser and Group Browser. This is caused by the `<install directory>`WEB-INF/classes/osuser.xml file having the providers defined twice.

Make sure there are no duplicate entries in WEB-INF/classes/osuser.xml. If the JIRA installation type is WAR/EAR, please re-deploy WAR and restart JIRA. If the solution above does not address problem, try re-indexing JIRA, followed by a restart.

Severity: Low
Article ID: JIRAKB104300816

[http://support.atlassian.com/browse/JSP-15344](http://support.atlassian.com/browse/JSP-15344)

### How to Export Users to CSV from JIRA

Sometimes it is useful to get a list of users exported to CSV for various purposes. JIRA doesn't currently have this functionality but you can leverage various database functionalities to do this.

Run one of the following queries specific to your database. The output will consist of the id, username, first, and last name of the users.

#### MySQL

```sql
select id, user_name, lower_first_name, lower_last_name into outfile '/tmp/jirausers.csv' FIELDS TERMINATED BY ',' OPTIONALLY ENCLOSED BY '"' LINES TERMINATED BY '\n' from cwd_user;
```

- **this will not** include headers

#### PostgreSQL

- Always back up your data before performing any modification to the database.
copy cwd_user(id, user_name, lower_first_name, lower_last_name) to '/tmp/jirausers.csv' delimiters',' CSV HEADER;

---

### How Come JIRA does Not Show Direct SQL Data Modifications

Direct database modifications are not supported by Atlassian. Always back up JIRA's database before performing any modification to it.

When making direct database modification queries (INSERT, UPDATE, DELETE), the changes are not reflected in the data presented on the application UI. The JIRA application has been written under the assumption that one instance will have exclusive access to the database schema. Some of the data is cached by the application and those caches are updated only when the application is aware that these have been changed. For the changes to be reflected:

1. Restart the application.
2. Perform any automated, scripted or mass edit through the application itself using one of the provided facilities:
   - JIRA RPC plugin
   - Jelly Scripting
   - Bulk Operations

---

### How to get JIRA Pages to Render when URL Contains an Underscore

When logging into JIRA through Internet Explorer with a URL that includes underscore (`http://mycompany_jira.com`), it will redirect every login attempt back to the login page. Logging in through Firefox renders correctly.

This problem is specific to Internet Explorer. Internet Explorer is compliant with the [RFC](https://tools.ietf.org/html/rfc3986) that defines the validity of an URL. An URL considered invalid in the RFC rules if the URL contains an underscore (`"_"`). This also could be caused by the base URL and Apache.

This can be resolved with either of the following methods:
1. Connect JIRA using the IP address or use "localhost" if it is on the same machine.
2. For a long term solution change the defined URL that doesn't contains an underscore.

---

### How to disable or enable the GOT FEEDBACK button

In Early Access Program (EAP) releases, or in copies of JIRA running an evaluation license, JIRA displays a 'GOT FEEDBACK' link at the top right of all pages.

This link provides an easy way for any JIRA user to provide Atlassian with feedback about JIRA, which importantly influences how JIRA is improved in future versions.
Some JIRA administrators, however, prefer that such feedback is coordinated via them and so prefer to remove this feedback link. (However, Atlassian hopes you will pass this feedback on! Especially given that EAP releases are provided specifically so we can get early feedback on releases! And of course no one should be using Early Access Program releases in production.... Right?!)  

To remove the 'GOT FEEDBACK' link:

1. Log in as a user with the JIRA System Administrators global permission.
2. Choose > Add-ons. The 'Find add-ons' screen shows add-ons available via the Atlassian Marketplace. Choose Manage Add-ons to view the plugins currently installed on your JIRA site.
3. In the dropdown next to the Filter visible add-ons field, choose System.
4. Enter JIRA Feedback Plugin in the Filter visible add-ons field.
5. Click the JIRA Feedback Plugin row in the table to expand the entry and choose Disable.

Alternatively, you can remove it using the command line:

1. Shutdown JIRA.
2. Browse through JIRA Install folder.
3. Open setenv.bat inside the bin folder.
   - Back up this file, in case anything goes wrong.
   - If you are using Linux, then browse through the bin folder and open setenv.sh.
4. On set JVM_REQUIRED_ARGS= (after all the existing parameters) insert the following line:
   ```
   -Datlassian.disable.issue.collector=true
   ```
5. Save the file.
6. Restart JIRA

**Note:** If you are using JIRA OnDemand, you will not be able to disable this button. Please raise a support request and our support team can assist you with this (see Getting Help).

Reduce the number of users synchronised from LDAP to JIRA

If you have connected JIRA to an LDAP directory for authentication, user and group management, you may want configure JIRA to synchronise a subset of users from LDAP rather than all users. There are two reasons for why you might make this change:

- Improving performance — If you have performance issues during synchronisation process, you may be able to improve this by synchronising a subset of data instead. See this knowledge base article for more information: Performance Issues with Large LDAP Repository - 100,000 users or more.
- Reducing your user count (not recommended) — You can synchronise a subset of users to JIRA from LDAP to reduce your user count. This will allow you to count less users against your JIRA license. However, synchronising a subset of users to JIRA from LDAP is not the recommended method for reducing your user count in JIRA. See this FAQ for more information: How do I reduce my user count in JIRA.

Procedure

The procedure for configuring JIRA to synchronise a different number of users from LDAP depends on how you initially set up your LDAP directory. For example, if you have all your JIRA users in one organisational unit and your non-JIRA users in another organisational unit, then you can simply configure JIRA to only synchronise users against a particular DN (distinguished name). However, if your setup is not so simple (e.g. you have your JIRA users and non-JIRA users in the same node), you will need to define an LDAP filter to synchronise the relevant users. Both of these methods are outlined below.

**Synchronising against Base DN, Additional User DN and Additional Group DN**

1. Log in as a user with the JIRA Administrators global permission.
2. Select Administration > Users > User Directories.
   - Keyboard shortcut: g + g + start typing directories.
3. Update the Base DN field, and optionally the Additional User DN and/or Additional Group DN to query
against the directory server as desired.
For example, if you have configured all of your JIRA users in the jira-users organisational unit only, for
your company at mycompany.example.com, your configuration would look like this:

- **Base DN** — dc=mycompany,dc=example,dc=com
- **Additional Group DN** — ou=jira-users

**Defining an LDAP filter**

1. Log in as a user with the JIRA Administrators global permission.
   Select Administration > Users > User Directories.
   **Keyboard shortcut:** `g + g + start typing directories`
2. Update **User Object Filter** and/or **Group Object Filter** fields as desired. The syntax for LDAP filters is not simple and your query will depend on how you have set up your LDAP directory.
   For example, if you have configured only JIRA groups to have 'jira' in the CN, you can use a wildcard search in your filter to find them by setting the **Group Object Filter** as `(objectCategory=group)(cn=*jira*)`

More information on defining LDAP filters is available in the pages linked in the Related Topics section below.

**Related topics:**
- How do I reduce my user count in JIRA
- Performance Issues with Large LDAP Repository - 100,000 users or more
- Unable to Create Issues Due to Exceeded License
- How to write LDAP search filters
- MSDN guide to LDAP search filter syntax

**How do I reduce my user count in JIRA**

You may want to reduce your user count in JIRA if you have *exceeded your user count* or if you want to *change to a lower-tier license* to reduce costs. If you only have a subset of your total users using JIRA, you can reduce your user count by simply configuring JIRA to allow fewer users to log in to JIRA. The methods for reducing your user count in JIRA are described below.

**Procedure**

The **recommended method** for reducing your user count in JIRA is to remove users from all groups with the 'JIRA Users' global permission. This is described in the following knowledge base article: Unable to Create Issues Due to Exceeded License.

Alternatively, if you have connected JIRA to an LDAP directory, you may want configure JIRA to synchronise a subset of users from LDAP rather than all users. This is described in the following FAQ: Reduce the number of users synchronised from LDAP to JIRA. However, this can be a complicated procedure and we recommend that you do not use this method unless necessary.

**Related topics:**
- Unable to Create Issues Due to Exceeded License
- Reduce the number of users synchronised from LDAP to JIRA

**How to Bulk Edit Groups in JIRA**

As in the Managing Groups documentation it is possible to edit group membership directly from the group rather than through the User Browser. There is a system limitation on the number of users you can add to a group at a
time of 100, which limits the amount of users that can be edited at one time. It is possible to add more than 100 members into the group at once and they can be extracted from the database with SQL. This can be done with the below steps.

1. Identify the User Directory the users belong to:

   ```sql
   SELECT id, directory_name FROM cwd_directory
   ```

2. Select all the users from that directory:

   ```sql
   SELECT user_name FROM cwd_user where directory_id = <id from the previous query>
   ```

3. Comma separate them then copy and paste into the User Box:

   ```
   user1, user2, user3, user4, user5, user6, user7, user8, user9, user10, user11, user12, user13, user14, user15, user16, user17, user18, user19, user20, user21, user22, user23, user24, user25, user26, user27, user28, user29
   ```

4. Press the << Join button.

   Please see JIRA-12844 - Ability to limit the number of results in a Search Request for further information on the 100 user limitation.

   **How to enable "Attach Screenshot" on Linux Machine**

   When Attaching a Screenshot in JIRA, a user must go to More Actions and select the the Attach Screenshot link. However, on a Linux machine, this feature is not available.

   **Note:** It is possible to enable this feature as per the below though this feature is not tested on Linux distributions and in hand is not supported by Atlassian Support.

   1. Enable the screenshot applet on Linux

      To enable the "Attach Screenshot" feature on your JIRA instance, add the following line on the jira-config.properties file, which is located on the <JIRA_HOME> directory.

      ```
      jira-config.properties

      jira.screenshotapplet.linux.enabled=true
      ```

      In a new JIRA installations, jira-config.properties file may not initially exist and if so, you will need to create it manually. Create the jira-config.properties file inside <JIRA_HOME> folder.

   2. Restart your JIRA instance

      Once you have modified the jira-config.properties file, restart your JIRA instance for the changes to take effect.
How to Configure Workflow to allow Certain Group to Perform Certain Workflow Transition

Steps in this page are using Scenario below, it might be vary depend on your setup
Only users from "Team Lead" group are allow to CLOSE an issue with Issue Type is Bug

Currently, JIRA is not able to set permission scheme based on issue type. It is a improvement request being filed in [JIRA-5865](https://confluence.atlassian.com/display/JIRA051/Activating+Workflow#ActivatingWorkflow-Creatingaworkflowscheme) - Allow permission schemes to be configured per issue type [RESOLVED](https://confluence.atlassian.com/display/JIRA051/Activating+Workflow#ActivatingWorkflow-Creatingaworkflowscheme). So if we want to allow only certain users to perform a certain transition on specific issue type. It is not possible, however we can achieve this by using Issue Type Workflow Scheme.

For example, if we want to allow only Team Lead to close bug and improvement request in Project A, we can do the follow setup.

1. Create a new Workflow scheme by referring to document below:
   - [https://confluence.atlassian.com/display/JIRA051/Activating+Workflow#ActivatingWorkflow-Creatingaworkflowscheme](https://confluence.atlassian.com/display/JIRA051/Activating+Workflow#ActivatingWorkflow-Creatingaworkflowscheme)
2. Copy the current in-use project A's workflow.
3. In the copied workflow, modify the "close issue" transition > under condition > add a new condition > only allow Team lead group to perform close issue transition. You can refer to page below to learn how to set condition to transition:
   - [https://confluence.atlassian.com/display/JIRA051/Configuring+Workflow#ConfiguringWorkflow-conditions](https://confluence.atlassian.com/display/JIRA051/Configuring+Workflow#ConfiguringWorkflow-conditions)
4. In the new workflow schemes, assign the modified workflow to the scheme by selecting the issue type - bug. Refer to page below for detail steps:
   - [https://confluence.atlassian.com/display/JIRA051/Activating+Workflow#ActivatingWorkflow-Assigndmultipleworkflowsstoaworkflowscheme](https://confluence.atlassian.com/display/JIRA051/Activating+Workflow#ActivatingWorkflow-Assigndmultipleworkflowsstoaworkflowscheme)
5. Repeat step above for improvement request and other issue type.
6. Associated the new workflow scheme to the project.

After that, only users from Team lead group/role are allow to close bug and improvement request, while other issue types are not affected.

How to Create a FishEye's Changeset or Crucible's Review Link on JIRA's Comment or Description

Note, the Application Links Link Rendering Plugin that is recommended on this page is not supported by Atlassian.

There are times when it is convenience to create a FishEye's changeset or Crucible's review link on a JIRA issue's field, such as on a comment or description. An example of this feature would be to write in a comment such as "I found something of interest in r234 that might explain this bug". The string r234 would then automatically be converted into a link to changeset 234 in FishEye.

In order to achieve this, you must:

1. Install the Application Links Link Rendering Plugin.
2. Create a trusted Authentication between JIRA and FishEye (Either Trusted or OAuth)
3. Configure the Comment and Description field to be Wiki Style Renderer

1. Install Application Links Link Rendering Plugin
   - Download the jar file from this link and placed it on `<JIRA-HOME>/plugins\installed-plugins\` directory
• You will need to restart your JIRA instance for the plugin to be installed

2. Create an Application Link between your JIRA and FishEye

• Create an Application link between JIRA and FishEye using OAuth Authentication or Trusted Application
• Make sure that you have created a project link between a Repository in FishEye and with a JIRA project

Do note that as of FishEye 2.9, JIRA does not need to create a project link to FishEye repo. However, in order for this feature to work, the project mapping must exists.

3. Make sure the renderer for the comment and description field are set to Wiki-Style Renderer

1. Go to the page "Administration >> Field Configurations"
2. Open the "Default Filed Configuration" or other field configuration associate to your project.
3. Locate the Comment field and make sure the renderer is set to Wiki Style Render
   - If not, change the render from "Default Text render" to "Wiki Style Render"

Did it work?

How to make the 'Assignee' field required when 'Allow unassigned issues' is turn ON in General Configuration?

The ‘Assignee’ field is required or automatically assigned by default when ‘Allow unassigned issues’ is turn OFF in Administration > General Configuration.

If it set as ON, user will be allow to choose the ‘unassigned’ option and this affect every project in JIRA. In certain use case, some project might need the Assignee field to be required and "unassign" is not an option.

In such case, there is not way to do it by default in JIRA, however this can be achieve by using a third party plugin call JIRA Suite Utilities, which has a set of conditions and validations to personalize workflow of JIRA.

To perform that:

1. Install the JIRA Suite Utilities. For install the plugin please refer to: Managing JIRA's Plugins#InstallingaJIRAPlugin
2. Use the 'Fields Required' validator function in your specified transition. Please refer to: https://studio.plUGINS.atlassian.com/wiki/display/JSUTIL/JIRA+Suite+Utilities+Workflow+Validators
3. Add the 'Assignee' field as required.

How to allow users to view sub-task only but not its parent issue

The subtask's security level is inherited from parents, so generally, if a users are able to view the subtasks, they are able to view the parent issue too and vise-versa.
How can we configure so that they are only able to view subtask?

This is useful in certain use case where we want to assign subtask to users but we doesn't them to view the parent issue due to some restriction.

In this case, it is achievable by using the following steps:

1. Go to Administration > Issues > Fields > Custom fields > Add Custom field > 'User Picker' > 'set values' > Associate with your create sub-task screen > Update_. e.g. Add a custom field named "SubtaskUser".

2. Go to Administration > Issue Security Schemes > 'your current schemes' Operations > Security Levels > 'the level you wish to set' > Add > User Custom Field Value e.g. 'SubtaskUser' > Add

3. Create an sub-task issue by using the security level you just set with the custom field above.
   a. On the create sub-task page, you will see the 'SubtaskUser' custom field and you can choose the specific user who will be able to view the sub-task issue besides those already in the security level.
   b. If you wish to assign the sub-task to the user who is not include in the security level, you may also need to add the user in the 'SubtaskUser' field, otherwise, he/she will not be able to access. (Note: The assignee must have the 'Assignable' permission.)

Now the user will be able to view the sub-task, but not the parent issue.

Why user does not get notification emails when he/she included in Notification Scheme?

If an user is included in the Notification Scheme user groups/project roles, when he/she create an issue or comment on issue, he/she is supposed to get the notification emails.

If others in the same notification scheme all able to receive the notification emails but himself/herself, it means the SMTP email server is working properly. He/she also can get notification emails if other people comment on that issue.

In this case, you need to check on the user profile if the 'Preferences > My changes'

To view your JIRA user profile:
   - Click your user name at the top-right of the browser window.

In 'My changes' you need to set 'Do not notify me' to 'Notify me'.

Note: This feature released since JIRA 5.0.3.

How to change the Date Time Range Picker format to 24h format

You need to make some Advanced JIRA configuration in the jira-config.properties or jira-application.properties file as following content:

<table>
<thead>
<tr>
<th>Preferred Date</th>
<th>Configuration for Date Picker</th>
</tr>
</thead>
<tbody>
<tr>
<td>01/Dec/12 17:04</td>
<td>jira.date.picker.js format=%e/%b/%y</td>
</tr>
<tr>
<td></td>
<td>jira.date.timepicker.js format=%e/%b/%y %H:%M</td>
</tr>
<tr>
<td></td>
<td>jira.date.timepicker.java format=dd/MM M/yy H:mm</td>
</tr>
<tr>
<td></td>
<td>jira.datepicker.java format=dd/MMM/yy</td>
</tr>
</tbody>
</table>
You can refer to the date picker format for different types of date and time formatting.

| 1.10.12 17:04 | jira.date.picker.javascript.format=%d.%m.%y |
|              | jira.date.time.picker.javascript.format=%d.%m.%y %H:%M |
|              | jira.date.time.picker.java.format=d.MM.yy |
|              | jira.date.picker.java.format=d.MM.yy |

What if you wish your Custom Field Appearing in Issue Navigator but not willing to set the context to All issue types

First of all, as mentioned in the KB: Custom Field Not Appearing in Issue Navigator Search Criteria, you HAVE to associate the custom field to ALL issue types. However this will cause other projects to have the unnecessary custom field in their project. There is workaround to hide the unnecessary custom field from these project so it won't appear.

The Desire Result

- With this setup, issue navigator result will show the custom value in the right project even by searching all issue types.
- This custom field will not shown in other projects visually, ie. hide it.

Steps to do that

Steps:

1. Create a screen which does not contain the custom field which you don't need. Copy the current create issue screen and remove the custom field. Let's say 'TestScreen'
2. Copy/create a Screen Scheme and associate 'Create Issue' operation with the 'TestScreen'. Let's say 'Test Screen Scheme'
3. Copy/create an Issue Type Screen Scheme and associate those issue types (which you don't want to have the custom field) with the 'Test Screen Scheme', and other issue types with the original screen scheme (which you are using currently) Let's say 'Test Issue Type Screen Scheme'
4. Go to the related projects and associate the project with the 'Test Screen Scheme'

Why Fix/Affected Version sort differently in issue screen after picking more than one version?

A user may notice that the versions on the issue screen are sorted "randomly". The versions are neither in ascending nor descending order.

Reason Why the Versions Sort Differently

The Versions are sorted according how the project versions are arranged or be scheduled.

For Example:

For screenshot below, you will notice there are all versions added in the project.
On the issue screen, when a user picks up all versions and it will arrange as the image below.

Affects Version/s: 1.4, 1.0, 1.2, 1.1, 1.3
Resolution: Unresolved
Fix Version/s: 1.4, 1.0, 1.2, 1.1, 1.3
Labels: None

Suggestions (for JIRA 5.x)

Arrange from the Project Versions by drag and drop.

Refresh your issue screen.

Affects Version/s: 1.0, 1.1, 1.2, 1.3, 1.4
Resolution: Unresolved
Fix Version/s: 1.0, 1.1, 1.2, 1.3, 1.4

Did it work?

Modify the gadget limit on a dashboard

By default, the amount of gadget on a dashboard has been limited to 20 by default. If you want to change the limit, you can make it to your preferred number:

**JIRA 4.3.x and below:**

1. Proceed to `$jira-install-path/atlassian-jira/WEB-INF/classes/jira-application.properties`
2. Locate this line:

   ```
   jira.dashboard.max.gadgets=20
   ``

3. Change the number to your preferred size
4. Restart JIRA
JIRA 4.4.x and above:

Please note that JIRA property no longer set in jira-application.properties since JIRA 4.4. Instead, you have to copy the key, paste it under jira-config.properties with the value. Please refer to this documentation for further information.

1. Edit or create a file named `jira-config.properties` if it doesn't exist at the root of Jira Home directory.
2. Insert the following (e.g. set the limit to 30):

   ```
   jira.dashboard.max.gadgets=30
   ```

3. Save the file
4. Restart JIRA to reflect the changes.

How to import attachment using CSV

CSV import commonly used for importing mass of issues and some issues comes with attachments. In JIRA version 5.0 and earlier, it is not possible to use FILE protocol to include the attachment. HTTP protocol is the only choice to import attachment to JIRA through CSV.

JIRA 5.0 and earlier have to use HTTP protocol for CSV import, however, JIRA 5.1 and above can use FILE protocol for CSV import.

File Protocol

1. Proceed to your JIRA Home Directory attachments directory (e.g. `<JIRA Home>/import/attachments/`)
2. Create a folder named csvimport and save your attachment within it. In the below example, a test.JPG image file was added to the csvimport directory:

   ```
   <JIRA_Home>/import/attachments/csvimport/test.JPG
   ```

3. Specify the file path within the CSV file.

   CSV file

   Assignee, Summary, Description, Attachment, Comment
   Admin, "Issue demonstrating the CSV attachment import", "Please check the attached image below.", file://csvimport/test.JPG, "01/01/2012 10:10;Admin; This comment works"

   Please note that the path should always use slashes (/), as the file path is specified according to the file URI scheme.

4. Proceed with using the CSV file import wizard.
HTTP Protocol

1. Save the attachment (eg. filename.png) inside the following directory `<JIRA_installation>/atlassian-jira/folder/`.
   
   Example:
   
   `<JIRA_Installation>/atlassian-jira/attach/filename.png`

2. Specify the URL of the 'Attachment' column within your CSV file.
   
   Example:
   
   `Assignee, Summary, Description, Attachment, Comment
   Admin, "Issue demonstrating the CSV attachment import", "Please check the attached image below.", http://jira-server:8080/attach/filename.png, "01/01/2012 10:10;Admin; This comment works"

3. Proceed with using the CSV file import wizard.

Log work optional view

You can have different view for Log Work, where there is the optional checkbox log work and the other showing the log work fields.

1. To have the Log Work checkbox

   To show the Log work checkbox as following:

   Set the transition screen to have both Log Work and Time Tracking fields.

2. To have the Log Work showing the fields

   To show the Log work fields as following:
Set the transition screen to have only Log Work and not Time Tracking field.

3. If you are facing issue with Log Work checkbox is only showing after work has been logged, even after you have followed the above.

This is because Time Tracking Legacy Mode is turned ON, please turn OFF Legacy Mode by Deactivating Time Tracking in System > Issue Features > Time Tracking and activating it again with untick the Legacy Mode

For more information relating to Log Work and Time Tracking, please refer to the **Logging Work** documentation.

**Receiving Daily Due Date Subscription**

Some people may prefer to receive a daily summary of updated issues, rather than continual notifications each time an issue is updated. To do this, you will need to:

- 1. Set up your search criteria
- 2. Save your search as a 'Filter'
- 3. Subscribe to your Filter

### 1. Set up your search criteria

To find all issues that have **due date before next day**, use the following **Advanced Search** query:

```
duedate < "1d"
```

Otherwise, to find all issues that had **overdue for one day**, use the following **Advanced Search** query:

```
due < "-1d"
```
For example, to find all issues in the "ACME" project that will due in the next day, use the following Advanced Search query:

```
project = "ACME" and duedate < "1d"
```

2. **Save your search as a 'Filter'**

Click the 'Save' link in the 'Operations' column. Type a name for your new filter (e.g. "Joe's Daily Due Date Issues"), then click the 'Save' button.

- For further details, please see Saving Searches ('Issue Filters').

3. **Subscribe to your Filter**

Once you have saved your new filter, click the 'Subscriptions' link in the 'Operations' column. Click 'Add subscription', adjust the default settings if you need to, then click the 'Subscribe' button.

- For further details, please see Receiving Search Results via Email.

**How to add comments to Excel export**

A guide on how to have comment field in Excel export

You can get comments in an issue by using the Word export or subscribing RSS feeds. However, you are not able to do so when doing an Excel export. To make this possible, you will require some plugins to get it work.

1. **Download and install plugin**

- If you wish to have only the last comment to be included in the Excel export, you can use Last Comment Plugin

  - The latest version only compatible up to JIRA 4.4

- If you wish to have all the comments to be included in the Excel export, you can use All comments plugin

  - The latest version only compatible up to JIRA 5.1
  - All comments plugin has been tested in JIRA 5.2 and it is working, however the comment that is being imported is not rendered correctly in the Excel view.

2. **After the install, you will require to add Custom Field that comes with the plugin.**

3. **Include the custom field in the Issue Navigator.**

4. **Do an Excel export.**

A New Feature request can be found in [JIRA-8426 - View comments as a field (eg. in Excel view)](https://jira.atlassian.com/browse/JIRA-8426)
How to change the Original Step in Workflow Transition

When you have already set up the workflow transition for the particular step correctly and realise you have set it up on a wrong Step by mistake. You can change the Destination Step for the workflow transition but you are not able to change the Original Step through JIRA User Interface.

There are two workaround to this:

1. Change the name of the Original Step Name which linked to the particular Workflow transition
2. Do a simple hack in Workflow XML by doing the following

   - View desired workflow
   - Download workflow XML
   - Open it using text editor preferably Notepad++
   - Edit the transition from one step to another, for example:
You will need to cut the code from `<action id>` to `</action>`, and paste it to your desire Steps (`<step id>`) inside the `<actions>`: `<actions>`

- Save the file and do Import from XML in Issues > Workflows

How to Hide the "Configure Fields" Button on the Create Issue Screen

⚠️ Atlassian does not support customizations to JIRA. For more information about Atlassian support, see Atlassian Support Offerings.
By default, during issue creation and issue edit, the “Configure Fields” button will be shown on the top right corner of the pop up (refer to the screen capture below). Some administrator would prefer to hide the button to prevent the users from changing the pre-configured fields.

If a user has a custom view before the javascript modification is implemented (i.e. for instance, the user has previously un-checked some of the fields to hide them), they will not be able to change their view (or re-check the hidden fields) until the customization is removed.

Hiding Jira "Configure Fields" Button without restart

1. For the javascript to run, you will need to paste the coding on the description area of the field since it supports html codings. To do this, actually you have two choices, you can either create a custom field or utilizing a default field on the screen.
2. Similar steps are applicable to both default field or custom field after you created a custom field. However do note that, if you used a custom field, the custom field will be visible to the users and hiding it from Field Configuration will disable the javascript pasted on its description.
3. Navigate to Administration > Issues > Fields > Fields Configurations > Configure to view the list of fields.
4. Choose the field that you wanted to paste the codes on (recommended to paste on Description Field or Comment Field since both of them is without pre-defined descriptions on them).
5. Click on edit to show the Field Description.
6. Paste the codes provided below to the Description field and Update the field.

```javascript
<script type="text/javascript">
(function($) {
    AJS.toInit(function()
    {
        // init on load
        AJS.$("#qf-field-picker-trigger").hide();
    
    })
    JIRA.bind(JIRA.Events.NEW_CONTENT_ADDED, function (e, context) {
        // init on refresh
        AJS.$("#qf-field-picker-trigger").hide();
        });
    })(AJS$);
</script>
```

7. After doing this, you can verify the result by trying to create an issue, the button "Configure Fields" should not be visible anymore. (Refer screen capture below)

How to revert from New Issue Navigator layout to Old layout in JIRA 5.2.x

The content on this page relates to changes which are not recommended or supported by JIRA. Consequently, Atlassian can not guarantee providing any support for it. Please be aware that this material is provided for your information only and using it is done so at your own risk.
After upgrade to JIRA 5.2.x from version prior to 5.2, there will be the new layout of issue navigator. This is a procedure to disable this new issue navigator for the entire JIRA instance.

⚠️ This will not work in versions after 5.2

Please try this in test instance before applying to the production instance.

To do the following, you have to disable some modules in the system plugin:

1. Go to Administration > Add-ons > Manage Add-ons
2. Under System Plugins section, Click on the Show System Plugins
3. Search for plugins named Atlassian JIRA - Plugins - Issue Navigation
4. Click on the plugin and expand the modules
5. In the module lists, disable the following 3 modules:
   - IssueNav kickass-rewrite(kickass-rewrite)
   - Quicksearch kickass-rewrite(quicksearch-rewrite)
   - Clear sorts kickass-rewrite(clearsorts-rewrite)

**How to display the issue type name in issue navigator column beside the image icon**

To achieve this use case, you need to modify the following velocity file: `installation directory\atlassian-jira\WEB-INF\classes\templates\jira\issue\field\issuetype-columnview.vm`.

As an example, which tested in JIRA 5.2.11 and 4.4:

For your information
Please backup the original value vm file first before process any changes, which can allow you to easily roll back. Atlassian does not support customisations to Velocity templates or other JIRA files. For more information about Atlassian support, see [Atlassian Support Offerings](#).

The original value of the file in JIRA 5.2.11

```vm
##disable_html_escaping() TODO REENABLE
#if (!$displayParams && $displayParams.get('nolink'))
  &lt;a href="${requestContext.baseUrl}/browse/${issue.getKey()}">
  #if ($displayParams.textOnly)
  $textutils.htmlEncode($!issuetype.nameTranslation, false)
  #else
  #set ($iconurl = $issuetype.iconUrlHtml)
  #if ($iconurl.StartsWith('http://') || $iconurl.StartsWith('https://'))
    &lt;img src="${iconurl}" height="16" width="16" border="0" align="absmiddle" alt="$textutils.htmlEncode($issuetype.getNameTranslation(), false)"
  title="$textutils.htmlEncode($issuetype.getNameTranslation(), false) - $textutils.htmlEncode($!issuetype.getDescTranslation(), false)"
  #else
    &lt;img src="${requestContext.baseUrl}${iconurl}" height="16" width="16" border="0"
  align="absmiddle" alt="$textutils.htmlEncode($issuetype.getNameTranslation(), false)"
  title="$textutils.htmlEncode($issuetype.getNameTranslation(), false) - $textutils.htmlEncode($!issuetype.getDescTranslation(), false)"
  #end
  #end #if
#end #if
</a>#end
```

The modified issuetype-columnview.vm file

```vm
##disable_html_escaping() TODO REENABLE
#if (!$displayParams && $displayParams.get('nolink'))
  &lt;a href="${requestContext.baseUrl}/browse/${issue.getKey()}">
  #if ($displayParams.textOnly)
  $textutils.htmlEncode($!issuetype.nameTranslation, false)
  #else
  #set ($iconurl = $issuetype.iconUrlHtml)
  #if ($iconurl.StartsWith('http://') || $iconurl.StartsWith('https://'))
    &lt;img src="${iconurl}" height="16" width="16" border="0" align="absmiddle" alt="$textutils.htmlEncode($issuetype.getNameTranslation(), false)"
  title="$textutils.htmlEncode($issuetype.getNameTranslation(), false) - $textutils.htmlEncode($!issuetype.getDescTranslation(), false)"
  #else
    &lt;img src="${requestContext.baseUrl}${iconurl}" height="16" width="16" border="0"
  align="absmiddle" alt="$textutils.htmlEncode($issuetype.getNameTranslation(), false)"
  title="$textutils.htmlEncode($issuetype.getNameTranslation(), false) - $textutils.htmlEncode($!issuetype.getDescTranslation(), false)"
  #end #if
#end #if
</a>#end
```

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
Please restart JIRA after the changes have been made.

The above modified .vm file can demonstrate the following effect as an example:

Atlassian does not support customisations to Velocity templates or other JIRA files. For more information about Atlassian support, see Atlassian Support Offerings.

Deploying Velocity Templates without a Restart

In a development instance, you can play with picking up velocity file changes without a restart. From `<jira-install>/atlassian-jira/WEB-INF/classes/velocity.properties`:

1. Change `class.resource.loader.cache` from true to false
2. Uncomment (remove the # sign from) `#velocimacro.library.autoreload=true`

Keep in mind that the next time you upgrade JIRA – or need a new installation for any reason – you will have to manually copy any changes you have made to the JSPs or templates into the new installation of JIRA. If the JSPs or templates have changed in the newer version, you will have to port your customization into them.

How to Edit Bundled or System Plugins
This is a guide on how to edit the bundled or system plugins in JIRA. It is highly not recommended unless necessary as it may corrupt the plugins.

**Modifying Contents of Bundled Plugins**

⚠️ Please note that this will only work if the bundled plugin has not been upgraded/modified.

Before you begin:

- **Backup** atlassian-bundled-plugins.zip file in <jira-install>/atlassian-jira/WEB-INF/classes.

To modify its content:

1. Unzip the atlassian-bundled-plugins.zip file.
2. Replace customized plugin jar in place of the existing jar file. You can either build the customized jar file from its source or just extract the jar, modify the files and create it back.
3. Zip all the jars back with the same name: atlassian-bundled-plugins.zip
4. Restart JIRA. It should take effect now.

**How to auto disable compatibility mode in Internet Explorer**

⚠️ The content on this page relates to platforms which are not supported by JIRA. Consequently, Atlassian can not guarantee providing any support for it. Please be aware that this material is provided for your information only and using it is done so at your own risk.

⚠️ The following workarounds were provided by other users who facing the same problem. Please always generate a backup of the file before any customization to ensure a revert is possible.

**JIRA 4.4.x:**

1. Open the file <JIRA_INSTALL>/atlassian-jira/include/decorators/header.jsp and <JIRA_INSTALL>/atlassian-jira/include/decorators/header-deprecated.jsp
2. Make a backup of header.jsp and header-deprecated.jsp
3. In the head tag of both files, add in the meta tag code from:

   ```html
   <head>
   ...
   </head>
   ```

   to:

   ```html
   <head>
   <meta http-equiv="X-UA-Compatible" content="IE=7,IE=8,IE=9" />
   ...
   </head>
   ```
4. Restart JIRA

JIRA 6.x:

1. Open the file `<JIRA_INSTALL>/atlassian-jira/decorators/general.jsp`
2. Make a backup of general.jsp
3. In the head tag, change the following code from:

   ```html
   <head>
   <script type="text/javascript">
   if (!window.performance) {
       window.mpPerformance = {}; 
       window.mpPerformance.responseStart = new Date().getTime();
   }
   </script>
   <%= include file="/includes/decorators/aui-layout/head-common.jsp" %>
   <%= include file="/includes/decorators/aui-layout/head-resources.jsp" %>
   </head>
   ```

   to:

   ```html
   <head>
   <%= include file="/includes/decorators/aui-layout/head-common.jsp" %>
   <%= include file="/includes/decorators/aui-layout/head-resources.jsp" %>
   <script type="text/javascript">
   if (!window.performance) {
       window.mpPerformance = {}; 
       window.mpPerformance.responseStart = new Date().getTime();
   }
   </script>
   </head>
   ```

4. Restart JIRA

**How to attach an attachment in a JIRA issue using REST API**

Upload the original_image.jpg using the following REST API code:

```
curl -D -u {username}:{password} -X POST -H "X-Atlassian-Token: nocheck" -F "file=@{path/to/image}" http://{base-url}/rest/api/2/issue/{issue-key}/attachments
```

For more information, please review our JIRA REST API code: [https://docs.atlassian.com/jira/REST/latest/#idp2011456](https://docs.atlassian.com/jira/REST/latest/#idp2011456)

> At the moment, JIRA do not have the essence of encoding binary data.

**How to restore a single attachment to an issue**

This guide will explain on how to restore a single attachment to an issue. Let say a user has accidentally deleted an important attachment from an issue, and you have a backup `/data/attachments` directory elsewhere.
Since JIRA 4.2, there were Changes to Attachment Creation so that JIRA now saves the attachment using an attachment ID instead of the attachment file name.

### On this page:
- Restoring a single attachment

### Related pages:
- Configuring File Attachments
- Attaching a File

### Restoring a single attachment

In order to restore the single attachment you need the following:

- A backup of /data/attachments/ directory
- The file type of the attachment that is accidentally deleted

### To restore the attachment:

1. Go to the backup /data/attachments/ directory
2. Open the attachments directory down to the folder of the issue key (Eg. /data/attachments/DEMO/DEMO-1/)
3. Compare the IDs in the directory with the existing ID from an attachment URL in the JIRA issue. For example the attachment ID below is 667983

   ![Attachment ID](http://your-jira/secure/attachment/667983/EditProjectRoles.png)

   Since you have deleted the attachment, it won't exist in the issue. However, you can refer to this step to identify the missing attachment ID with the attachments in the backup directory.

4. (Assume the deleted attachment ID is 667980) Copy the file 667980 to a temp directory
5. Rename the copied file 667980 to 667980.png (Assuming the attachment that was deleted is a PNG file type)
6. Upload the file 667980.png to the issue referring to Attaching a File to an Issue

### Why not able to edit assignee in issue screen?

If an assignee field is not associate with the screen scheme, then assignee field will not be edited. If you want to edit the assignee field, please go to project issue type screen and make sure the assignee fields is there.

- **If the assignee field is appear in edit screen, you may need to check the following information:**
  - Does the user has the Assign Issues permission?
  - Does the assignee has the Assignable Issues permission?
  - Try use Permission helper via System -> Add-ons -> Admin Helper. (Permission Helper looks at each condition which could determine whether the user has permission or not, and offers advice on how to change the settings.)
  - If you need further help, please file a ticket to our Atlassian Support System.

### How do i turn off notification when new user is created using SOAP API

Currently, JIRA do not have the control of turning off the notification being sent out after create a new user using SOAP API. Moreover, SOAP API is deprecated as of JIRA 6.0. For more information, please click on this documentation.

### JIRA does not pick up the data after running an UPDATE or DELETE SQL statement

There is a lot of data not updated in JIRA when running an UPDATE or DELETE SQL statement. The reason is that the JIRA cache does not update the data in memory dynamically. After restarting JIRA the cache of the...
database values will be updated.

⚠️ Please backup first before you proceed when running any UPDATE or DELETE statement in the JIRA database.

**Where is my pkey and issue name stored in JIRA 6.1 database?**

The `jiraissue` table does not contain the value for the issue in the `pkey` column starting from JIRA 6.1. It is now a combination of two values:

- `pkey` column in the `project` table
- `issuenum` column (a new column) in the `jiraissue` table

ℹ️ For more information, please refer to the Preparing for JIRA 6.1 documentation.

**Why is Resolution Date set on Unresolved Issues after a CSV import**

If you import issues and map with "Unresolved" resolution field, it would cause this problem to happen. Basically after mapping the resolution field, JIRA will recognize the resolution field as Resolved before (even if you put "Unresolved" in the Resolution). For more information, read Defining 'Resolution' Field Values article as quoted:

> Any issue that has the Resolution field set is treated by JIRA as "resolved". The Issue Navigator displays Unresolved when no resolution is set for an issue. So adding a resolution named Unresolved and setting it in an issue will mean that the issue is seen by JIRA as resolved. This will lead to confusion and is not recommended.

In the end JIRA will recognize the resolution date as the current date and time. For example:

🔍 So, what is the workaround for that?

Please try the workaround as per How to clear the resolution field when the issue is reopened article and do a Modifying Multiple (‘Bulk’) Issues.

**How to enable HTML Macro in JIRA**

⚠️ Caution: Including unknown HTML inside a web page is dangerous.

Because HTML can contain active scripting components, it would be possible for a malicious attacker to present a user of your site with script that their web browser would believe came from you. Such code could be used, for example, to steal a user's authentication cookie and give the attacker their Confluence login password.

By default, the HTML macros are disabled. You should only turn on these macros if you trust all your users not to attempt to exploit them.
To use HTML macro in wiki renderer field, it has to be enabled from the system add-on as the add-on module was disabled by default:

1. Login as JIRA System Administrator
2. Proceed to Administration >> Add-ons >> Manage Add-ons
3. From the drop down, select System
4. Search for Wiki Renderer Macros Plugin
5. Expand the plugin and further expand the module list
6. Look for html module and enable the module

---

**How to Set Monday as First Day of Week in Date Picker Calendar**

Some company required their date picker to show Monday as the first day of the week. To achieve that, you can do the following:

1. Go to Administration >> System >> User Interface >> Look and Feel
2. Scroll under "Date/Time Formats" section
3. Look for Use and check the ISO8601 standard in Date Picker checkbox
4. Update the field value

---

**Adding custom content to the front page**

Custom HTML content can be easily added to the dashboard by a JIRA administrator.

For example, to customize the text that appears on users' dashboards, click on General Configuration, click 'Edit Configuration', and edit the Introduction field.

Note that look and feel can also be customized (e.g. add your organization's logo and/or preferred color scheme).

Additionally, the announcement banner is useful for sending broadcasts to all JIRA users.

**Allow editing of Closed Issues**

By default, it is not possible to edit an issue while in the "Closed" state. If you would like to allow editing of closed issues, this can be done by editing the workflow (see Configuring Workflow), and removing the jira.issue.editable flag from the Closed step. The steps are as follows:

1. Find the active workflow that applies to the issues you wish to change. This is most easily done by going to the 'Workflow Schemes' admin page, then clicking on the Workflow link in the row applying to the issues' project and issue type.
2. It is not possible to edit an active workflow, so you will need to either make a copy (if using the default jira system workflow) or draft of the workflow, and edit that.
3. On the View Workflow Steps page, in the 'Closed' step's row, click 'View Properties'.
4. You should see a jira.issue.editable property with value false. Delete it, or set the value to true.
5. Publish your draft workflow, or if editing a copy, activate the workflow by creating a new workflow scheme associated with the edited workflow, and then associating it with your project.

---

Error rendering macro 'kbsurvey' : null

Help us improve!
This property and a number of others are also discussed at Workflow properties.

Allowing users to create issues anonymously

JIRA can be configured to allow users to create issues without having logged into JIRA. There are two related actions:

1. Allowing users to browse and search issues in the project without logging in.
2. Allowing users to create issues in that project without logging in.

These can be achieved by adding the Anyone group to the Browse Project and Create Issue permissions in the permission scheme for the project. Additionally, Reporter, in the project's field configuration scheme, must be set as optional.

Any issue created by a user who is not logged in will display 'Anonymous' for the reporter of the issue.

Anonymising JIRA Data

Support requests are often resolved significantly faster if a data export is provided as it will allow our legendary supporters direct access to a copy of your instance. We understand that sometimes this may be a difficult option due to the sensitivity of your data and have written an anonymising tool to handle this particular scenario.

Anonymising JIRA Data:

The JIRA inbuilt backup functionality will produce a ZIP file containing either 1 or 2 XML files, depending on the version that is being used. These files are a copy of the entire contents of JIRA's database, encoded in XML, that can be used to restore an instance - we have further detail on this in our Automating JIRA Backups documentation.

As of JIRA 4.4, the backup functionality will produce a ZIP file that contains 2 XML files. These files will be activeobjects.xml and entities.xml. Only entities.xml will need to be anonymised - please do not attempt to anonymise the activeobjects.xml. For versions prior to 4.4, only one XML file will be produced with the same naming convention as the ZIP it is compressed as (for example 1970-Jan-01-0001.zip will expand to 1970-Jan-01--0001.xml).

1. Ensure that the JAVA_HOME variable has been configured, as in our Setting JAVA_HOME documentation.
2. Download the JIRA Anonymiser.
3. Create a temporary directory.
4. Unzip the anonymizer in the temporary directory.
5. Unzip the JIRA backup ZIP file (for example 1970-Jan-01--0001.zip) in the temporary directory.
6. Anonymise the backup file with the below commands:

   $ java -Xmx512m -jar joost.jar <JIRA BACKUP>.xml anon.stx > <NAME OF ANONYMISED BACKUP>.xml

   For example, this would be anonymising a JIRA backup with the naming convention from JIRA 4.4+:

   $ java -Xmx512m -jar joost.jar entities.xml anon.stx > anon-entities.xml

   Depending on the size of the backup, additional memory may need to be allocated to the JVM. In order to do this, increase the value of the Xmx in increments of 128m.
7. Compress the generated anonymised XML backup file (e.g: anon-entities.xml) and the activeobjects.xml (JIRA 4.4.x only) into a ZIP or tarball.
8. Attach that ZIP or tarball onto the support issues as raised on support.atlassian.com.
9. The temporary directory can now be removed.
The screenshot below is a simple example of how it is run in the command prompt of Windows XP:

```
C:\WINODWS\system32\cmd.exe
C:\jira_anon}\java -jar joost.jar ..\jira_data.xml anon.stx > jira_data_anon.xml
C:\jira_anon}..
```

Information about the Anonymiser:

The anonymiser currently replaces the following text with x’s:

- Issue summary, environment, and description.
- Comments, work logs, change logs.
- Project descriptions.
- Descriptions for most elements (notification schemes, permission schemes, resolutions).
- Attachment file names.
- "Unlimited text" custom fields.

Please check the anonymised backup, anon-backup.xml, to ensure it's clean enough for the needs of your organisation before sending it to Atlassian.

Problems:

*Invalid XML Characters*

If, when the anonymiser runs, an error indicates that there are invalid XML characters in the XML backup of the database, run our utility to remove invalid XML characters first before anonymising.

**Appending Email Addresses to Comments Made by Anonymous Users when Using a Mail Handler**

To append email addresses to comments made by anonymous users when using a mail handler, follow the instructions below.

- There is a feature request at JRA-21468. Vote to have this included in the product.

Follow the instructions in How to make a JIRA patch.

1. Modify AbstractCommentHandler.java by adding 6 more lines after line 81, after the code block under if (body != null):
// append the From address at the end of body
body += "\n[Commented via e-mail ";
if (message.getFrom() != null && message.getFrom().length > 0)
    body += "received from: " + message.getFrom()[0] + "]";
else
    body += "but could not establish sender's address."

2. Place the compiled .class file under <jira-install>/WEB-INF/classes/com/atlassian/jira/web/action/iss
ue/AbstractCommentableIssue.class
3. Restart JIRA

⚠️ Tested on JIRA 3.13.5

**Asking for an attachment on the Create Issue page**

To prompt for an attachment on the Create Issue page, go to the relevant Field Configuration page (eg. Administration -> Issue Fields -> Field Configurations -> Default Field Configuration), and unhide the 'Attachment' field.

**Automatically Populate Timezone from a Created Issue**

Atlassian Support likes to use customers' timezones to respond more effectively to support tickets. We extract timezone information automatically, so customers don't need to enter it manually. To do that, we add JavaScript to our custom field description:

⚠️ No longer works starting JIRA 4.4

This Javascript no longer works starting from JIRA 4.4. It only works up until JIRA 4.3.
Your timezone. The value is set automatically from your browser, so please only modify if it's incorrect. <br>
<a href="http://www.worldtimezone.com/" target="timezone">World Timezones</a></b>

<script language="JavaScript">
<!--
function setCustomerTimezone()
{
  tzlist = document.getElementById("customfield_10421");
  if (tzlist) {
    if (/CreateIssueDetails.jspa/.test(tzlist.form.action)) {
      // Value has not yet been set if (tzlist.value == -1) {
        offset = new Date().getTimezoneOffset() / 60; // hours from GMT
        if (offset <= 0) { tzlist.value="GMT+"+(offset);  }
        else { tzlist.value = "GMT-"+offset; }
      //   }
    }
  }
}

window.onload = setCustomerTimezone;
//-->
</script>

**Can I store customer details, like company, address and contact information, in JIRA?**

JIRA itself stores only minimal user data (username, name, email, preferences). Since JIRA 3.7, you are able to store data in user 'properties'. You can store each customer detail as a separate user property, or create a wiki page for the customer and link to that instead. You could do this in Confluence by adding a Customer space and creating a page for every customer with their details. Then in JIRA, add a user property containing the link to that customer's page.

An alternative is to store user data in an LDAP server such as Active Directory or OpenLDAP. You can then authenticate users in JIRA against their LDAP password (see Configuring LDAP) and link to their full LDAP profile if available online.

There is also an open feature request for improved user properties at JIRA-6354. You may wish to sign up for a user account and vote or comment to help influence our product roadmap.

**Change JIRA Browser Icon**

The JIRA logo is displayed in the user's browser to identify the JIRA browser tab. To use a custom image for your JIRA site:

1. Obtain or create an image in PNG file format. To maximise browser compatibility, it should be 32x32 pixels, 71x71 DPI and have 8 bit color depth.
2. In your JIRA install, find the <jira-installation-directory>/atlassian-jira/images/icons directory (assuming you are using a 'recommended' distribution of JIRA).
3. Backup the file favicon.png
4. Replace the favicon.png with your custom PNG image.
   - You may also need to backup and replace the following images in your JIRA Installation Directory:
     - <jira-installation-directory>/atlassian-jira/favicon.ico
5. Restart your application server.

Users may need to clear their browser cache to view the new image.

**Changing Custom Field Types**

You generally can't shift between custom field types since the data type they store may not match.

**Before you begin**

⚠️ Please note that editing the database or any XML backup is not supported by Atlassian.

Always **back up** your data before performing any modifications to the database. If possible, try your modifications on a test server.

**Migrating custom field content manually**

One workaround is to use bulk edit operations to migrate content:

⚠️ Please note that this workaround is only applicable when you have many issues containing the same custom field value. As a scenario let's say you have 100 issues, and each issue have different value for the custom field, it will be very difficult for you to perform the migration by using the steps below.

1. Create a new field.
2. Using **Advanced Searching**, search for all the instances of the old field.
3. Using a **bulk edit** operation, populate the new field with the value of the old field for all the issues found. If some issues are closed, you may have to see **Allow editing of Closed Issues**.
4. Repeat this process for all values in the field.
5. Delete the old field, or remove it from the screen scheme.

**Upgrading custom fields**

⚠️ There have been changes made to the structure of several custom fields which may have caused this article to be outdated. With that, the below instructions may not work for JIRA versions 4.4+

More details on the field changes found here: [Plugin Developer Notes for JIRA 4.4#Single-andMulti-SelectCustomFieldChanges](#)

Certain fields can be safely **upgraded**, such as Version and Select lists to their multiple values counterpart. You can change the "customfieldtypekey" in the "customfield" table to whatever you need it to be. The table below lists the keys for commonly changed fields.

<table>
<thead>
<tr>
<th>Custom Field Type</th>
<th>Type Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single Version</td>
<td>com.atlassian.jira.plugin.system.customfieldtypes:version</td>
</tr>
<tr>
<td>Multi Version</td>
<td>com.atlassian.jira.plugin.system.customfieldtypes:multiversion</td>
</tr>
<tr>
<td>Single Select</td>
<td>com.atlassian.jira.plugin.system.customfieldtypes:select</td>
</tr>
<tr>
<td>Multi Select</td>
<td>com.atlassian.jira.plugin.system.customfieldtypes:multiselect</td>
</tr>
<tr>
<td>Multi User</td>
<td>com.atlassian.jira.plugin.system.customfieldtypes:multiuserpicker</td>
</tr>
</tbody>
</table>

When moving back from a multi select list a select list, you **have** to make sure that only one item is selected for each multi select list.

When moving from multi-select to multi-user, you **have** to ensure that each select-list value is a username. (user
For select lists, you also need to update the "customfieldsearcherkey" field to use an appropriate searcher:

- For multi-selects, it is "com.atlassian.jira.plugin.system.customfieldtypes:multiselectsearcher"
- For select lists, use "com.atlassian.jira.plugin.system.customfieldtypes:selectsearcher"
- For multi-user pickers, use "com.atlassian.jira.plugin.system.customfieldtypes:userpickersearcher"

**Examples**

For example if you want to update all the version custom fields to become multiple version custom fields, you can use the SQL below.

```sql
UPDATE customfield
SET customfieldtypekey = 'com.atlassian.jira.plugin.system.customfieldtypes:multiversion'
WHERE customfieldtypekey = 'com.atlassian.jira.plugin.system.customfieldtypes:version'
```

Or if you wanted to convert multi-select-list custom field to a multi-user custom field, first check that all custom field values map to users:

```sql
select * from customfieldvalue where id=(select id from customfield where cfname='multisel3')
and stringvalue not in (select username from userbase);
Empty set (0.02 sec)
```

Then you can change the custom field type:

```sql
UPDATE customfield
SET CUSTOMFIELDTYPEKEY='com.atlassian.jira.plugin.system.customfieldtypes:multiuserpicker',
CUSTOMFIELDSEARCHERKEY='com.atlassian.jira.plugin.system.customfieldtypes:userpickersearcher'
where cfname='MyMultiSelect';
```

Or if you wanted to convert text-field custom field to a free-text-field(unlimited text) custom field, first assign the value from stringvalue field to textvalue:

```sql
UPDATE customfieldvalue SET textvalue=stringvalue WHERE customfield=(SELECT ID FROM customfield WHERE customfieldtypekey='com.atlassian.jira.plugin.system.customfieldtypes:textfield'
AND cfname='Text Field');
```

Then, change the custom field type by updating the customfield table as below:

```sql
UPDATE customfield SET
CUSTOMFIELDTYPEKEY='com.atlassian.jira.plugin.system.customfieldtypes:textarea',
CUSTOMFIELDSEARCHERKEY='com.atlassian.jira.plugin.system.customfieldtypes:textsearch'
where cfname='Text Field';
```

Restart JIRA. Then reindex (Administration -> Indexing) to update the search index.

**Changing Templates Used by Export to Excel from the Issue Navigator**
When exporting a set of issues to Excel, customisation to the layout templates are controlled in Velocity files. Velocity templates for the export formats are defined in file `atlassian-jira/WEB-INF/classes/system-issueviews-plugin.xml`. The following files in particular define the Excel views:

- `atlassian-jira/WEB-INF/classes/templates/plugins/searchrequestviews/searchrequest-excel-header.vm`
- `atlassian-jira/WEB-INF/classes/templates/plugins/searchrequestviews/searchrequest-excel-footer.vm`
- `atlassian-jira/WEB-INF/classes/templates/plugins/searchrequestviews/searchrequest-description-header.vm`

Refer to [Microsoft® Office HTML and XML Reference](http://support.atlassian.com/browse/JSP-20921) for further information on the syntax of the template contents.

<table>
<thead>
<tr>
<th>Severity</th>
<th>Low</th>
</tr>
</thead>
<tbody>
<tr>
<td>Article ID</td>
<td>JIRAKB148766913</td>
</tr>
</tbody>
</table>

http://support.atlassian.com/browse/JSP-20921

**Changing the default attachment size limit**

To change the default size limit for attachments, see the Configuring File Attachments page.

**Changing the default session timeout**

To change the default session timeout (which is 5 hours or 300 minutes) you must edit the file `web.xml`. This file can be found in `<YOUR DEPLOYMENT>/WEB-INF/web.xml`.

- If you are deploying JIRA as a closed .war file you will need to unzip the .war, edit the file, and re-create the .war with exactly the same structure as it originally had.

The element you want to edit in the `web.xml` file is:

```xml
<web-app ...>
  ...
  <session-config>
    <session-timeout>30</session-timeout>
  </session-config>
  ...
</web-app>
```

The value within the `session-timeout` tag defines the amount of time the session will exist, in minutes.

Note that after editing the `web.xml` file you will need to restart JIRA for your change to take effect.

**User logouts**

In case JIRA users are still being consistently logged out, you may need to change the context path if you are using multiple Atlassian applications on the same server. For instructions, see this Knowledge base article.

**Changing the Default Tab Panel from Comments to All**

Atlassian does not support customisations to Velocity templates or other JIRA files. For more information about Atlassian support, see Atlassian Support Offerings.

**Deploying Velocity Templates without a Restart**

In a development instance, you can play with picking up velocity file changes without a restart.
From `<jira-install>/atlassian-jira/WEB-INF/classes/velocity.properties`:

1. Change `class.resource.loader.cache` from `true` to `false`
2. Uncomment (remove the `#` sign from) `#velocimacro.library.autoreload=true`

Keep in mind that the next time you upgrade JIRA — or need a new installation for any reason — you will have to manually copy any changes you have made to the JSPs or templates into the new installation of JIRA. If the JSPs or templates have changed in the newer version, you will have to port your customization into them.

The simple procedure on this page describes how to change the default view of issues from 'Comments' to 'All'. To do this, change the configuration file which controls the display of the tabs:

1. Edit the file `<jira-install>/WEB-INF/classes/system-issuetabpanels-plugin.xml`.
2. Each tab is controlled by a `<issue-tabpanel>` tag. To change the default selection, the `<default>true</default>` needs to be placed in the wanted `<issue-tabpanel>` tag.

### Changing the Due Date Input Format

The Look and Feel page allows you to customize the way times and dates are presented to users throughout the JIRA user interface.

When specifying dates and times, they should be based on the Java `SimpleDateFormat`.

When you are not in edit mode on the 'Look and Feel' page, the examples in the rightmost column of the Date/Time Formats section show you how the various formats will appear in JIRA.

**Relative time is used in date/time formats**

Issue date/time fields show a relative instead of absolute date/time format (for example: *Yesterday 12:00 PM* instead of *20 May 2013 12:00 PM*). You can still see the absolute date/time by hovering over the field.

The date/time format reverts to absolute after a week.

If you want to switch off this format, set the `jira.lf.date.relativize` application property to 'false'. See Advanced JIRA Configuration for more information.

### Configuring date picker formats

JIRA system administrators can configure the format of date pickers used throughout the JIRA user interface via options on the Advanced Settings page.

Be aware that these options are different from the Date/Time Formats configuration options on the Look and Feel page, which only customize JIRA’s presentation of times and dates to users.

![⚠️ Alert ⚠️]

The date or date/time formats for date pickers are defined by a pair of properties (one for Java and the other for JavaScript). The two properties in this Java/JavaScript pair must match in order for the date (or date/time) picker they define to function correctly.

- For Java formats, specify date/time formats based on the Java `SimpleDateFormat`.
- For JavaScript formats, specify date/time formats based on the Unix date format.

Here are some example US-based date configurations:

<table>
<thead>
<tr>
<th>Preferred Date</th>
<th>Value of the <code>jira.dat.epicker.java.format</code> property</th>
<th>Value of the <code>jira.dat.epicker.javascript.format</code> property</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>2010-10-01</td>
<td>yyyy-MM-dd</td>
<td>%Y-%m-%d</td>
<td>ISO 8601 format</td>
</tr>
<tr>
<td>Oct/1/10</td>
<td>MMM/d/yy</td>
<td>%b/%e/%y</td>
<td></td>
</tr>
<tr>
<td>10/01/10</td>
<td>MM/dd/yy</td>
<td>%m/%d/%y</td>
<td></td>
</tr>
<tr>
<td>Oct 1, 2010</td>
<td>MMM d, yyyy</td>
<td>%b %e, %Y</td>
<td></td>
</tr>
<tr>
<td>10/01/2010</td>
<td>MM/dd/yyyy</td>
<td>%m/%d/%Y</td>
<td></td>
</tr>
</tbody>
</table>
Here are some examples of date/time configurations:

<table>
<thead>
<tr>
<th>Preferred Date/Time</th>
<th>Value of the <code>jira.datetimepicker.java.datet imepicker.java.format</code> property</th>
<th>Value of the <code>jira.datetimepicker.java.script.formatproperty</code></th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>2010-10-15 08:50</td>
<td>yyyy-MM-dd HH:mm</td>
<td>%Y-%m-%d %H:%M</td>
<td>ISO 8601 format</td>
</tr>
<tr>
<td>15/Oct/10 8:50 AM</td>
<td>dd/MMM/yyyy h:mm a</td>
<td>%d/%b/%y %l:%M %p</td>
<td></td>
</tr>
<tr>
<td>10/15/10 08:50 AM</td>
<td>MM/dd/yy hh:mm a</td>
<td>%m/%d/%y %I:%M %p</td>
<td></td>
</tr>
</tbody>
</table>

**Changing the Project Key**

⚠️ You were meant to be redirected to [Editing a Project Key](#), but something went wrong. Please use site search to find the information you were after. If you can’t find it, [let us know](#).

**Changing the Size of the Fix Versions and Affects Versions Select List**

This page describes how to increase the size of the Fix Version/s and Affects Version/s drop-down lists. Please see [JRA-3028](#) for the full feature request.

⚠️ Atlassian does not support customisations to Velocity templates or other JIRA files. For more information about Atlassian support, see [Atlassian Support Offerings](#).

**Deploying Velocity Templates without a Restart**

In a development instance, you can play with picking up velocity file changes without a restart. From `<jira-install>/atlassian-jira/WEB-INF/classes/velocity.properties`:

1. Change class.resource.loader.cache from true to false
2. Uncomment (remove the # sign from) #velocimacro.library.autoreload=true

**Increasing the size of the field**

Change the line:

```xml
<select multiple name="$field.id" size="#minSelectSize ($versions 1 6)"
 id="$field.id">
```

For example, if you wanted to make it 15 (in the case where there are more than 3):

```xml
<select multiple name="$field.id" size="#minSelectSize ($versions 1 15)"
 id="$field.id">
```
Make sure to back up the velocity file before changing it. Keep in mind the notes from Modifying JIRA Templates and JSPs.

### Changing the Size of the Text Area Custom Field

⚠️ Atlassian does not support customisations to Velocity templates or other JIRA files. For more information about Atlassian support, see Atlassian Support Offerings.

**Deploying Velocity Templates without a Restart**

In a development instance, you can play with picking up velocity file changes without a restart. From `<jira-install>/atlassian-jira/WEB-INF/classes/velocity.properties`:

1. Change `class.resource.loader.cache` from true to false
2. Uncomment (remove the `#` sign from) `#velocimacro.library.autoreload=true`

ℹ️ Keep in mind that the next time you upgrade JIRA – or need a new installation for any reason – you will have to manually copy any changes you have made to the JSPs or templates into the new installation of JIRA. If the JSPs or templates have changed in the newer version, you will have to port your customization into them.

To work around the fixed size of a comment field, edit `<jira-install>/atlassian-jira/WEB-INF/classes/templates/plugins/fields/edit/edit-textarea.vm`.

**To change the size for all rows:**

```java
$!rendererParams.put("rows", "2")
```

**To change the size for a particular custom field:**

✔️ In this example, the custom field's id is 10220. You can get this value from editing the custom field and checking the URL.
## setup some additional parameters

```java
rendererParams.put("rows", "2")
rendererParams.put("cols", "40")
rendererParams.put("wrap", "virtual")
```

## let the renderer display the edit component

```java
rendererDescriptor.getEditVM($!value, $!issue.key, $!fieldLayoutItem.rendererType, $!customField.id, $!customField.name, rendererParams, false)
```

### Changing the Temporary Directory

To move the temp directory, edit `<JIRA>/bin/catalina.sh`:

```bash
if [ -z "CATALINA_TMPDIR" ] ; then
    # Define the java.io.tmpdir to use for Catalina
    CATALINA_TMPDIR="$CATALINA_BASE"/temp
fi
```

Replace the "CATALINA_BASE"/temp with your temporary file directory.

### Configuring project specific security

We are often asked the following:

**How do we configure the system so that a user/user group can only register/see issues on one specific project?**

In order to configure the above please follow the below instructions and tweak as necessary for your organization:

1. Create a new Permission Scheme (Administration -> Schemes -> Permission Scheme) for Project
1. Create a new user group say **Group_External** (Administration -> Users & Groups -> Group Browser)
2. Add the External Users to that group
3. Associate **External_Permission_Scheme** to Project External (Administration -> Projects -> Project -> select Project External)

**Note.**

When users are created they are automatically a member of the jira-user group in order to allow them to login. The thing to note here is that the **Default Permission Scheme** grants users within the jira-user group certain permissions so those projects using the Default Permission Scheme will essentially give those users access to it.

**To get around this either:**

- Remove your external users from the jira-user group and give Group_External the ability to login by granting them the global JIRA Users permission (Administration -> Global Settings -> Global Permissions)
  OR
- Edit any Permission Schemes that grant the jira-user group specific permissions

It is also important to add that with the release of 3.7 and the introduction of Roles within JIRA it will not be necessary to create Groups for the above configuration.

For a detailed example using **Group Permissions** please see the following documentation: Using Project Level Security with User Groups

For a detailed example using **Project Role’s** please see the following documentation: Using Project Level Security with Project Roles

**Controlling project visibility**

You can restrict project visibility to particular groups of users by using project permissions.

For example, if customers from Company X were put into the group "Cust-X" and given "Browse" permission for project Y, they will only be able to see Project Y (assuming you did not grant them the "Browse" permission for any other projects).

You should of course also give your developers permission to browse and operate on the project.

If you would like to restrict users to issues which they have created, set the "Browse Project" permission to be "Reporter." This way the user will have access to only the issues which they have created across all projects, but they will not be able to see any other issues.

You can also set security on an issue-by-issue basis. For more information on JIRA’s Issue Level Security, please consult the documentation.

Using Project Level Security with Project Roles

This tutorial provides a step-by-step guide for creating project roles and using them in an issue security scheme. We recommend creating a test project and two test users for this tutorial.

**Tutorial Goal**

When completed, this tutorial will provide two issue security levels. One for issues that specific customers and your company can view, another for internal company eyes only.

1. **Adding Project Roles**

First we need to create project roles for our scheme to use:

**Administration -> Users, Groups and Roles -> Project Role Browser -> Add Project Role**

1. Create a project role called Customer A.
2. Create a project role called Customer B.
3. Create a project role called My Company.

In this example, the My Company project role will always have the same users/groups for each project. As a result, we’ll set default members that will be used for all projects that use this scheme.
1. Next to the My Company project role, click Manage Default Members.
2. Add the users or groups for your company by clicking Edit next to the appropriate default (users or groups).

2. Adding an Issue Security Scheme

Next, we need to create the issue security scheme which will be hooked to our test project a bit later in this tutorial:

Administration -> Schemes -> Issue Security Schemes -> Add Issue Security Scheme

3. Adding Issue Security Levels

We need to add security levels for this new issue security scheme. These levels will be available for selection to those that have permission to add issue security levels to issues. Users can only see levels of which they are members.

Administration -> Schemes -> Issue Security Schemes -> Click the Security Levels link next to Customers and My Company Issue Security Scheme

First we need to add a level for each customer:

1. Add a new issue security level called Customers and My Company.
2. Add the Customer A, Customer B and My Company project roles to this issue security level.
3. Click Default to make this the Default.

Next, we want a level for internal company eyes only:

1. Add another issue security level called My Company
2. Add the My Company project role to this issue security level.

4. Associating your Issue Security Scheme with a Project

Explain the step here and use the following syntax and color for menu notations:

Administration -> Project -> Projects -> Click on your test project name

1. For the Issue Security Scheme option, click Select.
2. Choose the Customers and My Company Issue Security Scheme from the list.
3. Click Next.
4. If you would like to associate existing issues with a security level, select it from the list, if not leave it at None.
5. Click Associate.

5. Adding project-specific members to a project role.

We need to specify the project-specific role members for the Customer A & B project roles.

Administration -> Project -> Projects -> Project Team -> Project Roles -> View Members

1. Add the first test user to the Customer A project role by clicking Edit in the Users column.
2. Add the second test user to the Customer B project role by clicking Edit in the Users column.

Project roles allow you to use the same permission scheme for multiple projects. We can change the members of project roles via the project!

Did it work?

1. Create one issue and set the Issue Security Level to My Company.
2. Create another issue and set the Issue Security Level to Customer A.
3. Create one more issue and set the Issue Security Level to Customer B.
4. Try logging in as each test user to ensure that they only see the appropriate issue.

Using Project Level Security with User Groups

This documentation is meant to give an in-depth analysis of Configuring project specific security — allowing full access to all projects for internal users, and limited access to external users by using JIRA groups and a project.
permission schemes. It is also possible to use Project Roles, but in this case we did not.

The example is based on the Atlassian Project Permission documentation. While that documentation tells you everything you can do, we get a lot of questions about how exactly to set your system up to have two or more classes of users:

- Internal users (such as employees at your company) who have full permission
- External users (such as customers at your company) who have limited permission

Usually, though, in order to accomplish a security configuration which fits your company exactly, it will require a good amount of time, effort, and imagination on your part. At the moment JIRA is only able to support security at a project level or issue level. Currently there is no field level security available.

The first step for project level security is to define user groups. In this case a group called "external group" was created. All internal users will just be in the default "jira-users" group. In a default JIRA instance, when a user is created they will automatically be put into the jira-users group. Anyone who is external will have to be manually assigned to the external group and be removed from the jira-users group. There is no way to automatically assign users to certain groups without massive customizations to the JIRA environment. The reason for taking the approach of assigning all internal users to the jira-users group, is because this documentation is assuming that clients already have many internal users. Assigning a small group of users to one group as opposed to reassigning hundreds or thousands of users is easier.

If starting from scratch, it is better to define and assign groups new groups from the beginning. For example, an "internal group" as well as an external group. But, in this example we will just look at jira-users and the external group. See the group settings in the image below for more detail:

To get to this screen: go to Administration > Users, Groups & Roles > Group Browser.

Now make sure that the External Group is added to the global JIRA Users permission so that they have access to JIRA. All users must be in the global JIRA Users group in order to access JIRA. **Note: The JIRA Users group is different from the jira-users group. JIRA Users is global while jira-users is group specific.** See the image below for more detail.

To get to this screen: go to Administration > Global Settings > Global Permissions.
After creating the desired groups, separate permission schemes for each group need to be made. In the below image two schemes were created; an internal scheme and an external scheme. Obviously the internal scheme is for internal users and the external scheme is for external users. If your company has multiple users from multiple companies, you will need to make multiple schemes and groups for each project.

To get to this screen: go to Administration > Schemes > Permission Schemes.

After the schemes have been created, they must be tailored to meet your needs. For example: In the external scheme attach below, jira-users are given all permissions, while the External Group is given limited rights. Both groups must be present in this permission scheme to ensure that both internal users and external users have access to whichever project this scheme is assigned to. Only jira-users should be assigned to the Internal Scheme. See images below for more detail. Please note that in the External Permission Scheme the "Browse Projects" category has both jira-users and reporters (rather than External Group). This was done so external users can only see tickets they have created in the External Project and not others tickets. However, if "Reporter" is replaced with "External Group" then the External Group users will be able to view all tickets associated with the project.

To get to this screen: go to Administration > Schemes > Permission Schemes > Click on External Scheme.
To get to this screen: go to Administration > Schemes > Permission Schemes > Click on Internal Scheme.
Now assign the appropriate permission scheme to the appropriate project. For this example the internal scheme will be assigned to the internal project and the external scheme will be assigned to the external project. See the images below for more detail:

</tbody>
</table>

To get to this screen: go to Administration > Project > Projects > Click on External Project.
To get to this screen: go to Administration > Project > Projects > Click on Internal Project.

Once the above steps have been completed create users and add them to the appropriate group as seen in the image below. Note: When users are created will automatically be created belonging to jira-users and External Group. THe administrator will be responsible for manually removing the users from groups that the user should not belong to.

To get to this screen: go to Administration > Users, Groups & Roles > User Browser.

If done correctly the internal employees(jira-users) will have access to all projects, while the external users will only have access to their projects. Feel free to download the XML backup of this example on your local test instance.

The sample file

- Please ensure you have backed up your existing JIRA instance
- You can download the JIRA helpdesk sample file here: ExampleSecurity.zip
- Restore the sample data file. You can learn how to restore a file here

User list and logins

- All user passwords are the same: admin
- The main username to login with is: admin
  - Full JIRA admin rights
  - Access to all projects
- Internal users are: `internaluser`
- These users are in the group: `jira-users`
- Access to both the Internal and External Projects and all issues.

- External users are: `externaluser` and `jcostello`
- These users are in the group: `External Group`
- Access to External Project and Issues Created only.

## Connecting to SSL services

🚨 Atlassian applications allow the use of SSL within our products, however Atlassian Support does not provide assistance for configuring it. Consequently, Atlassian **cannot guarantee providing any support for it**.

- If assistance with conversions of certificates is required, please consult with the vendor who provided the certificate.
- If assistance with configuration is required, please raise a question on Atlassian Answers.

This page describes how to get web applications like JIRA and Confluence connecting to external servers over SSL, via the various SSL-wrapped protocols. For instance, you may want to:

- Refer to an `https://...` URL in a Confluence macro.
- Use an IMAPS server to retrieve mail in JIRA.
- Use SMTP over SSL (SMTPS) to send mail in JIRA.
- Connect to a LDAP directory over SSL.
- Set up Trusted Applications over SSL.

If you want to run JIRA *itself* over SSL, see Running JIRA over SSL or HTTPS or Integrating JIRA with Apache using SSL.

✅ **Add SSL Certificates automatically!**

We now have a JIRA SSL [Atlassian Labs plugin](https://labs.atlassian.com/plugins/ssl-certificates) for this process. Please install and use the plugin before going through these docs.

### On this page:

- Problem Symptoms
- The Cause
- Resolution
  - Obtain and Import the Server's Public Certificate
  - Alternative KeyStore Locations
  - Debugging

### Problem Symptoms

Attempting to access URLs that are encrypted with SSL (for example HTTPS, LDAPS, IMAPS) throws an exception and JIRA refuses to connect to it. For example:

```java
javax.net.ssl.SSLHandshakeException:
sun.security.validator.ValidatorException: PKIX path building failed:
sun.security.provider.certpath.SunCertPathBuilderException: unable to find valid certification path to requested target
at com.sun.mail.imap.IMAPStore.protocolConnect(IMAPStore.java:441)
at javax.mail.Service.connect(Service.java:233)
at javax.mail.Service.connect(Service.java:134)
```

This is the same as the following error that's generated in Chrome when visiting a page that's encrypted with a self-signed certificate, except Java can't "Proceed anyway", it just refuses the certificate:
The Cause

Whenever JIRA attempts to connect to another application over SSL (e.g.: HTTPS, IMAPS, LDAPS), it will only be able to connect to that application if it can trust it. The way trust is handled in the Java world (this is what JIRA is written in) is that you have a keystore (typically $JAVA_HOME/lib/security/cacerts) or also known as the trust store. This contains a list of all the known CA certificates and Java will only trust certificates that are signed by those CA certificate or public certificates that exist within that keystore. For example, if we look at the certificate for Atlassian:

We can see the *.atlassian.com certificate has been signed by the intermediate certificates, DigiCert High Assurance EV Root CA and DigiCert High Assurance CA-3. These intermediate certificates have been signed by the root Entrust.net Secure Server CA. Those three certificates combined are referred to as the certificate chain. As all of those CA certificates are within the Java keystore (cacerts), Java will trust any certificates signed by them (in this case, *.atlassian.com). Alternatively, if the *.atlassian.com certificate was in the keystore, Java would also trust that site.

This problem comes from a certificate that is either self-signed (a CA did not sign it) or the certificate chain does not exist within the Java keystore. Subsequently, JIRA doesn't trust the certificate and fails to connect to the application.

Resolution

In order to resolve this, the public certificate need to be imported in the Java keystore that JIRA uses. In the example above, this is *.atlassian.com and we cover how to install it below.

Obtain and Import the Server’s Public Certificate

1. Download and install the Portecle app onto the server that runs JIRA.
   This is a third-party application and not supported by Atlassian.
2. Ensure the $JAVA_HOME variable is pointing to the same version of Java that JIRA uses. See our Setting JAVA_HOME docs for further information on this.
   If running on a Linux/UNIX server, X11 will need to be forwarded when connecting to the server (so you can use the GUI), as below:

   ```
   ssh -X user@server
   ```

3. Select the Examine menu and then click Examine SSL/TLS Connection:
4. Enter the SSL Host and Port of the target system:
5. Wait for it to load, then select the public certificate and click on PEM:
7. Go back to the main screen and select the **Open an existing keystore from disk** option, select `cacerts` (for example `$JAVA_HOME/lib/security/cacerts`) then enter the password (the default is change it).
8. Select the **Import a trusted certificate into the loaded keystore** button:

9. Select the certificate that was saved in step 6 and confirm that you trust it, giving it an appropriate alias (e.g.: confluence).
   a. You may hit this error:
b. If so, hit OK, and then accept the certificate as trusted.

10. Save the Key Store to disk:

11. Restart JIRA.

12. Test that you can connect to the host.

**Command Line Installation**
1. Fetch the certificate, replacing google.com with the FQDN of the server JIRA is attempting to connect to:

**Unix:**

```
openssl s_client -connect google.com:443 < /dev/null | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > public.crt
```

**Windows:**

```
openssl s_client -connect google.com:443 < NUL | sed -ne '/-BEGIN CERTIFICATE-/,/-END CERTIFICATE-/p' > public.crt
```

2. Import the certificate:

```
<JAVA_HOME>/keytool -import -alias <server_name> -keystore <JIRA_HOME>/jira.jks -file public.crt
```

### Alternative KeyStore Locations

Java will normally use a system-wide keystore in `$JAVA_HOME/jre/lib/security/cacerts`, but it is possible to use a different keystore by specifying a parameter, `-Djavax.net.ssl.trustStore=/path/to/keystore`, where `/path/to/keystore` is the absolute file path of the alternative keystore.

However, setting this is **not recommended** because if Java is told to use a custom keystore (e.g. containing a self-signed certificate), then Java will not have access to the root certificates of signing authorities found in `$JAVA_HOME/jre/lib/security/cacerts`, and accessing most CA-signed SSL sites will fail. It is better to add new certificates (e.g. self-signed) to the system-wide keystore (as above).

### Debugging

Problems are typically one of two forms:

- The certificate was installed into the incorrect keystore.
- The keystore does not contain the certificate of the SSL service you’re connecting to.

### See Also

- Configuring an SSL Connection to Active Directory
- Running JIRA over SSL or HTTPS
- Integrating JIRA with Apache using SSL

### Creating an Unassigned Issue

All new issues are unassigned by default. If you wish to change this:

- Go to the General Configuration page of the **Administration** section. Now simply edit the configuration and turn OFF the 'Allow Unassigned Issues' flag. For more detail please refer to the documentation relating to this function.

By default, new projects also have their 'Default Assignee' set to 'Unassigned.' This is located in the **Roles** section and can be changed there.

### Current Reporter Browse Project Permission

Some JIRA installations have a use-case where they want a user to only see projects they **can** report issues in. Normally when you add the "Current Reporter" group to the "Browse Project" permission of one project, this project instantly becomes visible to all users (via the project table portlet), even if they are unable to report an
This guide is for those who want a user to only see issues they've reported and also not see any projects that are irrelevant to them (i.e. where they are unable to create issues). This permission is available as an optional permission type (since JIRA 3.2). You will need to uncomment the lines below in the file the WEB-INF/classes/permission-types.xml. Restart JIRA and this type will be available in your standard permissions page.

If you're running a WAR deployment, you'll need to rebuild the WAR after the change and redeploy. You may need to remove your old exploded WAR directory for the new one to take effect.

```xml
<type id="reportercreate" enterprise="true">
<class>com.atlassian.jira.security.type.CurrentReporterHasCreatePermission</class>
</type>
```

When using this special permission, users will only see projects where they have create permission, and issues within that project where they are the reporter.

### Why isn't this included in JIRA by default?
This permission is deliberately commented out of the permission-types.xml file. This is to ensure that only advanced JIRA administrators are able to access it. There are two reasons behind this:

- Firstly, the permission itself is used in fairly sophisticated scenarios.
- Secondly, the implementation of this permission is potentially dangerous. For example, it is possible to put your JIRA instance in an infinite loop by mapping this permission to the Create Issue function.

After uncommenting the lines, start up JIRA again, and you should see the "Reporter (show only projects with create permission)" option added to the Add New Permission page:

```
<table>
<thead>
<tr>
<th>View Read-Only Workflow</th>
<th>Create Issues</th>
<th>Edit Issues</th>
<th>Schedule Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Select the permissions that you want to assign)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>○ Reporter</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>○ Group</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>○ Single User</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>○ Project Lead</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>○ Current Assignee</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>○ User Custom Field Value</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>○ Project Role</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>○ Group Custom Field Value</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>○ Reporter (show only projects with create permission)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>○ Assignee (show only projects with assignable permission)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

Note that this is different than the original "Reporter" permission.
CVS ssh Jira Integration

CVS :ext: ssh Jira Integration

The following information is probably only relevant to Linux/Unix/OSX/Cygwin environments.

**CVS_RSH environment variable**

In order to use the :ext: method for connection to CVS, the CVS_RSH environment variable needs to be set in the environment that runs JIRA. It should be set to the path to the ssh binary.

```bash
CVS_RSH=`which ssh`
export CVS_RSH
```

**Problems Authorising when command line works**

One user reported the following:

> The problem was found to be the UsePAM directive in sshd_config on the cvs server(Debian-Sarge) - this needs to be disabled (which it wasn't) with the PasswordAuthentication enabled.

**Disabling Form Token Checking**

Please refer to the Form Token Handling documentation on our developer documentation site for more information about how this feature is implemented in JIRA.

**Displaying a Field Based on Another Field Selection**

Please note that adding Javascript to custom fields is a customisation and not maintained as a supported part of JIRA.

In Atlassian's support JIRA, when a user creates an issue with "Critical" priority, it will display the "Priority Explanation" field.

This can be achieved by performing the following steps:

1. Create a "Free Text Field (unlimited text)" custom field type (Administration -> Issue Fields -> Custom Fields)
2. Fill in the following text into the "Description" field:
3. Make sure to change the custom field id and priority id. To find the custom field id, view the source of the page when viewing an issue, or check the URL when editing a custom field.

**Editing a custom field option**

At the moment it is not possible to rename an option of a custom field, e.g. a Select List custom field. This is fairly easy to do using SQL. Please shutdown JIRA then execute:

```sql
update customfieldoption set customvalue = 'New Option' where CUSTOMFIELD = <cfid> and id = <id>;
```

To rename the option. Where `<cfid>` is the id of the custom field and `<id>` is the id of the option you would like to rename.

To get a list of all custom fields do:

```sql
select * from customfield;
```

Then update all issues with this value:

```sql
update customfieldvalue set STRINGVALUE = 'New Option' where CUSTOMFIELD = <cfid> and STRINGVALUE = 'Old Value';
```

Replace `<cfid>` with the custom field's id and 'Old Value' with the text value of the option.

Then restart JIRA and re-index the data (Administration -> System -> Indexing).

For details on editing the custom field tables, see the custom field tables documentation.

**Escalating issues (or sending email notifications) when the set turnaround time is exceeded**

Can JIRA send notifications based on a set issue turnaround time being exceeded? Can it automatically escalate issues that have exceeded a preset turnaround time?

No, not out-of-the box — but this is exactly what services are for. In particular, a Jelly script can be written to find
Field Layout Schemes in JIRA 3.x

JIRA 3.1.1 or earlier

Field Layout Schemes in JIRA 3.x

This document describes creating field layout schemes per issue type per project in JIRA up to (but not including) version 3.2.

Field Layout Schemes

Through the use of Field Layout Schemes, it is possible to configure the visible and required fields per issue type per project.

For example, the issue type Bug within project A could be associated with one field layout while the issue type Improvement also in project A could be associated with another field layout. Furthermore, the project default field layout (i.e. all issue types without an associated layout within a project) could be associated with yet another field layout. In this way, each issue type can be associated with a configurable field layout for each project.

System Field Layout Scheme

The System Field Layout Scheme governs the field layout for all issue types in all projects not associated with a specific field layout.

This field layout can be edited by navigating to the following Administration section:

Administration -> Issue Fields -> Field Layout (System)

The field layout is displayed and can be edited as required.

Creating a Field Layout Scheme

In order to create a specific field layout association for an issue type within a project, it is necessary to create a field layout scheme:

Administration -> Issue Fields -> Field Layout Schemes -> Add Issue Field Scheme

Once created, it is then possible to configure the field layout as required.

Field Layout Association per Issue Type per Project

With a custom field layout, it is possible to associate the field layout with a particular issue type within a particular project.

By navigating to the Project Administration section:

Administration -> Project -> <Project Name>

it is then possible to manage the field layout associations for that project by selecting the Manage link within the Field Layout Schemes table or within the project summary table. From here, it is possible to create a default field layout association for all unassigned issue types within the project or to create a field layout association with a specific issue type for the selected project.

The issue type specific association will overwrite the project default association.

Fields Allowing Custom HTML or JavaScript

lest note that adding Javascript to custom fields is a customisation and not maintained as a supported part of JIRA.

There are several ways to inject JavaScript or HTML into JIRA:

1. Edit the custom field's description. See Displaying a Field Based on Another Field Selection as an example.
2. Add JavaScript to the header, by modifying a JSP from the file system. See Adding JavaScript to all pages for Google Analytics as an example.
3. You can add HTML or Javascript in the Announcement Banner.
4. Edit the field description in the Field Configuration.

Finding the Id for Issue Types

When configuring a mail handler to create issues from email, it is often useful to know the IDs of issue types.

Here is how you can find the ID of an issue type:

1. In JIRA, click Administration > Issues > Issue Types
2. On the 'Global Issue Types' sub-tab, hover your mouse cursor over the Edit operation link of an issue type and JIRA will display the issue type's id appended to the URL shown in the browser's status bar. For example, the "id" in this link represents the id of the issue type: http://<your-jira-server>/secure/admin/EditIssueType!default.jspa?id=1

Group Name Guidelines for JIRA

We do not have a formal set of naming conventions for groups in JIRA. However we do have some current, or recently resolved, issues related to group names in JIRA, and based on those issues, we suggest at least the following guidelines:

- Don't use commas: JRA-12675
- Don't use ampersands (&): JRA-13780
- Keep group names to less than 60 characters: JRA-13329
- Don't use group names with only one character in JIRA versions prior to 3.12.3: JRA-14495
- Don't use '#' characters in JIRA versions prior to 3.12: JRA-13509
- We suggest standardising on lower case names for groups: JRA-13798, JRA-5434

Beyond those guidelines, our more general recommendation is to keep group names simple, preferably restricting them to alphanumeric characters, and '-', '_', or a space for word separators - e.g. "jira-users".

If you use non-ASCII characters in your group names, ensure that your database character encoding scheme supports those characters. For MySQL, ensure that the database has a character set encoding of UTF8 by following our instructions for creating the database.

If you are integrating JIRA with LDAP, ensure that you conform to any naming restrictions imposed by your LDAP server.

How can I control the editing of issue fields via workflow?

Introduction

Please note that the following instructions do not provide a complete solution to Field Level Permissions, but allow to control who can edit particular fields. This is achieved with the help of Transition Conditions in a Workflow.

These instructions do not provide a solution for restricting who can see the values of fields. Users who have permissions to view an issue, will be able to see the values of these fields for that issue, search by them, receive notifications when these fields change, etc.

Before you read these instructions, it is important to have a good grasp of how Workflows fit into JIRA. A good source of information on Workflows can be found in JIRA's documentation: Configuring Workflow

You should also familiarise yourself with how Screens work in JIRA: Configuring Fields and Screens

Instructions

Please note that the ability to edit some System Fields is already protected by a permission:

<table>
<thead>
<tr>
<th>System Field</th>
<th>Permission</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fix Version</td>
<td>Resolve Issue</td>
</tr>
<tr>
<td>Assignee</td>
<td>Assign Issue</td>
</tr>
</tbody>
</table>
The easiest thing to do for the above fields is to use Permission Schemes to control who can manipulate them. For more information on permissions please see: Managing Project Permissions

However, if the field you are trying to protect is not already protected by a permission, e.g. a custom field, you can use a workflow transition. This transition will allow certain users to only edit certain items of an issue without transitioning to another step of the workflow.

Please follow these instructions:

1. Create two Screens.
2. Using Screen Schemes make sure one of the Screens is mapped to the View Issue and Edit Issue operation. This screen should contain all fields, including the protected fields. Otherwise, no one will be able to see values of fields on the View Issue page.
3. Create another Screen and map it to the Create Issue operation in the Screen Scheme. This screen should not contain the protected fields.
4. Create a workflow transition that goes to the same step as it's original step. Ensure the transition uses the same screen as the Create Issue operation.
5. Create a new group or project role for users who should not be able to edit protected fields.
6. Protect the transition using the "User Is In Group" or "User Is In Project Role" conditions.
7. Place users who should not be able to manipulate protected fields into the new group or project role.
8. Edit the Permission Scheme of the project in question and ensure these users do not have the Edit Issue permission. Grant other permission that you deem needed to this group or project role.
9. Ensure that a transition such as this exists for all statuses (steps) in the workflow where the protected fields need to be manipulated. All of these transitions can use the same Screen.
10. Users who are members of the group or project role will be able to execute the transition to edit fields. Other users, who should be able to edit protected fields should use the normal Edit Issue operation.

Please note that the above setup will not allow the protected fields to be populated when issues are created or edited.

Using a Workflow to control edit of an issue by changing Workflow XML

You can use a workflow "transition" to allow certain users to only edit certain fields of an issue without transitioning to another step of the workflow. This page outlines how to achieve this using direct Workflow XML manipulation. If you are not comfortable with directly editing Workflow XML please see How can I control the editing of issue fields via workflow?.

First note that JIRA's workflow editor (as of Jira 3.4.2) uses the term "transition" where as the OSWorkflow documentation refers to the same element as an "action".

Since, this article primarily deals directly with the XML of the workflow instead of the workflow editor, the term "action" will be used.

As mentioned above, this article assumes knowledge of how to write an OSWorkfow in XML.

There are two items that allow us to use the workflow in this way:

- JIRA lets users edit an issue via Workflow actions even if they don't have the "Edit Issue" permission in the permission scheme
- OSWorkflow doesn't force you to transition to a different step, when executing an action

First, you will need to create a screen containing all the fields you want (and only those fields) the user to be able to edit.

Next you need to create the XML document for the workflow. An easy way to get started is to export a workflow from JIRA as XML and then edit that.

In each step that you want a specific user group to be able to edit the issue, create an action with the following attributes:

- The 'view' should be "fieldscreen"
• "jira.fieldscreen.id" should be set to the screen id that contains the fields you want the user to be able to edit

  (if you don't know the ID of the screen you want to use, just reassign the screen, after importing the XML, using JIRA's workflow editor).

• A condition of type "class" with the "class.name" as com.opensymphony.workflow.util.OSUserGroupCondition * The "group" as the JIRA user group the current user must be a member of in order to execute this action

• The resulting step set to the same ID as the step that contains the action

The following is an example:

```xml
<action id="2003" name="Edit Issue" view="fieldscreen">
  <meta name="jira.fieldscreen.id">10010</meta>
  <meta name="jira.description">Edit Issue (for Client)</meta>
  <restrict-to>
    <conditions>
      <condition type="class">
        <arg name="group">ourclients</arg>
        <arg name="class.name">com.opensymphony.workflow.util.OSUserGroupCondition</arg>
      </condition>
    </conditions>
  </restrict-to>
  <results>
    <unconditional-result old-status="Not Done" status="Done" step="2">
      <post-functions>
        <function type="class">
          <arg name="class.name">com.atlassian.jira.workflow.function.issue.UpdateIssueStatusFunction</arg>
        </function>
        <function type="class">
          <arg name="class.name">com.atlassian.jira.workflow.function.misc.CreateCommentFunction</arg>
        </function>
        <function type="class">
          <arg name="class.name">com.atlassian.jira.workflow.function.issue.GenerateChangeHistoryFunction</arg>
        </function>
        <function type="class">
          <arg name="class.name">com.atlassian.jira.workflow.function.issue.IssueReindexFunction</arg>
        </function>
        <function type="class">
          <arg name="class.name">com.atlassian.jira.workflow.function.event.FireIssueEventFunction
          </arg>
          <arg name="eventType">updated</arg>
        </function>
      </post-functions>
    </unconditional-result>
  </results>
</action>
```

Note that version 2.8 of OSWorkflow allows common actions with a step value of "0" which should result in no
change of the step value after executing the action. However, OSWorkflow 2.8 won't be available in Jira until Jira release 3.7 (see http://jira.atlassian.com/browse/JRA-8902)

Using Templates to control edit of an issue

Overview
You can control who can edit each field by making small changes to the Velocity template files used to display fields in the Edit Issue screen.

One of the points of pain with JIRA is trying to control who can edit particular fields of an issue, as discussed in JRA-1330. Various suggestions have been made there, such as using a workflow, but the page How to create a new Custom Field Type gave me the idea of simply changing the velocity template that is used to display a field to control who can edit the field's values. This approach also provides enough flexibility to make other changes such as who is permitted read the contents of a field.

Steps

1. Decide which field you want to control, e.g. Fix Versions
2. Find the template that is used to generate that field in the Edit Issue screen. The template is probably one of the files atlassian-jira/WEB-INF/classes/templates/jira/issue/field/*-edit.vm, e.g. versions-edit.vm in this case
   If you have the source code, then you can confirm exactly which template is used by looking in jira/src/java/com/atlassian/jira/issue/fields for the field type you are interested in.
3. Note that some templates are used by more than one field, e.g. the versions-edit.vm is used for both the Affects Versions and Fix Versions fields.
4. Find the field id of the field you want to control, e.g. for Fix Versions the field id is fixVersions. I actually found this out by simply tweaking the template to print out the $field.id, but it's really defined in atlassian-jira-enterprise-3.8-source/jira/src/java/com/atlassian/jira/issue/IssueFieldConstants.java.
5. Make the changes and restart JIRA.

Changes
This example shows the changes made to versions-edit.vm to control who can edit the Fix Versions field.

```velvet
#controlHeader ($action $field.id $i18n.getText($field.nameKey)
$fieldLayoutItem.required $displayParameters.get('noHeader'))
```

Here is where the changes start:

```velvet
<!-- By default, the fields are writeable -->
#set ($readonly = "no")
#if ($field.id == "fixVersions")
  <!-- This example is restricting who can change the Fix Version to members of the fix-version-writers group -->
  #if ($authcontext.user.inGroup('fix-version-writers'))
    #set ($readonly = "no")
  #else
    #set ($readonly = "yes")
  #end
#endif
```

The following line is part of the original template

---

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
but these are the lines that change what is displayed. A "break" command would be useful in Velocity.

```velocityEngine
#if ($readonly == "yes")
  <!-- Display the field value -->
  #if ($currentVersions)
    #foreach ($cv in $currentVersions)
      #foreach ($version in $versions)
        #if ($cv == $version.key)
          $textutils.htmlEncode($version.value)<br>
        #end
      #end
    #end
  #else
    <!-- The Fix Version has not been set -->
    Unknown<br>
  #end
#endif
```

All the other lines in this file are unchanged except for the closing `#end` line
In case that was a bit too detailed, here is the diff for JIRA 3.8.1:
[jira@toolsdev plugins]$ diff -c

--- 53,59 ----
</optgroup>
Pros

- Simple changes to one .vm file per field to be controlled, no recompilation of source code necessary
- Uses the existing Jira group mechanism

Cons

- Need to manually apply changes to updated versions of JIRA. Happily, the changes are cleanly localised.
- Only controls fields edited using the browser, not with the SOAP API
- Need some familiarity with the Velocity template language

Troubleshooting

If you are having trouble with a hidden value being reset when the issue is edited, you can try passing it back like this:

```html
<input type=hidden name="$customField.id" id="$customField.id" value="$value">
```

This may occur when a user with no write-permission for a select field edits the issue.

### How do I assign issues to multiple users

JIRA is designed so that issues must be assigned to a single individual to prevent tasks from being overlooked. A team lead or manager should assign issues out to individuals, or your users will pick from a list of issues that they have the option to take on.

However, if you want to configure JIRA to allow issues to be assigned to multiple users there are a few options for doing so:

- Managing Issues via a Queue
- Managing Issues via Group Ownership
- Managing Issues via a User Account
- Managing Issue via Sub-Tasks

It is easy to still setup a queue the a group can pick from, or affiliate an issue with group in addition to having it assigned to an individual within that group:

#### Managing Issues via a Queue

You can configure your JIRA project to assign issues to an 'Unassigned' "queue" by default, which your users can then pick issues from.

To do this, set up the following:

1. Configure your JIRA project to allow the ‘default assignee’ to be 'Unassigned' (see Defining a Project).
2. Ensure that 'Allow unassigned issues' is set to ON in your General Configuration settings (Administration > Global Settings > General Configuration).
3. Set any issues that you want to be in the queue to be 'Unassigned'.
4. Create a dashboard page with a filter that lists all 'Unassigned' issues, share the dashboard page and request that interested members of the group display the shared page on their dashboards. See Managing Multiple Dashboard Pages for instructions.

#### Managing Issues via Group Ownership

You can add a custom field to store which users and groups should be associated with a given issue. This is particularly useful for projects where a team owns all issues of a particular type.

To do this, set up the following:
1. Add a group picker custom field to your issues.
2. Configure an email notification in your project's notification scheme to be sent to the 'Group Custom Field Value'.

An issue can now be "assigned" to the group by selecting the appropriate group in the group picker. An email notification will be sent to the group.

Another option is to add a user picker custom field rather than a group picker, and assign multiple users to an issue. However, you will then have both the JIRA default user field and custom user field for your assignees.

Managing Issues via a User Account

You can create a JIRA user account to represent a group of people (e.g. ‘developers’) and assign issues to this user.

To do this, set up the following:

1. Create a JIRA user to represent the group (see Managing Users).
2. (Optional) Create an email mailing list for this group (not a JIRA function) and set the mailing list email as the JIRA user's email address.
3. Create a dashboard page showing issues assigned to this user, share the dashboard page and request that interested members of the group display the shared page on their dashboards. See Managing Multiple Dashboard Pages for instructions.

An issue can now be assigned the new "user" representing the group and your users can track the issues on their dashboards. If you have set up a mailing list, your users will also be notified by email.

Managing Issue via Sub-Tasks

If you have a task managed by different users then you are able to break the combined task into individual subtasks with their own single assignees.

How do I delete a user account?

Someone has left the company. How do I delete their user account if they have reported issues?

We recommend that you deactivate rather than delete a user's account. Deactivating a user's account will prevent that account from being used and being able to login, but will preserve their issues history.

- If you would like to deactivate a user's account, please read Deactivating a User's Account.
- If you would like to delete a user's account, please read Deleting a User's Account.

How do I disable Firebug for JIRA?

The Firebug add-on for Firefox can significantly degrade the performance of web pages. If JIRA is running too slowly (the JIRA dashboard, in particular), we recommend that you disable Firebug.

To disable Firebug for JIRA:

1. Open the 'Firebug' pane in the Firefox tab that has JIRA running, by clicking the Firebug icon.
2. Click the down arrow next to the 'Net' tab, and select 'Disable monitor' for the URL of your JIRA instance (e.g. jira.atlassian.com)
3. Repeat Step 2 on the 'Console' and 'Script' tabs.

How Do I Use an SSL Certificate Generated Using openssl?

You have an SSL Certificate that was generated using openssl, and you would like to use it with JIRA.

You need to have both the signed ssl certificate and the private key that was generated using openssl. Then you convert the certificate + key pair to pkcs12 format using openssl:
When doing this, openssl should ask for a password, so remember whatever you enter here. This will convert the certificate (server.cert) and the private key (server.key) into a pkcs12 file (server.p12).

Next you simply need to configure tomcat to use the pkcs12 (.p12) file as its keystore by editing $JIRA_HOME/conf/server.xml:

```xml
<Connector port="8443" maxHttpHeaderSize="8192"
    maxThreads="150" minSpareThreads="25" maxSpareThreads="75"
    enableLookups="false" disableUploadTimeout="true"
    acceptCount="100" scheme="https" secure="true"
    clientAuth="false" ss1Protocol="TLS" SSLEnabled="true"
    URIEncoding="UTF-8" keystorePass="changeit"
    keystoreType="pkcs12" keystoreFile="/path/to/server.p12" />
```

The important thing to specify is that keystoreType="pkcs12". The keystorePass is whatever password you gave when generating pkcs12 file, and the keystoreFile is the path to the file.

The process should be the same for Confluence (or indeed any other application running on Tomcat).

**How the CreateOrCommentHandler works?**

**How to change Multi Select Custom field size using script**

By default, Multi Select custom field will only show maximum 5 rows of options (refer screenshot below), this is not convenient for some users who have more than 20 options in their multi select custom field. Below is the
Thanks Kanishk Choraria for this workaround.

Atlassian does not support customizations to JIRA. For more information about Atlassian support, see [Atlassian Support Offerings](#).

The Steps

1. In Custom fields screen, click on **Edit** of the custom field.
2. When the page is loaded, refer to `?id=` at the address field of the browser for the custom field ID, refer the screenshot below on the highlighted red area for the id.

3. Replacing last five digit of 'customfield_10010' on the sample script below to match the ID you have obtained on the step above:

   ```javascript
   <script type="text/javascript">
   mselectbox = document.getElementsByName('customfield_10010');
   mselectbox[0].setAttribute("size", "20");
   </script>
   ``

4. The size of the customfield will change based on the attribute configured on the parameter, example
above, the size of multi select field will be expand to 20 rows when the ("size","20") is set, feel free to replace the number to suit your own preference.
5. Put the script above to Description of custom field (shown below) and update.

**Edit Custom Field Details**

If the search template is changed, manual reindexing must follow.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Multiple Select</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Multi Select Searcher</td>
</tr>
</tbody>
</table>

A description of the particular custom field.
You can include HTML, make sure to close all your tags.

Search Template

Note that changing a custom field searcher may require a reindex.

**Result**

The size will change based on the parameter set on the script.

How to change the location of stdout and stderr logs

If JIRA is running as service in Windows, stdout_*.log and stderr_*.log files will be created. These files will grow rapidly and over time can become very large. You can change the location of these files to a different location, if needed. One of the following methods can be followed:

**Method 1**

To change the stdout_.log and stderr_.log location,

1. Remove the JIRA service.
2. Open the service.bat file with editor and find the parameter below:
3. Change `set PR_LOGPATH=%CATALINA_BASE%\logs` to any location you wish, for example `set PR_LOGPATH=D:\logs`.

4. Run `service.bat install JIRA_SERVICE_NAME` to install JIRA as a service again.

**Method 2**

1. Open the JIRA service configuration as explained at *Setting Properties and Options on Startup - via CommandLine*.
2. Modify the location of the `stdlog` and `stderr` paths as shown in the screenshot below:

   ![Screenshot of JIRA service configuration](image)

   3. Apply the changes.
   4. Restart JIRA service for the changes to take effect.

**How to clear the resolution field when the issue is reopened**

In the default JIRA workflow, issues have their resolutions cleared upon re-opening an issue. This is important because many reports/filters could be inspecting for the presence of a *Resolution* to be considered resolved.

The *Resolution* field is typically cleared by setting a post-function in the workflow transition you’d like to have this occur.

1. The function to use is **Update Issue**.
2. The field to use is **Resolution**.
3. The value to choose is **None**.

**Update parameters of the Update Issue Field Function for this transition.**

![Screenshot of Update Issue Field Function](image)

*Please make sure that the value you set is valid for the project using this workflow. Otherwise, the transition may fail at execution time.*

How to configure comment field to become mandatory in workflow transition

A user may want to know how to configure the comment field to be mandatory on every transition screen.

Tips: There is a third party plugin that could help user to achieve it.

Pre-requisite:

Please install JIRA Misc Workflow Extension plugin, which is available from this link.

Note: check on JIRA compatible version.

Workaround

1. Install the plugin manually (Administrative > Plugins > Install Plugins > Upload Plugin).
2. Please edit the workflow and add the Comment Required Validator from validator transition.
3. Configure the custom error message and choose any group to be allowed or available to comment.

How to configure sub-task to have a specific screen?

By configuring a custom Issue Type Screen Scheme, it could able to have a specific screen for sub-task issue type. For example:

1. Create a screen via Administration -> Issue Fields -> Screens (e.g. Sub-task screen)
2. Create a Screen Scheme via Administration -> Issue Fields -> Screen Schemes (e.g. Sub-task Screen Scheme)
3. Configure this newly created screen scheme to have a 'sub-task screen' when creating issue
4. Create a Issue Type Screen Scheme via Administration -> Issue Fields -> Issue Type Screen Schemes. Configure this newly created Issue Type Screen Scheme to have a 'Sub-task Screen Scheme' for 'sub-task' issue type
6. Associate this Issue Type Screen Scheme with the project

For more information on Issue Type Screen Scheme, please refer to this documentation:

Error rendering macro 'kbsurvey' : null

How to convert types using Jelly

Scenario

When programming in Jelly, you can get in a situation as illustrated by the following code snippet:
The goal here is to create a new Project Role and then set the appropriate Permissions to it. However, as the `projectroleid` and `qaroleid` variables are not the same type, you should get an error like this:

```
Could not run script.
Extra Information: [hide]
xmlns:j="jelly:core">10010 QARole QA role
Exception: org.apache.commons.jelly.JellyTagException: null:10:0: Cannot assign
value of type 'java.lang.Long' to property 'projectroleid' of type
'java.lang.String'
java.io.PrintWriter@334cee
```

So `qaroleid`, which received a `java.lang.Long` value from the `jelly.role.id` context variable, should be converted to a `java.lang.String` type so it can be informed as `projectroleid` attribute when setting a Permission.

**Problem**

How can you convert types in Jelly?

**Solution**

You can use the `j:invoke` Jelly tag to call the method `toString` on the `jelly.role.id` context variable and store this value the in the `qaroleid` variable. So you should replace this line...

```
<j:set var="qaroleid" value="${jelly.role.id}"/>
```

... with this...

```
<j:invoke on="${jelly.role.id}" method="toString" var="qaroleid"/>
```

... and the script will work successfully.

You can also (just as an example matter) use the `new` Jelly tag to convert the `java.lang.String` value of the `qaroleid` variable into a `java.lang.Float` value and store it in the `qafloatvar` variable, as shown here:
You may find useful to look at these pages for more information on Jelly tags:

- Jelly - Tag Reference
- Jelly Scripting Hints

**How to create a download link to a file**

**Symptoms**

You can perform the following steps to create a download link to a file in JIRA:

1. Use 'Text Field' custom field type to represent the link to a file (Administration -> Issue Fields -> Custom Fields)
2. Enable the 'Wiki Style Renderer' for this 'Text Field' custom field (Administration -> Issue Fields -> Field Configurations)
3. In the Issue Screen, try to add a link in the 'Text Field' custom field. For example:

    `[file:///V:/Jira test/example.xls]`

The file can be opened by right clicking the link and select on the 'Save Target As...'. Do note that this only works on Internet Explorer but can also be enabled in Firefox. Please see:

- Linking to local file under Firefox

For more information on renderers, please refer to:

- Configuring Renderers

**How to deactivate comments for closed issues**

**Symptoms**

As a JIRA Administrator, you want to make sure that it is not possible to comment on closed issues.

**Resolution**
Go to your Workflow Editor and add a step property to the *Closed* status:

### JIRA 5.x

- There, add the property `jira.permission.comment.user` and make the property value *denied*:

  **Edit Properties**

<table>
<thead>
<tr>
<th>Property Key</th>
<th>Property Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>jira.issue.editable</td>
<td>false</td>
</tr>
<tr>
<td>jira.permission.comment.user</td>
<td>false</td>
</tr>
<tr>
<td>Click to Add a New Property</td>
<td>denied</td>
</tr>
</tbody>
</table>

**Environment**

This was tested on JIRA 5.0.6 and 5.2.11

### JIRA 6.1.x

- Add the property `jira.permission.comment.user` and make the property value *false*

**Environment**

This was tested on JIRA 6.1.5

How to disable the Resolve issue screen while resolving issues

If you don't want JIRA to show a screen when resolving an issue, then disassociate the 'Issue Resolved Screen' from the transition.

The transition view should not be associated with any screen.

How to display a different format for the Number customfield

If you do not like how the Number custom field is displaying in Jira (for example, if you do not want it to display the commas), you can modify a velocity file to configure this. In particular, look at the file WEB-INF/classes/templates/plugins/fields/view/view-number.vm. As mentioned here:

```
At the moment to change the way the numbers are printed the easiest thing to do is to edit:
WEB-INF/classes/templates/plugins/fields/view/view-number.vm
under the JIRA web application and replace:
$!numberTool.format($value)
with:
$value.longValue()
and restart.
```
How to ensure the Road Map tab is visible

If the Road Map project tab is not visible for a particular project, it may be for one of the following reasons:

- The Road Map Panel (roadmap-panel) module is disabled
- The "Fix Version/s" field is hidden via at the Field Configuration

So, if you are not seeing this tab, but you want to, ensure:

- The Road Map module is enabled under Administration -> System -> Plugins -> Project Panels Plugin
- The "Fix Version/s" field is not hidden under Administration -> Issue Fields -> Field Configurations

Please also note that you would need to add Version to the project. The tab will only show up if the Fix version field is actually used.
How to Get Unicode 'non-ASCII' Characters in HTTPS URL to Appear Correctly

In most cases URLs running over HTTP work fine, but not when using HTTPS (i.e. over SSL). This usually results in Unicode (non-ASCII) characters in an HTTPS URL appear incorrect in the URL, and the served page contains numerous errors.

This occurs when the useBodyEncodingForURI="true" flag is not defined in the HTTPS connector definition in conf/server.xml of the Apache Tomcat application server running JIRA. This flag is set as such by default in 'recommended' distribution installations of JIRA.

However, in JIRA WAR setups, this might not be the case. Hence, ensure that the useBodyEncodingForURI="true" flag is included in the following element of the conf/server.xml file of your Apache Tomcat installation running JIRA:

```xml
<Connector port="8443" maxHttpHeaderSize="8192" maxThreads="150" minSpareThreads="25" maxSpareThreads="75" enableLookups="false" disableUploadTimeout="true" acceptCount="100" scheme="https" secure="true" clientAuth="false" sslProtocol="TLS" useBodyEncodingForURI="true" />
```

After specifying the useBodyEncodingForURI="true" in all connector definitions (i.e. both the HTTP and the HTTPS connectors), as described in the 'Modifying Tomcat server.xml' section of the Installing JIRA on Tomcat 6.0 or 7.0 documentation.
How to have long component version names display properly in the Issue Navigator

If you create a component or version name which is very long, it is not possibly to view it in the issue navigator. If you're finding this happening in your Jira instance, you can set the width of the component or version list to auto and wrap it in a `<div>` element with fixed width in this file:

- WEB-INF/classes/templates/jira/issue/searchers/edit/project-constants-searcher-edit.vm

Here is a code sample:

```html
...<div style="width: 180px; overflow-x: scroll; border: 1px #ddddff solid;"><select style="width: auto;">...</select></div>...```

How to Rename the 'Priority' Field in the Issue Navigator

In order to rename the "Priorities" text in the issue navigator, you may need to edit the following properties file in the language pack:

```
com/atlassian/jira/web/action/issue/IssueNavigator_en.properties
```

The following property value in the IssueNavigator_en.properties:

```
issue.column.heading.priority
```

⚠️ Note that this has been changed in 4.3 and later.

ℹ️ Also note that this does not change Advanced search. See

```
JRA-27414 - Add advanced search field names to i18n file
```

http://support.atlassian.com/browse/JSP-27758

http://support.atlassian.com/browse/JSP-18571
The language pack is a JAR file located in <jira-install>/atlassian-jira/WEB-INF/lib. For more information about Customizing Text in JIRA, please refer to Customizing Text.

⚠️ For more information for JIRA 4.4+ please refer to the Renaming System Fields in JIRA JIRA Knowledge base article.

How to re-order statuses

There is currently no way to change Statuses order in JIRA, the only workaround is to manipulate JIRA database, please follow JIRA-5198 and vote on this feature.

This FAQ is to document down the workaround for JIRA-5198, all credit goes to the contributors in JIRA-5198.

Direct Database Manipulation is outside the scope of Atlassian support - this document is for informational purposes only.

⚠️ Warning
Please Backup Database before implementing the below workaround

The Steps

1. Shutdown JIRA
2. Backup Database
3. List down the current Statuses order using query below:

```
SELECT pname,SEQUENCE FROM issuestatus order by SEQUENCE;
```

4. You will get result like below:

<table>
<thead>
<tr>
<th>pname</th>
<th>SEQUENCE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open</td>
<td>1</td>
</tr>
<tr>
<td>In Progress</td>
<td>2</td>
</tr>
<tr>
<td>Reopened</td>
<td>3</td>
</tr>
<tr>
<td>Resolved</td>
<td>4</td>
</tr>
<tr>
<td>Closed</td>
<td>5</td>
</tr>
</tbody>
</table>

5. Update the current status sequence numbers to 10, 20, 30 instead of 1,2,3 so it's easier to modify later.

```
update issuestatus set SEQUENCE =10 where SEQUENCE='1';
```

6. Repeat step above for other statuses, you will get result like below:

<table>
<thead>
<tr>
<th>pname</th>
<th>SEQUENCE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open</td>
<td>10</td>
</tr>
<tr>
<td>In Progress</td>
<td>20</td>
</tr>
<tr>
<td>Reopened</td>
<td>30</td>
</tr>
<tr>
<td>Resolved</td>
<td>40</td>
</tr>
</tbody>
</table>
7. Finally, Update the table with the sequence you want, for example change Status "Reopened" show after status "Resolved":

```
update issuetatus set SEQUENCE = 45 where pname="Reopened";
```

8. Restart or Re-index JIRA to take effect.

**How to re-order the list of issue operation in an issue**

To re-order the issue operation list, the 'order' value at the following file needs to be edited:

```
/atlassian-jira/WEB-INF/classes/system-issueoperations-plugin.xml
```

For example, change the 'order' value for 'Comment on this issue' operation from 50 to 10. By doing so, it will place this operation at the top of the issue operation list:

```
<issue-operation key="comment-issue"
    i18n-name-key="admin.issue.operations.plugin.comment.issue.name"
    name="Comment on this issue"
    class="com.atlassian.jira.issue.operations.CommentIssueOperation"
    state='enabled'>
    <resource type="velocity" name="view"
      location="templates/plugins/operations/commentissue.vm" />
    <order>10</order>
</issue-operation>
```

Please restart JIRA after the modification. Do note that this modification will be applied to all the projects in JIRA.

**How to resize Free Text Field customfield**

You can customize the size of customfield (Free Text Field) at `%JIRA_HOME%/atlassian-jira/WEB-INF/classes/templates/plugins/fields/edit/edit-textarea.vm`.

**How to resize the 'Components' and 'Affects Versions' fields in the Issue Navigator**

When the values of components or versions are too long, the full name will be truncated within Issue Navigator. Hence, the user is not able to view the full name of the component/version.

Atlassian does not support customisations to Velocity templates or other JIRA files. For more information about Atlassian support, see [Atlassian Support Offerings](http://support.atlassian.com/browse/JSP-20022).

**Deploying Velocity Templates without a Restart**

In a development instance, you can play with picking up velocity file changes without a restart. From `<jira-install>/atlassian-jira/WEB-INF/classes/velocity.properties`:

1. Change class.resource.loader.cache from true to false
2. Uncomment (remove the # sign from) velocimacro.library.autoreload=true

Keep in mind that the next time you upgrade JIRA – or need a new installation for any reason – you will have to manually copy any changes you have made to the JSPs or templates into the new installation of JIRA. If the JSPs or templates have changed in the newer version, you will have to port your
The workaround is navigate to and edit the following file:

<JIRA_HOME>/atlassian-jira/WEB-INF/classes/templates/jira/issue/searchers/edit/project-constants-searcher-edit.vm

Change width: 180px to be something that is more appropriate for your JIRA instance.

A restart of JIRA is required for the change to take effect. Please make sure to test this in a development instance prior to implementing in your production instance.

Make sure to back up the velocity file before changing it. Keep in mind the notes from [JIRA:Modifying JIRA Templates and JSPs].

How to Restrict the Subversion Commits Tab to Selected Projects or Users

**Symptoms**

It may be the case that a project or subset of users in JIRA may need the subversion commits tab and another project or subset of users does not. It is not immediately obvious how to configure such access to the tab.

**Cause**

The tab is displayed based on the permissions associated with the user viewing issue, project, et cetera.

**Resolution**

To restrict the tab to selected projects or users, simply configure the appropriate project/group of users to either have or lack the View Development Tools permission.
How to search by number range in the Issue Navigator

When searching for some issues based on the "Number Field" custom field type, there may be a requirement to search issues for a range of numbers based on the custom field.

The "Number Field" custom field type can be configured to use the "Number range searcher". Hence, the issues can be searched within a range of values for that custom field. The search template can be changed by clicking on the "Edit" operation via Administration -> Issue Fields -> Custom Fields. For more information, please refer to the custom field documentation

Please note that a re-index needs to be performed via Administration -> System -> Indexing after changing the custom field searcher.

http://support.atlassian.com/browse/JSP-18314

How To Send Notifications By Issue Type

Goal

You would like to send a notification to a certain team when one (or more) specific issue types are created. For example, if a bug is files in Project X, you would like an email notification to be sent to the existing group development-team.

Procedure

This is a bit tricky, but can be done. You will need to work with Workflow Scheme, Workflow, Notification Scheme, and Events (links to our detailed documentation are included in-line with these instructions):

1. First, if your group is not created, create it now
2. Create a custom event, such as "Project X Bug Created"
3. Modify Notification Scheme for Project X to add this new event, and notify development-team
   a. Note, Notification Schemes are defined on a per-project basis, so go to Project X, Administer
      Project, and make sure you are modifying the correct scheme.
4. To send notifications for a/multiple specific issue type(s), but not all, you will have to create a workflow, a
   workflow scheme to be used for these specific issues, and associate the two
   a. Go to your workflows, locate the workflow you're currently using for Project X, and click on the
      "Copy" link to make a copy
      i. Choose an appropriate name (Project X Bugs)
   b. This should bring you to the edit screen. Make sure you're on the "Text" and not "Diagram"
      i. Click on the "Open" Step
      ii. You should see the Workflow Screen and the Workflow Browser in the upper right - click on
          the "Create" transition
      iii. Click on the "Post Functions" tab, and choose "Edit" for the Fire a Issue Created event
          function
         1. If this does not exist, you can choose "Add" and Fire the event you created in step 2
         iv. Change the event to "Project X Bug Created" and update the function
            1. This means that with bugs, only those users associated on the Notification Scheme
               with the "Project X Bug Created" event will receive notifications when the bug is
               created. If you would like the normal "Issue Created" notifications to go out as well,
               you will need to add those groups/users/roles to this notification as in Step 3 above.
   c. Now you need to create the scheme for this issue type - click on workflow schemes
      i. Click Add Workflow Scheme and choose an appropriate name (Project X Bugs Scheme)
      ii. Associate this with your new workflow (Project X Bugs), for issue type Bugs (or as many as
          you would like)
      iii. Associate another workflow, your original for Project X, with All unassigned Issue types
5. Finally, you need to associate this new scheme with Project X, so that it knows to use your new workflow
   with Bugs, and the old workflow with everything else
   a. Click on "Projects" in the JIRA Administration menu, and choose Project X
   b. Scroll down to the workflow section, and click on the associated scheme
   c. Click "Switch Screen" and choose your newly created scheme Project X Bugs Scheme
6. After all of this, you might want to do a background re-index

How to show a transition only when the Assignee is different from the Current User

This solution is particularly useful when your workflow has a restriction on assigning issues. For example, certain users can only assign an issue to themselves by executing a transition, and you want the "Assign to Me" action to be visible only if the Current User is not yet the Assignee of the issue.

Let us consider the assigning scenario. To show the "Assign to Me" transition only when the Assignee is different from the Current User, execute the following steps:

1. Download and install the Jira Scripting Suite plugin. See the Installation&Upgrade Guide.
2. Create a draft of your workflow so you can change it. See Configuring Workflow - Editing an active workflow.
3. Go to the "Assign to Me" transition and add a "Jython Condition". In the "Add Parameters To Condition" screen, paste the following lines of code and click "Add".

   ```python
   import com.atlassian.jira.ComponentManager
   curr = ComponentManager.getInstance().getJiraAuthenticationContext().getUser()
   assig = issue.getAssignee()
   result = (curr != assig)
   ```

4. Publish the changes to your workflow.

   This was tested in JIRA 4.0.2.

See also How to Allow Users to Assign Issues Only in a Specific Transition.

How to update custom field values during workflow transition.
By default, updating a custom field during a transition is not possible in JIRA, but there is workaround involving the JIRA Suite Utilities Plugin.

Step 1: install JIRA Suite Utilities Plugin

Please install JIRA Suite Utilities plugin, which is available from this link.

**Note: check on JIRA compatible version.**

Step 2: update your project's workflow transition

1. Navigate to the appropriate workflow
2. Create a Draft or Copy of the existing workflow
3. Navigate to the appropriate transition's Post Functions tab
4. Add Update Issue Custom Field to the post function.
5. Specify the custom field and the desired value to be updated.
   a. For example:

   ![Update Issue Custom Field](image)

Importing data

To import issue data from CSV (Comma-Separated Value), Bugzilla, FogBugz or Mantis, please see the documentation:

- CSV
- Bugzilla
- FogBugz
- Mantis

For other types of import, please contact us as we may have done it before. See also JIRA's Jelly support — Jelly is a scriptable interface to JIRA that is useful for importing data.

Letting customers only create issues

This page describes a minor JIRA modification which redirects users to an arbitrary page after creating issues (and potentially other operations). It is mainly of interest to JIRA Professional and Standard users.

Scenario

When JIRA is used in a public environment, it is often useful for customers to be able to raise issues directly, but not see other customers' issues.

You can also grant the Reporter (and your company groups) the Browse Issue permission. Customers can then view issues they have raised.

In JIRA Professional and Standard, Reporter isn't available, and permissions can only be granted/denied per group. We want the Create Issue permission granted to everyone, but Browse Projects denied:
Users will see a permission error after creating an issue - not very customer-friendly!

Redirecting to a custom page

What we want is the ability to redirect the user to a nice "Thanks for raising an issue" page. We might want to direct to a different page depending on which groups the user is in. This can be done as follows:

Modify actions.xml

Open atlassian-jira/WEB-INF/classes/actions.xml in your JIRA Installation Directory. If you are using the JIRA WAR distribution, first copy webapp/WEB-INF/classes/actions.xml to edit-webapp/WEB-INF/classes in your JIRA Installation Directory and edit actions.xml there.

Locate the section:

```
<action name="issue.ViewIssue" alias="ViewIssue">
  <view name="success">/secure/views/issue/viewissue.jsp</view>
  <view name="rss">/secure/views/issue/viewissue-rss.jsp</view>
  <view name="issuenotfound">/secure/views/issuenotfound.jsp</view>
  <view name="permissionviolation">/secure/views/permissionviolation.jsp</view>
  <command name="moveIssueLink" alias="MoveIssueLink">
    <view name="error">/secure/views/issue/viewissue.jsp</view>
  </command>
</action>
```

Modify the permissionviolation page to /redirectusers.jsp:

```
<view name="permissionviolation">/redirectusers.jsp</view>
```

Create a redirect JSP

Now create atlassian-jira/redirectusers.jsp (in your JIRA Installation Directory (or for JIRA WAR distributions, the edit-webapp/redirectusers.jsp of the JIRA Installation Directory), containing something like this:
<%@ page import="com.opensymphony.user.User"%>
<%
User user =
com.opensymphony.user.UserManager.getInstance().getUser(request.getRemoteUser());
if (user.inGroup("customerA-users")) {
response.sendRedirect("http://localhost/thankyou.jsp?user="+user);
} else {
response.sendRedirect("http://localhost/thankyou.jsp");
}%>

Your logic group(s) to check for and redirect URLs will be different. If you don’t want to create a custom page, you can redirect to request.getContextPath()+"/secure/Dashboard.jspa"

Deploy

Simply restart JIRA (or if you are using the WAR distribution, run build.bat or build.sh to regenerate the .war file and redeploy this in your application server).

Linking to local file under Firefox

There is a new KB article related to this topic which contains updated information. Please review that if you have questions about linking to file:// URLs from within JIRA:

KB Article: Can't Link to Local Files from within JIRA

Wiki markup allows you to links to files on the network / server with the format:

[file:///c:/temp/foo.txt]

This works fine under Internet Explorer, but Firefox and Mozilla block links to local files for security purposes. If you are happy with the risk of linking to local content, you can override the security policy and also enable linking in Firefox.

The instructions for this can be found at http://kb.mozillazine.org/Links_to_local_pages_don't_work and you may also want to check out the other network preferences.

Please note that you need to use full URL syntax for your link (from http://kb.mozillazine.org)

You also need to use proper URI syntax for local file references. It is not proper to enter an operating-system-specific path, such as c:\subdir\file.ext without converting it to a URI, which in this case would be file:///c:/subdir/file.ext. In general, a file path is converted to a URI by adding the scheme identifier file:, then three forward slashes (representing an empty authority or host segment), then the path with all backslashes converted to forward slashes.

Login problems

I have manually reset a user's password, but the user still cannot login

Check (in Admin -> Global Settings -> Global Permissions) that the user belongs to a group that has the JIRA Users permission.

The user cannot get past the login page. After clicking the "Log In" button, the login page just refreshes.

This usually occurs when JIRA cannot set a browser cookie. Ensure that cookies are allowed in the user's browser settings.

If you are using IE6, check that your server name does not have an underscore ("_") in it, as IE6 has a problem with this (see JIRA-1624).

Mail error - Unable to relay
I'm getting exceptions like "SMTPAddressFailedException: 550 5.7.1 Unable to relay for XXX@XXX". What does this mean?

The "Unable to relay" error means that your mail server doesn't allow relaying for the e-mail address that you are using for your SMTP server. (see http://www.chilkatsoft.com/faq/Smtp550.html). Please try getting your mail server admin to enable relaying for your e-mail address or use another address that has relaying enabled.

You can get more help on changing the e-mail addressed used by JIRA here.

Making JIRA login case insensitive for JIRA 3.13.x

As JIRA will depend on database whether to be case sensitive or insensitive, JIRA login for case sensitive database (eg. Postgres) will be case sensitive as well. To make the login page case insensitive, there are two files that need to be modified:

   <tr>
   <td valign="middle" align="center" colspan="2">
   <input id="login" type="button" onClick="CheckForm();" value="$i18n.getText('common.concepts.login')" tabindex="4" />
   </td>
   </tr>

   <script type="text/javascript">
   function CheckForm() {
   var Username = document.loginform.os_username.value;
   document.loginform.os_username.value = Username.toLowerCase();
   document.loginform.submit();
   }   
   </script>

   #if ($allowPasswordReset == true)
   <tr>
   <td valign="middle" align="right" width="25%"></td>
   <td valign="top"><font size="1"><a href="${baseurl}/secure/ForgotPassword!default.jspa">$i18n.getText('common.concepts.forgotpassword')</a></font></td>
   </tr>
   #end

2. <jira-install>/atlassian-jira/includes/loginform.jsp which control the loginform in the middle (eg. http://localhost:8085/login.jsp?os_destination=%2Fbrowse%2FTST-1). Modify the file as below
Restart JIRA after the modification. If it does not take effect, delete the work directory and restart JIRA.

**Outward Link Description and Inward Link Description**

When creating a new Issue Link Type, you need to specify an **Outward Link Description** (e.g. "duplicates") and an **Inward Link Description** (e.g. "is duplicated by").

**What do these mean?**

When a JIRA user links two issues together,

- the **Outward Link Description** applies to the issue from within which they clicked "Link this issue to another issue".
- the **Inward Link Description** applies to the issue that they choose to link to.

**Parsing utf-7 emails**

Some users report having problem parsing `unicode-1-1-utf-7` (aka `utf-7`) emails. JIRA breaks with a stacktrace like:
The solution

Hopefully one day, Sun will include support for this encoding natively (see this Sun bug report, but in the meanwhile you can install a library to get this working. Installation is quite simple:

1. Download the jutf7 jar from http://sourceforge.net/projects/jutf7
2. Copy the jar to your $JAVA_HOME/jre/lib/ext directory. No other directory will do - it has to be in this (lowest)classloader to be picked up.
3. Restart JIRA (or Confluence, or whatever is parsing the emails).

Project-specific email templates

Using email notifications, can separate templates be setup for projects or events?

Unfortunately templates are currently global. We anticipate adding this feature to JIRA in future.

QuickSearch guesses the issue key prefix (sometimes)

The Quick Search box (at the top-right of your JIRA screen) can sometimes find issues when you type just the number (e.g. '53'). Other times, you need to type the prefix too (e.g. 'JRA-53').

This is due to the concept of a 'selected project' - a bit of JIRA magic if you like. Basically, if you have recently done something in a project, that project becomes your 'selected project'. JIRA tries to 'guess' which issue you
are looking for, given the 'selected project'.

But if you've just logged into JIRA, and not yet gone to an issue or a project, you will need to type the complete issue key (including the prefix).

**Receiving a Daily Summary of Updated Issues**

Some people may prefer to receive a daily summary of updated issues, rather than continual notifications each time an issue is updated. To do this, you will need to:

1. **Set up your search criteria**
2. **Save your search as a 'Filter'**
3. **Subscribe to your Filter**
4. **(Optional) Stop the continual notifications**

**1. Set up your search criteria**

For example, to find all issues that have been updated in the past 24 hours, use the following Advanced Search query:

```
updated >= "-24h"
```

Or, to find all issues in the "ACME" project that have been updated in the past 24 hours, use the following Advanced Search query:

```
project = "ACME" and updated >= "-24h"
```

**2. Save your search as a 'Filter'**

Click the 'Save' link in the 'Operations' column. Type a name for your new filter (e.g. "Joe's Daily Updates"), then click the 'Save' button.

- For further details, please see Using Filters.

**3. Subscribe to your Filter**

Once you have saved your new filter, click the 'Subscriptions' link in the 'Operations' column. Click 'Add subscription', adjust the default settings if you need to, then click the 'Subscribe' button.

- For further details, please see Receiving Search Results via Email.

**4. (Optional) Stop the continual notifications**

If you don't want to receive continual updates each time an issue is updated, your name will need to be removed from the appropriate Notification Schemes.

**Receiving Notification for Select Issues or Updates**

To receive notifications of updates on issues meeting a set of criteria (For example, watching the output of a particular user), create an issue filter meeting said criteria and either subscribe to it by mail or add the RSS feed to a newsreader software.

For example, to search a list of issues with the following criteria:

```
Assignee: username
Updated from: -1d (updated within the last 24 hours)
```

The filter subscription will periodically send a notification reporting the issues assigned to username which have been updated within the last 24 hours. For more information, please refer to:

- Saving Searches ('Issue Filters')
- Receiving Search Results via Email
- Using the Issue Navigator
Removing Commas for Values Held in Number Field Custom Field Type

JIRA adds commas to numeric value stored in Number field, like 1,234. For further reference see JIRA KB: JRA-7582.

⚠️ Atlassian does not support customisations to Velocity templates or other JIRA files. For more information about Atlassian support, see Atlassian Support Offerings.

Deploying Velocity Templates without a Restart

In a development instance, you can play with picking up velocity file changes without a restart. From `<jira-install>/atlassian-jira/WEB-INF/classes/velocity.properties`:

1. Change `class.resource.loader.cache` from true to false
2. Uncomment (remove the # sign from) `#velocimacro.library.autoreload=true`

Keep in mind that the next time you upgrade JIRA – or need a new installation for any reason – you will have to manually copy any changes you have made to the JSPs or templates into the new installation of JIRA. If the JSPs or templates have changed in the newer version, you will have to port your customization into them.

This workaround will apply to all Security drop-down lists in the instance.

If you don’t want commas to be added, edit `/WEB-INF/classes/templates/plugins/fields/view/view-number.vm`. Replace the following line:

```
$!numberTool.format($value)
```

with:

```
$value.longValue()
```

Make sure to back up the velocity file before changing it. Keep in mind the notes from Modifying JIRA Templates and JSPs.

- Changing the Size of the Fix Versions and Affects Versions Select List
- Removing Commas for Values Held in Number Field Custom Field Type

Removing invalid characters from XML backups

⚠️ JIRA 3.1 and above should not suffer from this problem. Invalid characters are automatically stripped from imported data

In older versions of JIRA it was possible to cut & paste text containing control characters into JIRA issue fields. This causes problems, because JIRA’s backup format is XML, and XML does not allow for the storage of most control characters. When XML containing control characters is imported into JIRA, the import fails with an error:
1. Download atlassian-xml-cleaner-0.1.jar
2. Open a command prompt and locate the XML or ZIP backup file on your computer, ensuring that it is extracted if it's within a ZIP file. In this example, we will use entities.xml.
3. Run the application with the below:

   $ java -jar atlassian-xml-cleaner-0.1.jar entities.xml > entities-clean.xml

To fix this, the control characters will need to be removed from the JIRA backup file. This can be done with the following:

1. Download atlassian-xml-cleaner-0.1.jar
2. Open a command prompt and locate the XML or ZIP backup file on your computer, ensuring that it is extracted if it's within a ZIP file. In this example, we will use entities.xml.
3. Run the application with the below:

   $ java -jar atlassian-xml-cleaner-0.1.jar entities.xml > entities-clean.xml

This will create a copy of entities.xml as entities-clean.xml with the invalid characters removed. The entities-clean.xml will be able to be imported without the above errors now.

Removing NONE from the Issue Security Drop-Down List

There are some instances where the 'NONE' in the Issue Security Drop-Down list must be removed. By default in JIRA you cannot do this from the web interface. See JRA-5332 for a discussion on this feature request.

Atlassian does not support customisations to Velocity templates or other JIRA files. For more information about Atlassian support, see Atlassian Support Offerings.

Deploying Velocity Templates without a Restart

In a development instance, you can play with picking up velocity file changes without a restart. From <jira-install>/atlassian-jira/WEB-INF/classes/velocity.properties:

1. Change class.resource.loader.cache from true to false
2. Uncomment (remove the # sign from) #velocimacro.library.autoreload=true

Keep in mind that the next time you upgrade JIRA – or need a new installation for any reason – you will have to manually copy any changes you have made to the JSPs or templates into the new installation of JIRA. If the JSPs or templates have changed in the newer version, you will have to port your customization into them.
To remove the field, edit \texttt{<atlassian-jira/WEB-INF/classes/templates/jira/issue/field/securitylevel-edit.vm}. Delete the lines:

```html
<option value="@noneLevelId">
  #if (@noneLevelId && $security && $security == @noneLevelId )selected@end
  @i18n.getText('common.words.none')
</option>
```

Make sure to back up the velocity file before changing it. Keep in mind the notes from \textit{Modifying JIRA Templates and JSPs}.

**RELATED PAGES**

- Changing the Size of the Text Area Custom Field
- Removing NONE from the Issue Security Drop-Down List
- Changing the Size of the Fix Versions and Affects Versions Select List
- Removing Commas for Values Held in Number Field Custom Field Type

**Re-order workflow transactions**

If you need to re-order the workflow actions of a workflow step, for example:

```
From:
  \begin{itemize}
    \item action1
    \item action 2
    \item action 3
  \end{itemize}
To:
  \begin{itemize}
    \item action 2
    \item action 3
    \item action 1
  \end{itemize}
```

...You cannot do this from the web interface, but you can do it.

- Download the workflow as an XML file
- Open up the XML file and change the order of the \texttt{<common-actions>} and \texttt{<actions>} for every \texttt{<step>}
- Upload the XML and view the changes

There are some details \texttt{here} in our documentation.

http://support.atlassian.com/browse/JSP-19459

**Resolved issues appearing in Open issues filters**

**Symptoms**

If you find that supposedly "Resolved" issues are appearing in an open issues filter, your customized workflow may not be properly configured.

JIRA regards an "open" issue to be one without a resolution. With a standard JIRA workflow, this means all statuses except Resolved and Closed. When Resolving or Closing an issue, you are presented with a transition screen containing the Resolution field, which you must set to complete that transition. See the default workflow as an example.

It is possible to reconfigure JIRA such that Resolved issues, for example, do not have a resolution. This can
happen in two ways:

- The user creates a custom workflow, and doesn't prompt the user for a Resolution on the resolve screen.
- The user hides the Resolution field in the field configuration, so it never appears to users.

**Resolution**

The long-term solution is to fix the workflow to present the Resolution at every transition into a non-open status. If the Resolution field is hidden, it should be made visible.

Existing issues in Resolved or Closed that have no resolution can be fixed by reopening and reclosing with a resolution.

Here is the process, assuming issues in Resolved and Closed statuses without a resolution set:

1. Do a search for issues in status "Closed", with Resolution "unresolved", which will show affected issues.
2. On the right, you'll see the text "Bulk Change: all X issue(s)". Open that link twice, eg. the same page in two tabs or two browser windows.
3. In one page:
   - Click the checkbox to select all issues, and click "Next >>".
   - For Operation, choose "Transition Issues", and then choose "Reopen Issue"
   - Uncheck "Send mail for this update"
   - Click confirm.
4. Now in the second page (displaying that original set of issues):
   - Click the checkbox to select all issues, and click "Next >>".
   - Operation, choose "Transition Issues", and then choose "Close Issue"
   - Select a resolution (eg. "Fixed")
   - Uncheck "Send mail for this update"
   - Click confirm.

By doing this you have reopened and closed the issues, setting a resolution. The Closed issues should now no longer appear on your dashboard.

Repeat the same process, but selecting "Resolved" issues this time (and transitioning through Reopen and Resolve).

http://support.atlassian.com/browse/JSP-18371

**Restricting the Visibility of Worklog on an Issue**

To restrict the visibility of worklog done on an issue, adjust the 'Log Viewable By' (Visibility) field to specify which users can view the log work information in an issue. For more information, please refer to Logging Work on an Issue.
Retrieving the JIRA Administrator

⚠️ This article is for **JIRA 6.0 and above**. If you are running versions **5.2 and below**, please refer to our previous documentation.

On this page:

- **Scenario A**: I don't know which user has the JIRA Administrators or JIRA System Administrators global permission
  - If there are no Internal JIRA Administrators
  - If no users or groups exist in JIRA
- **Scenario B**: I know which user has the JIRA Administrators or JIRA System Administrators global permission, but I have forgotten the password
  - 1. Send it via email
  - 2. Set the password directly in the database

⚠️ Using Single Sign-On (SSO):

- If JIRA is configured for SSO through Crowd or another third-party service, only users from Crowd or the other service will be able to log in to JIRA.
- In order to log in as a user from the JIRA Internal Directory, roll back the changes made within Integrating Crowd with Atlassian JIRA or as made by the third-party authenticator.
You first need to find out which group(s) have been granted the global permission.

The **JIRA System Administrators** global permission was added to JIRA in version 3.12. Anyone granted the **JIRA System Administrators** global permission can perform all administration tasks in JIRA, whereas anyone granted the **JIRA Administrators** global permission can perform most but not all administration tasks. Prior to version 3.12, anyone granted the **JIRA Administrators** global permission can perform all administration tasks.

1. To find out which group(s) have been granted the **JIRA Administrators** global permission, run the following database query:

   ```sql
   select perm_parameter from schemepermissions where PERMISSION=0;
   ```

2. To find out which group(s) have been granted the **JIRA System Administrators** global permission, run the following database query:

   ```sql
   select perm_parameter from schemepermissions where PERMISSION=44;
   ```

3. Now that you know which group(s) have the global permission, run the following database query to find out which users are in that group (replace "jira-administrators" with the group returned by the above query):

   ```sql
   select child_name, directory_id from cwd_membership where parent_name='jira-administrators';
   ```

   If you are having issues with remote directory connectivity, you will need to use an account with a directory_id of 1.

   If you don't know the password for the user(s) returned by this query, move on to Scenario B.

   **If there are no Internal JIRA Administrators**

   If you’re using Crowd or an external user management system, there may be no users with administrator permissions. Find the groups in the external management system that you want to grant the administrator permissions and do the following:

   1. Shutdown JIRA.
   2. Use SQL to assign the appropriate group to the administrator permissions similar to this:

      ```sql
      update schemepermissions set perm_parameter='jira-system-administrators' where permission=44;
      update schemepermissions set perm_parameter='jira-administrators' where permission=0;
      update schemepermissions set perm_parameter='jira-users' where permission=1;
      ```

      (Oracle only): Execute a **COMMIT** so that the transactions are completed.

      4. Restart JIRA.

   **If no users or groups exist in JIRA**

   There may be no users or groups in your Internal Directory. If this is the case, you need to add one:

   1. Add a new 'localadmin' user with the password **sphere**:
If you are using Oracle database use the following:

```sql
insert into cwd_user values (999999,1,'localadmin','localadmin',1,'2012-01-04 19:49:05-08','2012-01-04 19:49:05-08','local','local','admin','admin','local admin','local admin@localadmin.com','localadmin@localadmin.com','uQieO/1CGMUIXX ftw3ynrsaYLSH+GTCPS4LdUGWB1usFvHPFuzD7Zvms6yMMva8I7FViHVEqr6Mj4pCLKAFQ==');
```

## 2. Add new groups:

```sql
insert into cwd_group(id, group_name, lower_group_name, active, local, created_date, updated_date, description, lower_description, group_type, directory_id) values ( '888888','jira-administrators','jira-administrators',1,0,'2011-03-21 12:20:29','2011-03-21 12:20:29',NULL,NULL,'GROUP',1);
insert into cwd_group(id, group_name, lower_group_name, active, local, created_date, updated_date, description, lower_description, group_type, directory_id) values ( '777777','jira-users','jira-users',1,0,'2011-03-21 12:20:29','2011-03-21 12:20:29',NULL,NULL,'GROUP',1);
```

If you are using Oracle database use the following:

```sql
insert into cwd_group(id, group_name, lower_group_name, active, local, created_date, updated_date, description, lower_description, group_type, directory_id) values ( '777777','jira-users','jira-users',1,0,TO_DATE('2011-03-21 12:20:29','yyyy-mm-dd hh24:mi:ss'),TO_DATE('2011-03-21 12:20:29','yyyy-mm-dd hh24:mi:ss'),NULL,NULL,'GROUP',1);
```

## 3. Add groups to the appropriate Global Permissions:

```sql
insert into schemepermissions (id, scheme, permission, perm_type, perm_parameter) values (444444,NULL,44,'group','jira-administrators');
insert into schemepermissions (id, scheme, permission, perm_type, perm_parameter) values (333333,NULL,1,'group','jira-users');
```

## 4. Add the group memberships for the 'localadmin' user:

```sql
insert into cwd_user values (999999,1,'localadmin','localadmin',1,'2012-01-04 19:49:05-08','2012-01-04 19:49:05-08','local','local','admin','admin','local admin','local admin@localadmin.com','localadmin@localadmin.com','uQieO/1CGMUIXX ftw3ynrsaYLSH+GTCPS4LdUGWB1usFvHPFuzD7Zvms6yMMva8I7FViHVEqr6Mj4pCLKAFQ==');
insert into app_user values(999999,'localadmin','localadmin');
```

If you are using Oracle database use the following:

```sql
insert into cwd_user values (999999,1,'localadmin','localadmin',1,TO_DATE('2012-01-04 19:49:05','yyyy-mm-dd hh24:mi:ss'),TO_DATE('2012-01-04 19:49:05','yyyy-mm-dd hh24:mi:ss'),'local','local','admin','admin','local admin','local admin@localadmin.com','localadmin@localadmin.com','uQieO/1CGMUIXX ftw3ynrsaYLSH+GTCPS4LdUGWB1usFvHPFuzD7Zvms6yMMva8I7FViHVEqr6Mj4pCLKAFQ==');
```

If you are using Oracle database use the following:

```sql
insert into cwd_group(id, group_name, lower_group_name, active, local, created_date, updated_date, description, lower_description, group_type, directory_id) values ( '888888','jira-administrators','jira-administrators',1,0,'2011-03-21 12:20:29','2011-03-21 12:20:29',NULL,NULL,'GROUP',1);
insert into cwd_group(id, group_name, lower_group_name, active, local, created_date, updated_date, description, lower_description, group_type, directory_id) values ( '777777','jira-users','jira-users',1,0,'2011-03-21 12:20:29','2011-03-21 12:20:29',NULL,NULL,'GROUP',1);
```

If you are using Oracle database use the following:

```sql
insert into cwd_group(id, group_name, lower_group_name, active, local, created_date, updated_date, description, lower_description, group_type, directory_id) values ( '777777','jira-users','jira-users',1,0,TO_DATE('2011-03-21 12:20:29','yyyy-mm-dd hh24:mi:ss'),TO_DATE('2011-03-21 12:20:29','yyyy-mm-dd hh24:mi:ss'),NULL,NULL,'GROUP',1);
```

3. Add groups to the appropriate Global Permissions:

```sql
insert into schemepermissions (id, scheme, permission, perm_type, perm_parameter) values (444444,NULL,44,'group','jira-administrators');
insert into schemepermissions (id, scheme, permission, perm_type, perm_parameter) values (333333,NULL,1,'group','jira-users');
```

4. Add the group memberships for the 'localadmin' user:
5. Enable the JIRA Internal Directory:

```
update cwd_directory set active = 1 where id = 1;
```

6. *(Oracle only)*: Execute a **COMMIT** so that the transactions are completed.

7. Restart JIRA.

Scenario B: I know which user has the **JIRA Administrators** or **JIRA System Administrators** global permission, but I have forgotten the password

⚠️ **Note that this will only work for users in the Internal directory.** The following methods will not work with external user directories (e.g. in an LDAP server), since authentication is performed externally. You can find which directory a user belongs to with the following SQL:

```
select u.user_name, d.directory_name from cwd_user u inner join cwd_directory d on u.directory_id = d.id order by directory_name, user_name
```

The password can be reset with either of the following:

1. **Send it via email**
   
   **This is the recommended approach.**
   
   If you have configured JIRA to send email, just click on the **Forgot Password** link on the login page, enter your username and click the **Send it to me** button. You will receive an email which will help you reset your password.

   
2. **Set the password directly in the database**
   
   **This is a last resort only - try the above recommended approach first.**
   
   1. You can also update the password hash stored for a user in your database. Run the following command to set the user called XXXX's password to the word **sphere**.

   ```
   update cwd_user set credential='uQieO/lCGMUIXXftw3ynrsaYLSi+GTCPS4LdUgWbIusFfHfUzd7CGvms6yMwA8f/7FVlHVEqr6Mj4pCLKAfQ==' where user_name='XXXX';
   ```

   2. *(Oracle only)*: Execute a **COMMIT** so that the transactions are completed.

   3. Restart JIRA.

**Scheme Entity Relations Map**

This diagram illustrates the relationships between various JIRA entities and schemes.

*[JIRA Scheme Entity Relations Map (click to view larger image)]*
Sending JIRA Data to Support

To replicate reported problems, Atlassian support staff may ask you for a copy of your JIRA data.

As of JIRA 4.1.1, it is no longer possible to send data via the Administration -> Support Request page. Please see below for instructions on providing a manual XML Backup.

- Manual XML Backup
- Anonymising JIRA Data:
- Information about the Anonymiser:
- Problems:
  - Invalid XML Characters

Manual XML Backup

To perform a once-off backup, follow the steps below.

1. Log in as a user with the 'JIRA System Administrators' global permission.
2. Select 'Administration' > 'System' > 'Import & Export' > 'Backup System' (tab) to open the 'Backup JIRA data' page.

Keyboard shortcut: 'g' + 'g' + type 'backu'
As shown in the screenshot above, the backup will be stored within the export subdirectory of the JIRA Home Directory.

3. When the backup is complete, a message will be displayed, confirming that JIRA has written its data to the file you specified.

4. Attach the generated file on disk to a support request on support.atlassian.com.

Support requests are often resolved significantly faster if a data export is provided as it will allow our legendary supporters direct access to a copy of your instance. We understand that sometimes this may be a difficult option due to the sensitivity of your data and have written an anonymising tool to handle this particular scenario.

Anonymising JIRA Data:

The JIRA inbuilt backup functionality will produce a ZIP file containing either 1 or 2 XML files, depending on the version that is being used. These files are a copy of the entire contents of JIRA's database, encoded in XML, that can be used to restore an instance - we have further detail on this in our Automating JIRA Backups documentation.

As of JIRA 4.4, the backup functionality will produce a ZIP file that contains 2 XML files. These files will be activeobjects.xml and entities.xml. Only entities.xml will need to be anonymised - please do not attempt to anonymise the activeobjects.xml. For versions prior to 4.4, only one XML file will be produced with the same naming convention as the ZIP it is compressed as (for example 1970-Jan-01-0001.zip will expand to 1970-Jan-01--0001.xml).

1. Ensure that the JAVA_HOME variable has been configured, as in our Setting JAVA_HOME documentation.
2. Download the JIRA Anonymiser.
3. Create a temporary directory.
4. Unzip the anonymizer in the temporary directory.
5. Unzip the JIRA backup ZIP file (for example 1970-Jan-01--0001.zip) in the temporary directory.
6. Anonymise the backup file with the below commands:

   ```
   $ java -Xmx512m -jar joost.jar <JIRA BACKUP>.xml anon.stx > <NAME OF ANONYMISED BACKUP>.xml
   ```

   For example, this would be anonymising a JIRA backup with the naming convention from JIRA 4.4+:

   ```
   $ java -Xmx512m -jar joost.jar entities.xml anon.stx > anon-entities.xml
   ```
Depending on the size of the backup, additional memory may need to be allocated to the JVM. In order to do this, increase the value of the Xmx in increments of 128m.

7. Compress the generated anonymised XML backup file (e.g: anon-entities.xml) and the activeobjects.xml (JIRA 4.4.x + only) into a ZIP or tarball.

8. Attach that ZIP or tarball onto the support issues as raised on support.atlassian.com.

9. The temporary directory can now be removed.

The screenshot below is a simple example of how it is run in the command prompt of Windows XP:

![Screenshot of command prompt running the anonymiser](image)

Information about the Anonymiser:

The anonymiser currently replaces the following text with x's:

- Issue summary, environment, and description.
- Comments, work logs, change logs.
- Project descriptions.
- Descriptions for most elements (notification schemes, permission schemes, resolutions).
- Attachment file names.
- "Unlimited text" custom fields.

Please check the anonymised backup, anon-backup.xml, to ensure it's clean enough for the needs of your organisation before sending it to Atlassian.

Problems:

**Invalid XML Characters**

If, when the anonymiser runs, an error indicates that there are invalid XML characters in the XML backup of the database, run our [utility to remove invalid XML characters](#) first before anonymising.

### Setting Additional Fields for Issues Created from Email

To set the issue's assignee from e-mail, set the ccassignee name parameter in the comment handler for the POP/IMAP service used to create issues. Refer to [Creating Issues and Comments from Email](#) for more information.

Several 3rd party mail handlers also exist for JIRA that provide features for setting additional fields:

<table>
<thead>
<tr>
<th>Name</th>
<th>Compatibility</th>
<th>Fields Supported</th>
<th>License</th>
<th>JRA's</th>
<th>Support Link</th>
<th>Documentation</th>
</tr>
</thead>
<tbody>
<tr>
<td>JIRA Enterprise Mail Handler</td>
<td>5.0 - current</td>
<td>ALL, see supported fields</td>
<td>Commercial</td>
<td>see list</td>
<td>link</td>
<td>see website</td>
</tr>
</tbody>
</table>
Enterprise Mail Handler

JEMH is a fully featured mail handler, that supports all common JIRA fields, as well as complex types like cascade selects. Directives to set fields can be supplied in many ways through Field Processors, e.g. subject, body, XML, CSV, regular expression matching, SMTP mail X-header values. JEMH configuration is now fully UI based, and includes TestCase features to validate configuration.

Examples of common formats come bundled in the plugin (generate examples option in TestCases section). See also the wiki.

Advanced Mail Handler

The Advanced Mail Handler allows users to define fields for the issues created email such as reporter, issue type, priority, summary, description and more.

The priority can be set on a scale 1-5 by setting the X-Priority on the email itself. See your mail server’s documentation for tips on how to set the X-Priority. A related discussion appears in JIRA-7316.

Setting a Default Value in the Description Field

This page describes how to set a Default Value for the Description field in JIRA. There’s a feature request for this at JRA-4812. Please watch and vote on the issue if this is important to you.

There are workarounds to add this functionality. The modification does not persist if you upgrade JIRA so you’ll have to re-apply these steps again in the future. Here are directions to set a default value for your Description field in JIRA:

1. Locate and backup the file: WEB-INF/classes/templates/jira/issue/field/description-edit.vm
2. Open that file:
   ```java
   #controlHeader ($action $field.id $i18n.getText($field.nameKey)
$fieldLayoutItem.required $displayParameters.get('noHeader'))

   ## setup some additional parameters
   $!rendererParams.put("rows", "12")
   $!rendererParams.put("wrap", "virtual")

   ## let the renderer display the edit component
   $rendererDescriptor.getEditVM($!description, $!issue.key,
   $!fieldLayoutItem.rendererType, $!field.id, $!field.name, $rendererParams,
   false)

   #controlFooter ($action $fieldLayoutItem.getFieldDescription()
$displayParameters.get('noHeader'))
   
   3. Add a section like this:
   ```

! The content on this page relates to platforms which are not supported by JIRA. Consequently, Atlassian can not guarantee providing any support for it. Please be aware that this material is provided for your information only and using it is done so at your own risk.
So, ultimately it should look something like:

```java
#controlHeader ($action $field.id $i18n.getText($field.nameKey) $fieldLayoutItem.required $displayParameters.get('noHeader'))

## setup some additional parameters
$!rendererParams.put("rows", "12")
$!rendererParams.put("wrap", "virtual")

## let the renderer display the edit component
$rendererDescriptor.getEditVM($!description, $!issue.key, $!fieldLayoutItem.rendererType, $!field.id, $!field.name, $rendererParams, false)

#controlFooter ($action $fieldLayoutItem.getFieldDescription() $displayParameters.get('noHeader'))
```

4. Restart your JIRA instance.

Adding multi-line values

If you wish to display in the description a default value of:

```
Step 1
Step 2
Step 3
```

you'll need to tweak the above instructions a bit:

```
#set ($description = "Step 1
\  Step 2
\  Step 3")
#set ($description = $description.replace('\',' '))
```

Setting Priority field value based on customfield value

Please note that adding Javascript to custom fields is a customisation and not maintained as a supported part of JIRA.

Check the comments below. This page has been flagged as outdated.
As the users are neglecting the description of the Priority field, a more detail custom field is created to represent the Priority field. Depending on the radio button custom field selected, the Priority field value is set.

1. Create a customfield name "Severity" at Browse >> Administration >> Issue Fields >> Custom Fields
2. Configure the radio button custom field to have a field options
3. Check the customfield ID in the Customfield table from the database by using the following SQL query:
   
   ```
   SELECT id FROM customfield WHERE cfname="Severity";
   ```

4. Modify the following javascript code so that `<id>` will be replaced with the id of the custom field found from the first step:

   ```javascript
   <script type="text/javascript" charset="utf-8" id="priorityCustomFieldScript">
   function setIssuePriorityAndSubmit(e) {
       // set the value of the priority field here:
       if(document.getElementById("customfield_<id>_1").checked) {
           document.getElementById("priority").selectedIndex = 0;
       } else if(document.getElementById("customfield_<id>_2").checked) {
           document.getElementById("priority").selectedIndex = 1;
       } else if(document.getElementById("customfield_<id>_3").checked) {
           document.getElementById("priority").selectedIndex = 2;
       } else if(document.getElementById("customfield_<id>_4").checked) {
           document.getElementById("priority").selectedIndex = 3;
       } else if(document.getElementById("customfield_<id>_5").checked) {
           document.getElementById("priority").selectedIndex = 4;
       }
   }

   function hidePriorityAndAddSeverityHook() {
       var row = document.getElementById("priorityFieldArea");
       row.style.display = 'none';
       AJS.$('#customfield_<id>_1').parents('form').submit(setIssuePriorityAndSubmit);
   }

   var currentLocation = window.location.href;
   if (currentLocation.indexOf('CreateIssue') > -1 ||
       currentLocation.indexOf('EditIssue') > -1) {
       AJS.$(document).ready(hidePriorityAndAddSeverityHook);
   }
   </script>
   ```

5. Paste the javascript into the description of the "Severity" customfield at Browse >> Administration >> Issue Fields >> Custom Fields.

There is no need to hide or remove the 'Priority' field from the screen. The javascript code will hide the Priority
Showing Extended Timestamp in the Created Column of the Issue Navigator

Information contained on this page is considered to be a customization of the installation and is out of scope for Atlassian Support. Please ensure to take a backup of your system before making any changes.

This document describes how to modify the Created date field in the Issue Navigator to include the time. By default, the column view of the field hard-codes the rendering format to the locale specific "Day" format.

For JIRA 4.3 and Later

Edit the file `JIRA_INSTALL_DIR/atlassian-jira/WEB-INF/classes/templates/jira/issue/field/date-columnview.vm`:

Change:

```groovy
#if ($value) <span title="${title}"><time datetime="${iso8601}">${value}</time></span> #else &nbsp; #end
```

to:

```groovy
#if ($value) <span title="${title}"><time datetime="${iso8601}">${title}</time></span> #else &nbsp; #end
```

- Note that you are simply changing "${value}" to become "${title}"

Procedure for JIRA 4.2 and Before

Edit the file `JIRA_INSTALL_DIR/atlassian-jira/WEB-INF/classes/templates/jira/issue/field/created-columnview.vm` to always use the extended `formatDMYHMS` rather than `formatDMY`.

For example, the following macro fragment should be changed:

```groovy
#if ($created)
    #if (${displayParams.excel_view})
        $outlookDateManager.getOutlookDate($authcontext.getLocale()).formatDMYHMS($created)
    #else
        $outlookDateManager.getOutlookDate($authcontext.getLocale()).formatDMY($created)
    #end
#if ($created)
```

Edited - full time-stamp

```groovy
#if ($created)
    $outlookDateManager.getOutlookDate($authcontext.getLocale()).formatDMYHMS($created)
#else
    &nbsp;
#endif
```
Single Sign-on

Single Sign-on Information

Tracking the Time Taken for Each Workflow Transition

There are 2 plugins available in JIRA Extension Page which might be able to fulfill the requirement:

- JIRA Charts can report Average Time in Status
- The JIRA Suite Utilities has a Transitions Summary Tab Panel.

Troubleshooting Issue Creation Via Email

1. Is the message reaching the e-mail account?

Have your mail server administrator confirm that e-mail sent to the account JIRA is using is successfully reaching the account's Inbox.

2. Is the Create Or Comment Handler service configured correctly in JIRA?

Please review this guide to confirm this:

Creating Issues and Comments from Email

3. Are permissions set properly?

Does the user submitting the issue have Create Issue permissions in the Permission Scheme? If you are having troubles adding comments, make sure your Issue Security Scheme is not restricting the user's access to the issue.

4. Still not working? Enable debug logging in JIRA:

First, we need to change the com.atlassian package from the WARN logging level to DEBUG. This can be done from the following menu:

Administration -> System -> Logging & Profiling -> Click Edit next to the com.atlassian package

5. Send two e-mails to the email address that JIRA is checking for new issues and comments. Wait 5 minutes and then submit a support request that includes the JIRA logs.

This can be done from the following menu:

Administration -> System -> Support Request

Remember to check the Attach JIRA logs box! Also, please note the e-mail address being used for testing and copy/paste the JIRA service settings for this Create Or Comment handler:

Administration -> System -> Services

Example of Service Info

| handler: Create Or Comment Handler |
| popserver: POP server - JSP |
| handler.params: project=JSP, issuetype=1, createusers=true, stripquotes=true, bulk=forward |
| usessl: No SSL |
| forwardEmail: jira-support@atlassian.com |

6. Change com.atlassian back from DEBUG to WARN.

Administration -> System -> Logging & Profiling -> Click Edit next to the com.atlassian package

WARNING: Leaving com.atlassian in debug mode will result in VERY large log files!

Note. If you want to log on a protocol level (IMAP, POP3 or SMTP), please refer to Logging email protocol details.

Using JIRA to Manage reusable modules

Many software products use external modules that are shared with other software products. The external projects are often managed separately, and have their own versions and life-cycles. So the question of how to
"map" this scenario to JIRA often arises. Currently, the best way to solve this in JIRA would be to create a separate JIRA project for each module and application. Then create issues in each JIRA project as needed and use issue linking to link related issues. Using Issue Links, issues can be easily linked across projects.

JIRA also has a clone issue function which can be used to copy an issue. The cloned issue can be then moved to another project. This should save the trouble of manually duplicating issues.

To get an idea of where each product and each module is "up to", JIRA's dashboard can be used. For example, one could place a portlet for each JIRA project that shows all open scheduled issues. This way the dashboard will provide an overview of all outstanding work for each project.

If all relevant issues for external modules have an issue in the product's JIRA project the standard reports and project summary panels (e.g. Change Log and Release Notes) should have all the information they need to be useful. Otherwise, JIRA can be extended by creating a custom project tab panel and/or a report that can look at more than one JIRA project and produce desired summaries. If you decide to write a custom report this tutorial should be useful.

In future we hope to better support this style of project organisation, eg. through shareable sub-projects (JRA-1072). Please vote/add your thoughts to the issue to increase its popularity. Also, please refer to this document which explains the way Atlassian schedules new features.

We already have users & groups defined elsewhere - can JIRA make use of these?

Yes. If you have users and groups defined elsewhere then you can either use an existing OSUser provider (such as LDAP or JDBC) or write your own if you have custom needs.

Where are the application server logs?

Please always provide us with both:

1. atlassian-jira.log (see Logging and Profiling)
2. the application server log file, as it can contain useful error information that is not in atlassian-jira.log

**JIRA Log Location**

The logs are written to the log subdirectory of your JIRA Home Directory (or elsewhere if you have configured a different location). You can view the location of the atlassian-jira.log in the 'File Paths' section of the System Information page.

**Application Server Logs**

Finding the application server log file is application server-specific and in some cases operating system-specific. Here is a decision tree:

- **If you are on Windows**
  - ..and JIRA was installed as a Windows Service:
    - ..then the logs are in the logs\stdout_*.log file in your JIRA Installation Directory and c:\WINDOWS\system32\atlassian-jira.log (WINDOWS may be replaced by WINNT), or for JIRA WAR, in your Tomcat installation directory.
  - ..and JIRA was started via start-jira.bat:
    - ..then some logs are effectively being lost (to the popup DOS window, where it cannot be recaptured). Some logs do go to the atlassian-jira.log file in the current directory (wherever you ran startup.bat from) but this might not work if your current directory isn't writeable (eg. c:\WINNT\system32, the default). Even if you see an atlassian-jira.log it may be an old one, created from a previous startup. **If you value your sanity** (and ours) please install JIRA as a service, even if only to get all of the right logs appearing in a consistent place.

- **If you are on Linux or Solaris**
  - ..then the logs are in logs/catalina.out in your JIRA Installation Directory, or for JIRA WAR, under your Tomcat installation directory.

Why doesn't JIRA have a Severity field like Bugzilla?
Originally, JIRA did have both a Priority and a Severity field. The Severity field was removed for a number of reasons, but principally because it was confusing to business users. To a software developer, it seems obvious that the severity of the bug ("The system crashes completely") is unrelated to the priority of it ("There is a one in a million chance of this occurring"). However, JIRA succeeds so well because business users can actually use it. If you present a business user with these two fields, they are instantly confusing (which is why the Severity field was removed).

In order to re-implement Severity, you can create a select-list custom field, order it (with field layouts), put it on your filters (with column layouts) and indeed search and filter it (in the Navigator).

For details, please see Custom Fields.

**Workflows Guidebook**

**XML format for import & export files**

Is the XML format for the import/export files (which also contains the configuration) documented?

Not as such - it is an XML version of the underlying entity model, pulled out of the database. As a result it is always changing with new fields and entities being added. The entity model itself is defined in WEB-INF/classes/entitymodel.xml.

Configuring IIS with Tomcat

⚠️ The content on this page relates to platforms which are not supported by JIRA. Consequently, Atlassian can not guarantee providing any support for it. Please be aware that this material is provided for your information only and using it is done so at your own risk.
It is possible to set this up rather painlessly and the main documentation that we provide covers most use cases. But sometimes there are a few IIS configurations that differ from the default.

You are not using the "Default Website" in IIS

If you are in this boat, you will need to mimic what the Jakarta ISAPI installer created for you in the default website.

There will need to be two virtual directories:

**One named 'jira'**

Follow these steps to setup the 'jira' virtual directory

1. Right-click on the website, go to New > Virtual Directory ...
2. The alias needs to be called **jira**
3. The path can point to any location, a temp directory, or perhaps your jira install location
4. Check the "Execute (Such as ISAPI application of CGI)", then next and you are now finished.

Now in the properties for the 'jira' virtual directory confirm:

1. The Execute Permissions is set to "Scripts and Executables" in the "Execute Permissions" section.

**One named 'jakarta'**

Follow these steps to setup the 'jakarta' virtual directory

1. Right-click on the website, go to New > Virtual Directory ...
2. The alias needs to be called **jakarta**
3. The path needs to point to the bin directory of the Jakarta Isapi Redirector, ie: C:\Program Files\Apache Software Foundation\Jakarta Isapi Redirector\bin
4. Check the "Execute (Such as ISAPI application of CGI)", then next and you are now finished.

Now in the properties for the 'jakarta' virtual directory confirm:

1. "Script source access" is checked
2. "Read" access is checked
3. The Execute Permissions is set to "Scripts and Executables"
4. The "Local Path" points to the bin directory of the Jakarta Isapi Redirector

You will also need to make sure that the non-default website has the Jakarta Redirector installed. This can be done by right-clicking on the non-default website, clicking 'properties' and then clicking on the "ISAPI Filters" tab.

From here you will need to:
1. Click the "Add..." button
2. Enter a filter name: **jakarta**
3. Browse to the "isapi_redirect.dll" file located here: C:\Program Files\Apache Software Foundation\Jakarta Isapi Redirector\bin
4. Click OK, Apply and then OK.
The final step is to restart the IIS Server, this can be done by opening the services.msc and clicking restart on "World Wide Web Publishing"

**Gotcha’s**

- If you are using IIS 6.0 did you remember to add the Jakarta Isapi Redirector to the Web Service Extension's and set the extension status to allow?
- Also for IIS 6.0 did you remember to add the Jakarta Isapi Redirector to the ISAPI Filters for the website?
- Is Tomcat listening on port 8009? Try the following from the command prompt to make sure:

```
netstat -na | findstr 8009
```

- Have you given JIRA a context in Tomcat's `server.xml`?

```xml
<Context path="/jira" docBase="${catalina.home}/atlassian-jira" reloadable="false">
```

And does it match the virtual directory and value in your `uriworkerman.properties` file?

```
/jira/*/wlb
```

**Database Notes**

These pages contain notes on configuring JIRA with various databases. They are supplementary to the JIRA documentation. If you've ever thought "I wish I'd known that when I started", please help others by adding a note to the relevant database page.

---

**Recommended Databases**

Please read the Supported Platforms document to see the list of databases that we recommend for use with your JIRA installation.

- Incorrect database type specified
- Restarting JIRA from the Setup Wizard
- Database limitations on number of projects
- JIRA and HSQL
  - Running SQL commands in a HSQL database — On rare occasions, one may wish to run raw SQL queries on a JIRA or Confluence internal database which is used for evaluation purposes. This page describes how to obtain a SQL console for HSQLDB databases, which are built into JIRA and Confluence for evaluation purposes.
- JIRA and MS SQL Server 2005
  - Connecting to named instances in SQL Server
  - Error caused by SET NOCOUNT in MS SQL Server
  - MS SQL Server 2000 Startup errors
  - Setting Up a SQL Server 2005 database for JIRA
- JIRA and MS SQL Server 2008
- JIRA and MySQL
  - Configuring MySQL 5.1 to store non-ASCII characters
  - JIRA Cannot Connect to MySQL with Named Pipes Enabled
  - JIRA Cannot Create Issues when Using MySQL with Binary Logging
  - MySQL Administrator and Data Truncation Errors
  - MySQL Data Access Exception - Errcode - 17 occurs with JIRA
• Setting Up a MySQL Database on Linux for JIRA

• JIRA and Oracle
  • Configuring Datasource for Oracle 10g JDBC drivers
  • Restoring data using I-Net (Oranxo) Driver for Oracle
  • Store Workflow on Disk with Oracle 8 — A workaround for the problem of > 4000 character workflows in Oracle 8 is to store these on disk, instead of in the database.

• JIRA and PostgreSQL
  • Setting up a PostgreSQL Database on Linux for JIRA

Incorrect database type specified

Background

JIRA needs to know what kind of database it will be using, in order to generate database tables of the correct data types, and to generate correctly formatted SQL. The database type is specified in the dbconfig.xml file at the root of your JIRA Home Directory. For example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<jira-database-config>
  <name>defaultDS</name>
  <delegator-name>default</delegator-name>
  <database-type>hsql</database-type>
  <schema-name>PUBLIC</schema-name>
  <jdbc-datasource>
    <url>jdbc:hsqldb:/path/to/jira/database/jiradb</url>
    <driver-class>org.hsqldb.jdbcDriver</driver-class>
    <username>sa</username>
    <password></password>
    <pool-size>15</pool-size>
    <min-evictable-idle-time-millis>4000</min-evictable-idle-time-millis>
    <time-between-eviction-runs-millis>5000</time-between-eviction-runs-millis>
  </jdbc-datasource>
</jira-database-config>
```

In this example, JIRA expects to use HSQLDB (JIRA’s internal database used for evaluation purposes).

If you’ve got it wrong ...

If you forgot to edit the dbconfig.xml file (see the documentation), then follow these steps to recover:

1. Fix the type in dbconfig.xml

Refer to the relevant documentation for your database in the Connecting JIRA to a Database section.

2. Fix the database

Is this the first time you have run JIRA?

If so, the database has been created incorrectly. Specifically, table columns have been created with incorrect data types, and you will see warnings like these in the logs:
2005-02-10 12:24:33,307 [core.entity.jdbc.DatabaseUtil] SQL Exception while executing the following:
CREATE TABLE jiraaction (ID BIGINT NOT NULL, issueid BIGINT, AUTHOR VARCHAR, actiontype VARCHAR, actionlevel VARCHAR, actionbody VARCHAR, CREATED TIMESTAMP, actionnum BIGINT, CONSTRAINT PK_jiraaction PRIMARY KEY (ID))
Error was: java.sql.SQLException: You have an error in your SQL syntax. Check the manual that corresponds to your MySQL server version for the right syntax to use near 'actiontype VARCHAR, actionlevel VARCHAR, actionbody VARCHAR, CREATED TIMESTAMP, actionnum BIGINT, CONSTRAINT PK_jiraaction PRIMARY KEY (ID))

2005-02-10 12:24:33,309 [core.entity.jdbc.DatabaseUtil] SQL Exception while executing the following:
CREATE TABLE changegroup (ID BIGINT NOT NULL, issueid BIGINT, AUTHOR VARCHAR, CREATED TIMESTAMP, CONSTRAINT PK_changegroup PRIMARY KEY (ID))
Error was: java.sql.SQLException: You have an error in your SQL syntax. Check the manual that corresponds to your MySQL server version for the right syntax to use near 'CREATED TIMESTAMP, CONSTRAINT PK_changegroup PRIMARY KEY (ID))

2005-02-10 12:24:33,310 [core.entity.jdbc.DatabaseUtil] Entity "ChangeItem" has no table in the database
2005-02-10 12:24:33,310 [core.entity.jdbc.DatabaseUtil] Could not create table "changeitem"

The solution is to drop (delete) and recreate the database. When next restarted with the correct data types, JIRA will recreate the tables correctly.

Upgrading JIRA?

This situation is potentially problematic, because the newer version of JIRA may have added tables or columns with incorrect data types to your existing database schema.

The safest solution is to start a new database, and import an XML backup made before the upgrade.

If for some reason, you cannot import an XML backup (e.g., your upgraded instance has been in production for a few days and contains new data), it is generally possible to patch the database by hand with SQL 'alter table' statements. Please review the log files for information on what types JIRA expects, and what is actually present. JIRA will print this information every time it starts up. If in doubt, attach the logs and other relevant information to a support request on our support system.

Other situations

If this is not the first time JIRA has loaded, and you are not upgrading, you probably do not need to fix the data. After fixing the dbconfig.xml file, restart and check the logs for errors. If there are none, the database is fine.

Need help?

Please create a support request and attach the startup logs, your current dbconfig.xml file, and any other information relevant.

Restarting JIRA from the Setup Wizard

If you ever want to restart JIRA from the Setup Wizard again:

1. Stop JIRA by running either bin\shutdown.bat (for Windows) or bin/shutdown.sh (for Linux/Solaris) in your JIRA Installation Directory (or the Apache Tomcat installation directory running the JIRA WAR distribution).

   If JIRA is running as a JIRA or Tomcat service, stop the relevant service.

4. Restart JIRA and access your JIRA server from a browser.
JIRA will detect that no database configuration is present and will take you through the JIRA Setup Wizard again.

Database limitations on number of projects

Limitations on project totals imposed by databases:

<table>
<thead>
<tr>
<th>Database</th>
<th>Limitation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle</td>
<td>1000. (See <a href="https://jira.123456789%5B%5D=jira-19317">JIRA-19317 - Olbiz generates queries with large IN clauses that result in ORA-01795 errors</a> for more details.)</td>
</tr>
<tr>
<td>SQL Server</td>
<td>No hard limit as a query can have any number of parameters, as long as it remains within the maximum batch size — which defaults to 65,536 * Network Packet Size (256MB). In practice, however, 2100 is the limit as this is the maximum number of parameters allowed by SQL Server.</td>
</tr>
<tr>
<td>MySQL</td>
<td>No hard limit; maximum query size has to be less than max_allowed_packet, which defaults to 1GB, but can be any value in the range 1024-1073741824 Bytes.</td>
</tr>
<tr>
<td>PostgreSQL</td>
<td>No hard limits; SQL query size is limited to the OS maximum file size.</td>
</tr>
<tr>
<td>HSQLDB</td>
<td>No limits specified, but in practice limited by heap memory.</td>
</tr>
</tbody>
</table>

JIRA and HSQL

This page has general notes on connecting JIRA to HSQL. It supplements the official [HSQL installation documentation](https).

- **Running SQL commands in a HSQL database**

  Running SQL commands in a HSQL database

  On rare occasions, one may wish to run raw SQL queries on a JIRA or Confluence internal database which is used for evaluation purposes. This page describes how to obtain a SQL console for HSQLDB databases, which are built into JIRA and Confluence for evaluation purposes.

  **Locate HSQLDB directory**

  HSQL stores its database as text files in the filesystem. Typically these files will be in a database subdirectory of your JIRA Home Directory:

  ```bash
  [jira-home-directory ~]$ ls -l database/
  total 108
  -rw-r--r--  1 jturner jturner 0 Jul 28 09:12 jiradb.data
  -rw-r--r--  1 jturner jturner 343 Jul 28 09:12 jiradb.properties
  -rw-r--r--  1 jturner jturner 72272 Jul 28 10:02 jiradb.script
  [jira-home-directory ~]$
  ```

  **Locate HSQLDB jar**

  The hsqldb jar file is located in the `lib` sub-directory of the JIRA Installation Directory:
Shutdown JIRA/Confluence

⚠️ If you haven't already, shut down any apps using the database.

Run The Console

Use the following command to bring up the HSQLDB console (replacing the JIRA_HOME and JIRA_INSTALL with the absolute paths)

```bash
java -cp JIRA_INSTALL/lib/hsqldb-1.8.0.5.jar org.hsqldb.util.DatabaseManager -user sa -url jdbc:hsqldb:JIRA_HOME/database/jiradb
```

In versions of JIRA before JIRA 4.1 the jar file was in common/lib

The hsqldb console should load, listing tables in the database in the left panel. You can run SQL commands in the top panel:

![SQL Database Manager](image)

Shutdown The Console

Once you have finished running SQL queries, shut down the console before starting JIRA/Confluence.

Troubleshooting

If you can successfully bring up the console, but no tables are shown, the jdbc:hsqldb: the usual reasons are

- JIRA/Confluence is still running. Ensure that the applications are shutdown before running the console.
- Path of the database file may be incorrect. You can update this by navigating to File > Connect and entering in the absolute path to JIRA_HOME/database/jiradb in the URL box and clicking Ok.
JIRA and MS SQL Server 2005

This page has general notes on connecting JIRA to SQL Server 2005. It supplements the official SQL Server 2005 installation documentation.

- Connecting to named instances in SQL Server
- Error caused by SET NOCOUNT in MS SQL Server
- MS SQL Server 2000 Startup errors
- Setting Up a SQL Server 2005 database for JIRA

Connecting to named instances in SQL Server

When using named instances you will need to specify the URL slightly differently in the connection properties. First off, try:

```
<url>jdbc:jtds:<server_type>://<server>[:<port>]//<database>;instance=<instance_name></url>
```
This is specified at the JTDS FAQ

If this doesn't work, try dropping the instance name, and changing the port to the port used by the named instance:

```
<url>jdbc:jtds:<server_type>://<server>[:<instance_port>]/<database></url>
```

Note. This port is different to the normal SQL Server port as each instance listens on a different port.

Error caused by SET NOCOUNT in MS SQL Server

It is necessary to ensure that the SET NOCOUNT option is not set in the SQL Server configuration. For further details on how to verify these settings, please refer to the JIRA Installation documentation.

If this option is set, it can result in the following errors that can be found in the log file:

```
2006-05-03 15:51:26,088 WARN [ofbiz.core.entity.SequenceUtil] [SequenceUtil.SequenceBank.fillBank] first select failed: trying to add row, result set was empty for sequence: ListenerConfig
2006-05-03 15:51:26,093 WARN [ofbiz.core.entity.SequenceUtil] [SequenceUtil.SequenceBank.fillBank] first select failed: trying to add row, result set was empty for sequence: ListenerConfig

A user reports getting errors like these every time JIRA starts up:

```
[core.entity.jdbc.DatabaseUtil] Entity "Action" has no table in the database
2003-11-06 09:33:45,265 ERROR [core.entity.jdbc.DatabaseUtil] Could not create table "jiraaction"
2003-11-06 09:33:45,265 ERROR [core.entity.jdbc.DatabaseUtil] SQL Exception while executing the following:
CREATE TABLE jiraaction (ID NUMERIC NOT NULL, issueid NUMERIC, AUTHOR VARCHAR(255),
actiontype VARCHAR(255), actionlevel VARCHAR(255), actionbody TEXT, CREATED DATETIME,
actionnum NUMERIC, CONSTRAINT PK_jiraaction PRIMARY KEY (ID))
Error was: java.sql.SQLException: There is already an object named 'jiraaction' in the database.
2003-11-06 09:33:45,265 WARN [core.entity.jdbc.DatabaseUtil] Entity "ChangeGroup" has no table in the database
2003-11-06 09:33:45,265 ERROR [core.entity.jdbc.DatabaseUtil] Could not create table "changegroup"
```

JIRA functions correctly otherwise.

A solution is suggested in this jira-user post:

```
Hi Jason,

I have had the same errors when at startup that you are seeing.

The problem on my server was that when the user in my database ('JIRA') created tables they were created as dbo.<tablename> and not JIRA.<tablename> so when JIRA attempts to verify a table JIRA.<tablename> exists it fails. Then it tries to create <tablename>, but it already exists. All the created tables are owned by 'dbo' and not 'JIRA'.

I am running on Microsoft SQL Server so my fix may not fit exactly but this is what I had to do:
Create the 'JIRA' user as a regular user of the JIRA database. Add the JIRA user to the db_owner (database owner) role. (DO NOT change the database owner to 'JIRA', just add the role!)

Of course, you will have to drop your existing database first.

Cheers,
Bradley.
```

We have also had reports from other users that there are also alternatives to this solution. The ddl_admin, db_datareader and db_datawriter roles could be used instead of db_owner role for the jirauser account.

Setting Up a SQL Server 2005 database for JIRA

On this page:
- Overview
Before you start

1. Enable network connectivity for SQL Server
2. Configure SQL Server with the appropriate Authentication Mode
3. Disable the 'SET NOCOUNT' option in SQL Server

Setting up the JIRA database

1. Create a new database
2. Create a new database user
3. Create a JIRA database schema

Overview

This page supplements the documentation for Connecting JIRA to SQL Server 2005. It provides detailed instructions on setting up your JIRA database for a straightforward integration of JIRA with SQL Server 2005. Unfortunately we do not provide support for advanced database configuration, such as hardening or performance tuning. If you require a more complex solution, refer to MS SQL 2005 Documentation and, if necessary, consult with someone in your organisation who is knowledgeable in the configuration of SQL Server 2005.

Before you start

1. Enable network connectivity for SQL Server

Ensure that your instance of SQL Server allows TCP/IP connection and is listing on the default port. Please note that network connectivity is disabled by default in some versions of SQL Server (e.g. SQL Server 2005 Express edition). Hence, you will have to enable it, as described below:

To enable TCP/IP for SQL Server,

1. Open the 'SQL Server Configuration Manager'.
2. Expand 'SQL Server 2005 Network Configuration' in the console pane.
3. Click 'Protocols for <instance name>'.
4. The details pane will display (see screenshot below). Right-click 'TCP/IP' and click 'Enable'.
5. Click 'SQL Server 2005 Services' in the console pane.
6. The details pane will display. Right-click 'SQL Server (<instance name>)' and click 'Restart' to stop and restart the SQL Server service.

Screenshot: Enabling TCP/IP for SQL Server 2005

2. Configure SQL Server with the appropriate Authentication Mode

Ensure that SQL Server is operating in the appropriate authentication mode. By default, SQL Server operates in 'Windows Authentication Mode'. However, if your user is not associated with a trusted SQL connection, i.e. Microsoft SQL Server, Error: 18452 is received during JIRA startup, you will need to change the authentication mode to 'Mixed Authentication Mode'.

Read the Microsoft documentation on authentication modes for instructions on changing the authentication mode.

3. Disable the 'SET NOCOUNT' option in SQL Server

To disable the 'SET NOCOUNT' option in SQL Server,
1. Open the 'SQL Server Management Studio'.
2. Navigate to 'Tools' -> 'Options' -> 'Query Execution' -> 'SQL Server' -> 'Advanced'. The advanced settings for SQL Server will display.
3. Ensure that the 'SET NOCOUNT' option is not selected, as per the screenshot below:

**Screenshot: Disabling 'SET NOCOUNT' for SQL Server**

![Image](image.png)

**Setting up the JIRA database**

**To set up your JIRA database for SQL Server 2005,**

1. Create a new database
   
   1. Open the 'SQL Server Management Studio'.
   2. Connect to the SQL Server that you want to integrate JIRA with. By default this will be 'localhost'.
   3. Navigate to '<your server name>' -> 'Databases' in the left menu of the 'SQL Server Management Studio'.
   4. Right-click 'Databases' under the server name of your SQL Server and select the 'New Database...' option from the dropdown menu that appears.
   5. The 'New Database' window will display. Select the 'General' option in the left menu.
   6. The 'General' page will display (see screenshot below). Enter jiradb in the 'Database name' field.
   7. Select the 'Options' option in the left menu. Check the collation type, the collation type has to be case insensitive e.g.: 'SQL_Latin1_General_CP437_CI_AI' is case insensitive. If it is using your server default, check the collation type of your server.
   
   **Screenshot: Create jiradb database**

   ![Image](image.png)

   8. Click the 'OK' button to create the database.

2. Create a new database user
1. Navigate to '<your server name>' -> 'Security' -> 'Logins' in the left menu of the 'SQL Server Management Studio'.
2. Right-click the 'Logins' folder and select 'New Login'.
3. The 'Login - New' window will display. Select the 'General' option in the left menu.
4. Enter the database user details into the window that displays (see screenshot below), as follows:
   a. Enter 'jirauser' in the 'Login name' field.
   b. Select 'SQL Server authentication'.
   c. Enter 'jirauser' as the password, and enter 'jirauser' again in the 'Confirm password' field.
   d. If you wish to enforce a password policy, check the 'Enforce password policy' checkbox. However, please be aware that you may need to modify the previously entered password ('jirauser') to meet your password policy rules (e.g. your password policy may require numeric characters in all passwords).
   e. Ensure that the 'Enforce password expiration' checkbox is unchecked. It will be automatically unchecked and disabled, if you have previously unchecked the 'Enforce password policy' checkbox.
   f. Ensure that the 'User must change password at next login' checkbox is unchecked. It will be automatically unchecked and disabled, if you have previously unchecked the 'Enforce password policy' checkbox.

5. Select the 'User Mapping' option in the left menu.
6. The User Mapping fields for jiradb will display (see screenshot below). Tick the 'jiradb' checkbox.
7. The 'Database role membership for:jiradb' panel will display in the bottom panel of the window. Tick the 'db_owner' checkbox.
8. Click the 'OK' button to save your changes.

Screenshot: Create jirauser user

Screenshot: Create user mapping for jirauser
3. Create a JIRA database schema

1. Navigate to '<your server name>' -> 'Databases' -> 'jiradb' -> 'Security' -> 'Schemas' in the left menu of the 'SQL Server Management Studio'.

2. Right-click the 'Schemas' folder and select 'New Schema'.

3. The 'Schema - New' window will display. Select the 'General' option in the left menu.

4. The 'General' page will display (see screenshot below). Fill in the fields, as follows:
   - Enter jiraschema in the 'Schema name' field.
   - Enter jirauser in the 'Schema owner' field.

5. Select the 'Permissions' option in the left menu.

6. The 'Permissions' page will display (see screenshot below). Click the 'Add...' button.

7. Enter jirauser in the 'Enter the object names to select (examples):' field on the pop-up window that displays. Click 'OK' to save your update and close the pop-up window.

8. Specify the schema permissions in the 'Explicit permission for jirauser' table on the 'Permissions' page, as follows:
   - Alter — check the 'Grant' checkbox.
   - Delete — check the 'Grant' checkbox.
   - Insert — check the 'Grant' checkbox.
   - References — check the 'Grant' checkbox.
   - Select — check the 'Grant' checkbox.
   - Update — check the 'Grant' checkbox.

9. Click the 'OK' button to save your changes.

Congratulations, you have set up a JIRA database for SQL Server 2005. Please refer back to the Connecting JIRA to SQL Server 2005 page to continue integrating SQL Server 2005 with JIRA.

JIRA and MS SQL Server 2008
This page has general notes on connecting JIRA to SQL Server 2008. It supplements the official SQL Server 2008 installation documentation.

JIRA and MySQL

This page contains additional notes, tips, tricks and caveats on connecting JIRA to MySQL, which supplements the official MySQL installation documentation. Many of these notes are contributed by users, based on their specific experiences in connecting JIRA to MySQL.

- Configuring MySQL 5.1 to store non-ASCII characters
- JIRA Cannot Connect to MySQL with Named Pipes Enabled
- JIRA Cannot Create Issues when Using MySQL with Binary Logging
- MySQL Administrator and Data Truncation Errors
- MySQL Data Access Exception - Errcode - 17 occurs with JIRA
- Setting Up a MySQL Database on Linux for JIRA

Configuring MySQL 5.1 to store non-ASCII characters

To set up a MySQL 5.1 database with JIRA to work with non-ASCII (non-English) characters, please do the following:

1. Create a new MySQL database using the following command:
   
   ```
   CREATE DATABASE jiradb CHARACTER SET utf8 COLLATE utf8_bin;
   ```

2. Grant all the required permissions to the JIRA user for the database as described here.

3. Change JIRA's JDBC URL (in the `dbconfig.xml` file in your JIRA Home Directory) to use the new database and be:
   
   ```
   jdbc:mysql://<your_server>:<port>/jiradb?autoReconnect=true&useUnicode=true&characterEncoding=UTF8
   ```

   Please note the '&' XML escape for the ampersands in the url above is needed since it is specified in an xml file.

4. Start JIRA and complete the setup process.

Please ensure that you create a new database using the correct character set and ensure that JIRA creates all its tables on startup without problems. This should allow you to work with all characters supported by Unicode, which covers most characters out there.

Please ensure that you are using the latest MySQL JDBC driver (see Connecting JIRA to MySQL for information on the JDBC driver).

Also please ensure you are using the UTF-8 character encoding in JIRA (Administration -> Global Settings -> General Configuration).

JIRA Cannot Connect to MySQL with Named Pipes Enabled

I've tried a number of things, and it looks like named pipes is the problem. This is a problem with MySQL, not with JIRA. Essentially I've had to install MySQL with two key things:

- Go through the Standard Installation route for MySQL, not the Detailed Installation route
- Enable TCP/IP connections in the MySQL Config Wizard afterwards

After doing this, JIRA now appears to connect to the MySQL and can see the new database.

Details of what I did to recover MySQL after installing it using named pipes:

MySQL Installation and Config:

- Select typical install
- Configure MySQL with the Configuration Wizard
  - Detailed Configuration
JIRA configuration to use MySQL:

- Download JDBC driver mysql-connector-java-3.1.12.zip
- Copy the mysql-connector-java-3.1.12-bin.jar file from this zip to C:\Jira\atlassian-jira-professional-3.6.5-standalone\common\lib
- Edit the conf/server.xml file
  - username and password for the jiruser account set up above
  - driverClassName="com.mysql.jdbc.Driver"
  - url="jdbc:mysql://localhost/jiradb?autoReconnect=true&useUnicode=true&characterEncoding=UTF8"
  - delete the minEvictableIdleTimeMillis and timeBetweenEvictionRunsMillis parameters
- Edit the entityengine.xml file and change the field-type-name to mysql

Re-start JIRA to use MySQL database

- run C:\jira\atlassian-jira-professional-3.6.5-standalone\bin\shutdown
- Tomcat web-server shuts down
- run C:\jira\atlassian-jira-professional-3.6.5-standalone\bin\startup
  - Get error on connection: Unable to establish connection with the database. I suspect this is because the database wasn't set up correctly above and can't open named pipes. This is probably the issue with WinNT-based systems not being able to support named pipes (without modification).
- run C:\jira\atlassian-jira-professional-3.6.5-standalone\bin\shutdown

Re-installing MySQL without named pipes

- Go to Control Panel->Add/Remove Programs and remove MySQL
- Delete C:\Program Files\MySQL
- Reinstall as above (typical installation)
- Configure and select "Standard Installation"
  - Install as Windows Service
  - Add \bin to path
  - Choose root password ************
- Execute configuration.
  - Success!
- Run MySQL Config Wizard. Choose options as above.
Execute configuration
  o Success!
Set up MySQL database and jira user as above.
run C:\jira\atlassian-jira-professional-3.6.5-standalone\bin\startup
  o FAILED! Tomcat starts and shuts down immediately. Looking at the logs, it seems that the jiruser account has a & in the password, which stuffs the XML.
log back in to MySQL as root and run:
  o DROP USER 'jiruser'@'localhost';
  o CREATE USER 'jiruser'@'localhost' IDENTIFIED BY '********'; (making sure password has no & in it)
  o GRANT ALL PRIVILEGES ON jiradb.* TO 'jiruser'@'localhost';
  o quit;
Edit conf/server.xml to the new password
run C:\jira\atlassian-jira-professional-3.6.5-standalone\bin\startup
  o No good. Still won't connect.
Try re-running MySQL config and this time enable TCP/IP connection over port 3306 (so that we don't have to use named pipes)
run C:\jira\atlassian-jira-professional-3.6.5-standalone\bin\startup
  o Tomcat server starts! Hurray. We appear to connect in some way, although there are lots of exceptions. Maybe these are due to the first start?
Point web browser at http://localhost:8080/
  o JIRA config screen appears - good
Go through the JIRA setup and initial configuration steps as above

http://confluence.atlassian.com/pages/editpage.action?pageld=133186
JIRA Cannot Create Issues when Using MySQL with Binary Logging

If you use JIRA with MySQL and attempt to create a JIRA issue, JIRA may generate an error similar to the following:

```java
Error creating issue: Could not create workflow instance: root cause:
while inserting:
[GenericEntity:OSWorkflowEntry][id,null][name,jira][state,0]
(SQL Exception while executing the following:INSERT INTO OS_WFENTRY (ID, NAME, INITIALIZED, STATE) VALUES (?, ?, ?, ?)
(Binary logging not possible. Message: Transaction level 'READ-COMMITTED' in InnoDB is not safe for binlog mode 'STATEMENT'))
```

OR

```java
Binary logging not possible. Message: Transaction level 'READ-COMMITTED' in InnoDB is not safe for binlog mode 'STATEMENT'
```

OR

```java
org.ofbiz.core.entity.GenericEntityException: while updating:
[GenericEntity:IssueType][id,1][iconurl,/images/icons/issuetypes/bug.png ] (SQL Exception while executing the following:UPDATE issuertype SET ICONURL=? WHERE ID=? (Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = STATEMENT and at least one table uses a storage engine limited to row-based logging. InnoDB is limited to row-logging when transaction isolation level is READ COMMITTED or READ UNCOMMITTED.))
```

You may encounter this problem if your JIRA MySQL database configuration:
- Makes use of the InnoDB database storage engine (which is recommended)
  AND
- Uses MySQL's default binary logging format

JIRA uses the 'READ-COMMITTED' transaction isolation level with MySQL, which currently only supports row-based binary logging. For more information about this, please refer to MySQL issue no. 40360.

To overcome this problem, you must configure MySQL's binary logging format to use 'row-based' binary logging.

To do this:

1. Shutdown JIRA and your MySQL service if necessary.
2. Open the MySQL configuration file (my.cnf) in a text editor.
   - On UNIX-based systems, this file may be located in the /etc directory.
3. Locate the `binlog_format` property in this file in the [mysqld] section and ensure that its value is `row`, such that you end up with:

```
binlog_format=row
```

   - This is only needed (and valid) for MySQL versions 5.1.5 and later.
4. Save your changes to this file and restart your MySQL service and JIRA.

MySQL Administrator and Data Truncation Errors

Hi All,

Due to the release of the 3.7 branch requiring an empty database on startup (see here), a lot of our customers have had issues importing their data into the new install due to encoding inconsistencies between their existing databases and the new ones they've created for 3.7.x.

Errors that users are seeing are Data Truncation errors that look like:

```
```

We've been told that users using 'MYSQL Administrator' to create their databases lack the ability to specify what encoding type they wish their database to use. Here is the comment we received from a customer:

```
I solved the problem. I used to create the database using the MySQL Administrator with the effect, that I could not define the character-set to use for the database. So I tried to create the database manually using the command-line tool and bang, the import of the data worked fine.
```

I hope this helps and saves you all some installation hiccups.

-Michelle

MySQL Data Access Exception - Errcode - 17 occurs with JIRA

A user reports of getting this error caused by a MySQL Bug:
com.atlassian.jira.exception.DataAccessException: java.sql.SQLException:
Can't create/write to file 'C:\temp2#sql_eb4_0.MYI' (Errcode: 17)
at com.atlassian.jira.upgrade.util.UpgradeUtils.getExactColumnName(UpgradeUtils.java:222)
at com.atlassian.jira.appconsistency.db.Build178SchemaCheck.isColumnInTable
(Build178SchemaCheck.java:81)
at com.atlassian.jira.appconsistency.db.Build178SchemaCheck.check(Build178SchemaCheck.java:71)
at com.atlassian.jira.appconsistency.db.Build178SchemaCheck.isOk(Build178SchemaCheck.java:38)
at com.atlassian.jira.appconsistency.db.DatabaseChecker.checkDatabase(DatabaseChecker.java:108)
at com.atlassian.jira.appconsistency.db.DatabaseCompatibilityEnforcer.contextInitialized(DatabaseCompatibilityEnforcer.java:32)
at org.apache.catalina.core.StandardContext.listenerStart(StandardContext.java:3692)

where the error code means:

C:\>perror 17
OS error code 17: File exists

The Workaround:
Disabling their virus checker seemed to resolve the issue of JIRA not coming up. Users should therefore not run
"on-access" checking on their JIRA servers.

Bug Details:
The bug is described in more detail on the following link MySQL Bug Forum.
Setting Up a MySQL Database on Linux for JIRA

The latest official documentation on configuring JIRA with MySQL can be found in the Connecting JIRA to
MySQL guide.

This is a step-by-step supplement guide for setting up your MySQL database for JIRA. Although this guide
assumes that your MySQL database server is running on Linux, the various procedures described below can be
adapted (or may be applicable) to other similar operating systems.

Enable MySQL TCP/IP networking

Some Linux distributions (eg. Debian) disable MySQL’s TCP/IP networking as a security precaution. You can
test that MySQL is listening on the default port (3306) as follows:
On Debian, you can enable MySQL TCP connections by editing `/etc/my.cnf`, commenting out the 'skip-networking' flag, and restarting mysqld.

Create MySQL database and user

Create a MySQL user called 'jirauser' and database called 'jiradb':

```
$ mysql --user=root -p
Enter password:
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 559 to server version: 5.0.13-rc-Debian_1-log
Type 'help;' or '\h' for help. Type '\c' to clear the buffer.

mysql> CREATE DATABASE jiradb CHARACTER SET utf8 COLLATE utf8_bin;
Query OK, 1 row affected (0.02 sec)

mysql> GRANT SELECT,INSERT,UPDATE,DELETE,CREATE,DROP,ALTER,INDEX on jiradb.* TO 'jirauser'@'localhost' IDENTIFIED BY 'mypassword';
Query OK, 0 rows affected (0.00 sec)

mysql> flush privileges;
Query OK, 0 rows affected (0.00 sec)

mysql> quit
Bye
```

The 'IDENTIFIED BY' phrase sets the password for the user (in this case, 'mypassword'). Your hostname may be different; you will find out in the next steps.

Now verify that user 'jirauser' can connect:

```
$ mysql --user=jirauser --password=mypassword --database=jiradb
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 565 to server version: 5.0.13-rc-Debian_1-log
Type 'help;' or '\h' for help. Type '\c' to clear the buffer.

mysql>
```
If you get errors like:

Access denied for user 'jirauser'@'localhost' (using password: YES)

You will need to adjust the 'host' field for the JIRA user record:

jturner@teacup:$ mysql --user=root -p
Enter password:
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 655 to server version: 5.0.13-rc-Debian_1-log
Type 'help;' or '\h' for help. Type '\c' to clear the buffer.

mysql> select user, host from user;
+-----------------+-----------+
| user            | host      |
| debian-sys-maint| localhost |
| jirauser        | localhost |
| root            | localhost |
| root            | teacup    |
+-----------------+-----------+
4 rows in set (0.00 sec)

mysql> update user set host='localhost.localdomain' where user='jirauser';
Query OK, 1 row affected (0.00 sec)
Rows matched: 1  Changed: 1  Warnings: 0

Tip: make it so that only one production server can connect to the database, so that when you later bring up a clone of the production server as a staging server, you will be protected from having two JIRA instances using the same database.

See also Atlassian's MySQL Tips.

If problems persist, see the MySQL Causes of Access Denied Errors page.

For more general information, see Adding New User Accounts to MySQL.

**Start JIRA**

**Check for errors in the log files.**

Again, if you see an 'Access denied' error:

Access denied for user 'jirauser'@'localhost.localdomain' (using password: YES)

Then you need to adjust your /etc/hosts so that 'localhost' comes before 'localhost.localdomain', and restart MySQL. This is a MySQL bug fixed in 5.0.11.

**Run the Setup Wizard**

Point a browser at http://localhost:8080/, and set up JIRA as described in the Setup Wizard.

**Troubleshooting**

Q: I get the following error message in MySQL, "Attempted reconnect 3 times. Giving up." What
should I do?

A: MySQL error message

```
jdbc:mysql://localhost/test?autoReconnect=true connection error:
Server connection failure during transaction.
Attempted reconnect 3 times. Giving up.
```

To troubleshoot your MySQL connection, please follow the steps below:

1. Enter the following command to connect to MySQL:

```
mysql -p -u [dbuser] -h 127.0.0.1 [dbname]
```

For example,

```
mysql -p -u mydbuser -h 127.0.0.1 test
```

2. If you cannot connect to MySQL after entering your password, login to your mysql with the root account:

```
mysql -p -u root
```

And enter following command:

```
mysql> GRANT ALL PRIVILEGES ON <dbname>.* to <user>@127.0.0.1 identified by
'<password>';
mysql> FLUSH PRIVILEGES;
```

where,

* <dbname> is your database name,
* <user> is your database user name,
* <password> is your database password.

Do not forget the last command: 'FLUSH PRIVILEGES'

3. If you still cannot connect, please check that your MySQL is listening on the default port of 3306 and bind in your IP, 127.0.0.1 by running either of the following commands:

```
netstat -a |grep mysql
```

or,

```
netstat -a |grep 3306
```

If MySQL is listening, you should see the following message:

```
tcp 0 0 *:mysql *:* LISTEN
```

Alternatively, you also could check if your MySQL is listening on the default port by running this command:
4. If you can connect successfully from the command line but JIRA cannot connect it may because a non-default port is in use. Note that the \{mysql\} tool can connect to non-standard ports without you having to specify a port, so it isn't always a guarantee of connectivity.

JIRA and Oracle

This page has general notes on connecting JIRA to Oracle. It supplements the official Oracle installation documentation.

- Configuring Datasource for Oracle 10g JDBC drivers
- Restoring data using I-Net (Oranxo) Driver for Oracle
- Store Workflow on Disk with Oracle 8

Configuring Datasource for Oracle 10g JDBC drivers

When using JIRA with Oracle, the Oracle 10g JDBC driver needs to have the `SetBigStringTryClob` property set to true to store text of unlimited size in the database. If this property is not set, you will have problems modifying JIRA workflows and storing large (over 32k) text strings.

The `SetBigStringTryClob` property needs to be set in the application server, where the database connection is defined (the ‘datasource’ definition). The definition depends on the application server that you are using. Please refer to one of the sections below that is applicable to your application server to determine what to add to the datasource definition.

The same thing applies to I-Net's JDBC driver, except the property is called `streamstolob`.

Refer to the Connecting JIRA to Oracle documentation for details on how to specify this property in JIRA's `dbconfig.xml` file.

Resolving Connection Closure Issues

If you experiencing problems with connections closing, you may be able to resolve them by configuring the Commons Database Connection Pool (DBCP) to detect broken connections and create replacement connections. Please read Surviving Connection Closures for instructions on how to do this.

Restoring data using I-Net (Oranxo) Driver for Oracle

When restoring data into an Oracle 9 database using the I-Net Oranxo Driver a user was seeing this error message in their logs:
org.ofbiz.core.entity.GenericDataSourceException: SQL Exception while executing the following: INSERT INTO jiraaction (ID, issueid, AUTHOR, actiontype, actionlevel, actionbody, CREATED, actionnum) VALUES (?, ?, ?, ?, ?, ?, ?) ([OraDriver] #7 Unexpected end of inputstream in header.)
at org.ofbiz.core.entity.jdbc.SQLProcessor.executeUpdate(SQLProcessor.java:375)

Fix

This error was fixed by changing the Set Clob entry in JIRA's dbconfig.xml in the JIRA Home Directory.

So instead of using:

```xml
<connection-properties>SetBigStringTryClob=true</connection-properties>
```

for this driver it needs to be replaced with:

```xml
<connection-properties>streamstolob=true</connection-properties>
```

See the appropriate section in the Oracle JDBC Manual for details on these connection properties and the Configuring JIRA to Oracle for more information about configuring your dbconfig.xml file.

Store Workflow on Disk with Oracle 8

⚠️ Atlassian support for Oracle 8 officially ends with the JIRA 3.6 release. Oracle 8 users are advised to upgrade to avoid the problem described on this page.
Applies to: Oracle 8 users

Oracle has a 4000 character limitation on its VARCHAR2 field type. This causes problems for JIRA, which uses VARCHAR2 to store comments and 'workflows'. Whenever a comment or workflow exceeds 4000 characters (very easy in the case of workflows), JIRA breaks.

Oracle have a workaround for this problem in their 10g JDBC driver, which can be used with Oracle 9 and 10. Use of this workaround has been incorporated into the documentation.

This doesn't help Oracle 8 users. A workaround for the problem of > 4000 character workflows in Oracle 8 is to store these on disk, instead of in the database. This can be done as follows:

1. Run JIRA (with hsqldb database) to construct the workflow, and then:
2. Export the created workflow as XML, and save this to disk, eg custom-workflow.xml
3. In the JIRA instance that will use Oracle, edit WEB-INF/classes/workflows.xml and add a line:

```
<workflow name="custom" type="resource" location="custom-workflow.xml"/>
```

Where 'custom' is the workflow name.

4. Copy custom-workflow.xml to WEB-INF/classes/
5. Restart JIRA. The 'custom' workflow should appear in the list of available workflows.

JIRA and PostgreSQL

This page has general notes on connecting JIRA to Postgres. It supplements the official Postgres installation documentation.

- Setting up a PostgreSQL Database on Linux for JIRA

Setting up a PostgreSQL Database on Linux for JIRA

The latest official documentation on configuring JIRA with PostgreSQL can be found in the Connecting JIRA to PostgreSQL guide.

This is a step-by-step supplement guide for setting up your PostgreSQL database for JIRA on Ubuntu. However, the various procedures described below can be adapted (or may be applicable) to other Linux distributions too.

Set Up a PostgreSQL User

PostgreSQL is very easy to set up on Ubuntu:

```
user:~$ sudo apt-get install postgresql-8.2 postgresql-client-8.2
Reading package lists... Done
Building dependency tree
....
* Starting PostgreSQL 8.2 database server [ OK ]
```

Now we create a jira PostgreSQL user for the user account that runs JIRA to connect as:

```
user:~$ sudo su - postgres
postgres:~$ createuser -P jira
Enter password for new role:
Enter it again:
Shall the new role be a superuser? (y/n) n
Shall the new role be allowed to create databases? (y/n) y
Shall the new role be allowed to create more new roles? (y/n) n
CREATE ROLE
```

Set Up a PostgreSQL user

We can now connect as our jira user and create a database.
postgres:~$ logout
user:~$ sudo su - jira
jira:~$ createdb jiradb
CREATE DATABASE

Start JIRA

Run the Setup Wizard

Point a browser at http://localhost:8080/, and set up JIRA as described in the Setup Wizard.

How to Set Up SMTP Relay in Exchange 2007

There are a few known issues setting up a proper SMTP relay for our Exchange 2007 environment. The JIRA install was originally relaying off a different SMTP service before it was moved to Exchange 2007 server. This is occurring because SMTP Relaying not configured in Exchange 2007. The issue that has been encountered thus far are:

Depending on the configuration for the Receive Connector (i.e. SMTP relay) in Exchange 2007 will encounter one of the following problems:

1. Emails would relay to outside domains but the user's name (that created or commented on the task) would be stripped off the From address in the email leaving only the "Jira-Replies" address.
2. Email will not relay to outside domains but the user’s name would stay intact in the From address of the email.

Neither solution is optimal. While it is possible to set up an anonymous SMTP relay in Exchange 2007, for it to work properly there is one step that needs to be completed outside of the MMC. That command is listed below after the step by step instructions below.

Step by step instructions for setting up an SMTP relay in Exchange 2007 for JIRA.
Open up the Exchange MMC and select Hub Transport under Server Configuration on the left side. Split into two horizontal windows, it makes it easier to see a list of configured servers with the Hub Transport role at the top, and Receive Connectors at the bottom. Select whichever Hub Transport server is needed want this relay for and select the "New Receive Connector" in the action area on the right of the MMC. This should open the "New SMTP Receive Connector" wizard.

Thanks to Michael Athey for writing, documenting and providing all content for this knowledge base article.

New SMTP Receive Connector wizard

Main windows

1. Give the new relay a name (this example uses JiraTest as the name)
2. Make sure the drop down selection is set to "Custom" for "Select the intended use for this Receive

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
3. Hit Next

Local Network settings window

1. Select "Add", then choose "Specify an IP address"
2. Enter the IP address of the Exchange Hub Transport server
3. Keep the Port setting at 25
4. Hit OK
5. Delete the default "All available IPv4 addresses"
6. Enter the FQDN for the Exchange Hub Transport server
7. Hit Next

Remote Network settings window

1. Select "Add"
2. Enter the IP address of the JIRA server
3. Hit OK
4. Delete the default 0.0.0.0-255.255.255.255 range
5. Hit Next
New Connector window

1. It should now be possible to see an overview of the connector being creating
2. Hit New

Completion window

1. Hopefully this shows the connector completed successfully
2. Hit Finish

It should now be possible to should now see the connector listed on the bottom half of the screen with any others that may have created previously.
Double click the one that was just created to open its properties.
Verify the FQDN is correct in the General tab...

and that the IP addresses are also correct in the Network tab.
The Authentication tab should only have Transport Layer Security (TLS) selected only.

- Now go to the Permission Groups tab and select Anonymous Users, unselecting any other options, then hit OK.
- Normally that should be it, but it's not. There is one more additional step that which needs to be done in PowerShell.
- Open up the Exchange Management Shell and type the following, where "JiraTest" is the name of the connector that was just created.

```
Get-ReceiveConnector "JiraTest" | Add-ADPermission -User "NT AUTHORITY\ANONYMOUS LOGON" -ExtendedRights "ms-Exch-SMTP-Accept-Any-Recipient"
```

What this command does is grant the relay permission to the Anonymous group for that connector. When simply selecting Anonymous Users through the GUI all that is assigned is the most common permissions, but it does not grant the relay permission. So now run the command through Management Shell.

After that is completed it is possible to start relaying JIRA's email through the Exchange 2007 setup.

**How to Use System JRE Instead of Embedded JRE**

JIRA installer comes with its own JRE, hence JIRA won't use system JRE when its run. If you want to configure JIRA to use system JRE please follow the steps below:

1. Shutdown JIRA
2. Edit `<JIRA_Installation_Directory>/bin/setenv.bat` or `setenv.sh` on your favorite text editor
3. Input the following lines:
   For setenv.bat:
   
   ```
   SET JRE_HOME="<Full Path of Your JRE Directory>"
   ```
   
   For setenv.sh:
   
   ```
   JRE_HOME="<Full Path of Your JRE Directory>"
   ```
   
4. Change the `JRE_HOME` value with the absolute path of your system JRE.
5. Save
6. Restart JIRA

### Installation LDAP server on OpenDS and ApacheDS in JIRA (Windows Environment)

This page contains an example of how to install/configure LDAP server on **OpenDS** and **ApacheDS** based in **Windows** environment in JIRA.

**Comparison between OpenDS and ApacheDS in terms of Specifications and Offered Features**

<table>

  • Archive zip |
| **Java Platform**    | Java Runtime Environment 1.5 and above       | Java Runtime Environment 1.6 and above       |

---

**How**
The bundled JRE version is 1.6 update 26. Please check your System Information page (JIRA Admin > System Information) and see if JIRA run in this JAVA version instead of the installed JRE on your system.

You will need to download and install **Apache Directory Studio** which is a Eclipse tool act as the LDAP Browser/Editor in order to use ApacheDS.
Offered Features

- Management of recurrent and scheduled tasks
- Monitoring of data in the Control Panel
- Collation matching rules for I18N
- Assured replication
- Configuration of replication groups

The Apache Directory Server is an embeddable LDAP server implemented in pure Java. It has several features that make it unique among LDAP servers. Some of these features are as follows:

- Designed as an LDAP and X.500 platform; pluggable components and subsystems make ApacheDS extremely modular and ideal for experiments with various aspects of the LDAP protocol.
- The server's frontend is completely separable from its backend and vice-versa making it very flexible for implementing virtual directories, proxy servers and gateways to X.500 directories.
- Several backends can be implemented and plugged into the server's partition nexus. The server supports a BTree based partition out of the box but any backing store can be used to implement a partition as long as it conforms to interfaces.
- The server exposes aspects of administration via a special system backend. LDAP can be used to manage these concerns through the system naming context at ou=system.
- The server contains a server side JNDI LDAP provider as the facade for the entire backend subsystem. JNDI operations are directly translated by this provider into operations against the nexus and the target partitions storing server entries.
- The server's networking code, MINA (Multipurpose Infrastructure for Network Applications) was designed for pluggable protocol providers, of all sorts and not just LDAP. MINA gives ApacheDS the ability to handle large amounts of concurrency.
- LDAP Stored Procedures and Triggers are scheduled for the next major version of ApacheDS.
- LDAPv3 compatible certified by the OpenGroup
Unique Usage Point

- Setup process is a breeze and straightforward since mostly is already pre-configured
- Love the Control Panel GUI interface which is easy to understand and very user friendly
- Suitable for beginner that are new to LDAP environment
- Offered Apache Directory Studio act as a powerful LDAP IDE (similar like Eclipse, Netbeans) which is useful when it comes to advanced configuration and debugging
- High scalability and flexibility in terms of implementation

Basically both of these LDAP directory server environment it is quite similar in terms of specification and supported environment too as is widely available for almost all operating system since it is both running in Java based application. Best of all it is open source and free.

Installation

This is based in Windows Environment only

OpenDS

1. Download OpenDS 2.2 Update 1 archive zip and extract it out to a particular location
2. Run `setup.bat` file and then basically follow either one of the tutorial below to setup your LDAP server

<table>
<thead>
<tr>
<th>Video tutorial</th>
<th>Document tutorial</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><a href="https://java.net/projects/opends/pages/2_4_OverviewOfTheQuickSetUpTool">https://java.net/projects/opends/pages/2_4_OverviewOfTheQuickSetUpTool</a></td>
</tr>
</tbody>
</table>

ApacheDS

1. Download ApacheDS 2.0.0-M13 and Apache Directory Studio 2.0.0-M7 either 32-bit or 64-Bit
2. Install ApacheDS first with the installation wizard then do the same for Apache Directory Studio (pretty straightforward)

Setting it up with JIRA

Setup Environment:

<table>
<thead>
<tr>
<th>OpenDS</th>
<th>ApacheDS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows 7 Professional 64-bit</td>
<td>Windows 7 Professional 64-bit</td>
</tr>
<tr>
<td>JIRA 5.2.11 Standalone connected to PostgreSQL 8.4 database</td>
<td>JIRA 5.2.11 Standalone connected to PostgreSQL 8.4 database</td>
</tr>
<tr>
<td>JRE 1.6</td>
<td>JRE 1.6</td>
</tr>
<tr>
<td>OpenDS 2.2 Update 1</td>
<td>ApacheDS 2.0.0-M13</td>
</tr>
<tr>
<td></td>
<td>Apache Directory Studio 2.0.0-M</td>
</tr>
</tbody>
</table>

General Setup Guidelines

1. Setup LDAP server in both OpenDS and ApacheDS (refer the installation instruction above)
2. Configure the users and groups in both server
3. Fresh install JIRA 5.2.11 connected with a fresh empty Postgres database
4. Go to Administrator > Users > User Directories > Add Directory
5. Choose Directory Type: LDAP and select Apache Directory Server 1.5.x for ApacheDS and OpenDS for OpenDS
6. Fill up all other required field: Name, Directory Hostname, Port and Base DN
7. Select Read Only as the LDAP Permissions
Make sure the attributes and object class you set in your LDAP server is correctly match the attributes that you bind in JIRA (under User and Group Schema Settings).

Example:

- The default bind user name attribute for OpenDS in JIRA (User Schema Settings) is `uid` so in your OpenDS LDAP server you have to set your username under `user id` attribute.
- The default bind user name attribute for ApacheDS in JIRA (User Schema Settings) is `cn` so in your ApacheDS LDAP server you have to set your username under `common name` attribute.

Differences in terms of User Interface and Configuration

<table>
<thead>
<tr>
<th>UI</th>
<th>OpenDS</th>
<th>ApacheDS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Main</td>
<td><img src="image1.png" alt="OpenDS UI" /></td>
<td><img src="image2.png" alt="ApacheDS UI" /></td>
</tr>
</tbody>
</table>
Create User
Installation Troubleshooting Guide

This troubleshooting guide lists some of the common installation problems people run into.

⚠️ If you have a question that is not answered here, please see our support page for information on how to seek help.

Issues

- **My JIRA instance starts up with strange errors, what could be wrong?**

🚨 **My JIRA instance starts up with strange errors, what could be wrong?**

If you're using the Windows XP, you may have extracted JIRA with the built-in unzip tool. This built-in unzip tool is broken - it silently fails to extract files with long names (see JRA-2153). Other users have also reported problems using WinRAR. Please use another tool like 7-zip or WinZIP to unpack JIRA.

If you're using Solaris, it also suffers from similar problems. You will need to use GNU tar to handle the long filenames.
Other users have reported similar problems using Midnight Commander.

**Error on Dashboard about Gadget plugin**

Some users have reported that installing JIRA 5.x on the Amazon Free servers succeeds except for an error on the Dashboard screens about gadget plugins not being found. Adding more memory to the VM made this error go away. More information at JIRA System Plugin Timeout While Waiting for Plugins to Enable

**Installing a LDAP server on Debian Linux for use with JIRA**

This page contains an example of how to install LDAP on Linux. It's assumed that you are working towards LDAP authentication in JIRA or Confluence.

**Install LDAP**

On Debian, an LDAP server can be installed with:

```
apt-get install slapd ldap-utils
```

Entering the following details when prompted (customize for your organization):

<table>
<thead>
<tr>
<th>Domain name</th>
<th>atlassian.com</th>
</tr>
</thead>
<tbody>
<tr>
<td>Organization name</td>
<td>Atlassian</td>
</tr>
<tr>
<td>Admin password</td>
<td>secret</td>
</tr>
<tr>
<td>LDAP v2 protocol</td>
<td>no</td>
</tr>
</tbody>
</table>

At this point, you might as well install a graphical LDAP browser, like 'gq'. Connecting anonymously, you'll see there is one entry, `cn=admin,dc=atlassian,dc=com`, created.

![GQ GUI](image)

Create a schema

Rather than try to devise my own LDAP schema, I used the 'migrationtools' package to create a schema, and import system users from `/etc/passwd`:

```
apt-get install migrationtools
```

1. Edit `/etc/migrationtools/migrate_common.ph`, and make the following changes:
1. Default DNS domain
   -$DEFAULT_MAIL_DOMAIN = "padl.com";
   +$DEFAULT_MAIL_DOMAIN = "atlassian.com";

1. Default base
   -$DEFAULT_BASE = "dc=padl,dc=com";
   +$DEFAULT_BASE = "dc=atlassian,dc=com";

1. Turn this on for inetLocalMailRecipient
2. sendmail support; add the following to
   @@ -93,8 +93,8 @@
   #$USE_UTF8 = 1;

1. Uncomment these to avoid Debian managed system users and groups
   -$IGNORE_UID_BELOW = 1000;
   -$IGNORE_GID_BELOW = 100;
   +$IGNORE_UID_BELOW = 1000;
   +$IGNORE_GID_BELOW = 100;

1. And here's the opposite for completeness
   #$IGNORE_UID_ABOVE = 9999;

1. Run /usr/share/migrationtools/migrate_all_online
```
teacup:/usr/share/migrationtools# ./migrate_all_online.sh
Enter the X.500 naming context you wish to import into: [dc=padl,dc=com] dc=atlassian,dc=com
Enter the hostname of your LDAP server **Connecting to an LDAP Directory**: localhost
Enter the manager DN: [cn=admin,dc=atlassian,dc=com]:
Enter the credentials to bind with:
Do you wish to generate a DUACConfigProfile [yes|no]? no

Importing into dc=atlassian,dc=com...

Creating naming context entries...
Migrating aliases...
Migrating groups...
Migrating hosts...
Migrating networks...
Migrating users...
Migrating protocols...
Migrating rpcs...
Migrating services...
Migrating netgroups...
Migrating netgroups (by user)...
Migrating netgroups (by host)...
Importing into LDAP...
add new entry "ou=Hosts,dc=atlassian,dc=com"
add new entry "ou=Rpc,dc=atlassian,dc=com"
add new entry "ou=Services,dc=atlassian,dc=com"
add new entry "nisMapName=netgroup.byuser,dc=atlassian,dc=com"
add new entry "ou=Mounts,dc=atlassian,dc=com"
add new entry "ou=Networks,dc=atlassian,dc=com"
add new entry "ou=People,dc=atlassian,dc=com"
add new entry "ou=Group,dc=atlassian,dc=com"
add new entry "ou=Netgroup,dc=atlassian,dc=com"
add new entry "ou=Protocols,dc=atlassian,dc=com"
add new entry "ou=Aliases,dc=atlassian,dc=com"
add new entry "nisMapName=netgroup.byhost,dc=atlassian,dc=com"
add new entry "cn=postmaster,ou=Aliases,dc=atlassian,dc=com"
lstmt: update failed: cn=postmaster,ou=Aliases,dc=atlassian,dc=com
ldap_add: Undefined attribute type (17)
additional info: rfc822MailMember: attribute type undefined
/usr/bin/ldapadd: returned non-zero exit status
```

At this point, you should be able to browse the updated schema in a LDAP browser:
Add users

Still in the migrationtools directory, run:

```
teacup:/usr/share/migrationtools# ./migrate_passwd.pl /etc/passwd | ldapadd -x -D "cn=admin,dc=atlassian,dc=com" -W
Enter LDAP Password:
adding new entry "uid=nobody,ou=People,dc=atlassian,dc=com"
adding new entry "uid=jturner,ou=People,dc=atlassian,dc=com"
adding new entry "uid=anonymous,ou=People,dc=atlassian,dc=com"
adding new entry "uid=devuser,ou=People,dc=atlassian,dc=com"
adding new entry "uid=jefft,ou=People,dc=atlassian,dc=com"
```

This creates users, but doesn't set passwords. We must do this manually:

```
teacup:/usr/share/migrationtools# ldappasswd -x -v -S -W -D "cn=admin,dc=atlassian,dc=com" "uid=jturner,ou=People,dc=atlassian,dc=com"
New password:
Re-enter new password:
Enter LDAP Password:
ldap_initialize( <DEFAULT> )
Result: Success (0)
```

You should now be able to connect anonymously, or as an authenticated user:
Notes

- Some customers have found it helpful to use Likewise Open for LDAP authentication, as it is easy to install and setup.

**Installing Java on Ubuntu or Debian**
Some Linux distributions (notably Debian and Ubuntu) come with a free version of Java called GIJ (from the GCJ project) pre-installed:

```bash
jturner:~$ java -version
java version "1.4.2"
gij (GNU libgcj) version 4.1.2 (Ubuntu 4.1.2-0ubuntu5)

Copyright (C) 2006 Free Software Foundation, Inc.
This is free software; see the source for copying conditions. There is NO warranty; not even for MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE.
jturner:~$
```

Unfortunately GCJ is incomplete, and unable to run Atlassian Java applications without problems.

The solution is to install a supported version of Java. Visit the Java download page on the Oracle web site to download a supported version of Java for your Linux distribution. Installation instructions are provided on this web site.

After doing this, make sure the correct version of Java is in use by running `java -version`:

```bash
jturner:~$ java -version
java version "1.6.0"
Java(TM) SE Runtime Environment (build 1.6.0-b105)
Java HotSpot(TM) Server VM (build 1.6.0-b105, mixed mode)
jturner:~$
```

If the GCJ Java is still being used, you will need to explicitly set Linux's default Java platform to a JIRA-supported (e.g. Oracle's) Java platform as the default:

```bash
jturner:~$ sudo update-alternatives --config java

There are 2 alternatives which provide `java'.

<table>
<thead>
<tr>
<th>Selection</th>
<th>Alternative</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>/usr/bin/gij-wrapper-4.1</td>
</tr>
<tr>
<td>+</td>
<td>/usr/lib/jvm/java-6-sun/jre/bin/java</td>
</tr>
</tbody>
</table>

Press enter to keep the default[*], or type selection number: 2
Using `/usr/lib/jvm/java-6-sun/jre/bin/java' to provide `java'.
jturner:~$
```

**Setting JAVA_HOME**

Some programs like Tomcat (bundled with most Atlassian products) need a JAVA_HOME variable set, so they know where Java is installed. This can be set system-wide in `/etc/profile`:
```bash
jturner:~$ sudo su -
Password: 
root:~# cat >> /etc/profile
JAVA_HOME=/usr/lib/jvm/java-6-sun
export JAVA_HOME
root:~#
```
The variable will be set for new terminals:

```bash
jturner:~$ echo $JAVA_HOME
/usr/lib/jvm/java-6-sun
jturner:~$
```

## Installing JIRA on Mac OS X

### JIRA running on Mac OS X should only be used for evaluation purposes!

Mac OS X is not a supported operating system for the JIRA server because until recently no supported Oracle JDK and JRE (formerly Sun JDK and JRE) was available for this operating system. It is our view that the cost of supporting JIRA on OS X would be better spent fixing bugs and developing other requested features.

**Please note:**
- If you encounter problems with your JIRA server running on Mac OS X, they may not be fixed as we do not test JIRA with unsupported Java platforms.
- However, JIRA users can still access your JIRA server through a [supported browser](http://example.com) on Mac OS X.

To install JIRA on Mac OS X, follow these steps:

- **Before you begin**
  - 1. Download and Install JIRA
  - 2. Set JIRA Home
  - 3. Create a Dedicated User Account on the Operating System to Run JIRA
  - 4. Start JIRA
  - 5. Run the Setup Wizard
  - 6. Next Steps

**Before you begin**

Please ensure that you have set $JAVA_HOME$. (You don't need to install Java as it comes with Mac OS X.)

1. **Download and Install JIRA**
   - 1. Download the JIRA `tar.gz` file [here](http://example.com).
   - 2. Unzip the downloaded file.

2. **Set JIRA Home**

To specify the location of your JIRA Home Directory:
1. Edit the `jira-application.properties` file and set the value of the 'jira.home' property to the desired location for your JIRA Home Directory.
   - See the JIRA Installation Directory page to find where this file is located.
2. Use the JIRA Configuration Tool (included with all JIRA distributions except JIRA WAR) to change the location of your JIRA Home Directory.
3. Set an environment variable named `JIRA_HOME` in your operating system whose value is the location of your JIRA Home Directory. To do this, do one of the following:
   - Enter the following command at a shell/console prompt before running JIRA:
     ```
     export JIRA_HOME=/path/to/jira/home
     ```
     - Specify the command above in a script used to start JIRA.

You can specify any location on a disk for your JIRA home directory. Please be sure to specify an absolute path.

Please note that you cannot use the same JIRA home directory for multiple instances of JIRA. We recommend locating your JIRA Home Directory completely independently of the JIRA Installation Directory (i.e. not nesting one within the other) as this will minimise information being lost during major operations (e.g. backing up and restoring instances).

3. Create a Dedicated User Account on the Operating System to Run JIRA

A dedicated user should be created to run JIRA, as JIRA runs as the user it is invoked under and therefore can potentially be abused. For example:

   - If your operating system is *nix-based (for example, Linux or Solaris), type the following in a console:
     ```
     $ sudo /usr/sbin/useradd --create-home --comment "Account for running JIRA" --shell /bin/bash jira
     ```
   - If your operating system is Windows:
     1. Create the dedicated user account by either:
        - Typing the following at the Windows command line:
          ```
          > net user jira mypassword /add /comment:"Account for running JIRA"
          ```
          (This creates a user account with user name 'jira' and password 'mypassword'. You should choose your own password.)
        - Opening the Windows 'Computer Management' console to add your 'jira' user with its own password.
     2. *(Optional)* Use the Windows 'Computer Management' console to remove the 'jira' user's membership of all unnecessary Windows groups, such as the default 'Users' group.

Ensure that only the following directories can be written to by this dedicated user account (e.g. 'jira'):

   - The following subdirectories of your JIRA Installation Directory for 'recommended' JIRA distributions (or for JIRA WAR distributions, the installation directory of the Apache Tomcat application running JIRA):
     ```
     logs
temp
work
     ```
   - Your JIRA Home Directory.

   - Do not make the JIRA Installation Directory itself writeable by the dedicated user account.

3. Start JIRA

Run `bin/startup.sh` to start JIRA.

JIRA will be launched in a black 'Tomcat' window (do not close this window). Wait until the startup messages have finished.

To access JIRA, go to your web browser and type this address: `http://localhost:8080`.

If JIRA does not appear, you may need to change the port that JIRA runs on.

If something goes wrong, please verify that Java is installed correctly. If the problem persists, please con...
5. Run the Setup Wizard

See Running the Setup Wizard.

Next Steps

- See JIRA 101 to start creating Projects, creating Users, and customizing your JIRA instance.
- By default, JIRA uses the standard Tomcat port (i.e. 8080). If you need another application to run on that port, either now or in the future, please see Changing JIRA's TCP Ports.
- As part of its installation process, JIRA automatically installs, configures and connects itself to an HSQLDB database. This is fine for evaluation purposes, however HSQLDB is prone to data corruption. For production installations, we strongly recommend that you connect JIRA to an external database.
- To get the most out of JIRA, please see Optimizing Performance.

Configure JIRA as service on Mac OS X

Apple Mac OS X is not a supported operating system for the JIRA server, as JIRA is only tested against Oracle JDK and JRE (formerly Sun JDK and JRE).

Please note: This does not affect your JIRA end users, who can still use Mac OS X with any of the supported browsers.

If you want to run JIRA as a server on OSX, you will need to configure it to load as a user daemon. OSX has migrated configuration scripts from services such as cron, rc, or init.d to the launchd utility. There are some good introductory and in-depth explanations of it's function on the web. You can find out more about launchd here:

It's easier to use Lingon (http://lingon.sourceforge.net/) to define your plist xml definitions for import into launchd; although because launchd does not permit forking of processes you will need to call $TOMCAT_HOME/bin/catalina.sh directly.

Example definition of com.atlassian.jira.plist:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<plist version="1.0">
  <dict>
    <key>Label</key>
    <string>com.atlassian.jira</string>
    <key>ProgramArguments</key>
    <array>
      <string>/usr/local/apache-tomcat-5.5.23/bin/catalina.sh</string>
      <string>run</string>
    </array>
    <string>/usr/local/apache-tomcat-5.5.23/bin/catalina.sh</string>
    <string>run</string>
  </array>
  <key>RunAtLoad</key>
  <true/>
  <key>ServiceDescription</key>
  <string>JIRA autoloaded as a service</string>
  <key>UserName</key>
  <string>pw</string>
</dict>
</plist>
```

I'd advise adding the <UserName> tag to tell OSX which user to run Tomcat under, eg running Tomcat under root is not recommended. JAVA_HOME will be inherited as an environment variable for whichever user you define in the XML definition - so configure it for that user's .profile in their home directory.
If you wanted to run JIRA as a WAR web-archive, and use OSX's factory install of Tomcat, please see the JIRA WAR installation instructions.

Is Clustering or Load Balancing JIRA Possible

<table>
<thead>
<tr>

</tbody>
</table>

Does JIRA support clustering for scaling?

Not at this time.

However we do understand that customers are interested in how JIRA can scale. To address this we have written a document that explains how JIRA performs in different configurations and it also provides a guide of how to scale JIRA in a large enterprise. So whether you are a new JIRA evaluator that wants to understand how JIRA can scale to your needs, or you're a long time existing JIRA administrator that is interested taking JIRA to the next level we have a document that will point you in the right direction.

To scale JIRA in your organization, there are two key approaches, which can be used in combination to scale JIRA across your entire organization:

1. Scaling a single JIRA instance.
2. Federation: Using multiple, connected JIRA instances

We detail both techniques to get the most out of JIRA for your organization at our Scaling JIRA guide.

What if I really want JIRA clustering?

Although not supported if this is something you must have then in your environment you may wish to work with one of our Atlassian Experts to come up with a tailor made solution. Please remember that this will not be supported by Atlassian. This means that if you experience a problem that can not be replicated in a non-clustered environment then that is where our support will most likely stop.

Note: If you wish to run JIRA in a clustered environment you will need a license for each node. You can place your order from our secure online order form.

Does JIRA support high-availability?

While not natively supported it is possible to build an environment with a JIRA failover strategy. This best practices guide: Failover for JIRA, assembles some of the best advice from our customers, our partners, and internal staff on setting up a failover solution for JIRA.

java.lang.NoClassDefFoundError

If you get the following error when starting JIRA:

```
"java.lang.NoClassDefFoundError:com/atlassian/jira/issue/search/parameters/lucene/SingleFieldMultiValueLuceneParameter"
```

this means that Windows XP's unzip is broken. See the Installation Guide for how to avoid this.

JVM and Appserver configuration info

LicenseFactory error after upgrading JIRA

If, after upgrading JIRA, you get an error containing 'com/atlassian/jira/license/LicenseFactory', it means that your application server is using old cached JSPs from the previous JIRA version. Please delete the directory

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.
where the app server keeps these (the `work/` directory in Tomcat; the `application-deployments/` directory in Orion; etc), and restart.

### Logging request headers

If you are having trouble authenticating to JIRA or a web application, it can be useful to log the details of all HTTP request headers that are being sent to the web application. If your application server is Tomcat, you can do this with the **Request Dumper Valve**.

Add the following entry to the `<Engine>` section of your Tomcat `conf/server.xml` file:

```xml
<Vale className="org.apache.catalina.valves.RequestDumperValve"/>
```

Then restart JIRA.

You will get lots of entries like the following in your `logs/catalina.out` log file:

```
INFO:             header=user-agent=Mozilla/5.0 (X11; U; Linux x86_64; en-US; rv:1.8.1.6) Gecko/20070108 Ubuntu/7.10 (gutsy) Firefox/2.0.0.6
INFO:             header=accept=text/xml,application/xml,application/xhtml+xml,text/html;q=0.9,text/plain;q=0.8,image/png,*/*;q=0.5
INFO:             header=accept-language=en-us,en;q=0.5
INFO:             header=accept-encoding=gzip,deflate
INFO:             header=accept-charset=ISO-8859-1,utf-8;q=0.7,*;q=0.7
INFO:             header=keep-alive=300
INFO:             header=connection=keep-alive
```

### Running multiple instances of JIRA on one machine

It's possible to run multiple JIRA instances on one machine as long as the instance completes the following requirements:

- Not sharing the same listening or shutdown port of any other instance or service.
- Not sharing the same database with another instance.
- When using services within windows, using 2 different windows service definitions.
- Not sharing the same JIRA home folder.
- Not deploying multiple instances using a Single Tomcat Application Container.
- Having separate licenses for each of the instances.

By default, JIRA runs on port **8080** (and hence is available at [http://<yourserver>:8080](http://<yourserver>:8080), eg. [http://localhost:8080](http://localhost:8080)).

If you want to run another JIRA instance but already has a service claiming port **8080**, there will be a conflict, and JIRA will fail to start. You may see errors like this:

```
LifecycleException: Protocol handler initialization failed:
java.net.BindException: Address already in use:8080
```

This can be fixed by changing JIRA to use another listening port (eg. **8090**) and shutdown port (eg. **8015**). This
is done by editing conf\server.xml (eg. in Wordpad). The start of the file looks like:

```xml
<Server port="8005" shutdown="SHUTDOWN">
  <Service name="Catalina">
    <Connector port="8080"
      maxHttpHeaderSize="8192" maxThreads="150" minSpareThreads="25"
      maxSpareThreads="75"
      enableLookups="false" redirectPort="8443" acceptCount="100"
      connectionTimeout="20000" disableUploadTimeout="true" />
  </Service>
</Server>
```

Here, change the shutdown port from "8005" to "8015" and change the listening port from "8080" to "8090" (or some other free port — see below).

Then restart JIRA (bin\shutdown.bat; bin\startup.bat) and point a browser to http://<yourserver>:8090 (eg. http://localhost:8090).

> If you are running on a Unix server and bind the ports below 1024 (such as port 80 for example), you will **need to start JIRA as root** in order to successfully bind to the port

### Which port number should I choose?

If you are not sure which port number to choose, use a tool such as `netstat` to determine which port numbers are free to use by JIRA. The highest port number that can be used is 65535 because it is the highest number which can be represented by an unsigned 16 bit binary number. The Internet Assigned Numbers Authority (IANA) lists the registration of commonly used port numbers for well-known Internet services, it's advisable to avoid any of those ports.

**Solaris ClassNotFoundException**

After unpacking the WAR on Solaris, JIRA fails to start with a `ClassNotFoundException` once deployed. How is this fixed?

On Solaris, the default `tar` utility should be avoided as it cannot handle long filenames. **GNU tar** should be used instead in order to handle long filenames found within the JIRA distribution, it can usually be found at:

```
/usr/sfw/bin/
```

Stacktrace example:

```
2006-11-15 15:43:27,539 ERROR [ContainerBase.[Catalina].[localhost].[/]]
Error configuring application listener of class
com.atlassian.jira.upgrade.ConsistencyLauncher
java.lang.ClassNotFoundException:

Windows cannot find -Xms128m

When running startup.bat I get an error message: "Windows cannot find '-Xms128m"

This error message means that the Java JDK (Java Development Kit) is not installed or the JAVA_HOME environment variable has not been set correctly. Please refer to the Java installation guide.

How to Hide "Can't access your account?" Link

The content on this page is a customisation. It is not supported by Atlassian Support. Please comment below with additional tips!

Administrator might want to hide the forgot password link from the log-in page to ensure that only JIRA administrator that could reset users password without enabling "External User Management" option.

In order to do this, please try the following steps

1. **If using JIRA 4.0.2 or earlier:**

2. **If using JIRA 4.1 or later:**

4. **Unzip** `jira-gadgets-plugin-x.jar`.

5. **Inside of the jar file is** `/gadgets/login.xml`, **the definition for the login gadget**.

6. **Find the following lines**

   ```javascript
   var rememberMe = AJS.$("#rememberme");
   forgotPassword = AJS.$("#forgotpassword");
   if (!login.allowCookies) {
   ```

7. **Modify it to:**

   ```javascript
   var rememberMe = AJS.$("#rememberme");
   forgotPassword = AJS.$("#forgotpassword");
   forgotPassword.hide();
   if (!login.allowCookies) {
   ```

8. **Zipped it back**
9. **Restart JIRA**

How to display custom field of the sub-task in the parent issue screen?

**Resolution**

**JIRA 5.x**

By adding the custom field id in the Administration > Advanced Settings page.

**Steps to follow:**

1. Create a custom field through Administrative --> Custom Fields
2. In the Custom Fields page, click on the Gear button at the right of the custom field’s row:

3. Hover over Edit and at the bottom of the page you will see the custom field’s id (e.g. id=10208)
4. Go to Administration --> General Configuration --> Advanced (button at the bottom of the page) --> jira.table.cols.subtasks
5. Click on the right column where it says (by default) issuetype, status, assignee, progress and add customfield_10208
6. Click on Update.

If you get no errors then you have probably done the trick. Navigate to an issue containing sub-tasks and you should see your custom field in the sub-task list (provided that the sub-task holds values in that field, of course).

Tested version
The above has been tested in JIRA 5.0.7, 5.2.4

JIRA 4.4.x

By editing the value of jira.table.cols.subtasks property in the jpm.xml file edit within the <default-value> tags. For example, in this situation if you wanted due date to come up you would change it like this and restart JIRA:

```xml
<property>
  <key>jira.table.cols.subtasks</key>
  <name>JIRA subtasks table columns</name>
  <description>The columns to show when viewing sub-task issues in a table</description>
  <default-value>issuetype, status, assignee, progress, duedate</default-value>
  <type>list&lt;string&gt;</type>
  <validator>com.atlassian.jira.bc.admin.NavigableFieldListValidator</validator>
  <user-editable>true</user-editable>
  <requires-restart>false</requires-restart>
</property>
```

Prior to JIRA 4.4

By editing the value of jira.table.cols.subtasks property in the jira-application.properties could solve the problem. For example:

```
jira.table.cols.subtasks = priority, issuetype, status, resolution, versions, assignee, customfield_10000
```

A restart of JIRA needs to be performed after making the modification.
How to change the font size for printing an issue

To use specific font size for printing purposes, custom css specifying the desired font size can be add into the Announcement Banner. The steps are as follow:

1. Go to 'Administration' > 'System' > 'User Interface' > 'Announcement Banner'
2. Enter the following code into the Announcement Banner section and change your desire font size:

```html
<html>
<head>
<style>
@media print
{body{font-size:9pt !important;}}
</style>
</head>
```

3. Print preview an issue view to check if the JIRA font has changed into desired size.
How to recover the comments viewable by a Project Role which has been deleted

Regular Expression:

Help us improve!

Error formatting macro: kbsurvey: java.lang.NullPointerException

Unknown macro: (htmlcomment)

Always back up your data before performing any modification to the database. If possible, try your modifications on a test server.

Scenario

1. You have a project role named "OLD" which was created some time ago.
2. Under circumstances, you decide to delete it and replace by a new project role named "NEW", or you have accidentally delete it.
3. Some users have comment viewable by "OLD" project role on some issues, and now those comments disappear on the issues. (This is the expected behavior, since the project role does not exist anymore)
4. You want to retrieve the comments and move it to the new project role "NEW"
5. You know at least one issue's issue-key and comment detail which is related to the project role "OLD".

Before you begin:

| Always BACKUP your data before performing any changes in your database and please ensure that you at least have a basic database knowledge before proceeding |

Steps to recover the comments:

**Step 1:**

You should know any issue's issue key which is having this problem. For example, "TEST-1" in this case, then you can run the following query in your MySQL database:

```sql
select * from jiraaction where issueid = (select id from jiraissue where pkey = 'TEST-1')
```

This is for checking the rolelevel for the comment which has been viewable by project role "OLD" (The rolelevel and old comment for "OLD" still exists in your database even after you have deleted the project role) Please see the attachment below:

<table>
<thead>
<tr>
<th>id</th>
<th>issueid</th>
<th>author</th>
<th>actiontype</th>
<th>actionlevel</th>
<th>rolelevel</th>
<th>actionbody</th>
</tr>
</thead>
<tbody>
<tr>
<td>10002</td>
<td>10100</td>
<td>admin</td>
<td>comment</td>
<td>10002</td>
<td>10101</td>
<td>next comment to test role</td>
</tr>
<tr>
<td>10003</td>
<td>10100</td>
<td>admin</td>
<td>comment</td>
<td>10101</td>
<td>10002</td>
<td>next it</td>
</tr>
<tr>
<td>10004</td>
<td>10100</td>
<td>admin</td>
<td>comment</td>
<td>10002</td>
<td>10101</td>
<td>next comment to test role</td>
</tr>
</tbody>
</table>

In this example, the rolelevel is 10101

**Step 2:**

Find out the rolelevel from last query and run:
update jiraaction set rolelevel=(select id from projectrole where name='NEW') where rolelevel=10101

This is for updating all the comments which have been restricted viewable by "OLD" to the new project role "NEW".

**How To Remove the Message 'Some issue types are unavailable due to incompatible field configuration and/or workflow associations.' from Edit Issue Screen**

Currently, JIRA will show the 'Some issue types are unavailable due to incompatible field configuration and/or workflow associations' when editing Issue Type in Edit Issue Screen. User might puzzled by this message as they are unaware of the configuration that is done by Administrator. The reason of this message is discussed in [here](#). This message can be suppress by:

1. edit the parameter `issue.field.issuetype.incompatible.types` in the `JIRA_Install/atlassian-jira/WEB-INF/classes/com/atlassian/jira/web/action/JiraWebActionSupport.properties` directory
2. remove the content of the `JIRA_Install/work` directory
3. restart JIRA

---

**JIRA Agile Guide**

![JIRA Agile 6.3](#) has been released! Read the [release notes](#) for more information on the features that have been added.

**JIRA Agile** is a [JIRA add-on](#) that adds a broad collection of agile project management capabilities to JIRA, and extends JIRA as a powerful platform for agile development teams. JIRA Agile simplifies the planning and organisation of tasks, workflows and reporting for agile teams.

Please refer to the [JIRA Agile documentation](#) for more information.

**Streamlining your development with JIRA**

JIRA and the Atlassian toolset work together to provide you and your team with a fast and guided software development process.

Discover how to integrate JIRA, Stash and Bamboo to support common Git workflows, while easily monitoring progress.

If you browse your Subversion repositories with FishEye, rely on Crucible reviews, or host your repos with Bitbucket, then this is for you too!

If you're using JIRA OnDemand, head over to [Streamlining your development with JIRA OnDemand](#) – that's the page you want!

If you don't have JIRA or the other tools installed yet, [Installing Atlassian Tools](#) will help you find what you need to know.

Read on for the JIRA integration story:

- Create feature branches from JIRA and JIRA Agile
- See your repository branches
- See the commits to your repositories
- See your build results
- See the status of pull requests
- See what's been deployed
- Making the integration work
Create feature branches from JIRA and JIRA Agile

A developer can quickly create a branch in the repository as soon as they start work on an issue.

If you use Atlassian Stash (or Bitbucket) to manage your Git repositories, your developers can quickly create a code branch directly from an issue in JIRA or JIRA Agile. The Create branch link will open your connected DVCS application and launch the process for creating a branch. If you have multiple repository applications connected, then they can choose where to create the branch.

**Development**

**Create branch**

The key for the JIRA issue will be automatically added to the name of the branch, clearly defining the purpose for the branch, and automatically linking the branch to the issue.

The process guides the developer at this crucial step in a number of ways:

- It defaults to the developer’s latest project and repository
- It suggests a branch to branch from
- It prepopulates the branch name and adds the JIRA issue key to the name automatically.

![Create branch for FUSE-113](image)

The screenshot above shows how Stash suggests a branch type and a matching prefix for the branch name when you have a branch model configured. A developer can override the settings that Stash suggests, but the branch model helps developers to conform to your process guidelines when creating branches. Read more about the Stash branch model.

See Making the integration work below, for the technical details.

**See your repository branches**

See all the branches that have been created for work on a JIRA issue, wherever they’re located.

The Development panel in a JIRA issue shows how many branches are related to the issue, wherever they’re located (perhaps in multiple instances of Stash and FishEye, or hosted in Bitbucket). As long as the issue key is part of the branch name, using the default JIRA issue key format, the branch is automatically included in this summary in the JIRA issue:
To see details of those branches, simply click the **branches** link. You'll see which repository each branch is located in, and the status of any pull requests for the branches. Click a branch to go to it in Stash (or the linked DVCS where it is hosted), or hover over a pull request status lozenge to see a direct link to the PR.

Use the **Create pull request** link to begin a discussion about the code changes on a particular branch – it opens the repository and starts the process for creating a pull request.

See **Making the integration work** below, for the technical details.

**See the commits to your repositories**

*See just how much work has been done for a JIRA issue, and when the latest work was done.*

The Development panel summarizes all the commits related to the issue, from all the linked instances of Stash (or other linked DVCSs such as Bitbucket and FishEye). A developer only needs to add the issue key, using the default key format, to the commit message. When the commit is later pushed to Stash, for example, the commit is automatically linked to the JIRA issue and gets included in the Development panel for the issue.
To see details of all those commits, just click the **commits** link. You can see just who made each commit, when they committed, and how many files were changed. Click through to see a particular commit in the repository where the commit was made. Commits are greyed out if they’ve already been merged.

### FUSE-113: 62 unique commits (and 56 duplicates)

See [Making the integration work](#) below, for the technical details.

### See your build results

**Quickly see at a glance whether builds are failing!**

The Development panel shows the most relevant status of the Bamboo builds that are related to your JIRA issue. The status icon is:

- ✔️ if all the different builds (for example, unit tests, functional tests, deploy to staging) succeeded.
- 🚨 if at least one run failed for any build by any linked instance of Bamboo.

A build is automatically linked to a JIRA issue if a commit involved in the build has the JIRA issue key in its commit message, as described above.

### Development

- **8 branches**
- **62 commits**
- **1 build ✔️**

To see details for all the builds, you can click the **builds** link. You can see the name of the **build plan** and how many tests passed, or failed. Click through to see a build result in Bamboo:

The screenshot above shows the build result for a plan branch in Bamboo. You can configure plan branches...
to be automatically created by Bamboo when a new branch is detected in the repository for the plan. Using plan branches ensures that commits to repository branches, and not just commits to master, get continuous integration testing. Because Bamboo does this automatically, there's no need to manually, and repetitively, configure a new Bamboo plan for every new branch in the repo. Read more about plan branches in Bamboo.

Bamboo can be configured to regularly poll the repo and to start a build when it finds changes. Alternatively, a repository change can trigger Bamboo to run the build, for example by using a post-receive web hook, such as this one. The web hook triggers the build plan (or plan branch) whenever a commit is made. Either way, the build result is passed to the JIRA issue and added to the summary in the Development panel. Note that Bamboo must be able to authenticate with Stash to check out source code.

See Making the integration work below, for the technical details.

See the status of pull requests

Quickly spot if the work on a JIRA issue has been reviewed and integrated.

The Development panel shows the most relevant status of the pull requests that are related to the issue. The pull request status is:

- OPEN if there is at least one open pull request.
- MERGED if there are no open pull requests, and at least one pull request has been merged.
- DECLINED if there are no open or merged pull requests, and at least one pull request has been declined.

A developer just needs to add the issue key to the title of the pull request, or have the key in the source branch name, for the PR to be automatically linked to the JIRA issue.

To see details of the pull requests simply click the pull requests link. You'll see the status of each pull request, who the reviewers are, and who has yet to complete their review. You can also see the number of comments on a pull request. Click through to see a particular pull request in Stash.
Once you are ready to merge a pull request, and when the reviewers have approved it, just follow the link to the PR in Stash.

Stash can be configured to automatically merge changes to newer release branches. This reduces the need for manual maintenance of repository branches, and allows bug fixes, for example, to be propagated to other branches where they should be applied. Read more about automatic merging in Stash.

See Making the integration work below, for the technical details.

**See what's been deployed**

_Easily check if the work on a JIRA issue has shipped to customers yet._

The Development panel shows the environments that Bamboo builds related to the issue have been deployed to.

<table>
<thead>
<tr>

<td><strong>Latest 16/Dec/13 3:45 AM</strong></td>
</tr>
<tr>
<td><strong>4 pull requests</strong> <strong>MERGED</strong></td>
<td><strong>Updated 16/Dec/13 4:20 AM</strong></td>
</tr>
<tr>
<td><strong>1 build</strong> ✔️</td>
<td><strong>Latest 06/Dec/13 11:17 PM</strong></td>
</tr>
</tbody>
</table>

### Deployed to Production

Create branch

To see the details of recent deployments, click the **Deployed** link. You'll see the deployment status and the release number and date, and you can through to see more details in Bamboo.
A deployment is linked to a JIRA issue if a commit involved in the deploy has the issue key in its commit message. When those code changes are later built (see above), and the resulting artifact is deployed (either manually or automatically) the environment information is passed to the JIRA issue. This assumes that the Bamboo build plan is associated with a deployment project in Bamboo.

See Making the integration work below, for the technical details.

**Making the integration work**

**In general**

- JIRA users only need the “view development tools” project permission to be able to see the Development panel. By default, anonymous users (those who are not logged in) don't have this permission, and so do not see the panel.
- A developer needs to use the default JIRA issue key format, that is, two or more uppercase letters ([A–Z] [A–Z]+), followed by a hyphen and the issue number, for example EG-123.
  - Commits are linked automatically if the issue key is included in the commit message.
  - Branches are linked automatically if the issue key is included in the branch name.
  - Pull requests are linked automatically if the issue key is included in the pull request's title or in the source branch name.
  - Builds and deployments are linked automatically if a commit involved in the build has the issue key in its commit message.
- JIRA needs to be connected with Stash, FishEye, Crucible or Bamboo using a 2-way application links that have both 2-legged and 3-legged authentication enabled. See the Application Links section below.
- JIRA needs to be connected with Bitbucket, GitHub or GitHub Enterprise using the DVCS Connector in JIRA. See Use the JIRA DVCS Connector.
- When using the supported versions of JIRA and the other applications, the Development panel replaces the Source, Commits and Builds tabs, as well as the Deployment panel, in a JIRA issue. So, for example, you won't see the Source tab, and commits in Stash will be accessible from the Development panel. However, if a connected application is older than the supported version, information from that application will continue to be displayed in those locations.
Supported versions

To see the integrations described on this page, you'll need the following application versions:

<table>
<thead>
<tr>
<th>Application</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>JIRA</td>
<td>6.2+</td>
</tr>
<tr>
<td>Stash</td>
<td>2.10+</td>
</tr>
<tr>
<td>Bitbucket</td>
<td>Current version</td>
</tr>
<tr>
<td>FishEye</td>
<td>3.3+</td>
</tr>
<tr>
<td>Crucible</td>
<td>3.3+</td>
</tr>
<tr>
<td>Bamboo</td>
<td>5.4+</td>
</tr>
</tbody>
</table>

Application links

When you create a new application link between JIRA and an instance of Stash, FishEye, Crucible or Bamboo, 2-legged (2LO) and 3-legged OAuth (3LO) are enabled by default. 2LO is required for information from an application to be included in the summaries in the Development panel; 3LO requires a user to authenticate with the other application in order to see information in any of the details dialogs.

- Users who can see summarized data in the Development panel may not have permission to see all the information that contributed to those summaries in the details dialogs (for example, for branches, commits and pull requests). That is, the details dialogs respect the access permissions that users have in the connected applications.
- An older application link between JIRA and any of those applications will need to have 2-legged authentication enabled.

Click here to see how to enable 2-legged OAuth...

An existing application link between JIRA and Stash, FishEye, Crucible or Bamboo (that perhaps used Trusted Apps authentication) needs to have 2-legged authentication (2LO) enabled for both outgoing and incoming authentication, so that information from the application can be included in the Development panel summaries.

When updating an older application link to use OAuth, 3-legged authentication is applied by default, but you need to explicitly enable 2LO. Enable 2-legged authentication for the application link from within JIRA as follows:

1. Go to the JIRA admin area and click Add-ons > Application Links.
2. Click Edit for the app link with the other application.
3. For both Outgoing Authentication and Incoming Authentication:
   a. Click OAuth
   b. Check Allow 2-legged OAuth.
   c. Click Update.

The application link update process will involve logging you into the other application for a short time to configure that end of the link, before returning you to JIRA.

Installing Atlassian Tools for Integration with JIRA
Hey there,

So you want to make sure you have everything installed before you can fully integrate with JIRA 6.2? No problem, we can help you out. Remember though, you don't need to have all the Atlassian products installed, just the one's you know and love. The only required product is JIRA.

So lets get started, you don't have JIRA!

Follow the installation guide here to ensure JIRA 6.2 is up and running. JIRA is the base platform that's used to tie everything together, so it's vital you have it installed and running smoothly.

Now you have JIRA, what's next? Well, Bamboo and Stash now integrate awesomely with JIRA. If you don't have them installed already, the links below will take you to an installation guide for each product so you can get them up and running.

<table>
<thead>
<tr>
<th>Product</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bamboo</td>
<td>5.4 and above</td>
</tr>
<tr>
<td>Stash</td>
<td>2.10 and above</td>
</tr>
<tr>
<td>BitBucket</td>
<td>Current</td>
</tr>
<tr>
<td>FishEye</td>
<td>3.3 and above</td>
</tr>
<tr>
<td>Crucible</td>
<td>3.3 and above</td>
</tr>
</tbody>
</table>
Now that you have them up and running, you can go to this page to get them integrated with style. Or read on....

Anything else I may need or want to try? You can also integrate your Bitbucket account with JIRA. Bitbucket doesn't require installation, however you will need to set it up and create accounts and repositories to make sure it works. Check out our Bitbucket 101 to make sure everything is set up correctly.

If you love FishEye and Crucible, they can also be integrated with JIRA. You'll need to install them, and the details on how to do that can be found in the links below.

Everything installed and working? Awesome! Now lets get ready to unleash the power of JIRA 6.2 integration...
